an opinion which is taken into account in the credit approval process, and (iii), as the case maybe, monitors the projects and respective clients. To check socio-environmental conformity, this team: a) verifies if the potential corporate client is involved in activities related to forced labor, child labor and prostitution. Should such activities come to light, the request for credit will be turned down; b) verifies if the potential client operates in sectors which have a significant socio-environmental impact, such as: (i) extraction and production of wood, firewood and charcoal from native forest areas; (ii) mining and industrialization of asbestos; (iii) fisheries; or (iv) production and sale of firearms, munitions and explosives. In these cases, Itaú Unibanco conducts specific investigations in accordance with the activity involved: i) investigates the potential customer's socio-environmental management and the existence of any legal or administrative actions or news items which might cast the client in an unfavorable light; ii) solicits socio-environmental documentation with respect to the potential client and the project itself, among which, the environmental license; iii) undertakes technical visits, as required; and (iv) requests a technical analysis of the project where necessary. Once the financing is approved, the contract is drawn up to include environmental clauses allowing Itaú Unibanco to suspend with immediate effect the liberation of funds and to require early repayment of the operation in the event of the financed entity's non-compliance with the socio-environmental legislation and regulations. There are also specific contractual provisions for such cases, among others, genetically modified organisms (GMO) research, compliance with legal forest reserve norms, permanent preservation areas and lands declared as pertaining to indigenous peoples' reservations. Where a transaction is collateralized with real estate, Itaú Unibanco checks as to whether the property given in guarantee carries any environmental liabilities through an examination to be performed by an appropriate expert" (Itaú Unibanco).

#### d) The liability of non-governmental organizations

1) Consolidate Chapter 27 of Agenda 21, in particular: "27.1. (...)The credibility of nongovernmental organizations lies in the responsible and constructive role they play in society. Formal and informal organizations, as well as popular movements, should be recognized as partners in the implementation of the Agenda 21. The nature of the independent role played by non-governmental organizations within a society calls for real participation (...); 27.5. Society, Governments and international bodies should develop mechanisms that allow non-governmental organizations to play their partnership role in a responsible manner and effectively in the process of environmentally sound and sustainable development. 27.6. In order to strengthen the role of non-governmental organizations as social partners, the United Nations System and Governments should begin a process of reviewing formal procedures and mechanisms for the involvement of these organizations at all levels from policy-making and decision-making to implementation, in consultation with non-governmental organizations (Erico Mabellini).

#### e) Information Access and Public Participation

##### International Recommendations

- 1) It is necessary to define the meaning of the right of access to information at both the international and national levels (PDMA).
- 2) Signing a Regional Convention in Latin America in order that the principle of information access may be implemented, under the control of an institution, such as ECLAC (The TAI Network).
- 3) Ratifying of the Aarhus Convention (PDMA).
- 4) Establishing the right to access information on biotechnology and nanotechnology as well as nuclear and other advanced technologies (Solange Telles da Silva).

##### National Recommendations

- 1) Establishing publication deadlines for all documents related to environmental decisions (PDMA).
- 2) Imposing financial penalties in the case of noncompliance with publication deadlines (PDMA).
- 3) Ratifying of the Aarhus Convention (PDMA).
- 4) Signing a Regional Convention in Latin America to be implemented the access to information in the region under control of a regional institution (PDMA).
- 5) Establishing a fully detailed decree of often imprecise terms, with some examples of articles (PDMA):
  - a) Public audiences may be conducted, for instance, by sector, population or community, in order not to allow domination of the audience by people who have greater chance to express themselves (Colin Crawford).
  - b) Requiring effective mechanisms of access to all relevant documents to public audiences by population and interested communities, as well as access to versions with comprehensible language of details of the proposed projects (PDMA).
  - c) Providing training courses for community leaders and mediation techniques in order to qualify the ones who need to access the public audience procedures (PDMA).
  - d) Requiring public participation from the beginning of the procedure or process that will affect a specific community (PDMA).
- 6) Requiring the preparation of Environmental Impact Report (EIR) linked to the Preliminary Study Environmental Impact Assessment (EIA) (PDMA).
- 7) Environmental documents shall be available on the Internet (Larissa Clare Pochmann da Silva).

#### f) Oversight and Accountability

- 1) Implementation of the monitoring system such as the GRI in the States (PDMA).
- 2) Controlling of information provided by the companies in their annual reports by the state through a government agency (PDMA).
- 3) Disclosure of corporate balance sheets on the Internet (with compatible data set by States) (PDMA).
- 4) Rule on the requirement of social balance, with the prediction of environmental and social aspects (PDMA).
- 5) Issuing a decree stipulating the criteria that should be in the company's annual social report in order to make that information comparable (PDMA).

#### g) Green Public Procurement

##### International Recommendations

- 1) Writing more specific guidelines on the green bidding topic at Rio +20 (Teresa Villac P Barki).
- 2) Strengthening of the sustainable Public Procurement in the MERCOSUL (Teresa Villac P Barki).

#### National Recommendations

1) Insertion of sustainable hiring in the planning activities of public entities (Teresa Villac P Barki).

#### h) Water: The Creation of Protected Areas on the High Seas

1) In order to achieve sustainable development, States should create marine protected areas (Fernanda Salgueiro Borges).

2) Marine Protected Areas should be considered as areas of full protection, essential for the conservation of biodiversity and for the maintenance of essential ecological marine processes (Fernanda Salgueiro Borges).

3) Any activity affecting or potentially affecting the ecological balance and biodiversity conservation in marine protected areas should be considered prohibited in respect of the right to an ecologically balanced environment for the present and future generations (Fernanda Salgueiro Borges).

4) Marine Protected Areas should ensure the protection of biodiversity and the quality of marine waters, to avoid acidification and death of organisms for biotic and abiotic necessary to capture carbon from the atmosphere, responsible for mitigating global warming and climate changes (Fernanda Salgueiro Borges).

5) Marine Protected Areas should ensure the preservation of natural fisheries resources, required for food security of present and future generations (Fernanda Salgueiro Borges).

#### i) Water: The Management of Aquifers Located under the Territories of Several Countries

1) Reduce asymmetric information (specific case of Guarani Aquifer) (David Cassuto and Romulo Sampaio).

2) Increase regional and local engagement (awareness, capacity-building and traditional knowledge) (David Cassuto and Romulo Sampaio).

3) Harmonization of national legislation (David Cassuto and Romulo Sampaio).

4) Regulatory structures (environmental services) (David Cassuto and Romulo Sampaio).

#### j) Taxation as a Means of Environmental Management

International Recommendations 1) Establish a limit (cap) for each country of carbon emissions. The initial cap will be the result of the average carbon emissions over the past three to five years. A transition rule might be created (more lenient rule) for developing countries and LDCs (Least Developed Countries – according to WTO classification) - so that these countries are not disadvantaged because of their low level of current development, and so they can still develop despite the targets for carbon reduction (Tatiana Falcão Octaviano).

2) The carbon emitted in each country shall be taxed in order to encourage companies to use resources in developing new technologies for clean energy production. The tax rates should be the same in each country (we suggest the establishment of a maximum rate and minimum rate), so that they are not created "carbon tax havens" (Tatiana Falcão Octaviano).

3) Establishing maximum and minimum rates that will also prevent the adoption of tariff adjustments on products importation (Border Tax Adjustments "BTA") (Tatiana Falcão Octaviano).

4) Creating a treaty that establishes a origin for the carbon emitted as a result of international activities (Tatiana Falcão Octaviano).

5) Creating a new international body with police power in order to monitor and eventually penalize those who do not comply to the limits imposed by the treaty (Tatiana Falcão Octaviano).

#### National Recommendations

##### 1) Green tax:

a) Establishing a less onerous form for the final consumer, for fuel tax, so as to encourage the consumption of cleaner fuels (such as biodiesel and alcohol) in order to reduce the consumption of high carbon concentration fuels, which are more pollutant, such as diesel and coal burning (Tatiana Falcão Octaviano).

b) Establishing a green contribution (purposing the creation of a fund to combat climate change and reduce the harmful effects of global warming) on fuel. The contribution would be progressive, more burdensome to diesel fuel and less to biodiesel, for example (Tatiana Falcão Octaviano).

c) The funds raised with the contribution should be used in development of green Brazilian technology for the production of electric cars, development of new forms of biodiesel (for instance, it is possible to transform peel potatoes and other vegetables into fuel) and even for the promotion of "green" initiatives such as increased efficiency in the recycling project, replanting of forests (which are also internationally known as "carbon sinks" as we consume and re-absorb carbon from the atmosphere), construction of bike lanes to encourage bicycle use by local people, etc (Tatiana Falcão Octaviano).

##### k) The Non-Regression Principle in Environmental Law

#### International Recommendations

1) Integration of the principles of non-regression of the human rights area into environmental law (Michel Prieur).

2) In order to preserve the sustainable development and ensure the necessary protection of the environment, states may not take legislative, administrative or judicial measures importing an unlawful reduction of their protection levels granting by laws that protect the environment except in public interest prevalent case (Maria Morelli).

3) If states adopt a legislative, administrative or judicial measure which reduces levels of environmental protection in force, they shall justify the reasonableness and proportionality of the measure (Maria Morelli).

#### National Recommendations

1) The environmental goals should be achieved in a gradual manner, through provisional and final targets, on the basis of a state planning that facilitates the implementation of activities related to these goals (Maria Morelli).

2) Efforts to ensure environment protection and conservation cannot decrease. So in this sense, it is forbidden to adopt legislative, administrative or judicial measures that

illegitimately reduce levels of environmental protection legislation, except in case of public interest, which must prevail (Maria Morelli).

#### l) The definition and criteria for local sustainability

##### National recommendations

1) Definition and promotion of sustainability indicators that can be used for the formulation of local environmental policies. Indicators should reconcile the protection and preservation of goods, services and environmental and cultural resources with economic and social development needs (PDMA).

#### m) Policies and standards for the protection of animals

1) Review: As founder and director of an NGO for the animal and environment, I would like to emphasize, that the animal protection associations also have great value to the conservation of the natural environment, which is "habitat" of wild animals from all over the world. The claims of the Animal Rights Movement will allow the Rio + 20 Conference to transcend the anthropocentric world view, by citing that not only humans, but also many non-human life forms that inhabit this planet with us, as the non-human animals are subjects of rights. Another important role of the third sector aimed at the protection of animals is the constituted authorities to help in the fight against wildlife trafficking, criminal activity that destroys the environment in a completely unsustainable and unacceptable way, in all respects (Erico Mabellini).

#### 4) Green Economy on Sustainable Development context: eradication of poverty

##### a) Regularization

1) Establishing property rights in forested areas and biomes in order to prevent illegal deforestation. (Fernando Meneguín).

2) The concession of rights to public lands to ensure better monitoring of national resources and to facilitate land regularization (Fernando Meneguín).

3) Imposing limits on land use; the concession of land rights, which are not absolute, but provide benefits to the title holder and to the state though terms and restrictions on the use of the land (Fernando Meneguín).

4) Establishing an effective policy and a coordinated regional planning (Jose Heder Benatti).

a) The State must be proactive and coordinate the process of regional planning for public policies that are effective, because the lack of a public goods allocation policy may leave space for the chaotic land occupation of public areas, through land invasion and deforestation, which often happens when there is no such policy.

b) So in this sense, it is necessary to establish a regional planning policy to include: land regularization; environmental licensing of rural properties; obedience to the social function of ownership; control, enforcement and economic instruments capable of stimulating the sustainable management of natural resources, especially forests.

i) For example, the economic or tax incentives can stimulate private spending in certain areas, discourage bad behavior, and correct the market trends that can encourage actions against nature conservation and the natural resources protection.

5) Land regularization in order to ensure control and define property rights, allowing the public power to know who is occupying land and how they are being used (Jose Heder Benatti).

a) Firstly, to overcome the current land chaos, land ownership must be determined - who is the owner of the land, public or private sector? If public, which federative entity?

b) Official recognition of the different existing forms of occupation should allow the state and society to have the control over the use of land and other natural resources. Therefore, the regularization will be positive and not negative, since it prioritizes family occupation.

c) Another positive effect of land regularization policy is the fight against illegal occupation of public lands.

6) There are several necessary steps to implement a land use (José Heder Benatti):

d) To overcome the limited management capacity of agencies responsible for planning land, whether in its technical or staff.

e) Understand that the consolidation of rural property, respecting the social and environmental assumptions, represents an important step towards the strengthening of citizenship and environmental protection.

7) The process of regularization of land occupation should (José Heder Benatti):

f) Be accompanied by a survey and a descriptive, georeferenced memorandum. The financial costs for its preparation should be the responsibility of recipient of legitimacy, with exception of the processes of regularization of small properties.

g) Include in the title deeds issued by the land agency clauses requiring the beneficiary to maintain, conserve and, if appropriate, restore the permanent preservation areas and legal reserves.

8) Other necessary and complementary actions to the regularization (Jose Heder Benatti).

h) Scanning of land acquis.

i) Modernization of access to registry information of rural land in order to increase the effectiveness of the real estate property registration processes records and ensure that information can be obtained quickly and from a distance by public authorities relating to questions of federal land.

#### b) Environmental Education

##### International Recommendations

1) Making investment in education a priority in developing countries and underdeveloped countries, since the lack of education contributes to unemployment which results in crime and poverty. In addition, ensure that education serves as a tool for public awareness of the current problems in the world, such as politics, health and environmental preservation. The unequal distribution of wealth is also a consequence of poor education (Patricia Pellanda).

##### National Recommendations

1) Environmental education, at all levels, is everyone's responsibility because it contributes to the reduction of social inequalities. The principle of transversality should be followed in schools (Maria Collares).

- 2) Government should be able to train teachers to teach environmental education at all levels of government and to monitor the effectiveness of the method adopted (Maria Collares).
- 3) Information on Environmental education requires transparency to public in order to contribute to the protection of natural resources, the public health and to the poverty eradication (Maria Collares).
- 4) Environmental education propels sustainable development. It should be compulsory in schools, social, professional and public activities (Maria Collares).
- 5) The inclusion of Environmental Law as a mandatory subject in law schools in order to contribute to educate professionals to apply effectively environmental legislation in all activities (Maria Collares).

c) The fundamental right to land and food

International Recommendations

- 1) Regarding the right to food, the focus of debates is on hunger eradication of people. This problem cannot be based on instruments that aim at increasing food production in the world, but on appropriate means to combat social inequalities and unequal distribution of wealth (Patricia Pellanda).
- 2) Cooperation and mobilization of all countries is necessary to fight against poverty and social exclusion. It is necessary to decentralize poverty policies in order to enforce cooperation, based on the premise that resources should be made available by the richest countries for the poorest countries (Alexceia Ferreira).
- 3) Encouraging the application of a "Solidarity Economy", warning private sector that their donations and supportive attitudes may contribute to the results of the company itself (Patricia Pellanda).

National Recommendations

- 4) Guarantee of land and territories granted to indigenous people and traditional communities as a collective right, transcending the idea of merely individual property (Patricia Pellanda).
- 5) Prevent State's domestic law equating indigenous lands to family farms. On this perspective it is important to achieve an international commitment and recognition of specific features of indigenous people and their cultural practices. This measure will prevent the high development of agribusiness lands and other explorations that have been occurring frequently on these populations' lands (Patricia Pellanda).
- 3) The commitment of States to reduce/eliminate corruption in politics. In addition to this, States shall punish those who: divert funds, individually enrich and "forget" their real function towards government and social obligations. Corruption can be reduced by strengthening social bases and basic education (Patricia Pellanda).
- 4) Public awareness that many problems can be solved in the short term through measures introduced by them and taken by the population itself, independent from the government. Problems such as hunger and environmental devastation belong to everyone. In long term, the eradication of poverty can be solved through an alliance between civil society and government. Since it is a problem that concerns everybody, it is the essential to engage various sectors of society (Patricia Pellanda).
- 5) Besides sufficient quantity of food to fulfill basic human needs, the quality of food and water should be prioritized, in order to achieve international food security intended. Quantitatively and qualitatively appropriate nutrition result in positive consequences for the health sector such as diseases reduction, especially those arising from the use and the consumption of pesticides and new technologies (transgenic) (Patricia Pellanda).

d) Definition and Criteria for a Sustainable City

National Recommendations

- 1) Definition and promotion of sustainability indicators that may be used for the development of local environmental policies. These indicators must reconcile the protection and the preservation of goods, services, environmental and cultural resources with the needs of economic and social development (PDMA).

e) The rights of indigenous people and of traditional communities

International Recommendations

- 1) A Protocol is necessary to precise definitions, obligations and rights of indigenous people and traditional communities with provisions such as (PDMA):
  - a) Prior, free and informed consent in relation to any activity held in indigenous areas;
  - b) Participation in the implementation of projects that can affect their lives;
  - c) Protection and guarantee to land access, natural resources and to benefits derived from their use;
  - d) Recognition of traditional knowledge of indigenous people and protection of people relocating to other territories;
  - e) Monitoring mechanism should be created at the international and national levels to ensure transparency and effectiveness of these rights.
- 2) Indigenous people may be impacted from the consequences of global climate change. It is necessary to ensure that such impacts are mitigated and that training and adaptation to climate change are rights of these peoples (PDMA).
- 3) Indigenous people have a crucial role in the conservation of environmental resources. This role should be recognized for compensation for environmental services and distribution of REDD benefits (Reducing Emissions from Deforestation and Degradation) (PDMA).

National Recommendations

- 1) Better access to information and participation of indigenous people in the implementation and development of projects that affect them directly or indirectly (PDMA).
- 2) Recognition of land and territories granted to indigenous people and traditional communities as a collective right, transcending the idea of merely individual property (Patricia Pellanda).
- 3) More precise definitions of terms such as traditional communities (Colin Crawford).

NATIONAL AND INTERNATIONAL INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT.

5) National Institutional Framework

a) Legal and Procedural instruments

International Recommendations: procedural instruments

- 1) Acceptance of civil society participation through representative entities such as amicus curiae in international environmental dispute settlement (Larissa Clare Pochmann da Silva).
- 2) Establishing a right to sue, the lack of implementation of environmental treaties in national tribunals (Gérard Monédaire).
- 3) Creation of Regional Integrations, provided with a distinct legal personality from the Member States, competent to sign Environmental Treaties (Gérard Monédaire).
- 4) Right of petition, so that the society can intervene in the Legislative Assemblies or Commissions (Gérard Monédaire).
- 5) Imposition of financial sanctions to disobedience or incomplete compliance with Tribunals decisions or laws concerning environment (Gérard Monédaire).
- 6) Reversal of the burden of the proofs in environmental disputes (Carole Peychaud).

International Recommendations: legal instruments

- 1) A treaty on the reparation of environmental transnational damage affecting citizens of other countries (Larissa Clare Pochmann da Silva).

National Recommendations: procedural instruments

- 1) Disclosure of condemnation of environmental damage with destination of these values to international public funds. Publicity of the application of these values to environmental protection (Larissa Pochmann Clare da Silva)

b) Analytical methods to measure the effectiveness of law enforcement

International Recommendations

- 1) The Secretariats of the Conventions must require States to designate national institutions to be National Points of Contact responsible for identifying the implementation of environmental treaties (PDMA).
- 2) The priority must not be the creation of new laws and treaties, but the political and legal commitment to the implementation of existing standards (Patricia Pellanda).

National Recommendations

- 1) Application of environmental quality standards such as agricultural pesticides eradication that have occurred in Europe (Solange Teles).
- 2) Creation of legal environmental sustainability indicators of environmental governance (Solange Teles).

6) International Institutional Framework

a) Existing Institutions

International Recommendations

- 1) Creating a new international agency within the United Nations to discuss sustainable development, which would incorporate the UNEP and the committee within the ECOSOC responsible for sustainable development (PDMA).
- 2) Creating a committee inside this new body that would represent international NGO's selected according to their performances (PDMA).
- 3) Focus on UNEP (PDMA).
- 4) The transformation of the UN Economic and Social Council to the Economic, Social, and Environmental Council (PDMA).
- 5) Reforming of the Commission on Sustainable Development in the General Assembly (PDMA).

b) The Necessity of new institutions: the World Environmental Court

International Recommendations

Considering the International Court of Justice (ICJ) importance in the international community - we propose the reform of the ICJ or the foundation of a World Environment Court, based on the following proposals (Rafael Prado):

- 1) Increase flexibility of the ICJ Environmental Chamber, and encourage the use of principle of the public participation principle and the access of stakeholders to justice (not just government but also civil society). The public participation principle is fundamental principle in International Environmental Law and was recognized by the ICJ Judgment in the same case of the Pulp Mills on the Uruguay River (Rafael Prado).

- 2) ICJ shall demonstrate its wide jurisdiction over environmental matters involving Member States, not by modifying its Statute inserted in the UN Charter, but materializing the public participation principle and access to information and to justice, in case of environmental issues that directly affect national populations of litigants countries (Rafael Prado).

c) The necessity of new Institutions: World Environmental Organization

International Recommendations

- 1) Environmental conventions Secretariats, as technical instances of conventions, would be specialized organs in the new International Organization (Sandro Schmitz dos Santos).

2) There would be a Settlement Body, according to the model of WTO, which would also be a consulting and arbitration body on violations of International Environmental Law. This body would also be composed of a Commission with competencies similar to the Inter-American Commission on Human Rights (IACHR) (Sandro Schmitz dos Santos).

3) Three would be the new organization sources of income: the quota-share from the participant countries, major financial penalties for environmental damage, and fees obtained from carbon credits certification and environmental economics in general (Sandro Schmitz dos Santos).

## Réseau des Agences Régionales de l'Energie et de l'Environnement (RARE)

Contribution du Réseau des Agences Régionales de l'Energie et de l'Environnement (RARE) à RIO +20

VERS UNE NOUVELLE GENERATION D'AGENDAS 21 LOCAUX

Quelques années seulement après RIO le réseau des agences régionales de l'énergie et de l'environnement (RARE) ont progressivement investi le champ du développement durable en France. Cette implication s'est notamment faite sur le terrain, en accompagnement direct de collectivités territoriales volontaires. D'abord peu nombreuses et pionnières, ces expériences se sont multipliées pour impliquer aujourd'hui l'essentiel des acteurs publics.

L'accompagnement au quotidien des Agendas 21 s'est également concrétisé par un apprentissage constant de tous les acteurs et par la diffusion d'outils méthodologiques et pratiques conçus par les agences du RARE.

Cette mutualisation de la compréhension du développement durable et des outils a généré et renforcé les réseaux régionaux d'échanges créés par les agences régionales avec d'autres acteurs publics.

Après plusieurs décennies d'existence, ces réseaux perdurent, les plus anciens forment les plus récents, ils se spécialisent en mettant l'accent sur certaines thématiques (éco-responsabilité, commande publique durable, énergie-climat...) et la participation est de plus en plus forte. Le développement durable bénéficie d'une reconnaissance de plus en plus grande mais se heurte à de nombreuses résistances au changement.

Le RARE souhaite faire part de son retour d'expériences pour renforcer encore la diffusion du concept de développement durable et contribuer à RIO +20 autour de sept propositions :

- 1) Passer de l'incantation à l'action,
- 2) De l'artisanat à la prise en compte réglementaire,
- 3) La valorisation de la diversité des agendas 21 et des modes de concertation,
- 4) Gommer les ambiguïtés et réaffirmer le développement comme axe structurant des politiques,
- 5) Du plan à l'action, maintenir la dynamique,
- 6) Des points clés incontournables au service de la qualité des démarches,
- 7) L'importance de l'implication et la formation des agents des collectivités.

VERS UNE NOUVELLE GENERATION D'AGENDAS 21 LOCAUX

1. Passer de l'incantation à l'action

Les premiers Agendas 21 se sont engagés en France au milieu des années 90, quelques années seulement après RIO. Le temps de l'élaboration de ces premiers Agendas 21 a été une période où la notion même de développement durable a dû faire ses preuves. C'était le temps de la présentation du concept et de sa démonstration de sa pertinence. À l'époque, l'idée était complètement neuve en France et la question de l'intérêt même d'une démarche de développement durable n'était pas acquise.

Aujourd'hui, la perception a changé et le concept a désormais fait ses preuves : il est possible de mener sur la durée l'élaboration d'un Agenda 21 en concertation avec la population. Après cette toute première génération de défricheurs, les acteurs publics s'interrogent sur le « comment faire » du développement durable et non plus sur « pourquoi faire du développement durable » comme à l'origine.

Proposition du RARE : Le RARE propose de poursuivre l'accompagnement des Agendas 21 jusque dans le suivi de la mise en oeuvre opérationnelle pour contribuer à la qualité des résultats. Les partenaires financiers des collectivités territoriales sont pour leur part invités à conditionner leurs aides financières à des objectifs de

développement durable.

## 2. De l'artisanat à la prise en compte réglementaire

Les pionniers du développement durable des années 90 ont contribué à la rédaction de ce qui allait progressivement devenir la référence en matière de développement durable. En 2006, après les premières initiatives en matière d'Agenda 21 en France, l'Etat, grâce à un large travail partenarial national, s'est doté d'un cadre de référence des démarches territoriales de développement durable.

Progressivement l'arsenal juridique français a également intégré le développement durable dans la plupart des nouveaux textes réglementaires. Le Grenelle de l'environnement renforce la place du développement durable sans toutefois lui donner une dimension obligatoire de façon générale. Seul un rapport développement durable est désormais exigé des plus grosses collectivités territoriales françaises.

Proposition du RARE : le RARE propose de rendre obligatoire pour chaque Etablissement Public de Coopération Intercommunale (EPCI) la réalisation des Agendas 21 au même titre que les règlements d'urbanisme ou les Plans Locaux d'Urbanisme (PLU).. En effet, la publication de ce document devrait être aussi stratégique que l'aménagement urbain, ou le logement.

Le RARE propose par ailleurs que chaque EPCI dispose d'un Conseil économique, social et environnemental, outil de base d'une concertation locale.

## 3. La valorisation de la diversité des Agendas 21 et des modes de concertation

Le cadre de référence français pour les Agendas 21 s'est appuyé sur les initiatives de toutes les collectivités territoriales, quelle que soit leur échelle. En effet, les territoires ont rapidement adapté la démarche à leurs spécificités, en expérimentant tant dans leurs actions que dans leurs méthodes.

Coeur du développement durable, la concertation a fait l'objet de diversification et d'innovation : les publics concernés, les formes, les lieux, les outils de concertation sont énormément diversifiés avec une recherche d'adaptation aux réalités du territoire.

Proposition du RARE : le RARE propose qu'un bilan global des Agendas 21 ainsi qu'un recensement des outils de concertation soit tiré de toute cette richesse d'expériences pour en assurer une large diffusion au plus grand nombre.

Le RARE rappelle également le caractère essentiel d'une co-construction réelle avec la population et l'ensemble des acteurs socio-économiques des programmes d'actions en matière de développement durable qui permet de conforter son contenu et assure sa réussite et sa diffusion.

## 4. Gommer les ambiguïtés et réaffirmer le développement durable comme axe structurant des politiques

Malgré le cadre de référence et parce qu'il est de plus en plus difficile de se soustraire à une approche de développement durable, l'absence de conditionnalité des aides ainsi que l'absence d'obligation réglementaire, permettent à chacun une approche « à la carte » en matière de développement durable.

Proposition du RARE : Le RARE propose que les Etats rappellent avec force la nécessité de la transversalité et de l'intégration du développement durable dans toutes les politiques. Une politique sociale, économique et environnementale, même réunies dans un même document ne saurait en aucune façon apporter une réponse en matière de développement durable.

Le RARE souhaite rappeler l'importance stratégique et structurante des Agendas 21 qui visent à organiser et à articuler entre elles l'ensemble des politiques, sans restreindre leurs champ d'action.

## 5. Du plan à l'action, maintenir la dynamique

La multiplication des expériences en matière de développement durable et des échanges entre acteurs régionaux et nationaux a permis la construction d'une culture commune. Il ressort de toutes ces démarches que le temps de l'élaboration des Agendas 21 est une période de très forte implication qui peut se terminer brutalement par la publication de l'Agenda 21 en tant que tel. Bien souvent la question de la pérennité de cette dynamique créatrice n'a pas été anticipée.

Proposition du RARE : le RARE propose d'intégrer, dès la conception de ces démarches territoriales, une réflexion sur la mise en oeuvre et les changements de comportement qu'elle implique. Une organisation pour la mise en oeuvre opérationnelle doit être structurée afin d'assurer le maintien de la dynamique initiale et l'association des parties concernées après la publication de l'Agenda 21.

## 6. Des points clés incontournables au service de la qualité des démarches

Une volonté politique forte, une équipe autour du porteur de projet, une reconnaissance et des moyens, le temps de la concertation, la recherche d'une diversification des partenaires, une programmation progressive mais opiniâtre sont autant d'éléments relevés au travers des très nombreux exemples d'Agendas 21 locaux.

Proposition du RARE : le RARE souhaite insister sur ces éléments de qualité indispensables à la réussite des Agendas 21. On assiste depuis quelques années à la tentation d'une banalisation des démarches de développement durable avec une baisse de la qualité finale par manque notamment de moyens, et/ou de temps et un défaut de concertation. Le RARE propose que les Agendas 21 soient évalués par des organismes indépendants. Par souci de cohérence, le RARE propose des outils déclinables à chaque échelle pour orienter une convergence des objectifs de l'échelle internationale à l'échelle locale.

## 7. L'importance de l'implication et de la formation des agents des collectivités

Les démarches territoriales de développement durable ne doivent pas apparaître comme un objet déconnecté de la réalité des services et porté seulement par les politiques. L'ensemble des services doit être étroitement associé à son élaboration et bénéficier des formations nécessaires à sa mise en oeuvre quotidienne.

Proposition du RARE : le RARE propose de faire du développement durable un élément de formation de base des agents, également intégré dans leur déroulé de carrière.

## CONCLUSION :

Les Agendas 21 sont des outils opérationnels et pratiques qui contribuent à la mise en place d'une économie verte et à la lutte contre la pauvreté, dans le cadre d'une co-construction avec l'ensemble des parties concernées. A ce titre, 20 ans après RIO, les agendas 21 locaux, sont des outils privilégiés à renforcer pour la mise en oeuvre du développement durable.

Le Réseau des Agences Régionales de l'Energie et de l'Environnement (RARE), propose en ce sens de les rendre obligatoires pour toutes les intercommunalités en les dotant d'outils de concertation locale, et en les évaluant pour s'assurer de leur qualité.

Le RARE s'engage à continuer activement l'accompagnement des Agendas 21 locaux dans le cadre de ses missions et compétences.

## PRESENTATION du RARE

Le Réseau national des Agences Régionales de l'Energie et de l'Environnement (RARE) regroupe 11 opérateurs qui interviennent, à l'échelle des régions et auprès des acteurs locaux. Elles élaborent des réflexions et des outils au niveau national et européen pour agir efficacement en faveur de la réduction de la consommation d'énergie et de la promotion du développement durable des territoires.

Les domaines d'intervention sont variés mais ceux rencontrés le plus souvent sont :

-  Les applications territoriales du développement durable;
-  Les outils et méthodes de travail pour l'animation de réseaux, l'observation et l'expérimentation...
-  L'animation des Observatoires Régionaux de l'Energie et des GES;
-  La mobilité, la qualité de l'air
-  La maîtrise de l'énergie et le développement des énergies renouvelables, et le changement climatique;
-  L'utilisation rationnelle et économe des matières premières (eau...);
-  La mise en valeur des espaces naturels;
-  L'éducation à l'environnement et l'emploi formation
-  Le management environnemental et les démarches de responsabilité sociétale;

### Les agences régionales

Acteurs de terrains depuis plus de 30 ans pour certaines d'entre elles, les agences régionales de l'énergie et de l'environnement, ont accumulé un capital unique de connaissances et d'expériences pour agir auprès des collectivités locales, des entreprises, des acteurs professionnels, des associations, de la communauté scolaire et du grand public.

Les formes d'interventions sont multiples : information, sensibilisation, animation de réseaux, observation, transfert de savoir, accompagnement de démarches et de projets, programmes européens et coopération décentralisée...

Chiffres clés : - 1995 : naissance du RARE

- 2011 : 11 organismes partenaires, 11 régions représentées dont 2 dans les départements et territoires d'outre mer, 230 collaborateurs

- 42% des régions disposent d'une agence régionale et représentent les 2/3 de la population française.

- La présence des agences dynamise l'activité sur le développement durable dans de nombreuses régions (Midi-Pyrénées, Rhône-Alpes, Bourgogne, Nord Pas de Calais, Ile de France, Provence-Alpes-Côte d'Azur, Haute-Normandie etc....)

Elles animent notamment des réseaux de territoires autour du développement durable :

-  Ile de France : <http://teddif.org/> et <http://www.areneidf.org/>
-  Midi-Pyrénées : <http://www.territoiresdurables.fr>
-  Rhône-Alpes : <http://www.ddrhonealpesraee.org/>
-  Provence-Alpes-Côte d'Azur : <http://www.territoires-durables-paca.org/>
-  Nord Pas de Calais : <http://www.cerdd.org>
-  Bourgogne : <http://www.alterre-bourgogne.fr/le-reseau-des-relais.html>
-  Haute-Normandie : <http://www.arehn.asso.fr/>

Les dernières publications du RARE sur le développement durable :

Le Manifeste : Agenda 21, Plan Climat... N'hésitez plus ! 2011

Guide PLU et DD : publication décembre 2011

Le livret « Action ! Réalisez votre politique de développement durable » 2007

---

## Reseau des Organisations de la Societe Civile Camerounaise sur les Changements Climatiques (Network of Cameroorian Civil Society Organization on Climate Changes) - RESO-Climat Cameroun/ROS4C

Summary of the Preparatory Work of ROS4C towards COP 17 and RIO+20

### CONTEXT

In preparation of the Conference of the Parties in Durban (COP 17) from November 28 to December 9, 2011, ROS4C, a network of about 150 Civil Society Organisations (CSO) in Cameroon, has been actively working for effective participation in COP 17.

The purpose of COP 17 is based on Climate Change (CC) and sustainable development. In addition to the polluting industrial practices of developed countries, CC is equally related to the abusive exploitation of tropical and temperate forests which influences and degrades the life cycle of all living organisms and human being.

The topics in the agenda of RIO+20 are Green Economy in the Context of Sustainable Development and Poverty Eradication and Institutional Framework for Sustainable Development and could open great opportunities for the consolidation of the cornerstones towards effective greening of the economy of African countries which are the most vulnerable to the effects of Climate Change (CC).

#### CLIMATE CHANGE: CHALLENGES AND THREATS TO CAMEROON AND AFRICA AT LARGE

Africa severely suffers from the outcomes of climate change. According to the Intergovernmental Panel on Climate Change, Africa's land mass and geo- physical characteristics shows it will warm one and a half more times compared to global average. Although Cameroon as well as countries of the Congo Basin currently contributes negligibly to CC, the country suffers the consequences of this phenomenon including; scarcity of water resources, decline in crops production, decreasing farming activities, scarcity of pasture lands, land degradation, rapid deforestation and desertification, coastal erosion, loss of biodiversity, imminent discrimination and violent against women, force migration, loss of sovereignty of natural resources, the burden of struggle to continue the existence of African communities living in harmony with nature, temporary and spatial disturbances of rainfalls patterns with negative impacts on the different sectors of development, drought and floods, increase in conflicts related to scarcity of resources, increase in waterborne diseases such as repeating cholera epidemics, long dry seasons (leading to decrease in streams flow) specifically in the Sahelian part of the country, degradation of mangroves etc.

In view of the above mentioned consequences and considering the following:

☞The failures of previous negotiations (the unsuccessfulness of the Framework Convention on CC, Convention on Biodiversity, lack of funding for the convention on desertification, increasing loss of certain species) which neither considered the urgency of CC , its causes and implementation on the African people and their livelihood,

☞The constraints attached to all the funds that were available to mitigate the effects of climate change like the Clean Development Mechanism (CDM) fund which did not benefit developing countries, especially Africa;

☞The land issues - in the framework of REDD+ and Green economy millions of hectares are in the process to be conceded to multinational companies for agricultural purpose, bio-fuels and carbon offsets to the detriment of the indigenous people at the level of Cameroon and Congo Basin countries,

We, ROS4C expect effective and efficient participation of Congo Basin CSO at the negotiations of COP17 to effectively tackle the issue of vulnerability, poverty as well as the poor commitment of Annex1 (A1) countries and emerging economies for CO2 emission reduction through fair and binding agreements in Durban. We hope that Durban will be the occasion to extend the commitment period of the Kyoto Protocol (KP) and to reach a good agreement on green climate fund and other fast climate fundings.

#### DEMANDS FOR DURBAN AND RIO+20

The negotiations in Durban should be addressed with respect to the two track of the BALI Road Map approach to protect the Congo Basin interests. We expect actions in the following domain in line with those of Pan African Climate Change Justice Alliance (PACJA), Climate Action Network International (CAN International), UN Conference on Sustainable Development, African Ministerial Conference on the Environment (AMCEN), Climate Justice Now, ACCRA Caucus, Francimat etc.

☞Developed countries must agree to reduce their CO2 emission to 25-40% below the level of 1990 by 2020, become carbon neutral before 2050 and adopt a second commitment period of KP by 2013. More so, the call of over 100 countries and civil societies to keep temperature increase below 1,5°C should be considered and developing countries should have equitable access to global atmospheric space;

☞Measures to stop massive deforestation leading to increase desertification in the Congo Basin will be considered and the international community will reinforce their support to African states in sectors such as sustainable management of forests through implementation of mechanisms of the United Nations Framework Convention on Climate Change (UNFCCC);

☞Real opportunities for financing CSO and Government projects related to climate, capacity building, transfer of green technology and linking the science-policy interface for environmental sustainability will be accessible considering the specific needs of Africa for addressing implementation gaps;

☞Development models for efficient, inclusive and sustainable economic growth through resource efficiency will be reoriented while recognizing Africa's interests on the Green Economy within the context of sustainable development, poverty eradication, institutional frameworks, needs and challenges faced by countries emerging from conflict. To this African countries must close all loopholes related market mechanism;

☞All obstacles to the full implementation of sustainable industrial growth that limits the environmental, social and economic costs of industrialization should be removed;

☞A1 Countries should provide non-A1 Countries with appropriate additional and long-term financing, technology and capacity-building support;

☞Emphasis should be put on renewable technology transfer in Congo Basin Region and their role in Millennium Development Goals (MDGs) and Green Economy;

#### RECOMMENDATIONS FOR COP 17

To the International Community

☞Kyoto Protocol (KP): the commitment period should be extended. This protocol is the only binding with clauses that could effectively lead to reduction and mitigation of Greenhouse Gas (GHG) emissions by A1 countries;

☞A long-term structure for fair and effective international action on climate change by supporting civil society in building capacities of local communities to adapt to climate change should be developed;

☞Adequate, predictable and sustainable finance for REDD+ should be ensured to deliver the substantial reductions of CO2 and Measuring Reporting and Verification (MRV) should be clearly defined;

☞The final commitment of developing countries for REDD+ should be linked to that of developed countries to continue the Kyoto Protocol;

☞REDD+ and as well as Green Economy should not be an occasion of alienation of people land and forests rights;

☞Safeguards in relation to REDD+ should be clearly defined while taking into account the rights of the indigenous and local people and lay more emphasis on gender mainstreaming;

☞A1 countries and emerging countries should agree to change the lifestyle - extravagant energy consumption, excess waste production and consumption models - of their population in order to reduce CO2 emissions;

☞A1 countries and emerging countries should be involved in the development of clean technology transfer, promote low carbon industries and clearly define the MRV;

☞Criteria for the Climate Technology Center host should be clearly defined and the clauses should be favorable to developing countries;

☞Funding and financing based on green funds should be finalised and that the modalities for funds acquisition should be clearly defined;

☞These funds should be under the supervision of the UNFCCC;

☞Solution/agreement should arise to mobilize innovative funds (transaction taxes on air, sea transportation), in view of making up the public budget's shortfall observed in several donor countries;

☞Develop clear, just and equitable policies, clauses and mechanisms for REDD+ and Green Economy to avoid what could appear as a possible future climate world war;

To Cameroon and Congo Basin Countries Governments

☞A national framework for consultation on the management of the thematic of land tenure should be established so that together we could identify the opportunities and threats posed by the granting of extensive land to large multinationals for agriculture and the production of bioenergy in the context of Green Economy and REDD+;

☞The government should communicate its opinions on the different points on the Durban agenda and have a preparatory meeting with members of CSO;

☞The government should establish a consultation platform with the CSO on the different points on the Durban agenda and Rio+20;

☞Promote laws that guarantee the development of renewable energies and Green Economy;

☞Promote REDD+ governance and clear mechanism for the benefit by the communities of REDD+ fundings;

☞Clearly develop institutional responsibilities and networking on the different pillars of climate change negotiation at national level;

To the Civil Society

☞A pressure group should be established on the land tenure system in Cameroon and Congo Basin countries in order to preserve population's rights and the right of young people to have access to land for the creation of sustainable and Green employments;

☞Oppose to geo-engineering, which could be disastrous to humanity;

☞Avoid Soil Carbon Markets at Agricultural level;

☞Encourage market carbon for peat soil in order to protect mangroves and raffia wetlands in high land regions;

☞The members of the Congo Basin CSO who will attend COP 17 should be attached to the regional network committee to prepare their effective participation not only at the negotiations but also in side-events as discussed in Douala among some members;

To COMIFAC (The Commission for the Central African Forest)

☞COMIFAC and all negotiators be prepared to strongly defend the challenges/ interests of the Congo Basin;

☞COMIFAC should communicate their opinions on the various items on the Durban agenda especially about the REDD+ issue, land tenure and none market option for REDD+;

☞A framework for consultation between the Congo Basin CSO and COMIFAC should be established to better exploit the opportunities that will be opened in Durban;

☞A schedule for strategic meetings should be prepared between COMIFAC negotiators and Congo Basin CSO representatives present in Durban for regular consultations;

To ECCAS (Economic Community of Central African States)

☞ECCAS should transparently establish funds for the support of Civil Society on climate actions both on the field in terms of projects and their participation in international negotiations;

☞Open a window for Congo Basin CSO projects on REDD+, Adaptation, Renewable energies and Green Economy for direct access for funds;

☞Support Congo Basin CSO independent observatory of REDD+, Green Economy and land tenure;

ROS4C expectations for RIO+20 At Rio de Janeiro, 4-6 June 2012

Towards Green Economy for the Emergency of African Nations

RECOMMENDATIONS FOR RIO+20

Governance

☞Agreement should be established for the development of a global instrument that ensures full liability for any social or environmental damage global corporation causes;

☞Solutions should be arisen to mobilize innovative funds (Financial transaction taxes, taxes on air and sea transportation), in view of making up the public budget's shortfall observed in several donor countries;

☞Agreement should be established to commit developed and developing Countries to bring the absolute consumption of renewable and non-renewable resources in a fair and equitable manner;

CO2 Emission Reduction

☞Adequate, predictable and sustainable finance for Green Economy should be ensured to deliver the substantial reductions of CO2 and Measuring Reporting and Verification (MRV) should be clearly defined;

☞Implementation of guidelines for Green Economy should lead to maintain low CO2 emission and to develop green technologies in economic sectors in Africa;

☞Policies, subsidies to combat corruption that drive deforestation should be established to achieve zero deforestation economy and stop the production, trade, import and

consumption of goods stemming from deforestation and degradation such as unsustainable timber and palm oil;

#### Rights of Indigenous and Vulnerable Peoples

¶Safeguards in relation to Green Economy should be clearly defined while taking into account the rights of the indigenous and local people and lay more emphasis on gender mainstreaming;

¶Safeguards in relation to Green Economy should ensure the involvement of citizens at all levels of decisions making at national and international level concerning their land;

¶Support for the establishment of national frameworks for consultation on the management of the thematic of land tenure should be established in the aim to identify the opportunities and threats posed by the granting of extensive land to large multinationals for agriculture and the production of bio-energy in the context of green economy;

#### Agricultural Sector

¶A long-term structure should be developed for fair and effective international action for Green Economy by supporting civil society in capacities building of local communities and groups to adapt to climate change through green technology;

¶Green Economy as well as REDD+ should not be an occasion of alienation of people land and forests rights;

¶Measure to avoid Soil Carbon Markets for large scale agriculture should be established;

¶Market carbon for ecosystem services should be encouraged;

#### Energy Sector

¶Commitment to providing access to clean and green modern energy for all by 2020, with clear and comprehensive implementation measures, adequate funding provisions should be established;

¶An acknowledgment that decentralised renewable energy is the best way to meet the needs of the poor while preserving the environment should be consolidated;

¶More funds for implementation of local projects for renewable energy systems in Cameroon and African countries should be make available;

¶Commitment to complete the pathway outlined by the IPCC Special Report on Renewable Energy enabling 80% of the world's energy needs to be met by renewable energy by 2050 should be established;

#### Capacity Building & Technology Transfer

¶Developed countries and emerging countries should be involved in the development of clean technology transfer for African nations in the context of Green Economy;

¶Criteria for the Climate Technology Center host should be clearly defined and the clauses should be favorable to developing countries;

¶Commitment increasing support in the capacity building of small scale food producers and farming communities in income generating activities and post harvest losses reduction in relation to renewable energy and energy efficiency facilities should be established;

#### Green Economy, Local Councils and MDG

¶Capacity building of local authorities and regional government should be strengthen in Green Economy;

¶Council development plans should be greened;

¶Women capacities to develop Green Businesses should be enhanced and their access to Green Fund guaranteed;

¶Green Technology needs assessment should be carried out at the council level as well as the potential of renewable energies as an engine for local Green Economy;

¶Renewable Energy programs should be promoted in order to develop Green Jobs for young and avoid climate conflicts at local and national level as observed some years back in some African countries.

---

## RESEAU NATIONAL DES ASSOCIATIONS ET DES ONGS CAMEROUNAISES (RENASONGCAM)

### PRESENTATION DU MESSAGE DU RESEAU AU SOMMET DE RIO + 20 DE LA CNUDD

#### I- CONTEXTE DU MESSAGE DU RESEAU AU SOMMET DE RIO + 20 CNUDD

Depuis que les activités marquant l'Année Internationale de la Montagne ont commencé en l'an 2002, le Cameroun y a toujours pris une part active. C'est ainsi qu'il a mis en place un Comité d'Organisation avec des membres pour assurer la réalisation desdites activités. Il a organisé le 17 Octobre 2002 un séminaire de lancement desdites activités. Il a, par la suite, réalisé la collecte d'informations relatives aux zones de montagnes. Tous ces événements et activités ont donné lieu à l'élaboration des rapports par le Point Focal National Politique du Comité, rapports communiqués à la FAO.

Notre pays a participé aussi à diverses rencontres internationales entre autres : la Réunion de Quito (Equateur) en septembre 2002 ; la Réunion des Points Focaux Nationaux tenue à Chambéry (France) du 30 Juin au 1er Juillet 2003, et enfin la Première Conférence Mondiale sur le Partenariat International pour la Mise en Valeur Durable des Régions de Montagne tenue à Merano en Italie les 05 et 06 Octobre 2003. Ensemble avec l'ONG SOS Catastrophes et Calamités Sans Frontières, Membre du Partenariat.

Bien avant la Conférence de Merano (Italie), le Cameroun a manifesté son intention d'adhésion au Partenariat International pour la mise en Valeur Durable des régions de Montagne depuis le 29 Août 2003, ce qui traduit bien les résultats de la réunion de Chambéry (France). L'organisation de ce séminaire qui a connu l'appui financier du Gouvernement Italien traduit dans les faits les résultats concrets du Partenariat International pour la Mise en Valeur durable des Régions de Montagne.

#### OBJECTIFS

L'objectif que poursuit le Cameroun à travers cette activité qu'il voudrait mener à savoir «Organisation du Séminaire atelier sur le renforcement des Capacités Institutionnelles» est le « Renforcement des capacités Institutionnelle sur la Mise en valeur Durable des Régions de Montagne au Cameroun ».

Actuellement seul le Point Focal National Politique détient toute l'information concernant et l'Année Internationale de la Montagne et les données sur le Partenariat International pour la Mise en Valeur Durable des Régions de Montagne. Il est temps de communiquer ces informations à d'autres acteurs qui oeuvrent dans ce domaine.

Le Point Focal ayant participé à toutes ces rencontres citées plus haut se doit, avec d'autres experts choisis selon leurs spécificités de former, en vue de renforcer leurs capacités, les différents acteurs. Ces acteurs sont les personnels de l'Environnement et de l'Administration Forestière, le personnel en activité dans les Conventions (Biodiversité, Changements Climatiques, Lutte contre la désertification, etc .... ) ; les autres Administrations que sont: l'Administration Territoriale et la Décentralisation, l'Agriculture; l'Elevage, les Pêches et les Industries Animales; les Mines, l'Eau et l'Energie; les Affaires Economiques, la Programmation et l'Aménagement du Territoire; les Finances et le Budget; le Tourisme; l'Urbanisme et l'Habitat; la Ville; la Recherche Scientifique et Technique; la Communauté Scientifique et Universitaire. Il sera également tenu compte de la Société civile et des Organisations Non Gouvernementales exerçant dans le domaine.

## II- MESSAGE DE RENASONGCAM AU SOMMET DE RIO + 20 CNUDD

C'est pour nous, Réseau National des Associations et des ONGs Camerounaises du Partenariat de la Montagne, un réel plaisir d'adresser ce message à tous les participants au Sommet de Rio + 20 de la CNUDD en notre qualité non seulement de membre du Partenariat de la Montagne, Point Focal Technique du Partenariat de la Montagne au Cameroun du réseau National des Associations et ONGs du Partenariat de la Montagne. Je vous rappelle que nous sommes au lendemain de la célébration de l'Année Internationale de la Montagne, dont l'objectif à la fois simple et ambitieux était de « veiller au bien être des communautés Montagnardes en encourageant la mise en valeur durable de leurs écosystèmes. L'atteinte de cet objectif était doublement conditionnée par la Paix et la Sécurité Alimentaire ».

Au Cameroun, nous avons constitué et mis sur pied, du retour de la conférence de Merano-Italie, un Réseau National des Associations et des ONGs Camerounaises du Partenariat de la Montagne pour veiller au bien être des communautés montagnardes et promouvoir également la mise en valeur durable des écosystèmes de Montagnes. Ce Réseau a pour principaux objectifs :

- 1- Sensibiliser le public sur l'importance des écosystèmes de montagnes ;
- 2- Identifier et répertorier les écosystèmes de montagnes et leurs caractéristiques ;
- 3- Elaborer un Plan d'Action National des ONGs et Associations pour promotion et Gestion Durable des Ecosystèmes de Montagnes
- 4- Organiser des actions non seulement pour célébrer l'Année Internationale de la Montagne, mais aussi surtout, visant au bien être des communautés montagnardes dans le cadre de mise en oeuvre et d'atteinte des objectifs du millénaire pour le Développement dans les communautés Montagnardes pour un développement durable.

Parmi les possibilités de diversification et d'amélioration des systèmes de production et des moyens d'existence en Montagne, il y a lieu de citer entre autres : le tourisme, les forêts et les parcours, et enfin l'industrie. De toutes ces possibilités, il nous semble opportun d'examiner les points concernant l'eau, l'agriculture et l'industrie.

- a) En ce qui concerne l'eau, étant donné qu'une grande partie de l'eau douce de la planète provient des zones montagneuses, il convient de noter que la valeur de cette ressource stratégique pourrait apporter d'importants avantages économiques aux montagnards ;
- b) S'agissant de l'agriculture, l'adoption d'une intégration de l'agriculture et de la transformation locale » pourrait aider à la diversification et au renforcement des écosystèmes vivriers en montagne ;
- c) A propos enfin de l'industrie et des services un développement harmonieux des villes de montagnes et des centres semi-urbains pourrait aider à maintenir l'équilibre entre la population qui continue d'augmenter la capacité de charge de la base de ressources naturelles, tout en fournissant des services aux communautés rurales. Les petites exploitations agricoles et agroalimentaires ajouteraient une valeur aux produits locaux et réduisant le volume avant les expéditions coûteuses vers les marchés.

Cependant, en raison du caractère transfrontalier des régions de montagnes, la coopération régionale est un instrument important pour mettre en oeuvre les objectifs du développement durable. Des liaisons avec de nombreux instruments multilatéraux. Comme la convention sur la Diversité Biologique, la convention sur la lutte contre la désertification, la convention sur les changements climatiques, la stratégie Internationale pour la réduction des désastres et les autres instruments appropriés devraient être mis en Valeur, en prenant en exemple l'attention spéciale sur les écosystèmes des montagnes et leurs communautés montagnardes.

Nous ne saurions terminer ce message sans toutefois lancer un très vibrant appel à tous les bailleurs de fonds membres ou non membres du partenariat de la Montagne au premier rang desquels la FAO, le Gouvernement Italien, aux bonnes Volontés des gouvernements locaux et bienfaiteurs, à nous venir en aide financièrement et multiformes dans la mise en oeuvre et en application de notre programme de mise en Valeur durable des montagnes au Cameroun aux fins d'améliorer les conditions d'existence des communautés montagnardes. Nous ne saurions terminer ce message sans faire quelques propositions à ce sommet de Rio + 20 allant dans le sens d'amélioration des conditions d'existence des communautés montagnardes à savoir :

## III- PROPOSITIONS

La création d'un :

- 1- Fonds Mondial pour la Mise en Valeur Durable des régions de Montagnes en assurant le bien être et les conditions d'existence des communautés montagnardes pour l'appui et l'assistance au développement économique, social et culturel des régions de montagnes ;
  - 2- La création des mutuelles communautaires des populations de montagnes pour le développement des régions locales de montagnes, taxes devant également servir pour les femmes dans leurs petits projets de lutte contre la pauvreté en zones de montagnes ;
  - 3- La création des taxes supplémentaires à prélever sur tous les produits de montagnes qui serviront à promouvoir l'éducation et les soins de santé des jeunes et des enfants et l'établissement des actes de naissances des enfants des régions de montagnes ;
  - 4- Aux pouvoirs publics locaux, régionaux et nationaux de redoubler des efforts et de leurs engagements afin de mettre en place des programmes pour prendre en compte la déforestation, l'érosion, la dégradation des terres et de la biodiversité, l'interruption des cours d'eau ;
  - 5- De développer et mettre en oeuvre, des politiques relatives au genre et des programmes incluant des investissements publics et privés qui encouragent ou éliminent les iniquités auxquelles sont confrontées les communautés de montagnes.
- Mettre en oeuvre des programmes en promouvant la diversification et les économies traditionnelles de montagne, des moyens de subsistance durables et des systèmes de production au niveau local ;

Enfin promouvoir la participation et l'implication des communautés de montagnes dans les décisions qui les touchent, et intègrent leurs savoirs traditionnels, leurs patrimoines et leurs valeurs dans toutes les initiatives de développement.

Toutes ces initiatives viseraient à améliorer le cadre de vie des populations montagnardes et la mise en valeur durable des écosystèmes de montagnes.

A Yaoundé, le 25 octobre 2011

## Rights of Mother Earth

Rights of Mother Earth

Proposal Universal Declaration of the Rights of Mother Earth

Preamble

We, the peoples and nations of Earth:

considering that we are all part of Mother Earth, an indivisible, living community of interrelated and interdependent beings with a common destiny;

gratefully acknowledging that Mother Earth is the source of life, nourishment and learning and provides everything we need to live well;

recognizing that the capitalist system and all forms of depredation, exploitation, abuse and contamination have caused great destruction, degradation and disruption of Mother Earth, putting life as we know it today at risk through phenomena such as climate change;

convinced that in an interdependent living community it is not possible to recognize the rights of only human beings without causing an imbalance within Mother Earth;

affirming that to guarantee human rights it is necessary to recognize and defend the rights of Mother Earth and all beings in her and that there are existing cultures, practices and laws that do so;

conscious of the urgency of taking decisive, collective action to transform structures and systems that cause climate change and other threats to Mother Earth;

proclaim this Universal Declaration of the Rights of Mother Earth, and call on the General Assembly of the United Nation to adopt it, as a common standard of achievement for all peoples and all nations of the world, and to the end that every individual and institution takes responsibility for promoting through teaching, education, and consciousness raising, respect for the rights recognized in this Declaration and ensure through prompt and progressive measures and mechanisms, national and international, their universal and effective recognition and observance among all peoples and States in the world.

Article 1. Mother Earth

(1) Mother Earth is a living being.

(2) Mother Earth is a unique, indivisible, self-regulating community of interrelated beings that sustains, contains and reproduces all beings.

(3) Each being is defined by its relationships as an integral part of Mother Earth.

(4) The inherent rights of Mother Earth are inalienable in that they arise from the same source as existence.

(5) Mother Earth and all beings are entitled to all the inherent rights recognized in this Declaration without distinction of any kind, such as may be made between organic and inorganic beings, species, origin, use to human beings, or any other status.

(6) Just as human beings have human rights, all other beings also have rights which are specific to their species or kind and appropriate for their role and function within the communities within which they exist.

(7) The rights of each being are limited by the rights of other beings and any conflict between their rights must be resolved in a way that maintains the integrity, balance and health of Mother Earth.

Article 2. Inherent Rights of Mother Earth

(1) Mother Earth and all beings of which she is composed have the following inherent rights:

(a) the right to life and to exist;

(b) the right to be respected;

(c) the right to regenerate its bio-capacity and to continue its vital cycles and processes free from human disruptions;

(d) the right to maintain its identity and integrity as a distinct, self-regulating and interrelated being;

(e) the right to water as a source of life;

(f) the right to clean air;

- (g) the right to integral health;
- (h) the right to be free from contamination, pollution and toxic or radioactive waste;
- (i) the right to not have its genetic structure modified or disrupted in a manner that threatens its integrity or vital and healthy functioning;
- (j) the right to full and prompt restoration the violation of the rights recognized in this Declaration caused by human activities;
- (2) Each being has the right to a place and to play its role in Mother Earth for her harmonious functioning.
- (3) Every being has the right to wellbeing and to live free from torture or cruel treatment by human beings.

#### Article 3. Obligations of human beings to Mother Earth

- (1) Every human being is responsible for respecting and living in harmony with Mother Earth.
- (2) Human beings, all States, and all public and private institutions must:
  - (a) act in accordance with the rights and obligations recognized in this Declaration;
  - (b) recognize and promote the full implementation and enforcement of the rights and obligations recognized in this Declaration;
  - (c) promote and participate in learning, analysis, interpretation and communication about how to live in harmony with Mother Earth in accordance with this Declaration;
  - (d) ensure that the pursuit of human wellbeing contributes to the wellbeing of Mother Earth, now and in the future;
  - (e) establish and apply effective norms and laws for the defence, protection and conservation of the rights of Mother Earth;
  - (f) respect, protect, conserve and where necessary, restore the integrity, of the vital ecological cycles, processes and balances of Mother Earth;
  - (g) guarantee that the damages caused by human violations of the inherent rights recognized in this Declaration are rectified and that those responsible are held accountable for restoring the integrity and health of Mother Earth;
  - (h) empower human beings and institutions to defend the rights of Mother Earth and of all beings;
  - (i) establish precautionary and restrictive measures to prevent human activities from causing species extinction, the destruction of ecosystems or the disruption of ecological cycles;
  - (j) guarantee peace and eliminate nuclear, chemical and biological weapons;
  - (k) promote and support practices of respect for Mother Earth and all beings, in accordance with their own cultures, traditions and customs;
  - (l) promote economic systems that are in harmony with Mother Earth and in accordance with the rights recognized in this Declaration.

#### Article 4. Definitions

- (1) The term "being" includes ecosystems, natural communities, species and all other natural entities which exist as part of Mother Earth.
- (2) Nothing in this Declaration restricts the recognition of other inherent rights of all beings or specified beings.

---

#### Projet de Déclaration Universelle des Droits de la Terre Mère

#### Droits de la Terre Mère

##### Préambule

Nous, les peuples de la Terre :

Considérant que nous faisons tous partie de la Terre Mère, communauté de vie indivisible composée d'êtres interdépendants et intimement liés entre eux par un destin commun ;

Reconnaissant avec gratitude que notre Terre Mère est source de vie, de subsistance, d'enseignement et qu'elle nous prodigue tout ce dont nous avons besoin pour bien vivre ;

Reconnaissant que le système capitaliste ainsi que toutes les formes de prédation, d'exploitation et de pollution ont causé d'importantes destructions, dégradations et modifications de la Terre Mère qui mettent en danger la vie telle que nous la connaissons de nos jours avec des phénomènes tels que le changement climatique ;

Convaincus de ce que dans une communauté de vie impliquant des relations d'interdépendance, il est impossible de reconnaître des droits aux seuls êtres humains sans provoquer de déséquilibre au sein de la Terre Mère ;

Affirmant que pour garantir les droits humains il est nécessaire de reconnaître et de défendre les droits de la Terre Mère et de tous les êtres vivants qui la composent et qu'il existe des cultures oeuvrant déjà en ce sens ;

Conscients de l'urgence à entreprendre des actions collectives décisives pour transformer les structures et les systèmes qui génèrent le changement climatique et qui font peser d'autres menaces sur la Terre Mère ;

Nous proclamons cette Déclaration Universelle des Droits de la Terre Mère et nous appelons l'Assemblée Générale des Nations Unies à l'adopter comme objectif commun pour tous les peuples et nations du monde afin que les personnes prennent la responsabilité de promouvoir, au moyen de l'enseignement, de l'éducation et de la prise de conscience, le respect des droits reconnus dans cette Déclaration, et à garantir sa reconnaissance et son application universelles et effectives par des mesures et des procédures diligentes et progressives à caractère national et international et ce, par tous les peuples et États du monde.

#### Article 1: La Terre Mère

- 1) La Terre Mère est un être vivant

- 2) La Terre Mère est une communauté unique, indivisible et autorégulée, composée d'êtres intimement liés entre eux, qui soutient, contient et renouvelle tous les êtres qui la composent.
- 3) Chaque être est défini par ses relations comme constitutif de la Terre Mère.
- 4) Les droits inhérents de la Terre Mère sont inaliénables puisqu'ils découlent de sa propre existence.
- 5) La Terre Mère et tous les êtres qui la composent sont titulaires de tous les droits inhérents et reconnus dans cette Déclaration, sans aucune distinction, telle qu'on pourrait l'établir entre des êtres biologiques et non-biologiques, selon les espèces, l'origine, l'utilité pour les êtres humains ou toute autre catégorie.
- 6) Tout comme les êtres humains jouissent des droits humains, tous les autres êtres de la Terre Mère ont également des droits spécifiques à leurs conditions et propres au rôle et à la fonction qu'ils exercent au sein des communautés dans lesquelles ils existent.
- 7) Les droits de chaque être sont limités par les droits des autres êtres, et tout conflit impliquant ces droits doit être résolu de façon à ce qu'on préserve l'intégrité, l'équilibre et la santé de la Terre Mère.

#### Article 2 : Les Droits Inhérents de la Terre Mère

- 1) La Terre Mère et tous les êtres qui la composent possèdent les droits inhérents suivants :

- le droit de vivre et d'exister ;
- le droit au respect ;
- le droit à la régénération de leur biocapacité et à la bonne continuité de leurs cycles et processus vitaux, libres de toute modification humaine ;
- le droit de maintenir leur identité et leur intégrité comme êtres distincts, autorégulés et intimement liés entre eux ;
- le droit à l'eau comme source de vie ;
- le droit à la pureté de l'air ;
- le droit à la pleine santé ;
- le droit à être libres de contamination, de pollution et de déchets toxiques ou radioactifs ;
- le droit de ne pas être génétiquement modifiés et transformés dans sa structure, ce qui menacerait leur intégrité et leur fonctionnement vital et sain ;
- le droit à une entière et prompte réparation suite aux violations occasionnées par l'activité humaine des droits reconnus dans cette Déclaration.

- 2) Chaque être a le droit à une place au sein de la Terre Mère et à accomplir son rôle en faveur de son fonctionnement harmonieux.

- 3) Tous les êtres ont le droit au bien-être et à vivre libres de tortures ou de traitements cruels infligés par les êtres humains.

#### Article 3 : Obligations des êtres humains envers la Terre Mère

Tous les êtres humains ont la responsabilité du respect de la Terre Mère et de vivre en harmonie avec elle.

- 1) Les êtres humains, tous les États et toutes les institutions publiques et privées ont le devoir :

- d'agir en accord avec les droits et les obligations reconnus dans cette Déclaration ;
- de reconnaître et de promouvoir l'application et l'entière mise en oeuvre des droits et des obligations établis dans cette Déclaration ;
- de promouvoir et de prendre part à l'apprentissage, à l'analyse, à l'interprétation et à la transmission des modes de vie en harmonie avec la Terre Mère en accord avec cette Déclaration ;
- de s'assurer que la recherche du bien-être humain contribue au bien-être de la Terre Mère, à présent et à l'avenir ;
- d'établir et de rendre effective l'application des normes et des lois pour la défense, la protection et la préservation des Droits de la Terre Mère ;
- de respecter, de protéger, de préserver et là où ce sera nécessaire, de restaurer l'intégrité des cycles et équilibres vitaux de la Terre Mère ;
- de garantir la réparation des dommages causés par les violations humaines des droits inhérents reconnus dans la présente Déclaration et de veiller à ce que les responsables rendent des comptes en vue de la restauration de l'intégrité et de la santé de la Terre Mère ;
- d'investir les êtres humains et les institutions d'un pouvoir de défense des droits de la Terre Mère et de tous les êtres qui la composent ;
- de mettre en place des mesures de précaution et de restriction pour éviter que les activités humaines ne conduisent à l'extinction d'espèces, à la destruction d'écosystèmes ou à la modification des cycles écologiques ;
- de garantir la paix et d'éliminer les armes nucléaires, chimiques et biologiques ;
- de promouvoir et d'encourager les actions visant au respect de la Terre Mère et de tous les êtres qui la composent en accord avec leurs propres cultures, traditions et coutumes ;
- de promouvoir des systèmes économiques qui soient en harmonie avec la Terre Mère et accordés aux droits reconnus dans cette Déclaration.

#### Article 4 : Définitions

Le terme "être" comprend les écosystèmes, les communautés de nature, les espèces et toutes les autres entités naturelles qui existent comme partie de la Terre Mère.

Rien dans cette Déclaration ne pourra entamer la reconnaissance des autres droits inhérents de tous les êtres ou de n'importe quel être en particulier.

## Rio+20 Earth Summit Sustainable Cities Working Group

Submission to the Secretariat for the United Nations Conference on Sustainable Development for the Zero Draft of the Rio+20 Outcome Document from the Rio+20 Earth Summit Sustainable Cities Working Group

The Rio+20 Earth Summit Sustainable Cities Working Group (the "Working Group") is pleased to provide this input "for inclusion in a compilation document to serve as basis for the preparation of zero draft of the outcome document" from the United Nations Conference on Sustainable Development ("Rio+20"). The Working Group consists of a diverse group of leading civil society organizations and experts. Working Group members are listed in the Table of Contents.

The Working Group believes that it is essential for Rio+20 to give high priority to the challenges and opportunities presented by urban development worldwide. Cities are critical to the planet's transition to a green economy that will increase opportunities, reduce poverty, and foster a more sustainable future. Since the first Earth Summit in Rio in 1992, urban populations have increased by more than one billion and now for the first time in history more people live in cities than in rural areas. By 2050, the world's population is projected to increase from 7 billion to over 9 billion, with roughly 70 percent of people residing in urban areas.

Growth and migration patterns represent a set of critical opportunities and challenges for sustainable development. On one hand, cities are the centers of social and economic activity and attract people seeking to attain a better life. Indeed, the world's top 50 metropolitan regions are economic powerhouses, accounting for just 12 percent of the planet's population, yet generating roughly 46 percent of global GDP. However, cities also consume more than 75 percent of the world's natural resources, use approximately 75 percent of the world's energy, and are responsible for 75 percent of its carbon emissions. As cities experience rapid growth, they struggle mightily to provide adequate infrastructure—housing, water, sanitation, and transportation—for their citizens. Many are largely avoiding these responsibilities. Since the first Earth Summit, the number of slum dwellers worldwide has grown from roughly 660 million to nearly one billion. If cities shrink from their obligations, it will put all of us at risk. The way we collectively address urbanization will define the fate of billions of people and the sustainability of human society.

The need for local action was recognized at the 1992 Earth Summit with the acknowledgement in Agenda 21 that many global challenges "have their roots in local activities." A number of mayors and local authorities have shown real leadership, including through the adoption of local Agenda 21s and other sustainability plans. However, most cities still have not fully embraced their vital role in "educating, mobilizing, and responding to the public to promote sustainable development" (Agenda 21, Chapter 28). Rio+20 offers an opportunity to harness widespread interest in sustainable and inclusive urbanization to produce specific commitments and scalable action.

This document contains recommendations and findings from members of the Working Group in six subject areas. These recommendations reflect the views of their identified authors and are not necessarily the position of their affiliated organization or of the Working Group. The authors identify three types of outputs from the Rio+20 Earth Summit:

1. Sustainable Development Goals - negotiated global objectives or targets similar to the Millennium Development Goals.
2. Institutional Arrangements - new international bodies, structures, or networks to facilitate and enhance efforts by governments and other stakeholders on urban sustainability.
3. Commitments - specific actions to be undertaken individually or collectively by governments and other stakeholders.

Working Group Coordinator: S. Jacob Scherr, Natural Resources Defense Council

### I. Green Jobs in a Green Economy

Michael Renner, Worldwatch Institute

#### Recommendations

##### 1. Sustainable Development Goals

- To assure that the creation of green and decent jobs is a central objective of a green economy
- To tailor green jobs development to the varying needs of industrialized, emerging, and developing economies

##### 2. Institutional Arrangements

- Create a UN Green Jobs Coordinating Group, assisted by a stakeholder and expert Advisory Council
- Establish a UN Green Jobs Best Practices Unit

##### 3. Commitments

- National governments promise to advance green skill-building, social protections, and job standards.

#### Need for Action

A green economy must address the intersection of environmental sustainability, economic development, and social equity. A change in trade, tax, and subsidy policies is needed to make greater use of an abundant yet underemployed resource—people—and reduce reliance on limited and polluting resources, such as fossil fuels. The best way to ensure that a green economy works for the great majority of people on this planet is to pursue the creation of good quality green jobs.

Green jobs contribute substantially to preserving or restoring environmental quality. This includes measures to reduce energy, materials, and water consumption; protect biodiversity and restore ecosystems like wetlands and forests; and minimize or avoid the generation of waste and pollution. Some green jobs will be new, such as those in the expanding field of renewable energy. But the bulk of green employment will be in existing jobs—which requires that skill sets, work methods, and occupational profiles are brought into accord with sustainability principles.

Technological, infrastructural, and behavioral choices offer varying degrees of environmental benefit and associated green employment impacts. Climate mitigation has different implications than adaptation, as does the pursuit of new building standards vis-à-vis retrofits, public transport versus fuel-efficient automobiles, or materials recycling or reuse compared with landfilling. These choices for the transition to a green economy suggest that there are varying “shades of green” in employment: some are more far-reaching and transformational than others.

- **Energy:** Carbon capture may render the fossil fuel industry somewhat less damaging. But renewable energy offers a greener choice, and can help overcome energy poverty. The current number of renewable energy jobs worldwide surpasses 4 million, double the number in 2008.
- **Transportation:** Greater fuel efficiency, smart traffic management, alternative fuels, and propulsion systems can reduce the motor vehicle industry’s footprint and green its workforce. But public transport (railways employ 7 million people and urban mass transit systems 7.6 million) is a more affordable option for many people, and permits greener and more equitable mobility. Millions more jobs are associated with the manufacture of 110 million bicycles and 22 million electric bicycles each year and their ongoing maintenance.
- **Buildings:** Performance standards and retrofitting have the potential for greening many of the world’s 110 million construction jobs. Paired with measures to make housing more decent and affordable, they would improve the lives of the world’s 1 billion slum inhabitants.
- **Waste:** Recycling and reuse offer more jobs than landfilling and waste incineration do, and are preferable from an environmental and health perspective. In industrialized countries, poor communities suffer from low-quality waste handling, and workers are exposed to dangerous and low-paying work. In developing countries, millions of informal waste-pickers confront hazardous conditions, but play a much bigger role in collecting recyclables than formal waste management. Organizing and formalizing informal recyclers would lift their incomes, reduce poverty, and ameliorate hazardous work conditions.

#### More Details on Recommended Outcomes

##### Institutional Arrangements

Policy cohesion should be accomplished via a UN Green Jobs Coordinating Group. This collaboration effort would integrate the work of relevant agencies such as UNEP, ILO, UNDP, UNIDO, UN Habitat, etc. An advisory council, drawn from businesses, labor, community groups, and relevant experts, could assist in analyzing key developments, opportunities, and challenges.

Facilitating the spread of green technologies and methods, and providing broad access to them, will be critical to the transition to a green economy. Successful policy innovations and green roadmaps will need to be shared as widely as possible. Some examples are renewable energy feed-in tariffs, micro-credit for solar home systems, green-building standards, and Bus Rapid Transit systems. The Rio+20 Earth Summit 2012 can create a repository for lessons learned by establishing a UN Green Jobs Best Practices Unit.

##### Commitments

Governments should improve knowledge of green jobs trends and developments, and integrate relevant data into national economic statistics, by:

- Crafting detailed definitions and sector-by-sector criteria for what constitutes green jobs (as the U.S. Bureau of Labor Statistics is currently doing);
- Generating regular annual reporting and data (via surveys, or via input-output modeling as the German environment ministry has done in the renewable energy sector for several years)

Governments should address potential skills shortages that could hamper the emergence of the green economy, by:

- Undertaking a national skills mapping exercise with the following aims: create skill profiles in each industry; identify strengths and gaps in existing skills patterns; create a plan for building the needed skill base (as the regional government of Navarra, Spain, has done);
- Setting up green training centers and programs, and encourage private sector companies and educational institutions to incorporate green jobs skills into their courses and apprenticeship and other workplace training, as appropriate. Ensure gender-balance and access by disadvantaged communities.

##### Social protections

- Governments should assure that Green jobs are “decent” jobs through effective social dialogue, collective bargaining arrangements, and partnerships for “high-road” strategies.
- Establishing and enforcing decent wage standards, occupational health and safety standards, and prohibitions against employers with a documented history of violating such standards from receiving public funds.
- Passing social-inclusion legislation (as Brazil has done with regard to informal waste pickers: offering legal recognition, requiring that municipalities work with recycling cooperatives, setting up pathways to formalization and poverty reduction)
- Creating and funding “fair transition” programs for workers in “brown” industries who are affected by the transition to a green economy, including retraining and relocation provisions.

##### Author and Contributors

Michael Renner is a Senior Researcher at the Worldwatch Institute, a research organization focused on global sustainability. This text has benefited from review comments by Philip Bump, Cheryl P. Derricotte, and Julie Roberts of Green for All, Michael Replogle of the Institute for Transportation and Development Policy, and Kathleen Mulligan-Hansel of the Partnership for Working Families, and feedback from Don Chen of the Ford Foundation.

## II. Strengthening Local Institutions and Empowering People for Sustainable Development Governance Joseph Foti and Jacob Werksman, World Resources Institute

### Recommendations

#### 1. Sustainable Development Goal

- Every nation will pass a freedom of information act, will put in place environmental impact assessment and other decision-making procedures with participation, and will have multiple means for citizens to enforce environmental laws by 2020.

#### 2. Institutional Arrangements

- There should be improved coordination and enhancement of existing networks promoting transparency, accountability, and inclusiveness at the local level through a new multi-sector partnership.
- There should be the expansion of international legal mechanisms, including but not limited to the Aarhus Convention, to improve accountability at all levels of government.

#### 3. Commitments

- Governments of all levels should advance concrete, measureable commitments to improve transparency, accountability, and inclusiveness in decision-making, based on the principle of common but differentiated responsibilities.
- All major local authorities worldwide should declare their intent to pass and implement laws, share best practices, and subject themselves to independent monitoring for open governance by 2015. Mayors and local executives will commit to take specific action to implement Principle 10.
- National governments will commit to decentralize to democratic local institutions and to accelerate the adoption of the above reforms.

### Need for Action

The indispensable role of good local-level governance is made clear in existing sustainable development declarations. Principle 10 of the 1992 Rio Declaration states that, "Environmental issues are best handled with the participation of all concerned citizens, at the relevant level." Similarly, Agenda 21, Chapter 28, says that local authorities "construct, operate and maintain economic, social and environmental infrastructure, oversee planning processes, establish local environmental policies and regulations, and assist in implementing national and sub-national environmental policies. As the level of governance closest to the people, they play a vital role in educating, mobilizing and responding to the public to promote sustainable development."

We have worked with non-governmental organizations who are members and affiliates of The Access Initiative, to gather more than 20 case studies on urban governance from 10 countries (Argentina, Bolivia, Cameroon, Chile, Costa Rica, Ecuador, Hungary, Mexico, Thailand, and the United States). These case studies demonstrated a number of barriers to transparency, accountability, and inclusiveness at the local level. Problems included:

- The public was unable to identify the agency responsible for the issue at hand.
- Services promised were not delivered and the public could not trace how allocated funds had been spent.
- Decisions were made in secret or the public was brought into a decision-making process well after all decisions had already been made.
- Decisions were made at the national level and local authorities and local residents had little say in their design and implementation.
- The public lacked the data to participate in complicated decisions such as river basin management.

Our contributors also pointed out a number of innovative approaches to bring local communities into the decision-making process such as participatory budgeting, social audits, and citizen suits. These approaches are already in place in many local jurisdictions. These case studies provide a solid basis for the our recommended Rio+20 outcomes

### More Details on Recommended Outcomes

We call on governments of all levels to come to Rio with concrete, measureable commitments to improve transparency, accountability, and inclusiveness in decision-making, based on the principle of common but differentiated responsibilities. By 2015, all major local authorities worldwide should pass laws, share best practices, and subject themselves to independent monitoring for the following:

- Making available and usable information on all agency jurisdictions, information on budgeting and revenue, and contracting;
- Accepting and promoting use mechanisms for public accountability in service delivery such as public social audits and report cards of agency performance;
- Passing open meeting laws for all local authorities;
- Adopting reforms for early, meaningful public participation in policy and planning by a broad range of stakeholders;
- Adoption of local Access to Information laws;
- Providing proactive information on land use, development planning, waste disposal, utilities, and regular environmental quality monitoring data;
- Building the capacity of stakeholders to participate by integrating the rights and means to access information and participation into educational curriculums.

Mayors and local executives should commit to begin these reforms by the time of the Rio+20 Earth Summit

### Authors and Contributors

These recommendations were developed by Joseph Foti and Jacob Werksman of the Institutions and Governance Program at the World Resources Institute. WRI serves as the Secretariat for the Access Initiative, the largest global network dedicated to ensuring that citizens have the right and ability to influence decisions about the natural resources that sustain their communities. Access Initiative members from around the world carry out evidence-based advocacy to encourage collaboration and innovation advancing transparency, accountability, and inclusiveness in decision-making at all levels. In preparation for Rio+20, national coalitions from the Access Initiative have called on our respective national governments to make public commitments to advance Principle 10, through the "Three Demands" campaign. For our research on urban governance, we received case studies and other input from: The Bolivian Society for the Defense of Nature (PRODNA), The Center for Human Rights and Environment

(CEDHA), CoopeSolidar (Costa Rica), The Ecuadoran Center for Environmental Law (CEDA), Environmental Management and Law Center (Hungary), The Foundation for Development and Environment (Cameroon), The Mexican Center for Environmental Law (CEMDA), OMB Watch (USA), Participa (Chile), and the Thailand Environment Institute.

### III. Planning and Housing Strategies for Sustainable and Inclusive Urban Development

Eric S. Belsky, Joint Center for Housing Studies of Harvard University

#### Recommendations

##### 1. Commitments

National governments should:

- Create National Incentive Funds for Integrated Urban Region and Municipal Planning
- Create Financing Innovation Funds to Invest in Innovative Financing Models for Inclusive and Sustainable Urban Development
- Establish National Urban Sustainable Planning and Development Commissions

#### Need for Action

There are three frequently encountered failures of urban governance and planning capacity that must be addressed. First is the failure to coordinate urban planning at the metropolitan level across different administrative boundaries (city, county, service districts, and state/provincial). Second is the failure to integrate multiple sectors into a systems approach to urban planning (housing, traditional infrastructure, economic development and infrastructure, social development and infrastructure, and natural resources and environment). Third is the failure to involve the urban poor and their organizations as genuine partners in urban planning processes intended to build upon their assets, ensure their participation, improve their living conditions, and reduce their environmental impacts. Given the large share of the urban population that are poor, the difficult and often environmentally vulnerable conditions in which they live, and the economic functions they serve, it is essential to make planning for the urban poor and their communities central to the urban development process.

#### More Details on Recommended Outcomes

Tackling these failures is not easy, and efforts to do so are constrained by limited public resources and challenges of mobilizing private investment and finance. While the solutions to these failures and resource constraints will vary across nations and urban areas within regions, there is a cross-national need to address these failures and constraints. There are three actions that could be taken by national governments to correct these failures and begin to ease the intensity of these constraints. The goal of these is to create the political commitment, institutional capacity, and financing to engage the public, private, NGO, and community-based civic sectors in developing concrete and integrated plans and investment incentives to promote inclusive and sustainable urbanism.

- Create National Incentive Funds for Integrated Urban Region and Municipal Planning. Since most metro regions and individual cities have generally failed to create a long-run vision and plan for inclusive and sustainable urban development, an incentive is needed to get more of them to do so. A national fund that would cover the costs of setting up the appropriate regional and local governance structures and build the capacity for integrated planning would allow more metro regions and cities to undertake such planning and give them the resources to do so. This would not only result in improved planning, but also establish more examples that can be studied and evaluated so that over time efforts to create coordinated and integrated sustainable and inclusive urban plans could be continuously improved. This incentive fund could require some degree of local matching funds and/or a competition for the funds with benchmarks for additional draws to encourage accountability and transparency. There is already a model for such funds operating at the international level called Cities Alliance, which is funded by member cities as well as multilaterals including the UN and the World Bank.
- Create Financing Innovation Funds to Invest in Innovative Financing Models for Inclusive and Sustainable Urban Development. The best planning for inclusive and sustainable urban development will fail to produce results without funds and financing models to support them. National governments should identify, invest in, and export successful financing models for slum improvements and sustainable development. Again, these funds could involve competitions with benchmarks for additional draws.

Governments especially should give consideration to establishing innovation funds that will seed new innovations and be used to scale-up 1) promising innovations in the financing of housing and infrastructure for the poor and 2) more comprehensive and integrated financing tools for sustainable urban development. Special attention should be paid to housing finance because housing is not only an important platform for health, safety, and economic opportunity but the financing needs of the urban poor to improve their housing falls between microfinance and conventional finance.

o Establish National Urban Sustainable Planning and Development Commissions. National governments 1) set the context in which urban governments make decisions and create the authority for urban governments to take action, 2) have capacity to get attention and drive change at the local level where many of the ultimate decisions are made and all the action takes place, and 3) can create incentives and provide legal and regulatory frameworks to drive inclusive and sustainable development at the local level. Therefore, establishing national urban planning commissions would be an important step toward achieving the goal of inclusive and sustainable urban development. This step would result in the development of regional and urban plans and strategies aimed at fostering sustainable urbanism. Establishing these commissions will help elevate the issue of inclusive and sustainable urban development both domestically and internationally, bring a much needed planning focus to efforts to address the complexities of moving towards a more inclusive and sustainable pattern of urbanism, bring transparency to the discussion, and allow learning to be shared cross-nationally. Each country commission would be expected to develop plans that take into account its own resource constraints, political system, culture, current conditions, and market potential. However, all commissions would have a common charge to be agreed upon at Rio+20 to ensure that all cover the same critical subjects. While national in scope, the central aim of each commission will be to: a) establish national urban development policies and b) work out and modify laws to produce an optimal division of responsibilities and authorities among levels of government, as well as provide models of how the public, civic, and private sectors can work together to meet plan goals.

#### Author and Reviewers

Eric S. Belsky is the managing director of the Joint Center for Housing Studies of Harvard University and lecturer in urban planning and design at the Harvard Graduate School of Design. The Joint Center is a collaborative venture of the Harvard Graduate School of Design and the Harvard Kennedy School of Government. The author would like to thank the following reviewers for their helpful comments: Christopher W. Williams, UN-HABITAT; Don Chen, Ford Foundation; Michael Replogle, Institute for Transportation and Development Policy; and Jacob Scherr, Natural Resources Defense Council.

### IV. Transport as Critical Element of Sustainable Development

Michael Replogle and Colin Hughes, Institute for Transportation and Development Policy

#### Recommendations

## 1. Sustainable Development Goals

- Ensure universal access to sustainable transport through support for safe, affordable public transport and safe, attractive facilities for walking and bicycling.
- Ensure global transport greenhouse gas emissions and transport sector fossil fuel consumption peak by 2020 and are cut by at least 40 percent by 2050 compared to 2005 levels, while ensuring transport contributes to timely attainment of healthful air quality.
- Cut traffic-related deaths in half by 2025.

## 2. Institutional Arrangements

- United Nations: Enhance UN agency coordination around critical sustainable transport tasks to improve effectiveness in global agenda setting, capacity building, data collection, monitoring of progress, technology transfer, regional development, and cooperation with other sectors.
- Development Agencies and Banks: Adopt and monitor (1) sustainable transport targets, (2) goals to advance equitable access for all, and report on these targets and goals. Increase support for sustainable transport capacity building and transport sector climate resilience and adaptation.
- Multi-lateral Carbon Finance Instruments: Foster transport sector contributions to CO2 mitigation roughly equal to its 23 percent of energy-related carbon burden by improving transport sector access to carbon finance with sector-appropriate appraisal requirements for CDM, GEF, and CIF funds, and a transport sector window to the Green Climate Fund.
- Enhance Private Sector Participation: Foster public private partnerships and implement new business models in support of sustainable transport.
- Capacity Development: Strengthen both current voluntary multi-stakeholder partnerships on sustainable transport as well as intergovernmental processes on transport.

## 3. Commitments

- National governments should take actions, such as setting goals to boost the share of travel by low carbon sustainable transport modes, adopting street and urban design standards to promote sustainable transport and urban development, and encouraging and funding implementation of sustainable transport and land-use plans for cities

### The Need for Action

Transportation is key to providing access to opportunities, jobs, and prosperity. Many recent statements recognize the importance of sustainable transport to advance sustainable development, including:

- Bangkok 2020 Declaration, endorsed by 22 Asian countries (UNCRD (2010), Bangkok Declaration for 2020: Sustainable Transport Goals for 2010-2020
- Bogota Declaration, endorsed by 9 Latin American nations (UNCRD (2011), Bogota Declaration Sustainable Transport Objectives)
- Report of the Secretary General to the UN Commission on Sustainable Development (CSD) 19th Session on Policy Options and Actions for Expediting Progress in Implementation: Transport.

Rapid economic development and urbanization are fueling massive growth in transport demand. Current practices of meeting increased transport demand mostly by growing car fleets and road capacity are unsustainable. Transport-related externality costs in developing countries are soaring. Road accident deaths top 1.3 million annually. Of those who die, 9 in 10 are from low- and middle-income countries; half are pedestrians, cyclists, and motorcyclists; victims disproportionately are poor. Fatalities are projected to rise 80 percent by 2020 in low- and middle-income countries (while falling 30 percent in high-income countries), at a cost to the developing world of US \$100 billion a year (equal to all current overseas aid from OECD countries).

Transport accounts for 25-80 percent of urban air pollution that leads to respiratory and heart disease and cancer. Air pollution causes approximately 2 million premature deaths worldwide per year, with more than half of this burden borne by people in developing countries. Studies by the IPCC suggest that cuts to greenhouse gas emissions by 50-85 percent below year 2000 levels are needed to limit catastrophic climate change. Yet unless comprehensive changes in policy are made, car ownership will triple to 2 billion, trucking will quadruple, and transport-related greenhouse gases will grow by 80 percent. A 2-degree Celsius climate protection goal cannot be met without a considerable contribution to CO2 mitigation by the transport sector.

A study by the UNEP shows that sustainable, low carbon, transport initiatives that reallocate just 0.34 percent of global GDP in support of public transport infrastructure and efficiency improvements to road vehicles could cut the volume of road vehicles required to support equal economic activity by one third, cut use of oil-based fuel by up to a third and boost transport sector employment by 10 percent. As the transport sector already directly provides 5-8 percent of a typical country's total paid employment, with much higher indirect value added and employment in related sectors, there is significant economic development potential from pursuit of such initiatives. The impact of these changes in the structure of transport services on climate change would be to reduce greenhouse gas emissions by 2050 by 68 percent below business as usual trends (and about 36 percent below 2010 levels).

Fuel cost savings and reduced traffic congestion from a sustainable transport program can support added sustainable economic development while boosting access for the poor to opportunities. Such strategies would also cut the huge public health costs of unmanaged motorization – accidents, pollution-related disease, and rising levels of obesity related to physical inactivity. With sustainable transport strategies, transport sector jobs will increasingly be generated through investment in low-carbon transport infrastructure and vehicles, alternative fuels, and telecommunications and other technologies. A study found public transport spurs 70 percent more jobs per unit of investment than building new roads; road and bridge maintenance creates 16 percent more jobs than new construction.

The technologies and policies needed to obtain these sustainable transport benefits are well known, proven to be effective, and often come at a small or net-negative cost when accounting for fuel cost savings and other co-benefits. Yet they do require a commitment to concerted action. In the absence of a transport sector specific Sustainable Development Goal, neither development assistance nor carbon-finance have focused effectively on many available low-cost opportunities for progress in transport.

### More Detail on the Proposed Outcomes

Achieving the proposed Sustainable Development Goal necessitates a global commitment to a set of best practices and strategies contained in new sustainable transport paradigm, known collectively as "Avoid, Shift, Improve" (ASI). The ASI Best Practices focus on avoiding unnecessary motorized trips with smarter planning, pricing, and technology; shifting trips to more sustainable modes through price incentives, better information, and improved service quality; and improving vehicle efficiency with cleaner fuels, improved network management, and more efficient vehicle technology. All the elements of ASI have been demonstrated at scale. Successful examples of this include Bus Rapid Transit, bicycle-sharing and bikeway networks, integrated land-use/transport planning, parking limitations and management, smart parking and car-sharing, vehicle registration quotas, congestion pricing, vehicle emission standards, and intermodal freight efficiency and logistics systems.

Potential national actions may involve institutional capacity building, expanding use of public-private partnerships, innovative financing, and integration of multiple sectors into a systems approach to urban planning. It also includes shifting subsidies and investments from fossil fuels, roads, and private motor vehicles to instead favor sustainable transport, targeted user-side-subsidies, climate resilient transport, and pro-poor development, with sound transport pricing.

#### Author and Reviewers

These recommendations were prepared by Michael Replogle and Colin Hughes of the Institute for Transportation and Development Policy (ITDP), a non-profit group that works with cities worldwide to bring about sustainable transport solutions that cut greenhouse gas emissions, reduce poverty, and improve the quality of urban life. The authors thank the Partnership for Sustainable, Low Carbon Transport (SLoCaT) and several of its members who actively reviewed and commented on earlier drafts of this statement.

#### V. The Role of Information & Communications Technologies (ICTs) in Creating Smart Sustainable Cities

Diana Lind, Next American City

##### Recommendations

##### 1. Sustainable Development Goal

- By 2020, every major city should become a "smart" city that enables all of its residents to have electronic access to sustainability data and governmental decision-making.

##### 2. Institutional Arrangements

- A new global smart cities initiative should be established to assist local governments to access and implement best practices for using ICT to achieve sustainability

##### 3. Commitments

Governments at all levels should:

- Create databases of critical information on transport, housing, waste, sanitation, and other urban sustainability issues. These databases should be readily available to the public;
- Develop and expand programs to enable the public to provide information electronically on sustainability issues, such as pollution and transportation needs, to governmental decision makers;
- Ensure that ICTs are available to poor and disenfranchised groups and people.

#### Need for Action

As cities today grow in size and complexity, their governments are tasked with becoming more environmentally sustainable, livable, and economically vibrant. In an effort to become more effective and efficient in this competitive environment, governments are increasingly turning to information and communications technologies (ICTs) to maximize their natural and financial resources. City governments may not have much cash but collect a wealth of data on a range of civic issues, such as transportation and energy use, housing, and crime and health statistics. Some tech-savvy cities have been quick to analyze this data to better inform decisions on where to build a hospital, allocate police presence, add transportation routes, or locate a public park. But many more cities still lack the ability to analyze their data, engage the public in the decision-making process and become more sustainable as a result.

A variety of actors, including governments, corporations, non-profit organizations, and individual citizens are using ICTs to improve the quality of urban life. Here are interesting examples:

- The cities of New York and Washington, D.C. created competitions to develop apps that make the use of public transportation and public spaces more convenient, make it easier to avoid restaurants with health code violations and enable people to sign local petitions on a cell phone.
- Singapore uses real-time traffic data gathered from smart phones to locate and predict traffic congestion, inform individual drivers and suggest alternate travel routes. This data can also be used to improve traffic engineering.
- In India, a non-profit organization uses a text-message program to notify residents about local piped water delivery, making it easier for citizens to access clean water.
- Near Fukushima, Japan, citizens who lack trust in the government's information have used their own Geiger counters and open-source software to compile their own map of radiation hotspots around the crippled nuclear power plants there.

#### More Details on Proposed Outcomes

While ICTs have the potential to improve cities' sustainability, to increase civic engagement, and to support governance decisions, many cities are unaware of or unable to harness these technologies. A new global initiative that engages the United Nations, The World Bank, leading national and local governments, corporations and key non-profit organizations should work together to determine best practices in this field, fund the expansion of ICTs for sustainability purposes, and ensure broader public access to public data.

#### Author and Reviewers:

Diana Lind is Executive Director of Next American City, a Philadelphia-based national nonprofit organization helping to improve the social, economic and environmental character of cities by reporting on best practices in areas such as transportation, housing, governance, and sustainability. The following reviewers contributed ideas and commentary on these recommendations: Nick Grossman, Civic Commons; Colin Maclay, Berkman Center for Internet and Society, Harvard University; Benjamin de la Pena, Rockefeller Foundation; Anthony Townsend, Institute for the Future; Ethan Zuckerman, Center for Civic Media, MIT.

#### VI. Putting Urban Metrics into Sustainable Development Indicator Systems

Eugenie L. Birch and Amy Lynch, University of Pennsylvania

##### Recommendations

##### 1. Sustainable Development Goal

- By 2020, all countries will adopt sustainable development indicator systems that include urban metrics scaled to national, provincial/regional and local goals as appropriate, measure their progress regularly, and report the findings publicly.

## 2. Institutional Arrangements

- The United Nations should create and maintain a dedicated database of nations' sustainable development indicator systems and of urban sustainability indicator systems.

## 3. Commitments

- National government should include and support the creation of urban metrics in their sustainability indicator systems.

### Need for Action

Failure to include urban concerns and related indicators (e.g. presence of services in peri-urban settlements, the availability of affordable urban housing and accessible transport, the percent city development on vulnerable or polluted land), in setting goals, policies, and programs will result in failure to achieve sustainable development. Information about sustainable urban development is widely available – we know how to engage in land suitability analysis, to build compact cities that have “smart” transportation, affordable housing. In addition, we understand that urban sustainable development requires regional actions (e.g. supporting green infrastructure investment to protect the water supply and assure food security) and national policy (e.g. carbon pricing or other environmental protection or sound fiscal and monetary policies) Through advances in information technology, we have the ability to build consensus around sustainable development goals and to monitor quickly the results of particular policies and programs. What we lack is the management capacity and political will to apply and manage these policies. We also lack a central repository that collects already accomplished and ongoing work in this area. The UN Division of Sustainable Development (DSD) has created a website ([http://www.un.org/esa/dsd/dsd\\_aofw\\_ni/ni\\_index.shtml](http://www.un.org/esa/dsd/dsd_aofw_ni/ni_index.shtml)) to track sustainable development efforts, but it is out of date as the last entries were in May 2010.

### More Details on Recommended Outcomes

While not a panacea, indicators that include urban metrics are an important tool to be used in forging the political will and measuring performance on sustainability that in the next decades is inextricably associated with cities. There are a number of successful systems, including in cities such as Vienna, New York, and organizations, such as ICLEI. The creation of a centrally located, easily accessed database of demonstration and best practices processes and associated materials within the United Nations will promote global knowledge-sharing and advance the work.

### Authors and Collaborators

These recommendations were developed by Eugenie L. Birch, Nussdorf Professor of Urban Research and co-Director, Penn Institute for Urban Research, University of Pennsylvania, and Amy Lynch, PhD candidate, University of Pennsylvania. Birch and Lynch have been working with the Office of International Affairs and Philanthropy, U.S Department of Housing and Urban Development and others on understanding and developing sustainable urban development indicators for the United States. Birch's most recent books are *Global Urbanization* (2011), *Women's Health* (2011), *Growing Greener Cities* (2008) and *Rebuilding Urban Places after Disaster, Lessons from Hurricane Katrina* (2006). Lynch is completing a dissertation on green infrastructure.

---

## Rio+20 Global Youth Music Contest Group

The Rio+20 GYMC is a global competition for youth organized by the International Association for the Advancement of Innovative Approaches to Global Challenges (IAAI) aimed to inspire, engage and mobilize youth to support sustainable development through music as an universal language that facilitates dialogue, bring global people together and strengthen effective global governance as well as the work of the United Nations system.

Launched on 15th September 2011 in Klagenfurt at the international conference “Knowledge, Youth and Global Commons” by 30 participants from over 25 different countries and on 05 October 2011 at the United Nations Vienna Austria, the Rio+20 GYMC encourages youth to communicate to a global audience, innovative and specific ideas regarding environmental protection, sustainable development and international cooperation.

The successful launch of Rio+20 GYMC was a clear testimony to youth unquestionable commitment and unwavering willingness to take a leading role in tackling global challenges. However, due to a lack of resources, youth participation in sustainable development is limited. As a result youth turn to other markets in the economy other than the green economy. For example; youth looking to work on sustainable issues in their summer vacation may be thwarted in their efforts, because these programmes are often unaffordable. If they or their parents cannot afford them, then youth turn elsewhere (e.g. media companies offering paid participation in mindless consumer-fueled reporting at summer vacations for teenagers camps of beaches). In order to fully engage youth, the Rio+20 GYMC would like to see the following outcomes from Rio+20 UN Conference:

### Green Economy

A Green and Sustainable Economy should be an economy that has an infrastructure that is open enough to include the youth participation.

### Institutional framework

Governments need to provide sustainable conditions for youth work by aiming to create youth opportunities. Youth participation needs to be operated on global governance and policy-making levels.

<sup>[4]</sup> Governments, the United Nations system and other stakeholders to renew efforts to implementing General Assembly Resolution A/RES/56/38 and subsequent resolutions of the United Nations General Assembly on measures to support volunteerism and look forward to further actions by the UNGA to commemorate IYV+10 and to continue to call for global recognition, support, and advocacy for volunteerism for sustainable peace and development

<sup>[4]</sup> There should be strategies that engage young people as agents for sustainable development and peace.

<sup>[4]</sup> Educational Institutions and Academia should integrate volunteerism, youth activities and an understanding of civil society into curricula and similar structures to promote a deeper and more universal understanding of civic service and volunteering.

<sup>[4]</sup> The Media should communicate to the public the value of volunteerism and youth and join as a stakeholder in promoting a supportive environment for community engagement and volunteerism.

<sup>[4]</sup> The Civil Society should mainstream volunteerism and civic engagement strategies into sustainable peace and development programming.

- ☞ Corporations should engage youth to make sustainable development initiatives a key part of their work, taking local communities into consideration.
- ☞ All stakeholders should be open to new ways to volunteer by connecting and engaging people through internet and other new technologies.
- ☞ There should be promotion of youth volunteering strategies that engage young people as agents for sustainable development and peace.
- ☞ All stakeholders should ensure equal opportunity for female and male young people not only in leadership positions within sustainable development, but also equal pay for these responsibilities. While encouraging volunteerism, common good oriented activities that provide resources for youth should be supported by governments.

#### Project examples

Jean Paul Brice Affana – Cameroon: With his youth-led NGO, Vital Actions for Sustainable Development (AVD), Jean Paul organized a press conference on the national launch of Rio+20 GYM in Cameroon on the 04th October, 2011 parallel to the launch of the "I Vote for Climate" campaign (video): ([http://www.voxafrica.com/vod/videos/&v=0\\_k58i9d62&p](http://www.voxafrica.com/vod/videos/&v=0_k58i9d62&p)). Jean Paul also established collaboration with the French Cultural Centre in Yaoundé city to mobilize youth in Cameroon to get involved in contest. The contest is announced in the centre's weekly newsletter. Furthermore, the French Cooperation included the contest in a series of activities that will start in January 2012 until December and will aim at promoting access to renewable energy for all. The Direction of Youth at the French Speaking Countries Organization, Francophonie, has published the contest announcement in its website visited everyday by more than one million youth. Finally, Jean Paul promoted the contest at various events he attended between September and October 2011, among them the One Young World Summit 2011 in Zurich, the 12th University on Youth and Development in Malaga and the 8th Commonwealth Youth Forum in Perth, Australia. The government can help Jean Paul by providing him with enough resources so that he can continue to effectively promote the project.

Jessica White - Austria: Based on the GYM, as a youth facilitator I raised sponsorship from the local government to facilitate the making of music and videos with disadvantaged youth who do not normally have access to resources such as music training, a recording studio and instruments and provided them with these resources and facilitated lyrics with the themes that they were interested in and related to Rio+20 objectives such as Governmental Debt, Wasting money, War, Oil Business / economy, Faith, Greed, and atomic energy. The workshops shall be over a series of six weeks, twice a week 2 hours each, the result shall be submitted to Rio+20 GYM that is part of the youth contribution of Rio + 20 UNCSD.

Anam Gill - Pakistan: For mobilizing young people in Pakistan, an article on Rio+20 GYM was published in two mainstream, highly circulated dailies Dawn International and The News International; the Dawn and the News. This initiative will also be aired on FM 91 Radio and talked about during the Freedom Songs show which is aired Lahore, Karachi and Islamabad. The main hindrances are security issues. Mobilizing resources to bring people to this initiative from other sectors like the government has been a challenge. The governments can support us in making this initiative a success. It is not only centred on funding but also guidance which we need to deter the challenges being faced locally.

Jones Llewelyn – United Kingdom: Helping a group of homeless young people from England and Wales along with young refugee and asylum seekers in the UK to make entries for the competition. In this case, the government can assist by communicating the results of the project to relevant government bodies such as DFID and them taking the results onboard.

## Rio+20 Network of Women's NGOs in Finland

1 November 2011

Rio+20 Network of Women's NGOs in Finland email. [paasihteeri@naisunioni.fi](mailto:paasihteeri@naisunioni.fi)

Rio+20 Network of Women's NGOs in Finland Contribution to the Compilation Document United Nations Conference on Sustainable Development 2012

Rio+20 process should address very clearly women as key actors of change both in poverty eradication and advancing sustainable development. It is essential to make gender equality and women's rights perspective an integral part of the global transition to green economy.

Special attention should be given to the following points:

#### Green economy and women's participation

In order to achieve the Rio+20 objectives of sustainable development and poverty eradication, green economy should be used as an instrument to promote gender equality. To maximise human contributions to sustainable economic growth, it is essential to

- ensure women's participation in environmental decision making at all levels
- increase women's participation in income-generating activities
- ensure women's access to clean and renewable energy
- invest in renewable energy and labour-saving technologies to reduce the amount of women's unpaid household and care work
- incorporate the idea of gender equality in all green economy investments and activities

#### Women's sexual and reproductive health and rights

Advancing sexual rights and reproductive health and rights is closely connected to resolving other development challenges, such as reaching balanced population development, adaptation to climate change, poverty eradication, promoting sustainable economic growth and social development.

Therefore it is crucial to ensure that every woman and girl around the world has -right to sexual self determination

- right to voluntarily marry and establish a family
- right to decide the number, timing and spacing of children
- access to accurate sexual and reproductive health information
- access to quality sexual and reproductive health services and modern contraceptive methods

## Women in rural areas

Environmental degradation and extreme poverty affect particularly women in rural areas in developing countries, as they are often highly dependent on local natural resources for their livelihood.

An effective way to increase agricultural productivity and sustainable economic growth in rural areas is to advance women's opportunities, for example by

- securing women's land and property rights -ensuring women's access to and control over productive resources

- investing in labour-saving clean technologies for female farmers to boost agricultural production

- ensuring that there is a greater gender equality focus in the aid directed to the agricultural sector

Additionally, as half of the world's population lives now in towns and cities, it is important to ensure that global transition to green economy promotes also women's position and opportunities in urban areas, for example equal access to less polluted, safe urban environments and their planning, transport, public spaces and information, and on the other hand to production and finance by ensuring inclusion of socio-economic networks.

## RiverWay South Organization

Local, Meso-level and Micro-level NGOs form partnerships for "Grass roots" initiatives on Sustainable Economic Development

By Judy R. Van Doorn, Ph.D.

Troy University

Submitted to the United Nations Conference on Sustainable Development for RIO+20.

Contact Information:

Judy R. Van Doorn, Ph.D.

Assistant professor of Psychology

Industrial Organizational Psychologist

Troy University

Counseling and Psychology Department

One University Place

Phenix City, Alabama 36869

Phone: 334-448-5189 Email: [jvandoorn@troy.edu](mailto:jvandoorn@troy.edu) "Grass Roots" Sustainability

Local, meso-level and micro-level NGOs form partnerships for "Grass roots" initiatives on sustainable economic development

An existing sustainability approach that is attempting to address the "social, economic, and environmental" components of sustainable development (Sha Zukang, 2011) is found with "grass roots", meso-level NGOs who are partnering with tri-state river stakeholders like the Apalachicola-Chattahoochee-Flint rivers stakeholders (ACFS) organization found in Alabama, Georgia, and Florida USA. A present goal of ACFS is to have a cooperative research-based, sustainable water management plan for better water resource usage (Van Doorn, Taylor, Tonsmeire, Davis, & Rooks, 2011; ACFS, 2011). On a more local, micro-level, the RiverWay South Institute – a "grass roots" community NGO (RiverWay South, 2011) – is cooperatively initiating a team-based approach to economic development sustainability through ecotourism. RiverWay South works along with tri-state university faculty and students to mediate and build community relationships to enhance environmental sustainability through education, ecotourism, and action plans for sustainable economic development.

The RiverWay South NGO is supported through membership dues, strategic marketing plans (Randall, 2005), grant funding through USDA rural development and business opportunity grants, local community investments and endorsements for sustainable economic development which are designed around the mission for protecting the watersheds' natural environmental resources (Champion & Rutland, 2005). Rural and local river community partnerships are encouraged with the goal of sustainable ecotourism to help stimulate local economies and, in turn, fit with the preservation and protection of the watershed environment which helps to save endangered species (UN report, 2011). The RiverWay South approach is one of sharing and cooperation between 4 or more regional university institutions, chambers of commerce, Rotary International, Riverkeepers' organizations, Visitor tourism bureaus, City councils, departments of wildlife, parks and recreation, and arts organizations. Regional university faculty and students partner together and look past their competitive interests by cooperating on better plans for economic development – a cohesive "win-win" sharing of environmental sustainability education and action-based plans for sustainable economic development on the ACF watershed rivers.

RiverWay-sponsored Projects have been contracted with University Institutes for continuing education along the Apalachicola-Chattahoochee-Flint river watershed and coordinated with regional town hall meetings for ideas and sharing of development needs assessments – a "grass roots and up" approach from the first project in Apalachicola, Florida to the present Project Riverway – Phenix City, Alabama (Elkins & Bivins, 2011; Culligan, Van Doorn, Rutland, & Brannen, 2010). There are four universities – University of Georgia, Troy University, Auburn University, and Columbus State University – working together on Project RiverWay – Phenix City, Alabama USA which brings faculty and students, city leaders, and volunteers together from different bordering states to build sustainable development plans and action-based projects. Regional towns with depressed economies in need of economic development for job creation and sustainable growth will benefit most from these projects. The projects follow community visions and are conducted through surveying community members' ideas in town hall meetings and selecting top needs for short-term and long-term development projects. Initial project implementation is completed through the esprit de corps that surfaces from volunteerism, community pride, student learning opportunities, and cooperative team-based approaches. Examples of short-term projects have included tree plantings, town park gardens, cultural heritage trails and museums, nature walking trails with new signage, environmental learning centers, and ecotourism projects including boat ramps that support whitewater outdoor sports on the rivers.

With the city of Freiburg, Germany taking sustainability initiatives to a new level of high energy efficiency and its vision to be the "greenest city," other communities may decide to develop local resolutions to encourage industry incentives for sustainable development and education (Business Insights, 2010; Purvis, 2008). Some sustainability case study programs include King County, Washington (Harrington, 2011) and the City of Tucson, Arizona (Lancaster, 2010). Additionally, the "agroecosystem" approach

presented at Stockholm's World Water Week suggests that tree plantings in fields and better livestock maintenance helps water conservation and higher food security (Simonsen, 2011). Federal laws like the U. S. Wild and Scenic Rivers Act of 1968 may need reconsideration and reviewing on the waterways and certain parts of rivers and nature preserves that need better protection (Bourne, 2011).

The idea of a "grass roots and up" micro and meso-level networking approach may be a key complement to the macro-level sustainability charges made by the United Nations' Brundtland Commission report entitled Our Common Future (1987), United Nations Conference on the Environment and Development (UNCED) Agenda 21 (1992), United Nations Educational, Scientific, and Cultural Organization's (UNESCO) biosphere reserve designations, and European Union energy efficiency targets. Graham and Bertels (2008) suggest that businesses create sustainability portfolios in order to build stewardship legitimacy and action for waste prevention. Foremost, education remains important to learning about the balance between sustainability, conservation, and economic development. The cooperative RiverWay South approach helps to bridge community sustainability efforts through hands-on projects and learning opportunities on sharing natural resources, protecting the environment, and quests for better economic development sustainability (Mabry, 2011; Littledyke & Manolas, 2010).

The planning and action-oriented approaches that NGO RiverWay South has contributed to the ACF river watershed region is presented for consideration by the board for the United Nations Conference on Sustainable Development for Rio+20. RiverWay South and its university approach is a positive, cooperative strategy for encouraging better economic sustainability at the individual, micro-based and team-based, meso- levels of organizations within small and rural communities that plan to initiate sustainable economic development through smart ecotourism and educational outreach balanced with environmental integrity.

## Romanian Mountain Forum

### ROMANIAN MOUNTAIN FORUM

To the  
Secretariat of RIO + 20 UNCSD

Romanian Mountain Forum is a non-governmental organization of national level, created as a result of IYM-2002, active member of the International Mountain Partnership and Euromontana, which brings together over 400 representatives of mountain territories from 27 counties, farmers, forest workers, communities and mountain NGOs, personalities from the circles of science, academic and university specialists in rural development and environment protection, as well as administrative and political factors - senators and deputies from the Romanian Parliament; Considering that the UNCDS - Rio +20 Summit will take place in 2012;

Based on the experience gathered between 1990 and 2011 in Romania and the lucrative relationships with European (EUROMONTANA, AEM, European Commission, Council of Europe, MF), international (Mountain Partnership, FAO, World Association of Mountain People, the World Bank) and national bodies;

In order to ensure that the specificity of the protection and sustainable development of the Carpathian mountain region of Romania (and of the mountains from South-Eastern Europe, with similar needs) will be safeguarded from degradation and supported within international negotiations, we address the following

#### CALL

In the vast area of the Romanian Carpathians, with ~ 90,000 km<sup>2</sup>, 824 administrative municipalities and 3560 villages, 3.6 million people and agri-zootechnics millennial traditions, 20 years after the international event Rio - 1992, which included Agenda 21, Chapter 13 - "Mountains" as fragile ecosystems, the demand for mountain goods, services and infrastructure has increased significantly. But in spite of all the efforts that have been made by some institutions and NGOs, by personalities with high responsibilities, with some notable results (agri-tourism and mountain tourism, pilot farms, training, scientific research, infrastructure, environment protection, etc.) including support measures, not enough compared to the pressing needs, in the year 2011 there is a very deep degradation of the mountain environment and the mountain rural economy, especially the private agriculture / animal husbandry, with very serious consequences, such as: Irrational cutting of forests, especially in the higher areas, such as conifers, with consequences on the environment and society (floods, landslides, etc.);

Degradation of the natural flora of mountain pastures with crucial feeding importance for ruminant livestock (cattle, sheep / goats), which are not competing with man for food (they eat grass, not grain).

This occurred as a consequence of the dramatic decrease of livestock (50-80 %.... depending on the micro-areas) and hence the volume of organic fertilizer, an essential factor for maintaining the natural flora of mountain meadows, flora which is of great social value - for food, absorption of carbon, biodiversity, landscapes, etc..

Main causes:

1. The focus of governments, local administrations and some agricultural producers on the big agriculture from areas with high fertility, such as plains and hills, based on crops and marginalization of smaller mountain agriculture and animal husbandry;
2. The monopoly installed by food industries, the lack of competition and the extremely low prices for raw materials, especially milk and meat, as organic products, of high biological quality, due to floral polymorphism. There are disappointing prices (e.g. 7-8 liters of milk for 1 euro!) and the consumer pays 1.2 to 1.4 euros / liter, a situation that was reported by RMF to all the factors of national responsibility and the highest institutions of the European Union (European Parliament, European Commission, Council of Europe).
3. The lack of effective protective intervention from the State, national or multinational the pressure of national or multi-national owners' structures on the administrative and political structures to maintain such a system, which is very harmful for the small mountain farmers, led to agri-zootechnics not being profitable anymore, with the effect of intense decrease of poverty for most of the producers, discouragement and hopeless future for the younger generations living in the mountain countryside;
4. The appearance of a very serious phenomenon, the lack of interest for modernizing the mountain farms and the massive agricultural abandonment (abandoned lands, tens of thousands of hectares of grassland which are no longer harvested, invasion of useless plants, etc.);
5. Mass exodus of youth from the 3560 mountain villages, to cities or abroad, where the unemployment rate increases, excessive aging of the population which is still agriculturally active;
6. Very serious for environment and economy: in the absence of organic fertilizers a natural phenomenon takes place, the mountain fodder polyflora will turn wild again, in just 8-10 years. This flora, a wealth of mountain areas, which generates food for many millions of people, has been selected, with hard efforts, by dozens of generations of people, in more than 2,000 years of continuous use of organic fertilizers, with sustainable traditional technology and best practices that have been preserved in the Romanian Carpathians and the Carpathians and Balkans elsewhere.

The natural flora will be lost in less than a generation, by human negligence, a loss that will be permanent under the circumstances of the twentyfirst century – such as globalization, free movement of people and many of today's agricultural alternatives for mountain young generations, which did not exist in the past centuries. The intimate connection and interdependence between MAN-ANIMALS-ORGANIC FERTILIZERS-FODDER FLORA is essential and irreplaceable in mountain agricultural economy, which is not a green economy and any harm to this fragile ecosystem is not only harmful but also it can not be recovered (the mountain punishes. ...)

For these reasons comes the necessity of giving priority to mountain agriculture, in order to avoid huge, irrecoverable losses.

7. A cause with negative effects can also be found in the misapprehension of the notion of "biodiversity", by interest groups that have generated attitudes and even rules for the conservation of invading plants, with no forage value, to the detriment of flora with high social value (ex. Nardus s.) or financial stimulation of late cutting of grass or excessive breeding of wild animals, such as predators, with discouraging consequences for mountain farmers.

8. The specialized institutional system, created in 1990, namely Romanian Mountain Area Commission, turned, by reduction, into the National Agency of Romanian Mountain Areas (Ministry of Agriculture) and the mountain research and vocational training institutions, have not been supported and developed but after 20 years of proven fertile activity, have been dissolved in 2010!

9. A project partnership between the Romanian and Austrian ministries of education and agriculture and the Romanian Mountain Forum, establishing the first nine professional schools of mountain agriculture, a government-funded project started in 2008 that was discontinued in 2009, under the pretext of economic crisis.

In conclusion,

In the Romanian Carpathians, which were not and are not using chemicals, there is food, quality protein, ensuring food security for more than 3 million people.

With a good management and support, ecological food could be produced, by using technologies that do not require oil, for more than 6 million people.

A sustainable alternative to "green economy", for the benefit of the whole society is still possible, but dependent on a general effort, the existence of distinct specific government policies and programs for mountain areas, with more intense interventions in the areas most vulnerable. Such a strategy is necessary at the level of the European Commission as well, where mixing mountain areas with "other disadvantaged areas" is an outdated type of approach, which did not bring the necessary balance in mountain economy, especially in emerging countries like Romania and others.

Romanian Mountain Forum, based on the national and international experience with governmental and non-governmental institutions, on the results of the scientific research from the last 20 years, under the pressure from the new challenges and threats posed by climate change and major population growth to more than 9 billion people in 2050, believes that:

The importance of mountain areas increases considerably in this century in terms of human food production and new habitat areas. It is extremely important for the food security of both the mountain people and the mankind that the mountains continue to produce quality food, by sustainable methods.

Mountain agriculture and animal husbandry are extremely fragile and bear, especially in less developed or emerging countries, but with tradition, such as Romania, the consequences of lack of strategies and programs. Mountain agriculture, as the "engine" of economic, social and cultural activities of mountain communities should be treated as priority by governments, because, as different from the case of fertile plain / hill areas, based on agricultural crops, in the mountain areas the natural fodder flora is turning wild again, in a very short period of time.

An entire mountain economy, created during centuries of human efforts, can be lost in a single decade of negligence, because under the deeply changed conditions of XXI century, abandonment of agriculture and traditions and the young generations leaving the mountain communities, is an irreversible phenomenon.

In the XXI century humanity can not afford to lose a large economic segment that produces food and many other goods.

On the contrary, a conscious attitude is necessary, imperative and urgent, in order to improve the overall effort to increase the investment adapted to the needs and diversity of mountain specificities, with direct beneficial effects on mountain populations, especially on poor communities and, indirectly, on the whole mankind.

We believe that it is in the interest of humanity that within the global and regional policies for mountain areas, as well as within the national policies, the two largest economies of the mountains - sustainable agriculture and forests - should coexist, in balanced ecosystems.

#### PROPOSALS

1. To be mandatory for regions, states and governments to protect, by strategies, legislation and special programs, the populations of mountain farmers, in order to avoid human desertification, loss of their economies and cultures, which are fragile.
2. The creation and availability of financial resources able to provide effective motivating support for small mountain farmers, especially for young agricultural population, for breeding ruminants in extensive systems and producing healthy human food in ecological conditions.
3. Creating and supporting a more efficient and stable governmental institutional system, specialized on mountain areas and government's support of mountain research and of a specific program for training of specialists and practitioners. Different provisions in the annual budgets for the financial resources meant for mountain agricultural economy.
4. Support of the establishment and operation of NGOs, especially of cooperative types of associations (Western) of mountain agricultural producers, at the level of traditional mountain basins, able to withstand market conditions. Endowing them with means of processing ecologic animal and vegetable raw materials, facilitation of selling these organic (mountain eco-bio) products on the national and international markets. The potential value added can be expressed by considering the mountain eco-bio-food products as "niche" products for a category of 'niche' consumers, interested and capable to pay an additional price for high quality and health guarantees, as a source that may become important for supporting mountain agri-food eco-bio-economy, increasing family incomes and investment potential of small farmers, fighting against poverty and gradually reducing the support needed from specific grants - uncertain on long-term - linked to demographic growth.
5. Establishment of non-exclusive rational rules to ensure a balance between agriculture and forests in the mountain areas, in the spirit of mutual acceptance.
6. To ensure the high value of perennality of high social value biodiversity, represented by the polymorphic natural fodder flora of mountain pastures and grasslands.
7. Giving up exaggerated guidelines and provisions, worthless or that may affect mountain food production.
8. Recognition, by governments, of the mountain populations' right to "being different", the right to being compensated for natural handicaps and to be provided with tax incentives and other types of effective support.

9. Establishment/strengthening and development of an educational and vocational training system, adapted to the specificity of mountain agriculture and animal husbandry, mountain environment and living.

10. In parallel with the protection and encouragement of mountain agriforestry economy, the creation of new job opportunities in the mountain countryside, part time or full time pluri-activity representing a characteristic for most mountain communities.

11. International financial institutions to create a special fund intended to safeguard mountain agri-livestock economies with traditions, that are in danger of degradation. Mountain Partnership should have an "intervention fund" specifically designed to support specialized non-governmental organizations with pro-mountain activity.

12. UN should boost the establishment of an International pro-mountain Convention which would be joined by the governments that are members of the Mountain Partnership – with a strong commitment from each government to take effective medium-term measures to prevent degradation of traditional agrilivestock economy and mountain environment, poverty and exodus of young generations and to foster sustainable development.

13. UN should develop the activity of Mountain Partnership, by establishing continental departments with the primary role to support mountain regions capable of producing human food - taking into account the specific elements (geo-climate, economics, traditions, etc.). Example: Europe with the regions of Carpathians and Balkans, Asia, Africa, South America.

Romanian Mountain Forum hopes that the considerations and proposals made will come to the attention of the Secretariat of the UN Commission on Sustainable Development and will be a contribution to Rio-2012 Agenda and the Final Declaration\*, respectively for the future UNCSD negotiations in favor of mountain issues.

President of R. M. F.

Radu Rey

## Romontana

National Association for Mountains Rural Development "ROMONTANA"

[www.romontana.org](http://www.romontana.org)

From Rio 1992 to 2012 and beyond: 20 years of Sustainable Mountain Development - What have we learnt and where should we go?

Key messages:

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably. We assert that mountains are territories with a future and opportunities for Europe and the world. They have much to deliver to society at large and have great potential for smarter, greener and more inclusive development. They are also distinctive areas, because of their altitude, their steep slopes, their low population density, their challenges and their opportunities, and consequently should be addressed specifically. We call for public and private investment in these areas. The return on investment might indeed take longer in these areas than in urban areas or lowlands, but the investment itself will undeniably be more sustainable.

At the same time, these mountain territories are faced with a number of challenges. Indeed, the ability of mountain systems to provide essential goods and services for all of humanity is increasingly under threat from climate change, globalization, a chronic lack of investment, ongoing land degradation in some areas, the absence of an integrated approach to territorial development in many countries, and increasing trends to the concentration of population in ever bigger agglomerations. We recognize that, despite the progress that has been made in promoting sustainable development in many mountain regions, most national and international development agendas still tend to treat mountains, if at all, as marginal environments. On the basis of its experience in the field of sustainable mountain development, its role in development of mountain policies at European, national and regional level, and its specific economic, environmental and social contexts, ROMONTANA recommends that the United Nations, in the discussion at UNCSD, to be held in Rio de Janeiro in 2012:

- recognise the specific role of mountains and the corresponding need for integrated mountain development policies and targeted investment;
- recognise in particular the role provided by mountain ecosystems in providing services that support and enhance the Earth's sustainability, and the key role that mountain communities play in delivering these services, by developing concepts of payment and compensation for ecosystem services, and implementing such concepts, and considering the economic value of services provided in the general interest (green accounting),
- integrate the assets of mountain regions in processes leading to sustainable development and green Economies, recognising that a geographical differentiation is needed; to identify therefore the conditions required to fully unleash mountain development potential and invest to secure that these conditions exist;
- adopt a multi-sectoral, multi-level and multi-stakeholder approach enabling the UN to direct its Sustainable Development policy towards concrete areas of interest and to identify and strengthen entities for cooperation and the implementation of such policies at the appropriate levels, whether regional, local or mountain range,
- promote networks and partnerships of mountain stakeholders at all levels (governmental, civil society, private sector) and encourage the relevant national and international organisations to consider mountain-related concerns.
- to support mountain-specific observation, research, knowledge development and awareness on environmental, economic and social aspects of mountain areas.

Mountains can deliver green growth.

Mountains and their economies are particularly well placed to deliver green growth, due to their rich natural and cultural heritage. They are the water towers of the world and major reservoirs of biodiversity and natural resources. Due to their topography, altitude and large forest areas, the renewable energy potential in mountain regions is superior to that of many lowland areas; though this also represents a challenge for landscape and biodiversity. As mountain agriculture provides many high-quality products and services, including organic or environmentally friendly farming and extensive rangelands, this sector, often in cooperation with others, can serve as a laboratory for the conservation of biodiversity in balance with human use of resources and interest.

Mountains are also among the most exposed to global change. This means that greening the economy is important for mountain economies to reduce their vulnerability and to increase local added value and employment as well as secure synergy between economic growth, environmental protection and social progress.

With their natural and cultural diversity and importance for downstream regions in terms of resources and ecosystem services, mountain areas are important innovation

motors in Green Economies, particularly in sectors where they are ideally placed to invent new and promising solutions, such as green transport, renewable energy supplies, life sciences, new forms of food supply chains, sustainable tourism, or remote service delivery.

However, innovative institutional arrangements are urgently required to foster governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, and the mainstreaming of mountains into overall national development and conservation processes.

This requires in particular:

- major investments to assemble the conditions allowing these areas to fully and sustainably exploit their potential, notably in the sectors of environmentally-friendly transport, energy, ICT and services of general interest;
- a multi-sectoral approach aiming, inter alia, at adequately rewarding the provision of ecosystem services from mountain areas in the general interest, where necessary by correcting market failures related to the specificities of mountain territories. Land managers such as farmers and foresters should, in particular, be equitably remunerated for the provision of public goods resulting from their economic activities .
- general support to the development of initiatives adding value to mountain products (food, crafts) and services (tourism...) in relation to their specific cultural and environmental features.

Romontana is member of the European Association for Mountain Regions "Euromontana" and has elaborated together with "Euromontana", in relation to these issues, recommendations on how to remunerate positive externalities provided by mountain land managers; foster the innovation potential of mountain areas; support development of sustainable tourism renewable energies, and services of general interest in mountain areas. It also has developed the European Charter for Mountain Quality Food products, launched at the European Parliament in 2005 and signed by almost 70 governments and organisations. This should lead to the adoption soon of specific protection for mountain food products at European level, opening the way to a specific market segment for mountain quality products, expected by many consumers.

Mountain development can contribute to a more inclusive global development

Enhancing global political commitment that translates into increased investments tailored to mountain regions will directly benefit mountain communities, some of which are very poor, and indirectly humanity as a whole. Mountain regions are likely to contribute widely to social innovation, thanks to their intense community life. Their governance and cooperation models are often unique, but may also provide valuable models for other regions. Furthermore, sustainable mountain development is a component of a more balanced territorial and placebased development which is highly needed and likely to contribute to a more even and socially sustainable distribution of population and wealth on Earth.

A more inclusive and place-based approach to development requires the adoption of a multistakeholder approach and a multi-level governance approach.

Across the world's mountains, the numerous networking entities active at different (governmental, NGO, research level, development agencies...) demonstrate a strong identification in the search for sustainable development solutions for mountains. The dynamism of the Euromontana network, bringing together different sorts of actors at different levels, since its creation in 1996, is a good demonstration of this. The UN can build on the European expertise in this respect – including European networks, inter-governmental conventions such as Alpine or Carpathian conventions, as well as emerging institutions in mountain research and policy development.

The UN must also promote the development of multi-level governance. Mountain ranges are functional areas whose geographical extent often overlaps multiple administrative boundaries. Euromontana is convinced that a focus on functional areas such as mountain ranges can help UN Sustainable Development policies to approach environmental and Green Economy challenges on a regional level, according to the Local Agenda 21 concept (thinking globally, acting locally).

Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends, strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

\*\*\*

"ROMONTANA" - National Association for Mountains Rural Development has been established in 2000 as a non-profit, non-governmental association, with no patrimonial purpose with the main purpose of supporting the general development of the Romanian mountain rural areas. Romontana is based in Romania, Suceava county, city of Vatra Dornei and has 6 branches established in the mountain counties of Alba, Brasov, Cluj, Hunedoara, Harghita and Gorj, gathering together institutions, organizations, universities, public and private bodies that are active in the best interest of the durable development of the mountain regions.

Objectives and activities: sustainable development of the mountain rural tourism and agritourism, specific training and education for the general development of the mountain rural areas of Romania, support for the economical development of the mountain communities, promotion of mountain quality products and services, supporting and promoting the interests of the mountain producers, protection of the mountain environment and cultural traditions, facilitating experience exchanges and partnership building between public authorities and private entities, national and international organizations involved in the sustainable development of the mountain area, lobby and informing the public regarding the realities and problems of the Romanian mountain area.

"ROMONTANA" has a wide experience and played an important role to the sustainable development of the mountain rural tourism in Romania, being one of the first and most representative rural tourism and rural development associations in Romania since it has been established in 2000 with the support of the Swiss government through SDC (Swiss Cooperation and Development Agency) and Euromontana. In over 10 years of activity it has organized a very experienced staff, experts in all the aspects of the rural areas, starting from rural tourism, rural economy to climate change and protection of the mountain environment. Romontana is member of the Mountain Partnership, Euromontana, World Rural Forum and Romanian Mountain Forum. Romontana has been involved in projects and common actions together with UNEP Vienna (Interim Secretariate of the Carpathian Convention) in the framework of the Carpathian Convention.

## Roots for Equity

The Earth Summit in 1992 based on the realizations and developments of the past decades had pointed out a new direction with respect to humanity: an important concept that the world learnt was of sustainable development which had taken into account the immensely harmful environmental practices encapsulated in a fossil fuel, for-profit production system. The Rio Summit had taken serious count of the degradation, extraction and exploitation of natural resources which was being carried out at the cost of the

poorest and most marginalized sections of Earth's population. The climate crises of even just the past few years including the super floods faced by Pakistan in 2010, and then in this year again floods in various parts of Asia and other parts of the continent, as well as other climatic disasters such as soaring temperatures and erupting blazing fires, freezing temperatures and snow storms in different parts of the globe are indicative that the Earth is now rebounding under the onslaught of global warming.

However, in the context of Globalization, the past 20 years have shown that the world's market-based production system has learnt no lessons. The multiple crises of the past decades ranging from economic, to ecological and food price escalations has shown very effectively though tragically the consequences of a capitalist mode of production.

In the years after the Rio Summit the advanced industrial countries have unheedingly operated to intensify imperialist practices pursuing a free market doctrine at the cost of the poor third world countries. This has been clearly the practice for agricultural production systems. The encroachment of agricultural lands in third world countries for production of agro-fuels as well as other export-oriented agricultural products has severely impacted the poorest segments of the global population, especially the small and landless farmers. The demand of agro-chemical and biotechnology firms to push for the acceptance and production of genetically modified organisms has further resulted in the contamination of highly sensitive food chain and food web systems eroding biodiversity. The result of multiple chemical-based industrial agricultural production methods has of course been constant rise in hunger and poverty; the FAO itself has agreed to the failure in decreasing hunger. The food price escalation in 2008 and then again in 2011 is ample evidence.

In light of failure of development model pushed through globalization, the Rio+20 has immense importance for the well being of the vast humanity and all life on the planet Earth. It gives us space to pause and rethink what the past 20 years have delivered in the context of sustainable development.

However, the thematic concerns of Rio+20 force human society especially in the context of Green Economy :Pathways to Sustainable Development and Poverty Eradication give much reason for urgent critical concern. It is indeed extremely disturbing to see that the context of Green Economy though looking very carefully for solutions based on renewable sustainable methods of production, has chosen the market as the base for delivery of a sustainable development pathway.

If the past 150 years of unsustainable development have shown us one thing clearly, it is that a market-based for profit oriented system of production cannot deliver a sustainable production system. The free market economy is based on a fault line which can only lead to overproduction and hence destruction, depletion and degradation of the Earth's natural resources which can only result in increasing the present economic and social injustices for the poorest segments of society. The constant push for capturing markets will only lead to further exploitation and extraction of resources. There is an underlying message in the Green Economy context that builds on the belief that maintaining status quo in the context of economic development paradigm is acceptable and eventually technology will find a path. Instead of decreasing production, getting away from carbon emitting and trading systems, changing life styles and development paradigms there is a constant thrust in finding technological fixes which would allow capitalist industries to continue their environmentally degrading path.

The immense inequality in distribution of wealth which is the cause and effect of a free market system has not been taken into account. Even after the immensely damaging impacts of globalization, a failure to meet the millennium development goals, further marginalizing vulnerable communities facing discrimination based on class, caste and gender, there is no push to change the direction in the context of Green Economy.

Communities which represent indigenous peoples, women, peasants, fisher folk, urban poor among others demand systems of production which are decentralized, with control over decision making and implementing in their hands. Solutions for various forms of crisis may they be of food, energy or climatic, need to be resolved with the participation of the people, especially those who are most vulnerable at the hands of multiple levels of crisis. Especially for farming communities, the principles of rights based approach and the anti imperialist context enshrined in food sovereignty is of utmost importance. Food sovereignty, a demand of the rural communities across the globe has built on the concept of local self sufficiency and self-reliance. These must be respected and implemented in deliberations arising through the Rio+20 Summit. It needs no emphasis, that Rio+20 cannot bypass the principled agreements of the Earth Summit well articulated in Agenda 21. Policies for both urban and rural development would have to be based on close loop manufacturing systems which would rely on renewable energy production systems owned by local communities in public interest rather than for private corporate controlled enterprises. Science in the service of the people rather than for free market profit reaping systems has to be the basis of technology development for delivering sustainable systems.

The Rio+20 has another important thematic concern and that is of IFSD (Institutional Framework for Sustainable Development). As has been said above, no institutional set up for sustainable development that is not premised on peoples genuine democratic participation is acceptable. The models of decision making and implementation which are hall marks of institutions such as the Bretton Woods, the World Trade Organization, and the bilateral trade agreements built on secrecy, coercion and negation of people's rights are unacceptable.

Institutional framework will have to be inclusive of local communities, building on principles of cooperation rather than competition, collective ownership rather than monopoly control and use of resources based on intergenerational considerations truly leading to a model of sustainable development.

It needs to be emphasized that the institutional framework has to build on critical pillars of social justice, gender justice and ecological justice. No doubt, for the success of such a system, a legal mechanism has to be engaged which could hold violators' accountable, allowing for a just and fair global governance for sustainable development.

## Rural Reconstruction Nepal (RRN)

For Compilation Document

Rural Reconstruction Nepal (RRN) is a Nepali NGO having special consultative status with Economic and Social Council (ECOSOC) of the United Nations. Remaining within the center of Credo of the International Rural Reconstruction Movement, RRN has been working with the poor and disadvantaged rural communities for the last two decades, focusing on the four-fold approach of rural reconstruction - education, health, livelihood and self-government.

Expectation for the outcome of Rio +20

3a.

- We are fast approaching to the deadline of 2015 for accomplishing the Millennium Development Goals set in 2000. But in most Least Developed (including Nepal) and some developing countries it has been found that most targets will not be achieved within the time-frame if the current pace of implementation continues. Therefore, this conference should give priority and be focused on contributing to the MDG targets by enhancing the linkages of socio-economic, political and environmental dimensions of sustainable development. Poverty, hunger, gender inequality, lower degree of women empowerment, insufficient health facilities, inadequate education services, climate change and its disproportionately adverse impacts on the poor and vulnerable, and lack of sustainable livelihoods interventions have remained as characteristics of our part of the world. Overcoming these situations is important achieving sustainable development to improve the status of people living in these countries.

- Enforceable systems and country based as well as international mechanisms be developed and put into action for achieving sustainable development and minimizing the impacts on environment.

- Full commitment from the parties to Rio+20 for effective implementation of the Rio commitments and declarations.

Comment on existing proposals: e.g. a green economy roadmap, framework for action.....

3b.

- Green economy will be the one among other issues during conference. We have some reservations supporting this idea, because we are not very much sure whether the focus on the sustainable development will get diluted due to disproportionate emphasis on green economy by ignoring other dimensions of sustainable development. We do have fear of governments that, focus on green economy will minimize the importance and target of sustainable development. Therefore, without dismantling the idea of sustainable development, the concern of green economy can be addressed and incorporated. By considering green economy as one of the overriding objectives of sustainable development and way out for poverty eradication, the social, economic and environmental consideration must remain balanced.

- It is said that green economy is low carbon, resource efficient and socially inclusive; which encourages public and private investments that reduces carbon emissions and pollution, enhance energy and resource efficiency and prevent the loss of biodiversity and ecosystem services. It is claimed that the Green Economy is the way out of the ongoing economic, climate, energy, water and food crises, by restructuring our economies to encourage and sustain green energy, green growth and green jobs. However, our goal is not only getting the green economy but to a sustainable world for all.

- There are some issues which the concept of green economy may not address adequately. Inequality in incomes, quality of life, and access to resources are some issues which are not the serious concerns under the concept of green economy. Similarly, it has not defined approach to tackle the pollution from existing industries and environmental degradation.

Views on implementation

3c. We suggest to build mechanisms for developing partnership arrangement and other implementation tools under the direct supervision and participatory decision of any specified UN agency. While implementation in countries is concerned, this must adhere to the Accra Agenda for Action and Paris Declaration of the Aid Effectiveness mechanisms. Independent country systems, processes and mechanisms must be respected.

Suggestion on cooperation mechanisms, partnership arrangements or other implementation tools

3d. Collective effort can bring change which will be sustainable in essence. Therefore, we suggest for building mechanisms for implementing tools identified after conference by involving all the actors of the society viz. Civil Society Organizations, Farmers, Indigenous peoples, Community Based Organizations, NGOs, local authorities, youth, private sector and others in each country.

Suggestions on possible sectoral priorities include

4a. Environmental management, employment generation, natural resources management and agricultural development based on the fundamental principles of human rights, democracy and sustainable development.

Green economy in the context of sustainable development and poverty eradication

4b.

We already discussed that the current concept of green economy does not address the status of inequality in incomes. Similarly access to resources is also one of the concerns in poverty eradication. Therefore, we cannot depend solely on green economy by introducing it as an important means for poverty eradication and sustainable development.

Institutional Framework

4c. We strongly believe that including civil society/non-government sector in the process of negotiations and discussions as equal members will further make decisions collective and effective.

Possible themes which can be focused during conference

4d. the focus of the conference may include

- Poverty eradication and the institutional framework for sustainable development

Special focus should be given for poverty eradication with time bound targets.

---

## Rwandan farmers group INGABO

Our view on sustainable development

As known, we also analyze sustainable development according to its three aspects which are social, economic and environmental.

The social aspect

Social aspects on development have to be considered on its real value:

- Firstly we have to know and analyze practices and the knowledge of farmers from the area we want to develop;
- Policies practices we introduce on those farmers have to consider those aspects;
- Researches made have to be participative in aim of considering farmers needs and practices;
- Strategic review, execution and evaluation have to be based on farmer centered approaches and this one have to be implicated at each level;
- New politics, practices and technologies have to be popularized to beneficiaries in their languages and considering the farmers level of comprehension;
- Investments made with states and particular investors must be benefic on local communities;
- Special programs for dropout groups have to be developed;
- To engage youth in current social and economic transformation;
- To fight against all kinds of social inequalities.

The economic aspect

Farmers make the highest proportion of the earth inhabitants. Considering the fact that they feed the planet, contribute on world economy, it is unbelievable to understand that they are the first victims of food insecurity and chronic poverty. According to this, we suppose to:

- Empowering farmers in organizational framework;
- Not to evaluate the agricultural improvement in only terms of production but also in terms of farmer's income indicators;
- Politics makers have to analyze and take care of their decisions' impact on local farmers;
- Considering the impact of agricultural sector on national economies, the budget allocated to this sector have to match with its real value;
- The part of the budget allocated to the agricultural sector which is used in administration have to be reduced so that beneficiaries could benefit from it;
- The international and regional markets mustn't be restricting local ones;
- To develop infrastructures in rural areas where agriculture is done.

The environmental aspect

To have a sustainable development, the earth needs a safe and clean source of raw materials. As the economic growth tends to endanger our ecosystem, it is vital to safeguard our natural resources such as land, water, air, forests, animals and others. So, the human beings have to:

- Control exploitation of natural resources;
- Create a better collaboration with the scientific world and environmental policy makers;
- Implement and use accordingly practices which improve our biodiversity;
- Focussing our forces on researches on new technologies which go with the climate change;
- Clearly explaining environmental issues in easy terms understandable by a small farmer;
- Regularly inform producers on weather conditions to allow them to plan their farming activities accordingly;
- Respect equity and equality principles on natural resources use and benefits;

---

## São Paulo State

São Paulo State's Contribution to Rio+20:

Targets for Energy Sector (Summary)

The 2012 United Nations Conference on Sustainable Development will address three main topics (Poverty Reduction, Green Economy and Governance), in connection to the previous decisions, specially those concerned with the 1992 Rio and the 2002 WSSD.

This proposal from São Paulo State focuses the global Energy sector, revisiting the 2002 Brazilian Initiative for a global target on renewable energy (10% by 2010) and the Millennium Development Goals.

## TARGET 1: MINIMUM LEVELS OF PER CAPITA RESIDENTIAL ELECTRICITY SUPPLY

The first target proposed is

TARGET 1: "All countries should provide a minimum per capita residential electricity of 600 kWh by 2030, through cleaner technologies and technical/financial support from the international community."

This is based on the rationale that

- (i) electricity is a versatile energy carrier, providing basic services that other types cannot achieve - communications, lighting, basic refrigeration etc. Figure 1);
- (ii) this basic prerequisite for development is still out of reach for most of the population in the poorer countries (Figure 2)
- (iii) good quality energy services provide women empowerment and thus control population in an ethically acceptable way (Figure 3).
- (iv) good quality energy services provide women empowerment and thus control population in an ethically acceptable way (Figure 3).
- (v) all countries with a "Low" HDI - Human Development Index (i.e. below 0.5, Figure 4) have a per capita residential electricity consumption below 200 kWh/yr, below a minimum level necessary for development;
- (vi) countries with a per capita residential electricity consumption above 600 kWh/yr have a minimally reasonable HDI;
- (vii) the HDI is still one of the best indicators of development, encompassing income, mortality and education;
- (viii) Access to modern energy services support the Millennium Development Goals (MDGs), specially to around 1.4 billion people without electricity and more 1.3 people utilizing traditional biomass;

Population in countries with low HDI (below 0.5) is around 1.02 billion people. To supply all these people with 600 kWh by 2030 it would be necessary to generate additional 531 TWh, through 242 GW of installed capacity, at a cost of US\$ 53 billion over 18 years. Average annual growth (12%) is ambitious, although acceptable considering the rapid evolution of technologies and access to development strategies.

## TARGET 2: INCREMENTAL SHARE OF RENEWABLES IN THE PRIMARY ENERGY MATRIXES OF ALL COUNTRIES

The other target revisits the Brazilian proposal at the WSSD (a 10% global target on renewables by 2010) and is stated as:

TARGET 2: "All countries should increase the share of renewables in each country's total primary energy supply, taking as a base the levels of year 2008 (ie 13%), in additional 4% (ie 17% of total) by 2030 and in additional 14% (ie 27% of total) by 2050"

The rationale is the following:

- (i) the proposal for a global target on renewables was in practice misunderstood by many delegates at the WSSD: many countries with RE shares above 10% perceived that they should not act; some countries with RE below 10% perceived that would be a huge and uneven task; moreover, the number 10% was considered arbitrary by some;
- (ii) although the proposal for a numeric target could not reach a consensus, the Johannesburg Plan of Implementation (JPOI) has recognized the importance of renewable energy (RE) sources for all of the three pillars of sustainable development (SD);
- (iii) JPOI also recognizes the importance of targets and timetables in the energy sector;
- (iv) Increasing the share of RE in all matrixes also encompasses the implicit idea of Energy Efficiency and Conservation (EE&C), perfectly connected to any objective concerning the concept of Green Economy;
- (v) The recent Intergovernmental Panel on Climate Change Special Report on Renewable Energy (IPCC SRREN), approved under consensus by around 200 countries, recognizes the relationship RE-SD;
- (vi) The IPCC SRREN also provides scenarios (Figure 5) with the relationship between levels of RE and greenhouse gas concentration pathways – a condition to have average global temperatures stabilized at safe levels, addressing one of the major environmental threats mankind is facing today (as well as being in connection with the ultimate objective of the United Nations Framework Convention on Climate Change, proposed at the UNCED 1992);
- (vii) The window of opportunity is closing; delayed climate action is likely to entail additional costs to economy, as shown in reports such as the Stern Review.

According to the IPCC (2011), renewable energy sources (hydro, biomass, solar, wind, ocean, geothermal, marine) represented 12.9% (63.5 EJ) of world primary energy in 2008. The IPCC SRREN, a compilation of existing scientific information, shows ranges of RE supply consistent to carbon dioxide (CO<sub>2</sub>) levels below 400 parts per million (ppm), based on 164 literature scenarios. Such compilation provides the following median levels<sup>2</sup> of (i) 139 EJ/year in 2030 (17% of total primary energy supply) and (ii) year 248 EJ/ in 2050 (27% of total). This requires growths in RE of approximately 3.6%/yr in the period 2008-2030 and 2.9%/yr between 2030 and 2050. Such high rates require integrated policies with energy efficiency and conservation. Countries with low HDI could be exempted from this rule while such condition lasts, but with a commitment towards long-term convergence to this end.

## Conclusion

Such proposals entail the third topic to be discussed at Rio+20: governance. Under the present financial crisis, leveraging the electricity consumption would add to the consumption market more than 1 billion people. An economy driven by renewables and energy efficiency is much likely to be labeled as "Green", in a dynamic and sustainable process.

## ANNEX

Figure 1. Evolution in Energy Services (IEA, 2010a)

## Save the Children

Submission by Save the Children, Plan International and World Vision (for the Children in a Changing Climate coalition) for Zero Draft of the outcomes document of UNCSD Rio+20, 2012

Children in a Changing Climate (CCC) is a coalition of leading child-centred development and humanitarian agencies calling for investment in children as agents of change for resilient, sustainable development. CCC welcomes the dual track of Rio+20 to i) develop a roadmap for the green economy, and ii) develop a new institutional framework for sustainable development. These are two areas that are crucial for building a green, environmentally safe world for current and future generations. This submission outlines the key issues for children that must be considered in the development of a new institutional framework for sustainable development.

### The Role of Children and Young People in Sustainable Development

Children and young people every day demonstrate their important role in achieving and raising awareness about environmental safety and sustainability. The involvement of youth in environment and development decisionmaking and in the implementation of programmes is critical to successful sustainable development the world over.

Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. In order to successfully and equitably achieve this aim, we must put today's children and future generations at the heart of any sustainable development plans.

Girls and boys under the age of 18 make up half the population in some of the world's poorest countries, and over a third of the population of the world as a whole. They are some of the most vulnerable people requiring protection in the face of environmental risks, in particular the immediate and long-term impacts of climate change and disasters. Their children will inherit the world we leave behind.

Through our education, disaster risk reduction and climate change adaptation programmes, we have seen children advancing the principles of sustainability in school, at social clubs, and at home – effecting real change in their communities, and their countries, right up to the global level.

Education for sustainable development (ESD), as part of the formal curriculum as well as informal education activities, ensures that children are well informed about environmental degradation and environmental risks. With this knowledge and suitable encouragement young people are able to contribute fully to policymaking and action to address environment and development issues. ESD should be a central part of a strategy for sustainable development for the 21st century.

In order to secure a sustainable future for the world:

- Education and awareness for sustainable development must be prioritised in planning and implementation for sustainable development.

Education and awareness raising are the foundation of sustainability, safety and resilience-building in development. Through formal and informal education activities, children can raise one another's awareness and that of their duty-bearers: parents, teachers, community leaders, local governments. The principles and options for sustainable development will then be understood, supported and acted upon.

- The active involvement of children and young people in planning, decision-making and implementation of sustainable development activities must be encouraged and supported, financially and technically, by national governments and the international system.

Girls and boys of all ages must be given equitable access to information and opportunities to meaningfully take part in ensuring sustainability in their futures, and for their children. Their unique insight and contribution are crucial, from the local level to the international; and their role as implementers of sustainable development activities is pivotal to the success of those activities.

### It's already happening

Stepping up to the challenge, in 2011 around 2000 children from Africa, Asia and Latin America took part in two global consultations calling for the increased involvement of communities, in particular children, in decision making and action to identify and reduce environmental risks. One of these culminated in the production of the Children's Charter for Disaster Risk Reduction which has been translated into multiple languages and dialects and has been signed up to by more than 200 representatives from civil society and 26 governments to date.

In the Philippines, children made short films to successfully lobby their local government to ban chromite mining, which was poisoning a river and exacerbating floods. In Bihar, India, children across 50 villages played a major role in community risk mapping and leading village taskforces for flood risk reduction, including developing community plans for child protection in emergencies. Child-centred education training builds the skills of local governments to engage with children and introduces teachers to new participatory teaching methods, including for risk reduction lessons. In Laos, children themselves have reported higher school attendance after the teachers began to use new methods in other classes.

Children and young people are increasing their knowledge and stepping up their action for sustainable, resilient development in communities across Asia, Latin America and Africa. With regular, specific and systematic support ESD can continue to generate in this vast and relatively untapped stakeholder group the knowledge, motivation and wherewithal to achieve a sustainable world for the future.

### It's already supported

Multiple international agreements and campaigns have already emphasised, acknowledged, and committed to the importance of children's role in building a sustainable future for the world. The outcome of the Rio+20 meeting should echo and advance Agenda 21: It must continue to advance education for sustainable development, and support children's meaningful participation in decision making which will affect them, and their world – and the future of both.

The outcome document from Rio+20, must put children and future generations at the heart of any new sustainable development initiatives, recognising their centrality to the creation and success of sustainability.

This submission is based upon and supported through several international agreements and campaigns, including

- UNDESA Agenda 21, chapters 3 (poverty), 24 (women), 25 (children and youth), 36 (education and awareness)

- United Nations Convention on the Rights of the Child, articles 3 (best interests of the child), 6 (survival and development), 12 (right to participate), 28 and 29 (right to

education)

- . United Nations Framework Convention on Climate Change, articles 4 (commitments), 6 (education and awareness)
- . Millennium Development Goals, especially 1 (poverty), 2 (primary education), 4 (reduce child mortality), 7 (environmental sustainability)
- . Hyogo Framework for Action, especially priorities 1 (governance), 3 (knowledge and education)
- . SAARC Declaration, article III.B.4 (education, awareness and training for disaster management)
- . Incheon REMAP, article I.E. (child-centred and people-centred education for risk reduction)
- . Beijing Declaration on South-South Cooperation for Child Rights, paragraphs 15-17 (equity) and 18-20 (environment and disaster risk reduction)
- . Children's Charter for Disaster Risk Reduction, signed up to by 200+ individuals including representatives from civil society, the UN and 26 national Governments
- . UNISDR Step Up! for Disaster Risk Reduction campaign, supported by UN Secretary General, Ban Ki Moon

Children's Charter

an action plan for disaster risk reduction

for children by children

The Children's Charter for Disaster Risk Reduction (DRR) has been developed through consultations with more than 600 children in 21 countries in Africa, Asia and Latin America.

Children were asked about the impacts of disasters on their lives, the networks that exist in their communities to tackle disasters and their priorities for DRR going forward.

The following abbreviated version of the charter presents five points selected based on the priorities identified by children themselves, grouped together according to the most common themes.

The aim of this charter is to raise awareness of the need for a child - centred approach to DRR and for stronger commitment from governments, donors and agencies to take appropriate steps to protect children and utilise their energy and knowledge to engage in DRR and climate change adaptation.

1.) Schools must be safe and education must not be interrupted

"I felt unhappy when I saw the school destroyed by the storm. I did not go to school because the school was destroyed. It happened at night and in the morning my friend and I went to school and found it had been destroyed."

child from Laos

2.) Child protection must be a priority before, during and after a disaster

"We do not feel protected by anyone in our community" child from Mozambique. In India, children suggested training in life - skills which they feel would "enable them to protect themselves from risks and troubles" and that they be provided special care when they are traumatised by disasters.

3.) Children have the right to participate and to access the information they need

"I am part of the Emergency Committee that has been created in the community. Our goal is to reduce the disaster risk by implementing the principles of the Community Emergency Plan." child from

Dominican Republic.

4.) Community infrastructure must be safe, and relief and reconstruction must help reduce future risk.

"Build bridges because every year children miss school in the rainy season when they have to cross gullies, rivers and water channels huge enough to drown them."

child from Lesotho

5.) Disaster Risk Reduction must reach the most vulnerable

"In my area, there were three children about - 5 years old. Once they went on the river dyke to avoid the flood water which could make them wet on the street, but they slipped and fell in the river and were drowned because they could not swim."

child from Philippines

Children's Charter Pledge

By signing up to the pledge below, you can show your support to make this important Children's Charter a reality to improve the situation for children around the world.

"I/We pledge to prioritise and include children in DRR programming. I/We will report on progress at the Global Platform in 2013."

For more information and to sign up to the Children's Charter please visit our website [www.childreninachangingclimate.org](http://www.childreninachangingclimate.org)

1.) Schools must be safe and education must not be interrupted

Education was the most commonly occurring theme and prioritised by all children during the consultations. Children want access to information and training in DRR, they want DRR and climate change to be included in the curriculum and for their schools to be safe and built on higher ground. " We want to learn about DRR through outdoor activities; you can find truth from practice" ( child from China ). They also want their learning materials to be protected and for safe play areas to be identified before a disaster so they can continue as normal a life as possible. If safe play areas are not identified before a disaster, children report that their movement is restricted and they end up either staying in their homes or playing in unsafe environments such as rubbish dumps or flood waters.

2.) Child protection must be a priority before, during and after a disaster

The consultations raised a number of child protection issues which deeply affect children's security and sense of well - being. Children want protection from harmful behaviours and practices and state that after a disaster, especially if they are forced to move away from their homes as a result, they feel insecure, at risk and unsafe. " We left our houses to come here when the floods happened. We live in tents; we do not feel safe here" ( child from Mozambique ). Children also report increased child

- trafficking, child labour and dropping out of school as a result of disasters. Clearly, children's psycho

- social well

- being as well as their physical security is being routinely affected by disasters, and the 'normal channels' are insufficient to protect children.

3.) Children have the right to participate and to access the information they need

Children are ready and willing to participate in measures to tackle disaster risks and climate change – they want to help disseminate key messages and protect their communities as well as themselves.

Whilst some children acknowledge that measures are been taken to disseminate awareness and information through the radio, village gatherings and school visits, the majority of children feel completely cut off from any information regarding disasters. Children expect and are asking for help to raise their awareness and level of preparedness. Rather than children feeling that "adults do not listen to what we say" ( child from Mozambique ) children need to be given the opportunity as citizens in their own right to contribute and engage in DRR activities within their communities.

4.) Community infrastructure must be safe, and relief and reconstruction must help reduce future risk

Children are sensitive to the continual erosion of development in their communities. For instance, to enable continued access to health care and thereby to reduce illness during a disaster, children highlighted the importance of safe hospitals and health centres. They also identified the need to maintain access through improved roads and bridges as when these are damaged and not repaired, children are unable to travel safely to school and are often forced to stay at home. Children also report that in times of disaster, a range of services are cut off and reconstruction efforts are often insufficient in bringing them back to a reasonable standard. Children have a strong awareness of the need to clean up and care for the environment and the way in which unsafe and dirty environments are impacting them. Finally, they understand safeguarding livelihoods will help them remain children - "The dam water can be used for irrigation and this will help us get food and learn better." ( child from Kenya )

5.) Disaster Risk Reduction must reach the most vulnerable people

Children recognise that people are affected differently by disasters. They felt that some people are more vulnerable than others and require special attention; yet such groups are often ignored and isolated. The children identified a range of factors including disability, age, gender, social status and proximity (specifically communities living in remote locations) as determining levels of inclusion.

" To me, there is a big difference because many disabled children are not treated properly by providing them the necessary information since they are not being taken into account due to the fact of being disabled." ( child from the Philippines ). The children also felt that orphans and young children below the age of five needed particular attention. 1. The consultations were conducted: by Save the Children in Cambodia, China, Dominican Republic, East Timor, Ethiopia, India, Laos, Mozambique, Philippines and Vanuatu; by World Vision in Bangladesh, Brazil, Ethiopia, Ghana, Kenya, Lebanon, Lesotho, Mexico, Nicaragua, Philippines, Tanzania and Vietnam; and by Plan in Indonesia

## Seas At Risk

UNCSD Rio+20

United Nations Conference on Sustainable Development

Rio de Janeiro, 4-6th June 2012

Seas At Risk

Contribution to the Rio+20 Zero Draft

Seas At Risk is a Brussels-based independent association of European environmental organisations working to protect the marine environment and restore it to health. It is concerned with the full range of marine environmental issues, but at present its resources are focussed on the promotion of climate-friendly low impact fisheries, reducing the climate impact of the shipping industry, marine litter, offshore oil & gas drilling, and a number of more general marine-related EU policy processes. Seas At Risk progresses its objectives by representing its members at international political and regulatory meetings of government and by raising awareness amongst decision makers of the importance of marine issues. In this role Seas At Risk is active in a number of international bodies including the UNFCCC, the International Maritime Organisation, the North East Atlantic Fisheries Commission, and the major EU institutions. It hopes to participate in Rio+20.

As an organisation with a focus on marine and oceans issues our contribution here will be restricted to these areas, although we see the perilous state of the oceans, and the failings in oceans governance as symptomatic and illustrative of the wider environmental and developmental problems that must be addressed at Rio+20.

Stopping the Collapse of Oceanic Systems A theme for Rio+20

In the past, including at previous UNCSDs, oceans conservation has tended to play second fiddle to terrestrial environmental concerns. The threats posed to the oceans have always been serious, but other issues were perhaps seen as more pressing. This we believe is now changing, and Seas At Risk agrees with UNEP's identification of the "potential collapse of oceanic systems" as a key emerging issue for Rio+20. The "perfect storm" of overfishing, habitat destruction, pollution and ocean acidification should on its own place oceans issues at the very top of the Rio+20 agenda, but add to this the significance of the green economy and governance issues to solving these problems and you have a substantial argument for making oceans a key overarching theme of the Rio+20 conference.

Under this theme, Seas At Risk believes the following issues should be addressed at Rio+20.

Overfishing & oceans governance

The protein derived from fish, crustaceans and molluscs accounts for around 15% of the animal protein intake of the human population. Seafood is an essential major world-wide protein source, yet around 50% of fish stocks are fully depleted and another 25% are either overexploited or depleted. The further collapse of key fish stocks

would have devastating effects not just on the environment but on the nutrition, development and economics of many countries around the world, including some of the most vulnerable.

More generally, the biodiversity and productivity of the world's oceans are diminishing at an increasing and alarming rate. Globally some 90% of large fish species, like sharks, tuna and swordfish, have disappeared in the last few decades. Once abundant species such as Atlantic cod and the common skate are now considered globally threatened. Many marine habitats, ranging from the species-rich rocky reefs of Europe and coral reefs of the tropics, to the fragile creatures and ecosystems found in the deep sea, have already been fundamentally altered by destructive fishing techniques and other anthropogenic activities. And international commitments to-date have resulted in only around 1.5% of the world's oceans being nominally protected as "Marine Protected Areas" and less than 0.5% having full protection as "Marine Reserves". Many observers believe that only by fully protecting a third of our oceans will marine biodiversity and fish stocks have a chance of recovery.

The deep seas are a particular concern. Recognised as regions of extreme vulnerability to human impacts, the deep seas are subject to numerous harmful practices which threaten long-term sustainability. High seas bottom trawling in particular not only directly removes vulnerable longlived species from the deep sea, but also damages sensitive habitats such as deep sea coral. Without a healthy marine environment there cannot be healthy fish stocks and without healthy fish stocks the fisheries and the communities they support have no future. In respect of overfishing and oceans governance Seas At Risk would like to see a Rio+20 agreement that includes:

1. A global plan of action to ensure that all fisheries are exploited sustainably, and in compliance with and not exceeding scientific advice.
2. An agreement to upgrade oceans governance and start a negotiating process towards a new implementing agreement under the UN Convention on the Law of the Sea for the protection and conservation of high seas biodiversity and the management of human activity in areas beyond national jurisdiction. This to include provisions on monitoring, the use of environmental assessment, and implementation of the precautionary principle and ecosystem-based approach in decision-making.
3. A global mechanism for the establishment of an extensive and representative system of Marine Protected Areas in the high seas including no-take zones. A target of full protection for at least 30% of the world's seas and oceans should be set.

#### Pollution and marine litter

Seas At Risk and its members are concerned about all forms of marine pollution but believe that marine litter and plastic marine litter in particular poses a huge, growing and previously underestimated problem.

Marine debris is a widespread pollution problem with plastics making up approximately threequarters of all litter floating in the ocean. During the 25th International Coastal Clean-up in 2010 some 615,407 volunteers from 114 countries picked up nearly 4,000 tonnes of litter. Over three quarters of this debris was plastic. Scientists estimate there to be 250 billion pieces floating in the Mediterranean Sea alone. Almost all North Sea fulmars, a bird that exclusively feeds in the marine environment, are found with plastics in their stomachs. Beaches in the North East Atlantic have on average 712 pieces of plastic per 100m, and plastic bags make up around 10% of all marine litter. Huge floating oceanic "garbage patches" have been found in both the Pacific and Atlantic Oceans.

The marine environment has become engulfed in plastics and they are of special environmental concern as they may never completely disappear from the environment, and could persist for many hundreds if not thousands of years. Larger items will eventually break down into small plastic particles and microscopic dust, which can be consumed by filter-feeding animals such as barnacles. Toxic pollutants can be attracted onto the surface of plastic pieces so may pose a previously unrecognised threat to marine animals once ingested. Ultimately these pollutants may then be passed up the food chain to fish and to human consumers. Items of fishing litter which are also composed of plastic are also of particular concern as these are the items most likely to entangle wildlife. Marine litter affects multiple areas of the marine environment across the globe and the underlying causes are multi-dimensional, multi-sectoral and multi-geographical.

Although the problem has recently received some much needed publicity, action to solve it has been slow and so far ineffective. Both of the central themes of the Rio+20 conference – governance and the green economy - have very clear links to tackling this serious problem.

In respect of marine litter Seas At Risk would like to see a Rio+20 agreement that includes:

1. An international Action Plan and targets for tackling the rising tide of marine litter. This is necessary in itself and to compliment and encourage more bottom-up, national and regional strategies. Marine litter is an excellent example of the kind of pressing global marine issue that would benefit from enhanced international governance and stronger implementation, compliance and enforcement mechanisms. The United Nations Environment Programme upgraded to the status of a UN "specialised agency" could perform this role.
2. An international commitment to use green economic instruments to favour and incentivise the use of long life, fully biodegradable and sustainably sourced goods and packaging. Such an initiative would fit well with the green economy agenda, and would protect our oceans from the flood of disposable and single use goods that are ending up in the marine environment. It would also benefit the terrestrial environment, and have far reaching positive resource, economic and social impacts.

#### Ocean acidification & climate change

Ocean acidification, caused when CO2 dissolves in seawater, has been called the "evil twin" of climate change and while much less well known or understood, its implications for the marine environment are equally if not more profound and long-lasting.

Corals are in the frontline of rising marine pH levels but the impact will reach far beyond the reefs to associated marine life and the social and economic activities that depend on them. Impacts on shell forming organisms are also already being felt and this holds the potential to undermine whole marine ecosystems. If key elements in a food web are removed as a result of the inability of organisms to build shells then the food web itself can collapse with unimaginable consequences for the world's oceans and those that depend on them for their livelihood.

The only way to tackle ocean acidification is to reduce CO2 emissions. All sectors have to play a part in this, but Seas At Risk believes that a special responsibility lies with the marine industries whose future is so intertwined with a healthy marine environment.

In respect of ocean acidification and climate change Seas At Risk would like to see a Rio+20 agreement that includes:

1. A coordinated international push to raise awareness and understanding about the threat of ocean acidification.
2. As part of the push for a green economy, an international agreement to eliminate harmful subsidies that have the effect of keeping marine fuel prices lower than they would otherwise be. At present these work against fuel efficiencies of the shipping sector and allow harmful and fuel-intensive fishing practices that would otherwise be uneconomic.
3. An international commitment to a package of measures to reduce CO2 emissions from the shipping sector including market-based measures, incentives for renewable technical developments, and speed limits. The latter is especially important as emissions are predicted to double or triple by 2050 and speed limits are the only option available that can result in fast deep cuts in emissions.

4. A commitment to cease the search for new marine oil & gas reserves, accepting that the CO<sub>2</sub> emissions that will result are unsustainable and that drilling in deep and otherwise hazardous environments will always pose unacceptable Deep Water Horizon-style risks to the marine environment.

## SEED Initiative

RIO+20 COMPILATION DOCUMENT: SEED SUBMISSION

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document? The outcome document should:

<sup>84</sup> acknowledge the contribution of grassroots social and environmental entrepreneurs in delivering the green economy

<sup>84</sup> include commitments from governments, multilateral including financial institutions to put into place policies, incentives and programmes to facilitate strong growth of social green enterprises and to encourage 'conventional' small and micro enterprises to move towards a triple bottom line

<sup>84</sup> provide for the development of targets and indicators, including on the growth of social and environmental entrepreneurship at the local level, and an ongoing process for evaluation of progress.

b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

i) On a green economy roadmap: Such a roadmap should be developed at the international level and then mirrored in national and regional strategies and plans. It would benefit from an explicit inclusion of the role of social and environmental SMMEs, and of the different institutions that could support them.; The roadmap also needs targets, milestones and indicators; and a mechanism for reporting.

ii) On Sustainable Development Goals: Development is crucially dependent on access by the poor to affordable energy, both in rural and urban environments, and on food security through strengthening smallholder farmers, assisting them to implement sustainable agriculture and providing them with access to finance, to appropriate technology, and to markets. SMMEs have a crucial role to play in delivering both of these, and SD goals should include targets in these areas and ways of measuring progress towards the goals.

iii) On a revitalized global partnership: Governments and stakeholder institutions at the local level will need to take action to realise many elements of the green economy. However, a revitalised global partnership between the relevant bodies of the UN, governments and major groups will be needed to steer the process and monitor progress towards the various targets and goals. In particular, business should be a major player in the partnership, given that without its full participation, the green economy cannot become a reality. National business associations and institutions such as the UN Global Compact and World Business Council on Sustainable Development should reach out to local entrepreneurs to ensure their concerns are taken up.

c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

Action will be required by all – the UN and financial institutions, governments, private sector, academia, civil society and community groups - if the green economy is to become reality. Implementation needs to be from the grassroots upwards, as well as through major policy levers downwards and needs to be coherent. Therefore actors at local, national, regional and international levels need to be integrated into the development of implementation plans.

d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Cooperation mechanisms and partnership arrangements that would help to accelerate the transition to the green economy are needed with regard to:

i) SMMEs: In order to ensure that the contribution of SMMEs to the green economy is stimulated and measured, we propose that:

<sup>84</sup> government departments responsible for small business development become more directly involved in green economy;

<sup>84</sup> partnership arrangements with institutions doing global research on SMMEs (eg Global Entrepreneurship Monitor; OECD; etc.) take on the challenge of economic analysis of the contribution of social and environmental SMMEs;

<sup>84</sup> the experience of institutions working on the reporting of social and environmental impacts of SMMEs is reviewed with a view to developing a common framework;

<sup>84</sup> government departments work in partnership with business associations to put in place simple reporting mechanisms that could provide opportunities to SMMEs for enhancing their profiles and attracting finance; and that

<sup>84</sup> these actions be taken over the next two years.

ii) Implementation of Rio+20 agreements:

SEED was registered as a Type II partnership at WSSD. Its successes since then in stimulating and supporting start-up social and environmental entrepreneurs in developing countries have been in no small part due to the partnership between UNEP, UNDP and IUCN, and supporting governments and institutions (Germany, India, the Netherlands, Spain, South Africa, the UK and the USA, Conservation International, and Hisense). At the same time, it has championed those start-ups that have themselves started their activities in a partnership structure. This often involves two or more of a national or international NGO, a community-based organisation, a local or national government body, a company, and a research institution. Again, the use of partnership, coupled with careful partnership management, is a critical success factor for the establishment and scale up of such enterprises.

On the basis of this experience, partnerships, particularly between different types of stakeholders, should feature as one of the implementation tools for Rio+20. While the

post-WSSD partnership experience has been mixed for some, it has been an important implementation modality for SEED, and SEED would recommend that an emphasis on effectiveness of partnerships be continued in the Rio+20 document. Where possible, the output document should highlight the potential role of existing partnerships in taking forward the Rio+20 outcomes. All current and future partnership arrangements should be time bound and measurable, so that progress can be assessed and gaps in implementation more readily identified.

Partnerships need to change over time to reflect the changing circumstances and needs of any initiative. They may complete their objective and then be wound up, or it may be necessary to discontinue them because they are not working as partnerships or cannot successfully deliver their original objectives. Good discipline is needed in dealing with each of these circumstances. It should not be seen as a sign of failure to wind up a collaboration, but rather a willingness to adapt, change and find new ways to solve problems.

Specific Elements:

Green economy in the context of sustainable development and poverty eradication How the green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication, and its potential added value The green economy is not just about new sectors of economic opportunity; it is also about the need (and opportunity) to build social and environmental dimensions into existing sectors and jobs. Since the global economy is driven very largely by small, micro- and medium-sized enterprises<sup>1</sup>, putting in place incentives for them to move towards a triple bottom line and introducing mechanisms to stimulate and facilitate the emergence of enterprises that integrate social, economic and environmental benefits into their business model should be a central plank of efforts to transition to the green economy. The challenge is enormous and will require efforts by all stakeholders, at all levels. But success would certainly lead to sustainable alleviation of poverty, improved community resilience, to better management of natural resources, and to climate change mitigation and adaptation.

Experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities The SEED Initiative was founded by UNEP, UNDP and IUCN at the 2002 World Summit on Sustainable Development to further social and environmental entrepreneurship, alleviate poverty and promote the sound management of natural resources; it is hosted by UNEP-World Conservation Monitoring Centre.

Through the SEED Awards scheme, SEED has since 2005 assisted over 70 innovative local social and environmental entrepreneurs working in partnership in developing countries to establish and scale-up. The Winners have been rewarded with a package of tailored capacity building, networking and profiling nationally and internationally.

Information from over 1000 applicants and Winners has been included in a series of studies to reveal the barriers and enabling factors. The main findings of the baseline<sup>2</sup> were that small social and environmental enterprises:

- <sup>14</sup> have social targets relating to job and revenue creation in communities to alleviate poverty
- <sup>15</sup> focus on strengthening the social structure and resilience of communities
- <sup>16</sup> invest a significant amount into training in local communities and that they need assistance with:
  - <sup>17</sup> skills to adopt more business-oriented approaches for managing and financing their work
  - <sup>18</sup> access to technology
  - <sup>19</sup> partnership management
  - <sup>20</sup> setting measurable social, environmental and business targets, and monitoring and evaluation against those targets.

SEED hosted a high level Symposium on the Green Economy: Accelerating the Transition, in South Africa in April 2011, addressed by the Deputy Minister for Economic Development and attended by a wide range of stakeholders from government, the private sector, academia, and local entrepreneurs and communities. The aim was to explore linkages between policy frameworks and local entrepreneurs. Relevant findings<sup>3</sup> were:

- <sup>21</sup> Partnerships across institutions, sectors and states are essential to achieve the necessary policy coherence and implementation on the ground. In most countries, there is a need to strengthen capacity for policy development at the environment and economy nexus both within and between states and institutions. Policy coherence at the national level is an important enabling factor for the success of local enterprises.
- <sup>22</sup> The green economy should be people-centred, aimed at poverty alleviation and with a pro poor approach, supported by research and aid coordination. Indicators for the green economy should be sensitive to measuring pro poor outcomes.
- <sup>23</sup> Innovative approaches and incentives are needed to build capacities that meet the immediate needs of green economy entrepreneurs.
- <sup>24</sup> Innovation and investment are essential components for moving to the green economy. Research into new processes, the development of intellectual property and the use of IP as an asset to attract investment need to be part of the enabling policy environment. The value chain of research, IP development, entrepreneurship and investment is essential for the implementation of the green economy.
- <sup>25</sup> The green economy can and should have its roots at the local level, in small, micro and medium-sized socio-environmental enterprises. Governments play a central role in setting policy, creating skills development programmes, supporting research, addressing policy coherence and building institutional relationships. Added to this is their responsibility for policies, regulations and programmes for support to the SMME sector so that social and environmental enterprises can thrive and build the green economy from the ground up.

Together these reports provide evidence of the urgent need for access to technologies, skills development and training opportunities for both entrepreneurs and local communities. Without these, there will not be the capacities on the ground to absorb the financial flows and the transition to a Green Economy will not take place as rapidly as it might. While there is no shortage of good and innovative ideas, translating and consolidating these into solutions and opportunities at the local level requires solid financial and business skills and discipline which are often in short supply. Without these, there will not be the capacity at local level effectively to absorb monetary flows from investments in the green economy. At the same time, direct action to provide incentives to drive the green economy at the local level is an imperative.

Possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication

The range of sectors contained within the green economy and of stakeholders who need to be involved in its implementation in order to deliver poverty alleviation and the sound management of natural resources demands action at all levels. Building on the points made above, the outcome document should spell out that governments and other stakeholders need to:

- <sup>26</sup> introduce financial assistance and incentives, enabling and coherent regulatory frameworks, access to technology, and related capacity building measures, into national strategies and plans to secure the rapid growth of social and environmental small, micro and medium-sized enterprises that will drive the green economy from the ground up.

 develop indicators and reporting mechanisms for SMEs to demonstrate pro-poor and environmentally beneficial outcomes as a result of their activities

 stimulate and support green social innovation particularly in sustainable agriculture, access to low-carbon energy and climate change adaptation and mitigation at the local level, including through entrepreneurship and capacity building, in order to address local problems and poverty and build economic and social resilience. Institutions which work across local, national and international levels can play a major role in bringing this about.

October 2011

## Ship and Ocean Foundation

Proposal for Rio+20

Ocean Policy Research Foundation

<Proposal background>

The United Nations Convention on the Law of the Sea (UNCLOS), adopted in 1982, came into effect in 1994; and in 1992, at the United Nations Conference on Environment and Development (UNCED), the Sustainable Development Principle and the Plan of Action Agenda 21 necessary for its implementation was adopted. These made clear an international policy framework for comprehensive management and sustainable development of the ocean, which covers 70% of the earth's surface. Also, at the 2002 World Summit on Sustainable Development (WSSD), UNCLOS and Chapter 17 of Agenda 21 were recognized as fundamental documents concerning the ocean, and concrete goals and time schedules for their related measures were agreed upon. It is a fact that over the past 20 years many places around the world have added to this momentum and made great progress in environmental protection and conservation of the ocean and coastal zones and in sustainable development. UNCED and WSSD, along with the coming into effect of UNCLOS, have thus had tremendous impacts. However, there are many problems that remain unsolved concerning the ocean, existing problems that have worsened over time, and unexpected ones that continue to arise. In order for international society to formulate appropriate responses to the problems of comprehensive ocean management and sustainable development, including issues concerning jurisdictional water delimitation, conservation of the marine environment, appropriate fisheries management, securing of maritime transport safety, and adaptation to global warming, each country must address the closely interrelated problems of the ocean and of maritime affairs, and, under the auspices of UNCLOS and Agenda 21, respond to them in a comprehensive fashion.

The Ocean Policy Research Foundation is an NGO in Special Consultative Status with ECOSOC and makes "Promoting Co-existence between Man and the Ocean" its guiding philosophy. Thus, recognizing the importance of sustainable development and comprehensive management of the ocean, as put forth by UNCLOS and Agenda 21, it has adopted an integrated approach in carrying out surveys, research, and implementation on a variety of ocean problems facing mankind. Of the seven programme areas in Chapter 17 of Agenda 21, we have placed special emphasis on "Integrated management and sustainable development of coastal and marine areas, including exclusive economic zones," "Marine environmental protection," "Strengthening international, including regional cooperation and coordination," and "Sustainable development of small islands," carrying out a variety of activities in our capacity as an NGO. We view Rio+20 as an extremely important conference for discussing an Action Plan for the next ten years. Thus, we call for "comprehensive ocean management" and "sustainable ocean development" to be considered main pillars of the Agenda and included in concrete terms in the Programme of Action. To this end, we offer the following proposal:

<Proposal 1>

In order to secure the survival of the human race in the face of an ever-expanding population, it is indispensable that the ocean and coastal zones are effectively developed and used while conserving them under the concepts of comprehensive ocean management and sustainable ocean development. As humanity sets its Programme of Action for the next ten years, we must remain keenly aware that "the problems of ocean space are closely interrelated and need to be considered as a whole," as stated in the foreword to UNCLOS. To achieve this, OPRF would like to express its strong desire that an independent chapter be devoted to the Ocean Agenda, ensuring that the importance of the oceans are clearly understood by international society. If a separate chapter is not possible, we strongly call for the Ocean Agenda to be presented in such a way as to be clearly understood in its entirety by governments and the general public.

<Proposal 2>

We propose that the Ocean Agenda referred to above include the following five measures:

1) promotion of comprehensive ocean policy 2) management of islands and their surrounding ocean areas 3) sustainable development of maritime industries 4) education of the public and 5) responses to marine disasters. The measures are discussed in detail below:

1) Promotion of Comprehensive Ocean Policy

Comprehensive management of the vast ocean that covers 70% of the planet requires that all countries share in a common legal and international framework. Each country needs therefore to establish an ocean policy system at the national level, coordinate its basic legal framework on the ocean, and make changes in its administrative organization necessary to implement ocean policy (e.g., a government-wide coordinating body and/or designation of a lead agency), thus allowing a comprehensive approach to ocean problems. We believe such a comprehensive approach to be extremely effective, as can be seen in the experience of those countries that have already made much progress in these initiatives; unfortunately, however, it is still not yet the universal practice. In Japan, a framework for comprehensively addressing ocean problems was created in 2007 with the passing of the Basic Act on Ocean Policy, which set out the basic philosophy, 12 basic measures requiring comprehensive initiatives, and the creation of an organization to comprehensively promote ocean policy. In order to manage the world's oceans both comprehensively and appropriately, we believe it necessary that in future each country establish at the national level such a system for implementing comprehensive ocean policy. To accomplish this, the sharing of knowledge and experience concerning each country's ocean policy is needed, along with the promoting of technological cooperation for developing countries as they set out to adopt comprehensive ocean policies.

→Specific Elements: c. Institutional framework for sustainable development

2) Management of Islands and Their Surrounding Ocean Areas

Today, islands are faced with various conservation and management challenges due to local environmental problems, global climate change and variability, and concerns about the submersion of islands caused by sea level rise. In order to respond to the various issues in the three areas of 1) Conservation and Management of Islands 2) Management of the Surrounding Ocean Areas and 3) Response to Climate Change and Variability, there is a need to acknowledge islands and their surrounding ocean areas as unified areas and implement sustainable development of island societies, as they carry out appropriate development, exploitation and conservation of the ocean through

cooperation and collaboration between island States and the international community. In other words, regarding the Conservation and Management of Islands, there is a need to promote measures for developing island management strategies, improving the security and resilience of island societies, implementing waste management strategies, and developing renewable energy. For Management of the Surrounding Ocean Areas, there is a need to promote the establishment of baselines and maritime limits, implementation of practical fisheries management policy, the maintenance and securing of shipping services, exploitation of marine minerals in accordance with preservation of the ocean environment, and conservation and sustainable use of the marine environment and marine biodiversity. As for responses by island societies to Climate Change and Variability, adaptive measures must be promoted and relevant international law issues discussed.

Island States are being called upon to develop and adopt integrated policies and plans for oceans, coasts, and islands based on their respective social and cultural backgrounds, and then establish implementing institutions and organizations to address these issues. International society also has a responsibility to support the development and adoption of the policies and plans that result from island States' initiatives. (For more details, see the policy proposal "For the Better Conservation and Management of Islands and Their Surrounding Ocean Areas" in Appendix 1)

→Specific Elements: d. Any proposals for refinement of the two themes

### 3) Sustainable Development of Maritime Industries

For the sustainable growth and development of the global economy, increased economic activity among countries, including developing States, is indispensable. Maritime industries center on maritime transport, which provides the fundamental infrastructure for these trading activities and is thus an important industry that must continue to develop. At the same time, increases in maritime transport will require more ships, resulting in congested seaways and greater risk to the global environment. Maritime industries must therefore rapidly transform themselves to become clean industries of low-carbon and reduced environmental impact, though to do so new technologies and international guidelines will have to be developed through coordination and cooperation among international organizations, national governments, businesses, and research institutes. While regulations for emissions from ships, better training for seafarers, and other concrete initiatives are already underway, an industry-wide carbon footprint reduction initiative that takes into consideration the acceptable use of energy and emissions is urgently needed. Thought should be given to applying these initiatives to government ships as well as to commercial ones.

Also, from the standpoint of security, international society must stand firm in its response to the recent frequent occurrences of piracy and armed robbery, but there is also a need to create an anti-piracy and judicial framework to eliminate these threats. When doing so, there is also a need for clear guidelines on issues where States may have differing opinions, such as regarding what obligations foreign vessels, including government ships, have when operating in ocean areas under the sovereign and jurisdictional right of another State and what rules are necessary in these areas. (For more details, see the policy proposal "Guidelines for Navigation and Overflight in the Exclusive Economic Zone" in Appendix 2)

→Specific Elements: d. Any proposals for refinement of the two themes

### 4) Education of the Public

Effective response to the closely interrelated problems of the ocean requires action not only at the national and governmental levels but by all the citizens of a State, thus making the increase of understanding and knowledge on the part of each citizen a necessity.

As put forth in Agenda 21, Chapter 36, education of the general public should be carried out both formally and informally, though formal schooling is potentially a highly effective means of impressing upon tomorrow's leaders the importance of the ocean. This need to expand ocean education in formal curriculums should thus be recognized and promoted in each country's ocean policy. However, care must be taken that implementation of this integration of ocean education into each country's educational system proceed in harmony with existing educational policies, and its expansion calls for cross-sectional coordination within relevant ministries and agencies. In Japan, as Article 28 of the Basic Act on Ocean Policy advocates the "Enhancement of Citizens' Understanding of the Oceans" and the Basic Plan on Ocean Policy includes measures on the "Enhancement of Citizen's Understanding of the Sea and Fostering of Human Resources," these goals now have a firm place in Japan's ocean policy. To implement them however, requires coordination with the education administration, which is now underway in cooperative efforts among universities, research institutes, industry, NGOs, and the private sector.

Also, as ocean problems imply a variety of subject matter to be addressed by many disciplines, an interdisciplinary approach to ocean education must be developed that is not limited to the natural sciences but includes the humanities and social sciences, and promotes research from an educational perspective. Towards that end, there is an urgent need to create a platform on which countries can share their advanced educational practices and knowledge.

→Specific Elements: d. Any proposals for refinement of the two themes

### 5) Responses to Marine Disasters

Upon the recent Great Tohoku Earthquake and Tsunami, tremendous damage was incurred due to the tsunami, in spite of all past efforts invested in scientific research and disaster preparedness. We would like here to sincerely thank the many people around the world for their generous support for the relief efforts. By way of gratitude, we would also like to share with the international community what we have learned from our experience, in the hopes that such damage might be reduced in future. As population density is high along the coasts and a great variety of human activities takes place there, and as the coastal zone and ocean areas are home to complex yet delicate ecosystems, when a natural disaster occurs it can have enormous effects on the society, economy, and environment of the area.

Although Agenda 21 and the WSSD Plan of Implementation confirmed the need for systematic natural disaster precautions in order to fully realize sustainable development, in many areas such as coastal zones and ocean areas that would most benefit from systematic disaster prevention its implementation is still insufficient. We should follow the wisdom of science in adopting precaution as a pre-condition and, with the ocean in mind, reconsider disaster prevention systems to increase the resilience of coastal countries in the face of natural disasters.

From our recent experience, Japan learned that even if severe damage is incurred the utmost priority must be given to preventing the loss of human life, and that a combination of "hard" and "soft" measures for "disaster reduction" is necessary. We are now setting policies for comprehensive town reconstruction plans oriented to "disaster reduction," such as relocation of towns to higher ground or more effective evacuation routes and facilities if relocation is not feasible. It is also necessary to create early tsunami detection, prediction, and warning systems and view activities on land and ocean areas as an interdependent continuum in planning for town reconstruction. Along with these, we propose the sharing and examination, within international frameworks, of the knowledge on tsunamis accumulated by individual countries and international society at large for creation, improvement and expansion of disaster action plans and guidelines.

## Sobrevivencia and Global Forest Coalition (GFC)

about the Diversion of Existing Forest Conservation and Development Funding to REDD+

We the undersigned NGOs and Indigenous Peoples' Organizations (IPOs) want to express our profound concern about the way funds for forest conservation and restoration, and poverty eradication, are being misdirected toward REDD+ projects and policy processes (ostensibly to reduce emissions from deforestation and forest degradation and to enhance forest carbon stocks). Our organizations are working to halt the continued loss of the world's forests, and to address the impacts this forest loss has on the rights and needs of forest-dependent peoples and on the climate. As such, it is our considered opinion that REDD+ as a mechanism suffers from a large number of inherent risks and problems which cannot be remedied

1) REDD+-type projects are already having severe negative impacts on the environment and on economically and politically marginalized groups in society, particularly Indigenous Peoples, small farmers, other forest dependent communities, and women.<sup>1</sup> Most of the world's remaining forests are found in areas that are relatively unattractive for industrial agriculture, cattle ranching or other land uses and are inhabited by Indigenous Peoples, small peasant communities and other groups. Many of these groups have insecure title over their land, yet due to their social, economic and cultural circumstances, the resources found in forests play a major role in sustaining their livelihoods. A sudden increase in the economic value of forest land due to the introduction of performance payments for forest conservation will definitely lead to an increased risk of conflict over land between these communities and more economically and politically influential groups that see an opportunity to profit from these payments. For this reason, increased conflicts over land, elite resource capture, forced displacements, involuntary resettlements and human rights violations are inherent outcomes to REDD+ as a forest conservation approach.

2) Performance-based payments for forest carbon storage address only one presumed driver of forest loss: the lack of proper economic valuation of the role of forest carbon storage in overall carbon sequestration. This approach fails to address other direct and indirect drivers of forest loss. Such drivers include lack of recognition of the land rights of Indigenous Peoples and the rights and role of customary caretakers of forest areas; overconsumption of and trade in forest products and products that directly or indirectly impact on forests; and perverse incentives such as subsidies for export crops and monoculture tree plantations. Other important drivers that are ignored by REDD+ include mineral, oil, gas or coal exploration and extraction activities, shrimp farming and large-scale infrastructure projects such as hydroelectric dams, as well as incoherent government policies in general.

3) Performance-based payments for forest carbon will by definition lead to a situation where one value of forests dominates forest policy decision-making, thus undermining what the Executive Director of the UN Forum on Forests has called a "360 degree" approach to forests, an approach in which all functions and values of forests are taken into account in a balanced manner. This deficiency will not only lead to a marginalization of the social and cultural values of forests in forest policy-making, but also to a marginalization of biodiversity values. Already, there has been a strong tendency in forest carbon offset projects to support growing monoculture plantations of rapidly growing tree species, despite their negative impacts on biodiversity.<sup>3</sup> This problem is exacerbated by the flawed forest definition that has been used by the United Nations Framework Convention on Climate Change (UNFCCC) process, which includes monoculture tree plantations as well as "temporarily unstocked areas", and allows the use of Genetically Engineered (GE) trees.

4) Forest carbon cannot be equated to carbon stored in fossil fuel deposits. There will always be a high risk of non-permanence in forest carbon offset projects, yet it is broadly recognized that no satisfactory solutions for this problem have been developed.

In fact, this problem cannot be resolved as non-permanence is an inherent feature of forest or tree plantation carbon.

5) Another inherent problem with REDD+ is that performance-based payments will require a significant investment in monitoring,

verification and reporting (MRV) systems that can claim to ensure that the forest carbon benefits of a certain initiative are real and additional. Such MRV systems could take up more than half of the overall budget of REDD+ initiatives. As a group of international market specialists have noted:

"Assuming that forest carbon requires a quantification process similar to the one used today, there is no reason to expect that the market for REDD forest carbon will behave any differently. The expertise, travel requirements and operational scale required to follow IPCC-like standards almost certainly requires a multinational organization, one that is well-capitalized and capable of managing many clients at once. Will these organizations be numerous? Unlikely. Will they be domiciled in developing countries? It seems improbable. These skills and scale will cost money to deploy, and that – far more than avarice or inefficiency – explains why REDD projects are likely to spend so much on MRV... Forest carbon is likely to behave as any commodities market would, which implies that producers will derive only marginal benefits from the market as a whole. Moreover, the unique logistical challenges posed by counting carbon to IPCC-like standards imply a very limited population of providers willing to do this for projects."

This is an unacceptable waste of money in times when resources are scarce and funding for REDD+ is likely to come from the same sources that could also finance other sorely needed real climate change mitigation and adaptation initiatives.

Moreover, these costs make it impossible for economically marginalized groups including Indigenous Peoples, forest dependent communities and women, as well as poor countries, to participate in an equitable manner in REDD+ projects.

6) All these problems will be exacerbated if, as is virtually certain, REDD+ is financed through carbon offset markets. This is the funding option supported by many influential countries and other major stakeholders including the World Bank; even those REDD+ initiatives currently being supported through philanthropy and public monies are generally designed to help jump-start forest carbon markets.<sup>6</sup> In addition to undermining forest conservation, such markets can only make climate change worse, due to irresolvable problems relating to permanence, additionality and leakage, while continuing pollution in the North and creating toxic hotspots in vulnerable community areas already disproportionately impacted by toxic exposures and environmental injustices.

7) REDD+ is inherently about commodifying and privatizing air, forests, trees and land. This approach runs counter to the cultural and traditional value systems of many Indigenous Peoples and other forest-dependent communities.<sup>7</sup> There is a severe risk the market-oriented approach inherent to REDD+ will undermine value systems that are an essential element of successful community-driven conservation of forest areas, and Indigenous traditional ecological knowledge and conservation practices. In numerous places in the world, REDD+ projects and policies are being implemented in violation of the principle of Free, Prior and Informed Consent (FPIC). In Ecuador, the government continues to develop a REDD+ program despite the fact that the most representative organization of Indigenous Peoples, the Confederation of Indigenous Nationalities of Ecuador, (CONAIE), has explicitly rejected REDD+ policies in the country.<sup>8</sup> As Kenya's Mau Forest is made "ready" for a UNEP-funded REDD+ project, members of the Ogiek People continue to suffer evictions, and Ogiek activists are attacked for protesting land grabs.<sup>9</sup> In Indonesia, the Mantir Adat (traditional authorities) of Kadamangan Mantangai, district of Kapuas in the province of Central Kalimantan, "reject REDD projects because it is a threat to the rights and the livelihoods of the Dayak community in the REDD project area", and have called for the cancellation of a project that has "violated our rights and threatened the basis of survival for the Dayak community."<sup>10</sup> Many companies and organizations which have historically caused pollution and deforestation are promoting REDD+ as a profitable opportunity to "offset" their ongoing pillaging of the planet, including the World Bank, the Inter-American Development Bank, Dow, Rio Tinto, Shell, Statoil, BP Amoco, American Electric Power- AEP, BHB Billiton and the International Tropical Timber Organization.

In Brazil, Chevron-Texaco, infamous for causing significant forest loss in the Ecuadorian Amazon and threatening Indigenous Peoples in voluntary isolation, which might lead to genocide, backs a REDD+ project in the Atlantic Forest which uses uniformed armed guards called Força Verde who shoot at people and jail them if they go into the forest.<sup>11</sup> In Bolivia, BP, whose oil spill in the Gulf of Mexico was the biggest environmental disaster in the history of the United States, participates in the biggest REDD+-type project in the world, which helps it to greenwash its destruction of biodiversity and communities' livelihoods.<sup>12</sup> As noted in the New York Times, "...programs to pay for forest preservation could merely serve as a cash cow for the very people who are destroying them."<sup>13</sup> In Papua New Guinea, Colombia, Peru and elsewhere, "carbon cowboys" are running amok, conning communities into signing away their land rights with fake contracts.<sup>14</sup> In the words of one Indigenous leader, REDD+ may be "the biggest land grab of all time" REDD+ is inherently about commodifying and privatizing air, forests, trees and land and corrupts everything that Indigenous Peoples hold sacred, including their traditional knowledge systems.<sup>15</sup> Where REDD+ projects target the territories of Indigenous Peoples living in voluntary isolation, as in the Peruvian Amazon or the Paraguayan Chaco, they might even threaten the very survival of these Peoples.<sup>16</sup> These risks and problems have been recognized by a large number of UN organizations and other international institutions, as well as by the Parties to the UN Framework Convention on Climate Change themselves.<sup>17</sup> The so-called "safeguards" adopted by a majority of Parties to the UNFCCC show that they are already concerned about the potential negative environmental and social impacts of REDD+. However, these REDD+ "safeguards" will not save forests from being converted into plantations, or Indigenous Peoples' rights from being violated in REDD+ projects. Nor can they prevent the damage that REDD+ carbon offsets would do to genuine efforts to address climate change. Voluntary, weak and relegated to an annex, they are unsupported by any consensus to make them legally binding, let alone establish a compliance and redress mechanism. In the past, such voluntary safeguards schemes have usually proven to be ineffective, many even serving as greenwash for corporate malpractice. For that reason, many institutions have emphasized that all land tenure conflicts have to be resolved and that rights of Indigenous Peoples, local communities and women have to be secured, before REDD+ projects and policies are implemented.<sup>18</sup> However, this is not a realistic proposition. We strongly support any policy efforts to address land tenure conflicts and human rights violations, especially as far as the rights of Indigenous Peoples are concerned. But land tenure problems and human rights violations in forest areas are far too complicated to be fully resolved in a foreseeable timeframe, and REDD+ will not help. On the contrary, as stated above, the promise of potential performance-based payments would make it more instead of less difficult to resolve these issues, and would tend to weaken instead of strengthen communities' struggles for their rights.

Considering this long list of broadly acknowledged and inherent risks and negative impacts of REDD+, it is remarkable that an estimated \$7.7 billion US has already been committed to it by donor countries.<sup>19</sup> Still more remarkable is the fact that foundations formerly renowned for supporting human rights and justice work are adding millions of dollars to projects and initiatives that promote REDD+.<sup>20</sup> Meanwhile, there is a financial stranglehold on the often small and independent civil society and Indigenous Peoples organizations that denounce the growing list of human rights violations and environmental destruction caused by REDD+-type projects.

Unintentionally or not, this extreme, unjust funding disparity constitutes a form of de facto financial censorship, and this means that the right to Free, Prior, Informed Consent of the custodians of the majority of the world's forests, Indigenous Peoples, is being compromised.

If there is almost no funding to support detection, documentation and rejection of the negative social and environmental impacts of REDD+ projects, to say nothing of reasoned criticism of its underlying premises, it will be impossible to expose and disseminate all of the crucial information that remote communities need in order to make decisions about REDD+, and any consent they grant will not be thoroughly and fully "informed". It must be noted that REDD+ and its relationship to the world of carbon markets and offset regimes is a very complex area that many NGOs involved in climate policy do not fully understand. In this respect it should be taken into account that Indigenous Peoples' fundamental right to Free, Prior and Informed Consent is a pillar of the United Nations Declaration on the Rights of Indigenous Peoples. This right is also recognized in the REDD+ safeguards adopted by the majority of Parties to the Climate Convention, and by UN-REDD and other donors. Funding the painting of a rosy REDD+ picture in which communities get paid to take care of forests and share in the costs-benefits of REDD+ programs without showing the darker realities in the background is at best negligent and at worst implicates funders in a severe violation of one of the most important rights of Indigenous Peoples. This letter is intended both as a wakeup call to funders and an invitation to bridge this funding gap.

In this respect it is also important to ensure that community capacity-building and awareness-raising projects provide fair and unbiased information about the quite desolate state of the climate negotiations, and the unwillingness of large Northern polluters to agree to legally binding targets for reducing greenhouse gas emissions or financial support for needed climate measures. In the eyes of many social movements, REDD+ is a paltry fig leaf in this respect. The \$100 billion US that was mentioned as possible climate finance in Copenhagen has not been concretized yet, and it is increasingly clear that some of the most important donor countries expect the bulk of this funding to come from carbon markets.<sup>21</sup> Already, carbon markets have proven to be a highly volatile and inequitable source of funding, and the current lack of political momentum for a legally binding successor to the Kyoto Protocol will only create more market uncertainty. It is important this information is shared with communities and Indigenous Peoples when they are informed about the "opportunities" of REDD+.

Although protecting forests is a critical piece of the climate mitigation puzzle, a market-oriented and corporate-driven system of performance-based payments comes with inherent risks that are both overwhelming and unavoidable. The irony is that at the same time REDD+ is being so aggressively promoted, there are numerous examples of Indigenous Peoples' territories and areas where forests have been conserved or restored successfully by communities without performance-based payments based on individual land titles and questionable carbon rights. Examples from countries like India, Gambia, Nepal, Brazil and Rwanda have demonstrated that recognizing community governance over forests and Indigenous Peoples' rights over their territories provides more effective and ethically sound incentives for forest conservation and restoration, while the Ecuadorian proposal to keep fossil fuels in the ground shows the way toward a more realistic approach to mitigating climate change. In addition to such direct approaches to the fossil fuel problem, it is essential to assure the necessary space for the empowerment of communities that have successfully conserved their forests, and to address the direct and underlying drivers of deforestation such as over-consumption and over-production for and by industrialized societies.

In conclusion, we believe that REDD+ is a fundamentally flawed symptom of a deeper problem, not a step forward. It is a distraction that the planet – our Mother Earth - does not have time for. We should build on the many existing examples of successful forest conservation and restoration rather than investing billions of dollars in an untested, uncertain and questionable REDD+ scheme that is likely to undermine the environmental and social goals of the climate regime rather than support them.

Addressing climate change and forest loss require measures that contribute to thorough economic, ecological and social transformation.

To present all sides of the REDD+ story as part of a larger effort to build the diverse and powerful global alliances that can support the transformation that our planet and peoples need, will require the full support of the charity, gift-giving and philanthropy community.

We're up for the task.

Are you?

---

## Social Watch

Social Watch

October 31, 2011

Social Watch submission to the Rio 2012 Zero Draft Document

About Social Watch

Social Watch is an international network of citizens' organizations in the struggle to eradicate poverty and the causes of poverty, to end all forms of discrimination and racism, to ensure an equitable distribution of wealth and the realization of human rights. We are committed to peace, social, economic, environment and gender justice, and we emphasize the right of all people not to be poor.

The members of Social Watch, citizen coalitions in over 70 countries, hold governments, the UN system and international organizations accountable for the fulfillment of national, regional and international commitments to eradicate poverty and achieve sustainable development. The international secretariat of Social Watch is hosted by Instituto del Tercer Mundo (ITeM, an ONG in special consultative status with ECOSOC).

Economy, poverty and sustainable development

General Assembly Resolution 64/236 instructs the Rio 2012 Conference to discuss the economy "in the context of sustainable development and poverty eradication". By monitoring antipoverty efforts and development strategies at national and international level, Social Watch has found that economic indicators and social well being indicators do not correlate and it is therefore urgent to revise economic strategies to achieve the internationally agreed goals and make the enjoyment of human rights a reality for all. Further, in spite of the recommendations formulated in 1992 by the Rio Summit to develop sustainable development indicators and all the work done in this area since then, the international community still lacks agreed indicators to measure the sustainability of the global public goods under its surveillance. Global public goods cannot be provided by any single state acting alone, and they include the preservation of the life supporting functions of the atmosphere and the oceans (threatened by global climate change) or the reliability and stability of a global financial system, indispensable for trade and development but threatened by unhindered speculation, currency volatility and debt crises. The failure to provide those public goods impacts the livelihoods of billions of people around the world and threatens the one public good that inspired the creation of the United Nations: global peace.

The evolution of key economic indicators has been extraordinary in the last two decades. The total world exports multiplied almost five times, growing from a total value of 781 billion dollars in 1990 to 3.7 trillion in 2010. Trade is indispensable for growth and development. There are even many programs of aid for trade. And trade has gone up and up.

Per capita GDP has been used for many years as the main indicator of development and countries are still ranked according to it by international organizations. Between 1990 and 2010 the average person in the world more than doubled her or his income from a little over four thousand dollars in 1990 to over nine thousand dollars per capita in 2010.

These indicators hint to an abundance of resources, which are far enough to guarantee that nobody should suffer from hunger in the world.

Yet, there is a dire reality of poverty and hunger in the world. To monitor deprivation without resorting to income related indicators, Social Watch has developed a Basic Capabilities Index, which is an average of infant mortality, births attended by specialized personnel and primary education. All these three are very basic indicators and they should have gone up to one hundred percent, meaning that no children should be out of school, no women should deliver their babies without assistance and no kids born alive, or at least less than one percent of them, should die before their fifth anniversary, when the major cause of those deaths is associated with malnutrition and poverty.

All these three indicators are part of the internationally agreed goals and of any concept of a social floor and of dignity. Dignity for all is what the UN Charter and the Universal Declaration on Human Rights want to achieve and what the leaders of the world committed themselves to achieve in the Millennium Declaration.

[Rio+20 Secretariat: Please refer to full submission document for graph]

But the world is far from achieving these basic targets. BCI only moved up 7 points between 1990 and 2010, which is very little progress. And the progress was actually of over four percentage points between 1990 and 2000 and of barely three percentage points between 2000 and 2010. This is the opposite trend of the lines for trade and income, both of which grew faster after the year 2000 than in the decade before. But the social indicators progressed slower after the turn of the century, in spite of the excellent performance of the economy and in spite of the international commitment to accelerate social progress and achieve the MDGs.

Growing inequalities within and between countries is the obvious reason for that divergence of trends between the economy and social indicators. And the social indicators can only get worse as the impact of the global financial crisis started in Wall Street in 2008 start to be registered by internationally comparable statistics, a process that always lacks two to three years behind the processing of the economic indicators.

The hard numbers prove that prosperity does not trickle down. It used to be common sense that a growing economy benefits the poor, that a rising tide will lift all boats, big or small, or that the pie has to grow first before we can share it, but the indicators of social progress seem to show the opposite.

[Rio+20 Secretariat: Please refer to full submission document for graph]

The graph above combines the BCI average of social indicators with per capita CO2 emissions. This graph2 shows that while 50 percent of carbon emissions are generated by 13 percent of the population, 45 countries with a total population of 1.2 billion people have managed to achieve social indicators that are better than the world average with per capita emissions of CO2 from fossil fuels below the world average. And none of them are labeled as "high income". Yet, the members of that group of the "clean and virtuous" have no recognition or compensation for their achievement. Quite to the contrary, similar to other middle-income countries and those considered as "least developed", they often find their space for making domestic policy choices to achieve sustainable development squeezed by external demands, conditionalities and impositions that press them to take steps such as to slash tax rates and spending on social services.

The fact remains that there are countries that have lowered their infant mortality to levels similar to those of the US with one tenth of the per capita CO2 emissions of North America demonstrates that a better quality of life is achievable without requiring consumption and production patterns that destroy the environment.

Between 1990 and 2000, the BCI (social indicators index) improved five points (from 79 to 84), while the world per capita emissions of carbon dioxide actually decreased from 4.3 tons to 4.1. But in the first decade of the 21st century, world CO2 emissions moved up to 4.6 tons per capita and social indicators only moved up three points. Although the economic boom of the first decade of the century failed to boost social indicators, it did accelerate environmental destruction.

At the Earth Summit held in Rio de Janeiro, the leaders of the world stated that "the major cause of the continued deterioration of the global environment is the unsustainable pattern of consumption and production, particularly in industrialized countries (...) aggravating poverty and imbalances". This is still true today.

Sustainable development goals

The 1992 Rio Summit demanded further work on the definition of indicators of sustainable development which would be the basis both for defining the concept and establishing common international goals. Two decades after, this is one of the areas where not enough progress has been done. The report of the Stiglitz-Sen-Fitoussi Commission clearly suggests that well-being indicators and sustainability indicators are of a different nature and compares them with the dashboard of a car, with separate displays for speed and remaining gas. One informs about the time needed to achieve a destination, the other one refers to a required resource that is being consumed and may reach a limit before the destination is reached.

The human rights framework sets clear goals for well-being indicators. The rights to food, to health, to education impose the mandate to achieve universal attendance of all girls and boys to education, the reduction of infant mortality to less than 10 per thousand children born alive (since all mortality above this figure is related to malnutrition and poverty), the universal attendance of all births by specialized personnel, the universal access to safe water and sanitation and even the universal access to phone and internet services.<sup>3</sup> Basically all of the six first goals of the MDGs can be read as a request to fulfill existing rights in accordance with the International Covenant on Economic, Social and Cultural Rights. Plus other goals not listed in the MDGs, such as the right to social security (article 22 of the Universal Declaration), now recognized as the basis for a "social floor".

The national and international debate should not be about those goals, as they have already been agreed upon, but over when they will be progressively achieved. The realization of those rights is a responsibility of governments "individually and through international assistance and co-operation, especially economic and technical, to the maximum of available resources," according to the Covenant on ESCR. The prioritization of resources also applies to international assistance. In order to monitor the effective use of the maximum available resources (including those of international cooperation) the Universal Periodic Review of the Human Rights Council should be strengthened to perform this task. Further, the Optional Protocol to the Covenant on ESCR should be ratified, so as to allow citizens to claim their rights in court, and the bilateral and multilateral development agencies have to be made accountable for their human rights impact.

Sustainability indicators, on the other hand, refer to the depletion of a certain non renewable stock or asset. When those are part of the global commons international agreements are required to ensure sustainability. Contrary to human well-being, which can be formulated in terms of goals, sustainability needs to be addressed in terms of limits. Limits can be an absolute ban on certain activities, such as the ban on whaling or on the emission of ozone depleting gases (Montreal Protocol), or they can establish quotas to ensure non depletion, which can be assigned to economic actors through different market and non-market mechanisms respecting the equity and solidarity principles. Internationally, more work needs to be done on fisheries, to avoid further depletion of species that are vital to feed millions of people. Above all, an ambitious agreement is needed on the second commitment period of the Kyoto Protocol that limits temperature rise to well below 1.5° to prevent catastrophic climate change and ensures just and fair sharing of drastic emission reductions, in accordance with common but differentiated responsibilities and historical responsibility.

Any formulation of "sustainable development goals" that does not include adequate climate change targets or does not address the human rights aspects and the sustainability aspects simultaneously and in a balanced way, risks derailing the comprehensive sustainable development agenda without any compensatory gains.

---

## Soka Gakkai International

Proposals for the UN Conference on Sustainable Development (UNCSD)

Soka Gakkai International

The Soka Gakkai International (SGI) hereby submits its proposals in response to the invitation "to provide inputs and contributions for inclusion in a compilation document to serve as basis for the preparation of zero draft of the outcome document."

As a non-governmental organization with membership in 192 countries and territories and a decades-long record of activities promoting education, learning and civil society engagement, we focus on the following three action areas whereby education in all its forms can play a key role in achieving the objectives and addressing the themes of UNCSD. We also hope these action areas can serve to invigorate the UN Decade of Education for Sustainable Development, 2005-2014 (DESD) and encourage active follow-up efforts by diverse stakeholders.

- Lifelong learning for sustainable development
- Education and awareness-raising for a green economy
- Education targets in "Sustainable Development Goals"

Lifelong learning for sustainable development

Education and learning take place not only in schools but also in all aspects and areas of our lives. UNESCO's "ESD calls for lifelong learning and recognizes the fact that the educational needs of people change over their lifetime." Similarly, in the UNEP, "The strategy is also consistent with the environmental education principles which recognise environmental education as a continuous and lifelong process, based on interdisciplinary approaches, active participation and individual and group responsibility for the environment."

We propose a new program of lifelong learning for sustainable development to be launched in 2015 as follow-up to the DESD. It can serve to facilitate efforts in informal education while furthering work in formal education.

Such a program would profile existing educational/learning activities relevant to ESD and clarify what is best learnt at each life-stage, and in which venue or situation.

UNEP describes its mission as "Inspiring, Informing and Enabling." When we think about ESD, in addition to UNEP's mission above, it is crucial to take into consideration the importance of self-learning and applying knowledge gained to our own life and experiences. Therefore, we propose a formula of "Learn, Reflect, and Empower" (LRE) for promoting ESD.

This three-step formula is effective in ESD in our experience. The acquisition of knowledge alone is not only insufficient, but this approach can easily lead to the learner feeling overwhelmed by the extent and complexity of the problems, resulting in disempowerment. The LRE formula equips people for action and enables them to be confident that even one person's actions can make a difference.

Ideally, education should inspire the faith that each of us has both the power and the responsibility to effect positive change on a global scale. This LRE formula can be utilized in any type of ESD activity and at any stage of life. We will see the development of learning systems throughout society which enable people to learn, reflect, adapt and take appropriate action in response to complex, interrelated and everchanging circumstances.

As such a program involves all members of societies including the business sector and consumers, it would help lay foundations for efforts toward the 10-Year Framework of Programmes on Sustainable Consumption and Production.

#### Education and awareness-raising for a green economy

The aim is to inform ordinary people about successful approaches to a green economy and to encourage economic activities based on it. Efforts are also needed to achieve a paradigm shift in thinking about growth by utilizing and raising awareness of new indexes for measuring development and economic approaches which take visibly into account social and environmental costs. Poverty eradication must also be a central goal, with the provision that natural resources are not exploited to the detriment of future generations.

Education is vital so that evolving concepts of a green economy will be more familiar to ordinary people. More widespread understanding will enhance the quality of green economy initiatives and what the international community agrees at UNCED. This process will be ongoing.

The idea of a green economy, unlike other economic models, includes the aims of sustainable development and the eradication of poverty. A common purpose on a global scale is necessary, and education is important to this end.

In the first stage starting from 2015, we consider it to be desirable to establish a program and tools which can be used in secondary education and higher education. Also, the 10YFP SCP should mention an education program on green economy.

The LRE formula can be applied here as well, empowering learners to take concrete action and not only absorb past economic theories and knowledge. In order to realize this, the program should include case studies of both success and failure, and on-the-job- training courses.

Philosophical and ethical aspects must also be covered to promote an integrated way of thinking about sustainability issues, and the overarching rationale for a green economy.

Widely recognized documents such as the Earth Charter can be of use in this respect. Incorporating education targets in "Sustainable Development Goals" Sustainable Development Goals (SDGs) are being proposed to complement the Millennium Development Goals (MDGs). The education-related target among the MDGs is "Children everywhere, boys and girls alike, will be able to complete a full course of primary schooling." SDGs should be related to the life-long learning program we propose here, promoting the kind of education that encourages us to expand our vision, encouraging our openness to understand, appreciate and promote interlinkages. The LRE formula can be helpful in this respect. An SDG education goal would complement the MDG education goal.

To further the above proposal, we offer the following observations about the issues surrounding the use of nuclear-powered energy:

#### Reflection on the past 20 years

In Rio and Johannesburg, the international community agreed that natural resources are limited and that carbon emissions should be cut. Developing countries, with rising energy demands, have been faced with the pressure of reducing dependence on fossil fuels.

In response, aided by nuclear energy interests in developed countries, the export of nuclear technology has become widespread. Many countries are planning to develop the nuclear power option.

In March 2011, Japan was faced with the compound disasters of earthquake, tsunami and Fukushima nuclear power plant accident. Radioactive materials were scattered over a wide area. Residents around the plant have been forced to evacuate with no clear prospect of return.

#### Requested policies

##### a) Energy summit

In international negotiations about energy, the International Energy Agency (IEA) has been playing a key role. As the agency comprises only 28 countries, it has been inviting emerging countries like China and India, as well as transnational corporations to join its debates in recent years.

However, the Fukushima accident has highlighted the necessity of reflection of ordinary people's concerns in energy policies, as they are affected by the process of power generation not just as consumers. Even in oil producing countries, only a few corporations and governments benefit from the oil industry, while local residents often suffer from severe disruption to their local environment, causing political instability. It is essential to take people's concerns and views into consideration. In a world where increasing energy demand is inevitable, we are faced with the urgent task of how to secure energy supplies in a sustainable way. In order to solve this, we think a periodic summit is indispensable, one which decides global energy policies with the presence of governments, transnational corporations, and representatives of civil society, led by an inter-organizational bureau linking international organizations such as the UN Security Council, UNEP, CSD and IEA.

Nuclear power plants inevitably cause sacrifices and risks to future generations and the natural environment. From such summit debates, civil society can reasonably and urgently conclude whether the role of nuclear power should be limited to that of a transitional or bridging technology until alternative technologies mature.

##### b) Technology transfer of renewable energy to developing countries

In the meantime, we need to create a system which encourages technology transfer of renewable energy to developing countries. Promotion of this shift can be a driver of a green economy. The shift derives not only from the ethical undesirability of nuclear plants, but also from the prerogatives of a green economy that cannot ignore the negative costs and risks of nuclear power plants.

Finance will be a challenge, and the instrumentality of taxes imposed on actors who sacrifice others can be considered. Currently, an aviation tax has been implemented in a few countries, and ideas for a Tobin tax or taxation on weapons trade are being proposed. The trade of fissile materials, which is already internationally controlled and monitored, could be taxed more effectively than weapons. These, too, are subjects for summit debates through which civil society must become informed and engaged.

---

## Solidaritas Perempuan (Women's Solidarity for Human Rights)

Sustainable Development Based On Ecological, Social And Gender Justice

A proposal to the Zero Draft of the Rio Summit in 2012

Submitted by Solidaritas Perempuan (Women's Solidarity for Human Rights)

Indonesia

Though the Rio Declaration will soon celebrate its 20th Anniversary but the world right now doesn't reflect its success in achieving sustainable development goals. The existing development model continuously ignores the pillars of social justice and of ecological justice. Hence, it strengthened the exploitation of natural resources and people; and on the other hand it strengthened the impoverishment and injustices to environment, social lives and women.

The Rio Summit, therefore, has to reaffirm the principles of Rio Declaration of 1992, to foster consistent implementation based on principles of ecological, social and gender justice.

#### Social And Gender Justice Based Green Economy

Sustainable development based Green Economy will only achieve welfare for people –women and men- whilst nurturing the environment and its natural resources if the principles of ecological, social and gender justice are integrated. The Green Economy concept should be provided in manner and languages accessible for local and indigenous peoples including the women. Those principles are as follows:

##### 1. Principles of Ecological Justice:

- Acknowledgement that natural resources are not trade or conservation commodities but an integral aspect of human's lives.
- Integration of local wisdom including local and indigenous women's wisdom into the development of Green Economy
- The utilization of natural resources have to take into account the sustaining relation between human kind and environment and impacts of the utilization to lives of women and men.

##### 2. Principles of Social Justice:

- Acknowledge and ensure the integration of principles of ecological and gender justice; democracy; accountability; transparency; welfare of peoples; respect and protect human rights including women's human rights and rights of indigenous peoples.
- Any utilization of natural resources has to go through processes of Free, Prior and Informed Consent (FPIC) particularly from peoples –women and men- whose lives directly depending from those natural resources.

##### 3. Principles of Gender Justice:

- Protect women's human rights and particularly develop measures to involve women in decision makings in any development in their places
- Set-up objectives and measures to eradicate gender injustices such as discrimination, double burden, stereotype, violence, sub-ordination and marginalization against women
- Technology development for improvement of environment and fostering sustainable development should be people's driven and accessible to people, including the women.

#### Governance of Sustainable Development

The good governance of sustainable development can only be carried out by implementing principles and measures as follows:

- Consistent implementation of Agenda 21 based on principles of Rio Declaration, acknowledgement of the rights of indigenous peoples, precautionary principles, common but differentiated responsibility, polluter-pays principle and to include objectives of gender justice, and furthermore, strengthen access of people to information and for public participation.
- Involvement of peoples, including women, at all levels of decision-makings at local, national, regional and international level to implement sustainable development. Military is not allowed to intervene in the implementation of sustainable development and not allowed to be executor of sustainable development.
- Development of instruments and mechanism to protect rights of peoples including rights of indigenous peoples and women's human rights. These will include accountability mechanism for any policy, program and project of Green Economy that affect lives of peoples, their livelihood and living environment.
- Ensure that financing from International Financial Institutions such as the World Bank, IMF and the regional banks (ADB, AfDB et al) is excluded from the financing of sustainable development, nor the private sector financing.
- Ensure that organizations like World Trade Organization and the kind are not involved in the development of sustainable development of the countries.

---

## South Asia Women's Network (SWAN)

### DHAKA DECLARATION:

#### SWAN (South Asia Women's Network)'s Positions on an emerging Green Economy

##### Preamble

We, the women of South Asia, gathered in Dhaka, Bangladesh on July 2 and 3, 2011, for the Third Annual Conference of SWAN (South Asia Women's Network), which was dedicated to the theme of "Women of South Asia and the Green Economy". We come from nine South Asian countries: Afghanistan, Bangladesh, Bhutan, India, Myanmar, Maldives, Nepal, Pakistan, and Sri Lanka.

The SWAN Annual Conference brings together eight individual SWAN networks, respectively on Arts and Literature; Women in Peacemaking; Health, Nutrition, and Food Security; Education; Crafts and Textiles; Microcredit, Livelihood, and Development; Environment; and Women in Media. Women working in each of these areas make vital contributions to the Green Economy. There can be no Green Economy without Arts and Literature that express our local traditions, and women play a central role in preserving and disseminating these traditions. There can be no Green Economy without Peace. Armed conflict, terrorism and all violent acts are destructive of the Green Economy. The peace we ask for cannot ever be at the expense of women's rights. A Green Economy is the only enduring basis for good health, and for ensuring adequate nutrition and food security. Education for an authentic Green Economy is our commitment. Our rich tradition of crafts and textiles does not just contribute to our rich culture; it is the very basis of green livelihoods. Facilitating local sustainable livelihoods is the real role of microcredit and financial systems. We will use the media to show to our region and the world that the women of South Asia bring solutions to the ecological and poverty crises. We will define the Green Economy on our terms, through our cultures and our lives.

South Asia is the region that bears a heavy burden of the global ecological crisis, including climate change and species extinction. The melting of the Himalayan glaciers, the intensification of droughts, floods, and cyclones and the rising sea level aggravate the already-serious ecological stresses in our region. Despite the differences and diversity within our region, we all share and depend on one geographical space. During periods of deep catastrophe and uncertainty, we need to recognize a multiplicity of perspectives that will offer diverse and plural solutions.

South Asia is one of the richest regions in terms of bio-cultural diversity, but this diversity is under threat of monocultures pushed through the Green Revolution and genetic engineering. These non-sustainable and failed technologies are being forced on our people, driving them deeper into debt and poverty. Our rich biodiversity and knowledge heritage is being patented and pirated, depriving our people of the benefits of their own heritage and resources. When environmental crises force us to migrate to cities, we also experience loss of livelihoods due to lack of access to urban space, materials and new forms of urban management. Our bodies are imprinted with toxics from unsustainable consumption of others.

The right to sustainable development should be inalienable. This is vital for women's empowerment and for preserving our planet for future generations. Women of South Asia bear the highest burden of climate change, biodiversity erosion and unsustainable forms of urbanization. But we also bring solutions to these global crises with our knowledge, skills, wisdom, and experience. We seek to work in harmony with nature, rather than resorting to geoengineering that could further aggravate the ecosystem balance. That is why we bring something unique to the global discussion on sustainable development and the Green Economy in the lead-up to Rio+20 and visions beyond.

#### Statement and Commitment

A Green Economy should be an economic system that ensures social justice and equity, protects the ecological balance and creates economic sufficiency. Such a Green Economy should replace the current economic order, which is based on inequity, environmental destruction and greed, which has resulted in keeping nearly half the world's population in poverty, and has brought the planet to the point of a severe environmental catastrophe through climate change. The core idea of a Green Economy must be poverty alleviation, environmental sustainability through maintaining biodiversity, and the well-being of all the people.

As SWANs, we embrace such a Green Economy. We commit ourselves to raising our collective voices for it. We will transcend the fragmenting boundaries that attempt to divide us, and will unify our energies to create a better world for all.

Our local economies have always been in harmony with nature. We have used resources prudently, and shared them equitably. SWAN believes that agriculturists and craftspeople around the world have always worked in tandem with the seasons and in harmony with nature. A craftswoman carries with her the wisdom of generations that did not pillage the planet for profit. She has a deep commitment towards nurturing the natural world for sustaining livelihoods. The only raw materials needed to keep millions employed is a thriving green environment with rich forests, wild grasses, clean waters, and unravaged hillsides. The dignity and creativity of hand-work greatly contributes towards sound rural economies. This work of women across the South Asian region must be acknowledged by all those who wish to build an inclusive and truly integrated, ecologically balanced world.

Today, those who have created the ecological crisis talk of the Green Economy. For them, the Green Economy means appropriating the remaining resources of the planet for profit — from seed and biodiversity to land and water as well as our skills, such as the environmental services we provide.

For us, the privatization and commodification of nature, her species, her ecosystems, and her ecosystem services cannot be part of a Green Economy, for such an approach cannot take into account our traditions. The resources of the Earth are for the welfare of all, not the profits of a few. Sharing our vital resources equitably and using them sustainably for livelihoods and basic needs is at the heart of our concept of a Green Economy. Our rich knowledge of biodiversity, our ecologically sustainable agriculture, and our crafts techniques are free of fossil fuels and toxics. They generate creative and dignified livelihoods and they provide the basis for poverty alleviation. We stand committed to strengthening these life-giving traditions.

It is of vital importance to spread awareness about these issues through the media and through the educational process, which reaches out to youth and children. Awareness about the Green Economy and the significance of its diverse impacts is essential in order to enable all segments of society to make informed choices. Recognizing the changing face of the media, SWAN encourages the use of new media, including social networking tools, to reach out and support the women of South Asia in their struggle to meet the challenges of ensuring the Green Economy for sustainable development.

Our Green Economies are diverse and decentralized and therefore are a path of empowerment for all. Women are the storehouse of knowledge and provide the cultural base to create and build economies that increase wellbeing and happiness, joy and beauty, sustainability and equity. It is from our region of South Asia that the concept of Gross National Happiness has spread worldwide. We will deepen this concept and make it the basis of the Green Economy.

We stand committed to peace in our region and to strengthening these life-giving traditions. We commit ourselves to defending the ecological integrity of our region — our mountains and rivers, our land and oceans, our natural forests, biodiversity and seeds. We commit ourselves to creating prosperity and peace through the Green Economy that protects and enriches our natural and cultural heritage. We commit ourselves to resisting those irresponsible policies and armed conflicts that directly harm women and children. We commit ourselves to equity and to defending vital resources, like forests, seed and biodiversity, rivers and water, as a commons. We recognize that the Green Economy we envisage will greatly facilitate and strengthen women's empowerment in South Asia and in other parts of the world.

We commit ourselves to working together to show that a better world is possible. We commit ourselves to making our voices heard at all important regional and multilateral forums where these issues are being discussed.

#### Signatories:

1. Ms Veena Sikri, Professor, Academy of Third World Studies, Jamia Millia Islamia University, New Delhi (India) : Convener of SWAN and Coordinator of the SWAN on Arts and Literature
2. Dr Vandana Shiva, Navdanya (Research Foundation for Science, Technology & Ecology), New Delhi (India), Co-coordinator of the SWAN on the Environment
3. Mr. Uchita de Zoysa, Executive Director, Centre for Environment & Development, Colombo (Sri Lanka) : Co-coordinator of the SWAN on the Environment
4. Ms Shinkai Zahine Karokhail, Member of the National Assembly of Afghanistan : Coordinator of the
5. Ms Shaheen Anam, Executive Director, Manusher Jonno Foundation, Dhaka (Bangladesh) : Coordinator of the SWAN on Microcredit, Livelihood and Development
6. Dr Mira Shiva, Director, Initiative for Health, Equity and Society; and Founder Member, Diverse Women for Diversity : Coordinator of the SWAN on Health, Nutrition and Food Security
7. Dr Rasheda K Choudhury, Executive Director, CAMPE (Campaign for Popular Education), Dhaka (Bangladesh) : Coordinator of the SWAN on Education

8. Ms Jaya Jaitly, Founder President of the Dastkari Haat Samiti, New Delhi (India) : Coordinator of the SWAN on Crafts and Textiles

9. Ms Nandini Sahai, Director, The International Centre, Goa (India) and Founder Director, MICCI (Media Information and Communication Centre of India) : Coordinator of the SWAN on Women in Media.

AFGHANISTAN:

10. Ms Razia Sadat, Member of the National Assembly of Afghanistan

11. Ms Elay Ershad, Member of the National Assembly of Afghanistan

12. Asila Wardak Jamal, Director, Human Rights & Women's International Affairs, Ministry of Foreign Affairs, Kabul

13. Ms Monireh Hashemi, Theatre Director, Simorgh Film Association of Culture and Art (SFACA), Herat,

14. Ms Frozan Rahmani, Correspondent, Pajhwok News Agency, Kabul

15. Ms Hasina Safi, Afghan Women's Education Centre (AWEC), Kabul.

BANGLADESH

16. Ms Sabrina Islam, President, Women Entrepreneur's Association, Dhaka

17. Ms Farida Zaman, Professor & Chairman, Deptt of Drawing and Painting, Faculty of Fine Arts, University of Dhaka

18. Ms Tropa Majumdar, Theatre Director, Dhaka.

19. Ms Munni Saha, Head of News, ATN News, Dhaka.

20. Ms Lubna Marium, Creative Director, Sadhana, Dhaka

21. Ms Khushi Kabir, Coordinator, Nijera Kori, Dhaka

22. Dr Kaosar Afsana, Associate Director Health, BRAC, Dhaka

23. Dr Meghna Guhathakurta, Executive Director, Research Initiatives Bangladesh, Dhaka

24. Dr Niaz Zaman, Professor, Department of English, University of Dhaka

25. Ms Rubi Ghaznavi, Managing Director, Arannya Crafts, Dhaka

26. Sara Zaker, Deputy Managing Director, Asiatic Marketing Communications, Dhaka

27. Suraiya Chowdhury, Director of Design, Prokritee, Dhaka

28. Ms Rokeya Sultana, professor, Department of Print Making, Faculty of Fine Arts, University of Dhaka

29. Ms Kanak Champa Chakma, Contemporary Free Lance artist

30. Ms Jharna Dhara Chowdhury, Secretary, Gandhi Ashram Trust, Jayag, Noakhali

BHUTAN

31. Ms Kunzang Choden Tshering, Chief HR Officer, Ministry of Economic Affairs, Thimphu

32. Ms Roseleen Gurung, Microfinance Specialist, Tarayana Foundation, Thimphu.

33. Ms Namgay Wangmo, Project Officer, Bhutan Association of Women Entrepreneurs (BAOWE), Thimphu

34. Ms Meena Rai, Programme Officer, Bhutan Association of Women Entrepreneurs (BAOWE), Thimphu

INDIA

35. Ms Bharati Chaturvedi, Director, Chintan Environmental Research and Action Group, New Delhi.

36. Professor Madhu Khanna, Director, Centre for Comparative Religions and Civilisations, Jamia Millia Islamia University

37. Dr Saryu Doshi, Author and Art Historian, Mumbai

38. Ms Shalini Joshi, Co-Director, Nirantar, Centre for Gender and Education, New Delhi

39. Dr Sabiha Hussain, Associate Professor, Dr KR Narayanan Centre for Dalit and Minority Studies, Jamia Millia Islamia University

40. Ms Sohaila Kapur, Theatre Director and Playright, New Delhi

41. Ms Sarita Kumari, Social Activist, Ghanerao, Rajasthan

42. Ms Sadia Dehlvi, Editor, Curator, Author and Art Historian, New Delhi

43. Ms Usha Ganguli, Theatre Director, Rangakarmee, Kolkata. Email :

44. Ms Arati Jerath, The Crest Edition, Times of India, New Delhi

MALDIVES

45. Ms Yudhra Abdul Latheef, Attorney-at-Law, Deputy State Attorney, Attorney General's Office

46. Ms. Aminath Shaneez Saeed, National President 2011, Junior Chamber International, Maldives,
47. Ms Thoiba Saeedh, Director, Encore Theatre Productions, Male
48. Ms. Aishath Rishtha, Programme Mannager, SWAD, Society for Women Against Drugs, Male

#### MYANMAR

49. Ms Cherie Aung Khyn, CEO & Designer, Elephant House Co. Ltd, Yangon
50. Ms. Nu Nu Yee, Vice President, Myanmar Women Entrepreneurs' Association, Yangon
51. Mr Isaac Khen, Executive Director, Gender and Development Initiatives, Yangon,

#### NEPAL

52. Ms Pramila Acharya Rijal, Chairperson, SAARC Chamber Women Entrepreneurs' Council (SCWEC).
53. Mr Bidur Thapa, Director of Field Programmes and Operations, SEARCH-Nepal, Kathmandu
54. Ms Prativa Shrestha, Coordinator, Status of Women in Nepal Report, Shtrii Shakti, kathmandu,
55. Ms Radha Kayastha, Madhesh Foundation for Peace and Development, Kathmandu
56. Ms Abha Jha, Madhesh Foundation for Peace and Development, Kathmandu

#### PAKISTAN

57. Professor Salima Hashmi, Dean, School of Visual Arts and Design, Beaconhouse National University, Lahore
58. Ms Madeeha Gauhar, Artistic Director, Ajoka Theatre, Lahore.
59. Ms Madiha Kazi, Textile Designer, Thardeep Rural Development Programme, Karachi
60. Dr. Durre Sameena Ahmed, Chairperson and Senior Research Fellow, Center for the Study of Gender and Culture, Lahore
61. Ms Marianna Baabar, Diplomatic Editor, The News, 27 A, Harkey Street, Rawalpindi
62. Ms Zoia Tariq, CEO, ZEST Media/Events/Publications, Lahore
63. Ms Ambreen Waheed, Executive Director, Responsible Business Initiative, Lahore
64. Dr Faiz H Shah, Head, Development Management, Asian Institute of Technology, Bangkok.
65. Ms Tabinda Alkans Jaffery, CEO, Asasah Microfinance, Lahore
66. Ms Zehra Arshad, National Coordinator, Pakistan Coalition for Education, Islamabad.

#### SRI LANKA

67. Hon'ble Justice Shiranee Tilakawardane, Justice of the Supreme Court of Sri Lanka, Colombo 2.
68. Ms Vidyani Hettigoda, Chairperson, Women's Chamber of Industry and Commerce, Colombo.
69. Ms Nishani Jessica Marina Dissanayake, Foreign News Editor, Lakbima (Sinhala daily), and Editor, Samudra (Sinhala magazine)
70. Ms Mano Alles, Managing Director, Abans Financial Services, Colombo
71. Ms Rohini Nanayyakara, Chairperson and Board Member, Lanka Orix Leasing Company Ltd, and Lanka Orix Microcredit Limited, Colombo
72. Ms. Chandramali Liyanage, National Crafts Council of Sri Lanka, Colombo.

## Spire

Submission by Spire (<http://Spireorg.no>), a Norwegian youth-led non-governmental organisation, to the UN Conference on Sustainable Development (Rio+20) in Rio de Janeiro, 3 – 5 June 2012.

### Introduction

The Rio+20 summit must deliver an improved plan to solve the huge challenges we face in the area of development and environment. The plan should reflect the principle of common but different responsibility and the rights for young and future generations. The summit must acknowledge that in order to achieve sustainable development deep social changes need to take place. Short term economic growth can no longer be the measure of success. Spire opposes the commercialization of nature (as seen for example in the report "The Economics of Ecosystems and Biodiversity"). The outcome of the Rio conference needs to promote that nature is the basis of our wealth and has a value beyond what can be measured in economic terms.

Education for sustainable development and youth participation

Children and youth should be an integrated aspect of all development and environmental policy in the same way as women and gender. In order to obtain the necessary social transformation all parties need to prioritise education for sustainable development. Young people need to prepare for having sustainable livelihoods and taking part in the new green economy.

- Education for sustainable development must be integrated in all levels and all subjects in primary and higher education.
- Youth-led informal education for sustainable development must be recognised in terms of training and financial support. Young people have the right to participate and to be heard in decision making concerning our future. States are responsible of removing economic barriers which hinder youth participation and of opening up decision making fora for youth.
- Actual and representative youth participation in international fora for sustainable development must be secured. Official youth delegates can promote meaningful youth participation at an international level.
- Mechanisms which secure youth participation in national decision processes must be developed at national levels.

Institutional framework ensuring the rights of young and future generations

To ensure the rights of young and future generations, there is a need of institutional changes that better protects the environment. These institutions needs to be mandated compliance mechanisms.

- Rio must strengthen international environmental law and establish an International Environmental Court.
- Appointing an Ombudsperson for future generations at international and national level can be a good institutional mechanism for promoting sustainable development .

Food security means food sovereignty and sustainable small-scale agriculture

The principle of food sovereignty should be the framework for achieving food security. All countries must have the right to produce enough food for their population. Food security depends on sustainable small-scale agriculture adapted to local ecological conditions. Sustainable small-scale agriculture provides employment and livelihoods, is less harmful to the environment and more resilient for climate change than large-scale farming.

- Rio+20 must promote sustainable and responsible food production which is climate resilient, nutritious and provide livelihood and employment opportunities.
- The knowledge of youth and women, and their rights to land ownership must be recognised.
- Rio must establish an action plan for implementing the conclusions in the report "International Assessment of Agricultural Knowledge, Science and Technology for Development" (IAASTD).

Green energy for all

Energy access is essential in order to fight poverty. Small-scale production of renewable energy is an important part of the solution for ensuring energy access. At the same time, a transformation to renewable energy and reduced energy consumption in Western countries is needed. This can happen without negative consequences for living standards.

- Rio must promote an equal distribution of energy consumption globally, through increased access to green energy in developing countries and a dramatic reduction of energy consumption in developed countries.
- Direct and indirect subsidies on fossil fuel must be abolished.
- Rio must initiate a strong effort for developing green energy technology.
- Funding for green technology projects in developing countries must be in addition to traditional development aid.

---

## Stakeholder Forum for a Sustainable Future

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

#### 1. Introduction

The total population of the world has just passed seven billion and is continuing to increase. Everywhere people aspire to higher living standards and higher levels of consumption. There is growing concern about the capacity of the world's natural resources to provide food, energy and other materials to sustain this growing demand. At the same time the growing scale of human activity is threatening to cause dangerous levels of climate change, increased levels of pollution, destruction of natural habitats and biodiversity.

Operating within planetary boundaries is a necessary precondition for sustainability. But at present the world is pressing harder against ecological limits and we have already breached the safe operating space or boundaries for three of nine key planetary systems (climate change, biodiversity loss and excess nitrogen and phosphorus production). To balance the discussion on planetary boundaries we welcome the initiative of Oxfam to start a discussion on social boundaries.

At present the global economy is not effective in addressing these emerging problems. The drivers of the global economy tend to amplify and exacerbate them. As some fossil fuels become scarcer, more effort is put into developing more marginal sources with more severe environmental and pollution impacts. As pressures on food resources become greater more marginal land is taken and threats to biodiversity become greater. As fish stocks are depleted, fleets travel ever further from their bases threatening collapse of stocks on an oceanic or global basis. The impacts of greenhouse gas emissions, waste and pollution are inadequately controlled and grow ever more severe.

Business as usual is also proving to be ineffective even in its own terms. Pursuit of the wrong kind of growth and the wrong kind of investment has led to economic crisis and stagnation, job losses on a massive scale, and sharply growing inequalities both within and between countries.

In order to avoid catastrophe the operation of the global economy needs to be transformed. All resources need to be used more efficiently, and renewable resources to be substituted for finite non-renewable ones. Renewable resources (e.g. marine fish stocks) need to be managed in a way that ensures that they are indeed renewed. Key habitats and biodiversity need to be conserved. Greenhouse gas emissions and other damaging pollution need to be cut back. Waste needs to be minimised, and reuse and recycling maximised. Vested interests, monopoly power and excessive rewards for the few need to be curbed, with greater equity within and between countries established.

Furthermore, we need to reform existing institutions and create new institutions to deliver this sustainable future. However, form must follow function and it is vital that any new institutional framework is fit for purpose.

All parts of society need to be engaged in the transition, as they will all be affected by the changes. So the transition must be managed in an open and co-operative way that ensures a just and fair transition to the sustainable green economy. We need common value and language and new politics to shape and guide the transition in a harmonious and equitable way. Only then will we create the trust required to build socio-environmental security and resilience, now and into the future.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

6. Supplementary information

6.1. Bonn DPI Declaration – Sustainable Development Goals

To achieve the goals of Rio + 20 in an ambitious, time-bound and accountable manner, we call upon governments in accordance with human rights, the principle of common but differentiated responsibilities, and respective capabilities to adopt the following draft Sustainable Development Goals together with the sub-goals, reasons and clarifications relating to each goal

The goals below are aspirational. While some of these are based on commitments already made by governments and other stakeholders, others are proposed on the basis of advanced thinking among civil society organizations.

**SDG – SUSTAINABLE CONSUMPTION AND PRODUCTION:** By 2020, consistent with the Biodiversity Strategic Plan adopted at the 10th meeting of the Conference of Parties to the UN Convention on Biological Diversity ("CBD COP10"), the human ecological footprint is reduced so that it remains within the Earth's biological carrying capacity. In accordance with the principle of common but differentiated responsibilities, we call on nations and populations engaged in wasteful overconsumption to reduce their impacts and help increase the consumption of vital goods and services for impoverished nations and peoples, so they also can enjoy reasonably high standards of living that provide equitable access to health care, decent work opportunities and education.

By 2020, governments should promote production processes that reflect the best available technologies for eco-efficiency, recycling, remanufacturing, reuse of waste materials, product durability and longevity. Wasteful practices such as planned obsolescence are identified and eliminated. Public procurement standards and incentives reward leading corporations that share and disseminate best green practices worldwide. By 2020, the majority of the world's goods and services are procured by governments from sources certified by objective third parties as sustainably produced.

This goal is tied to the preparation and implementation of sustainability or green economy roadmaps, that consider and address commonly agreed sustainability principles, adopt sustainable development goals in critical areas, and implement governance reforms to foster the transition to a green economy and to improve the institutional framework for sustainable development.

Further, establish a set of Millennium Consumption Goals for the period 2012-2020 towards creating an intergenerational and internationally shared right to equitable consumption opportunities and ensuring quality of life and wellbeing of all people by 2020, while eradicating all kinds and levels of poverty, respecting animal welfare and embedding sufficiency based sustainable economies.

**SDG – SUSTAINABLE LIVELIHOODS, YOUTH & EDUCATION:** By 2015, nations commit to the principle of sustainable livelihoods as a right for all people and implement monetary, fiscal and language policies to encourage full and decent work. By 2020, biodiversity and ecosystem service considerations are mainstreamed within existing rural development platforms and initiatives to conserve sustainable livelihoods in indigenous and local communities that depend on natural capital for survival.

By 2015, governments incorporate within development frameworks as a priority, investments in the education, health and employment of young people, who constitute a large proportion of the population of developing countries and face disproportionate levels of poverty, unemployment, gender discrimination and ill health. Governments should support comprehensive policies, youth participation and multisectoral programmes that empower present and future generations to fully and freely exercise their human rights, fulfil their aspirations and be productive citizens.

By 2030, national governments reorient all national aims and objectives towards achieving sustainable societies and will mainstream sustainable development into all national educational policies and curricula.

By 2020, consistent with the Biodiversity Strategic Plan adopted at CBD COP10, governments ensure that people are aware of the values of biodiversity and the step they can take to conserve and use it sustainably.

**SDG - CLIMATE SUSTAINABILITY:** By 2050, governments should have reached clear pathways towards climate sustainability that regulates the global temperature rise below 1.5 degrees C. Emissions of greenhouse gases should be reduced to 25% of 1990 levels by 2020, 40% by 2030, 60% by 2040 and 80% by 2050. Carbon taxes and tariffs should be in place to provide incentives for low-carbon development and manufacturing, finance GHG emissions reduction projects, REDD+ and other offset mechanisms, and green infrastructure solutions to help vulnerable communities adapt to climate change.

Developed countries, as the main cause of climate change, in assuming their historical responsibility, must recognize and honor their climate debt in all of its dimensions as the basis for a just, effective, and scientific solution to climate change. The above goal shall include the equitable sharing of remaining atmospheric space, considering past use and consumption and mid and long-term emission reduction targets that are in line with what the science requires.

**SDG – CLEAN ENERGY:** By 2030, at least 50% of the world's energy supply comes from renewable sources. By 2020 energy demand is reduced through efficiency and conservation by at least 20%. By 2030 energy poverty is eliminated by providing universal access to modern energy services from renewable sources.

**SDG - BIODIVERSITY:** Governments are urged to honor their commitments to implementing the Strategic Plan for Biodiversity, in particular those related to the Green Economy such as Target 2: "By 2020, at the latest, biodiversity values have been integrated into national and local development and poverty reduction strategies and planning processes and are being incorporated into national accounting, as appropriate, and reporting systems"; and Target 3: "By 2020, at the latest, incentives, including subsidies, harmful to biodiversity are eliminated, phased out or reformed in order to minimize or avoid negative impacts." We urge governments to support investments in natural infrastructure and ecological restoration and to facilitate the development of markets that value the regulatory services provided by ecosystems.

**SDG –WATER:** By 2030, governments will achieve universal availability of an acceptable quantity and quality of water for health, livelihoods, ecosystems and production, adequate sanitation, coupled with an acceptable level of water-related risks to people, environments and economies.

This goal is over and above the achievement of the MDGs and other internationally agreed development goals. The right to safe and clean drinking water and sanitation shall be recognized as a human right and it shall be the responsibility of all states to respect such right. As an interim goal, by 2015 the proportion of people unable to reach or afford safe drinking water, and without access to basic sanitation, shall be halved as agreed in the JPOI.

By 2020, local, municipal and national governments and all stakeholders commit to achieve the following intermediate targets:

20% increase in total food supply-chain efficiency – reducing losses and waste from field to fork;

20% increase in water efficiency in agriculture – more nutrition and crop per drop;

20% increase in water use efficiency in energy production – more kWh per drop;

20% increase in the quantity of water reused;

20% decrease in water pollution;

**SDG – HEALTHY SEAS AND OCEANS (BLUE ECONOMY):** By 2020, consistent with the Strategic Plan for Biodiversity, governments establish at least 10% coastal and marine areas. By 2030, oceanic dead zones will be recovered by reducing nitrogen runoff from land by 50% or more. By 2020, Marine Protected Areas will be established in at least 25% of each Exclusive Economic Zones (—EEZII) and the high seas in representative networks capable of restoring minimum viable populations of all at-risk stocks, protecting marine biological diversity, and maximizing benefits to commercial and subsistence fishers in surrounding waters. By 2015, the use of bottom trawling, dynamite fishing, electro-fishing, poisons and other unsustainable practices will be eliminated. By 2030, reverse the decline of fish stocks and create sustainable and diverse and abundant fish stocks, supported by healthy habitat to provide for the needs of all users, and by 2015, ban the practice of shark finning.

We also make the following policy recommendations: (a) reduce plastic pollution in the oceans, including by banning or taxing single-use plastics, supporting the use of recycled plastics in new products, and holding manufacturers responsible for plastics through their entire life cycle; (b) establish an international monitoring network for ocean acidification to enable the identification of vulnerable regions and industries and to provide an early warning system for industries already experiencing harm; (c) designate the high seas of the Central Arctic Ocean as a zone for international scientific cooperation, where extractive and polluting activities are suspended until we have a better understanding of the area and the potential effects of such activities; and (d) schedule, as a matter of urgency, an intergovernmental conference to address the multiplying threats to ocean areas beyond the jurisdiction of individual nations.

**SDG – HEALTHY FORESTS:** By 2020, all remaining frontier forests are protected from conversion and degradation, consistent with the Strategic Plan for Biodiversity adopted at COP10, with a well-resourced and equably governed REDD+ mechanism in place, which respects the rights and knowledge of indigenous peoples and local communities and other environmental and governance safeguards, to reward developing countries for protection and sustainable management of their forests, not only for carbon capture and storage but for their wider ecological services. A policy of no net loss of forestland, globally and nationally, is also achieved by 2020. At that time, all new forest areas cleared will be offset by ecologically sound restoration of forests in nearby areas. Restoration of over 150 million hectares of cleared or degraded forest landscapes is achieved by 2020, with the creation of millions of new jobs and enhanced livelihoods, improved security and adaptation to climate change.

Reduce deforestation emissions by key corporations and their supply chains committing to avoid the purchase of products that cause deforestation, such as soy or cattle from deforested lands in the Brazilian Amazon, palm oil from deforested agricultural land in Indonesia, or illegal wood and wood products throughout the world.

Additionally, for stakeholders everywhere to undertake and/or participate in large-scale, environmentally and socially responsible reforestation efforts.

Measures proposed under the Clean Development Mechanism (—CDMII) must be carefully examined by the communities depending on forests for their subsistence, as we see that they favor already important land-grabbing and the destruction of their livelihoods.

At Rio+20, we call on governments to pledge concrete and systematic support and promotion of multi stakeholder managed forest certification systems, in all parts of the world, with particular emphasis on tropical rainforests.

**SDG - SUSTAINABLE AGRICULTURE:** By 2030, global agricultural production is transformed from industrial to sustainable. Chemical inputs, herbicides, and pesticides are largely replaced with organic and biological alternatives. Interspersed natural areas are protected and restored as sources of pollination, pest control and soil fertility. Food for export is secondary to food for local consumption. Cultivated crop strains are diversified, as are production techniques and the mix of agricultural producers. Best management practices reduce erosion by 90% and nitrogen runoff by 50% or more. Local ecological knowledge of indigenous peoples, traditional, and local communities is utilized to identify resilient crops and cultivation practices that provide maximum protection against climate change.

This goal should also include sustainable and humane food systems that provide healthy food to meet current food needs while maintaining healthy ecosystems, farmer resilience, and ensure good animal health and welfare that can also provide food for generations to come with minimal negative impact to the environment, through agro-ecological farming systems. We consider the right to keep their own seeds as an important issue of farming.

A sustainable and humane food system should promote food sovereignty of communities, empower small-scale food producers in food and agricultural governance, and also encourage local production and distribution infrastructures with equal opportunities for men and women farmers, and the important role of youth in this area, and makes nutritious food available, accessible, and affordable to all, while at the same time providing sustainable livelihoods to producers through the payment of fair prices for their products. Sustainable food systems must be based on food sovereignty and the right for small-scale peasants, women's groups and local communities to plant and exchange their seeds and share their knowledge.

Give strong and increasing support to small scale farming, producing healthy foods through targeted research, extension services and enabling conditions, and wherever possible, vegetarian diets, and to ensure women's property and inheritance rights.

Recognize and support by all means possible, the important role and special needs of women as the primary producers and purchasers of food, along with the implementation of women's property and inheritance rights.

**SDG - GREEN CITIES:** By 2030, cities have developed and are implementing action plans to address transport, public health and environmental needs in a harmonious and integrated way. By 2030, from the local to national, government policies foster compact, mixed-use, pedestrian-oriented, urban development that minimizes energy use and maximizes residential health and that reflects the concept of a society for all ages. All new buildings meet green building standards by 2030. By 2030, city transport needs are or remain predominantly met by mass transport, walking and bicycling. Quality of life is also improved for residents by 2030, providing access to green buildings with urban rooftop gardens, clean water, clean energy, waste management systems and sustainable transport. By 2030, urban areas with significant storm water pollution issues reduce impervious surface area by 30% below 2012 levels.

**SDG - SUBSIDIES AND INVESTMENT:** By 2020 at the latest, consistent with the Biodiversity Strategic Plan adopted at CBD COP10, harmful incentives, including subsidies, for fossil fuel production, unsustainable agricultural, fisheries and forest practices, and those harmful to biodiversity, are eliminated, phased out or redirected to promote renewable energy, sustainable practices and the conservation and sustainable use of biodiversity. By 2015, governments commit to a minimum investment of 2% of GDP per year to foster the transition to a green economy, taking into account national socio-economic conditions.

**SDG - NEW INDICATORS OF PROGRESS:** By 2020, nations supplement or replace GDP with a new measure of sustainable economic welfare based on best available information at that time. Economic performance and the forecasted effects of policy changes will be measured by this new metric. We encourage a process of continuous improvement and refinement of the new measure over time and an international process to set standards and make available common methods and data sources. We also encourage the adoption of several other headline indicators of environmental, economic, social, cultural and linguistic sustainability to provide a measure of progress towards the green economy transition, such as civic participation, improved well-being and achievement of sustainable development goals.

**SDG - ACCESS TO INFORMATION:** By 2022, governments will enact and implement Freedom of Information laws giving people the right to obtain accurate and truthful information held by their government, especially on the environment. Governments will actively make available to all stakeholders useful, accurate and truthful well-publicized data and information in appropriate formats and languages, including on the internet. These laws should include whistleblower protection and should extend to information disclosure by corporations.

**SDG - PUBLIC PARTICIPATION:** By 2022, governments need to ensure that voluntarism and citizen engagement are incorporated in all global, national and local action plans for implementation of sustainable development and human well-being, to commit to the creation of an enabling environment for citizen engagement and voluntary action, and will include mandatory public participation in (a) major development project approvals and environmental impact assessment procedures, (b) drafting of national level sustainable development policies, laws and regulations and (c) administrative decisions such as pollution permitting.

**SDG - ACCESS TO REDRESS AND REMEDY:** By 2022, governments will adopt and implement laws ensuring effective access to judicial and administrative proceedings concerning sustainable development, including redress and remedy. In particular, they will ensure that the costs of such proceedings are reasonable and affordable to affected people and that access to such proceedings is available through expansion of legal standing and other means to interested people and organizations.

**SDG - ENVIRONMENTAL JUSTICE FOR THE POOR AND MARGINALIZED:** By 2022, governments will adopt laws that obligate government agencies to take appropriate measures to provide information and engage affected people living in poverty, women and other disadvantaged groups when making sustainable development decisions.

**SDG – BASIC HEALTH:** By 2015, to support attainment of the health MDGs, and to contribute to health, well-being and sustainable development, ensure universal access to

health care and services, wherever feasible, free at the point of use for women and children, and including sexual and reproductive health, and thus strengthen the resilience of people and communities to the consequences of climate change and environmental degradation.

## 6.2. Principles of a Fair and Green Economy

For a full discussion on how the Principles were drawn together see: <http://www.stakeholderforum.org/fileadmin/files/Principles%20FINAL%20LAYOUT.pdf>

### 1. Equitable distribution of wealth

Promote the equitable distribution of wealth within nations and among nations, to reduce disparities between rich and poor, and achieve social and economic justice, within a sustainable and fair share of the world's resources and leaving sufficient space for wildlife and wilderness.

### 2. Economic equity and fairness

Guided by the principle of common but differentiated responsibilities, create economic partnerships that would transfer substantial financial and technological assistance to less developed countries, to help minimize the gap between the developed and developing world and support the environmental sustainability of both.

### 3. Intergenerational Equity

Environmental resources and ecosystems must be carefully managed and safeguarded so as to enhance the value of environmental assets for future generations, thereby equitably meeting their needs and allowing them to flourish.

### 4. Precautionary Approach

Science should be utilized to enhance social and environmental outcomes, through the identification of environmental risk. Scientific uncertainty of environmental impacts shall not lead to avoidance of measures to prevent environmental degradation. The 'burden of proof' should lie with those claiming that there will not be significant environmental impacts

### 5. The Right to Human Development

In harmony with the environment is fundamental to the achievement of sustainable development, so that individuals and societies are empowered to achieve positive social and environmental outcomes.

### 6. Internalization of Externalities

Building true social and environmental value should be the central goal of policy. To this end, market prices must reflect real social and environmental costs and benefits, so that the polluter bears the cost of pollution. Tax regimes and regulatory frameworks should be used to 'tilt the playing field', making 'good' things cheap and 'bad' things very expensive.

### 7. International Cooperation

The application of environmental standards within nation States must be undertaken in a cooperative manner with the international community, based on an understanding of the possible impact on the development potential of other States. Environmental measures relating to trade should avoid unfair protectionism, but overall should ensure that trade supports sustainable resource use, environmental protection and progressive labor standards, promoting a 'race to the top' rather than the bottom.

### 8. International liability

Acknowledging that actions within national boundaries can cause environmental impacts beyond national jurisdictions, requiring cooperation in the development of international law that allows for independent judicial remedies in such cases.

### 9. Information, participation and accountability

All citizens should have access to information concerning the environment, as well as the opportunity to participate in decision-making processes. To ensure that environmental issues are handled with the participation of all concerned citizens, institutions at all levels (national and international) must be democratic and accountable, and make use of tools that enable civil society to hold them to account. In this regard, the access to justice by citizens for redress and remedy in environmental matters is a cornerstone of enhancing accountability.

### 10. Sustainable Consumption and Production

Introduce sustainable production and consumption with sustainable and equitable resource use. Reduce and eliminate unsustainable patterns of production and consumption, i.e. reduce, reuse, and recycle the materials used, acknowledge the scarcity of the Earth resources and implement activities accordingly.

### 11. Strategic, co-ordinated and integrated planning to deliver sustainable development, the green economy and poverty alleviation.

An integrated approach must be adopted at all levels to expedite the achievement of socio-economic and environmental sustainability through strategic planning with civil society and stakeholders, and across all relevant government departments.

### 12. Just Transition

There will be costs in making the transition to a low carbon, green economy in the pursuit of sustainable development. Some States and actors are better able to bear those costs than others and are more resilient to transitional changes. In the process of change, the most vulnerable must be supported and protected – developing countries must have access to appropriate financial and technical assistance, citizens and communities must also have access to new skills and jobs.

### 13. Redefine Well-being

GDP is an inadequate tool for measuring social wellbeing and environmental integrity. Many socially and environmentally damaging activities enhance GDP – such as fossil fuel exploitation and financial speculation. Human wellbeing and quality of life, and environmental health should be the guiding objectives of economic development.

### 14. Gender Equality

Gender equality and equity are prerequisites to the transition to a green economy and the achievement of sustainable development. Women have a vital role to play as agents of change for environmental management and development – their actions must be rewarded accordingly and their skills enhanced.

### 15. Safeguard biodiversity and prevent pollution of any part of the environment

Protect and restore biodiversity and natural habitats as integral to development and human wellbeing, and develop a system of governance that protects the resilience of ecosystems to prevent irreversible damage.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

---

## 4. Continued Engagement of Stakeholders

Rio +20 is going to be a multi-stakeholder Summit. Partnerships between the many sectors in society can be developed, created and strengthened in the lead up to Rio+20 and during the conference itself. Each sector needs to recognise the contribution and potential of the others and to seek out new ways of helping and reinforcing each other's efforts for sustainability.

Governments assembled at Rio could help by recognising and endorsing the various high level declarations and commitments that will be made by the principal sectoral organisations or groupings also assembled at Rio, and annexing them to the final Rio declaration. Each Government should also commit itself at Rio to encouraging and promoting action for sustainable development by all the major groups working for sustainable development at national level in its own country, including regional and local governments, businesses and trade unions, and all the wide variety of non-governmental organisations and other groups.

As each Government develops or renews its own sustainable development implementation strategy after Rio it should also commit itself to working with all these other actors in an open, transparent and co-operative way so as to build effective partnerships for the sustainability transition, and to mobilise the human and financial resources needed to achieve it.

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

### 5. Sectoral Issues and Challenges

There are also specific sectoral and thematic issues that must be discussed at Rio+20. These issues have reached a point of urgency and require immediate attention. The issues include, but are not limited to:

- The water, energy and food securities nexus – Global trends such as population growth and rising economic prosperity are expected to increase demand for energy, food and water, which will further compromise the sustainable use of natural resources and equitable access. This pressure on resources could ultimately result in shortages which may put water, energy and food security for the people at further risk, hamper economic development and poverty reduction, lead to social and geopolitical tensions and cause lasting irreparable environmental damage.

Ensuring the resilience of basic ecosystems services through the integration of common challenges and solutions of these securities is vital; which should be coupled with principles of fair and secure access to water, energy and food for all people.

- The Blue Economy – Healthy oceans provide tremendous economic, social, and environmental benefits that directly support livelihoods around the globe, and further support life-sustaining processes for the planet. Consideration and inclusion of these services at Rio+20 is imperative to ensure the global community can continue to rely on the marine environment on which it so essentially depends.

Regulation of the marine ecosystems such as international and national standards should be established to ensure sustainability underpins the localized and wider blue economy. The proposed Sustainable Development Council, UNEP and proposed WEO could play a role in this. In particular, regulation could include: licensing for markets; access criteria that relate to conditions for access based on social, environmental and economic impacts could be developed; transparent allocation of fishing quotas; and independent and verifiable measures for quotas and the renewable and sustainable exploitation of marine resources.

Rio can set us on course to cease overfishing and restore fish stocks to ecosystem maximum health. In order to achieve this it is essential that all exploitation of renewable marine resources and commercial fishing must be environmentally, socially and economically sustainable (includes fish, water, coastal ecosystems and reefs); and that non-renewable resources such as oil and gas must have their subsidies phased out.

- Sustainable Agriculture and Food – There is a need for urgent reform of the global food system. This requires an understanding of the complexities of our planet's ecosystem services, the way in which they interact with one another and our impacts on them.

UN policies and programmes and Rio+20 provide an opportunity for global leaders to agree on humane and sustainable agriculture policy and practice, with a focus on agro ecological approaches and recognising the fundamental role of small scale farmers in providing food for those most in need, the majority of which are women. In addition to improving the efficiency of food systems and reducing waste, a focus should be on improving production. These goals can be achieved in part through sharing of knowledge, best practice and technology.

Resilient, healthy and localised food systems that are supported by a multi-functional and agro-ecological food production system can be created. Through re-orienting agricultural assistance to prioritise sustainable agriculture practices, by curbing food speculation and price volatility, and by ceasing no patenting of life forms, sustainable agricultural systems can be achieved.

- Renewable Energy - Addressing energy access through locally appropriate renewable technologies enables development and catalyses a global shift away from fossil fuels. UN initiatives and Rio+20 offer opportunities to build on the extensive research that exists on the most effective way to catalyse the uptake of renewable technology. Meanwhile, outcomes must ensure that the necessary energy transformation respects the principles of a green and fair economy. Communities and stakeholders must be central to all policies at each stage and on all levels (global, national and local level).

Policy enablers that increase the capacity of national governments to decentralize the energy system could be developed and international governance that supports the re-shifting of subsidies away from fossil and polluting fuels to clean and renewable fuels must be delivered. The High Level Commission on access to energy should be integrated into the new and existing framework for sustainable development governance.

Development of a Global Feed In Tariff to finance electrification programmes in the global south, would enable the transition to a low carbon energy system that is 100% renewable electricity and that provides fair and universal access for all from wind, water or solar sources; and universal access to modern energy services. Development and adoption of specific criteria to achieve this include, affordability, transparent and inclusive decision making, and inclusive ownership models (e.g. cooperatives).

- Green Skills and Jobs – Lifelong learning and skills that are environmentally sound; socially decent and reflective of the need to transition to the green and fair economy will underpin the development of the green job and skills industry. The employment sector can rapidly expand to allow for the expansion of the industry, goods and services and other related green jobs that is already underway.

National governments could support education and training programmes in the green jobs and skills sector and establish an international monitoring body for green skills and jobs. There is a significant role that investment of taxes into the sector can play, and establishing industrial policies that reflect the core values of green jobs.

Such initiatives can strengthen the drive for regeneration and re-skilling in the sector and create decent, environmentally friendly work creation to bring employment to the vast majority of unemployed across the globe.

- Urbanisation and Planning – Efficient and inclusive urban mobility is essential for economic and social development since it enables citizens to access goods, services, jobs, markets, education opportunities and social contacts. Yet, urban planning and management has been unable to either cope with the growth thus far or address urban challenges. So without improved capability for urban planning and greater political vision and support, this future increase is likely to cause significant socio-environmental problems for our cities and towns. The rapid urbanisation and growth of cities must be addressed so that there is fair access to resources as well as sustainable resource

use.

Through planning compact communities and directing development towards existing communities; providing sustainable transport choices; preserving open space, farmland, natural beauty, and critical environmental areas; and creating a range of housing opportunities and choice quality living for people of all income groups, ages and needs we can rethink the design of the urban landscape. Development decisions must be made in a fair and economically inclusive way to develop systems focussed on the delivery of sustainable development, operating within environmental limits and enabling social justice.

• Sustainable consumption and production - Consistent with the Biodiversity Strategic Plan adopted at the 10th meeting of the Conference of Parties to the UN Convention on Biological Diversity ("CBD COP10"), the human ecological footprint is reduced so that it remains within the Earth's biological carrying capacity. In accordance with the principle of common but differentiated responsibilities, we call on nations and populations engaged in wasteful overconsumption to reduce their impacts and help increase the consumption of vital goods and services for impoverished nations and peoples, so they also can enjoy reasonably high standards of living that provide equitable access to health care, decent work opportunities and education.

Governments should promote production processes that reflect the best available technologies for eco-efficiency, recycling, remanufacturing, reuse of waste materials, product durability and longevity. Wasteful practices such as planned obsolescence are identified and eliminated. Public procurement standards and incentives reward leading corporations that share and disseminate best green practices worldwide. By 2020, the majority of the world's goods and services are procured by governments from sources certified by objective third parties as sustainably produced.

Trade – Outsourced emissions are a major loophole in current efforts to tackle climate change and build a green economy. International flows of carbon embedded in trade have grown considerably since the original Rio summit, with developed northern nations benefiting unjustly from effectively outsourcing pollution to the global South, and in particular China and India.

Agree to the principle of Clean Trade Agreements. These arrangements, negotiated between states and regions, would come to replace Free Trade Areas and build mutually-agreed carbon constraints into the terms of trade. Clean Trade Agreements would aim to halt the 'race to the bottom' witnessed as globalization has unfolded – where industry invariably migrates to regions with the least stringent environmental regulations – and reverse the growth in outsourced emissions.

---

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

## 2. The Green and Fair Economy

The Green Economy needs to be a fair one, with all that this implies. To this end, the social dimension of sustainable development needs to be given greater emphasis. The basic preconditions for this are: social cohesion, fairness, including inter-generational fairness, fair redistribution and solutions for social problems such as growing inequality, lack of access to a whole range of resources, poverty and unemployment. The transition to a green economy will only be politically acceptable if it is pursued in an equitable way, both within and between countries.

The change needed is big and promising, but it will also be disruptive to some businesses and economic interests. It is therefore essential that everyone should be fully informed and should fully understand the reasons for the changes and be brought into a broad coalition and alliance for change; and that the interests of all those who may be adversely affected in the short-term are properly taken into account.

The work on planetary boundaries, biocapacity thresholds and One Planet Living offer important contributions to understanding the global ecological landscape within which Rio+20 is operating, and can offer compelling support for the need to embark on such a global transition.

The Summit should establish agreement and commitment on the following:

1. Principles to be embodied in the green and fair economy and to guide transition towards it;
2. Quantification of the various dimensions or aspects of a green economy and how to measure progress towards it;
3. Progress on Sustainable Development Goals (SDGs) and incremental targets with key dates by 2015 to act as a successor framework for the Millennium Development Goals (MDGs);
4. Measures needed to promote green economy - a toolbox of green reforms;
5. Guiding principles and specific measures needed in key sectors;
6. The just transition - Ensuring fairness within and between countries;
7. Engaging and mobilising stakeholders in the transition;
8. Financing the transition; and
9. The institutions to govern and guide the transition, nationally and internationally.

### 2.1. Principles for a Green and Fair Economy

Recognising the challenges of this agenda, it is therefore critical that any global agreements that advance progress towards a green economy are governed by an over-arching set of principles that have common currency among governments and stakeholders alike.

There is range of literature that can be drawn upon in the identification of some common guiding principles for the green economy. Rio +20 should pay particular attention to strengthening existing and agreed Principles in such a way as to give a stronger impetus to the key requirements of the green economy. Fifteen in particular have been identified that draw on The Stockholm Declaration, the Johannesburg Declaration, The Earth Charter, The One Planet Living Principles, The Green Economy Coalition (GEC), the Trade Unions Congress' (TUC) 'Just Transition' principles, and nef's (the new economics foundation) work on the new economy and their Great Transition programme of work and campaign.

1. Equitable distribution of wealth
2. Economic equity and fairness
3. Intergenerational Equity
4. Precautionary Approach
5. The Right to Human Development
6. Internalization of Externalities

7. International Cooperation
8. International liability
9. Information, participation and accountability
10. Sustainable Consumption and Production
11. Strategic, co-ordinated and integrated planning to deliver sustainable development, the green economy and poverty alleviation.
12. Just Transition
13. Redefine Well-being
14. Gender Equality
15. Safeguard biodiversity and prevent pollution of any part of the environment

Section 6 below goes into more detail and gives full explanatory text on each of these principles.

## 2.2. Specific initiatives

Specific initiatives to enable and promote the Green and Fair Economy include:

- Beyond GDP - The current reliance on economic growth and GDP as an indicator of success has led to perverse outcomes. It has not delivered fair levels of well-being for society or individuals. GDP is an inadequate metric through which to gauge well-being over time. Instead we need to reassess our common values, making decisions that lead to a green and fair economy around what we really value. There is an important distinction between assessing current well-being and assessing sustainability.
- Sustainable Management of Natural Resources and Capitals - The poor management and regulation of natural assets and ecosystems leads to increasingly frequent and severe regional and global crises, and is a major factor behind food, water and energy insecurity (see Section 3 below for further details on these securities). Outcomes from Rio+20 must ensure that national development strategies take full account of the state of natural assets and ecosystems, and their role in sustaining human and animal well-being and economic activity; actively investing in their conservation and enhancement to avoid a devastating and irreversible global crisis. National ecological wealth accounting should also be integrated into national accounts and sovereign credit rating in order to develop an economic system that maintains and enhances natural capital.
- Fiscal Reform - True environmental costs of production and consumption must be internalised into accounting models in order to address the causes rather than simply the symptoms of environmental degradation. The polluter pays principle should be adopted in practice in standard accounting and reporting practices for both business and governments, so that these costs can be reflected in market valuations and environmental impact assessments. Furthermore, green taxes should be used to incentivise positive behaviours and discourage harmful ones. For example, an internationally agreed mechanism to raise finance from international transport.

A global Financial Transaction Tax (FTT) should be implemented, with a significant proportion of the revenue raised used to support long-term efforts to fight climate change in developing countries and implementing sustainability programmes. Lastly, all subsidies that undermine sustainable development should be eliminated, particularly those underpinning fossil fuel use and unsustainable agricultural and fishery practices.

The Santiago Principles for sovereign wealth funds could be amended to direct funds to sustainable development activities and fiduciary responsibilities could be reformed to realign the systemic process driving short-termism. By shifting fund manager's incentives away from short-term gains by integrating these long-term principles and frameworks into the market system, sustainability can be built into the financial architecture, which drives investment decisions. In addition the credit rating system could integrate sustainability criteria in line with the principles of the green and fair economy.

- Sustainable Public Procurement – Governments must use public procurement as a leadership and leveraging tool to promote the Green and Fair Economy. All public procurement contracts should include specifications for labour, well-being and environmental sustainability standards. Regulation could also be implemented to ensure the reuse of waste as raw material for new products to maximize the lifecycle and take action through providing the right incentives for research and development and by driving a cradle-to-cradle approach to manufacturing and industry.
- Global Convention on Rio Declaration Principle 10 – Access to environmental information, participation in transparent decision-making processes, and access to judicial and administrative proceedings should be basic rights for all, at all levels of decision-making, including local, national and international processes. Rio+20 should support a proposal for a Global Convention on Access to Information based on Principle 10 of the 1992 Rio Declaration. There could also be regional replications of the Aarhus Convention in other parts of the world.
- Convention on Corporate Sustainability – The convention would operate under, four key principles:
  1. Transparency – companies should be required to integrate material sustainability issues within their report and accounts;
  2. Accountability – there should be effective mechanisms for investors to hold companies to account on the quality of their disclosures, including through an advisory vote at its All General Meeting (AGM);
  3. Responsibility – Board duties should explicitly include setting company's values and standards and ensuring that its obligations to its shareholders and other stakeholders are understood and met;
  4. Incentives – Companies should state in remuneration reports whether the remuneration committee consider ESG factors which are of material relevance to the sustainability and long term interests of the company when setting remuneration of executive directors; aligning remuneration with the interest of the shareholders, including customers and employees.

Companies should be required to present their Corporate Sustainability Strategy to a separate vote at its AGM. If no report is to be published a justification for this should be produced and this justification should also be put to a vote.

The future convention should draw on experiences and content from the Global Compact, Sustainable Stock Exchanges initiative, Carbon Disclosure Project and the OECD guidelines. Voluntary Initiatives such as the successful ISO 26000 and the Global Report Initiative can provide guidance on the framework necessary to ease the implementation of Sustainability Reporting.

Governments may wish to relook at the proposed Chapter 41 of Agenda 21 from 1991. This was called Transnational Corporations and Sustainable Development and submitted for consideration by the UN Center for Transnational Corporations.

- Roadmap or pathway to a green and fair economy – Such a roadmap or pathway should combine the elements of the core principles of the Green and Fair Economy with the sectoral goals and target integrated to develop a transition pathway that can be geographically, politically and culturally relevant to the diverse populations and societies across the globe. It is important that the recommendations are not too specific as to be alienating for different countries; but to offer enough of a 'map' or 'blueprint' that can be used globally.

The concepts and initiatives on the Green and Fair Economy presented above were developed as a part of Stakeholder Forum's Global Transition 2012 initiative, in partnership with nef (new economics foundation) and the New Economics Institute; as well as other multi-stakeholder consultations and initiatives. These include peer-reviewed think pieces from several different authors. For full details and to read the think pieces, please visit the website – [www.globaltransition2012.org](http://www.globaltransition2012.org). It also draws on the work Stakeholder Forum has been engaged in as Chair of the BOND Development and Environment Group (BOND-DEG) in the UK (which has made its own submission to the zero draft), and the Bonn DPI Declaration.

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

### 3. Institutional Framework for Sustainable Development

There is growing acceptance of the need to strengthen and reform the institutions dealing with sustainable development at all levels of governance, local, national, regional and global. Rio+20 has been given a mandate by the UN General Assembly to take action to strengthen these institutions. However, it is vital that form must follow function for any reform of the institutional framework for sustainable development. Rio+20 should seek to improve the integration of the different elements on sustainable development; social, environment and economic.

#### 3.1. Integrating Sustainable Development Across the UN

Rio+20 should seek to establish a permanent Sustainable Development Council, on par with the Council on Human Rights as a subsidiary body of the UN General Assembly.

The Council would address new and emerging issues such as the nexus of water, energy and food security, addressing climate change impacts, and consider the changes required in economy post Rio+20. It is vitally important for governments to consider the inter-linkages between these areas, most of which do not have a place in the UN system for discussion individually or collectively.

In order to integrate the three pillars of sustainable development, the Council should be given authority to request reports from the specialised agencies working on social, economic and environmental issues:

- Specialised agencies with a mandate focussing on social issues, such as ILO, WHO, UNESCO and others would report on social issues;
- Units working on economy and finance, such as IFCs, IMF, the World Bank Group would report on economic issues and on green economy;
- While a new and strengthened UN environment organisation (see below) with a specialised agency position, and specialised agencies with an environment portfolio (such as FAO, WMO, IMO, ICA and others) would all report on environmental issues.

To further develop the capacity of the Sustainable Development Council to function as the highest body of the United Nations to deal with sustainable development, Rio+20 should:

- Ask the UN General Assembly at its next session to establish a high level committee of experts to provide specific proposals regarding the structure, mandate, modalities and work-programme of this Council and how to provide the Council with the necessary authority within the UN system to effectively interact with all levels of the intergovernmental system;
- Further mandate the committee of experts to report to the General Assembly by December 2012, with either specific recommendations regarding function and modalities of the Sustainable Development Council. Or with a recommendation that at its first meeting, in 2013, the new Council should determine its own modalities;
- Ensure that this high level committee includes expert representatives from all relevant stakeholders, including governments, the intergovernmental system, the major groups and academia.

In order to ensure that the whole UN system operates effectively to support the work of the Sustainable Development Council, the following institutions should be explored in supporting the structure, mandate and modalities of the new Council:

- An Interagency Committee on Sustainable Development, building on the experiences from earlier and present interagency committees, now named appropriately the High Level Committee on Sustainable Development could be established to service the Chief Executive Board of the Council;
- A Sustainable Development Board - made up of the governing bodies of UNFPA, UNICEF, UNDP, WFP, UNEP and UN Habitat and other relevant and similar units - should be formed to meet once a year to coordinate their policies, and support sustainable development at the country level. This would focus on support for the UN Delivering as One process. It would be able to report to the Council on emerging threats at the country level.
- An Intergovernmental Panel on Sustainable Development should be set up to ensure that there was no fragmentation between scientific panels. The Panel should be given a specific mandate to ensure that the scientific bodies are able to integrate their findings and create a more coherent information base from which governments and other organisations can make better, more informed decisions. It should be modelled on experiences from the International Panel on Climate Change (IPCC), and be given oversight of IPCC and the Intergovernmental Platform on Biodiversity and Ecosystems Services (IPBES) and any future sectoral panels. It would also enable coherent scenario making across the area of sustainable development.

#### 3.2. Strengthening the Environment Pillar

There is an urgent need to strengthen the environmental pillar of sustainable development to give it equal political weight to social and economic pillars within the UN system. Rio+20 should strengthen UNEP and adopt a resolution calling for the UN General Assembly to give it an upgraded and authoritative status within the UN system to be the supreme UN organisation dealing with the environment. This could be accomplished either by establishing either:

- a World Environment Organisation (WEO) with universal membership, or
- a UN specialised agency, a UN Environment Organisation (UNEO).

The upgraded environment organisation should be given a new and strong mandate, which could be modelled on the World Health Organisation (WHO) mandate, but for the environment and sustainable development. The present functioning governance structures integrated into the new organisation in order to give space to the Major Groups at the same level as today. However, it must strive to strengthen its scientific base. The new organisation should also be headquartered in Nairobi, Kenya.

#### 3.3. Specific Initiatives

Specific initiatives and proposed framework conventions to enable and promote the Institutional Framework for Sustainable Development include:

- Sustainable Development Goals – In August 2011, Colombia submitted a proposal to the UN to introduce Sustainable Development Goals (SDGs). It sees these as a possible foundation for building international political commitment at Rio, providing measurable 'tangible goals' for the sustainable development debate. Enclosed in Section 6 are suggestions from the UN DPI NGO Conference 'Chair's Text' on SD Goals as a contribution to this proposal. The SDGs would address the Agenda 21 aims produced at Rio 20 years ago. The SDGs would apply in all countries, and therefore act as a complementary, successor framework to the Millennium Development Goals (MDGs), which end in 2015 and focuses mainly on the Global South. Furthermore, SDGs would also provide a more balanced approach between the economic (poverty reduction) pillar of the MDGs and the environmental and social pillars of sustainable development.

- Sustainable Consumption and Production Governance – To support the achievement of any new SDGs, a shift to more sustainable consumption and production (SCP) patterns is necessary. Improved SCP Governance must be a key part of the discussions at Rio+20. For example, a new agreement for an updated SCP Framework, building on the Marakesh Process and the 10-Year Framework of Programmes (10YFP), would be an important first step.
- Reform of International Financial Institutions – There must be better incorporation of sustainable development parameters in the existing International Financial Institutions, particularly in terms of funding, operations, strategic plans, objectives and implementation. Additionally, Rio+20 should pursue further reforms to strengthen the efficiency of the Global Environment Facility (GEF).
- Principle 10 – Rio+20 should agree to elevate Principle 10 of the Rio Principles on access information, participation and transparency to a framework convention. UN Regional Commissions should also explore the possibility to simultaneously develop Principle 10 Conventions for their regions based on existing experiences.
- New and emerging technologies - Rio+20 should agree to establishing a framework convention on new and emerging technologies, including geo-engineering, nano-technology, and incorporating the precautionary approach and principle into the work of such a framework convention.
- International Court for the Environment - Environmental problems extend across international boundaries, but there are few effective international institutions to deal with them properly. Strengthening international environmental law mechanisms are essential to securing sustainable development. The Rio+20 outcome document should accordingly recommend the establishment of an International Court for the Environment (ICE).
- A High Commissioner or Ombudsperson for Future generations – Rio+20 should agree to establish an office for a High Commissioner or Ombudsperson for Future Generations to ensure the needs of future generations are represented in the relevant decision-making processes.
- National Councils on Sustainable Development – Rio+20 must revisit the recommendations from the UN Conference on the Environment and Development (UNCED) in 1992 and the World Summit on Sustainable Development (WSSD) in 2002 and strongly recommend to the participating nations on the need to re-establish or further develop and strengthen National Council for Sustainable Development with appropriately developed national strategies, funding and governance structures where stakeholders/ the major groups are fully integrated. Such Councils could merge with any Economic Development Councils to strengthen the follow up to Rio+20.

Rio+20 should ask the UN General Assembly at its first session to mandate a high level group of experts, including representatives of the Major Groups, in line with the UN General Assembly resolution calling for major group participation in the Rio+20 process, and give the high level groups of experts a mandate to study the issues highlighted above, develop a framework convention covering these issues and report to the first scheduled meeting of the Council on Sustainable Development of its progress.

The concepts and initiatives on the Institutional Framework for Sustainable Development presented above were developed as a part of the work of the Sustainable Development Governance 2012 Network managed by Stakeholder Forum, IUCN, ANPED and Climate and Sustainability Platform. This included think pieces from several different authors. For full details and to read the think pieces, please visit the website – [www.earthsummit2012.org/sdg2012](http://www.earthsummit2012.org/sdg2012)

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

The Green Economy should be always referred to as the Green and Fair Economy to also capture the social pillar of sustainable development.

Stakeholder Forum – Rio+20 Zero Draft Submission

Stakeholder Forum is an international organisation working to advance sustainable development and promote democracy at a global level. Our work aims to enhance open, accountable and participatory international decision-making on sustainable development through enhancing the involvement of stakeholders in intergovernmental processes.

## 1. Introduction

The total population of the world has just passed seven billion and is continuing to increase.

Everywhere people aspire to higher living standards and higher levels of consumption. There is growing concern about the capacity of the world's natural resources to provide food, energy and other materials to sustain this growing demand. At the same time the growing scale of human activity is threatening to cause dangerous levels of climate change, increased levels of pollution, destruction of natural habitats and biodiversity.

Operating within planetary boundaries is a necessary precondition for sustainability. But at present the world is pressing harder against ecological limits and we have already breached the safe operating space or boundaries for three of nine key planetary systems (climate change, biodiversity loss and excess nitrogen and phosphorus production).<sup>1</sup> To balance the discussion on planetary boundaries we welcome the initiative of Oxfam to start a discussion on social boundaries.

At present the global economy is not effective in addressing these emerging problems. The drivers of the global economy tend to amplify and exacerbate them. As some fossil fuels become scarcer, more effort is put into developing more marginal sources with more severe environmental and pollution impacts. As pressures on food resources become greater more marginal land is taken and threats to biodiversity become greater. As fish stocks are depleted, fleets travel ever further from their bases threatening collapse of stocks on an oceanic or global basis. The impacts of greenhouse gas emissions, waste and pollution are inadequately controlled and grow ever more severe.

Business as usual is also proving to be ineffective even in its own terms. Pursuit of the wrong kind of growth and the wrong kind of investment has led to economic crisis and stagnation, job losses on a massive scale, and sharply growing inequalities both within and between countries.

In order to avoid catastrophe the operation of the global economy needs to be transformed. All resources need to be used more efficiently, and renewable resources to be substituted for finite non-renewable ones. Renewable resources (e.g. marine fish stocks) need to be managed in a way that ensures that they are indeed renewed. Key habitats and biodiversity need to be conserved. Greenhouse gas emissions and other damaging pollution need to be cut back.

Waste needs to be minimised, and reuse and recycling maximised. Vested interests, monopoly power and excessive rewards for the few need to be curbed, with greater equity within and between countries established.

Furthermore, we need to reform existing institutions and create new institutions to deliver this sustainable future. However, form must follow function and it is vital that any new institutional framework is fit for purpose.

All parts of society need to be engaged in the transition, as they will all be affected by the changes. So the transition must be managed in an open and co-operative way that

ensures a just and fair transition to the sustainable green economy. We need common value and language and new politics to shape and guide the transition in a harmonious and equitable way.

Only then will we create the trust required to build socio-environmental security and resilience, now and into the future.

## 2. The Green and Fair Economy

The Green Economy needs to be a fair one, with all that this implies. To this end, the social dimension of sustainable development needs to be given greater emphasis. The basic preconditions for this are: social cohesion, fairness, including inter-generational fairness, fair redistribution and solutions for social problems such as growing inequality, lack of access to a whole range of resources, poverty and unemployment. The transition to a green economy will only be politically acceptable if it is pursued in an equitable way, both within and between countries.

The change needed is big and promising, but it will also be disruptive to some businesses and economic interests. It is therefore essential that everyone should be fully informed and should fully understand the reasons for the changes and be brought into a broad coalition and alliance for change; and that the interests of all those who may be adversely affected in the short-term are properly taken into account.

The work on planetary boundaries, biocapacity thresholds and One Planet Living offer important contributions to understanding the global ecological landscape within which Rio+20 is operating, and can offer compelling support for the need to embark on such a global transition. The Summit should establish agreement and commitment on the following:

1. Principles to be embodied in the green and fair economy and to guide transition towards it;
2. Quantification of the various dimensions or aspects of a green economy and how to measure progress towards it;
3. Progress on Sustainable Development Goals (SDGs) and incremental targets with key dates by 2015 to act as a successor framework for the Millennium Development Goals (MDGs);
4. Measures needed to promote green economy - a toolbox of green reforms;
5. Guiding principles and specific measures needed in key sectors;
6. The just transition - Ensuring fairness within and between countries;
7. Engaging and mobilising stakeholders in the transition;
8. Financing the transition; and
9. The institutions to govern and guide the transition, nationally and internationally.

### 2.1. Principles for a Green and Fair Economy

Recognising the challenges of this agenda, it is therefore critical that any global agreements that advance progress towards a green economy are governed by an over-arching set of principles that have common currency among governments and stakeholders alike.

There is range of literature that can be drawn upon in the identification of some common guiding principles for the green economy.<sup>3</sup> Rio +20 should pay particular attention to strengthening existing and agreed Principles in such a way as to give a stronger impetus to the key requirements of the green economy. Fifteen in particular have been identified that draw on The Stockholm Declaration, the Johannesburg Declaration, The Earth Charter, The One Planet Living Principles, The Green Economy Coalition (GEC), the Trade Unions Congress' (TUC) 'Just Transition' principles, and nef's (the new economics foundation) work on the new economy and their Great Transition programme of work and campaign.

1. Equitable distribution of wealth
  2. Economic equity and fairness
  3. Intergenerational Equity
  4. Precautionary Approach
  5. The Right to Human Development
  6. Internalization of Externalities
  7. International Cooperation
  8. International liability
  9. Information, participation and accountability
  10. Sustainable Consumption and Production
  11. Strategic, co-ordinated and integrated planning to deliver sustainable development, the green economy and poverty alleviation.
  12. Just Transition
  13. Redefine Well-being
  14. Gender Equality
  15. Safeguard biodiversity and prevent pollution of any part of the environment
- Section 6 below goes into more detail and gives full explanatory text on each of these principles.

### 2.2. Specific initiatives

Specific initiatives to enable and promote the Green and Fair Economy include:

**Beyond GDP** - The current reliance on economic growth and GDP as an indicator of success has led to perverse outcomes. It has not delivered fair levels of well-being for society or individuals. GDP is an inadequate metric through which to gauge well-being over time. Instead we need to reassess our common values, making decisions that lead to a green and fair economy around what we really value. There is an important distinction between assessing current wellbeing and assessing sustainability.

**Sustainable Management of Natural Resources and Capitals** - The poor management and regulation of natural assets and ecosystems leads to increasingly frequent and severe regional and global crises, and is a major factor behind food, water and energy insecurity (see Section 3 below for further details on these securities). Outcomes from Rio+20 must ensure that national development strategies take full account of the state of natural assets and ecosystems, and their role in sustaining human and animal well-being and economic activity; actively investing in their conservation and enhancement to avoid a devastating and irreversible global crisis. National ecological wealth accounting should also be integrated into national accounts and sovereign credit rating in order to develop an economic system that maintains and enhances natural capital.

**Fiscal Reform** - True environmental costs of production and consumption must be internalised into accounting models in order to address the causes rather than simply the symptoms of environmental degradation. The polluter pays principle should be adopted in practice in standard accounting and reporting practices for both business and governments, so that these costs can be reflected in market valuations and environmental impact assessments. Furthermore, green taxes should be used to incentivise positive behaviours and discourage harmful ones. For example, an internationally agreed mechanism to raise finance from international transport.

A global Financial Transaction Tax (FTT) should be implemented, with a significant proportion of the revenue raised used to support long-term efforts to fight climate change in developing countries and implementing sustainability programmes. Lastly, all subsidies that undermine sustainable development should be eliminated, particularly those underpinning fossil fuel use and unsustainable agricultural and fishery practices.

The Santiago Principles for sovereign wealth funds could be amended to direct funds to sustainable development activities and fiduciary responsibilities could be reformed to realign the systemic process driving short-termism. By shifting fund manager's incentives away from short-term gains by integrating these long-term principles and frameworks into the market system, sustainability can be built into the financial architecture, which drives investment decisions. In addition the credit rating system could integrate sustainability criteria in line with the principles of the green and fair economy.

**Sustainable Public Procurement** – Governments must use public procurement as a leadership and leveraging tool to promote the Green and Fair Economy. All public procurement contracts should include specifications for labour, well-being and environmental sustainability standards. Regulation could also be implemented to ensure the reuse of waste as raw material for new products to maximize the lifecycle and take action through providing the right incentives for research and development and by driving a cradle-to-cradle approach to manufacturing and industry.

**Global Convention on Rio Declaration Principle 10** – Access to environmental information, participation in transparent decision-making processes, and access to judicial and administrative proceedings should be basic rights for all, at all levels of decision-making, including local, national and international processes. Rio+20 should support a proposal for a Global Convention on Access to Information based on Principle 10 of the 1992 Rio Declaration. There could also be regional replications of the Aarhus Convention in other parts of the world.

**Convention on Corporate Sustainability** – The convention would operate under, four key principles:

1. Transparency – companies should be required to integrate material sustainability issues within their report and accounts;
2. Accountability – there should be effective mechanisms for investors to hold companies to account on the quality of their disclosures, including through an advisory vote at its All General Meeting (AGM);
3. Responsibility – Board duties should explicitly include setting company's values and standards and ensuring that its obligations to its shareholders and other stakeholders are understood and met;
4. Incentives – Companies should state in remuneration reports whether the remuneration committee consider ESG factors which are of material relevance to the sustainability and long term interests of the company when setting remuneration of executive directors; aligning remuneration with the interest of the shareholders, including customers and employees. Companies should be required to present their Corporate Sustainability Strategy to a separate vote at its AGM. If no report is to be published a justification for this should be produced and this justification should also be put to a vote.

The future convention should draw on experiences and content from the Global Compact, Sustainable Stock Exchanges initiative, Carbon Disclosure Project and the OECD guidelines. Voluntary Initiatives such as the successful ISO 26000 and the Global Report Initiative can provide guidance on the framework necessary to ease the implementation of Sustainability Reporting.

Governments may wish to relook at the proposed Chapter 41 of Agenda 21 from 1991. This was called Transnational Corporations and Sustainable Development and submitted for consideration by the UN Center for Transnational Corporations.

**Roadmap or pathway to a green and fair economy** – Such a roadmap or pathway should combine the elements of the core principles of the Green and Fair Economy with the sectoral goals and target integrated to develop a transition pathway that can be geographically, politically and culturally relevant to the diverse populations and societies across the globe. It is important that the recommendations are not too specific as to be alienating for different countries; but to offer enough of a 'map' or 'blueprint' that can be used globally.

The concepts and initiatives on the Green and Fair Economy presented above were developed as a part of Stakeholder Forum's Global Transition 2012 initiative, in partnership with nef (new economics foundation) and the New Economics Institute; as well as other multistakeholder consultations and initiatives. These include peer-reviewed think pieces from several different authors. For full details and to read the think pieces, please visit the website – [www.globaltransition2012.org](http://www.globaltransition2012.org).

It also draws on the work Stakeholder Forum has been engaged in as Chair of the BOND Development and Environment Group (BOND-DEG) in the UK (which has made its own submission to the zero draft), and the Bonn DPI Declaration.

### 3. Institutional Framework for Sustainable Development

There is growing acceptance of the need to strengthen and reform the institutions dealing with sustainable development at all levels of governance, local, national, regional and global. Rio+20 has been given a mandate by the UN General Assembly to take action to strengthen these institutions. However, it is vital that form must follow function for any reform of the institutional framework for sustainable development. Rio+20 should seek to improve the integration of the different elements on sustainable development; social, environment and economic.

3.1. Integrating Sustainable Development Across the UN Rio+20 should seek to establish a permanent Sustainable Development Council, on par with the Council on Human Rights as a subsidiary body of the UN General Assembly.

The Council would address new and emerging issues such as the nexus of water, energy and food security, addressing climate change impacts, and consider the changes required in economy post Rio+20. It is vitally important for governments to consider the inter-linkages between these areas, most of which do not have a place in the UN system for discussion individually or collectively.

In order to integrate the three pillars of sustainable development, the Council should be given authority to request reports from the specialised agencies working on social, economic and environmental issues:

▣ Specialised agencies with a mandate focussing on social issues, such as ILO, WHO, UNESCO and others would report on social issues;

▣ Units working on economy and finance, such as IFCs, IMF, the World Bank Group would report on economic issues and on green economy;

▣ While a new and strengthened UN environment organisation (see below) with a specialised agency position, and specialised agencies with an environment portfolio (such as FAO, WMO, IMO, ICA and others) would all report on environmental issues.

To further develop the capacity of the Sustainable Development Council to function as the highest body of the United Nations to deal with sustainable development, Rio+20 should:

▣ Ask the UN General Assembly at its next session to establish a high level committee of experts to provide specific proposals regarding the structure, mandate, modalities and work-programme of this Council and how to provide the Council with the necessary authority within the UN system to effectively interact with all levels of the intergovernmental system;

▣ Further mandate the committee of experts to report to the General Assembly by December 2012, with either specific recommendations regarding function and modalities of the Sustainable Development Council. Or with a recommendation that at its first meeting, in 2013, the new Council should determine its own modalities;

▣ Ensure that this high level committee includes expert representatives from all relevant stakeholders, including governments, the intergovernmental system, the major groups and academia.

In order to ensure that the whole UN system operates effectively to support the work of the Sustainable Development Council, the following institutions should be explored in supporting the structure, mandate and modalities of the new Council:

▣ An Interagency Committee on Sustainable Development, building on the experiences from earlier and present interagency committees, now named appropriately the High Level Committee on Sustainable Development could be established to service the Chief Executive Board of the Council;

▣ A Sustainable Development Board - made up of the governing bodies of UNFPA, UNICEF, UNDP, WFP, UNEP and UN Habitat and other relevant and similar units - should be formed to meet once a year to coordinate their policies, and support sustainable development at the country level. This would focus on support for the UN Delivering as One process. It would be able to report to the Council on emerging threats at the country level.

▣ An Intergovernmental Panel on Sustainable Development should be set up to ensure that there was no fragmentation between scientific panels. The Panel should be given a specific mandate to ensure that the scientific bodies are able to integrate their findings and create a more coherent information base from which governments and other organisations can make better, more informed decisions. It should be modelled on experiences from the International Panel on Climate Change (IPCC), and be given oversight of IPCC and the Intergovernmental Platform on Biodiversity and Ecosystems Services (IPBES) and any future sectoral panels. It would also enable coherent scenario making across the area of sustainable development.

### 3.2. Strengthening the Environment Pillar

There is an urgent need to strengthen the environmental pillar of sustainable development to give it equal political weight to social and economic pillars within the UN system. Rio+20 should strengthen UNEP and adopt a resolution calling for the UN General Assembly to give it an upgraded and authoritative status within the UN system to be the supreme UN organisation dealing with the environment. This could be accomplished either by establishing either:

▣ a World Environment Organisation (WEO) with universal membership, or

▣ a UN specialised agency, a UN Environment Organisation (UNEO).

The upgraded environment organisation should be given a new and strong mandate, which could be modelled on the World Health Organisation (WHO) mandate, but for the environment and sustainable development. The present functioning governance structures integrated into the new organisation in order to give space to the Major Groups at the same level as today. However, it must strive to strengthen its scientific base. The new organisation should also be headquartered in Nairobi, Kenya.

### 3.3. Specific Initiatives

Specific initiatives and proposed framework conventions to enable and promote the Institutional Framework for Sustainable Development include:

▣ Sustainable Development Goals – In August 2011, Colombia submitted a proposal to the UN to introduce Sustainable Development Goals (SDGs). It sees these as a possible foundation for building international political commitment at Rio, providing measurable 'tangible goals' for the sustainable development debate. Enclosed in Section 6 are suggestions from the UN DPI NGO Conference 'Chair's Text' on SD Goals as a contribution to this proposal. The SDGs would address the Agenda 21 aims produced at Rio 20 years ago. The SDGs would apply in all countries, and therefore act as a complementary, successor framework to the Millennium Development Goals (MDGs), which end in 2015 and focuses mainly on the Global South. Furthermore, SDGs would also provide a more balanced approach between the economic (poverty reduction) pillar of the MDGs and the environmental and social pillars of sustainable development.

▣ Sustainable Consumption and Production Governance – To support the achievement of any new SDGs, a shift to more sustainable consumption and production (SCP) patterns is necessary. Improved SCP Governance must be a key part of the discussions at Rio+20. For example, a new agreement for an updated SCP Framework, building on the Marakesh Process and the 10-Year Framework of Programmes (10YFP), would be an important first step.

▣ Reform of International Financial Institutions – There must be better incorporation of sustainable development parameters in the existing International Financial Institutions, particularly in terms of funding, operations, strategic plans, objectives and implementation. Additionally, Rio+20 should pursue further reforms to strengthen the efficiency of the Global Environment Facility (GEF).

▣ Principle 10 – Rio+20 should agree to elevate Principle 10 of the Rio Principles on access information, participation and transparency to a framework convention. UN Regional Commissions should also explore the possibility to simultaneously develop Principle 10 Conventions for their regions based on existing experiences.

☞New and emerging technologies - Rio+20 should agree to establishing a framework convention on new and emerging technologies, including geoengineering, nano-technology, and incorporating the precautionary approach and principle into the work of such a framework convention.

☞International Court for the Environment - Environmental problems extend across international boundaries, but there are few effective international institutions to deal with them properly. Strengthening international environmental law mechanisms are essential to securing sustainable development. The Rio+20 outcome document should accordingly recommend the establishment of an International Court for the Environment (ICE).

☞A High Commissioner or Ombudsperson for Future generations – Rio+20 should agree to establish an office for a High Commissioner or Ombudsperson for Future Generations to ensure the needs of future generations are represented in the relevant decision-making processes.

☞National Councils on Sustainable Development – Rio+20 must revisit the recommendations from the UN Conference on the Environment and Development (UNCED) in 1992 and the World Summit on Sustainable Development (WSSD) in 2002 and strongly recommend to the participating nations on the need to re-establish or further develop and strengthen National Council for Sustainable Development with appropriately developed national strategies, funding and governance structures where stakeholders/ the major groups are fully integrated. Such Councils could merge with any Economic Development Councils to strengthen the follow up to Rio+20.

Rio+20 should ask the UN General Assembly at its first session to mandate a high level group of experts, including representatives of the Major Groups, in line with the UN General Assembly resolution calling for major group participation in the Rio+20 process, and give the high level groups of experts a mandate to study the issues highlighted above, develop a framework convention covering these issues and report to the first scheduled meeting of the Council on Sustainable Development of its progress.

The concepts and initiatives on the Institutional Framework for Sustainable Development presented above were developed as a part of the work of the Sustainable Development Governance 2012 Network managed by Stakeholder Forum, IUCN, ANPED and Climate and Sustainability Platform. This included think pieces from several different authors. For full details and to read the think pieces, please visit the website – [www.earthsummit2012.org/sdg2012](http://www.earthsummit2012.org/sdg2012)

#### 4. Continued Engagement of Stakeholders

Rio +20 is going to be a multi-stakeholder Summit. Partnerships between the many sectors in society can be developed, created and strengthened in the lead up to Rio+20 and during the conference itself. Each sector needs to recognise the contribution and potential of the others and to seek out new ways of helping and reinforcing each other's efforts for sustainability.

Governments assembled at Rio could help by recognising and endorsing the various high level declarations and commitments that will be made by the principal sectoral organisations or groupings also assembled at Rio, and annexing them to the final Rio declaration. Each Government should also commit itself at Rio to encouraging and promoting action for sustainable development by all the major groups working for sustainable development at national level in its own country, including regional and local governments, businesses and trade unions, and all the wide variety of non-governmental organisations and other groups.

As each Government develops or renews its own sustainable development implementation strategy after Rio it should also commit itself to working with all these other actors in an open, transparent and co-operative way so as to build effective partnerships for the sustainability transition, and to mobilise the human and financial resources needed to achieve it.

#### 5. Sectoral Issues and Challenges

There are also specific sectoral and thematic issues that must be discussed at Rio+20. These issues have reached a point of urgency and require immediate attention. The issues include, but are not limited to:

☞The water, energy and food securities nexus – Global trends such as population growth and rising economic prosperity are expected to increase demand for energy, food and water, which will further compromise the sustainable use of natural resources and equitable access. This pressure on resources could ultimately result in shortages which may put water, energy and food security for the people at further risk, hamper economic development and poverty reduction, lead to social and geopolitical tensions and cause lasting irreparable environmental damage.

Ensuring the resilience of basic ecosystems services through the integration of common challenges and solutions of these securities is vital; which should be coupled with principles of fair and secure access to water, energy and food for all people.

☞The Blue Economy – Healthy oceans provide tremendous economic, social, and environmental benefits that directly support livelihoods around the globe, and further support life-sustaining processes for the planet. Consideration and inclusion of these services at Rio+20 is imperative to ensure the global community can continue to rely on the marine environment on which it so essentially depends.

Regulation of the marine ecosystems such as international and national standards should be established to ensure sustainability underpins the localized and wider blue economy.

The proposed Sustainable Development Council, UNEP and proposed WEO could play a role in this. In particular, regulation could include: licensing for markets; access criteria that relate to conditions for access based on social, environmental and economic impacts could be developed; transparent allocation of fishing quotas; and independent and verifiable measures for quotas and the renewable and sustainable exploitation of marine resources.

Rio can set us on course to cease overfishing and restore fish stocks to ecosystem maximum health. In order to achieve this it is essential that all exploitation of renewable marine resources and commercial fishing must be environmentally, socially and economically sustainable (includes fish, water, coastal ecosystems and reefs); and that non-renewable resources such as oil and gas must have their subsidies phased out.

☞Sustainable Agriculture and Food – There is a need for urgent reform of the global food system. This requires an understanding of the complexities of our planet's ecosystem services, the way in which they interact with one another and our impacts on them. UN policies and programmes and Rio+20 provide an opportunity for global leaders to agree on humane and sustainable agriculture policy and practice, with a focus on agro ecological approaches and recognising the fundamental role of small scale farmers in providing food for those most in need, the majority of which are women. In addition to improving the efficiency of food systems and reducing waste, a focus should be on improving production.

These goals can be achieved in part through sharing of knowledge, best practice and technology.

Resilient, healthy and localised food systems that are supported by a multi-functional and agro-ecological food production system can be created. Through re-orienting agricultural assistance to prioritise sustainable agriculture practices, by curbing food speculation and price volatility, and by ceasing no patenting of life forms , sustainable agricultural systems can be achieved.

☞Renewable Energy - Addressing energy access through locally appropriate renewable technologies enables development and catalyses a global shift away from fossil fuels.

UN initiatives and Rio+20 offer opportunities to build on the extensive research that exists on the most effective way to catalyse the uptake of renewable technology. Meanwhile, outcomes must ensure that the necessary energy transformation respects the principles of a green and fair economy. Communities and stakeholders must be central to all policies at each stage and on all levels (global, national and local level).

Policy enablers that increase the capacity of national governments to decentralize the energy system could be developed and international governance that supports the reshifting of subsidies away from fossil and polluting fuels to clean and renewable fuels must be delivered. The High Level Commission on access to energy should be integrated into the new and existing framework for sustainable development governance.

Development of a Global Feed In Tariff to finance electrification programmes in the global south, would enable the transition to a low carbon energy system that is 100% renewable electricity and that provides fair and universal access for all from wind, water or solar sources; and universal access to modern energy services. Development and adoption of specific criteria to achieve this include, affordability, transparent and inclusive decision making, and inclusive ownership models (e.g. cooperatives).

**Green Skills and Jobs** – Lifelong learning and skills that are environmentally sound; socially decent and reflective of the need to transition to the green and fair economy will underpin the development of the green job and skills industry. The employment sector can rapidly expand to allow for the expansion of the industry, goods and services and other related green jobs that is already underway.

National governments could support education and training programmes in the green jobs and skills sector and establish an international monitoring body for green skills and jobs.

There is a significant role that investment of taxes into the sector can play, and establishing industrial policies that reflect the core values of green jobs.

Such initiatives can strengthen the drive for regeneration and re-skilling in the sector and create decent, environmentally friendly work creation to bring employment to the vast majority of unemployed across the globe.

**Urbanisation and Planning** – Efficient and inclusive urban mobility is essential for economic and social development since it enables citizens to access goods, services, jobs, markets, education opportunities and social contacts. Yet, urban planning and management has been unable to either cope with the growth thus far or address urban challenges. So without improved capability for urban planning and greater political vision and support, this future increase is likely to cause significant socio-environmental problems for our cities and towns. The rapid urbanisation and growth of cities must be addressed so that there is fair access to resources as well as sustainable resource use.

Through planning compact communities and directing development towards existing communities; providing sustainable transport choices; preserving open space, farmland, natural beauty, and critical environmental areas; and creating a range of housing opportunities and choice quality living for people of all income groups, ages and needs we can rethink the design of the urban landscape. Development decisions must be made in a fair and economically inclusive way to develop systems focussed on the delivery of sustainable development, operating within environmental limits and enabling social justice.

**Sustainable consumption and production** - Consistent with the Biodiversity Strategic Plan adopted at the 10th meeting of the Conference of Parties to the UN Convention on Biological Diversity ("CBD COP10"), the human ecological footprint is reduced so that it remains within the Earth's biological carrying capacity. In accordance with the principle of common but differentiated responsibilities, we call on nations and populations engaged in wasteful overconsumption to reduce their impacts and help increase the consumption of vital goods and services for impoverished nations and peoples, so they also can enjoy reasonably high standards of living that provide equitable access to health care, decent work opportunities and education.

Governments should promote production processes that reflect the best available technologies for eco-efficiency, recycling, remanufacturing, reuse of waste materials, product durability and longevity. Wasteful practices such as planned obsolescence are identified and eliminated. Public procurement standards and incentives reward leading corporations that share and disseminate best green practices worldwide. By 2020, the majority of the world's goods and services are procured by governments from sources certified by objective third parties as sustainably produced.

**Trade** – Outsourced emissions are a major loophole in current efforts to tackle climate change and build a green economy. International flows of carbon embedded in trade have grown considerably since the original Rio summit, with developed northern nations benefiting unjustly from effectively outsourcing pollution to the global South, and in particular China and India.

Agree to the principle of Clean Trade Agreements. These arrangements, negotiated between states and regions, would come to replace Free Trade Areas and build mutually-agreed carbon constraints into the terms of trade. Clean Trade Agreements would aim to halt the 'race to the bottom' witnessed as globalization has unfolded – where industry invariably migrates to regions with the least stringent environmental regulations – and reverse the growth in outsourced emissions.

## 6. Supplementary information

### 6.1. Bonn DPI Declaration – Sustainable Development Goals

To achieve the goals of Rio + 20 in an ambitious, time-bound and accountable manner, we call upon governments in accordance with human rights, the principle of common but differentiated responsibilities, and respective capabilities to adopt the following draft Sustainable Development Goals together with the sub-goals, reasons and clarifications relating to each goal. The goals below are aspirational. While some of these are based on commitments already made by governments and other stakeholders, others are proposed on the basis of advanced thinking among civil society organizations.

**SDG – SUSTAINABLE CONSUMPTION AND PRODUCTION:** By 2020, consistent with the Biodiversity Strategic Plan adopted at the 10th meeting of the Conference of Parties to the UN Convention on Biological Diversity ("CBD COP10"), the human ecological footprint is reduced so that it remains within the Earth's biological carrying capacity. In accordance with the principle of common but differentiated responsibilities, we call on nations and populations engaged in wasteful overconsumption to reduce their impacts and help increase the consumption of vital goods and services for impoverished nations and peoples, so they also can enjoy reasonably high standards of living that provide equitable access to health care, decent work opportunities and education.

By 2020, governments should promote production processes that reflect the best available technologies for eco-efficiency, recycling, remanufacturing, reuse of waste materials, product durability and longevity. Wasteful practices such as planned obsolescence are identified and eliminated. Public procurement standards and incentives reward leading corporations that share and disseminate best green practices worldwide. By 2020, the majority of the world's goods and services are procured by governments from sources certified by objective third parties as sustainably produced.

This goal is tied to the preparation and implementation of sustainability or green economy roadmaps, that consider and address commonly agreed sustainability principles, adopt sustainable development goals in critical areas, and implement governance reforms to foster the transition to a green economy and to improve the institutional framework for sustainable development.

Further, establish a set of Millennium Consumption Goals for the period 2012-2020 towards creating an intergenerational and internationally shared right to equitable consumption opportunities and ensuring quality of life and wellbeing of all people by 2020, while eradicating all kinds and levels of poverty, respecting animal welfare and embedding sufficiency based sustainable economies.

**SDG – SUSTAINABLE LIVELIHOODS, YOUTH & EDUCATION:** By 2015, nations commit to the principle of sustainable livelihoods as a right for all people and implement monetary, fiscal and language policies to encourage full and decent work. By 2020, biodiversity and ecosystem service considerations are mainstreamed within existing rural development platforms and initiatives to conserve sustainable livelihoods in indigenous and local communities that depend on natural capital for survival.

By 2015, governments incorporate within development frameworks as a priority, investments in the education, health and employment of young people, who constitute a large proportion of the population of developing countries and face disproportionate levels of poverty, unemployment, gender discrimination and ill health. Governments should support comprehensive policies, youth participation and multisectoral programmes that empower present and future generations to fully and freely exercise their human rights, fulfil their aspirations and be productive citizens. By 2030, national governments reorient all national aims and objectives towards achieving sustainable societies and will mainstream sustainable development into all national educational policies and curricula.

By 2020, consistent with the Biodiversity Strategic Plan adopted at CBD COP10, governments ensure that people are aware of the values of biodiversity and the step they can take to conserve and use it sustainably.

**SDG - CLIMATE SUSTAINABILITY:** By 2050, governments should have reached clear pathways towards climate sustainability that regulates the global temperature rise below 1.5 degrees C. Emissions of greenhouse gases should be reduced to 25% of 1990 levels by 2020, 40% by 2030, 60% by 2040 and 80% by 2050. Carbon taxes and tariffs should be in place to provide incentives for low-carbon development and manufacturing, finance GHG emissions reduction projects, REDD+ and other offset mechanisms, and green infrastructure solutions to help vulnerable communities adapt to climate change.

Developed countries, as the main cause of climate change, in assuming their historical responsibility, must recognize and honor their climate debt in all of its dimensions as the basis for a just, effective, and scientific solution to climate change. The above goal shall include the equitable sharing of remaining atmospheric space, considering past use and consumption and mid and long-term emission reduction targets that are in line with what the science requires.

**SDG – CLEAN ENERGY:** By 2030, at least 50% of the world's energy supply comes from renewable sources. By 2020 energy demand is reduced through efficiency and conservation by at least 20%. By 2030 energy poverty is eliminated by providing universal access to modern energy services from renewable sources.

**SDG - BIODIVERSITY:** Governments are urged to honor their commitments to implementing the Strategic Plan for Biodiversity, in particular those related to the Green Economy such as Target 2: "By 2020, at the latest, biodiversity values have been integrated into national and local development and poverty reduction strategies and planning processes and are being incorporated into national accounting, as appropriate, and reporting systems"; and Target 3: "By 2020, at the latest, incentives, including subsidies, harmful to biodiversity are eliminated, phased out or reformed in order to minimize or avoid negative impacts." We urge governments to support investments in natural infrastructure and ecological restoration and to facilitate the development of markets that value the regulatory services provided by ecosystems.

**SDG –WATER:** By 2030, governments will achieve universal availability of an acceptable quantity and quality of water for health, livelihoods, ecosystems and production, adequate sanitation, coupled with an acceptable level of water-related risks to people, environments and economies.

This goal is over and above the achievement of the MDGs and other internationally agreed development goals. The right to safe and clean drinking water and sanitation shall be recognized as a human right and it shall be the responsibility of all states to respect such right. As an interim goal, by 2015 the proportion of people unable to reach or afford safe drinking water, and without access to basic sanitation, shall be halved as agreed in the JPOI.

By 2020, local, municipal and national governments and all stakeholders commit to achieve the following intermediate targets:

20% increase in total food supply-chain efficiency – reducing losses and waste from field to fork;

20% increase in water efficiency in agriculture – more nutrition and crop per drop;

20% increase in water use efficiency in energy production – more kWh per drop;

20% increase in the quantity of water reused;

20% decrease in water pollution;

**SDG – HEALTHY SEAS AND OCEANS (BLUE ECONOMY):** By 2020, consistent with the Strategic Plan for Biodiversity, governments establish at least 10% coastal and marine areas. By 2030, oceanic dead zones will be recovered by reducing nitrogen runoff from land by 50% or more. By 2020, Marine Protected Areas will be established in at least 25% of each Exclusive Economic Zones (—EEZ||) and the high seas in representative networks capable of restoring minimum viable populations of all at-risk stocks, protecting marine biological diversity, and maximizing benefits to commercial and subsistence fishers in surrounding waters. By 2015, the use of bottom trawling, dynamite fishing, electro-fishing, poisons and other unsustainable practices will be eliminated. By 2030, reverse the decline of fish stocks and create sustainable and diverse and abundant fish stocks, supported by healthy habitat to provide for the needs of all users, and by 2015, ban the practice of shark finning.

We also make the following policy recommendations: (a) reduce plastic pollution in the oceans, including by banning or taxing single-use plastics, supporting the use of recycled plastics in new products, and holding manufacturers responsible for plastics through their entire life cycle; (b) establish an international monitoring network for ocean acidification to enable the identification of vulnerable regions and industries and to provide an early warning system for industries already experiencing harm; (c) designate the high seas of the Central Arctic Ocean as a zone for international scientific cooperation, where extractive and polluting activities are suspended until we have a better understanding of the area and the potential effects of such activities; and (d) schedule, as a matter of urgency, an intergovernmental conference to address the multiplying threats to ocean areas beyond the jurisdiction of individual nations.

**SDG – HEALTHY FORESTS:** By 2020, all remaining frontier forests are protected from conversion and degradation, consistent with the Strategic Plan for Biodiversity adopted at COP10, with a well-resourced and equably governed REDD+ mechanism in place, which respects the rights and knowledge of indigenous peoples and local communities and other environmental and governance safeguards, to reward developing countries for protection and sustainable management of their forests, not only for carbon capture and storage but for their wider ecological services. A policy of no net loss of forestland, globally and nationally, is also achieved by 2020. At that time, all new forest areas cleared will be offset by ecologically sound restoration of forests in nearby areas. Restoration of over 150 million hectares of cleared or degraded forest landscapes is achieved by 2020, with the creation of millions of new jobs and enhanced livelihoods, improved security and adaptation to climate change. Reduce deforestation emissions by key corporations and their supply chains committing to avoid the purchase of products that cause deforestation, such as soy or cattle from deforested lands in the Brazilian Amazon, palm oil from deforested agricultural land in Indonesia, or illegal wood and wood products throughout the world.

Additionally, for stakeholders everywhere to undertake and/or participate in largescale, environmentally and socially responsible reforestation efforts.

Measures proposed under the Clean Development Mechanism (—CDM—) must be carefully examined by the communities depending on forests for their subsistence, as we see that they favor already important land-grabbing and the destruction of their livelihoods.

At Rio+20, we call on governments to pledge concrete and systematic support and promotion of multi stakeholder managed forest certification systems, in all parts of the world, with particular emphasis on tropical rainforests.

**SDG - SUSTAINABLE AGRICULTURE:** By 2030, global agricultural production is transformed from industrial to sustainable. Chemical inputs, herbicides, and pesticides are largely replaced with organic and biological alternatives. Interspersed natural areas are protected and restored as sources of pollination, pest control and soil fertility. Food for export is secondary to food for local consumption. Cultivated crop strains are diversified, as are production techniques and the mix of agricultural producers. Best management practices reduce erosion by 90% and nitrogen runoff by 50% or more. Local ecological knowledge of indigenous peoples, traditional, and local communities is utilized to identify resilient crops and cultivation practices that provide maximum protection against climate change.

This goal should also include sustainable and humane food systems that provide healthy food to meet current food needs while maintaining healthy ecosystems, farmer resilience, and ensure good animal health and welfare that can also provide food for generations to come with minimal negative impact to the environment, through agro-ecological farming systems. We consider the right to keep their own seeds as an important issue of farming.

A sustainable and humane food system should promote food sovereignty of communities, empower small-scale food producers in food and agricultural governance, and also encourage local production and distribution infrastructures with equal opportunities for men and women farmers, and the important role of youth in this area, and makes nutritious food available, accessible, and affordable to all, while at the same time providing sustainable livelihoods to producers through the payment of fair prices for their products. Sustainable food systems must be based on food sovereignty and the right for small-scale peasants, women's groups and local communities to plant and exchange their seeds and share their knowledge. Give strong and increasing support to small scale farming, producing healthy foods through targeted research, extension services and enabling conditions, and wherever possible, vegetarian diets, and to ensure women's property and inheritance rights.

Recognize and support by all means possible, the important role and special needs of women as the primary producers and purchasers of food, along with the implementation of women's property and inheritance rights.

**SDG - GREEN CITIES:** By 2030, cities have developed and are implementing action plans to address transport, public health and environmental needs in a harmonious and integrated way. By 2030, from the local to national, government policies foster compact, mixed-use, pedestrian-oriented, urban development that minimizes energy use and maximizes residential health and that reflects the concept of a society for all ages. All new buildings meet green building standards by 2030. By 2030, city transport needs are or remain predominantly met by mass transport, walking and bicycling. Quality of life is also improved for residents by 2030, providing access to green buildings with urban rooftop gardens, clean water, clean energy, waste management systems and sustainable transport. By 2030, urban areas with significant storm water pollution issues reduce impervious surface area by 30% below 2012 levels.

**SDG - SUBSIDIES AND INVESTMENT:** By 2020 at the latest, consistent with the Biodiversity Strategic Plan adopted at CBD COP10, harmful incentives, including subsidies, for fossil fuel production, unsustainable agricultural, fisheries and forest practices, and those harmful to biodiversity, are eliminated, phased out or redirected to promote renewable energy, sustainable practices and the conservation and sustainable use of biodiversity. By 2015, governments commit to a minimum investment of 2% of GDP per year to foster the transition to a green economy, taking into account national socio-economic conditions.

**SDG - NEW INDICATORS OF PROGRESS:** By 2020, nations supplement or replace GDP with a new measure of sustainable economic welfare based on best available information at that time. Economic performance and the forecasted effects of policy changes will be measured by this new metric. We encourage a process of continuous improvement and refinement of the new measure over time and an international process to set standards and make available common methods and data sources. We also encourage the adoption of several other headline indicators of environmental, economic, social, cultural and linguistic sustainability to provide a measure of progress towards the green economy transition, such as civic participation, improved well-being and achievement of sustainable development goals.

**SDG - ACCESS TO INFORMATION:** By 2022, governments will enact and implement Freedom of Information laws giving people the right to obtain accurate and truthful information held by their government, especially on the environment. Governments will actively make available to all stakeholders useful, accurate and truthful well-publicized data and information in appropriate formats and languages, including on the internet. These laws should include whistleblower protection and should extend to information disclosure by corporations.

**SDG - PUBLIC PARTICIPATION:** By 2022, governments need to ensure that voluntarism and citizen engagement are incorporated in all global, national and local action plans for implementation of sustainable development and human well-being, to commit to the creation of an enabling environment for citizen engagement and voluntary action, and will include mandatory public participation in (a) major development project approvals and environmental impact assessment procedures, (b) drafting of national level sustainable development policies, laws and regulations and (c) administrative decisions such as pollution permitting.

**SDG - ACCESS TO REDRESS AND REMEDY:** By 2022, governments will adopt and implement laws ensuring effective access to judicial and administrative proceedings concerning sustainable development, including redress and remedy. In particular, they will ensure that the costs of such proceedings are reasonable and affordable to affected people and that access to such proceedings is available through expansion of legal standing and other means to interested people and organizations.

**SDG - ENVIRONMENTAL JUSTICE FOR THE POOR AND MARGINALIZED:** By 2022, governments will adopt laws that obligate government agencies to take appropriate measures to provide information and engage affected people living in poverty, women and other disadvantaged groups when making sustainable development decisions.

**SDG – BASIC HEALTH:** By 2015, to support attainment of the health MDGs, and to contribute to health, well-being and sustainable development, ensure universal access to health care and services, wherever feasible, free at the point of use for women and children, and including sexual and reproductive health, and thus strengthen the resilience of people and communities to the consequences of climate change and environmental degradation.

## 6.2. Principles of a Fair and Green Economy

For a full discussion on how the Principles were drawn together see:

<http://www.stakeholderforum.org/fileadmin/files/Principles%20FINAL%20LAYOUT.pdf>

### 1. Equitable distribution of wealth

Promote the equitable distribution of wealth within nations and among nations, to reduce disparities between rich and poor, and achieve social and economic justice, within a sustainable and fair share of the world's resources and leaving sufficient space for wildlife and wilderness.

### 2. Economic equity and fairness

Guided by the principle of common but differentiated responsibilities, create economic partnerships that would transfer substantial financial and technological assistance to

less developed countries, to help minimize the gap between the developed and developing world and support the environmental sustainability of both.

### 3. Intergenerational Equity

Environmental resources and ecosystems must be carefully managed and safeguarded so as to enhance the value of environmental assets for future generations, thereby equitably meeting their needs and allowing them to flourish.

### 4. Precautionary Approach

Science should be utilized to enhance social and environmental outcomes, through the identification of environmental risk. Scientific uncertainty of environmental impacts shall not lead to avoidance of measures to prevent environmental degradation. The 'burden of proof' should lie with those claiming that there will not be significant environmental impacts

### 5. The Right to Human Development

In harmony with the environment is fundamental to the achievement of sustainable development, so that individuals and societies are empowered to achieve positive social and environmental outcomes.

### 6. Internalization of Externalities

Building true social and environmental value should be the central goal of policy. To this end, market prices must reflect real social and environmental costs and benefits, so that the polluter bears the cost of pollution. Tax regimes and regulatory frameworks should be used to 'tilt the playing field', making 'good' things cheap and 'bad' things very expensive.

### 7. International Cooperation

The application of environmental standards within nation States must be undertaken in a cooperative manner with the international community, based on an understanding of the possible impact on the development potential of other States. Environmental measures relating to trade should avoid unfair protectionism, but overall should ensure that trade supports sustainable resource use, environmental protection and progressive labor standards, promoting a 'race to the top' rather than the bottom.

### 8. International liability

Acknowledging that actions within national boundaries can cause environmental impacts beyond national jurisdictions, requiring cooperation in the development of international law that allows for independent judicial remedies in such cases.

### 9. Information, participation and accountability

All citizens should have access to information concerning the environment, as well as the opportunity to participate in decision-making processes. To ensure that environmental issues are handled with the participation of all concerned citizens, institutions at all levels (national and international) must be democratic and accountable, and make use of tools that enable civil society to hold them to account. In this regard, the access to justice by citizens for redress and remedy in environmental matters is a cornerstone of enhancing accountability.

### 10. Sustainable Consumption and Production

Introduce sustainable production and consumption with sustainable and equitable resource use. Reduce and eliminate unsustainable patterns of production and consumption, i.e. reduce, reuse, and recycle the materials used, acknowledge the scarcity of the Earth resources and implement activities accordingly.

### 11. Strategic, co-ordinated and integrated planning to deliver sustainable development, the green economy and poverty alleviation.

An integrated approach must be adopted at all levels to expedite the achievement of socio-economic and environmental sustainability through strategic planning with civil society and stakeholders, and across all relevant government departments.

### 12. Just Transition

There will be costs in making the transition to a low carbon, green economy in the pursuit of sustainable development. Some States and actors are better able to bear those costs than others and are more resilient to transitional changes. In the process of change, the most vulnerable must be supported and protected – developing countries must have access to appropriate financial and technical assistance, citizens and communities must also have access to new skills and jobs.

### 13. Redefine Well-being

GDP is an inadequate tool for measuring social wellbeing and environmental integrity. Many socially and environmentally damaging activities enhance GDP – such as fossil fuel exploitation and financial speculation. Human wellbeing and quality of life, and environmental health should be the guiding objectives of economic development.

### 14. Gender Equality

Gender equality and equity are prerequisites to the transition to a green economy and the achievement of sustainable development. Women have a vital role to play as agents of change for environmental management and development – their actions must be rewarded accordingly and their skills enhanced.

### 15. Safeguard biodiversity and prevent pollution of any part of the environment

Protect and restore biodiversity and natural habitats as integral to development and human wellbeing, and develop a system of governance that protects the resilience of ecosystems to prevent irreversible damage.

---

## STEPS Centre

**Input to the compilation document to serve as basis for the preparation of the zero draft of the outcome document from the Rio+20 UNCSD**

**Contribution by the STEPS Centre (<http://www.steps-centre.org>), 1<sup>st</sup> November 2011**

The STEPS Centre on Social, Technological and Environmental Pathways to Sustainability (<http://www.steps-centre.org>) is grateful for this opportunity to engage in the

Rio+20 process. We are a global research and policy engagement centre, funded by the UK Economic and Social Research Council, bringing together development studies with science and technology studies. We offer the following contribution to the outcome document of the Rio+20 conference, drawing on the products of our research over the past five years, which has focussed on the challenge of linking science and technology with poverty reduction, environmental sustainability and social justice. We see this as central to fostering a green economy in the context of sustainable development and poverty eradication.

In particular, we draw on our project 'Innovation, Sustainability, Development: A New Manifesto' (<http://anewmanifesto.org>). The project involved a seminar series, a collection of 13 background papers, and conducted 20 roundtables with partners around the world. The Manifesto, which was launched at the Royal Society, London, in June 2010, was not a representative synthesis of the diverse views encountered during the project, but rather puts forward the STEPS Centre's perspective on these debates. It serves as the basis for much of this contribution, which is as a result largely confined to an account of the '3D agenda' and the 'areas for action' discussed in the Manifesto document.

This contribution is organised based on the structure outlined by the co-chairs guidance note on the UNCSD2012 website: <http://www.uncsd2012.org/rio20/documents/guidancenote.pdf>

## General Content

*a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?*

- The STEPS Centre (<http://www.steps-centre.org>) sees meeting the interlinked global challenges of poverty reduction, social justice and environmental sustainability as the great moral and political imperative of our age, and believes that science, technology and innovation of many kinds have essential roles to play in this. We hope to see a strong consensus emerging from Rio+20 that provides a global framework supporting different forms of innovation that address sustainable development challenges at local, national and global levels.

- In order to meet these challenges, we advocate a '3D agenda' - involving increased attention to three currently under-emphasized themes within innovation policy:

- The first D is about the technical, social and political *directions* for change: 'what is innovation for?'; 'which kinds of innovation, along which pathways?' and 'towards what goals?'

- Taking these questions seriously requires us to examine much more sharply questions of *distribution*. For any given problem: 'who is innovation for?'; 'whose innovation counts?' and 'who gains and who loses?'

- In turn, this raises further questions about *diversity*: 'what – and how many – kinds of innovation do we need to address any particular challenge?'

- We see an opportunity for the Rio+20 summit to recognise and enhance the role that science, technology and innovation can play in building a green economy at a global level, and to set a framework in which the questions associated with the 3D agenda above are discussed as matters for legitimate political argument.

- Scientifically-informed and democratically legitimate policy instruments are playing a vital role in forging a green economy, incentivising technological innovation towards sustainability goals. While governments, firms and scientific institutions can all contribute to the 3D agenda, civil society – both in the form of organised public-interest groups and, more importantly, spontaneous citizen-led movements - is often the real source of change. Approaches for including such actors in policy processes, as well as supporting and protecting their innovative activities and practical contributions towards sustainable development, are discussed further below.

*b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?*

- Whilst green economy roadmaps are useful planning tools, they must respect cultural variety, regional diversity and democratic accountability. In imagining, articulating and implementing such plans, attention must be paid to the multitude of possible pathways to sustainability and especially the potential contributions of marginalised communities.

- The STEPS Centre advocates a framework based around five 'areas for action' - *agenda setting, funding, capacity building, organising and monitoring, evaluation and accountability*. These focus on the inclusion of broader networks of actors in processes for making innovation policy, and are outlined in more detail in response to question d, below.

- Sustainable development goals in the model of the MDGs should not neglect the need to build distributed innovation capabilities that enable continual locally-driven improvements at sub-national and national levels, rather than setting static endpoints to be obtained as a result of externally-driven programmes.

*c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);*

- Governments, Major Groups, UN system, IFIs all have a vital role. Within the Major Groups, the scientific and technological community and those groups most often marginalised from policy processes – women, children and youth, indigenous people, NGOs, and farmers - are particularly important in their contributions to a '3D' innovation agenda.

*d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?*

Our vision is a world where science and technology work more directly for social justice, poverty alleviation and the environment. What this means for particular contexts, places and people will be enormously varied – as will be the means to achieve it. Nevertheless, the following broad recommendations are offered in order to catalyse and provoke specific concrete actions in different places. They are organised around the different areas for action identified in the New Manifesto: *agenda setting, funding, capacity building, organising, monitoring, evaluation and accountability*. Each set of actions addresses contrasting dimensions of innovation systems. They are therefore targeted towards different people and organisations who bear responsibility in each of these areas.

## Agenda setting

The setting of agendas for science, technology and innovation policy and investment needs to be informed by an explicitly political consideration of innovation direction, distribution and diversity. The institutional architectures for the setting of innovation priorities at national and international levels therefore need reworking to enable diverse interests and new voices, including those of poorer and marginalised people, to be involved in inclusive debate. In some countries and settings this will involve building on existing institutional arrangements; in others it will require establishing new fora.

Within countries, we recommend that governments establish and support 'Strategic Innovation Fora'. Whatever they are called, these statutory bodies should be mandated to

review funding allocations, debate major investment decisions, deliberate on controversial areas of science and technology options and audit the distribution of risks and benefits from potential innovation pathways. These fora should also be inclusive: constituted by – and bringing together – diverse stakeholders with interests in science and technology futures, including citizens' groups and social movements representing the most marginalised interests. These fora would address both public and private sector innovation activity, holding legal powers to call evidence. They would report to parliaments (and through these, to wider civil society) on an annual basis.

At the international level, we recommend the establishment of a 'Global Innovation Commission'. Breaking the conventional model of a 'commission', this would be a broadly-constituted deliberative body, widely networked (among other areas) into global civil society and holding itself accountable to the most disempowered communities worldwide. It would operate under a United Nations umbrella, but with a formal role in trade bodies such as the World Trade Organisation. The Commission would facilitate open, transparent political debate about major investments with global or trans-boundary implications, north-south technology transfers, and public and philanthropic international aid geared to science, technology and innovation. In addition to annual reporting, each year a series of focused enquiries would be conducted on specific topics, including in response to national Strategic Innovation Fora or concerted representations by global civil society networks.

### **Funding**

The funding of science, technology and innovation – whether from public, private or philanthropic sources – needs to be geared much more strongly to the challenges of poverty alleviation, social justice and environmental sustainability. This requires that the needs and demands of poorer and marginalised women and men as potential users of technologies, as well as the outcomes of innovation, are addressed in funding allocations.

We recommend therefore that all science and technology funding agencies (individually or collectively), regularly review their portfolios to ensure that a significant and increasing proportion of their investments are directly focused on these challenges. Such agencies should also progressively improve the balance in investments across basic science, technology, engineering, design and science services. They should demonstrate a shift towards increasing support for the social, cultural and economic dimensions of innovation systems. Transparent accounts linked to these criteria should be produced and made available to public scrutiny, including by relevant Strategic Innovation Fora.

In order to encourage diversity in innovation pathways, we recommend specific funding allocations to support experimentation in niches, and networking and learning across these, involving the private sector, community groups and individual entrepreneurs. In order to help democratise the process of innovation we recommend that procedures are established directly to involve end users of science and technology – including poorer and marginalised people – in the allocation of funding. And we recommend that incentives for the private sector to invest in forms of innovation geared to poverty alleviation, environmental sustainability and social justice – such as advance purchase agreements, technology prizes or tax breaks – are enhanced. Achievements of this kind should be more deliberately recognised and widely publicised: nationally, regionally and globally.

### **Capacity building**

Capacity building for science, technology and innovation must move beyond a focus on elite science and so-called 'centres of excellence' to support science that works more directly for diverse social and environmental needs. As a vital complement to training scientists and technology experts, this means extending the scope of capacity building to other players in the innovation system, including local entrepreneurs, citizen groups, small businesses and others. A key challenge in improving innovation processes is linking between groups, and facilitating inclusion of otherwise excluded people.

We therefore urge an extension of capacity-building support towards 'bridging professionals' who are able to link technical expertise with particular social, ecological and economic contexts. We additionally recommend capacity building investments focused on enhancing the ability of citizens and users to engage actively in innovation processes, not just as passive recipients but as active users, creators and inventors. We recommend also the support of civil society networks and social movements to facilitate the sharing of technologies, practices and wider experiences and learning. Capacity support should further enable such groups to engage with national and international political debates about science, technology and innovation – for instance through memberships of Strategic Innovation Fora and the Global Innovation Commission.

This, in turn, will involve investment in new priorities for training, including key reforms to tertiary, further and higher education in the area of science, technology and development. These will require new institutions (or refashioned old ones) that actively link science and technology to located needs and demands, and the building of new learning platforms, virtual and face-to-face. They will also include greater provision for local community engagement in tertiary, further and higher education as well as wiki spaces for innovation support of a kind that enable more inclusive, networked and distributed forms of innovation.

### **Organising**

Organising for innovation requires identifying and supporting social and institutional arrangements that enable technologies to work in particular contexts, and to meet the needs of poorer and marginalised women and men. We recommend that firms, public and philanthropic organisations developing specific technological innovations invest in concrete plans to ensure that these social, cultural and institutional aspects of application are addressed. Further, local experiences with these organisational aspects of innovation need to be shared and learned from more widely. This requires an open, distributed and networked approach, with active investment in linkages between public, private and civil society groups.

We therefore recommend that future investments – by the public and private sectors – should especially highlight bridging functions, connecting formerly separate organisations and linking upstream and downstream research and development activity. While in many cases, new organisations will not be required, strategic investment in facilitating and coordinating bodies may be needed. Such bodies must be complemented by support for local organisations, networks and movements, and the ability for informal, lateral sharing of innovation. Overall, investment should extend its focus from basic science, to emphasise other aspects of the innovation system, including engineering, design, science services, and social entrepreneurship. Further, we recommend that support be increased for open source innovation platforms, with limits placed on narrowly-defined property-based systems which impede competition and constrain innovative activity.

We propose that at national level, and led by Strategic Innovation Fora, a broad framework for science and innovation policy is developed which puts poverty alleviation, social justice and environmental sustainability at its core. The legal underpinnings, regulatory rules and investment priorities that emerge from such a policy must explicitly reflect such priorities, and be overseen, reviewed and audited in a transparent and accountable way.

### **Monitoring, evaluation and accountability**

Increased accountability and full transparency must be at the centre of democratised innovation systems – across public and private sectors and at local, national and international levels. This requires active engagement by citizens in priority setting, monitoring and evaluating innovation activities.

We recommend that in all countries benchmark criteria, relating to the priorities of poverty alleviation, social justice and environmental sustainability, are set and so become the basis of indicators for monitoring innovation systems. At the international level, overseen by the Global Innovation Commission, similar criteria should be established for monitoring and annual reporting. Further, we recommend the improvement of data collection systems and methodologies, switching the focus from indicators such as

publications, patents and aggregate levels of expenditure, to assessments of the wider development outcomes of innovation efforts. All organisations – whether government departments, philanthropic foundations, non-government organisations and private sector firms registered in a particular country – investing in research and development above a certain amount should be required to report on expenditures in relation to these criteria. Such data should be freely available and open to public scrutiny.

Finally, we propose that the Strategic Innovation Fora (or similar bodies), should have a statutory obligation to report publicly both to national parliaments and the Global Innovation Commission on a regular basis concerning innovation direction, distribution and diversity, presenting full data from all research and development organisations.

## Stockholm Environment Institute

Position paper – Sustainable Energy for All SEI and FBDS

Position paper

"A Global Assessment on Sustainable Energy for All" Submitted to UNCSD2012 by Stockholm Environment Institute (SEI) and Brazilian Foundation for Sustainable Development (FBDS) on behalf of the assessment partnership.

Stockholm and Rio de Janeiro, October 30th, 2011

Supporting the political preparations for Rio2012, the UNDESA secretariat's analytical preparations, and the high level group appointed to the official UN year of Sustainable Energy for All, leading research institutes have joined forces to produce a global assessment on sustainable energy for all. The assessment is supported by the Governments of Sweden and Brazil. The assessment builds on and integrates existing efforts in among partners such as the Global Energy Assessment (IIASA, PBL and SEI), Planetary Boundaries (SEI and PBL), Low carbon development (ACPC), energy access and clean energy (TERI), Electricity Governance (WRI), Brazilian Biofuels Programs from the water, energy and land nexus perspective" (COPPE), Guidelines for a Green Economy in Brazil (FBDS) and Integrated Sustainability Scenarios (PBL).

The assessment can be followed at [www.sei-international.org/Rio20](http://www.sei-international.org/Rio20). The final report will be published in March 2012. Contact: Måns Nilsson, Research Director, SEI, [mans.nilsson@sei.se](mailto:mans.nilsson@sei.se).

The global energy predicament

Energy is fundamental to human and economic development. Without reliable energy services, development is not possible. However, the debate about energy for all must go beyond current debates about basic access for poverty alleviation. Since the industrial revolution, people have relied on affordable energy to meet economic development aspirations. It is time to consider what energy services need to be available to enable all countries to reach an economic development equivalent to at least today's middle income segment.

Our planet is currently inhabited by 7 billion people, yet some three billion people still lack access to basic energy services. With the global population projected to reach ~9 billion people by 2050, an additional two billion people will require energy services by 2050. At the same time, energy is one key driver behind some of the troubling global environmental trends we are now experiencing. The combined pressures on the Earth system have now reached a point where we increasingly risk crossing a number of thresholds that could cause serious disruption and harm on societies across the world. We have entered a new era – the Anthropocene – where humans are now a dominant driving force of change at the planetary scale; we may be approaching, or in some instances have actually reached, an upper limit in terms of human pressures on the planet (Stockholm Memorandum, 2011). This means that meeting energy demands of a growing world economy and population must occur in a world that on aggregate bends the curves of current global environmental change.

Thus, human development will not be possible without an energy transition that responds to the demands of development and poverty alleviation as well as the constraints imposed by climate change. This energy transition needs to unfold in a new geopolitical and global economic context, with structural and geographical shifts in both economic and political power. On top of that, the global financial crisis brings into play additional challenges in terms of availability of resources but also can open new opportunities if used to implement anti-cyclic measures.

The need for a new sustainable energy based development strategy

Humanity thus faces a triple global energy challenge; (1) the urgent need for affordable energy services for all – both covering basic needs and income-generating productive activities, (2) the need for a rapid phase-out of fossil fuels (the cheap energy sources that have been key to historical wealth creation) to stabilize the global climate system, and (3) the necessity to meet this need within the "safe operating space" of Earth systems boundaries such as biodiversity, land use and freshwater use. All these are impacted by the energy choices we make.

Resolving this triple challenge will require an unprecedented energy transition over the coming 3-4 decades, backed up by strong political endorsement and financial resources. In order to assess the scope of such a global energy transition, our partnership is carrying out a scenario based global energy assessment on sustainable energy for all as a contribution to the Rio + 20 Earth Summit ( summary in Annex below). Our assessment urges nations in the world to recognize:

a) the fundamental importance of increasing energy demand in poor and emerging economies, from basic needs to energy services for income generation, as a precondition for attaining sustainable development. Energy is not only a fundamental building block for human development but the key to unleashing economic development. Securing energy for development is therefore a primary concern – and point of shared interest – across developing, emerging and developed countries.

b) that energy is a driver in the "Anthropocene" but also that a global energy transition within planetary boundaries is within reach, despite massive growth in energy demand, to meet basic energy needs and growing energy demands from economic development. The transition will require substantial investments but will generate co-benefits such as employment opportunities, enhanced security from diversification of supply, and better resource efficiency.

c) the urgent need to accelerate the energy transition. Key transformation pathways have been set in motion but must be accelerated at national and regional levels. Carbon pricing is necessary but not sufficient for driving the transition. Beyond this, governance responses need to be explored across levels to induce transitions through scaling up a diversity of supply and demand options.

The overarching recommendation for the world's nations to consider is the adoption of a set of strategic principles, translated into practical action in order to enable a global energy transition in time to avoid large scale crises for nations of the world:

1. Accelerate the implementation of national and international energy policies that drive efficiency enhancements and provide incentives for innovation and support scale-up of renewable energy sources (e.g., white and green certificates, feed-in tariffs, technology standards, and removal of subsidies for fossil energy sources).
2. Develop a transparent global investment fund for renewable energy systems for poor and emerging economies and couple this with technology sharing and learning platforms for sustainable energy. Investments and accelerated adoption of renewable energy technologies by developed countries can bring down the costs thereby reducing the size of the fund needed. Position paper – Sustainable Energy for All SEI and FBDS
3. Develop policy assessment frameworks for economic development policies and strategies that enable the management of Earth systems risks and vulnerabilities in relation to renewable and non-renewable energy expansion worldwide, and its linkages to other sectors such as water and agriculture. The planetary boundaries framework can be a basis for an integrated and systemic assessment framework for the world's energy systems, with due regard to issues of equity and justice.
4. Adopt sustainable energy supply and demand measures as a "currency" for measuring progress in development endeavors (e.g., for reaching the Millennium Development Goals) and for policy action on meeting global environmental goals. This means that sustainable energy provision or demand improvements are accounted for and credited within the global negotiating frameworks including UNFCCC and CBD.

ANNEX: A global assessment of a sustainable energy for all (Summary)

Our assessment complements the range of energy pathways previously examined in the recently launched Global Energy Assessment (GEA, 2011). Our assessment develops two key scenarios; (1) basic levels of energy access are met within a carbon constrained world (based on GEA pathways), and (2) an energy pathway is developed, which is consistent with much greater levels of development in the developing world and higher levels of convergence to the levels of well-being currently enjoyed in OECD nations, whilst still keeping within the planetary boundaries.

Energy for all: from basic access to pathways in a new development model

Worldwide, approximately 2.7 billion people today rely on traditional biomass for cooking and heating and about 1.3 billion have no access to electricity (IEA, 2011). Up to a billion more have access only to unreliable electricity networks (AGECC, 2010). Access of the poor to energy is a central concern for governments around the world. Providing clean and affordable energy reliably for poor households is an important prerequisite in the fight against poverty and to improve wellbeing, and widely regarded as a key to make advancements on the Millennium Development Goals (Ekholm, Krey et al. 2010).

However, there is an increasing consensus in the developing world that "energy for all" must go beyond basic access and should be understood as energy system development through electricity and modern fuels for productive and industrial uses everywhere in the world, compatible with income generation and economic development, in for instance agriculture, industrial processes, and fuel for transport. Our assessment therefore looks at the implications of a new global development model in energy terms, which in income terms shows a more rapid convergence over time in GDP per capita than is usually considered, and examines what energy end uses are required at these levels of GDP, taking into account potentials for efficiency improvements.

In the "new model" scenario, annual GDP per capita growth trajectories will average 0.5-1% for EU and US, 4-5% for emerging economic powers such as China, and 7-8% for the less developed countries (preliminary estimates). This means that by 2050, all countries in the world will have a GDP per capita which is at least at the level of current middle-income countries (ca 20,000 USD per capita).

Extrapolating the trends would imply converging income levels globally before 2100. The converging GDP trajectories is a development that has normative connotations, but it is also one that is already underway in several places. For example, while the EU has experienced growth rates of about 0-2% annually over the last decade, many countries in Latin America, Asia and Africa have registered growth rates of about 10% annually.

Achieving the three sets of objectives that we included in our operationalization of sustainable energy for all requires transformations in several energy subsystems, including, for instance: reorganization and modal shifts of urban and regional transport and infrastructure, enhancing energy efficiency in buildings and industry; expanding wind, solar and agro-bioenergy production, enabling consumption reductions and lifestyle change, expanding off grid solar energy, and new cooking and heating technologies and developing smart transmission networks and distribution grids. Such transformations and systems changes will unfold with specific patterns in each of the world regions, depending on demographic and income trajectories, natural resource constraints, and technical feasibility. They are examined in in-depth case studies from a socio-technical systems and innovation perspective.

Planetary boundaries: sustainable energy within a safe operating space

The growing scientific insights that we may have entered a new geological epoch, the Anthropocene, where humanity constitutes a global geological force through the aggregate human pressures on the Earth system, triggered the scientific development of a new framework for global sustainability – "the planetary boundaries concept" - building on recent advancements in Earth system science (Rockström et al., 2009). The planetary boundaries framework identifies Earth system processes that require active stewardship in order to avoid unwanted non-linear changes in the biophysical systems on Earth that in turn are likely to generate deleterious or even catastrophic outcomes for regions of nations or the world at large. Nine planetary boundaries have been identified, of which 7 have received proposed quantifications for safe boundary levels of key control variables (Table 1).

Table 1. Planetary boundaries (source: Rockström et al, 2009)

[Rio+20 Secretariat: Please refer to full submission document for graph]

Energy systems are dependent, and impact upon, essentially all of the planetary boundaries. Energy systems based on fossil energy sources impact on the planetary boundaries for climate change, ozone depletion, aerosol loading, and chemical pollution. Hydropower affects the boundaries on freshwater use, rate of biodiversity loss, and land use change. Nuclear power affects the boundaries on chemical pollution risks and biodiversity. Renewable energy systems based on biomass systems impact the boundaries on land use change, freshwater use, interference with the nitrogen and phosphorus cycles, the rate of biodiversity loss, aerosol loading and climate change.

Energy access to service basic human needs will have a limited impact on our ability to stay within the planetary boundaries. According to the IEA (2011) basic universal electricity access would add around 1.3 per cent of total GHG emissions in 2030. However, more ambitious targets associated with productive uses of energy provide more of a challenge. On the climate change boundary, as an example, our assessment looks at the global energy pathways up to 2050 compatible with a 2 degrees target, based on

the most recent review of the global climate science (eg Rummukainen, Johansson et al. 2011 and GEA, 2011). The 2 degree target requires global emissions reductions of 50-60% from 2000 to 2050 (and close to 100% by 2100). At the same time, to enable the provision of energy for development requires a convergence in per capita emissions around the world. Preliminary estimates point to emissions reductions in the EU and US in the range of 75-90% compared with 2000 levels by 2050. Countries in Sub-Saharan Africa and many parts of Asia can instead increase emissions for a few decades more, but will ultimately have to bend the curves on emissions well before 2050.

Assessment Partners: Stockholm Environment Institute (SEI), Brazilian Foundation for Sustainable Development (FBDS), African Climate Policy Centre (ACPC), Energy and Resources Institute (TERI), Federal University of Rio de Janeiro (COPPE), International Institute for Applied Systems Analysis, (IIASA), Netherlands Environmental Assessment Agency (PBL), World Resources Institute (WRI).

## Sustainable World Initiative

### Sustainability Evaluation and Reporting (SER)

Recommendation to fully incorporate SER into the "Zero Draft" of the Secretary General's Compilation Document for Rio 2012, and for its incorporation into the final 'plan of action' at the United Nations Conference on Sustainable Development (Rio+20)

Background: The nations of the world have already clearly acknowledged and endorsed our common responsibility to operate human civilization in harmony with the natural environment, so as to maximize human development potential, advance human well-being, and preserve all life on planet Earth. More specifically, as provided in Agenda 21, the relationships between population size, human societal activity, and environmental resources and between environmental degradation and the components of demographic change should be analyzed.<sup>1</sup> Moreover, assessments should be made of national population carrying capacities in the context of satisfaction of human needs, sustainable development and human rights, and special attention should be given to critical resources, such as water and land, and environmental factors, such as ecosystem health and biodiversity.<sup>2</sup>

In developing the final plan of action for the United Nations Conference on Sustainable Development, it is important to reaffirm and build upon Agenda 21 by explicitly recognizing that:

1. All life on planet Earth is dependent on a highly complex and ubiquitous set of biological and geophysical resource systems;
2. Human life and all of our economic and societal activities require and rely on the goods and services of Earth's natural resource systems;
3. Economic and social development are dependent on adequate and healthy resource systems;
4. Human civilization for all practical purposes, must operate within the limits of one planet Earth (a closed system with finite resources);
5. A sustainable system is one that can continue to operate indefinitely without degrading the biophysical basis of its own existence;
6. Sustainability (or resource system integrity) can be measured by assessing the total amount of biophysical resource demands placed upon a system, and comparing these demands to the system's total capacity to supply needed resources;
7. Scientifically based accounting methodologies are available to do sustainability assessments as described in item 7 above;
8. Sustainability evaluation methodologies [also referred to as resource macro-balance assessments] can be used demonstrate unsustainable behavior long before such behavior causes severe and potentially irreparable damage to planetary resource systems;
9. Sizable human population increases and growth in the global economy over the past few decades have caused humanity's resource demands to exceed planetary natural resource limits. The world is now in a state of natural resource overshoot, an unstable drawdown condition that can lead to economic and societal breakdown;
10. Global warming, climate change, peak oil, fresh water shortages, toxicity increases in the global food chain, rapid biodiversity loss, coral reef degradation, and deforestation are all tangible signs that we are exceeding regional and global resource limits;
11. Human over-consumption (overshoot) of global resources, and the resulting endangerment to the health and well-being of many global resource systems, is a significant emerging issue that the world must address;
12. Earthly resources are, to a large extent, managed and controlled by individual sovereign nations. However, demands on resource goods and services can easily transcend national boundaries through international commerce and unequal exploitation of the global commons; and
13. Shortages of resources, degradation of global resource systems, and other deleterious conditions associated with resource overshoot such as global warming and climate change, pose a threat to global harmony, equity, and security. Recognizing these fundamental tenets, and desiring to promote global equity, maximize global security, preserve global resource systems, and protect the ability of future generations to adequately meet their needs, the Conference and the attending countries should:

1. Embrace the broad concept of sustainability (balanced living within our resource means) and commit to a program of action which defines, and ultimately will result in, continuous sustainability [resource macro-balance] improvement;
2. Acknowledge that the preservation of global resources and resource systems is the responsibility of individual nations, as well as all nations of the global community working together;
3. Declare that resource preservation and sound conservation practices are in the best interests of everyone in the world community;
4. Participate in international dialogs and initiatives that advance scientific, social, and political understanding of resource preservation issues;
5. Support the adoption of sustainability evaluation processes [resource macro-balance assessments] at the country level, and periodically determine our national resource sustainability position in accordance with the plan of action contained herein.
6. Commit to the public disclosure of national sustainability evaluations and the sharing of them with the United Nations Environmental Program, in accordance with the plan of action.
7. Encourage participating countries to adopt and commence work on a national strategic planning process that will ultimately define and advance viable alternative future sustainable living scenarios.

8. Call upon the United Nations Environmental Program (UNEP) to support national sustainability evaluation and reporting. Proposed Plan of Action Basis for action -

1.0 The global economy and total scale of human societal activity on the planet is not sustainable at current levels of population and consumption, and the global issue of resource over-use is becoming more severe with time. Our global 'business as usual' is leading us on a collision course with nature and undermining the resource assets of the planet that are foundationally necessary for social and economic development. The fundamental shift that has occurred in our relationship with the natural world is a significant emerging issue that the world must address.

2.0 The ongoing (and accelerating) human over-conscription of resources, sometimes referred to as ecological overshoot - but more generally referred to as resource overshoot - now jeopardizes the long-term viability of many earthly resource systems. As these overshoot threats compound in scale and duration, we place human well-being (for both current and future generations) in jeopardy.

3.0 In response to this emerging issue, and to the threat it represents, humanity must now pay close attention to the resource sustainability of our total economic and societal activities. We must begin to monitor our combined activities and to take appropriate steps to ensure that they are conducted within the finite limits of planetary resource capacity. To ensure a truly sustainable future for the world, we must address the total biological and geo-physical balance between what humans and other species demand of nature and what nature can provide. Creating and preserving an appropriate total resource demand vs. supply balance is a critical requirement of sustainability and the long-term viability of the planet. Objectives .

1.0 Make total resource sustainability central to our current and future thinking. Such a plan will require both national and international action and a new approach to international environmental governance.

2.0 Develop an internationally recognized process for conducting periodic sustainability assessments at the national governance level that would commit participating countries to:

2.1 Periodically reviewing their bio-physical resource demands;

2.2 Comparing these demands with their resource capacities; and

2.3 Developing future sustainable living scenarios for their countries which ultimately bring their resource demands into balance with their resource capacities. Activities -

1.0 National Action: Each nation must individually embrace the broad concept of sustainability (living within our means) and commit to a program of action which results in continuous macro[?]balance improvement. This commitment will require a robust scientifically-based sustainability planning effort, and for most countries this will mean creating a new national sustainability institution, or at least a new sustainability focus within an existing institution. It will require new evaluation processes, periodic reporting, and a commitment to adopting national policies that promote self-sufficiency within the natural resource limits of each respective sovereign territory.

1.1. Each nation, within the bounds of international law and human rights, enjoys full national sovereignty, knows its own societal and cultural needs, and has the right to determine its own unique path toward sustainability. Consequently it is at the aggregated level of national governance that most of the sustainability work must be done.

1.2 Each nation, with coordinating assistance from the new International Sustainability Program (ISP), should commit to annually evaluating its national resource sustainability position, and reporting the results of these evaluations to its citizens, policy makers, and to the ISP.

2.0 International Sustainability Program (ISP): A new international sustainability focus is required3 to accomplish the following:

2.1 Support of national sustainability efforts [?] Nations will require scientific, policy, and administrative support to evaluate, report progress, and move in the direction of macrobiophysical sustainability within their respective sovereign entities. An international sustainability institution is needed to provide scientific as well as policy guidance in support of these national sustainability efforts, and to provide universally acceptable sustainability standards.

2.2 Allocation of international resources - Certain resources are spatially outside of national boundaries and are considered part of the global commons, most notably ocean resources including international fisheries and the ocean's carbon sequestration capacity. All such international resources must be allocated to individual sovereign states so that they are realistically included in national sustainability plans and goal setting. If international resources are allocated in this manner, then national sustainability plans can be aggregated to produce a viable global sustainability scenario.

2.3 Global management of waste loadings . Toxic waste loadings cannot be managed within a national 'balance with nature' framework for a number of reasons. First, the long term capacity of the biosphere (along with the lithosphere) to assimilate toxic and other difficult anthropogenic waste streams is not clearly understood. Second, many (if not most) toxic wastes migrate beyond national boundaries, and we are not able to accurately account for this migration. Third, in order to manage by balancing it is essential that we are able to reasonably calculate an anthropogenic demand (human waste output), and compare it to the assimilation capacity of natural ecosystems. The former we can probably do by reporting and aggregating point source emissions, but the latter is virtually impossible. We simply do not know, and cannot calculate with the required degree of precision, nature's capacity to assimilate our toxic waste loadings. These realities make it clear that we must regulate toxic wastes at the international level and address the threats posed by them in much the same way that we dealt with threats to the world[?]s ozone layer, and in a manner consistent with the precautionary principal for the long-term benefit of all nations. [Note: This ISP function applies for persistent toxic wastes and does not apply to humanity's largest non-aqueous waste stream: CO2. CO2 emissions can be managed by individual nations within a renewable resources 'balancing framework,' because we are able to calculate CO2 demand (by aggregating point source emissions) and also calculate the carbon sequestration capacity for individual sovereign territories.]

2.4 International sustainability goal setting - Although each sovereign country will independently chart its own course toward the goal of national macro-sustainability, and achieve progress along its respective path (see section 2.1. above), progress for the world as a whole may be insufficient to reasonably ensure the future viability of global ecosystems (e.g. excessive planetary warming or ocean degradation). Therefore sustainability goal setting must also be done at the global level. The international sustainability institution must solicit appropriate scientific advice, and periodically develop sustainability goals and targets. This international body will also be responsible for overseeing international efforts or negotiations aimed at encouraging or facilitating international action on sustainability.

2.5 Global sustainability monitoring - Global sustainability can best be evaluated and achieved via aggregation of national sustainability efforts. The international sustainability institution, as an international watchdog, must monitor and ensure progress of individual national efforts, and report progress (or non-compliance) to appropriate international forums.

2.6 Forum for international resource agreements - Many nations will not be able to achieve balanced resource plans within the natural resource constraints of their sovereign territories. Therefore they will need, at least for some period of time, to acquire legitimate rights to resources from other nations. The international sustainability governance function should provide a forum for the negotiation of such resource treaties and agreements, and promote transparent international dialog about global resource demands, capacities, and sustainability trends.

The new international sustainability administrative focus (the ISP) will be initially formed and made operational by the end of 2012. UNEP will be the lead agency for the

creation of the ISP.

## SustainUS

Inputs: Rio+20 Compilation Document

November 1, 2011

As youth, we will live in a world shaped by the outcomes of the Rio+20 summit. Over the past century we have seen the needs of future generations neglected while ecosystems are abused and the people who depend on them ignored. Global ecological and economic crises are not distant possibilities; they are an immediate reality and require global collaboration. We call for a Rio+20 process that ensures bold and immediate action that protects the rights of future generations to lead meaningful and dignified lives.

### Expanding the Definition of Sustainable Development

Sustainability is a critical organizing concept for global action but vague and competing definitions pose a liability to successful outcomes. Current UN definitions are helpful but often fail to go far enough in capturing the full scope of work involved in meaningful sustainable development and a transition to a global green economy. We call on Member States to:

- Adopt a definition of sustainability that conveys underpinning ecological, social, cultural, and economic principles. We need to re-conceptualize development and prioritize the precautionary principle if we are to achieve sustainability.
- Adopt a definition of "green economy" that prioritizes the well-being and basic needs of people and recognizes that infinite material growth is impossible in a finite world. A green economy must minimize ecosystem degradation and move beyond GDP as the sole indicator of prosperity.

### Improving Institutions and Governance Systems

Achieving the goal of global sustainability depends on having an effective institutional framework based on commitment from sovereign governments. Rio+20 will be a unique opportunity to strengthen international environmental governance and to develop the necessary tools to mitigate and adapt to current world challenges.

- We call on Member States to strengthen the responsibilities and mandate of the UNEP. The strengthened institution needs to possess the financial support to fully streamline its monitoring, assessment and reporting responsibilities.
- We call on the Secretariat to initiate an extensive review of compliance mechanisms within existing international environmental agreements, identifying the most successful practices and supporting their use in future agreements.

### Creating Tools for the Green Economy

Our current global economic institutions and international economic system have failed to adequately support sustainable development – we need new policies to assist in the transition to a green economy. Youth need to be a central stakeholder of any such policies since we will be the ones to carry forward this new economy. We call on Member States to:

- Streamline green technology standards across all countries and international institutions to better facilitate the transfer and dissemination of green technology.
- Address the adverse impacts of structural adjustment programs (including austerity measures, privatization, and export-led growth) on sustainable development and poverty alleviation.
- Promote 'active labor market policies' including: subsidized or free primary, secondary, and post-secondary education; job training; and unemployment insurance in order to improve labor market flexibility and income mobility in the face of ecological changes and changes to industrial structure that may emerge due to environmental regulation.
- Establish international legal structures that recognize and protect the rights of 'benefit corporations' to pursue a 'triple bottom line' of economic, social, and environmental gains without undermining fiduciary responsibility.
- Recognize and address the need for a reform of the international banking and finance sector through the implementation of a Financial Transaction Tax (also known as a Tobin or Robin Hood Tax). The money collected through this tax should be put towards sustainable development initiatives.
- Call for a review and potential cancellation of third-world debt in appropriate circumstances where it will allow for further investment in sustainable development initiatives. Debt-for-nature swaps, with indigenous peoples as key stakeholders, should also be considered.
- Recognize, with regards to the green economy, that one size does not fit all and instead offer a range of ideas and possibilities for all countries on the path to sustainable development. These should be based on the sharing of best practices, lessons learned, and the robust transfer of knowledge and technology.

### Equity and Equality: The Foundation of Sustainable Development

The objective of any international policy should be to further promote equity and equality. Rio+20 needs to prioritize both of these concepts as it discusses ways to bring about sustainable development. We call on Member States to:

- Prioritize local control of resources, recognizing that the privatization of essential resources such as water – especially without robust public monitoring and oversight – risks restricting people's access to resources that have sustained them for generations. In the absence of resource management structures, states should build capacity for management rather than privatizing or managing resources directly. Indigenous peoples and their historical rights to resources, particularly land, must be explicitly protected.
- Address the inequities of development by establishing concrete planning mechanisms for the equitable distribution of benefits of international development projects. Development fundamentally implies a change in existing structures. As a result, we must actively mitigate harms to those who are adversely affected.
- Recognize that developing countries, local communities and individuals need stronger legal and economic institutions to maintain their sovereignty and freedom to develop along paths other than export-led growth.
- Establish a legal forum in which affected individuals can seek redress from parties facilitating trans-national development projects. Individuals need to be given space to legally defend themselves when their land and communities are threatened.

- Recognize and address the need for global protection of the commons. Land, sky, water, ecosystems, ores, public spaces, scientific knowledge and local customs all sprang from nature's abundance and/or the life's work of previous generations. We need international institutions to assist in protecting these shared resources.

#### Conflict and Disaster: Obstacles to Sustainable Development

In the Johannesburg Declaration (paragraph 19), Member States "reaffirm [their] pledge to place particular focus on, and give priority attention to, the fight against the worldwide conditions that pose severe threats to the sustainable development of our people, which include...armed conflict...[and] natural disasters..." We need a renewed commitment to closing implementation gaps and achieving progress on these critical issues. We call on Member States to:

- Address as a priority the impacts of armed conflict on local communities and the environment, with special consideration for related conditions that pose severe threats to children and youth, such as: disruption of basic services, endemic disease, intolerance, terrorism, and environmental hazards and degradation (e.g., landmines and medical waste).
- Strengthen international, national, and local partnerships to engage local stakeholders in support of integrated financial mechanisms, as well as post-conflict and environmental disaster assessments, cleanup and reconstruction, capacity building, victim assistance, and risk education.
- Actively foster, with the support of the Secretariat, intra-UN collaboration to effectively and comprehensively address the impacts of armed conflict and disaster on sustainable development. Civil society should also be actively involved in the development and implementation of innovative and robust policy measures.
- Recognize the unique needs of environmentally displaced peoples and consider establishing international procedures to assist them.
- Emphasize the crucial role of sustainable development in mitigating the economic, social, and environmental effects of armed conflict, and in promoting and sustaining peace.

## Swedish International Centre of Education for Sustainable Development (SWEDESD)

Contribution to UNCSD2012 Compilation Document from the Swedish International Centre of Education for Sustainable Development (SWEDESD)

This contribution relates in particular to "specific element B" in the Co-Chairs' Guidance Note, i.e. to green economy in the context of sustainable development and poverty eradication.

On the importance of education for sustainable development (ESD) in the quest for a green economy

What is a green economy?

And what is the link between a green economy and ESD?

The first question partly answers the second one. Being a new concept without an established definition, there is some confusion on what green economy entails and implies. As the UN general secretary puts it (UN 2010):

"greater conceptual clarity is needed with regard to the links between a green economy and sustainable development. In particular, there is a need to be explicit on the practical implications of the approach, namely the menu of policies and actions proposed under the banner of the green economy"

Interpretations of the green economy cover disparate and sometimes contradictory ideas, and naturally different stakeholders bring different views to the discussion – spanning from promotion of innovation, green jobs and technology transfer to reformation of the way we think about progress and wellbeing; from changing incentive structures in global financial markets to advocating community-based small-scale banking; from the importance of food security to the importance to stop subsidizing the use of fossil fuels; and so on.

In this sense, the green economy concept is susceptible to the same critique that is raised against the sustainable development concept – that it is so inclusive that it runs the risk of becoming watered down and weak as a guide to policymaking. The topics mentioned above are certainly not new on the development agenda. So, is green economy old wine in new bottles?

The SWEDESD stand is that the green economy concept is a welcome addition to the box of tools available for ESD. It provides a useful lens through which the sustainable development agenda can be looked upon, better understood and advanced. Although discussions on green economy cover disparate ideas, they have in common a basic notion that the current economic system is generally not providing the most desirable social outcomes – be it in terms of margins to the physical boundaries of the planet (e.g. Rockström et al 2009), poverty (e.g. UNDP 2010) or inequality across and within nations (e.g. Wilkinson and Pickett 2009). In other words, the green economy concept implies that a fundamental part in finding paths towards sustainable development is analyzing how markets in a broad sense allocate limited resources. The importance of correcting market failures is indeed a key message in the most prominent policy documents on green economy (e.g. UNEP 2011; UN-DESA 2009; OECD 2009; European Commission 2011; UNEP, ILO, IOE & ITUC 2008 and Jackson 2009).

Focusing on market failures can help acknowledging social and environmental values that are currently not accounted for in conventional markets and policies. It can also reveal potential for unacknowledged synergies between different policy objectives. Ecosystem services for poverty alleviation (ESPA) approaches is one example (Millennium Ecosystem Assessment 2005). In ESPA, ecosystems services contributing to the livelihood, subsistence and/or resilience of people living in poverty as well as benefits for other parts of society are secured by investments that conventional markets fail to do.

By focusing on how markets tie together human activities and allocate resources that are limited, the green economy concept also has the potential of making short-term tradeoffs between different policy objectives explicit – perhaps more so than in previous development approaches where the characteristics of markets is not a focus area. Short-term tradeoffs between policy objectives are frequently evident when the three dimensions of sustainable development (social, ecological, economic) are considered together – e.g. when poverty because of unemployment increases when a business that harms ecosystems is shut down, or when there are conflicting interests in services from a particular ecosystem – e.g. recreation values in a forest versus commercial values such as timber.

So what role can ESD play in green economy?

Just as often stressed regarding sustainable development in general, a key for advancing the understanding of what a green economy is and how it should be implemented is creating platforms where different stakeholders can meet and learn in collaboration. Such platforms are needed both inside and outside the formal educational system, in accordance with ESD theory (UNESCO 2005). As mentioned above, a focus on resource allocation can help economists identify market failures, synergies and tradeoffs. However, arriving at an overall understanding of how relevant aspects fit together can be thought of as assembling a jigsaw puzzle where a multitude of disciplines within both natural and social science contribute with pieces of information. Natural scientists are trying to pin down the pressure from economic activity that ecosystems on which we depend can stand given the size of the population, demographers are trying to predict the population growth over the coming decades given expected GDP growth, engineers work on new technology that can increase human wellbeing and decrease environmental impact, behavioral economists, sociologists and psychologists try to complement the "rational agent" theory in order to better predict behavior in markets, and so on. Although the understanding of complex social-ecological relationships is continuously improved, the pieces are still too scattered for a coherent picture to emerge. The cross-sectoral approach inherent in the ESD concept can help in assembling the puzzle so that a this picture is discerned, although it will perhaps never be completed. Further, innovative ESD pedagogy and methodology can facilitate interaction and collaborative learning across scientific disciplines and scholarly traditions. In short: ESD can help in creating better-informed policy making, and in disseminating new understanding broadly in society – i.e. give input to the complex processes that shape social preferences upon which decisions in democracies are based.

As an illustration of this, one can think of environmental valuation. This is a method for revealing true preferences related to the environment that are not accurately expressed in markets because of imperfect information, ill-defined or lacking property rights, bounded rationality, moral hazard and/or free riding (e.g. TEEB 2010). The results from environmental valuation can guide policies aimed at correcting market failures through taxation, subsidies or command and control measures. While environmental valuation can capture certain values ignored in markets (in particular non-use values), techniques targeted at eliciting individual preferences are partly subject to the same phenomena that make markets fail – in particular imperfect information. We can never know the preferences of future generations, or the exact shape of ecosystem services supply curves including thresholds that can cause sudden collapses. There are further problems involved in aggregating expressions of individual ordinal utility (e.g. Arrow 1951). To tackle these issues, ESD institutions could play an important role by bringing together stakeholders with different expertise and diverging preferences and facilitate deliberation in accordance with group valuation techniques, thereby shaping and formulating social preferences (e.g. Jacobs 1997). This methodology is slowly emerging in academic settings, but it deserves more attention as a key tool for implementing the green economy concept.

In view of the above, SWEDESD calls for the explicit acknowledgment of the importance of ESD in pursuing the green economy agenda in the UNCSD2012 Compilation Document – certainly also beyond the end of the UN decade of ESD 2005-2014.

So what are the critical issues in the discussion on green economy?

To conclude this contribution and adhere to the UN general secretary's call for items on the menu of green economy policies, we list below a few issues that we think deserve particular attention in the continued discussions on green economy. To be solved they all require collaborative learning among different stakeholders and input from various scientific disciplines, which again highlights the importance of ESD.

- There is a need for large scale support to initiatives such as the Green Accounting for Indian States & Union Territories Project (GAISP) aimed at mapping environmental values currently not acknowledged by markets.
- There is a need for multilateral discussions on green economy to focus explicitly on the problem of leakage, i.e. that regional environmental regulations may have little effect as activities causing environmental costs move to regions where regulation is lacking.
- There is a need for a deeper understanding of how rebound effects hamper decoupling, i.e. how gains from greater efficiency in production are used to increase economic activity leaving overall environmental impact unaffected or even worsened. The discussion on shorter work hours should be considered in this regard (e.g. Rosnick & Weisbrod 2006).
- The risk of increasing poverty and inequality when economic activities causing environmental cost shut down following strengthened regulation needs to be thoroughly addressed. The "green jobs" discourse and role of public investments in "green" infrastructure and training should be considered (e.g. UNEP, ILO, IOE & ITUC 2009).
- The relationship between wellbeing and conventional economic growth needs to be understood better in order to see what role the GDP measurement or proposed alternatives should play in guiding policy.
- The role of the financial sector in creating credit that enhances conventional growth needs to be examined further in the light of market failures, along with the effect that moral hazard, bounded rationality and "animal spirits" (Akerlof & Shiller 2009) have on the function of capital and derivatives markets.
- The trade-off between securing intellectual property rights in order to spur innovation and quickly disseminate new "green" technologies needs to be better understood, in particular in view of government R & D funding.

## Swedish Society for Nature Conservation (SSNC)

SUBMISSION TO INPUT DOCUMENT FOR THE ZERO DRAFT OF OUTCOME DOCUMENT FOR THE UN CONFERENCE OF SUSTAINABLE DEVELOPMENT (RIO+20)

A public investment programme to drive transformation to 100% renewable energy while ensuring universal access to affordable, renewable energy.

The case for establishing a global system of national feed-in tariffs/guarantee prices linked to a global fund

By The Swedish Society for Nature Conservation (SSNC)

Box 4625, SE-116 91 Stockholm, Sweden

[niclas.hallstrom@naturskyddsforeningen.se](mailto:niclas.hallstrom@naturskyddsforeningen.se)

1 November 2011

This document is a contribution to the negotiation process of the UN Conference on Sustainable Development (Rio +20) outcome document, and in particular provides concrete input to the operationalization of the conference theme "A Green economy in the context of sustainable development and poverty eradication". It presents the core elements of a highly interesting approach to simultaneously tackle climate mitigation needs and the need to address development needs, in particular global energy poverty.

This approach has been developed by, among others, the Division for Sustainable Development at the UN Department for Social and Economic Affairs, and is gaining traction among both negotiators, policy makers and civil society organisations – in both developing and developed countries.

The scheme is one of the few mechanisms on the table that has a truly transformative potential, and that speaks clearly to why substantial public funds are needed for climate and development (e.g. through the UNFCCC Green Climate Fund or other new initiatives), and how a mechanism to effectively make use of a significant portion of these funds can be used to simultaneously tackle development and climate. The proposal is practical, doable and has the potential to evolve during the coming few years to become one of the most significant mechanisms to move the world towards sustainable development.

The following document<sup>1</sup> outlines the overall idea which we hope will be picked up by several governments in the lead up to Rio+20. One of the key strengths of the idea is its integrated approach which effectively transforms the current locked in, zero-sum logic of the climate negotiations to a win-win logic where mitigation and increased access to energy are no longer contradictory, but rather mutually reinforcing.

Furthermore, it speaks to the kinds and scope of funds that are needed, the potential to crowd in further investments, both public and private, and also shows some significant qualities in relation to governance, transparency and accountability. It provides a highly interesting framework where direct access to resources are ensured, while being output-based and thus ensuring that financial resources are only dispersed upon the delivery of clean, fossil-free and affordable energy. The proposal is framed as a cooperative, win-win effort, which would essentially have MRV built-in. In addition to the substantial transformative scope for both mitigation and provision of energy access for the 1.5 billion people currently lacking basic energy services, a major quality of the idea is its potential to help rebuild much eroded trust between developing and developed countries through true cooperation.

In addition to all of this, the approach would also constitute a true investment with significant returns also for the rich countries providing the public funds. With investments in renewable energy at the significant scale suggested, the actual costs of the technologies would be dramatically cut over a short period of time, thereby making the massive transition to 100% renewable energy also in the north in the decades ahead significantly cheaper. The proposal is a front-loaded public investment programme, which would at its end in 10-15 years time have achieved a radically new and favorable cost situation for renewable energy.

The recent IPCC report on renewable energy clearly shows the almost limitless technical potential for renewable energy, given the right economic context and political will. And as the IPCC report also points out, feed-in tariffs/guarantee prices are among the most effective mechanisms to quickly tap this potential and move the world towards 100% renewables and zero-carbon emissions. We hope the UNCSD process will take this idea into consideration, and clearly acknowledge the need for effective and substantial public investments in renewable energy through a global programme for feed-in tariffs/guarantee prices in the developing countries.

A green energy revolution for climate and development through a global system of feed-in tariffs for renewable energy

The climate crisis requires drastically reduced use of fossil fuels. At the same time at least two billion people need to increase their energy use to satisfy their basic needs.

With drastically increased investments in renewable energy through global feed-in tariffs both these challenges can be met simultaneously – while quickly making renewable energy competitive and reducing costs also in the rich countries.

A Marshall plan for climate and development where both South and North can gain.

Energy access – the need for affordable energy

Increased access to energy is essential in order for many of the world's poor people to improve their living conditions and exercise their right to live well. If poor people's needs are not taken seriously, any prospect for effectively tackling climate change also diminishes.

Two billion people – half the population in the developing countries – still need to rely on bioenergy, agricultural residues and dung for cooking. As many live with incomes of less than 2 dollars per person and day.

Access to energy is a decisive factor for people's well being. For example, countries with a low energy use score very low on the UN index for human development (HDI). For these countries even slightly higher energy use among the poor generally correlates to drastic improvements in HDI.

The double challenge

In order to promote a transition towards renewable energy, industrialized countries tend to favor the idea of increasing the prices of fossil energy relative to renewable alternatives, e.g through carbon trading schemes or taxes. But for poor people the main concern is cost, the availability of affordable energy – no matter what kind. For developing countries, a key challenge is therefore to make the renewable energy cheap enough.

This is the departure point for a UN proposal that has been called both "A Green Energy Revolution" and "A Global Green New Deal", launched in the 2009 UN report Promoting Development – Saving the Planet.

The Swedish Society for Nature Conservation sees this proposal as highly promising, and believes it has the potential to create a breakthrough in the climate negotiations. If the plan would be implemented, major positive changes to tackle the double challenge of tackling poverty while effectively reducing emissions would be achieved in a relatively short time, something which would rebuild some of the much eroded trust between developing and rich countries.

Global feed-in tariffs

The core idea in the proposal is to create a boom in demand for sustainable, renewable energy in developing countries. The key tool is to introduce guaranteed prices, or feed-in tariffs, for sustainable renewable energy. Feed-in tariffs have already been introduced in approximately 50 countries, and have contributed to significant increases in renewable energy in e.g. Germany and Spain. Many analysts have concluded that feed-in tariffs are by far the most effective policy tool/system for crowding in investments for renewable energy (see for example several Deutsche Bank reports<sup>3</sup>) The core principle is that those who invest in renewable energy are guaranteed to sell the energy at agreed prices that allows for a small margin. The price for consumers are then decided with consideration to what poor people can afford. The cost difference are covered by a subsidy financed by the rich countries through a global climate fund. According to the UN estimation, about USD 100 billion would be needed annually during 10-15 years – the time period needed in order to cut the production costs to a level where the subsidies are no longer needed and renewables have become cheaper than fossil fuels.

Financing and the Green Climate Fund

In the UN Framework Convention on Climate Change (UNFCCC), all industrialized countries have made a binding commitment to support poor countries through financing both a transition to low or zero-carbon societies and adaptation to the impacts of climate change. However, so far there have been very limited concrete contributions.

The proposal for subsidized feed-in tariffs have several qualities which speaks in favor of an ambitious global investment plan that could also gain traction among the industrialised countries.

- The system is output based, i.e payment (the subsidy) is only provided when the new, renewable energy is delivered. The energy will be metered in any case when it is sold, and the subsidy is then instantly provided through the national feed-in system, which in turn is coupled to the global climate fund. No money is dispersed for the actual construction of renewable energy projects – it is up to the investor to ensure that production costs are kept within the budget. There is thus little risk for corruption and misuse of funds.
- There is a time-limit for the program. The quicker the costs for new investments decreases, the quicker the need for the subsidies also diminishes. The program will not go on forever, but will last 10-15 years to take the world over the threshold to a renewable future.
- Diminishing costs and increased demand will create jobs, benefit progressive companies and facilitate/lower the costs for the necessary energy transition in both developing and industrialized countries.
- The proposal is fully compatible with the developing countries' demand for public financing through the creation of the Green Climate Fund, while at the same time tackling the rich countries' reluctance to provide funds with direct access. The proposal builds on mutual, cooperative agreements on how to use and disperse a substantial part of the money to meet clearly defined goals (promotion of renewable energy and improved access to affordable energy for the poor).
- The proposal breaks away from the climate negotiations current zero-sum logic to a positivesum, win-win approach where total energy availability increases, while emissions are cut – and energy access is tackled. The proposal can in a more general sense become an important stepping stone for rebuilding trust between north and south.

This proposal would have several direct implications on the way any financing body (e.g the new Green Climate Fund) would need to be set up.

☞ There is a need for real money. The feed-in tariff subsidies would be delivered on a continuous basis as renewable energy under the scheme is sold, i.e. the feed-in subsidy would be claimed by the producer from the national authority in charge of the feed-in tariff system at the very moment consumers pay their (affordably priced) energy bill. The national authority would in turn claim the subsidy from the specially established energy/feed-in tariff window of the global fund.

☞ This means that e.g. already existing aid flows, carbon credits or private investments, can not constitute sources of the Green Climate Fund – contributions must be new, additional and disbursable public money. However, the scheme will actively crowd in and enable both public and private investments in renewable energy that are manifold larger than the subsidies under the fund.

☞ There is a strong argument for front-loaded investments: early investments will drive the costs of renewable energy down quicker and thus reduce overall costs.

☞ A full fledged system involving most developing countries would require approximately USD 100 annually over at 10-15 year period, according to UN DESA. This clearly shows the need to significantly adjust upwards the Cancun figure for the Green Climate Fund of USD 100 billion and ensure this is public funding.

☞ It is also essential that the climate fund be governed in a way that guarantees participation and influence for both poor countries and civil society over how the money is allocated and that there is transparency in their spending.

#### Technology

The public investment proposal does not require new, uncertain technological breakthroughs. On contrary, the core idea is to mainly promote the refinement of and increase demand and cut costs for the kind of renewable energy solutions that already exist.

Steady demand is a very important driver for technological development and reduction of costs. The more ambitiously the world focuses on providing people with renewable energy, the quicker will the costs decrease.

But, there are more hurdles than high energy costs. The proposal also suggests actions to adapt both policy and the technologies to varying national and local conditions, and to support the developing countries with training and technological support.

It is also important to deal with the issue of patents, which enables companies to charge more for their technologies and leads to complicated procedures that often limits the availability of the desired technologies. These barriers must be effectively dealt with and removed.

A system of feed-in tariffs means that society are actively picking the winners, i.e actively promoting the kinds of energy solutions that are desirable. It is therefore essential that a system and procedures are designed, from the very beginning, that guarantees that technologies are assessed and scrutinized in a reliable and thorough manner, with participation of civil society and affected groups. Society must ensure that the technologies which are promoted do not lead to undesired, negative effects for people and the environment (i.e. no large hydro, biochar, biofuels, or nuclear energy should be eligible for feed-in tariffs). Assessments must be made at several levels, from the local to the global. It is particularly important to analyze how different technologies impact on the poorest and most vulnerable groups in society.

#### Energy efficiency and systems approaches

It is essential that any feed-in tariff system is designed so that they simultaneously promote energy efficiency and energy development that is appropriate for the local context. Requirements and support for energy efficiency should be integrated in the design of the scheme, so that the maximum amount of energy services is obtained from each invested kilowatt-hour. It is not appropriate to only promote the maximum amount of installed capacity – this would constitute a waste of public resources, weaken the benefits, and promote mega-projects at the expense of more appropriate, local and smallscale solutions. It is also important to ensure ways to promote and subsidize non-electricity energy solutions where more appropriate.

#### Bottom-up energy revolution

A global system of feed-in tariffs could and should encourage and enable a bottom-up, people-driven transition to renewable energy. For example, a cooperative, a municipality, or a group of communities could come together and decide they should construct their own solar energy system and set up a small, local grid. With a feed-in tariff law in place, they would be able to take a commercial loan, or obtain state grants to begin the construction process almost immediately, knowing they are guaranteed the feed-in subsidy over the whole 10-15 year period. The proposal thus has a potential to spur a massive true small-scale, bottom-up renewable energy revolution across the world.

At the same time, the scheme may allow for commercial actors to make investments with a guaranteed, modest profit margin. It is, however, essential that the various national feed-in laws and systems become promoters of local, people-based solutions and that measures are designed from the beginning to avoid crowding out and dominance by e.g. large, foreign corporations. A substantial share of the feed-in subsidies should be oriented to off-grid solutions (i.e. small, local grids rather than large national grids).

#### Part of the solution

A global action plan for climate must reach beyond the transition to renewable energy. And it must be clear that the quest is not about a copying of Western high energy use and overconsuming notion of development. Yet, there are unquestionable needs for much more energy among the poorer segments of society in developing countries.

The main message in this proposal is thus to take an integrated approach to climate and development and recognize the critical/essential need for major, front-loaded public investments to enable the necessary structural transformations that are needed. Responses to climate change and poverty must be bold, ambitious and visionary, and must manage to integrate the double challenges of climate and development. There is a need for ambitious public investments also in energy efficiency, new and efficient public transport systems, a transition to organic agriculture and ways to tackle deforestation. In addition, public investment must increase many times in order to deal with adaptation for those who are the poorest and most vulnerable.

Climate change is at the core an issue of climate and justice/equity.

The ideas for a global system of feed-in tariffs for renewable energy presented here is gaining major traction among a broad range of actors, including Parties, civil society organizations, social movements, researchers and others. The Swedish Society for Nature Conservation is working with partners to ensure that this promising scheme will be firmly placed on the agenda of both the UNFCCC and Rio +20 negotiations, and that simultaneously a constellation of countries from both the north and the south come together to set up an initial pilot scheme that can, as a following step, be scaled up as a formal UN structure. We strongly encourage the UNCSO to seriously consider this proposal.

An 92-page compilation of fact-sheets, reports, articles and other material from both SSNC, the UN, Deutsche Bank and other institutions speaking in favour of this idea can be downloaded at [http://www.naturskyddsforeningen.se/upload/Foreningsdokument/Klimat/Knackfragor/GER\\_feed-intariff\\_compilation.pdf](http://www.naturskyddsforeningen.se/upload/Foreningsdokument/Klimat/Knackfragor/GER_feed-intariff_compilation.pdf)

## TakingITGlobal

THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT (UNCSO) 2012

### INPUTS OF TAKINGITGLOBAL

Population dynamics, education and sustainable development are linked. It is important to reaffirm role of sexual and reproductive health and rights, gender equality, poverty, transportation and food systems while achieving sustainable development. This means ensuring that policies and programmes that aim to achieve sustainable development should also promote the human rights of all people to the highest attainable standard of sexual and reproductive health and wellbeing, particularly for women, young people and those living in poverty.

Young people are the present and the future. There are over 1.8 billion people aged 10-24 years in the world today, the majority of whom live in developing countries. In most developing countries, this generation of young people comprises more than a third of their country's population. In 67 developing countries, young people aged 10-24 constitute more than 40% of the adult population above 10 years of age. Young people are the most significant demographic group today and will remain so for the coming decades.

Policies should take into account the drivers of population growth. As the world reaches 7 billion, it is projected to grow to 9.3 billion by 2050. In the context of a green economy, there is an urgent need for countries to incorporate policies and programmes that take these dynamics into account and effectively respond to the shifting sources of population growth, especially through access to comprehensive sexual and reproductive health services and contraceptives.

Access to sexual and reproductive health and rights addresses high fertility and sustainability. Globally, an estimated 215 million women want to use family planning methods and services, but do not have access to them. Universal access to sexual and reproductive health including family planning should be one the key interventions needed to achieve sustainable, low-carbon development. If governments and other donors fund sexual and reproductive health services and supplies, we can advance environmental sustainability while also promoting social justice, development and human rights.

Gender equality and access to health will slow down population momentum. Putting in place approaches to increase the age at marriage and enhancing adolescents' sexual and reproductive health, educational levels, and income-generating potential can have significant effects on population growth rates. Where girls are able stay in school until secondary school and are empowered to decide on matters related to their sexuality and reproduction, there is a significant observed effect in delaying child birth and increasing spacing.

HIV prevention amongst young people ensures a sustainable workforce. Governments must recognize that the response to HIV is both a human rights issue and also an economic necessity crucial to eradicating poverty.

Access to sexual and reproductive health services promotes adaptation. Young women's health and well-being, their ability to choose if or when to have children and their risk or early pregnancy is affected by their lack of access to safe and stigma free sexual and reproductive health services, contraception and comprehensive sexuality education. Such access helps build resistance among individuals and communities and should be incorporated as a part of policies to promote sustainable development and adaptation strategies for climate change.

### RECOMMENDATIONS:

In the context of the Green Economy, member states should:

- Recognize that sustainable development entails empowering young people, particularly the most marginalized, by investing in their education, health including sustainability, sexual and reproductive health, employment and leadership.
- Prioritize their full and effective implementation of these commitments through multi-sectoral programmes that link social justice, access to health, gender equality and low carbon living with environmental sustainability.
- Effectively educate and communicate the social and environmental costs unsustainable lifestyles with an emphasis on food, meat consumption, food distribution costs and sustainable transportation.
- Take into account population dynamics in policies and expand rights-based programmes that effectively respond to the shifting sources of population growth through promotion of sexual and reproductive health and rights.
- Commit to achieve a society built upon gender equality which develops the capacities and empowerment of young people, particularly young women. Young women should be prioritized in the production and marketing of green technologies in the transition to a green economy, and there should be a focus on addressing the gendered impacts of climate change as a part of strategies to promote adaptation.
- Support gender-sensitive, age-appropriate, life-skills-based comprehensive sexuality education for young people both in and out of school based on international standards

as a way to empower young people, promote gender equality, human rights, prevent HIV and increase use of sexual and reproductive health services.

- Expand and support young people's choices and opportunities by ensuring and investing in access to youth friendly sexual and reproductive health services including family planning, particularly for marginalized adolescent girls and young women, those living with disabilities and in humanitarian situations.

- Reaffirm the goal of universal access to HIV prevention, treatment, care and support, in line with the Declaration of Commitment on HIV (2001) and the Political Declaration on HIV/AIDS (2006).

- Embrace the vision of Zero New Infections, Zero AIDS Related Death and Zero Discrimination and support efforts to achieve the three Bold Results on HIV and Young People under the UNAIDS Strategy 2011-2015, namely, (1) Raising comprehensive knowledge to 80%, (2) Doubling condom use amongst young people and (3) Doubling HIV testing among young people - in order to reduce new HIV infections among young people by 30% by 2015.

- Support integrated approaches to sustainable development that build on people's expressed needs, and strengthen community-based strategies, including through the meaningful participation of young people. In the context of the Institutional Framework, member states should:

- Ensure the meaningful participation of young people in decision making processes, by putting in place enabling structures and supportive policies and through building the capacities of youth-led organizations.

- National development plans, poverty reduction strategies, sustainable development strategies, policies and programmes should be planned, implemented, monitored and evaluated in equal partnership with young people through a participatory approach.

- Renew a global focus upon resource management, and lifecycle accounting for products, supervised by an international body dependent on the United Nations, supported by an international fund and a sharing of knowledge. Establish a comprehensive international information and labeling systems to measure the hidden costs of global consumer products.

- Implement tax structures and incentives to promote sustainable behaviors and increase the costs of unsustainable living. Remove subsidies for extraction of fossil fuels, and instead economically promote global access renewable energy while investing and upgrading resource management and water treatment facilities. Increase protection to small farmer against the strong competition of bigger corporations.

- Young people and youth-led organizations should be empowered to hold their governments accountable for their commitments including through full transparency initiatives including monitoring budgets and participation in appropriate institutional mechanisms.

---

## Thamesbank

Thamesbank

C/o Netherbury

Meadow Close

Bridge, Kent CT4 5AT

United Kingdom

Submission to Rio 20 on behalf of Thamesbank

### 1. Introduction

Thamesbank submits the following contributions to the United Nations Conference on Sustainable Development, for inclusion in a compilation document to serve as a basis for the preparation of a zero draft of the outcome document. This submission sets out our views on how to make the United Nations Conference more effective in terms of addressing water issues. Although our group exists to better protect the Thames River from the current and future threats facing the river from pollution, over development and misuse of resources, our long term aim is to ensure that all water bodies under Rio 20 are given similar protection if true Sustainable Living is to be achieved.

Thamesbank was set up over 10 years ago to campaign for the sustainability of the River Thames' ecosystem. We have always applied the Rio 1992 sustainable principles and aim to create an international example to secure a genuinely sustainable future for the river, the communities that live and work around the river, and for the ecosystems which depend on it. However, sustainability of the River Thames has continued to deteriorate. We need effective and adequate measures from Rio to ensure water bodies like the River Thames become sustainable.

The river is facing unprecedented challenges . New riverside developments, longer-term plans for the Thames Gateway, are stresses likely to increase as a result from climate change, and the challenges posed by the 2012 Olympic Games are all going to impact on the river. In particular, we are concerned about the proposal to build a 22km long cesspit for rainwater (a vital resource) and sewage by the Thames when other recommended more sustainable approaches have not been adequately explored by the Government or its agencies.

### 2. "Sustainable Development" should be changed to "Sustainable Living"

"Sustainable Development" should be changed to "Sustainable Living". Sustainable Development is a misnomer and an inappropriate word because it suggests that development is something that has to be achieved in order to achieve sustainability whereas true sustainability is about changing all our existing living practices to become sustainable in a world with finite resources. Development in the developed world has gone too far - it is not sustaining our planet. We should not be advocating a similar mistaken journey for the so called undeveloped countries or for ourselves.

### 3. Planning and why Sustainable Living must be made to determine every planning application

In the UK, planning decisions are made across the land that adversely impact upon the natural environment and water on a continual and cumulative basis. Environmental laws and other planning considerations do not effectively mix. The environment usually loses to economic considerations, those considerations which are sadly still based on the failed and outdated growth domestic product theory. That is why Thamesbank wants to see the concept of Green Growth embedded within the concept of Sustainable Living as part of the outcome document. What we mean by Green Growth is illustrated in the paper by Peter Head entitled 'Total community retrofit - an accelerated model for the UK to reach its climate change obligations by 2050' (attached). Consequently, every planning decision must be based on Sustainable Living. The process, outcome and later operation of each and every planning permission must equate with Sustainable Living. This means in practice that each permission granted must be carbon negative for

the process, the outcome and for its operation. The consideration of water is obviously fundamental to this process.

#### 4. Case Study - The Thames -Why water bodies need an overarching integrated statutory sustainable management body to achieve sustainability

Thamesbank is concerned that the Rio 20 process may not give adequate consideration to water issues in developed countries where water issues may wrongly be considered less important. The River Thames is of vital importance and that is why we include it here as a case study. It is under strain from excess sewage, water extraction and development yet there is no overarching integrated body statutory or otherwise to ensure that all aspects of the Thames are properly managed to secure water cycle sustainability. We need such a body and other water bodies do too. We believe that without such a body, the River Thames will not achieve Sustainable Living. To illustrate our growing concerns, we attach the recently published Selborne Commission Report<sup>1</sup> on the 22km Thames sewage/rainwater cesspit proposal. The Report voices concerns about the sustainability of the proposal but how will these concerns be properly addressed without there being one overarching integrated statutory management body solely in charge of the River Thames ecosystem?

#### 5.Enforcement mechanisms

Parties, organisations and ordinary individuals need to be able to enforce environmental laws and agreements on an international level otherwise Rio 20 will fail and our water bodies will continue to deteriorate. We second and adopt the proposals submitted by Wildlaw UK below:

Working Group - Technical Subgroup

This Declaration could be enforced by:

- i) an international environmental court such as the proposed International Court for the Environment which advocates wider access to environmental justice.
- ii) adoption of domestic laws which recognise and protect the rights of nature, e.g. the Bolivian Law of Mother Earth and the Ecuadorian Constitution.
- iii) recognising the rights of individuals and civil society groups to enforce the rights of nature, e.g., by widening interpretation of the provisions of the United Nations Economic Commission for Europe Convention on Access to Information, Public Participation in Decision Making and Access to Justice in Environmental Matters (the Aarhus Convention).
- iv) creating institutional mechanisms to promote and advocate the rights of nature such as Bolivia's proposal for an ombudsman for Mother Earth, or a Commission for Nature's Rights, similar to the Equality and Human Rights Commission in the U.K.
- v) Respecting the provisions of the World Charter and Earth Charter which set out duties and responsibilities for the respect and protection of Earth and the 'greater community of life and future generations'.

Dido Berkeley/ Emily Shirley/Graham Stevens of Thamesbank

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

During recent months, citizens around the globe have rallied to challenge practices they view as restricting personal growth and freedom. We value an inclusive process whereby all interested participants have the opportunity to review and comment within a timely manner on draft outcome documents, following the model used during annual UN NGO Conferences.

A possible structure for this document is presentation of main points and responsibilities related to three main audiences, i.e., Member States, Major Groups and UN System, followed by a section emphasizing opportunities for intersectoral collaboration. Contents of the outcome document must connect planned actions to achieve MDGs as related to sustainable development and healthy environments for all persons.

Of particular interest is MDG8: Develop a global partnership for development. Perhaps it would be useful to emphasize opportunities for active leadership by business/industry, major financial institutions and donors, indigenous people, women and children, and youth, particularly benefitting least developed countries. Which successful international partnerships are models illustrating donor and recipient accountability? (e.g., substantial work by The Bill and Melinda Gates Foundation, researchers, Member States, and Civil Society to eradicate malaria and polio and develop new models of sustainable agriculture).

There are numerous opportunities for UNmultimedia.org to interface with Member States and their accredited press representatives to disseminate broadly the outcome document to Civil Society and the public in a variety of formats, printed, audio, and digital. The youth delegates will have creative ideas to interface with their peers through social media and other informal networks.

---

#### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

---

#### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

---

#### **d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

### Specific Elements

#### **a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

We encourage ECOSOC, UN Commission on Sustainable Development, UN Forum on Forests, UN Framework Convention on Climate Change, Convention on Biological Diversity, and other conference organizers to provide an historical perspective detailing progress made on sustainable development and environmental protections since the 1972 Stockholm Conference on the Environment. What major barriers remain? What promising practices are likely to overcome these barriers?

Further, we call for clearly articulated and succinct summaries of latest evidence revealing how current development practices lead to adverse effects on the health and

wellbeing of all beings. Misleading information not supported by scientific study appears to contradict calls for action to protect our planet issued by Member States and UN Secretary General. Some elected officials have taken a stand opposing sustainable development practices, likely confusing their populace.

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

What are challenges and successes related to micro-economies, including policies and lending practices supporting small and medium-sized businesses within communities that do not harm the environment and yield jobs with living wages? (e.g., supporting a "local foods movement"). How does movement toward a green environment contradict large industrial development, which is often supported by taxpayers and governments? What are effects on funding social protections if fewer jobs are created by small and medium-sized businesses? What are known and unknown effects on the health of our planet from development practices that taint air, land and water? Who is responsible to inform the public, pay for and monitor waste mitigation? How may partnerships between large, medium and small businesses be mutually beneficial? How may we diminish trade-restricting rules and practices? These topics seem well suited for panel presentation of multiple viewpoints (public policy, financial institution/investor, industry, small business owner, environmental advocate).

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Billions struggle to meet daily needs while unemployed and living in poverty. Poverty eradication is an issue that we strongly support. There is indisputable evidence that public health suffers in populations with limited access to preventive and clinical services. Women and children are disproportionately affected when there are few resources supporting healthy pregnancies, childbirth, child growth and development.

Health promotion activities extend beyond the traditional health care encounter. Aims are "to achieve the highest attainable standard of health" (WHO Constitution of 1948) by enhancing health-related knowledge, skills and abilities, and ensuring social protections for community residents who are at risk of disease and illness (i.e., very young, older adults, persons with chronic conditions, those living in poverty).

Desirable activities include: (a) teaching healthy habits; (b) providing access to clean and affordable water and sanitation; (c) ensuring food security for all; (d) offering assistance to build safe affordable housing; (e) providing opportunities for daily physical activity and family recreation; (f) ensuring access to essential health care services and medicines; (g) advocating for full employment at fair wages; (h) removing barriers to independence and full participation by persons with disabilities; (i) removing safety hazards from home, school and workplaces; and (j) assisting with disaster preparedness. These activities contradict movement in some Member States to restrict resources to those who can pay for these. We assert that proposed models of sustainable development show promise in improving health of all persons!

Inputs for Compilation Document, Rio+20

General Content: Contributions should endeavour to address the following questions:

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

Response: During recent months, citizens around the globe have rallied to challenge practices they view as restricting personal growth and freedom. We value an inclusive process whereby all interested participants have the opportunity to review and comment within a timely manner on draft outcome documents, following the model used during annual UN NGO Conferences.

A possible structure for this document is presentation of main points and responsibilities related to three main audiences, i.e., Member States, Major Groups and UN System, followed by a section emphasizing opportunities for intersectoral collaboration. Contents of the outcome document must connect planned actions to achieve MDGs as related to sustainable development and healthy environments for all persons.

Of particular interest is MDG8: Develop a global partnership for development. Perhaps it would be useful to emphasize opportunities for active leadership by business/industry, major financial institutions and donors, indigenous people, women and children, and youth, particularly benefitting least developed countries. Which successful international partnerships are models illustrating donor and recipient accountability? (e.g., substantial work by The Bill and Melinda Gates Foundation, researchers, Member States, and Civil Society to eradicate malaria and polio and develop new models of sustainable agriculture).

There are numerous opportunities for UNmultimedia.org to interface with Member States and their accredited press representatives to disseminate broadly the outcome document to Civil Society and the public in a variety of formats, printed, audio, and digital. The youth delegates will have creative ideas to interface with their peers through social media and other informal networks.

Specific Elements:

a. Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.

Contributions could include possible sectoral priorities (e.g., (e.g., energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) and sectoral initiatives that contribute to integrate the three pillars of sustainable development could be launched and endorsed at Rio+20.

Response: We encourage ECOSOC, UN Commission on Sustainable Development, UN Forum on Forests, UN Framework Convention on Climate Change, Convention on Biological Diversity, and other conference organizers to provide an historical perspective detailing progress made on sustainable development and environmental protections since the 1972 Stockholm Conference on the Environment. What major barriers remain? What promising practices are likely to overcome these barriers?

Further, we call for clearly articulated and succinct summaries of latest evidence revealing how current development practices lead to adverse effects on the health and wellbeing of all beings. Misleading information not supported by scientific study appears to contradict calls for action to protect our planet issued by Member States and UN Secretary General. Some elected officials have taken a stand opposing sustainable development practices, likely confusing their populace.

b. Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication

Response: What are challenges and successes related to micro-economies, including policies and lending practices supporting small and medium-sized businesses within communities that do not harm the environment and yield jobs with living wages? (e.g., supporting a "local foods movement"). How does movement toward a green environment contradict large industrial development, which is often supported by taxpayers and governments? What are effects on funding social protections if fewer jobs are created by small and medium-sized businesses? What are known and unknown effects on the health of our planet from development practices that taint air, land and water? Who is responsible to inform the public, pay for and monitor waste mitigation? How may partnerships between large, medium and small businesses be mutually beneficial? How may we diminish trade-restricting rules and practices? These topics seem well suited for panel presentation of multiple viewpoints (public policy, financial institution/investor, industry, small business owner, environmental advocate).

c. Any proposals for refinement of the two themes. ## The Euro-Mediterranean Center for Climate Change

Sustainable Development and Climate Policy: 20 years later

Climate policy is playing a first role in the political agenda of both developed and developing countries. Today the main concern of climate policy is focused on curbing greenhouse gas emissions with the purpose of limiting global warming.

However, at least 2 degrees of temperature increase are certainly unavoidable, which calls for investments and measures to adapt to forthcoming climate change. At the same time, the present difficult economic situation calls for measures that reduce GHG emissions without harming, rather fostering, economic development.

The Cancun Agreements while reaffirming the clear objectives for reducing human-generated greenhouse gas emissions over time to keep the global average temperature rise below two degrees, it encourages the participation of all countries in reducing these emissions (through their NAMAs - National Appropriate Mitigation Actions), in accordance with each country's different responsibilities and capabilities to do so.

A new principle seems emerging for a post-Kyoto environment: in order to achieve a new climate agreement we need both domestic and global policy, we need to actively involve developed and developing countries bearing in mind that social and economic development and poverty eradication are the first and overriding priorities of developing countries and that a low-carbon development strategy is indispensable to sustainable development.

There is no doubt that the outcome of different climate policies - if implemented effectively within a cooperative framework - will not only reduce the risks associated with climate change, but will also improve environmental sustainability. Nevertheless reaching an agreement and in particular the challenge of limiting GHG emissions causes social costs affecting developments needs and goals especially in developing countries. If the costs of climate policy fall back on society, especially where it is more vulnerable, it is not certain that climate policy will improve sustainability, as social costs can offset the improvement in the environmental sphere.

At the same time it's worth to be noticed that adaptation is called to play an active role in the climate international agreement settings. Economic research is now focusing on the assessment of the optimal mix of adaptation and mitigation expenditures in a cost-effective setting in which countries cooperate to achieve a long-term stabilisation target (AD-WITCH model developed at CMCC/FEEM).

Besides the NAMAs the Climate conference in Cancun also established a process for least developed countries (LDCs) and other interested developing countries to formulate and implement national adaptation plans (NAPs) to identify and address their medium and long-term adaptation needs.

One of the objectives of the Cancun Agreements is to assist the particularly vulnerable people in the world to adapt to the inevitable impacts of climate change.

Again the concept of sustainable development can be part of the solution.

A global climate policy will more likely lead to an overall improvement in sustainability if it is implemented together with policies aimed at improving social and economic welfare.

Low carbon development in the context of sustainable development, and development policies integrating national adaptation plans. This seems to be the recipe for

developing countries.

Further research is needed on how mitigation and adaptation policies can work together in the context of a sustainable development. At the same time further contribution is required in the definition of sustainable development in order to help governments to take concrete actions in the context of climate change.

A more holistic assessment of climate policy agreements would be desirable and we believe that Rio+20 could represent the ideal arena to further discuss the (climate) policy implications of the sustainable development concept.

## The Federal Times (TFT)

An Input brief Compilation to RIO-20

An input brief Compilation document submitting to RIO+20 to build our common future pathways to a safer, more equitable, cleaner, greener and more prosperous world for all.

I, suggest to RIO+20 give an opportunity to sustainable green economy to improve every corner of the world that makes a evolutionary, revolutionary and metamorphosis changes the health and environment protection of the grass-root level people who lives corner of world. Simultaneously keep on eyes of RIO-20 successfully to achieve the Millennium Development Goals to improve the income of the poorest of the poor who lives at least developed countries, developing countries and poor who are in slums in developed countries, make a strategy to secure decent work for women and men everywhere, decent work is widespread need, shared by people, families and communities in every society. Decent work is a global demand today, confronting political and business leadership worldwide. Much of our common future depends on how we meet this challenge.

I request RIO-20 create a unity of purpose among the three constituents – Governments, workers and employers, give the right pathway to fundamental principles and rights at work, employment, social protection and social dialogue. I request RIO-20 provide clean water is an agent for change, most of the people in the least developed and developing countries are not getting clean water and most of the working poor are not getting clean water, hence, fallen in poverty line, at present it is need to provide clean water to eradicate poverty and reduce the poverty in the world.

I suggest “Clean, Accessible Water Makes a Big Difference”, and “Clean Water and Proper Sanitation is a Basic Human Right”, but, satisfactorily providing clean water in least developed and developing countries governments’ in the world. Most of the Governments’ unable to provide clean accessible water, hence, increases poverty in the world. Many countries in the world are neglect clean water, more than a billion people lack access to clean drinking water, and over 2.4 billion lack access to proper sanitary facilities. The result is that there are more people in the world’s hospitals today suffering from water-borne diseases than any other ailment; at any time, more than half of the hospital beds in the world are filled with people suffering from water-borne diseases. I request the RIO+20 identify and make a strategic survey those are poorly managed water resources countries, regions and rural areas in each and every country, make a strategic report to bring awareness among governments’, employers and employees.

## The Feminist Task Force (FTF) from the Global Action Against Poverty(GCAP)

Natural disaster preparedness a climate change adaptation

Natural disasters don’t discriminate, but people do. Existing socio-economic conditions can lead to different outcomes in natural disasters even for demographically similar communities, but the most vulnerable groups suffer more than others. Natural disasters reinforce, perpetuate and increase gender inequality, making bad situations worse for women. Therefore in disaster preparedness it is imperative to promote a culture of participatory planning and implementation of disaster risk reduction initiatives. This can build local and national government and civil society partnerships and cooperation in support of local initiatives to dramatically reduce the costs of risk reduction, ensure local acceptance and build social capital.

Women and men experience different vulnerabilities and cope with natural disasters differently; therefore, an increase in the magnitude and frequency of natural disasters will have different implications for men and women. Therefore gender mainstreaming is essential to be considered in mitigation and adaptation policies, strategies and programs. For example, as women’s asset determine how they respond to climate change impacts it is necessary to provide them with education , resources and technology , promote their participating in decision making and others as fundamental issues that will enhance their livelihoods in mitigation and adaptation.

The effects of natural disaster, emergencies and climate change are multifaceted: social, political, and economic as well as environmental . While women are generally more vulnerable but not helpless they exhibit surprising resilience and are key agents of environmental transformation. Therefore there is a need to elaborate responses not imposed from above, but modeled on needs, aspirations, knowledge and capabilities of women and men that are then actively involved as crucial partners in Climate Change mitigation and adaptation efforts.

There are limitations to what household and community action can do to reduce disaster risk without government support, or without a broader infrastructure and service framework into which community provision can integrate. Gender considerations should be introduced in key critical issues on the climate change agenda, namely: mitigation, the Clean Development Mechanism, adaptation and capacity building. Efforts should be directed towards a wider application of a gendered approach even in other strategic sectors, including, for instance, technology transfer and vulnerability studies.

Innovative approaches and tools that exist and develop by several CSO should be applied creatively alt local governments using community based approaches- However, they need scaling up with support from national governments.. Improved local governance is usually built on partnership between competent and accountable local government and an active civil society that can articulate needs and priorities. Capacity building and t raining stakeholders on gender issues and link it to Natural disaster preparedness is crucial to have women voices heard, a necessary conditions for risk reduction.

To address a gender perspective in DRR and in line with international legal instruments and agreements, we as CSO request that Governments should :

- Implement a gender analysis and gender mainstreaming in coordination with all Ministries responsible for disaster risk reduction, climate change, poverty reduction and women/gender machineries;
  - Mainstream gender into national policies, strategies and plans and implement a gender approach in planning and programs;
  - Ensure women and men's equal access to natural hazard early warning systems;
  - Develop and produce statistics desegregated by sex on impact of disasters, carry out gender-sensitive vulnerability, risk and capacity assessments and develop gendersensitive indicators to monitor and measure progress;
  - Increase awareness of the public and media on the gender sensitive vulnerabilities and capacities in disasters and gender specific needs and concerns in disaster risk reduction and management;
  - Organize and develop research on cost-benefit and efficiency of gendersensitive policies and programs in disaster risk reduction, climate change adaptation and poverty reduction;
  - Link DRR and climate change adaptation from a gender perspective;
  - Support gender-sensitive financial risk-sharing mechanisms, including risk insurance and reinsurance;
  - Improve disaster preparedness, response and contingency planning from a gender perspective and make them respond to the specific needs and concerns of men and women;
  - Increase women's participation in disaster relief coordination and secure equal access to disaster relief assistance between men and women;
  - Build and enhance the capacities of professional communities and pertinent national institutions to enable gender mainstreaming into all development sectors.
- . guarantee trainings with gender perspective for preparedness and readiness with respect to risk management, mitigation and adaptation, including planning and resource management for programs and projects to this effect.
- . take steps to guarantee early and timely alert processes for the prevention and mitigation of risks..

---

## The Global Reporting Initiative (GRI)

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

How can the world manage the transition to a "Green Economy in the context of sustainable development and poverty eradication"? GRI suggests that a Green Economy will only be achieved if organizational information on the three pillars of sustainable development - economic, social and environmental performance - is widely available to decision makers, together with information on organizational governance. This can be achieved by the UN Conference on Sustainable Development (Rio+20) adopting a policy framework on sustainability reporting based on the report or explain approach: this practical measure would make a positive impact.

Thousands of organizations now report on their economic, social and environmental performance, showing that sustainability reporting adds value. Research shows that in 2011, 95 percent of the largest 250 companies worldwide issued sustainability reports, up from around 80 percent in 2008 and 50 percent in 2005.

While the number of reporters is growing, including in emerging economies such as Brazil, China and India, and the quality of reporting is improving, sustainability reporting is yet to achieve its full potential: the adoption of the practice is too slow.

Mainstream financial analysts have already started to include sustainability information in their analyses. But a critical mass of sustainability information is needed to inform markets. In this respect, it can be argued that companies that do not report sustainability data withhold from the markets vital information needed for the assessment of medium to long term risk and value, thereby imposing a cost on the markets and undermining their effective functioning.

Regulators are understanding the importance of the issue. Governments, international organizations, stock exchanges and a number of private initiatives have developed a wide range of policy, regulation, requirements, and guidelines to promote sustainability reporting and environmental, social and governance (ESG) disclosure, while some others are currently considering doing the same.

Among others, Australia, China, Denmark, the European Union, France, India, Germany, Norway, Spain, Sweden and the United States have developed policy initiatives to promote sustainability reporting and/or environmental, social and governance (ESG) disclosure, while stock exchanges in Brazil, China, Malaysia, Singapore, Pakistan and South Africa are playing a pivotal role in requiring or recommending listed companies to disclose sustainability/ESG information.

At the same time NGOs and investors are calling for more transparency in the corporate sector on sustainability impacts and performance.

There is a widespread movement which is building momentum and a global approach to the issue would be beneficial for the global economy. If sustainable development is to be reached, the world needs to move now from the innovative and pioneering approach of the estimated 4,500 companies that report their sustainability performance to a true global mainstream practice for all organizations.

The UN Conference on Sustainable Development (Rio+20) can achieve this by adopting a policy framework on sustainability reporting based on the report or explain approach.

During the early development of sustainability reporting, the question was 'why do you report?'. As sustainability challenges grow, increasing the need for urgent action, the question is now becoming 'why don't you report?'. Regulators, managers, employees, investors and consumers all have a direct interest in knowing how companies and other

organizations are contributing to sustainable development. Where this information is missing, they have a right to be concerned.

There are many compelling reasons now for governments to adopt a report or explain approach to sustainability reporting by all companies. It would establish a level playing field, promote transparency, foster innovation, set the basis for good governance, leave space for flexibility of approach, and represent a smart regulation approach, being relatively simple to enact and implement. It would ultimately make more and better quality sustainability information available, enabling better measurement of progress towards sustainability.

The international principles and objectives for sustainable development agreed at the United Nations Conference on Environment and Development and World Summit on Sustainable Development remain more important than ever. It is now urgent to make them reality. If the transition to a Green Economy on the path to sustainable development is to be made, all large businesses and other organizations must become engaged and contribute. Sustainability reporting is a practical way to achieve this goal.

For these reasons, the Global Reporting Initiative calls on the governments, international bodies and major groups, who will be involved in the United Nations Conference on Sustainable Development (Rio+20) to:

- a. Acknowledge the growing practice of sustainability reporting and recognize that, improving corporate management and performance, facilitating stakeholder engagement, driving innovation and competitiveness represents an essential contribution to the transition towards a Green Economy;
- b. Note that the increased quantity and quality of data available through sustainability reporting can be a powerful tool to help organizations and markets work more efficiently;
- c. Commit to develop a global policy framework requiring all listed and large private companies to consider sustainability issues and to integrate material sustainability information within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not. The global policy framework (which can take the form of a Convention) should adhere to three key principles:
  - Report or Explain – establish a report or explain approach to sustainability reporting policy;
  - Transparency – enhance transparency by requiring national measures which would mandate the integration of material sustainability issues within the company reporting cycle, in their Annual Report and Accounts;
  - Accountability – provide effective mechanisms for investors and all stakeholders to hold companies to account on the quality of their disclosures, including for instance an advisory vote at the Annual General Meeting (AGM); and
- d. Recognize the need for a process that builds on data available through sustainability reporting, leading to the development and adoption of macro-level metrics such as the Sustainable Development Indicators that, beyond GDP, would allow a more comprehensive measurement of well-being, environmental health and the progress made towards a Green Economy taking into consideration the use of already developed methodologies.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Report or Explain

A policy proposal for sustainability reporting to be adopted as a common practice for the advancement of a Green Economy

for the UN Conference on Sustainable Development (Rio+20)

Thousands of organisations now report on their economic, social and environmental performance, showing that sustainability reporting adds value. If sustainable development is to be reached, the time has now come for sustainability reporting to become standard practice. This can be achieved by the UN Conference on Sustainable Development (Rio+20) adopting a policy framework on sustainability reporting based on the report or explain approach. This proposal outlines the case for such policy approach and invites discussion.

International principles and objectives for sustainable development were agreed at the United Nations Conference on Environment and Development in Rio de Janeiro in 1992. Their implementation was elaborated on at the World Summit on Sustainable Development in Johannesburg in 2002. In 2012, the United Nations Conference on Sustainable Development (Rio+20) will provide an opportunity to realize these principles and objectives at a time when global sustainability challenges are ever more critical.

In practical terms, how can the world manage the transition to a "Green Economy in the context of sustainable development and poverty eradication" (hereafter Green Economy)? This proposal suggests that a Green Economy can only be achieved if organizational information on economic, social and environmental performance - the three pillars of sustainable development - as well as disclosure on organizations' governance is widely available to decision makers, including governments and private sector organizations. If businesses and all other organizations monitor and report data on their sustainability performance, they will have the vital information needed by executives to manage risk and identify sustainability opportunities. This would help them engage with stakeholders, and help financial markets work efficiently, in a shared effort to pave the

way to sustainable development worldwide. Importantly, this information is also needed to monitor the effectiveness of sustainability policies, and to help in the development of new macro-level metrics such as national Sustainable Development Indicators. By looking beyond traditional GDP, this would enable a more comprehensive measurement of wellbeing, environmental health and the progress made towards a Green Economy.

#### Background on sustainability reporting

Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992. In Agenda 21 of the Conference, governments agreed that business and industry should be 'encouraged to adopt and report on their environmental records, as well as on the use of energy and natural resources'.<sup>1</sup> Building on this, the World Summit on Sustainable Development also underlined the importance of reporting by noting the need to enhance corporate environmental and social responsibility and accountability, including through actions such as 'public reporting on environmental and social issues'.

Since that time, many leading Organizations worldwide have begun to integrate sustainability into their overall strategy to ensure they operate responsibly and sustainably. A 2011 report by KPMG shows that 62 percent of the companies surveyed have sustainability strategies in place, compared to just over half in 2008.<sup>3</sup>

According to a recent McKinsey survey, more than 50 percent of executives consider sustainability "very" or "extremely" important in a wide range of areas, including overall corporate strategy.

Increasingly, sustainability reporting is seen as an important gauge of both the quality of an organizations' governance processes and on and of its long term business strategy. Transparency to a wide stakeholder group creates an impetus for improving performance and sustainability reporting practice, enabling companies to measure, monitor and manage their impact on society, the economy, and help contribute to a sustainable future.<sup>5</sup> Businesses generally seek to make a profit by pricing competitively and driving down costs. Costs are not just set against financial accounts, but also economic, social and environmental ones. The market for more sustainable products and services is also expanding. A growing number of organizations recognize these factors and are beginning to act on them.

The practice of sustainability reporting was advanced further in 1997 when the idea of creating a global framework for sustainability disclosure was conceived and the Global Reporting Initiative (GRI) was founded. Publicly inaugurated at the UN Headquarters in 2002, GRI produces what has become the leading global framework for sustainability reporting. Key features of GRI's Sustainability Reporting Framework include its:

- Comprehensive scope, covering the main sustainability issues
- Continuous development, reflecting user experience
- Multi-stakeholder developed framework and governance model
- Universal relevance, including for private sector, public agency and civil society organizations.

Using a common reporting framework can promote international comparability between reports.<sup>7</sup> Various regulations, standards and initiatives now recommend or require reporting. This is why GRI collaborates closely with other organizations that provide normative frameworks and principles complementary to GRI's Reporting Framework. Collaborations include:

- the United Nations Global Compact (UNGC): the Communications on Progress – COP – represent the mechanism through which UNGC participating companies demonstrate progress towards attainment of the ten UNGC Principles; GRI and UNGC joined forces to build a universal framework for corporate sustainability performance and disclosure, aiming to transform business practices on a global scale;
- the Organisation for Economic Cooperation Development (OECD): The OECD Guidelines for Multinational Enterprises recommend disclosure on social and environmental performance;
- the United Nations-backed Principles for Responsible Investment initiative (PRI), which specifically encourages use of the GRI Framework;
- the International Organization for Standardization (ISO), whose Standard on Social Responsibility encourages reporting.

By working together to harmonize with these organizations, current and potential reporters have clarity and consistency to make their respective contributions to a sustainable global economy.

#### The business case for sustainability reporting

Thousands of organizations worldwide now produce sustainability reports. Research shows that in 2011, 95 percent of the largest 250 companies worldwide issued sustainability reports, up from around 80 percent in 2008 and 50 percent in 2005.<sup>8</sup> In producing such reports, these companies assess the sustainability dimensions of their activities and report their policies and performance. Among these reporters are innovators, leaders and early adopters of sustainability reporting. These companies represent an enormous pool of experience and expertise that continues to contribute to better disclosure and transparency.

The internal and external value that companies have found in sustainability management and reporting is widely documented. Sustainability reporting increases innovation and competition, drives continuous performance improvement and at the same time makes organizations more accountable for their impacts.<sup>9</sup> The evidence for the business case is building as uptake of reporting increases.

"The business case for Sustainability Reporting has been proven by many leading companies around the world: hardly any that started reporting have discontinued. This means that these companies find value in sustainability reporting, otherwise they would not continue. Sustainability reporting is good business practice."

Ernst Ligteringen, GRI Chief Executive

Some organizations are now producing integrated reports, a new and still emerging form of corporate report that seeks to bring together financial performance data with material information about an organization's strategy, governance, performance and prospects in a way that reflects the economic, political, social and environmental context within which it operates. An integrated report is intended to provide a clear picture of how an organization creates value, both now and in the future. In August 2010, the International Integrated Reporting Committee (IIRC) was established to create a globally accepted framework for integrated reporting. The objective is that through integrated reporting many more companies and their stakeholders will become aware of sustainability performance measurement and disclosure and start acting on this information.

#### The market case for sustainability reporting

Recent years have seen an increasing interest from markets in sustainability performance data disclosed in reports. Investors look for positive returns, either by holding stock or by trading it, and study markets to see how they will develop. Markets are hindered by incomplete data, making it difficult for to assess risks or opportunities arising from sustainability issues. This is why information brokers such as Bloomberg now offer environmental, social and governance (ESG) performance data on thousands of

companies on more than 350,000 terminals worldwide. Bloomberg's competitor, Thomson Reuters, also offers ESG information to clients, while rating agencies such as Standard & Poors have created ESG indices for India, Egypt and the MENA region.

Sustainability reporting is increasing and mainstream financial analysts have already started to include sustainability information in their analyses. While the number of reporters is growing, including in emerging economies such as Brazil, China and India, and the quality of reporting improves, sustainability reporting is yet to achieve its full potential: the adoption of the practice is too slow. As an illustration, it took 12 years for the G250 to grow from 35% to 95% in the sustainability reporting practice. At the current rate it would take decades before sustainability reporting becomes common practice across global markets. An estimated 4,500 organizations are included in sustainability reporting databases, a fraction of the more than 45,000 publicly traded companies that are required to disclose their annual accounts and the estimated 82,000 corporations that do business across national borders in the world today. This means that regulators, investors and stakeholders know little or nothing of the sustainability practices and impacts of the vast majority of the world's large companies.

Markets, however, will not treat sustainability information seriously as long as only a minority of companies report. A critical mass of sustainability information is needed to inform markets and enable performance benchmarking and analysis. In this respect, it can be argued that companies that do not report sustainability data withhold from the markets vital information needed for the assessment of medium to long term risk and value. By leaving information gaps and creating asymmetries of information, non-reporting companies impose a cost on the markets and undermine their effective functioning.

At the same time a positive trend needs to be discerned: governments, international organizations, stock exchanges and a number of private initiatives have developed policy, regulation, requirements, and guidelines to promote sustainability reporting and disclosure, while some others are currently considering doing the same. Among others, Australia, China, Denmark, the European Union, France, India, Germany, Norway, Spain, Sweden and the United States have developed policy initiatives to promote sustainability reporting and/or ESG disclosure, while stock exchanges in Brazil, China, Malaysia, Singapore, Pakistan and South Africa are playing a pivotal role in requiring or recommending listed companies to disclose sustainability/ESG information.

At the same time NGOs and investors are calling for more transparency in the corporate sector on sustainability impacts and performance<sup>12</sup>. Therefore, it is possible to recognize a widespread movement which is building momentum and a global approach to the issue would be beneficial for the global economy.

If there is to be a change, the world needs to move now from the innovative and pioneering approach of 4,500 companies to a true global mainstream practice for all companies.

"Companies do not operate in a vacuum. They operate in the triple context of commerce, the environment and society. Stakeholders cannot make an informed assessment about sustained value creation by a company from its financial report. Information is required on the governance of the company and how its operations impact on the environment and society. ESG disclosures are required and if not furnished the company should explain why not."

Prof. Mervyn King, GRI Honorary Chairman

The case for a report or explain approach

During the early development of sustainability reporting, the question was 'why do you report?'. Reporting on aspects of performance other than financial was not required by managers, regulators or investors. Pioneers of sustainability reporting started the process because they recognized its value to their operations. They recognized that better information was needed to improve the management of their companies, and its relationships with all stakeholders. Continued and growing sustainability reporting by companies demonstrates their assessment that the practice adds value.

As sustainability challenges grow, increasing the need for urgent action, the question is now becoming 'why don't you report?'. Regulators, managers, employees, investors and consumers all have a direct interest in knowing how companies and other organizations are contributing to sustainable development. Where this information is missing, they have a right to be concerned.

Landmark developments demonstrate the benefits of a report or explain approach to regulation.

In Denmark, large businesses (including state-owned companies) have been required by law to include information about their corporate social responsibility (CSR) policies and practices in their annual reports since 2009.<sup>13</sup> Companies must account for their CSR policies (or disclose if none are in place), how these policies are translated into actions, what the companies have achieved as a result, and what they expect in the future. An impact assessment study published by the government in 2010 concluded that the requirement to report was helping motivate more businesses to develop and report on sustainability.

In South Africa, the over 450 companies listed on the Johannesburg Stock Exchange (JSE) are required to apply or explain the King Code of Governance (King III). The King Code recommends that organizations produce an integrated report in place of their annual financial and sustainability reports. As King III now falls within the listing requirements of the JSE, listed companies have to produce an integrated report, or explain why they have not. Underlying this requirement was the recognition that sustainability information was nowadays as important to company directors as it was to investors.

There are many reasons for governments to adopt a report or explain approach to sustainability reporting by all companies.

- **Level playing field:** By establishing the basic principle of report or explain, a common floor of practice would be established. While sustainability reporting would remain voluntary, companies would still be free to choose what information to disclose. A consistent reporting approach, applied across national boundaries, would make it easier for companies to operate more effectively in global markets and along transnational supply chains.
- **Transparency:** Markets can only be effective when relevant information is available. Information contained in sustainability reporting is essential for a Green Economy. A report or explain requirement would help ensure that the information needed by markets and society to assess a company's management and performance, is provided. This would be based either on reported data, or the explanation for not reporting. Investors and customers would then be able to make informed decisions regarding penalties, premiums or voting decisions they would attach to disclosures, or lack of disclosure.
- **Innovation:** By monitoring and reporting their sustainability performance, all organizations would be better placed to consider innovative ways to improve their performance and increase their contribution to sustainable development. Evidence from the last decade suggests that sustainability reporting is a powerful source of innovation and performance improvement. Reporting encourages businesses to engage with stakeholders, integrate sustainability into their business strategy and bring to market new products and services.
- **Governance:** As sustainability challenges mount, it is increasingly inconceivable that corporate governance can be considered responsible if it fails to take into account sustainable development issues. Whether from a perspective of risk prevention, the desire to develop products and services that help solve the world's problems, the intention to contribute to the development of a green economy, or the broader desire to ensure that the role of business in society is understood and trusted is a prerequisite of good governance.

- Flexibility: A report or explain approach would neither prescribe which measures should be taken at national level – leaving each Government to choose the policy approach depending on the peculiarities of the economic environment – nor how companies should report - leaving space for them to choose their preferred framework, sustainability indicators and standards. This would enable new reporters, including small and medium sized enterprises, to start at a basic level and improve quality and expertise over time.
- Smart regulation: A report or explain policy would be relatively simple to enact and implement. It does not require complex or excessively prescriptive regulation and is fully consistent with current financial reporting requirements. It could be required by governments and public authorities, and also by market actors, such as stock exchanges requiring listed companies to report or explain, or institutional investors requiring their investment targets to report or explain. Stakeholders would become engaged as part of the reporting process. The resulting democratization of sustainability information would see markets and society as whole would play a monitoring, assuring, promoting, and enforcing role.
- Progress towards sustainability: A common report or explain approach would ultimately make more and better quality sustainability information available. This would enable markets and policy makers to better monitor progress, provide support, and refine policies, thereby contributing the transition to a Green Economy and sustainable development.

#### GRI Proposal

The international principles and objectives for sustainable development agreed at the United Nations Conference on Environment and Development and World Summit on Sustainable Development remain more important than ever. It is now urgent to make them reality. If the transition to a Green Economy on the path to sustainable development is to be made, all large businesses and other organizations must become engaged and contribute. Sustainability reporting is a practical way to achieve this goal.

For these reasons, the Global Reporting Initiative calls on the governments, international bodies and major groups, who will be involved in the United Nations Conference on Sustainable Development (Rio+20) to:

- a. Acknowledge the growing practice of sustainability reporting and recognize that, improving corporate management and performance, facilitating stakeholder engagement, driving innovation and competitiveness represents an essential contribution to the transition towards a Green Economy;
- b. Note that the increased quantity and quality of data available through sustainability reporting can be a powerful tool to help organizations and markets work more efficiently;
- c. Commit to develop a global policy framework requiring all listed and large private companies to consider sustainability issues and to integrate material sustainability information within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not. The global policy framework (which can take the form of a Convention) should adhere to three key principles:
  - Report or Explain – establish a report or explain approach to sustainability reporting policy;
  - Transparency – enhance transparency by requiring national measures which would mandate the integration of material sustainability issues within the company reporting cycle, in their Annual Report and Accounts;
  - Accountability – provide effective mechanisms for investors and all stakeholders to hold companies to account on the quality of their disclosures, including for instance an advisory vote at the Annual General Meeting (AGM); and
- d. Recognize the need for a process that builds on data available through sustainability reporting, leading to the development and adoption of macro-level metrics such as the Sustainable Development Indicators that, beyond GDP, would allow a more comprehensive measurement of well-being, environmental health and the progress made towards a Green Economy taking into consideration the use of already developed methodologies.

---

## The Natural Step

### PROPOSING A UNIFYING FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

#### The Natural Step Network

#### CONTRIBUTIONS FOR DRAFT ZERO

#### UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT - RIO+20

##### Our vision:

“An application framework emerges from the Rio + 20 process which enables communication between sectors (public, private, civil society), social groups and regions. A Unifying Framework provides a practical definition of sustainability making it possible to get consensus on the gap between current situation and sustainability. This enables a systematic evaluation of policies, strategies and actions and their return on investment. The public is re-energized and galvanized into action, as happened with Local Agenda 21 and the MDGs (Millennium Development Goals). “

This document is the result of the collective wisdom of a community of around 1,000 sustainability practitioners from all over the world. They base their practice on a research that dedicated the last 20 years to develop, test, apply, and improve a robust, scientific-based framework which emerged in Sweden from a process of consensus building. The participants—scientists, policy makers, and business leaders—aimed to add value to the transition process of businesses, municipalities and organizations in general to move towards sustainability.

#### THE PILLARS OF THE RIO+20 CONFERENCE

This Unifying Framework proposes principles that address a “holist, equitable and far-sighted approach to decision making at all levels’. In complying with these principles we will ensure “intra- and intergenerational equity” enabling institutions to be in service of the goal of sustainable development. The Unifying Framework makes it practical to integrate economic, social, environmental goals and objectives. It will also be of service to the decisions and policies on both the first pillar “Green Economy in the Context of Sustainable Development and Poverty Eradication” and the second pillar: “Institutional Framework for Sustainable Development”.

According to the Rio+20 guidelines, the Institutional Framework for Sustainable Development pillar is mostly focused in proposing an institutional reform within the UN system, examining its governance model with the aim to address sustainable development. Although, it is absolutely needed and urgent that those discussions happen within the conference process and beyond, this is not enough to ensure that the UN system will be equipped appropriately to face all the governance challenges to implement strategies towards sustainable development.

Therefore we propose here that 'The Institutional Framework for Sustainable Development' discussions take one step further, as to besides agreeing on an effective UN governance model, also adopt and indicate in the Conference Final Report what we call the 'Unifying Framework for Sustainable Development', enabling the various stakeholders to be effective in making concrete steps towards sustainability.

## FRAMEWORKS, CONCEPTS AND STANDARDS

Throughout the last 40 years, most notably after Rio Earth Summit in 1992, a number of tools, concepts and standards have emerged for better ecological performance especially in businesses and industries. Many initiatives with general or specific applications have been developed, such as Life Cycle Assessment (LCA), the Ecological Footprint, Cradle-to-Cradle, Factor X, EMS, ISO 14001, among others. Likewise, many other tools and concepts which included the social and economic perspectives were developed and widely applied, to name a few: Agenda 21, Millennium Development Goals (MDGs), The Earth Charter, Fair-Trade, Global Compact, TNS Framework, ISO 26001 and GRI.

The United Nations recognize the relevance of the tools, standards and concepts to establish a common knowledge which enables nations, municipalities, businesses, NGOs and UN bodies to standardize, create and measure policies, transnational agreements and strategic plans, to accelerate the process towards sustainable development.

Many tools and concepts for Sustainable Development created promising assemblies, networks and organizations using bits and pieces of those concepts and tools for their respective projects and programs. In fact, a systemic view of these tools shows them to be complementary, instead of competing with each other, as well as potentially beneficial for deciding on policies and actions that create economic benefit from both environmental and social wellbeing perspective. However, a vast resource still lies unexploited: the highest potential of using all tools, concepts and standards articulated within a unifying framework, brings needed clarity, enables actions as part of "fullpicture" strategic plans, and helps monitor complete processes to track true progress.

## PROPOSING A UNIFYING FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

The proposal here is to guide sustainable solutions by systems thinking. Ever so well-intended decisions outside the realm of a systems perspective, often leads to sub-optimization or worse – blind alleys. By inviting the most accepted tools, concepts and standards to convene in evaluating and co-creating a Unifying Framework for Sustainable Development, already proven scientifically to be possible (Robèrt, K.-H. (2000), "Tools and concepts for sustainable development, how do they relate to a general framework for sustainable development, and to each other?" Journal of Cleaner Production 8(3): 243- 254), we envision:

"An application framework emerges from the Rio + 20 process which enables communication between sectors (public, private, civil society), social groups and regions. A Unifying Framework provides a practical definition of sustainability making it possible to get consensus on the gap between current situation and sustainability. This enables a systematic evaluation of policies, strategies and actions and their return on investment. The public is re-energized and galvanized into action, as happened with Local Agenda 21 and the MDGs (Millennium Development Goals). "

Tools, concepts and standards all convening to a common platform that we call "The Unifying Framework" to be applied on a collaborative and complementary basis to support UN system, nations, municipalities, businesses and NGOs to make concrete stepping stones towards sustainability; that is the most effective way to accelerate the journey towards sustainability ... through COLLABORATION. There is no more powerful word in actual days to tackle current worldwide challenges.

## WHAT A UNIFYING FRAMEWORK CONSISTS OF

Through a five level structure it is possible to understand how all the tools, concepts and standards can serve to a Unifying Framework:

### A Unifying Framework for Sustainable Development

[Rio+20 Secretariat: Please refer to full submission document for graph]

SYSTEMS LEVEL - Level 1 represents the overarching system that we are focusing on, i.e. the economy and society as a wholly owned subsidiary of the biosphere.

Sustainability has to do with society being able to perpetuate the cycles of nature and allow new generations of people to live and prosper on a healthy planet. The challenge society is facing today is that humankind is acting in a way that compromises the system's conditions—creating unbalances by dispersing extracts from the earth's crust & synthetic products foreign to nature, faster than it can assimilate them; by physically destroying eco-systems; and by hindering people's capacity to meet basic needs—since we live in a closed system in regard to matter, the only open element being the sun regenerating the system through photosynthesis".

### Biosphere within the Systems Level

[Rio+20 Secretariat: Please refer to full submission document for graph]

SUCCESS LEVEL - Level 2 defines the shared goal, the vision of sustainability within the biosphere. This requires having a clear and practical definition of what sustainability means.

The 'Brundtland Report' defines sustainable development as development that 'meets the needs of the present without compromising the ability of future generations to meet their own needs' (WCED, 1987, 8). This widely accepted definition describes what we have succeeded to accomplish when we have a sustainable society. However, this definition should be complemented with additional detail which makes it more operational and provides guidance for sustainable development planning.

A principle-based definition of sustainability, building-block of the methodology we propose here, gives us such guidance. The principles are derived by clustering known sustainability-related impacts to identify root cause mechanisms. By reversing those mechanisms, and then testing their creativity potential on out-of-the-box solutions & basic re-designs, it has been possible to derive basic principles for sustainability: "In a sustainable society nature is not subject to systematically increasing...

- I. concentrations of substances extracted from the Earth's crust, (such as fossil carbon or metals),
- II. concentrations of substances produced by society, (such as nitrogen compounds, CFC's, and endocrine disrupters),
- III. degradation by physical means (such as large scale clear-cutting of forests and over-fishing) And, in that society...
- IV. people are not subject to conditions that systematically undermine their capacity to meet their needs." (such as from the abuse of political and economic power)."

From: Holmberg, John and Karl-Henrik Robèrt. (2000). Backcasting from non-overlapping sustainability principles--a framework for strategic planning. International Journal of Sustainable Development and World Ecology, no. 7: 291-308. p>

These principles have been tested, and continuously refined in cooperation between researchers and scientists, business corporations and local governments with the objective of being (i) necessary to not confuse the picture with highly debatable values etc., (ii) sufficient to cover all aspects of sustainability, (iii) general to be easy to

understand in any area or on any arena to allow cooperation across sectors and disciplines, (iv) concrete to guide decisions and actions in real life, and (v) mutually exclusive to allow comprehension and development of indicators to monitor progress towards compliance with the principles.

STRATEGIC LEVEL - Level 3 focuses the process to reach the vision (level 2). Investments should be planned strategically. This implies a step-by-step approach towards the success level in a way that ensures that financial, social, and ecological resources continue to feed the process. Trade-offs are selected according to their capacity to serve as platforms towards complying with principles of success.

#### BACKCASTING FROM PRINCIPLES

To analyze outcomes and take strategic decisions with reference to a full systems perspective in the future, i.e. to seek smart development paths once it is made clear what we want to accomplish, we propose the Backcasting planning methodology. This approach begins by formulating a shared vision of an imagined future success. Keeping this goal in mind while examining the present situation, stakeholders may devise smart development paths to reach their shared vision (level 2).

We acknowledge that it is difficult to make many people agree on detailed images of a distant future since we have different values, while technical and cultural conditions keep developing and changing. What may be a smart solution today might appear as a hopelessly obsolete solution tomorrow. That is why the proposed methodology suggests that we apply backcasting based on principles, meaning that we can do anything, but constrained by the limits of a sustainable society - the Four Sustainability Principles (4 SPs).

Smart strategic pathways (i) lead in the direction of the vision, (ii) are flexible with regard to other possible measures and steps further ahead, and (iii) are likely to give good return on investment— financial, social, environmental, political—for further investments in new stepping stones towards sustainability.

ACTION LEVEL - Level 4 is about everything we do in concrete terms. We apply the strategic guidelines at level 3 to inspire, inform and scrutinize every action or investment.

TOOLS LEVEL - Level 5 relates to Tools, Concepts and Standards that are often required for decision support, in addition to monitoring and disclosures of the (level 4) actions to ensure they are chosen (level 3) strategically to arrive stepwise at the (level 2) objectives in the (level 1) system. An attempt to contribute to a visual understanding of the dynamics of 5 levels above is presented in the figure below:

#### ABCD Process

[Rio+20 Secretariat: Please refer to full submission document for graph]

This is what we call the ABCD process: A) design and share visions of success that are informed by the sustainability principles; B) perform assessments of the current situation, using the envisioned future within sustainability principles as a lens; C) brainstorm actions potentially leading to the vision including the sustainability principles, and D) find smart strategic pathways that make use of the identified actions as stepping stones. The prioritized actions and measures are then clustered and formulated into clear targets.

#### AN INVITATION FOR COLLABORATION

The Tools, Concepts and Standards provide important contributions for Levels 4 (Actions) and 5 (Tools) by management, communication and monitoring processes and represent key pillars in the Unifying Framework. With this document we are specifically seeking cooperation with key tools-developer entities which developed and/or manage such concepts and approaches, to play a complementary role in crafting a strong Unifying Framework allowing different types of organizations to have a systemic perspective; envision a sustainable future; and create, implement & monitor a journey towards sustainability.

If chosen actions are guided by a system's perspective and a long term vision of sustainable development, following smart strategic pathways and using a toolkit which encompasses all the knowledge developed so far, we will most likely be on the right track to build the society we envision together.

In summary, we believe the Rio+20 Conference can be a key milestone in society's journey towards sustainability by creating the opportunity to bring together methodologies proven over the years to be effective for their own specific purpose, but that acquire a more powerful role in the broader context of the Unifying Framework for Sustainable Development - a new era of accelerated transformation towards sustainability.

#### CONCRETE ACTIONS OF THE PROJECT TOWARDS RIO+20

1) Invite the most accepted tools, concepts and standards to convene in evaluating and co-creating the Unifying Framework for Sustainable Development. Such coalition will be developed during the process towards Rio +20;

2) Participate in forums and conferences preparatory to Rio+20, in different parts of the world to present the Unifying Framework concept;

3) Pre-launch the Global Game for transformational social change (developed by the Brazilian Edgard Gouveia Jr – Ashoka fellow who developed the Oasis Game in Brazil). The pre-launch will take place in Rio during the Rio+20 Conference, inviting all participants and present audience to participate in the game—which envisions having 2 billion players in 4 years. Official launch is scheduled for December 2012. This game will integrate an online platform with the real world by connecting and challenging people around the world to play with and against each other to perform tasks that transform our world.

Through the game's online platform, players will be challenged to create individual, local, regional and global actions. The game is being developed with the conceptual basis of the Unifying Framework for Sustainable Development.

#### The Global Game Development Process

[Rio+20 Secretariat: Please refer to full submission document for graph]

4) Build leadership capacity for sustainable development through transformative dialogues using the World Café format, combined with the ABCD process (which is part of the Unifying Framework) to build the Shared Vision for Sustainability. These Roundtables will take place in various parts of the world during the process towards Rio+20 (Dec – Jun, 2012), culminating in a huge event called "1000 Round Tables", in Rio de Janeiro, Brazil, during the days of the conference.

Pictures of the '1000 Round Tables' held in Tel Aviv, Israel in Sept, 2011

[Rio+20 Secretariat: Please refer to full submission document for graph]

The event will invite 10,000 people (10 people per table) to participate in an energizing and engaging dialogue calling for action to build the future of a sustainable society (which starts now!). This World Café model was inspired by the '1000 Round Tables' held in Tel Aviv, Israel last Sept, 2011.

The proposal of the Unifying Framework for Sustainable Development together with these powerful actions – The Global Game for Transformational Social Change and the

Round Tables process – will definitely inspire renewed commitment and increased actions towards sustainable development. We hope the Rio+20 Secretariat sees value in this initiative and give us full support to move it forward.

Gomes ([tegomes@uol.com.br](mailto:tegomes@uol.com.br)).

The Natural Step Global Network

November 2011

## The Nature Conservancy

SUBMISSION FROM THE NATURE CONSERVANCY TO THE COMPILATION DOCUMENT, AS THE BASIS FOR PREPARATION FOR THE ZERO-DRAFT OUTCOME DOCUMENT FOR UNCSD 2012 (RIO+20)

### Context

In order to address new and emerging challenges, and plan for a future which allows all people to live sustainably, it is essential that natural resources are managed effectively. Healthy ecosystems are the very foundation upon which societies depend, through critical ecosystem services such as: food and water security; materials for shelter; income from tourism and sustainable use of terrestrial and marine resources; and protection from climate change impacts and natural disasters. We are, however, currently degrading that natural capital at a rate that threatens human development. In October 2011, global population reached 7 billion; by 2050, it is predicted to be over 9 billion. By that time, the world will likely add another 3 billion middle class consumers. Increasing demands on food and water, and the expansion of hard infrastructure have created a “nexus of need” for those with responsibility for, and expertise in, human development planning and environmental management to work cooperatively and, indeed, seamlessly, to adopt a holistic approach to future planning. The Economics of Ecosystems and Biodiversity report estimated that under a business-as-usual scenario, “a year’s natural capital loss would lead to a loss of ecosystem services worth in the order of US\$2.0-4.5 trillion over a 50 year period” – as much or more than the total financial capital lost during the 2008 financial crisis. If we do not become more conscious of the impacts of our actions, and collectively change our practices accordingly, resource constraints, natural capital loss and climate change will produce negative feedbacks that could limit sustained and sustainable development and growth.

The UN Conference on Sustainable Development (Rio+20) provides a unique opportunity to address these challenges, particularly through the theme of “a green economy in the context of sustainable development and poverty eradication”. A green economy is one that is ecologically and economically healthy and productive, which provides social benefits to improve people’s lives. The maintenance of healthy natural resources, which has been a theme running through international discourse and documents over the past few decades, including the legally-binding, as well as “soft” law outcomes from the 1992 UN Conference on the Environment and Development, and the targets and timetables in the 2002 Johannesburg Plan of Implementation, underpins our collective capacity to achieve a green economy. Addressing implementation of such commitments through appropriate enabling conditions, tools and policies that facilitate the development and “scaling up” of innovative approaches should be a core issue in the outcome document for Rio+20.

### Recommendations

With reference to a green economy in the context of sustainable development and poverty eradication, the Rio+20 outcome document should refer to the following issues as necessary to create a new global development paradigm: • Recognizing the fundamental role of nature as a solution-provider to development challenges, such as food, water, and energy security, poverty alleviation and human health, further efforts to mainstream and integrate the values of ecosystem services as integral to development planning are necessary. In particular:

- o Improving valuations of natural capital as part of national accounting frameworks.
- o Scaling up payments for ecosystem services across sectors.
- o Creating supportive policies and incentives to mainstream the value of nature, and activities to maintain natural systems, into development planning processes.
- o Creating policies that position natural infrastructure as a building block for a new green economy, by integrating natural infrastructure into the processes of infrastructure planning and investment.
- o Creating policies which enable planning at whole river basin scales.

 Example: Through payments for ecosystem services mechanisms such as “water funds”, operational in Latin America, downstream water users, such as municipalities and corporations, are compensating upstream land managers to keep the watersheds clean and healthy. This public-private partnership for ecosystem services ensures continued water quality and availability for cities, and provides a more sustainable and cost-effective solution than the “gray” alternative: construction and maintenance of water treatment plants. Valuing natural capital, through payments for ecosystem services, should be included in the outcomes for Rio+20.

• Recognizing the importance of oceans and coasts to achieving economic and social development objectives (often referred to as a “blue economy”), it is imperative to catalyze action towards achieving sustainable management of oceans and coasts. Notably, sustaining the economic prosperity and welfare of coastal communities and states will require implementing and scaling up a suite of marine and coastal conservation tools and community planning initiatives. In particular:

- o Scaling up efforts to protect and restore critical ecosystems that provide important ecosystem services and social and economic benefits.
- o Mainstreaming the value and importance of marine and coastal ecosystem services and promoting ecosystem based approaches in adaptation to the impacts of climate change and disaster risk reduction strategies.
- o Integrating ecosystem considerations into marine and coastal development planning through the use of marine spatial planning and strategic environmental assessments.
- o Improving sustainability of fisheries, and in particular coastal fisheries, through leveraging community-based and rights-based approaches to fisheries management and galvanizing investments in, and market demand for, sustainable seafood that supports and facilitates reforms in fisheries management.
- o Promoting sustainability standards and increased sound investments in ocean businesses and technologies.

Example: Through the Micronesia Challenge, the Caribbean Challenge, the Coral Triangle Initiative, and the progression of the new Western Indian Ocean and Coastal Challenge, island and coastal states are responding to common challenges and working together to sustainably manage their natural resource base. In the Micronesian sub-region, the three independent states and two US trust territories are completing the process of valuing their ecosystem services and the financial cost to maintain them, and established the Micronesia Conservation Trust to fund sustainable development activities in perpetuity. By working collectively, these states are better able to share experiences, leverage their successes, and plan for the future. In order that these commitments to sustainable marine resource management become the effective building

blocks within the context of a new green economy, and so that the international community can learn from their respective challenges and innovative solutions, further efforts to integrate and invest in such experiences will be necessary.

- Recognizing the asset value of ecosystem services, all actors (states, private sector and civil society) need to cooperate in developing new and innovative finance mechanisms within a green economy to provide sustainable sources of funding for natural resource management and social development planning. Such mechanisms include debt-for-nature swaps; conservation trust funds; and compensation for reducing emissions from deforestation and degradation.

Example: Debt loads of developing countries are an ongoing burden which greatly limits their ability to implement effective development plans and reduce poverty. Recently, by forgiving a portion of such debt, the United States has increased Indonesia's capacity, both immediate and long-term, in relation to management of the forest sector. Increasing the use of debt swaps as a finance mechanism within the green economy, has the potential to accelerate the achievement of sustainable development and poverty eradication.

- Recognizing the contribution of all actors (public, private and civil society) in establishing a new holistic green economy, and noting that many are not formally represented in traditional international legal processes, the creation of international norms needs to further evolve, to one that includes a suite of more flexible and open approaches involving actors from a range of sectors and interests. The current nine major groups' framework does not allow the kind of collaborative and open exchange of ideas and lessons that will be required within a new sustainable development paradigm.

Example: The Nature Conservancy and Dow Chemical have embarked upon a collaboration to help Dow and other companies recognize, value and incorporate nature into global business goals, decisions and strategies. The aim of the collaboration is to advance the incorporation of the value of nature into business, and to take action to protect the earth's natural systems and the services they provide people, for the benefit of business and society. The lessons they learn will also help governments, at national and sub-national levels, as well as other corporations and organizations, to more accurately value their ecosystem services and plan both for the immediate and long-term. There is currently, however, no space within the international system for such lessons to be shared. Creating the space for non-state actors to interact more effectively with governments would help ensure that relevant expertise is available to assist societies in finding creative solutions to the challenges they face with regard to transitioning to a green economy within the context of sustainable development and poverty eradication.

- Recognizing that for the outcomes of Rio+20 to be effective, they will need to be integrated into a number of multilateral processes related to sustainable development. Of particular importance, the revision of the Millennium Development Goals provides a critical opportunity to learn from past experiences and include new and innovative approaches that have proven to be cost-effective, sustainable and have multiple benefits. Over the past few decades, there are a number of examples that demonstrate that nature-based solutions have contributed to solving key development challenges. Sustainable management of natural resources can, and should, be given a higher priority within the global development agenda and be further integrated in other development goals particularly in preparation for the post-2015 development framework.

#### Conclusion

The Rio+20 outcome document should focus on what is required to implement the commitments and pledges already delivered in previous sustainable development fora and documents, and include what we have learned, and what we need to focus on to improve our planning, as guided by science. We know that forest conservation is a low-cost solution to a significant part of the climate mitigation problem, comprising up to 40% of the cost-effective near-term measures to limit warming to 2 degrees. We know from experiences in New York City, Bogota and Quito that upper watershed conservation is a cost-effective solution to water quality and availability issues for cities, compared to building filtration plants. We know from Thailand and Vietnam and Louisiana that restoring mangroves and coastal estuaries is a cost-effective way to protect coastal communities and infrastructure.

The outcome document should provide a way forward to build upon these concepts, including in discussions across the financing for development, sustainable development, environment, climate change and biodiversity-related fora within the UN system. Rio+20 needs to commit to a global investment program in the planet's natural capital, because the earth's natural systems are cost-effective solution providers.

---

## The Organizing Committee of 2011 Kubuqi International Desert Forum

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

To Share our experiences of desertification control with more people who need it and learn from others.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Document from China Elion Resources Group

Today, desertification has become one of the most serious ecological environment issues directly threatening people's survival and development. So far, 65% of land in the world has been facing desertification in varying degree and desertification is expanding at an annual rate of 50,000-70,000 square kilometers, which inflicts a dozen billion people with poverty and starvation. Desertification has received widespread attention from governments and international community of the world.

China is one of the countries encountering relatively severe desertification atrocity. Chinese government has been committed in long term to the undertaking of desertification prevention and control, organized series major ecology construction projects and promoted livelihood improvement for people living in desert area.

As one of the largest desert ecology enterprises in the world, Elion Resources Group of Inner Mongolia, in the last two decades, has persistently safeguarded Kubuqi Desert, afforested over 5000 square kilometers of deserts and rehabilitated 10000 square kilometers of desertified land, erecting an over-240-kilometer-long green ecological wall in north China, leaving a miracle print in Chinese desertification control history and creating a desertification control model with Chinese characteristics—"Kubuqi Model".

The great change of The Kubuqi Desert

The Kubuqi Desert is located at the north of Erdos highland in Inner Mongolia with a total land area of 18600 square kilometers; it is the seventh largest desert in the country. Back in the Tang Dynasty, this desert was recorded historically of "three feet deep sand here stops horse from travelling". The people lived here over generations suffered from pain and torture. Their security for life is constantly threatened by the changeable condition and ferity of the desert, their land, house and life could be destroyed any time. People around the desert periphery are forced into exile and their life is full of uncertainty.

Since the founding of New China, Chinese government pays great attention on desertification control. Under the influence of reform and open policy, as a non stated-owned enterprise, Elion Resources Group has determinedly and undoubtedly taken on the task of combating desertification for the enterprise itself and the local people based on their responsibility. Through perseverant efforts and faith over two decades, the Kubuqi Desert nowadays is no longer the barren land with terrible sand storms. Instead, it is a green oasis flowing with clean lake water, a favorable tourist area with groups of animals, ecological system and complex food chain. The great changes can be experienced from data as below:

1. The total land area of Kubuqi Desert is 18600 square kilometer and was known as "the barren land" two decades ago; nowadays, the afforestation in this desert has reached more than 5000 square kilometers, equivalent to the land area of seven Singapore, controlled desertification land is more than 10000 square kilometers, it is neither the barren land nor dead sea, instead it has turned into an green oasis overflowing with vigor and vitality. The tangible evidence of "more green, less yellow" can be shown from the satellite.
2. The frequency of sandstorm in Kubuqi desert is about 70—80 times per annual, and it would only take one night to blow into the capital compared with once or twice a year, great contributions are therefore made in improving the weather quality along Beijing and Tianjin, even Korea and Japan. Additionally, precipitation has increased to a few centimeters from the initial millimeters two decades ago. (accurate figures are better here)
3. Two decades ago, camel was the only transportation to carry all the living goods of six months on a journey of 50 kilometers with 2—3 days in return, and visiting doctor and getting educated was even an extravagant hope for the herdsmen. There are five spanning roads of total 500 kilometers long on Kubuqi desert nowadays, tight integration of international school and modern medical institute have also been promoted. The changes of two decades (accurate number is needed here) helped the herdsmen's annual income growing at two digit speed. Cars and modern house are no longer luxuries in the past.

The herdsmen were suffering, had a life of misery in the past, and now they are having a life of happiness and prosperity.

4. Desertification problem was regarded as the cancer of the earth two decades ago; people sacrificed countless time, effort, material and money for combating desertification. The Kubuqi today truly is an example reflecting the development of green desert economy, becoming pioneering green living space clarifying the direction of achieving sustainable development, even the model on turning desert disadvantage to advantage, turn negative to positive.

Who has been combating desertification?

Desert is a remote and threatening place to many people; however it is also the passion of life for those heroes who has dedicated in desertification control, especially for the vice president of All-China Federation of Industry and Commerce, the Chairman of Elion Resources Group, Wang Wenbiao. Over twenty years ago, he was a teacher and Kubuqi government official before becoming the salt factory manager of Kubuqi desert, and this salt factory is the place of origin for Elion Resources Group today

In the late eighties last century, the desert was the biggest problem for the salt factory even it had a huge potential, less than a hundred kilometers distance was detoured to 330 kilometers, and the profit of tons of product was wasted on the way, and the factory was facing destruction any time. Facing the life challenge, the people who were raised up in the desert were bravely stepped on the journey of homeland-protection by afforesting under the leadership of Wang Wenbiao. The seeds were vastly taken care of in the barren land and now they have grown into rows of strong "green soldiers" guarding the lake permanently.

However, the small—scale of desert management was nothing compared with the ferity of the desert. Sandstorm stopped transportation and the enterprise was threatened to be broken down. In the early nineties, Elion Resources Group started the industrial desertification control, and eagerly exploring multiple win solutions of "desert, greenage, livelihood and industry". The first "green tunnel" on the Dead Sea was created in the hinterland in 1997. This had ultimately brought revival to the enterprise and people's

living was vastly improved as well. The desert value was therefore reconsidered while Elion was on the way of industrial desertification control. Gradually the long march is looking broader and brighter.

What made desert afforestation come true?

Firstly is science and technology bringing about afforestation, which means to strictly rely on science and technology, eagerly delving in sand prevention models suitable for local condition. During repeated experience and research, Elion has concluded the concept of sand prevention, which is "side-locking, hinterland penetrating, road division, separate management, technology support and industry driven", the desertification combating of "six in one" was also promoted by combining road, electricity, water, telecommunication, network and greenage." Thus three industries are formed there from. First of all, afforestation by road construction has helped reaching greenage of total 2000 square kilometers; five desert spanning roads of total 500 kilometers are constructed, and lots of salix and licorice are also planted on the sides of the roads. Secondly, 100 square kilometers of desert afforestation was also reached through green protection belt. Elion has also built a sand-prevention belt of total 242 kilometers, which is a green screen securely stabilized the desert. Thirdly desert greenage of 2000 square kilometers was achieved by desert hinterland ecological repair. Tree-planting has hugely improved the efficiency of desert afforestation combining ecological immigration, recovery based on aerial and mechanic planting.

Secondly is the utilization of desert resource through science and technology, turning desert disadvantage into advantage, developing and utilizing desert as a precious type of resource, expanding living space for human while enlarging desert green economy. Cleaning energy is the first industry which was invested by Elion with ten millions of dollars, almost equivalent to 20 trillion of Korean Won, the photovoltaic industry, biomass energy and new material industry were later on developed utilizing resources from desert land, sunshine and biomass. The second is natural medical industry. People of Elion also planted 1500 square kilometers of licorice on favorable locations, not only stabilizing the sand but also valuable in its medical purpose, created a win-win situation of "afforestation increased with profit" for the enterprise. Their licorice medical industry has reached a large scale of 40 billion RMB and they are now organizing natural medical industry to be on the market at full swing. The third is the industry of desert modern agriculture and tourism. Improving desert ecological environment is improving desertification and expanding the land for agriculture. With their help, more than 2000 square kilometers of desert area has turned into agricultural land, it is the new solution for sustainable utilization of global land. At the meanwhile, a unique industry of desert tourism also emerged by relying on natural landscape of the desert.

July, 8, 2011, 2011 Kubuqi International Desert Forum was successfully held in Kubuqi Desert's Seven-star Lake. Politicians, experts and scholars coming from more than 30 countries visited Kubuqi Desert. After their inspection, they regarded the Kubuqi Pattern as the contribution that Elion made to the whole world. "Kubuqi Pattern" is an innovative practice and successful example created by Elion Resources Group during its over 20 years' practice of Kubuqi Desert desertification control and speeding up sand industry development, which is based on available desert resources and supported by technology innovation, with enterprise development driven by science and technology, large-scale desertification control driven by the industry and people's livelihood improvement driven by ecology. "Kubuqi Pattern " embodies priority of ecology, development and people's livelihood, forming a new model of "rehabilitation to development to re-rehabilitation to re-development" which is a virtuous development cycle and realizing the multi-win structure of "desertification prevention and control, industry development, ecology improvement, social stability, national solidarity, farmer's prosperity and interaction".

The core connotation of "Kubuqi Model" is the so-called "three driving", which are enterprise development driven by science and technology, large-scale desertification control driven by industry and people's livelihood improvement driven by ecological zone.

Science and technology brings about enterprise development. Elion Resources Group always adheres to the concept of "science and technology are the primary production force", roundly depending on the advancement of science and technology to promote scientific enterprise development and green development. It also has successively, in a broad sense, cooperated with over 10 domestic and international scientific institutes, universities and enterprise, (such as Belgium's . Through synergized key difficulty tackling in major principles, various fields and involving in whole project process, technology introduction, independent research and development, it has promoted a robust enterprise development and provided support for Kubuqi Desert desertification control. Meanwhile, Elion Resources Group was named as "National Base of Desert New Energy Commercialization of Research Findings" and "International Technology Cooperation Base". National Tourism Bureau named Kubuqi Desert as "National Desert Tourism Experimental Base". National Forest Bureau named Kubuqi Desert as "The First Combat Convention of Desertification Experimental Base of China".

Industry brings about large-scale desertification control. In the last over 20 years, depending on the wealth accumulated by industry development, Elion Resources Group has been adhering to ecology construction of Kubuqi Desert. As of now, Elion Resources Group has invested over 3 billion RMBs on forming a development mechanism of virtuous cycle which is "desertification control driven by industry and industry promoted by desertification control". Generally speaking, the development of Elion's Desertification control can be divided into two parts. The 10 years before 1997 was just called small actions. The purpose was for the factory to survive. Industrialization started from the accomplishment of the first cross sand road. Construction of the first cross sand road made Elion to know the desert better. We found a point to break the ice by developing sand industry such as planting licorice. Elion Group programmed "one belt, for districts and one town" in Kubuqi Desert. One belt means Kubuqi desert stereoscopic combine type of afforesting belt, which consisted by four industry zones. Four Districts means the new material cycling industry district on the east side of Kubuqi desert, the new energy cycling district on the north, Kubuqi Seven-star Lake ecological tourism district and Modern desert agriculture demonstration district. One town is a 20 square kilometers ecology low carbon area. The formation of the industry brings about the development of desert economy and enriched local people.

Improving people's livelihood through ecological development. 20 years' effort, Elion has made significant efforts to improve the ecological environment in 5000 square kilometers' sandy areas, developed the ideology of all-inclusive, wide-covering and universal benefits to the people. There used to be more than 60-70 times sandstorm happened in this area every year, but after Elion's treatment, the number was reduced to one or two every year. Rainfall capacity was changed from dozens of mm every year to 300mm every year, which totally changed the bad weather condition of this area. And also protects Beijing, the capital city where closed to Kubuqi desert, from being influenced by the sandstorm. Besides, Elion Group vigorously implemented the project of "Helping people, enriching people and benefiting people through ecological construction". 1) Benefiting people through ecological construction. Besides improving the ecological environment, efforts have also been made to improve people's living environment, so that the local people wouldn't have to live the miserable life with sand. Under the support of local government, Elion Resources Group has gathered native dwellers and constructed a residential quarter for them, allowing them to get out of deep desert and live a life of intensified production. 2) Enriching people through ecological construction. The ecological industry developed in the desert has provided over 5000 employment opportunities for local peasants and herdsmen, while free professional training has also been provided to make them the new-generation ecological construction workers, tourist service staff and skilled workers of intensive breeding and planting. The ecological industry has increased the income of natives by over RMB 300 million per year. The per capita net income of herdsmen has increased from RMB 2,000 in the past to RMB 30,000 at present. Through desertification control and the development of sand industry, the native dwellers have migrated from the life of poverty and obsolete production mode to the road of affluence. Experiences show that desertification control and sand industry development are two important approaches to respond to climate change, improve ecological environment, address the food & clothing problem of the vulnerable groups in worldwide desertifying areas, and accomplish long-term development. 3) Benefiting people through ecological construction. Through the construction of sand-control afforestation highways, Elion has improved the production and living conditions of peasants and herdsmen in the desert. Elion invested RMB 100 million to build the desert school offering full-time nursery and free education, thus providing preferable elementary education for the children of local peasants and herdsmen.

Conclusion

Combating desertification is a long term project which may lasts for hundreds of years. As a private enterprise, Elion Resources Group develops economy in accordance with

the idea of "Green, Cycling, Clean and Low Carbon", holding a green flag of combating desertification and developing desert economy. 20 years accomplishment is not only afforesting, but to created a system with the meaning of combination of government's support, company's investment and people's participation, which is a great experience to the world. On 29th Aug, 2011, China's State leader, member of the Political Bureau of the CPC Central Committee, Chairman of CPPCC Mr. Jia Qinglin visited Kubuqi desert. He demanded Elion Group to continue the work in Kubuqi after his inspection. Elion Group was recognized as a representative of China's high level desertification control technology and a demonstration of China's ecology construction.

Kubuqi Pattern has brought the attention from the UN and the whole world. On 17th, Oct 2011, Chairman of the Board of Elion Resources Group Mr. Wang Wenbiao was invited to UNCCD's COP10 Business Forum held in Korea, and gave a key note speech as the creator and practitioner of Kubuqi Pattern. Mr. Wang introduced Kubuqi Pattern and shared his experiences on combating desertification with ministers, government officers and delegates from more than 44 countries all over the world. Mr. Sha Zukang, Deputy Secretary-general of the United Nations and Mr. Luc Gnacadja, Secretary of UNCCD and delegates from all over the world highly commended Kubuqi Pattern as one of the most successful case in desertification control field. Kubuqi Pattern is recognized as a devotion to combating desertification. It's not only belonging to China, and also the world. Kubuqi Pattern should be spreaded to accelerate the process of global desertification control. In his speech, Mr. Wang expressed himself sincerely that he would like to spread Kubuqi Pattern to the world where needed and to carry forward this green devotion from China, enriching more people live in desert.

One, we need a logical management system. We have a win-win management system in Kubuqi which includes the support from the government, the investment from the enterprise and the participation from local people. This system makes sure the success of today's Kubuqi desert.

Two, we must rely on technological innovation. For these years, Elion Group cooperated with more 10 scientific research institutes domestic and overseas, built a desert economy research institute, which brought couple of cooperation projects, exploited several patent technologies and developed the technologies such as watering sand willow, licorice translation, saccasoul willow grafting desert cistanche, Dicotyledoneae grafting cynomorium coccineum. These technologies provide strong support for our desert economy development.

Three, we must take the improvement of people's living condition as our own duty. The land owned by herdsmen can be valued as resource. They can use the land they have as capital and join our market. Elion Resources Group rents land from herdsmen, brought huge profit to them. For all these years, we provided thousands of working opportunities to local herdsmen, such as constructors of zoology construction project, which brings them more than 300 million RMBs income every year. As the development of Elion Group's sand industry, the income of local people raised 10 times in 7 years. Elion invested more than 100 million RMBs to build a free boarding nursery school to give the children better education. Fact shows that combating desertification is an important act of improving people's living condition. On the other hand, we can not develop our green economy in the desert without local people's support.

Four, we must have long term ambitions and firm spirit. Combating desertification and afforesting, including desert economy development, are complex projects with high investment, large scale, slow effect and long period. In the past 20 years, Elion Resources Group fights the desert with the spirit of firmness, persistence, perseverance, willingness of fight and sense of responsibility without complaining.

Desertification, land degradation and drought are the three main issues of global land sustainable management. The urbanization of developing countries makes land degradation unavoidable. Global warming makes drought a hardly solved issue. The practicing of Kubuqi Pattern indicates that combating desertification is the most hopeful issue of the three. Kubuqi pattern shows that the desert can be afforested, the soil of the desert can be improved and the solar energy of the desert can be powerful. As far as desertification trends gets better, the dilemma of land sustainable management could be broke.

We will rely on the abundant solar, land and biomass resources of Kubuqi desert. In the coming 3-5 years, basing on technological, system and pattern innovation, the afforested area in the desert will be reach 10,000 square meters, the income of desert clean energy and natural medicine will be reach 100 billion RMBs. Elion Resources Group will create more green space for mankind and create a whole new method of global desert green economy development.

---

## The Partnership for Education and Research about Responsible Living

SUBMISSION TO THE BUREAU OF THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT

by PERL (The Partnership for Education and Research about Responsible Living)

October 2011

PERL (The Partnership for Education and Research about Responsible Living) (<http://www.perlprojects.org>), is a partnership of educators and researchers from 130 institutions in 50 countries who work developing methods and materials to encourage people to contribute to constructive change through the way they choose to live. PERL offers the following proposal for the compilation of the zero draft outcome document for UNCSD June 2012.

Proposed text for the Rio+20 Outcome Document

Education for responsible, sustainable living

Sustainable lifestyles are central to overcoming poverty and conserving and protecting the natural resource base for all. Sustainable methods of production are needed; use of resources needs to be minimized; and pollution and waste reduced. In the current state of multiple global crisis, innovation in education is essential to tackle these challenges. Teaching people to better understand the problems we are currently facing, and to think differently in order to tackle them, is an important task for education systems, as are building skills for critical thinking and problem-solving.

Rationale

In a world threatened by economic crisis, environmental disaster, poverty, social unrest and conflict, there is growing global consensus that the international community must unite to prepare for a better common future. Education is at the centre of the development process; our ability to generate well-educated societies is critical in overcoming the challenges we face.

Thus, education is inextricably linked to well-balanced development that takes into consideration the social, environmental and economic dimensions of an improved quality of life for present and future generations. The global financial and economic crisis together with other crises linked to climate change, food and energy, have demonstrated the need for viable, long-term solutions. A system of production and consumption imposing significantly lower pressures on natural resource stocks and the environment while improving the quality of life and social well-being for all, is now widely recognised as necessary in order to move to sustainable development. This has given new relevance to debates on how education should respond to changing realities and contribute to a better future.

Education for SCP should not be understood in a narrow sense so that it simply means learning to consume and produce less. Instead, such education should serve to

empower consumers by making them aware of their rights and responsibilities as well as the needs of individuals throughout the world. It should equip them with critical thinking skills to be conscious consumers and active, compassionate citizens. Education for SCP should train people to support business practices and government policies that are ethically sound, seek eco-efficiency, provide a wide range of choices and alternatives, and supply reliable information to consumers. Changing unsustainable patterns of consumption and production requires changes in attitudes and behaviours on a massive scale. Such education needs to be based on multi-stakeholder partnerships, research and activities which support sustainable lifestyles innovation in both developed and developing countries.

Regulations, new technology and material incentives alone cannot bring about significant attitude and behaviour changes. Education cannot do this alone either. Together, education, regulations and material incentives/new technology can provide the necessary knowledge, frameworks and motivation for constructive change to sustainable living. Together they can provide the foundations for the transitions needed to achieve a more equitable and sustainable economy.

#### Concrete measures / recommendations

- Encourage all countries to include a comprehensive program of value-based, holistic, interdisciplinary and practical education for sustainable living in their curricula, teacher training, school activities and informal education
- Endorse a 10-year framework of programs on sustainable consumption and production to support the development of education for sustainable living in formal and informal educational systems in all countries as well as dissemination of good practices, learning kits, guidelines and material. This Framework of programs would build upon the work of the UN Decade of Education for Sustainable Development. It would encompass a variety of approaches but ensure focus on life skills and creative social learning processes.
- Provide the resources for carrying out the above-mentioned programs.
- Carry out a mid-way review after five years of the progress made.

---

## The Royal Society

### Royal Society submission to Rio+20 consultation

#### Introduction

The Royal Society welcomes the opportunity to contribute to the preparatory process of the Rio+20 meeting. The Society believes that Rio+20 is a critical milestone for reinvigorating international political commitment and catalysing action for meeting the challenges the world now faces.

The Royal Society Science Policy Centre (SPC) has undertaken work on a wide range of issues relevant to sustainable development, most recently completing reports on Nuclear Fuel Stewardship<sup>1</sup>, the Governance of Solar Radiation Management methods of Geoengineering<sup>2</sup>, Geoengineering the Climate<sup>3</sup> and Ground-level Ozone<sup>4</sup>. The Society has also been central to the development of interacademy statements<sup>5</sup> – at both G8+5 and global (through the IAP global network of academies<sup>6</sup>) levels: these have set out clear consensus among the international scientific community on wide-ranging issues, such as global health, energy security, climate change, ocean acidification, tropical forests and water and sanitation. Currently the SPC is preparing a report entitled *People and the Planet*, which considers the dual contribution of population and consumption to sustainable development.

The Society's submission to the Rio+20 consultation is based exclusively on the content of the *People and the Planet* report which is expected to be published in early 2012.

This submission contains the following key messages:

The zero draft document must recognize the fundamental importance of population and consumption to achieving sustainable development. A failure to consider the close interactions between the two when identifying goals, desired outcomes and delivery mechanisms for Rio+20 will compromise efforts to achieve sustainable development. Unsustainable population growth, lack of access to reproductive health-care and continuing degradation of environmental services will compromise development and poverty eradication efforts across the world. Demographic changes present challenges and opportunities for sustainable development, and will influence the achievement of a global green economy. Planning for a transition to a green economy must take these dynamics into account.

#### Population and Consumption and Rio+20

The Rio+20 meeting provides a critical opportunity for reinvigorating international efforts to achieve sustainable development; for lifting the 1.4 billion people who live on less than \$1.25 a day out of poverty; for addressing the unsustainable consumption of natural resources and the environmental degradation that results; and for enhancing the health and wellbeing of all citizens around the world.

Since 1992 the progress made in achieving sustainable development has been limited despite previous statements of high-level political support, identification of goals, targets and action plans. Rio+20 must do better.

It is the Society's view that there are two main reasons for the poor progress made to date:

1. the reluctance of global leaders to integrate population dynamics and sexual and reproductive health rights into sustainable development strategies and mechanisms for delivery; and
2. the failure of market economies to confront the environmental and resource pressures created by an economic model based on the continual expansion of consumer demand, to capture the full value of environmental goods and services, and to address global disparities in the distribution of incomes, consumption levels and access to environmental resources.

Unless Rio+20 addresses each of these issues the Society is concerned that the transformation to a just, equitable, low carbon and environmentally resilient planet is unlikely to be realized.

In the hope that the Rio+20 Green Economy theme will address point 2 above, the emphasis of this submission is on point 1, as the Society is concerned by the low profile of population matters in the preparatory process to date. However, it is the Royal Society's view that both consumption and population are of fundamental importance to achieving sustainable development and must be addressed together in an internationally co-ordinated and politically integrated fashion.

Economic, social and environmental systems are all strongly influenced by population, especially rates of growth and demographic changes such as urbanisation, migration, and age structure change. The economic and environmental outcomes arising from population growth and demographic change are directly or indirectly a consequence of consumption of resources. Population and consumption are therefore inseparable factors in sustainable development. These linkages have been recognized by the international sustainable development community in the past – in the 1992 Rio Declaration and Agenda 21, the 1993 Population summit of the World's Scientific Academies, the 1994 Cairo International Conference on Population and Development Programme of Action (ICPD POA) and key actions subsequently agreed at ICPD+5, +10 and +15 (see Appendix 1). Although stabilization of global population growth was identified as important for achieving sustainable development in the report of the Secretary-General to the May 2010 Preparatory Committee<sup>7</sup>, population issues have otherwise had a notably low profile in the lead up to Rio+20. This is despite the known implications of population growth and demographic change for a world with finite natural resources, the obvious social equity implications for the many millions of women around the world without access to reproductive health care including contraception and safe abortion, and the social and economic development implications of high fertility levels in the poorest regions of the world and the rapid ageing of societies, which is now occurring in both developed and emerging economies.

In late October the global population reached 7 billion people. It is now larger, more urban and older than ever before and is characterized by gross disparities in rights, opportunities and standards of living. In some of the world's poorest countries high fertility rates hamper development and perpetuate poverty, while low fertility rates in both the richest countries and some of the emerging economies are raising concerns about prospects for economic growth and social security. Globally, current levels of consumption are unsustainable, and yet billions of people currently consume too little to meet their basic human needs. These economic, social and environmental interactions are expressed through the life choices made by individual people and communities, and are likely soon to limit the wellbeing potential of many more people in all parts of the world.

For these reasons it is difficult to see how progress can be made if the challenges and opportunities presented by population growth and demographic changes at the global, regional and national level for the social, economic and environmental pillars of sustainable development, are overlooked.

To ensure that population is considered alongside consumption at the Rio+20 meeting and subsequent activities, the Royal Society would like to propose that the Principles, Objectives and Key Actions of the 1994 Cairo ICPD POA and subsequent ICPD meetings (see Appendix 1) be reflected in the zero draft document. The POA built on the actions and objectives agreed in Agenda 21 in relation to the interrelationships between population and development, and captured key issues which are just as relevant today as they were in 1994; for example; the important influence of population growth and structure on human wellbeing, the need to recognize reproductive rights and improve access to reproductive health care, to improve gender equality, equity and empowerment of women, to recognize the links between population, economic growth and poverty and population and environment, and the need to integrate population and (sustainable) development strategies.

In terms of specific expectations the Royal Society would like to see the dual importance of population and consumption reflected in any goals, targets and/or programmes of action to come out of the Rio+20 discussions. In this context the Royal Society is supportive in principle of the Colombian Government proposal for the development of Sustainable Development Goals and agrees that Agenda 21 provides a good starting point for identifying the key issues requiring action. However, any new goals developed must address population and consumption together in an integrated way, and should reflect the 1994 Cairo ICPD POA and actions agreed at subsequent ICPD meetings.

In the same context, the Royal Society agrees that the Green Economy concept should provide a useful mechanism for helping to achieve sustainable development, in particular through decarbonising consumption, reducing the other environmental impacts of consumption, and reducing consumption inequalities. However, the Society would like to see explicit consideration given to the challenges and opportunities presented by population size, growth rates, structure and distribution in these discussions. For example, how can the green economy agenda be used to ensure countries have the appropriate conditions in place (e.g. health and education infrastructure) to enable them to realize their potential demographic dividend as they approach this stage in their demographic transition? How can the green economy be applied so as to ensure that as countries grow economically they do so equitably and in a low-carbon and environmentally-sustainable way? How can current patterns and trends for increasing international migration be managed to support the growth of a green economy for the benefits of all? What are the implications of the rapid population growth forecast in some parts of the world for the delivery of their green economy, and what are the implications of population decline in areas with low fertility rates? What are the opportunities and challenges presented by an ageing population for a green economy? And, how can the green economy agenda be used to deliver patterns of urbanisation that meets sustainable development objectives? To this end the Royal Society strongly encourages the UN Rio+20 secretariat to work closely with its colleagues in the UN Population Division, UN Environment Programme and UN Development Programme and appropriate national authorities to develop these themes.

Finally, in terms of specific outcomes, the Royal Society would like to see Rio+20 result in a clear statement of intent and commitment to achieving sustainable development by global leaders. This must be accompanied by:

1. Outcome driven goals and measurable targets, based on the 1992 Rio Principles, Agenda 21 and the 1994 Cairo International Conference on Population and Development Programme of Action (and subsequent ICPD meeting agreed actions). These should complement and significantly strengthen the Millennium Development Goals;
2. Political commitment for the development of an international programme of action for enabling the delivery of the goals. This must contain challenging targets that reflect the size and urgency of the challenge. It should reflect the fundamental importance of population and consumption to sustainable development, the need for improved integration of economic, environmental and social policy making, the principle of common but differentiated responsibility, and the respective roles of the public and private sectors. This should not be an action plan aimed only at achieving the transition to a green economy, or, aimed only at increasing the profile of environmental sustainability. It must facilitate the integration of the three pillars of sustainable development.
3. Firm commitments from governments and the private sector to invest financially in the delivery of the action plan.

The Royal Society would be happy to provide assistance to the Rio+20 secretariat on the issues listed above, or on any of the other matters mentioned in the Introduction to this submission. Please contact

Rachel Garthwaite,

Senior Policy Advisor, Environment and Climate Change, The Royal Society, 6-9 Carlton House Terrace, London,

1 November 2011.

#### 1. ICPD IPOA (1994) PRINCIPLES

The implementation of the recommendations contained in the Programme of Action is the sovereign right of each country, consistent with national laws and development priorities, with full respect for the various religious and ethical values and cultural backgrounds of its people, and in conformity with universally recognized international human rights. International cooperation and universal solidarity, guided by the principles of the Charter of the United Nations, and in a spirit of partnership, are crucial in order to improve the quality of life of the peoples of the world.

In addressing the mandate of the International Conference on Population and Development and its overall theme, the interrelationships between population, sustained economic growth and sustainable development, and in their deliberations, the participants were and will continue to be guided by the following set of principles:

Principle 1

All human beings are born free and equal in dignity and rights. Everyone is entitled to all the rights and freedoms set forth in the Universal Declaration of Human Rights, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status. Everyone has the right to life, liberty and security of person.

Principle 2

Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature. People are the most important and valuable resource of any nation. Countries should ensure that all individuals are given the opportunity to make the most of their potential. They have the right to an adequate standard of living for themselves and their families, including adequate food, clothing, housing, water and sanitation.

Principle 3

The right to development is a universal and inalienable right and an integral part of fundamental human rights, and the human person is the central subject of development. While development facilitates the enjoyment of all human rights, the lack of development may not be invoked to justify the abridgement of internationally recognized human rights. The right to development must be fulfilled so as to equitably meet the population, development and environment needs of present and future generations.

Principle 4

Advancing gender equality and equity and the empowerment of women, and the elimination of all kinds of violence against women, and ensuring women's ability to control their own fertility, are cornerstones of population and development- related programmes.

The human rights of women and the girl child are an inalienable, integral and indivisible part of universal human rights. The full and equal participation of women in civil, cultural, economic, political and social life, at the national, regional and international levels, and the eradication of all forms of discrimination on grounds of sex, are priority objectives of the international community.

Principle 5

Population-related goals and policies are integral parts of cultural, economic and social development, the principal aim of which is to improve the quality of life of all people.

Principle 6

Sustainable development as a means to ensure human well-being, equitably shared by all people today and in the future, requires that the interrelationships between population, resources, the environment and development should be fully recognized, properly managed and brought into harmonious, dynamic balance. To achieve sustainable development and a higher quality of life for all people, States should reduce and eliminate unsustainable patterns of production and consumption and promote appropriate policies, including population-related policies, in order to meet the needs of current generations without compromising the ability of future generations to meet their own needs.

Principle 7

All States and all people shall cooperate in the essential task of eradicating poverty as an indispensable requirement for sustainable development, in order to decrease the disparities in standards of living and better meet the needs of the majority of the people of the world. The special situation and needs of developing countries, particularly the least developed, shall be given special priority. Countries with economies in transition, as well as all other countries, need to be fully integrated into the world economy.

Principle 8

Everyone has the right to the enjoyment of the highest attainable standard of physical and mental health. States should take all appropriate measures to ensure, on a basis of equality of men and women, universal access to health-care services, including those related to reproductive health care, which includes family planning and sexual health. Reproductive health-care programmes should provide the widest range of services without any form of coercion. All couples and individuals have the basic right to decide freely and responsibly the number and spacing of their children and to have the information, education and means to do so.

Principle 9

The family is the basic unit of society and as such should be strengthened. It is entitled to receive comprehensive protection and support. In different cultural, political and social systems, various forms of the family exist. Marriage must be entered into with the free consent of the intending spouses, and husband and wife should be equal partners.

Principle 10

Everyone has the right to education, which shall be directed to the full development of human resources, and human dignity and potential, with particular attention to women and the girl child. Education should be designed to strengthen respect for human rights and fundamental freedoms, including those relating to population and development. The best interests of the child shall be the guiding principle of those responsible for his or her education and guidance; that responsibility lies in the first place with the parents.

Principle 11

All States and families should give the highest possible priority to children. The child has the right to standards of living adequate for its well-being and the right to the highest attainable standards of health, and the right to education. The child has the right to be cared for, guided and supported by parents, families and society and to be protected by appropriate legislative, administrative, social and educational measures from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sale, trafficking, sexual abuse, and trafficking in its organs.

Principle 12

Countries receiving documented migrants should provide proper treatment and adequate social welfare services for them and their families, and should ensure their physical safety and security, bearing in mind the special circumstances and needs of countries, in particular developing countries, attempting to meet these objectives or requirements with regard to undocumented migrants, in conformity with the provisions of relevant conventions and international instruments and documents. Countries should guarantee to

all migrants all basic human rights as included in the Universal Declaration of Human Rights.

#### Principle 13

Everyone has the right to seek and to enjoy in other countries asylum from persecution. States have responsibilities with respect to refugees as set forth in the Geneva Convention on the Status of Refugees and its 1967 Protocol.

#### Principle 14

In considering the population and development needs of indigenous people, States should recognize and support their identity, culture and interests, and enable them to participate fully in the economic, political and social life of the country, particularly where their health, education and well-being are affected.

#### Principle 15

Sustained economic growth, in the context of sustainable development, and social progress require that growth be broadly based, offering equal opportunities to all people. All countries should recognize their common but differentiated responsibilities. The developed countries acknowledge the responsibility that they bear in the international pursuit of sustainable development, and should continue to improve their efforts to promote sustained economic growth and to narrow imbalances in a manner that can benefit all countries, particularly the developing countries.

### 2. Key Actions for the Further Implementation of the Programme of Action of the ICPD -- ICPD+5 (1999)

Progress and challenges in the first five years of implementing the Cairo agreement were the focus of a series of meetings leading up to special session of the United Nations General Assembly (ICPD+5) in June 1999. The session identified Key Actions for the Further Implementation of the ICPD Programme of Action, including new benchmark indicators of progress in four key areas:

#### 1. Education and literacy

Governments and civil society, with the assistance of the international community, should, as quickly as possible, and in any case before 2015, meet the Conference's goal of achieving universal access to primary education; eliminate the gender gap in primary and secondary education by 2005; and strive to ensure that by 2010 the net primary school enrolment ratio for children of both sexes will be at least 90 per cent, compared with an estimated 85 per cent in 2000. Governments, in particular of developing countries, with the assistance of the international community, should: ... Reduce the rate of illiteracy of women and men, at least halving it for women and girls by 2005, compared with the rate in 1990"

#### 2. Reproductive health care and unmet need for contraception

"... Governments should strive to ensure that by 2015 all primary healthcare and family planning facilities are able to provide, directly or through referral, the widest achievable range of safe and effective family planning and contraceptive methods; essential obstetric care; prevention and management of reproductive tract infections, including sexually transmitted diseases, and barrier methods (such as male and female condoms and microbicides if available) to prevent infection. By 2005, 60 per cent of such facilities should be able to offer this range of services, and by 2010, 80 per cent of them should be able to offer such services."

"Where there is a gap between contraceptive use and the proportion of individuals expressing a desire to space or limit their families, countries should attempt to close this gap by at least 50 per cent by 2005, 75 per cent by 2010 and 100 per cent by 2050. In attempting to reach this benchmark, demographic goals, while legitimately the subject of government development strategies, should not be imposed on family planning providers in the form of targets or quotas for the recruitment of clients."

#### 3. Maternal mortality reduction

"By 2005, where the maternal mortality rate is very high, at least 40 per cent of all births should be assisted by skilled attendants; by 2010 this figure should be at least 50 per cent and by 2015, at least 60 per cent. All countries should continue their efforts so that globally, by 2005, 80 per cent of all births should be assisted by skilled attendants, by 2010, 85 per cent, and by 2015, 90 per cent."

#### 4. HIV/AIDS.

"Governments, with assistance from UNAIDS and donors, should, by 2005, ensure that at least 90 per cent, and by 2010 at least 95 per cent, of young men and women aged 15 to 24 have access to the information, education and services necessary to develop the life skills required to reduce their vulnerability to HIV infection. Services should include access to preventive methods such as female and male condoms, voluntary testing, counselling and follow-up. Governments should use, as a benchmark indicator, HIV infection rates in persons 15 to 24 years of age, with the goal of ensuring that by 2005 prevalence in this age group is reduced globally, and by 25 per cent in the most affected countries, and that by 2010 prevalence in this age group is reduced globally by 25 per cent."

### 3. ICPD+10 (2004) COMMISSION ON POPULATION AND DEVELOPMENT Thirty- Seventh Session

Review and appraisal of the progress made in achieving the goals and objectives of the Programme of Action of the International Conference on Population and Development 22-26 March and 6 May 2004.

Resolution 2004/2: Follow-up to the Programme of Action of the International Conference on Population and Development\* 6 May 2004, New York \* E/CN.9/2004/9 The Commission on Population and Development,

Bearing in mind that 2004 marks the tenth anniversary of the International Conference on Population and Development, held in Cairo in 1994, and of the adoption of its Programme of Action,

Concerned that, based on current trends, many countries may fall short of achieving the agreed goals and commitments of the Programme of Action,

Reaffirming the United Nations Millennium Declaration<sup>2</sup> and the internationally agreed development goals, including those contained therein,

Reiterating the call to implement fully and build further on the commitments made and agreements reached at the International Conference on Financing for Development,

Recalling General Assembly resolution 57/270 B of 23 June 2003, Bearing in mind the goals and objectives on population and development of the other major United Nations conferences and summits, and their reviews,

Welcoming the decision of the General Assembly to commemorate at its fiftyninth session the tenth anniversary of the International Conference on Population and Development,

Taking note of the report of the Secretary-General on the review and appraisal of the progress made in achieving the goals and objectives of the Programme of Action of the International Conference on Population and Development,

Taking note also of the report of the Secretary-General entitled "Flow of financial resources for assisting in the implementation of the Programme of Action of the International Conference on Population and Development: a 10-year review",

Noting that the current levels of financing, including levels of official development assistance, are still well below those needed to achieve the internationally agreed development goals, including the goals contained in the United Nations Millennium Declaration,

Stressing the importance of population and reproductive health for development, Bearing in mind the report of the International Conference on Population and Development and on the key actions for the further implementation of the Programme of Action,<sup>6</sup> in their entirety,

1. Reaffirms the Programme of Action of the International Conference on Population and Development<sup>1</sup> and the key actions for its further implementation;
2. Stresses that the implementation of the Programme of Action and the key actions makes an essential contribution to the achievement of internationally agreed development goals, including those contained in the United Nations Millennium Declaration;
3. Recalls that it has been estimated that, in the developing countries and countries with economies in transition, the implementation of programmes in the area of reproductive health will cost, in 1993 United States dollars, \$18.5 billion in 2005 and \$21.7 billion in 2015,<sup>7</sup> and that it is tentatively estimated that up to two thirds of the costs will continue to be met by the countries themselves and approximately one third from external resources;
4. Reiterates that increased political will from all Governments and reaffirmation of the commitment for mobilization of international assistance, as agreed in Cairo, are urgently needed to accelerate the implementation of the Programme of Action, which will in turn contribute to the advancement of the broad population and development agenda;
5. Also reiterates that Governments should continue to commit themselves at the highest political level to achieving the goals and objectives of the Programme of Action, inter alia, through the integration of the Programme of Action in programmes and national policies for poverty eradication;
6. Recognizes that the effective implementation of the Programme of Action will require an increased commitment of financial resources, both domestically and externally, and in this context calls upon developed countries to complement the national financial efforts of developing countries related to population and development and intensify their efforts to transfer new and additional resources to the developing countries, in accordance with the relevant provisions of the Programme of Action, in order to ensure that population and development objectives and goals are met;
7. Urges donor countries to fulfil their commitments with regard to their official development assistance for population assistance;
8. Calls upon both donors and developing countries to make every effort to strengthen their commitment to meet the estimated costs of the Programme of Action;
9. Encourages Governments, international organizations, including those of the United Nations system, international financial institutions and other relevant stakeholders to assist developing countries in implementing the Programme of Action through technical assistance and capacity-building activities to accelerate the implementation of the Programme of Action;
10. Reiterates that international cooperation in the field of population and development is essential for the implementation of the Programme of Action and the key actions for its further implementation and for the attainment of its goals by 2015, and calls upon the international community to continue to provide, both bilaterally and multilaterally, support and assistance for population and development activities in the developing countries;
11. Emphasizes the importance of building and sustaining partnerships among Governments and relevant civil society stakeholders, in accordance with section V of the key actions, so as to strengthen the capacity of developing countries for the successful implementation of the Programme of Action and the key actions for its further implementation, and invites all Governments and relevant organizations of the United Nations system, as well as the private sector and nongovernmental organizations, to continue to support these activities;
12. Calls upon the United Nations Population Fund to continue to play a crucial role, within its mandate, in helping recipient countries to achieve the goals and targets contained in the Programme of Action, the key actions for its further implementation and the United Nations Millennium Declaration, recognizing the strong and widespread support for the activities of the Fund.

---

## The UN CSD Education Working Group

### CONCEPT NOTE

RIO 2012 and Beyond

FRAMING POLICY DIALOGUES: A Well-Prepared Society

Submitted by:

The UN CSD Education Working Group

November 1, 2011

URL: <http://www.un.org/esa/sustdev/csd/review.htm>

-UNCSD Education Working Group

Contact: P.J. Puntenney

The upcoming UN Conference on Sustainable Development is to be held in Rio de Janeiro in 2012, 20 years after the historic summit of 1992. According to its organizers, the summit's objectives are to secure renewed political commitment to sustainable development; to assess progress towards internationally agreed goals on sustainable development and to address new and emerging challenges. The Summit will also focus on two specific themes: a green economy in the context of poverty eradication and sustainable development, and an institutional framework for sustainable development. After 20 years of dramatically evolving changes, this concept note is an invitation to shape a briefing on Environmental Education for Sustainability as a key policy instrument with specific strategic recommendations in the lead-up to Rio+20 and the implementation of the outcomes post-Rio 2012.

Recognizing the number of global environmental challenges and security issues, there is a need to improve the knowledge base of all stakeholders, particularly decision-makers on the interplay of human and natural systems, with an understanding of new opportunities for investment, new technologies, and innovations, among others.

Environmental Education as a policy instrument enables the governance structures for Sustainable Development as “learning systems” to increase capacities so that knowledge may be translated into action-implementation and practices towards sustainable systems. Knowledge through Environmental Education effectively promotes action-based priorities in transitioning to a green economy and to implementing needed mechanisms that strengthen an Institutional Framework for Sustainable Development (IFSD).

Broad support on multi-stakeholder engagement in environmental governance acknowledges the respective roles of each stakeholder, takes into account the Rio Declaration on the principle of “common but differentiated responsibilities”. The centrality of Environmental Education for Sustainability to the IFSD therefore emphasizes the need for supportive structures including a comprehensive and effective monitoring system of implementation of environmental education in the context of commitments to a Green Economy, poverty eradication and the IFSD.

A multi-stakeholder consultative process was conducted by the UN CSD Education Caucus from 2010 to 2011 in preparation for Rio+20. Concept Note 2012 and Beyond was launched during PrepCom II, seeking further input into the shaping of this document. The following is divided into Part I, Taking Stock of the successes, gaps, and challenges of the 21st century, followed by requirements that should be reflected in the Rio+20 outcome document. Part II, Confidence Building provides an overview

\* The UN CSD Education Caucus was formed as an intergenerational, multi-stakeholder platform during UNCED in 1992 to advance the work on Agenda 21. The Caucus currently has 600+ member organizations (formal and informal educators) with leaders in each of the World Regions. The Caucus facilitates input through a consultative process to create briefings, serve in an advisory capacity, lobbying, advocating, networking, and building working relationships to support the education agenda within the CSD Summary of Work, the MDGs, climate change, environmental governance, and more.

## PART I: Taking Stock

### Rio 1992, A Catalyst

For governments, institutions, and civil society, the first Earth Summit in 1992 (UNCED) created a significant learning environment, where knowledge led to understanding and action, and new strategies emerged. New visions of environment and development clearly linked social, cultural, economic and political spheres of human behavior with the nexus of interactions between the environment and society. Many more people who were unable to participate in Rio were inspired by what had happened in Rio, creating initiatives within their own work and communities. Governments and non-governmental organizations (NGOs) repeatedly pointed to education as a key policy instrument for bringing about a transition to sustainable development, an education that was defined as a life-long process of action-oriented and reflective learning, involving all citizens as informed environmental decision-makers. Environmental Education and Sustainability became part of the underlying foundation for UNCED, alongside the legal, planning, and financial components, integrated into the Rio Declaration and Principles, Agenda 21 and the mandates that followed.

Post-Rio in 1992 and into the policy preparations and outcomes from the 2002 World Summit on Sustainable Development in Johannesburg, South Africa, the vision of linking cross-sectoral, cross-generational knowledge to understanding and action, within a broad multi-stakeholder platform-based strategy shifted within the policy world to a supportive function of building capacity. Education in the institutional sense, schooling, was well represented but less of a priority in the minds of the policy-makers. The understandings and implementation strategies gained from the series of conferences on Environmental Education and Sustainability in the 1970s lessened over time:

To develop a world population that is aware of, and concerned about, the environment and its associated problems, and which has the knowledge, skills, attitudes, motivations and commitment to work individually and collectively toward solutions of current problems and prevention of new ones.

(Belgrade 1975, “A Global Framework for Environmental Education”, <http://www.envir.ee/orb.aw/class=file/action=preview/id=1011467/The%2BBelgrade%2BCharter.pdf>)

From the pre-Rio meetings and subsequent follow-up UN CSD sessions, the Education Caucus has observed and experienced strong support from a majority of the delegations, the NGO community, and major groups for this broader policy concept of education. Yet, the dual nature of the term education still gets translated into schooling in people's minds and simply stated, “not relevant to my area of focus”. Consequently education is ignored or left out demonstrating a lack of understanding of the broader context that has been in play from the outset of Rio. This is where a majority of environmental educational opportunities regarding sustainability are occurring - outside of schooling. These dual realities are not separate but inter-related and are an important element of the policy process. More importantly, millions of people worldwide be they individuals, communities, organizations or governmental institutions are already creating initiatives to address sustainability challenges in their communities and regions. One challenge to a green economy strategy is an effective linking or integration of knowledge and understandings into UN sustainable development processes and outcomes.

### 21st Century Challenges

As global crises increase in pace, what we knew yesterday does not apply today. Supporting sustainable development requires knowledge of the interactions between human and natural systems, understanding of management levers as well as technological developments and innovations, economic analysis, political will, and a framework that creates a capacity throughout and across all areas of society to respond to evolving needs.

No longer can we seek solutions to problems one at a time. Global environmental policies transcend traditional boundaries between sectors, nationalities, cultures and generations. We all need to be able to recognize increasingly complex and inter-related issues where attempts to ameliorate one can alter or even exacerbate the impacts of another. New knowledge of how multiple stressors affect human and natural systems requires decision-makers to have an ability to translate knowledge and awareness into usable information to colleagues, enabling them to make wise short-term judgments as scientific and local, national, and regional information is improved.

The 21st century challenge to global environmental security will require an unprecedented solidarity of purpose and concert of action from a well-prepared global society. Yet under the current conditions of globalization, we are faced

with the challenge that the complexity of living systems remains beyond full human comprehension. Fragmentation, biodiversity loss, lack of adequate access to water and sanitation, food insecurity, environmental degradation, and increasing poverty are occurring simultaneously. It is not enough to focus singularly on technology, trade and finance, or economic development.

Policy-makers are in a position to decide what to do and when to act based upon available evidence and their beliefs about the risks and benefits of a green economy strategy. Currently, we are using 20th century approaches and models to address 21st century issues. In order to increase the responsive capacity of nation states based upon 21st century models to meet 21st century challenges, then, governance structures for sustainable development must be created as “learning systems.” This reality also brings to light that the success of outcomes from Rio 2012 depends upon ready engagement and communications within institutions, with the public and private sectors, across fields and new sources of knowledge, and simultaneously on effective, broad-based multi-stakeholder collaborations. More importantly, a successful outcome would be to develop an institutional responsiveness that engages the public as part of a systems-wide strategy to understand what's working, what's not, and potential options to address crises within the social-cultural and economic contexts and ecological conditions within each country.

Both at the global level and within nation states, environmental governance is evolving to meet these challenges but the gap between government priorities and what society urgently needs from the UN and the outcomes from Rio 2012 must be crossed more quickly. Only strong flexible mechanisms can bridge the gap leading to a well-informed polity and a well-prepared society.

Therefore at a minimum the new framework for sustainable development requires a vision of cooperative action from local to global and global to local, positioning Environmental Education for Sustainability as a visible action-based priority within the Rio 2012 strategies to greening the economy, eradicating poverty, and strengthening institutional structures to achieve sustainable development.

Issues:

- Narrow structural learning gaps in a global environmental governance framework
- Engage diverse stakeholders in sustainability
- Build and strengthen governmental capacities based on responsive models of learning
- Integrate "Knowledge to Action for All Levels of Decision-makers" into Rio+20 processes
- Strengthen and build active engagement and partnerships of all key stakeholders

Recommended Action:

- 1) Hold informal strategy meetings with delegations and related groups on Environmental Education for Sustainability to develop a clear vision, identify policy mechanisms, and create next steps leading to implementation within the final negotiated outcomes of Rio+20 in June 2012.
- 2) Ensure sufficient capacity (human, financial, technical, etc.) for efficient implementation of the provisions on Environmental Education for Sustainability in the final outcomes.
- 3) Craft a concise political declaration from Rio+20 that includes a statement on Environmental Education for Sustainability.
- 4) Reaffirm the principles in the Rio Declaration, Agenda 21, and the instruments subsequently adopted for implementing Agenda 21, including Chapter 36.1, and the JPOI.
- 5) Utilizing the points in this Concept Note, create a roadmap and global cooperative action integral to achieving the aims and objectives of Rio+20 and the IFSD that centralizes Environmental Education for Sustainability as an essential strategic component to the implementation and actions beyond 2012.
- 6) Draft new text on education, elaborating on the importance of Environmental Education for Sustainability throughout the final Rio 2012 text and related outcomes such as roadmap(s) and toolkits, and related policy options.

## PART II: Confidence Building

### Institutional Framework on Sustainable Development (IFSD)

#### Overview

There has been and will continue to be debate and dialogue on what an IFSD should entail. Given the extraordinary challenges and stakes involved in building consensus within UN negotiations on sustainable development [as well as in the successful implementation of negotiated outcomes and their review], it may be useful to consider measures of confidence building. It is with that in mind that the [UN CSD] education community, as in its Concept Note Rio 2012 and Beyond, continues to place emphasis on the framing of policy dialogues that will lead to a well-prepared society.

Thinking about the potential development of and/or setting the stage for furthering the discussion on an IFSD, we read this to mean the following as part of the future form and function of the framework.

The earlier work by the UN and its member states on Environmental Education led to the development of National Strategies, many of which have been revised and/or incorporated into NSDS and Plans of Action, national legislation, and other country-level policies and strategies. The roots of this policy work can be traced directly to the 1972 Stockholm Conference on the Human Environment (A/CONF.48/14/Rev.1), expressed within the 2002 JPOI (A/CONF.199/20), and especially noting that Environmental Education within in the UNCED framework was positioned as part of the underlying foundation of the 1992 Rio Declaration, the Principles, Agenda 21 and the mandates that followed, in particular paragraph 36.1 of Chapter 36 (A/CONF.151/26 (vol.1)).

The original intent regarding Environmental Education as a key policy mechanism to advance Agenda 21 has been limited by a sectoral focus on schooling and formal education, training, and communications to transfer or disseminate knowledge. The results on the ground become limited while civil society moves forward creating a serious disconnect for the UN to stay informed and engaged with diverse stakeholders.

The aim: to develop informed political entities and an informed civil society able to participate in and act on principles of sustainability.

The issue: One of the greatest challenges facing the implementation of Agenda 21 within the UN is staying abreast of evolving, strategic approaches to achieving sustainability.

IFSD Challenge: Accordingly, requisites of an IFSD affirm the call for environmental education in its many forms to be built into a wide cross section of implementation strategies. A "learning systems" model of organization and the proviso that negotiations and agreements of understanding appropriately results in action within communities of decision-makers and practitioners at all levels.

The current approach is to think in terms of providing information, dissemination, creating a clearing house or knowledge exchange that does not engage people in sustainable development or meet the unique conditions of the stakeholders. Thus, reinforcing the twentieth century model of deficit development.

For example, within the negotiation processes on climate change, it is common knowledge the structure is in transition, what is not being discussed in these climate forums funnels back into the more substantive dialogues as resistance, which weakens specific recommendations leading to long-term cooperative action. If the IFSD is to function effectively for the next 3-4 decades to 2050, it will require a 21st century framework that is based upon informed environmental decision-makers within flexible, responsive structures. Questions to think about include, how do we create a framework to make those needed next steps? Examining the proposed institutional framework for Sustainable Development, what is the next step in confidence building? Who else should be engaged in the dialogue on developing a responsive framework to address current and future crises?

To achieve a major shift to a global green economy, long-term answers are needed in order to understand complex concepts such as poverty eradication and develop options based upon synergies. Consequently, three target audiences require strong support and sustained engagement: the business community, the government, and the public. How the framework for sustainable development is conceived to shape the leadership and areas of responsibility within the UN, relationships external to its proceedings are equally significant.

#### A) Private Sector - In a world of scarce resources

The primacy of sustainable development to management financiers, stockholders, bondholders, product engineers or productivity staff readily focuses on maintaining the ability to earn a living and jobs.

It is, on the other hand, the end-users, the customers, the consumers, the output laborers and service workers who are the primary points of sensitivity to an organization's environmental impacts, both global and local. Customers are the people who experience the reckless consumption of "shared resources" such as air, water, and natural habitats. Laborers are the people of the world who must suffer the impacts, both direct and indirect, of unsafe work environments, workplace pollution and degrading pay and lifestyles.

As our economies around the world are rapidly becoming more global, so is each organization's customer base and employee footprint, including that of the UN.

Historically, organizations (including businesses) have omitted their true consumption of "shared resources" by keeping pollution out of sight or remotely relocated. Today, in contrast, the Internet and millions of camera-equipped cell phones allow most of

the world's people to be "powerfully proximate" and "continuously connected." Suddenly, for the first time in human history there is no hiding place too remote to avoid being documented in near real-time on "the web." The seas of floating trash slowly circling in the Pacific are now viewable on YouTube, as are the melting glaciers of the Arctic.

IFSD Challenge: To encourage and interact with the monitors, observers and reports on the ground, only organizations and institutions of business and government will survive long-term (meaning multiple decades) will be those that are transparent to their customers about their REAL impacts, both economic and environmental. For the first time in history, customers are beginning to decide whether to trust and do business with an organization based upon the organization's integrity and observed behavior. Not what the company's advertising agency or "spin doctor" is pushing. The Internet is revealing the REAL cost of providing goods and services to a base of informed customers who can exercise free choice in how they spend their scarce resources.

#### B) IEG and SD - Effectively protecting Environmental Systems

The question here is who will ultimately control resource development and its benefits. Most developing country governments react strongly against meddling by international standard setters. Resource rich governments are interested in privatizing their responsibilities by requiring foreign companies to provide health care, education and other basic services to neighboring communities. Ultimately however, privatization does not build "government capacity" or strengthen the hand of disenfranchised people.

Increasingly, government employees responsible for environmental policy, initiatives, strategic planning, laws, finance, integration of sustainable development are less and less required to have the appropriate training and experience regarding ecosystems protection.

IFSD Challenge: To strengthen the move away from the 20th century models that support deficit development as a global strategy. In the lead up to Rio+20 and beyond, identify the next generation of strategies to reinforce development rights. These will require a more nuanced understanding of the political systems that govern resource development together with a deeper understanding of the industries themselves and the human and natural systems they impact. Social performance standards have reached their limitations. If we're serious about supporting global "sustainable development", then the need is to focus on improving economic governance, on strengthening civil society, on increasing government capacity within the context of the protection of ecosystems.

#### C) Public Engagement

The UN system is committed to public engagement. Therefore thought leaders within the UN will become more and more important as well as the use of evolving open source technologies to engage diverse stakeholders in sustainable development. If the aim of Environmental Education for Sustainability is to:

Create an enabling environment where society at all levels, whether governments, business, academia, civil society organizations, youth, or ordinary people, are knowledgeable concerning the biophysical environment and its associated problems, aware of how to actively participate as an informed environmental decision-maker and motivated to work toward achieving sustainable solutions.

IFSD Challenge: To turn the camera lens slightly to focus the framework on Environmental Education for Sustainability and build the support structures accordingly, including financial mechanisms to ensure a long-term view, which can't be couched in short-term and near term needs. Few programs emphasize the role of civil society in working, both individually and collectively, toward the solution of problems that affect our well being for planetary survival. There is a vital need for an educational approach within and external to the workings of the UN system regarding societies relationship to the total environment, strengthening the balance between the three pillars. The first benchmark for the IFSD will be the measure of Environmental Education for Sustainability as a top priority in terms of form and function.

Recommended Outcome:

- 1) Develop EE policy mechanisms to reinvigorate a "broad multi-stakeholder platform-based strategy", including a roundtable workshops format (like the 2008 IUCN Barcelona meeting on Environment and Security) to identify not only challenges but also synergies.
- 2) Build into the work of the policy dialogues on the IFSD, the integrated role of Environmental Education for Sustainability in achieving IEG, coherence, and unity, to advance as well as strengthen sustainable development within the UN.
- 3) Document and monitor the existing and future policies, legislation and strategies on Environmental Education for Sustainability. The strengths have been evolving and building since the 1972 Stockholm Conference on the Human Environment, it is a simple matter of building upon this success worldwide.

-UNCSD Education Working Group

Contact: P.J. Puntenney

November 2011

1) Our expectations for the outcome of Rio+20, and our concrete proposals in this regard, including views on a possible structure of the Outcome document?

Since the Conference addresses issues of the whole worldwide community, we hope that the final declaration of Rio+20 will include recommendations regarding a language policy that can protect linguistic diversity and enable effective communication at the same time. Such recommendations should clearly condemn linguistic discrimination and policies that lead to language death and cultural dominance of larger languages over smaller languages.

2) Our comments on existing proposals:

a) We would like to express our support for the following recommendations in the Declaration of the 64th Annual UN DPI/NGO Conference in Bonn, Germany, 3-5 September 2011:

p.11, line 414

#### EDUCATION AND LEARNING FOR SUSTAINABLE DEVELOPMENT

p.11, lines 419-422:

We call for the respect and inclusion of ethnic languages in the educational system, as these languages comprise the complexity of their respective environments, and to take into consideration the potential of a neutral international language that combines ease of learning and clarity with neutrality, and therefore can be seen as inherently sustainable;

b) We would also like to express support for the commitment in the declaration of Ethical Commitments to Global Ecological Posture and Behaviour as one of the alternative treaties produced by the NGO community during the Rio Summit in 1992.

The commitment 14. states:

14. Contribute enthusiastically to surmounting artificial obstacles, be they political or religious, with the objective of formatting a universal human nation. We suggest the adoption of the international language Esperanto as the second language of all peoples, and we recommend that all NGOs participate in its diffusion.

3) Our views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.)

As with many aspects of sustainable development, a transition towards an effective and non-discriminatory language pallet in the world that safeguards linguistic diversity and makes access to worldwide communication attainable for everyone needs coordinated steps by many actors. The choices of which languages are learned by individuals are partly made by themselves, but also greatly influenced by their government's education policy. The choice of each government will depend on choices of others, and a prisoner's dilemma is likely to lead to suboptimal choices when central guidance is lacking. The UN institutions and NGO's should be positive examples of successful application of language policies within their organisation that combine effective communication with equal right for everyone regardless of native language, for example using a neutral international language, e.g. Esperanto.

4) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

The transition towards a language policy including the application of a neutral international language can start with relatively easy example decisions regarding the internal processes of UN institutions and NGO's. Adding a neutral international language to the existing arbitrary choice of official languages will not induce great costs on the short term and can generate considerable savings on the long term. The decision to include a neutral international language in member-states' education programmes might require more preparation time and a thoroughly worked out transition plan, as language skills in national languages currently applied widely in international communication will remain vital throughout the desirable transition.

Nevertheless, this transition could be eased by the experience in the Esperanto movement with the propaedeutic value of this neutral international language.

---

## Third Planet

### THIRD PLANET

#### Engaging the Public • Finding Solutions

November 1, 2011,

The following brief observations are offered for consideration by Third Planet a non-governmental organization accredited as an observer organization to the UNFCCC (2000) and accredited to the WSSD (2002).

While both the Green Economy and an Institutional Framework for Sustainable Development are very necessary Third Planet's primary concerns today are driven by solutions for adaptation and building resiliency to climate change.

The document for the Green Economy should certainly state its overarching goal of mitigating greenhouse gases, among its many other benefits and the document on an Institutional Framework for Sustainable Development could present a vehicle for setting the agenda on capacity-building for adaptation to climate change.

The Issues Brief 3 "IFSD: Issues related to an intergovernmental body on SD", in its only reference to climate change, states that "CSD, or a similar body, can provide useful policy guidance and contribute towards setting the intergovernmental SD agenda on selected issues".

Our view however is that neither of these documents can contribute the strong voice now needed on adaptation to climate change. There is high level cooperation within the UNFCCC on this issue and certainly the role of the UN's Chief Executives Board for Coordination (CEB) should not be understated. In fact CEB's role should be a flag for the importance attributed to the issue.

Our view is that the need for capacity-building for adaptation and resiliency, in both the north and south, now goes far beyond the objectives of the Nairobi Work Programme and needs to be the purview of a high visibility organization responsible exclusively for Adaptation to Climate Change. Certainly IPCC should continue to provide the scientific assessments and assert their role as the experts and SBSTA needs to be intimately involved but currently Adaptation, per se, is 'lost' to the world outside the United Nations. Adaptation must be elevated into the public consciousness. We can begin that process with a separate Adaptation-specific outcome at Rio+20 that draws attention to the fact

that sustainable development cannot exist without both mitigation and adaptation to climate change.

Adaptation to Global Climate Change is so important now that Rio+20 should include the high-level adaptation elements of the conventions and conferences on desertification, biological diversity, migratory species, wetlands, oceans, disaster reduction and sustainable development. How we best present their findings and undertakings to our communities, whether in a separate convention or not, might be worthy of consideration and development.

## Third World Network

THIRD WORLD NETWORK SUBMISSION FOR THE COMPILATION DOCUMENT OF THE UN CONFERENCE ON SUSTAINABLE DEVELOPMENT 2012 (RIO+20)

### A. Introduction

The expectations for the Rio+20 outcome are inextricably linked to the unfulfilled commitments and promises of the 1992 Rio Conference on Environment and Development, the accompanying three conventions and the subsequent United Nations agreements and action plans.

The paradigm shift from unsustainable economic growth models to sustainable development was a commitment at the highest political level but this has not taken place. Today income inequalities between and within States are pervasive. World exports have increased almost 5-fold while world per capita income has more than doubled. However, the top 20% of the population enjoys more than 70% of total income and those in the bottom quintile gets only 2% of global income.

The starkly unfair distribution of wealth from globalization and economic growth is epitomized in the United States as seen in a study released by the US Congressional Budget Office on 25 October 2011 that found that the average after-tax real income of the top 1% of the country's households grew by 275% between 1979 and 2007 - about seven times greater than the increase in income by the remaining 99% over the same period. Meanwhile the income of the poorest 20 percent of the earners in the US grew by only 18% during that period, less than 1% per year.

That distorted distribution of economic wealth is at the high price of a deregulated and destabilized international financial system, and a multilateral trade system that is largely characterized by rules that are not balanced, operating to the disadvantage of developing countries. This system favours transnational corporations and a minority of the population. When financial and economic crises hit, the majority especially the poor bear vastly disproportionate impacts.

At the same time, the ecological crisis from resource depletion to pollution and climate change has worsened since 1992. Social marginalization, and even exclusion, in on the rise despite some progress in the social dimension in several developing countries. In recent years and increasingly so, developed countries are also going through social tensions and upheavals.

Developed countries also agreed to take the lead in shifting from unsustainable consumption patterns but these have remained largely unchanged, and instead spread to developing countries with the wealthy adopting similar lifestyles while poverty eradication continues to be elusive. With income inequalities sharpening in all countries, over-consumption and unsustainable consumption dominates production choices (and hence natural resources use and financial resources allocation) while the poor and marginalised are deprived of a dignified standard of living.

The disenchantment of expectations on the part of young people, women, indigenous peoples, rural and urban poor and other marginalized populations across the world as well as a middle class under threat constitute perhaps an unprecedented challenge for governments and the UN in the next few months as we prepare for Rio+20.

### B. Reaffirm the Rio 1992 Principles and re-commit to implement the agreed sustainable development agenda

There are already sustainable development principles and frameworks adopted in 1992 followed by subsequent programmes, action plans and measures worked out at each session of the Commission on Sustainable Development, as well as the relevant treaties and conventions. Between 1992 and 1997 there was a high level of activity as a result of the high political commitment at Rio 1992 – many developing countries made efforts to formulate national sustainable development strategies and policies, a number established national sustainable development bodies and mechanisms, Local Agenda 21 was a framework undertaken by local governments in several countries and the CSD sessions themselves were engaging and productive.

The "Rio Conventions" on climate, biodiversity and combating desertification and land degradation are beyond environmental agreements but rather legally binding agreements that requires development paradigm shifts in accordance with the principle of common but differentiated responsibilities, that is based on equity and the historical responsibility of developed countries.

Components of the sustainable agenda are also in the outcomes of the UN Summits and Conferences since 1992 including on social development, women, financing for development, the impact of the global financial and economic crisis on development, least developed countries, small island developing states etc.

There is also further evolution of human rights as a cross cutting dimension for sustainable development, in particular the adoption by the General Assembly of the UN Declaration on Human Rights, the contributions of the UN Special Rapporteurs on the Right to Food and on the Right to Health, and emerging work on indicators based on the International Covenant on Economic, Social and Cultural Rights.

Rio+20 must therefore focus on implementation.

Today the implementation gaps of the sustainable development agenda are widely acknowledged and it is crucial for Rio+20 to acknowledge the fundamental causes for the implementation failure. These include:

- Overshadowing of the sustainable development agenda by globalisation characterized by economic liberalization that has created ecological and social crises, increased concentration of wealth in a handful of large corporations in each sector (industry and finance) and undermined the policy autonomy and space of States. Such globalization has itself created economic crises further exacerbating social tensions, conflicts and political destabilization;
- Weakening of multilateralism that is crucial for sustainable development by continuing unilateralism (such as trade protectionism and rejection of some of the Rio principles and even the Conventions by some countries);
- Disproportionate influence of global economic institutions and their lack of public accountability, including to the UN;
- Lack of implementation means (finance, technology and capacity building) that was an integral part of the 1992 Rio global sustainable development partnership with governments at the core of that partnership and developed countries committing to provide the implementation means;
- Lack of integration of the 3 pillars of sustainable development at all levels of policy and governance despite initial efforts in the 1990s and numerous UN commitments and programmes related to the 3 pillars.

Thus there is an urgent need to reaffirm the internationally agreed principles contained in the Rio de Janeiro Declaration on Environment and Development of 1992, in particular the fundamental principle of common but differentiated responsibilities, as the political framework for sustainable development.

Secondly, political commitment must be renewed to implement the agreed sustainable development agenda, building on accumulated knowledge and experiences over the past 20 years, starting with Agenda 21 and the Johannesburg Plan of Action.

Thirdly, a "revitalized global partnership for sustainable development" must be based on States resuming their responsible role and asserting policy autonomy as a counter to the unfettered market forces that are causing instabilities at all levels. Accordingly, Rio+20 must revive the work of the UN on a global framework for corporate accountability.

Fourthly, in any private-public sector collaboration there is a need to ensure independence of public policy and governance from undue influence by the private sector, especially transnational corporations and large enterprises. There is a need to distinguish these from family and community enterprises and small and medium sized enterprises that are often left out of consideration or not given their due recognition.

Fifthly, recognizing the importance of appropriate technology for sustainable development Rio+20 needs to establish an intergovernmental body on technology that facilitates technology transfer and innovation (and deals with barriers such as intellectual property rights) and builds capacity for technology assessment. The CSD in its first session in already stressed the need for technologies to be assessed for their health, safety, environmental, economic and social impact.

#### C. Rebuilding confidence and seeking consensus for post-2012 implementation

Confidence building is needed in the next few months due to the retreat by most developed countries of their international sustainable development commitments, and even rejection by some of the principle of common but differentiated responsibilities. Since equity is the necessary framework for operationalising sustainable development at all levels, the emerging divergence of views on CBDR in various multilateral fora where decisions and commitments are being negotiated raises deep concerns.

UNGA Resolution 64/236 called for discussion and refinement of "a green economy in the context of sustainable development and poverty eradication" as one of the 2 themes.

However, it is clear from the preparatory process and numerous related discussions that there is still no universally accepted definition or common understanding on the term "green economy". While parts of the UN system such as ESCAP has facilitated Member States in arriving at some common understanding of green growth, its details and operationalisation remain unclear to most governments.

At the level of national and local governments, communities and enterprises, and civil society organisations, a wide range of activities including policies, programmes, projects and measures are developed and implemented that all concerned term these "green" in accordance with their respective interpretations and descriptions.

At the same time concerns by many developing countries are being reiterated especially on the substitution of the sustainable development framework by an undefined concept of green economy, trade protectionism and new development assistance conditionality.

However, it is also emerging strongly from the preparatory process, especially the regional preparatory meetings (including those of civil society and Major Groups prior to each regional meeting), the Beijing Symposium and the Delhi Ministerial Dialogue that there is a growing consensus on reaffirming the Rio principles and sustainable development framework at the international level and allowing national strategies to be formulated that can refine the 3 pillars along the best principles, approaches and practices. In these efforts the best of "green economy" could be assimilated within the sustainability paradigm and the context of national and (sub)regional realities. Instead of a disproportionate focus on the green economy theme and on goals and roadmaps at this juncture that could undermine confidence building and consensus at Rio+20 the Outcome document could address the widely expressed concerns (this is gaining support from Member States) and reflect the above growing consensus.

#### D. Institutional framework for sustainable development

The UN is the primary forum for an Institutional Framework for Sustainable Development (IFSD) for the integration of the three pillars of sustainable development and the implementation of the sustainable development agenda. In this context, there is an urgent need to strengthen institutional arrangements on sustainable development at all levels in accordance with the Rio principles, especially common but differentiated responsibilities. The meaningful participation of developing countries in the IFSD is also a key principle.

Multilateral environmental agreements have increased in number in response to environmental challenges and effective leadership is needed to address policy fragmentation, and avoid overlapping and duplication. Major agreements such as the 3 "Rio Conventions" are in fact about sustainable development requiring fundamental shifts in all the 3 pillars to deal with climate change, biodiversity and land degradation. Accordingly the institutional framework needs to facilitate the interface and integration of the 3 pillars.

To accomplish this integration of the three pillars and achieve sustainable development, the IFSD should at least meet the following functions:

1. Identify specific actions to fulfil the sustainable development agenda, starting with the implementation Agenda 21 and the Johannesburg Plan of Action
2. Provide support to regional structures and national mechanisms in developing and implementing their national sustainable development strategies
3. Provide support for developing countries to participate meaningfully at the international and regional levels of decision making
4. Provide guidance and identify specific actions in order to fulfil the sustainable development agenda
5. Monitor progress in the implementation, including commitments for provision of means of implementation and recommend actions to correct and address challenges
6. Assess the balanced integration of the 3 pillars in the international system and establishment necessary mechanism to follow up commitments on sustainable development and to identify weaknesses or gaps that affect the full implementation of the sustainable development agenda
7. Promote the participation of civil society in the sustainable development agenda. The IFSD requires adequate Secretariat actions and functions. These include: (a) Research, analysis and reports and recommendations, to alert governments and the public of trends and developments and to give alerts on emerging problems. (b) Provide technical assistance and advice in general; (c) To make arrangements for convening meetings, their reports and follow up on the outcomes.

The IFSD should take a balanced approach to the three pillars, so that each pillar is equitably developed in concepts, outcomes and actions. There should be cross-fertilisation and crossreferencing between the three pillars. For example, the social pillar has to take account of the economic and environmental dimensions; the economic pillar has to take account of the social and environmental dimensions; and the environment pillar has to take account of the social and economic dimensions. In some issues, the connections are even more obviously direct, for example, the management of energy and water resources have to link to access of the poor to energy and water resources.

Further, the following would enhance the IFSD:

1. Creation of a Council on Sustainable Development under the General Assembly: This would be the umbrella organization, building on the experience and roles of the Commission on Sustainable Development, with the core function of the Council is the integration of the three pillars, the development or updating of the general sustainable development principles, and the international cooperation components of finance, technology and capacity building. This general component could include mechanisms for coordinating among the agencies, committees or secretariats of the three pillars; the mobilizing and operations of finance and technology transfer; and the convening of high-level meetings of Ministers or Heads of Governments and States on "Sustainable Development" overall in which the issues of the three pillars are on the agenda. Under this umbrella architecture, there should be more time given for the convening of meetings on sustainable development pillars and issues, for example climate change, biodiversity, financial and economic issues, intellectually property and sustainable development issues where there is now a felt need for more time for intergovernmental discussion. There would be space to explore new mechanisms or better coordination for important but relatively neglected issues such as water or energy. There can be more time for more effective mobilizing of financial resources and technology development and transfer.
2. International financial architecture reform: the latest series of financial crises has not triggered the political momentum for the much needed reform of the international financial architecture largely due to the reluctance of the major developed countries to make this a priority at the UN and IFIs or to put in place a rigorous regulatory framework on the private financial sector. The UN has a legal mandate in its Charter to deal with financial issues and Member States have adopted far reaching recommendations in the wake of the 2008 financial/economic crisis. Rio+20 needs to provide political commitment for the needed reforms as the road to Rio continues to be paved with fresh financial scandals.
3. Fair and equitable trade rules: the current impasse at the World Trade Organisation largely reflects the rejection by many developing countries of further liberalization that undermines sustainable development and the imbalances in the existing agreements. For example, implementation of the Agreement on Trade-related Aspects of Intellectual Property Rights is violating the right to affordable medicines and access to information, facilitating private expropriation of seeds, plants, animals, microorganisms and traditional knowledge, and restricting technology transfer and innovation. The growing trade disputes over subsidies for renewable energy technologies and products and other climate related unilateral trade restrictions between developed and developing countries reveal the flaws in existing rules. At the same time there is a proliferation of bilateral free trade agreements (mostly between developed and developing countries) that go beyond trade to almost every aspect of a country's development and requires liberalization beyond WTO requirements, undermining sustainable development. Thus there is a need for the existing trade rules to be aligned with sustainability principles and norms, and for the push for "business-as-usual" economic liberalisation to be withdrawn.
4. ECOSOC to play its mandated role: the socio-economic policy role of ECOSOC and its coordination role vis-à-vis the various functional commissions have been discussed and refined over the years and its relationship with the proposed Council on Sustainable Development would need to be defined.
5. Broaden UNEP's mandate and increase its resources: UNEP should be enabled to function to support developing countries in the implementation of the sustainable development agenda, assisting countries with formulating their institutions, action plans, policies, laws and implementation mechanisms; assisting countries obtain information, knowledge, technologies, good practices, recovery from natural disasters, etc., and fostering more effective coordination and cooperation in implementation activities among policyformulating and implementing agencies, at international and regional levels, and national level.

Tokyo Metropolitan Government Submission to Rio+20

Cities as a Key to Climate Actions

1) Today, people living in cities exceed half the world's population, and by 2050 this percentage is expected to reach 70%.<sup>1</sup> Due to their vibrant industrial and economic activities, urban areas are responsible for significant greenhouse gas (GHG) emissions. According to the International Energy Agency (IEA), cities are currently responsible for 67% of the energy-related GHG emissions, and this percentage will grow to 74% by 2030.<sup>2</sup> The world's 50 largest cities annually emit GHGs equivalent to 26 billion tons of CO<sub>2</sub> (tCO<sub>2</sub>e), a level comparable to being the world's third-largest emitter, following China and the United States.<sup>3</sup> Addressing GHG emissions from urban activities is therefore a major concern in relation to climate change, and an issue that will become even more important in the future.

2) By 2030, urban populations are expected to double, with the built-up area of cities expected to triple.<sup>4</sup> In emerging countries, including China and India, urban areas are expanding in keeping with economic growth and urbanization, and the construction of cities is rapidly advancing. If the buildings and infrastructure are built with conventional energy performance, current GHG emission levels would be locked-in over the decades to come. Therefore, the shift to low-carbon buildings and infrastructure in developing countries, especially in emerging countries, is an urgent issue for sustainable development and it should be the highest priority in promoting a green economy.

3) As places where people live, move about, and produce and consume, cities are locations of large-scale energy consumption. While efforts to reduce carbon emissions on energy supply side is certainly important, efforts on the demand side for a reduction in total energy consumption are also essential. The key to preventing global warming will be the minimization of energy demand and shifting all facets of human society – houses, transportation infrastructure, factories, office buildings, commercial facilities and other facilities – to low-carbon ones, and it is in cities that such facilities and activities are concentrated. Cities are the key to the climate change issue.

The Tokyo Metropolitan Government's Leading Actions

4) Recognizing the special characteristics of cities and the responsibilities that cities have in relation to the climate change issue, the Tokyo Metropolitan Government for more than ten years has been implementing measures ahead of national-level climate change efforts.

5) Examples of activities include:

Beginning with fiscal year 2002, the Tokyo Metropolitan Government (TMG) has implemented the "Tokyo Green Building Program." Under this program, developers of new large-scale buildings must submit plans regarding environmental measures that will be implemented, including for CO2 reductions; these plans are evaluated and made public.

Also beginning in fiscal year 2002, TMG has been implementing the "Tokyo CO2 Reduction Program," which requires existing buildings having large emissions of GHGs (such as factories, office buildings, and commercial facilities) to establish voluntary targets for CO2 reduction and to submit emission reduction plans. Under this program, a 12.7% reduction in emissions was achieved over the five-year period from FY 2005 through FY 2009. Following the introduction of this program in Tokyo, similar mandatory reporting program have so far been introduced in 35 other prefectures and major cities throughout Japan.

- In April 2010, TMG also launched a cap-and-trade program that mandates reductions in emissions of 6% or 8% for those large facilities above. This is the world's first city-level cap-and-trade program that covers office buildings and commercial facilities. Saitama Prefecture, which is adjacent to Tokyo, also launched a cap-and-trade program in April 2011, following Tokyo's program.
- Tokyo's experience demonstrates that it is possible for cities to develop and implement their own low-carbon policies making use of regulations and market mechanisms. As a result of these efforts, a number of highly energy-efficient buildings have been built in Tokyo, and the city is ushering in an "era of green buildings."

World Cities Taking the Initiative

6) Numerous cities around the world are undertaking a variety of measures to address climate change.

At the C40 Cities Climate Leadership Group Mayors Summit held in São Paulo in June 2011, 55 case studies were presented in 16 different fields, including (1) Energy Efficiency in Existing Buildings, (2) Bus Rapid Transit and Low Emission Buses, (3) Tree Planting, (4) Integrated Waste Management, (5) Sustainable New Construction, (6) Compact Cities, (7) Public Engagement, (8) Renewable Energy for Urban Environment, (9) District Heating and Cooling, (10) Bicycle Infrastructure, (11) Adaptation and Vulnerability, (12) Landfill Gas Capture, (13) Smart Cities, (14) Green Taxis, (15) Green Industry, and (16) Urban Drainage.

According to "Climate Action in Megacities,"<sup>6</sup> a report presented at the C40 São Paulo Summit by the engineering and consulting firm Arup, in the cities participating in the C40 initiative – home to 297 million people – 4,734 actions have already been taken to address climate change, with an additional 1,465 new measures being developed.

The Alternative Approach – Let Cities Go First

7) While international climate change negotiations are currently making little headway, cities are moving ahead of national-level policies by proactively undertaking efforts to contribute to reducing GHG emissions. While national governments should continue their negotiations aimed at swiftly concluding a framework for addressing climate change, in the meantime GHG emissions continue to increase, and global warming is progressing. Therefore, in addition to the ongoing approach of seeking agreement among nation states, international society should take an "Alternative Approach" to make cities go first with their low-carbon actions. Through demonstrating that low-carbon actions and economic growth can go hand-in-hand, progressive initiatives by cities can foster understanding among the governments and citizens of developing countries, thereby providing support for efforts to reach an international agreement.

8) Local governments have a special role.

Because they work most closely with citizens and businesses, local governments are able to undertake tailored measures, such as calling directly on households and business entities to make lifestyle changes and undertake energy conservation; promoting environmental education; conducting on-site energy efficiency audits and providing energy conservation advice; along with other efforts.

By having administrative authority in areas such as urban planning, transportation, water and sanitation and waste management, local governments are able to promote the "green economy" – through advancing low-carbon projects in these various fields, and by making use of regulatory measures or market mechanisms that promote low-carbon consumption and investments.

9) During Japan's rapid economic growth era during the 1960s and 1970s, the TMG and other city governments were the first to institute measures to address the problems of pollution – problems that were most pronounced in cities; these measures were later adopted at the national level. The solution to environmental problems requires bringing together the imperatives of the environment and the principles of economics, and Japan's history of addressing pollution illustrates how cities can lead this process, by serving as concrete examples of successful implementation, which is effective in increasing understanding on the part of society as a whole.

Cities' Cooperative Actions Lead the World

10) The TMG wishes to share with the cities of the world what it has learned so far in addressing climate change. We believe that promoting international cooperation – assisting the cities of the world to take progressive actions and to learn from one another's experiences – will lead to solutions to our global climate change challenges. However, accomplishing this will require the support of the international community for cooperative efforts among cities.

11) For these reasons, the Tokyo Metropolitan Government calls upon the international community to do the following:

Through the Rio+20 process, conduct deliberations regarding urbanization and how to shift cities to low-carbon paths, as these are key issues related to the climate change issue.

The Rio+20 outcome document should clearly spell out the important role played by cities and local governments, and should promote the "Alternative Approach" that makes cities go first.

International organizations and international financial institutions should develop programs to help share and disseminate the innovative efforts on the part of cities and local governments, and should financially support international city-to-city cooperative activities.

New governance structures for sustainable development should enhance the role of local governments.

12) This past summer, Tokyo was able to overcome a severe power shortage which occurred as a result of the March 11 Great East Japan Earthquake, tsunami and nuclear accident at the Fukushima Daiichi Nuclear Power Plant. By making use of energy conservation measures involving businesses and households that had previously been put in place, Tokyo was able to achieve an 18% reduction in peak energy demand compared to the previous year, allowing the city to deal with the summer peak demand period without the occurrence of any unplanned power outages. Moreover, this crisis has fundamentally transformed the consciousness of the people of Japan concerning energy; efforts on the part of citizens and businesses to promote energy conservation and renewable energy are now gaining pace. The movement in Japan toward a low-carbon society has received a strong boost. Tokyo will continue to step up its efforts to become a low-carbon city, and we hope to become a sustainable city that can be a model for

the world.

## Transformative Education Forum

**Fueling the great transition in education:** Rio+20 as the turning point for investing into the transformation of formal educational systems

### A. EXPECTATIONS FOR RIO+20

Our expectation for the outcome of Rio+20 is to make the conference the turning point for heavily investing into transforming formal educational systems. While the current proposals for Rio+20 are important for rethinking sustainable development, there must be a dedicated section in the outcome document that addresses the need for mainstreaming Education for Sustainable Development.

Education for sustainable development is necessarily an interdisciplinary approach to learning. The fragmentation of educational "disciplines" has separated the scientific from the natural world, and allowed us to create technological models that were ultimately destructive to larger economic, social and environmental systems. This resulted in creating great wealth for the very few, with ecological devastation to the planet. There are few who would dispute the need for a new approach to Education for Sustainable Development, given global climate change, environmental degradation and the death of

4.9 million a year from chemical exposure (World Health Organization 2011).

An education that reconnects learning goals to sustainable development must be one that creates the problem-solving actor who understand the critical environmental crises in their international contexts and the social-political and economic crises that define many of those contexts. You literally have to educate for a "world" thinker and doer. The essential paradigm shift then, is not just in minor curriculum and some added subject matter but a shift in the root understanding of the learner-thinker and engaged problem-solver that a sustainable society hopes to engender:

Education of the whole person - mind, body, animating spirit

Integration of traditional as well as modern, rational "ways of knowing"

100% inclusivity

Peer and participatory, experiential modes of learning are present alongside "teacher led" and delivered methods

Pedagogies that create the felt sensation and states of awareness of living systems principles

Validation of diverse and multiple intelligences including the key emotional, social and cultural intelligences

Balance STEM (Science, Technology, Engineering and Math) with sustainability, value systems, ethics, moralities and philosophy including examination of economic and social equity systems

Inclusion of groundbreaking new neuroscience and brain theory on how the integrated brain actually learns best

Intragenerational justice, human rights and peace education for a sustainable humanity as well as a sustainable planet

### COMMENTS ON EXISTING PROPOSALS

There is a wide number of initiatives which currently struggle to put into practice Education for Sustainable Development (ESD). The UN Decade for ESD helped tremendously in connecting grassroots initiatives with each other and building a collective conceptual framework. However, what all of these initiatives have in common is that they are still "drops in the ocean" and do not yet reach the critical mass leading to a paradigm change in education. As stated by the World ESD conference in Bonn in January 2009: despite huge progress in the conceptual framework for ESD in many countries, ESD is still in its infancy and we now need to put this knowledge into action.

Existing multilateral environmental agreements such as climate, chemical and waste conventions need to drastically change scale in their approach to education and public awareness. Not surprisingly, sustainable development is still predominantly hypocritical, leading to small alterations of overall unchanged curves. The drastic changes needed, first and foremost in industrialized countries, have not yet occurred. The challenges in achieving this change are deeply rooted in education.

### C. VIEWS ON IMPLEMENTATION

**We urgently need to make sustainability a core component of formal education. We need to enter a great transition in education** where the fundamentals - learning to read, count and write - also include learning the knowledge and skills needed to change the course of society, both locally and globally. **A genuinely sustainable world is one which ultimately has achieved:**

Global environmental sustainability: all resources used are renewable, all waste is either avoided or recycled, « zero emission » achieved (CO2 concentrations stabilised)

Global solidarity: millennium development goals achieved + human rights and fundamental public goods for all (education, health and justice)

Global justice: equity achieved for all people through mechanisms ensuring fair distribution of wealth

Global governance with the capacity to address global issues / global citizenship: democratic expression, control & participation from the local to global level.

### SPECIFIC RECOMMENDATIONS FOR PARTNERSHIPS AND TIMELINES FOR DECISIONS

Addressing the real causes and raising the engagements at the level of the problems calls for: 1) large-scale solutions 2) new, different, daring approaches that have not yet been tried 3) visionary, long-term strategies 4) global integrated approaches able to reach daily educational practices everywhere in the world.

**We call upon the conference to :**

**make ESD one of the Rio+20 sustainable development goals**

**direct the Global Environment Facility to create a dedicated fund to accelerate the training of future citizens in sustainability**

• **At the global level:** network high-level training/r&d public centers in all regions of the world, with the best minds and resources for developing tools, curricula, training,

networking etc.

• **At the country/local level:**

• demonstrate sustainability in buildings, local transport, food, waste etc.

• curriculum change: knowledge + skills, values, ethics

-teacher training *in all aspects of sustainability: climate/environment + global citizenship, health, peace, development etc.*

Further recommendations for partnership timelines and decision-making are currently being addressed at the Transformational Education Forum (TEF) convening in Monterey, California from October 30<sup>th</sup> to November 2<sup>nd</sup> 2011, hosted by the Naval Post Graduate School. The Monterey TEF Forum is composed of 64 participants, representing 25 countries and 35 educators/directors/managers and community leaders directly involved in international education activities around the world. Over this four-day period, participants in this forum have addressed critical problems and needs in education, ranging from groundbreaking Neuroscience and Brain Theory to emerging IT educational technologies. Participants in the TEF are currently developing a set of twelve guiding principals for Education for Sustainable Development, which should be discussed at R+20 for future implementation.

## Transparency International

Rio+20 and a roadmap for strengthening climate governance

Submission by Transparency International

Climate change poses untold challenges to green economy growth, sustainable development and poverty alleviation. Efforts to further these trajectories must therefore be allied to strong climate governance, which includes the disbursement and use of huge future investments. Currently the system of climate governance is diverse and fragmented, and lacks connectivity and accountability to those most affected by climate change. Attempts at strengthening this architecture will have to build in safeguards against risk, including corruption risks, to provide for collective ownership, legitimacy and meaningful effect at the international, national and local levels.

Drawing on lessons learned in areas that include development aid, the extractive industries, public procurement and emissions trading, Transparency International (TI) hereby outlines a number of recommendations for optimising sustainable development and driving green economy growth. We propose that these recommendations form the basis of a declaration at the Rio+20 conference which should outline a roadmap for governments to agree upon, implement and enforce measures to strengthen climate governance and guard climate finance against waste or abuse.

For the full version, please reference the Submission Document

---

## Transport Research Foundation (TRF)

Submission of TRF (Transport Research Foundation) to RIO +20 – The United Nations Summit on Sustainable Development

### 1 Introduction

The transport sector has been an important topic at world summits and intermediate meetings of the CSD since Rio 1992, notably though 20 years later 95% of transport still uses fossil fuel. Several references were made to transport in the Johannesburg Plan of Implementation such as promoting public transport but despite this, market share for public transport world-wide is decreasing<sup>1</sup>. Transport now counts for almost 25% of energy related CO2 emissions at global level, and very few countries are investing enough in public policies to substantially tackle climate change with low carbon transport strategies. The growth in land transport for passengers and freight is a concern for sustainable as well as climate change reasons.

Considering the present economic crisis, the development of green economies becomes even more important and sustainable transport is a key component of this. It is therefore vital to assist the developing countries in building institutional and technical capacity that will allow them to develop low carbon transport policies to combat climate change in the following years.

RIO+20 aims to reaffirm political commitment to sustainable development, evaluate the progress on agreed commitments and furthermore explore emerging challenges. Low carbon transport is not only directly linked to the major topics of the RIO+20 summit, but it can also be considered as a key element to strengthen green economies by providing better access to markets, creating new jobs, increasing energy security, improving human health and prosperity, reducing road accidents and improving overall well-being at regional and national level. Access to sustainable transport is also vital for giving equitable and affordable access to education and jobs to women, youth and children in particular, many of whom often do not have direct access to private transport.

### 2 What is sustainable low carbon transport?

Rapid economic growth generates significant pressures on mobility, environment and human development. Increasing - mobility has resulted in growing motorised fleets of private cars, motorcycles and trucks, in order to satisfy overall demand for passenger and freight transport activity. It is estimated that the global vehicle fleet is on a course now to multiply three or four-fold in the next few decades and the market share of pedestrian access and walking is decreasing. As the world has become significantly more urbanised in the past 20 years this is now hampering development and quality of life. The current trends are expected to have severe negative impacts for the environment and in respect to social and economic terms resulting in:

Exploitation of natural resources

Degradation of environment and loss of biodiversity

Increased numbers of fatalities and injuries from road accidents

Degradation of human health and increased respiratory and cardiovascular diseases

Reduction of accessibility and an increase of social exclusion as a result of excessive motorised traffic and congestion

Loss of productivity and competitiveness Larger externalities –as part of GDP- to the local and national economies

Efforts have been made internationally to tackle current unsustainable mobility patterns, aiming to reduce the need for transportation and also decrease dependence of transport on fossil fuels. In order to decarbonise the transport sector and promote sustainable mobility, a series of measures are recommended, best described by the holistic approach of Avoid-Shift-Improve which aims to promote i) avoiding or reducing the number of journeys taken, by integrating land-use and transport planning, ii) shifting to more efficient forms of transport, such as public transport, cycling and walking and iii) improving vehicle and fuel technologies for all motorised modes of transport, in order to reduce adverse environmental effects. Thus, investments should be directed to:

Infrastructure for public transport and non motorised transport

New technologies for all classes of vehicles

Cleaner fuels Intelligent Communication and Technologies to improve system efficiency and to substitute conventional transport

Technologies to improve public transport and freight services

Incentives for behaviour change and developing strategies to link land-use planning and transport

Successful examples can be found all over the world, but more are needed. Examples include:

Implementation of Mass Transit and Bus Rapid Transit (BRT) projects. Sustainable transportation solutions need to be found with low capital investments, particularly for regions with considerable financial restraints. Best practices can be found in Latin America, Asia and Africa but also in developed countries

Public bike schemes, safebikeways and cycle paths as well as the integration of bikeways with public transport. There are many successful implementations over the past 5 years such as Paris, Barcelona and Mexico City. There are now 39 public bike schemes in China, including Hangzhou, thought to be the largest in the world, with more than 60,000 bikes.

Demand management policies such as Vehicle Quota Schemes as in Singapore, Shanghai and Beijing, urban tolling as in London and Stockholm and increasing pedestrian and low emission zones as in Berlin and Milan.

Use of new fuel technologies and clean vehicles. The car industry is moving slowly towards new fuel technologies and clean vehicles but they are still too expensive for most of the developing world. However, public transport has proven technology for the use of most alternative fuels – electric propulsion, hybrid systems, CNG, Bio gas, Ethanol, Fuel cell as well as clean diesel which needs to be supported.

Research into cleaner fuels; higher quality of diesel and gasoline (unleaded gasoline, ultra low sulphur diesel and new synthetic diesels), as these are not available to the developing world and leaded fuel is only just being phased out.

Passenger information technologies, integrated fare collection systems and GPS technologies allow both public, private and freight transport to maximize efficiency yet they are expensive for much of the developing world. Particularly in the case of public transport, it has been observed that advanced technology can trigger a modal shift from car driving to public transport and the first BRT system in Mexico City showed a 15% shift away from car driving (among BRT users), resulting in almost 50,000 less car trips per day within a 20km corridor. Internet, teleconference applications, and global communication systems now decrease the need for travel. However, within the foreseeable future, not all activities can be carried out remotely and therefore transport needs to become more efficient and low carbon focussed.

Demographic changes – increasing urbanisation, more people living in the developing than developed world – as well as the road transport growth rates, shows that it is increasingly apparent that transport must be part of sustainable development goals. Recent evaluation of the Millennium Development Goals showed an uneven progress across countries and regions. For example, whereas India and China achieved notable progress in poverty alleviation, sub-Saharan Africa showed adverse progress not only in poverty alleviation but also dramatic increases in traffic accident rates. Likewise, in respect to the seventh –transport oriented- Millennium Development Goal, there was very little progress on environmental protection in relation to reducing transport related CO2 emissions.

The 18th session of the Commission on Sustainable Development, held in May 2010, reported that most developing countries still lack adequate transport infrastructure and services. As a consequence, access to basic services such as health and education, as well as to jobs and income generating opportunities is difficult for the poor, and in particular women, youth and children. The latter jeopardize the eventual achievement of internationally agreed Millennium Development Goals.

### 3 Sustainable low carbon transport and green economy

Rio+20 presents a unique opportunity to envision a green economy with sustainable low carbon transport. The transport sector can make a strong contribution to a green economy and can deliver green job opportunities. Public investments directed towards infrastructure for public transport, non-motorised transport and green transport technologies contribute to the creation of new local jobs and help support local economies. An example arises from the implementation of Bus Rapid Transit projects, where a BRT replaces a traditional bus operation (individual bus owners), employees are offered more secure employment and better conditions in terms of working hours, safety, salary, training and other benefits. Latin America is now in a position to export their knowledge on BRT to others.

Likewise, low carbon transport will create new business opportunities, through public-private partnerships. Increased private sector involvement for the implementation and operation of public transport systems, non-motorised and bike and car share services, park & ride facilities, intermodal interchange hubs, intelligent transportation systems and better freight logistics are just examples.

UNEP's chapter on transport in their recently published a report on Green Economy examines its role in a green economy and identifies strategies to ensure that future investments in the transport sector will be increasingly green.

### 4 Sustainable low carbon transport and poverty eradication

Poverty eradication is one of the top priorities in the current political agenda worldwide, as well as a primary theme of the Rio+20 summit. Poverty alleviation and eradication of hunger has been explicitly addressed by the United Nations through the Millennium Declaration where special attention was given to goals that aim to tackle poverty in developing countries.

The Aichi statement<sup>6</sup> (2005) on environmental sustainable transport reaffirmed the Johannesburg Plan of Implementation adopted in the 2002 World Summit on Sustainable Development and also noted the important contribution of sustainable transport systems towards the realization of the Millennium Development Goals through improving

access to education, employment opportunities and health care. Moreover it recognised the need to develop national and local policies in order to promote social equity through safe and affordable urban transport systems that may alleviate poverty, include gender aspects in urban transport planning and satisfy the basic needs of most vulnerable users such as the children, elderly and disabled.

The Bangkok 2020 Declaration (August 2010) adopted by 22 participating Asian governments of the Fifth Regional Environmentally Sustainable Transport Forum also suggests a set of performance indicators – including indicators of social equity - to measure progress on the implementation of environmentally sustainable transport. Similarly the Bogota Declaration, the Regional Sustainable Transport Forum held in Bogota, Colombia (June 2011) highlights the need to develop and adopt Avoid-Shift-Improve strategies towards sustainable development and offers a working definition of sustainable transport - "the provision of services and infrastructure for the mobility of people and goods needed for economic and social development, and improved quality of life and competitiveness. These services and transport infrastructure provide secure, reliable, economical, efficient, equitable and affordable access to all, while mitigating the local and global negative impacts on health and the environment, in the short, medium and long term, without compromising the development of future generations".

If progress in implementing sustainable development and eradicating poverty has been slow in the past 20 years, it has not been due to a lack of declarations and statements, thus international action as well as the commitment of developed countries to provide financial instruments and technical capacity to developing countries is increasingly urgent.

#### 5 Institutional requirements for sustainable low carbon transport

Robust institutional frameworks are essential in order to facilitate the development and implementation of public policies towards sustainable low carbon transport. Although a large part of transport planning occurs at local or state level, public policies - as well as the availability of financial resources - are usually discussed at national level. Hence, it is important for the Rio+20 summit to propose institutional arrangements that will strengthen sustainable low carbon transport at a national level, but also provide the local governments with institutional and financial instruments that will facilitate their efforts towards sustainable development and green transport.

Greening transport requires key enabling conditions, such as:

Designing appropriate regulation, planning and information provision

Setting the right financial conditions and economic incentives

Ensuring technology transfer and access Strengthening institutions and capacity

Economic incentives and financial stimulus are key issues for developing countries, thus financial patterns should be reformed in order to provide adequate funding for green transport, by investing in technology, capacity building and infrastructure, and also by shifting investments towards sustainable low carbon transport. International agencies and development banks have a particular role to play in strengthening institutional capacity and providing the financial instruments that are required. Rio+20 therefore presents a unique opportunity to increase political will and make the respective commitments.

Transparency and accountability are also key issues to discuss, reaffirming Principle 10 of Rio Declaration which urges for citizen's participation in decision making, access to environmental information and access to juridical and administrative proceedings, aiming to facilitate and encourage public awareness as best instrument to deal with environmental issues. Strengthen the commitment to promote sustainable modes as stated in the Johannesburg Plan of Implementation.

Recommendations and a call for action for governments at RIO+20 June 2012; we urge:

1. Governments attending Rio+20 to recognise the important links between sustainable transport, greening economies and poverty alleviation.
2. To agree that sustainable, low carbon transport is core to sustainable development goals. The sustainability of transport should be mentioned as a target in any declaration and follow up to the Johannesburg Plan of Implementation.
3. Sustainable transport is embedded within sustainable development goals. A higher level of accountability is needed and enabling frameworks so sustainable, low carbon transport facilitates economic development.

The collection of comparable data and statistics on transport activity is coordinated at international; level (along similar lines to the collect of energy use and consumption).

Eight universal key indicators are suggested:

- i) Share of passengers and freight<sup>7</sup> by mode and average vehicle load factors by mode
- ii) Annual transport fossil fuel consumption by mode and related greenhouse gases
- iii) Vehicle fleet size, average fuel efficiency and total vehicle-km travelled by mode
- iv) Share of household income spent on transport by poorest 20% (urban and rural split)
- v) Share of local and national GDP spent on transport (urban and rural split)
- vi) Proportion of urban roadways with safe walking & cycling facilities
- vii) Proportion of population within 1 km of public transport
- viii) Ratio of traffic deaths amongst wealthiest 20% to poorest 20% of population

---

## Triglav Circle

Harmony with Nature: Statement by the Triglav Circle

This paper constitutes the Triglav Circle's input to the compilation document for the Zero draft of Rio +20. The Triglav Circle is a registered NGO, having special consultative status with ECOSOC.

For website see <http://www.triglavcircleonline.org>

Thank you for this opportunity to convey a statement on Harmony with Nature on behalf of the Triglav Circle, which was created in the wake of the World Summit for Social

Development to work on enriching the public discourse on global issues with spiritual and ethical perspectives.

The founding objective of the Circle is to realize the core messages of the Social Summit articulated in the Copenhagen Declaration:

Our societies must respond more effectively to the material and spiritual needs of individuals, their families, and the communities in which they live...

Also:

We are deeply convinced that economic development, social development and environmental protection are interdependent and mutually reinforcing components of sustainable development, which form the framework for our effort to achieve a higher quality of life for all people.

These commitments by governments were part of a text rich in moral affirmations and reflective of a holistic vision of development and social progress. Today, the Triglav Circle seeks to promote an approach to international relations and public policy grounded in moral and spiritual values. It aspires to enrich the discourse on global problems with the accumulated knowledge of scientists, philosophers, artists, religious thinkers and academics. The Circle pursues its objectives not only through regular dialogues, seminars, and research, but also through its special consultative relationship with the United Nations Economic and Social Council, its cooperation with similarly motivated organizations, and the work of individual members in their respective spheres of action.

The UN's initiative to promote harmony with nature is indeed very timely and important to the work of the Circle. Members carefully read the texts prepared by the Secretary General and met to consider their implications. The Circle is grateful to the General Assembly for its Resolutions on Harmony with Nature and applauds the Secretary General for his two excellent reports on this subject. These reports illustrate the broad breadth and depth of the subject. Members feel that it is critical to adopt a holistic approach to healing the wounded environment and to protecting those spaces where harmony between humanity and nature still exists. The well-being of present and future generations depends on living within the limits of Nature. These endeavors require material sacrifices, great humility, and a wide sharing of knowledge obtained not only from the empirical sciences, but also from philosophy and the arts.

#### Political Leaders and Harmony with Nature

Different conceptions of harmony with nature have been reflected in the works of poets, philosophers, sages and artists for millennia, beginning with the drawings of the earliest cave dwellers. In parallel, at first gradually but especially, since the 19th century, economic processes destroying the natural environment have been accelerating despite remedial efforts at the individual, national, and international levels. Among respected political leaders who were alarmed by these trends, were James Madison, the fourth President of the United States; John Stuart Mill, the political philosopher, economist, and parliamentarian; and Vaclav Havel, the former President of the Czechoslovakia. They have addressed environmental questions in terms particularly relevant to the quest for harmony with nature.

In his prophetic speech to the Agricultural Society of Albemarle VA, on May 12, 1818, James Madison, expressed serious concerns about the environmental damage that industrial progress would cause. He anticipated today's major environmental challenges including loss of biodiversity, destruction of the land, and pollution of the atmosphere. His speech contained a persuasive argument for an "ecological" method of agriculture and forewarned about deterioration of the soil and deforestation as consequences of progressive and aggressive agricultural practices. Madison questioned the ethics of reducing the vast wealth of natural resources to the singular purpose of supporting human life. He advocated protecting the rich diversity of life and warned against too much specialization at the expense of other species of plants and animals. He pointed out that each plant needs different types of soils and responds differently to different types of manures.

Beyond his comprehension was the destruction of any species of flora or fauna that did not enter into the economy of humankind. The interconnections among species and the "beings" themselves should be respected, —even where their links and utility were obscure to human thinking and economy. Madison stated:

The Earth contains no less than thirty or forty thousand kinds of plants; no less than six or seven hundreds of birds; nor less than three or four hundred of quadrupeds; to say nothing of the thousand species of fishes. Of reptiles and insects, there are more than can be numbered. ... On comparing this vast profusion and multiplicity of beings with the few grains and grasses, the few herbs and roots, and the few fowls and quadrupeds, which make up the short list adapted to the wants of man, it is difficult to believe that it lies with him so to remodel the work of nature as it would be remodeled, by a destruction not only of an individual, but of entire species; and not only of a few species, but of every species, with the few exceptions which he might spare for his own accommodation.

Although global warming had not been identified as a threat in his time, Madison clearly anticipated the pollution of the atmosphere and the harm this could bring to life on the planet. He stated that:

The atmosphere is not a simple but compound body... The atmosphere in its natural state, and in its ordinary communication with the organized world, comprises various ingredients or modifications of ingredients, derived from the use made of it, by the existing variety of animals and plants... Is it unreasonable to suppose, that if, instead of the actual composition and character of the animal and vegetable creation, to which the atmosphere is now accommodated, such a composition and character if that creation were substituted, as would result from a reduction of the whole to man and a few kinds of animals and plants—is the supposition unreasonable, that the change might essentially affect the aptitude of the atmosphere for the functions required of it? And that so great an innovation might be found, in this respect, not to accord with the order and economy of nature?

In book IV, chapter VI of *Principles of Political Economy* (first published in 1848), John Stuart Mill praised the virtues of nature. He related harmony with nature to development of character, intellect, and wholesome desires. Left alone to meditate among the trees and flowers, in meadows or beside placid lakes, humankind would restore its soul and spirit. It is not good for man to be kept perforce at all times in the presence of his species. A world from which solitude is extirpated is a very poor ideal. Solitude, in the sense of being often alone, is essential to any depth of meditation or of character; and solitude in the presence of natural beauty and grandeur, is the cradle of thoughts and aspirations which are not only good for the individual, but which society could ill do without.

Mill challenged the assumption that economic resources were unlimited and evoked a depressing vision of vast wastelands resulting from the relentless exploitation of the land and elimination of plants and animals unfit for human consumption. To avoid such a future, Mill proposed that the pursuit of industrial arts should serve a greater purpose than material enrichment. Promoting a society as Mill proposed, where reasonable material advances are balanced by progress in the art of living is not on any government agenda today. The success of the modern state is measured by increased economic growth, to the neglect of the natural environment. Perhaps, these circumstances offer some explanation for the apparent dissatisfaction of people around the world. Humankind is in danger of subservience to the exigencies of the market economy and a dominating and narrowing perspective that confuses the purpose of economic growth with the goals of human life.

The reality of modern political economic power, which complicates the quest for harmony between and within societies, as well as between human kind and the natural environment, has much to do with the state to which society has advanced in science and technology. The current paradigm of modernity is an elaborate construction of Promethean man. It is not a construction in consonance with Nature, nor is it in consonance with the nobility and dignity that sages found inherent in the human spirit. It ignores the extravagant social and environmental costs of reducing humanity to a commodity or a cog in a "monetized universe."

So where does this leave society? It leaves it in a strange and unhappy condition portrayed by artists and scholars in a variety of grotesquely depressing ways. Such is the imagery—appropriate also to the post-modern era—that man of letters, Roland Barthes captures in his critique of a classical Dutch painting. For him, the painting evokes a

society where all vestiges of nature and its sacredness have been imprisoned by human intentions. The dominating vision is of humankind and its empire of things: ...man stands now, his feet upon the thousand objects of everyday life, triumphantly surrounded by his functions. Behold him, then, at the pinnacle of history, knowing no other fate than a gradual appropriation of matter. No limits to this humanization, and above all, no horizons: (...) the overloaded boat connects the two shores and thus closes the movement of trees and water by the intention of a human movement, reducing these forces of Nature to the rank of objects and transforming the creation into a facility.

Confronting such a vision of modern society and the reality of environmental destruction, Vaclav Havel raised the following questions:

Is not the essence of the environmental crisis related to the loss of respect for the order of existence in which humankind is not the creator, but a mere component of its mysterious meaning or spirit? (...) Is not the crisis the logical consequence of the perception of the world as a complex of phenomena controlled by certain scientifically established laws and (ignoring) questions on the meaning of existence and (the relevance) of metaphysics? (...)

Absent in the present discourse is meaningful appreciation of the limits to humankind's capacity to learn the larger truths of existence through scientific rationality. Empiricism cannot frame all the questions and provide all the answers. For Havel, only an awakening of the human spirit can help society address the fundamental causes of the current environmental crisis. A prerequisite for any effective environmental policy is a radical change in heart and spirit. Havel writes: "Only humankind understands of its place in the universe will allow the development of new models of behavior, scales of values, and objectives in life and, through these means, to finally bind a new spirit and meaning to specific regulations, treaties, and institutions."

Today, there are many voices echoing, illustrating, and enlarging upon these reflections and urging a vision of nature that reflects its essence as a complex of living and nonliving substances. Nature has intrinsic as well as instrumental value and should be considered not simply a collection of inputs to feed the world's economy. Nature consists of interdependent parts of an integrated ecological system deriving from and existing in an infinite universe. The realization of projects aimed at establishing lasting harmony with nature demands holistic and transcendent thinking.

It would be absurd to fail to recognize the intellectual, ideological and political change that these efforts demand, and equally unfair to minimize the results to be achieved. There is now general recognition that the earth and its ecosystems are fragile and destructible.

Triglav Recommendations:

1. The realization of projects aimed at establishing lasting harmony with nature in consonance with sustainable development requires imaginative, holistic, and transcendent thinking.
2. There is much wisdom to be found in the writings of political thinkers who foresaw the dangers of extensive industrialization and extravagant and aggressive technologies that would bring about abuse of the natural environment.
3. Man's wisdom can never replicate piece by piece, the wonders of Nature. Thus there is need for a re-enchanted vision of nature to inspire policies to respect and restore the environment.

Monopoly of Scientific Thinking

Today, the most valued function of science and technology is to produce the knowledge that informs the most efficient use of natural resources. What is to the physical senses 'scientific' is generally treated as the only practical form of knowledge. Intuition, imagination and philosophical reflection have little practical relevance in this enterprise, which is consuming the natural environment. Notions such as dignity, meaning, and magnanimity are ignored in the search for answers to the most pressing global issues, including the environmental crisis. Sadly as Karl Marx stated: "All our invention and progress seem to result in endowing material forces with intellectual life, and in stultifying human life into a material force."

To establish harmony with nature demands a dramatic shift in the modern instrumental rational, materialist mindset. The pursuit of lifestyles that place high value on intellectual and artistic endeavors and a flourishing natural environment requires rehabilitation of currently neglected philosophical and other metaphysical sources of knowledge. It means actualizing the belief that reality includes a harmonious order of qualities and relationships that are not evident to the physical senses but discernible through the powers of the mind. It means reexamining material evidence and the values streaming from it, in the light of these other essential sources of knowledge. Imagination and intuition will provide balance to scientific objectivity. Idealism will see life freed from what can be described as the drab blur of triteness and endless calculations, or the imprisonment that comes with the appropriation of things.

To this society in awe of its growing capacity to control and reform nature, modern philosopher, Jacques Maritain offered the view of a much grander Reality, over which humankind had very limited control. Philosophers can witness the supreme dignity of thought and point to that which is eternal in nature and humanity. They can stimulate the thirst for pure knowledge of those fundamentals about Nature and humanity itself.

Thus, it should be emphasized that while scientific rationality and the physical sciences are essential to well-being in modern societies, matters of human destiny and fulfillment in harmony with nature are beyond its ambit. This view was held by Albert Einstein who emphasized that scientific thinking and instrumental rationality had strong limitations. He wrote that the whole of science is "nothing more than a refinement of everyday thinking (...) even the concept of the 'real external world' rested exclusively on sense impressions." Einstein also affirmed that science is methodically directed toward finding regulative connections between our sensual experiences—bringing together, by systematic thought, the perceptible phenomena of the world into as thorough going an association as possible. In the immediate, it produces knowledge and indirectly implies means of action. But, such empirical thinking is neither the way to determine the meaning in life, nor to identify goals and values essential to sustainable life-styles, social harmony, and happiness. These can only be discovered through holistic thinking enlightened by the creative spirit.

Triglav Recommendations:

1. It should be emphasized that while scientific rationality and the physical sciences are essential to well-being in modern societies, matters of human destiny and fulfillment in harmony with nature are beyond its ambit. What is to the physical senses 'scientific' is not the only practical form of knowledge. Notions such as dignity, meaning, and magnanimity should not be ignored in the search for answers to the most pressing global issues, including the environmental crisis.
2. Imagination and intuition must balance scientific objectivity in restoring harmony with nature.
3. To establish harmony with nature there must be a dramatic shift in the socio-political mindset. Decision makers must reexamine empirical evidence and the values streaming from it, in the light of the non-empirical but none the less other important sources of knowledge about life.
4. Philosophers should be witnesses to the capacity of the human mind to transcend the mundane passions and place value on what is eternal in humankind. He/she should stimulate the thirst for pure knowledge of those fundamentals about Nature and the nature of humanity itself.

Science and Harmony with Nature

Although an instrumental approach to nature can be blamed in part for catapulting humanity into a global, technological civilization under a regime of domineering materiality, this instrumental mentality does not characterize the whole of scientific thinking about the earth.

Highly respected scientists see the necessity of perceiving the natural environment as a complex and delicate system having its origins in the cosmos. They have made it their life work to try to understand this universe. Humbled by the uncertainties of their scientific theories, they are in awe of their discoveries. Nobel Laureate, Richard Feynman remarked:

This universe has been described by many, but it just goes on, with its edge as unknown as the bottom of the bottomless sea of the other idea—just as mysterious, just as awe inspiring, and just as incomplete as the poetic pictures (of the ancients) that came before. But they see that the imagination of nature is far, far greater than the imagination of man. No one who did not have some inkling of this through observations could ever have imagined such a marvel as nature is.

Physics and higher mathematics reveal many significant ideas concerning the realities of the universe and life. Thus they loosen chains binding human intentions to material circumstances and aspirations. With the assistance of enlightened reason, modern scientists can guide humanity to a more profound sense of purpose. Physicist Brian Greene summarizes this view:

To open our ideas to the true nature of the universe has always been one of physics' primary purposes. It is hard to imagine a more stretching experience than learning, as we have over the last century that the reality we experience is but a glimmer of the reality that is.

The sublimity and order revealed in Nature and the cosmos offer direction in the quest for harmony with nature.

Nearly 100 years have passed, since Einstein made his discoveries. In the meantime, other sophisticated mathematical theories about the Universe have surfaced. Super String Theory and M Theory, an advanced version of String Theory, may successfully merge general relativity and quantum mechanics, and hold out the hope that humankind is closer to understanding the deepest laws of the universe.

According to Greene, string theory holds that there is one fundamental building block of the multidimensional universe; that is the string. The infinite number of particle species simply reflects the different vibration patterns that a string executes, just as a string on a violin or cello can vibrate in many different ways, producing a full range of sounds. Greene writes: Metaphorically, the different notes that can be played by a single species of string would account for all of the different particles that have been detected. At the ultramicroscopic level, the universe would be akin to a string vibrating matter into existence.

A glimpse of reality is perhaps offered in the timelessness of transcending ideas. Aristotle's esteem for the powers of music seems to be shared by certain contemporary scientists discovering the intellectually stimulating qualities of Mozart symphonies. Such discoveries bare out today what Aristotle surmised thousands of years ago when human intelligence had a more instinctive sense of Nature. The human mind is altered by music, perhaps bringing it closer to the never-ending harmonies of the strings and branes of the universe under the baton of a master Consciousness. Such symphonies would surely inform the ultimate Harmony with nature, which links humankind through the ecology of the earth to the cosmos in which it abides.

Astrophysicist and philosopher of science, Owen Gingerich, sees the wonders of the universe in particular the remarkable arrangements of carbon and oxygen nuclear resonance, as a way for making sense of the astonishing cosmic order that the sciences repeatedly reveal and even more so the remarkable evidences of design in the biological realm. In light of the rapidity with which modern society is consuming nature and its resources, Gingerich believes that unless society learns the message of service and sacrificial love that a transcendent belief in the meaning the cosmos conveys, humankind may be doomed as a species.

To neglect a deeper understanding of the systemic workings of the universe is to continue to "wrestle in the dark with an unknown opponent," according to Greene. He also notes that: "Assessing life through everyday experience is like gazing at a Van Gogh masterpiece through a coke bottle." Although physicists have insights into physical reality, they are themselves unable to predict more than a fraction of nature's behavior. The humility that comes with recognizing that humankind's understanding of the world is only a glimmer of reality validates earlier views on the importance of that "glimmer of acquaintance" for society's well-being and human-kind's flourishing. Even glimpses of reality, the awe they inspire and the respect they generate are better than ignorance for the continuity of life and should give reason for living in conformity the nature that envelops all living creatures.

Triglav Recommendation:

1. With the assistance of enlightened reason and imagination, modern science should lead humanity to a sense of purpose that perceives value in wisdom and harmony with nature.

#### Compassion and Purpose in Harmony with Nature

One of the major failures of modernity is the incapacity to recognize that love, selfless work, and creativity are intrinsic to human nature and are the necessary building blocks of a compassionate society. Without love and magnanimity, people lack a positive ethic for confronting the many environmental crises which beset the globalizing world. Fear alone cannot provide an ethical foundation for responsible environmental policy. After a while, arguments based on fear lose credibility and cannot provide an effective motivation for long term responsibility. It is urgent to recognize the roles that compassion, selflessness and generosity have in motivating socially responsible behavior.

Considering general notions of harmony with nature and their moral foundations, British political philosopher, John Locke wrote in his piece entitled, *Conduct of Understanding*, 1754: "We should love our neighbor as ourselves" – is such a fundamental truth for the regulating of human society, that, I think by that alone one might without difficulty determine all cases and doubts in social morality." This statement, from one of the great architects of liberalism, offers direction for building that heretofore ephemeral moral foundation for social justice and harmony with nature.

The concept of "love," as used in Locke's text has the quality of universality. It expresses nobility and compassion. Similar ideas are conveyed in writings of the ancient Greeks, Taoists, Confucians, Islamic scholars, and Buddhists, to mention only the most widely accepted belief systems and philosophies. This common wisdom emphasizes virtuous social behaviors, including a generous response to the needs of ones' fellow human being and other living creatures inhabiting the planet. It conveys the universal "truth" that in seeking harmony in society and with nature, one finds one's own well-being. A society without a strong sense of compassion permeating its ethos will ultimately collapse as its natural surroundings deteriorate.

One of the major challenges today is to find a meaning in human life that is rooted in harmony with nature. This search is not about grand ideologies or social experiments in the name of God. It is "simply" a quest for sense and direction that can inspire human flourishing and life in equilibrium with nature. It is not teleological: it is in the largest sense about "being."

Purpose in just "being," echoes in the harmonies of nature, as revealed in a story of a small bird, told by Giuseppe Sermoni. "The bird, *Cyanosylvia svecica* (blue throat) delivers his most artistic song, objectively the most complex, when relaxed in the depth of its own bush, poetizing to himself." The song changes when the bird seeks to protect its own interests. It becomes a monotonous repetition of string strophes and all the graces and harmonies are lost.

Pondering the message of *Cyanosylvia sveccia*, should not people feel some inclination to seek satisfaction in lifestyles minimally controlled by material needs and drives and maximally concerned with the exercise of their inner song composed by their intellectual and artistic gifts? It may be that these mental exercises actually increase the capacity of the brain for holistic thinking, so that return to old ways of seeing the world would neither be comfortable nor satisfying. Certainly life styles concentrated on the art of living bring at least as much happiness as advertisers are promising in promoting "the services of things" to the privileged and underprivileged alike. Philosophers have been telling this story for centuries and even now and then the modern media delivers this message, perhaps out of genuine sentiment or perhaps out of a general malaise caused by a premonition of imminent environmental catastrophe.

Triglav Recommendations:

1. The international community should take into account the common wisdom that emphasizes virtuous social behaviors including having compassion for the needs of other beings.
2. All humanity would do well to heed the universal "truth" that in seeking harmony in society and with nature, one finds one's own well-being.
3. It must be remembered that a society without a strong sense of appreciation of the need to protect the inherent beauty and purity of the natural world will ultimately collapse.
4. The ultimate meaning and purpose for human life should be inspired by nature, the well spring of all life.

The above text was authored by Barbara Baudot, as Coordinator of the Triglav Circle. This statement does not necessarily reflect the views of all Circle members but is consistent with the ethos of the Circle. Supporting views are given below.

Statements by Individual Members and Friends of the Circle

Harmony with Nature: A Writer's Perspective

The proposed initiative on Harmony with Nature is a sharply focused, intellectually sophisticated, and timely one. In addition to building directly on such landmarks of modern conservation as Rachel Carson's *Silent Spring* (1962) and Aldo Leopold's *A Sand County Almanac* (1949), it resonates with a global literature of nature's inherent value that encompasses the poets of T'ang Dynasty, Japan's Haiku tradition, the writing of Jean-Jacques Rousseau, the English Romantics, and Alfred North Whitehead's synthesis of philosophy and physics. What all these writers and many more affirm is that without a healthy biosphere there is no possibility for human prosperity and happiness. Such an assertion is not an alternative to the economic and political policies that generally and appropriately concern the United Nations. But it is a necessary complement to it.

Especially today, when the grave challenges of climate change and runaway population are being experienced in especially challenging ways by citizens of developing nations, it is crucial to correlate ecological and social health. Many studies have demonstrated the necessity of a full suite of native animals for the continued health of forests and soils. (Leopold's *Thinking like a Mountain*, from *Sand County Almanac*, was one influential statement of this relationship.) Similarly, the protection of waterways and wetlands is indispensable for stable agricultural systems. One of the best ways to promote such protection of nature's fundamental elements is through an attitude of respect and love that is in turn ratified by indigenous traditions around the world. Harmony, in other words, is between the arts, religion, and the sciences, as well as between humanity and what the philosopher David Abram has called 'the more-than-human world.' By this phrase, Abram means not greater than humanity, but instead encompassing people within a much broader community of life.

Many prescient writers, from Teilhard de Chardin to the systems-thinker Donella Meadows, have described this sort of synthetic perspective as a crucial next step in cultural evolution, and one which will support the development of hopeful new social institutions. I share this view, and devoted my 38-year career as a scholar and a professor of Environmental Studies to exploring its ramifications. For the United Nations to commit to the proposed initiative would, I believe, be a bold, appropriate, and highly productive action. It would encourage many vital endeavors in both the industrialized and developing nations of the world.

Statement by John Elder, Stewart Professor of Literature and Environmental Studies Emeritus, Middlebury College; author of *Reading the Mountains of Home* and Editor of the Norton Book of Nature Writing; recipient of Fulbright and Guggenheim Fellowships; and member of the Triglav Circle.

Triglav Recommendations:

1. It should be remembered that without a healthy biosphere there is no possibility for human prosperity and happiness. It is crucial to correlate ecological and social health.
2. One of the best ways to promote such protection of nature's fundamental elements is through an attitude of respect and love that is in turn ratified by indigenous traditions around the world. Harmony, in other words, is between the arts, religion, and the sciences, as well as between humanity and what the philosopher David Abram has called 'the more-than-human world.'

Nature and Culture: The Only Harmony We Know

In 2008 the Icelandic nation was faced with serious economic situation and to many the future looked bleak. All official efforts were obviously put into addressing the financial crisis. However, midst in this grave situation a group of 153 interested people, coming from different sectors of the society established a Nature Fund, the first of its kind in Iceland.

At this significant time in the nations' recent history, it came obvious how important and dear to us, our Natural Heritage is. Intertwined with our Cultural Heritage it shapes us as individuals and moreover makes us the nation we are. The nature and the culture have together created a small nation that further has commitments to the rest of the world, by preserving its own National heritage. The Audlind Nature Fund was established to guard the principal resources of Iceland's nature, to maintain their variety and to protect their sustainability. The principal goal of Audlind is to protect and reclaim Iceland's natural heritage. This goal will be attained by encouraging stewardship of nature, including participation of individuals, societies, corporations, investors, municipal communities and government.

Now that water has been recognized as the world's most valuable natural resource, effort must be put into both its preservation and restoration. Wetlands' important and natural role in water management is crucial in this endeavor. Audlind Nature Fund is already running a wetland restoration program, but Iceland's natural wetlands have been severely diminished; in some areas over 90% of wetlands have already been drained. This will, if continued, place threats to water quality and the health of the natural environment. However with raised awareness and tangible restoration projects this evolution can be turned around. Some successful restoration projects already pay tribute to this attempt.

The Audlind Nature Fund emphasizes working with landowners as well as other NGO's and governmental entities, responsible for land management. This approach is extremely important since natural resources can only be saved for future generations' livelihood and enjoyment, if we that are responsible for nature's present utilization are able to value its current role as the source of both our physical and cultural existence.

Audlind Natural Fund is honored to have one of its initiator and founder, Vigdís Finnbogadóttir, former president of Iceland as its patron. Iceland, October 31st, 2011

Submitted on behalf of Vigdís Finnbogadóttir, [member of the Trigrav Circle]

Salvör Jónsdóttir,

First chair of Audlind Natural Fund

Trigrav Recommendation:

1. Because water has been recognized as the world's most valuable natural resource, efforts must be put into both its preservation and restoration. Wetlands' important and natural role in water management is crucial in this endeavor.

On Educating Children about Nature

Natural funds, conservation lands, parks and nature centers must be vigorously put to use in the education of the world's children. Children should be taught of the magic and the beauty that nature holds for them. This education should begin from the earliest ages of awareness of their surroundings. They are the hope of the future and if they grow up appreciating their natural surroundings through playing in them, discovering life in them and making friends with the different creatures inhabiting these corners of the planet they will likely never allow themselves to give into destructive behaviors in the future.

Nouna Kettaneh, Ph.D.

Physics and Mathematics

Member of the Trigrav Circle

Trigrav Recommendation:

1. Natural funds, conservation lands, parks and nature centers must be vigorously put to use in the education of the world's children. Children should be taught of the magic and the beauty that nature holds for them. This education should begin from the earliest ages of awareness of their surroundings.

On Harmony with Nature

This message is to convey my strong support for the UN's efforts to enhance "harmony with nature", and my hope for substantial advances in the meetings and events to come.

Two observations might be of interest in addressing this massive and complex agenda. First, is that the last century has witnessed an explosion in scientific knowledge and technological innovations. Many, if not most, of these innovations, while of immediate and immense use to the earth's inhabitants, do negatively affect the environment in a serious manner. To overcome this conflict of interests, and advance harmony with nature, equal attention is needed for studies and preventive innovations to address these secondary negative effects.

The second observation is about the "level of solution". Advancing harmony with nature requires actions at all levels—individuals and families, the immediate communities, and national, regional and global organizations. Important for achieving these actions, are international laws and regulations, capabilities for monitoring results, and promoting compliance. No global organization is in a better position to guide these efforts at the governmental levels than the UN.

Finally, the education of current and future generations cannot be emphasized enough. In order to enhance compliance throughout societies of varied cultures and levels of development and geographic characteristics, the population itself must understand and become convinced that these changes are necessary and that the required sacrifices are being made in a fair and equitable manner.

Saad Z. Nagi, Member of the Trigrav Circle

Professor Emeritus of Sociology

The Ohio State University

Former Director of Social Research Center, American University in Cairo

Trigrav Recommendations:

1. The last century has witnessed an explosion in scientific knowledge and technological innovations. Many, if not most, of these innovations, while of immediate and immense use to the earth's inhabitants, have a serious negatively effect on the environment. To overcome this conflict of interests, and advance harmony with nature, equal attention is needed for studies and preventive innovations to address these secondary negative effects.

2. Advancing harmony with nature requires actions at all levels—individuals and families, the immediate communities, and national, regional and global organizations. 3. The education of current and future generations cannot be emphasized enough. In order to enhance compliance throughout societies of varied cultures and levels of development and geographic characteristics, the population itself must understand and become convinced that these changes are necessary and that the required sacrifices are being made in a fair and equitable manner.

The Environment and Social Equity

The environmental crisis is hitting the poor much more than the affluent. Knowledge-intensive solutions including technologies are available to restore natural systems, and dramatically reduce pressures on climate and the environment while improving human well-being. A "green economy" is attainable but must be embedded in a holistic concept of sustainability. What we need is a change of lifestyles. A holistic understanding of sustainability includes reinventing the state against financial markets that have become arrogant, and disregard social equity and long term considerations of climate and the environment.

Ernst U. von Weizsaecker

Member of the Trigrav Circle

UNEP International Resource Panel, co-chair

Former Chairman of the Bundestag Environment Committee

Triglav Recommendations:

1. Society must recognize that a holistic understanding of sustainability includes reinventing the state against financial markets that have become arrogant, and disregard social equity and long term considerations of climate and the environment.
2. The world needs a change in life style that demands a well-functioning multi- institutional society, conscious of the need for social equity and respectful of the call for keeping economic activities within the carry capacity of the natural environment.

On Harmony with Nature

An underlying theme of the stimulating discussions over the years at the Triglav Circle have either presupposed or stressed harmony with nature as a precondition for sustainable development. This emphasis has also taken critical note of the degree to which the operationalization of sustainable development has effectively minimized the impact of 'sustainable' by giving priority to 'development' as principally assessed by aggregate rates of growth.

As we move into the 21st century it becomes increasingly evident that the array of challenges emerging from the climate change problematique cannot be adequately addressed unless the concept of sustainability becomes a substantive guideline for development. Such an imperative requires a new understanding of the relationship between the economy and the environment that draws upon an ethos of harmony with nature, as informed by positive and negative learning experiences drawn from a variety of civilizational perspectives.

We in the West have stressed autonomy and the maximization of self-interest often interpreted on the basis of an increasingly dysfunctional reductive and materialist worldview. The Triglav discussions were particularly useful in bringing to bear non-Western understanding of the human interface with nature that more integrally and naturally stress the centrality of harmony as a keystone value and goal.

It is hoped that the Rio +20 discussions will advance public appreciation that without the serious struggle to achieve harmony with nature, which will necessarily involve some difficult reversals of consumerist life style patterns, there will be no sustainable development in the decades ahead, and the more likely reality will be ever more evident as 'unsustainable development' or more accurately development that is unsustainable disclosing itself as de-development that is part of ecological descent into a planetary inferno. Richard Falk

Member of the Triglav Circle

Professor emeritus of International Law, Princeton University,

Author, editor, and/ or co-editor

Triglav Recommendations:

1. The Rio +20 discussions must advance public appreciation that without the serious struggle to achieve harmony with nature, which will necessarily involve some difficult reversals of consumerist life style patterns; there will be no sustainable development in the decades ahead.
2. The world should recognize that development that is unsustainable, disclosing itself as de-development, leads to an ecological descent into a planetary inferno.

Ecological Implications of Confucian Humanism

Confucianism as a spiritual humanism involves four dimensions in its project for human flourishing: self, community, Earth, and Heaven. Self-cultivation is the point of departure for character building which is the primary purpose of Confucian moral education. Education is more than acquisition of knowledge or internationalization of skills. It ought to be a holistic way of learning to be human. Such a learning is defined in Confucian terms as "learning for the sake of the self," "the learning of the heart-mind and nature," or "learning to be a profound person." It is misleading, however, to assume that Confucian learning is a quest for individual happiness or inner spirituality. Rather, Confucian learning, far from being "individualistic," is a communal act.

The self is never an isolated individual but a center of relationships. As the center, the self is independent and autonomous. Its independence and autonomy is predicated on the dignity of the person as an internal value rather than a socially constructed reality. At the same time, the self as relationships is inevitably interconnected with an ever-expanding network of human-relatedness.

Community is never separated from the self. To paraphrase from William James, without the creativity of the centered self, community stagnates and without the sympathetic resonance of the community, true selfhood fades away. Community in Confucian humanism is variously understood as family, village, country, world, and cosmos

Self-realization as a communal act presupposes the personal commitment to harmonizing the family, governance of the state, and world peace. The full realization of personhood entails the authentic possibility of transcending selfishness, nepotism, parochialism, nationalism, and anthropocentrism. The underlying paradoxes are clues for understanding the subtleties of Confucian moral reasoning. An essential task of self-cultivation is to overcome selfishness. The maintenance of harmony in the family requires that we overcome nepotistic attachments at the expense of openness to other relationships. Communal solidarity is predicated on our ability to recognize the meaningful existence of other communities. Patriotism is at odds with chauvinistic nationalism.

Indeed, following the trajectory of this line of thinking further, we must transcend anthropocentrism to enable the self-realization of humanity to fruition.

The underlying paradoxes are clues for understanding the subtleties of Confucian moral reasoning. An essential task of self-cultivation is to overcome selfishness. The maintenance of harmony in the family requires that we overcome nepotistic attachments at the expense of openness to other relationships. Communal solidarity is predicated on our ability to recognize the meaningful existence of other communities. Patriotism is at odds with chauvinistic nationalism. Indeed, following the trajectory of this line of thinking further, we must transcend anthropocentrism to enable the self-realization of humanity to fruition.

Tu Weiming

Chairman of the Board of the Triglav Circle

Professor, Peking University and Harvard University

Triglav Recommendations:

1. Education is more than acquisition of knowledge or internationalization of skills. It ought to be a holistic way of learning to be human.

2. Self-realization as a communal act presupposes personal commitment to harmonizing the family, governance of the state, and world peace. The full realization of personhood entails the authentic possibility of transcending selfishness, nepotism, parochialism, nationalism, and anthropocentrism.

#### Harmony with Nature and Social Progress

When adopting in April 2009 International Mother Earth Day, to be celebrated every year on 22 April, the General Assembly of the United Nations expressed its conviction that "in order to achieve a just balance among the economic, social, and environmental needs of present and future generations, it is necessary to promote harmony with nature and the Earth." A few months later, in its resolution entitled Harmony with Nature, the Assembly declared that "humanity can and should live in harmony with nature." And, in December 2010, in its second resolution on this subject, the Assembly stated that "sustainable development is a holistic concept that requires the strengthening of interdisciplinary linkages in the different branches of knowledge."

Harmony, holism, complementarity of different sources of knowledge: such concepts applied by the General Assembly to the protection of the environment and to economic and social progress, are of the utmost importance. They are elements of the nascent political philosophy so clearly required by the problems and opportunities that are inherent to an interdependent and yet conflicted and unjust world.

The search for harmony is the antidote to environmental degradation, economic unbalance and social injustice. Holism is the response to the various forms of dualism - notably Man and Nature, Spirit and Heart, the Spiritual and the Temporal, the Abstract and the Concrete, Reason and Sentiment, "Hard" and "Soft" Values - that have plagued the dominant conception of modernity. Recourse in the public discourse to intuition, poetic and artistic imagination, the teachings of past philosophies and spiritual traditions, would balance the logic of science and the calculations of instrumental rationality. The United Nations, which is both a mirror of the world and a unique force to change the spirit of the time towards a greater wisdom, is a critical institution to debate and contribute to implement such political philosophy.

It is a matter of urgency. Seven billion people cannot hope to prosper, and even to survive, if the various dis-harmonies affecting the world are allowed to continue. And, the present generation has the responsibility to prepare a hospitable world to the nine billion of the year 2050. A greater Harmony with Nature is a matter of survival, and it is also a wonderful project that should and would stimulate and mobilize the creative energies of people around the world. For Harmony with Nature is intimately and unavoidably linked with Harmony among Nations, among Peoples, and with Harmony with the Self. Love and Respect for Nature is Love and Respect for the Other.

As all forms of violence, in thoughts, words and actions, feed each other, all forms of benevolence and altruism, in ideas and deeds, also feed each other. Here and there, throughout the world, women and men of good will, inspired by the search for the common good of humanity, are taking initiatives and working tirelessly for the emergence of a better and more harmonious world. The United Nations ought to give an international and global expression to these efforts. Harmony with Nature and Social Progress for All, are inseparable exigencies of our time. The conference "Rio plus 20", including the working of the implications of the beautiful concept of Harmony with Nature, offers an opportunity that should not be missed.

Jacques Baudot,

Secretary of the Triglav Circle,

former Director of the Budget and Controller of the United Nations, former Director of the Social Development Division, and Coordinator of the United Nations World Summit for Social Development, Copenhagen, March 1995.

#### Triglav Recommendations:

1. Building upon the General Assembly's acceptance of the concepts of harmony, holism, and complementarity of different branches of knowledge, the UN ought to be a center of reflection and debate on the policy implications of these concepts as they are applied to the protection of the environment and economic and social progress.
2. A greater harmony of humankind with Nature is a matter of survival. But the links between harmony with nature, social and political harmony and harmony with the self are such that actions motivated by the recognition of the precariousness of life on Earth can also be part of a dynamic and joyful global political project. The UN, starting with Rio + 20 is a privileged institution for debating and orchestrating this project.

#### Environnement et Tradition en Afrique de l'Ouest

La gestion de l'environnement a été toujours au centre des préoccupations de tous les empires qui se sont succédé en Afrique de l'ouest. La gestion environnementale était intimement liée à la gestion des ressources humaines elle-même. Nous allons retenir le règne de la dynastie de Soumaoro dans le Mandén qui a particulièrement organisé et structuré la gestion de l'environnement entre 993 après JC et 1235 à la fin de la dynastie.

1. La gestion de la forêt Cette dynastie a institué ce qu'on appelle les forêts sacrées en Afrique de l'ouest pour préserver les plantes d'intérêt médical et aussi en faire des hôpitaux verts où les malades contagieux sont soignés. Ces lieux servaient les de refuge pour les femmes et les enfants en cas de conflit s. A l'époque la coupe des branches d'arbre frais était sévèrement interdit d'où l'obligation respecter cette règle.
2. La gestion de la faune Concernant la protection de la faune, la dynastie de Soumaoro a institué l'organisation de la chasse en interdisant la pratique à tout moment et recommandant dans chaque village un chef chasseur et un chasseur dans chaque famille dont le rôle consistait à apporter la viande de la cuisine. Donc, la société s'était organisée de manière à permettre la reproduction libre des espèces sauvages.
3. La gestion de l'eau La gestion de l'eau a été confiée aux hommes du fleuve qu'on appelle « ba mōkō » en particulier les bozos, les somonos, les sorghos en pays sorai. Ils sont chargés de veiller à la sécurité de la navigation, de l'organisation et l'exploitation de ressources du fleuve et la gestion de la reproduction des poissons par l'observation d'un calendrier de pêche.
4. La gestion du feu de brousse La gestion du feu de brousse était une question d'une extrême importance car il s'agissait de préserver les ressources naturelles de la brousse dont les arbres fruitiers et médicinaux mais aussi la faune. C'est pourquoi, il ya un calendrier de mise à feux des clairière ( fougā). Ceci pour empêcher l'embrasement de toute la savane et la forêt. En 1236, les rois du mandén se sont rassemblés à Kouroukan fougā ( actuelle Kangaba, une préfecture malienne) pour adopter une constitution. Appelé la charte du Mandén, cette constitution a fait adopter à l'unanimité des douze rois présents la préservation de l'environnement. Toutes ces mesures ont été entérinées et validé par la charte de Kouroukan fougā.

Aujourd'hui, toute la population de l'Afrique de l'ouest fonctionne sur ces règles non écrites. Ainsi, la société traditionnelle ouest africaine a procédé à une organisation interne de son harmonie avec la nature .Cependant, les comportements, pratiques, et coutumes liés à cette harmonie subissent une influence du modèle de consommation occidental et d'un relâchement dans la transmission du savoir local et communautaire. A cela il faut ajouter les changements de comportement consécutifs à la pauvreté. Toutes choses qui contribuent à menacer l'équilibre de cette belle harmonie traditionnelle, notamment en milieu rural.

#### Perspectives et Recommandations

Au regard de la menace croissante sur les ressources environnementales en Afrique de l'ouest, notamment dans le sahel, il conviendrait à un niveau concerté (Organisations de la société civile, décideurs politiques, agences de développement, et communautés) d'envisager et mettre en œuvre les mesures suivantes :

- 1) La documentation et la vulgarisation du savoir local dans le domaine de la gestion de l'environnement
- 2) Une accélération de la promotion des énergies renouvelables (le soleil est la denrée la plus accessible et la mieux partagée dans le sahel)
- 3) L'information et l'éducation des communautés rurales sur les réalités et risques de la dégradation rapide de notre écosystème. Ces communautés sont loin, très loin des résultats de recherches et autres informations pertinentes sur le changement climatique

A cet égard, l'initiative de l'animation des centres de ressources communautaires pourrait contribuer à partager les informations élémentaires de base sur les questions de l'environnement

- 3) L'éducation pour le développement durable devrait commencer par formation des enseignants, qui à leur tour prendrons en charge les enfants à l'école
- Conclusion

L'impact du changement climatique est une réalité dans le sahel. Les populations vivent le phénomène et le subissent comme une fatalité, parfois comme une malédiction divine. Elles constatent une rupture progressive de l'harmonie avec la nature sans pouvoir en expliquer les raisons. Il y a un problème réel d'information, de sensibilisation et d'éducation sur la question. Ces dispositions sont relativement faciles à mettre en œuvre dans un milieu où les Hommes ont un respect « religieux » pour la terre d'autant qu'une pensée religieuse ou philosophique suggère que « Dieu créa l'homme à partir de la terre »

Adama N. Diarra

Membre de Triglav Circle

Directeur du Fond de Solidarité

Ancien Ministre de la Jeunesse

Gouvernement du Mali

Commissaire, Croix Rouge Internationale

Triglav Recommendations:

Au regard de la menace croissante sur les ressources environnementales, il conviendrait à un niveau concerté (Organisations de la société civile, décideurs politiques, agences de développement, et communautés) d'envisager et mettre en œuvre les mesures suivantes :

1. La documentation et la vulgarisation du savoir local dans le domaine de la gestion de l'environnement.
2. Une accélération de la promotion des énergies renouvelables.
3. L'information et l'éducation des communautés rurales sur les réalités et risques de la dégradation rapide de notre écosystème. Ces communautés sont loin, très loin des résultats de recherches et autres informations pertinentes sur le changement climatique.
4. A cet égard, l'initiative de l'animation des centres de ressources communautaires pourrait contribuer à partager les informations élémentaires de base sur les questions de l'environnement, l'éducation pour le développement durable devrait commencer par formation des enseignants, qui à leur tour prendrons en charge les enfants à l'école.

Sustainable Development, Non-Consumerism and Happiness

Since the disaster caused by the earthquake and tsunami in Tohoku area, including the near catastrophic accidents in four nuclear furnaces in Fukushima on March 11 2011, Japan has been facing a difficult decision about which of two paths to take for its nation's future. One is to continue the present course of consumerism based on fossil and atomic energy, and the other is the frugal social life based mainly on renewable energy sources which in essence depend on solar energy.

These alternatives are just like the paths described in Rachel Carson's "Silent Spring." One is the continuation of the present path, which appears easier than the other; the un-trodden way of harmony with nature appears to be much more difficult. If we should decide to take the harder way, we should examine not only the perspective that it will guide us to a happier society but also what kind of measures should be taken to persuade people to follow it. Failure in the case of environmental change, because of over indulgence in consumerism can wipe humanity from this planet. We should not take a chance by betting on the easy life, since the magnitude of loss is infinitely large. Elise Boulding wrote "Frugality is one of the most beautiful and joyful words in the English language, and yet one that we are culturally cut off from understanding and enjoying. The consumption society has made us feel that happiness lies in having things, and has failed to teach us the happiness of not having things."

The fundamental importance of a frugal lifestyle in which harmony with nature is the prerequisite for a sustainable society has been expressed by many Asian historical figures. For example:

Ando Shoeki an 18th century Japanese physician and thinker wrote about the importance of harmony with nature in a startling book "Shizen Shineido (The true way of life to live in accordance with nature)(3)". The book contains a story about four meetings held by, animals chaired by a monkey, birds chaired by an eagle, insects chaired by a beetle and fishes chaired by a whale. The conclusion of all four meetings coincided with the same statement that: Among all creatures the manner in which humans live is by far the most out of sync with nature. Only people, among all creatures, use money and many of them enjoy life without individual productive labor (agriculture). People make their own "laws" for the benefit of their own profit, most of which are against the law of nature. In short they concluded that the most harmful creature in the world of living things is without doubt people who live in a manner out of harmony with nature.

A similar way of looking at our way of life was written by a Chinese thinker Wang Chong as early as in 1st century in a book "Lunheng (Balanced Consideration)(4). In which is a sentence stating: We call locust a harmful insect because it devours crops we produce. However, if a locust can talk, it will say that crops are not for people only. Heaven gives crops for every creature so that humankind is a harmful 'insect' for locusts. Since the industrial revolution, people have consistently preferred "development" to the more natural and environmentally sound old fashioned way of life. It must be emphasized that a sustainable economy is an ethical imperative.

If we should decide to take the harder way, we should examine not only the perspective that it will guide us to a happier society but also what kind of measures should be taken to persuade people to follow it.

Hideo Shingu, Ph.D

Member of the Triglav Circle

Professor Emeritus, Kyoto University [Engineering and Energy Use]

Former Dean of the Graduate School of Energy Science at Kyoto University

Representative, Kyoto Energy and Environment Research Association

<http://www.enekan.jp/>

Triglav Recommendations:

1. The world community must recognize the fundamental importance of a frugal lifestyle in which harmony with nature is the prerequisite for a sustainable society.
2. A sustainable economy is an ethical imperative.

#### From the Big Bang to Harmony with Nature

Out of the Big Bang, 13.7 billion years ago, came hydrogen and helium, the elements that power most of the 60,000,000,000 stars in our Milky Way galaxy. But essential atoms for life, oxygen, carbon, and nitrogen, and rarer elements such as phosphorus and iron, formed over billions of years in the fiery cauldrons in the cores of giant stars, spewed into space by gigantic supernova explosions. They formed further generations of stars and planets. Armed with the necessary ingredients for organic chemistry, many became congenial habitats for the contingent evolution of life as manifest in our cosmic home, Earth.

Today seven billion people inhabit our planet. Human beings and domesticated animals make up 90% of the vertebrate mass today, up from 0.1% 10,000 years ago. Nearly 80% of Earth's land surface has been modified by humans. Both air and potable water, which have always seemed freely available, are becoming increasingly precious. Fortunately scientists discovered the man-made cause of the polar zones of ozone depletion before catastrophic consequences followed. Whether the toxins of climate change are heeded remains to be seen.

This is the decade of the exo-planets, the astronomical discovery of planets orbiting thousands of other suns. There must be hundreds of millions of habitable planets in our galaxy, but whether any are inhabited by other sentient beings we may never know. But think on this: how long will our environment remain congenial to thinking beings? If we destroy our habitat within a century, we would have been electronically communicative for scarcely two centuries, a mere whisper in cosmic time. If other civilizations last less than a millennium, our chances of co-existing with other sentient life in the vast sweep of time seem vanishingly small.

The human brain is the most complex object we know in the entire cosmos. We might just be the unique pinnacle of the universe's entire evolutionary process. Let us hope that we have the foresight and moral courage to make the hard choices necessary to preserve our species, our environment, and our heritage for the generations to come. Owen Gingerich

Professor Emeritus of Astronomy and of the History of Science, Harvard University Senior astronomer emeritus at the Smithsonian Astrophysical Observatory. Triglav Recommendations:

1. The world community should ponder how long our environment will remain congenial to thinking beings. If we destroy our habitat within a century, we would have been electronically communicative for scarcely two centuries, a mere whisper in cosmic time.
2. Human beings might just be the unique pinnacle of the universe's entire evolutionary process. Let us hope that we have the foresight and moral courage to make the hard choices necessary to preserve our species, our environment, and our heritage for the generations to come.

#### Harmony with Nature

It is both timely and urgent that the United Nations takes up this subject in the context of preparation for Rio + 20. As stated in the Secretary-General's Report on Harmony with Nature (A/66/302), there is an urgent need for a major shift in values in our societies and in the social, economic and environmental paradigm. Humanity's current domination and exploitation of nature has led to materialistic and consumerist societies that have produced unacceptable and dire consequences on the lives of humanity and all living creatures. Only through reverence for nature can we re-create our ways of life and a world that is more humane and inclusive. The UN provides an excellent and most appropriate forum for governments, the civil society, all other interested and concerned parties and people of good will to come together to raise awareness, share experiences, and discuss this very important topic, which, despite being mentioned in Agenda 21 twenty years ago, has not been taken up until now.

The concept of "harmony with nature" is hardly a new one and in fact forms the basis for both Confucius and Taoist teachings in China (around 500 BC). The focus of these philosophies was on how harmony could be restored and maintained between human life and the life of the universe. Out of this focus came the Confucian moral philosophy of "human heartedness" and correctness, and the Taoist philosophy of simplicity and self-purification. Both philosophers were proponents of the belief that Heaven, Earth and Humanity formed the three legs of the tripod. From these flow all creativity – all species, land, waters and civilization. The teachings of Confucius put the spirit of "the vastness of heaven and the thickness of the earth" into the heart of humanity, thus putting heaven, earth and humanity into a perfect whole. Knowing one's place within the greater world of the forces of nature, having respect, obedience and to be in tacit agreement with all creatures in nature are prerequisites for attaining serenity and harmony within the person, within the family, within the society and ultimately within the nation and beyond.

According to Confucius, the path of harmony lies in developing certain essential qualities that are innate in human nature called "the four virtues" — compassion or benevolence, righteousness, propriety, and wisdom. These are developed using oneself as a measure of one's conduct toward others – "Do not do unto others what you would not want others to do to you," is a famous Confucian saying. In practicing human-heartedness (including, for example, through giving and through the quest for wisdom), we gradually lose the selfishness that invades the spirit, and in becoming less selfish we cast off the false distinctions we once made between people, and between the world of people and the universe at large. Thus, we perceive the essential unity of the universe. In the process, we improve not only ourselves but also our environment. Just as the tree, true to its own nature, spreads and gives shade, and in turn influences its environment.

Since everything in the universe is linked together by a shared origin and a shared spirit or "energy", there exists a natural tendency toward harmony. In nature, everything works together perfectly – that is nature's way. Only people have the ability to stray from human nature as it originally expressed itself. For example, the leaf can do nothing but float and be carried; the sheep follows with no thought.

Harmony with nature is best demonstrated in the art of Chinese calligraphy. It has been said that "Words are the voice of the heart; calligraphy is the painting of the heart". The ancients penned characters as a means of spiritual elevation, for it was considered possible to express the essential spirit of the universe through brushwork. In Chinese thoughts, the act of writing a character is seen as parallel to the universal process of creation, and an embodiment of principles that govern all life. Just as "spirit" or "energy" creates all living things in the universe, the human spirit creates art. One stroke could signify the whole of nature and humanity. Like Taoism which believes that we need only yield - quietly and passively - to our inner law, while simulating our spiritual understanding of all nature, including the human, the art of calligraphy is seen as a matter of letting the true spirit within flow freely, without hindrance. It is the spirit that moves the brush which is guided by the heart. Finally, it is interesting to note that the Chinese character

"harmony" ("Ho") consists of two parts: the character "grain" on the left side and "mouth" on the right side, signifying that "Harmony" is that time when all creatures (not only human beings) will be nourished.

Gloria Kan

Member of the Triglav Circle

Former Chief of Branch in the United Nations

Department of Economic and Social Affairs

Triglav Recommendations:

1. Knowing one's place within the greater world of the forces of nature, having respect, obedience and to be in tacit agreement with all creatures in nature are prerequisites for attaining serenity and harmony within the person, within the family, within the society and ultimately within the nation and beyond.
2. Only through reverence for nature can we re-create our ways of life and a world that is more humane and inclusive.
3. All peoples must see that there is an urgent need for a major shift in values in our societies and in the social, economic and environmental paradigm if human well-being is to be sustained.

A Word about the Intrinsic Value of Nature

Intrinsic value refers to the power of nature to inspire. For example John Stuart Mill, saw nature as the cradle of thoughts and ideas. Nature's intrinsic value lies in its reflections of the laws and evolution of the universe, the source of its scientifically unknowable essence. It lifts the sensitive observer to the realm of the infinitude of ideas wherein one feels intuitively in harmony with nature. It empowers the imagination, it offers poetic inspiration, and prods intuitions about unseen but present ideas. It helps the restrained thought to transcend physical impressions to gain transcendent perspectives and thus cleanse and nourish the soul. The intrinsic value of nature perceived and introduced into the political discourse on problems confronting contemporary societies—affluent or destitute—enriches reflections and policy perspectives, reveals higher aspects of humanity and offers fresh ideas for political action.

Acquaintance with and sensitivity to the intrinsic values of nature's creations inform humanity that only a holistic approach to the problems of the environment can restore harmony with nature. Only very limited understanding of natural phenomena, [whether animals, plants, or other living organisms or whether elements of the biosphere, -- the atmosphere, the land or the sea], can be gained by reducing the study of nature to an examination of fragmented parts.

The futility of taking a fragmented approach to nature and environmental problems is well illustrated by the tragic situation of the honey bee presently encountered in many parts of the world. To deal with colony collapse disorder, one has to appreciate the intrinsic nature of the bee, the spirit and the instincts of the hive. The interconnected lives of bees are intrinsic to the hive. Left to nature, there is order and balance in the life of the bee which thrives in symbiosis with other living creatures and forms of life. It has its role in promoting the continuity of plants through the process of pollination, in reward for which it is richly fed by the nutrients produced by their blossoms. Humankind's disregarding of the complex nature and life of the bee and focusing only on keeping the hive alive for its instrumental value may be the underlying cause of the collapse.

In selectively reducing the hive to a mobile pollinating factory for human enterprises, the harmony of the hive has been disturbed, the bees stressed, their instincts all but destroyed, their food poisoned by pesticides or uprooted to make place for monocultures with their short blossoming periods. The "modern" honey bee has a much more limited and unpredictable access to pollens and nectars, than do its wild relatives in other places in the world. When food is scarce their honey combs are injected with corn syrup substitutes of questionable nutritional value. Certainly this syrup lacks the vital natural nutrients to which honey bees in uncontaminated habitats of wild flowers are accustomed.

In the interest of human business, foreign queens are hired to replace those native to the hive. Often their wings are clipped to prevent them from swarming out of the hive as they would have been prodded by instinct to do. Their natural life span of 4 to 5 years has been reduced to an average of two years to insure frequent renewal of the industrialized hive. They have been forced to forego nurturing by newly hatched bees whose first role in life is to feed the eggs and larva of future generations. Drones have been bred and directed to a particular bee, rather than allowed to seek their mates according to the radar of their natural predispositions. Considering all of these unnatural incursions into the life of the hive, it is not surprising that the immune systems of their inhabitants have been vastly weakened.

Ultimately, the stress caused by the imbalances and disharmonies of their unnatural lives may destroy these precious insects. The honey bee is the canary in the "coal mine" of human existence. Humankind must heed its warning. If humankind fails to appreciate the intrinsic value of these sublimely, amazing insects and continues to treat them as mere instruments for material gain and other questionable ends, their collapse may be final. And so millions of years during which the honey bees have served nature and humankind as a source of sustenance and healing potions, with byproducts of inspiration for poetry, music, art and politics will come to a crashing end. As go the bees, so for the song birds, the frogs, the polar bears, and the butterflies to mention a few of the endangered species.

With their loss and that of others similarly fated in the vast and relentless on going destruction of the natural world, humanity will not only be deprived of essential resources but will also lose the ephemeral wonders that inspire art, imagination, and creative thinking.

Barbara Baudot, Ph.D.

Coordinator of the Triglav Circle

Professor of Politics and International Relations

Former Economic officer with the United Nations

Triglav Recommendation:

1. People must consider the intrinsic value of nature and its creatures as vitally important. A holistic approach to imbalances in nature caused by human intervention is essential to slowing destruction and restoring balance.

Holism in Medicine and Nature: Humility Needed

We are living in an era where the health-care profession is characterized by super specialization, such that often patients are endangered iatrogenically. Fixing one part of the body can sometimes damage other parts.

This sobering fact is based on the realization that our knowledge of how our bodies work is fragmentary and still changing rapidly. So-called "Holistic" medicine seeks to

redirect attention to maintaining the health of our body as a whole and even, by extension, the alignment of the individual within his/her social framework (e.g. mental health). Because the number of variables involved is so large and their interactions so poorly understood, the scientific foundations of "holistic" medicine are spectacularly inadequate. Thus there is room for all kinds of practical interventions that include many verging on, or even being, outright charlatanism. The role of placebo effects is clearly large, but the underlying mechanisms are yet to be explored. Thus, our present state of knowledge can only justify a sense of humility with which we confront our ability to control "nature" and its influence on us.

Nelson Kiang

Nelson Y.S. Kiang

Member of the Triglav Circle

Founder and former Director of the Eaton-Peabody Laboratory of Auditory Physiology

Professor Emeritus of Otology and Laryngology at Harvard Medical School

Triglav Recommendation:

1. Whereas fragmentation and specialization have their limits and drawbacks—in medicine as in other endeavors— holism is necessary but extremely complex. Applied to health, or to the relationship between man and nature, holism should be approached with rigor and humility.

---

## U.S. Green Building Council

As we move toward the kickoff of the historic Rio+20 conference next year, the U.S. Green Building Council and the Green Building Council Brasil are focused on advancing the inclusion of a framework for sustainable and resilient urban infrastructure and the built environment. As we all work to inform the next global paradigm that will ultimately be forged in Rio, we have prepared the following joint position paper that elaborates on the importance of green, resilient communities and neighborhoods, sustainable and affordable housing, and green schools, with a central message that green building is at the vanguard of a new green economy.

By issuing recommendations to governments around the world who are working to bring to scale sustainable solutions in the areas of urban growth and the built environment, this paper provides a framework for action under the Rio+20 theme "the green economy in the context of sustainable development and poverty eradication" that is centered on the following strategies.

### 1. Foster Green Communities and Neighborhoods:

- Revise zoning codes and development ordinances to facilitate high-density and mixed-use development.

- Provide a range of incentives to developers for building green.

- Make public financing conditional on sustainability criteria.

### 2. Achieve Sustainable and Affordable Housing:

- Strengthen residential building codes to include thresholds for energy and water use.

- Integrate green features into government housing programs and funds for affordable housing.

- Work with private lenders to establish a green mortgage program.

- Incentivize homeowners and affordable housing project owners to undertake green retrofits.

### 3. Build Green Schools:

- Identify and implement health, safety, and environmental standards for school buildings.

- Establish a revolving loan fund for green school renovations.

- Implement a green purchasing policy for public schools.

- Integrate schools into broader urban and community planning.

### 4. Pursue Resiliency as part of the Sustainable Built Environment:

- Consider resilient infrastructure and buildings throughout the development process as an adaptation strategy for climate change.

- Pursue sustainability and resiliency strategies together wherever possible as they address equally important dimensions of climate change in urban environments—mitigation and adaptation.

- Invest in resilient, green buildings as a "no regret" strategy, as they prepare vulnerable populations against the long-term uncertainty of climate change while adding health benefits and improving the quality of life to affected individuals in the short-term.

## U.S. Partnership for Education for Sustainable Development

The U.S. Partnership for Education for Sustainable Development submits the following statements:

Education for sustainable development is a crucial component for the development of a sustainable and green economy and should be explicitly addressed. Essential outcomes should include:

1) structures to support a multi pronged approach that facilitates international collaboration on shifting our formal educational systems so that students and teachers at all levels of formal education learn how to be systemic thinkers and effective change agent skills to help create a sustainable future,

2) structures and processes to support resource sharing and strategy collaboration to educate the public about our sustainability challenges and possible solutions with an emphasis on two areas: building market demand for sustainable products, processes and policies, and decreasing demand for unsustainable products/processes/policies,

Through our work with over 40 national higher education associations in the U.S., national K-12 networks and business networks (e.g. [www.theSeedCenter.org](http://www.theSeedCenter.org), [www.aashe.org/dans](http://www.aashe.org/dans), [www.aashe.org/heasc](http://www.aashe.org/heasc) and [http://www.uspartnership.org/main/show\\_passage/83](http://www.uspartnership.org/main/show_passage/83) ), we have learned that you cannot build a green economy unless the people working in government, businesses, and non-profits and the larger public understand our joint global green and sustainability challenges and know how to participate in solutions in their roles as family member, worker, consumer, investor and community member. Therefore, education must be addressed.

Education also has a unique and important role to play in generating and supporting the partnerships that will catalyze a green and sustainable economy. Educators can research and identify working models and then share them with potential employers and employees so green businesses and green jobs can grow within a healthier context of sustainable development. With a growing national trend to incorporate education for sustainable development into the over 4000 higher education institutions and as well as into K-12 school systems, the U.S. education community is well positioned to and wants to both learn from others and contribute internationally to the crucial work of education for a sustainable future as a key component that needs to be explicitly addressed. Thank you.

---

## Ugandan Farmers Federation (UNFFE)

We farmers from the Ugandan Farmers Federation (UNFFE) wish to propose the following as approaches to revamping agriculture and animal production, and hope you will consider them for inclusion in Greening the Economy with Agriculture. They reflect our inputs into Rio+20.

### A. CROP PRODUCTION

- (i) **Provision of good quality seeds and planting materials.** Support should be extended to the seed companies in developing countries to enable them multiply adequate quantities and quality of seed.
- (ii) **Promotion of fertilizer use in areas with low soil fertility.** There is a need to repackage fertilizers in quantities that suit small holder farmers and are hence affordable.
- (iii) **Enhancing mechanisation, particularly tractorisation.** Individual farmers as well as farmer groups that are eager to procure tractors should get government support to acquire them. This will go a long way in alleviating the labour shortages for land preparation.
- (iv) **Ensuring provision of good quality agro-chemicals.** Governments should intensify the fight against poor quality agro-chemicals by strengthening the inspection services.
- (v) **Promotion of value addition.** Appropriate arrangements be put in place to enable organised farmer groups to access the agro-processing funds designated for the sub-counties. Maize Shellers, Rice Hullers and Cassava Mills should be given priority.
- (vi) **Climate Change mitigation and adaptation.** Special attention needs to be put to mitigating the bad effects of Climate Change and addressing all possible adaptation measures. Water harvesting techniques should be given emphasis and sizeable investment should be put into promoting irrigation. Government should also put up more weather stations, preferably automatic ones, to facilitate dissemination of more reliable weather information to the farmers to enable them plant in time.
- (vii) **Improvement in the marketing system.** Farmers should be encouraged and supported to market collectively, use good storage facilities, and national and regional commodity exchanges. Where necessary, government could consider intervening in the market, particularly whenever there are bumper harvests so that farmers are not discouraged from producing during the following season.

### B. ANIMAL PRODUCTION

- (i) **Provision of high quality livestock breeds.** The need for high quality livestock breeds cannot be overemphasized. Farmers should be assisted to acquire good breeds.
  - (ii) **Provision of livestock feeds and water.** Shortage of livestock feeds, and the quality of the feeds leaves much to be desired. Deliberate efforts should be made to encourage and support livestock feed companies to increase production and stay in the business. There is also need to invest in grass and legume seeds for pasture improvement. Water capture methods are essential, to ensure livestock water.
- Further, emphasis should be put on programmes designed to control invasive weeds that destroy pastures and grazing land. Such invasive weeds include Lantana camara (kapanga) which not only destroys pastures but harbours tsetse flies and is poisonous to the animals.
- (iii) **Animal diseases control.** Farmers' ability to control animal diseases is still limited by hindrances to access drugs such as de-wormers, acaricides and vaccines, particularly the ones for poultry. Some of the drugs are either not readily available within the vicinity of the farmers or they are too expensive. Support should be extended to the local stockists and the Veterinary Staff in the field are facilitated to respond to the farmers needs.

- (iv) **Value addition.** It is necessary to set up chilling and processing facilities. Groups/cooperatives should be encouraged to enable market access with some bargaining power. Further, it is very important that government puts in place strong law enforcement machinery to promote good hygiene during transportation of milk from the farms to the collecting/marketing centres.

### C. FISHERIES

- (i) **Capture Fisheries.** It is important to promote good fishing practices through enforcing the necessary laws and regulations which include the following:
  - a) using the right fishing gear b) using the appropriate fishing boats c) limiting the number of boats allowed to fish on a given Lake d) strengthening the capacity and operation of the Beach Management Units

Possibilities of stocking water bodies such as big swamps and valley dams should be explored.
- (ii) **Fish farming.** This should be promoted and willing farmers should be assisted in digging the ponds. Besides, fish fries (fingerlings) breeding centres should be set up.

## UK Environmental Law Association (UKELA)

### UKELA's proposal for the Rio Conference on Sustainable Development

#### Executive Summary

The UK Environmental Law Association propose that the Rio Conference addresses the following regulatory issues, for the reasons given in this submission:

- I. Achieving consistency in language and terminology related to sustainable development.
- II. Developing a flexible international definition of Sustainable Development to apply universally. However an overly prescription or limited definition of Sustainable Development will hamper the development of law through other channels.
- III. Considering the role of guidance to be used as a mechanism to give effect to duties.
- IV. Considering the extent that regulations should be made consistent to ensure that reporting obligations are published, monitored and reviewed and to ensure consistency in the process, content and quality of information.
- V. Developing mechanisms to ensure that information provided in voluntary and mandatory reports are meaningful. This could probably be addressed through increased auditing requirements and developing the role of regulators in both guidance and enforcement capacities.
- VI. Developing regulation to ensure reporting obligations on local government are publicised, monitored and reviewed.
- VII. Scrutinising the interaction between the role of law and the development of international standards more closely.
- VIII. Giving consideration to an international court for the environment.

#### The UK Environmental Law Association

1. The UK Environmental Law Association aims to make the law work for a better environment and to improve understanding and awareness of environmental law. UKELA's members are involved in the practice, study or formulation of Environmental Law in the UK and the European Union. It attracts both lawyers and non-lawyers and has a broad membership from the private and public sectors.

2. UKELA's current priorities include:

- Informing and actively influencing the broad law and policy debate on climate change including the measures to reduce greenhouse gas emissions and manage their impacts at the international, EU and domestic level
- Helping deliver more effective and efficient environmental regulation including enforcement at the EU and UK level, not lower standards nor less regulation unless the same or better outcomes will be achieved

3. UKELA works on a UK basis and seeks to ensure that best legislation and practice are achieved across the devolved jurisdictions.

#### Issues

##### 1.1 Terminology

*Proposed outcome:* that the Rio Conference achieves consistency in language and terminology relating to sustainable development.

##### *Reasons*

4. The term 'Sustainable development' was conceived to reconcile tension between environmental and developmental concerns. The term is used globally in policies, strategies and treaties such as UNFCCC. It is often also used interchangeably with the term 'sustainability' although the terms denote different things. 'Sustainability' is used to describe an aspiration for finding a better way for humans to live within our support system. 'Sustainable Development' is the policy manifestation of society's attempt to achieve that goal.

5. The inconsistent and vague use of language is a fundamental issue that needs addressing to provide an agreed outcome on how the goal of sustainable development should be reflected in legal systems. For example, research, standards and policy documents often refer to 'the principle of sustainable development' or 'principles of sustainable development' or the objective of 'sustainable development'. The lack of consistency and precision is probably a reflection of the diverse stakeholders interested in the development of sustainable development.

6. In legal terms a 'principle' is a rule or standard that:

- is undisputed in legal doctrine
- does not need to be proved
- provides a foundation for the development of other laws and regulations.

7. There are generally accepted principles associated with environmental law and policy, such as the precautionary principle and the preventative principle, that are used to underpin environmental laws at all levels. Sustainable development is often cited as one of these. These principles are general guides to action rather than detailed rules. The status of these principles can alter because of changes in policy. For example, as a result of changes in waste policy the proximity principle is no longer a central principle of EC waste management law. Other principles are so well established that there is discussion on their status as binding norms of international law.

##### 1.2 Definitions and the law

*Proposed outcome:* that the Rio Conference:

- achieves consensus on the development of a flexible international definition of Sustainable Development to apply universally. However an overly prescription or limited definition of Sustainable Development will hamper the development of law through other channels.

- considers the role of guidance to be used as a mechanism to give effect to duties

#### Reasons

8. The most commonly referred definition of Sustainable Development is 'Development that meets the needs of the present without compromising the ability of future generations to meet their own needs'. [1]

9. No definition of Sustainable Development is found in primary International, European or UK law. The European Union has used the Environmental Impact Assessment Directive and the Strategic Environmental Assessment Directive as means to give effect to the objective of Sustainable Development.

10. Whether 'the law' has played a secondary role in the development of the definition as a global term is an issue that has been raised on many levels. The 'law' can operate on different jurisdictional levels but it is also a term that encompasses:

- the law expressed as a statutory duty/right
- the law embodied in Contract
- the law of Tort

#### Duties and rights

11. Whilst the term 'sustainable development' is used in some UK and Scottish statutes, there is no definition within the statutes.

12. Where Sustainable Development is expressed as a duty in legislation, the statute requires that a particular body or group of public bodies should act in a certain way. Some of the duties are mandatory but vary in their clarity, strength and the extent they are qualified by other provisions. The discretions that are introduced can be formulated in a broad way, or be limited to ensure that the authority acts in a way that constrains or structures the discretion.

13. Conferring rights on parties in the context of Sustainable Development may require a shift in legal boundaries: for example, it might create new causes of action such as a right to challenge development based on the global allocation of natural resources; or confer standing (*locus standi*) on currently unrecognised claimants (e.g. NGOs standing as advocates for future generations). This is not impossible, taking into account intergenerational principles and the growing application of wild law.

#### Contract

14. The use of contract as a body of law governing relations between legal persons is another area where the law concerning the application of the goal of sustainable development may lead to legal development, notwithstanding the lack of a precise definition. Whilst the use of express contract provisions, memorandum of understandings and side letters are means employed to ensure that the economic, environmental and social objectives of sustainable development are incorporated into a contract, enforcement for breach of these terms will depend on how the courts interpret the express terms of the contract. Although the UK courts have not had to provide a judgment on whether sustainable development is an implied term in a contract (necessary for 'business efficacy'), it is not impossible that a court in the future could be asked to provide a judgement on the issue, particularly where the trend is towards business and government developing the objectives of sustainable development and sustainability reporting. For example, it may be an implied term of a contract for the design and build of a new commercial building with a projected lifespan of 30 – 70 years (depending on location) that it is both resilient to the reasonably foreseeable impacts of climate change and 'sustainable'.

#### Tort

15. The question of whether a party has a 'duty of care' owed in relation to sustainable development principles will depend on the nature of the transactions between the parties. Where sustainability is key to a contract (for example in public procurement) there may be room to argue for damages or restitution for unjust enrichment where one party has failed to carry out its services in accordance with what is required.

#### Highlighting the issues

16. One of the reasons that legislation has played a secondary role in the development of the meaning of the term 'sustainable development' is that the law expressed as a statutory duty, had not been a major driver to ensure the achievement of sustainable development. Arguably, the efficient drivers are energy efficiency costs and savings/resource shortages/business reputation.

17. One problem with an imprecise definition is that it is more difficult for the courts to interpret and enforce in a way that is consistent with the legislature's intentions. Where duties are imposed by legislation on an agency including the terms 'sustainability', without an exact definition, this can give rise to issues. For example, Natural Heritage (Scotland) Act 1991 required Scottish Natural Heritage (SNH) to 'have regard to the desirability of securing that anything done whether by SNH or any other person, in relation to the natural heritage of Scotland is undertaken in a manner that is sustainable. The Act provided no definition of 'sustainable' and consequently SNH had to define the term for its own purposes. Given the need for integrated solutions as a matter of public policy it is not useful for every agency to develop its own definition and approach to sustainable development.

18. On the other hand, the imprecise nature of the term may allow for it to be less static and the provision of ministerial guidance in exercising the 'sustainable development' objective or duty can be a beneficial approach.

19. There is also the issue of enforcement. None of the statutes create criminal or administrative offences in relation to sustainable development.

20. Sections 1.3 – 1.5 give further legal background on the current issues concerning the application of 'sustainable development'.

### 1.3 Principles incorporated into Sustainable Development

21. There are generally accepted principles associated with environmental law and policy, such as the precautionary principle and the preventative principle, that are used to underpin environmental laws at all levels. Sustainable development is often cited as one of these. These principles are general guides to action rather than detailed rules.

22. The concept of sustainable development incorporates the principles of intergenerational equity, the sustainable use of natural resources, equitable use of resources and the principle of integration. Sustainable Development was initially reflected in EU law through the 'integration principle'. The integration principle is set out in Article 11 of the Treaty on the Functioning of the European Union as 'Environmental protection requirements must be integrated into the definition and implementation of the Community policies and activities, in particular with a view to promoting sustainable development'.

23. Intergenerational equity is the principle of administering and preserving resources and assets (such as quality and diversity of environment), which do not belong to any

generation but are to be administered and preserved in trust for all future generations.

24. Intergenerational equity is argued to be a key principle underpinning sustainable development, as inequities are a cause of environmental degradation. Poverty deprives people of their ability to exercise choices in an environmentally sound manner.

#### 1.4 The approach of the International Court of Justice and the European Court of Justice

25. In international law, sustainable development as a legal concept has tended to be found in mostly 'soft law' documents such as Agenda 21.

26. In *Gabcikovo-Nagymaros Project* (judgement 25 September 1997, para 140) the International Court of Justice referred to Sustainable Development as a concept which necessitates the reconciliation of economic imperatives with environmental protection, thus enhancing its understanding in international law. There is academic opinion that by invoking the concept of sustainable development, the ICJ indicates that the term has a legal function and both a procedural/temporal aspect. In a separate opinion, Vice President Weeramanthy discussed the role of sustainable development in international law in the context of legal instruments and the historical background, concluding that: 'the principle of sustainable development is ... a part of modern international law by reason not only of its inescapable logical necessity, but also by reason of its wide and general acceptance by the global community'.

27. Before the Lisbon Treaty the 1992 Treaty of the European Union set an objective to 'promote economic and social progress which is balanced and sustainable'. The Lisbon Treaty changed the wording by committing to sustainable development as a concept in its own right (Article 3(3) of the revised version of the Treaty on European Union).

28. There are very few references to Sustainable Development in EU case law. The following cases have dealt with the principles indirectly: *Greece v Council Case 62/88* and the Court of the First Instances judgment in *Artegodan v Commission, Case T-74/00* where it referred to 'the protection of public health, safety and environment is to take precedence over economic reform'. These two examples are by no means exhaustive.

29. In the last decade, there have been increasing developments in the reasoning of the European courts in relation to sustainable development as a concept, and the environmental principles that are said to comprise it (the precautionary principle and polluter pays principle in particular). These legal developments have given a higher profile to these principles in EU law but do not yet form a coherent body of case law, nor do they compel sustainability-focused policy outcomes. Increasingly academic work is being done to analyse and appraise the complex legal changes being brought about by environmental principles in this particular legal jurisdiction (as well as in others), and the analysis is far from straight forward.[2]

#### 1.5 The approach of the UK courts and legislation

30. In the UK 'sustainable development' is appearing more often in UK and Scottish legislation in a variety of legal forms such as duties, objectives and procedural requirements. There is no standard form of a duty. The provisions vary greatly.[3]

31. The English courts have acknowledged 'sustainability' as a material consideration in local planning decisions. A material consideration is capable of being a main issue in planning law decisions and may deserve significant weight.[4] It is often the case that compliance with sustainability provisions occurs after a successful judicial review process. This is a reactive process and does not ensure compliance with provisions at an early stage. It is also a time consuming and costly process.[5]

32. The coalition government's proposed text for a presumption in favour of sustainable development included in the Draft National Planning Policy Framework(DCLG, 24 July 2011) includes an extended definition of the 'Brundtland Definition'. The presumption states: 'There is a presumption in favour of sustainable development at the heart of the planning system, which should be central to the approach taken to both plan making and decision making'. The issue is what this presumption means. Framed that way the presumption appears to promise an easier ride for developers. If there were to be a focus on the global allocation of natural resources to give effect to the concept of 'inter-generational equity' derived from the 'Brundtland definition' then it might impact on development, by limiting developments to give effect to 'sustainability' in a global context,

#### 1.6 The question of mandatory reporting

*Proposed outcomes:*

33. It is proposed that the Rio Conference achieves consensus on:

- the extent that regulations should be made consistent to ensure that reporting obligations are published, monitored and reviewed and to ensure consistency in the process, content and quality of information
- developing mechanisms to ensure that information provided in voluntary and mandatory reports is meaningful. This could probably be addressed through increased auditing requirements and developing the role of regulators in both guidance and enforcement capacities
- developing regulation to ensure reporting obligations on local government are publicised, monitored and reviewed

*Reasons*

34. Companies are using voluntary reporting or are required to produce mandatory reports to demonstrate how they are managing the environmental and social impacts of their operations. In the UK, listed companies are required under the Companies Act 2006, to set out in their business review (using Key Performance Indicators (KPIs)) environmental, employee, social, community and supply chain issues. Although this is a legal requirement there is no statutory reporting standard and no requirement that the information in the enhanced business review is audited. In many cases, research by various companies including government agencies has shown that although voluntary and mandatory reporting has increased there is a lack of meaningful data.

35. Legislation can also be used to ensure reporting obligations on local government are publicised, monitored and reviewed. For example statutes may require Ministers or public bodies to produce a strategy, scheme, plan or report on sustainable development. Although these provisions can be easily complied with the question is how this is monitored and enforced. Judicial review can be used but the process is slow, costly and not the most effective means of enforcement.

#### 1.7 The use of International Standards

*Proposed outcomes*

36. It is proposed that the Rio Conference addresses the need for closer scrutiny of the interaction between the role of law and the development of international standards.

*Reasons*

37. Increasingly international standards are being developed to help organisations address issues like life cycle of products, environmental impact, and social impact (such as

ISO 26000), health and safety and employment issues and implementing sustainability management systems. The International Standards board has recognized the need to produce a guide for all standard writers with guidelines for addressing sustainability issues. As definitions such as 'sustainability' are being developed, the lack of an international agreement on the term will impact on the application of the principle in all standards that refer to the guide.

### 1.8 The issue of international resolution of disputes

#### *Proposed outcome*

38. It is proposed that the Rio Conference considers the case for an international court for the environment.

#### *Reasons*

39. Environmental disputes at a domestic and international level are becoming more frequent. This includes actions on misrepresentations by companies in their CSR policies. Resolving disputes at international level is problematic. Often routes such as arbitration are preferred and very little resort is had to the International Court of Justice. The use of different procedures to determine resolutions also leads to inconsistencies. The appellate division of the World Trade Organization also hears environmental cases. However there is also the issue of a lack of enforcement action.

40. For a further discussion on the international dispute resolution see the submission to the Rio 2012 by the BOND-DEG – UK NGO's joint Rio Narrative

[1] Our Common Future (Brundtland Report ) 1987.

[2] E Scotford, Environmental Principles and the Evolution of Environmental Law (Hart Publishing, forthcoming 2012).

[3] See for example the Greater London Authority Act 1999, the Environment Act 1995, the Water Industry Act 1991 as amended by the Water Act 2003.

[4] See R (Ludlam) v the First Secretary of State, Derbyshire DC [2004] EWHC 99.

[5] Horsham DC v First Secretary of State, Devine Homes plc [2004] EWHC 769.

mso-bi... To better integrate sustainable development policies within the UN system, governments need to support overall integrative mechanisms within the UN system that better align the social, economic and environmental pillars of sustainable development.

- In order to strengthen national governance, other policy instruments can complement regulation if they are carefully designed. But they are not panaceas.
- International economic institutions must advance transitions to a sustainable economy, including by multilaterally harmonized systems that allow for discriminating between products on the basis of production processes, based on multilateral agreement. Global trade and investment regimes must be embedded in a normative context of social, developmental, and environmental values.
- In order to fill regulatory gaps in international sustainability governance, new or strengthened international regulatory frameworks are needed in several areas, including on emerging technologies, water, food, and energy.
- Public-private governance networks and partnerships should be streamlined and strengthened. However, there is still a strong need for effective and decisive governmental action.

(see policy brief on Transforming Governance and Institutions – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

### **New and emerging challenges**

- Concerted, global and immediate action is needed to reduce the risk of fundamentally disrupting the stability of the Earth system, with consequences for global economic and political systems. Actions to enhance the resilience and decrease the vulnerability of human communities are also urgently needed. This must be accompanied by concerted global and enhanced action aimed at bridging the development gap between North and South and eradicating poverty, taking into account a growing world population.
- Specific topical priorities which require urgent action include climate change, food security, water security, energy security, biodiversity loss, disaster risk reduction, and sustainable consumption and production patterns, with an overarching goal of human wellbeing and environmental and economic sustainability.
- Other immediate challenges to be addressed include: ocean acidification, pollution and overfishing; disruption of the nitrogen and phosphorus cycles; global chemical pollution; deforestation; and megacities and urbanization; all of which need action based on the latest science and technology, coordinated targeted observations and research, and improved governance.
- Addressing human health needs and concerns should generally be among the priority actions towards sustainable development and poverty eradication. It should also be central in addressing most if not all new and emerging challenges identified above. The increasing global mobility of people, animals and goods, as well as global warming, is leading to new disease risks in countries and regions where these diseases did not occur before.

(see the series of 9 Rio+20 policy briefs – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

### **Climate change:**

- The immediate priority is to stabilize the global climate at a temperature of no more than 2°C above pre-industrial levels. We must reduce the carbon intensity of the global economy, undertake a massive decarbonisation of the energy sector, and effectively manage Earth's carbon and radiant energy budgets.
- As climate change is already occurring, action is needed by all countries to design and implement strategies to adapt to the consequences of climate change and to limit its socio-economic costs for societies worldwide, with a particular focus on the most vulnerable regions, nations and socio-economic groups. Participation of a broad range of stakeholders will be essential in this undertaking.
- Action is also critical in the domain of science. We must continue to improve our understanding of the climate and Earth system, to refine our predictive tools and reduce uncertainties in projections of future climate and its impacts, particularly at the regional level. Social science research into adaptation and good governance will also be crucial.

**Water security:**

- Water security is vital to all social and economic sectors as well as the natural resource base on which the world depends. But an expanding population, growing economies and poor water management are putting unprecedented pressure on our freshwater resources.
- We simply cannot continue to use water as wastefully as we have in the past; we have to change the way we manage our water resources.
- Scientists and policy makers have a joint responsibility to work together in the development of more sustainable solutions to existing and emerging water problems.
- Water must be given the prominence it deserves on the global agenda
- Human and environmental water needs must be balanced to safeguard biodiversity and ecosystem services. Unavoidable compromises should be mediated by science rather than lobbies.
- Water security has multiple dimensions, including social, humanitarian, economic and ecological. Major decisions on water resource management must be made therefore with broad cross-sectoral input.
- There is a need to improve the availability of data and information, particularly on transboundary water resources and planetary thresholds. We need to evaluate our water needs and prioritize allocations.
- There is a need to introduce and implement strong policy and legal frameworks (i.e. water laws).
- Proper finance mechanisms are required to ensure sustainability of water services, while capacity building is required at all levels.

(see policy brief on Water Security – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

**Food security:**

- The planet needs to feed an estimated 9 billion people by 2050. There will be a need for a knowledge-based focus on enhancing sustainable production and productivity: increasing yields while minimizing environmental footprints.
- Waste reduction at all stages of the food system (post harvest losses, transport, storage) and resolving distribution issues is also essential, as this would provide much of the extra food needed for a growing population.
- A strong foundation of multi-lateral and cooperative mechanisms that work across disciplines, sectors and national boundaries needs to be put in place. Institutions operating effectively at multiple levels will be at the centre of sustainable food systems; these will need to be flexible, promote appropriate use of innovative technologies and policies, and recognize the increasingly important role of non-state actors in enhancing food systems.
- As the greatest proportion of the world's poor are small-scale farmers, agriculture must also be a key focus for poverty eradication.
- Investment is needed in training, knowledge sharing and extension services for farmers at all scales.
- Greater involvement of farmers, including small holders and big agro business, in planning and decision making is needed.
- Research is needed for multiscale, multi-level analyses of the dynamic linkages between food security, environmental concerns and development issues.
- A food systems approach is recommended. This links the activities of producing, processing, retailing and consuming food with the outcomes of these activities for food security and other societal goals, showing how food insecurity arises and also providing a framework for policy development to meet the food security challenge.
- A transition to healthier diets as societies grow richer is needed to reduce both environmental and public health burdens.
- Food trade needs to be enhanced to encourage secure access to nutritious food for the poorest and most vulnerable.
- There is an urgent need to develop technologies and policies that will result in sustainable production practices.
- Above all, there is need for a strong focus on resilience, equity and sustainability.

(see policy brief on Food Security – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

**Biodiversity and ecosystem services:**

- We share this planet with millions of other species and varieties of life, and depend on ecosystems for all our basic needs. While current trends in biodiversity and ecosystem services are sharply and dangerously negative, the right actions, developed and implemented promptly, can restore a biologically rich and ecologically viable planet.
- The multiple values of biodiversity and ecosystem services should be incorporated into policy and management decisions.
- Green economies should be created based on 'inclusive wealth', which includes all forms of capital – natural, social and human as well as financial and manufactured – and in which intergenerational wellbeing increases over time.
- Biodiversity and ecosystem services should be incorporated into water and land-use planning at all scales from local to global, including both protected areas and production landscapes and seascapes.
- Policies and practices should be implemented that reduce inequities in access to the benefits derived from biodiversity and ecosystem services, and ensure that those who bear the cost of their provision are fairly compensated.
- Ecosystem governance and management should be restructured to recognize that ecosystems transcend political boundaries.
- Global governance institutions should be developed that work in partnership with national institutions, local organizations and the private sector, to address global-scale drivers of biodiversity change.
- The Strategic Plan for Biodiversity 2011–2020 and the Aichi Targets should be implemented at all scales.

- The important contributions played by the planet's forests and oceans should be recognised and terrestrial and marine ecosystems should be linked in policy planning.
- Indigenous peoples and their knowledge should be involved in biodiversity research and in the development of conservation strategies and plans.

(see policy brief on Biodiversity and Ecosystems – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Energy for all:***

- There is no uniform solution for making low-emissions sustainable energy available globally, including for more than one billion people without access to modern energy services. Decisions regarding the use of any given energy technology must be based upon thorough analyses of technological and economic feasibility, diverse energy needs, as well as analyses of long-term sustainability and compatibility with the goals of climate stability, environmental protection, social equity, and personal health and safety.
- The optimal energy mix for any particular country and sector will depend upon the natural resource base, trade access to energy sources and socio-economic context.
- Efforts to further develop and deploy energy technologies must focus in particular on technologies for energy efficiency and conservation, as well as on advanced renewable energy systems.
- In this context, R&D and investment in renewable and alternative sources of energy should be significantly stepped up; including feed-in-tariffs to incentivise investment in renewable energy.
- There is a need to develop strategies for achieving greater energy efficiency in all sectors, notably the construction and transport sectors.
- In the transportation sector, urgently needed actions include diversification of engine fuels, increased use of low-emissions vehicles, and a strong emphasis on urban mass transit. Enhancing support for R&D in this sector will be essential.

(see policy brief on Energy Sustainability: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Disaster risk reduction:***

- The world faces an increasing loss of human lives, livelihoods and economic assets due to natural and human induced disasters. There is an intrinsic relationship between disaster risk reduction, sustainable development and poverty eradication. An urgent priority is to strengthen significantly disaster preparedness using knowledge, innovation and education for effective response at all levels.
- Integrated natural and social sciences research should be developed, including improved methods for predictive multi-risk assessment and socioeconomic cost-benefit analysis of risk reduction action at all levels. The technical and scientific capacity to develop and apply methodologies, studies and models to assess vulnerabilities to and the impacts of hazards should also be strengthened.
- The resilience of nations and communities to disasters should be enhanced through people-centred approaches to the entire disaster risk cycle, including prevention, preparedness and emergency response as well as recovery and rehabilitation.

#### ***Sustainable consumption:***

- Unsustainable consumption patterns in industrialized countries and in some parts of the emerging and developing economies are one of the main factors putting increasing pressure on the planet's social, economic and environmental systems.
- Addressing this problem requires urgent action, and this should be considered throughout efforts to move towards a green economy and sustainable development.
- Practical action, including awareness raising and education, should be underpinned by appropriate knowledge and transdisciplinary research across the multidimensional factors of economics, waste and environment, human behaviour, and lifestyle.
- Communication of clear messages to the public on sustainable consumption and waste reduction will be key, as will clear strategies for public action.

(see policy brief on Human Wellbeing: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

These recommendations are taken from work by the worldwide international scientific community for Rio+20, particularly a series of ICSU-UNESCO regional science and technology workshops in the five UN geo-political regions (see: [www.icsu.org/rio20/regional-workshops](http://www.icsu.org/rio20/regional-workshops)) and a series of nine policy briefs prepared specifically for Rio+20 (see: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)) in the context of the Planet Under Pressure science and policy conference (London, 26-29 March 2012). The recommendations also draw on consultations with the constituencies of the scientific and technological community spanning all relevant disciplines in the natural, social, economic, engineering and health sciences, in cooperation with the International Social Science Council (ISSC), the World Federation of Engineering Organization (WFEO), UNESCO, WMO, UNEP and UNU. For further information and recommendations from a disciplinary perspective see submissions for Rio+20 by ICSU's Scientific Union Members ([www.icsu.org/rio20/icsu-members](http://www.icsu.org/rio20/icsu-members)).

## United Methodist Church – General Board of Church and Society

The **United Methodist Church – General Board of Church and Society** – an international NGO in consultative status with UN ECOSOC based in New York and Washington, DC, hereby submits its position on a number of issues related to the Rio+20 Conference.

In its Book of Resolutions, The United Methodist Church declares that: "The indivisibility of human rights underscores the understanding that freedom without food is hollow, that justice without jobs is like a clanging cymbal, and that liberty is a sham when people do not have land to inhabit and farm.... Societies become peaceful when the demands of justice are met. Justice becomes not only a dream but a reality when the implements of war give way to implements of peace. Food and jobs, also, are implements of peace. Would that indeed, at the end of the day, no child, no woman, and no one, goes to bed hungry with an empty stomach." (BOR, # 6025)

#### A. Expectations for the Outcome of Rio+20:

- The United Methodist Church affirms human rights as a foundational principle, universal and indivisible in all its aspects – civil, political, economic, social and cultural. The human rights approach to sustainable development is crucial in re-affirming and promoting sustainable development.
- Human rights are founded on human dignity. Human dignity affirms the well-being of every person, enabling and empowering each one to forge their well-being without imperiling the well-being of future generations. Rio+20 must affirm empowerment, equity and justice as fundamental elements of a sustainable future.
- At Rio+20, governments must re-affirm and not renege on already available and legally-binding international human rights instruments, including the Right to Development. Together with the human rights obligations of states, Rio+20 must also be guided by commitments previously made by these states in Rio 20 years ago and in subsequent reviews of the UNCS process.

#### B. The Green Economy:

- Economic justice must be at the foundation of Rio+20's discussion of the economy, including proposals for a green economy. This entails an economy that is just, equitable, and sustainable.
- Economic justice demands that any notion of economic growth must be the result of participatory decision-making – inclusive of all sectors of society, but especially the poor and vulnerable – forging a future that redounds to their well-being and not just based on market conditions that favor the private sector.
- Economic justice demands that control of resources should be in the hands of those who need and depend on them the most. This requires that corporate control of these resources should be regulated fully so as to conform to human rights standards – including those standards that protect sustainable production and consumption.

#### C. Sustainable development goals:

- As it is, the Millennium Development Goals – already dubbed as minimum development goals – are in danger of meeting their targets by 2015. Any new set of goals must not only re-instate the human rights-based approach that was lost in the negotiation of the MDGs, but also must now include clearly-defined mandates for all stakeholders in the achievement of sustainable development. Such mandates must enunciate duties and obligations that are measurable for success or failure.
- Local and national bodies dealing with sustainable development are crucial in realizing global sustainability. National plans must be mandated by Rio+20 so that whatever agreements are forged have both local and global implementing mechanisms.

#### D. Civil society participation

- The determination of sustainable development that meets the needs and capacities of peoples and the earth arises out of truly inclusive, consultative, democratic and participatory processes among all stakeholders. Civil society's role in the implementation of Agenda 21 and agreements that will come out of Rio+20 Conference is crucial and indispensable and must be clearly inscribed in any agreements forged in Rio. It is highly recommended that a consultative body of all stakeholders, including civil society be formed and mandated to support Agenda 21 and Rio+20 agreements.

We offer the above, and our endorsement of the position paper below by the CoNGO Committee on Sustainable Development as our submission for the Rio+20 Conference.

*Environmental, social and economic development that meets the needs of the present without compromising the ability of future generations to meet their own needs.*

#### Earth Summit Rio + 20 Discussion Paper Summary and Recommendations for Government

earthsummit2012discussionpaper@gmail.com

#### General Background

Twenty years ago, following the first Earth Summit in Rio de Janeiro, Maurice F. Strong, Secretary General of the Summit, said that "the movement to turn the world from its self-consumptive course to one of renewal and sustenance has unmistakably spread." <sup>i</sup> He added, however, that "there is not yet a concerted and decisive response to the magnitude and urgency of the task." As Strong said, "There is still a great deal to do."

Today these words ring true. There is still a great deal to do! An unsustainable and unjust model of development prevails. It commodifies and exhausts Earth's resources and relies heavily on unequal trade liberalization which favors developed countries and transnational corporations over people, healthy ecosystems, and the needs of present and future generations. A growing inequality exists between the wealthy and those who are impoverished by the lack of access to adequate food, water, energy, land, education and health services.

This growing gap in wealth is recognized as one of the root causes of conflict and violence worldwide. As the Johannesburg Summit acknowledged, these "deep fault lines that divide human society between the rich and the poor and the ever-increasing gap between the developed and the developing worlds pose a major threat to global prosperity, security and stability." <sup>ii</sup> The 2012 UN Conference on Sustainable Development (Rio+20) must reclaim and advance an ethical and inclusive global vision that promotes ecological and social integrity, the global common good, and the well-being of all peoples and Earth. Moreover, in the words of the Earth Charter, Rio+20 must move us to realize our "responsibility to one another, to the greater community of life and to future generations." <sup>iii</sup>

#### Opportunities and Challenges

Mr. Sha Zukang, Secretary General of the upcoming Rio + 20 Conference, said, "Rio + 20 is humanity's chance to commit to a transition to a green economy, to lift people out of poverty. We cannot wait another 20 years." The 1992 Summit's promise to make "environmental protection... an integral part of the development process" has not been fulfilled, and its call to action document, *Agenda 21*, which at the time 178 governments agreed to adopt, is largely forgotten. This document provided a framework for action to be implemented globally, nationally and locally by governments, organizations of the United Nations and major groups in every area in which the activity of humans has a direct impact on the environment. Why this failure when the international community has the technological expertise, a clearer, scientifically-based understanding of Earth as a living system of interdependent, interrelated components of which humans are a part, and the financial resources to explore and implement more sustainable modes of

development? Clearly, there is reluctance to critique present economic and social systems, as well as a lack of political will for action based on such critiques.

The October 2010 Report of the Secretary General, *Harmony With Nature*, "provides an overview of how the life-style of the twenty-first century, through its consumption and production patterns, has severely affected Earth's carrying capacity, and how human behavior has been the result of a fundamental failure to recognize that human beings are an inseparable part of nature, and that we cannot damage it without severely damaging ourselves. ... The philosophy of holism, embodied in the concept of sustainable development, rests on an understanding that all things are interconnected and that nothing occurs in isolation." <sup>iv</sup> Any substantive alteration of one of Earth's components affects the health and vitality of the entire system.

The prevailing economic theory, grounded in limitless expansion and growth, is in contradiction with finite resources. The competition that is a hallmark of the current model has led to ever increasing inequity between the rich and those who are living in poverty, at both global and national levels. Furthermore, at the time of the 1992 Earth Summit, one of Maurice Strong's greatest disappointments was the failure to move firmly enough against the world's industrial-military complex. Since then, the business of war has intensified – destroying human life and well-being, abusing the environment, consuming resources and blocking the United Nations' main agenda of fostering sustainable pathways to peace and security. Therefore, we see the following elements, rooted in an equitable and holistic understanding of the interconnectedness of all of life, as foundational in the deliberations that will take place during Rio+20.

### Green Economy

The limitless growth and production model of development must be abandoned. We support a green economy that reflects an integration of the environmental, social and economic pillars of sustainable development; that places equity of access to green technology, jobs and practices for developing countries over green capitalism, which disproportionately benefits developed countries and transnational corporations. "A green economy results in improved human wellbeing and social equity, while significantly reducing environmental risks and ecological scarcities...it can be thought of as one which is low carbon, resource efficient and socially inclusive." <sup>v</sup>

A green economy must recognize the limits of the free market economy, and favor a more locally-based economy; respect the diversity of cultures, and the consequent need to develop "diverse green economies;" while addressing structural change that would genuinely address the eradication of institutional poverty and its accompanying injustices. In addition, in a green economy GDP cannot be the strategic marker of development to the exclusion of all other indicators. It is important to utilize a variety of indicators, including the *Human Development Index* (HDI), based on the premise that "people are the real wealth of a nation." <sup>vi</sup> The HDI, however, does not currently include any environmental measures in its calculations despite an emphasis on the environment in the 2010 *Human Development Report* – "human development, if not sustainable, is not true human development."

### Human Rights and Earth Rights

We firmly advocate a shift from an ethic of exploitation to an ethic of right relationship – an ethic based on the rights of humans and of Earth as essential for individuals, society and ecosystems to flourish. The concept of the rights of nature is also emerging, with the growing awareness of Earth as a living system of interconnected components. <sup>vii</sup> This concept highlights the importance of human beings living in a more balanced and harmonious relationship with nature, as opposed to the prevailing relationship of domination. This planetary vision can lead to a just and sustainable peace.

"Earth rights are human rights; they are not separate rights." <sup>viii</sup> If people do not have access to clean water, food and sanitation; if people are restricted in their prudent use of land in the name of "progress;" if people are victimized by governments and corporations which engage in unbridled extraction, pollution and devastation of land and bodies of water, then human and Earth rights are violated.

**In conclusion, we support the following recommendations that promote an integrated approach to sustainable development:**

### SUSTAINABLE DEVELOPMENT

- Enforce the following principles as referred to in Agenda 21:
  - o Apply the Precautionary Principle to ensure that new products and technologies (e.g., genetically modified seeds) do not have destructive or irreversible damage that results in environmental degradation. <sup>ix</sup>
  - o Enforce the Polluters' Pay Principle and apply payment to the adaptation and mitigation needs of developing countries. <sup>x</sup>
  - o Guarantee the representation of local peoples, especially Indigenous Peoples, as active participants in decision-making processes to bring about equitable, fair and just sustainable development. <sup>xi</sup>
- Acknowledge the human right to water and proper sanitation, and hold accountable those corporations which both deplete and pollute the global water supply.
- Sponsor educational programs for citizens on sustainable development and, specifically, on patterns of consumption and production within each country's context.

### GREEN ECONOMY

- Endorse the establishment of the proposed Financial Transaction Tax to contribute to climate adaptation and more equitable economies in developing countries.
- End subsidies for fossil fuels and industrial agriculture in order to move toward the end of fossil fuel dependency; and invest in small farmers and agro-ecology.
- Facilitate the transfer of innovative technology from the developed world to assist the developing world in an approach to development that does not rely on fossil fuels.
- Shift from free trade liberalization to the implementation of fair trade policies.
- Evaluate global military expenditures and reallocate significant resources to sustainable development, green technology, and financing of climate adaptation and mitigation for developing countries.

### GLOBAL INSTITUTIONAL ENVIRONMENT FRAMEWORK

- Support the establishment of an effective international institutional environment framework which calls governments and international corporations to transparency and accountability.
- Include environmental measures in the *Human Development Index*, and encourage the use of a wide range of indicators, beyond GDP and the HDI, to assess development.

## United States Council for International Business (USCIB)

November 1, 2011 United States Council for International Business: Submission to UN for Rio+20

### Questions:

- 1. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**
- 2. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**
- 3. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**
- 4. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

### USCIB Recommendations:

Governments in Rio next year should :

- Promote greener growth through international cooperation that is truly flexible to national circumstances and priorities and engages the private sector through global markets. International cooperation should balance private and public sector measures, so that companies of all sectors and nationalities assimilate greener metrics and practices as part of their bottom lines.
- Foster cleaner and greener technological innovation and its dissemination and uptake to respond to a wide range of long-term sustainability challenges going forward, including food and energy security, climate change. This requires enabling conditions for greener investment and innovation, including rule of law, sound science and life-cycle informed decision making, intellectual property right protection, open markets and trade, especially for cleaner technologies.
- Enhance substantive, direct, recognized channels of input to international processes for business and operated by business organizations. Rio+20 should explore ways to enhance business engagement in sustainability policy formulation and implementation,

including through public-private sector partnerships. In USCIB's view, simple, business-owned, bottom-up approaches based on business groups and associations will complement existing informal dialogues and approaches, and bring valuable business insight and expertise to the elaboration and implementation of the outcomes of Rio+20.

•

Agree on concrete steps to liberalize trade in cleaner technologies: governments at Rio should make concrete progress towards reducing and removing tariffs for cleaner technologies and energy sources, while maintaining flexibility to adjust to evolving scientific knowledge and innovation. Increasing trade and market access should be the objective, so that greening economic activity is an opportunity, rather than a source of tension.

- Redouble efforts to implement existing commitments, including the MDGs, and ensure adequate reporting and verification of progress. Until the international community can make good on previous commitments, measure and report progress towards attainment, and understand how to address gaps in implementation, we believe setting new targets in those areas would be premature. Rio+20 outcomes should further capacity building for governments seeking assistance to develop and implement basic rules that, inter alia, ensure equal opportunities for all citizens and stakeholder groups to participate in relevant governmental processes.
- Underscore strong governance and institutions at the national level as indispensable components of the effective implementation of sustainability and the capability of governments to carry out their commitments and actions. In that context, Rio should increase transparency via building awareness of and improving access to publicly held environmental information. However, such access must take into account public and state security and the need to protect the integrity of decision-making processes, as well as privacy interests of individuals. Sound information stewardship should apply, to ensure that in addition, proprietary information, including certain regulatory data and other confidential business information, must be protected from disclosure, as should information that would undermine the competitiveness of companies.

•

Identify priorities for action in the main emerging issues, notably in the areas of food security and energy.

### Strengthening Implementation

- The Rio outcomes should focus on: 1) identifying implementation gaps and the existing obstacles to national implementation of existing commitments and the MDGs; and 2) enhancing the UN system's coordination mechanisms to ensure that adequate and well-deployed international measures and resources assist countries in achieving those goals. Doing so depends on adequate reporting and verification of progress.
- Business supports strengthening the science-policy interface within international institutions, with the full and meaningful participation of developing countries. This must also include channels for credible and robust science from stakeholders, particularly from business and industry. Another key element relates to strengthening links between policy making and financing, to widen and deepen the funding base for effective actions that generate an appropriate return to public and private investments. Governments must approach the challenge of the overall framework of intergovernmental institutions with more deliberate and strategically guided resourcing, as well as more vigilant oversight.

## Greening Economic Growth

•

The OECD has said that, "Green growth means fostering economic growth and development, while ensuring that natural assets continue to provide the resources and environmental services on which our wellbeing relies. To do this, it must catalyze investment and innovation, which will underpin sustained growth and give rise to new economic opportunities." Rio should recognize the essential context is sustainable development and a return to economic growth. Greening the economy and growing the economy should be considered as mutually reinforcing and indispensable objectives. Growth will be essential to fund actions, especially as nations seek to recover from financial challenges.

•

There will likely be multiple approaches to greening economic activity, and this diversity is a valuable source of solutions and resources. Because of the range of approaches and possibilities, we question whether a single top-down "roadmap" can stimulate the full range of innovation needed. Opportunities exist to improve the environmental performance of existing technologies and systems that are already widely deployed, including those that may not be labelled "green."

•

Realizing the full potential of greening growth will depend on international cooperation to pursue economy-wide approaches, and on synergy of international regulatory frameworks and the global marketplace.

•

Greener growth should be pursued through:

-International and economy-wide approaches – with flexibility to national circumstances and priorities

-Incenting and supporting innovation, investment and job creation

-Greening all jobs, and the building of capacity and training to contribute and keep pace with innovation

-Encouraging free trade, including through liberalizing trade in and removing barriers to cleaner technologies, in an integrated approach with consideration of upstream inputs and downstream users.

-Emphasizing resource efficiency and life cycle approaches – these are key to "doing more with less," which relates to increasing productivity to answer the needs and aspirations of growing populations while managing and minimizing environmental

impacts.

-Balancing public and private sector measures to pursue greening of commercial activity

-Segueing from the necessity of public support/advocacy to ingrained/internalized approaches that are meaningful to and integrated in company bottom lines.

-Avoiding subsidies, and where they are used, they should be of finite duration, and with the goal of becoming self-sustaining and without need for ongoing external support.

-Incorporating information on both risks and benefits in decision-making.

-Working within existing multilateral trade and environment frameworks and agreements.

-Pursuing flexible policies and assessment processes that are responsive to evolving scientific knowledge, and to experience with new technologies and policy approaches.

### Improving Institutional Frameworks for Sustainable Development:

• For U.S. business, this important area has two parts: 1) Improving the institutional framework for sustainable development from the perspective of business, so that it affords opportunities to work in synergy with business contributions to sustainable development and 2) Enhancing the role of business in the institutional frameworks themselves.

• The fight against bribery and other corruptive practices should be a shared top priority for governments, government enterprises and private companies, with a focus on the demand side of corruption. Achieving improved conditions for transparency and integrity in doing business in all countries is of paramount importance for private and public sector actions in support of implementation of Rio 2012 recommendations.

•

Strengthening and integrating sustainable development frameworks will require global economic and social institutions to become more responsive to environmental concerns, but will also require more integration of social and economic dimensions by "environmental" institutions.

• A sound and strong foundation for sustainable development in the U.N. system is essential. The U.N. Commission on Sustainable Development has been the primary U.N. institution and should be the starting point for considering where and how to make improvements. CSD should be strengthened, and given the resources necessary to fulfill its mandate, and other changes in existing institutions in the UN system, as well as consideration both of new bodies and sunseting of less effective ones, should also be explored.

•

•

•

- 
- 

Rio2012 outcomes should take a next step in enhancing and recognizing the substantial role of business to policy design and implementation at the international level. The business community was recognized as one of the “major groups” by Agenda 21, agreed at UNCED in Rio, 1992. This designation represented a validation of the central role that business plays in the pursuit of sustainable development: in compliance with regulation; through the jobs, products, services and return on investment it provides, its interface with the consuming public, and in its corporate responsibility activities. In recent years, discussions in numerous forums have increasingly – whether implicitly or explicitly – touched on the role of business in myriad ways: technology, investment, implementation, job and wealth creation, competitiveness, capacity building, among others. Sustainability and globalization challenges cannot be addressed by governments alone; they require active collaboration between governments and stakeholders, particularly business. While each of the nine major groups brings varied capabilities, networks and structures to the process, from our standpoint, business plays a unique and critical role. For business, we underscore the need to a) distinguish those opportunities where business expertise, for example on technical or financial matters, would be valuable to inform deliberations, analysis or implementation and b) provide substantive channels to contribute those views directly in a timely fashion for governments. In this connection, one size does not fit all. Recognizing diversity also includes diversity within the business community. Substantive, direct, recognized channels of input to international processes for business and operated by business organizations are critical to proper policy design and implementation. There are positive experiences and models on which to build. Business involvement in international policy deliberations predates Rio 2012, and has taken many forms. For example, the International Labour Organization has a tri-partite structure, with employers joining governments and trade union representatives at the table. The OECD created two consultative mechanisms to access business and trade union views and expertise through the Business and Industry Advisory Committee (BIAC) and its analogue for trade unions, TUAC. These models and others could serve as templates for enhanced engagement by international policymaking forums with business post 2012.

regulation. USCIB's vision and strength are provided by an active [membership](#) of leading corporations and business organizations, while our unique [global network](#) helps turn the vision into reality.

As sole U.S. affiliate of the [International Chamber of Commerce](#) (ICC), the [International Organization of Employers](#) (IOE), and the [Business and Industry Advisory Committee](#) (BIAC) to the OECD, USCIB presents informed business views and solutions to government leaders and policy makers worldwide. Through ICC, USCIB has participated in Business Action for Sustainable Development 2012 (BASD 2012) and wishes to associate itself with BASD 2012's submission.

USCIB's work on sustainable development is predicated on our conviction that economic growth, innovation and a robust private sector are essential to achieving environmental improvement and better living conditions worldwide. USCIB was active in the U.N. Conference on Environment and Development (UNCED, 1992) and the World Summit on Sustainable Development (WSSD, 2002), and has regularly attended the U.N. Commission on Sustainable Development and U.N. Environment Programme (UNEP).

USCIB's Environment Committee promotes appropriate environmental protection within an open trade and investment system; and advances continuous improvement in technological innovation and environmental management within the context of economic growth as fundamental to sustainable development. USCIB has recently launched the International Business Green Economy Dialogue (IBGED) project. IBGED seeks to provide a clearer understanding of the path forward to building international cooperation to green economic growth. USCIB and its partners are seeking dialogue via educational, outreach and advocacy efforts in international policy deliberations, through a series of meetings to engage the private sector and inform discussions ahead of Rio+20. The IBGED Project also includes the development of a series of peer-reviewed papers written by independent academics to provide specialized perspectives on a range of green economy areas. The 'Green Perspectives' academic papers are to be published in a special edition of Energy Economics contemporaneous with Rio+20.

---

## Universidad de Cienfuegos “Carlos Rafael Rodríguez”

Resumen:

El trabajo desplegado por el Centro de Estudios Socioculturales (CESOC) y un equipo multidisciplinario de la Universidad de Cienfuegos, construye una plataforma teórica - metodológica para el despliegue de las acciones en función de la calidad de vida de las familias del ecosistema de montaña. Solo presenta un acercamiento a los resultados alcanzado hasta el momento. Desde las ciencias sociales y otras disciplinas se estudia el desarrollo rural de las familias productoras: el rescate de tradiciones y prácticas deportivas tradicionales a partir de la gestión del conocimiento, el desarrollo sostenible para el macizo montañoso del Escambray y las familias productoras, los jóvenes, el empleo y la diversidad cultural basada en la gestión de proyectos. Los retos de la universidad por subvertir los conflictos actuales que impiden el desarrollo en el ecosistema de montaña nos impone el despliegue de un sistema de trabajo interdisciplinario sustentado en la gestión del conocimiento y la innovación, ofreciendo contribuciones específicas al desarrollo sostenible del ecosistema de montaña. El objetivo del empeño está sustentado sobre las diversas instancias de las facultades, centros de estudio, carreras y departamentos de la universidad. Le corresponde a la universidad asumir este empeño donde el cuestionamiento principal radica en ¿cómo subvertir el decrecimiento económico y el deterioro de las relaciones sociales en el ecosistema de montaña, protegiendo la biodiversidad, desde una racionalidad soportada en la ciencia y la técnica y con la participación de las grandes mayorías?

Introducción:

La base de todo el argumento radica en la caída de la producción cafetalera de manera continua en un 86% en los últimos 25 años. Si se coincide con Marx, (1979) en que los procesos económicos condicionan la vida social, política y espiritual de la sociedad y lo que se refleja en el decrecimiento del principal renglón económico de la montaña. Este puede constituir el termómetro del sistema productivo, lo que ha de entender cuan profundas serán sus implicaciones. Se añaden la paralización de las áreas de desarrollo en las que se construyeron asentamientos poblacionales nuevos y se ampliaron o desarrollaron grandes espacios productivos, lo que llevó a grandes inversiones que hoy se encuentran en deterioro, destrucción y/o abandono. El trabajo de campo ha develado procesos de una variada gama de conflictos entre los pobladores de los asentamientos poblacionales de la zona montañosa que se reflejan en:

Disparo del papel de la economía informal.

Deterioro de relaciones sociales: conflictos diversos.

Conflicto cultural de mucha trascendencia: cultura cafetalera vs. cultural marginal.

Poca relevancia económica social de la familia: crítica situación económica, poca participación, bajos ingresos.

Fuerte impacto migratorio - reducción de la identidad.

Compleja situación en las relaciones intersectoriales.

Merma del liderazgo social productivo de las instituciones y organizaciones.

Agudización del conflicto entre ecosistema y exigencias de los procesos productivos.  
Deterioro de la vida social - cultural comunitaria.  
Sistema de cuencas - sistema de asentamientos poblacionales.  
Bajos ingresos familiares - alto costo de la vida.  
Alto nivel de atención de salud – deterioro del modo y estilos de vida.  
Deterioro de la gestión empresarial.  
Falta de correspondencia entre el desarrollo social y el aporte económico de la zona.

Los estudios sociales que se han desarrollado en los últimos tiempos en la zona permiten demostrar las posibilidades y potencialidades del trabajo comunitarios (Agüero, 1995), la riqueza de un patrimonio cultural, (Agüero, 1999) y las potencialidades de las instituciones educativas (Agüero, 2000) aunque se devela la vitalidad y trascendencia del imperativo del despliegue de una cultura crítica y del capital cultural (Agüero, 2005).

#### Resultados del trabajo interdisciplinario

El imperativo de la Universidad para ofrecer una contribución desde los argumentos planteados corresponde resumir los principales resultados del empeño interdisciplinario. La Facultad de Cultura Física y Deporte realiza un estudio con el fin de contribuir a la calidad de vida de los montañeses desde el rescate de prácticas deportivas tradicionales, la capacitación de los pobladores, el mejoramiento del conocimiento e información, el uso de técnicas participativas y el autodiagnóstico promovido desde las instituciones educativas. Para ello se ha creado una estrategia de trabajo con diferentes tareas a cumplir, integrado por los profesores del departamento de Educación Física de la UCF, y una selección de Especialistas de la zona, profesores y médicos de cada Consejo Popular (Mayarí-Sopapo, San Blas- Sierrita y Crucecita-Nicho), encargados de instruir a los monitores seleccionados dentro de las mismas brigadas de trabajo de recogedores de café o de otras actividades agrícolas y velar por la salud de sus compañeros y estimular las actividades deportivas tradicionales. Los monitores están integrados por 200 estudiantes del politécnico de Mayarí que se materializa hasta la actualidad en : control y toma del pulso en 200 núcleos familiares de todo el territorio de la montaña del Escambray del municipio de Cumanayagua, control de Alcoholismo, del hábito de fumar, Hábitos dietéticos y otros controles como pruebas antropométricas, etc., Lo que nos da la posibilidad de conocer a los campesinos del territorio y ayudar a resolver las patologías adquiridas por las características del territorio y algo a destacar es que todo este proyecto se está haciendo sin gastos monetarios por el motivo de que son actividades que están en su contenido de trabajo. Utilizando las clases de educación física en el centro estudiantil se realizó una superación especializada con los alumnos muestreados en las pruebas anteriores y se comienza con la orientación dirigida a partir de escuela-comunidad y alumno - familia, y rescatar las formas tradicionales de deportes para recolectar datos a 200 núcleos familiares para poder conocer y evaluar el estilo de vida y hábitos dietéticos. Las muestras de los estudiantes permiten evaluar el Índice de Masa Corporal e Índice de Cintura-Cadera que son los más usados para saber si el peso corporal y la relación de algunos de los parámetros pueden influir negativamente en la salud.

Desde la multidisciplinariedad una reflexión hacia las aportaciones desde la Ingeniería Mecánica al desarrollo sostenible enfoca los actores claves en la montaña como la Empresa Agroindustrial Cafetalera "Eladio Machín", la UBPC Sabanita, Finca de Frutales El Nicho y Sistemas Cooperativos [CCS, CPA].

Las áreas de aportaciones desde la ingeniería mecánica se concentran en:

Térmico: permite el estudio de la biomasa y el manejo eficiente del potencial biomásico con el fin de crear cocinas eficientes.

Hidráulico: permite el manejo racional y eficiente de un recurso natural esencial para incentivar el sistema de riesgo y cultivos intensivos.

Energético: garantiza la eficiencia y ahorro en cuanto al desempeño de equipos y control de gastos.

Los principales resultados de estas áreas son:

1. Potencia necesaria para la cocción de los alimentos 7.45 Kw.
2. Potencia emitida hasta gastar toda la leña 11.04 Kw.
3. Aprovechamiento efectivo 67.5 %.
4. Se desaprovecha 32.5 % del combustible.
5. Calor que sede el combustible 13425.36 kJ/kg
6. Calor que absorbido por el alimento 1427.47 kJ/kg.
7. Eficiencia del fogón 10.63 % (Muy Baja)
8. Se evalúa el potencial hidráulico de la finca y se determinan las potencialidades del mismo, se propone el uso de esta fuente de abasto para la generación a baja escala de electricidad con la utilización de la turbina Peltón de la cual se propone el diseño. El agua salida de la turbina se utiliza para uso doméstico y para el riego de las plantaciones.
9. Sobre el potencial hídrico de la zona se determinaron las capacidades del mismo para riego y se propone como debe ser manejado para el uso eficiente.
10. Se propone el uso de tecnologías alternativas como son los arietes hidráulicos para riego.

Las soluciones propuestas tuvieron aceptación en las acciones desarrolladas con los actores claves del entorno montañoso. Hubo un proceso de alta relevancia por los aprendizajes entre los actores implicados que ganaron en conocimientos y aportes a los procesos de desarrollo en relación a las variantes propuestas. Hubo un crecimiento humano, emocional, afectivo entre los investigadores y los actores involucrados en todos los procesos, lo que permitió un acercamiento a experiencias concretas multidisciplinarias de alta relevancia para la práctica productiva. Los 8 estudiantes que participaron en el proceso alcanzaron resultados importantes, y aportes en el fortalecimiento de su desempeño profesional. Se destaca un impacto favorable desde las tres áreas esenciales de la ingeniería mecánica que se han aplicado en el proceso del trabajo con actores claves en el ecosistema de montaña, a partir del proceso de integración multidisciplinaria entre varias ciencias, especialmente las ciencias articuladas a la ingeniería mecánica, las ciencias agrarias y las ciencias sociales. Sin embargo, se impone seguir cultivando las relaciones entre estas ciencias y otras como las económicas.

Dentro de todo el proceso el sector juvenil es el más vulnerable al cambio y sobre todo el que mayor tendencia tiene de abandonar el espacio rural, por beneficios propios que ofrece la política social del país. El trabajo agrícola ofrece una precarización de las relaciones de producción y no brinda satisfacciones materiales ni espirituales a las nuevas generaciones. Mientras que las nuevas tendencias en las reformas de la política económica respecto al agro cubano demuestra que este sector social puede emplearse en la esfera de la agro producción si se potencializa, tal es el caso de la aplicación del decreto ley 259 con la entrega de tierra en usufructo. Las generaciones más jóvenes mostraron motivaciones ante la propuesta y hoy la región cuenta con 887 fincas solicitadas. Esto es un elemento que viene a potencializar el desarrollo de la

producción en el asentamiento, fundamentalmente la producción cafetalera y de cultivos varios. En el caso del grupo juvenil de forma general, optan por los beneficios que le ofrece los otros sectores, fundamentalmente los servicios, sin descartar las alternativas del mercado subterráneo. Los jóvenes de este escenario se caracterizan por insertarse en labores agrícolas con campesinos individuales mientras trabajan en el sector de los servicios o no están empleados. La implementación de las reformas impacta negativamente en el sistema de vida de las nuevas generaciones. La ruptura de la relaciones socio productivas del medio condujo a la materialización de la vida más pragmática, a la búsqueda del dinero con el menor esfuerzo propio y se reproduce una tendencia al trabajo agrícola sin una cultura productiva. Los grupos juveniles tienden a discontinuar los estudios y por tanto, se reubican en esferas laborales de muy poca remuneración económica o terminan emigrando de la región. En el caso de las féminas, interrumpen la superación escolar por otras salidas como el matrimonio; salen del medio familiar para crear sus propias estrategias de sobrevivencia. Esto provoca en la mayoría de los casos la maternidad a edades tempranas. Por estas y otras razones las mujeres se convierten en uno de los grupos más frágiles de proceso. En este sentido las familias productoras de café y el empleo en la esfera productiva precisan de un estudio interdisciplinario. A partir de los cambios sustanciales en cuanto al incremento del precio del café, la desmotivación por el trabajo, el déficit de la fuerza de trabajo y especialmente la calificada estas esferas de producción se encuentran en desequilibrio. Por tanto, el trabajo comunitario está enfocado en tres principios básicos fundamentales:

La participación de los habitantes de la montaña como actores y gestores de los cambios que se proponen en todo el proceso productivo.

Combinar acciones de carácter científico – investigativo, socioculturales y de capacitación.

La naturaleza inter y transdisciplinaria de los estudios que se proponen.

En este sentido es importante emprender acciones concretas a partir de la experiencias, necesidades y con el protagonismo de los pobladores, ya que el deterioro de la producción cafetalera revela una crisis imprescindible de subvertir. Donde los cambios estructurales a partir del fenómeno social de la globalización, la cultura, las transformaciones de las necesidades del productor y con ello de las familias.

Los resultados se encaminan hacia el funcionamiento de un sistema de unidades docentes en la zona de montaña que incluye a la Empresa Municipal Agropecuaria (EMA para elevar el papel de la gestión del conocimiento, concediendo coherencia y sustentabilidad al trabajo de la universidad, Sistematizar el trabajo en comunidades a partir del apoyo a programas de maestría en sociología y estudios socioculturales, Promover acciones interdisciplinarias que permitan aportes relevantes desde la gestión del conocimiento en los servicios sociales, la educación, la cultura y los sistemas productivos de diferentes estructuras, Articular una red de trabajo entre las universidades cubanas que laboran en ecosistema de montaña.

La socialización de genera a través de la participación en eventos científicos estudiantiles y de profesionales, publicaciones en revistas de impacto y esencialmente en la sistematización de la experiencia a través del desarrollo de un Taller acerca de la Universidad en la montaña.

A través de acciones concretas se logra un acercamiento a identificar el sistema contable en estructuras productivas y algunos procesos de implementación de uno nuevo, se establecen normas de calidad para la producción de café, se logran avances en las mediciones para lograr el ahorro en portadores energéticos de la empresa cafetalera. Fortalecer la educación ambiental y mejorar el ambiente sociocultural para el desarrollo sostenible permite evaluar las eficiencias energéticas de las minihidroeléctricas, el potencial energético de los recursos forestales, se evalúa en parte la eficiencia de cocinas en la montaña, Se logra sistematizar la preparación de estudiantes de grado 12 para sus pruebas de ingreso en la educación superior.

A través de estas se obtiene una calidad de vida adecuada de sus habitantes y resultados positivos que repercuten en los renglones socioeconómicos y culturales del municipio Cumanayagua y la Provincia de Cienfuegos. Su socialización está marcada por los diversos trabajos de diplomas de los estudiantes de pregrado, las publicaciones en revistas especializadas y en los eventos y congresos internacionales que se desarrollan; así como la transmisión a través de los canales de comunicación masiva del territorio. Teniendo en cuenta que se proponen los resultados de la primera etapa de investigación presentamos los mismos por las diferentes esferas en las que el trabajo estuvo estructurado. Esto nos permite revelar con mayor claridad los significativos impactos que el proyecto ha tenido en la etapa al introducir sus resultados en los informes de la Empresa Municipal Agropecuaria, en la docencia de la Universidad, tanto en la sede central así como la FUM Cumanayagua.

#### Conclusiones

- El presente resultado está encaminado a incrementar la producción cafetalera de la región, mejorar la gestión de la empresa cafetalera a través de asesorías a productores, caracterizar su entorno, describir el papel de los jóvenes productivos cafetaleros, mejorar el sistema contable, incrementar la calidad del proceso productivo.
- Se tuvo en cuenta la sistematización de resultados para el desarrollo y la interrelación entre la docencia de pre, postgrado y la investigación científica.
- Se promovieron acciones encaminadas a la evaluación, sistematización y transformación de los procesos de producción cafetalera, los programas de ahorro energético y de agua y las cocinas eficientes con fin de posibilitar un incremento en la producción cafetalera de la región.
- Evaluaciones del proyecto de rehabilitación cafetalera en la localidad de Mayarí y Aplicaciones de un procedimiento para la evaluación expost de una Rehabilitación cafetalera en la localidad de Mayarí.
- Se desarrollaron procesos de intervención desde la descripción hasta la capacitación en todas las instancias de trabajo en la montaña.
- Incremento de la participación de estudiantes a partir su trabajo científico curricular y extracurricular, realizando tareas de impacto vinculadas a las acciones principales del proyecto en el territorio.

## Universidad Nacional Federico Villarreal

UNIVERSIDAD NACIONAL FEDERICO VILLARREAL

RECTORADO

A LA CONFERENCIA DE LAS NACIONES UNIDAS SOBRE EL DESARROLLO SOSTENIBLE

(Brasil, 2012)

La Universidad Nacional Federico Villarreal (UNFV) de Lima-Perú, tiene 48 años de vida institucional, cuenta con 18 facultades y 61 especialidades, aproximadamente 21 000 estudiantes, 2300 docentes y 866 administrativos. La Escuela de Postgrado tiene alrededor de 5800 estudiantes en maestrías y doctorados.

La Universidad Nacional Federico Villarreal, en su contribución a la Conferencia de las Naciones Unidas sobre el Desarrollo Sostenible a realizarse en el 2012 en el hermano país de Brasil quién brinda su hospitalidad, así mismo saluda al Secretario General de la Conferencia al Dr. Mr. Sha Zukang deseándole éxitos y señala su posición institucional al respecto.

Nos sumamos a través de acciones concretas a la comunidad internacional en la promoción del desarrollo sostenible, nuestra aspiración común y hacemos nuestro el principio 37 de la Declaración de Johannesburgo.

Desde 1997 participamos en los períodos de sesiones de la Comisión sobre el Desarrollo Sostenible y hemos desarrollado un sinnúmero de publicaciones, así como hoy contamos con un portal referido al Desarrollo Sostenible y Armonía con la Naturaleza. En resumen como universidad estamos comprometidos con el desarrollo sostenible y hemos sido impulsores de Educación para el Desarrollo Sostenible (EDS) en el Perú (en el anexo 1 presentamos algunos aportes de nuestras acciones en favor del desarrollo sostenible).

Reconocemos los esfuerzos y somos testigos de los esfuerzos de la Organización de las Naciones Unidas en hacer realidad el desarrollo sostenible (Estocolmo 72 – Río + 20....2016/2017). Por ello como parte del sector académico, expresamos nuestro reconocimiento institucional al actual Secretario General de la ONU Dr. Ban Ki-moon por su compromiso y despliegue para orientar a la comunidad internacional a la búsqueda de la paz mundial y del bienestar humano con calidad para todos y por siempre.

Destacamos que su estrategia de sensibilizar y concientizar a la humanidad hacia el desarrollo sostenible, esta dando frutos. Acertadamente la Educación para el Desarrollo Sostenible (EDS) es de vital importancia para el logro del desarrollo sostenible y así mismo los informes sobre Armonía con la Naturaleza (A/65/314 y A/66/302) los mismos que denotan en su concepción una profunda dedicación y elevado tecnicismo con visión holística, son hoy utilizados como un referente y sirven de inspiración en los procesos de enseñanza-aprendizaje con el fin de reeligarnos a la Madre Tierra, de reconocer y respetar a todas las formas de vida existentes en nuestro maravilloso y hermoso planeta Tierra. Estos instrumentos deben seguir proveyéndose desde las Naciones Unidas y hacer todos los esfuerzos para que lleguen a todos los hogares y familias del mundo para asegurar una sola visión planetaria de la sostenibilidad.

Observamos por primera vez un proceso mundial más participativo, armonioso y masivo, de carácter ejemplar, único y sostenible, pues organismos, instituciones y ciudadanos tenemos hoy la oportunidad de expresar nuestros sentimientos, necesidades y aspiraciones frente a la gran Conferencia de las Naciones Unidas sobre el Desarrollo Sostenible.

Deseamos que en la Conferencia de las Naciones Unidas sobre el Desarrollo Sostenible (Brasil 2012) se tenga en cuenta lo siguiente:

a) En materia de Erradicación de la Pobreza/Poverty Eradication:

- Exhortar a los gobiernos a un mayor compromiso político y nacional respecto a la definición, implementación y ejecución de una Estrategia Nacional de Erradicación de la Pobreza (ENRP) que integre a los tres pilares del desarrollo sostenibles: social, ambiental y económico.
- Que la Estrategia Nacional de Erradicación de la Pobreza tenga objetivos, metas e indicadores comunes para todos los países y se establezcan plazos determinados algo similar a los de la Cumbre del Milenio.
- Asegurar que la ENRP sea en su formulación participativa y consensuada por todos los grupos principales y más allá de ellos.

b) En materia de una Economía Verde/Green Economy:

- Determinar el marco conceptual y fomentar el desarrollo de estadísticas básicas, sobre todo en materia ambiental, que permitan avanzar respecto al trabajo que se viene desarrollando en materia de indicadores de desarrollo sostenible.

c) En materia de una Arquitectura Institucional a favor del Desarrollo Sostenible/Institutional Framework for Sustainable Development:

- Se recomiende a los gobiernos a establecer un Marco Institucional Nacional y Subnacional a favor del Desarrollo Sostenible con lineamientos internacionales claros y precisos. Fundamentalmente reorganizando y/o refortaleciendo a las instituciones públicas existentes y que potencialmente puedan constituirse en palancas eficientes y eficaces para una concertación en pro del desarrollo sostenible.
- Se señale y exhorte a comprender que la gobernanza ambiental y la gobernanza para el desarrollo sostenible se complementan y no se superponen. La gobernanza ambiental debe entenderse como parte y aliado de una gobernanza para el desarrollo sostenible.
- Que en el diseño del Marco Institucional Nacional y Subnacional se asegure la participación de todos los actores interesados.
- Establecer mecanismos nacionales dentro del Marco Institucional a favor del Desarrollo Sostenible para integrar los objetivos y metas de las diversas Conferencias y Foros Mundiales realizados a la fecha y los que se convengan en adelante.

d) En materia de Educación para el Desarrollo Sostenible/Education for Sustainable Development (EDS):

- Establecer las bases para un Segundo Decenio de las Naciones Unidas sobre la Educación para el Desarrollo Sostenible (DEDS 2014-2025).
- Dar énfasis y encargar a la UNESCO la pronta elaboración de los Indicadores de EDS asegurando para ello una mayor participación de la comunidad internacional.
- Exhortar a los Estados a asegurar inversión pública, privada y provenientes de la cooperación a EDS a fin de impulsar la sensibilización y concientización de todas las personas en desarrollo sostenible.
- Exhortar a un mayor compromiso por parte de las instituciones de educación superior a la promoción del desarrollo sostenible, del desarrollo humano, armonía con la naturaleza y específicamente a liderar cuestiones vinculadas a EDS y al Decenio de las Naciones sobre Educación para el Desarrollo Sostenible (DEDS).

e) En materia de Armonía con la Naturaleza/Harmony with Nature:

- Establecer un portal mundial sobre armonía con la naturaleza a fin de globalizar la información y el conocimiento reflexivo y cognitivo que permita que el ser humano se reelige con la Madre Tierra.
- Apoyar al Secretario General de las Naciones Unidas en la preparación de sus informes sobre Armonía con la Naturaleza y tengan carácter de divulgación y difusión oficial al ámbito nacional y subnacional y se constituyan en material educativo.
- Exhortar a la integración con una visión fundamentalmente holística el tema de armonía con la naturaleza en todos los niveles de enseñanza formal, informal y no formal. Además se le vincule y/o articule a todo el proceso de EDS y como actividad importante del DEDS.
- Seguir debatiendo científicamente en los próximos años el tema de Armonía con la Naturaleza y en el que se tenga en cuenta los descubrimientos que hasta hoy se tienen y se generen en el futuro. La ciencia es de vital importancia para la comprensión de una auténtica sostenibilidad planetaria basada en armonía con la naturaleza.

- Se recomienda se vea la posibilidad de generar una Década de las Naciones Unidas sobre Armonía con la Naturaleza (2012-2022)

Esta propuesta fue elaborada en coordinación con los docentes de la facultades de Psicología y de Ingeniería Geográfica, Ambiental y Ecoturismo de la UNFV Dra. Lucía Emperatriz Valdéz Sena y del Dr. Jorge Lescano Sandoval.

En mi condición de Presidente de la Comisión de Orden y Gestión y Rector de la Universidad Nacional Federico Villarreal hacemos votos para que la Conferencia de las Naciones Unidas sobre el Desarrollo Sostenible a realizarse en el hermano país de Brasil logre sus objetivos y metas trazadas.

En la ciudad de Lima, Perú a los 30 días del mes de octubre de dos mil once. Celebrando los 48 años de vida institucional y en el mes del Señor de los Milagros nos unimos a los manifiestos en pro del desarrollo sostenible nuestra común aspiración humana.

Ing. Freddy Alberto Aponte Guerrero

Presidente Comisión de Orden y Gestión y Rector de la

## University of Cambridge Programme for Sustainability Leadership

SUBMISSION

UNIVERSITY OF CAMBRIDGE PROGRAMME FOR SUSTAINABILITY LEADERSHIP

INPUT TO THE OUTCOME DOCUMENT OF THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT (RIO+20)

a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document:

The University of Cambridge Programme for Sustainability Leadership has brought together companies with a global reach to issue a collective call for action from their leaders to the world leaders at the UN Earth Summit in 2012. These business leaders have signed a Leadership Compact that sets out where business will lead in properly valuing and maintaining the Earth's natural capital [1]. It also sets out what it urges the governments of the world to do in order to seize this opportunity for leadership.

The business leaders are speaking with a sense of urgency. In the two decades since the 1992 United Nations Conference on Environment and Development in Rio, the world has failed to respond to the challenge of sustainable development with adequate determination. Specifically we have not addressed risks posed by the loss of natural capital. Vital services under threat range from crop pollination to carbon storage and freshwater provision, from wood production to the renewal of soil fertility and fisheries. The world no longer lives off the dividends of natural 'capital', but off the capital itself.

The challenges we face are complex and critical. To turn the situation around requires immediate action at all levels, by all of us: businesses from all sectors, investors, governments, civil society and citizens. Engaging business and industry through cross-sectoral cooperation is fundamental to the transition to a resource efficient and Green Economy. With this in mind the Leadership Compact, to be launched by the corporates in January 2012, is set out below. We believe that all the elements listed need to be reflected in the Outcome document to ensure that it has the backing of business globally.

#### LEADERSHIP COMPACT: 'COMMITTING TO NATURAL CAPITAL'

##### AS BUSINESS LEADERS WE PLEDGE TO:

1. OPERATE WITHIN THE LIMITS OF NATURAL SYSTEMS. We aim to manage supply sources in order to protect the environment and improve social equity. We will encourage cooperation between those relying on the same ecosystems for their products, services and livelihoods. We commit to good governance, transparency and inclusive decision-making throughout our value chains and to develop ways to ensure that land is used for social and economic development in ways that protect, manage or restore the value of the natural capital for current and future generations.

2. IDENTIFY AND ADDRESS EXTERNALITIES. We will build a deeper understanding of the externalities – the un-costed impacts on people and the environment – associated with the production and consumption of goods and services. We will identify the right value for these externalities and interdependencies both in our direct operations and through our supply networks, and collaborate within and across industries to develop transparent reporting.

We commit to moving beyond demand-driven production to operating within supply constraints. To underpin this move, we will integrate externalities into assessments of business risk and opportunities, and into our decision-making. We will communicate material risks, and our strategic responses, more clearly to investors and society.

3. ENABLE CONSUMERS TO MAKE BETTER-INFORMED CHOICES. We will work with industry bodies, governments and citizens to deepen public debate on how to realign consumption within the limits of natural capital and to eliminate wastage and inefficiency. We will seek a fuller consensus on the key elements of sustainable lifestyles, and will continue to design, manufacture and promote products that can be used more sustainably, and to extract raw materials responsibly.

4. Develop rigorous and realistic targets and plans. We recognise that the commitments above must be transparent, measurable, and scalable across business. We pledge to build on current initiatives to identify appropriate metrics so we can monitor our own performance and report our annual progress (e.g. regarding water, biodiversity, deforestation, greenhouse gas emissions, waste and pollutants). In 2012 we will work together to identify rigorous and realistic targets to promote the protection and efficient use of natural capital, based on these metrics.

By demonstrating leadership we aim to inspire other companies to do likewise. Many of us have already taken significant steps and we call upon governments to provide essential cost and regulatory signals to enable us to go further and more rapidly.

##### WE THEREFORE URGE GOVERNMENTS TO:

A. ESTABLISH A HOLISTIC POLICY FRAMEWORK TO SUSTAIN NATURAL CAPITAL. It is essential that governments introduce policies that encourage companies, investors and regulators to assess natural capital impacts on company value chains, provide incentives for more sustainable products, and support effective collaboration across sectors between those reliant on the same ecosystems. As part of this framework, governments and companies must be required to disclose their environmental impacts. In support of this goal we urge that governments join with leading companies in support of a global convention on corporate reporting, based on principles of transparency, accountability and board responsibility, to develop national regulations that mandate the integration of material sustainability issues into public reporting to key stakeholders, including investors.

Efforts to change purchasing and investment behaviour by business and governments, and to promote innovation, are a key part of this framework. These efforts should include fiscal and tax policy and incentives, and targeted public procurement. Such an approach should aim to encourage investors to reflect the true value of natural capital in their decision-making. Governments and companies must work together more effectively to encourage stronger standards and more sustainable consumer choices. Successful responses to global social concerns, as achieved with Health & Safety, demonstrate that governments can work together to put in place the necessary standards and targeted regulation.

B. WORK WITH ALL STAKEHOLDERS TO PROMOTE SUSTAINABLE RESOURCE USE. To ensure the most efficient use of natural capital, we encourage national governments to develop plans openly and transparently for the use of natural capital. This process must include all stakeholders, recognising that many citizens derive their livelihoods from natural resources, while lacking formal land use rights.

C. SET A CLEAR GOAL OF 'NO NET LOSS'. Some companies have already adopted the principle of 'no net loss', aiming to replenish natural capital of forests or biodiversity depleted through their operations. Governments should set similar goals for key natural capital assets (e.g. wetlands, forests and coastal habitats). Countries that have exploited natural capital to create wealth should support those struggling with poverty to develop in a way that conserves their natural capital. The Convention on Biological Diversity provides one existing framework for action.

Businesses' bottom line – and that of the entire global economy – is built on products and services provided by ecosystems and other components of natural capital [2]. Companies and governments must signal that the choice between economic development and sustaining natural capital is a false one, and take measures to create a global economy that pursues both goals simultaneously.

As demand for resources such as land, water, agricultural produce, timber and fish continues to grow beyond supply, price volatility will inevitably become more pronounced. The resilience of the Earth's natural systems to absorb shocks and disturbances is being systematically undermined [3]. Effective action now will reduce the risk of social upheaval around the world in the near- and long-term future, exacerbated by resource scarcity and increased volatility in the price of food and other commodities.

We do not have twenty more years to debate what needs be done. We therefore urge you, the governments of the world, to seize the opportunity for action presented by Rio+20 and, with business, respond to the growing challenge of resource scarcity. Delay is not a viable option. We look forward to working with you in preparation for Rio+20 and beyond and hope that, together, we can provide the leadership the Earth needs in this crucial arena, at this crucial time.

b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

A. ESTABLISH A HOLISTIC POLICY FRAMEWORK TO SUSTAIN NATURAL CAPITAL. It is essential that governments introduce policies that encourage companies, investors and regulators to assess natural capital impacts on company value chains, provide incentives for more sustainable products, and support effective collaboration across sectors between those reliant on the same ecosystems. As part of this framework, governments and companies must be required to disclose their environmental impacts. In support of this goal we urge that governments join with leading companies in support of a global convention on corporate reporting, based on principles of transparency, accountability and board responsibility, to develop national regulations that mandate the integration of material sustainability issues into public reporting to key stakeholders, including investors.

Efforts to change purchasing and investment behaviour by business and governments, and to promote innovation, are a key part of this framework. These efforts should include fiscal and tax policy and incentives, and targeted public procurement. Such an approach should aim to encourage investors to reflect the true value of natural capital in their decision-making. Governments and companies must work together more effectively to encourage stronger standards and more sustainable consumer choices. Successful responses to global social concerns, as achieved with Health & Safety, demonstrate that governments can work together to put in place the necessary standards and targeted regulation.

B. WORK WITH ALL STAKEHOLDERS TO PROMOTE SUSTAINABLE RESOURCE USE. To ensure the most efficient use of natural capital, we encourage national governments to develop plans openly and transparently for the use of natural capital. This process must include all stakeholders, recognising that many citizens derive their livelihoods from natural resources, while lacking formal land use rights.

C. SET A CLEAR GOAL OF 'NO NET LOSS'. Some companies have already adopted the principle of 'no net loss', aiming to replenish natural capital of forests or biodiversity depleted through their operations. Governments should set similar goals for key natural capital assets (e.g. wetlands, forests and coastal habitats). Countries that have exploited natural capital to create wealth should support those struggling with poverty to develop in a way that conserves their natural capital. The Convention on Biological Diversity provides one existing framework for action.

Businesses' bottom line – and that of the entire global economy – is built on products and services provided by ecosystems and other components of natural capital. Companies and governments must signal that the choice between economic development and sustaining natural capital is a false one, and take measures to create a global economy that pursues both goals simultaneously.

c) WHAT ARE THE VIEWS ON IMPLEMENTATION AND ON HOW TO CLOSE THE IMPLEMENTATION GAP, WHICH RELEVANT ACTORS ARE ENVISAGED AS BEING INVOLVED (GOVERNMENTS, SPECIFIC MAJOR GROUPS, UN SYSTEM, IFIS, ETC.);

Establish a holistic policy framework to sustain natural capital. It is essential that governments introduce policies that encourage companies, investors and regulators to assess natural capital impacts on company value chains, provide incentives for more sustainable products, and support effective collaboration across sectors between those reliant on the same ecosystems. As part of this framework, governments and companies must be required to disclose their environmental impacts. In support of this goal we urge that governments join with leading companies in support of a global convention on corporate reporting, based on principles of transparency, accountability and board responsibility, to develop national regulations that mandate the integration of material sustainability issues into public reporting to key stakeholders, including investors.

Efforts to change purchasing and investment behaviour by business and governments, and to promote innovation, are a key part of this framework. These efforts should include fiscal and tax policy and incentives, and targeted public procurement. Such an approach should aim to encourage investors to reflect the true value of natural capital in their decision-making.

Governments and companies must work together more effectively to encourage stronger standards and more sustainable consumer choices. Successful responses to global social concerns, as achieved with Health & Safety, demonstrate that governments can work together to put in place the necessary standards and targeted regulation.

d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

1. OPERATE WITHIN THE LIMITS OF NATURAL SYSTEMS. We aim to manage supply sources in order to protect the environment and improve social equity. We will encourage cooperation between those relying on the same ecosystems for their products, services and livelihoods. We commit to good governance, transparency and inclusive decision-making throughout our value chains and to develop ways to ensure that land is used for social and economic development in ways that protect, manage or restore the value of the natural capital for current and future generations.

2. IDENTIFY AND ADDRESS EXTERNALITIES. We will build a deeper understanding of the externalities – the un-costed impacts on people and the environment – associated with the production and consumption of goods and services. We will identify the right value for these externalities and interdependencies both in our direct operations and through our supply networks, and collaborate within and across industries to develop transparent reporting.

We commit to moving beyond demand-driven production to operating within supply constraints. To underpin this move, we will integrate externalities into assessments of business risk and opportunities, and into our decision-making. We will communicate material risks, and our strategic responses, more clearly to investors and society.

3. ENABLE CONSUMERS TO MAKE BETTER-INFORMED CHOICES. We will work with industry bodies, governments and citizens to deepen public debate on how to realign consumption within the limits of natural capital and to eliminate wastage and inefficiency. We will seek a fuller consensus on the key elements of sustainable lifestyles, and will continue to design, manufacture and promote products that can be used more sustainably, and to extract raw materials responsibly.

4. DEVELOP RIGOROUS AND REALISTIC TARGETS AND PLANS. We recognise that the commitments above must be transparent, measurable, and scalable across business. We pledge to build on current initiatives to identify appropriate metrics so we can monitor our own performance and report our annual progress (e.g. regarding water, biodiversity, deforestation, greenhouse gas emissions, waste and pollutants). In 2012 we will work together to identify rigorous and realistic targets to promote the protection and efficient use of natural capital, based on these metrics.

By demonstrating leadership we aim to inspire other companies to do likewise. Many of us have already taken significant steps and we call upon governments to provide essential cost and regulatory signals to enable us to go further and more rapidly.

e) SPECIFIC ELEMENTS:

a) OBJECTIVE OF THE CONFERENCE: TO SECURE RENEWED POLITICAL COMMITMENT FOR SUSTAINABLE DEVELOPMENT, ASSESSING THE PROGRESS TO DATE AND REMAINING GAPS IN THE IMPLEMENTATION OF THE OUTCOMES OF THE MAJOR SUMMITS ON SUSTAINABLE DEVELOPMENT AND ADDRESSING NEW AND EMERGING CHALLENGES.

The University of Cambridge Programme for Sustainability Leadership has brought together global companies to issue a collective call for action from their leaders to the world leaders at the UN Earth Summit in 2012. These business leaders have signed a Leadership Compact that sets out where business will lead in properly valuing and maintaining the Earth's natural capital. It also sets out what it urges the governments of the world to do in order to seize this opportunity for leadership.

The business leaders are speaking with a sense of urgency. In the two decades since the 1992 United Nations Conference on Environment and Development in Rio, the world has failed to respond to the challenge of sustainable development with adequate determination. Specifically we have not addressed risks posed by the loss of natural capital. Vital services under threat range from crop pollination to carbon storage and freshwater provision, from wood production to the renewal of soil fertility and fisheries. The world no longer lives off the dividends of natural 'capital', but off the capital itself.

The challenges we face are complex and critical. To turn the situation around requires immediate action at all levels, by all of us: businesses from all sectors, investors, governments, civil society and citizens. Engaging business and industry through cross-sectoral cooperation is fundamental to the transition to a resource efficient and Green Economy. We believe that all the elements listed in the Leadership Compact on Committing to Natural Capital need to be reflected in the Outcome document to ensure that it has the backing of business globally.

## University of the Basque Country

International Environmental Law and new sovereignty (Proposal for Rio+20 compilation document) by Dr. Xabier Ezeizabarrena<sup>1</sup> (Phd Law, University of the Basque Country), Abstract

This proposal tries to underline the international general experience on Environmental disputes within the context of Rio+20 process, in particular from the point of view of concerned individuals and NGOs. In this sense there is a need for international alternative settlement of environmental conflicts. However, states and their subdivisions are reluctant to submit themselves to such adjudication, especially in the relationship with individuals and NGOs. Although one may safely state that the international law of the environment is on the road to strengthening the role of non-state actors, there is still a long way to go before access of these actors to international adjudication will be fully recognised. Therefore, there is real need worldwide for an open debate and proposal on an international forum for making available the need for international resolution of environmental disputes. The pending international challenges on Climate Change would find here another reason to push forward in terms of international solidarity and new sovereignty on environmental matters.

### Environmental Rights as a Key Point of the Rule of Law

During the second half of the 20th century we have seen the development, either under international or domestic laws, of certain ethical and political parameters and rules called human rights. The development of human rights law is demonstrated by the establishment of, for instance, the European Court of Human Rights<sup>2</sup> (ECHR) and the provision, in many constitutions, of systems for an effective judicial protection of these rights. The purpose of environmental rights law is to reach certain common legal grounds to achieve a similar international framework of law for sustainable development.

Reality, however, demonstrates otherwise. Subject to a few exceptions, national courts do not assume the existence of the required customary or principles of international environmental law necessary for individuals, non-governmental organizations (NGOs) and municipalities to derive claims from their violation.

### Judicial Protection of Environmental Rights

#### Existing mechanisms

The current lack of judicial protection of environmental rights by recourse to national courts is not compensated through the availability of international judicial review. There are various international dispute settlement mechanisms which address environmental issues in specific contexts, such as the International Tribunal for the Law of the Sea, the Court of Justice of the European Community (CJEC) and the ECHR. In addition, there exists an environmental chamber of the International Court of Justice (ICJ), though it has not often been accessed by governments for a variety of reasons. Furthermore, decisions of the World Trade Organization's (WTO) dispute settlement bodies may also affect environmental matters. The Permanent Court of Arbitration (PCA) is also actively working in this field during the last years.

#### Need for international arbitration and conciliation and efficient enforcement of international environmental law

One of the main tasks of institutionalised arbitration and conciliation of environmental disputes is to protect the rights of peoples to an adequate environment by granting individuals and non-governmental organisations access to justice. Arbitration could also develop a substantive right to a healthy environment based on existing international human rights, principles previously mentioned, as well as statutory law applicable under the relevant conflicts rules. This would comprise prevention, restitution and compensation of environmental harm. The deficit analysis presented above clearly shows that individuals and NGOs are not adequately protected in international environmental disputes. Their role must be strengthened in order to achieve sustainable development.

This proposal argues that there is a need for international enforcement, arbitration and conciliation on environmental international matters. However, the relative success of international courts dealing with environmental issues does not mean that every single petition reaches the final procedural phase misleading, in many cases, the real protection of environmental rights. Therefore, new concepts of sovereignty within a general proposal of international environmental justice should be fostered within the international arena.

#### The path forward

The experience of the enforcement International Environmental Law in general shows that from the point of view of concerned individuals and NGOs, there is a need for an international alternative dispute settlement mechanism to deal with environmental conflicts. However, given their relationship with individuals and NGOs, States and their subdivisions are reluctant to submit themselves to such adjudication. Although one may safely state that the international law of the environment is on the road to strengthening the role of non-state actors, there is still a long way to go before the access of these actors to international adjudication is granted full recognition. In light of its flexible procedure for issuing consultative opinions, its independence and broad scope of legitimacy, there is a clear space to offer an open study and debate on the necessity of an international forum for the international resolution of environmental disputes.

In terms of Human Rights this proposal would become a clear example of an open field within the law for sustainable development which is open for new developments. Once again in this context, international law seems to start assuming a shifting process within the concept of sovereignty. Thereby, the system could take advantage of this sort of procedures whenever the involved parties may assume the voluntary jurisdiction of a real international universal jurisdiction. This challenge is nowadays a key element for the development and real enforcement of the whole principles and rules of sustainable development, even for the direct protection of individuals or collective rights of legal persons. Therefore, we have a pending challenge open towards and within Rio+20 context.

## Vermillion Institute

Vermillion Institute submission

This submission deals primarily with specific strategies for closing the implementation gap and advancing the state of play of the SD agenda.

### I. BACKGROUND:

Last year, UNEP RONA convened a civil society forum in San Francisco, and asked the participants to discuss the very issues about which the Second Preparatory Committee members are now asking for feedback.

Building from the ideas in that consultation, as well as on the discussions of the implementation gaps that the First Preparatory Committee members brought forth, Vermillion wishes now to highlight the following gaps for this submission.

\*\*\*\*

### II. ADDRESSING THE DRIVERS AND OUTCOMES OF SOME IMPLEMENTATION GAPS

#### -- ON THE NGO SIDE

The drivers of a lack of cooperation and consensus among NGOs are:

Funding from government often comes from specific departments/agencies to solve specific, narrowly defined problems. Therefore narrowly defined NGO projects are seen as having tight fits --- but too often their projects have the applicability and stability of someone standing on stilts. On the other hand, more integrative projects/approaches have a wider base and can accomplish more, but rarely show a tight enough fit to be approved. This is because agencies can find themselves on the wrong side of government auditors for funding projects that are not using most of the money for the originally defined purpose.

Funding from both government agencies and company sponsorships tends to go to easy to describe projects; the more complex and integrative projects that are capable of tackling more difficult problems, are less easily communicated to the public, and less frequently funded. NGOs are therefore less willing to undertake more complex projects, and have fewer resources to cooperate to see them completed.

Government agencies are often willing to share the recognition in their funding. However, except in high-profile settings, companies are generally less willing to share the stage with other companies in funding public-interest projects.

#### SOME OUTCOMES OF THIS GAP

When you fund one org to develop something, sets up a win/lose dynamic for the NGOs. In each of these settings, NGOs succeed in getting funds when they show why they are more deserving. They chip away at each others' credibility, and this does not lend itself to building cooperation or consensus.

From the point of view of the donor, when all their eggs go in just a few baskets, the results of their programs are more vulnerable to external risks, and less likely to deliver for the public interest.

Also due to all these factors, NGOs often choose not to cooperate. The result is more splintering of knowledge over time instead of deepening it. For the SD agenda, it means more and more groups diluting each other instead of deepening the underpinning of their work.

The losing organizations become less cooperative, and more militant --- less inclusive of other views, and more ideological --- in order to get those narrowly defined pots of funding.

#### -- ON THE INDUSTRY SIDE

Some readers will be familiar with the concept of 'Green Muting'. Simply stated, Green Muting is the effect where companies become less willing over time to share their sustainability outcomes and insights publicly, because, on the one hand, if they talk about what they've tried that has worked, external groups may try to show how the company is really just greenwashing, and on the other hand, if they talk about what they've tried that hasn't worked, external groups may use that to show how the company 'just screws things up.'

We need better disclosures to inform research and public policy leading to a sustainable economy, so this effect works at odds with efforts to encourage disclosures.

Vermillion believes the world needs better systems for something like a semi-permeable membrane that will enable companies to disclose their techniques and outcomes in a private setting, to inform research and public policy without risking their reputations due to the disclosures.

### III. SOLUTIONS

#### -- BARRIERS TO BRIDGING THE DIVIDE

In order to help groups connect and cooperate, Vermillion has been working to pilot an Innovators in Economics project --- to help GPI experts connect and cooperate, to challenge each others' ideas in private settings, and build greater depth within their concepts.

In order to help companies better inform public policy Vermillion has been working to pilot an Innovators in Sustainability project --- to help companies discuss what has worked, what hasn't, and what has been in the way, in settings where they aren't at risk for the disclosures.

We also note that both of these major groups do not see the strands that connect their macro (GPI) discussions, and their micro (disclosure) discussions --- and these projects seek to help bridge the gaps between the development of these major groups.

Vermillion sees other such programs, and recommends that they should be strategically funded to help deepen the concepts of sustainable development.

But more can be done.

### IV. RECOMMENDATIONS FOR THE OUTCOME DOCUMENT

With respect to improving cooperation mechanisms and partnership arrangements, Vermillion recommends that national and regional governments agree to:

1. Fund integrative discussions, and settings where NGOs and multi-stakeholder groups get funding to come together and challenge each others' ideas, on the path to

strengthening the underpinnings of

their ideas and finding consensus where possible.

2. Direct government auditors to give latitude to agencies that fund projects that advance the goals of multiple government agencies at the same time in integrative ways.

3. Through public education campaigns and tax policy, encourage companies to update their community investment policies to set aside 20% of their budgets to fund cooperative NGO projects that are more complex (less easy to describe), and another 20% to go ONLY to projects where the company shares leading sponsor status with at least three companies from other industries.

## Vinyl 2010 Partnership

Vinyl 2010 Partnership input and contribution to the zerodraft for the outcome document of Rio+20 (UN Conference on Sustainable Development)

### 1. Introduction

Vinyl 2010 the 10-year Voluntary Commitment for Sustainable Development of the European PVC industry has been a Partnership registered with the Secretariat of the UN Commission on Sustainable Development since 2004.

The World Summit on Sustainable Development that took place in Johannesburg (2002) served as a catalyst and contributed to shape the work done by Vinyl 2010 in the years to come. Our industry is confident that Rio+20 will provide a clear indication on a shared Roadmap to a Green Economy and secure a renewed political commitment for Sustainable Development.

The European PVC industry welcomes this opportunity to submit input to contribute to the zero-draft for the outcome document of Rio+20. Our input on expectations for the outcomes of Rio+20 is based on the concrete experience of Vinyl 2010 as a UNCSD registered Partnership and on the lessons learned on the ground during the implementation of our 10-year Voluntary Commitment.

Concretely we recommend to:

1. Support and recognise Voluntary Agreements and Public-Private Partnerships as effective tools for a faster transition to a Green Economy.
2. Strengthen the role of the UNCSD Partnerships for Sustainable Development.
3. Support Micro, Small and Medium enterprises in their transition towards a Green Economy.
4. Adopt a Life Cycle Assessment (LCA) approach based on sound science for sustainable Green Growth.

#### 1.1. Background: the Vinyl 2010 experience for Sustainable Development

Polyvinyl chloride, or PVC, is one of the most widely used polymers in the world. Due to its very versatile nature, PVC is used extensively in many industries and provides several popular and necessary products in construction, automobiles, electric and IT cabling, smart & credit cards, packaging, fashion & design, medical devices, amongst other things.

PVC has many qualities that meet key sustainability criteria amongst other things it is lightweight and highly durable which contributes to an efficient use of natural resources. However, by the late 1990] these qualities were being eclipsed by concerns over the use of certain additives as well as the lack of recycling options for PVC products once they had reached their end-of-life phase.

Aware of these concerns, in 2000 the European PVC industry took the ground-breaking step of launching the Vinyl 2010 Voluntary Commitment.

This Voluntary Commitment was a 10-year plan aimed at creating a sustainable development framework and improving product stewardship across the life cycle of PVC. Its objective was to minimise the environmental impact of the PVC production, promote the responsible use of additives, support collection and recycling, as well as to encourage social dialogue between all of the industry stakeholders. Vinyl 2010 is the legal entity set up to provide the organisational and financial infrastructure needed to manage and monitor the progress towards the goal set in the Voluntary Commitment. It groups European vinyl resin manufacturers and plastic converters, as well as producers of stabilisers and plasticisers. The four founding members are: the European Council of Vinyl Manufacturers (ECVM), the European Plastics Converters (EuPC), the European Stabiliser Producers Associations (ESPA) and the European Council for Plasticisers and Intermediates (ECPI).

Vinyl 2010 operated through projects covering technology, research, organisation (e.g. recycling schemes) and communication (e.g. on best practice). Total expenditure in waste management projects reached 6.6 million Euro in 2010 alone (more than 57 million Euro were spent in the 10 years). Resource allocation in terms of time and efforts was quite large, too.

Originally signed in March 2000 and covering the EU-15, the Voluntary Commitment has since been expanded as the EU has enlarged to cover all EU-27 countries.

The establishment of an infrastructure for the collection and recycling of PVC in Europe is one of the most significant achievements of Vinyl 2010. Prior to 2000, PVC had been dismissed by many as an unrecyclable material destined to be landfilled. At the time there were virtually no recycling systems in place. Today, thanks to Vinyl 2010, over 260,000 tonnes of post-consumer waste were recycled in 2010 alone.

Other notable achievements include:

- ◆◆ The phasing-out of Cadmium stabilisers from PVC products in the EU-27 by 2007. Lead stabilisers are on track to be fully replaced by 2015.
- ◆◆ On-going research, testing and expert evaluations of PVC plasticisers.
- ◆◆ The establishment of a Research & Development programme on new recycling and recovery technologies.

A decade later, Vinyl 2010 is widely regarded as a leading example of industry self-regulation working in practice and delivering concrete results. All major targets have been met or exceeded, and a new sustainable business model involving the whole PVC value chain has been created.

#### 1.2. VinylPlus: the new 10-year Voluntary Commitment of the European PVC industry

In 2010, as the 10-year programme was reaching the end of its foreseen lifetime, the Vinyl 2010 Board together with the four founding associations decided to move forward

with a new 10-year Voluntary Programme under the name of VinylPlus. The new commitment builds upon the achievements of Vinyl 2010 and the increased awareness of the importance of Sustainable Development and Social Responsibility within the PVC industry.

VinylPlus is even more ambitious than its predecessor in terms of targets and scope. It aims to achieve a quantum leap in recycling rates, technological innovation and stakeholder engagement over the next decade.

The new programme has been developed bottom up in an open process of extensive stakeholder dialogue, including private companies, NGOs, regulators, civil society representatives, and PVC users. VinylPlus is built around addressing five challenges to ensure that PVC contributes to Sustainable Development and a Greener Economy in Europe: achieving the recycling of 800,000 tonnes of PVC and the development of innovative recycling technologies; addressing concerns about organochlorine emissions; ensuring the sustainable use of additives; enhancing energy efficiency and the use of renewable energy and raw materials in PVC production; and promoting sustainability awareness throughout the whole PVC value chain. These challenges are based on The Natural Step System Conditions for a Sustainable Society.

## 2. Expectations for the outcome of Rio+20

The Johannesburg World Summit on Sustainable Development acted as true inspiration for the European PVC industry. The document Contributing to Sustainable Development published by Vinyl 2010 in August 2002, addressed the four key objectives of the Summit: protecting the natural resource base of economic development, notably freshwater, energy and land; integrating environment and poverty eradication; making globalisation sustainable, by redressing imbalances in, and generally improving, living and working conditions; enhancing good governance and participation. This document was aimed at presenting examples of how the PVC industry and its products could make a positive contribution towards the pursuit of the Summits objectives, and how to move forward.

Furthermore the commitment taken by the European PVC industry was, and is, fully in line with the Johannesburg Declaration on Sustainable Development which states that the private sector has a duty to contribute to the drive towards sustainability.

Vinyl 2010 approach was therefore further defined, in line with the spirit of the Agenda 21 Chapter 30 Strengthening the role of business and industry, in particular concerning:

◆◆ Social Responsibility The issue of Corporate Social Responsibility is becoming more and more relevant in contemporary society. This is due to the fact that it is clearer in everyday experience at individual, business and societal levels that real, stable and long-term progress requires social sustainability in addition to economic growth. We believe Voluntary Commitments from industry are part of the Corporate Social Responsibility to make effective progress on sustainable development

◆◆ Cradle to grave approach Vinyl 2010 was (to our knowledge) the only Voluntary Commitment involving the entire upstream and downstream chain from raw-material production to post-consumer waste in a single industry

◆◆ SME's contribution Bringing together around 21,000 companies, Vinyl 2010 (and now VinylPlus) is a model for Corporate Governance aimed at Sustainable Development and Durable Consumption because it looks at the entire life cycle of a product and because it actively includes Small and Medium Sized Enterprises.

◆◆ Transparency Vinyl 2010 (and now VinylPlus) closely involves external stakeholders and policy-makers (i.e. Members of the European Parliament and EU Commission Officials). An independent Monitoring Committee has been set up to supervise the implementation of the Voluntary Commitment.

◆◆ EU enlargement The Vinyl 2010 initiative became ever so more significant in the context of an enlarged European Union with 27 Member States. Rigid regulatory approaches were unlikely to be effective in ashort timeframe, as they could not answer market diversities, local financial constraints or consumer's behaviour.

With reference also to the Chapter V of JPOI, Vinyl 2010 was cooperating with the EU new Members and trade unions with the objective of raising health, safety, and environmental standards to higher levels and to harmonise sustainability goals. The aim of Vinyl 2010 was also to obtain a gradual enlargement of the Voluntary Commitment to the new EU Member States.

Vinyl 2010 is now an integral part of the PVC industrys ethos in Europe, setting a series of principles and values enclosed in the concepts of Social Responsibility and Sustainable Development:

◆◆ Voluntary action getting on with tackling the sustainability challenges of PVC in a proactive way.

◆◆ Measurable targets and deadlines.

◆◆ Continuous improvement to always accept that the journey to sustainability requires constant evaluation and learning along the way.

◆◆ Collaboration ways of working together within the industry to find solutions that no single player can implement, and reaching out to a much broader stakeholder group.

◆◆ Transparency opening-up, sharing and recognizing of the gap between where we are now and where we aim to be.

◆◆ Scientific rigour and research make sure that technologies, processes and materials are assessed according to strong credible and scientific sustainability principles.

◆◆ Dialogue create more debate with external contacts and those who have something to say about PVC, and be open to listening and learning from others in a positive and receptive manner.

◆◆ Responsibility no one is going to secure a place for PVC in the sustainable future other than the industry itself.

◆◆ Seeking business prosperity we need businesses successful businesses along the value chain of PVC that means making an acceptable return on investment, and being competitive at the same time as seeking the route to sustainable development.

◆◆ Priority to sustainability innovation research, design and innovation should have no goal other than improving the sustainability potential of PVC including its market competitiveness, as well as openly challenging components, materials and practices that do not make sense in terms of sustainable development.

As it was the case for the Johannesburg Summit, the European PVC industry, now represented in VinylPlus, expects that the outcome of Rio+20 will give a clear indication on a shared Roadmap to Green Economy, setting inspiring principles and frameworks, as well as helping (our) industry to be an active partner in the transition to a global Green Economy. Based on our experience we suggest considering the following aspects:

1. Support and recognise Voluntary Agreements and Public-Private Partnerships as effective tools for a faster transition to a Green Economy.
2. Strengthen the role of the UNCSD Partnerships for Sustainable Development.
3. Support Micro, Small and Medium enterprises in their transition towards a Green Economy.

4. Adopt a Life Cycle Assessment (LCA) approach based on sound science for sustainable Green Growth.

In the next sections these four suggestions will be analysed in more details.

#### 2.1. Support and recognise Voluntary Agreements and Public-Private Partnerships as effective tools for a faster transition to a Green Economy

Vinyl 2010 has been a clear success and is a perfect example of industry self-regulation working in practice. It has been a learning-by-doing process, and in a certain way it has helped to revolutionise the PVC value chain in Europe.

The programme has demonstrated that successful industry voluntary agreements can be effective and that, sometimes, self-regulation (without forgetting the role of institutions and decision-makers) can achieve results faster than regulations.

In addition, this proactively voluntary approach and, in our case, the involvement of the entire value-chain, can provide a ready platform for collaboration and dialogue with regulators as well as for the implementation of certain policies within the industry (e.g. REACH, BATs, etc).

The experience of industry's initiatives like the Vinyl 2010 Voluntary Commitment and product stewardship schemes like the Forest Stewardship Council are demonstrable proof that self-regulation can be effective in meeting Sustainable Development goals and in helping the transition towards a Green Economy.

The 2nd Communication on Environmental Agreements of the EU Commission welcomed voluntary commitments as a way to achieve environmental improvements. The comments<sup>6</sup> received from EU MEPs about the achievements of Vinyl 2010 are encouraging and stimulating our industry to work even harder in order to accomplish the new, more ambitious goals set by the VinylPlus commitment.

The key to the success and spreading of such initiatives is that they are recognised by policy-makers and stakeholders as making a real contribution towards Sustainable Development and a Greener Economy.

In the complex, fast changing and interconnected world we live in, Sustainable Development cannot be achieved only by decree. It is very important for a voluntary commitment to be credible and the only way to do so is by including measurable objectives and deadlines, but it is also fundamental to act within an institutional framework which involves regulators and stakeholders.

The European PVC industry is therefore calling on policy-makers to:

- ◆◆ Take account of the achievements of initiatives such as Vinyl 2010.
- ◆◆ Support voluntary agreements when formulating new policies to promote sustainable Green Growth.

#### 2.2. Strengthen the role of the UN CSD Partnerships for Sustainable Development

Partnerships for Sustainable Development (voluntary, multi-stakeholder initiatives aimed at implementing sustainable development) were an important complementary outcome of the World Summit on Sustainable Development (WSSD).

The Commission on Sustainable Development (CSD) was designated by the WSSD as the focal point for discussion on partnerships that promote Sustainable Development. At its eleventh session in 2003, the Commission stressed that Partnerships in the context of the WSSD process and its follow-up should be developed and implemented in accordance with a set of agreed Criteria & Guidelines.

Since 2004, Vinyl 2010 has been a Partnership registered with the Secretariat of the UN Commission on Sustainable Development.

In our experience, the CSD Partnership programme represents an important and effective tool for advancing the Sustainable Development agenda: not only implementing multi-stakeholders plans for Sustainable Development (as outcome of the WSSD), but also because it can represent a global benchmarking platform. Vinyl 2010 has been participating in the UNCSD Partnerships Fair since 2006 to exchange views on its approach, initiatives, best practices and achievements. Comments and suggestions received have been encouraging and supporting our industry in its efforts towards the achievements of the set targets.

We believe that the potential contribution by Partnerships towards Sustainable Development and Green Growth could be further exploited, not only in terms of implementation mechanism, but also in terms of knowledge, experience, best practices and transferable skills sharing.

Not all Partnerships have the possibility to participate in the Partnerships Fair and there should be more opportunities for interaction and information exchange during the year (e.g. regional events, online Partnerships platforms, etc.). In addition, even if the Partnerships Fair is an official part of the CSD, it is not always recognised as such by many delegates. The Partnerships credibility and contribution to the CSD work might be enhanced by mainstreaming in some form the most relevant outcomes of the Partnerships interactive discussions in the High-level segment and with Major Groups.

Finally, in our participation in the UNCSD Partnerships Fair we have learned that the best contributions to the implementation of multi-stakeholders plans for Sustainable Development and to the sharing of best practices and lessons learned are coming from those Partnerships that have clearly defined measurable targets and deadlines; clear roles and defined leadership (and accountability) for the implementation amongst partners; and a transparent regular reporting system. We recommend to taking these elements into account as part of the Criteria & Guidelines for Partnerships registration for the next decade; stricter criteria, though, should be balanced by stronger recognition of the role, contribution and achievements of the Partnerships, with the objective of strengthening the engagement of business and civil society.

#### 2.3. Support Micro, Small and Medium enterprises in their transition towards a Green Economy

According to the EU Commission's DG Enterprise and Industry, whilst over 99% of all enterprises in Europe are SMEs, 90% of SMEs are actually micro-enterprises with fewer than 10 employees and the average company has just five workers. However, these micro-enterprises account for 53% of all jobs in Europe, so their importance to the European economy is enormous.

Their small size and limited resources mean micro-enterprises face particular problems. Finding the finance to get a new business going, or to grow an existing one is a difficult challenge. The administrative tasks, or red tape, which all firms have to carry out weigh particularly heavily on Europe's micro-enterprises. And finding staff with the right skills, willing to work for a small firm can be a problem, as is ensuring they have the time to update their skills and keep up with developments in the field.

This is also true for the management of environmental issues.

Representing around 21,000 SMEs, Vinyl 2010 and now VinylPlus, believe that trade associations and industry voluntary programmes can play an important role in reaching out to SMEs and helping them in achieving significant environmental targets in their transition toward a Green Economy.

But it is of paramount importance that governments and institutions, and consequently other external stakeholders, recognise the efforts made by the industry. In the case of Vinyl 2010/VinylPlus, for example, the inclusion in the Public Procurement Specifications of the use of recycled materials, such the PVC collected and recycled by several SMEs with the help of Recovinyl8 would support the industry efforts to boost collection and recycling throughout Europe. Incentivising initiatives aimed at improving eco-efficiency of the SMEs, as it happening in the case of the Care+ programme, could support and accelerate the transition towards a Green Economy.

#### 2.4. Adopt a LCA approach based on sound science for sustainable Green Growth

Popular schemes to evaluate and promote green products are often based on environmental labels. Labels should have the role of educating consumers, incentivising eco-design and encouraging environmental responsibility. Existing environmental labels, unfortunately, have been and are often developed as a voluntary pass/fail scheme to label products, based only on partial environmental criteria and political choices.

A few years ago, during an Eco-label hearing at the European Parliament, one of the arguments raised claimed that science should not take precedence over policy-making. This clearly illustrates the viewpoint of a group of stakeholders who reject the very notion of sound science in favour of scaremongering and emotional laden decisions, without even considering the practical damage that such choices could do to our economies and the social contribution that products that would be effected deliver.

The PVC industry therefore endorses LCA approaches as an effective technical and scientific tool to take sustainable choices. This is also in line with the principles of the EU directive on Integrated Pollution Prevention and Control (IPPC). IPPC advocates for life cycle thinking in order to take appropriate actions and avoid shunting the environmental impacts from one phase of the life cycle to another.

LCA can provide a standard methodology based on a common and reliable inventory data and it can be clearly seen how LCA is the only unique instrument to be used as common approach in many different kinds of environmental related issues.

---

- Young people call for ending over-exploitation and undemocratic stewardship of Earth's resources @ #EarthSummit 2012 #OWS <link>
- Young people need a President For The Planet at #EarthSummit 2012 <link>
- Worried about unemployment, corruption, and huge subsidies to big biz? Demand change @ #EarthSummit 2012 #OWS <link>

### Background

#### Tell the UN that the status quo is unsustainable for our planet's three billion young people

In June 2012, presidents, prime ministers and other world leaders will come to Rio de Janeiro for the United Nations Conference on Sustainable Development. With more than 50,000 participants expected, the event will mark the 20th anniversary of the historic first Earth Summit held there in 1992. The "Rio+20" gathering will set the agenda for the next decade or more for action on critical global challenges.

For the youth of the world, much stands to be gained or lost from the Rio+20 Earth Summit. That's because young people, more than any, understand how they will be affected if world leaders fail to take action on the intertwined environmental and economic pressures they face. There are already plenty of unfulfilled promises in scores of treaties and action plans, and the world's youth are expecting this summit to do much more than just deliver another agenda with lofty goals for the distant future.

As world leaders prepare for Rio+20 they must ensure that young people are a top priority by taking real actions to immediately put us all on a more sustainable path. The Earth Summit is about more than just the planet, it is about our future.

The United Nations is requesting public comments concerning the conference through November 1st.

#### What to do:

Send a message, before the November 1<sup>st</sup>, 5pm EST (2100 GMT) comment deadline, urging the United Nations to ensure that the world's youth will be a top priority at Earth Summit 2012.

#### Contact information:

United Nations Conference on Sustainable Development Secretariat Email: [dsd@un.org](mailto:dsd@un.org)

UN-DESA, DC2-2212 2 UN Plaza New York, NY 10017

#### Sample letter

Subject: I stand with the world's young people in calling for a transformative Earth Summit 2012

Dear United Nations,

I am writing in support of three billion young people who are worried about their – and their planet's – future. The current degradation and exploitation of our Earth's resources is simply unsustainable, and world leaders must respond in full measure when they meet next June in Rio de Janeiro.

First, we need all world leaders to recognize the urgency of the current situation. They need to understand and inform their own people about the dangers of not acting to move us toward a green economy and a more sustainable future. Youth are worried about the inequity and corruption that contribute to the overtaxing and mismanagement of critical natural resources and ecosystems and undermine the basis for ensuring decent livelihoods for the next generation. The United Nations should urge presidents and prime ministers from every nation to commit as early as possible to come to Rio and to initiate their preparations for the Earth Summit.

Second, world leaders must deliver more in Rio than another agenda with lofty goals for a distant future. Over the last half-year, young people meeting around the world have called out the weak implementation of scores of existing treaties and action plans adopted at previous summits. These young people are demanding that the next Earth Summit instead generate specific commitments to real actions from governments at all levels, corporations, communities and civil society groups. I agree, and the United Nations should ensure that we are holding everyone accountable for their promises.

Third, governments and corporations need to commit to major new investments in education, employment and empowerment of young people in the transition to a green economy.

We cannot wait another generation for sustainability; the world's young people need their leaders to act now.

Sincerely,

[**Danny MBUYI**, national coordinator **ASSOCIATION OF VOLUNTEER SUSTAINABLE DEVELOPMENT IN DR CONGO/AVD**

## Wild Law UK

Submission by Wild Law UK to the United Nations Conference on Sustainable Development

### Introduction

Wild Law UK1 submits the following contributions to the United Nations Conference on Sustainable Development, for inclusion in a compilation document to serve as a basis for the preparation of a zero draft of the outcome document. This submission sets out our views on how to make the United Nations Conference on Sustainable Development (Rio +20 Summit) a success. The common belief of those who are part of Wild Law UK is that governance systems, including law, must be rapidly reoriented so that they support, rather than undermine, the long-term health and integrity of the Earth. This approach is known as Earth-centred governance, which recognises that humans are one of the many species making up the amazingly diverse Earth community and seeks to rebalance our relationship with the Earth system.2 Wild Law UK aims to secure rights of nature in law. Wild Law UK consists of more than 100 UK-based legal professionals from the private, public and voluntary sectors and non-lawyers from all walks of life, including students, environmental campaigners, academics, scientists and economists.

### Summary

Rio +20 should urgently:

1. Address the need for Earth-centred governance, and recognise the rights of nature to support, rather than undermine, the long-term health and integrity of the Earth.
2. Re-define sustainable development to embody Earth-centred principles.
3. Endorse and promote the Universal Declaration of the Rights of Mother Earth3 and secure political commitment to implement this at the national and local levels.
4. Reorient Agenda 21 to incorporate Earth-centred governance principles.
5. Support the proposal for a Declaration of Ecocide.
6. Support the proposal for a Declaration of Planetary Boundaries.

In Section A, Wild Law UK sets out our general views on the objectives of Rio+20, and in Section B on the specific issues which should be addressed at the Conference.

### Section A: Objectives of Rio+20

A.1. To secure renewed political commitment for sustainable development A.1.2. The Stockholm Declaration in 1972 recognised 3 elements/ 'pillars' to sustainable development: environment, society and economy. The Report of the World Commission on Environment and Development: Our Common Future in 1987 defined sustainable development as development that meets the needs of the present without compromising the ability of future generations to meet their own needs. However, over the years sustainable development has become conflated with unlimited economic growth and does not ensure protection of the environment or social justice. Current approaches to sustainable development fail to recognise that the economy is rooted in and dependant on Earth and should support the whole community of life on Earth and future generations. Earth, our life support system, is a non-negotiable/tradable element of sustainability.

A.1.3 A different approach to sustainable development is needed. As Einstein once said: 'we cannot solve a problem with the same thinking we used when we created [it]'. Wild Law UK believes that for development to be truly sustainable it needs to be founded on Earth-centred principles which promote the long-term health and integrity of the Earth, recognising that Earth has limits within which humans must live, and respecting the inherent rights of all life on Earth of present and future generations. Wild Law UK suggests that a more accurate approach to sustainable development would be seeing it as two pillars, economy and society, rooted in the Earth/ environment and functioning within her limits.

### A.1.4 Earth-centred principles include:

#### a) Earth-centred governance

- Recognises the intrinsic value of nature – as a life support system for all life on Earth, rather than as a "resource" for the sole benefit of humanity.
- Respects the Earth's limits/boundaries and reflects scientific understanding of how ecosystems operate. For example we should adopt a precautionary approach and prevent human activities from causing species extinction, the destruction of ecosystems or the disruption of ecological cycles, including through phenomena such as climate change.
- Respects rights of nature to exist, to habitat and fulfil their role in the community of life, and to restoration from damage.
- Recognises humans are one of many species in the amazingly diverse Earth community.

#### b) Mutually enhancing relationship with nature

- Rebalances the human relationship with the Earth system, from which human wellbeing derives, so that it contributes to the wellbeing of the whole Earth community now and in the future.

#### c) Community ecological governance

- Respects the rights of all species of the Earth community to participate in governance decision-making which affects their life and future. A.1.5 Rio +20 needs to renew political commitment to redefine sustainable development to embody Earth-centred principles. The Rio Summit in 1992 was known as the 'Earth Summit'. Rio+20 should ensure Earth is at the centre of sustainability.

## A.2. Progress to date

A.2.1 Progress is lacking. While it is commendable that previous summits on sustainable development have led to international environmental agreements, for example the Rio Summit 1992 led to the Convention on Biological Diversity and UN Framework on Climate Change, environmental degradation continues to increase. Numerous assessments confirm that present and future generations are facing unprecedented, multiple and connected ecological, social and economic crises. There are threats of mass extinction of biodiversity (many in the scientific community believe that we have already entered the sixth mass extinction caused by human activity), mass deforestation and loss of habitats, climate change, peak oil, increased food insecurity, increased poverty and breakdown of communities.

A.2.2 Our current relationship with nature is one-sided, but this cannot be sustained. If we continue with this human-centred approach/unlimited economic growth, the Earth will reach a tipping point beyond which ecosystems and Earth's life support systems will collapse. Without the natural world we cannot survive. Without recognising the intrinsic value and rights of the Earth and all life, we are in severe danger of irreparably damaging our own life support system.

A.2.3 A critical gap in implementing outcomes of the major summits is a lack of recognition of Earth-centred principles.

## A.3. New and emerging challenges

A.3.1 Rio +20 should address the alarming reality that we have exceeded the safe operating space (boundaries) for three of nine planetary systems (climate change, biodiversity loss and excess nitrogen and phosphorus production).<sup>6</sup> Such human activities are damaging Earth and undermining the conditions of life for present and future generations. Wild Law UK believes Governments and society need to address this urgent challenge if we are to pass on a viable and flourishing future to the generations to come.

A.3.2 Rio +20 should also address the growing challenge of human-centred governance, and lack of recognition of the rights of nature. Current governance is failing to prevent the cumulative degradation of the natural world. The root cause is disconnection from the Earth and human-centred thinking embedded in laws and sustainable development policies, which even in their most protective environmental form, treat nature as a "resource" for the sole benefit of humanity. A recent example of this is the UK's Natural Environment White Paper which values nature purely for 'environmental services' for the benefit of humans. Laws and policies recognise the rights of fictitious corporations but not the inherent rights of nature, which is alive. As such, protection of nature is often subsumed to the perceived greater "[human] public interest" in economic growth. Such anthropocentrism is out of step with science, and leads to a dangerously unbalanced relationship between humans and the rest of the community of life on Earth.

## Section B: Specific issues which should be urgently addressed at Rio

B.1. Rio +20 should redefine sustainable development to embody Earth-centred principles.

B.1.1 These principles are set out in detail in A.1.4 above.

B.2. Rio +20 should adopt the Universal Declaration of the Rights of Mother Earth<sup>7</sup> and encourage implementation mechanisms at national and local levels.

B.2.1 Following the failure of Copenhagen Summit, the Bolivian Government organised an alternative conference for communities, NGOs, lawyers, academics, scientists and governments from around the world, in Cochabamba, Bolivia, coinciding with Mother Earth Day on April 22nd 2010. Around 35,000 people participated from 140 countries and they adopted a Declaration of the Rights of Mother Earth which recognizes Earth as a living being with rights to life, to continue her vital cycles and processes (free from human disruptions), and to restoration from destructive human activities.

B.2.2 Wild Law UK believes that the time has come to recognise the rights of nature in law.

B.3. Rio +20 should avoid:

- renewing political commitment to a human-centred definition of sustainable development which prioritises unlimited economic growth and short-term individual gain, over interests of the whole community of life on Earth, of present and future generations.
- focussing on the green economy, rather than on overarching governance systems, of which the economy is one element. Growing the economy must not be seen as an end in itself. The purpose of governance should be to promote the wellbeing of the whole community of life on Earth.
- defining a 'green economy' as unlimited economic growth, without regard to Earth-centred principles, particularly the Earth's limits and planetary boundaries.

B.4. Green economy in the context of sustainable development and poverty eradication

B.4.1 There is a lack of clarity on the definition of green economy. Wild Law UK believes a green economy should be based on Earth-centred principles, as explained above, for the benefit of the whole community of life on Earth.

B.4.2 As Article 7 of the Universal Declaration of the Rights of Mother Earth states: 'The rights of each being are limited by the rights of other beings and any conflict between their rights must be resolved in a way that maintains the integrity, balance and health of Mother Earth.' Further States should promote economic systems that are in harmony with Mother Earth and consistent with the rights of nature.<sup>8</sup> Earth-centred governance seeks to rebalance our relationship with the Earth system from destructive to mutually enhancing for the benefit of the whole Earth community.

B.5. The institutional frameworks (at international, regional, national and local levels) required

B.5.1 Sustainable development is more than a green economy. Institutional frameworks are necessary at all levels to deliver Earth-centred governance, not just a green economy, for the benefit of present and future generations of all species (not just humans). Any institutional framework should be guided and aligned with the Earth-centred principles explained above, and promote a significant shift in personal and societal values and behaviour towards nature. Earth-centred governance and limits must underpin all our decisions.

B.5.2 Inspiration for institutional frameworks can be drawn from the proposed Ombudsman for Mother Earth in Bolivia.<sup>9</sup> Also the Green Ombudsman for future generations in Hungary, appointed in 2007 to uphold the peoples' Constitutional right to a healthy environment. The Commissioner is entrusted with broad powers to investigate complaints including environmental issues, advocate on sustainability issues and also widen the knowledge base through research projects.

B.5.3 People also have an important role to play in implementing sustainable development. Rio established Agenda 21 as a blueprint for sustainable development and this set out the importance of local actions. The World Charter for Nature, a legally binding document adopted by the United Nations General Assembly in 1982, calls for humans to be guided by a moral code of action including respect and protection of nature. The Earth Charter, a United Nations initiative developed by global civil society and launched

as a people's charter in 2000 by the Earth Charter Commission, "seeks to inspire in all peoples a sense of global interdependence and shared responsibility for the well-being of the human family, the greater community of life, and future generations". The Universal Declaration of the Rights of Mother Earth says that 'every human being is responsible for respecting, protecting and living in harmony with Mother Earth'.<sup>11</sup> Public participation and leadership in decision-making is critical to ensure a more sustainable future for all. Wild Law UK acknowledges that in order to secure such a radical change we need to transform hearts and minds, creating a shift in personal and cultural world views, values and ethics. Some examples of best practice for local governance includes the Transition Town movement (which aims to build the resilience of local communities to cope with the twin challenges of peak oil and climate change), Community Ecological Governance and the Council of Elders in many indigenous communities.

B.5.4 A transition from human to Earth-centred governance is urgently needed. Inspiring legal precedents include the Ecuadorian Constitution – which was the first Constitution in the world to recognise the legally enforceable rights of nature. In a recent case in Ecuador, the Provincial court of Loja granted an injunction against the Provincial Government of Loja to stop dumping excavation material into the Vilcabamba river, because it violated the constitutional rights of the river to exist and maintain its vital cycles, structure, functions, and evolutionary processes. There are also dozens of local ordinances (laws) in the United States which acknowledge the legal rights of natural communities and ecosystems to 'exist and flourish', which recognise self-governance of communities and which deny the personhood of corporations engaging in ecologically and socially destructive activities.

B.6. The objectives and roles the UK Government should assume in the run-up to and at the Conference

- support and implement the Universal Declaration of the Rights of Mother Earth
- raise awareness of the need for Earth-centred governance
- promote a shift in personal and societal values and behaviour to recognise the rights of nature
- promote economic systems which comply with Earth-centred principles and define green economy within Earth's limits for the benefit of present and future generations
- facilitate public participation in Rio +20
- show leadership in the EU by implementing Earth-centred governance.

B.7. Ideal outcomes from Rio+20

B.7.1 Re-framing of sustainable development to embody Earth-centred governance principles.

B.7.2 Adoption of the Universal Declaration for Rights of Mother Earth<sup>16</sup> by the United Nations and implemented at the national level.

B.7.2.1 This Declaration could be enforced by:

- an international environmental court such as the proposed International Court for the Environment<sup>17</sup>, which advocates wider access to environmental justice.
- adoption of domestic laws which recognise and protect the rights of nature, e.g. the Bolivian Law of Mother Earth and the Ecuadorian Constitution.
- recognising the rights of individuals and civil society groups to enforce the rights of nature, e.g., by widening interpretation of the provisions of the United Nations Economic Commission for Europe Convention on Access to Information, Public Participation in Decision Making and Access to Justice in Environmental Matters (the Aarhus Convention).
- creating institutional mechanisms to promote and advocate the rights of nature such as Bolivia's proposal for an ombudsman for Mother Earth, or a Commission for Nature's Rights, similar to the Equality and Human Rights Commission in the U.K.
- Respecting the provisions of the World Charter and Earth Charter which set out duties and responsibilities for the respect and protection of Earth and the 'greater community of life and future generations'.

B.7.3 Re-orientation of Agenda 21 to incorporate Earth-centred governance principles – as an 'Agenda for the Earth Community'.

B.7.4 Adoption of the proposed Crime of Ecocide<sup>19</sup>, with Ecocide to mean 'the extensive destruction, damage to or loss of ecosystem(s) of a given territory, whether by human agency or by other causes, to such an extent that peaceful enjoyment by the inhabitants of that territory has been severely diminished.' This could be enforced by an international court.

B.7.5 Support the proposal for a Declaration of Planetary Boundaries<sup>20</sup> which recognises and respects the necessary Earth-system processes which sustain all life, and promotes responsibility for safeguarding these processes from serious or irreversible damage. A Planetary Boundary Institution could promote the principles of the Declaration.

B.7.6 Support the social movement for Earth-centred governance. There is a growing movement of communities, organisations, lawyers, policy makers and academics advocating for the rights of nature and living in harmony with nature. There are strong advocates in the UK, U.S., Australia, Africa, South America and Asia, including Wild Law UK, Gaia Foundation, Global Alliance for Rights of Nature, African Biodiversity Network<sup>23</sup>, Centre for Earth Jurisprudence and many more. Connections with other like-minded advocates should be supported. For real change to occur, an holistic approach and practice of Earth-centred governance and respect of rights of nature is necessary by other stakeholders including the wider public, Government, and business.

B.8 The potential risks to the ideal outcomes being achieved. These include:

- a persistent presumption of the status quo for unlimited economic growth over Earth-centred governance
- lack of support from member States, particularly in implementation and enforcement
- lack of financial support to promote Earth-centred governance.

These obstacles can be overcome if there is political commitment to addressing the root causes of continued environmental degradation.

Wild Law UK, 27 October 2011

---

## Women

### Women's Major Group Summary

#### Input to "Zero Draft" Outcome Document

#### UN Conference on Sustainable Development (Rio+20)

1 November 2011

Women's Major Group Submission, UNCSD Rio+20, 1 November 2011

The Global Women's Major Group submission is submitted in response to the request for input by the Secretariat for the UN Conference on Sustainable Development. It has been developed by over 50 organizations worldwide to reflect the diversity of women's perspectives. This summary comprises the global Women's Major Group submission. A longer Women's Major Group compilation document (working document) for Rio+20 is annexed. The Women's submissions are available at the UNCSD website [www.uncsd2012.org](http://www.uncsd2012.org) under 'Major Groups–Women', along with regional Women's Major Group statements from Asia, Africa, and Latin America and the Caribbean.

## SUMMARY

### Introduction

Throughout the world women are key actors in maintaining the sustaining livelihoods and welfare of their families and communities, and in making a transition to a more equitable and sustainable world. Our economy is linked to and depends on a healthy planet. It also depends on women's economic contributions, both formal and informal.

### Women's Vision for Rio+20: an Equitable and Sustainable World

Social equity, gender equality and environmental justice must form the heart of sustainable development, and of the outcomes of the Rio+20 UN conference in 2012. Twenty years after the first Rio conference, great social and economic inequities still remain. These inequities especially affect women and children, who make up the majority of those living in poverty.

Measures to ensure equity, equality, social and environmental justice need to be prioritized, as these are the cornerstones for achieving sustainable development globally. These measures should promote:

**Ø Gender equality in all spheres of our societies:** education, employment, ownership and control over resources, access to justice, political representation, institutional decision-making, care giving and household and community management. A world where women can fully deploy their potential in all spheres of our societies, meaning without gender-based violence, where women share in land ownership and financial resources, where women and girls are equally represented in all areas and in which women's sexual and reproductive rights are assured.

**Ø Respect for human rights and social justice:** building societies based on respect for human rights of all people, ensuring social protection, sustainable livelihoods and environmental security, and fair distribution of the earth's natural and economic resources. A world where economic, social and environmental rights for women and men are fully respected.

**Ø Environmental conservation and protection of human health:** creating societies which function within the earth's ability to support life and human livelihoods, preventing

disruptive climatic changes as well as pollution and contamination of ecosystems and human settlements. A world where women's livelihoods are not irreversibly harmed by environmentally destructive economic activities.

### 1. Renewing Commitments to Sustainable Development and Gender Equality

*(this section refers to point 4.a. of the Rio+20 guidelines for submissions)*

Women worldwide have been working towards recognition of the gender dimensions of sustainable development by the United Nations. The Women's Action Agenda 21 was developed in 1991 by women from all regions in the world, and aimed to influence the outcomes of the 1992 United Nations Conference on Environment and Development in Rio de Janeiro (UNCED, or the "Earth Summit"). It contained an outline for a healthy and peaceful planet, and formed an important basis for introducing gender equality in the official UNCED outcomes. It criticized existing economic thinking and development models and practices that were deemed unjust, inequitable and unsustainable.

In response to women's efforts and advocacy, Principle 20 of the Rio Declaration (1992) recognizes that: *"Women have a vital role in environmental management and development. Their full participation is therefore essential to achieve sustainable development."* Chapter 24 of Agenda 21 "Global Action for Women towards Sustainable Development" contains 11 different commitments with specific recommendations to strengthen the role of women in sustainable development and to eliminate all obstacles to their equal and beneficial participation, particularly in decision making activities.

Other important global agreements that underline the importance of gender equality and sustainable development include the Convention on the Elimination of All forms of Discrimination Against Women (CEDAW), the Beijing Platform for Action, the Cairo Program of Action and the Millennium Development Goals.

We call on governments to renew their commitments to these agreements and support their commitments through action and direct financing to support gender equitable sustainable development.

We recommend that the Rio+20 Outcome Document include a set of 'Sustainable Development Goals' (SDGs) that complement existing agreements, including specific crosscutting goals, targets and indicators on gender equality in all spheres of society.

### 2. Views on 'Green Economy' in the Context of Sustainable Development and Poverty Eradication

*(this section refers to point 4.b. of the Rio+20 guidelines for submissions)*

We are critical about the use of the term 'Green Economy'. We are concerned it is too often separated from the context of sustainable development and poverty eradication. We are concerned it will be used and misused to green-wash existing unsustainable economic practices that lead to inequities and infringe on the rights of effected peoples and future generations, because it does not fundamentally and adequately question and transform the current economic paradigm.

In particular, the current economic system:

**Harms women and the environment:** while the wealthy consume more and more natural resources and are responsible for increasing levels of environmental damage, those living in poverty are suffering from degradation of their agricultural land, forests, water supplies and biodiversity, and of alteration of weather cycles due to climatic changes.

**Is inequitable and unsustainable:** social and economic inequities are inherent in the present economic system and are increasing in many countries both in the North and the South; with especially adverse consequences for women and children.

**Uses performance indicators that are socially and environmentally blind:** our (failing) economies are currently managed so as to achieve and celebrate growth of the Gross Domestic Product (GDP) and do not promote human and environmental welfare.

Most governments state that their objectives are progress and development, yet at the same time use economic tools which do not help attain these objectives, but instead have lead to concentration of wealth and increased inequities. Governments at Rio+20 should renew support for the objectives of equitable and sustainable development, and should commit to choosing the right economic tools. In a sustainable development framework, the economy has to fulfil social progress taking into account environmental limits.

We support the transformation from the current economic system to a sustainable and equitable economic system that ensures gender equality, human rights and environmental justice and supports sustainable livelihoods and poverty eradication.

#### **Recommendations regarding 'Green Economy' in the context of Sustainable Development and Poverty Eradication**

Ø Use the term '**Sustainable and Equitable Economy**' instead of 'Green Economy'

Ø Principles of a Sustainable and Equitable Economy:

<sup>EN</sup> Promotion of social equity, gender equality and intergenerational equity

<sup>EN</sup> Democracy, transparency and justice

<sup>EN</sup> Application of the precautionary principle

<sup>EN</sup> Ethical values, such as respect for nature, spirituality, culture, harmony, solidarity, community, caring and sharing

<sup>EN</sup> Global responsibility for the global common goods

<sup>EN</sup> Environmental sustainability

<sup>EN</sup> Common but differentiated responsibilities

Ø Sustainable and Equitable Economies have economic policies aiming at:

<sup>EN</sup> Poverty eradication and gender equality: with fairer distribution of resources and rights, and assurance of human security of all

<sup>EN</sup> Ending violence against women through legislation, support services for women, affordable access to justice for women, and information about rights and norms

<sup>EN</sup> Prioritizing peace promotion and conflict prevention

<sup>EN</sup> Preventing toxic and radioactive harm on women's and children's health, and ensuring safe waste reduction, reuse and recycling policies

<sup>EN</sup> Providing women, adolescents and girls universal access to sexual and reproductive health

<sup>EN</sup> Sustainable agriculture, food security and food sovereignty and recognition of women's role in food production

<sup>EN</sup> Assuring access to clean, efficient and safe energy and technologies for all, especially for women

<sup>EN</sup> Safe water and sanitation for all, particularly for poor rural and urban women and girls

<sup>EN</sup> Conserving biodiversity, women's access to natural resources and respect of their environmental rights

<sup>EN</sup> Necessary and equitable measures for mitigation of and adaptation to climate change

<sup>EN</sup> Measures against land grabbing – protecting women's (continued) access to (communal) land and commons

<sup>EN</sup> Phasing out GMO's as women in many countries are the majority of the 'seedkeepers'

Ø Measure and operationalize progress through:

<sup>EN</sup> Policies that recognize and promote women's economic contributions

<sup>EN</sup> Indicators that go beyond the 'GDP' (Gross Domestic Product), including indicators to show gender impacts

<sup>EN</sup> Financial sector re-regulation and reform, encouraging long-term perspectives

<sup>EN</sup> Fiscal sector reform, including new taxation to redistribute wealth, such as a financial transaction tax, and taxing of non-renewable and unsustainable resource exploitation

<sup>EN</sup> Investments in women's leadership, education, skills and entrepreneurship

<sup>EN</sup> Investments in health care, child-care and social protection floor

### **3. Views on an 'Institutional Framework for Sustainable Development'**

*(this section refers to point 4.c. of the Rio+20 guidelines for submissions)*

Rio+20 offers a platform for much-needed fundamental reform of international governance to ensure sustainable and equitable development within the carrying capacity of the planet.

Our existing institutional and governance structures have proved inadequate to meet our rising sustainable development challenges. Our core policy formulation, economic thinking and motivations remain firmly detached from our broader sustainability concerns. Since our electoral cycles and business models of reporting increasingly define our decision-making, short-term gains take precedence over future and long-term interests.

With women comprising a small percentage of those in decision-making positions of government, parliament and private enterprises, women remain disconnected from the core of policy-making. Without true representation of their needs, women are left without a voice, or a legitimate means in which to question or present their concerns

Many institutions that regulate and manage programs and projects are not gender sensitive. These institutions need to change and demonstrate internal practices of gender equality.

**Important pillars for governance of sustainable development (global, regional, local) include:**

-  Rio Principle 10 (right to information and participation), and conventions that cover all countries
-  Rio Principle 20, ensuring the full participation of women (for example, through quotas, and changing governance culture)
-  Valuing the unrecognized contributions of women and of the environment to sustainable development
-  Financing of sustainable development that respects the right of free, prior and informed consent of Indigenous Peoples, and the rights of communities
-  Gender criteria of financial mechanisms for sustainable development
-  Recognition that women can capacitate "sustainable economies" with their knowledge systems and hitherto undervalued "care economy" contributions
-  Protection of women's indigenous and traditional knowledge systems from appropriation and exploitation by big business
-  Acceleration of progress towards gender equality in all areas of governance, the judiciary and the economy

**Recommendations regarding 'Institutional framework for Sustainable Development'**

- Ø Governance of sustainable development should be placed at the highest level of the UN, reporting directly to the UN General Assembly, with accountability mechanisms that include specific gender indicators
- Ø Gender mainstreaming within the entire sustainable development governance structure, based on the CEDAW, the Beijing Platform for Action, Agenda 21 and the Millennium Development Goals, including: collection and use of gender analysis and sex-disaggregated data; improved institutional gender capacity; consultation with networks of gender experts; partnering with women's organizations; and user-friendly involvement mechanisms that will enable grassroots women to participate in global, national and local dialogues
- Ø Strengthened international environmental governance, including adequate public and predictable resources for a reformed United Nations Environment Programme (UNEP), enabled to assure capacity building at national level and coherence of the MEAs
- Ø Safeguarding environmental, social conditions for the benefit of present and future generations through national and international ombudspersons for future generations as independent institutions with legal powers<sup>1</sup> and funds for future generations
- Ø A strengthened and adequately financed UN Women, to guide and implement flagship programmes on strengthening women's role in sustainable development, and coordination between all UN agencies on gender and sustainable development
- Ø Strengthening of effective and balanced civil society participation
- Ø Reform international finance, economic and trade organisations, to assure priority for equitable social development and environmental protection, and prevent a commodification of natural resources

1 As supported by the Major Groups: Workers and Trade Unions, and Youth

**4. Views on the 'Objective of the Conference' including 'Emerging Issues'**

*(this section refers to point 4.a. of the Rio+20 guidelines for submissions)*

The Rio+20 agenda includes setting priorities for work on "Emerging Issues". Women's priority and sectoral issues, including some identified among the UNEP Foresight 21 Challenges for the 21st Century List, include:

**Ø Food security and food sovereignty: Women's voice over agriculture and biodiversity**

Women produce much of the world's food. They need secure land tenure and resource rights to ensure their productivity. Their traditional knowledge about seeds, farming skills and livestock management needs to be recognized. Given that women constitute more than 50% of those who "go to bed hungry every night" (World Disasters Report on Hunger), food security systems need to address issues of equitable distribution of food, and need to address reasons behind crop failures, collapsing fish stocks and food price increases, including large-scale industrial bio-energy production. A review of the unfair legal framework for intellectual property in this field is needed to defend food security and food sovereignty, especially for women. Effective measures should be adopted at the global level to prevent speculation in the food market and maintain sustainable fishing practices both near shore and on the high seas. To increase the social and environmental resilience of communities and prevent loss of agricultural biodiversity, women's production needs to be supported, including through improved access to education, resources and markets. To defend food security and food sovereignty, their rights to choose what to plant, eat and sell, must also be ensured.

**Ø Rush for Land: Women's land rights and ownership tenure, and prevention of land grabbing**

Women's land rights need to be ensured. Women farmers and indigenous peoples are currently losing their territories, resources and livelihoods in the grabbing of land by governments, local and foreign investors, including for large-scale bioenergy production. This results in increased poverty and lack of food security and food sovereignty. The increasing influence of corporations and other economic actors over environmental policies is also leading to privatization of common lands. Women are among the main victims of this trend, as they are deprived of access to resources that are of essential importance to their livelihoods and communities. These practices should be halted and community and indigenous rights should be respected, protected and strengthened. In consultation with women's groups, plans need to be put in place at all levels to ensure that land purchases do not threaten and compromise the livelihood of rural women.

**Ø Halt privatization and commodification of the commons: Women most affected**

The increasing influence of corporations and other strong economic actors over environmental policies is leading to tendency to privatize and commodify the commons<sup>2</sup> - formerly ruled by community rules and accessible to them - including water, genetic resources, and Indigenous territories and community conserved areas. Women are amongst the main victims of this trend, as they are deprived of access to resources that are of essential importance to their families. The privatization of the commons should be halted and Indigenous and community rights should be respected, protected and strengthened.

[/bonn\\_outcomes/Sept\\_2\\_2011/11\\_9\\_30\\_UNEP\\_Regional\\_MGS\\_Statement\\_Europe\\_2\\_Sept.pdf](#)

#### **Ø Women and children's greater harm from radiation: Need for phasing out of nuclear**

Women and children are at significantly greater risk of suffering and dying from radiation-induced cancer than a man exposed to the same dose of ionizing radiation, and are not protected accordingly by current regulation. There is no "safe" dose of radiation. We take a firm position against nuclear energy as one of the solutions to the energy crisis. It is neither clean nor sustainable, as many nuclear disasters have already so painfully pointed out. States must take decisive positions from immediate decommissioning to phasing out, and take the path of promoting the use of renewable energy. A legally binding mechanism to address the cost of decommissioning and clean up of nuclear power-plants, nuclear waste and uranium mines should be committed to at Rio+20. Redress and clean-up should be financed according to the polluter-pays principle. The entire nuclear cycle is threat to our generation and to that of our children. A UN rapporteur on uranium and nuclear risks should be agreed on<sup>3</sup>.

#### **Ø Promotion of clean renewable energy technologies and phasing out of unsustainable energy**

Close to 2.4 billion people in developing countries still depend almost entirely on traditional biomass fuels (wood, charcoal, dung and agricultural residues). It is mostly women who are tasked with collecting and managing these fuels, which limits their time and opportunities for education and income-generating activities. Investments in access to modern energy are needed for improved livelihoods, education, health services, water and sanitation, education, and transportation. Women need increased access to cleaner, more efficient energy sources and technologies for household use and productive activities, as well as training and education for business development - including designing, producing, marketing and managing new energy products and services. Unsustainable energy sources such as nuclear, shale gas, tar sands and coal continue to be expanded and subsidised. Governments should agree in Rio to eliminate direct and indirect subsidies to unsustainable energy supply – currently estimated at 7-9 billion Euro annually – and instead to create

incentives and a fair legal environment for renewable energy and women's access to these resources.

#### **Ø Strengthen gender priority in Climate Change policies**

Climatic changes are already causing major problems in many regions of the world, and women bear the harshest impacts of the current climate crisis. Due to gender roles and inequalities, climate changes have particularly adverse impacts on women's livelihoods and work burdens, and also reinforce gender discrimination and the feminization of poverty. Women have valuable experience, knowledge and ideas about climate change mitigation, adaptation, resilience and disaster risk management, and are important actors in the promotion of sustainable consumption. Women's decision-making power and participation in the development and implementation of climate change policies, mechanisms and funding must be increased to ensure they are gender-responsive. Women also need access to environmental rights, climate change funding, and sustainable technologies.

#### **Ø Women and migration**

Due to unsustainable activities and climate change, many regions are experiencing land degradation, desertification, water insecurity and scarcity, sea level rise, droughts/floods, land grabs, changing disease vectors and deforestation. Economic and ecological displacement and migration are expected to increase as a result of this resource instability, both rural to urban and cross-border. In Asia, women make up the majority affected. A sustainable development agenda must address the social costs of this migration by addressing conditions of women's economic deprivation and environmental degradation, as well as by establishing policies to assist the migrants, particularly women and children, and improve their legal status.

#### **Ø Women and children at risk: Need for new approaches to minimizing risks of novel technologies and chemicals**

Women are greatly concerned by the technological solutions offered to climate change, including geo-engineering, many of which are motivated by profit. Women are also very concerned by the rising volume of chemical production of many toxic chemicals and chemicals yet to be adequately tested for safety, and the wide-scale deployment of new technologies such as nano-technology in consumer products without necessary health information. Women and children are at specific risk from diseases associated with toxic chemicals - including many cancers, infertility, metabolic disorders, and learning and developmental disabilities – which are likely to increase in incidence and severity. We seek from our governments a commitment to the rapid reduction and elimination of toxic substances and highly hazardous pesticides and fertilizers, while steadily phasing-in non-chemical pesticide management approaches. Rio+20 outcomes should include participatory and transparent mechanisms for assessing these technologies, using the precautionary principle and a gender perspective to examine, among others, dangers to women's reproductive health, multiplication of their already many burdens and other impacts.

#### **Ø New challenges to water availability: Burden for women**

Approximately one billion people live without access to clean water, and over 2 billion lack basic sanitation. In many developing countries, it is women and girls who are often most affected by lack of water, as they are primarily responsible for obtaining and transporting water for daily use. Water scarcity is compounded by climatic changes, and increasing due to chemical – amongst others from shale gas fracking – and biological pollution. This is a serious threat to the health of women and their babies and families, and it adds to the women's burden of water provision. Given the importance of protecting the health of future generations and the health of women who are more vulnerable to toxic chemicals during pregnancy, access to clean water for women and their families must be ensured and pollution of water halted at every level. In line with the UN resolution of 2010, we consider water as a basic human right, and as such it must be treated as a common good. Its treatment, distribution and management must be under public control, including mechanism of

social control and community administration. Due to their major role in water provision and administration, women must be the leadership of water management decisions.

### **5. Views on Rio+20 Outcomes**

*(this section refers to point 3.a. of the Rio+20 guidelines for submissions)*

We call on governments to recognize that sustainable development is built on a healthy environment as the foundation of all human well-being and that economic development must serve human and cultural development and take place within the carrying capacity of the planet. Economic instruments should aim at incorporation of externalities, equitable redistribution of wealth and equality between women and men.

#### **Ø Sustainable and equitable economies**

**Commit to gender-sensitive development of binding international and national measures**, in particular:

<sup>EN</sup> Agree to develop binding policies that ensure healthy and sustainable livelihoods for women, in particular through halting use of unsustainable, radioactive and harmful substances and technologies

<sup>EN</sup> Agree to assure a Social Protection Floor for all women as a fundamental human right, thus effectively reducing poverty and allowing women to fully participate in

sustainable development

<sup>EN</sup> Agree to end violence against women through legislation, support services for women, affordable access to justice for women, and information about rights and norms

<sup>EN</sup> Agree to assure access to clean, efficient and safe energy, water and sanitation for all, especially for women

<sup>EN</sup> Agree to assure women's access to natural resources, measures against land grabbing, access to and protection of commons, and respect of women's environmental rights

#### Ø Governance of sustainable development

**Commit to gender-sensitive development of binding international and national measures, in particular:**

<sup>EN</sup> Agree to strengthen international governance of environment and to bring global sustainable development governance to the highest level of the UN, whilst assuring gender targets and policies for the new structures

<sup>EN</sup> Agree on binding measures for the protection of women's indigenous and traditional knowledge systems from appropriation and exploitation by corporations (strong regulation of corporate power which effectively protects the most vulnerable in times of globalization)

<sup>EN</sup> Agree on the development of agreements that guarantee global access to timely information, relevant public participation, affordable access to justice, liability and redress mechanisms

<sup>EN</sup> Agree on creating specific windows and incentives to increase women's role and access to assets and finance in the area of sustainable development

<sup>EN</sup> Agree to create an independent technology assessment organisation with the mandate to assess, control and, where necessary, limit use of technologies before widespread use, based on the precautionary principle

<sup>EN</sup> Agree to create global mechanisms for the protection of the global commons, including clean up of harmful pollution such as from uranium mining, and a mechanism for its implementation

<sup>EN</sup> Global and national institutions to protect the rights of future generations<sup>4</sup>

4 As supported by the Major Groups: Workers and Trade Unions, and Youth

#### Ø Commit to targets and indicators for women's engagement

The Outcome Document should include specific targets and indicators to support and promote women's engagement as key actors in sustainable development and to measure government progress on recommended actions. These could be incorporated into Sustainable Development Goals or could stand alone.

#### Ø Include gender equality goals in Sustainable Development Goals

A proposal has been presented by member states for Sustainable Development Goals (SDG), which governments in Rio can agree to develop up to 2015, to follow up the Millennium Development Goals.

The Women's Major Group supports the idea of SDGs, however, regrets that the proposal does not yet include any specific gender related goals, unlike the MDGs which contain several.

A set of Sustainable Development Goals should be adopted that includes specific crosscutting goals on gender equality in all spheres of society, in particular these could aim to:

<sup>EN</sup> Secure women's greater access and control over assets, land tenure, inputs and natural resources including traditional common lands;

<sup>EN</sup> Promote women's access to services and technologies needed for water, energy, agricultural production, family care, household management and business enterprises;

<sup>EN</sup> Provide comprehensive social protection measures, especially for women;

<sup>EN</sup> Provide safe health care facilities, including for sexual and reproductive health;

<sup>EN</sup> Enable women and men to combine their jobs with childcare;

<sup>EN</sup> Support investments in women's economic, social and political empowerment, including through new financing and credit facilities accessible to women;

<sup>EN</sup> Support for traditional knowledge systems and management practices;

<sup>EN</sup> Determine specific targets for women with regard to technology training, business management skills and extension services;

<sup>EN</sup> Promote women's participation in government and business leadership, with targets of at least 40% women;

<sup>EN</sup> Strengthen women's organizations/self help groups, entrepreneurs and networks to enable them to negotiate the terms of their engagement with sustainable development projects; and

<sup>EN</sup> Develop in-house capacities for gender mainstreaming within implementing agencies and local partners.

**The world stands at a crossroads**, and the future of our planet Earth and its human communities lays in (y)our hands. United in our diversity we, women from all regions in the world, call on our governments and other stakeholders to renew the commitments on equitable and sustainable development made at the Earth Summit in Rio de Janeiro in 1992. We commit ourselves to contribute to a peaceful and healthy planet, in which human rights are well respected and women's voices are well-represented. We urge you to act in the spirit of global solidarity, trust, environmental and social care, and incorporate our recommendations into Rio+20 decisions.

#### WOMEN's MAJOR GROUP, Rio+20

## **ANNEX**

to the Women Major Group Submission for the Zero-draft Document

### **Women's Global Rio+20 Compilation**

#### **Position Statement**

#### **UN Conference on Sustainable Development**

Working Document

Version 1. November 2011

This is a compilation of the Women's Major Group Rio+20 position statements based on input from the March 2011 Women's Major Group Position Paper, women's statements presented at the Bonn UNDPI conference, the UNEP global Rio+20 consultation in Bonn and the Regional Rio+20 preparatory meetings in Santiago de Chile, Seoul, Cairo and Addis Ababa. This is a working document in continued progress. A globally developed summary of this document has been submitted as the Women's Major Group submission for the zero-draft document for Rio+20. This compilation document is an annex.

#### **Content**

##### **1. Introduction**

- 1.1. Women's and Nature's invisible contribution – Bedrock of our Economies
- 1.2. Women are key actors in the transition to a more equitable and sustainable world

- 5.1.9. **Strengthen gender priority in Climate Change policies**

#### **6. Recommendations for Rio+20 Outcome document**

- 6.1. Sustainable and equitable economies: Commit to gender-sensitive development of binding international and national measures
- 6.2. Governance of sustainable development: Commit to gender-sensitive development of binding international and national measures
- 6.3. Commit to targets and indicators for women's engagement
- 6.4. Sustainable Development Goals – add Gender Equality goals

#### **1. Introduction**

##### **1.1. Women's and Nature's invisible contribution – Bedrock of our Economies**

- Ø Women and the Environment are the bedrock of our economies and modern societies
- Ø Both women and the environment make an invisible contribution which is currently not valued and not measured
- Ø Women's livelihoods depend on a healthy planet and access to natural resources
- Ø The dominant monetary economy is linked to and depends on a healthy planet, and on both women's visible and women's invisible economic contributions
- Ø Most governments state that their objectives are progress and development, but at the same time use the wrong economic tools, which at best focus on GDP growth and at worst on making a minority rich.
- Ø It is time not just to state again the right objectives, but also to choose the right tools
- Ø In a sustainable development framework, the economy has to fulfil social progress taking into account environmental limits.
- Ø To reach Sustainable Development, it is time to move from the current economic system to one that embraces the 'Care Economy' – and from there, ultimately to sustainable and equitable economies based on gender equality.**

## 1.2. Women are key actors in the transition to a more equitable and sustainable world

Throughout the world, women are providing basic necessities for their families - food, water, fuel, homes and health care - and also caring for others, building communities and running businesses. They are forest stewards, farmers, land managers, community leaders, researchers, political leaders, technology designers, and entrepreneurs.

Ø On the positive side, all but 6 countries in the World have ratified the Convention on Elimination of all Discrimination Against Women (CEDAW), and the last country not to allow women to vote has decided to do so in a few years time. Much progress has been achieved throughout the world, as many countries have developed policies and laws in place that reduce discrimination against women. But great challenge remain in the implementation of these policies and in the behavioural changes required within households, communities and institutions to promote gender equality. Thus, in many countries women's knowledge, skills and contributions remain largely unrecognized and undervalued. All studies show that eliminating gender inequalities are good for countries

Ø World Bank: investing in women is best investment in development of their communities<sup>5</sup> and World gender inequality brings economic costs

Ø FAO: by eliminating gender discrimination in agriculture, food production would raise by 20% worldwide<sup>6</sup>

<sup>5</sup> World Bank - World Development Report 2012, Gender Equality and Development <http://econ.worldbank.org/WBSITE/EXTERNAL/EXTDEC/EXTRESEARCH/EXTWDRS/EXTWDR2012/0,,contentMDK:22851055~menuPK:7778074~pagePK:7778278~piPK:7778320~theSitePK:7778063,00.html>

<sup>6</sup> add reference Food and Agriculture Organisation

## 1.3. Recalling key outcomes of Rio 1992 on Women's role and Gender equality

We recall Rio Declaration Principle 20 which says: *'Women have a vital role in environmental management and development. Their full participation is therefore essential to achieve sustainable development.'*

We recall Agenda 21 Chapter 24 "Global Action for Women towards Sustainable Development" which underlines the role that women play in sustainable development, and distinguished 11

commitments with specific recommendations to strengthen the role of women in sustainable and beneficial development. The chapter contains specific recommendations to strengthen the role of women in sustainable development and to eliminate all obstacles to their equal and beneficial participation, particularly in decision making activities relating to promoting environmentally sound management and sustainable development.

As well as 145 other references throughout the Agenda 21 text, in 33 of its 40 chapters, which underline the importance of women in sustainable development.

## 1.4. Recalling the Women's Action Agenda 21

The Women's Action Agenda 21, an outline for a healthy and peaceful planet, aimed to influence the outcomes of UNCED. It formed an important basis for introducing gender equality in the official UNCED outcomes, including Agenda 21, the Rio Conventions and the Rio Declaration.

*The Women's Action Agenda for a Healthy Planet*, WAA21, was a critical reflection of women's collaboration on environment and sustainable development.

The WAA21 starts with a common vision on the interaction between the life-giving capacity of the Earth and women's shared concerns about the health of the planet, social inequalities and the systems and values that cause such problems. Strong impetus is put on human rights, and the need for recognition of women as powerful forces of change, as catalysts and initiators of environmental action.

***"We, women of many nations, cultures and creeds, of different colours and classes, have come together to voice our concern for the health of our living planet and all its interdependent life forms. As long as Nature and women are abused by a so-called "free market" ideology and wrong concepts of "economic growth," there can be no environmental security"***<sup>7</sup>.

<sup>7</sup> From: Preamble, WAA21 (Source: <http://www.iisd.org/women/action21.htm>)

WAA21 identified eleven urgent Action Areas, and specific recommendations were presented for each of these areas: Democratic Rights, Diversity and Solidarity; Code of Environmental Ethics and Accountability; Women, Militarism and Environment; Foreign Debt and Trade; Women, Poverty, Land Rights, Food Security and Credit; Women's Rights, Population Policies and Health; Biodiversity and Biotechnology; Nuclear Power and Alternative Energy; Science and Technology Transfer; Women's Consumer Power; and: Information and Education.

WAA21 criticized ongoing economic thinking and the official UNCED positions on sustainable development. It reflected a strong criticism of the existing models and practices of development that were deemed unjust, inequitable and unsustainable. The WAA21 text formed the basis for women's mobilization and efforts to influence the UNCED negotiations.

## 2. Women's Vision for Rio+20: an Equitable and Sustainable World

### Key elements of women's common vision

Twenty years after the first Rio conference, great inequities remain. Social and economic inequities are especially hard on women and children as they form the majority of the world's poor.

We agree to prioritize measures to assure equity, equality, social and environmental justice as they are cornerstones for achieving sustainable development globally.

**2.1. Gender equality in all spheres of societies:** education, employment, ownership and control over resources, access to justice, political representation, institutional decision-making, care giving and household management

Ø World where women can fully deploy their potential in all spheres of our societies

Ø World without gender-based violence - at home, in the workplace, in society

Ø World where women no longer own less than 1% of land and wealth, but share in land ownership and equally access financial resources

Ø World where women and girls are equally represented (50%) in education, job markets and political office

Ø World in which women sexual and reproductive rights are assured

Ø World where no economic activity is connected to violence, including rape

**2.2. Human rights and Social justice;** societies based on respect for human rights of all people and equitable management, ensuring livelihoods through safe and decent food, fuel, shelter, and health care, and a fair distribution of the earth's natural resources.

Ø A world where the human rights of all women and men are fully respected, including the human rights of Indigenous Peoples and other ethnic groups.

Ø A world where economic, social and environmental rights of women and men are fully respected

Ø World where poverty of women and men is eradicated.

Ø A world where all women and men share equally the limited environmental resources.

Ø World where women and men enjoy social protection.

Ø A world where men and women are equally taking care of their families, communities and environment

Ø A world where different systems of knowledge and experience are respected and can cooperate on equal footing

Ø World where products we consume no longer are based on exploitation and contamination of workers, including women and children, and consumers are informed about the social and environmental impacts of products

Ø World in which public and private enterprises are held liable for current and future damage and redress is assured for communities, including women

Ø World where products are produced in a fair manner, assuring decent pay and social security

Ø A world where the reproductive and sexual rights of women and men are fully respected

Ø A world where women have equal rights and implementable opportunities for information, participation, and access to justice

**2.3. Environmental conservation and protection of human health;** societies which function within the earth's ability to support life and human livelihoods, preventing disruptive climate change and pollution and contamination of ecosystems.

Ø World where women's livelihoods are not irreversibly destroyed by environmentally destructive economic activities

Ø World where basic needs and services are fulfilled, a world more focused in providing services (such as transport) and less in producing goods (as producing cars)

Ø World in which women do no longer need to fear from exposing their children to long-term health damage from harmful substances in their bodies during pregnancy and breastfeeding

Ø World in which free and prior informed consent of indigenous women and peoples over their natural resources is enforced

8 unsustainable economic activities, which surpass the earth's carrying capacity and cause long term contamination (toxic, radioactive) and disruption (ecosystems, climate)

Ø World in which prices include all externalities for damage and full insurance for risks

Ø World that provides incentives for zero-waste, life cycle approach, low-carbon and resource efficient, production that enhance and restore the natural environment, while also providing livelihoods, employment and entrepreneurial opportunities for women as well as men

### 3. Caring, Green and Inclusive Sustainable Economies

#### Views on the Rio+20 theme of a 'green' economy in the context of sustainable development and poverty eradication'

Based on the lessons from the financial and food crisis there is a need to clarify the hierarchy of the 3 components of sustainable development – environmental, social and economic. The "economic development" pillar - and its instruments of private and public regulation of finance - must serve human development, based on fiscal mechanisms and equitable redistribution of wealth including the goal of equality between women and men.

The backbone of all policies and strategies for sustainable development must be formed by the human rights approach. Policy decision should be preceded by an analysis of possible negative consequences on human rights and in terms of gender equality in relation to environmental rights. This analysis should include values for domestic work, the caring for others and the planet and informal labor provided mostly by women.

#### 3.1. Current damage to women and environment of our economic systems

While the wealthy consume more and more natural resources and are responsible for increasing levels of environmental damage, people living in poverty are suffering from degradation of their agricultural land, forests, water supplies and biodiversity, and alteration of natural weather cycles due to climate change.

### 3.1.1. Current economy system: inequitable and unsustainable

While the wealthy consume more and more natural resources and are responsible for increasing levels of environmental damage, the poor are suffering from degradation of their agricultural land, forests, water supplies and biodiversity, and alteration of natural weather cycles due to climate change. Social and economic inequities are especially hard on women and children as they form the majority of the world's poor.

Ø too much funding goes to perverse subsidies for unsustainable and speculative activities<sup>9</sup>

Ø almost all countries (with a few exceptions) are growing more unequal, inequality is growing in the North and the South.

Ø too little funding goes to human capital development and social equity, too little reaches women

Ø in times of GDP reduction, austerity measures are often a greater burden on women than on men<sup>10</sup>

Ø current prices do not include externalities and future costs

Ø current economic decision making is too short term, long term benefits are not valued

Ø Military budgets and tax spending for bailing out banks take away necessary funding for social development and environmental protection.

<sup>9</sup> an estimated 700 – 900 billion USD of subsidies go to support fossil and nuclear energy annually, see UNEP report towards green economy 2011, some 1 billion USD per day (!) goes to subsidies for unsustainable agriculture (bad for public health, bees, ecosystems, soil, biodiversity).

<sup>10</sup> a 2011 study by the UK trade unions show that 70% of the austerity measures are a greater burden on women than men

### 3.1.2. Gender Blind – current economic indicators

Ø Our economies are currently managed so as to achieve growth of the GDP – Gross Domestic Product.

Ø We have seen growth which lead to increasing inequity, growth which depleted the natural resource base of the economy itself, growth which did not benefit women, even jobless growth.

Ø We do not want growth without equity, not even 'green' growth.

### 3.1.3. Poverty Eradication that benefits women

Ø The majority of the poor are women.<sup>11</sup>

Ø The agenda for the Rio+20 UNCS D will address the Green Economy in the context of sustainable development and **poverty eradication**.

Ø Poverty eradication depends more on fairer distribution of resources and rights for the poor, than on GDP growth.

Ø Poverty reduction also happens without GDP growth, through improving the environment, as most poor depend on natural resources for livelihoods – forests and fisheries are an example.

Ø Women from low income communities are unable to participate in a "greener" economy if they have to spent most of their time for the "care economy"<sup>12</sup>

Ø Basic livelihoods for women need to be assured, including access to basic services so as to allow their participation in society including in the economy

<sup>11</sup> The UN estimates that approximately 70% of the 1.3 billion people living on less than one dollar a day are women, and these figures are rising with current food, fuel and financial crises.

<sup>12</sup> e.g. gathering fuel, water, assuring food, and caring for children, ill and disabled

### 3.1.4. Preventing toxic and radioactive harm on women's and children's health

Ø Women and their families are suffering health damage from contamination by harmful substances and radiation, even at very low doses. This damage also has a significant negative impact on sustainable and social development and poverty eradication.

Ø During pregnancy women unknowingly pass radioactive and persistent harmful chemicals on towards their children, and these to their children, with a risk of long-term, irreversible damage to the body and the brain

Ø Halting irreversible damage should be a priority area for Rio+20, in particular irreversible long term damage by radiation and by persistent, bio-accumulative, carcinogenic, mutagenic, repro-toxic and hormone disruption chemicals

### 3.1.5. Agriculture, women and rural development

Ø Women own only 1 % of the land, but 59%-80% of women are employed in the agricultural sector.

Ø Women in agriculture earn much less than men due to gender discrimination, changing this would increase food production by 20% according to FAO

Ø Increasing control by large corporations of the food chain is leading to the spread of industrial monocultures of crops such as soybean, oil-palm and eucalyptus, the proliferation of genetically modified products, privatization and patenting of life as well as commercial contracts for the sale of carbon dioxide and other so-called "environmental services"

Ø Food versus Fuel: the agro-fuel plantations cause land grabbing and other violations of the rights of indigenous peoples and communities and are one of the root causes of the current food crisis and effect in a dramatic way the lives of women and their families.

Ø Agro-toxics used in intensive agriculture, including agrofuels or monocultures of trees, pollute the earth and the health of women

Ø Agricultural biodiversity is being lost, and with it we are loosing women's traditional knowledge of seeds and productive skills, leading to a dramatic degradation of women's social and environmental resilience.

### 3.1.6. Energy - lack of access for women to safe sources

Ø Close to 2.4 billion people in developing countries still depend entirely on traditional biomass fuels which are detrimental for the environment and health

Ø Over 2 million people, mostly women and children as they spend most time indoors, suffer from respiratory diseases caused by biomass burning

Ø It is often women who are tasked with collecting and managing biomass fuel supplies such as firewood, dung and agricultural residues, leaving less time for productive activities.

Ø In many countries, energy prices are subsidized; eliminating subsidies on fossil fuel would harm the poor most if not replaced by social security systems

### 3.1.7. Nuclear energy – women and children at greatest risk

Ø Women and children are at significantly greater risk of suffering and dying from radiation-induced cancer than a man exposed to the same dose of ionizing radiation (National Academy Press, USA)<sup>13</sup>.

Ø „Radiation kills men—but it kills significantly **more** women. Both cancer incidence and death are 50% higher for women“<sup>14</sup>

Ø Regulation of radiation and nuclear activity ignores the disproportionately greater harm to both women and children<sup>15</sup>.

Ø Radiation harm includes not only cancer and leukemia, but reduced immunity and also reduced fertility, increases in other diseases including heart disease, birth defects including heart defects, other mutations

Ø Radioactive contamination of pregnant women in Chelyabinsk, Russia, have shown mutations of chromosomes, being transmitted into the 3rd and 4th generation of children<sup>16</sup>.

Ø Victims of nuclear energy will never be compensated for, as the nuclear industry pays artificially low insurance costs<sup>17</sup>, which means the tax-payer and future generations pay both economically as with their health.

Ø Nuclear energy is highly subsidised, the price of nuclear energy does not include the irreversible and long term damage caused throughout the nuclear fuel cycle<sup>18</sup>

<sup>13</sup> Biological Effects of Ionizing Radiation (BEIR) VII, Phase 2 report, "Health Risks from Exposure to Low Levels of Ionizing Radiation," published by the National Academy Press in 2006, Washington, DC.

<sup>14</sup> Mary Olson, NIRS Briefing Paper October 2011 - [www.nirs.org/radiation/radhealth/radiationwomen.pdf](http://www.nirs.org/radiation/radhealth/radiationwomen.pdf)

<sup>15</sup> The background for some recommendations include calculations of the different radiation effects on women and children but the final, "allowable" doses to the public do not incorporate this information.

<sup>16</sup> Tomsk research quoted in WECF factsheet on nuclear industry and health: [www.wecf.eu/english/publications/index.php](http://www.wecf.eu/english/publications/index.php)

<sup>17</sup> For nuclear power plants in New York state, the insurance would amount to some 6 billion USD each year, which is higher than the cost of construction of the plant (Professor Bell).

<sup>18</sup> Communities in countries with uranium mines, risk irreversible pollution of groundwater aquifers with radio-nuclides, and long term health damage. Developing countries and countries in transition do not have the funds to properly clean-up uranium mining tailing, nor decommission nuclear powerplants

### 3.1.8 Climate Change, natural disaster preparedness and women

<sup>19</sup> Slow-onset and sudden climatic changes already cause major problems in many regions of the world.

<sup>20</sup> Due to gender inequalities, discrimination and the feminization of poverty, women and girls are particularly vulnerable to the impacts of climate change, which destroy women's and girls' livelihoods and increase women's and girls' work burdens.

<sup>21</sup> Natural disasters reinforce, perpetuate and increase gender inequality, making bad situations worse for women.

<sup>22</sup> Women and men experience different vulnerabilities and cope with natural disasters differently;

therefore, an increase in the magnitude and frequency of natural disasters will have different implications for men and women.

<sup>23</sup> On the other hand, women have valuable experiences, knowledge and ideas about climate change adaptation, resilience and disaster risk management, and are important actors in the promotion of sustainable consumption.

<sup>24</sup> However, women's decision-making power and participation in development and implementation of climate change policies, mechanisms and funding are very limited.

### 3.1.9. Women lack access to safe water and sanitation

Ø Up to 2,2 billion people live without access to clean water (1 billion) or basic sanitation (2,2 billion).

Ø In many developing countries, it is women and girls who are often most affected by lack of water, as they are primarily responsible for obtaining and transporting water for daily use.

Ø Women and girls may travel many miles and spend much of their time securing essential water supplies

Ø Their task becomes more difficult as rivers and lakes become polluted and ecosystems degraded, and as their access routes are sometimes cut off (via fencing or threats) by large-scale land acquisition for industry or other private developments.

Ø Lack of safe water and sanitation limits women's development possibilities. This starts with girls' school attendance, which decreases when there is no access to safe sanitation, thus limiting their ability to get an education.

Ø Increasing access to safe water and sanitation for children is the most effective manner to reduce mortality of girls (World Bank)

### 3.1.10. Biodiversity decline negatively impact on women

Ø The degradation and destruction of forests, grasslands, coastal areas and other ecosystems is having a particularly strong negative impact on women, as they often depend on the wood, medicinal plants, wild fruits, seafood and other food and energy sources these ecosystems provide.

Ø Women and their traditional knowledge systems play a very important role in the management of Indigenous territories and community conserved areas and other community-based initiatives to conserve and restore ecosystems. This role, and these initiatives, should be recognized, protected against outside economic interference, and strengthened.

### **3.1.11 Oceans fisheries and women's health and food security**

Ø Ocean acidification threatens marine resources with unknown consequences for fisheries that are critical sources for household nutrition for poor women in coastal zones.

Ø Unsustainable fisheries practices can lead to declines of global fish stocks including those used by indigenous people in coastal areas.

Ø Harmful man-made pollution such as Persistent Organic Pollutants (POPs) and mercury in oceans have spread due to increasing water temperatures, and enter into the fish and seafood, and eventually humans<sup>19</sup>.

<sup>19</sup> The 2010 UNEP Report on "Climate Change and POPs" found that increasing water temperatures make POPs and other hazardous substances, such as methylmercury, more volatile and more mobile. Other recent studies have shown that these are being taken up by fish and seafood, and eventually humans through their diet. A WHO report to the negotiation to create a global instrument on mercury, with the objective of protecting human health and the environment by reducing mercury releases noted that in subsistence fishing populations, between 1.5/1000 and 17/1000 children showed cognitive impacts because of their exposure to methylmercury, an organic compound of mercury. A further impact on revenue from oceanic fisheries is that hazardous toxic substances reduce the reproductivity of fish, and so future food security as well as significant revenue for fishing nations is at risk. These are significant impacts on communities which have few choices for dietary protein and they indicate that greater global effort is needed to stop releases of harmful toxic substances into the

environment.

Ø Sustainable aquaculture can be a source of protein and household income. The role of women in these industries is limited despite their potential for food security.

### **3.2. Rio+20 Recommendations for "Sustainable and Equitable Economies" Referring to Rio+20 Agenda point "Green Economies in the framework of poverty eradication and sustainable development"**

Social equity and environmental justice must remain at the heart of sustainable development, and the outcomes of the Rio+20 UN conference in 2012.

We support the transformation from the current economic system to a sustainable and equitable economic system which ensures gender equality, human rights and environmental justice and supports sustainable livelihoods and poverty eradication.

#### **3.2.1. Principles of Sustainable and Equitable Economies**

##### **3.2.1.1. Sustainable and equitable economies promote social equity, gender equality and intergenerational equity**

Ø should

o Be based on a human rights approach

o Function within the limits of the planet

o Ensure a fair distribution of limited resources between men and women

o Ensure a fair distribution of limited resources among all countries and social groups

o Ensure equity within one generation and with future generations

o Ensure a fair transition for those effected by the change to sustainable and equitable economies

##### **3.2.1.2. Sustainable and equitable economies must be based on the precautionary principle**

Ø If there is indication of potential harm to the health of humans and the planet, binding measures must be taken, before harm is done

Ø Independent technology assessment before widespread use

Ø Polluters should be held liable for historic, current and future damage and costs

Ø Policy indicators must change, to well reflect the value of our environment and wellbeing the future

Ø Global funds can assure investments in protecting the environment for future generations

Ø Children, women and indigenous peoples in particular, should have to right to obtain redress for current and future damage

##### **3.2.1.3. Sustainable and equitable economies must be based on democracy, transparency and justice**

Ø Assure

o timely access to information

o effective public participation

o democratic decision making

o affordable access to justice

Ø All private and public companies report on their social and economic impact, – including gender impact – if not voluntary, then through legally binding regulations

Ø Legally binding regulations for Corporate Social Responsibility reporting should ensure that "green-washing" is eliminated.

#### 3.2.1.4. Sustainable and equitable economies must be based on ethical values and global responsibility

Ø Values for respect for nature, spirituality, culture, harmony, solidarity, community, caring and sharing

Ø Value of the global common goods

Ø Sharing worldwide whilst aiming for individual and societal wellbeing within the context of 'buen vivir<sup>20</sup>' (good living)

Ø Sharing means a more equitable distribution: eradicating poverty and changing and reducing excessive consumption patterns, in two direction, contraction and convergence policies. The need for eliminating not only not only extreme poverty, but also extreme wealth, in order to remain within the caring capacity of the planet

Ø Due value to and responsibility for common goods as an ongoing ethical, social and legal challenge for the local, national and international communities in charge of guarding these commons

<sup>20</sup> Term comes from the constitution of Ecuador, and used in the Regional Rio+20 Statement from Latin America and Caribbean

#### 3.2.2. Measuring and operationalizing sustainable and equitable development

##### 3.2.2.1. Policies should recognize and promote women's economic contributions

Profound policy and legislative changes are needed, that:

 secure women's property rights, land tenure, and control over natural resources, taking into account the need to prevent the further privatization of the commons;

 protect women's access to common lands

 promote women's access to services and technologies needed for water, energy, agricultural production, family care, household management and business enterprises;

 provide safe health care facilities, including for sexual and reproductive health;

 enable women - and men - to have access to childcare facilities at their places of employment? combine their jobs with childcare;

 support investments in women's economic empowerment; and

 promote women's participation in government and business leadership.

##### 3.2.2.2. Beyond GDP

Ø Although "green GDP" and " green Dow Jones indexes" exist, and are a step in the right direction, they are not widely used

Ø Gender equality, environmental impact and social indicators should be added to GDP as a basis for economic policy decisions (good examples include Gini coefficient, Gross National Happiness and "Buen Vivir" a.o.)

Ø Indicators to show gender impacts should be added: countries should commit to using them and reporting on them as part of Rio+20 implementation

##### 3.2.2.3. Financial sector reform – encouraging long term perspectives

Ø The financial sector needs further re-regulating, to assure that its supports moving towards sustainable and equitable development,

Ø Private financial institutions should not be allowed to speculate against sovereign states

Ø Long-term benefits should be worth more than short term benefits

Ø Financial institutions should support local sustainable development, and the "solidarity economy" (Ecuador)

Ø Countries should agree in Rio+20 to implement tested measures such as the financial transaction tax (India, Brazil) to increase long term perspective in financial investments and generate revenue for sustainable and equitable development

Ø Funds for sustainable and equitable development should ensure specific funds for access by women, in particularly women in indigenous peoples and local communities

Ø Countries should agree in Rio+20 to allocate 50% of GEF funds to local level funding, and to increase GEF micro-finance activities

##### 3.2.2.3. Fiscal sector reform – redistribution of wealth

Ø Redistribution of wealth is the only way to poverty eradication and improving women's global situation

Ø New taxation is needed to fairly distribute economic and environmental wealth in our societies. Last decades taxation has become cantered in the "efficient allocation" of capital and less progressive and less likely to address increasing inequality.

Ø Efforts should be made to fight tax havens and tax evasion.

Ø Making more funds available for poverty reduction, countries should agree in Rio+20 to start phasing out perverse subsidies, whilst continuing support for the poor

Ø Available funds should be reallocated, in particular to a "basic global women's income", to bring the poor out of deprivation<sup>21</sup>

Ø Best practices by countries which are taxing non-renewable and unsustainable resource exploitation to invest clean up and future sustainable activities should be agreed on as a model by countries in Rio+20

Ø In an economy where externalities are not included in the price of products, responsible consumption and production is more costly, hence consumers and producers which take responsible decisions should be given incentives included fiscal

Ø Proven flanking measures including mandatory substitution of harmful substances and practices, feed-in tariffs a.o. should be adopted by countries in Rio+20

Ø 21 effective examples include a.o. Brazilian Bolsa Familia, where social funds were geared at the women in the households, bringing almost 50 million people out of deprivation

#### 3.2.2.4. Investing in women's education, skills and entrepreneurship

For women to be catalysts for sustainable development, women need to be freed from economic, legal and political constraints that limit their ability to own land, control rights to natural resources, obtain necessary training, access information, raise financing and acquire relevant technology.

Ø Support spread of women-friendly technologies - ones that can free up women's time, reduce their drudgery, and expand their economic, social and political opportunities.

Ø Support women's education and training in technical and entrepreneurial skills

Ø Support anti-discrimination labour laws, equal pay, family friendly mandates, women right to organize and targeted schemes for accessing "non- traditional" jobs for women

Ø Support specific funding windows for women to invest in productive assets and communication means

Ø Set policy targets for women's access to technology, funding, resources, information

#### 3.2.2.5. Investing in the health care, child-care, and social security nets

Ø Social Protection is a fundamental human right, one of the best instruments for poverty reduction and a motor of development, it is a useful mechanism to ensure that countries grow with equity and social cohesion and it is a key component of gender equality. Establishing a social protection floor is key for sustainable development. A Social Protection Floor must include as a minimum child benefits, health care, income security for the elderly and the disabled, parental leave protection, benefits for the unemployed, and affordable, quality essential public services

Ø Women must have access to reproductive health care and family planning resources in order to be able to participate in productive activities.

Ø Countries should agree in Rio+20 on policies that guarantee child care, health care and social support programs specifically for female household members. Gender equitable childcare solutions are needed.

#### 3.2.2.6. Ending violence against women

Women are still living in gruesome conditions—facing violence both inside and outside their homes, dealing with the same inadequate services and critical economic disparities. Most of these women are dependent on their male counterparts as providers. More than 510 million women are abused by their partners during their lifetime<sup>22</sup>. Witnesses of violence have poorer health, and are more likely to perpetrate or suffer violence. In all countries, women who change their matrimonial statues (divorce, widowhood) loose out economically. Eliminating violence against women is fundamental for sustainable development, allowing women to fully participate in societies. Policies to eliminate violence against women need to:

22 World Bank World Development Report 2012 Gender Equality and Development

☞ Expanding support services for women victims of violence

☞ Strengthening and enforcing legislation to protect women from violence and prosecute the perpetrator

☞ Strengthening legislation which protects women from economic regression after divorce

☞ Making access to justice affordable and accessible for women, also in rural and remote areas

☞ Inform women and girls on their rights in school and via media

☞ Raise awareness with men and women on the inacceptability of violence against women to shift norms

#### 3.2.2.7 Peace, women and sustainable development

Ø Peace is an important precondition for sustainable and equitable development. The absence of peace – reflected in internal and international conflicts – puts an enormous burden on local communities, human and natural resources.

Ø During times of conflict violence against women increases and there are many competing claims on natural resources that often become scarcer or polluted, adversely affecting women's productive and reproductive roles.

Ø Military expenditures have increased from \$ 1,204 billion in 2006, to \$ 1,630 billion or 2.6% of global GDP in 2010 (SIPRI Yearbook, 2010). Militarization is absorbing financial and human resources, as well as natural resources.

We recommend to:

☞ Include peace promotion and conflict prevention on the Rio+20 agenda.

☞ Strengthen adherence to international law, in particular the agreed provisions of treaties on arms control, on human rights and on humanitarian law.

☞ Reallocate funds from military budgets to human needs and sustainable development.

☞ Implement Security Council Resolution 1325, which assures women's equal participation in conflict prevention and resolution, peace-keeping and peace-building, and promote women's contributions to fostering a culture of peace.

### 3.2.3. Sector Specific Recommendations

#### 3.2.3.1. Energy access for women

Ø Policies and actions to enlist women as active agents in development based on cleaner and more efficient energy systems and technologies

Ø Investments in women as energy managers and entrepreneurs to simultaneously address the multiple challenges of poverty eradication, gender equality, environmental conservation,

and climate change threats.

Ø Removal of constraints limiting the ability of women to take advantage of business opportunities offered by new energy options, including legal barriers that limit their property rights, land tenure, and access to credit.

#### 3.2.3.2. Nuclear phase-out – women's priority

<sup>EN</sup> The increased harm from ionizing radiation to women is not fully understood, therefore the Principle of Precaution dictates that protective action must be taken once a potential harm is identified.

<sup>EN</sup> Women's right to know about the health risk from ionizing radiation which they are exposed to and how to protect themselves from this harm, should be implemented

<sup>EN</sup> Women should have equal protection under the law, and regulation should be strengthened to protect those most at risk from ionizing radiation: women and children

<sup>EN</sup> There is no "safe" dose of radiation to anyone of either gender, or any age; a global phase-out of nuclear energy is the only acceptable path to take.

#### 3.2.3.4. Climate mitigation – gender equitable

<sup>EN</sup> Ensure that gender is mainstreamed in UNFCCC and national climate change policy processes and institutions.

<sup>EN</sup> Guarantee women's full and equal participation in climate change decision-making at global, national and local level.

<sup>EN</sup> Secure women's environmental rights (including their land entitlement) under REDD and other climate change mechanisms.

<sup>EN</sup> Ensure that all climate change funding mechanisms are gender-responsive, including the Global Climate Fund

<sup>EN</sup> Guarantee women's access to climate change funding, training/education and sustainable technologies.

#### 3.2.3.4. Climate adaptation and natural disaster preparedness

<sup>EN</sup> Implement a gender analysis and gender mainstreaming in coordination with all Ministries responsible for disaster risk reduction, climate change, poverty reduction and women/gender machineries;

<sup>EN</sup> Ensure women and men's equal access to natural hazard early warning systems;

<sup>EN</sup> Develop and produce statistics desegregated by sex on impact of disasters, carry out gender-sensitive vulnerability, risk and capacity assessments and develop gender-sensitive indicators to monitor and measure progress;

<sup>EN</sup> Increase awareness of the public and media on the gender sensitive vulnerabilities and capacities in disasters and gender specific needs and concerns in disaster risk reduction and management;

<sup>EN</sup> Support gender-sensitive financial risk-sharing mechanisms, including risk insurance and reinsurance;

<sup>EN</sup> Increase women's participation in disaster relief coordination and secure equal access to disaster relief assistance between men and women;

<sup>EN</sup> Guarantee trainings with gender perspective for preparedness and readiness with respect to risk management, mitigation and adaptation, including planning and resource management for programs and projects to this effect.

<sup>EN</sup> Take steps to guarantee early and timely alert processes for the prevention and mitigation of risks.

#### 3.2.3.5. Safe waste reduction, reuse and recycling

<sup>EN</sup> Create legally binding measures to exclude harmful waste from the waste stream

<sup>EN</sup> Promote reduction of waste, reuse of waste and finally recycling – phase out dumping, landfilling

and incineration

<sup>EN</sup> Provide incentives and build capacity for women leadership and decision making in safe waste management

#### 3.2.3.6. Measures against land grabbing – protecting women access to land

Women farmers and indigenous peoples are currently losing their territories, resources and livelihoods in the grabbing of land by governments, local and foreign investors, including for large scale bioenergy production. This results in increased in poverty and lack of food security and food sovereignty. The increasing influence of corporations and other economic actors over environmental policies is also leading to privatization of common lands. Women are among the main victims of this trend, as they are deprived of access to resources that are of essential importance to their livelihoods and communities. 23

23 For instance in Tanzania, Agrisol Energy and Pharos Global Agriculture are seeking a land deal which when successful will cause the displacement of 162,000 refugees most of whom are women. This will lead to a turnover of 800,000 acres of land to the American Company.

#### 3.2.3.7. Assuring women's access to safe water and sanitation

A number of countries have introduced legislation that prohibits privatization of water sources, provides incentives for efficient water use, and supports public investments in water supply and sanitation services. Some countries have also introduced targets (including quotas) for women in water management and control organizations, which has had a beneficial impact on quality of services and cost recovery. In 2010, the UN General Assembly recognized a human right to water and sanitation and proposed criteria for its implementation.

<sup>EN</sup> Environmental protection policies and enforcement of water protection measures are needed, and women and other stakeholders should participate in their development and implementation.

<sup>EN</sup> Sustainable and affordable technologies and management of water and sanitation need to be accessible to women.

<sup>EN</sup> Integrated water management is needed that democratizes control over basic water supplies and sanitation services. Privatization of water resources - in particular of water

sources, rivers and lakes - can have a disproportionately damaging impact on women who have less economic power and access to income from formal employment.

<sup>84</sup> Dedicated funding programs are needed to ensure that women and girls obtain safe water and sanitation at homes, schools and other public places, as well as the adoption of legislation which protects water sources as public goods.

### 3.3.Regional perspectives

In addition to the common positions presented, specific regional perspectives and priorities on this theme are presented below.

#### 3.3.1.Latin American Caribbean (LAC)

Ø Women of Latin America and the Caribbean are concerned about the use of the concept of "green economy". They believe that the use of this terminology carries the risk that economic actors, even internationally, dominate and determine the policies of sustainable development.

Ø Indigenous Peoples women are also concerned about the use of the concept of green economy and the institutional framework endorsed. Developing countries are being forced to follow a proposal that has not been clearly defined, and no one knows how it will work. On governance issues, they consider that spaces for a broad and inclusive participation are still lacking .

Ø The economic element of sustainable development should embrace the elements and values that underpin the recognition of the rights of Mother Earth and good living. These along with the theme of human rights should guide the way with optimism to the next meeting in Rio plus 20.

Ø The women in the LAC region are clear that a vision focused on sustainable development cannot focus solely on an economic agenda, but it must deepen agendas addressing the social, cultural, and environmental policies that have been implemented since the last meeting in Rio in 1992.

Ø They raise a clear front against 'dollarization' of life, and assure their willingness to work to make the real change that leads to address issues that we are urgent to change the paradigm of development on our planet including a priority gender considerations.

In the LAC region, women believe that to achieve sustainable development the world must necessarily pass through the elimination of all gaps of gender discrimination still facing Latin America and the Caribbean, and it is urgent to think about a comprehensive approach to development where the contribution of women in the region, is recognized, valued and positioned in the proper place.

#### 3.3.2.West-Asia

##### On Rio+20 agenda point "Green Economy and poverty eradication"

<sup>84</sup> Implementation of the CEDAW convention as the basis for a Green Economy any Sustainable Development

<sup>84</sup> Integration of Gender issues in the Monitoring & Evaluation indicators to assure social justice of fair distribution of wealth.

##### On agriculture and rural development

<sup>84</sup> There is a strong need to establish social associations, networks, co-operatives and syndicate as an institutional way of protection and creating pressure groups to help rural and farming communities stand for their own rights identity and to improve farmers'

<sup>84</sup> The right to access data and information to help rural and farming communities to take better decisions, in particular affordable access to spatial data as well as crop, climatic and other types of data which are currently often only available to corporations.

<sup>84</sup> Appropriate technology (economical, social, culture and environmental) should be available and capacity building should be supported, to assure the sector contributes to Green Economy and Sustainable Development.

#### 3.3.3.Asia

We, the Women's Major Group representatives at the Asia Pacific Regional Preparatory Meeting for Rio+20 call on governments to reaffirm their commitments to Agenda 21 and the Beijing Platform for Action, and fulfill their obligations to the Convention on the Elimination of all forms of Discrimination against Women (CEDAW) and the International Covenant on Economic, Social and Cultural Rights.

We also call on governments to respect recent international agreements including the 2009 UN Conference on the World Financial and Economic Crisis and its Impact on Development where the causes and effects of the global economic, food and ecological crises were discussed and urgent measures adopted to achieve a less volatile macroeconomic environment for sustainable development, including making economic policies compatible with human rights obligations.

On the road to Rio+20, we invoke the principles enshrined in these instruments – especially non-discrimination and substantive equality and their linkages to gender, economic and ecological justice. We assert the need for a radical change in mind-set necessary to steer humanity off the course of repeated crises and self-destruction.

Governments in the Asia Pacific region must recognize that gender is cross cutting in development processes and that gender equality is vital to the achievement of sustainable development.

##### On Rio+20 agenda point "Green Economy and poverty eradication"

We wish to reframe the "green economy" as "sustainable economies". We reject current economic models pursued in the name of efficiency and economic growth, but are in fact driven by profit and

greed, and have resulted in unprecedented levels of poverty, inequality and food insecurity that disproportionately affect women. Instead we are working to realize "sustainable economies" that are gender just and enable long-term social and well-being outcomes for present and future generations, especially marginalized groups such as indigenous, ethnic and sexual minority groups.

As women comprise half the world's population and also count among the poorest, a "sustainable economy" must recognize women's paid and un(der)paid contributions to economic production, must generate sustainable livelihoods by which women can realize the full enjoyment of their human rights, including sexual and reproductive rights, and prevent all forms of discrimination and violence in women's exercise of their economic rights and co-stewardship of the earth's resources. Central to this is women's unmediated right to access, own, control and benefit from productive resources and assets, which includes land, water, seeds, energy sources, livestock, financial resources, public subsidies and appropriate technologies

## Women, agriculture and rural sustainable development

Women farmers must be recognized as co-managers of community resource bases and co-decision-makers in determining the use of natural resources and the distribution of benefits arising from them. They must be assured of capacity development in bio-diverse ecological agriculture including humane sustainable livestock and fisheries production, necessary rural infrastructure, appropriate technologies and marketing skills for their economic autonomy. We further seek from our governments a commitment to the rapid reduction and elimination of toxic substances and highly hazardous pesticides and fertilizers, while steadily phasing-in non-chemical approaches.

There is much to learn from gender-responsive good practices on agro-ecology and sustainable natural resource use and management that strive for balance and synergy between humans and nature. It must also be recognized that woman can capacitate "sustainable economies", with their indigenous and traditional knowledge systems which should be protected from appropriation and exploitation by big business.

## Women and distressed migration

Distressed migration is a phenomenon across many countries in our region, with women comprising the bulk of those who migrate from rural to urban areas and from developing to developed countries. Governments must address the huge social costs resulting from distressed migration by addressing women's economic deprivation and environmental degradation.

## Women, corporate-driven technologies and climate change

As marginalized and excluded groups, women bear the harshest impacts of the current climate crisis, including increased ecological and economic displacement. States must address the gender-differentiated impacts of climate change while ensuring greater and more meaningful participation of women in the climate deliberations and outcomes, and in adaptation and mitigation strategies.

Women are greatly concerned by corporate driven technological solutions to climate change that are harmful to the planet and people. Such technologies must be subject to rigorous, transparent and participatory assessments including the implications on women's and children's health and well being.

## Energy and nuclear industry

We take a firm position against nuclear energy as one of the 'solutions' to the energy crisis. It is neither clean nor sustainable, as many nuclear disasters have already so painfully pointed out. States must immediately phase out nuclear energy and seek fresh and up-scaled financial resources to shift the world to green (renewable) energy, which will benefit all of humankind.

### 3.3.4.Africa

On behalf of the Women Major Group we wish to state that the World Summit on Sustainable Development (WSSD) 2002, reaffirmed sustainable development's central role in the international agenda. The Johannesburg plan of implementation (JPOI) adopted at the WSSD contains commitments and targets that member states agreed to pursue in order to foster sustainable development at all levels.

A truly sustainable 'green economy' would involve economic development that takes place within the limits of nature, and ensures a fair distribution of resources among all countries and social groups - as well as between women and men. Social equity and environmental justice must remain at the heart of sustainable development, and the outcomes of the Rio+20 UN conference in 2012. Environmental conservation is critical for maintaining the earth's ability to continue to support life, and human livelihoods. As countries confront the challenges of providing food, energy, shelter, health care and employment for growing populations, governments must find ways to preserve vital ecosystems and limit the disruptions of climate change, and to manage the world's natural resources in an equitable manner, with an emphasis on human rights, gender equality, and environmental justice.

We the WMG in Africa call on governments to reaffirm their commitment on the following:

### 1. GREEN ECONOMY

#### a) Access to water and sanitation

**Water and sanitation are essential for women's economic development.** A large number of the world's people live without access to clean water or basic sanitation. Due to gender roles, it is women and girls who are often most affected by lack of water, as in many countries they are primarily responsible for obtaining and transporting water for daily use. Women and girls travel many kilometres and spend much of their time securing essential water supplies, and their task becomes more difficult as rivers and lakes become polluted and ecosystems degraded. Lack of safe water and sanitation limits women's development possibilities. Privatization of water resources - in particular of water sources, rivers and lakes - can have a disproportionately damaging impact on women who have less economic power and access to income from formal employment.

**We call for environmental protection policies and enforcement of water protection measures, and women should participate in their development and implementation. We also call for dedicated funding programs to ensure that women and girls obtain safe water and sanitation at homes, schools and other public places.**

#### b) Transportation

Access to affordable transport is limited for women in Africa. Changing demographic and land-use patterns have made the distance to fields, water and fuel wood sources greater, increasing travel times to these sources. Transport planning tends to underestimate the economic and social value of women's time, as well as the economic benefits.

**We call on governments to accelerate investment in affordable means of transport and involve women in transport planning and implementation.**

#### c) Land – Agriculture, food security and food sovereignty

Property rights for women are still not recognised and respected. Women need secure land, property and resource rights. In many countries, women produce close to 80% of the food, but own only 1% of the land. The significance of the livestock sector and its socio-economic importance to African women cannot be over emphasized.

**We call upon governments to expedite implementation of the Land Policy Initiative of the AU, specifically women's access and ownership to land.**

#### d) Access to Energy

**Green energy policies must incorporate a gender perspective.** According to the African Development Bank, most of the 2.5 billion people using traditional biomass for household energy live in Africa. African women play a major role in the collection and management of biomass fuel such as fuelwood, dung and agricultural residues for

household use. Access to modern energy in rural and poor urban areas leads to improved health services, clean water and sanitation, better education, efficient transportation and a more profitable informal sector. All of these directly benefit women. Gender-equitable energy policies, legislation and investments could effectively boost women's opportunities for economic and social empowerment and their ability to contribute to the green economy.

**We call upon Africa Governments to implement programmes that directly support women's access to affordable off-grid energy technologies as well as connection to grid.**

#### **e) Access to health services Institutional Framework**

AIDS/HIV and other sexually transmitted diseases have a devastating effect on women in Africa. There is lack of access to proper medical facilities for women in rural and poor urban areas. This is compounded by conflicting social, economic, cultural and political factors.

**We call on governments to invest in more functional health facilities in rural and poor urban communities, educate and train women on health issues that affect them, especially maternal mortality.**

#### **f) Governance, Peace and Security**

Violent conflict in Africa over natural resources and political power has had adverse effects on women's health and sustainable livelihoods.

**We call upon Africa Governments to guarantee and uphold good governance and democratic processes that ensure peace and security.**

### **POVERTY REDUCTION**

The UN estimates that approximately 70% of the 1.3 billion people living on less than one dollar a day are women. The situation is worsening due to the current environmental and climatic changes resulting in food crisis, flooding, famine etc, in Africa.

**We call on governments to provide incentives for low-carbon economies that enhance and restore the natural environment, thus providing new green livelihoods, employment and entrepreneurial opportunities for women in the context of sustainable development and poverty reduction.**

**We also call on governments and development partners to ensure that policy formulations and foreign investment are based on the bottom – up approach involving all critical**

**stakeholders, especially women.**

In the development of the 10YFP the Women Major Group on behalf of the Major Groups will want to offer the following:

Incorporate a gender perspective in SCP projects and policies

Ø Address differing women's SCP needs and priorities in the North and South

Ø Analyse obstacles to, and opportunities for, scaling up SCP initiatives to benefit women especially grassroots women,

Ø Provide education for girls, vocational and technological training for women, and adult literacy programmes, as part of every intervention

Ø Acknowledge and incorporate women's traditional knowledge and their contribution to green economies.

#### **Poverty, MDGs and sustainable development (proposed by Alice Odingo)**

In Africa, the attainment of the MDGs is still a challenge. A majority of the population are still poor, with the majority being women. The continent is far from sustainability, as droughts, famine and climate change take precedence, leaving very little in the welfare of the majority of the people of Africa, while the little resources that exists are affected by conflict and are still held in the hands of a few individuals. The African continent is further ravaged by conflict, which create insecurity for not only women and girls, but all the victims.

Ø Green Economy would require gender disaggregated data on the achievement of the MDGs and sustainable development in Africa, with measurable indices for the success and proposals to deal with the challenges.

Ø Green economy would require special efforts to redistribute resources to the poor, particularly, the women and girls to remove inequity, while also encouraging sustainable consumption and production.

Ø Green economy would call for improvement in governance, to promote peace and security for women in Africa, while also ensuring gender balance in conflict resolution teams.

#### **3.3.5.Europe UNECE (to come after 2 of December, regional premeeting in Geneva)**

### **4. Governance of Sustainable Development**

#### **Women's views on the Rio+20 theme of an institutional framework for sustainable development**

To assure global sustainable and equitable development, fundamental reform of International Environmental Governance and a new framework for governance of sustainable development are needed.

Our existing institutional and governance structures have proved inadequate to meet our rising sustainable development challenges. Our core policy formulation, economic thinking and motivations remain firmly detached from our broader sustainability concerns. Monitoring and enforcement of agreed sustainable development strategies at all governance levels are weak and many central sectors and policies operate entirely without a broader sustainability overview.

Since our electoral cycles and business models of reporting increasingly define our decision-making, short term gains take precedence over future and long term interests. Meanwhile, women appear disconnected from the core of policy-making. Without true representation of their needs, women are left without a voice, or a legitimate means in which to question or present their concerns.

Governments lack the mechanisms to facilitate accountability, access and monitoring of all sustainability policy decisions and their effective implementation.

#### **4.1. Stronger Institutional framework for Sustainable Development at Global Level**

#### 4.1.1. Shifting the priorities from the Economic to the Social and Environmental areas

Ø Reform international finance, economic and trade organisations, to assure priority for equitable social development and environmental protection, and preventing a commodification of natural resources.

#### 4.1.2. International Environmental Governance needs to be strengthened

Ø Strengthened international environmental governance, including adequate public and predictable resources for a reformed United Nations Environment Programme (UNEP)  
Capacity building programmes for national level should be increased

Ø Contribution to increased coherence of MEAs should be extended

#### 4.1.3. Governance of Sustainable Development should be placed at the highest level of the UN

Ø Governance of Sustainable Development should report directly to the UN General Assembly

Ø Including accountability mechanisms, that include specific gender indicators.

#### 4.1.4. Gender mainstreaming of the Sustainable development structure

o organizational assessment to gauge current levels of awareness, knowledge and skills in gender and gender analysis methods within implementing agencies and local partners

o Use of gender analysis and sex-disaggregated data to better understand women's roles, perceptions, needs and gender issues related to SD

o hire full time gender staff to lead gender activities, develop action plans for gender integration, etc.

o provide training in gender and organizational change, gender analysis to staff at senior and other levels

o engage with existing Gender Working Groups and Gender Focal Points within local partner organizations and governments (these exist in many government departments but are usually have weak capacities and are not linked to women's empowerment or gender advocates)

o build links to networks of gender experts

o build capacities and support women and men champions and Gender Focal Points within partner organizations to:

§ lead processes of change within their organizations

§ communicate with women's groups and mixed groups about gender issues within sustainable development initiatives

§ provide technical assistance and backstopping for Sustainable Development activities

Ø New Key Gender Institutional Structures should be agreed upon to ensure sustainable development:

o Localize already existing institutions by partnering with women's organisations working on the grass-root level

o Involve in dialogues with women of every level to contribute in developing new institutional structures that will be available and accessible

o Have user-friendly involvement mechanism that will enable grass-root women to participate in global, national and local platforms

o New Institutional Structures should adopt a tailor-made approach to serve and address the unique needs and challenges of women

#### 4.1.5. Create global instruments to protect rights of Future Generations

Additional global instruments to protect rights of Future Generations can include

o Legal institutions to protect the rights of future generations, e.g. an ombudsperson for Future generations<sup>24</sup> as independent institutions with legal powers<sup>25</sup>

o Funds to pay for future costs, e.g. 'Redemption Fund'<sup>26</sup>

<sup>24</sup> Hungary has such an institution

<sup>25</sup> As supported by the Major Groups: Workers and Trade Unions, and Youth

<sup>26</sup> The concept for the 'redemption fund' was presented at the G20 in France, national funds already exist, e.g. in Norway

<sup>27</sup> Used in the Convention for Biological Diversity, CBD

<sup>28</sup> The majority of nations affiliated with the UN have ratified the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW). This Convention entered into force on September 3, 1981 and has been ratified by 186 countries. CEDAW compels state parties to take positive action to prevent discrimination towards women across all sectors including in sustainable development. CEDAW ensures the full and effective participation of women in decision making processes in an equal manner to men. The principles of CEDAW are increasingly finding their way into national constitutions, laws, and other policy frameworks. The Convention has been also called upon to help resolve cases involving discrimination against women in courts around the world. CEDAW focuses on elimination of discrimination against women (Articles 2), visibility of women in national statistics (Article 2), equality between men and women before laws and in courts (Article 15), promoting participation of women in political and public life and decision making (Article 7 and 8), equal rights between men and women, also in employment and pay (Article 11), gender equality in access and rights to bank loans, mortgages, and other forms of financial credit (Article 13), and ensuring equality of men and women in education and training (Article 10). Furthermore, CEDAW strengthens provisions for rural women, recognizing their rights to participate in government programs, employment, training, and financing (Article 14).

#### 4.1.6. UN Women should be strengthened and adequately financed

UN Women should be strengthened and adequately financed to provide guidance and implement flagship programmes on strengthening women's role in Sustainable Development

and coordination between all UN agencies on gender programs related to Sustainable Development

#### 4.1.7. Strengthening of effective and balanced civil society participation

- o Financing effective and balanced civil society participation
- o Capacity building for effective public participation of women
- o Rotation and democratic principles should be applied
- o Strengthen collaboration between major groups for example through Vienna+ model<sup>27</sup>

### 4.2. Pillars of Governance of Sustainable Development (global, national, local)

#### 4.2.1. Rio Principle 10: Right to public participation, Right to information, Right to justice, for example through

- o Global or regional convention on Rio Principle 10

#### 4.2.2. Rio Principle 20: full participation of women, for example through

- o Quota for women in all levels of governance
- o Changing governance cultures

#### 4.2.3. Implementation of the Convention to End All Discrimination Against Women (CEDAW) to assure gender equality<sup>28</sup>

#### 4.2.4. Safeguard environmental social conditions for the benefit of present and future generations

§ Establish national Ombudspersons, Commissioners or Guardians for Future Generations, as independent institutions with legal powers and duties *to ensure long term goals are taken into account, to challenge existing governance structures and participatory processes and to better deal with concerns from all citizens.*

#### 4.2.5. Valuing the unrecognized contributions of women and the environment to sustainable development

- o Gender indicators for "real" cost and contributions

#### 4.2.6. Criteria for financing of sustainable development

- o Funding mechanisms that respects the right of free, prior and informed consent of Indigenous Peoples, and the rights of communities which are impacted by the financial flows

- o timely information, effective participation, and redress mechanisms

#### 4.2.5. Gender considerations of financial mechanisms for Sustainable Development

- o Assure that global funding reaches women at the local level, in particular countries should commit that 50% of Global Environment Funding should be earmarked for local level implementation, assuring access for community and women's organisations

- o Recognition that women can capacitate "sustainable economies" with their knowledge systems and hitherto undervalued "care economy" economy contributions

- o Protection of women's indigenous and traditional knowledge systems from appropriation and exploitation by big business.

- o Accelerate progress towards gender equality in all areas of governance, the judiciary and the economy

### 4.3. Regional perspectives

#### 4.3.1. Latin America and the Caribbean

The women of Latin America and the Caribbean, are clear that the road to Rio 20 is just beginning, it requires enormous work and effort to make participation of women a fundamental element which permits to practice full and effective participation of women in all processes and areas of development and conservation.

They want to integrate a region that is diverse, more equal and equitable. They are clear of the enormous challenge as a region to achieve respect for human rights of women: sexual and reproductive rights, rights to live a life free from violence and femicide, rights to sustainable development means among others: the right to water, land and natural resources, the right to health and food sovereignty, right to education, science and technology, and finally, the recognition of the rights of indigenous peoples and their traditional knowledge.

LAC Women consider the following statements important for action:

Consider sustainable development as a holistic concept that values equally the social, economic and environmental as well as equity and equal opportunities, access to justice, information and participation of people.

Understand that sustainable development is a central objective the good life of human beings and as such States need to recognize that to achieve this goal they should eliminate all forms of discrimination against women.

They specifically propose:

1.-An evaluation of the implementation of the Rio Principles, Agenda XXI, this time using clear indicators that show evidence of gender differentiation and fairness in general. This assessment should be the basis for discussion in Rio ... what has been accomplished?, What has not been met and why? What is the role of financial institutions and private banks? Why has it been so difficult to finance and implement sustainable development where the woman is a party?

2.-Ensure access to land, sea and control over natural resources, education, information and access to environmental justice principles and provide social security, reproductive health care and food sovereignty of life of women. Aiming for healthy integration of women in a world in balance with nature, which requires adequate funding.

3.- The commitment to recognize, respect, value and position the knowledge of women and especially the traditional knowledge of indigenous women. Rate urgently,

traditional knowledge on the issues of adaptation, mitigation and biodiversity conservation of indigenous women have always been implemented and to promote and strengthen their role as change agents, promoting the good life of indigenous peoples.

#### 4.3.2. Arab region

<sup>[9]</sup> A striking observation is that the “Arab Spring” has resulted in a withdrawal of women activities from the public life. Therefore, institutional tools are needed to support women participation on all levels, up to the highest decision making levels, including on emerging issues such as Green Economy and Sustainable Development.

<sup>[9]</sup> Developed countries should take their environmental commitments seriously if we want to have peace on Earth

#### 4.3.3. Asia and Pacific region

We expect nothing less from Rio+20 than a commitment to promoting sustainable development and gender equality in ways that go beyond the limited “add women and stir” approach, and which genuinely recognize women’s co-leadership and co-stewardship. Toward this end we call for sex disaggregated data and gender budgets to assure equitable resource allocation.

We further insist on the full realization of the Rio Principles including the precautionary principle, common but differentiated responsibilities, polluter pays, and Principle 10 on access to information and justice. We, the Women’s Major Group call on all our governments to take action now.

#### 4.3.4. African region

### INSTITUTIONAL FRAMEWORK

The global environmental governance has not effectively implemented the Rio principles for sustainable development, and the Johannesburg Plan of Action.

**We call on governments to put in place a coordinating mechanism and parallel institutions at the regional and national level for sustainable development which defend women’s rights and interests.**

#### 4.3.5. European/UNECE region (after Dec 1)

### 5. Women’s priorities for Rio+20 agenda point “Emerging Issues”

The Rio+20 agenda includes setting priorities for work on “Emerging Issues”. Women’s priority issues, including some identified among the UNEP Foresight 21 Challenges for the 21st Century List include:

#### 5.1.1. Women and Children’s greater harm from radiation – need for phasing out of nuclear

Ø The entire nuclear cycle is threat to our generation and to that of our children, is that of nuclear industry.

Ø We take a firm position against nuclear energy as one of the solutions to the energy crisis. It is neither clean nor sustainable, as many nuclear disasters have already so painfully pointed out.

Ø Based on the UNEP foresight report, we call on governments to start developing legally binding mechanisms to address the cost of decommissioning and clean up of nuclear power-plants, nuclear waste and uranium mines.

Ø We are calling UN to develop a global strategy to address the risks that nuclear energy and the whole uranium cycle, such as mining and waste disposal, pose to global environment and human lives and health, and decide on an effective and quick global government response.

Ø We need to establish the institutional framework and the financial means to document, monitor and assess the environmental damages and risks of Nuclear and Uranium Technologies. Such an institution shall make comprehensive use of all parties concerned and their diverse types of knowledge and experience.

Ø A legally binding mechanism to address the cost of decommissioning and clean up of nuclear power-plants, nuclear waste and uranium mines should be committed to at Rio+20.

Ø Redress and clean-up should be financed according to the polluter-pays-principle, amongst others by mining industry.

Ø A UN rapporteur on uranium and nuclear risks should be agreed on29.

29 [1] Proposal of the women major group, UNEP regional statement 2011/2012, see [http://www.unep.org/civil-society/Portals/59/Documents/Bonn\\_Consultations\\_2011/bonn\\_outcomes/Sept\\_2\\_2011/11\\_9\\_30\\_UNEP\\_Regional\\_MGS\\_Statement\\_Europe\\_2\\_Sept.pdf](http://www.unep.org/civil-society/Portals/59/Documents/Bonn_Consultations_2011/bonn_outcomes/Sept_2_2011/11_9_30_UNEP_Regional_MGS_Statement_Europe_2_Sept.pdf)

#### 5.1.2. Women and children at risk - need for new approaches to minimizing risks of novel technologies and chemicals

Ø Women are greatly concerned by the technological solutions offered to climate change, including geo-engineering, many of which are clearly motivated by profit.

Ø The health of women and their families may be threatened by the current regulatory incapacity of government entities to prevent the release of new technologies and chemicals before safety is adequately assessed. Without full safety review, based on health standards, of technologies and chemicals, women and children’s health may be compromised.

Ø Previous history of premature use of many toxic chemicals, specifically POPs chemicals, has led to both compromised health and difficult remediation problems. Learning from this history of regulatory failure, only recently addressed by the Stockholm Convention, governments must implement precautionary measures regarding new technologies and chemicals.

Ø Women are also very concerned by the rising volume of chemical production of many toxic chemicals and chemicals yet to be adequately tested for safety, and the wide-scale deployment of new technologies such as nano-technology in consumer products without necessary health information.

Ø Women and children are at specific risk from diseases associated with toxic chemicals - including many cancers, infertility, metabolic disorders, and learning and developmental disabilities – which are likely to increase in incidence and severity.

Ø The rising volume of chemical production of many toxic chemicals and chemicals yet to be adequately tested for safety may require some form of adaptation, requiring enhancement of health facilities necessary for those diseases associated with toxic chemicals and therefore likely to increase in incidence and severity.

Ø Such diseases include many cancers, infertility, metabolic disorders, and learning and developmental disabilities. Given a potential increase in learning disabilities and cognitive decline associated with toxic chemicals, adaptation may require a greater number of special education schools, special job training and care centers. Surely prevention is preferable.

Ø We seek from our governments a commitment to the rapid reduction and elimination of toxic substances and highly hazardous pesticides and fertilizers, while steadily phasing-in non-chemical pesticide management approaches. Rio+20 outcomes should include participatory and transparent mechanisms for assessing these technologies, using the precautionary principle and a gender perspective to examine, among others, dangers to women's reproductive health, multiplication of their already many burdens and other impacts.

### 5.1.3. Food security needs food sovereignty

Ø Women produce much of the world's food. They need secure land, property and resource rights to ensure their productivity. Their traditional knowledge about seeds, farming skills, and livestock management needs to be recognized.

Ø Given that women constitute more than 50% of those who "go to bed hungry every night" (World Disasters Report on Hunger), food security systems need to address issues of equitable distribution of food, and need to address reasons behind crop failures, collapsing fish stocks and food price increases, including large-scale industrial bio-energy production.

Ø A review of the unfair legal framework for intellectual property in this field is needed to defend food security and food sovereignty, especially for women.

Ø Effective measures should be adopted at the global level to prevent speculation in the food market and maintain sustainable fishing practices both near shore and on the high seas.

Ø To increase the social and environmental resilience of communities and prevent loss of agricultural biodiversity, women's production needs to be supported, including through improved access to education, resources and markets.

Ø To defend food security and food sovereignty, their rights to choose what to plant, eat and sell, must also be ensured.

Ø Subsidies and other support measures for agro-fuels have significantly added to the recent food price hikes and have already been responsible for the death of thousands of people due to hunger and malnutrition. All subsidies and other support measures to large-scale industrial bio-energy production should be immediately withdrawn.

Ø Patents in the field of food and agriculture have contributed to the control of these sectors by large corporations. A review of the unfair legal framework for intellectual property in this field is needed to defend food security and food sovereignty, especially of women.

### 5.1.4. Rush for Land: women's land rights and ownership tenure, and prevention of land grabbing

Ø Women's land rights need to be ensured. Women farmers and indigenous peoples are currently losing their territories, resources and livelihoods in the grabbing of land by governments, local and foreign investors, including for large scale bioenergy production. This results in increased in poverty and lack of food security and food sovereignty.

Ø The increasing influence of corporations and other economic actors over environmental policies is also leading to privatization of common lands.

Ø Given that investors concerned with food and resource shortages likely to emerge due to climate change, arable land is being purchased in developing countries by foreign investors and by local elites<sup>30</sup>. Women farmers and Indigenous Peoples, including in particular mobile Indigenous peoples, are currently losing their territories, resources and livelihoods in this rush for land, resulting in poverty increase and lack of food security and food sovereignty.

Ø Women are among the main victims of this trend, as they are deprived of access to resources that are of essential importance to their livelihoods and communities. These practices should be halted and community and indigenous rights should be respected, protected and strengthened.

Ø In consultation with women's groups plans need to be put in place at all levels, to ensure that land purchases do not threaten and compromise the livelihood of rural women.

30 Borras et al. 2011.

### 5.1.5. Women and Migration

Ø Due to unsustainable activities and climate change, many regions are experiencing land degradation, desertification, water insecurity and scarcity, sea level rise, droughts/floods, land grabs, changing disease vectors and deforestation.

Ø Economic and ecological displacement and migration are expected to increase as a result of this resource instability, both rural to urban and cross-border.

Ø In Asia, the women make up the majority affected. A sustainable development agenda must address the social costs of this migration by addressing conditions of women's economic deprivation and environmental degradation, as well as by establishing policies to assist the migrants, particularly women and children, and improve their legal status.

### 5.1.6. New challenges to water availability – burden for women

Ø Approximately one billion people live without access to clean water, and over 2 billion lack basic sanitation. In many developing countries, it is women and girls who are often most affected by lack of water, as they are primarily responsible for obtaining and transporting water for daily use.

Ø Water scarcity is further compounded by the pollution of existing sources by environmental chemicals dumping and by "fracking" techniques used to extract gas and oil from the earth. Chemical pollution of water is a serious threat to the health of women and their families, who often have no means to purify chemically polluted water.

Ø Accepted science indicates that low levels of exposure to toxic chemicals during pregnancy can harm the developing fetus, in ways that compromise health later in life. Cancers, diabetes, learning disabilities, immune system dysfunction, and birth defects are among the health outcomes associated with gestational exposures in laboratory and human studies.

Ø Given the importance of protecting the health of future generations and the health of women who are often more vulnerable to toxic chemicals during pregnancy, access to clean water for women and their families must be ensured and chemical pollution of water halted at every level.

Ø In line with the UN resolution of 2010, we consider water as a basic human right and as such it must be treated as a common good. Its treatment, distribution and

management must be under public control, including mechanism of social control and community administration. Due to their major role in water provision and administration, women must be the leadership of water management decisions.

#### 5.1.7 Privatization and commodification of the commons

Ø The increasing influence of corporations and other strong economic actors over environmental policies is leading to tendency to privatize and commodify the commons<sup>31</sup>, - formerly ruled by community rules and accessible to them, - including water, genetic resources, the climate, and Indigenous territories and community conserved areas. Women are amongst the main victims of this trend, as they are deprived of access to resources that are of essential importance to their families. The privatization of the commons should be halted and Indigenous and community rights should be respected, protected and strengthened.

31 Rules, Games, and Common-Pool Resources; Ostrom, Elinor et al. Editors, Ann Arbor, University of Michigan Press, 1994

#### 5.1.8. Promotion of clean renewable energy technologies and phasing out of unsustainable energy

Ø Close to 2.4 billion people in developing countries still depend almost entirely on traditional biomass fuels (wood, charcoal, dung and agricultural residues. It is mostly women who are tasked with collecting and managing these fuels, which limits their time and opportunities for education and income-generating activities.

Ø Investments in access to modern energy are needed for improved livelihoods, education, health services, water and sanitation, education, and transportation. Women need increased access to cleaner, more efficient energy sources and technologies for household use and productive activities, as well as training and education for business development - including designing, producing, marketing and managing new energy products and services.

Ø Unsustainable energy sources such as nuclear, shale gas, tar sands and coal continue to be expanded and subsidised. Governments should agree in Rio to eliminate direct and indirect subsidies to unsustainable energy supply – currently estimated at 7-9 billion Euro annually – and instead to create incentives and a fair legal environment for renewable energy and women's access to these resources.

#### 5.1.9. Strengthen gender priority in Climate Change policies

Ø Climatic changes are already causing major problems in many regions of the world, and women bear the harshest impacts of the current climate crisis. Due to gender roles and inequalities, climate changes have particularly adverse impacts on women's livelihoods and work burdens, and also reinforce gender discrimination and the feminization of poverty.

Ø Women have valuable experience, knowledge and ideas about climate change mitigation, adaptation, resilience and disaster risk management, and are important actors in the promotion of sustainable consumption.

Ø Women's decision-making power and participation in the development and implementation of climate change policies, mechanisms and funding must be increased to ensure they are gender-responsive. Women also need access to environmental rights, climate change funding, and sustainable technologies.

### 6. Recommendations for Rio+20 Outcome document

We call on governments to recognize that sustainable development is built on a healthy environment as the foundation of all human well-being and that economic development must serve human and cultural development and take place within the carrying capacity of the planet. Economic instruments should aim at incorporation of externalities, equitable redistribution of wealth and equality between women and men.

#### We call on governments to:

##### 6.1. Sustainable and equitable economies: Commit to gender-sensitive development of binding international and national measures , in particular

Ø Agree to develop binding policies which assure healthy and sustainable livelihoods for women, in particular through halting use of unsustainable, radioactive and harmful substances and technologies

Ø Agree to assure a Social Protection Floor for all women as a fundamental human right, thus effectively reducing poverty and allowing women to fully participate in sustainable development

Ø Agree to end violence against women through legislation, support services for women, affordable access to justice for women, and information about rights and norms

Ø Agree to assure access to clean, efficient and safe energy, water and sanitation for all, especially for women.

Ø Agree to assure women's access to natural resources, measures against land grabbing, access to and protection of commons, and respect of women's environmental rights.

##### 6.2. Governance of sustainable development: Commit to gender-sensitive development of binding international and national measures, in particular

Ø Agreement to strengthen international governance of environment and to bring global sustainable development governance to the highest level of the UN, whilst assuring gender targets and policies for the new structures.

Ø Agree on binding measures for the protection of women's indigenous and traditional knowledge systems from appropriation and exploitation by corporations (strong regulation of corporate power which effectively protects the most vulnerable in times of globalization)

Ø Agree on the development of international agreements, which guarantee global access to timely information, relevant public participation, affordable access to justice, liability and redress mechanisms.

Ø Agree on creating specific windows and incentives to increase women's role and access to assets and finance in the area of sustainable development.

Ø Agreement for the creation of an independent technology assessment organisation with the mandate to assess, control and where necessary limit use of technologies before widespread use, based on the precautionary principle

Ø Agreement to create global mechanisms for the protection of the global commons, including clean up of harmful pollution such as from uranium mining, and a mechanism for its implementation

Ø Global and national institutions to protect the rights of future generations<sup>32</sup>

32 As supported by the Major Groups: Workers and Trade Unions, and Youth

### 6.3. Commit to targets and indicators for women's engagement

The Outcome Document should include specific targets and indicators to support and promote women's engagement as key actors in sustainable development and to measure government progress on recommended actions. These could be incorporated into Sustainable Development Goals or could stand alone.

### 6.4. Proposal to include gender equality goals in Sustainable Development Goals

A proposal has been presented by member states for **Sustainable Development Goals (SDG)**, which governments in Rio can agree to develop up to 2015, to follow up the Millennium Development Goals.

The Women major group supports the idea of SDGs, however, regrets that the proposal does not include as yet any specific gender related goals, unlike the MDGs which contain several.

A set of Sustainable Development Goals should be adopted that includes specific crosscutting goals on gender equality in all spheres of society, in particular these could aim to:

- Ø Secure women's greater access and control over assets, land tenure, inputs and natural resources including traditional common lands;
- Ø Promote women's access to services and technologies needed for water, energy, agricultural production, family care, household management and business enterprises;
- Ø Provide comprehensive social protection measures, especially for women;
- Ø Provide safe health care facilities, including for sexual and reproductive health;
- Ø Enable women and men to combine their jobs with childcare;
- Ø Support investments in women's economic, social and political empowerment, including through new financing and credit facilities accessible to women;
- Ø Support for traditional knowledge systems and management practices;
- Ø Determine specific targets for women with regard to technology training, business management skills and extension services;
- Ø Promote women's participation in government and business leadership, with targets of at least 40% women;
- Ø Strengthen women's organizations/self help groups, entrepreneurs and networks to enable them to negotiate the terms of their engagement with sustainable development projects and;
- Ø Develop in-house capacities for gender mainstreaming within implementing agencies and local partners.
- Ø Address organizational strengthening needs within organisations engaged in sustainable development: develop in-house capacities for gender mainstreaming within implementing agencies and local partners.

**The world stands at a cross-roads**, and the future of our planet Earth and its human communities lays in (y)our hands. United in our diversity we, women from all regions in the world, call on our governments and other stakeholders to re-new the commitments on equitable and sustainable development made at the Earth Summit in Rio de Janeiro in 1992. We commit ourselves to contribute to a peaceful and healthy planet, in which human rights are well respected and women's voices are well-represented. We request that you act in the spirit of global solidarity, trust, environmental and social care, and take our recommendations well to heart.

## Women Deliver

Submission to the Compilation Document in preparation of the Zero Draft Outcome Document of the United Nations Conference on Sustainable Development

Women Deliver is a global advocacy organization bringing together voices from around the world to call for action against maternal death. The health of girls and women is a cross-cutting issue, and particularly relates to sustainable development goals. A sustainable planet requires all of its inhabitants to commit to a green lifestyle. For that to occur, there must be recognition that girls and women are those most affected by air pollution, unclean or scarce water, and are the demographic predominantly working in tourism and on small farms. Therefore, their health and empowerment is a key component of any effort to promote sustainable development. Their needs must be addressed and they must be actively involved in ongoing and future efforts.

Our key recommendations are as follows:

- Include girls and women as primary stakeholders, consultants and decision-makers in developing sustainable programs and policies.
- o The agricultural sector uses 70% of all water worldwide, and the majority of smallholder farms (especially in Africa) are women-owned. Women need information on and access to sustainable irrigation. By fostering greater access to capital through microfinance, women farmers can then invest in sustainable tools and technologies.
- o Women constitute 60-70% of the labor force of the tourism industry, one of the primary drivers of the growth for the world economy. There are tremendous opportunities in developing tourism to be more sustainable by regulating energy and GHG emissions, water consumption, waste management, protection of biological diversity and cultural heritages. By engaging women as agents of change, we can realize success in this arena.
- Improve girls and women's access to fresh water and safe drinking water.
- o Girls and women are the primary family members tasked with fetching water for their household. Improving access to drinking water cuts down on the time spent obtaining it, which then frees up girls and women's schedules to care for their families and work for additional income. Also, improving access cuts down on the distance girls and women need to walk alone and often in dark, remote areas which puts them at risk for sexual assault.

- o There are existing solutions out there, such as the Lifestraw developed by Vestergaard Frandsen, which provides point-of-use water treatment in the home. We need to share experiences and lessons learned on these types of life-saving solutions, and also cultivate the development of new innovations. • Promote the use of clean household fuels.
- o Smoke exposure from traditional cookstoves and household fires cause 1.3 million premature deaths annually. As women and children are inside the home for most of the day, they are most affected by toxic fumes which can lead to emphysema, lung cancer, cardiovascular disease and cataracts, as well as low birth weight for infants born to mothers exposed to these fuels.
- o Relying on biomass for cooking and other household needs places a heavy burden on the environment and depletes natural resources. Furthermore, it requires girls and women to spend many hours a day collecting firewood which both drains their hours for income generation and also places them at risk of violence.
- o The Global Alliance for Clean Cookstoves is a public-private partnership calling for 100 million homes to be provided with clean and efficient stoves and fuels by 2020. By utilizing gas, liquid, solar or processed solid fuel, this solution promotes sustainability, enables girls and women to spend less time preparing and cooking food, and increases girls' and women's health and well-being throughout the life-cycle.

## Women Environmental Programme

RECOMMENDATIONS OF THE NIGERIAN MAJOR GROUPS ON RIO + 20 AT A ONE DAY WORKSHOP HELD ON THE 6TH SEPTEMBER 2011, BOLTON WHITE HOTEL, ABUJA, NIGERIA

### 1.0 BACKGROUND TO THE WORKSHOP

The United Nations Conference on Sustainable Development (UNCSD) is being organized in pursuance of General Assembly Resolution 64/236 (A/RES/64/236). The Conference will take place in Brazil on 4-6 June 2012 to mark the 20th anniversary of the 1992 United Nations Conference on Environment and Development (UNCED), in Rio de Janeiro, and the 10th anniversary of the 2002 World Summit on Sustainable Development (WSSD) in Johannesburg.

In order to ensure high quality inputs to the Conference, the Second Committee of the General Assembly called for efficient and effective preparations at the local, national, regional and international levels by Governments and the United Nations system and encouraged the active participation of all major groups at all stages of the preparatory process.

Against this background, Women Environmental Programme in Partnership with Clean Energy and Safe Environment Initiative, International Center for Energy, Environment and Development, Friends of the Earth, Nigeria/Environmental Rights Action and the Nigerian Climate Action Network organized a One Day National Consultative Workshop of the Nigeria Major Groups at Bolton White Hotel, Abuja on the 6th of September, 2011. The consultative workshop aimed at creating awareness and soliciting inputs and contributions for inclusion in a compilation document of the Nigerian government serving as basis for the preparation of zero draft of the conference outcome document.

The workshop drew over 70 participants from across the major groups which consisted of business and industry, children and youth, farmers, civil society organizations, farmers, local authorities, indigenous people, women, the scientific and technological community and trade unions, government representatives, international non-governmental organizations, donor agencies and the diplomatic missions in Nigeria.

### 2.0 TECHNICAL AND PLENARY SESSIONS

The workshop plenary sessions, covered a broad spectrum of issues related to Rio+20, with presentations made by renowned and professionals on different thematic areas such as; Achieving Sustainable Development in Nigeria Rio+20 years by Ambassador AdamuEmozozo, Director with the Federal Ministry of Foreign Affairs, Green economy and environmental governance, the Nigerian perspective's- Professor ChinedumNwajuba, Synergies between the Rio conventions: Assessing Implementation-HuziMshelia, Climate Change and the success of Rio+20- Mr. NnimmoBassey, New and Emerging issues- the Energy Crisis- Mr. EwaEleri and Gender Perspectives in the Green Economy and the Poverty Eradication in Nigeria by Ms. Lesley Agams.

During the plenary, participants deliberated and took stock of the alarming state of the environment, poverty and inequalities that exist in Nigeria and expressed its disappointment with the widely perceived failure of Nigerian government to live up to the commitments taken at the 1992 Rio Conference. They also noted the new and emerging threats to the environment and people, such as the global warming, energy crisis, threatening food security, water and sanitation, technological innovation as "green economy" which could cause irreparable damage to nature and human health, as well as create new sources of poverty and inequalities.

Participants noted that the concept of green economy is characterized by widespread inequalities and which are viewed as inefficient, unsustainable and inequitable with economic policies that advance rather than promote the concept of sustainable development and therefore agreed that there is the need for the concept of the green economy to be properly understood based on our national circumstances, so that it does not cause dislocation or shock to the national economy.

One of the major outcomes of the Nigerian Major Groups recommendation is that the concept of "green economy" should not replace "sustainable development" and advocated for social equity, economic sufficiency as a framework within which to pursue more sustainable production and consumption patterns.

On the institutional framework, the group noted the failure of global environmental governance to push ideals of the original Rio for sustainable development. The group advocated a coordinating mechanism and parallel institutions at the national level, empowered to pursue system-wide policy coherence, accountable and truly participatory decision-making processes. In this regard, they called for a clear coordinated framework of United Nations agencies are strengthened with the Commission on Sustainable development elevated to a status of a Council with decision making mandate where United Nations Environment Programme is transformed into a specialized institution for the environment

Some of the other recommendations include;

#### Global Level

1. Participants argued that creating a green economy in the context of sustainable development and poverty eradication will need to be built through the bottom up approach, responding to national and local priorities and challenges and therefore called on government to ensure that policy formulations are based on the use of bottom – up approach involving all critical stakeholders especially women and youths as well as community participation.
2. The UN estimates that approximately 70% of the 1.3 billion people living on less than one dollar a day are women, and these figures are rising with current environmental and climatic changes resulting into food crisis, flooding, famine etc in Africa. We need an economy that provides incentives for zero-waste, low-carbon economies that enhance and restore the natural environment, thus providing new green livelihoods, employment and entrepreneurial opportunities for women as well as men.

3. Food and Agriculture: Push for ecological, non-chemical the implementation of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD) report and demand for follow-up process to ensure a rethink of the model of industrial agriculture. This will involve policy work up to and beyond Rio+20. The IAASTD clearly showed that genetic engineering will not occupy a significant niche in feeding the world in the years to come and that effort should be focused on enabling small scale family farming. This is a clear way for securing livelihoods in Nigeria and indeed Africa where the majority of our people are small-scale farmers, fishermen or pastoralists.

4. Gender sensitive policies can best be achieved through gender mainstreaming; an approach which ensures that concerns and needs of both men and women are considered in all planning and policy-making is critical. Therefore, government's officials and staff members need targeted training and capacity building to raise their awareness of gender disparities and discrimination against women.

#### Regional Level

5. The New Partnership for Africa's Development (NEPAD) is revitalized, implemented and monitored with actionable indicators so as to ensure effective vertical and horizontal linkages, as well as effectiveness implementation on NEPAD's Principles, Programme of Action, Priorities and desired Outcome Country Level.

#### Government of Nigeria

6. Nigeria is naturally endowed with human and natural resources, there is ample evidence that small businesses, with its resources and capabilities, can play a vital role in helping achieve the goals related to sustained economic growth in an environmentally and socially responsible manner, and therefore call on government to create an enabling environment (energy, security etc.), where small scale businesses can thrive.

7. The private sector can play a key role in achieving the goals of sustainable development, especially in poverty reduction. Most of the people in Nigeria work in the private sector, either as self-employed, small entrepreneurs, farmers, small and medium size enterprises, employees of larger corporation etc. They generate employment, goods, food and most of the items and services that people use every day. The participants therefore call on government to create an enabling environment for the private sector to be engaged to fill the implementation gaps that have limited achievements of the goals of sustainable development and to address the new and emerging challenges.

8. The Nigerian participation in Rio +20 is critical as a leader and largest country on the African continent, therefore the workshop participants called on the Nigerian government to make its positions available to the major groups so that inputs can be made to enrich it.

9. The nine major groups needs to have a more and better coordinated networking, advocacy and sensitization mechanisms involving governments and other stakeholders in the preparation for Rio +20 and implementation of the outcomes of Rio conference is imperative and therefore called for the establishment of a national coordinating council comprising of all the major groups and government representatives.

10. The participants called on the President of the Federal Republic of Nigeria, Dr. Jonathan Ebele Goodluck for the signing into law the National Climate Change Commission bill.

11. The need for government, ministries, department and agencies (MDAs) to create an enabling environment framework that are critical to effective and successful implementation of sustainability policies and conventions at national level.

12. The participation and involvement of youths, the disabled, aged, physically challenge in environmental policies/ decision making issues, participation and financing of these category of persons to programs and events.

13. The government of Nigeria should make adequate budgetary provision for the major group's participation at the Rio + 20 and the implementation of its outcome.

#### Signed for and on behalf of the Nigerian Major Groups

1. Priscilla M Achakpa- Women Environmental Programme
2. Huzi Mshelia – Clean Energy and Safe Environment Initiative
3. Ewa Eleri- International Center for Energy, Environment and Development/Nigerian Climate Action Network
4. Nnimmo Bassey- Friends of the Earth, Nigeria/Environmental Rights Action

---

## Women in Informal Employment: Globalizing and Organizing

Women in Informal Employment: Globalizing and Organizing (WIEGO) is a global research-policy network that seeks to improve the status of the working poor, especially women, in the informal economy. It does so by highlighting the size, composition, characteristics, and contribution of the informal economy through improved statistics and research; by helping to strengthen membership-based organizations of informal workers; and by promoting policy dialogues and processes that include representatives of informal worker organizations.

#### WIEGO's Contribution to the United Nations Conference on Sustainable Development

Employment – more precisely, “decent work” – is a key pathway to poverty reduction. Most of the world's poor, especially in developing countries, are working. There are 630 million working poor, of whom the majority are women (ILO 2009). They cannot work their way out of poverty because the vast majority earn their living in the informal economy, where average earnings are low and costs and risks are high.

Workers who are informally employed are an integral component of cities around the world. They work as construction workers, domestic workers, waste pickers, home-based workers and street vendors. Informal employment is particularly significant in developing countries, where it comprises one half to three quarters of non-agricultural employment: specifically, 48 per cent in North Africa; 51 per cent in Latin America; 65 per cent in Asia; and 72 per cent in sub-Saharan Africa. If South Africa is excluded, the share of informal employment in non-agricultural employment rises to 78 per cent in sub-Saharan Africa. If comparable data were available for other countries in South Asia in addition to India, the regional average for Asia would likely be much higher. If informal employment in agriculture is included, as is done in some countries, the proportion of informal employment greatly increases: from 83 per cent of non-agricultural employment to 93 per cent of total employment in India; from 55 to 62 per cent in Mexico; and from 28 to 34 per cent in South Africa.

Principle 5 from the Rio Declaration on Environment and Development states: “eradicating poverty is an indispensable requirement for sustainable development”.

Rio+20 Conference in 2012 provides an opportunity to advance global efforts towards securing economic rights for informal workers, particularly women, and to address the

root causes of low incomes and high risks in the informal economy, such as:

- lack of productive resources and economic opportunities
- lack of economic rights – as workers and producers
- lack of social protection
- lack of organization and representation

Today, after 19 years since the Earth Summit, the informally employed face new or intensified threats such as the far-reaching impacts of the global economic recession on the livelihoods of the working poor, the rapid pace of urbanization and the regulatory policies that exclude the working poor and undermine their livelihood. This troubling context requires renewed creativity, energy and information sharing.

We therefore propose that outcomes focus on

- Address poverty and gender inequality
- Promote social economic inclusion of informal workers
- Include informal workers and their organizations in policy dialogue discussions.
- Strengthen the voice and organized leadership of informal workers
- Sensitize policy makers to the fact that the vast majority of those living in poverty/extreme poverty in their countries are actually working poor, and, as such, have special needs to reduce exposure to risks, while at the same time creating potential to overcome poverty by advocating for policy and practice change that can improve their lives.
- Create spaces for dialogue, exchange and mutual learning among policy makers and informal economy actors to foster more responsive policies for the working poor.

WIEGO believes that all policy and process discussions regarding eradicating poverty and promoting sustainable development must include worker representatives themselves, specifically informal workers who make up the majority of workers in developing countries. Informal workers and their organizations must be included in solutions for eradicating poverty and improving livelihoods if the implementation of those solutions are meant to be successful.

## Workinggroup on Great Transformation

Monetary reform for a sustainable monetary system

For Rio+20 Compilation Document

A sustainable economic system needs a sustainable monetary system. The current monetary system is based on the fractional reserve system and is not sustainable at all. A monetary reform is needed.

Regarding our monetary system there is an increasing number of independent experts coming to basically the same conclusions<sup>1</sup>:

Most of the countries in the world face problems of worsening distribution of wealth and growing mountains of debt. These phenomena are not primarily the result of economic misbehavior but the result of the design of our monetary and financial system, which is not sustainable.

Any finance and monetary system that allows to gain money without activities in the real economy is not sustainable. It leads to growing differences in distribution of wealth and demolishes the societal system in regular intervals.

There is also a growing number of proposals for the monetary reform, including the following:

US Congressman Kucinich's Monetary Reform Bill <sup>2</sup>

Towards A Twenty-First Century Banking and Monetary System <sup>3</sup>

Münchener Modell <sup>4</sup>

Monetative<sup>5</sup> – Geldschöpfung in öffentliche Hand

Without addressing the question on monetary reform there is no way to establish a sustainable economic system. Therefore we suggest that the issue of monetary reform should explicitly discussed in the Rio+20 preparatory process. The Rio+20 document should include concrete proposals on how to tackle the monetary reform.

## World Animal Net

Joint submission by World Animal Net and 109 partner-organisations to the compilation document in preparation of the zero draft of the Rio+20 outcome document

Expectations for the outcome of Rio+20:

Together with 109 partner-organizations from more than 50 countries from all UN regions, World Animal Net believes that by focusing on the theme of a Green Economy in the context of sustainable development and poverty eradication, the Rio+20 Summit will provide a key opportunity to address how we treat animals, be they wild, companion, working or farm animals or more generally animals in disasters. We believe that the welfare of animals needs to be considered within policies that affect them and particularly the welfare of livestock used for farming, as their welfare is directly affected by human activities.

Therefore, World Animal Net and 109 partner-organizations would like to recommend the Rio+20 outcome document's considerations include specific commitments on global agriculture systems and food supply chains that will allow achieving global food security while preserving ecosystems and ensuring human and animal welfare. The outcome document must recognize the benefits of humane and sustainable livestock production.

To integrate the three pillars of sustainable development, World Animal Net and its partner-organisations recommend the following measures:

1. Develop policies for humane and sustainable food supplies IGOs, national governments and food supply industries urgently need to develop policies for sustainable and humane food supply chains. For livestock production to have a reduced impact on climate change and to be sustainable, it must be biologically based, socially just and humane. To achieve this, animal welfare needs to be included in all future discussions on agriculture, land use and climate change.
2. Manage unsustainable demand for farm animal products and support producers in transition National governments and IGOs need to develop mechanisms to deal with the current acceleration in meat and dairy production, notably in grain feeding and intensive production methods that are not ecologically sustainable. Both the proposals for Sustainable Development Goals (Colombia, Guatemala) and the Millennium Consumption Goals (prof. Munasinghe) would provide excellent ways to ground commitment for this and establish clear, measurable targets for changing food consumption patterns. Implementing an ambitious 10YFP on SCP that prioritizes sustainable and humane food production and consumption would also be highly desirable..
3. Research and development to support humane and sustainable agriculture Research is urgently needed to support farmers in developing livestock systems, breeds, feeding and management to ensure humane and sustainable animal production. Research is also required to determine effective policies for addressing meat consumption.
4. Phase out subsidies and investment for unsustainable, inhumane systems Financial support for industrial livestock production methods, such as unseen subsidies for externalized costs, should be ended. Economic mechanisms to support humane, sustainable livestock production (for example grants and research funding) should be prioritized.

Comments on the Green Economy in the context of sustainable development and poverty eradication

About a billion of the world's poorest people depend on animals for food, income, transport, social status, and financial security.

With a view to achieve a Green Economy in the context of sustainable development and poverty eradication - and more specifically to achieve sustainable development in agriculture and food production - the Rio+20 outcome document's considerations on the future of food and farming must recognize the benefits of humane livestock systems . Ensuring the welfare and responsible use of animals is an effective tool to help achieve sustainable development through environmental protection, poverty alleviation and enhanced wellbeing:

1) Environmental sustainability – Humane animal production systems reduce environmental damage Livestock production's is well recognized as a major contributor to greenhouse gas emissions . It is also a highly polluting sector – including phosphorus, nitrogen and pesticide contamination of water - and is a main cause of deforestation (for pasture and the growing of feeds).

Higher welfare animal production systems often require fewer inputs of grain feed, fuel and water. Pasture based systems utilise land otherwise unfit for production. They also keep animals at stocking densities that reduce the risk of major pollution and use breeds often more robust and resilient to environmental challenges. Pasture and mixed farm systems also have benefits such as such as biodiversity preservation and carbon sequestration in well-maintained grazing systems.

2) Economic sustainability - Good animal health and welfare can reduce costs and raise profits for producers Good animal health and welfare can reduce costs and raise profits for producers. For example, in dairy production, investing in increased cow longevity and fertility will help to achieve better returns in the form of milk and calves during the animal's lifetime. Due care for the welfare of animals during handling and transport can limit bruising and levels of stress, preventing financial losses from poor meat quality and unnecessary damage to carcasses at the slaughterhouse. The perceived quality of high welfare products also often attracts a premium from consumers.

3) Social sustainability 'Human beings have an important role in protecting one another and other forms of life, in particular animals.' Safeguarding animal welfare of livestock forms an important part of this social responsibility.

Call for action:

- Develop policies for humane and sustainable food supplies
- Manage unsustainable demand for farm animal products and support producers in transition
- Phase out subsidies and investment for unsustainable, inhumane livestock systems

Institutional framework for sustainable development

Vulnerable groups need adequate representation in policy making processes. This is especially critical for the voiceless, for example future generations and animals.

Call for action:

Establish an ombudsperson system to defend the interests of future generations and animals.

Sincerely,

Wim de Kok

President World Animal Net

EXPECTATIONS FOR THE OUTCOME OF THE CONFERENCE

CONCRETE PROPOSALS Intactness of the Earth

The Earth being a very fragile planet in its composition, delicately balanced in all its parts (viz., lithosphere, hydrosphere, atmosphere), any scheme of sustainable development to be successful has to flow from the realization of this fundamental fact.

In destabilizing the structure of the planet or disturbing its titanic plates by violent activities, one cannot expect to simultaneously subscribe to the requirements of sustainable development. Similarly, by inflicting injuries to the lithosphere by such acts as gas emission, soil erosion, land slide, desertification, and deforestation cannot be conducive to the precepts of sustainable development. Likewise, senseless exploitation and ruthless destruction of Earth's resources cannot go hand in hand with the demands of sustainable conduct. In the same vein, subjecting the land mass of the Earth to suffocating pollution and toxification cannot be treated as a tolerable activity for a sustainable economy.

Similar degenerative activities in hydrosphere (viz., oceans, seas, lakes, ponds, rivers, glaciers) violate the premises of sustainable life. If pollution beyond the natural

absorptive capacity and exploitation of marine resources (living and non-living) above replenishment capacity cannot be regarded as sustainable. Therefore, promulgation of effective checks is necessary to stem the tide against the sustainability standards, so that a conducive future could be ensured.

Degenerative perpetrations are also increasingly rampant in the atmosphere (even beyond in outer space). Overloading the atmosphere with carbon dioxide and other toxic gasses is having harmful effects over weather, setting in motion consequences equally injurious to life on the Earth, emission of other gasses is punching holes in ozone layer, with hazardous consequences to health among others.

It is thus expected that Rio+20 will proceed with the fundamental premise that only with a healthy Earth can emerge a sound sustainable development plan. With these bases, a comprehensive program has to evolve with the recognition that the planet's resources (both living and non-living) have limits, demanding accordingly their sensible treatment. They need their proper conservation, preservation, and protection. They too have their rights and therefore, as parts of civilizational desiderata, they need proper handling on all counts.

#### Comments on Existing Proposals

The Agenda 21, Rio Conventions, Johannesburg Plan, and the Millennium Declaration have all been important steps as they touched upon important questions (e.g., biodiversity, desertification, climate change), thereby helping to define the parameters of Sustainable Development goals and to build a global sustainable agenda. The momentum so generated gave rise to many other constructive initiatives (e.g., Green Economy Roadmap) and produced pressure for creation of implementational devices (e.g., Framework for Action, Global Partnership).

These initiatives ushered in visible spectrum of socio-economic progress worldwide. As such, numerous projects of development may be proudly mentioned to testify this claim of advancement.

Yet, the progress has been sporadic and uneven, far below the expected measure. Therefore, the underlain conditions of dissatisfaction and insecurity have remained, encompassing most of the sectors across the board (e.g., water, food, energy, biodiversity, climate).

Such circumstances have posed many challenges, which have necessarily to be seriously addressed. Not only the remaining issues are there, having not been fully resolved, but also emerging problems have further added to difficulties.

#### Implementational Views

Among these, one critical aspect is that of implementation of what had been solemnly agreed upon. Many gaps have been left consciously or unconsciously. While the plans of action, programs of timing, roadmaps of procedure are in existence, they have not been wholly or partially acted upon.

Therefore there is a need of concerted endeavors on the part of all relevant actors (e.g., public sector, private sector, civil society, organizations, institutions, groups, individuals), on all levels (viz., local, national, regional, international, global).

#### Implementational Methodologies

In order to pursue the professed goals, with implementational elements in sight, there is the necessity of incorporating due methodologies. In order to systemize the entire gamut of means, firstly the context of priorities of tasks has to be decided, so that specific issues demanding urgent attention may be taken up immediately. Then, the general questions could be taken up, at their turn. Also, the framework of timing is equally important, so that all problems could be attended to properly. A simple issue may not be allowed to degenerate in the waiting, while a complex problem may have sufficient time to muster concerted support, whereas the middle ones may be settled in due course. Accordingly, all tasks must be sorted out diligently as short-term, medium-term, and long-term, in view of their importance and urgency.

It is at this juncture that the cooperative mechanisms as parts of essential methodologies have to be sought. They may be developed with agencies of common interest, which naturally are the most conducive, with prospects of intense and sustained relationships. But, even with those of diverse leanings, casual ties could still be possible in areas of some degree of mutuality. The essential feature is that any available measure of cooperation (short or long, incidental or sustained) should be welcomed.

Beyond these, there could be likelihood of partnerships, for reciprocal gains in defined spheres of pursuit. It may be comprehensive in the sense of coverage of all or most areas of concern. Or, it may be partial, dealing with a select facet or several chosen facilities. In both ways, they are gainful.

Besides, there are certain advocacy groups, voluntary services, special facilities, and honorary offers, whose capacities could profitably be deployed.

#### SPECIFIC ELEMENTS Conference Objectives

In the wake of only partial success and many failures, with numerous impending dilemmas and crises, it has been a bold and wise step to hold another Conference on the same theme. It will provide opportunities to utilize the experiences gained during the interim period, both to avoid pitfalls and fill the gaps, while meeting challenges and resisting temptations.

The international community, consisted of all stakeholders, is therefore returning to Rio with renewed vigor to objectively: i) assess the progress made during the intervening years; ii) fill up the remaining implementational voids; iii) build institutional stamina to address emerging challenges; iv) formulate action oriented policies; v) produce workable development agenda for the coming decades; vi) mobilize financial and technological resources; and vii) capture conducive opportunities.

With the obtainment of political commitment for such a program, focusing on green economy and poverty eradication as its *leit motif*, it has laid down its plan for sectoral development priorities. This consists, among other things, such factors as: energy, food, agriculture, forests, technology, water, oceans, urbanization, production, consumption, biodiversity, climate change, and natural disasters.

#### Green Economy

The concept of Green Economy, if friendly to the Earth and natural forces, may be considered as a positive move. Embracing most of the sectors of life on the planet, it must be considered as having great potential to promote the elements of developmental sustainability. Otherwise, it will invite futility and dejection. Here, the lessons learnt from past successes as well as from failures must provide light to chart a correct course, both for seizing opportunities and meeting challenges. Accordingly, the elements of agreements have to be universal in their nature to encompass all facets of the problem and global in scope to cover all areas of the world, in a harmonious way.

#### Poverty Eradication

Poverty Eradication, even though an important goal, it can hardly be treated as a pillar of the sustainable development scheme. As a symptom rather than an independent issue in itself, it should have been considered as a sector within the context of green economy, as broadly defined. Even if brought in as one of the main independent pillar, it ought to be considered in realistic terms, so that its intrinsic significance is not eclipsed. It is within this context that its potentialities have to be assessed in view of past

triumphs, as well as defaults, in order to profit from professed fortunes and deal with imminent dilemmas, to provide proper elements to be included in anticipated agreements.

#### Institutional Framework

Sustainable development being a global problem, to tackle it adequately, naturally demands a global response. However, since no such machinery presently exists, the closest approach could be involvement of all stakeholders (viz., national governments, international organizations, private sector, civil society, interest groups, individuals) on all levels (international, regional, national, local).

As a catalyst, the United Nations can play the key role by bringing the national governments together and generating a climate of binding commitments, thereby opening the road for global standards.

With the promulgation of legal norms, appropriate institutional framework will follow, both by design and by practice. A broadly based tripartite structure could initially be established with open channels from the top tier (international) through the middle rungs (regional, national) to the bottom one (local). With their respective responsibilities at their designated stations, they will be coordinated according to their interests and commitments, always linked together by the common cause of a better future for all.

With the underlain devotion and constant practice, the urge for integration of all functional levels into a single administrative authority will tend to increase in time, finally to be merged into a compact body of all pursuances.

#### Proposals for Refinement

Refinement of all its facets of the sustainable development scheme will come from three elements: i) conceptual soundness; ii) functional reality; and iii) growth potential.

As for the green economy, while its concept is sound, its functional reality rests on the will of sovereign states. For a successful passage, it has to be broadly based and functionally viable to serve the largest interests, while able to cut through the resisting impediments.

As regards to the premise of poverty eradication, it is difficult for it to stand alone as a main independent pillar of the sustainable development scheme, because essentially it is a dependent component of other interacting factors. Its refinement therefore depends either on making it a part of a larger phenomenon or broadening it separately as an independent entity.

Concerning the institutional framework, its refinement includes its functional efficacy on all organizational levels, with reliable coordination among them. With the aid of international organizations and cooperation with regional entities as well a national sovereigns and local authorities, it will apt to present itself as a viable structure, capable of taking the current load while having the capacity of constant improvement for future responsibilities.

## World Business Council for Sustainable Development (WBCSD)

Contribution to the United Nations Conference on Sustainable Development

Submitted by the World Business Council for Sustainable Development

The World Business Council for Sustainable

Development (WBCSD) is a partner in the Business

Action for Sustainable Development co coalition (BASD 2012). This submission complements and supports the submission of BASD 2012 to the Conference on Sustainable Development.

The World Business Council for Sustainable Development (WBCSD) has been an active and constructive participant in sustainable development efforts at the international level since the first Rio Summit in 1992. We are pleased to provide this submittal as our initial contribution to submittal the United Nations Conference on Sustainable Development (Rio+20), and as a complement to the submission from the BASD 2012 coalition and the Business & Industry Major Gr Group.

The mission of the WBCSD is to provide business leadership as a catalyst for change toward sustainable development, and to support the business license to operate, innovate and grow in a world increasingly shaped by sustainable development issues. Through our participation in the Rio+20 process, we hope to stimulate action which reflects the urgency and the complexity of the challenges we are facing.

In 2010 we published the Vision 2050 a discussion paper which explored what a pathway 2050, would look like that would allow the world to reach t vision of "9 billion people liv the living well, and within the limits of the planet". The pathway proposed 9 key elements, and for each a measure ". of success:

People's Values - Sustainability embedded in all products and services & lifestyles

Human Development - Billions of people lifted out of poverty

Economy - Cost of carbon, water and other ecosystem services internalized

Agriculture - Agricultural output doubled through improved land and water productivity

Forests - Deforestation halted, carbon stocks in planted forests doubled from 2010 eforestation

, Energy and Power - C 2 emissions reduced by 50% worldwide (based on 2005 level) CO

Buildings - All new buildings use zero net energy

Mobility - Near universal access to reliable and low carbon mobility, infrastructure & information

Materials - Four-to-tenfold improvement in the eco-efficiency of resources and materials tenfold from 2000.

Making these changes – and more – will enable us to consume just over one planet's worth of ecological resources in 2050, as opposed to the 2.3 planets we will be using if we continue on the business-as-usual path we are on today.

WBCSD strongly believe that the world already has the knowledge, science, technologies, skills and financial resources needed to achieve Vision 2050 but the foundations for much of what is required will need to be laid at speed and scale in the next decade. At the same time, the map is far from complete. There are still many significant questions to be answered about governance, global frameworks for commerce, roles and responsibilities, and risks. Nevertheless, these can be answered in time for progress to be made.

In Rio in 1992, we saw a dramatic change in awareness of sustainable development issues. It is our hope that from Rio in 2012, we will see a dramatic change in the pace of

efforts to address sustainable development issue.

About this submittal

This submittal, as a complement to the BASD 2012 coalition's submittal, addresses specific topic areas which WBCSD has identified as priority areas for Rio+20. A more complete catalog of our efforts related to sustainable development can be found at [www.wbcds.org](http://www.wbcds.org). It is our hope that these components will be useful in the development of the Zero Draft of the Rio+20 outcome document.

About the WBCSD

The World Business Council for Sustainable Development is a CEO-led organization of forward-thinking companies that galvanizes the global business community to create a sustainable future for business, society and the environment. Together with its members, the council applies its respected thought leadership and effective advocacy to generate constructive solutions and take shared action. Leveraging its strong relationships with stakeholders as the leading advocate for business, the council helps drive debate and policy change in favor of sustainable development solutions.

The WBCSD provides a forum for its 200 member companies - who represent all business sectors, all continents and a combined revenue of more than \$7 trillion - to share best practices on sustainable development issues and to develop innovative tools that change the status quo. The Council also benefits from a network of 60 national and regional business councils and partner organizations, a majority of which are based in developing countries.

Disclaimer

This submission is released in the name of the WBCSD. Like other WBCSD publications, it is the result of a collaborative effort by members of the secretariat and executives from several member companies. A wide range of members reviewed drafts, thereby ensuring that the submission broadly represents the majority view of the WBCSD membership. It does not mean, however, that every member company agrees with every word.

**[UNDESA/DSD: Pleade download the original document to read the full submission]**

---

## World Coal Association

The World Coal Association was founded in 1985 and has been working on behalf of the global coal industry for the past 25 years. WCA's members comprise the world's major international coal producers and stakeholders. The WCA provides a voice for coal in international environment and energy forums. The World Coal Association has Category II Consultative Status with the United Nations Economic and Social Council and Consultative Status with the UN Industrial Development Organisation. WCA is also an admitted observer organisation with the United Nations Framework Convention on Climate Change.

Key points

Access to energy is essential to achieving sustainable development and green economic growth. Efforts to address sustainable development must be supported by international targets on energy access.

Access to modern energy sources is key to sustainable economic and social development

According to the International Energy Agency, coal is expected to provide more than half of the grid-based energy needed to provide electricity to the 1.3 billion globally who currently lack access to it.

As nations develop they seek secure, reliable and affordable sources of energy to strengthen and build their economies – coal is a logical choice in many of these countries because it is widely available, safe, reliable and relatively low cost.

The world faces a huge challenge in meeting the future energy needs of developed and developing countries. All available sources of energy will be needed to meet this challenge.

If the world is to meet global emissions reduction targets while meeting the ever-growing demand for energy, then advanced coal technologies – such as high efficiency low emissions power generation and carbon capture and storage must be supported by governments and other international institutions.

In addition to its energy benefits, coal contributes to economies and communities through responsible mining and supporting industrial processes such as steel production and is therefore a key component of sustainable development.

The challenge of energy poverty

The International Energy Agency recently highlighted that there are currently 1.3 billion people worldwide who lack access to electricity (with approximately 85 percent of those in rural areas). The IEA also identifies that without additional dedicated policies to address energy poverty, by 2030 this number will only reduce to 1.2 billion. The IEA also states in its WEO2010 report that to achieve universal modern energy access by 2030 would require an average annual investment of \$36 billion between 2010 and 2030.

Given all of this, achievement of the Millennium Development Goals is unlikely to be possible without addressing the significant challenges posed by the world's energy poverty situation.

Yet an obvious absence from the Millennium Development Goals is any specific goal designed to address energy poverty.

Energy and climate – integrated priorities

The world faces significant challenges in facilitating sustainable development and poverty alleviation in the developing world. Energy plays a key role meeting these challenges. However an effective response to the legitimate aims of energy security and economic development, including poverty alleviation, must also integrate with global action on climate and environmental concerns.

These issues are inextricably linked. The world's least developed countries need access to low cost energy, but they are also the most vulnerable to the impacts of policies aimed at reducing anthropogenic greenhouse gas emissions.

As both developed and developing economies continue to grow, the demand for energy will only increase. Secure, affordable and sustainable sources of energy are key to addressing the challenge of energy security and poverty alleviation whilst also reducing greenhouse gas emissions. Significantly reducing poverty in developing economies is a necessary first step to reducing greenhouse gases.

Absent this first step, developing economies will not have the capacity to focus their attention on reducing their greenhouse gas emissions. Ensuring secure, affordable and sustainable energy requires a diverse energy mix and coal is a key part of that mix. It is both an essential energy resource for electricity generation and a vital raw material for industrial production eg. steel, chemicals and cement. Coal is vital for long-term sustainable development and can be used in a manner consistent with GHG reduction goals. International action on energy and development

As economies develop and grow they look for reliable, affordable sources of electricity. Energy also plays a central role in sustainable economic and social development, yet the Millennium Development Goals fail to include energy access as a key target.

The outcome document of the Rio+20 summit must include a commitment to address the world's significant energy poverty challenges.

Many countries have access to indigenous coal resources and use those supplies to fuel their energy needs. These countries must be supported to use their natural resources consistent with global climate objectives. The IEA says that coal is expected to provide more than half of the grid-based energy needed to provide electricity to the 1.4 billion globally who currently lack access to it.

In order to meet joint sustainable development and greenhouse gas reduction goals, governments and the international community should support action that:

includes a target of universal access to modern energy by 2030 as part of the Millennium Development Goals to promote eradication of poverty through access to affordable, reliable sources of energy, including coal, which support provision of employment, health care and education.

recognising that different countries will meet their energy needs from different sources, promote the deployment of the cleanest and most efficient coal technology available – including advanced high efficiency, low emission coal-fired power generation and in suitable environments, alternative coal technologies such as underground coal gasification and coal bed methane utilisation.

facilitates the development of CCS technology because according to all credible scenarios rapid and large-scale deployment of CCS in both developed and developing countries is necessary to limit the global temperature rise to less than two degrees. These priorities can be met by:

The various international development banks providing loans for the deployment of CCS and advanced coal-fired power generation where coal is identified as an efficient means of electricity generation in developing countries. These institutions must also support development of power grids to deliver electricity where it is needed.

Joint action by aid donors and recipients in recognising where energy needs are a key challenge to development and where supporting the deployment of CCS and advanced coal-fired power generation can contribute to the achievement of development objectives.

Financing CCS and advanced coal-fired power generation through the various climate financing mechanisms. Coal's role in society In addition to the important role it plays in meeting the world's energy needs, the production and utilisation of coal makes a significant contribution to society.

Across the globe many communities benefit from being centres of coal mining. They benefit from the jobs, royalties, infrastructure and other improvements that mining brings; while responsible mining companies, such as those who form the World Coal Association, see mine safety as critical and strive to ensure zero-harm as the key priority for their operations.

Coal also forms a key component of many industrial processes and is a key part of almost 70 percent of the world's steel production. Steel is a fundamental material for modern life. The manufacture of steels ultimately delivers the goods and services that growing economies demand – healthcare, telecommunications, improved agricultural practices, better transport networks, clean water and access to reliable and affordable energy. Steel is a vital building block for development – facilitating economic growth and poverty alleviation

## Conclusion

The World Coal Association urges the international community to recognise the essential role energy plays in supporting economic and social development. The international community is also urged to recognise that all sources of energy, including coal, will play a role in achieving energy access targets. Policy frameworks and financial support must be put in place to support the development of advanced coal technologies and CCS alongside other clean energy solutions if the world is to meet development and environmental challenges.

## World Council of Churches and the Lutheran World Federation

### THE WORLD COUNCIL OF CHURCHES – THE LUTHERAN WORLD FEDERATION

Joint Submission for the Compilation Document for the United Nations Conference on Sustainable Development (Rio+20 Conference)

1 November 2011

The World Council of Churches and the Lutheran World Federation submit these inputs and contributions for inclusion in the compilation document for the United Nations Conference on Sustainable Development (Rio+20 Conference). Both the WCC and the LWF are non-governmental organizations in consultative status with the UN Economic and Social Council.

General Content a): What are the expectation for the outcome of Rio+20, including views on a possible structure of the Outcome document?

In the churches' perspective, justice must be the basic criterion of applied ethics in all decisions concerning the measures to promote sustainable development and to cope with climate change. Although climate change is a global issue affecting all peoples and nations, those who are and will increasingly be affected by negative climate change consequences are the vulnerable communities who have contributed the least to global emissions. These include women and children, indigenous peoples, poorest communities, people with disabilities and inhabitants of coastal low lying areas.

Vulnerable communities and states are also much more dependent on natural resources for their subsistence and do not have the means to mitigate emissions and to adapt to climate change. Their survival is at risk, and justice requires that the nations most responsible historically for the adverse ecological conditions should take the greatest responsibility towards the adaptation of these vulnerable communities and nations.

Accordingly, we strongly urge that the Outcome document include a preamble that highlights ethical principles that can be shared by people who are religious and non-religious. Some suggested wording:

Promises of unlimited economic growth, fueled especially by carbon consumption, are jeopardizing the planet's future and the future of life as we have known it—especially the lives and lands of those who are the most vulnerable in the world. Climate change is accelerating, as made evident through increasingly severe and frequent storms, rising seas and devastating droughts. It also contributes to more severe food shortages, the increased spread of diseases, conflicts over scarce land and water, and the forced migration of people.

Who dies first as a result of climate change? This is an everyday reality for the millions of victims of droughts or storms. Death as a result of climate warming is not a natural disaster, since climate warming is caused by human activity.

The question is thus not who dies first due to fate, but whom do we sacrifice first because of what we do or fail to do? Do we sacrifice the populations of the small islands whose land disappears? The children in the slums of the megacities who suffer from hunger because of high food prices? Older people in industrialized countries who are infected by new diseases due to climate change? The victims of storms or broken dams? (These questions posed by Christoph Stueckelberger in *God, Creation and Climate Change: Spiritual and Ethical Perspectives* – LWF Studies, July 2009, p. 47.)

We must begin to live sustainably—in such a way as not to detract from the potential quality of life of future generations.

General Content b): What are the comments on existing proposals?

There should be specific and measurable goals. One positive example would be the Sustainable Development Goals proposed by the Governments of Colombia and Guatemala.

General Content c): What are the views on implementation and how to close the implementation gap?

A binding outcome treaty would be desirable. There should be economic incentives for behavior that promotes sustainable development and that mitigates climate change, and economic disincentives for behavior that does not.

General Content d): What specific cooperation mechanisms are envisaged?

No specific comments.

Specific Content a): Objective of the Conference

The Conference should lift up human rights mechanisms as major instruments to hold governments and the private sector accountable. A clearly integrated human rights framework would include the right to development, the right to food, the right to clean water and sanitation, the right to housing, the right to medical care, the right to education, and so forth.

Specific Content b): Green Economy

The Conference should reflect the ethical insights that a green and just economy has to be measured according to the well-being of all and not just a few. In particular, this time-honored ethical measure should be applied: what is the situation of the poor and most vulnerable, especially women and children.

Going toward a green economy must mean that externalities are included in the price of products (e.g., by taxes or other means). Policies should be made from the perspective of small-holder farmers and small businesses (as opposed to the perspective of powerful large corporations).

In particular, a less wasteful and more efficient use of natural resources, including water, is vitally important. The question, however, is how to ensure control over and access to these resources for those sections of society who are less "competitive" (e.g., as small farmers compete with large corporations over user rights for water) and who have limited access to the finance and technology required to, for example, make more efficient use of water resources.

Specific Content c): Institutional framework for sustainable development.

A rights-based approach is necessary as an accountability mechanism.

Specific Content d): Any proposals for refinement of the two themes.

No proposals.

---

## World Educators for Sustainable Societies

[www.tratadodeeducacaoambiental.net](http://www.tratadodeeducacaoambiental.net)

2nd Journey on International Environmental Education

### OPEN LETTER FROM EDUCATORS

for a just and happy world!

Rio +20 in the transition to Sustainable Societies.

We, educators from all over the world, now when our Planet once again brings forth the major issues that were addressed in Rio 92, we reaffirm our adherence to the principles and values expressed in planetarian documents such as Treaty on Environmental Education for Sustainable Societies and Global Responsibility, the Earth Charter, the Charter of Human Responsibilities, the Rio Declaration, among others. (1)

But it is not enough just to reaffirm! Plethora of theoretical references enlighten us, its the principles, values, policies and action plans proposed in the cited documents must truly out of paper, despite of the "development", that has kept 80% of humanity apart of the minimum conditions of life in Culture of Peace, with environmental and social justice. (2)

It is unacceptable that we still have wars, spending on weapons, a billion hungry and miserable, lack of clean water and sanitation for huge portions of humanity. It is

unacceptable violation of human rights (gender diversity, ethnic, generational, social and geographical conditions), the loss of species diversity, culture, language and genetics, greedy gains, urban violence and all forms of discrimination and projects of oppressive power. (3).

The human manifestations in several countries for the overthrow of dictators of all kinds are indicators of the need for new proposals for organization of 7 billion humans. It is evident that governance and governability of the planet must be in the hands of local communities in which there must be the overall responsibility for the common good of humans and non humans and all natural systems and life support. (4)

We need to learn and practice other ways of making public policy from the communities, and State policies require to be committed to quality of life. Therefore, it is urgent to strengthen the processes educators committed to human emancipation and political participation in building sustainable societies, where every human community feel committed, active and included in the sharing of wealth and abundance of life on our planet. (5)

The carrying capacity of Mother Earth is nearing its limit, due to the mode of occupation, production and consumption irresponsible of capitalism, which has become the global economical model, and now also features the Green Economy speech. For us, whatever concepts or terms used, the essential is that the socioenvironmental vision is always ahead. Building Sustainable Societies in Global Responsibility is based on the values of life to which the economy must serve. (6)

Sustainable Societies are made of environmentally educated citizens in their communities, where they decide for themselves and from their own needs what it means Green Economy, Sustainability, Sustainable Development, Climate Change and many other concepts that can be moved away of their original meaning or motivation - which is the transition for another world possible - , being co-opted o coined to serve the hegemonic liberal rationality. Each community can see and feel beyond words and semantics, while maintaining its course towards the planetary union, tracing its own history. (7)

Retake and to appropriate locally of these concepts under the force of the Planetary Identity empower learning communities, from the practice of dialogue, the sense of belonging and manifestations that are necessary to Well Being and individual and collective happiness. In these practices the essence of the spiritual dimension emerges as a radical practice of ethical valorization of life, respectful care to all living things, connecting hearts and minds through love. It is a process that empowers the individual to the practice of dialogue with oneself, with others, with the planetary community as a whole, restoring a sense of citizenship and overcoming the separation between society and nature. (8)

It must then ask: where is the role of Education for Sustainable Societies and Global Responsibility? The answer in the XXI century can be only one: in the center. In the center of daily life, of education management, policy management, economic and environmental management. Thus, environmental education is consolidated into another world, with environmental and social justice, ensuring the development of an effective participatory democracy that can assure the social, cultural and spiritual development of communities, as well as its social control. (9)

We want to establish and strengthen local and planetary action plans, which focuses an education able to unravel the structures of class and power between people, nations and institutions that currently exist on our planet Earth. (10)

Educating ourselves for Sustainable Societies means situate ourselves in relation to the current global system, to reshape our presence in the world, leaving the comfortable position of neutrality. Because education is always based on values, there will never be neutrality in education, whether formal, non-formal, informal, face or distance learning. (11)

Educators from all over the world agree that the way to real sustainability can be done by various currents or tracks which are based on values and principles that link to sustainability. Transformative Learning, Ecoliteracy, Popular Environmental Education, Ecopedagogy, Gaia Education, Environmental Educ-Action are some of them. All these currents have in common to bring contributions to the construction of new models of society, and all remind us of the need to develop knowledge, awareness, attitudes and skills necessary to participate in the construction of these new models, integrating them into our way of being, of producing, of consuming and belonging. (12)

More than ever we claim for an education able to arouse admiration and respect for the complexity of life support, with the utopia to build sustainable societies through the ethic of care to protect the bio and socialdiversity. In making this educational process, the transdisciplinarity intrinsic to socio-environmental education leads to interaction between the various areas of science and technology and the different manifestations of popular and traditional knowledge. This allows the integration of existing knowledge and production of new knowledge and new social and environmental actions while carrying out the Dialogue between Wisdom and Care as High Technology in the Education for Sustainable Societies and Global Responsibility.

## World Farmers Organisation

Agriculture's Contribution to the Green Economy Proposed Outcomes from the Rio +20 Summit

Rio +20 Summit

On the occasion of the 20th anniversary of the first Earth Summit in Rio de Janeiro in 1992, a high level session will be convened "to secure renewed political commitment for sustainable development, assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges." – General Assembly resolution.

The focus of the Conference includes:

 a green economy in the context of poverty eradication and sustainable development

 and the institutional framework for sustainable development.

The implementation gap on sustainable development commitments is the primary point of discussion for the Earth Summit. The green economy should be part of the means to

implement overarching sustainable development commitments made at the original Earth Summit and in Johannesburg.

We believe the Summit could further policy coherence on food security, drawing on the CSD-17 findings and the work of the High Level Task Force on Food Security.

#### Role of Farmers

Farmers represent one-third of the world's population and one-half of its poor. As the planet's primary ecosystem managers, farmers' activity depends on a sound environment. They are best placed to ensure sustainable development thereby contributing to a green economy. Farmers provide multiple goods and services to society, such as production of food, non-food products such as renewable energies, delivery of ecosystem services and land stewardship to protect and enhance biodiversity. They also play a key role for rural development and rural employment. Thus, the farming sector contributes to economic growth and to reducing poverty and hunger in developing countries, while still being an important part of the economy in industrialised countries.

Farmers are at the core of the green economy as there are significant synergies between poverty alleviation and sustainable farming. Farmers' organizations want to be a key partner in all levels of discussion.

#### What is the Green Economy

Though it is notoriously difficult to reach an agreed definition of a green economy, broadly it is aligned with the goals of sustainable development: social, economic, and environmental sustainability. The green economy recognizes that protecting and conserving environmental resources can be a significant driver for the economic growth.

#### What are the primary goals for Agriculture in the Context of the Green Economy?

- 1) Produce more with less by finding ways to meet global requirements for food while minimizing the need to encroach forests, jungles, and other eco-systems and maximising the efficiency of production.
- 2) To use a knowledge-based approach of best practices that sustains production and minimizes the negative impacts of farming activities on the environment.
- 3) Develop new approaches to reward farmers for adopting practices decisions that protect and/or enhance the provision of goods and services from functioning ecosystems that also foster sustainability and address poverty by enabling smallholder farmers to break the subsistence cycle.
- 4) Reduce poverty since farmers represent one half of the world's poor and despite high profile promises, woefully few resources have truly begun to flow to help farmers break the poverty cycle.

**[UNDESA/DSD: Pleade download the original document to read the full submission]**

---

## World Federation of Engineering Organizations (WFEO)

### 1. General considerations

Rio+20 is a crucial opportunity for governments to recognize, enhance and map out the vital relationship between Science, Engineering, Technology and Innovation, and Policy-making, within a multi and trans-disciplinary framework.

Rio+20 should be a fundamental milestone in the implementation of a new social contract for science, engineering, technology and innovation, with the inclusion of all society, particularly women, vulnerable communities and indigenous peoples. Subjects like food and water security, climate change, energy, urban and human well-being, disasters, ecosystems and biodiversity, sustainable consumption and production need to be revisited.

### 2. Green Economy

Green Economy is being defined by attributes. There is a need for a guiding framework or principles for implementing the green economy.

Green Economy has to respect and operate within the natural limits of the planet.

Expectations and proposals within a Green Economy framework were clustered in terms of Infrastructure, Natural Disasters, and Knowledge and Technology Development, and are presented in the following sections.

#### 2.1. Infrastructure

New and emerging challenges that will require special attention in building or adapting infrastructure are related to:

- Reversing the rate of terrestrial, freshwater and marine biodiversity loss;
- Managing hazardous wastes in all habitats (e.g. urban, industrial and agriculture areas located in temperate, subtropical and tropical areas) through the development of complete eco-toxicological approaches;
- Developing climate change mitigation and adaptation capacities, recognizing that richer nations have greater responsibility in mitigation while developing nations will require greater efforts in adaptation;
- Building resilience to floods, tsunamis, volcanoes, and other natural risks, as well as related human displacements, in the framework of climate change;
- Developing a systematic approach to urbanization, as current rates of urbanization constitute a major environmental and social challenge, and
- Developing clean energy sources and sustainable agriculture.

The use of any given technology requires a thorough analysis of the technological, economical, and environmental feasibility for implementing scientifically sound and efficiently engineered solutions.

A systemic approach to urbanization should be developed, such as land use and territorial planning, including urban and peri-urban planning, based on continuous dialogue among all the stakeholders of society.

Regarding energy options, some of the technologies needed are not yet economically viable. In particular we have not yet learned to harness the abundant solar energy at a competitive cost, although costs are coming down fast. In addition, building the necessary infrastructure to bring large scale renewable electricity from places with high yields (areas with high solar exposure or strong winds) to the places with high consumption requires huge investments and long lead times, as well as development of mechanisms to encourage infrastructure investment.

In addition to an increased share of renewable energy in the world's energy mix, energy efficiency measures will help reduce the energy intensity of national economies and, therefore, slow down the increase of primary energy demand.

End-use efficiency, power-plant efficiency, biomass, biofuels, nuclear and carbon capture and storage need to contribute. Hydro and wind power are suited to be deployed for the long term. Energy storage technologies – e.g. pumped hydro and compressed air storage, batteries for transportation – are key to the management of intermittent renewable energy sources. These are either mature technologies or are making big strides, while geothermal power ("hot dry rock") still awaits the "proof-of-concept". Carbon capture and storage (CCS) is being developed and demonstrated at large scale. Today, wind and concentrated solar thermal power are close to being cost competitive in developed countries or in regions where other energy sources are in short supply.

Research is needed to define the extreme loadings for which engineered facilities should be designed, operated and maintained. Historical records, which have been the bases for engineering decisions, can no longer be considered to define the environments our facilities will face in the future.

## 2.2. Natural Disasters

Measures for prevention, reduction and mitigation should concentrate on preventing the occurrence of disasters or minimizing disaster impacts. In the case of man-made disasters, it is critical to eliminate the human cause through public safety measures, capacity building and training, and safety systems, to avoid recurrence of the disaster, or to minimize its impact without extension beyond the affected region.

For the reason that disasters are social phenomena, both structural and non-structural measures should be applied in an integrated manner, using a social, comprehensive, and multi-disciplinary approach. Specifically, early recovery in the affected areas and societies is essential and sound reconstruction is a must to prevent disaster recurrence.

From the aspects of project appraisal, most governments, international financial institutions and private sector entities use cost benefit analysis which, however, is inappropriate to take account factors of disaster risk management projects, especially because disaster risk management projects require prolonged terms. Private sector entities also bear social responsibilities toward prevention, reduction and mitigation of disasters. It is particularly recommended to develop other project appraisal methods than the conventional cost benefit analysis.

## 2.3. Knowledge and Technology Development

To develop science and technology which would support sustainable development objectives new paradigms and renewed efforts need to be taken to:

- Improve multi and trans-disciplinary collaboration and knowledge-sharing between the natural sciences, exact sciences, engineering and technology communities;
- Design new and redesign existing institutions, research and training programmes, and funding mechanisms to support multi and trans-disciplinary research in all fields of the natural, exact, engineering and social sciences;
- Close the gap of human resources for science, engineering and technology, with a focus on women and gender issues and the inclusion of the underprivileged, and disadvantaged minorities;
- Emphasize the modelling of complex systems, particularly in regional, national and local contexts, and the assessment of the social and environmental impacts of new technologies and research developments;
- Give high priority to multi and trans-disciplinary research, focusing on sustainable development issues such as clean energy and energy efficiency, sustainable food production, the structure of human settlements, and ecosystems and biodiversity.

Scientific and Technological Communities advice should be unbiased, independent, focused and based on scientific knowledge, engineering criteria and technological state-of-the-art. This advice is particularly relevant for risk management, early warning and monitoring systems for new and emerging challenges, natural disasters and extreme events.

The activity of the Professional Engineer within the STC Major Group is mainly built on providing governments, decision makers and civil society with the elements to understand what is feasible to achieve conditions for sustainable development, and this is been done on the basis of

- actual scientific knowledge and the limitations imposed by the laws of Nature,
- the technologies we currently possess, and
- the potential of success of technologies that are under development.

## 3. Institutional Framework

An umbrella organisation to lead on Sustainable Development should include organisations which have great influence over investments. UNEP has an environmental bias that will not allow it to strengthen the whole agenda of sustainable development.

The experience accumulated by the UN Department responsible for the Secretariat of CSD (Department of Economic and Social Affairs – DESA) constitutes a good source of manpower and expertise for the creation of an independent Agency to deal with Sustainable Development.

An adequate regional governance structure for science, engineering, technology and innovation could be established by:

- building partnerships with all major regional and global players;
- developing and implementing instruments for regional R&D co-operation;
- incorporating information systems to support decision-making, including repositories of science, engineering, technology and innovation policy information for social inclusion;

- facilitating the establishment of problem-oriented networks for targeted research activities towards sustainable development;
- contributing to the development of sustainable development indicators, including social, technical, engineering, exact and natural science dimensions.

A feasibility assessment should be conducted for establishing regional systems, based on existing institutions, to study the science-policy interface aiming at analysing successful and unsuccessful practices; identifying the relationship between science, engineering, technology, and innovation and development, and allowing policy to be more evidence-based.

## World Future Council

World Future Council contribution to Rio+20 Outcomes

Theme II, Institutional Framework for Sustainable Development  
Ombudspersons for Future Generations:

Tackling Sustainability Implementation Gaps  
October 2011

### Rationale

In 1992 world leaders and civil society met in Rio de Janeiro, concerned and keen to address how human development and environmental protection continues in a harmonious way. They acknowledged that planet Earth is not only a resource, but the home for a wealth of biodiversity, ecosystems and natural cycles, upon which our security and wellbeing depend. They saw that the policies we had in place risked destroying the means for providing healthy and fulfilling lives for future generations:

"We borrow environmental capital from future generations with no intention or prospect of repaying... We act as we do because we can get away with it: future generations do not vote; they have no political or financial power; they cannot challenge our decisions." World Commission Sustainable Development Report Our Common Future, 1987 A farsighted declaration with principles and recommendations for sustainable development and intergenerational equity was formulated for all countries of the world. Twenty years on and despite numerous international processes and agreements, unsustainable trends continue at an alarming rate and scale. The multiple crises in food, fuel, ecosystem destruction and economic instability are the visible symptoms, rapidly closing down the preconditions for fulfilling lives in the future, even for those economically wealthy today, let alone the marginalised and impoverished.

The future generations that the Brundtland Commission was concerned about are now 23 years old. The International Labour Organisation (ILO) speaks of them as a "lost generation" because of record numbers in youth unemployment (13% globally). Even in the most developed countries, child poverty has reached 30% (UK), and over 25% of children in the US lived off food stamps in 2010, double the percentage of adults. Most countries face rapidly increasing wealth inequality in their societies (the Gini coefficient in China has moved from 0.3 to 0.5). In some cases we have reached the highest inequality levels on record (US). In a world of 60 trillion USD of global GDP, around 1 billion people live in chronic hunger. Meanwhile, the planetary boundaries within which humanity can safely operate have been reached or overshoot – with a clear rising tendency.

### Analysis

Our existing institutional and governance structures have proved inadequate to meet our rising sustainable development challenges. Our core policy formulation, economic thinking and motivations remain consistently detached from our broader sustainability concerns. Monitoring and enforcement of agreed sustainable development strategies at all governance levels are weak and many central sectors and policies operate entirely without a broader sustainability overview. Since electoral cycles and business models of reporting increasingly define decision-making, short term gains take precedence over future and long term interests. Meanwhile, citizens and civil society appear disconnected from the core of policy-making. Without full representation of their needs, citizens are left without an adequate voice, or a legitimate means by which to question or present their concerns. We lack adequate mechanisms to facilitate accountability, access and monitoring of all sustainability policy decisions and their effective implementation.

Considerable evidence demonstrates that as long as sustainable development remains separated from core policy formulation and economic thinking, and as long as gaps in implementation are not secured, sustainability challenges will not be met.

"Relevant lessons for sustainable development include recommendations to build on existing institutions; promote collaboration, coherence, efficiency and effectiveness in partnerships; and ensure meaningful and equitable public access to international forums related to sustainable development by adapting and structuring their processes and mechanisms in a way that they promote transparency and facilitate the participation of those groups that might not have the means for participation without encouragement and support." Synthesis Report, UN Secretary General, 2011

"...governance accountability can be strengthened when stakeholders gain better access to information and decision-making, for example through special rights enshrined in agreements, charters and codes, and stronger participation in councils that govern resources, or in commissions that hear complaints. International environmental, developmental and economic institutions must adopt such novel accountability mechanisms more widely." The Earth System Governance Project Policy Brief, Sept 2011  
Proposal Recalling the two themes of the UN Conference on Sustainable Development: a Green Economy in the Context of Sustainable Development and Poverty Eradication and the Institutional Framework for Sustainable Development:

We call for the establishment of Ombudspersons for Future Generations at national and international levels as a concrete proposal for the conference, under the Institutional Framework for Sustainable

### Development (IFSD) theme.

This institution is designed to safeguard economic, environmental and social conditions for the benefit of current and future generations by undertaking their institutional representation in all areas of policymaking. The institution provides the necessary checks and balances to help overcome the structural short-term orientation of our democratic institutions and brings the sustainable development agenda to the heart of governments and policy-making. The Ombudsperson (which could take the shape of a

Parliamentary Commissioner, Guardian or Auditor depending how it fits best into each nation's governance structure) facilitates coherence between the separate pillars of government, to overcome single issue thinking, and holds government departments and private actors accountable if they do not deliver on sustainable development goals.

[UNDESA/DSD: Please download the original document to read the full submission]

## World Population Program, IIASA

Convinced by the need to integrate the three pillars of sustainable development (economic development, social development, and environmental protection), IIASA (with funding from the United Nations Population Fund) brought together more than twenty population and development experts to discuss how population factors promote or impede sustainable development. The experts, including Indian-born economist, Sir Partha DasGupta, Chinese demographer, Dr Peng Xizhe, and former Chief Scientific Adviser to UK Government, Sir David King, conclude with five broad actions that they recommend to the Rio+20, United Nations Conference on Sustainable Development.

Following are their conclusions and recommendations:

Demographic Challenges for Sustainable Development

The Laxenburg Declaration on Population and Sustainable Development

Statement of a Global Expert Panel (October 2011)

"Human beings are at the centre of concern for sustainable development. This was the view expressed in the 1992 Rio Declaration on Environment and Development, which we reaffirm. Therefore, consideration of the changing numbers, characteristics, and distributions of human beings on the planet must be at the core of any serious analysis of challenges and opportunities for sustainable development.

Any analysis of sustainable development must recognize the differences among people in terms of their impacts on the environment and their vulnerabilities to risk, which depend on their age, gender, location, and other socioeconomic characteristics. New evidence indicates that human capital, enhanced through education and health (including reproductive health), can make a substantial difference in people's contributions to sustainable development and their capacity to adapt to environmental change.

Only by accounting for and addressing demographic factors will it be possible to achieve sustainable development. Investments in human capital should be emphasized alongside other measures to promote sustainable development, a "green economy", and adaptation to environmental change.

The current demographic divide

Over the last half century, world population has more than doubled, from 3 billion in 1960 to 7 billion today. Because of the young age structure in low- and middle-income countries, continuing population growth in the coming decades is a virtual certainty, even in the unlikely event that birth rates fall precipitously in these countries. Consequently, the world's population will very likely be between 8 and 11 billion by 2050, depending primarily on the speed of future fertility decline. But this population growth will not occur evenly across the globe.

Indeed, traditional demographic groupings have broken down. While the population of sub-Saharan Africa is likely to increase by a factor of three to five over the course of this century, Eastern Europe is already on a declining trajectory. China, due to its very rapid recent fertility decline, is likely to reach a peak population in 10-20 years and then enter an era of population decline. Along with China and other developing countries with low fertility, the industrialized countries face the challenges of population aging and changing living arrangements, including the adjustments that need to be made to social security and health care systems. Meanwhile, life expectancies are on the rise in most countries, even those worst hit by HIV/AIDS. Mortality decline is a long-term trend that research indicates will likely continue, both in countries where people now live the longest and in those where life expectancy is much shorter. Levels of mobility, urbanization, and education also differ substantially among and within regions, adding significant dimensions to the demographic divide.

Nearly all of the world's population growth will occur in the cities and towns of today's poor countries, primarily because of rural-to-urban migration combined with high national population growth. Meanwhile, the populations of many low-fertility countries will be declining. The demographic divide between rapidly growing urban populations in poor countries and slow growth or decline in industrialized countries is historically unprecedented.

These demographic differences fundamentally affect people's contribution to environmental burdens, their ability to participate in sustainable development, and their adaptability to a changing environment. Different demographic challenges require differentiated responses. The developmental challenges are by far the most significant where population growth and poverty are the highest, education is the lowest, and vulnerabilities to environmental change are the greatest. Negative impacts on the environment tend to be the most significant where people's material consumption levels are at their highest.

Demographic factors in the transition to a green economy

Efforts to meet the legitimate needs and aspirations of rapidly growing populations in developing countries and to reduce poverty will entail higher consumption and production; if inappropriately managed, these efforts will further increase pressure on the natural environment. As well as increasing carbon emissions through fossil fuel combustion with current technologies, population growth also often contributes to depletion and degradation of essential life-support systems, including deforestation, depletion of aquatic resources, air pollution, loss of biodiversity, and degradation of agricultural lands. It is important to reduce such negative impacts on the environment and the global climate in order to derive multiple benefits for local as well as global sustainable development.

Fertility decline in high-fertility countries, by slowing population growth, makes many environmental problems easier to solve and development easier to achieve. Some of these benefits operate through the changing age structure that declining fertility induces. If the number of children relative to the working-age population is reduced, the demographic dependency ratio falls, creating an opportunity to increase investments in health, education, infrastructure, and environmental protection. It has been shown empirically that this demographic bonus, if properly utilized, can help propel countries out of poverty. Research in the last decade suggests that education increases people's life opportunities in general, greatly contributes to technological and social innovation, and creates the mental flexibility required for a rapid transition to a green economy. This applies to both low- and high-income countries. Hence, the enhancement of human capital from early childhood to old age through formal and informal education and life-long learning is now known to be a decisive policy priority.

The majority of the world's population now lives in urban areas, and urbanization is certain to continue. As recent research has affirmed, urbanization often improves people's economic productivity and their access to education, health, and other services. However, urban population growth also presents challenges for urban planning and good governance: challenges that are especially acute in environmentally fragile locations. For the African and Asian countries where urban growth is most rapid,

reducing vulnerability will require the urban transition to be achieved without the creation of undue environmental hazards or social inequality.

Investing in the tide of global youth

A striking demographic challenge is the rapidly increasing tide of young people entering the labor markets of developing countries with high aspirations but limited opportunities to find productive employment. Globally, there are 1.2 billion young men and women aged 15–24, the typical age for entering the labor market. And there are many more young people to come. In sub-Saharan Africa alone, the population aged 15–24 will likely increase from its current level of 170 million to 360 million by mid-century. With youth unemployment rates already high, assuring proper education and creating jobs for those hundreds of millions of young people are top priorities.

If not given the chance for a decent life, these masses of young people without much hope for the future can pose a serious threat to social and political stability. But if they are provided with education and appropriate jobs, the young possess enormous potential for innovation, including the ability to adopt new technologies that accelerate economic progress and speed up the transition to a green economy. With a long life ahead of them, young people are likely to have genuine interest in sustainability because they themselves would experience the repercussions of unsustainable trends.

Ages 15–24 are when people marry and begin to have children. Increasing education and employment will have a predictably major impact on fertility decline through postponed marriage and childbearing, thereby reducing future population growth in the developing world. Hence, ensuring appropriate investment in young people—which must begin in early childhood when the seeds of future development are planted—must be an essential component of broader policy packages to promote global sustainable development.

Differential vulnerability of people must shape appropriate policy

Environmental degradation and climate change do not affect all countries and all geographic regions in the same way. Vulnerability also varies significantly among people living in the same region, according to their socioeconomic circumstances. Even within a household, effects can differ importantly according to age and gender. Policies to reduce vulnerability must therefore focus on the most vulnerable segments of the population within countries and regions. Region-specific or even urban/rural-specific policies alone no longer suffice. Ignoring the more particular demographic dimensions of vulnerability will misdirect the focus of policy and dilute its impacts.

The spatial distribution of populations among regions, between village and city, and across cities is a significant dimension of sustainable development. Migration within and between countries has always been an integral part of the human response to changing economic, social, and environmental conditions. This pattern is likely to continue, not only due to increased economic opportunities facilitated by improved information and transport systems and globalization of production and labor markets, but also exacerbated by population displacement and relocation due to environmental degradation and civil conflict.

The principal demographic factors that increase vulnerability are poverty, poor health, low levels of education, gender inequality, declining family support for the elderly, and unfavorable geographic location. Populations with these characteristics also often lack a political voice, putting them at even greater risk. Within these populations, women and children are usually the poorest and least empowered. Vulnerability is reduced and adaptive capacity enhanced where there is investment in poor people's human capital, particularly their education, and most particularly the education of girls and women, whose importance in these adoptive and adaptive processes is now known to be especially great. Policies that do not include features focused on these people will likely not succeed.

Five action implications for sustainable development

- 1) Recognize that the numbers, characteristics, and behaviors of people are at the heart of sustainable development challenges and of their solutions.
- 2) Identify subpopulations that contribute most to environmental degradation and those that are most vulnerable to its consequences. In poor countries especially, these subpopulations are readily identifiable according to age, gender, level of education, place of residence, and standard of living.
- 3) Devise sustainable development policies to treat these subpopulations differently and appropriately, according to their demographic and behavioral characteristics.
- 4) Facilitate the inevitable trend of increasing urbanization in ways that ensure that environmental hazards and vulnerabilities are under control.
- 5) Invest in human capital—people's education and health, including reproductive health—to slow population growth, accelerate the transition to green technologies, and improve people's adaptive capacity to environmental change.

This expert panel convened at the International Institute for Applied Systems Analysis (IIASA) in Vienna on September 30–October 1, 2011. Panel members, all of whom attest to this statement, are:

Wolfgang Lutz and William Butz (Coordinators), World Population Program (IIASA) and Wittgenstein Centre for Demography and Global Human Capital Marcia Castro, Department of Global Health and Population, Harvard School of Public Health

## World Resources Forum

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The Davos World Resources Forum calls on governments, businesses and civil society to take immediate action to double the current level of resource productivity by 2020 and reach at least a fivefold increase by 2050. This recommendation is not only directed towards governments, business and civil society, but also serves as a commitment to ourselves in our capacity as individuals and the most valuable resources of the planet.

---

#### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

There is an urgent need to take effective steps towards achieving a resource-efficient, climate-resilient Green Economy. A true sense of urgency that is magnified by numerous crises (financial, food, climate change) should be translated into concrete actions. Economies are locked in unsustainable consumption and production behaviour. Radical change in developed countries as well as leapfrogging in developing countries is needed. For developing countries, resource efficiency is essential for the eradication of poverty.

For developing countries, technology transfer, access to resource-efficient technologies and financial support for making the transition is necessary, as well as effective governance, resource-efficient infrastructure and education. Higher prices of resources provide an opportunity for commodity-exporting developing countries to address those critical challenges. Using these resources in an unsustainable way could pose risks to social stability and environmental sustainability. In addition, security, social and economic challenges relating to natural resources in fragile states were identified as an emerging issue. Unfair international trade rules need to be firmly addressed.

---

#### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

Data and indicators should be improved, since one cannot manage what one cannot measure. Overconsumption of the rich needs to be addressed and basic needs of the poor satisfied. Concrete roadmaps should be established, with clear plans for implementing financial and legal instruments. Individuals, particularly the poor and vulnerable, need to be empowered to take action.

Youth need to be equally involved in the discussions about the future of our natural resources. Intergenerational dialogue such as that which took place at this World Resources Forum (WRF) should be encouraged. Youth, and in particular young women in developing countries, should be empowered to be part of the solution.

---

#### **d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

An ethical framework for consumption (addressing both environmental and social impacts) should be part of a new global plan on resource efficiency. It has to be recognised that not everything that can be counted counts and not everything that counts can be counted. Values, emotions, mind-sets, and underlying driving forces for consumption, such as status, need to be taken into account as well.

### Specific Elements

#### **a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

Housing, sanitation, mobility and food are key sectors. Critical metals require urgent attention due to their potential for essential sustainable technologies and products. International governance structures for resource efficiency, including for minerals and metals, need to be strengthened.

---

#### **b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

New paradigms and ways of thinking are needed, since one cannot solve the problems with the same kind of thinking one used when creating such problems, and 'business as usual' is not an option. Improvements of resource efficiency by a factor 2, 5, 10 or even 50 are possible. More research to underpin these targets is needed, but at the same time, immediate action to move towards these goals is urgent.

Circular economy approaches require not only technical but also institutional changes and social innovation. Eco-design and upgrading products and production processes and product service systems will boost a transition to a green economy and strengthen the competitiveness of industries concerned.

The Green Economy can only be accomplished through the measurement of performance and transparency as well as through partnerships between governments and businesses, and businesses and civil society. Governments also need to create a framework for innovation.

---

#### **c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

---

#### **d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will**

**include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

1. More than 400 participants from over 40 countries and international organisations attended the World Resources Forum 2011 in Davos, Switzerland, from 19-21 September 2011, and exchanged their views and perspectives on best practices, policy options and research on natural resource management and promoting and implementing a Green Economy.
2. They called upon the hosting Government of Switzerland and others to inform the Rio +20 process of the outcomes of the Forum and agreed to review the progress of implementation at the next WRF to be held in China, 14-17 October, 2012, hosted by the Government of China.
3. They agreed on the following key recommendations and identified next steps for all stakeholders. The vision of Davos
4. There is an urgent need to take effective steps towards achieving a resource-efficient, climate-resilient Green Economy. A true sense of urgency that is magnified by numerous crises (financial, food, climate change) should be translated into concrete actions.
5. Economies are locked in unsustainable consumption and production behaviour. Radical change in developed countries as well as leapfrogging in developing countries is needed. For developing countries, resource efficiency is essential for the eradication of poverty.
6. For developing countries, technology transfer, access to resource-efficient technologies and financial support for making the transition is necessary, as well as effective governance, resource-efficient infrastructure and education. Higher prices of resources provide an opportunity for commodity-exporting developing countries to address those critical challenges. Using these resources in an unsustainable way could pose risks to social stability and environmental sustainability. In addition, security, social and economic challenges relating to natural resources in fragile states were identified as an emerging issue. Unfair international trade rules need to be firmly addressed.
7. Data and indicators should be improved, since one cannot manage what one cannot measure. Overconsumption of the rich needs to be addressed and basic needs of the poor satisfied. Concrete roadmaps should be established, with clear plans for implementing financial and legal instruments. Individuals, particularly the poor and vulnerable, need to be empowered to take action. An ethical framework for consumption (addressing both environmental and social impacts) should be part of a new global plan on resource efficiency.
8. Housing, sanitation, mobility and food are key sectors. Critical metals require urgent attention due to their potential for essential sustainable technologies and products. International governance structures for resource efficiency, including for minerals and metals, need to be strengthened. Establishing a green resource-efficient circular economy
9. Resource productivity is expected to become a key driver for economic development in the next decades. Key instruments for developing resource-efficient economies include establishing clear indicators and goals, as well as taxing resources and pollution instead of taxing labour. Ecological, water and carbon footprints are emerging concepts that can also encourage transparency towards the consumer.
10. New paradigms and ways of thinking are needed, since one cannot solve the problems with the same kind of thinking one used when creating such problems, and 'business as usual' is not an option. Improvements of resource efficiency by a factor 2, 5, 10 or even 50 are possible. More research to underpin these targets is needed, but at the same time, immediate action to move towards these goals is urgent.
11. Circular economy approaches require not only technical but also institutional changes and social innovation. Eco-design and upgrading products and production processes and product service systems will boost a transition to a green economy and strengthen the competitiveness of industries concerned.
12. The Green Economy can only be accomplished through the measurement of performance and transparency as well as through partnerships between governments and businesses, and businesses and civil society. Governments also need to create a framework for innovation.
13. At the same time, it has to be recognised that not everything that can be counted counts and not everything that counts can be counted. Values, emotions, mind-sets, and underlying driving forces for consumption, such as status, need to be taken into account as well.
14. Youths need to be equally involved in the discussions about the future of our natural resources. Intergenerational dialogue such as that which took place at this WRF should be encouraged. Youths, and in particular young women in developing countries, should be empowered to be part of the solution.
15. It was felt that although change is underway, the implementation of activities should be accelerated with the greatest sense of urgency, and increasing demand for change should be transformed into action.
16. Considering all of the above, the Davos World Resources Forum calls on governments, businesses and

## World Rural Forum

PROPUESTA DEL FRM AL DOCUMENTO DE COMPILACIÓN RIO+20

### Introducción

La Conferencia Rio +20 busca renovar el compromiso de los líderes mundiales en favor del Desarrollo Sostenible. Los contenidos de la conferencia van a pivotar en torno a dos temas, la economía verde en el contexto del desarrollo sostenible y la erradicación de la pobreza, y el marco institucional para el desarrollo sostenible.

La organización para el desarrollo Foro Rural Mundial (FRM), cuyo campo de actuación es el desarrollo rural solidario basado en la defensa y promoción de la Agricultura Familiar-AF- lanzó en el año 2008 una campaña internacional que tenía como objetivo solicitar a la ONU la Declaración de un Año Internacional de la Agricultura Familiar. Una campaña que fue cobrando legitimidad en forma de más de 365 adhesiones formales de organizaciones agrarias, sociedad civil y gobiernos de más de 60 países de todo el mundo

A fecha de hoy, 31 de octubre de 2011, estamos ante la inminente Declaración, por parte de la Asamblea General de Naciones Unidas, del año 2014 como Año Internacional

de la Agricultura Familiar.

En este sentido, el FRM considera que la Cumbre Rio+20 puede suponer una gran oportunidad para lograr el máximo reconocimiento de la AF en el marco legislativo y político mundial en los próximos años.

1.- La Agricultura en la Cumbre de Johannesburgo. "La agricultura desempeña un papel fundamental para garantizar las necesidades de una población mundial creciente y está de forma inextricable ligada a la erradicación de la pobreza, especialmente en los países en desarrollo. Es crucial realzar el papel de la mujer a todos los niveles y en todos los aspectos del Desarrollo Rural. La agricultura sostenible y el desarrollo rural son esenciales para la implementación de una aproximación integrada orientada a aumentar la producción de alimentos y mejorar la seguridad y sanidad alimentaria de forma medioambientalmente sostenible." Este es el punto número 40 recogido en la Declaración de la Cumbre de Johannesburgo.

En este sentido y de cara a identificar pautas, la FAO desarrolla un programa llamado GEA (Greening Economy with Agriculture), en español: Reverdecer la economía con la agricultura. <http://www.fao.org/rio20/fao-rio-20/gea/es/>

La FAO afirma que no puede existir una economía verde sin agricultura, en tanto que la agricultura utiliza el 60 % de los ecosistemas mundiales y proporciona medios de subsistencia al 40 % de la población mundial actual.

2.- Economía Verde y Agricultura Familiar La Agricultura como sector productivo es importante para la Economía Verde y la Economía Verde lo es a la Agricultura de la misma manera.

Esta relación es tanto más clara si nos centramos en el modelo de Agricultura Familiar-AF- que el Foro Rural Mundial defiende y promueve junto con 365 organizaciones agrarias y de desarrollo de más de 60 países en 5 continentes.

Cuando se habla de Economía Verde se hace con la convicción de que ésta representa una forma adecuada para abordar los grandes retos actuales, como son la erradicación de la pobreza, la degradación medioambiental, así como el desarrollo económico y la generación de empleo. En todos estos aspectos existe una fuerte vinculación con la Agricultura Familiar.

La Agricultura Familiar es un modelo productivo basado en el vínculo que existe entre una familia y la parcela de tierra, a menudo pequeña o mediana, que trabaja para obtener su renta principal, de forma sostenible y respetuosa con el medioambiente. Cuando se habla de AF se asumen conceptos como autosuficiencia y "auto-resiliencia", que hacen clara alusión a su capacidad para adaptarse con eficacia a los cambios medioambientales y económicos.

La Agricultura Familiar representa un sector de valor estratégico debido a su función económica, social y ambiental que son los tres componentes del desarrollo sostenible.

En la actualidad hay 1.500 millones de hombres y mujeres agricultores trabajando en 404 millones explotaciones de pequeño tamaño de menos de 2 hectáreas (IAASTD 2009), 410 millones recolectando las cosechas ocultas de los bosques y sabanas (ETC 2009), entre 100 y 200 millones son pastores (Convention on Biological Diversity 2010), 100 millones son pescadores artesanales (Kura et al. 2004); y 370 millones pertenecen a comunidades indígenas (IFAD 2009) de los que la gran mayoría están vinculados a la agricultura. Además, 800 millones de personas cultivan huertos urbanos (World Watch Institute 2007). Estos datos dejan patentes la importancia y la presencia de la AF en el mundo.

Los hombres y mujeres dedicados a la agricultura familiar producen el 70% de los alimentos del mundo. La Agricultura Familiar es la base de la producción sostenible de alimentos con el objetivo final de alcanzar la seguridad y la soberanía alimentarias, de la gestión sostenible de la tierra y de su biodiversidad, así como de la preservación de la importante herencia sociocultural de las comunidades rurales y de las naciones.

Atendiendo a los tres pilares del Desarrollo Sostenible, la AF es clave para: Atendiendo a la descripción de estas dos prácticas económico-productivas podemos concluir en que efectivamente hay una conexión entre AF y EV, la producción sostenible de alimentos y erradicación e la pobreza.

El FRM considera que la AF encaja perfectamente en un marco que favorezca la Economía Verde en tanto que nos enfrentamos a:

- Una población mundial en constante aumento y con cambios importantes en sus pautas alimenticias
- La creciente escasez de recursos naturales (tierra y agua), reducción de biodiversidad, de fertilidad, etc.
- Las consecuencias del Cambio Climático. La AF ha de adaptarse al CC y también representa una vía para mitigar las consecuencias del mismo.

Para afrontar de forma exitosa este futuro inmediato se precisa una mejora importante tanto en la mayor eficiencia en el uso de los recursos como en los niveles de productividad. El FRM cree firmemente que la AF es una herramienta clave a desarrollar en esta línea. Al igual que no hay recetas únicas para la Agricultura Familiar tampoco las hay para promover la economía verde. Por ello es crucial el diagnóstico y el diseño de políticas y planes a nivel nacional, atendiendo a las especificidades propias. No todos los países y regiones están en el mismo punto de desarrollo de sus modelos de AF y tampoco en capacidad de desarrollar su economía verde al mismo nivel. Esta Conferencia de Rio+20 puede sentar las bases de un compromiso global y nacional de apoyo claro a la Agricultura Familiar en el marco de actuación de la Economía Verde.

### 3.- Demandas del Foro Rural Mundial- FRM a Rio +20

El documento final de Rio+20 ha de recoger la importancia de la Agricultura Familiar, en clave de Economía Verde, como la alternativa más viable para erradicar el hambre y la pobreza en el mundo de forma sostenible.

En este sentido este documento del FRM, recoge algunas de las demandas que, en defensa y promoción de la AF, se propusieron en la Conferencia Mundial de Agricultura Familiar, celebrada en Bilbao (España) entre los días 5 y 7 de octubre 2011. (\*Declaración Final adjunta).

Dicha Conferencia ha representado un hito muy importante en el del marco de la Campaña Mundial en favor de la declaración, en 2011, por la 66 Asamblea General de Naciones Unidas de 2014 como Año Internacional de la Agricultura Familiar-AIAF. Este acontecimiento puede representar una etapa muy importante para promover, de forma concertada, los objetivos de Rio + 20 en cuanto a la Agricultura Verde.

Llamada a los gobiernos para promover y defender la Agricultura Familiar.

1) Garantizar el acceso y el control de los agricultores familiares sobre los recursos naturales, principalmente tierra, agua, bosques y semillas. Garantizar el derecho a la tierra de las mujeres y hombres agricultores familiares, pastores, y pueblos indígenas, el derecho a los recursos pesqueros de las comunidades pesqueras artesanales, y el derecho a empleos dignos y salarios justos para los trabajadores agrícolas. Los bosques, las tierras y las semillas no son mercancías, son espacios de vida y componentes clave para la vida. Continuar con las reformas agrarias y proteger a los agricultores familiares contra el acaparamiento de tierras. Asegurar el reconocimiento legal de los derechos de propiedad de la comunidad. Fortalecer los procesos de registro de la propiedad de la tierra con la activa participación de las organizaciones de agricultores

familiares.

2) Promover enfoques agroecológicos sostenibles por y con los agricultores familiares. Invertir junto con los agricultores familiares en sistemas, tecnologías y prácticas de modelos de agricultura sostenibles, agro-ecológicos, respetuosos con el medio ambiente, que aseguren la gestión adecuada de los recursos naturales (tierra, suelo, bosques, agua), la sostenibilidad del medio ambiente y la biodiversidad, la resiliencia climática, un amplio uso de los recursos locales y de la sabiduría local, y el control de los agricultores sobre sus propias semillas. 3

3) Garantizar el acceso y mayor poder de mercado de los agricultores familiares Proveer un ambiente apropiado para que los agricultores familiares puedan producir y comercializar productos de forma conjunta a lo largo de todas las líneas de productos básicos y apoyar la creación de valor añadido en sus explotaciones. Invertir en el fortalecimiento de las capacidades de los agricultores familiares y sus organizaciones para mejorar su interacción con los mercados locales, nacionales y regionales. Apoyar la generación de valor añadido de los productos procedentes de la agricultura familiar con el fin de crear empleo y mejorar los ingresos. A nivel macroeconómico, realizar un análisis crítico de la OMC (Ronda Doha) y los Tratados de Libre Comercio, mientras se impulsa la reforma y la integración de los mercados regionales que protegen a los agricultores familiares contra los efectos de la volatilidad de los precios. Garantizar que los productos agrícolas y alimenticios no son objeto de especulación.

4) Promover el empoderamiento de la mujer y la equidad de género. Reconocer a las mujeres como conductoras y agentes de cambio de la agricultura. Incorporar el género en los aspectos clave de las investigaciones agrícolas participativas, en el diseño de políticas, en su ejecución, en el seguimiento y las evaluaciones. Eliminar la discriminación de género en las legislaciones nacionales (especialmente en cuanto a la tenencia de tierras y el ganado, acceso a los recursos y derechos contractuales) y asegurar que las leyes específicas se ponen en práctica. Facilitar la participación de las mujeres en todas las iniciativas de toma de decisiones a través de las cuotas obligatorias, al menos el 40%, capacitación en liderazgo, intercambio de información y visibilidad. Proporcionar fondos para créditos sensibles al género, sistemas de ahorro, servicios de transporte y de salud que apoyen a las mujeres agricultoras. Aumentar el número de mujeres agentes de extensión y formar a los hombres agentes de extensión para ser más sensibles a temas de género. Inversiones dirigidas a mejorar el conocimiento, la formación y la innovación con respecto a la producción sostenible y la conservación

5) Fortalecer las organizaciones de mujeres y hombres agricultores familiares. Reconocer a las organizaciones de agricultores como socios principales en la toma de decisiones y en la prestación de servicios agrarios mediante la creación de espacios institucionalizados de participación, incentivos para que las y los agricultores puedan administrar sus asociaciones y cooperativas de manera independiente y creíble, ya sea según criterios geográficos y de líneas de productos,, mediante la concesión de subvenciones, donaciones , préstamos o proyectos de cooperación a través de sus organizaciones.

6) Promover la agricultura entre los jóvenes. Desarrollar políticas y ofrecer programas que hagan de la agricultura un reto, una carrera/vocación significativa, más atractiva, rentable y de confianza para la juventud, a través de la aplicación de tecnologías modernas y adecuadas para generar valor añadido y basadas en las TICs, inspirándoles a nuevas innovaciones en la agricultura. Todo esto teniendo en cuenta la juventud urbana, que también tienen que encontrar ese significado para establecer el vínculo necesario entre la agricultura rural y peri-urbanas.

4.- Conclusión Los años venideros van a estar caracterizados por fuertes oscilaciones en el precio de las materias primas y de la energía, por una población mundial en importante aumento (se estima que para el año 2030 el 60% de la población mundial viva en áreas urbanas), y unos recursos naturales productivos (tierra y agua sobre todo) fuertemente mermados.

Como hemos tratado de reflejar en párrafos anteriores, la Economía Verde que promueven los gobiernos precisa de la AF como expresión de la Agricultura Verde, en tanto que ésta es pilar fundamental en la economía local de muchas regiones, implicando a más de 1500 millones de personas en el mundo. Asimismo es la piedra angular sobre la que se asienta la Seguridad Alimentaria de un porcentaje muy elevado de la población mundial, al producir el 70% de los alimentos. Y por último podemos mencionar con igual relieve la larga lista de bienes y servicios públicos que su actividad proporciona a la sociedad en general.

En este contexto nuestro compromiso y el de los gobiernos de todo el mundo es el de garantizar el suministro de alimentos sanos y suficientes obtenidos sin menoscabar la sostenibilidad del planeta. Desde el FRM, en representación de las 365 organizaciones adheridas a la Campaña en favor del AIAF, hacemos un llamamiento para que durante la Conferencia de Rio+20 la Agricultura Familiar ocupe una parte importante de las discusiones políticas, valorando la conveniencia de potenciar el Año Internacional de la Agricultura Familiar 2014, como una gran oportunidad de hacer avanzar de forma operativa la Agricultura Verde en tanto que componente esencial de la Economía Verde.

[Final Declaration](#)

## World Society for the Protection of Animals (WSPA)

Submission from the World Society for the Protection of Animals International to the compilation document in preparation of the Rio+20 zero draft

### 1. General – about WSPA International

The World Society for the Protection of Animals (WSPA) is an international organisation which has been working to promote animal welfare for more than 25 years. Working on the ground with communities, owners and local partners, WSPA is active in over 50 countries. It has consultative status at the Council of Europe and the United Nations and collaborates with national governments, the Food and Agriculture Organization and the World Organisation for Animal Health. WSPA is also the world leader in animal-focused disaster response and risk reduction working with partner organisations, governments, humanitarian groups and international agencies. With 30 years of experience, we are often the only animal organisation able to access disaster-struck regions.i

### 2. What are the expectations for the outcome of Rio+20, including views on the Outcome document?

Rio+20 outcomes must recognise the role and impact of animal agriculture and result in specific and ambitious commitments on livestock systems and humane and sustainable agriculture. Specific commitments need to be made at Rio+20 on global agriculture systems and food supply to achieve global food security without jeopardizing ecosystems and compromising human and animal health and welfare. Food and agriculture are key sectoral priorities but need to be at the heart of all relevant UN policy and work programmes post Rio+20 given their importance and the rapid changes taking place in the food system.ii We support proposals for a detailed framework for action with targets, financing and we propose the following elements which should be incorporated. We also submit proposals on the Green Economy, Emerging issues and Institutional Framework.

### 3. Actions to be implemented and concrete proposals

WSPA makes five recommendations and asks that these be included in the outcome document: Recognize the positive role livestock and animal welfare can have in achieving sustainable agriculture and incorporate specific and regionally-sensitive policies and measures which ensure that global food production is both humane and sustainable.

Promote and support - through investment in research and development - humane, integrated livestock farming systems to ensure farmers' livelihoods and the climate resiliency of rural communities; Phase out subsidies and public investment for unsustainable, intensive farming systems while providing support for farmers rearing livestock humanely and sustainably;

Recognize the importance of livestock in economic development and the role farm animals play in helping to lift people out of poverty and build sustainable livelihoods in developing countries. Recognise and address the challenge of unsustainable demand for farm animal products Concrete proposals - more detailed measures in a Framework for Action could include: shifting subsidies away from industrial systems toward more humane, sustainable systems of animal agriculture that protect animal welfare and the environment;

fiscal measures which internalize environmental and social costs; publicly funded research into breeds and production systems that deliver better animal welfare and environmental and economic outcomes;

farmer advice, education and assistance, and promotion of good agricultural practice, especially for small farmers; technology transfer and development aid based on higher welfare systems, including through the promotion and sharing of best agricultural practices;

encouragement of sustainable and humane diets through education and measures which affect behaviour change including labelling and marketing schemes to promote welfare friendly food; strengthen legislation, e.g. environmental and animal welfare legislation and effective monitoring and enforcement of existing welfare legislation;

promotion and implementation of investment policies that support good animal welfare; ensure that businesses adopt and implement social responsibility policies across the board, based on ISO26000 (which includes respect for animal welfare) public procurement (e.g. for schools, hospitals) where applicable to source humane and sustainable meat and dairy meals.

#### 4. The green economy theme- why farming & livestock are key

Livestock are central to the Green Economy – global and regional recognition and action is required both to support humane and sustainable animal agriculture which protects livelihoods and the environment and to end unsustainable forms of production and consumption There is huge potential but currently limited understanding of the opportunities presented by humane sustainable farming systems, or the impact of animal agriculture on the Green Economy - from backyard systems to large scale industrial production.

Whilst it is often poorly recognised, the livestock sector employs around 1.3 billion people and about a billion of the world's poorest people depend on animals for food, income, transport, social status, and security. Livestock products also form a significant part of the global diet.

Rates of livestock production and consumption are increasing rapidly and currently this growth is based mainly on industrial systems. This transformation can reduce smaller scale producer viability as well as put an unacceptable strain on natural resources. Traditional mixed family farms are often squeezed out as formal markets, based on industrialised systems, gain hold. Evidence suggests that as the industrial livestock sector develops, small-scale producers are squeezed out.

A recent report comparing pasture and intensive dairy systems in the UK illustrates that, in some cases, the economic viability of higher welfare systems can be superior to industrial systems. v Yet too often governments support large scale industrial farming, assuming misguidedly that it is always better for jobs and local economies. Implementing humane and sustainable livestock farming practices will provide the opportunity to ensure that jobs and livelihoods as well as nutrition, especially in developing countries and rural areas, are safeguarded and improved. This means Rio+20 outcomes should commit to:

ensuring that all food production that involves livestock is ultimately based on high welfare, sustainable systems globally; guarantee that farmers have sufficient reward (in the market place or via public support) for producing high welfare and sustainable livestock produce;

engaging consumers in the processes of change, in terms of what and how much they buy and consume. The ongoing discussions on sustainable consumption and production must focus on ensuring we can meet the challenges of changing global consumption patterns and that food and feed distribution is more equitable. Better animal welfare in farm systems can support sustainable food production: Higher welfare animal production systems often require fewer inputs of grain feed, fuel and water. Pasture based systems can utilise land otherwise unfit for production.

They also keep animals at stocking densities that reduce the risk of major pollution and disease spread, and use breeds often more robust and resilient to environmental challenges than breeds chosen primarily for high yield. Other benefits compared to industrial systems include better nutrient cycling, enhancing product quality and therefore profits and consequent enhanced food security and resilience against shocks.vi Pasture and mixed farm systems can have multiple benefits – such as enhanced biodiversity and landscape, nutrient cycling, and carbon sequestration in well maintained grazing systems.

#### 5. Emerging issues

##### a. Improving food security and public health

The industrial production of livestock, which is heavily reliant on imported grain and protein, combined with unsustainable levels of consumption of animal proteins in industrialised countries are important drivers of global food insecurity and ill health. Rio+20 must ensure investment in more humane and sustainable farming systems - which can secure livelihood and nutrition needs in developing countries whilst reducing the global demands for grain and proteins in industrial animal farming in developed countries.

Hunger is not a result of lack of food availability but rather the inequitable distribution of food – there are as many people suffering from obesity as malnutrition. Despite producing enough food today to feed the global population, we still have nearly 1 billion people hungry. Billions of tonnes of food are also wasted each year in supply chains and by consumers. Public health problems associated with livestock production include food borne disease, and overconsumption of unhealthy levels of animal products. In addition, the routine use of antibiotics in industrial animal production facilitates the rapid proliferation of antibiotic-resistant strains of bacteria. Humane farming methods can be commercially viable, environmentally resilient and can feed the world. Taking environmental and socio-economic factors into account, innovative, moderate-scale, agro-ecologicalvii and humane farming is far more productive than highly industrialised farming and can achieve more diverse outputs of crops and meat from the same amount of land.

Ensuring developing country farmers can achieve good levels of production using these methods will require international investment, support and collaboration.

Feeding a growing world population will also mean achieving changes in consumption patterns – with less but higher standard meat and dairy in western diets – as well as tackling waste.

##### b. Climate change mitigation and adaption

Global livestock production has major climate impacts. But further intensification and industrialisation – which will create greater environmental harm and exacerbate animal welfare problems - is not the solution. Rio+20 outcomes need to recognise that humane, sustainable farming systems can enhance climate mitigation and farmer resilience against climate related pressure and shocks. Farmers also need support in adapting to new climatic conditions. Livestock production is well recognised as a major contributor to greenhouse gas emissions.<sup>x</sup> While some analyses of the climate impact of farm systems have led to propositions that further intensifying animal agriculture is a solution, these assessments often fail to account fully for emissions such as those from land use change associated with imported feed, and the potential for carbon capture (sequestration) in permanent pasture, extensive systems. Such analyses also often ignore the most disturbing waste in industrial scale animal production systems, for example where offspring considered unsuitable for production are born simply to be killed at birth, as in egg laying chickens or some dairy systems.

It is not justifiable to push for ever further intensification of dairy, pigs and poultry to tackle greenhouse gas emissions (GHG) emissions, as these highly industrialised systems are often already disastrous for animal welfare. Expanding large scale industrial production would exacerbate this trend while fuelling increases in production, in demand and an overall increase in sector impacts on greenhouse gas emissions. Left unchecked, by 2050, animal production is predicted to account for 70% of the sustainable level of all global GHG emissions.

Measures to mitigate climate emissions in livestock could include technical and management options, such as alternative feeds and breeds. These must be based on high animal welfare standards and must be accompanied by the integration of livestock into broader environmental services and addressing sustainability in consumption. Impact assessment should include animal welfare, land use, pollution, public health, rural economies and poverty effects. Careful attention to and support for adaption by livestock producers, with adequate financing, will be vital. <sup>xiii</sup> Climate change will have far-reaching consequences for dairy and meat production especially in vulnerable parts of the world. The impact of climate change can heighten the vulnerability of livestock systems and reinforce existing factors that are affecting production systems such as drought.

Breeds suited to the environment locally and which fit into a more humane production system often can be more robust and resilient than industrially produced breeds.

There is a strong connection between climate adaptation and disaster management for livestock, such as seen recently in the current crisis in the Horn of Africa where livestock have such a central role in lives and livelihoods. WSPA is involved in disaster management programmes around the world and animals must be included as part of disaster preparedness.

#### c. Tackling biodiversity damage

Producing feed for livestock is one of the largest drivers of global biodiversity and natural systems damage. Rio outcomes need to promote integrated crop and livestock systems which ensure animal welfare, reduce the need for high levels of cereal and protein feeds and which are based on agro-ecological methods. Grazing and feed crop production for livestock is the largest human use of land. Industrial animal agriculture production relies on imported grain and protein production, much more so than robust extensive higher welfare farming. Conversion of biodiverse-rich ecosystems such as rainforest and savannah to produce feed for industrial pig and poultry farming is not sustainable. Many low input, extensive systems, while having land requirements, need few or no feed imports and are often located in areas unsuitable for production of food crops e.g. uplands. There are sectors where higher welfare systems do need feed as well as land (such as free-range poultry), and this brings the issue of consumption levels to the fore which needs to be addressed. Land use and land use change is one of the greatest causes of biodiversity loss – yet such biodiversity is necessary for balance of the world's ecosystems and for diverse human benefits.

#### 6. Institutional frameworks for Sustainable Development

Rio+20 needs to result in a strong commitment to policies and financial mechanisms which incorporate specific and regionally-sensitive measures to achieve sustainable animal agriculture that respects animals, people, and the planet. The process must be inclusive and respect the needs of those with no voice, including sentient animals.<sup>xv</sup> A detailed framework for action is needed with short term goals (by 2014) on promoting best practice, challenging the trend for more industrialised production and setting research, development and investment programmes in place which prioritises humane, sustainable animal agriculture that respects animals, people, and the planet. In the medium and longer term, policies at national and international level to tackle production, supply chains and consumption will be required.

A new approach to implementing this framework is needed which involves stakeholders in farming, sustainability initiatives and animal welfare experts. Involvement of major finance, global farming and food corporations is insufficient to ensure good programme or policy design. Such players will be needed and can be valuable to pursue good practice on a large scale but a far wider range of voices are needed to design effective humane sustainable solutions for sustainable development.

Contact Basia Romanowicz [BasiaRomanowicz@wsa-international.org](mailto:BasiaRomanowicz@wsa-international.org)

## World Team Now

World Team Now would like to have an extension to contribute the ideas and hopefully allow more time for public comment. We are committed to gaining global policy for renewable energy and that is enforceable and continues on the frame of the Kyoto Protocol.

Here are some other initial thoughts but we request more to time to address:

The 1992 Rio Summit was fundamental in making the linkages between social issues, Environmental protection and economic prosperity. We are concerned with how humanity lives in better balance with our resources. We call for a binding agreement to inspire national government's energy policy.

-The UN should be more vigorous in delivering water purification technology to those populations that lack safe drinking water. Consider that solar water purification technology has made great advances in recent years.

-The UN should broker agreements with the major oil producing and mining companies to deal equably with those Nations where oil drilling and mining for gold and other precious metals is anticipated. In addition, they should employ sustainable technology and practices that do not leave polluted water and wastelands behind.

\_The UN could play a stronger role in dispelling the objection that addressing climate change is a drag on economies by sponsoring on the ground programs to demonstrate otherwise -- both in poor and rich settings.

For instance, how about sponsoring EV charging infrastructure on the Pan American Highway to provide EV charging from Alaska to Ushuaia, Argentina, and other

Next year, June 4th hopefully we all will be back in Rio+20 for the United Nations<sup>i</sup> Earth Summit 2012 to continue what was started many years ago . What is a „life call“ for transformation within many of us being stewards of our earth may finally become important enough to motivate our world leaders to agree on strong global policy that supports our collective environment, for humanity, and our future.

It was a life changing significant journey for many of us who attended The Earth Summit/Global Forum in Rio De Janeiro, in 1992. I wish I could capture the energy in this room and bottle it,<sup>j</sup> said Olivia Newton-John at a press conference. It further ignited a collective spark that fueled the fire inside of many activists, leaders indeed, all of us

who made it to Rio, and continued on the environmental path!

We all laugh at the acronym UNCED, thinking much is un-said but there were significant achievements to come out of Rio with Agenda 21, The Climate Change Treaty which gave way to the Climate Convention (UN Framework Convention on Climate Change - UNFCCC). This was where the Biodiversity and Desertification Conventions got legs. There was the Rio Declaration, for more on the history of the Earth Summit, click [here](#).

During this year long road to Rio+20 World Team Now will be focused on renewable energy and policy, with on the ground projects to demonstrate what is possible. To read about some coverage of recent renewable energy projects click [here](#). Or be inspired by Googles solar energy goal to go viral, and make solar affordable for us all. The scientists are our real heroes, and most are behind the scenes quietly doing their research without the eyes of the world on them. Several of the organization partners in the campaign Tck, Tck, Tck including World Team Now, believe in 100% reliance on renewable energy in the future. What once seemed impossible, like putting a man on the moon, becomes possible with bold declarations and commitment to execution.

World Team Now will also share some of the original video, stories and information from Rio 1992 when Suzanne Maxx wore multiple hats; a speaker, a performer, activist, journalist, and videographer for Jerry Brown (who was then running for President of the USA). In the footage, we follow a VIP entourage that included many people deeply respected. Our goal is to encourage all to participate now and wear the hat of being a citizen of our world committed to living in better balance with our resources.

If all of us, the people of the world push for global political will to drive towards united commitment, transformation can happen. On the eve of World Environment Day this is an invitation to join World Team Now virtually; from the past into our future, as we invite all to be present in whatever way possible next year at the reunion in Rio.

## World Vision International

### World Vision International

#### Input for the Compilation Document for the United Nations Conference on Sustainable Development

##### *Prioritising the health of children for sustainable development*

##### **Preamble**

As a child-focused development organisation, World Vision is concerned that environmental trends – including ecosystem degradation, unsustainable agricultural practices, excessive harvesting of natural resources, pollution and now climate change – pose increasing health risks to the world's poorest and most vulnerable children. Around three million children under five die each year from diseases (such as acute respiratory infections, diarrhoea and malaria) due to a number of largely preventable environment-related causes. The effects of environmental risk factors are exacerbated by existing adverse social and economic conditions, including poverty, conflict, urbanisation and undernutrition.

While political commitment to addressing climate change and environmental degradation has risen in recent years, there remains a disconnect in the dialogue and strategies to deal with both environment and development issues. The health of the world's poorest children continues to be severely compromised by 'siloed' approaches to aspects of sustainable development. A specific focus on children is largely missing from current discourse on the environment, climate change, and sustainable development.

We need a sustainable development framework which is truly concerned with integrating protection of the environment; the management and conservation of natural resources; and social development, with the health and wellbeing of today and tomorrow's children at its centre.

We also need to move beyond aggregated global goals for tackling poverty, recognising that vast differences exist between countries, and between populations: for example, those living in poverty in middle income countries, and those in fragile states. National level goals and targeted approaches to sustainable development are urgently needed, tailored to such distinct contexts.

World Vision is particularly concerned about the effects of unsustainable practices on two of the largest contributors to child mortality – undernutrition and acute respiratory infections – and calls for a greater understanding of the links between these conditions, the natural environment, and sustainable development.

World Vision believes that two sectoral themes should be prioritised in the outcomes of Rio+20, with specific goals that should be launched and endorsed in the outcome document:

- § Sustainable agriculture and better outcomes for child nutrition
- § Household energy practices and better outcomes for child respiratory diseases

This submission outlines general recommendations for the outcomes of Rio+20, followed by specific recommendations in these two priority areas.

##### **General recommendations on outcomes for Rio+20**

##### ***World Vision urges member States to:***

- § Address the link between *health and sustainable development* at Rio+20 in 2012 by:
  - o Highlighting the health implications of unsustainable development practices for current and future generations of children;
  - o Accelerating the development of an action plan for sustainable development which prioritises the health of children and emphasises intergenerational equity;
- § Increase *political will and ambition* to tackle the challenges of environmental degradation, climate change, chronic poverty, and child mortality simultaneously;

§ Ensure that *fairness and equity* are at the heart of a sustainable development framework, based on the principle of ‘common but differentiated responsibilities’;

§ Promote *local action and participation* of communities, including children, and ensure *accountability* to the poorest and most vulnerable people across the planning, assessment implementation and evaluation cycle;

§ Acknowledge that all policies for sustainable development affect the health of children and communities, and prioritise *cross-sectoral governance and policy coherence* across relevant ministries at the international, regional and national levels;

§ Reaffirm *internationally agreed development goals*, including those contained in the United Nations Millennium Declaration, and commence a dialogue to move towards a post-MDG 2015 framework which brings together the environment and development agendas: and

§ Commit to the *development of national goals and targets*, recognising, for example, that increasing numbers of people living in poverty are emerging in two distinct contexts – fragile states and middle income countries.

#### **Priority areas in the green economy**

Sustainable agriculture and access to clean, household energy for cooking and cleaning are areas where the pillars of sustainable development can be successfully integrated. These two areas hold a central place in both development and environmental agendas and are crucial to children enjoying good health.

The food, energy, climate and environmental health crises must be tackled together, not as separate problems – pursuing separate solutions to these crises ignores their interrelationships, and fails to take advantage of possible synergies. Tackled in an integrated manner, these thematic areas would be the litmus test for what a new sustainable development paradigm could achieve.

#### **Sustainable agriculture and child nutrition**

Over a third of all child deaths each year – approximately two and a half million – are caused by the underlying factor of undernutrition.

Despite increases in global agricultural productivity, efforts to reach global targets on reducing hunger and undernutrition are not being met: current agricultural practices and infrastructure are

unsustainable and inequitable, and nutritious food is not getting to those who need it – often, not even to those who grow it. Food production and distribution, together with inadequate food utilisation at the household level (e.g. unsafe food preparation and handling, poor food choices, lack of access to clean water and sanitation), are failing to provide good nutrition for the world’s poorest children.

Climate change, which contributes to food instability, presents a greater urgency to find ways to more sustainably produce and distribute food – agriculture is part of the climate problem as well as the solution.

World Vision welcomes UNEP’s *Towards A Green Economy* report, which highlights agriculture as a major element in reorienting the way we manage the planet towards a sustainable future. We must consider how agriculture can intentionally and reliably ensure that the poorest children on the planet will have access to nutritious food.

Many organisations and governments are working on improving agriculture, land and water management practices to enhance world food supplies and increase food security for the world’s poor. However, the health and nutrition sector is poorly linked to many of these emerging policies and practices.

#### **Recognising that:**

§ There are inherent linkages between child undernutrition and health in the world’s poorest communities, food and nutrition insecurity, unsustainable agricultural and water use practices, degraded natural environments, and climate change;

§ The health and nutrition sector is poorly linked to many of the emerging policies and practices for agriculture and food production;

§ Neither conventional nor traditional agricultural approaches on their own can meet the challenges of our changing climate and current injustices; and

§ A decisive shift is needed to reorient agriculture and land use policies towards a new and common standard – of focusing on productive, sustainable and resilient agriculture while placing children’s nutrition at the centre of our efforts;

#### **World Vision calls on member States to:**

§ Make concrete commitments at Rio+20 for individual and collective actions towards sustainable agriculture and food security initiatives that are sensitive to nutrition and climate issues;

§ Include child nutrition as a headline indicator for global goals on sustainable agriculture and food security negotiated at Rio+20;

§ Incorporate child nutrition indicators in monitoring and reporting provisions around sustainable agriculture, food security and poverty reduction strategies and processes;

§ Prioritise investments in agricultural adaptation to climate change in developing countries, allocating USD 7 billion a year for this purpose, and exploring the possibility of climate-related funding; and

§ Support investments in ecological restoration, and facilitate the development of markets that value the regulatory services provided by ecosystems.

#### **At the national, sub-national and local levels, governments, development agencies and programme managers should prioritise:**

##### **Integrated strategies and targets for child nutrition:**

§ Support the Framework for Scaling Up Nutrition (SUN) and support country scale-up of efforts to reduce undernutrition;<sup>1</sup> and

§ Ensure that agriculture policies, programmes and development assistance support country-led strategies that include improved child nutrition as a key objective.

<sup>1</sup> The SUN calls for action on both direct nutrition interventions and integrating nutrition objectives in other key development sectors, particularly agriculture and food security.

##### **Support for small-scale farmers:**

§ Support small-scale farmers to combine productivity and conservation objectives (such as measures to improve soil fertility and soil carbon, measures to reduce soil

degradation, and diversification of farming activities).

**Participatory agriculture-nutrition initiatives:**

§ Promote participatory and gender-sensitive initiatives such as access to microcredit, especially for women farmers, recognition of land titles and female ownership, and community-based nutrition education programmes.

**Clean household energy and child health**

Worldwide today, approximately 1.3 billion people have no access to electricity. Almost 2.7 billion people are fully dependent on burning traditional solid fuels such as wood, dung, crop residues and coal to meet energy needs, but these forms of biomass are inefficient, unsafe and often non-renewable. These materials are typically burnt in simple cooking stoves with very incomplete combustion. Consequently, women and young children are exposed to high levels of indoor air pollution every day.

Children are becoming ill and dying as a result of the indoor air pollution created from using inefficient stoves. Approximately 57 per cent of deaths from indoor air pollution are due to acute respiratory tract infections (including pneumonia) in children under 5 years. Acute respiratory infections are the single most important cause of mortality in children, accounting for around 2 million deaths annually.

Inefficient and unsustainable household energy practices for cooking and heating also have serious implications for the environment, including local and regional air pollution, and local deforestation and land degradation where households are reliant on wood.

Expanding access to more efficient cooking stoves could help to prevent an estimated 2 million deaths annually from child pneumonia and adult chronic lung disease that are directly attributable to indoor burning of solid fuels.

Yet few countries have set targets for reducing the share of the population relying on traditional biomass for energy needs. Of 140 developing countries, 68 have established targets for access to electricity, but only 17 countries have targets for access to modern fuels. Access to clean cooking

facilities has received significantly less government attention than electricity access, notwithstanding the significance of exposure to indoor air pollution, the increased risk of acute respiratory infections in children, and other health, environmental, and economic implications. Financing for cooking stove projects has been limited.

World Vision welcomes the recent estimates in the World Energy Outlook 2011 of investment required for household energy access. We also welcome the fact that Energy for Sustainable Development has been identified as a key issue by the Preparatory Committee for Rio+20, and the designation by the United Nations of 2012 as the *International Year of Sustainable Energy for All*. The international community needs to capitalise on this momentum at Rio+20.

**Recognising that:**

§ Access to modern energy services<sup>2</sup> is fundamental for human development, from alleviating poverty, to promoting economic development, gender equality, food security, and health;

§ Children are becoming ill and dying as a result of the indoor air pollution created from using traditional biomass and coal in inefficient stoves for cooking and heating;

§ Modern household energy facilities such as fuel-efficient stoves for cooking and heating can cut child deaths by reducing exposure to indoor air pollution;

§ Despite the negative health and environmental consequences associated with energy practices and fuel use in developing countries, clean, efficient and affordable energy access for poor households has received little attention;

§ Improved health outcomes for children are not currently a particular focus of energy investment decisions, and health and environmental impacts are not always considered in the energy models of donors and companies;

2 Modern energy services are defined here as those which are reliable, affordable, sustainable and from low-greenhouse gas-emitting sources

**World Vision calls on member States to:**

**Make commitments to energy access and child health:**

§ Adopt a clear statement that recognises the link between energy access and the MDGs, and demonstrates that modern energy access for the poorest and most vulnerable communities is a political priority where policies and funding will be reoriented accordingly. This commitment should prioritise the reduction of indoor air pollution and prevention of childhood respiratory infections as a key outcome.

**Commit to developing national targets and indicators:**

§ Leaders of developing countries should commit to setting interim national goals, targets and indicators for scaling up access to household energy facilities, to reach the global goal of universal access by 2030;

§ For countries with high dependence on traditional biomass, specific goals for access to fuel-efficient cooking stoves, with targets for improved health outcomes for women and children, should be set as part of national development and poverty reduction strategies; and

§ Goals, targets and indicators should be outlined by 2015 and reported on annually thereafter.

**Prioritise community level capacity development and participation:**

§ National governments should involve affected communities in the planning, implementation and monitoring and evaluation of fuel-efficient stoves projects.

**Ensure policies target the poorest and most vulnerable:**

§ National energy policies and plans should target the poorest and most vulnerable children and communities in developing countries. For example, funding should not focus solely on large-scale electricity infrastructure to the detriment of small-scale projects that will have a greater chance of reaching the poorest households and contributing to better local health outcomes.

**Scale-up public funding for energy access and clean cooking facilities:**

§ The donor community should urgently mobilise additional investment to provide universal access to clean cooking stoves by 2030, estimated at \$74 billion, and \$17 billion for biomass cooking stoves (\$0.8 billion per year). The bulk of financing for fuel-efficient stoves should come from multilateral and bilateral sources, to assist the poorest

countries and communities with start-up costs where adequate commercial return is not initially offered; and

§ Donor governments should commit to making these funds available through the emerging Green Fund at the 17th Conference of Parties in Durban in December 2011.

#### Process considerations of the outcome document

##### *The outcome document of the UNCSD should:*

§ Be a politically-binding document that recommit governments to achieve sustainable development;

§ Adopt global goals and targets in the areas identified (agriculture and household energy);

§ Establish a roadmap for working out the detail for the development and implementation of goals and targets at regional and national levels;

§ Outline a pathway for the advancement of a post-MDG 2015 framework, which ensures the full participation of affected communities, recognising the differences between contexts such as middle income countries and fragile states, with consideration given to the development of Sustainable Development Goals.

*Comments and questions should be directed to Kirsty Nowlan at [kirsty\\_nowlan@wvi.org](mailto:kirsty_nowlan@wvi.org)*

## World Water Council

Contribution of the World Water Council to the Zero Draft of the Rio+20 Outcome Document

### IT'S ALL ABOUT WATER

The World Water Council, as was expressed earlier to the Secretary General of the United Nations, considers the Rio+20 United Nations Conference on Sustainable Development to be a political gathering of the highest importance in achieving sustainable world development and stands ready to contribute to all the relevant processes by mobilizing its entire means available. The Council, as the highest level non-governmental entity in water matters, is well positioned through its vast core membership, encompassing technical and scientific organisations, the public and private sectors, as well as development and donor agencies, in addition to ministries, local authorities, and intergovernmental and United Nations bodies, to contribute to the Rio+20 process in an effective manner, in particular as related to the underlying necessity of water's central role in achieving sustainable development in an interdisciplinary way.

The idea of establishing the World Water Council was born during the International Conference on Water and Environment, organized by the UN system and held in Dublin in 1992 as a contribution to UNCED, with a view towards mobilizing all stakeholders involved in water issues, as a means of solving the emerging water challenges. Ever since its inception, the Council has shaped the global water debate by, inter alia, organizing the series of World Water Fora, the next of which will be held in March 2012 in Marseille, France. This 6th World Water Forum defines itself both as a forum of solutions and as a mechanism to elevate water matters to the level of the Rio+20 process and beyond.

Water connects and does not divide. This is equally true at different scales, whether one talks about transboundary watersheds and aquifers or about the connection between natural and social cycles in general. Water binds them together. Indeed, it is water that cuts through and connects all the Millennium Development Goals, as well as all the impacts of climate variability in addition to many other global drivers. It is, therefore, water that must be given sufficient attention whenever seriously discussing any of the above goals or drivers, whether it be at the political or technical level. Because of this interconnectedness, it is water that is the principal vector for global change impacts and through which promising response strategies could be established in an adaptive manner.

When it comes to the major drivers, of which population change is the most significant, along with its derivatives of land-use change, urbanization and migration, water scarcity will increase, together with an increase in extreme hydrological conditions. Humanity, therefore, will need more storage space to have buffer capacities against the vagaries of extreme flows, whether to face excess water brought by floods or droughts caused by increased aridity. More reservoirs are required for sustainable demand management for populations in flux. Of course, in this process, all the unwanted social and environmental consequences must also be mitigated. Intelligent technology that is respectful of nature offers solutions to do so. Likewise, we need to invest more in the cleanest, most significant renewable energy source: water power. This shows precisely how closely water and energy issues must be linked in the future. Also, river navigation is to be enhanced to curb greenhouse gas emissions of mass transportation.

Water is indeed the engine of sustainable development not only from an environmental point of view but also in examining global challenges from a social point of view. As related to public health, for example, 80% of diseases are water-born or water-related. Half of the hospital beds in the world are occupied by patients with ailments due to the lack of good-quality water. Appropriate sanitation is the key to changing this deplorable situation. Water supply and sanitation, therefore, contribute to a green economy by increasing productivity related to a decrease in water-related illness and by reducing the pollution load on river basins and aquifers. They create jobs and income for unskilled workers, thus reducing poverty in less developed countries. Most importantly, adequate sanitation improves public health by significantly reducing infant mortality. A \$1 investment in sanitation yields a \$7 cost reduction in public health expenses.

Water is at a turning point in its long history. The time of easy water is definitively over. The delicate balance between freshwater supply and its demand for all uses must evolve due to the global changes that affect the planet. Each country, each city, each community must consume less and manage better.

We are at the dawn of the establishment, everywhere in the world, of demand regulation policies. These policies must indeed guarantee respect in a concrete way for the right to water, as defined by the United Nations General Assembly. They must be supported by three pillars that guarantee equitable and sustainable management of this rarified resource: financing, governance, knowledge.

There is no way to break the vicious circles of poverty unless we invest in water and sanitation. Investments are badly needed in every sphere: political, financial, and educational, as well as in building capacities for the benefit of developing countries. This is a main concern for the Council. The Council stands ready to contribute to this process by mobilizing all its areas of expertise and by working together with everybody to make Rio+20 a truly historical event.

---

## World Youth Alliance

Submission by the World Youth Alliance for the Rio+20 compilation document

For more detailed information about the World Youth Alliance and our position on the relationship between the dignity of the human person and global sustainability, please

visit <http://www.wya.net> or contact Elyssa Koren, Director of Advocacy, at [elyssa@wya.net](mailto:elyssa@wya.net).

The World Youth Alliance, a global coalition of young people committed to promoting the dignity of the person, stresses that the following principles should be included in the Rio+20 consensus document:

- Each human person is a precious and vital resource, capable of answering the challenges societies face with innovation and invention.
- The inherent dignity of the human person lies at the root of the goal of promoting sustainable development practices.
- Education is a foundational element of development.
- Poverty eradication takes place at an individual level, by educating and investing in persons, and enabling their creativity and natural capacities to develop and flourish.
- The role of women in achieving sustainable development is critical because they are at the center of social and economic life in their communities.
- Maternal health occupies a special place in our efforts to achieve sustainable development.
- The desire of women and men to found a family must be considered by States in their creation of policies on sustainable development and women's health.
- The entry point for resolving resource scarcity challenges is the infinite potential for innovation and advancement that resides in the human person.
- The right to freedom of thought, conscience and religion is essential in protecting human participation in sustainable development.

#### Expectations for the outcome of Rio + 20

1. Each human person is a precious and vital resource, capable of answering the challenges societies face with innovation and invention. In accordance with Principle 1 of the Rio Declaration on Environment and Development, the World Youth Alliance affirms that "human beings are at the centre of concerns for sustainable development". It is the intrinsic worth of the human person that provides the basis on which to found policies and laws that create conditions under which human beings can flourish. Without such a foundation, human dignity becomes secondary to the protection of the environment and development. Instead, human dignity is the reason for the pursuit of a sustainable world and the foundation of human rights.<sup>1</sup> This fundamental relationship between human dignity and the protection of the environment must be emphasized in the Rio +20 process.

2. The inherent dignity of the human person lies at the root of the goal of promoting sustainable development practices. The recognition of this dignity is the basis for authentic development. Authentic sustainable development is understood as taking place at all levels of society, thereby creating a social, political and economic environment that allows persons to reach their full potential. It is thus the dignity of each individual person and the value of human capital as a whole that comprise our greatest resource, and recognition of this should be at the core of all efforts for sustainability. The Rio +20 outcome document ultimately should reflect this emphasis on the integral link between the dignity of the human person and sustainable development.

#### Human capital at the root of sustainable development

3. At its very essence, global sustainability is about a world that puts people at the center and uses its economy to serve their interest. The World Youth Alliance recognizes that energy, food, land and water scarcity is a growing challenge for countries at all levels of development, and we place great value on our natural environment as a source of both physical sustenance and immeasurable beauty to be cared for with responsible stewardship. It is imperative that a response to these challenges be predicated on authentic sustainable development, which holds the human person at its center and directs human potential towards improvements in society. Such integral development will ensure the fulfillment of basic needs, and achieve advancements in every sector of society so that each person will be able to live in a manner commensurate with his or her inherent dignity.

4. Education is a foundational element of development. The goal of education must be to help people recognize their dignity and equip them with the necessary tools to exercise their potential. When members of a population are aware of how their education contributes to development, they will be more able to fulfill their responsibility in society.

5. With the human person at the center of development, poverty eradication becomes an important goal of efforts to create a sustainable world. As noted by Principle 5 of the Rio Declaration, "All States and all people shall cooperate in the essential task of eradicating poverty as an indispensable requirement for sustainable development, in order to decrease the disparities in standards of living and better meet the needs of the majority of the people of the world". Poverty eradication takes place at an individual level, by educating and investing in persons, and enabling their creativity and natural capacities to develop and flourish. It requires whole communities to work together for the common good. Poverty eradication requires strong families who take seriously their duties and responsibilities in caring for their members and building intergenerational solidarity.

#### Gender equality and sustainable development

6. The World Youth Alliance recognizes that the role of women in achieving sustainable development is critical. As mothers, providers of food and caretakers of children, the elderly, and the sick, women are at the center of social and economic life in their communities. Empowerment of women brings about reduced family poverty, increased health and reduced child mortality.

7. As such, maternal and women's health occupy a special place in our efforts to achieve sustainable development; they are fundamental for the education and economic advancement of women and girls. Health education that is life-affirming, person-centered, and evidence-based equips women with the tools to know their bodies, which empowers them and contributes to their overall health.

8. However, the issue of women's health must not be addressed solely within the framework of the provision of family planning services. The desire of women and men to found a family must be considered by States in their creation of policies on sustainable development and women's health. Because the world's greatest resource is the human person, sustainable development should focus not on slowing population growth but on utilizing the potential of people.

#### The value of technology and innovation

9. The entry point for resolving the challenge of resource scarcity is the infinite potential for innovation and advancement that resides in the human person. The creativity of the human person is the primary catalyst for development. Human creativity generates new ideas and alternatives for growth and sustainability. It is by empowering all people to take part in a global sustainable economy that we can begin to address the challenges of population expansion. The World Youth Alliance affirms Principle 9 of the Rio Declaration, which notes that "States should cooperate to strengthen endogenous capacity-building for sustainable development by improving scientific understanding through exchanges of scientific and technological knowledge, and by enhancing the development, adaptation, diffusion and transfer of technologies, including new and innovative technologies". The central focus of a human dignity-centered approach to achieving sustainable development should lie in harnessing the capacity and innate ingenuity of the human person to maximize technological advancements for the good of society.

Recommendations by the World Youth Alliance for the Rio+20 compilation document The World Youth Alliance specifically urges the Rio+20 process to incorporate the following paragraphs:

1. Principle 1 of the Rio Declaration on Environment and Development, which states that “human beings are at the centre of concerns for sustainable development,” recognizes that human dignity is the reason for the pursuit of a sustainable world and the foundation of human rights. Authentic sustainable development is understood as taking place at all levels of society, thus creating social, political and economic conditions that enable social and economic growth. The principle of subsidiarity affirms the importance of local input and solutions to development, and prioritizes the inclusion of these voices as the first and necessary step of sustainable development.

#### The right to health

2. The right to health is an essential component of sustainable development. Ensuring that individuals have access to health services directly contributes to poverty eradication and economic growth. Health services refers to basic health care, which includes access to clean water, sanitation, and basic nutrition. Maternal health care

3. Developing areas in most regions of the world are furthest from achieving the Millennium Development Goals. Currently, MDG 5, on maternal health, is the least achieved MDG. The provision of basic maternal health care is critical to protect the lives of women and mothers and must be the focus in attaining the MDG and sustainable development. Recognizing that health of women enables protection of vulnerable children and in particular increases livelihood and educational opportunities for girls, maternal health is essential for sustainable development. Statistics show that maternal morbidity is highest in the rural areas of developing countries. Only one-third of rural women receive the recommended prenatal care and only two-thirds receive prenatal care at least once. Furthermore, there are disparities between urban and rural women: urban women are twice as likely to receive professional care at childbirth than are rural women. In particular, sub-Saharan Africa, Southern Asia and Oceania have the lowest attendance by skilled personnel and the highest maternal mortality.

4. For sustainable development, women must have access to maternal health care, including prenatal and post-natal health care and emergency obstetric care. The most important step in improving women's reproductive health is increasing the number of skilled birth attendants, who are trained in treating obstetric fistula, hemorrhaging, high blood pressure and infection, the primary causes of maternal mortality. The UNFPA states that three-fourths of all maternal deaths could be averted by the presence of skilled birth attendants.<sup>10</sup> Furthermore, better infrastructure, more hospitals and cleaner health care facilities will reduce maternal mortality.

#### Women and girls

5. Acknowledging the skewed ratio of births of male children to births of female children and the preference for male children over females in some cultures, gender equality is an essential component of sustainable development. The role of girls, who are at the center of social and economic life in their communities, must be protected if a society is to achieve economic growth and sustainable development.

#### Freedom of thought, conscience and religion

6. Protection of the right to freedom of thought, conscience and religion, as affirmed in Article 18 of the Universal Declaration on Human Rights, is necessary to achieving sustainable development. This right reflects that humans are born with dignity and conscience. It enables individuals to move forward within their professional and community obligations while being assured of protections for their beliefs and conscience.

7. In particular, given the importance of health care and maternal health care for women in the attempt to develop a sustainable world, the right to freedom of thought, conscience and religion is critical for health-care providers. It enables them to feel comfortable in providing care for people within their communities and allows for increased participation in the provision of a fundamental need.

8. Furthermore, recognizing the centrality of education to a sustainable world, the right to freedom of thought, conscience and religion must extend to educators. Contributions of people of faith to the field of education have been of paramount importance, and these educators must be guaranteed protection of their beliefs so that they can continue to care for and instruct the next generations of global citizens.

---

## WSPA Netherlands

### Joint Stakeholder Policy Statement on Sustainable and Humane Agriculture

#### Inputs for the Rio+20 compilation document

By focusing on the theme of a Green Economy in the context of sustainable development and poverty eradication, the Rio+20 Summit will provide a key opportunity to set the world on a new global course for agriculture and food production. Such a change of direction is vital for our food production systems to become humane and sustainable.

Farmed animals play a vital role in our lives, whether we rely on them for food, revenue or to help balance our ecosystems. Ensuring the welfare and responsible use of these animals can be an effective tool to help achieve sustainable development, deliver poverty alleviation and enhance wellbeing. It is central to tackling specific environmental issues including climate change, water pollution and scarcity and food security.

The intensification of industrialized farming and agriculture systems is not the solution to these issues for such systems can be highly detrimental to human and animal welfare and their rapid growth has contributed to an overall increase in direct and indirect greenhouse gas emissions. Other negative environmental and social impacts of the industrialized production of agricultural commodities can include rural decline and biodiversity loss.

Therefore, to achieve sustainable and humane food production and ensure a successful transition to a green economy, and in view of the links that exist between agriculture, food security and environmental issues, the signatories to this statement call on member states and other relevant stakeholders to commit to policies which:

- 1) Recognize the positive role animal welfare can have in achieving sustainable agriculture and incorporate specific and regionally-sensitive measures which ensure that global food production is humane;
- 2) Promote and support humane, integrated livestock farming systems to ensure farmers' livelihoods and the climate resiliency of rural communities;
- 3) Phase out subsidies and public investment for unsustainable, intensive farming systems while providing support for farmers rearing livestock humanely and sustainably;
- 4) Recognize the importance of livestock in economic development and the role farm animals play in helping to lift people out of poverty and build sustainable livelihoods in developing countries.

## WWF International

sustaining human well-being and economic activity; actively invest in their conservation and enhancement to avoid a devastating and irreversible global crisis;

 **Go beyond GDP:** Develop a new standard indicator to measure environmental performance alongside GDP and use it, along with human development indices, to provide a more accurate reading of the state of our economies and to incite preservation of the natural environment and more equitable development;

 **Full-cost accounting:** Devise rules whereby the full environmental costs of production and consumption are internalised into accounting models in order to address the causes rather than simply the symptoms of environmental loss;

 **Transparent certification schemes:** Expand, support and standardise certification schemes that are multi-stakeholder and science-based to move toward sustainable consumption and production;

 **Set up an investment vehicle to facilitate the transition to and implementation of green economies through upfront funding for leapfrogging technologies, technology cooperation, and retrofitting programmes, notably using innovative finance.**

### Institutional Frameworks for Sustainable Development

 **Integration of the three pillars of sustainable development:** WWF supports the creation of a Sustainable Development Council to coordinate, consolidate, advance and ensure the crosssectoral integration of sustainable development at the highest level of decision-making;

 **Strengthen the environmental pillar by upgrading UNEP to a Specialised Agency with a mandate to support and ensure compliance of all MEAs;**

 **Better embed sustainable development criteria in existing International Financial Institutions in order to promote genuinely sustainable investments.**

### 1. INTRODUCTION

WWF's Living Planet Report shows that humanity is already using fifty percent more natural resources than the earth can regenerate in a year. Furthermore, high income regions use five times the amount of natural resources than those of the lowest income countries. We are living beyond the Earth's means and are distributing these unsustainable proceeds inequitably: the poorest countries and communities bear a disproportionate share of the negative effects of the growing global demand for resources while industrialised nations enjoy most of the benefits. Future generations will face resource scarcities and environmental degradation not of their making that will increasingly lead to conflict and insecurity. The growing number of urban poor that will live in tomorrow's cities adds additional urgency to finding sustainable and equitable development paths.

The UN Conference on Sustainable Development (Rio+20) 2012 presents world leaders with a stark choice: they can tinker around the edges of global development as we know it today or they can lift our ambitions by delivering a new, internationally agreed vision for development that catalyses fundamental changes in our economies towards more social and economic equity and environmental sustainability where humans live in harmony with nature. This vision will require deliberate choices and targeted public and private investment not just to decouple development from increased natural resource use, but to actively preserve, enhance, and effectively manage the world's natural resource base and the ecosystem services on which human wellbeing depends.

It will also require purposeful investment development that enhances the capacity of the poor to move out of poverty and fulfil their rights and needs for access to resources, financial assets, energy, water, food, housing, health, and education.

Solutions towards sustainable economies should be founded on a number of key principles:

 **Managing natural capital in equitable ways by rewarding those who provide ecosystem services and protect biodiversity;**

 **Setting up appropriate frameworks to achieve food, water and energy security for a growing global population and ensure that consumption patterns and production systems are within planetary boundaries;**

 **Providing economic incentives to foster environmentally and socially responsible development, notably through full cost accounting and an indicator that goes beyond GDP;**

 **Fostering effective governance built on inclusive processes and broad participation and with international and regional cooperation among governments and between the public and private sectors and civil society;**

 **Investing in human and natural capital, especially in developing countries and rural communities and promoting reform to secure equitable access to natural resources and sustainable use.**

Compilation Submission

Human Affect "Policy In Action"

Implementation Initiative Directive

Policy in Action

"Human Affect" AD HOC UNIT:

Human Rights Learning Through Art, Athletics and Science

International Artistic Advocacy

Human Rights Learning and Implementation Initiative

Foundational Ethics and Principles

Universal Declaration of Human Rights Articles 1 and 27

Article 1

All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood.

Article 27

Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.

Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary or artistic production of which he is the author.

Purpose

Human Affect AD HOC UNIT: Purpose surrounds supporting and assisting in promoting and healing mother earth and humanity through creative transformational methods.

Human Affect AD HOC UNIT advocates within the:

1. "Development of public information activities in the field of human rights learning, Indigenous Peoples, Climate Change, Millennium Development Goals and the United Nations Charter on Peace and Security, all which supports the World Public Information Campaign on Human Rights", resolution 6/10 entitled "United Nations declaration on human rights education and training", and resolution 6/24 entitled "World Program for Human Rights Education".

2. *Acknowledging* that Civil Society Non Governmental Organizations play an important role at the national, regional and international levels in the promotion and protection of

Human Rights and Sovereign Rights through education and learning.

3. The sixtieth anniversary of the adoption of the Universal Declaration of Human Rights in 2008 is a suitable occasion for the United Nations to increase its efforts to promote a human rights culture worldwide through education and learning.

4. Every woman, man and child, in order to realize their full human potential, must be made aware of all their human rights and fundamental freedoms.

5. Human rights learning should contribute to the fulfillment of the Universal Declaration of Human Rights as a way of life for people everywhere.

6. Public information activities in the field of human rights.

7. Awareness and implementation of the Universal Declaration of Human Rights, the Declaration on the Rights of Indigenous Peoples, International CSD Climate Change

Declaration and other Sustainable Development Declarations, Millennium Development Goals and the United Nations Charter on Peace and Security.

## Theatre

Human Affect "The Play" International Initiative is the...

Human Affect AD HOC UNIT: "Policy in Action" implementation initiative that utilizes "Human Rights Learning Through Art, Athletics and Science", originated, written, developed and initiated by Sandra "Akiwa Gizzel" Nelson, the International Executive Administrative President for "Ye Ethiopia Wiyen Mahber Be Alem" aka: Ethiopian World Federation, United Nations ECOSOC NGO,

fictional setting based on stories which emulate Human Rights Concerns that echo around throughout the planet within all continents and nations.

The stories which encompass *Human Affect "Policy in Action"* speak on Human Rights Concerns in the areas of...

1. Domestic Abuse, Violence Against Women
2. Economic, Social and Ecological Sustainability,
3. Racism, Tolerance
4. Human Trafficking of Young Boys and Girls for the Sex Trade and Human Trafficking of Indigenous population for Sustainable Development of Developed and Developing Countries.
5. Refugee Children in Combat, Refugee Human Displacement
6. Homelessness, Eradication of Poverty
7. HIV/AIDS and other Disease
8. Climate Change and other Disasters
9. Indigenous People, Original Ones Sovereign Rights
10. Women's Birth Health and Safe, Fresh, Healthy, Clean Potable water for sustainable living, sanitation and hygiene.

Human Rights Learning Through the Art of Theatre carries several components that are essential tools which can be utilized in correcting many social, economic, ecological and environmental challenges affecting mother earth and the international human population.

## Policy In Action

Human Rights Learning Through Art, Athletics and Science:

Human Rights are rights inherent to all human beings, whatever ones nationality, place of residence, sex, national or ethnic origin, color, religion, language, or any other status. We are all equally entitled to our human rights without discrimination. These civil, political, economic, social and cultural rights are all interrelated, interdependent and indivisible.

The International Theatrical Advocacy Initiative titled, "Human Affect", touches on the basic criteria of all nine core international human rights treaties.

Human Rights Learning Through the Arts and Athletics is an excellent way to promote human rights, promote policy, support international human rights treaties, mechanism, United Nations instruments, Initiatives, years and decades while offering alternative learning for all.

Through the Creative Written Word whether based on fiction or non-fiction, offenses of the ones Human Rights can be expressed in a safe, non-aggressive environment in the form of poetry, pros, plays, scripts, children's books, novels, etc. Taking the reader on a journey alone or with others that may be listening, watching or reading along.

From a written work, which is catered for an individual, group, child, adult which encompasses ones culture and tradition, much introspective, thought, reasoning and transformation can occur.

Human Rights concerns performed in any Theatrical style not only brings communities together to enjoy live performance but also takes the audience on a journey giving them insight into the meaning of Human Rights, Human Rights Violation and Resolutions that can take place within any family, community, town, City or Country. Within the storyline the audience is offered a safe place where the nature of their personal and/or communal environment is opened up and explored without threat or harm while always leaving a place for enjoyment, learning, discussion and exploration.

Music, may it be classical, jazz, hip-hop, pop, indigenous, rock, etc., can ignite, in its sound and rhythm memories, emotions, experiences and/or encounters, whether challenging or engaging, that reflect on a situation for healing and, or can promote international unity through creative learning.

Dance, as an artistic medium, motivates body movement and function which offers instant release of emotional stress and distress that is held inside the body. Movement gives way to self expressive and human balance through the release harmful energy making way for peaceful, reconciliation and self gratification that easily transfers into open dialogue as an immediate resource for responsible solutions.

As a spectator or artist of the visual arts a persons experience is recorded on canvas, paper, cement, wood, etc. to be displayed for the journey of the onlooker. One painting or drawing can invoke continual discovery and change for long periods of time for generational learning and understanding.

All creative artistic genres offer individuals, communities, nations and peoples the opportunity to develop their own Human Rights Learning Through the Art, Athletics and Science *International Advocacy Initiatives* that can assist in helping families, groups, children and adults, of any age, race, gender and or nationality in developing inclusive environments of expression for correction while healing offenses with little outside intervention.

Human Rights Learning Through Art, Athletics and Science also offer economical, social, ecological and environmental sustainability through artistic methods such gardening, pottery, sewing, cooking, yoga, meditation and more.

These general artistic forms, when organized for economic sustainability, offer community development and continuity without the burden of large budgets and distressful planning.

The people involved are partaking in their own training and learning structures that supported within a safe environment, of their making.

By placing corrective methods in the grassroots community leader authorities will discover the simplicity in resolving issues that lead to sustainable outcomes, healthy expression, reasonable solutions and responsible resolutions.

Ones, with in the boundaries of their own making, while being guided through respectful, expert mediation, will find the they are able to agree upon simple solutions that are humanly sustainable. By utilizing the Human Affect arts, athletics and science model "Policy in Action" that initiates and promotes simple, peaceful, learning activities that ones of any age, race, nationality and financial status can participate within.

Mother earth and human sustainability then become coherent possibilities that accessible and transparent for all.

Human Rights Learning Through Art, Athletics and Science - *Policy in Action*, is a basic learning format that upholds the Universal Declaration of Human Rights in all its character while easily balancing policy, treaties, initiatives for a communities social development and as an essential foundation for Human Rights Learning.

By utilizing Human Rights Learning Through Art, Athletics and Science - *Policy in Action* communities work together through creative mediation methods to assist expert actors finding responsible solutions that secure ongoing sustainable resolutions. Art that crosses boundaries awakes the complacent, less privileged, oppressed, abused and threatened to a Universe of vast cultures and traditions which peacefully generates a energy filled with possibility, hope and transformation.

#### Safe Birth Health and Water Human Rights

Motherhood and childhood are entitled to special care and assistance. All children shall enjoy the same social protection. (Article 25, Section 2)

#### III. Section Three

#### UN CSD Rio + 20 "International Earth Day"

#### "Human Affect: Policy in Action"

#### Implementation Initiative Recommendations

#### Major Group: Farmers

#### Human Affect 10 Policy in Action Issues: Comparative Compilation

#### Domestic Abuse/Violence Against Women

Domestic Abuse in rural farm area is associated with an uncertain future relating to the decline of the family farm and lack of alternate rural employment, especially full-time jobs.

#### Economic Social Ecological Sustainability

Land for the farmers: Many small farmers are poor and some are becoming poorer. A main reason is unequal land distribution, where small farmers have little land security or access and lose a large part of their income to landowners. Land reform is urgently required and landless farmers are fighting for their rights. But the landowners in most countries have political clout and are resisting change.

#### Racial/Tolerance

Agriculture acknowledges in 1999 decades of widespread discrimination against indigenous peoples were denied federal assistance loans without legitimate grounds. Although some were approved payment, but received funds after harvesting season, was left struggling to pay off accumulated interest resulting from loss of property.

#### Human Trafficking of Young Girls and Boys for the Sex Trade

Human Trafficking is approximately 75-80% is for sex. Young girls and boys are lured with false promises of high-paying farm work. Most trafficking into the commercial sex trade involves young adults.

#### Child Soldiers in Combat

Recruitment of child soldiers by non-governmental armed groups poses a significant problem for prevention because international human rights law does not bind these armed groups; they are not state actors. The three popular self-employment models that are used in reintegration programs in Central Africa are animal rearing crop farming and small trade or kiosk ownership...If a child is not literate or not numerate, keeping track of stock, dealing with supplies and managing financial flows can be considered almost impossible.

#### Homelessness/Poverty

In Cannabis Tens of millions are sick and dying, the displaced, the hungry, homeless and hurting humanity who need better secured agriculture and good cash crops, pastures, grains. This would greatly increase agricultural investments which would level the playing field for farmers and people in Africa.

#### HIV/AIDS and other Diseases

HIV/AIDS affects agriculture both directly and indirectly at the household level, changing supplies of labor, assets, and pattern of farming and other activities; as well as affecting communities as a whole and the wider economy; and some of the changes come back to affect farming households.

#### Climate Change and other Disasters

Among proposed changes: more widespread adoption of so-called no-till farming, a practice that involves leaving un-harvested crop stalks and other plant matter behind in the field undisturbed by plows and other soil-agitating instruments. "

#### Indigenous Issues/Genealogy

Some indigenous peoples also plant small gardens using a sustainable method called shifting cultivation as a farming technique. Clear small area of land and burn, next plant seedlings, later soil is too poor for crops to grow, and then it's moved to nearby un-cleared area to farm. Shifting cultivations is still practiced by indigenous peoples who have access to a lot of land.

#### Women's Birth Health/Child Health/Water as a Human Right

Investigations concerning babies with birth defects were seven times more likely to be born to women exposed to chemicals used in gardens and fields, compared to women who were involved in dipping livestock used to prevent ticks. Findings suggest alternate farming methods and elimination of reuse of pesticide containers as a preventive measure. Agriculture in Africa is one of the most important income generating activities and the fifth biggest employer in the country. South Africa is one of the major users of pesticides in the continent.

#### Major Group: Children and Youth

## Human Affect 10 Policy in Action Issues: Comparative Compilation

### Domestic Abuse/violence against women

Afro American children and youths are subject to more domestic abuse due to low income which is contributed the economy not producing jobs, thereby causing mental distress and tension in the family unit. Frustrations are directed to the children and youths because the inability to meet the demands and concerns dealing with food, clothing and shelter. The children and youths are the ones who are generally taking the brunt of this domestic abuse which can lead to emotional, mental and social damage that can affect development and growth. These overwhelming issues cause children to lose ability to feel empathy for others, or feel socially isolated unable to make friends due to social discomfort or confusion over what is acceptable.

### Economic-Social Ecological Sustainability

Educating children on how to save Mother Earth by recycling, reuse, and rethinking their actions in the area of waste, water and Biodiversity to save the planet that will ensure sustainable measures to ensure and promote the preservation of natural resources and conservation.

### Racism/Tolerance

Afro-Indigenous children are faced with racism at an early age. Racial guidelines are set in place to separate the races based on gender and ethnicity. Employment and the educational institutions discriminate based on student quotas of students attending their schools. Afro Indigenous children faced with this racism suffer mental and emotional distresses

### Human Trafficking of Young Girls and Boys for Sex Trade

Since the Portuguese dominated the transatlantic slave trade. Human Trafficking has not changed much over the centuries. Human Trafficking of young girls start at the age of 5-18 years of age and sex trade of young boys are also on the rise in the United States. Young girls and boys are forced into the sex trade by paying for their services The children are tricked into thinking that they will be honest wages for honest services rendered, but later find out they are slaves to Human Trafficking.

### Child Soldiers in Combat

In DRC child soldiers are abducted and forced to join the combat zones. Boys and girls are sexually abused, Most child soldiers are between the ages of 15 and 18 years, but some are as young as seven, and some under 15 years of age.

Children are more vulnerable and not independent decision makers, also they are easy to train and to brutalize and force into a very violent life style.

### Homelessness/Poverty

Homelessness and poverty is prevalent in many African communities. Street has become the way of life for impoverish children. Their unstable lifestyles, lack of medical care and inadequate living conditions increase young people's chronic illnesses. Often times leading to unprotected sex which is contributed to the HIV/AIDS. Homeless must find ways to eat, some scavenge or fine exploitative work. Many homeless children are enticed by adults and older youths into selling drugs, stealing and prostitution.

### HIV/AIDS and other Diseases

In Somalia and Senegal HIV is prevalent in these regions indicating HIV rates and number of people dying varies greatly between African countries. The vast majority of children infected with HIV during pregnancy, childbirth or breastfeeding result from their mother being infected with the virus. Educating mothers with preventive measures and awareness will result in a positive solution.

### Climate Changes & other Disaster

Educating young people in matters of the environment conservation focusing on issues related to climate change. raise the visibility of environmental conservation through awareness by using cultural activities targeting young people from all regions. Also further encouraging involvement exchanging of ideas and experiences. Providing the youths with a sustainable networks within Africa to engage young people in fulfilling missions in environmental conservations .

### Women's Birth Health/Child Health/Water as a Huma Right

Women who are at risk of babies dying at the age 5 due to the lack of water in the diet, affect the birth rate of babies born to mothers lacking the key component which is water. Also HIV/AIDS is the second factor of babies born with low birth rates and deformity. There is a lack of awareness to women positive with HIV/AIDS have a 25-45% chance to pass the disease on to their unborn child.

## Major Group: Business and Industry

### Human Affect 10 Policy in Action Issues: Comparative Compilation Issues

#### Domestic Abuse/Violence Against Women

The Bureau of Justice Statistics (BJS) reported that African-American women experienced domestic violence at a rate 35% higher than Caucasian women. These problems are resulting from lack of financial independence, frustration and education. Domestic Abuse/Violence affects mental, emotional and major health and social issues.

Businesses and Industries are faced with absenteeism, and lack of productivity.

#### Economic-Social Ecological Sustainability

Environmental concerns for business activities aroused in the latter part of the 20th century with evidence of chemical pollution and a variety of industrial accidents opposition of indigenous peoples to logging and mining operation and the discovery of human impact on global systems such as the ozone layer and the climate changes.

#### Racial/Tolerance

Business and Industries affects racial tolerance continues to be a clear trend in American society, it is still a major factor concerning employment, housing, education and health care. Low income is one of the contributing factors concerning these issues in the Afro Indigenous community.

#### Human Trafficking of young girls and boys for the sex trade

One of today's biggest human rights crises is the, food international trafficking of girls and boys into sex slavery. This generally happens when businesses and industries continue to outsource their product for low-cost labor. Human, trafficking generates profit since freedom of choice and economic gain are the heart of productivity. Victims are typically very young, most ranging in age from eight to 18 years old. Some are as young as four or five years old

#### Child soldiers in combat

As of July 2011 new reports indicate children continue to serve as child soldiers in some of the Central African Republics armed groups. Many children living in the CAR are still vulnerable to being recruited into armed groups operating in parts of the country.

#### Homelessness/Poverty

Homelessness and Poverty is the lack of permanent housing resulting from extreme poverty and unsafe unstable living environments. Employment and low wages are the common denominator for those with little to no education. The staggering statistics of the Afro indigenous peoples are being reported and most are at risk for losing their jobs and unfortunately are the ones that will be the most affected.

#### HIV/AIDS

HIV/AIDS were brought in to the Afro-Indigenous communities by European homosexuals that passed this disease onto the Afro-Indigenous men that were bi-sexual in nature and later transmitted the disease to their female partners. Prior to 1980 there were other diseases prevalent in the indigenous communities which if contracted had medical cures.

HIV/AIDS dramatically affect business and industries by setting back economic and social progress, adding costs depleting skills with absenteeism accounting for much of company costs.

#### Climate Change and other Disasters

Clean energy is one of the major solutions and valuable keys that will unlock and ensure sustainable use of our natural resources. Shareholders and stockholders are demanding businesses and industries to demonstrate effective practices by incorporating these tools. It is important for business and industry commit to innovative solutions that will benefit our economy and sustainable development.

#### Indigenous Issues/Genealogy

Business and industries concerns for Afro indigenous peoples should be focused on Human Rights and Civil Rights, Economic and Social issues, Discrimination of race, gender, employment and reasonable health insurance availability for all workers. They have a responsibility to respect all human rights and engage in human rights at all levels.

#### Women's Birth Health/Child Health/Water as a Human Right

It is essential that there are Women's birthing centers available for those that are located in areas heavily populated by indigenous peoples that are unemployed, to assist teen pregnancies, displaced pregnant women. Birth centers health that help encourage and build self esteem , Business and Industry insurance policies that reflect low-cost visits to Women's Birth Health Facilities.

“

#### **Major Group: Workers and Trade Unions**

#### **Human Affect 10 Policy in Action Issues: Comparative Compilation Issues**

#### **Domestic Abuse/Violence Against Women**

Trade Union are saying "NO" to Domestic Violence by reinforcing Union Policies and actions to stop Violence Against Women in cooperation with the Global Union Federation. They have incorporated plans, initiatives and actions to place these concerns as priority, by wiping out Violence against Women in homes, societies and workplaces, in order for women to have equal opportunities to be functional in their work and life.

#### **Economic, Social and Ecological Sustainability**

Trade Union Actions to Promote Environmentally Sustainable Development they are vital in facilitating the achievement of sustainable development due to their experience in addressing industrial change, the high priority they gave towards protection of the working environment in regards to domestic violence and related natural environment and their promotion of socially responsible and economic development..

#### **Racism/Tolerance**

Millions of workers around the country is suffering with discrimination based on color, cultural differences and ethic and national origin. Trade Unions must wholeheartedly take up the rights to defending and protecting the rights of those people affected by directly or indirect racism, and must adopt a specific clear direct and determined approach to fighting racism.

#### **Human Trafficking of Young Girls and Boys for Sex Trade/Trafficking of Indigenous Population for Sustainable Developed and Undeveloped and Developing Countries**

Human Trafficking is prevalent throughout the developed and undeveloped and developing countries of the Indigenous Population and Diaspora. Young boys and girls are forced to serve as sex slaves. Young girls are the most crucial their perpetrators. Trade Unions priority should be is to set in place Partnerships/Endorsements with Coalition Enforcements and Political Actors to eradicate Human Trafficking in these countries.

#### **Refugee Children in Combat/Refugee Human Displacement**

Recognizing child labor as a violation of children's and workers' rights, trade unions are joining with families and community organizations to combat child labor, to move children out of work and into school, and to support core labor standards which will promote, strong unions that will protect against child labor, improve conditions through effective unions, children are much less likely to have to work, to build alliances with unions in other countries and union and community organization.

Overcrowded refugee camps in Kenya and Ethiopia are receiving some 3000 new displaced refugees every day families flee from famine stricken and war torn areas. In the Horn of Africa food and water is that is used to support millions are disappearing rapidly, which causes those that are strong enough to travel on foot hundreds of miles to make it to the refugee center seeking food and aid. Over 800.00 Somalians, Ethiopians, Eritreas and Kenyans are malnourished and die at an early age.

#### **Homelessness, Eradication of Poverty**

Last year in Bulawayo, Zimbabwe the leaders attacked the leaders of the local farm workers union and they were forced to scatter. The International Labor Organization was one of the largest trade union in the agricultural sector, but due to the government takeover of the farmland and reallocation of Zimbabwe farms mostly owned by white people, Zimbabwe fell into a deep recession and the farms were taken over by squatters, which caused farmers workers to be displaced, loose homes, property, income and access to vital services after the farms where they worked were invaded and new owners terminated all contracts of previous workers. Union officials continue to flee the country and workers find themselves evicted and destitute.

#### **HIV/AIDS and Other Diseases**

Trade unions are educating workers about the prevention of HIV/AIDS, and its devastating effects. Pamphlets are widely distributed amongst all workers and are encouraged to attend workshops and open discussion in the classroom. Also a survey was conducted on affiliated trade union in Africa to identify trade unions which are particularly affected by the virus and highlight priorities for action. Zimbabwe is developing a project which focuses on training women as educators and counselors on HIV/AIDS to reach as wide a community as possible to spread general awareness about the virus.

#### Children/Youth

Trade unions are engaging with community workers to initiate training with children and young people. Also by putting emphasis on educating them on hazardous environment that aims to improve engagement of workers and trade unions in the development and implementation of Child Welfare and Social networks.

#### Climate Change

Trade unions have been involved in this issue for some years. They have organized a conference of workers on the issues of the environment how to prevent poisoning of the atmosphere and raised the issue of the environment and global warming and how to implement the "Green" economy, reduce carbon emissions. They will end up believing and getting involved in this cause for one simple reason. As the climate changes and as resources dry up the nature of work and employment will change across the planet.

**Women Birth Health/health** Women with birth complications premature babies, sick children, accident victims and people dependent on antiretroviral medication have literally been caught in the crossfire between strikers and government some have already died while others will die as the result. What can Trade Unions do to help to facilitate and ensure proper measure are take in the areas to educate Afro Indigenous women of the Disapora with Birth Health Issues

The union can help its members in at least three ways:

1. The union can protect workers from HIV infection by improving health and safety at work
2. The union can protect workers with HIV infection or AIDS
3. The union can provide support for workers and their families who have HIV infection or AIDS and may become too sick to work

## Young Professionals Chronic Disease Network

Young Professionals Chronic Disease Network Input to the Rio +20 United Nations Conference on Sustainable Development Compilation Document

The Young Professionals Chronic Disease Network (YP-CDN) believes that investment in youth is a cornerstone of sustainable development and represents a new opportunity for massive gains in health and development across all incomes. There is clear opportunity to influence behaviors, consumption patterns and lifestyles, the ability to transform youth into powerful advocates and build from the bottom-up the next generation of inspired regional, national and global leaders for development. It is this investment in human capacity, in people, that will sustain our future. As the next generation, a small part of the 3 billion youth under age 25 globally, we kindly offer our commitment, passion and energy towards realizing a strong sustainable development agenda.

Representing over 400 emerging leaders, students, youth and young professionals in over 40 countries, we developed a Youth Manifesto on non-communicable diseases (NCDs) for the United Nations High-Level Meeting on NCDs that took place September 2011 (attached) [1]. There are fundamental links among the world's leading killers and drivers of ill-health, the core risk factors (tobacco, poor diets, inadequate physical activity and harmful alcohol use) and sustainable development. We wish to generalize these recommendations in this instance.

To this end, the compilation draft should forcefully acknowledge that unhealthy consumption and lifestyles threatens sustainable development. Critically, nutrition shifts and demands for meat, fatty foods and palm oils, global mobility shifts away from walking/bicycling and towards more use of cars (as examples) threaten environmental sustainability and severely undercut health gains made in the past century. Reducing tobacco use, increasing physical activity and increasing fruit and vegetable availability would pay health and development dividends across all countries and must be on the path towards sustainable development [2].

As the next generation, we view the UN GA High Level Meeting on NCDs, the Rio World Conference on Social Determinants of Health, and the Rio +20 Meeting on Sustainable Development as critically linked. They feed into a shared health, development and environmental sustainability platform. Here, in light of these meetings on social, economic and environmental determinants, we focus our comments on the poverty eradication theme for the compilation document:

First, we assert that NCDs are a development issue. NCDs impact the social, economic and environmental pillars of development. There is a fundamental connection between burgeoning NCDs and the failure/difficulty of reaching traditional Millennium Development Goal (MDG) targets [3]. Integration of targets on NCDs, including tobacco control, into the core development agenda is a concrete first step. The recent High-Level Meeting on NCDs brought NCDs to the global agenda, but now is the time to successfully integrate the issues and relevant health indicators into the sustainable development agenda. The cost of inaction on NCDs by 2030 (\$47 trillion) represents lost lives, livelihoods and a stolen future for the next generation which we represent [4]. Health must feature prominently on the sustainable development agenda as we can no longer afford to ignore NCDs.

Governments, civil society organizations, development agencies, and the global public health community at large should expand the next round of development targets beyond MDG-specific targets to a combination of human and economic development goals that explicitly address primordial, primary, secondary, and tertiary prevention and the treatment of NCDs.

Second, we call for transformative, transdisciplinary education to foster the development of people who can successfully develop, implement and evaluate the interventions across sectors and disciplines. We call on public and private academic institutions to encourage interdisciplinary education of the public health workforce. Governments should invest in health professional education at the primary, secondary, undergraduate, graduate, and postgraduate level, stressing: 1) intellectual capital, 2) communication skills, and 3) cross-disciplinary networks [5,6].

Third, we call on governments and development agencies to actively seek input from young people on global development issues to harness their energy, creativity and

leadership. We seek to ensure that the voices of young people, inclusive of students and young professionals, are meaningfully included in high-level negotiations and processes. This includes investments in youth leadership for global, regional and national processes and the inclusion of specific time-bound outcomes related to young people and NCDs in global health policy. Youth inclusion ensures not only representation from a key population, but sustainability as the youth leaders of today will be the adult leaders of tomorrow.

Fourth, we call for new commitments to enable universal and equitable access to NCD-related medicines, vaccines, diagnostic and health technologies that successfully balance the right to health against that of trade interests. In particular, we call on equitable access to medicines at affordable prices and for policy makers to make full use of the flexibilities embodied in the TRIPS Agreement and confirmed by the 2001 Doha Declaration, to "protect public health and, in particular, to promote access to medicines for all" without any restrictions on the scope of diseases. Additionally, we support the full implementation of the WHO Global Strategy and Plan of Action on Public Health, Innovation and Intellectual Property, as committed by governments in the Rio Declaration on Social Determinants of Health.

Fifth, we call on policy makers to assert the rights of the child and conceptualize health across the life-course. There is increasing evidence that NCDs that may manifest during adulthood are impacted by critical events and exposures during childhood, infancy, and in utero. In addition, children are increasingly affected by NCDs in the first instance. Although NCDs affect many young people, most prevention measures are not targeted towards youth. It is young people who will bear the brunt of the economic, social and emotional burden of NCDs throughout their lives. Here, governments and international research and funding bodies should direct more funds to translation trials that can add externally valid evidence to support extensive implementation of science-based findings into real-life settings.

Bloom, D.E., Cafiero, E.T., Jané-Llopis, E., Abrahams-Gessel, S., Bloom, L.R., Fathima, S., Feigl, A.B., Gaziano, T., Mowafi, M., Pandya, A., Prettnet, K., Rosenberg, L., Seligman, B., Stein, A., & Weinstein, C. (2011). The Global Economic Burden of Non-communicable Diseases. Geneva: World Economic Forum. [5]. Kishore SP, Siegel KR, Kelly B, Vedanthan R, Ali MK, Koplan JP, Narayan V, Fuster V. "Preparing

the University Community to Respond to 21st Century Global Public Health Needs", Global Heart Journal, 2011; 6(4), 183-90. [6]. Huffman MD, Siegel KR, Kishore SP, Bitton A. "Regarding the Prevention of Global Chronic Disease: Academic Public Health's New Frontier", Am J Public Health, Oct 2011;doi:10.2105/AJPH.2011.30040

The Young Professionals Chronic Disease Network (YP-CDN; www.yppchronic.org) is a global network promoting research, policy and advocacy work on non-communicable diseases (NCDs). It capitalizes on the energy, innovative thinking, and courage of young people to challenge the status quo. The YP-CDN participates in the local and global knowledge economy using social media to create virtual platforms for sharing knowledge and ideas. Members are students and budding experts in their fields -public health professionals, doctors, sociologists, anthropologists, philosophers, nutritionists and architects.

In 18 months, YP-CDN has expanded from a small group of 12 medical and public health students to a vast network of 230 people of many disciplines spanning more than 30 countries across 6 continents. On the one hand we have set into motion a grassroots social movement to address the escalating burden of NCDs. By connecting and empowering young people and communities at the global level we give them a voice at the political negotiating table. On the other hand we inform evidence-based policy-making through the development of technical reports, peer reviewed articles, and policy position statements. We held our first meeting at the Harvard Endemic NCD Conference on March 2-3, 2011; over 50 individuals were in attendance from around the world. The photo above profiles the new community.

Contributors: Sandeep P. Kishore, Karen Siegel, Aria Ahmad, Amina A Aitsi-Selmi, Mohammed K.Ali, Phillip Baker, Sanjay Basu, Asaf Bitton, Jerry Bloomfield, Gene Bukhman, Eleanor Emery, Andrea Feigl, Karen Grepin, Mark Huffman, Kiti Kajana, Shweta Khandelwal, Kavitha Kolappa, Chenhui Liu, Naaznin Lokhandwala, Vishal Marwah, Modi Mwatsama, Nicole Novak, Paul Park, Christina Parsons Perez, Matthew R. Price, Nikka Rapkin, Hester Rice, Ben Seligman, Sumit Shah, Joao da Silva, Devi Sridhar, David Stuckler, Rajesh Vedanthan, Justin Zaman

Governments, civil society organizations, development agencies, and the global public health community at large should re-frame NCDs as a barrier to development by explicitly including NCDs as a target for "technical assistance, capacity building, program implementation, impact assessment of development projects, funding, and other activities," as recommended by the Institute of Medicine.

o Governments, civil society organizations, development agencies, and the global public health community at large should expand the next round of development targets beyond MDG-specific targets to a combination of human and economic development goals that explicitly address primordial, primary, secondary, and tertiary prevention and the treatment of NCDs.

o Governments should include NCDs and NCD risk factor data collection across all age groups to understand the current burden of NCDs and long-term effects of NCDs and to provide more reliable future projections of the NCD burden.

o Governments should implement programmes that tackle the social determinants of NCDs with particular reference to the following: access to information, lifestyle choices, therapies, and financing.

o Governments should engage local, regional, national, and global communities in health-related priority setting, ensuring fair representation from all stakeholders, including civil society.

o All stakeholders should engage with the private sector in reducing the amount of salt, sugar, and saturated fat content in the food supply and should eliminate trans fats intake, with an emphasis on minimizing price shocks that disproportionately harm poor populations.

o Governments should implement the Framework Convention on Tobacco Control in its entirety to reduce global tobacco consumption by 30% in 10 years. Special commissions should be instituted to target informal sector tobacco consumption practices.

o Governments should include "health across the lifespan" as a central pillar of all policies ("health in all policies") to enhance the conditions and health system in which people are born, grow, live work, and age.

o Governments, civil society organizations, development agencies, and the global public health community at large should strengthen maternal and child health programs to reduce maternal and infant mortality rates by 75% as a means to assert women and children's health rights.

o Governments and private sector actors should implement recommendations from the WHO policy document, "Set of Recommendations on the Marketing of Foods and Non-Alcoholic Beverages to Children"

- o Governments and development agencies should actively seek input from young professionals on global development issues to harness their energy, creativity and leadership.
- o Governments should invest in health professional education at the primary, secondary, undergraduate, graduate, and postgraduate level, stressing: 1) intellectual capital, 2) communication skills, and 3) cross-disciplinary networks.
- o Educational institutions should build leadership capacity in young professionals by developing and implementing cross-disciplinary and trans-national leadership programs that address NCDs.
- o The WHO and civil society should improve the affordability and availability of global level internships, scholarships and other training opportunities for young people, particularly for trainees from LMICs.

#### 5. Enable global access to essential drugs and health technologies

- o Governments should mandate generic substitution of medicines and utilize compulsory licenses to reduce the cost of managing chronic diseases by expanding global financing bodies like The Global Fund and UNITAID for the provision of essential NCD medicines and diagnostics.
  - o The WHO should swiftly enable pre-qualification for the 34 NCD medicines in the WHO Primary Essential Medicines for NCDs (PEN).
  - o Government ministries should support local supply chain management through increased accountability and incentives
  - o The WHO should survey the availability and financial cost of diagnosis and treatment of NCDs, including catastrophic health spending, among WHO member states and work with the World Bank and others to develop financial safety nets for populations in need.
  - o Augment and align global health funding from donor agencies, member countries and private industry with areas of greatest public health gains, as measured through estimated age-adjusted death rates and DALYs.
  - o Governments should identify regional-and country-level secondary economic gains or losses from interventions that impact NCDs, including interventions outside the health system, in order to achieve a "health in all policies" policy as done in Finland.
  - o Governments should introduce NCD Action plans at the ministerial level including NCDs as a line-item in national budgets but also taking care to integrate NCD prevention and control into current priorities.
  - o Governments and international research and funding bodies should direct more funds to translation trials that can add externally valid evidence to support extensive implementation of science-based findings into real-life settings.
- Governments, civil society, development agencies and global public health organizations should:
- o Empower and engage communities, particularly youth, to promote equitable access to education and leadership.
  - o Incorporate the voice of the empowered community in decision-making.
  - o Work to increase local communities' awareness of risk factors for NCDs and their long term effects, thereby enabling individuals to take control of their own health and amplifying the positive effects of societal changes on health.

1. Promoting the view that these diseases should not be viewed solely as "the fault" of the individual, but that NCDs are societal problems that require societal solutions. We will lobby our specific governments, promoting NCD awareness on university campuses around the world to this end.
2. Contributing to the development of a vision of a future society rooted in a social determinants of health approach and to work towards integrating the multitude of global agendas, including climate change and sanitation.
3. Performing research to create new knowledge realize health gains across the life course, including how they relate to the rights of the child, and to share current research with governments to accelerate progress.
4. Lobbying our individual academic institutions to introduce lectures on the global burden of disease, social determinants of health, and the relation of NCDs to development priorities and leveraging interdisciplinary training opportunities to tackle the complexities of real-world implementation.
5. Monitoring the WHO Essential Medicines List (EML) concept including adding NCD medicines to the EML, ensuring their listing in national EMLs; monitoring whether medicines make it to shelf and partner with grassroots organizations to prevent drug stock-outs.
6. Encouraging synergies and fostering dialogue between public health (clinical-and population-based) and related disciplines, such as urban planning or agriculture, as well as actively recruiting alternative, non-medical sources of revenue in partnership with our peers who work in these disciplines.
7. Contributing to the development of a highly skilled movement through peer-to-peer support and capitalize upon opportunities offered by seniors in the field to develop intellectual capital, influence, and cross-disciplinary networks. We will continue to use virtual communities (web 2.0 technologies) to produce a dynamic and barrier-breaking health movement.

---

## Yves Rocher

### YVES ROCHER CONTRIBUTION TO RIO+20 – OCTOBER 2011

Yves Rocher has been developing expertise in Botanical Beauty for 50 years. The brand's roots are in La Gacilly, a small rural village in French Brittany. Its founder Mr. Yves Rocher created his business there in order to stem rural flight. In his capacity as an entrepreneur and an elected official, Mr. Yves Rocher refused to practice land consolidation, a widespread intense farming practice at the time, encouraged handicrafts and the handicrafts industry, and set up Yves Rocher's three Breton production sites—each of which has received Quality, Security and Environment certifications (ISO 9001, OHSAS 18001, and ISO 14001)—and two of which are also certified bird garden sanctuaries of the French League for Bird Protection ("LPO").

Mr. Yves Rocher also set up an organic farm that produces flowers used in the brand's various products, and created a botanical garden open to the public. Mr. Yves Rocher

has turned La Gacilly into a dynamic and lively town that combines a modern economy, crafts, and the promotion of nature. The brand that carries his name has grown to become a leading European cosmetics company, distributing over 300 million products annually in 80 countries.

Within the scope of preparing for the Rio+20 Summit, Yves Rocher offers to share its concrete experience. Sustainable Development integration at La Gacilly, but also at a larger scale, requires a continuous improvement approach and highlights two key themes that could be shared at the Rio+20

Summit:

- An analysis of the interactions with the biosphere at the local level and beyond, and the implementation of levers for action which enable more sustainable interactions;
- A deep understanding of the issues involved in and the conditions for sustainable development via research and mediation.

#### FROM INTERDEPENDENCE TO BIODIVERSITY

Developing tools that convey the biodiversity interdependence of organisations The founding example of La Gacilly is a demonstration of how Yves Rocher has sought to integrate itself in its human and environmental ecosystem, in line with the mission defined by its founder. The Brand has developed and expanded well beyond Brittany, but its business mission has remained constant. To this end, it must conduct an analysis on its interactions with its ecosystem and with the myriad of ecosystem services that it depends on (air and water purification, and the provision of raw materials for example).

Yves Rocher's business is intrinsically dependent on biodiversity. At the level of La Gacilly, these links are rather tangible, due to the way its ecosystem operates. When applied to a larger scale, exhaustive knowledge of these links becomes a radically different kind of challenge. Current economic systems reflect these interactions with biodiversity very imperfectly. At the organisational level, tools such as the Business and Biodiversity Interdependence Indicator (BBII) from Orée, and the Ecosystem Services Review (ESR) of the World Resources Institute, the World Business Council for Sustainable Development, and the Meridian Institute address these issues.

<sup>[8]</sup> The development of tools to analyse interdependency to biodiversity, their adaptation to the specificities of the business, as well as their dissemination, are a valuable achievement for economic actors in particular.

Developing levers for action that incorporate biodiversity interdependence Knowledge of the interactions with biodiversity is a prerequisite for inventing new sustainable levers for action. Take plant sourcing for example. Before using plant-based raw material, resource availability and integration in the local environmental and socio-economic balance must be assessed. Beyond environmental impact management, botanical sourcing can also be used as a tool to foster biodiversity conservation and sustainable development in a broader sense, in accordance with the founding principles of the Convention on Biological Diversity. Yves Rocher field experience can contribute to demonstrate that this is possible.

Yves Rocher builds on its local experience in socio-economic and environmental integration in La Gacilly. In terms of sourcing, it encourages the use of plants that it cultivates in La Gacilly, even if their resale price is above market price. Yves Rocher would like to continue to keep this plant production local because of the intangible value that it generates locally. Yves Rocher strives to apply this philosophy to others areas of activity, particularly in plant supply systems in distant locations. Each new supply system must thus be adapted to the specific context (cultural, environmental, industrial etc.), and built via a symbiotic approach.

Experimenting is essential (the root of the word "experiment" literally means to "pass through" a trial and to learn lessons from it). The construction of the supply system of the essential oil of saro (*Cinnamosma fragrans*), a Madagascan shrub, is a poignant example. Villagers harvest saro leaves and distil them to produce the essential oil. In addition to providing an incentive for ecosystem conservation, there are a whole host of benefits—saro cultivation and replanting trials, instructor financing, and most importantly, support for economic development. So that local producers can become economically and technically selfsufficient,

Yves Rocher paid for the still used to distil the essential oil. It also transferred know-how and test results so that local producers can easily sell the essential oil to other firms. This type of scheme rethinks the supply system, and allows its actors to better know each other. It is based on a human network (in Madagascar for example, these network players include Yves Rocher, the NGO MATE, Malagasy SMEs and harvesters). Sustainable sourcing strengthens the relationship between stakeholders, building bridges between these stakeholders who share common interests and who can then combine their strengths in a shared project. Beyond a basic strategy to secure the supply system upstream by strengthening it, this sustainable approach creates extended value for cosmetics products and above all creates meaning. This is not only about plants, but also about humans. The effort to incorporate biodiversity interdependence in plant sourcing is henceforth part and parcel of the Botanical Beauty concept. This effort is reflected in plant selection, and in establishing supply system relationships and the operational tools that are meant to encourage more long-term use of the plants by including them in a diversity of products.

<sup>[9]</sup> Once the interdependent biodiversity relationship is recognised, new levers for sustainable action can be planned. The example of plant sourcing shows that it is possible to reconcile the concerns of consumers and producers of plant raw materials, all while contributing to sustainable biodiversity management. In line with the principles of the Convention on Biological Diversity, levers for action can be developed to combine biodiversity promotion and conservation. Their wider application, particularly within the framework of applying the Nagoya Protocol, could be facilitated by sharing concrete field experiences, and via more interaction among the involved stakeholders (indigenous and local communities, NGOs, firms, and administrations for example).

#### GRASPING SUSTAINABLE DEVELOPMENT IN ALL ITS COMPLEXITY

Encouraging interdisciplinarity in research Sustainable development requires consideration of the environmental, economic and social spheres as a whole and of their interconnections in particular. Research on this requires heterogeneous expertise (chemistry, ecology, climatology, economics . . .) whose segmentation is now being offset by a more interdisciplinary and transversal approach. As a concrete example, his multi- and inter-disciplinary model from the plant to the skin has demonstrated its advantages for innovation at the level of Yves Rocher research and development.

<sup>[10]</sup> So that each actor can fully understand how it can become part of and contribute to the sustainable development goal, it is vitally important to increase the interdisciplinary nature of research.

Increasing collaboration between public research and business Collaboration between business and research—notably public research—could also be supported, by expanding research and innovation networks for example. One of the goals would be to strengthen coordination between fundamental and applied research. Businesses can provide their operational and field knowledge, which is often developed in various countries, and also share their lessons learned through interaction with several stakeholders. In France, the National Foundation for Biodiversity Research is also opening new horizons through involving business, associations, public institutions, local authorities, natural area administrators, and elected officials—all as key actors in biodiversity.

<sup>[11]</sup> Collaboration between business and public research could act as a tool to link up research by strengthening operational and concrete sustainable development logic on the field.

Increase the importance granted to human and social sciences Sustainable development research goes beyond a strictly scientific framework, and encompasses the

concerns and stakes of a new multiplicity of stakeholders. The perception of sustainable development is diffracted amongst its actors (including various elements of civil society, non-governmental organisations, administrations, and companies.) It is crucial to go beyond strictly scientific and analytical concerns, and to integrate social and human dimensions that address their concerns and their perception of the issues.

 Enriching reflection on sustainable development could involve granting more importance to human and social sciences, as well as multiplying the interfaces between the sciences, civil societies, and policies.

Strengthen sustainable development mediation

The appropriation of sustainable development issues and also the awareness of responsibility for the causes and the consequences of individual and collective actions, especially consequences that are delayed and that are observed in a different location are two key issues. Yves Rocher can share its experience linked with the role of mediator with its clients it is able to and must play, to heighten their awareness of sustainability issues. This green mediation involves each of the products sold annually but also events for the general public such citizen mobilisation. As part of the Plant for the Planet programme, the Yves Rocher Foundation — Institut de France launched an international viral campaign in July 2011. This programme is embodied by a tribe of planters, and aims to mobilise as many people as possible ahead of the Rio+20 Summit.

 Faced with the complexity of sustainable development issues, mediation must be strengthened to clarify sustainable development issues to both inform and educate the public.

## Zoi Environment Network

### From Rio 1992 to 2012 and beyond: Sustainable Mountain Development

#### Central Asia

Last updated: 1 November 2011

This report is an illustrated overview of the trends and challenges in sustainable mountain development in Central Asia since 1992. It highlights selected achievements and lessons learned, and identifies opportunities for further progress. The information comes from interviews with key actors, from official and scientific sources and from media accounts. While the report strives to maintain high research standards, it presents the scientific and technical material in a manner accessible to lay readers.

The Swiss Development Cooperation has provided support for the process of identifying trends, developments, lessons and opportunities in the Central Asia mountains and in other mountain regions.

The views expressed in this document are those of the authors and do not necessarily reflect the views of the partner organizations and governments.

This report was prepared by the University of Central Asia (head office in Bishkek, Kyrgyzstan) and Zoi Environment Network (Switzerland) with assistance and advice from: the Kyrgyz State Agency on Environmental Protection and Forestry, the Tajik Committee on Environmental Protection, CAMP Alatoo, CAMP Kuhiston, the Alliance of Central Asian Mountain Communities, The Aga Khan Mountain Societies Development Support Programme, the Regional Mountain Centre, the National Centre on Mountain Regions Development, the Centre for Climate Change and Disaster Reduction, the Osh Aarhus Environmental Information Centre, Issyk-Kul State University and the Central-Asian Institute for Applied Geosciences. Colleagues at the Consortium for Sustainable Development of the Andean Ecoregion and at Bern University provided useful comments.

Numerous site visits, regional consultations in Bishkek and Karakol and online discussions helped shape this report. A preliminary version was presented at the Lucerne World Mountain Conference (10-12 October 2011, Switzerland) where the experience and insights of colleagues in other mountain regions of the world informed this final report.

Case study authors, contributors and reviewers: E. Batjargal (coordinator), N. Dhanani, A. Soronkulova, N. Safarov, B. Toktoraliev, A. Aidaraliev, B. Salykmambetova, Ch. Alibakieva, I. Dairov, T. Mamatov, M. Anarbaev, L. Joldubaeva, Sh. Kainazarov, G. Ilipbaeva, M. Kuchmanov, N. Abdylasoba, A. Kiyazova, A. Barieva, U. Kasymov, A. Karsymbek, S. Djumabaeva, C. Kelner, T. Bakirov, A. ## Executive summary

For the five countries of Central Asia – the Republic of Kazakhstan, the Kyrgyz Republic, the Republic of Tajikistan, Turkmenistan and the Republic of Uzbekistan – the sustainable development movement launched in Rio in 1992 has played out in the context of the 1991 collapse of the Soviet Union. The transition from a planned to a market economy and from totalitarianism to democracy and independence was a rocky period of geopolitical changes that coincided with rapid technological development and globalization and a growing awareness of environmental changes related to climate, biodiversity and land degradation. Regional tensions and conflicts gave rise to new security requirements. New demographic and labour market realities and changes in the ownership and control of natural resources created shifting social dynamics.

This report analyses the region's progress in sustainable mountain development over the past 20 years, and examines how the forces and trends affecting Central Asia create both challenges and opportunities for the new countries and their people. The Lucerne World Mountain Conference in October 2011 issued a call for action for the protection of water supplies, the reduction of poverty and the unlocking of the economic potential of the mountains of the world. A summary of how Central Asia is performing against the Lucerne call for action follows:

- Compared to other mountain regions, Central Asia lacks experience in mountain governance, but the 2002 Bishkek Global Mountain Summit, which concluded with the formation of the Bishkek Mountain Platform, marks a turning point, and provides a strong basis for further improvements.
- In the energy, mining and tourism sectors, the challenges regarding the equitable sharing of benefits are substantial, but so too are the opportunities, and numerous efforts are underway to unlock the economic potential for the benefit of all the affected parties.
- The decentralization that has occurred as part of the transition to independence has increasingly involved mountain people in the decision-making that affects their lives and communities. The region has experienced an impressive growth in the number of Village Organizations and Civil Society Organizations whose participation has influenced countless decisions.
- In many instances of transboundary or highland–lowland tensions, the political will to resolve mutual problems is missing, but international aid organizations such as the Aga Khan Foundation and regional institutions such as the Interstate Commission for Sustainable Development are working on capacity-building and on the generation and exchange of knowledge, expertise and innovation in mountain development.
- Organic agriculture and small hydropower offer promising avenues for private sector investment in sustainable development in Central Asia, and the region's strategic location is a built-in incentive for private investment in trade and public investment in the transport infrastructure. Commitments to mountain development may change with the political winds, and mountain advocates may find more consistent public support for their concerns by working to integrate mountain issues into the Rio conventions and the associated country plans and programmes.
- All of the Central Asia countries recognize the vulnerability of their mountain ecosystems, but the protection of these ecosystems could benefit from linking the strategies for mountain development with other, broader agreements on trade, economic development, conflict resolution and resource management.
- The Global Environment Facility supports the preparation of reports and plans related to the Rio conventions, and funds projects from the local to the regional level in Central Asia. The mountains could benefit from more explicit inclusion in other development projects, and the countries of the region may want to consider debt exchange – a mechanism that redirects debt repayments to sustainable mountain development.

With more than 90 per cent of their national territories considered as mountainous, Kyrgyzstan and Tajikistan are mountain countries, while Uzbekistan, Kazakhstan and Turkmenistan – with much smaller mountainous regions – are countries with mountains. The mountain regions of these latter three countries are no less important, but this report necessarily devotes more space to the main Central Asian mountain regions, which lie in Kyrgyzstan and Tajikistan.

## Findings, observations and recommendations

**Findings:** The findings of this report fall within four broad categories – people; infrastructure; ecosystems; and institutions, governance and knowledge. The effects of the forces and trends at work have been both positive and negative, sometimes both at the same time, and progress in the mountains of Central Asia can be characterized as a series of forward and backward steps.

### People in the mountains (one step forward, two steps back)

- Border security concerns have constrained the movement of goods and people, especially the nomadic people and those living in or traveling around mountain enclaves.
- Public expenditures on education and health are less than one quarter of the previous (Soviet) levels. The official literacy rate is high, but the declining quality of education in mountain countries is becoming an obstacle to sustainable development. Child mortality rates are falling, but the risk of malaria, tuberculosis, HIV/AIDS and other diseases remains high.
- The rules on ownership rights have relaxed across the region, and a free and competitive market system has evolved, but corruption marred the transition.
- Tajikistan's animal husbandry and food production exceed 1991 levels, and honey production has substantially increased. Kyrgyzstan's food production has increased, but its animal husbandry lags behind previous levels.
- Large-scale hydroelectric projects are a drain on national resources, a source of international tensions and a cause of resentment among the local communities that may share the costs, but may never share the benefits.
- A reluctance on the part of governments and mining companies to share profits equitably, and a lack of transparency in decisions, have led to discontent among groups in the mountains.
- Civil war and armed conflict wracked the mountainous regions of Tajikistan for the entire decade of the 1990s. In Kyrgyzstan, violence widened the ethnic and geographic

divides.

- Women have become heads of households as a result of the labour migration of men. In rural areas they are highly vulnerable to crop failures, heatwaves and natural disasters.

#### **Infrastructure in the mountains (two steps forward, one step back)**

- The expansion of the road system has increased the accessibility to remote mountain areas. The increase in the number of people who have cars has improved mobility and connectivity.
- The use of the Internet in mountain countries has grown substantially. Online education and distance learning are increasingly available options.
- Information technologies in the banking sector have lowered the costs and increased the efficiency of labour remittances.
- The quality of hydrometeorological stations and equipment have declined sharply.
- Kyrgyzstan enacted economic reforms and allowed access to geologic information to promote development in the mining sector. Tajikistan lags behind.
- Kyrgyzstan and Tajikistan are working to develop their large hydropower potential, less than 10 per cent of which is used.
- Tourism offers a promising source of alternative livelihoods. Central Asian countries have an opportunity to further develop winter and cultural tourism.

#### **Mountain ecosystems (one step forward, two steps back)**

- The increased use of cars has increased the risks to previously unreachable mountain ecosystems.
- Tajikistan and Kyrgyzstan have the lowest greenhouse gas emissions in Central Asia.
- In the last 50–60 years, between 15 per cent and 35 per cent of the Tien Shan and Pamirs glaciers have melted.
- The use of woody biomass and dried dung as major sources of energy, combined with forest cuttings and the widespread collection of slow-growing shrubs have diminished mountain biodiversity.
- Fires and pest attacks on mountain forests due to limited controls and hot, dry weather conditions have destroyed and damaged significant forested areas, especially in Kazakhstan.
- Lake Issyk-Kul fisheries have declined to negligible levels, and previously abundant endemic fish species have become endangered.
- The enrichment of agricultural biodiversity resulting from the efforts of Soviet agronomists is threatened by the pressures to compete in global markets, and the genetic diversity of the local food base is at risk.
- The growth in rainfed crop cultivation in the mountain areas has increased soil erosion on steep slopes.
- Overgrazing and the collection of bush exposes the mountain territories to a high risk of desertification.
- Protected areas have doubled in size over the past 20 years, and include buffer zones, corridors and national parks, but underfunding and inexperience limit the effectiveness of the protection.

#### **Institutions, governance, knowledge (one step forward, one step back)**

- "Electronic government" systems promote more efficient and decentralized governance, and increase public access to government information and services.
- Mountain countries and provinces are providing better media access, establishing small local data bases and issuing environmental reports online, thus expanding the opportunities for participation in governance.
- Kyrgyzstan passed new laws on decentralization and the use of natural resources and energy. The process reached the village level with the establishment of democratically elected Pasture Committees.
- Mountain-focused NGOs advocate for open processes of policy formulation and act to bridge any gaps between new legislation and strategies and the realities in mountain communities.
- In Kyrgyzstan, enforcement efforts could not keep up with the rapid pace of the new legislation passed to respond to evolving local needs and ambitions.
- Tajikistan continues to rely on a command-and-control approach to governing. The legislative process is less transparent and less inclusive.
- The 2002 Bishkek Global Mountain Summit generated momentum for regional cooperation on mountain issues, but the impetus has diminished and the cooperation has been inconsistent.
- The potential for local conflict over pasture and water use has increased, but the support of NGOs and improvements in governance have reduced anxieties.

**Observations:** The establishment of a green economy and the further pursuit of good governance are relevant and necessary steps for successful sustainable mountain development in Central Asia. The greening of the energy, agriculture, forestry, tourism and water sectors will not only provide environmental safeguards, but also give the countries a competitive advantage economically and promote the equitable distribution of social benefits. The continuing improvement in the efficiency and effectiveness of institutions will aid in the development of a green economy and in the progress towards good government.

**Recommendations:** The Central Asia mountain report team recommends the exploration of two ideas that have been a part of discussions of sustainable mountain development in Central Asia:

- The creation of a mountain countries group under the auspices of the United Nations
- The exchange of external debt for an equivalent investment in sustainable development.

## Part 1: Setting the stage

The Preamble to Agenda 21, the comprehensive programme for global action on sustainable development adopted by the 1992 Earth Summit in Rio de Janeiro, begins with a simple statement: "Humanity stands at a defining moment in history." The same might have been said in a different context the previous year when the Soviet Union collapsed. For the people of Central Asia, the transition to independence has coincided with the global sustainable development movement, and as the new countries of Central Asia have increasingly engaged with the wider world, the ideas of sustainable development have helped shape progress in the region.

Diverse mountain ranges described by the early Persians as the "Roof of the World" and by the Chinese as the "Heavenly Mountains" have always played a pivotal role in this vast area comprising five countries – the Republic of Kazakhstan, the Kyrgyz Republic, the Republic of Tajikistan, Turkmenistan and the Republic of Uzbekistan. Agenda 21 recognizes the mountain environment as nothing less than "vitaly necessary for the survival of mankind." In 2002, the halfway point between Rio and Rio+20, the International Year of Mountains culminated with the Bishkek Global Mountain Summit in Bishkek, Kyrgyzstan. The Bishkek Summit coincided with an economic upturn in Central Asia, and marks an important moment in sustainable mountain development in the region.

This report concentrates on sustainable mountain development in Central Asia over the past 20 years, considers the influence of the transition to independence, identifies some of the challenges and opportunities and presents selected case studies of mountain projects designed to meet the challenges and take advantage of the opportunities.

### 1.1 Mountain ecosystem goods and services

The mountains of Central Asia provide an astonishing array of essential ecosystem goods and services that serve not only the mountain inhabitants but also those in the lowlands and people around the globe. These goods and services, which fall into three broad categories – provisioning, regulating and cultural – include forest products and land for food production; watershed protection; habitat for flora and fauna of local and global significance; the regulation of natural hazards and climate; natural areas for leisure and recreational activities; and perhaps most important of all, the storage and release of water. In the Regional Sustainable Development Strategy of Central Asia (2008), the governments officially acknowledge the role of mountains as "water towers" and storehouses of biodiversity.

Almost 90 per cent of the population of Central Asia relies on water that falls in the mountains where it is stored in glaciers and snow before making its way downstream to population centres. Densely populated valleys and oases of the vast drylands of Central Asia depend on mountain water transported by numerous rivers and streams, especially the Syr Darya River, which arises in the Tien Shan Mountains, and the Amu Darya, which arises in the Pamirs. Each flows more than 2 000 kilometres to empty into the Aral Sea. Other major regional rivers originating in the mountains are the Ili, Chu, Talas and Saryjaz.

Overall, Tajikistan holds 40 per cent, and Kyrgyzstan 30 per cent, of the water resources serving the five Central Asia countries. These water resources also serve China and Russia. Uzbekistan, with the largest population in the region, is the biggest water consumer, in large part because of an economy based on irrigated agriculture. With 90 per cent of their water resources coming from mountains located outside their country borders, Uzbekistan and Turkmenistan, are highly vulnerable to water shortages, especially the downstream communities. Global warming is slowly decimating mountain glaciers, affecting snow reserves and at the same time increasing the water requirements of basic agricultural crops. A relatively large Zeravshan glacier in Tajikistan – a source of water for half a million hectares of irrigated lands and densely populated ancient oases of Samarkand and Bukhara in Uzbekistan – retreated by 2.5 kilometres between 1927 and 2009. A projected reduction in the Amu Darya river runoff – the expected effect of climate change in the Pamirs over the next 20 to 40 years – can only make matters worse.

Mountain regions are crucial to the maintenance of the natural and agricultural global biodiversity. The vertical distribution of natural species by elevation results in a wide range of species and ecosystems spread over a relatively small surface area. Endemic species find homes in isolated islands of mountain habitat with characteristics conducive to unique life forms and varieties. Central Asia is home to more than half of the world's 150 wild tulip species, many of which grow only in the mountains. Similarly, the number of crops that either originated or further diversified in Central Asia mountains is impressive. The region is famous for harbouring genetic resources of the wild species of several domesticated plants and animals such as wheat, apples, almonds, walnuts and pistachios, as well as horses, goats and yaks.

The Central Asia mountains host at least 20 distinct ecosystems and 4 500–5 500 species of vascular plants, almost one quarter of which are unique (endemic) to the region. At lower altitudes and in the foothills, dryland ecosystems prevail. At higher altitudes, grasslands, shrubs and forests are widespread. Meadows and tundra-like ecosystems are found on high mountain plateaus. Globally endangered species resident in the mountains include the snow leopard (with more than half of global population) and the Marco Polo sheep. The numbers of these species have declined, however, as a result of poaching, hunting and the depletion of the food base. The high biodiversity richness and endemism of flora and fauna of the mountains of Central Asia is exemplified by the fact that the number of vascular plant species found in the Pamir-Alai or the Tien Shan Mountains is four times higher than that of the nearby lowland Karakum Desert, which has twice the area.

Mountain forests and shrublands in Central Asia cover almost five million hectares, including 2.5 million hectares of coniferous forests, and more than 350 000 hectares of globally significant fruit-and-nut forests comprising walnuts, almonds, pears, apples, cherries and pistachios.

Mountain forests provide invaluable watershed protection and erosion control, and contribute to the regulation of water resources by decreasing or smoothing runoff – with a corresponding decrease in erosion – and by retaining groundwater. They also provide mountain people with a rich source of the fuel wood essential to the heating of living spaces, the cooking of food and the purification of drinking water, and with timber and other forest products such as wild fruits, nuts and medicinal plants for subsistence or trade. A relic species of Tien Shan spruce forms a unique and spectacular forest belt in the Tien Shan Mountains. Juniper woodlands of the Gissar and Pamir-Alai Mountains may be 1 000 years old.

In addition to reducing erosion, mountain forests also protect communities and transport infrastructure from natural hazards by preventing, or reducing the impact of, such events as landslides, flash floods and avalanches. And while mountains are vulnerable to the effects of climate change, they also play an important role in modulating the climate across wide areas, and are important reservoirs for the storage of carbon.

For residents of the largest Central Asian cities – Tashkent, Almaty, Bishkek, Dushanbe and Ashgabat – mountains provide fresh air and the breezes that disperse urban air pollution. Mountains and their refreshing lakes and white-water streams are among the most popular weekend destinations for urban residents. In addition to picnics, hiking or skiing in beautiful unspoiled highlands, the key mountain attractions include geothermal sources and spas, kumis horse milk therapy and the sampling of diverse mountain honeys, local herbal teas and traditional products.

Mountains provide a profound sense of place, a source of inspiration and a rich cultural heritage. The degree of cultural diversity varies among the mountain regions of the world. In a manner reminiscent of Switzerland, people in isolated mountain areas of Central Asia, especially in the Pamirs, differ significantly from those in the main valleys, and communities tend to develop distinctive cultural identities and languages. In the Soviet period, however, mountain minorities were integrated with the "mainland" and partly lost their specificity. Before the era of industrialization and urbanization, spirituality was also common in mountain communities of Central Asia, where people regarded the mountains as living forces and sources of power or symbols of the sacred.

The rich and diverse cultures of Central Asia and the strong sense of place in the mountains attract visitors from around the world, and tourism offers an additional income source for mountain communities.

The challenges to the continuing capacity of mountain environments to deliver their ecosystem goods and services come from natural hazards and disasters, from climate change and its effects on mountain ecosystems and from the competing uses of the resources. The management of risks entails the balancing of interests – highland and lowland; agricultural and industrial; local, national and regional; and economic, educational and cultural.

The main drivers of change in the extent and quality of Central Asian mountain ecosystems and their services since the 1950s have been population growth (and associated increasing consumption of natural resources and energy); agricultural developments; changes in land use; industrialization (and associated ecosystem fragmentation, over-exploitation and pollution); and, increasingly, the effects of global warming. During the last two decades, a continuation or augmentation of these drivers in combination with political, economic and social changes has rendered development unsustainable in some areas. At the same time, new opportunities and initiatives for sound natural resource management and conservation have developed and counter-balanced some of the negative trends.

## 1.2 Key characteristics of the Central Asian mountains

The landscape of Central Asia is characterized by dramatic peaks, high mountain plateaus, deep valleys, massive glaciers, steppes and vast desert plains. Two of Asia's major mountain ranges – the Pamirs in Tajikistan and the Tien Shan in Kyrgyzstan – make those countries the most mountainous in the region, with an average elevation of about 3 000 metres above sea level, peaks exceeding 7 000 metres and more than 90 per cent of their national territories considered as mountainous. In addition to being more mountainous, Kyrgyzstan and Tajikistan are less developed and less economically advanced than the other three Central Asian countries. At the same time, these countries often label their mountain territories as the Alps or the Switzerland of Central Asia.

Mountain ecosystems also cover parts of Eastern Kazakhstan (Kazakh uplands, Djungar Alatau, Tarbagatai and Altai), south-east Uzbekistan (Western Tien Shan and Gissar) and Turkmenistan (Kopet-Dag and Kugitang), and extend into Afghanistan (Hindu Kush) and China (Eastern Tien Shan and Pamir). Mountains comprise 20 per cent of the area of Uzbekistan, 10 per cent of Kazakhstan and 5 per cent of Turkmenistan, but the natural resource programmes in these countries nevertheless tend to highlight the role of mountains in specific geographic areas, and to focus on mountain biodiversity treasures. Overall, mountains cover 800 000 square kilometres or 20 per cent of the total area of Central Asia.

The Tien Shan Mountains, one of the most extensive mountain systems of Central Asia, cover all of Kyrgyzstan and extend into Kazakhstan and the Chinese province of Xinjiang. The highest peak of the Tien Shan is Jengish Chokusu, or Victory Peak, which stands at 7 439 metres. In south-eastern Kazakhstan, the picturesque Djungar Alatau Mountains, together with the Tien Shan, form a 400 kilometre-long natural border with China.

The 300 kilometre-long and 170 kilometre-wide Ferghana Valley separates the Tien Shan from the Pamir Mountains, and extends into Uzbekistan, Kyrgyzstan and Tajikistan. It is the most densely populated and ethnically diverse region of Central Asia, with an average population density of 350 persons per square kilometre. Some districts exceed 1 000 persons per square kilometre, and in 2010 the total population in the valley and nearby mountains exceeded 12 million.

The Pamir Mountains join the Tien Shan in Kyrgyzstan in the north and the Hindu Kush Mountains in Afghanistan and Pakistan in the south, and contain some of world's highest peaks including the Conger, which rises to 7 719 metres in China, and Somoni Peak, at 7 495 metres in central Tajikistan. The Eastern Pamir are dominated by high plateaus (above 3 000 metres) and host nomadic populations of Kyrgyz origin, while the Western Pamir are carved by rapid mountain rivers, with deep valleys, spectacular gorges and traditional settlements nestled on alluvial fans. Eighteen distinct ethnic groups are known to occupy this culturally diverse region, and the 200 000 people living there depend largely on subsistence farming and international aid.

Glaciers cover 4 per cent of Kyrgyzstan and 6 per cent of Tajikistan. They are also present in Kazakhstan and Uzbekistan. In total they cover an area of 12 000–14 000 square kilometres within Central Asia and about 20 000 square kilometres if the glaciers within China's territory are included. The glaciers contain frozen water reserves of about 1 000 cubic kilometres – the equivalent of 10 years of water flowing down the Amu Darya and Syr Darya Rivers. Melt water from snow, glaciers and permafrost supplies about 80 per cent of the total river runoff in Central Asia. Glaciers are crucial to the agricultural economy of the region. They produce water in the hottest and driest period of the year and compensate for low precipitation.

The Tien Shan and the Pamirs feature contrasting climates from harsh and dry in the interior and in the eastern corners (below zero annual surface temperatures; 150–300 millimetres average annual precipitation, mainly in summer) to more humid and temperate in the western parts (1 000–1 500 millimetres average annual precipitation, mainly in winter and spring). Many high mountains consist of barren ground, glaciers and other environments inhospitable to humans, but home to wild animals such as the Marco Polo sheep and the snow leopard. Mountains with more favorable climatic conditions possess fine grasslands and forests.

Kazakh uplands stretch for more than 1 000 kilometres from west to east and feature numerous hills and mountains up to 1 500 metres above sea level. Several rivers of central Kazakhstan, including the Ishim, Nura, Sarysu, Silety and others, originate here. Numerous salty and freshwater lakes dot the uplands.

The Kopet-Dag, also known as the Turkmen-Khorasan Mountain Range, run along the border of Turkmenistan and the Islamic Republic of Iran, a region characterized by foothills, dry and sandy slopes, mountain plateaus and steep ravines. The highest Kopet-Dag peak in Turkmenistan stands southwest of the capital, Ashgabat, at 2 940 meters. The country's highest elevation is 3 137 metres in the Kugitang range. Turkmen mountains are famous for their deep and spectacular caves and dinosaur footprints.

Arable lands occupy less than 0.5 per cent of the total area in the Tajik Pamirs, and pastures another 12.0 per cent. In the Tien Shan Mountains of Kyrgyzstan, the proportion of pastures and arable lands is higher. Only half of Kyrgyzstan's land area and less than one third of Tajikistan's land area is suitable for agriculture, mainly for grazing. Croplands and gardens occupy less than 7 and 5 per cent of their land areas, respectively. Other lands are considered not suitable for agriculture due to harsh climate, poor soils, the predominance of rocks and glaciers. Nevertheless, a majority of the mountain communities of Central Asia practice agriculture – principally cultivating cereals and vegetables, gardening, collecting forest products and extensive livestock grazing on a wide range of pastures. Tourism, mining and trade form important economic sectors that have been gathering momentum in the mountain regions over the past 20 years. Infrastructure development has likewise experienced growth. All of these activities contribute to the revival of the ancient Silk Road in the modern age of globalization.

## 1.3 Trends in the Central Asia mountain regions over the past 20 years

To the people of the Central Asian mountain communities, the array of forces affecting their lives must seem at times as diverse and powerful as the mountains themselves. As a result of geopolitical forces, five new countries faced the transition to independence and national governance and all that that implies. The 20-year transition period coincided with a period of rapid technological development and globalization and a growing awareness of global environmental changes related to climate, biodiversity and land degradation. New requirements for security arose out of international and regional conflicts over governance, ethnic differences and resources. Socio-economic forces added to the mix as new demographic and labour market realities emerged, and changes in the ownership and control of land and other vital natural resources took effect. And all of this played out in the context of the environmental degradation and the limited capacity to respond that were the legacies of the former Soviet Union.

All of the changes resulting from these forces affect mountain communities. And everything, it seems, is connected. One example can demonstrate the point: Global climate change affects glaciers, precipitation patterns and the timing of snowmelt. The water resource consequences may entail disruptions in allocations and affect multiple users. This situation raises the issues of resource distribution and ownership, and poses challenges to governance and, in some cases, international relations. Water resource

allocation decisions have implications for individual livelihoods and economic development in such sectors as tourism, energy production and agriculture. Competing demands may exacerbate urban–rural conflicts or conflicts over scarce natural resources.

The following subsections identify the trends at work in Central Asia, and make links among them. But as the climate change example shows, the connections are numerous, and any attempt to exhaust the possible permutations would be futile. Some of these trends will likely continue or intensify while others may fade. The effects of the trends are both positive and negative, sometimes both at the same time, and progress in the mountains can be characterized as a series of forward and backward steps. Policymakers and stakeholders can decide for themselves the lessons to take from the events of the past 20 years as they try to adjust to the driving forces in order to maximize the benefits for mountain communities.

Arguably, the mountain communities of Central Asia are more sensitive to social, political and environmental changes than are lowland communities, and while they remain marginalized and remote, their self-reliance and resilience may help them seize the opportunities that changes bring. By becoming more proactive and communicating their views widely, and by learning from each other, mountain communities may be able to ride the wave of change to a more stable, prosperous and sustainable future.

## Geopolitical Changes

### 1.3.1 Independence and the transition to national governance

Situated between the Russian Federation, Iran, Afghanistan and China, Central Asia was a unified area under the Soviet Union with a common heritage in terms of language (Russian in combination with national languages), culture, education and infrastructure, and with unified energy, water, agricultural and industrial systems and road connections.

Following the disintegration of the Soviet Union in 1991, all the former Soviet Republics of Central Asia declared their national independence, thus ushering in a new political era characterized by diverse systems of national governance, inherited and emerging economic development bases and differing strategic visions. The task of political and economic transformation fell mostly on the same authorities who had been Communist party leaders and members. In 2011, all the Central Asian nations celebrated 20 years of national independence – a shared historical milestone. At the same time, they continue to develop at very different speeds along increasingly different paths.

Prior to 1992 the newly independent Central Asian nations had no experience with democratic governance or market economies. The energy-rich and industrialized countries – Kazakhstan, Uzbekistan and Turkmenistan – enjoyed large capital inflows into energy and industrial projects and invested new profits in the housing sector and infrastructure development, especially the expansion and rebuilding of the capital cities of Astana, Tashkent and Ashgabat.

The withdrawal of Soviet support hit remote mountain communities in Tajikistan and Kyrgyzstan particularly hard, and a downward development spiral continued from 1991 into the late 1990s. For most of the 1990s, turbulent changes rocked the densely populated areas and spread to the mountain villages of Central Asia where economic collapse and the loss of job opportunities followed the end of orders and subsidies from the Soviet government. Gross national products fell in just five years by almost 50 per cent, and the new states were unable to maintain funding for such priority needs as education, health and pensions. Only after 15 years of recovery have the economies approached their 1991–1992 levels, but the countries' total external debt has increased. By end of 2011, the external public debt exceeded US\$ 2.7 billion in Kyrgyzstan and US\$ 2.2 billion in Tajikistan. The peak of the public debt servicing is forecast for 2015–2020 when in addition to the interest on loans the countries will have to repay the principle.

Financial dependency on Moscow has been steadily declining, but Russia still plays an important role in the economies of Kyrgyzstan and Tajikistan both directly – through the provision of loans and funding for infrastructure and industrial projects – and indirectly through opening its markets for labour migrants and traditional agricultural products (wool, cotton, fruits and vegetables). Under the Soviet agricultural system, orders from central authorities determined agricultural specialties and crop patterns. After a period of disruption that included undernourishment in mountain villages, a new system of self-management took root, and in the last 5–10 years the mountain farmers have become more self-reliant. The Kyrgyz and Tajik economies have been growing over the last 10 years as a result of increased agricultural production, expansion of services and trade, favourable world markets for gold and aluminum and soaring remittances from labour migrants abroad. Reducing dependency on the state, catalysing initiative and promoting an entrepreneurial spirit entailed a major change in the mentality for both people and institutions.

A period of regional and global cooperation followed the post-Soviet era with Central Asian governments demonstrating a general willingness to cultivate closer relationships between each other and with their regional neighbours and global players. Participation in the United Nations, the Organization for Security and Cooperation in Europe (OSCE), the Shanghai Cooperation Organization (SCO), the Eurasian Economic Community (EurAsEC), the Commonwealth of Independent States (CIS) and the International Foundation for Saving the Aral Sea (IFAS) are some examples of this wider cooperation, as is the progress toward World Trade Organization (WTO) membership. In Central Asia only Kyrgyzstan is a WTO member, joining in 1998. Through the initiative of Kyrgyzstan, the UN declared the International Year of Mountains in 2002 and supported the Bishkek Global Mountain Summit in 2002, and through the initiative of Tajikistan, the International Year Freshwater in 2003.

Uzbekistan, of all the Central Asian States, has retained a system of central planning and management most like the Soviet style. Strong political and economic control is still a dominant characteristic of the country, and the Uzbek government is striving to increase levels of international trade and aiming to become the regional leader in terms of population and agricultural and industrial production capacity, much like in the Soviet era.

Kazakhstan has similar aspirations. A country rich in oil, gas and mineral reserves, Kazakhstan has experienced an influx of foreign investment leading to a rapid rise in wealth that has brought both challenges and new opportunities. As the bridge between Europe and Asia, Kazakhstan is also working hard to raise the standing and prestige of the country on the international stage by chairing the Organization for Security and Co-operation in Europe in 2010, and by hosting events such as the 2011 Asian Winter Games, the 2010 Asia-Pacific and the 2011 Pan-European Environmental Conferences and other high-level business and political meetings. Kazakhstan has recently put forward a "Green Bridge" environmental initiative which will be featured at the Rio Summit in 2012. In addition, the ambitious strategic development plan, "Kazakhstan 2020", sets major economic and social targets for the country.

Turkmenistan's abundant hydrocarbon resources are fuelling the country's rapid economic growth and the modernization of its economy, particularly in the textile, food and construction industries. The state controls strategic farming sectors such as cotton and wheat production, but private farmers grow most of the fruits and vegetables, and manage the livestock. The government provides free electricity, natural gas, water and subsidies for many services and consumer products, but political and media freedoms and civil society participation in decision-making in Turkmenistan are tightly regulated.

Following the breakup of the Soviet Union all of the countries in Central Asia experienced a period of upheaval in the transition to market economies, but Kyrgyzstan is the only one to experience three periods of major political change: the demise of the government of President Askar Akaev in 2005; the demise of the government of President Kurmanbek Bakiev in 2010; and the establishment of a parliamentary democracy with the President having fewer powers than the Prime Minister and the National Parliament. Arguably, the demand for change that fuelled the "tulip revolutions" in Kyrgyzstan started in the Naryn and Talas mountains, where the people saw a role for themselves in decision-making at the individual, village and country levels. The open spirit that exists in the mountains provided an environment where the people felt free to express their ideas for reform, and the small population and its remoteness from urban centres meant that central government exerted little influence on mountain affairs. The rapid economic changes, including growing energy tariffs without adequate social safeguards for the impoverished mountain areas, and the widespread corruption of the central and provincial authorities further fuelled the uprising. The benefits of political reform in Kyrgyzstan have come at a cost – dozens of lives were lost, and in the absence of

political stability, mountain initiatives languished and investors looked for opportunities in countries with more stable regimes.

At present, some observers point out that Kyrgyzstan is more democratically advanced ("liberal") and decentralized than its neighbours. Political parties play a role in the parliament and government, and local and provincial authorities have the autonomy necessary to conduct their own affairs. Government ministries are required to consult with public advisory councils, which include representatives of youth, non-governmental organizations, well-known experts, citizens and representatives from the private sector. These councils provide information to the ministries regarding government services and their participation may improve efficiency and increase accountability. Under the new system and the governing legislation, mountain communities can assert their preference that taxes raised on mining operations directly benefit, at least in part, the local communities.

Strict and effective enforcement of the central government prerogatives was a hallmark of the Soviet system, but the transition to independence came with an exodus from the new Central Asian republics of the European settlers (Russian, Ukrainians, Germans and others) who had managed the enforcement bureaucracy and chiefly guided industrialization. This loss of experienced managers and engineers led to some initial problems with both enforcement and engineering skills, but as new national managers and specialists gained experience, the situation began to stabilize. In Kyrgyzstan, the shortage of skills and money combined with major political shakeups meant that enforcement efforts could not keep up with the rapid pace of the new legislation passed to respond to evolving local needs and ambitions. One effect of this diminished enforcement capacity was that authorities, businesses and communities had difficulty keeping up with all the changes. As part of their expanding role, NGOs now initiate legislation and actively encourage enforcement of environmental laws on such matters as pastures, mining, forests, energy efficiency and environmental audits, among others.

Tajikistan, in contrast, continues to rely on a system with an authoritarian approach to governing. The legislative process is less transparent and less inclusive, and has no practical mechanism for accepting feedback. Decentralization and self-governance in Tajikistan is not as advanced as in Kyrgyzstan, but stronger control and less diverse legislation make enforcement easier to manage.

The village councils that existed in the early 1990s were inherited from the Soviet era. With little experience in strategic management, these councils found their responsibilities in the new political and economic realities to be challenging. As the decade progressed, the village organizations evolved into stronger, though still informal, bodies for local decision-making on routine and strategic matters, and for planning village development. By the turn of the century, village organizations had demonstrated their efficiency and effectiveness, and were becoming well established, especially in the Pamir Mountains of Tajikistan. They are now self-reliant and independent, and enjoy widespread support as they face the challenge of maintaining and improving the management skills necessary to respond to the rapidly changing world around them.

### 1.3.2 New international borders

The revision of national boundaries following the emergence of the independent states of Central Asia created new international border entry points, and the opening up of airspace increased the scope for international flights and international tourism. The visually apparent definition of borders became a top priority after independence, and with the new political landscape came more border restrictions – customs, immigration and security checkpoints. Security concerns led to an increase in defensive or fortified installations such as fences, trenches and even areas with land mines. These developments have constrained the movement of goods and people, especially the nomadic mountain people who have traditionally moved both vertically and horizontally through the mountains of the region.

The creation of new borders has also altered the ownership status of previously shared pastures, forests and watersheds. Moreover, Kyrgyzstan, Kazakhstan and Tajikistan have given up parts of their mountain territories to China to settle border disputes, much to the consternation of the affected communities. As a result, some mountain dwellers have had to relocate – some to lowland areas – and settle in new conditions that do not meet their previous standards. Negotiations over some areas still in dispute continue.

In some cases the new borders have resulted in increased travel time. Prior to independence, if the direct route between travelers' points of origin and their destinations crossed the borders of Soviet republics, the travelers could pass as if no border existed. Now, where international crossings are restricted, the same trips may entail long detours to avoid the borders. For poorer mountain countries and communities this change is more than an inconvenience. The new routes require expensive improvements in the existing road system or the construction of the new roads and tunnels, an economic burden the countries can ill afford. The longer distances simultaneously add to travel time and expense and reduce efficiency.

The increase in the number of borders has created a competitive disadvantage for the mountain countries in terms of international trade in perishable goods. Each border crossing entails customs clearances, adding time in transit, and the additional time – to say nothing of the costs – is particularly a problem in the export of fresh food where time is of the essence. The mountain countries are more affected because they face more border crossings to get their produce to foreign markets. Kyrgyzstan and Tajikistan share borders with China, and could avoid the multiple border problem with exports to the Chinese, but China is not recipient of Central Asian produce.

Mountain enclaves – essentially islands of one country inside another – first appeared on maps in the Soviet period, and existed only on paper. No one paid any attention to these borders, but they persist as a Soviet legacy, and are making an already difficult life harder. With the advent of border fences and land mines, these isolated communities have become even more isolated. The restricted access also affects movement in the surrounding country as travel within national boundaries now entails detours around the mountain enclaves.

One of the most problematic regions is the Ferghana Valley shared by Uzbekistan, Kyrgyzstan and Tajikistan, where people historically traded broadly across borders. With the new restrictions, opportunities for local trade and labour markets have significantly declined, while at the same time corruption has flourished due to a growing shadow economy and illegal trade. Additionally, episodes of shelling of civilians by the border guards caused a wave of local public indignation.

Physical borders – fences and trenches, for example – restrict the movements of migratory animals, and may adversely affect the populations of some species as their migration patterns are disrupted. Conversely, where there are no physical borders, stock from one country may follow old grazing patterns that take them across the new borders into another country where they may be appropriated never to return to their owners. In places where border control is strict, the formerly common economic space, including agricultural land, is now divided, and one of the benefits has been the reduced pressure on pastures that no longer receive stock from what is now another country. In addition, many watersheds once held in common have become international, and what was once a matter for one country has become much more administratively complicated.

After the collapse of the Soviet Union, Russia continued for some time to protect the border with Afghanistan with the same level of guards and military presence as before, but gradually reduced its presence and military assistance. The richer lowland countries with gentle landscapes have been able to maintain a reasonably high level of border security, but the rugged mountainous landscape and limited financial and military resources of Tajikistan have meant that border protection between the Tajik Pamirs and the Afghan Hindu Kush remains a continuing challenge. Inadequate control in the mountain regions of the Tajik–Afghan border has led to increased security risks including the intrusion of armed troops and the trafficking in drugs. Joint efforts by the Afghan International Security Assistance Force (ISAF) and the Collective Security Treaty Organization have improved border security, but drug trafficking remains a destabilizing force in the mountain territories.

These challenges to border security notwithstanding, Tajikistan and Afghanistan can celebrate the development of friendship bridges between the two countries. These new bridges encourage the exchange of goods and services, and benefit both sides.

As part of its sensitivity to border issues with China and Afghanistan, the Soviet Union restricted movement near the borders in the mountain territories. After independence, Kyrgyzstan lifted the restrictions, but they remain in force in Tajikistan where outside businesses and travelers need special permission to operate in the Pamir Mountains and non-local individuals need special access permits to travel there. This policy is a constraint on commerce.

### 1.3.3 Political and economic influences

The transition to independence entailed the shift from one player – the Soviet Union – to a multitude of players, among them: five new states; numerous NGOs and advocacy groups; bilateral and multilateral aid institutions; community groups; and vastly expanding numbers of businesses and farms. The participation of all these new players altered the dynamics of development.

Russia is a long-standing partner of the mountain countries of Central Asia. The main areas of cooperation cover peace-keeping and border security, trade and energy. Russia receives most of the labour migrants from Central Asia's mountain areas, and is the main export destination for their agricultural products. Russia supplies Tajikistan and Kyrgyzstan with technology, fuel, wood and investment in hydropower projects, and provides soft loans.

China's rise on the global stage and its dominance in international trade has changed the patterns of business and trade in Central Asia. Foreign investment and infrastructure development projects increasingly come not from the West or from Russia, but from China, and political relations are changing in the region in concert with economic ties and trade. Among the technologies China now provides to the region are those related to mining, manufacturing, agriculture, power production and construction, and Chinese nationals are found among the mining communities and trade bazaars in the mountains. Some Chinese food exports now compete with specialized mountain products, and the lower cost and out-of-season availability of the Chinese products place mountain growers at a disadvantage. As an importer, China receives gold, raw materials and fossil fuels from the Central Asian countries.

The Aga Khan Development Network (AKDN) and Switzerland have been the main sources of aid for the mountain communities of Central Asia from the beginning of the transition to independence up to the present, and although both sources have reduced their humanitarian aid from previous levels, they continue to provide follow-up assistance. The AKDN provided aid across a range of functions, and concentrated on mountain farmers in Tajikistan where they still provide food assistance and guidance on reforms. (See section 2.6 for more information on the work of the Aga Khan in Central Asia.) Switzerland divided its attention equally between Tajikistan and Kyrgyzstan offering country-to-country aid on security, peace-building, disaster risk reduction, sustainable agriculture and forestry and economic development. Both players have also been proactive in mountain education, health and research. Switzerland provided initial support to the Central Asian Mountain Partnership (CAMP), which over the last decade has influenced and promoted the exchange of local and national mountain development good practices.

The European Union, the United States, Japan, Turkey, Iran and other individual countries have provided bilateral aid in the form of targeted interventions, and the Global Environment Facility (GEF), the Asian Development Bank (ADB), the World Bank (WB), the Organization for Security and Cooperation in Europe and the United Nations have provided multilateral assistance for economic and social reforms at all levels, and for natural resource management in the mountains. The multilateral aid has contributed to the development of policies and institutions through sustainable development and sectoral strategies for agriculture, water and energy. The ADB specifically assisted in the development of national and regional sustainable mountain development strategies and a regional environmental action plan in the early 2000s.

The regional organizations that deal with environmental issues in Central Asia – the International Foundation for Saving the Aral Sea, for example – form the basis for continuing regional cooperation on sustainable development. (Section 1.5 discusses institutions and governance in the region, and Part 2 includes numerous case studies involving the new players in the region.)

Global Environmental Changes, Globalization and Technology

### 1.3.4 The effects of climate change

Weather records confirm that the surface temperatures in Central Asia are rising. In the mountains of Kyrgyzstan and Tajikistan, temperatures have increased by 0.3°C–1.2°C in the last 50–70 years, depending on the location. Almost everywhere, climate warming in winter is more pronounced than in other seasons. A slight increase in precipitation has occurred in the mountains of Uzbekistan, the northern Tien Shan and the Western Pamir. In contrast, the central parts of the Tien Shan and the Eastern Pamir have experienced decreases in precipitation.

Under likely climate change scenarios for Central Asia, average temperatures are expected to increase by 1°C–3°C by 2050, and, if the global greenhouse gas emissions are unmitigated, could rise by 3°C–6°C by the end of the century. Scientists also project that climate change will reduce precipitation in the southern parts of Central Asia. The precise local impact these weather changes may have, especially in the mountains, is unknown.

The health effects of climate change can be serious. Climate warming and heat stress contribute to cardiovascular disease, increased risk of malaria outbreaks and intestinal infections (typhoid, salmonellosis, dysentery, helminthiasis) due to heavy rainfall combined with inappropriate communal water supply and sanitation.

As independence altered the political landscape, global warming is changing the physical landscape, and the points of reference that define some borders in mountain regions are on the move. In the Alps, for example, retreating glaciers, melting permafrost and the resulting landslides are changing the mountain morphology. Some of the glacial ridges that were used as border-defining reference points have moved, and Swiss and Italian officials are working to redefine their border. Central Asia can expect similar changes throughout its mountain border regions.

Central Asian mountain dwellers and hikers have already reported visible changes in frequently visited glaciers. Many mountain paths that were reliable 30 years ago have disappeared or changed beyond recognition. The surface of many glaciers has thinned and their ice bodies are increasingly covered with lakes and debris. Numerous low-altitude glaciers smaller than 0.5 square kilometres have totally melted. Today's rate of glacier loss in Central Asia is 0.5–1.0 per cent per year, and in the last 50–60 years, between 15 per cent and 35 per cent of the Tien Shan and Pamir glaciers have melted, depending on location, size and elevation. This trend is comparable to ice reduction in the European Alps, the Caucasus and the Himalayas, and these trends are confirmed by the professional glaciological and meteorological monitoring.

The degradation of the large Fedchenko glacier in central Tajikistan provides more vivid evidence of climate warming. The glacier, which exceeds 70 kilometres in length and two kilometres in width, shrank by one kilometre in length during the twentieth century, and substantially thinned. In Kazakhstan, the surface and the ice volume of the Tyuyksu glacier, which is the only remaining reference site in Central Asia reporting to the World Glacial Monitoring Service, shrank by more than 30 per cent in the last 50 years, receded by one kilometre and lost more than 40 million cubic metres of ice. This glacier is one of the main sources of water for Almaty, the largest city of Kazakhstan.

Petrov Glacier in the north Akshirak massif of central Kyrgyzstan, where the country's main gold mine, Kumtor, is located, shrank by almost two kilometres in the past 50 years. A large glacial lake with a surface area of four square kilometres and water volume of 60 million cubic metres has formed on top of its terminal moraine and is spreading steadily. Glacial dam stability, lake levels and permafrost thawing all increase the risk of flooding and its impacts on downstream infrastructure in the upper Naryn.

The mountain snow cover that plays a critical role in the water cycle and in the existence of glaciers is also slowly disappearing. Over the past 20 years, the seasonal snow-covered area of the Tien Shan has decreased by as much as 15 per cent. In summer, rain instead of snow appears more often in the mountains, even at high

elevations. Since snow melt and rainfall are the two main sources of water runoff from the mountains of Central Asia, these climate change effects will largely determine the availability of water.

The World Bank has recently given the highest vulnerability rank to the two mountain countries of Central Asia – Tajikistan and Kyrgyzstan – among 28 nations of Europe, the Caucasus and Central Asia. This ranking is based on current climate variability and the potential impacts on natural disasters (droughts, floods) that exacerbate sustainable development challenges in the areas of poverty and food security, infrastructure, energy and agriculture. Moreover, the high level of male labour migration makes women in rural areas highly vulnerable to shocks from crop failures, heatwaves and natural disasters. A consideration of this situation led to Tajikistan's selection for participation in the Pilot Program for Climate Resilience. (See section 2.3.1 for details.)

In scenarios of strong climate warming and lack of precipitation, water resources in the main rivers would fall by 15– 40 per cent. With less fresh water and land suitable for agricultural use, people will have to move to places where they can survive. Droughts and crop failures will push inhabitants of the rainfed mountain areas and pastures towards cities and irrigated oases. Water is a key resource for both agricultural production and electricity generation in the region, and competition for the control of this vital resource is likely to increase as river flows decline.

As mountain countries, Kyrgyzstan and Tajikistan will probably have enough water for their own needs but may not be able to meet demand in their role as regional water towers. Turkmenistan and Uzbekistan, as downstream states with extensive irrigated agriculture and high dependence on external water supplies, may suffer the most from a water deficit. In the longer term, regional water resources are under threat. In the next two to four decades the water flow in the Amu Darya and Zeravshan may be reduced by 10–15 per cent and in the Syr Darya by 5 per cent.

The good news is that in spite of reductions in glacier size and volume, the flows of Central Asia rivers have not yet changed significantly. In selected river basins, the intensified glacier and permafrost melting has even increased the discharge of some rivers, while runoff from glacier-free river basins has dropped slightly. Some experts suggest that rock glaciers and high-altitude permafrost contain amounts of frozen water comparable to the ice in mountain glaciers and therefore can compensate for the adverse effects of climate change. But the current trend towards low-water years, as water levels are reaching extreme minimums, is worrying. Such a situation occurred in the Amu Darya basin in 2000, 2001 and 2008. The severe 2000–2001 drought in southern Central Asia may provide a glimpse of the future. During that drought Tajikistan and Afghanistan experienced a failure in rainfed crops and pasture productivity, while water shortages affected the lower reaches of the Amu Darya far from the mountains, especially Karakalpakstan in Uzbekistan. In 2008, hydrological drought and extreme cold in Tajikistan and Kyrgyzstan, combined with the vulnerability of the energy sector, rising food prices and lower access to remittances, created a serious food and energy crisis. Damages amounted to about US\$ 250 million in Tajikistan alone. In the context of changing climate and drought impacts, mountain countries are pursuing expansion of large and small water storage facilities.

Climate change is increasingly becoming a factor defining the future conditions of mountain ecosystems and adds to ongoing environmental pressures on sensitive habitats, flora and fauna. Vegetation succession can be observed at many alpine sites that were covered by glaciers until recently. Droughts, a more arid climate and the reduction of water flow in the rivers all affect aquatic and tugai floodplain forest ecosystems. The areas annually affected by locusts (mostly in southern parts of Central Asia) significantly increased. Pest attacks in southern Tajikistan in 2003– 2005 halved the cotton harvest in the hardest-hit districts. Climate change has amplified the risks of forest fires and the spread of forest diseases, and scientists warn that the mountain forests of Kazakhstan will be exposed to significant fire risks in dry years due to the impacts of heatwaves. The past 15 years featured particularly high numbers of, and large mountain areas affected by, forest fires.

Tajikistan and Kyrgyzstan have the lowest greenhouse gas emissions in Central Asia (1–2 tonnes of CO<sub>2</sub> per person per year), mostly because hydropower is their main energy source and they produce and consume only small amounts of fossil fuel. In addition, after the Soviet Union disintegrated in 1991, both countries experienced significant economic and industrial decline and an energy crisis. Their total greenhouse emissions in 2005 were reduced to 33–40 per cent of their peak emissions in 1990–1991. Mountain forests and tree plantations in Kyrgyzstan and Tajikistan collectively absorb more than 1.5 million tonnes of CO<sub>2</sub> annually, about 10–15 per cent of the country's total CO<sub>2</sub> emissions. The capital cities and densely populated valleys contribute most of the emissions in these countries. In contrast, energy-rich Kazakhstan, Uzbekistan and Turkmenistan have reasonably high greenhouse emissions per capita (12–14 tonnes of CO<sub>2</sub> per person per year), high total emissions and a lower carbon absorption share.

### 1.3.5 Natural disasters

Climate change could amplify the risk of floods, mudflows and landslides in the mountains, including glacier-related hazards. There has been a series of glacial outburst floods in the mountains of Tajikistan, Uzbekistan, Kyrgyzstan and Kazakhstan, making it even more urgent to monitor these hazards. With the melting of glaciers, glacial lakes appear every summer in the mountains. Some of them grow significantly and, if contained by unstable moraines, they occasionally burst and release large amounts of water in destructive flash floods, sometimes with serious impacts on life and property.

Almost 1 000 glacial lakes exist in the mountains of Central Asia. Annually, dozens of potentially risky glacial lakes appear in the mountainous areas above Almaty, Bishkek and Tashkent cities, around Lake Issyk-Kul and the densely populated Ferghana Valley, and in the narrow Pamir-Alai valleys. Experts suggest that climate change is likely to increase this number. There have already been deadly floods in the past 15 years, including in the Shahmardan (Uzbekistan and Kyrgyzstan, 1998), Dasht (Tajikistan, 2002) and Issyk-Kul (2008) valleys.

Some large mountain lakes, such as Tajikistan's Lake Sarez, which formed in 1911 as the result of a rock slide in the central Pamir mountains, represent a serious risk. Situated at an elevation of 3 000 metres, the lake is over 60 kilometres long, almost 500 metres deep and contains 17 cubic kilometres of water. A new rockslide into the lake could form a high wave, and depending on its volume, the season and the location of the slide, this wave could cause a destructive flood. The water level in the lake is likely to grow due to intensified glacier and permafrost melt caused by climate warming. Lake Sarez has received high international attention, and a sophisticated monitoring and early warning system has been installed with support from Switzerland and the World Bank.

In Tajikistan and Kyrgyzstan, average annual economic losses from natural disasters reach 1.0–1.5 per cent of GDP (equivalent to US\$ 25–30 million). Estimates foresee that in some years the impact will reach 5 per cent of GDP. A recent assessment of Kazakhstan's climate vulnerability indicates that areas most at risk from climate change and natural disasters are the mountains and adjacent lowland provinces. Mountain regions in Central Asia experience recurrent and devastating earthquakes: Almaty city in 1910, Ashgabat city in 1948, Tashkent city in 1966, and numerous high mountain villages of Afghanistan, Tajikistan and Kyrgyzstan have all suffered major loss of life and damage to property. Earthquakes cause the largest number of deaths from natural disasters in Central Asia, followed by floods and landslides, while recent droughts affected the largest number of people, causing substantial economic losses and food insecurity. Agronomic practices are often inappropriate for sustainable land management and drought resilience in mountains, and the lack of agricultural advisory services and adequate meteorological forecasts for the mountain areas hamper their development potential.

The mountains of Kyrgyzstan and Tajikistan around the Ferghana Valley served the Soviet Union as important sources of uranium ore, mercury, antimony and other metals. The legacy of past mining operations remains in hazardous waste sites that are often located in weather-sensitive, flood-prone locations near towns and along rivers and drainage zones. Pollutant spills and natural disasters in this and other mountain areas could affect a population far beyond the people living in the vicinity, and could lead to profound transboundary effects.

The next decade or two offer a window of opportunity to ensure that mountain development become more resilient and less vulnerable to climate change. This effort will

require improvements in water resource management and land use, as well as in biodiversity protection, and will benefit from improvements in addressing environmental pollution, and a strengthening of interstate cooperation on disaster forecasting and mitigation. Most climate change and natural disaster effects have transboundary dimensions, and regional cooperation among the responsible state agencies, the civil and scientific community and international humanitarian organizations is essential to the development of an effective response. Disasters pose a serious obstacle for sustainable development and could tighten the existing social and economic constraints. The reduction of vulnerability is a key element of the sustainable development process.

### 1.3.6 Dwindling biodiversity

With the abrupt end of the Soviet era, the people in the Kyrgyz and Tajik mountains faced sudden poverty and the risk of famine, and responded by hunting wild animals for meat and trophies. The increase in hunting placed a corresponding increase in the pressures on wildlife. The cessation of Soviet supplies of solid and liquid fuels to the Tien Shan and Pamir Mountain communities had similar consequences – woody biomass and dried dung became major sources of energy for cooking and heating, and the widespread collection of slow-growing shrubs, such as artemisia and teresken (*Ceratoides papposa*), as well as forest cuttings throughout the 1990s and into the early 2000s have diminished mountain land cover and biodiversity. Fires and pest attacks on mountain forests due to limited controls and hot, dry weather conditions destroyed and damaged significant forested areas, especially in Kazakhstan.

Many grasslands have been affected by the overgrazing of 20 years ago. During the economic transition, the number of livestock initially declined, and herding practices centred around settlements. This development led to overuse of so-called winter and autumn pastures in the low mountains near populated areas as the regular fodder supply was no longer available or affordable to most households. At the same time, the conditions of summer pastures in the high mountains improved, but the growth of unpalatable grasses and shrubs increased. Currently, throughout the region animal stock is increasing. But the new pasture legislation and regulations developed in Kyrgyzstan that combine a scientific approach (carrying capacity of pastures) with economic tools (pasture use tickets) and community participation pave the way for more sustainable approaches in livestock herding.

A notable exception to the general decline in livestock populations was the dramatic increase in the numbers of goats, and the extensive grazing of goats added significantly to the grazing pressures already spreading to mountain forests. In combination with the other unsustainable forest uses – illegal cutting for fuel or sale and forest clearing in floodplains by mining projects – these pressures resulted in the near extinction of medicinal and rare plants and animals important both locally and globally. The development of sustainable forestry practices over the last decade has turned the tide, and the collection of medicinal plants and non-timber forest products is now better organized. Tajikistan and Kyrgyzstan protect most of their mountain forests and prohibit timber felling, and Kyrgyzstan gives communities responsibilities and incentives to take care of fruit and nut forests. (Section 2.2.4 provides more detailed information.)

The condition of the ecosystems of the mountain lakes in Kyrgyzstan is alarming. Lake Issyk-Kul, with a surface area of 6 236 square kilometers the region's largest mountain lake, is among those threatened by overfishing and alien species. Just four to five decades ago, Issyk-Kul was a flourishing fishing ground and the country's most popular holiday destination. In the last decade, however, fisheries declined to negligible levels, and the government banned all fishing here in 2003. In spite of this, thousands of illegal fishing nets are detected annually. Endemic fish species previously abundant in the lake have now become endangered. Issyk-Kul is on the Ramsar Convention's list of globally significant wetlands and forms the core of a biosphere reserve. The restoration of the lake's ecosystem depends in large part on the restocking of the lake with juvenile endemic fish from hatcheries and on tighter control of illegal fishing.

In the Soviet era, professional agronomists assisted mountain farmers in the selection, development and maintenance of agricultural species – both animal and vegetable – adapted for the local mountain environment. The enrichment of agricultural biodiversity resulting from these efforts is now threatened by the pressures to compete in global markets, and the genetic diversity of the local food base is at risk. Because the arable land is so limited, the promise of higher production and maximum output led to the replacement of old species with new ones, and some of the old local varieties are disappearing or being underused. An untested new variety may be vulnerable to a crop disease that could wipe it out, and the unavailability or loss of the old variety leaves the farmer with limited options.

Each new variety requires maintenance, and some new varieties work out and some do not. In the absence of rigorous maintenance, the risks and uncertainties are growing. In addition, some crop varieties new to the mountains may require chemical fertilizers to thrive in the environment, adding environmental pressures and production costs and reducing profits.

In the Kyrgyzstan stock sector, which benefited from the special attention of the Soviets, some sheep species have disappeared in the switch from wool to meat production over the last 10–20 years. On the other hand, milk-and meat-producing cattle have been replaced by breeds better adapted to mountain conditions. In the 1980s, in an effort to crack down on the problem of alcoholism, and at the initiative of the Soviet leader Mikhail Gorbachev, many vines and some gardens were eliminated in Kyrgyzstan. Plantations in Tajikistan also suffered. The echo of that campaign still reverberates today.

Alien species and genetically modified organisms (GMOs) are threats to biodiversity everywhere, but mountain environments, in view of the narrow range of habitats, are particularly vulnerable. The introduction of alien species is a risk associated with the increasing accessibility of roads, higher levels of trade and globalization, and farmers may introduce GMOs unintentionally or in the interests of higher production. In neither case do mountain communities have the capacity to manage the situation or to detect the problems that may ensue. Habitats may change in response to the introduction of alien species or GMOs, to new grazing patterns or crop selections and even to new ownership, and any of these changes to habitats affects biodiversity.

The region is taking a strong positive step with participation in the United Nations Convention on Biological Diversity 10-year strategic Aichi plan for enhanced cooperation on biodiversity and benefit-sharing. The plan aims to preserve natural areas and to protect endangered species.

### 1.3.7 Land degradation

Concerns over food security promoted the growth in rainfed crop cultivation in the mountain areas, especially in Tajikistan. This cultivation often increased soil erosion on steep slopes. Overgrazing near mountain villages across Kyrgyzstan and the collection of teresken bush for fuel in the Eastern Pamirs exposed these mountain territories to a high risk of desertification. Soil compaction, reduction of vegetative cover and increased erosion of mountain slopes also contribute to higher sediment formation and silt loading of the rivers with implications for the useful life and effectiveness of the reservoirs and irrigation canals and the operation of hydroelectric turbines.

### 1.3.8 Roads, rails and international trade

The expansion of the road system through the improvement of national roads and the addition of new international roads has increased the accessibility to remote mountain areas. This new accessibility has brought both additional pressures from visitors and from business development, and new income opportunities in terms of tourism and hospitality and the trade of native products. The increase in the number of people who have cars has improved mobility and connectivity, but has also brought increased risks to previously unreachable mountain ecosystems, and the additional traffic has contributed to environmental noise and air pollution. Moreover, traffic accidents on the roads of Tajikistan and Kyrgyzstan result in 500–2 000 deaths per year and in numerous injuries.

Better construction technology has produced less expensive and more reliable roads as well as new tunnels that provide mountain communities with year-round access and that reduce commuting time – in some cases by as much as half. These improvements mean that mountain communities can now rely on outside suppliers even in winter. It is

a dramatic improvement, considering that only 15–20 years ago Tajikistan was separated into three isolated parts in the winter due to lack of year-round roads and to difficult alternative routes. Most of this new expansion is sponsored by Chinese investment or the Asian Development Bank, and managed by Chinese companies. In Kyrgyzstan, the main roads are rapidly improving, but marginal and remote mountain districts – such as the Chatkal Valley – remain isolated. Local communities hope that with the mining boom in the area, infrastructure and the valley's accessibility will gradually improve.

In Tajikistan, a new road from the capital, Dushanbe, to the northern province of Sogd has caused controversy. Fifty kilometres of this nationally important road are already rebuilt to international standards, and plans call for a total of 300 kilometres, but the development of the road occurred without regard to local concerns. The tolls on the road are prohibitive for locals, and there is no alternative route. Despite the recent change to differentiated scales for the different types of road users, dissatisfaction among the locals remains high, and further progress may be stymied.

Air access in the mountains was better in the Soviet era when fuel was cheaper and small aircraft were in service. The infrastructure for this air service is still available, but it is no longer a cost-effective way to travel or transport goods. An exception to this trend is the Issyk-Kul airport, which Kyrgyzstan recently completed to serve the international tourism that is growing in importance.

Mountain countries are also seeking the development of rail systems both for transport independence and for international trade. Transit countries – those between two destinations – stand to benefit from China's growing role in the region. Both Kyrgyzstan and Tajikistan are discussing the possibilities of rail connections with China, but controversies have arisen. One option is for the countries to finance the developments with loans that may strain national budgets. The cost of a 270-kilometre railroad from the Chinese border through Kyrgyzstan to Uzbekistan is estimated at US\$ two billion. A second option is for the governments to give up mineral deposits to China in exchange for rail (and road) investments. Here the controversies are whether the exchange can be of equal value and whether the local communities involved would prefer to retain the land for traditional purposes.

Another controversy is over the dimension of the rails – whether to follow the Chinese (and Western European) standard or the Soviet standard already in place in Central Asia. This matter is currently subject to expert discussions and lively public debate. The resolution of this issue will in all likelihood also determine who provides the equipment and maintenance for the new system. If these issues are not enough of a challenge, there is the technical challenge that the mountains in this region are moving at a rate of several centimetres per year. The implications for rail and tunnel construction and maintenance are apparent.

The Central Asian mountain countries seeking to develop international trade by expanding roads and rails may find support for their rationale in the Swiss experience. Switzerland has built tunnels and improved roads largely for the benefit of international trade.

In Kyrgyzstan, the opening of roads to China, in combination with attractive local conditions with regard to labour, taxes, customs, trade regulations and connectivity, led to the development about 20 years ago of the Dordoi market near Bishkek. Currently the largest market in Central Asia, Dordoi covers 100 hectares, and offers 10 000 containers with 40 000 trading outlets. The local employment generated by the market is hard to estimate, but probably exceeds 50 000 jobs. The current total turnover surpasses US\$ 330 million per month, or US\$ 4 billion per year. In the suburbs of the southern Kyrgyz ancient trading city of Osh, the second largest market, Kara-Suu, has 10 000 trading outlets and turnover of US\$ 0.8–1.0 billion per year. Before the global financial crisis of 2008, the annual turnover of the Kyrgyz bazaars reached US\$ 7 billion per year. Almost anything that is used by individuals is traded here – from cheap Chinese-made clothing and electronics to cars and name-brand products. Markets in Kyrgyzstan are not just major shopping and employment centres, but also the main transit points through which goods from China move to Kazakhstan, Russia, Uzbekistan and Tajikistan. This re-export is one of the largest economic activities of Kyrgyzstan and in recent years imports from China to Kyrgyzstan climbed to US\$ 5–9 billion per year, exceeding the country GDP.

By 2020 China could become the largest economy in the world. Rapid growth in wealth and consumption in neighboring countries such as Russia, Kazakhstan, Uzbekistan and Turkmenistan could further opportunities for trade, transit and labour for the mountain countries. By taking advantage of this trend and offering competitive, environmentally friendly food, original textile products, rapid and reliable logistical services, skilled and low-cost human resources and by sharing valuable mountain ecosystems goods and services, they have good prospects for channeling their development in sustainable way.

The success of the Dordoi market and the rise in international trade have boosted the textile industry in Kyrgyzstan. The industry now employs some 300 000 workers, mostly women, in the production of clothing, carpets and other traditional products.

International trade has played an important role in Kyrgyz agriculture as well. In one notable development, approximately 15 years ago in the Talas Valley, Turkish interests identified the possibilities for producing beans of good quality in an environmentally sensitive way. Now the entire valley specializes in bean production (70 000 tonnes in 2010), and trade has expanded to Russia, Kazakhstan and other countries. Beans are a nitrogen-fixing crop so the ecological concerns regarding monoculture are less a factor with beans than with other crops, but there are economic vulnerabilities. Currently the economic benefits are substantial, but the risks of crop or market failures are more severe when a region relies on only one crop. Similarly, Tajikistan has recently initiated the substantial expansion of orchards, mainly in mountain areas, to diversify and increase the potential of its agricultural sector to supply growing markets in Russia and across the region.

### 1.3.9 The expansion of mobile communications and information technologies

The Central Asian region is experiencing a significant upward trend in the availability and affordability of communication technology such as mobile telephones and Internet access. The use of the Internet in mountain countries has grown substantially over the past decade and many highland hotels, other tourist-related businesses and farmers are now able to advertise their products and services and conduct business online. Online education and distance learning are also becoming popular and increasingly available options, and consumers can now order mountain eco-produce online. The introduction of information technologies in the banking sector has lowered the costs and increased the efficiency of labour remittances, which now pass through banks rather than being transferred through friends. The growing capacity of "electronic government" systems allows broader, faster and more efficient and decentralized state governance, as well as increased public access to key government information and services.

This same communication technology is benefiting the mountain environment as blogging and social media raise awareness about environmental issues, and the sophisticated technology helps a new generation develop a better understanding of ecosystem degradation and environmental protection measures. The more advanced technology and the use of mobile communications for scientific observations are also improving the study of weather patterns and the prediction of natural disasters. Mobile communication technology allows for the more cost-efficient and rapid collection of climate and weather conditions, and improves the prospects for effective early warnings. Mountain weather stations increasingly use mobile networks to transmit data and exchange information.

Mountain communities are also improving the communication of public information by providing better media access for news reporting, and by establishing small local data bases of special information of interest to certain users. More data on mountains are available on Websites, and there is an increasing trend among mountain provinces to issue regular environmental reports online. These developments are all steps toward the greater decentralization of information availability, and are expanding the opportunities for public participation in decision-making and governance.

The mass media are expanding their environmental coverage, and are increasingly looking for topics with a local connection. This development coincides with the Central Asian Festival of Ecological Journalism, an annual event designed to raise public awareness of environmental protection and the rational use of natural resources, and to promote the development of ecological journalism in the region. The festival sponsors competitions, and publishes the entries online.

The use of geographic information systems enables the production and updating of maps regarding a range of environmental pressures, but much of the excellent data compiled in the Soviet era are not yet digitized. Botanical, soil and archeology information remains paper-based, and only the basic geologic and meteorological data are digitized. In addition, many scientists fail to disclose their data, in spite of the availability of outlets for dissemination, and intentionally or not, provide no access or references.

### 1.3.10 New opportunities in tourism

Tourism is not currently a large part of the GDP of any Central Asian country, but given the remoteness of mountain communities and the limitations of mountain agricultural production, tourism offers a promising source of alternative livelihoods for local operators and related businesses. In addition to developing winter tourism, Central Asian countries have an opportunity to further develop cultural tourism, particularly in the summer months. Kyrgyzstan, which generated US\$ 500 million in the tourism sector in 2010, is currently working on this prospect, while Tajikistan may be underestimating the potential. As Central Asia becomes increasingly accessible to outsiders, international tourists may show more interest in learning about the various mountain cultures by visiting the places where those cultures exist.

In the Soviet era, hot springs in and around mountain areas of Central Asia were popular year-round destinations for vacationers and those seeking the healing powers of the waters. Now privately managed, many of these resorts have fallen into decline, and are not as widely known or as popular as they once were. With proper development and management, the hot springs could return to their previous popularity as major mountain attractions and bring economic and social benefits to the local communities. The springs also provide an opportunity for the bottling of mineral water.

Over the past decade, mountain trekking associations, through experience exchanges with trekkers from other mountain regions, have helped develop mountain trails and have sponsored annual mountain cleanups. These associations also offer courses on mountain safety, and hold Alpinads – climbing and orienteering events intended to improve the skills of trekkers and to instill respect for the mountains.

Shortly after independence, Kyrgyzstan recognized the potential of tourism, and established a ministry of tourism to exploit those possibilities. The increase in privatization has gradually reduced the original role of the ministry, but Central Asian countries would do well to explore new roles for government in the promotion of tourism in the new economy. In many western countries, governments regulate the tourism industry and promote it for the benefits that accrue to the nation as well as to the local communities and operators who host the tourists.

The Central Asian mountains have long been famous for summer tourism, but until recently the potential for winter tourism had been underutilized, a situation that started to change with the 2011 Asian Winter Olympics, recently held in Kazakhstan, and with new developments in Kyrgyzstan. Hosting a Winter Olympics comes with a major investment in facilities and infrastructure that endures long after the games are over, and Kazakhstan now has venues and systems that can support the development of a winter tourism industry. Kok-Zhaiyau, a new ski resort being built near Almaty city, for example, will be the largest winter mountain resort in Central Asia. The Swiss experience shows that mountain sports development can bring risks of ecological damage, and can mean a change of livelihoods for local residents. But the economic benefits can be significant, and Central Asia is well situated to explore the possibilities for attracting local, national and international tourists.

Uzbekistan has always had more capacity than its neighbours to manage tourism, and its historical role as the hub for cultural and mountain tourism in Central Asia continues to this day. This dominant role is sometimes resented by the mountain people and tourist firms of the destination countries. With the independent countries now managing their own economies, the mountain communities of Kyrgyzstan and Tajikistan want control of their own tourism. The new opportunities in the region provide Kyrgyzstan and Tajikistan the chance to compete with Uzbekistan, and to cooperate on the development of Silk Road tourism ventures. The Chatkal, Alai and Turkestan Mountains in south-western Kyrgyzstan and the Fann and Gissar Mountains in western Tajikistan have numerous cultural and historical sites and are among the promising regions for cooperative ventures with Uzbekistan.

### 1.3.11 The gold rush and other mountain mining developments

Kazakhstan is the regional leader in minerals production and processing, while Uzbekistan is the world's ninth largest gold producer, but most of their mining projects are located in remote desert areas. In the mountains, the development of the mining sector has been significant over the past decade, particularly in Kyrgyzstan and Tajikistan. At the end of the Soviet era and into the 1990s, there was almost no gold mining in either country, and little state or international interest. With gold prices reaching record levels over the past 20 years, however, both local and global investors have become interested in developing even low-grade deposits. Now, mining and metallurgy industries are the major cash sources for national budgets, contributing up to 50 per cent of the national export earnings in Tajikistan (aluminum and gold) and up to 30 per cent in Kyrgyzstan (mainly gold from the Kumtor mine).

Kyrgyzstan, which foresaw the mining and energy sectors as having significant development potential, moved to create conditions favourable to mining operators by enacting economic reforms and by allowing access to geological information. Currently almost all of its territory is licensed for mining activities. Tajikistan, in contrast, continues to consider its geological information confidential, as in the Soviet era, and its legislation and the ease of doing business currently lags behind Kyrgyzstan's. As a result, Tajikistan has attracted fewer investors, and where Kyrgyzstan's mining sector has advanced, Tajikistan's remains stagnant. The World Bank is assisting both countries in reducing barriers in mining sector.

The influx of new mining technologies and the launch of new projects have given rise to both opportunities and difficulties for governments and local communities. A reluctance on the part of governments and mining companies to share gold-mining profits equitably and a lack of transparency in decisions have led to feelings of discontent among poor and vulnerable groups in the mountains. Indeed, the benefit-sharing arrangement between mining projects, central government and local communities remains a lingering cause of resentment. The conflict between the use of land for traditional pasture and grazing, nature conservation and for mining activities is also a source of friction in Kyrgyzstan.

The experience of the Kumtor gold mine in Issyk-Kul Province in western Kyrgyzstan has influenced all the developments that followed. In 1997, with the support of Canadian investment, operations started at the Kumtor mine, which now produces 90 per cent of Kyrgyzstan's gold, about 15–20 tonnes per year. Kumtor tax payments contribute substantially to the national budget, and the mine provides significant employment opportunities to communities throughout the area. In addition, Kumtor sponsors local social development programmes such as schools, kindergartens and summer camps, and has introduced a local development fund that is increasingly considered as a model by other mining companies.

Kumtor maintains high safety standards, but a transport accident resulted in a spill of cyanide into a local river. The toxic material dispersed quickly causing some environmental damage, but the psychological perception was significant and long-lasting. The accident galvanized local resistance to mining whether or not cyanide would be used in operations, especially in areas with no mining history. The abandoned Soviet mining legacies across the country stand as stark reminders of possible grim scenarios not to be repeated. Mining operators now encounter local opposition wherever they go, and find that environmental impact statements and the necessary permissions do not overcome the hostility and distrust they face.

The central government's failure to understand local demands and its slow response to adjust its mining regulations complicate the situation. The mining sector is important nationally, and the central government has been the main beneficiary of the taxes from mining operations. The locals want a fair share, and because they view the mining operators as more capable than the central government they increasingly seek more benefits from the companies. Rather than step into the breach to negotiate with the parties, the central government has essentially left the mining operators and the locals to their own devices.

Local resistance and dissatisfaction continue to grow as mining operators fail to communicate their environmental protection strategies with local communities, and then fail to meet the obligations they do make. The companies that operate the mines change frequently, and the commitments of one company may no longer be honoured by the next. Broken promises, inequalities in salaries, dubious local staff hiring procedures and potential environmental damage have hardened local opposition, and the central government continues to ignore the discrepancies between its plan for the mining sector and the reality that has ensued. Fortunately, NGOs have been quick to see the problems and have initiated dialogues between operators and locals, in particular in the Chatkal and Naryn regions.

Regulations on mining are sometimes contradictory to environmental protection priorities: mining is allowed in river beds and sometimes even in the buffer or main zones of protected nature areas. Local communities oppose mining developments in or near nature reserves and along rivers and springs where ecosystem damage caused by industrial operations could have negative implications. Residents fear their valleys will become polluted and people will stop buying their vegetables and other agricultural products. Some companies have extensively developed alluvial deposits in sensitive ecosystems that provide clean water, and geological prospecting has affected high mountain pastures. But in a number of situations, local elites have taken advantage of the situation through speculations on environmental grounds that seem whipped up with the goal of extracting a bigger share of future profits or of taking over and reselling the mining license. The tension between local environmental interests and the mining sector mirror the experience in Western countries in previous decades. The stakes are high: if political stability and consensus on social-environmental issues in the Kyrgyz mining sector are achieved, the country's gold production could double within the next few years.

Tajikistan has had a less favourable business climate than Kyrgyzstan, but the Tajik government, with the assistance of international organizations, is currently working on reforms that may lead to a mining boom in the future. Tajikistan has been famous for silver mining from ancient times, and a recent geological audit suggests that it has probably one of the largest silver reserves in world. The government has officially announced a request for international tenders for the development of these deposits. Chinese investments and technology will support recently announced plans of Tajikistan to develop its own alumina mining and to expand cement production capacities.

Of the international developers active in the mining sector in the Central Asian mountains, the Russian and Kazakh mining companies have enjoyed the most success, especially at the community level, largely because language barriers and limited integration into the local context have blocked the progress of Western and Chinese companies. The Kyrgyz experience may be instructive as Tajikistan moves forward with development in the mining sector.

Kyrgyzstan has taken the lead in promoting an international initiative on transparency in extractive industries, and is working to involve as many mining companies as possible. The transparency initiative requires financial disclosure that shows how mining activities benefit governments. The initiative does not, however, require disclosure of how the activities may or may not benefit local communities.

In both Kyrgyzstan and Tajikistan, the environmental problems associated with the increase in mining and related activities are offset to some extent by the declines in all other industrial sectors. While the increase in mining increases potential threats to the environment, the reduction in industry reduces other threats.

Kyrgyzstan still operates a mercury mine from the Soviet era, and while the operation is inefficient and mercury has a high local and global environmental impact, the mine is important to the local economy. The United Nations Environment Programme is currently working on a mercury convention that would limit mercury production, and the international community is looking for opportunities to help Kyrgyzstan phase out its mercury mining without damaging local communities socially or economically. The replacement of mercury mining with gold extraction or preprocessing is considered an environmentally acceptable and socially responsible alternative to the continuation of primary mercury production, and high gold prices may help Kyrgyzstan make the transition.

Finally, both mountain countries have experienced a boom in small-scale mining for placer gold, particularly in Kyrgyzstan. Artisanal miners are a heterogeneous group of men aged from 16 to 60+ years, and their reasons for mining are varied. For some, mining was and still is the main source of cash income. Gold helped them to survive in the turbulent economic transition period of 1992–2000. For others it is an income supplement in winter months when agricultural activities are limited. In any case, artisanal gold mining is beyond the control of central and local authorities and the increasing degree of labour mechanization and the use of mercury for fine gold extraction are growing threats to the mountain environment.

### 1.3.12 Tapping the vast potential of energy resources

Over the past 20 years, national energy resources in Central Asia have attracted international investors. Oil, gas, uranium and hydropower are proving to be lucrative sources of economic development. In light of this growing trend, the mountain countries in the region have become both locations and transit routes for energy resources, mainly electricity. Years of intense exploitation of uranium, however, has had a detrimental impact on the mountain environments and economies of Kyrgyzstan and Tajikistan. Ensuring the sustainable use of natural resources is therefore important consideration for the region.

Both Kyrgyzstan and Tajikistan have large hydropower potential, and both countries are working on policies and strategies to develop that potential on all scales. International organizations including the World Bank and the Asian Development Bank have demonstrated much more interest in the energy sector than in mining, and are active in promoting markets for energy generation and transfer. Energy-hungry neighbours, China, Pakistan, India and Afghanistan, are also interested in the prospect of benefiting from the development of Central Asia hydropower through the Central Asia-South Asia Electricity Trade and Transmission (CASA-1000) or other projects. Currently, Tajikistan has about 5 000 MW of installed hydropower capacity and Kyrgyzstan has 2 700 MW, less than 10 per cent of their technically feasible hydropower potential. Russia, China and Iran are interested in investments in the hydropower sector. Planned and ongoing projects aim to further expand hydropower capacity on the rivers with existing power cascades, chiefly on the Vakhsh in Tajikistan and on the Naryn in Kyrgyzstan. Additional plans and projects contemplate development on non-modified major rivers such as the Panj, Zeravshan and Obihingou in Tajikistan and the Suusamy and Saryjaz in Kyrgyzstan.

In view of the growing national energy demand, the mountain countries of Central Asian have chosen to increase their power generation capacities using both renewable (mainly hydropower) and non-renewable energy sources such as coal, deposits of which are accessible and affordable in mountain countries. Coal-fired plants would serve as a short-term solution to overcome energy deficits and increase energy security. The emerging trend towards increasing use of coal for power generation and in cement production and other industries is a concern, however, since this use adds to the national carbon footprint and causes local air pollution.

Frequent country-wide shortages of fossil fuels, chiefly gasoline, diesel and natural gas, which are imported from Russia, Turkmenistan, Uzbekistan and Kazakhstan, are pushing the mountain countries to seek alternatives. Moreover, fuel prices in the Central Asian mountain countries are very high and constrain local business profits. Kyrgyzstan sees biofuel plantations and home-grown fuel production as a solution. The country's biofuel strategy foresees the initiation of biofuel crops in 2012. Currently, populations in the mountains often uses dry biomass (wood and dung) to meet local energy needs.

Like in the mining sector, the development of the energy sector is rife with controversy and competing interests – upstream and down, local and international. The Rogun Dam on the Vakhsh River in southern Tajikistan is a case in point. Slated to rise more than 300 metres high, the Rogun Dam is a source of tension between Tajikistan and Uzbekistan. To facilitate the development of the project and to attract international investors, the World Bank is providing assistance in the technical, economic and socio-environmental assessments. In the absence of international investors, Tajikistan sought to develop the project as a state-owned venture financed out of the national budget and through shares that it obliged its people to purchase.

The focus on large-scale projects has left governments and the international development banks vulnerable to criticism. The massive projects are a drain on national resources, a source of international tensions and a cause of resentment among the local communities that may share the costs, but may never share the benefits. Small

projects with local beneficiaries do not enjoy the economic and other incentives of the large projects, and rely on individuals, NGOs and donors for sponsorship. The high potential of hydropower overshadows the potential of the geothermal, wind and solar energy that could also increase the provision of energy at the local level.

Corruption is rife in the largely state-owned energy sector, and, especially in Kyrgyzstan where hydropower is a state monopoly, there is no information available on who buys power nor on how much they pay for it. Illegal connections to the grid are common, and the industrial sector enjoys privileges while some communities have no service. For the past 20 years, the system has operated without transparency and without consultation of NGOs or citizens, but in July 2010, Kyrgyzstan launched an initiative on transparency in the energy sector to ensure the public participation in decision-making and the accountability of energy companies.

#### Security and Tensions

##### 1.3.13 Conflict and the need for hard security measures

The mountain countries of Central Asia have not enjoyed the same level of prosperity and stability as their lowland neighbours, and the highland regions thus tend to be more susceptible to discontent and violence. Civil war, armed conflict and insecurity wracked the mountainous regions of Tajikistan for the entire decade of the 1990s. In Kyrgyzstan, violence in densely populated northern and southern areas widened the ethnic (Kyrgyz–Uzbek) and geographic (north–south) divides.

As soon as it became independent, Tajikistan plunged into a civil war that resulted in the deaths of over 50 000 people. An agreement brokered by Russia and the United Nations brought peace, but sporadic violence and recurring insecurity continued until as late as 2010. The country has undergone a slow and sometimes painful process of reunification and reconstruction. Tajikistan has not yet recovered from the civil war's impacts on the economy, infrastructure and families, and poverty remains widespread. The Tajik President has suggested that the civil war damage and the loss of opportunities for the national economy could be as high as US\$ 10 billion.

Kyrgyzstan witnessed violent Kyrgyz–Uzbek inter-ethnic clashes in its southern Osh province as early as 1989, and in 1999 armed groups again entered the southern area of the country (now the Batken province). Resentment at widespread poverty, nepotism and ethnic divisions between north and south occasionally erupt in violence, and the country's first two post-Soviet presidents were swept from power by popular discontent. Economic damage from the events of April and June 2010 in Kyrgyzstan exceeded US\$ 70 million, excluding impacts on investment and the business environment.

Conflict and insurgency in mountainous areas are much more difficult to combat than those in the flat land and desert countries of Kazakhstan, Uzbekistan and Turkmenistan, all of which are also more prosperous. Rugged mountain terrain provides effective hideouts for fighters thus making combat more challenging.

Warfare in mountainous countries has had not only a serious social and economic impact, but also an environmental one. Conflicts in the mountains have directly affected progress on the implementation of Agenda 21. The 1999 treacherous invasion of armed groups into the Batken region of Kyrgyzstan, for example, destroyed the globally significant and unique Abramov Glacier monitoring station. The Uzbek national hydrometeorological service – Uzhydromet – had been operating this strategically located station on the border between Kyrgyzstan and Tajikistan for over 30 years. Similarly, security concerns stemming from the conflict in Afghanistan have limited access to the Panj/Amu Darya River, which forms the border between Tajikistan and Afghanistan, and have precluded water monitoring and flood warnings on this major international river of Central Asia. Civil conflict in Tajikistan has virtually devastated populations of endangered animals in the Romit strict nature reserve and valley in central Tajikistan and has adversely affected the Beshai Palangon (also known as Tigrovaya Balka) strict nature reserve.

Drug trafficking and the ongoing conflict in Afghanistan also raise continuing security concerns. The United States and her allies have long expressed concern about the possibility of infiltration between Afghanistan and the Central Asian states, and border control – particularly for the mountain countries – remains an important issue. Both the United States and Russia have established military presences in Kyrgyzstan and Tajikistan, and what happens in Afghanistan will certainly have implications for Central Asia and mountain development.

Frictions and conflicts have weakened the mountain countries of Central Asia. Unity, rule of law, justice and a national consensus on how to proceed would strengthen these nations and substantially contribute to sustainable mountain development.

The Chinese province of Xinjiang, as the main physical connection between China and Central Asia, is an area of economic and political importance, and ongoing conflicts there may impede progress towards better relations between the Central Asian countries and China. Xinjiang refugees seeking protection in Central Asia have prompted stricter border security.

Finally, one remarkable achievement in the past 20 years in the field of global security is Kazakhstan's decision to give up its nuclear arsenal (the world's fourth largest) left by the Soviet Union, and to close the Semipalatinsk nuclear test site permanently. The more than 450 underground, surface and airborne nuclear tests conducted here over several decades led to adverse effects on the environment and human health. Following a resolution on a nuclear-weaponfree Central Asia, Kazakhstan is now promoting a Universal Declaration of a Nuclear-Weapon-Free World at the UN.

##### 1.3.14 A new era in highland–lowland relations

As the independence era has unfolded and new political realities have set in, interstate tensions and diverging priorities over the use of water resources have started to dominate the political, economic and environmental agenda in the region. The last decade in particular has been characterized by an increase in disputes over water usage, particularly in countries dependent on agriculture. A lack of political will and the absence of any effective mediation mechanisms have only exacerbated the problem. Tensions between the highland countries of Kyrgyzstan and Tajikistan and the lowland countries of Uzbekistan, Turkmenistan and Kazakhstan have largely been generated by disparities in levels of prosperity and stability, energy accessibility and different priorities for water usage.

Water for irrigation is crucial to the agricultural communities in the lowland countries. The mountain countries, in contrast, often face significant electricity and fuel shortages, especially during the winter period, and therefore require water reserves for power generation. In line with population growth, energy demands have grown substantially over the past 20 years. Finding the balance between large-scale energy generation, such as hydropower, and water provision for large-scale agriculture is proving very difficult and politically sensitive. As the demand for energy and food continues to grow, tensions surrounding water may escalate.

Part of the conflict relates to the timing of the release of water: lowland agriculture needs water in the summer and fall, and the mountain countries need the water for power generation primarily in the winter. The retention of water through the summer and the larger release of water in the winter have resulted in flooding on the Syr Darya River.

The Soviet-era agreements and structures related to water allocation and supply for agriculture have generally stayed in place across the region, but the barter system of energy-for-water exchanges is no longer in effect. This has meant that mountain countries, which have limited fossil fuel resources, are now exploring alternative ways to meet their energy requirements. The development of the hydropower sector in upstream states is a leading example of this shift towards energy self-sufficiency but has been met with concern by the lowland countries fearful of the impact on their own water supplies needed for agriculture. An increase in mining operations in mountain watersheds, largely in response to international demand for the region's gold and other mineral reserves, is also contributing to the growing friction between the highlands and the lowlands.

Facilitating cooperation between the concerned parties is an important element of resolving disputes of water usage. The ongoing cooperation between Kyrgyzstan and

Kazakhstan over the Chu-Talas River Basin, assisted by the Organization for Security and Co-operation in Europe, the United Nations Economic Commission for Europe and the United Nations Development Programme is an encouraging example of modern cooperation.

But despite these welcome efforts to reduce tensions in the region, the agriculture-water-energy nexus is poorly managed and has the potential to escalate into further conflict or economic blockage to stop the energy development projects of the mountain countries. International organizations such as the Asian Development Bank, the World Bank and the United Nations are among a number of external parties that have been involved in facilitating dialogue between the governments of the highland and lowland countries. But progress has been limited, not only due to a lingering lack of trust and political will, but also due to practical problems such as lack of the modern technology necessary for progress in the agricultural and energy sectors.

The emergence of China as a dominant regional player and a major water and energy consumer is also altering the political, economic and environmental landscape of the Central Asian region. Similarly, earlier agreements on water allocations during the Soviet period did not consider Afghanistan, whose interests in the basin have only recently begun to gain prominence.

### 1.3.15 Soft security for stability and conflict avoidance

The term “soft security”, as used here, describes the non-military factors that support stability and help avoid conflict. In Central Asia, particularly in the remote and largely impoverished mountain communities, the principle soft security factors relate to energy and food security.

The tangible and detrimental impact of conflict on both mountain populations and the surrounding environment highlights the urgent need for more sustainable development of highland communities. By minimizing the root causes of discontent and insecurity – such as poverty, the unequal distribution of land and water, unaffordable food and energy and the lack of job opportunities and basic education – the risk of conflict can be lessened and the chances of sustainable development of mountain environments and the well-being of mountain communities can be increased. The potential for local conflict over pasture and water use in border and densely populated regions has increased throughout the last decade. The support of NGOs and improvements in governance have recently reduced anxieties.

Herding is the main livelihood for Kyrgyz mountain dwellers. The access to Kyrgyz pastures by the herders from neighbouring Uzbekistan and Tajikistan was formerly regulated by local arrangements, but Kyrgyz legislation introduced in 2009 calls for agreement between the countries at the central level. In spite of the new opportunities, the introduction of the new pasture law has increased tensions over pasture use in near-border regions, especially around enclaves in the Batken Province of southern Kyrgyzstan.

While the demand for affordable energy has increased with population growth, the withdrawal of support from Moscow has left the region with an outdated and limited energy infrastructure. This in turn has led to a hike in energy prices with the result that, for poor communities in Central Asia’s mountain regions, electricity and fuel supplies are prohibitively expensive. Energy appears to be more affordable in Kyrgyzstan than in Tajikistan. Most rural families in Tajikistan, especially the mountain regions, seem to spend three quarters of their income on food and energy. Local initiatives have given rise to a number of generators (solar heat, biogas) and small-scale hydropower supply facilities, but the state generally still holds a monopoly on national power resources, and most communities do not have reliable and affordable access to energy. In Tajikistan, one million people spend much of the winter without electricity and nearly half of all households rely on firewood and dung for winter heating. In Kyrgyzstan, households have responded to the growing energy deficit by significantly increasing coal consumption.

The sad irony is that in spite of the huge hydropower potential, the populations of both mountain countries experience – especially in winter – energy deficits and recurrent electricity cut-offs that negatively affect businesses, well-being, health and education.

The rising cost of fuel is also influencing the rising price of food in the highlands. Since Soviet times, the Central Asian mountain nations have relied on imports of food products, particularly non-mountain products such as sugar, flour and cereals. Now, with higher fuel costs, such staple goods are more expensive, and mountain populations are at risk of malnutrition and related health issues. In Tajikistan, an increase in the proportion of bread consumption corresponded with the persistence of malnutrition, and neither Tajikistan nor Kyrgyzstan has yet achieved food sufficiency. The importance of the links between food security and energy security has led the United Nations and other international aid organizations to adopt a compound crisis analysis that considers food and energy as related problems that require integrated solutions.

## Social Dynamics

### 1.3.16 Natural resource ownership, management approaches and property rights

As part of the transition from collective farming to a market economy, Central Asian governments launched a land redistribution process that resulted in agricultural lands passing into a quasi-private ownership or long-term private rental. This privatization turned the management of formerly collective farms over to individuals, villages or groups, and the number of farming units skyrocketed. The corruption of local officials, however, marred the transition as those in power sought the best land for themselves, or sold favour to those seeking land of their own. Although the state retains official ownership, private management systems such as long-term individual leasing are now widespread.

For the states, the fragmentation into many smaller farms represented a challenge to their management capacity. Kyrgyzstan left decisions on what to grow to the farmers while Tajikistan took a more prescriptive approach. Even so, mountain farmers in Tajikistan, far from the centre of government, enjoy a high degree of freedom. The challenge for farmers was deciding what, and how much, to grow. With self-determination came personal considerations about food security and whether to cultivate for cash or for the flour that families needed to make their own bread since the state no longer provided it. These changes in the structure of agriculture conspired to constrict the options for crop rotation. Fragmentation and smaller farm size, climate, elevation, terrain and the imperatives for cash or flour all implied some limits on a farmer’s latitude regarding crop selection.

Rural dwellers in Kyrgyzstan and Tajikistan (70 per cent of the total population) rely substantially on their own agriculture production for food and income. Animal husbandry, which has historically played a more important economic role in Kyrgyzstan than in Tajikistan, has declined as a share of agricultural production in both countries. Wool production has suffered the highest percentage declines. In recent years, however, livestock production has increased steadily in both countries. In 2010, Tajikistan’s animal husbandry (meat production, eggs, milk) and food production exceeded 1991 levels, while Kyrgyzstan’s food production increased, its but animal husbandry still lags behind previous levels. Honey production in Tajikistan substantially increased over the same period, and reached Kyrgyzstan’s level of 2 500–3 000 tonnes per year. In contrast, Kyrgyzstan honey production declined.

During the initial transition period, 1 500 Soviet collective farms in Tajikistan were transformed into more than 37 000 individual farms, while 500 Soviet collective farms in Kyrgyzstan were transformed to more than 70 000 individual farming units and 700 agricultural associations and cooperatives. Currently, the number of private farming units exceeds 350 000 in Kyrgyzstan, and 50 000 in Tajikistan.

Prior to the Soviet era, the mountain communities of Kyrgyzstan and Tajikistan practiced primarily subsistence-based agriculture – livestock production in the Kyrgyz Tien Shan, and a mixture of crop cultivation, gardening and livestock breeding in the Tajik Pamirs – with some trade between home-based agriculturalists and nomadic pastoralists. During the Soviet period the agricultural sector was transformed from a household-level system to a centrally planned large-scale production system. Over the last 20 years,

the agricultural sector has reverted to household-level agriculture, but with more reliance on trade than in the pre-Soviet period.

With the change in land ownership, the income gap widened between those who acquired sufficient land for stock management and domestic animals and those who did not. The disruption of state-provided agricultural services, the rise in the number of smallholder herding and the lack of self-organization limited mobility and, subsequently, led to the breakdown of the transhumance system. People without enough land and a few animals could not manage their herds, and could not replace the winter fodder provided by the Soviets. Eventually many families lost their animals. The Soviets had provided economic and agricultural management services, and with independence farmers were responsible for their own management, animal disease control, winter fodder and access to markets. After 20 years many farmers now have the necessary business skills, but the income gap persists.

The state continues to manage some mountain hunting areas, and collects license fees and taxes, but the trend is toward private ownership and management. The well-run private hunting reserves that are careful to prevent illegal hunting maintain the highest wildlife levels. The corrupt private reserves, in contrast, pursue aggressive short-term goals with no attempt to balance hunting with the numbers of animals. As a result, these reserves enjoy a short-term financial gain at the cost of dramatically reduced animal populations.

With license fees that run from US\$ 10 000 to US\$ 15 000, the potential for local income from international trophy hunting is significant. Tajikistan has established a revenue sharing scheme with locals, but Kyrgyzstan, which has a low regard for international hunting, has not.

The introduction of Integrated Water Resources Management (IWRM) changed the approach to water management over the past 20 years. The previous approach relied on administrative principles and political boundaries; the integrated approach relies on hydrographic boundaries. The IWRM method has already enjoyed success in small basins, and in the Ferghana Valley, IWRM demonstrates how to manage resources more effectively with fewer disputes. On the Zeravshan River between Tajikistan and Uzbekistan, however, the two countries are independently implementing IWRM, but have not connected the two systems partly because political relations between the two countries remain complicated.

### 1.3.17 Demographics, poverty and labour migration

Over the past 50 to 60 years, population growth and an increase in life expectancy have led to dramatic demographic changes in the mountain regions of Central Asia. The population in Tajikistan, for example, increased from 2.1 million in 1960 to 7.5 million by 2011 (including 1.6 million since 1990). In Kyrgyzstan, the population increased from 2.2 million in 1960 to 4.4 million in 1990, and then to 5.3 million by 2011. Overall, the total population of Central Asia increased from 24.4 million in 1960 to over 60 million in 2011. In Tajikistan the average age is 22 years; in Kyrgyzstan, 27 years; and in Kazakhstan, 30 years.

As small, mountain, poor, geographically isolated and landlocked countries with predominantly agricultural economies and rural populations, Tajikistan and Kyrgyzstan are more impoverished and less industrially developed than their neighbours. These Central Asian republics had benefited from substantial budgetary support and the economic power and common markets of the Soviet Union, and Soviet policies had led to a high level of social and economic development and strategic support for the populations of Central Asia, particularly those in the remote mountain areas, in terms of security, jobs, food and fodder provision and energy supplies. The withdrawal of subsidies and the interruption of traditional trading links and markets led to rapid increases in unemployment and poverty, and dispelled illusions of an easy path to new and better lives. Poverty rates reached 60–80 per cent in both countries, and affected all remote mountain provinces. Over the last two decades, Tajikistan and Kyrgyzstan have remained Central Asia's poorest nations, though recent poverty rates declined to 40–50 per cent.

Labour income and social transfers (pensions and aid) remain important income sources for households in Kyrgyzstan and Tajikistan, and income from the sale of foodstuffs and local produce accounts for a similar share. The role of remittances has increased dramatically over the last decade and has become the major source of income as well as the safety net for most households. The construction and urban service sectors in Russia and Kazakhstan are major sources of employment for labour migrants coming from Tajikistan and Kyrgyzstan.

Unemployment and subsequent urban migration have changed the social fabric of many mountain communities. The Soviet withdrawal led to a major deficit of jobs, and many men from mountain communities now travel to capital cities or to Russia or Kazakhstan to find work. This drain of young and middle-aged men from traditional mountain communities has had an impact on family structures and placed an additional burden on women, who increasingly take the lead in households, while village elders take on the roles usually played by younger men. In some poverty-stricken areas, women who are heads of households have also joined the labour migration. Civil unrest, political instability and ethnic issues have also contributed to the emigration of skilled workers from the Central Asian region generally. According to official data and expert estimates, more than one million residents of Tajikistan and 500 000 residents of Kyrgyzstan now work and live abroad.

Tajikistan now has more than 800 000 men working in Russia alone, and the evidence suggests that the temporary migration of one individual can lead to the permanent migration of entire families. Remittances sent home by migrants constitute a large financial inflow to their home countries and often exceed the amount offered in international aid. The value of remittances to Tajikistan officially reported by banks in 2010 exceeded US\$ 2.5 billion, an amount equal to one half of the national budget. In Kyrgyzstan, the value of remittances is lower than in Tajikistan, but still significant – US\$ 1.0 billion.

Real incomes of households in Tajikistan and Kyrgyzstan grew rapidly over the past decade, leading to an equivalent growth in private consumption, and a nearly 50 per cent reduction in poverty. These trends are largely attributable to the gradual increase in transfers from labour migrants. While ten years ago remittances accounted for 5–10 per cent of GDP in both Tajikistan and Kyrgyzstan, by 2010–2011 the proportion stood at more than 30–40 per cent of GDP. In 2008, Tajikistan topped the world with remittances as a proportion of GDP at over 50 per cent.

Remittances maintain national economies and are key factors for economic and social stability. The growing importance of remittances as a source of foreign exchange is reflected in the fact that cumulatively they have outpaced foreign direct investment and official development assistance over the past 10 years. The officially reported figures on remittances no doubt underestimate their full scale, since remittances through informal channels are not counted in the financial statistics. Excessive dependence on remittances, on the other hand, has economic and social drawbacks. The national economies of Tajikistan and Kyrgyzstan are ever more dependent on the economic and labour conditions in the countries receiving migrants. The effects of the 2008–2010 global economic crisis on Russia and Kazakhstan have already negatively affected the flow of remittances. The disruptions to family and village life lead to increases in the number of divorces and other personal problems. Labour migrants abroad are sometimes subject to exploitation and abuse – most of them work illegally, do not speak Russian, have no awareness of labour regulations and have low qualifications. Russia's plans for tightening immigration policies on temporary labourers could force many migrants, especially those with limited command of the Russian language and the lack of basic skills and vocational education, to return home.

### 1.3.18 Urbanization

The urban populations in the mountain countries of Kyrgyzstan and Tajikistan in the Soviet era were a small percentage of the total populations. After independence, Kyrgyzstan experienced a movement of people from poverty areas in the mountains to urban centres, but new residential construction did not keep pace with the influx of new residents, and the resulting informal settlements exacerbated the existing urban problems. Bishkek is surrounded by these informal and unregulated settlements that developed chaotically and without regard to seismic hazards, and the city now faces the questions of how to integrate the settlements safely into the city structure and how to provide infrastructure and services.

Within its borders, Tajikistan experienced a migration in the opposite direction: from lowlands and urban areas back to the mountains. During the 1950s and the 1970s, the Soviets orchestrated two periods of resettlement from the mountains to the lowlands for the purposes of land development and cotton cultivation. Some of the migration was forced, and some voluntary, but in any case, whole mountain communities were abandoned for many years. At the time of independence, about half of these migrants from the resettlement programme went back to their old villages. Civil war in the 1990s and the availability of energy resources for heating were additional factors encouraging people to return to the mountains.

The Tajikistan rural population has grown over the past 20 years, but some of the same problems experienced by Kyrgyzstan are present – urban construction has not kept pace with population increases, and although privatization has led to higher quality in some expensive developments, most builders opt for cheaper solutions of lower quality. Until recent years, most new construction failed to meet minimum standards of earthquake resistance and energy efficiency. The energy-intensive construction sector offers huge opportunities for improvements in efficiencies. Waste management is another problem – smaller communities lack waste management systems, and larger ones, such as the capital cities, may have the systems but do not have proper landfill facilities.

Urban services have dramatically changed in the past 20 years. In the 1990s, most of the urban housing stock was taken over by city residents, and semi-private services and homeowners' associations have largely replaced the Soviet-era state municipal management and maintenance companies. Urban service providers in Kyrgyzstan and Tajikistan, however, often operate below cost-recovery levels, and revenues from tariffs cannot cover the costs of upgrading the deteriorating urban infrastructure. Water losses in degraded urban pipelines are rather high, and many urban wastewater treatment facilities are not functioning properly (especially for biological treatment) and generally perform less effectively than two decades ago. Urban water consumption has generally declined mainly due to changes in the industrial and economic profiles of urban areas, and partly due to the introduction of individual water meters. (Urban drinking and industrial water systems were often connected, so a decline in industrial operations has resulted in reduced water consumption.)

Two decades ago, industrial air pollution was one of the major urban environmental issues. Nowadays, air pollution associated with road traffic density is one of the major factors undermining air quality, and traffic congestion is limiting the mobility of urban residents and commuters. This is particularly evident in Almaty city in the foothills of the Zailiisky Alatau Mountains. With a population of more than 1.4 million, Almaty is the largest urban agglomeration in Kazakhstan. Pollution from traffic is exaggerated by specific meteorological conditions such as mountain–valley winds and temperature inversions in autumn and winter. The introduction of city metro, bus priority lanes and the enforcement of better fuel standards are some of the ongoing response measures in Almaty.

### 1.3.19 Education and health: Investing in human capital

The health implications of mountain-to-lowland migration and vice versa are subject to research that was started by the Soviets and that continues today. The findings demonstrate that long-time lowland residents who move to the mountains have diminished performance. The same outcome follows when the move is in the other direction. The adaptation period is long, and the migration may shorten longevity. At very high elevations – 3 000 metres or higher – life expectancy is 48 years (Murgab district in Tajikistan's Eastern Pamir) compared to 70 years at lower elevations.

The decline in Soviet support for mountain communities has affected not only the economy and opportunities for employment, but also the levels of basic education and healthcare. Literacy and the education of children living in rural and isolated mountain communities were Soviet priorities, but the withdrawal of funding from Moscow has left many of the newly independent states of Central Asia with insufficient funds to maintain the same levels of education. Public expenditures on education and health are less than one quarter of the Soviet levels. As a percentage of GDP, current spending on health and education (3–4 per cent) is also considered very low. The abandonment or privatization of the traditional summer mountain camps for children has further limited the access of poorer children from rural areas to educational and health restoration opportunities. Many rural mountain schools are without an adequate number of teachers (due to low salaries and lack of teachers), and the number of doctors per resident and the number of hospital beds have declined by half. In healthcare, in particular, the remoteness of mountain communities only exacerbates the problems associated with inadequate staff and facilities.

The official literacy rate is high (98 per cent) and is comparable to advanced economies. Indeed, the population is a relatively well-educated, which is the admirable heritage of the Soviet era. But increasingly, mountain countries face the crucial situation when the declining quality of education becomes an obstacle for sustainable development. The numbers of students and universities have increased three-to five-fold in the last twenty years, but the quality of graduate and post-graduate teaching, especially in natural sciences and engineering, has deteriorated.

The competitiveness of countries in today's high-tech and globalized world is dependent on investment in human capital. Resource management skills, a sense of responsibility and knowledge of and respect for mountain ecosystems are key factors for success in pursuing a sustainable mountain development agenda.

Kyrgyzstan has taken active steps to join the Bologna Process to adjust its higher education to international standards, but vocational education and professional development courses still lag behind the realistic needs. Tajikistan is planning major reforms in basic education by introducing a 12-year study cycle with options for specialist courses and certified technical training. Issyk-Kul State University in Kyrgyzstan and Khorog State University in Tajikistan historically lead in mountain-focused higher education, and the International University of Kyrgyzstan has created the UNESCO Chair on sustainable mountain development. The University of Central Asia is now working to increase the focus on mountains, and organizations such as the Aga Khan Foundation are providing assistance to mountain societies to develop both traditional and modern knowledge. (See section 2.5.2 for more detailed information.)

As industrial and agricultural practices have changed, the environmental health risks from the associated pollution have decreased, but the growth of populations in mountain valleys has come with increased risks from biological pollution. The majority of these populations take their water from open sources, and are thus exposed to microbial and bacterial contamination. Inadequate wastewater-processing facilities increase the risks, and natural disasters such as mudslides and earthquakes can introduce even more contamination into water sources and thereby increase the risk of water-borne disease outbreaks.

Child mortality rates are generally falling, but in the high-mountain city of Naryn, the rate is twice that of Bishkek. The risk of malaria, tuberculosis, HIV/AIDS and other dangerous diseases remains high, and increases with poor living standards, increased migration and inadequate preventive measures and health services. Tajikistan is the only country in the world where polio is on the rise. About 450 confirmed cases have been reported in 2010 in the country, compared to 900 cases worldwide. Kyrgyzstan faces health risks from epizootics (such as brucellosis, foot-and-mouth disease and anthrax) in the southern mountain areas, and domestic animals are sometimes poisoned by grazing on land polluted in the Soviet era.

### 1.3.20 Religion, culture, ethnicity and traditional knowledge

The Tien Shan nomadic communities have deep roots in Tengriism, an ancient religion that incorporates elements of shamanism and animism, and that focuses on living in harmony with nature. Sulaiman-Too Sacred Mountain in Osh, Kyrgyzstan, is a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage site. The scenic mountain oasis of Ulytau, situated among the arid grasslands in the geographic centre of Kazakhstan, and its Auliye-Tau Sacred Mountain, comprise an ancient Kazakh shrine, which is covered with beautiful legends and rock engravings. Mountain areas of Central Asia have numerous mazars, which are among the distinguished pilgrimage sites in the region.

Houses in the Tajik Pamirs have distinctive architectural elements combining pre-Islamic and Islamic traditions and values. Made of stone and mud, these houses have main

living rooms with columns that are named after saints, and that symbolize faith, peace, purity, friendship, love, loyalty and protection. In contrast, the nomadic populations in the Kyrgyz Tien Shan often live in traditional yurts – easy to assemble and transport houses with wooden (willow) structures, wool coverings and colourful carpets. The dome of the Kyrgyz yurt is displayed on the Kyrgyz national flag. While yurts are widely used across Kyrgyzstan and in other parts of Central Asia by pastoral communities, the majority of the rural population live in modern houses. Because the Tajik Pamir dwellers raise more crops than livestock, they eat mainly vegetables, legumes and foodstuffs such as bread and noodles made from wheat flour. The diet of the Kyrgyz Tien Shan dwellers has a high proportion of meat and horse milk. Changes during the economic transition affected nutrition and led to a considerable reduction in food variety. Consumption of meat products, fruits and vegetables generally declined, while consumption of bread, potato and dairy products increased.

Independence saw the rise of Islam in Central Asia, particularly in Tajikistan and the mountain regions where the roots of the religion go deep. Differences in belief regarding whether government should be secular or theocratic have been a source of civil conflict and difficult relations between countries. Extreme Islamic groups across Central Asia have used the mountains as hiding places. In Uzbekistan, where government repression has led to opposition to the regime, extremists have resorted to hiding in Tajikistan from which they launch attacks into Uzbekistan. This situation has strained relations between the countries.

From the beginning of the transition to independence, His Highness the Aga Khan, the forty-ninth hereditary Imam of the Ismaili Muslims, has been active in supporting development in the Tajik Pamirs. In the tradition of service in international affairs, the Aga Khan has provided development assistance to Tajikistan through the Aga Khan Foundation (AKF) and the Aga Khan Development Network. (See section 2.6 for a description of the activities and accomplishments of the AKF Mountain Societies Development Support Programme.)

The rise of Islam in the region corresponds with a fall in pork production and consumption, as well as with a decrease in the hunting of wild boars in Tajikistan and Kyrgyzstan. As a result, the wild boar population has increased. The consumption of alcohol also appears to be falling, but no reliable statistics are available to confirm this impression.

Since independence, the Central Asian states have begun to reassert their identities, drawing upon the indigenous cultures that had often been overlooked during the previous era. Families have always been an important part of social networks in the region, and with the end of Soviet support have taken a major role in supporting children and the elderly. The role of families is often underestimated, but is crucial in a culture where social security is a private responsibility.

The lack of resources has led mountain communities to resume traditional practices or to adapt modern ideas to the resources available. Energy shortages have limited the opportunities for food-processing, for example, and the mechanical solutions are too expensive, so some mountain communities have tried to re-establish water mills. In the Soviet era, there was no demand for the animal hides and wood-carving products traditionally made in the mountains, and the skills in those traditional crafts significantly diminished. Now, however, with the new market opportunities and the growth of tourism in the region, the traditional mountain crafts are experiencing a resurgence, and some communities are specializing in traditional crafts.

Traditional music of enormous diversity has long been an integral part of life in Tajikistan and Kyrgyzstan, and with independence only became more important and more diverse. These countries' music incorporates a range of instruments from the simple and traditional to the electronic, and shows little influence from western sources. The Aga Khan supports the further development and dissemination of music traditions through programmes at the University of Central Asia.

The recently deceased Kyrgyz writer and philosopher, Chingiz Aitmatov, was a Central Asian cultural hero whose work was translated into more than 150 languages. His evocative descriptions of the mountain environment and his advocacy for mountain ecosystem conservation brought attention to the issue, and his career demonstrates how one man can influence an entire region through his cultural contributions.

After independence, the exodus of Russians and Europeans from Kyrgyzstan and Tajikistan changed the proportions of the countries' populations in terms of national ethnicity: with fewer outsiders, higher percentages of the populations are Kyrgyz or Tajik. A related factor – place of origin as distinct from ethnicity – affects personal lives and politics throughout the region. North–south and east–west differences are quite pronounced in Tajikistan but geographic divisions are also important in Kyrgyzstan. The exploitation of these place-of-origin differences can lead to political and social unrest and conflict. The increasing number of Chinese workers in both countries may create antipathy among residents due to labor competition, wage inequalities and cultural differences.

Russian remains the international language of Central Asia, and in Kyrgyzstan – where the links to Russian investments are historically stronger – the Russian language remains well known in both metropolitan and rural areas. Russian was common in Tajikistan 20 years ago, but now, because of the stronger national identity and legislative requirements regarding national language, Russian is fading away. But Russia is the main receiving country for Tajik migrants, and Russian is the language of regional meetings, and Russian language skills are therefore still important to many people in Tajikistan. At the same time, the Chinese language is becoming more popular among students and traders who plan to develop business links or participate in China-supported mining and energy projects in Central Asia.

#### 1.4 Soviet environmental legacies and emerging conditions

The trends discussed in the previous section all have a bearing on the environmental, economic and social conditions in Central Asia, as do the environmental legacies left by the Soviets. This section is not an exhaustive assessment of those legacies, but rather a consideration of the more visible and pressing concerns of public and private interest. The institutional and governance aspects of sustainable mountain development, discussed in the next section, fit within the context of the trends and the legacies.

Abandoned mines, hazardous industrial waste sites and mine tailings – mostly legacies of the Soviet period – continue to be a major environmental concern for the mountain countries of Central Asia. Although their reserves are not large in modern terms, Kyrgyzstan and Tajikistan were among the pioneers in developing the uranium mining sector. When the Soviets left, they simply abandoned the mines and tailings with no remediation. These hazardous sites remain obstacles to sustainable development, environmental protection and population security in the region. Abandoned and active mining sites and metallurgy industries cause environmental problems in the Altai Mountains of Kazakhstan and in the Irtysh River basin, where the country's mining sector was born in the eighteenth century.

The cost of remediation is prohibitive for the countries, and in the absence of legislation or financial resources to undertake the task, Kyrgyzstan and Tajikistan have no remediation plans in place, but are looking to international partners for assistance. Abandoned mining sites pose as much or more danger to neighbours in the event of a flood or other mine failure, and regional cooperation is one prospective solution. As the owner of the legacy, Russia is participating in negotiations and may commit to helping resolve the problems.

In Kyrgyzstan, abandoned uranium tailings are a national priority both politically and environmentally, but because of the scale of the problem the resources needed are overwhelming, and no progress has been made. Continued efforts at cooperation with Russia and the other Central Asian countries is a promising path, as is the prospect of private sector involvement. Private firms may be interested in reopening some mines or in re-mining some tailings.

The independence era has seen a dramatic reduction in water pollution as a result of changes in industrial practices and the ending of some industrial and mining operations. In Kyrgyzstan, for example, the production of animal skins no longer employs the toxic chemicals that killed almost all the fish in some areas, and fish stocks in rivers are slowly recovering as a result of the changes in business operations and land use. Similarly, the water quality in Lake Issyk-Kul is improving as a result of reductions in fertilizer use because the agricultural runoff no longer carries away high levels of chemical residues. Currently, illegal fishing, overfishing and invasive species are the main threats to the Lake Issyk-Kul ecosystem.

Another positive environmental development in the independence era is the expansion of protected areas in the mountains – a doubling in the size of the total area protected in Tajikistan and Kyrgyzstan – and the application of particular types of protection, such as buffer zones and corridors, to local circumstances. Currently, all the countries of Central Asia protect their mountain ecosystems relatively well through regulations and the maintenance of protected areas. Where the Soviets maintained strict nature reserves that excluded visitors, the new states – underfunded and with less experience – are developing national parks, a new concept in the region, and one in keeping with the spirit of Rio and the Aichi targets. They are also creating reserves for special purposes such as watershed protection, forestry or regulated hunting without necessarily restricting access for recreation or other compatible uses.

Over the past decade, the border mountain regions have seen the development of joint parks and other protected areas. In the Altai Mountains, Russia and Kazakhstan cooperate on forest fire and wildlife protection and on ecotourism, and in the Western Tien Shan, Kazakhstan, Uzbekistan and Kyrgyzstan maintain a joint park that is nominated for UNESCO World Heritage designation. Afghanistan, Tajikistan, China and Pakistan are working on plans for a project in the Wakhan Corridor.

In the Soviet era, the state owned the forests and managed the planting programmes, and used afforestation primarily for river bank and slope protection. Now, individual planting programmes are investments in the economic and environmental future and are targeted to a range of specific applications – visual amenity benefits, timber or fuel, for example. Forest managers assist in the natural regeneration of forests, and, on the premise that the community cares more than the central government, communities are now managing local nut forests.

In some ways, water protection in the Soviet era was better, particularly in the exclusion of riparian areas from any other uses. Now, the absence of controls and the diversity of land uses have meant less protection. Water resources have become more vulnerable to physical use and damage, and the associated ecosystem services have diminished.

In agronomy, the results of the transition to independence are mixed. The Soviets took an advanced scientific approach to plant development and species selection, but their introduction of species was inadequate and they often ignored traditional practices. Now the botanical gardens and fruit and nut forests, which had been restricted, are open to public use, but the overall scientific effort has been reduced dramatically. A combination of the best aspects of each approach would improve the situation.

### 1.5 Institutions and governance in sustainable mountain development

The period of glasnost and perestroika started by Mikhail Gorbachev near the end of Soviet era raised public awareness about the environment and led to the strengthening of environmental institutions and legislation. After independence Central Asian governments were quick to develop national action plans, programmes and strategies on environmental protection in general, as well as on specific environmental issues such as climate change, desertification, biodiversity, persistent organic pollutants and others. All the countries of Central Asia are signatories to the three Rio Conventions: the UN Framework Convention on Climate Change, the UN Convention on Biological Diversity and the UN Convention on Combating Desertification. In addition, numerous multilateral and regional environmental agreements have been signed or ratified. The countries have taken different development paths, and their strategies and approaches to sustainable mountain ecosystem management have developed differently.

The key regional player in water and environmental cooperation is the International Fund for Saving the Aral Sea, an organization that deals with environmental and socio-economic challenges of the Aral Sea basin through its Aral Sea Basin Programme. Funded by international donors and by the Central Asia states, the Programme works on climate change, natural disasters in the mountains and watershed protection, among numerous other issues. Some ongoing projects in the mountains not directly linked to the Programme are contributing to its implementation.

The Interstate Commission for Sustainable Development (ICSD) was established in 1993 to assess regional environmental conditions and to coordinate the planning and implementation of environmental and sustainable development programmes. In 2008, the ICSD supported the initiative of Kyrgyzstan and Tajikistan to establish the Regional Mountain Centre of Central Asia (RMCCA) with headquarters in Bishkek. The RMCCA promotes cooperation in the Central Asia region for mountain ecosystems conservation and the sustainable use of natural resources, and works to improve the socio-economic conditions in mountain areas by providing policy support and by promoting cooperation with other mountain regions. The Regional Environmental Centre of Central Asia (RECCA) is implementing the Payment for Ecosystem Services (PES) project with Swiss support in the tourist and agricultural areas in the mountains of Issyk-Kul Province of Kyrgyzstan.

Kyrgyzstan began to attract the attention of the international community to mountain development in 1998, and successfully advocated for the UN declaration of the International Year of Mountains in 2002, which culminated with the Bishkek Global Mountain Summit. The Summit concluded with the formation of the Bishkek Mountain Platform, and reinforced the International Partnership for Sustainable Development in Mountain Regions (known as the "Mountain Partnership"). The Food and Agriculture Organization of the United Nations offer to host the Secretariat was welcomed, and since its establishment, the Mountain Partnership Secretariat has been advocating for an integrated approach to sustainable development in the world's mountain regions. In 1998, Kyrgyzstan established the National Centre for Mountain Regions Development (NCMRD), which is responsible for coordination and formulation of national policy on mountains. In 2003, the International Information and Education Centre for mountain states was established under the NCMRD. The Kyrgyz Agency for Rural Investments has played a major role in supporting rural infrastructure and business initiatives in the mountain villages across the country.

Tajikistan focused its attention on regional freshwater resources and glaciers, and conducted numerous regional and national activities highlighting the importance and crucial role of Central Asia mountains as water towers. Kazakhstan has recently established the Regional Centre on Glaciology under UNESCO auspices to promote the exchange of scientific knowledge and popular information about conditions of mountain glaciers across the region, and also established the Regional Centre for Disaster Response and Risk Reduction.

The high level of poverty together with the growing vulnerability of the ecosystems affected by the unsustainable use of natural resources by local communities demanded urgent interventions. In 2000 the Government of Switzerland launched the Central Asian Mountain Partnership (CAMP) initiative in Kyrgyzstan, Tajikistan and Kazakhstan with an aim to promote sustainable mountain development. In a shift from waiting to acting, civil society started to participate in the development process. In 2002, at the initiative of civil society and NGOs, and with support of the Swiss Agency for Development and Cooperation, the new programme was launched as an association of rural communities that would exchange information, knowledge and experience to foster participation in solving common local problems. In 2003, the Alliance of Central Asian mountain communities (AGOCA) was formally created and registered in Kyrgyzstan. The overall goal of the organization is to assist in the sustainable development of Central Asian mountain regions and thereby contribute to the improvement of local living standards.

Mountain-focused NGOs involve various levels of stakeholders from central governments to village institutions and the general public. They often communicate "mountain voices", advocate for interactive and open processes of policy formulation and act to bridge any gaps between new legislation and strategies and the realities in mountain communities. Another category of civil society organizations – mountain associations – are working with young people and hikers to promote mountain environmental knowledge, to clean up garbage and to cultivate responsible outdoor traditions. Finally, private and public foundations such as the Aga Khan Development Network have contributed to integrated mountain development.

The Regional Environmental Action Plan (REAP) approved in 2001 by all Central Asian states treats mountain ecosystems as regional environmental priorities. The Framework Convention on Environmental Protection and Sustainable Development of Central Asia, adopted in November 2006, is aiming to strengthen regional environmental cooperation in five priority areas: air pollution, water pollution, land degradation, waste management and mountain ecosystem degradation. Kyrgyzstan,

Tajikistan and Turkmenistan have signed the Convention. The Central Asian Sub-Regional Strategy for Sustainable Development, drafted in 2007–2008, is now being considered by the countries. In general, however, the progress on the implementation of all these regional agreements has been rather slow.

National strategies, programmes and action plans on biodiversity, land management, climate change, natural disasters and the environment all mention the role of mountain regions, but often do not include adequate and realistic financial provisions. They also underestimate the implementation capacities at the local level and the cross-border importance of mountain ecosystems and services. The Global Environment Facility has recently supported national exercises on improving the linkages between finance mechanisms and regional capacity-building and the action plans associated with the Rio conventions. Mountain development would benefit from an elaboration of more specific actions, from sufficient resourcing of these actions and from synergies with development projects in tourism, trade and commerce, roads and agriculture. New opportunities in climate change and renewable energy finance, support for watershed protection, and biodiversity benefit sharing and PES are among the emerging funding prospects.

With the launch of a mountain partnership in Central Asia, Kyrgyzstan, Tajikistan and Kazakhstan prepared national sustainable mountain development strategies and a regional strategy, but the shortage of resources over the last decade resulted in poor implementation, especially at the local level. Environmental institutions or scientific groups often designed and implemented these strategies, while the key stakeholders in agriculture, water, energy and others remained preoccupied with their own development priorities. Most economic, social and environmental development strategies in the years of independence focused on densely populated, industrial or agricultural regions, and failed to consider the specific circumstances of the mountain communities. The growing number of obligations under multilateral environmental agreements and national legislation were not matched by an increase in institutional capacity and financing priorities. The deterioration of management and enforcement capacities at both the central and local levels further constrained implementation. Stakeholder responses to new mining, water, forestry and pasture programmes and strategies varied from support to strong opposition.

New laws at the beginning of 2000 moved Kyrgyzstan toward a decentralized government with specific attention devoted to mountain areas. The Law of the Kyrgyz Republic on mountain territories was approved in 2002, and the Kyrgyz Government Decree on state support to the population living and working in high-altitude areas, in 2007. These laws provide salary and pension increments, as well as financial support for mountain schools, hospitals and infrastructure improvements. Kyrgyzstan leads Central Asia in developing decentralized governance, and offers new opportunities through legislation on the use of natural resources in such key sectors as pastures and forests.

## 1.6 Monitoring and research

Environmental monitoring and research provide an essential base for sustainable mountain development. The collection and analysis of hydrometeorological observations enable the weather and climate forecasting that benefits farmers and that supports disaster risk reduction. The monitoring of glaciers and permafrost tracks the progression of climate change, and helps scientists predict the downstream implications of a changing mountain environment. Research and conservation related to biodiversity and land resources help ensure the continuing provision of valuable ecosystem services. And geologic and seismic research encourage the development of mineral resources and lessen the potential impacts of natural disasters.

Much of the baseline information for current environmental research in the mountains comes from an ironic source – the search for Bigfoot. Rampant speculation in the 1960s regarding the existence of Bigfoot led scientists, under the guidance of K. Stanukovich, to advocate successfully for an expedition of discovery in the Pamirs. The ensuing research uncovered no credible evidence of the elusive Bigfoot, but it did establish a significant base of knowledge related to botany and physical geography, and considerably advanced environmental knowledge in the region.

### 1.6.1 Hydrometeorology

During the Soviet era, meteorological monitoring received extensive support from the state and was an important aspect of environmental planning across Central Asia. The Soviet hydrometeorological service was strategically important, but its high level of staffing and funding were beyond the means of the new countries, and over the past 20 years, the quality of the stations and the equipment has declined sharply, and the vast majority of former monitoring sites are in a state of neglect. This is due in part to the failure of the newly independent states to recognize the importance of meteorological forecasting and data and to ensure that environmental monitoring remained a priority on the national agenda. The high costs of maintaining and servicing weather monitoring stations, particularly in mountain countries, also contributed to the decline in investment in meteorological services.

Over the past decade, attitudes and perceptions have started to change in this regard, with both governments and international donors such as the World Bank, the United States Agency for International Development and the Swiss Development Cooperation recognizing the benefits of having reliable weather forecasting systems in place across the region. The role and impact of the weather on agriculture, notably crop production, is one aspect that has captured the attention of many governments in Central Asia. Equipped during Soviet times to monitor the surrounding vegetation and land, the meteorological stations proved extremely useful for the forecasting of summer grass growth and the conditions of pastures for grazing. The benefits of this agricultural meteorology are once again being recognized, and investment in the necessary infrastructure should be encouraged. Seasonal weather forecasting – the prediction of weather patterns for the coming months – is a particular challenge and requires further improvement.

The replacement of manual monitoring with modern technology and the corresponding reduction in the reliance on human labour are other important trends in meteorological observation in the region. These developments permit more efficient and consistent monitoring of weather conditions in remote and inhospitable mountain areas, but local institutions have often greeted the introduction of new technologies with hostility and distrust. This situation is changing and automatic weather stations are being integrated into daily operations. The monitoring equipment provided by donors is often specific to the country of origin, and requires specialized training as the technology varies across the region. A more coordinated approach by donors is needed in this regard.

### 1.6.2 Ice, snow and permafrost

During the Soviet era, the high mountains of Central Asia were home to 12 major glacier monitoring sites, two of which – in Kazakhstan and Kyrgyzstan – were of global importance. Most of these stations ceased operation in the post-Soviet period, and only the major glacier observation site in Kazakhstan at Tuyksu glacier remains active, albeit in an outdated and underfunded state.

Glaciers have, however, become a hot political topic over the past few years, with heads of national governments and donors increasingly highlighting the melting of glaciers as a consequence and indicator of climate change. Central Asia's glaciers, some of which are the largest in the Eurasia, are also proving to be popular tourist attractions, putting glaciers and their protection back on the national agenda.

All of the Central Asia countries with glaciers (Kazakhstan, Kyrgyzstan, Tajikistan and Uzbekistan) are in the process of compiling glacier inventories through a combination of field research and satellite imagery. Given that the last such assessment was done in the 1970s, this is a timely development. Since 2008, international donors have established two new monitoring sites – one near Bishkek at Adegyne glacier and the other on Enylchek, the largest glacier in Kyrgyzstan. These new multi-purpose sites are equipped to measure not just glacier activity, but also weather patterns, mountain lakes and even the movement of tectonic plates.

The methodology and approach to glacier monitoring has changed significantly since the end of Soviet rule, bringing both benefits and drawbacks for the region. On the plus side, there is now a greater involvement of local scientists in glacier monitoring activities, as opposed to the dominant involvement of experts from the central institutions in

Moscow or Tashkent. On the downside, the growing autonomy of countries within Central Asia has led to a diverse array of glacier monitoring and assessment methodologies and a subsequent lack of regional coordination and compatibility. In an attempt to overcome this problem, the long-standing glacier monitoring center in Kazakhstan, in collaboration with UNESCO, is starting to hold regional glacier-focused conferences to encourage better regional coordination. Kazakhstan and UNESCO have recently established a regional glacier centre in Almaty.

In response to the increasing impacts of climate change, a number of global researchers are heading to Central Asia to undertake ice-drilling and glacier measurement activities, a practice the Soviet authorities never extensively pursued. With the use of advanced technology, many scientific researchers are now able to drill down to depths of 1 000 metres and are developing a deeper understanding of the impact of climate change on the region's glaciers. High levels of competition between the various glacier research groups is, however, a persistent problem. The concealment of glacier data and the limited exchange of information can result in a repetition of activities and be detrimental to the development of effective measures. Moreover, deliberate attempts to ensure glacier monitoring activities are kept confidential can provoke feelings of resentment and hostility within local communities and among experts. In one instance, local glacier experts and scientists only found out that international researchers were ice-drilling in their area a year after the operation had begun.

In the Soviet period, snow researchers placed gauges in the mountains, and using helicopters, calculated highly accurate measurements of water equivalency from annual snowfall. With the withdrawal of Soviet support, these procedures proved to be too expensive to continue. Recent attempts to replace the earlier programme with satellite observations are promising, but the new approach needs more testing, and a 20-year gap in observations remains. Soviet-era meteorological stations with a focus on snow research are still in service, and continue to take manual measurements and to provide avalanche risk analysis and warnings crucial to local decision-making. Researchers have made initial efforts to automate the system of snow measurements, but the new methods are unproven.

Kazakhstan operates a special laboratory for permafrost drilling and a research site with a dozen thermometric wells up to 300 metres deep, and advises important economic sectors of their findings. This laboratory does not have the same capacity as in the Soviet period, but it delivers useful information. It conducted permafrost research at several sites in the central regions of Kyrgyzstan and Tajikistan in the 1970s and 1980s. A renewed focus on permafrost research can assist in the development of mining and roads, rails and other infrastructure.

### 1.6.3 Biodiversity and land resources

In Central Asia, mountain biodiversity conservation is carried out in three key ways – through the upkeep of botanical gardens, animal reserves and nurseries; in specialized wild nature conservation sites; and through monitoring stations in mountain regions and nature parks and reserves. These efforts are usually funded by both national institutions and through international projects and bilateral cooperation channels. The Pamir botanical garden near the Tajik town of Khorog is one of the highest botanical gardens in the world (at an elevation of 2 000 metres), and is now a popular tourist destination. Diminished funding and local capacity, however, have resulted in a decline in the maintenance levels of many of the region's botanical gardens and natural parks. Similarly, small mountain research centres have virtually disappeared over the past 20 years, mainly as a result of privatization or poor budget management.

Nature parks have generally been retained and protected throughout the independence era, with many flora and fauna conservation programmes being carried out by scientific and public institutions across the region. While this is a welcome development, these programmes are becoming outdated and should be reassessed to account for modern trends and challenges such as climate change and an increase in invasive species. Inventories of mountain forest areas should also be carried out in a more systematic way, especially given that forest protection also directly benefits lowland areas. Kyrgyzstan, with the help of the Swiss government, is the only Central Asian country to have completed an up-to-date inventory of mountain forests, and offers hope that other countries will do the same. On the positive side, heightened global awareness and interest in the region's snow leopard and other endangered species has led to an increase in state and donor funding for biodiversity conservation.

Local authorities are starting to take more control over what was a poorly monitored and unregulated system of land use and conservation. In the immediate aftermath of independence, a chaotic period of illegal land grabbing ensued, and the central authorities were unable to determine how the land was used. Over the past five years, governments and donors have begun to pay more attention to ensuring that land is used sustainably and to investing in systems to monitor soil erosion and the quality of crop production. Up-to-date soil inventories do not exist in the region, but steps to improve this system are welcome, despite the slow level of progress so far.

Since 2000, a new focus on biodiversity research employs sophisticated techniques to link species population numbers across borders. The results of this research are used to regulate hunting and to improve biodiversity protection in the region. In addition to this effort, the World Wildlife Fund is promoting the development of maps of ecological networks and migration corridors, and is working to establish buffer zones to limit disturbances from human activity.

Finally, governments in Central Asia are looking to follow the lead of the United Kingdom and other countries in formally evaluating the monetary value of national ecosystems and their benefits. This kind of assessment will help in determining how much should be invested in nature protection initiatives and may encourage further funding. If mountain regions can prove both the value and critical importance of their existence, downstream countries may also be encouraged to invest in highland areas. These activities are in line with the Nagoya Protocol and are beneficial in ensuring that the genetic resources of countries are valued, recognized and invested in accordingly.

### 1.6.4 Geological survey and seismology

State-funded geological research during the Soviet era identified deposits of various precious minerals in significant quantities across Central Asia. Under Soviet rule, however, only a small number of mining facilities, notably in Kyrgyzstan, were given the green light to exploit the sites. In Kyrgyzstan the private sector is now taking over geological research and developing the country's mining sector. The nature of the private geological research is proving to be more detailed than in Soviet times and more oriented towards attracting global interest to Kyrgyzstan's mining sector. In contrast, Tajikistan – despite being on the path to a market economy and democratic reforms – remains reluctant to encourage private or foreign investment in the country's mining sector, and its geological research remains under-developed and lacking capacity. Kyrgyzstan provided its skilled labour force with incentives to stay in the geological research sector, but many skilled workers from Tajikistan have left the country in search of better pay and working conditions.

The infrastructure, resources and facilities needed for seismic research have largely remained in place in both Tajikistan and Kyrgyzstan. But although the equipment and technology has undergone a degree of modernization, routine testing at the local level has become less frequent, and the results of seismic research remain disconnected from practical implications for community facilities such as housing. Business development plans still need to take into account the potential consequences of seismic activity. (See section 2.5.1 for recent developments in seismic research in the region.)

The governments of Central Asia are increasingly better equipped to manage emergency situations. In the wake of the devastating tsunami that struck Japan in March 2011, however, and the nuclear crisis which ensued at the Fukushima nuclear plant, Central Asian countries need to review the security of their industrial facilities. Given that the region is at particular risk from flash flooding and landslides, measures to prevent accidents involving industrial facilities such as mines (and tailings), dams and power plants should be put in place.

### 1.6.5 Other mountain research

The Soviets conducted high-level research in fundamental physics in the mountains of Central Asia. This research, which focused on high-energy particles in cosmic rays,

was suspended in 1991, but Russian and other international interest in the work has given rise to the possibility of restarting the research by renewing the existing facilities and installing new equipment. The Soviets also employed high-elevation telescopes in Central Asia observatories, and these facilities are still in use for satellite tracking, navigation and orientation, and for astronomy.

The research started by the Soviets on the health effects associated with life at high elevations has expanded to include international scientists who participate with Central Asian colleagues on joint efforts, the results of which are now more widely shared in the scientific community.

## **Part 2: Case studies: Progress, changes and lessons learned**

The problems constraining sustainable mountain development are formidable, among them: environmental challenges and poor natural resource management; limited infrastructure and local development opportunities; poor economic performance and governance inefficiencies; poverty; and the erosion of education. The demand and the will to tackle these problems are on the rise and are genuine. Some demands have roots in the previous high standards and levels of education, security, energy and food sufficiency.

Over the past 20 years the Central Asian mountains have benefited from numerous sustainable development projects and initiatives. The sponsors and participants have included governments, international organizations, NGOs – both global and local – and educational and scientific institutions. This part of the report presents excerpts from case studies on selected sustainable development projects in the region. The cases are a selection of stories outlining the progress, challenges and lessons learned on the path towards sustainable mountain development in Central Asia. Individual cases demonstrate how the environmental, social and economic aspects of sustainability connect and overlap, and taken together the cases show the progress made in the mountains in this critical period of adjustment. The case study projects typically relate to one or more of the trends discussed in Part 1.

### **2.1 Networks**

Three of the case study projects demonstrate the benefits of networking among groups working on mountain sustainable development – the Central Asian Mountain Partnership network, the Alliance of Central Asian Mountain Communities experience exchange and the Interstate Commission on Sustainable Development in Central Asia.

#### **2.1.1 The Central Asian Mountain Partnership network**

The Central Asian Mountain Partnership (CAMP) focuses on institutional development for civil society organizations:

Started with action-oriented research and baseline studies in three Central Asian countries, CAMP consisted of small-scale projects on natural resource management; livelihood and village development; community mobilization; and the introduction of participatory mechanisms. This initial work was undertaken jointly with the Centre for Development and Environment supported by the Swiss Agency for Development and Cooperation. This project became especially relevant in the wake of the year 2002, which was declared the International Year of Mountains by the United Nations. At that time Central Asian states received a rare opportunity to attract the world's attention to the problems of rural people living in mountain areas.

The network aimed at promoting sustainable development in the mountainous regions of Central Asia, and soon spun off successor organizations – CAMP Alatau in Kyrgyzstan, CAMP Kuhiston in Tajikistan and CAMP Consulting in Kazakhstan, all part of the CAMP network. These newly established agencies faced the immediate challenge of strengthening their own capacity and securing institutional stability.

Civil society in Central Asia has developed significantly since 1991. A more open and enabling environment, and the urgent need to plug gaps in social services left by the withdrawal of state support, have led to the mushrooming of civil society organizations (CSOs). In Tajikistan, for example, by 2011 the number of CSOs exceeded 2 000, up from 150 operating in the mid-1990s. In Kyrgyzstan, the number of civil society organizations exceeds 8 000. Governments accept the role and contribution of CSOs to democratic transformation and socioeconomic development.

The institutional growth for the CAMP agencies took place in parallel with the formation and growth of local institutions supported under the programme: the Territorial Public Self-governance bodies (TPSBs) at the village level, and the Alliance of Mountain Communities of Central Asia and the Mountain Villages Partnership and Development Foundation at the regional level. Thanks to successful partnerships, the geographical focus of projects has been expanded and sustainability ensured. The projects on energy efficiency, pasture management and local risk management have been implemented in all three countries. As the CAMP agencies evolved in different specializations, some difficulties in cooperation arose. Currently, CAMP Consulting in Kazakhstan focuses on felt products, CAMP Kuhiston in Tajikistan is strong in disaster management and CAMP Alatau in

Kyrgyzstan focuses on pastures and mountain development in general.

The main outcome of the CAMP network effort is seen in the local capacity-building for integrated management of the natural resource base. Capacity-building efforts including the well-known training modules such as "Learning for Sustainability -L4S" helped to introduce participatory management and partnership principles, thus empowering local communities and fostering a new generation of local leadership and community-based institutions safeguarding environmental sustainability in conjunction with economic profit.

The L4S module is based on the approach developed by the Centre for Development and Environment of Bern University and adapted for local conditions by CAMP Alatau. This approach promotes group learning on priority topics related to sustainable development: sustainable pasture management, water resources management, integrated local risk management, energy efficiency, conflict over natural resources and others.

The programme mobilized local communities to take ownership of their own destinies instead of maintaining a passive, anticipatory position. As the CAMP network interventions are guided by the integrated and holistic approach to local development, many of initiatives have been replicated and scaled up by others.

Eleven years of institutional sustenance also demonstrates the growth in terms of local capacity and leadership. The geographic focus for the CAMP projects and programmes and their high degree of relevance and responsiveness to local needs have been built on strong linkages with mountain communities. The annual CAMP forum networking events provide opportunities for sharing experiences and fostering dialogue between the concerned stakeholders and the general public. The 2004 CAMP forum focused on "Social mobilization and village development"; in 2005, "The role of local self-governance in sustainable development"; in 2006, "Strategies for sustainable energy use in villages"; in 2007, "Cooperation with state structures at the local community level"; in 2008, "Mountain communities and business – dialogue and cooperation"; in 2009, "Labour migration – facing challenges and opportunities"; in 2010, "Central Asian mountain communities and climate change – call to action"; and in 2011, "Mountain Green product – challenges and opportunities for mountain communities of Central Asia". About 100 participants attended each forum. These forums bring forward the voices of mountain communities to the national and regional levels and show the importance of working together for a common goal.

#### **2.1.2 Experience exchange: The Alliance of Central Asian Mountain Communities**

The Alliance of Central Asian Mountain Communities (AGOCA) was founded in 2003 with the overall goal of assisting in the sustainable development in the Central Asian

mountains. The AGOCA approach to its goal entails training and the exchange of information and experiences:

At the foundation of the Alliance, 10 pilot villages were selected from three countries – Kyrgyzstan, Tajikistan and Kazakhstan – to develop the AGOCA mission. The main expectations of the communities was that AGOCA provide updated mountain-related information to its members as well as regular exchange-of-experience visits among the villages and countries. Today, AGOCA is active in 40 villages.

Since 2003 AGOCA has carried out practical and theoretical workshops and training in such areas as:

- Solar cabinets for cooking
- Processing of dairy products at home
- Willow-twining
- Wool processing
- Microfinance
- Energy efficiency

To date, more than 2 500 villagers have participated in AGOCA training and have acquired skills and knowledge that enhance their capacity and increase their opportunities. From 2003 to 2009, twice-annual national meetings in the three countries focused on the exchange of communities' experiences and discussions of realized projects and plans for the coming year. Members who attend the exchange-of-experience visits pay only their transportation costs one way, while AGOCA covers the other way and the hosts provide meals and lodging.

The annual AGOCA Conference, rotated among the member countries, serves as a general assembly meeting of AGOCA members and Territorial Public Self-governance bodies, and is the Alliance's main decision-making body. Thanks to AGOCA training, the leaders of the TPSs have won a high degree of respect in their communities: four have become deputies in local self-governments and two have become heads of their villages.

The publishing of White Books – collections of successfully realized AGOCA projects in Kyrgyzstan, Tajikistan and Kazakhstan – was a significant achievement. With the aim of broader dissemination of good practices among our villages and abroad, the White Books were published from 2004 to 2007 in five languages: Kyrgyz, Tajik, Kazakh, Russian and English. Once a year AGOCA also publishes its own magazine in the five AGOCA languages. Distributed through AGOCA members and partner organizations to all the countries of Central Asia, AGOCA magazine covers projects from planning to implementation, and includes recommendations and lessons learned.

In 2011, AGOCA founded the Kyrgyz language newspaper Ayil Demi (Spirit of the Village) with a circulation of 5 000. The newspaper covers the development issues of mountain communities in Kyrgyzstan and provides a platform to express their needs, thoughts and good practices.

### **2.1.3 The Interstate Commission on Sustainable Development in Central Asia**

The Interstate Commission on Sustainable Development in Central Asia (ICSD) was established in 1994 and coordinates and manages regional cooperation in environmental protection and sustainable development in Central Asia. The Commission consists of representatives from environmental ministries and agencies, and ministries of economy and science. A similar Commission dealing with water issues is composed of representatives of water ministries. The Commission allows participation of civil society organizations as observers and cooperates with the youth environmental network of Central Asia:

The Sustainable Development Commission was instrumental in developing the Regional Environmental Action Plan (2001), which targets air pollution, water resources, land degradation, mountain ecosystems and waste management. Over the last decade, the Commission produced themed reports on emerging environmental and development issues such as renewable energy, sound chemicals management, atmospheric brown cloud and stability of mountain lakes, and provided inputs to the Global Environment Outlooks 4 and 5. In 2009, the ICSD produced a draft regional strategy on adaptation to climate change. The initiative "Green Bridge", which aims to promote the partnership among Europe, Asia and the Pacific, was also facilitated and supported by the Commission.

The Commission has provided substantial inputs to the development of the "Framework Convention on Environmental Protection for Sustainable Development of Central Asia", which was endorsed in 2006. Prolonged procedures in Kazakhstan and Uzbekistan, however, have prevented this Convention from coming into effect. In 2007–2008, the Commission formulated a "Sub-Regional Strategy on Sustainable Development of Central Asia", which is pending approval. Both documents highlight the role of mountain areas as regionally important providers of ecosystem goods and services.

The ICSD supported the initiative of Kyrgyzstan and Tajikistan to establish the Regional Mountain Centre of Central Asia in Bishkek in 2007. This initiative promotes cooperation for mountain ecosystems conservation, sustainable use and improved socio-economic conditions of the mountain people. The significant continuous dependency of the Commission's activities on external funding, however, created financial vulnerability. Currently, new funding mechanisms are being discussed.

## **2.2 Food, biodiversity and land management**

The first case in this group of four is a kitchen garden project from Kyrgyzstan. The next two cases consider pasture management in the mountains. The first pasture project, also located in Kyrgyzstan, takes a community-based natural resources management approach, and works at the watershed level. The second is a cross-border collaboration between Kyrgyzstan and Tajikistan on regional cooperation for sustainable resource management. The final case in this group is a Kyrgyz–Swiss collaboration in sustainable forestry.

### **2.2.1 Kyrgyz high-altitude kitchen gardens**

The Kyrgyzstan Mountain Societies Development Support Programme (MSDSP KG) used a multi-input area development approach in a kitchen gardens project that combined market development, natural resource management and health promotion:

The kitchen garden project links with Village Health Committees (VHCs) – independent institutions comprised of volunteers elected by the villagers and headed by a medical professionals – and works within a challenging context where villagers commonly express disbelief in the potential for vegetable cultivation in high-altitude mountain areas. Kyrgyzstan's high mountain communities have low population densities and limited market access. District center markets generally operate only once a week, and due to high transportation costs, vegetable prices are at least three times higher than in urban areas.

In 2005, an initial baseline survey of health conditions in the Alai and Chon-Alai districts of Kyrgyzstan revealed that the vast majority of health problems suffered by women and children were related to nutrient deficiencies and malnutrition. The survey demonstrated an apparent need for improved access to nutrient-rich diets to mitigate anemia especially among mountain-dwelling mothers and children.

In 2006, the MSDSP KG Health Programme launched a project to address the poor nutritional status of women and children by introducing kitchen gardens in the high-altitude communities (2 000–3 100 m) of the Alai and Chon-Alai, areas that have not traditionally grown vegetables. The introduction of vegetable cultivation is encouraged through direct training and the provision of instructional booklets, high quality seeds (tomatoes, carrots, sweet peppers, red beets and cabbage), and materials to build greenhouses. The overall objective of the project was to improve access to fresh vegetables in high-altitude communities. The project has established 310 kitchen gardens in 28 villages in the Alai and Chon-Alai districts, or in 35 per cent of the villages.

The outcomes included:

- An improved nutritional status among women and children resulting from reduced susceptibility to vitamin and mineral deficiencies
- A paradigm shift changing the perceptions of high-mountain communities about the possibility of growing vegetables in high-altitude climates
- Alternative income-generating opportunities for poor, remote mountain-dwelling households.

The kitchen gardens were initiated with a very small pilot sampling of households – just six groups (two in the Alai, four in the Chon-Alai) of less than 60 households. The present number of 310 kitchen gardening households was achieved incrementally, and specifically based on best practices as assessed annually. This methodology was a key factor in the project's success. An overall assessment of the project brings to light the successful combination of environmentally sound technologies, including climate-and altitude-appropriate techniques, which proved to coalesce for a net benefit: improved health status, improved soil quality and income generation.

Village Health Committees disseminated information and played a strong organizational role in the project from the very beginning. Their main responsibilities included disseminating information on the prevention of common diseases, assisting with immunizations, monitoring of proper nutrition and adherence to standards of sanitation and hygiene through mass campaigns and public meetings. Kitchen gardeners have since become more independent and need less support from VHCs. The Training and Extension System (TES) Centre and Osh Rural Advisory Service conducted training on making compost, conserving vegetables and preparing fresh salads and juices to obtain the maximum nutritional benefit from harvested vegetables. The TES Centre also helped develop a manual with this critical gardening information and the measures to avoid bacterial contamination (particularly botulism) during the process of canning vegetables. Local government, including Aiyl Okmutus (AOs) and village organizations, assisted in collecting information and identifying candidates for participation. The Kyrgyz Republic Ministry of Agriculture, through its district agricultural departments, benefits from the increased production in their districts in line with their mandate.

On average, each kitchen gardener generated US\$ 280 in additional income from selling vegetables. Of more than 20 kitchen gardeners interviewed, half produce enough vegetables (cabbage, tomatoes, carrots) to be able to sell a part of their harvest. In contrast to the land-use practices of typical households, this crop diversification strategy promotes the use of crop rotation, which prevents the degradation of soil quality, excessive erosion, insect and disease problems and phytotoxic effects. According to 2008 government data, potatoes were cultivated on three thousand hectares of land in the Alai and Chon-Alai districts. Almost every kitchen gardener participating in the project attested to growing solely potatoes before the intervention. Therefore, the crop diversification and rotation practices promoted food security and sustainable land use of high-mountain arable lands.

Most of the kitchen gardeners were able to preserve vegetables for the winter period from vegetables they had grown. On average, each household preserved 30–50 liters of vegetables. Socially, this improved their community standing and ability to meet the demands of holidays and receiving guests. Both the seasonally fresh vegetables and preserved vegetables contributed to the improved health status of project participants. Of the participants surveyed, 56 per cent reported improvements in health, especially in the health of women and children.

Overall, the change in attitudes was the most difficult objective to attain, and the most significant outcome of this project. Kitchen gardeners – and their many neighbours who witnessed the successful growing of vegetables

– now believe that vegetables can be grown in high-altitude mountain communities. The successes of the kitchen gardens of 310 project-sponsored households affected the attitudes and beliefs of over 9 000 households in 28 villages.

The project had no negative environmental effects, but there is the potential for future damages to soil content and pasture quality if crop rotation practices are not maintained. In order to ensure their maintenance, MSDSP KG plans to increase the capacity of local governments and district agricultural departments to serve as advocates of this environmentally sound approach.

As the success of the kitchen gardens reduced the demand for valley produce, the negative economic effects of the project fell on those businesses who earn money transporting vegetables weekly from valleys to the mountain regions. The negative social effects were limited to a lifestyle adjustment. Traditional Kyrgyz mountain communities sustained themselves primarily on livestock. Many semi-nomadic communities travel to summer pastures at high altitudes and have been doing so for generations. Vegetable cultivation requires close care and interferes with the semi-nomadic lifestyle traditionally practiced in the region.

In 2011, the kitchen gardens were studied to analyze the results of the kitchen garden initiatives, to identify the challenges faced by the beneficiaries and to discover opportunities for marketing vegetables.

Access to high-quality and climate-appropriate vegetable seeds and pest control remains one of the main challenges for project participants. There is a need to develop small seed shops locally because many kitchen gardeners from remote areas of the Chon-Alai reported travelling 300 kilometres to Osh city to locate seed vendors. Despite the relatively low concentration of pests at high altitudes, farmers are still challenged by the unavailability of insecticides and herbicides locally for their high-altitude farming practices.

Additional marketing skills are needed for kitchen gardeners who intend to increase vegetable production and serve their villages as well as neighboring ones. For instance, farmers from Jekendi and Karamyk villages of the Chon-Alai can make a wider variety of vegetables available to communities in the Kashka-Suu subdistrict, which is more than 2 800 metres above sea level, and where growing vegetables such as tomatoes and sweet peppers is difficult and arable land is limited.

The project subsidized 70 per cent of the total cost for each villager interested in starting a kitchen garden and the villager was expected to pay back 30 per cent to the project to be shared between the Village Organization and the VHC. But repayment rarely occurred on time, leaving these stakeholders empty-handed. Currently, this poor mechanism for the collection and disbursement of seed costs undermines the relationship and trust between kitchen gardeners and stakeholders. The VHCs are supposed to collect and manage the funds, but gardeners are resistant to pay because they do not have a clear understanding of the intended use of the money. Village Health Committees – and local governments, for that matter – lack the transparency needed to operate such a system. The system needs to be reevaluated and remedied.

The initiative could be expanded to other villages where communities traditionally have not grown vegetables. Further plans are being developed to organize exchange visits to other high-altitude farming environments where market approaches have been successfully integrated – in China, for example. Additionally, project evaluations suggest that kitchen gardeners would greatly benefit from improved links to input supply chains.

Additionally, the project will seek to expand the involvement of stakeholders in multiple stages of implementation. Specifically, the AOs and district agricultural departments need further training so they can play a more active role as a resource and work towards institutionalizing the healthy development of their citizens. Local government members can be invited to kitchen garden training and learn to facilitate the promotion of access to high-quality inputs.

### 2.2.2 Sustainable pasture management

One of the organizations in the Central Asian Mountain Partnership network is CAMP Alatau, an NGO that promotes sustainable development in the mountains of Kyrgyzstan. The importance of livestock grazing for mountain livelihoods and the degraded conditions of Kyrgyz pasture land prompted CAMP Alatau to initiate a project on sustainable pasture management at the watershed level:

The project covered an area of 200 000 hectares of pasture land in the watersheds of the Zhergetal and On-Archa Rivers in the mountainous Naryn region of Kyrgyzstan. Villages from five ayil okrugs (rural administrative districts) participated in the initiative. The ayil okrugs and the number of residents in each are as follows: Zhergetal (5 420); Minbulak (5 123); Onarcha (3 138); Kazankuigan (1 130); and Emgekchil (3 025).

The collaboration between CAMP Alatau and local pasture users started with awareness-raising workshops conducted for local communities. These training sessions helped to identify the village activists with whom CAMP Alatau continued to work, building their capacity as members of "pioneer" pasture committees well before the 2009 Pasture Law that gave locals the right to manage and utilize pasture resources at their own discretion. The collaboration also involved local authorities, as well as pasture departments at the village and district levels. The field office in the Naryn region maintained vertical liaison with all local stakeholders. A network of local pasture committees and microfinance agencies was created to disseminate sustainable pasture management tools developed by CAMP, and to encourage replication in other regions. Initial investments were made in repairing the pasture infrastructure and in increasing winter feed production. Learning for Sustainability (L4S) modules were developed for local community training, and field offices were set up to work with the communities of CAMP pilot villages.

The goal of CAMP's sustainable pasture management effort was to improve resource management practices through participatory and community-based processes. Addressing pasture management in all its complexity enables herders – the primary user groups – to make well-informed decisions on herd size and pasture resource management. The objectives were to enable herders to join the efforts for collective actions on the maintenance of pasture infrastructure; to improve their capacity for assessment, planning and monitoring; and to achieve the sustainable use of the common resources. Reaching these objectives would improve the productivity and profitability of the livestock sector and thereby reduce poverty.

Initial investments were made in repairing the pasture infrastructure and in increasing winter feed production. In each pilot village a micro-credit agency was established to support sustainable pasture management initiatives. This is an ongoing process, not an easy one given the difficulties of crippled infrastructure, destroyed extension services and livelihood challenges. Mobilizing herders for the co-management of resources was one of the project's biggest challenges. It took time to convince the herders of the need to change grazing practices, and to provide training in the skills necessary to maintain pasture resources and to manage herd size and quality. Prior to the 2009 Pasture Law, local institutions had no authority to manage pasture resources, and the institutional split among local, district and regional authorities often created more challenges regarding land tenure and land use in near-village, intensive and remote pastures.

As the resource base for the livestock sector is better managed, the benefits can be seen in improved environmental quality for pastures and in more areas restored. The reduced pressure on grazing land resulting from the introduction of improved breeds, together with a flexible pasture management system, improved the environmental quality of pastures and enabled the restoration of more areas. The monitoring data that pasture users were trained to collect can be used as indicators for the environmental outputs in succeeding years. The yields in terms of economic profits are visible when the herds are better managed through focusing on herd quality. Timely pasture rotation results in better fattening of the herd, thus producing more profits and a preferred quality of meat from open range grazing in high mountain pastures.

In addition to reduced poverty and increased food security, the social aspects of the project are evident in the decentralization process that reached the village level with the establishment of democratically elected Pasture Committees. In the pilot area three Pasture Committees were established and the project supported the development of local pasture management plans that include activities for pasture infrastructure improvement, including bridges and access roads to remote pastures.

One outcome of the new Kyrgyz pasture law is that with 450 legally empowered pasture committees ("Jayet Committees") nationwide, local representatives better present and promote the long-term interests of the community, while numerous intermediary institutions and bureaucracies are eliminated. Another feature is the application of the market user fee-based mechanisms that would be fully retained at the local level and reinvested into the conservation of pastures. The size of user fees varies and is set by the local community depending on the needs for sustainable use and conservation of pastures. The financial capacity available from fees rose from nine million Kyrgyz soms (US\$ 200 000) in 2008 to 33 million soms (US\$ 730 000) in 2010. In pilot villages covered by CAMP Alatau, the fee collection rates reach 80–90 per cent.

A heightened sense of community and sense of responsibility for the stewardship and ownership of resources is apparent when herders and community members sit together to coordinate their moves to summer pastures, repair bridges by mobilizing their own resources or develop and implement pasture use plans. The project's participatory and inclusive processes of negotiation, reporting and accountability contributed to local community empowerment and capacity improvement at all levels. Ulan Bakaev, 36, from Zhergetal village described his experience this way:

"The CAMP Alatau project changed my life and helped to improve the well-being of my family. A few years ago I used to be one of the village jobless trouble-makers, spending days in pottering around the village and drinking. Driven by poverty and desperately seeking for the ways to support my wife and kids, I even decided to go to Russia for earnings... But then CAMP Alatau launched their project in our ayil okrug, and I joined those folks who attended their training and became actively involved in the project activities... Now I am a member of the local Pasture Committee, I am respected by my community, they even put forward my name in the elections for the village head last year... The knowledge and skills gained in the CAMP Alatau project helped me to improve my farming management skills and earn more money. I've got skills on artificial insemination and improve not only my livestock quality, but provide services to other villagers..."

### 2.2.3 Pamir-Alai Land Management and regional cooperation in mountainous countries

A transboundary initiative of Kyrgyzstan and Tajikistan, the Pamir-Alai Land Management (PALM) project is funded by the Global Environment Facility and numerous national and international partners. The project considers the link between poverty and land degradation, and seeks to restore, sustain and enhance the mountain ecosystems to the benefit of the economic and social well-being of the rural communities:

The project area focuses on the Pamir Mountains in Tajikistan and the Pamir-Alai Mountain ranges in Kyrgyzstan. The region is highly diverse. It contains within its borders a great variety of climatic, topographic and ecological conditions, leading to different forms of land use and to livelihood systems based on natural resources. The area can be divided into three broad subregions differentiated on the basis of topographic, climatic and socio-cultural and land-use differences.

Given that all land resources are legally the property of the state, the lack of clarity regarding private user rights for individual farm plots, together with de facto common property resources (e.g., pastures, wildlife, woodlands), encourage short-term resource exploitation rather than long-term conservation. The results include a lack of stewardship, a deterrent to invest in conservation and disputes over occupancy and resource use rights within and between local communities and local and central

government authorities. Due to the uncertainties of climate and the fluctuations in distant and local markets, local communities require secure resource rights and long-term security of land tenure and occupancy rights if they are to adopt sustainable land management practices and assume responsibility for ecosystem protection.

Several trainings, seminars and round-tables on a broad range of topics covering sustainable land management, including the FAO Land Assessment in Dry Areas (LADA) methodology were conducted in Tajikistan and Kyrgyzstan. At present, this methodology is increasingly used by pasture committees.

The issue of pasture rotation is extremely important. A successful pasture rotation programme would allow animals to graze on remote pastures for longer periods of the year and could contribute to remediating the land degradation due to overgrazing close to the villages while at the same time increasing the quality of the livestock.

In combination with pasture management, work is needed to restore the degraded land. Most urgent is the recovery and re-establishment of shrubby vegetation and forests. This has long-term positive effects on the sustainable supply of fuel wood, on regeneration of biodiversity and wildlife and on carbon sequestration in the region.

As part of the PALM project, targeted communities in the Alai Mountains in Kyrgyzstan and in the Pamir Mountains in Tajikistan are developing their own land-use plans and implementing specific micro-projects incorporating sustainable land management. Beyond the local level, PALM supports the strategic and policy environment for sustainable land management on a regional scale. The strategy and action plan for the entire project area (endorsed in 2011) covers four priorities:

- Improving biodiversity and forest management
- Increasing the efficiency of farming
- Improving the sustainable use of mountain pastures and increasing the productivity of livestock
- Reducing risks from natural disasters.

The strategy and action plan is supported by a memorandum of understanding signed by central environmental authorities of Kyrgyzstan and Tajikistan, and by the administrations of the Osh Province in Kyrgyzstan and the Mountain Badakhshan Autonomous Province and the Jergetal district in Tajikistan.

In parallel, research and advisory agencies are working with local communities on targeted approaches – such as introducing improved fodder cropping and improved goat husbandry; an analysis of the value chain of local products from the Pamir Alai region; promoting community-based protection areas and wildlife protection; and the mapping of local small-scale hydropower potential and natural disaster hazards and land use risks in the area

– as well as on assessing global and regional price trends and the demand for wool, berries and medicinal plants.

Local experts consider that the experience gained in the PALM project implementation is worth demonstrating in other mountain areas of Central Asia and beyond. One mechanism for knowledge exchange is the World Overview of Conservation Approaches and Technologies (WOCAT), which already features selected PALM lessons.

Jamoats in Tajikistan and aйл okmots in Kyrgyzstan, are distinct administrative, legal and political entities at the lowest level of local government. Each of these subdistrict units contains 2–6 settlements that, while forming separate communities, usually have some common social ties based on ethnicity, geographic location and ecosystem resource use.

Each jamoat/aйл okmotu community land-use plan and sustainable land management strategy includes a portfolio of micro-projects for those agreed priority component activities that require external investment funding. To be eligible for financial support, a micro-project must be one with a need identified through the community land-use planning process. To date, more than US\$ 200 000 were provided as grants for co-financing of micro-projects. The projects' implementation must also be expected to make a positive contribution to reducing poverty while restoring, sustaining and enhancing the productive capacity and protective functions of the ecosystem resources of the High Pamir and Pamir Alai Mountains. The concept of environmentally sensitive tourism is worth pursuing as a potential future income-generator.

#### **2.2.4 Community-based forestry**

The Kyrgyz–Swiss Forestry Support programme (KIRFOR) was launched in 1995 to develop and maintain forest sector reform in Kyrgyzstan with a focus on productive and sustainable forest management. The main participants were the State Agency for Environment and Forestry, the National Forest Institute, the State Agency for Local Self Governance, aйл okmotu and forest enterprises. Funded by the Swiss Agency for Development and Cooperation, the KIRFOR programme was implemented by Interooperation – a leading Swiss non-profit organization – and by the Swiss Foundation for Development and International Cooperation (SDC):

The problems resulting from human impact on the forests of Kyrgyzstan prompted the adoption of urgent measures to implement a comprehensive policy of multilateral cooperation in the sustainable development of forests. The goals included the improvement of the quality of life, the strengthening of local economies and the conservation of natural resources.

From the outset, institutional reform was a priority. The KIRFOR programme began at the field level with the

reform of forestry practices then extended to the national level and included an intersectoral approach.

The basic approach to the development of national forest policy in Kyrgyzstan is a working partnership involving stakeholders from state agencies, forest management, science, local communities, the private sector and civil society in a "bottom-up" approach. The development of the forestry sector of Kyrgyzstan was viewed as a constant process of reform through the optimization of control systems, the improvement of relationships and the introduction of modern technologies, all coupled with capacity-building.

The current national forest policy in Kyrgyzstan provides a systematic examination of the problems of the forest based on three elements: "Forest-Man-State". "Forest" includes the imperative of stability of forest resources and biodiversity. "Man" in forest policy reflects the need to involve local communities and the private sector in forest management, and to account for their influence and interests in forest management.

The role of "State" in the forestry sector is changing with the course of social development. Under the provisions of national forest policy, the state reserves the controlling and regulating function and passes the production functions of forest management to local communities and the private sector. Together these three elements are intended to create a sustainable forest management system that preserves and increases forests while contributing to socio-economic development.

The need to develop new approaches for forest resources is due to the real environmental situation and the dynamics of socio-economic development. The main threat to the stability of forest ecosystems has come from the growing pressure on local populations forced to make use of natural resources in their lives. Prohibitions on forest use have only created conflict. Today, the centralized system of forest management, due to lack of resources, cannot fully ensure the sustainability of forest development. Therefore, a sustainable forest management community is the most promising management option for forest conservation and renewal.

After studying traditional forest management schemes, Kyrgyzstan introduced community forest management, an experimental approach that engaged community groups and

local authorities to manage forests. The development of cooperation between the forestry sector and ayil okmotu has created a framework for information sharing, planning and decision-making.

A positive result of the efforts in the development of a new national forest policy for Kyrgyzstan was a package of documents designed to create the conditions necessary for the preservation, growth and sustainable use of forests, and in sustainable forest sector development:

- The concept of sustainable development of forestry until 2025, approved by the government in 2004
- The National Forest Programme 2005–2010, approved by the government in 2004
- The National Action Plan for Forestry 2006–2010, approved by the government in 2006
- A new plan for 2011–2015, pending approval by the government
- An Action Plan to strengthen law enforcement and governance in the forestry sector, approved by the government in 2009.

Despite the success of the KIRFOR programme in walnut and fruit forests, implementation of sustainable forest management is far from complete. The remaining challenges include involving local populations in the participatory management of other types of forests, particularly juniper, spruce and riverside forests. Building upon the experience gained from the KIRFOR programme, the Kyrgyz authorities, with support from donors (the Japan International Cooperation Agency and the Food and Agriculture Organization of the United Nations), are developing joint forest management models that should allow forest enterprises, ayil okmotu and local communities to plan and implement decisions together.

### 2.3 Climate change and natural disasters

Two case studies focus on the related issues of climate change and natural disasters. The first is a pilot study on climate resilience, and the second is a tree-planting project designed to stabilize mountain slopes.

#### 2.3.1 Climate change: Pilot Program for Climate Resilience in Tajikistan

The Centre for Climate Change and Disaster Reduction, a local NGO in Tajikistan, addresses the issues of climate change adaptation and natural disaster risk reduction in mountain regions. Oxfam GB in Tajikistan funded and facilitated this study:

The Strategic Climate Fund provided Pilot Program for Climate Resilience (PPCR) funding for eight recipient countries (Bangladesh, Bolivia, Cambodia, Mozambique, Nepal, Tajikistan, Yemen and Zambia) and two regions (the Caribbean and Pacific). The criteria for participation in the PPCR included the level of vulnerability to climate change hazards and risks, country preparedness to move towards climate resilient development plans and country distribution across regions and types of hazards. The participation of Tajikistan as a landlocked mountain country in the PPCR is justified by its high vulnerability and low adaptive capacity to cope with the current climate variability that will likely exacerbate existing development challenges. In Tajikistan the PPCR is coordinated by the World Bank, the Asian Development Bank and the European Bank for Reconstruction and Development.

This study analyses the Pilot Program for Climate Resilience in Tajikistan. The goal of the PPCR is to help countries adopt a climate-resilient development path that is consistent with national poverty reduction and sustainable development goals. The main objectives of the study were to identify lessons learned and to make recommendations for channeling climate change adaptation funds in the context of Tajikistan. The study was based on interviews and focus group discussions with a wide range of stakeholders. Participants included representatives of government institutions, international and local NGOs, academia, bilateral and multilateral donors and civil society.

The key outcomes of the PPCR are the development of the Strategic Program for Climate Resilience (SPCR) and the approval from the Climate Investment Fund of a US\$ 50 million grant for a 3–5 year period. The project areas set to receive SPCR funding include:

- Capacity-building for climate resilience
- Improving weather, climate and hydrological service delivery
- Improving climate science and modelling
- Enhancing climate resilience in the energy sector
- Developing sustainable agriculture and land management
- Building climate resilience in the Panj River basin.

With the exception of the last item, the list specifies no geographic area for any of the projects. The region

would benefit from an equitable distribution of funds across both programmatic and geographic areas.

The critical lessons learned and recommendations of the Pilot Program for Climate Resilience in Tajikistan include:

- PPCR-funded projects should address the needs of those most vulnerable to climate change and contribute to the sustainable development of the country
- The Government of Tajikistan should be the primary actor in designing, implementing and channeling resources for national climate change adaptation strategies
- Civil society and communities should be guaranteed meaningful participation throughout the process of planning and implementing climate funding
- Capacity-building should accompany climate funding
- Climate funding processes should be transparent and accountable to the people of Tajikistan
- Country-level ownership of adaptation finance is required
- Gender equality and women's participation should be central to climate funding
- National climate funding approaches should be informed by existing models.

The PPCR process faced high expectations from a wide range of interested parties and could not hope to meet all of them. The PPCR could have provided, and still should

provide, a real opportunity to pilot ways of reaching those most impacted by climate change in ways that could radically improve their quality of life.

The results of the study were published as a report (in English, Russian and Tajik) and presented to the public and relevant stakeholders in order to address the gaps and lessons learned in the first phase of the PPCR. The report is available online at: <http://www.oxfam.org/en/policy/climate-change-investment-resilience-tajikistan>.

### 2.3.2 The stabilization of hazardous mountain slopes through planting fruit trees

Camp Kuhiston took an integrated approach linking disaster risk management in mountains with the planting of appropriate fruit tree species to improve land productivity in the Nurobod district:

In the Nurobod district of central Tajikistan, numerous tributaries flowing from the high mountains have cut deep gorges into the soft loess soils, and during the spring snow melt there is a risk of floods, landslides and

mudflows that threaten mountain communities. In the spring of 2010, the single local road that links the 26 villages in the area to the main road to the capital Dushanbe was blocked for 41 days due to a mudslide.

CAMP Kuhiston catalysed donor support and facilitated disaster risk management training and tree planting to stabilize hazardous mountain slopes around the villages. Initially, the local government showed limited interest, but when the practical interventions started, it became more interested and supportive. The Tajik Horticulture Institute developed a tree planting plan, selected saplings, conducted training and monitored tree development. This was complemented by soil sampling by the Tajik Soil Institute. The head of the village initiated a local community action day known as a khashar to erect a wire fence and to plant the saplings in accordance with the plan.

The project targeted about 300 community members, who increased their natural disaster management skills and who participated in local risk assessments, the formulation of mitigation measures and emergency response. A total of 2 000 fruit trees (peach, apple, quince, walnut, pear, cherry and apricot) were planted in seven communities. The trees will stabilize the soil cover, improve the soil structure and increase the nutrient content of the soil. As the trees have grown and become established, the risk of natural hazardous such as floods and mudslides has decreased. Up to 100 people received training on fruit tree planting and on soil and water conservation measures. The newly planted peach trees suffered in the heavy spring rains, and their growth was not as rapid as first hoped. But they survived and will most likely produce fruit in several years. This case study was documented in the World Overview of Conservation Approaches and Technologies database.

Over-exploitation of natural resources is one of the unsustainable activities leading to increased risk of natural disasters. Shahtuti Bolo village burns almost 12 metric tonnes of dry wood per year, and the average annual fuel bill is US\$ 350 per household, both amounts typical for the Nurobod district. To supplement the planting of the fruit trees, a campaign on energy efficiency measures is under way to reduce the amount of biomass burned by households. This is achieved by improvements in outdoor cooking stoves, by introducing energy efficient indoor stoves and through better thermal insulation and the installation of solar water heaters.

### 2.4 Community-based tourism

The prospects for tourism in Central Asia have improved since independence, and Kyrgyzstan in particular has worked to develop the sector. Ecotourism and cultural community-based tourism, generally regarded as sustainable development activities, offer significant opportunities at the national and local levels. Community-based tourism is the practice of providing tourism services that utilize local accommodation, food, music, crafts and traditions. The experience of Bokonbaevo village, Issyk-Kul Province, Kyrgyzstan, demonstrates some of the possibilities:

Based on the idea that ecotourism ensures the protection and careful use of natural resources and benefits the local population, and in light of the importance of tourism in general, the Alliance of Central Asian Mountain Communities provided training to its members on "Sustainable Use of Natural Resources: Techniques for Receiving Tourists". More than 150 participants from seven villages attended the training sessions. The training covered topics of hospitality; service orientation; language courses for local guides; food and beverage service; and environmental safeguarding practices. The communities were supported in their marketing and public outreach activities. Later, standards and classifications for guest houses were introduced. As a result, most of villages initiated ecotourism products and one of those villages is Bokonbaevo.

This initiative was launched with the aim of reviving forgotten kinds of tourism and introducing visitors to the national customs, games, horse-riding and life in traditional Kyrgyz yurts.

The social and cultural aspects of Bokonbaevo tourism activities foster preservation of traditional culture, knowledge and skills. Overall, up to one fourth of the total village population of 12 000 is involved in activities associated with tourism, including homestay, cultural sightseeing, trekking, horse-riding, ecological food products and handicrafts. In addition, the "One village-One product" project contributed to the quality improvement and competitiveness of local products in this and other villages around Lake Issyk-Kul.

The Bokonbaevo community-based tourism (CBT) association, in cooperation with local self-government bodies, organizes annual events with such themes as:

- Promotion of traditional embroidery such as saima and shyrdak
- Demonstration of Kyrgyz horses
- Southern Lake Issyk-Kul beach clean-up.

Community-based tourism differs from commercial tourism in the way income is generated and distributed: all the income remains in the villages where the CBT members decide themselves how to distribute it. By creating demand in tour products and locally produced goods and services, tourism has many positive direct and indirect economic outcomes on local livelihood and rural poverty alleviation. The jobs that were previously available only to skilled non-locals employed by commercial tourism companies based in the capital city are now filled by local residents. Guides, interpreters, cooks and chefs, drivers and managers all come from the local community. This promotes social balance, justice and inclusiveness for local communities.

Environmental considerations for minimizing the adverse impacts from tourism include programmes on waste management. As the ecosystem services and goods are exploited for profit generation, the local communities invest 5–20 per cent of the income in environmental conservation. The use of renewable energy in guest houses and other services helps to raise awareness at the household and small business levels and to reduce the carbon footprint of the local tourism sector. An energy efficiency programme run by CAMP Alatau installed 100 energy-efficient stoves, and improved thermal insulation for 30 houses in Bokonbaevo village.

Community-based tourism services can be easily booked centrally through the Bishkek coordination office or via CBT in villages across Kyrgyzstan. The CBT Bokonbaevo earns more than US\$ 10 000 per summer season, but the cold off season for tourism (lasting for 8–9 months) is problematic. In this context, the village is looking forward for cooperation with tourism service providers in the skiing sector.

## 2.5 Science and education

The last two case studies concern developments in the areas of science and education. The Central Asia Cross-Border Natural Disaster Prevention (CASCADE) project focuses on capacity-building in the area of disaster risk reduction, specifically earthquake risk reduction. The University of Central Asia is a multi-campus regional institution with ambitions to become a global leader in higher education.

### 2.5.1 Earthquake risk reduction: The CASCADE project

Initiated by the German Foreign Office in 2008, CASCADE is implemented by the German Research Centre for Geosciences (GFZ)—Helmholtz Centre in Potsdam and the Central-Asian Institute for Applied Geosciences (CAIAG):

The representatives of Central Asian agencies involved in disaster risk management, among them decision-makers from ministries responsible for emergency response and leading seismologists from Germany and Central Asia, met together to confirm their readiness to join efforts in earthquake risk reduction in Central Asia, to establish the platform for political and scientific cooperation and to implement the coordinate concept of seismological monitoring in Central Asia.

The project objective was to strengthen international and regional cooperation in disaster prevention and risk management in order to minimize the consequences of earthquakes. One part of the project concentrated on science and one part on capacity-building.

The scientific component included:

- Installation of a cross-border seismic network
- Seismic microzonation
- Assessment of building vulnerability.

Experts from GFZ, CAIAG and the national institutes of seismology in five countries established the Central Asian Real Time Monitoring System. Six seismic stations, located in Kazakhstan, Kyrgyzstan, Tajikistan and Turkmenistan, operate within this network, and the last seismic station is scheduled to be installed in Uzbekistan in the fall of 2011. The main feature of this network is real-time data flow. A seismoComp3 system was installed in the data centres of each partner allowing local scientists to receive, analyse and archive the continuous data streaming from different countries in Central Asia.

The CASCADE project devoted strong efforts to collecting data about the seismic vulnerability of the building stock in the different countries, and worked with local partners on the harmonization of the vulnerability classification, converting, as a first step, the original local classification to a common scale. The information will be exploited in future collaborations to improve the development of seismic risk scenarios for Central Asia.

In developed countries, earthquake risk reduction strategies are not centred as much on forecasting as on earthquake-resistant construction. Scientists and regulators use seismic microzonation to develop building codes that contemplate the specific seismic characteristics of an earthquake-prone area in defining the specific construction requirements. Microzonation is basically site-specific risk analysis that considers the geophysical qualities of a given area in order to understand the potential consequences of an earthquake. The project's seismic microzonation of Bishkek, for example, allows analysts to quantify the expected differences in earthquake hazards within the city based on local site effects. The Bishkek experience highlights the need for similar studies in the main cities of Central Asia, especially in light of population growth and urbanization.

The project did not focus on technology alone. Capacity-building and awareness-raising activities targeted scientists and engineers as well as decision-makers, regional planning authorities, educators, civil society representatives and the mass media. Central Asian scientists were trained in the use of modern seismological equipment, in the newest technologies for data processing and analysis and on advanced techniques for estimating site effects in urban areas. Overall, the capacity-building effort trained more than 200 persons.

### 2.5.2 The University of Central Asia: One university, three campuses

Founded in 2000 to promote Central Asian social and economic development, the University of Central Asia (UCA) is a secular and private institution established by the International Treaty and Charter signed by the Presidents of Tajikistan, the Kyrgyz Republic and Kazakhstan, and by His Highness the Aga Khan:

UCA aims to achieve its education and development goals through three schools (a Graduate School of Development, an undergraduate School of Arts and Sciences and a School of Professional and Continuing Education), a Research Program (including the Mountain Societies Research Centre and the Institute for Public Policy and Public Administration), a Central Asian Faculty Development Program and a Humanities Program. The University also aims to develop and maintain itself in a manner that benefits the social and economic development of nearby communities and the region as a whole.

UCA is located in and designed to serve the mountain regions of Central Asia. The University will have residential campuses in Tekeli (Kazakhstan), Naryn (Kyrgyz Republic) and Khorog (Tajikistan). The UCA School of Professional and Continuing Education has learning facilities in these locations as well as in the region's capital cities and other locations, including Northeast Afghanistan.

As one of more than a dozen institutions within the larger Aga Khan Development Network, UCA connects directly with mountain societies through AKDN agencies such as the Aga Khan Foundation and the Mountain Societies Development Support Program in Kyrgyzstan and Tajikistan and the Rural Support Program in Pakistan and Afghanistan. The University collaborates with a wide range of government agencies and departments. Existing professional development programs are currently supported by more than 40 memorandums of understanding with its three Founding States. Critical to UCA's programs are its relationships with universities in Europe, North America and elsewhere in Asia. Also, UCA is the host of the Central Asia regional hub of the Mountain Partnership and Mountain Forum as well as the Swiss-based National Centre for Competence in Research North–South.

Certain UCA programs are currently operational, while others, including the undergraduate and graduate programs, are in the planning stages. The University is currently supporting 30 Central Asian Faculty Development scholars to pursue post-graduate studies at international partner universities. These scholars will return to UCA to serve as faculty. These scholars are part of a program to help UCA achieve its aim of having 80 per cent of its faculty be from the region and to hold doctoral degrees earned at universities meeting international standards. At the School of Professional and Continuing Education, more than 34 000 learners have participated in internationally benchmarked non-degree programmes such as accounting; information technology; applied languages; entrepreneurship and microfinance; tourism; public administration; and technical and vocational education. Some graduates are envisioned to serve as support staff for the university in the future. In 2010, 154 trained instructors at 35 universities in the region were using the Aga Khan Humanities Program (AKHP) curriculum and were reaching 7 500 learners. The AKHP curriculum was developed to provide education that promotes principles of pluralism, ethics, democratic values and social justice. The University employs 400 full-time staff (more than 95 per cent Central Asian) and is creating jobs in rural communities in an era of labour migration and urbanization. The University also trains and temporarily employs 400–450 staff annually in activities associated with the construction of the university campuses. The number of construction staff is expected to increase dramatically with the initiation of major

construction of the three campuses in 2012.

Several key factors have enabled UCA's early achievements and have laid the foundation for long-term success. First, the Aga Khan and the Aga Khan Development Network have made a long-term commitment to establish UCA not as a project, but as a permanent institution. University planners have the benefit of knowing that UCA will receive financial and technical support in the early years to establish its financial footing. Second, UCA is nested within AKDN and benefits from the Network's extensive experience in the Central Asia region. Third, the concept of UCA was developed over a number of years by leading international and regional intellectuals, practitioners and other resource people. This in-depth analysis of the need for and role of UCA established a solid conceptual foundation for the university. Fourth, while making the commitments from the international treaty operational has sometimes proven challenging, the existence of the treaty represents the high-level political commitment necessary to achieve the grand ambitions of UCA. Finally, the regional presence of UCA with its three campuses is a unique characteristic that has been attractive to international educational institutions and funders that want to expand their reach to the region through dealing with only one institution.

## 2.6 Integrated approach to mountain development

Since 1992 the Aga Khan Foundation (AKF) and the Aga Khan Development Network have worked in mountain communities in many regions of Tajikistan. Collaborating with individual agencies in such areas as economic development, education, cultural revitalization, health care and financial services, the AKDN seeks to build institutions and programmes that respond to the challenges and opportunities of social, economic and cultural growth in Tajikistan. The Mountain Societies Development Support Programme (MSDSP), sponsored by the AKF, works in several areas in rural development – natural resource management, community development, enterprise development, engineering and policy and evaluation. The programme targets a population of more than 730 000 people:

Since 1998, MSDSP has been working with local community-based organizations to strengthen their capacity to identify, prioritize and realize their development agendas. The programme supports communities to establish their own community-based groups and provides them with institutional support in the form of training, capacity-building and community development funds. At the local level, these organizations are called village organizations (VOs). To date, MSDSP has supported over 1 150 VOs with more than 100 000 active village members, half of them women.

Since 1997, MSDSP has supported the construction or rehabilitation of 400 water and sanitation projects, 864 irrigation projects, 270 road and bridge projects, 280 health facilities, 158 schools and 28 mini hydropower projects. Alongside every project, the MSDSP enables community-based organizations and local governments to ensure their maintenance over the long term through special interest groups, such as Water User Associations and similar units.

The Aga Khan Development Network established the First MicroFinanceBank of Tajikistan (FMFB) in 2003, the first fully licensed commercial bank in the country to have a principal focus on micro-credit lending. One of the most important products that FMFB offers is a group loan, aimed at the poorer segments of Tajik population who have difficulty providing collateral to the Bank. Based on the principle of group solidarity, the loan is given to a group of 3–10 individuals and repayment becomes a collective responsibility; each member effectively guarantees the repayment of the other members. Group loans are often offered to women, usually for small business start-up costs or small-scale agricultural production.

A core MSDSP strategic direction is to increase rural incomes and employment by strengthening the private sector through micro-and small-enterprises, business services and capital.

Agricultural processing and tourism are among strategic areas for local business development.

The Aga Khan Development Network sponsors opportunities for local market development and cultural exchange along the Tajik-Afghan border. Providing communities on both sides of the border with access to opportunity increases the potential for income generation and improved livelihoods. Cross-border activities began in 2006 at Darvaz then expanded into other areas to promote local markets and the exchange of ideas.

The Aga Khan Community Health Project works to empower community members and community-based organizations to address their own healthcare needs. Since its inception, the Project has trained over 500 community health promoters.

The Nursing Development Project aims to improve the education of nurses in Tajikistan. In partnership with the World Health Organization, the project has developed and implemented a new four-year nursing curriculum in all medical colleges of Tajikistan. Teachers from nursing institutions throughout the country are now trained in an expanded range of disciplines including sociology, psychology, nursing management, family health, communication, health promotion and safe motherhood.

In 2001, the Aga Khan Fund for Economic Development (AKFED) launched the Indigo mobile telephony company in Tajikistan as part of an effort to improve service and spur competition in the country's mobile services industry. In March 2010, the company announced the change of its brand to Tcell. Today, Tcell is the largest mobile operator in Tajikistan by revenue, with annual figures in excess of US\$ 110 million, and by subscriber base, with a 35.5 per cent market share in 2010 (over two million subscribers). It has become an exemplar in the country for its corporate practices and customer service.

Following the collapse of the Soviet Union in 1991 and civil war, Tajikistan's electrical infrastructure was in need of significant investment. Among the most affected areas was the Mountain Badakhshan Autonomous Province, where economic and human development was stifled during the cold winter months as a result of a lack of electricity for heating and the consequent closure of schools, health centres and businesses. Many of the region's 220 000 residents resorted to wood fuel for their heating and cooking needs during the winter, resulting in the decimation of local forests. The AKFED, in partnership with the International Finance Corporation, formed the PamirEnergy Company in 2002 to address the situation. Over US\$ 30 million has since been invested by the company to repair the electrical infrastructure of the province and to expand hydroelectric capacity. In the wake of these efforts, almost 90 per cent of the region's inhabitants now have access to electricity while tariff subsidies have ensured that even the poorest households are able to access power.

## 2.7 Lessons learned

Making generalizations from any case study is a risky proposition. By their nature case studies are specific to a particular time and place, and the degree to which the experience is transferrable to any other time and place is subject to the comparability of the circumstances. A project such as the Kyrgyz kitchen gardens, for example, may not work in neighbouring Tajikistan much less in Morocco or Panama. On the other hand, conditions may be sufficiently similar that a kitchen garden project would succeed in these other countries. The point to remember is that the people in the other places are in the best position to decide whether such a project would work, and whether some adjustments for local conditions might be necessary. The replication of successes is an inherent goal of pilot projects. The highest value of the cases presented here is in the potential transfer of knowledge to others in a similar situation.

The literature on sustainable mountain development is rich with advice on practices that have proven effective over time and across space. Extensive research and field experience have led to a broad agreement on the important considerations for successful sustainable development. Professionals in the field are likely to advocate for:

- A decentralized approach that provides local participants with a share in decision-making

- A capacity-building function that assists participants to acquire the tools and knowledge necessary to succeed
- The broad participation of civil society, NGOs and decision-makers at all levels
- A strong and effective process for incorporating the views of stakeholders
- The inclusion of all relevant sectors
- A process that honours traditional knowledge
- A multidisciplinary and geographically focused approach
- A balance among the three components (environmental, economic and social) of sustainable development.

Conforming to this guidance may not guarantee a project's success, but the failure to conform may increase the likelihood of failure. Where there is no tradition of local participation in civic affairs, adherence to the best sustainable development practices may be more difficult, but the experience of the Central Asian mountain projects reported here suggests that the effort to overcome the barriers to broad participation is rewarded by the success of the projects.

The capacity-building component of sustainable development can include a wide range of activities – from workshops on the processes to be followed to training on the specific tasks necessary to implement a project to institution-building. The CASCADE earthquake risk reduction project, for example, applied a highly sophisticated analysis of seismic data to the development of an appropriate building code. The capacity-building component of the project focused on helping scientists, engineers and decision-makers understand the seismological equipment and technology used in the analysis. The project succeeded in training 200 people, a significant increase in the knowledge base needed to develop earthquake building code. In the meantime, however, rapid urbanization in Bishkek ran ahead of the seismic study, and the informal and unregulated settlements that sprang up must now be integrated into the city structure. The Bishkek experience indicates the importance of having the necessary institutions in place as part of the context for sustainable development – the success of the seismic project now depends on the development of the institutional capacity to regulate the construction of new buildings and the retrofitting of existing buildings.

Two of the networking case studies provide the kind of modest lessons learned that connect directly to the experience gained from the projects. The CAMP study found that the introduction of participatory and partnership principles to replace the centralized command system required the development of new systems; that consolidating the efforts for more coordinated and cohesive interventions required the strengthening of institutional capacity at all levels; and that institutional development required investment in human potential and local capacity-building. The AGOCA experience exchange found that neglectful and careless selection of training participants leads to a reduction in the percentage of participants who benefit from the project. This finding led to the strengthening of the selection process.

The CAMP Alatau pasture management project also derived lessons directly from their work. In this case the findings have implications for the science, financial requirements, scale and policy considerations for pasture management. The study finds that the complexity of sustainable pasture management requires a holistic, multidisciplinary and integrated approach; that policy level interventions and practical implementation of the work needs to be supported with the allocation of sufficient financial resources; and that future sustainable pasture management interventions should be undertaken at the watershed scale to address the upstream and downstream and transboundary aspects of mountain massifs that span two or more countries. The CAMP Alatau project concludes that raising awareness and promoting the concept of payment for ecosystem services is of the utmost importance.

The analysis of mountain development in Central Asia beyond the case studies also shows that:

- Political stability and conflict avoidance are the key factors for sustainable mountain development.
- Personal safety, food and energy security, decent jobs, health and education, and poverty alleviation are the key priorities for people in the Central Asia mountains. If these basic necessities are not addressed and balanced, sustainable mountain development and environmental protection cannot be ensured.
- Good governance, corruption prevention, transparency and participation in decision-making in the main economic and social sectors are paramount to success of development projects in the mountains.
- Communication of easily understandable, reliable information is crucial for public understanding, support and motivation to act responsibly.
- The absence of well-defined property and management rights and responsibilities puts constraints on, and adds uncertainties to, sustainable mountain development.
- Heavy reliance on subsidies (as in the Soviet period), natural resource extraction and use without benefit sharing (as in the energy and mining sectors) and continuing reliance on substantial external donor inputs may lead to unsustainable mountain development patterns that could hit hard in times of abrupt change.
- Affordable microfinance, successful demonstration projects and new knowledge often lead to self-reliance.
- The valuation of mountain ecosystem services and the provision for ecosystem carrying capacity, including the regulation and mitigation of man-made pressures, are essential to mountain development and benefit sharing.
- Legislation and programmes on mountain development are essential, and need to be supported by efficient institutions and resources.
- The lack of willingness to cooperate and the tensions between upstream and downstream countries (mainly on region's delicate and politicized water issues) impede regional cooperation.

### Part 3: Opportunities and the prospects for a green economy

The trends enumerated in Part 1 have influenced, and continue to influence, the development of the new Central Asian countries – for better or for worse. The countries may seem at times to be at the mercy of the geopolitical, socio-economic and global forces at work, but the trends associated with these forces provide an array of opportunities as diverse and profound as the forces themselves. The governments, communities and people who take advantage of the opportunities afforded by the trends stand to benefit for years to come. This part of the report offers suggestions on where the best opportunities may lie and on how the people of Central Asia might seize them to their advantage.

#### 3.1 Opportunities associated with the trends

The transition to independence required the new countries to establish their own governments and economies without their former reliance on the Soviets for administration, planning and finance. The end of dependence on the Soviet state paved the way for self-reliance at both the state and individual levels. With greater exposure to the international community and more responsibility for their own destinies, the new countries are learning to tackle their own problems. The progress in responding to the

depletion of mountain resources, for example, is an area where the advice and assistance of the international community over the last 20 years has helped develop the knowledge and skills necessary for the task, and has created the opportunity for continuing success at the state, local and individual levels.

### 3.1.1 Independence and governance

As the countries have developed their own legislation and the corresponding enforcement regimes, they have replaced the former centralized and subsidized system. Continuing this work, and strengthening what now exists on the basis of their own resources, will help the countries establish the rule of law. At both the national and local levels there are opportunities to develop governance that leads to greater stability, prosperity and sustainability.

Even today, almost twenty years after the Rio 1992 Summit, which highlighted the importance of mountain ecosystems in Agenda 21, the national development strategies in key socio-economic sectors do not fully consider mountain ecosystem services and sometimes lack consistency with national environmental and sustainable development strategies. By truly incorporating environmental and sustainable development considerations into their national strategies, the countries can seize the opportunity for better coordination and efficiency among their planning efforts, and can realize the synergy that comes with the participation of all the relevant players.

Legislation and programmes that target mountain territories are already in place in Central Asia, but they need to be enriched by international practices and strengthened to support sustainable development. The consolidation of efforts and the creation of a mountain countries group under the United Nations could help to define and promote common interests and exchange good practices.

Another initiative, initially proposed by Kyrgyzstan in 2005 and being increasingly pursued by the Kyrgyz government since then, is the exchange of external debt for sustainable development. The idea behind this mechanism is that the lender would agree to convert debt repayments into support for sustainable development projects. A similar system was successful in Latin American countries, and Kyrgyzstan is hoping to replicate that success.

### 3.1.2 New borders and mobility

At the beginning of independence, the Central Asian countries placed a high priority on the definition of the new international borders and the development of new border controls. In the mountains, where the terrain is complex and travel is difficult, the new border controls have worsened the situation by further restricting the movement of goods and people. The establishment of travel corridors that easily accommodate the movement of goods and people would enable commerce to the benefit of the states and to the people who live near the borders. All the Central Asian countries would stand to gain from the improvement of travel corridors, and the situation is ripe for international cooperation in the development of mutually beneficial solutions.

### 3.1.3 Sub-national cooperation

The political and economic assistance to Central Asia has come in the form of multilateral and bilateral aid from a variety of sources. While traditional cooperation across borders is normally a bilateral endeavour between countries, there are an increasing number of sub-national efforts occurring at city and regional levels. These efforts offer the opportunity to explore more fully the benefits of experience exchanges and direct cooperation on mutual concerns. International organizations with specific expertise, through better coordination of their work, could build on this experience with programmes that provide assistance at the community, rather than at the national level, and that link lowland benefits to mountain projects and vice versa.

### 3.1.4 Climate change

Climate change and natural disasters require responses at a national level, but there are also opportunities for regional cooperation across Central Asia. Currently the countries of the region conduct their own research and devise their own climate change policies and disaster risk reduction strategies. A lessening of the political barriers among the countries could encourage collaboration and the exchange of knowledge that could lead to a more effective regional response to climate change and natural disasters in the lowlands as well as in the mountains. While the mountain communities do not contribute significantly to greenhouse gas emissions, the mountain regions will benefit from any progress on mitigating climate change. The mountains have a vast potential for carbon storage through afforestation projects, and sustainable land use practices to enhance this potential will benefit the entire region.

Mountains are complex environments with complex climates, and the response to the effects of climate change requires a greater effort to consider the specific mountain conditions. Flatland approaches may not apply, and targeted research and interventions are necessary for an effective response. The lowlands are affected by climate change in the mountains, and the lowland countries are well advised to account for mountain ecosystems in their planning. Mountain environments are particularly sensitive to climate change, and are often the first place where the effects are visible – in shrinking glaciers, for example. This sensitivity and visibility create the opportunity to increase awareness of climate change in the mountains, and to build support for an effective local, national and regional response.

The total GHG emissions in Central Asia are projected to grow in the coming decade in almost all scenarios reported by the countries. From the perspective of mitigating global climate change this is an unfortunate development and more could be done to increase energy efficiency, promote the use of renewable energy sources and efficient stoves and increase resilience to climate change through adaptation.

### 3.1.5 Natural disasters

Disaster risk reduction strategies need to contemplate the links between natural and industrial hazards both within and between countries. Where existing resources are inefficiently spent, there are opportunities for greater cooperation among the ministries and institutions that have responsibility for seismic and flood monitoring, industrial risk analysis and disaster relief.

### 3.1.6 Biodiversity management and conservation

The expansion of protected areas in the independence era, including cross-border natural parks and biosphere reserves, has created a foundation for further protection of the region's rich biodiversity. Special reserves for watershed protection or forestry afford the opportunity for stronger measures to protect native flora and fauna, especially in the mountains.

The mountains are a warehouse of genetic resources related to agriculture, and as such offer an opportunity for further promotion and research. Governments can provide incentives, such as discounts or local produce promotions, to farmers to maintain local varieties alongside other crops, and international organizations may be able to influence the direction of mountain agriculture and to help improve local varieties and breeds. The mountains would also benefit from the more careful control of invasive species and genetically modified organisms, along with more biofriendly methods of crop production.

The number of domestic animals already exceeds the high levels attained during the Soviet era, and this agricultural achievement should be viewed not only from an economic angle but also in the context of the Soviet experience – the serious land degradation that occurred then may occur again. Now, however, local innovative practices and sustainable pasture management may accommodate the greater number of stock without the degradation of the land resulting from overgrazing.

### 3.1.7 Land degradation

Excess irrigation leads to land degradation in addition to water losses in the agricultural sector, and the irrigation systems in Central Asia need to adjust to modern standards. Similarly, the expansion of rainfed agriculture on steep mountain slopes needs to be monitored, and crop rotation needs to be encouraged to prevent land degradation from water and wind. Governments and local communities can work to create favourable conditions, and the more rational use of water for irrigation can benefit the entire region.

### **3.1.8 Geographic isolation, roads and trade**

The development of roads and rails throughout Central Asia, while a boon to trade and commerce, may have negative environmental implications that deserve careful consideration. The mountain countries, surrounded as they are by big players and big consumers, are strategically positioned to create rail links, the development of which would benefit their economies and raise their regional importance. Similar benefits would accrue if the countries become energy hubs and develop their power infrastructure. The mountain countries could also pass legislation to make themselves more competitive in encouraging the regional trade that helps their economies. The international community, including the United Nations, could assist mountain countries in tackling the economic effects of geographic isolation and high shipment costs.

### **3.1.9 Information technology**

The expansion of mobile communications and information technologies has already benefited the region in numerous ways. Mountain businesses can further this progress by increasing their use of the Internet for advertising, and communities can communicate the trade and tourism opportunities in their areas. As remote mountain areas link to the rest of the world, they can develop educational and professional opportunities, promote ecosystem awareness, contribute to environmental knowledge and communicate their concerns.

### **3.1.10 Tourism**

The tourism sector in Central Asia has expanded in the independence era, and governments now have a chance to provide incentives to broaden the opportunities for a community-based tourism that relies on a traditional style of modest accommodations and quality service. Winter tourism that focuses on activities other than skiing (with its high capital and operating costs) could help mountain communities by providing seasonal employment at the time of year it is most needed.

### **3.1.11 Mining**

The resolution of the continuing controversies in the mining sector requires creativity and perseverance. Governments need to ensure that the local concerns are aired and respected in order to reduce the tensions that are currently preventing mining operations. In addition, governments need to bring artisanal mining practices into compliance with modern standards by ensuring that competent authorities provide the necessary monitoring and oversight. In their efforts to clean up the abandoned mines and tailings left over from the Soviet era, governments would be wise to seek opportunities to develop economically viable ways to rehabilitate the sites through partnerships with potentially affected countries, international organizations and private enterprise.

### **3.1.12 Energy**

The huge potential of hydropower in the mountain countries provides the opportunity to combine progress on the goals of energy security, climate resiliency and economic development. Investments in large projects need to consider the environmental and downstream effects. By balancing local, national and international interests in energy development, the countries can secure power for their own people, and sell power to their neighbours.

Modernization of the power system may require higher tariffs, but governments should take account of income levels, especially for those living in the mountains, in devising a fair tariff system.

In the development of biofuel production programmes, governments should learn from the experiences of others, balance the requirements of both the economy and the environment in determining the crops to use and recognize the environmental challenges in deciding how much biofuel to develop.

### **3.1.13 Security**

The cooperation on intelligence exchange and border controls currently in place in Central Asia forms a solid foundation on which to build a stronger system that is adequate to the actual threats. All the participants will benefit from better security arrangements, especially in the mountains where potential hideouts are plentiful. At the national level, a dialogue between ethnic and religious groups may help build the trust necessary to achieve internal security, maintain stability and reduce the potential for conflict.

Tensions between the highland and lowland countries often centre on the issues of energy accessibility and water usage, and are evident in the absence of trust in the economic and environmental assessments of power and water projects. Comprehensive and transparent assessments may help, but absent the political will to change, a breakthrough is unlikely. All of the regional players need to recognize the role of mountain ecosystems with respect to water resources in Central Asia, and to cooperate on the investment in, and maintenance of, mountain ecosystem services.

Food, energy and water security are crucial to the maintenance of stability in the mountains and the neighbouring regions. In light of their marginal existence and the scarcity of resources, mountain communities may need the support of outsiders to provide these essential elements of soft security.

### **3.1.14 Resource ownership and property rights**

As resource ownership in Central Asia has slowly moved from state to private hands, the increase in efficiency has been apparent in such areas as tourism, mining and agriculture. But property rights are not yet well respected, and legal uncertainties undermine the sense of responsibility that normally follows from ownership. In addition, there are growing inequities between rich and poor. Governments need to establish fair resource distribution policies and encourage the efficiencies and responsibilities that come with property ownership.

### **3.1.15 Migration**

The remittances that come from labour migrants have become a crucial source of income for families, and the Central Asia governments need to recognize the situation with new policies that establish the legal framework and official services that migrants and their families need. The prospect that unskilled workers may no longer be welcome in recipient countries suggests that governments need to invest in education and language skills, and to work collaboratively with international partners. In recognition of the changing status of women as heads of household, the governments also need to consider labour regulations and other approaches that help lift the burden on women.

### **3.1.16 Education and health**

As educational opportunities have increased in the independence era, the quality of education has declined, and realistic literacy rates are falling. Reversing this trend requires a greater investment in human capital, more innovation and an increase in the number of teachers. That Central Asian universities are now specializing in mountain development issues is an encouraging trend. Higher education institutions have an additional opportunity to focus on the preparation of the next generation of managers in tourism, mining and infrastructure, all of which demonstrate promising growth potential.

In health, many trends are similarly encouraging – decreasing child mortality and greater access to safe drinking water, among others. These advances in public health are a good base for the development of stronger environmental health protection. The complex changes in the mountain environment require more attention to the associated environmental health risks.

### 3.1.17 Traditions and modernity

The mix of traditional skills and modern practices represents a flourishing trend in mountain trade and services, and governments and other active players should encourage the conditions that enable the trend to grow and spread to other regions. The production of authentic, high quality products should be a source of pride in the countries where they are made. The ongoing reanalysis of history and culture and traditions should continue to support this revitalization and celebration of mountain culture.

## 3.2 Towards a green economy

Given their low-carbon profile and the high proportion of hydropower in their energy use, the mountain countries of Central Asia are well positioned for a transition to a low-carbon, resource-efficient and socially inclusive green economy. Rural electrification experienced a step back in the last 20 years as energy production capacities have not been adequate to meet growing energy demands. The development of community-scale hydro, biomass, wind and solar facilities, together with the improvement of energy efficiency in the housing sector, could help improve the accessibility and reliability of energy supplies. Booming businesses – in tourism and agro-processing, for example – may also invest in small renewable energy systems to make their businesses climate friendly. Reducing the energy losses in energy infrastructure is another area that promises significant advances.

The economies and populations of the mountain countries rely on agriculture, biodiversity and forest products, and increasingly on mineral extraction, transport and trade. Green economy initiatives in these sectors can provide significant benefits.

### 3.2.1 Agriculture, water and land use

The agricultural sector employs nearly half of the total population in the Central Asian mountain countries, and a green economy offers significant opportunities to diversify the sector through the expansion of organic crops and environmentally sound grazing practices. The global and regional markets for organic food and other high-quality and environmentally friendly mountain goods (wool, fibre, wild forest products) are growing, but only a small fraction of agricultural production in Central Asia is currently certified and labeled as organic. There is a great potential to reduce pollution and to increase yields and local benefits through the introduction of biological pest controls, crop rotation and diversification, all of which will ultimately reduce soil erosion and biodiversity loss, and enhance the quality of life and food security of mountain dwellers. "One village—one product" schemes and improving market access for local producers promise broader opportunities for local agricultural products and handicrafts. Fish stocks in mountain lakes

– heavily depressed by over-exploitation – need to be restored and managed sustainably.

Central Asian agriculture is infamous for its inefficient use of water. Growing population and food demands increase pressure on water resources, while climate change is adding to an already difficult situation. Investing in more efficient water use and improved sanitation is not only cost-effective but also necessary to avoid conflicts and water-related diseases and epidemics. One of the responses to growing water scarcity is the building of dams. But dams require massive investments and could have negative environmental consequences. Small-scale water management solutions should be promoted. Principles for the pricing of resources and services provided by mountain areas to lowland and downstream regions, and mechanisms for the allocation of a fair share of the benefits to mountain communities, should be established, tested and introduced in practice.

### 3.2.2 New thinking, new technologies, new skills

Trade liberalization can facilitate consumer access to clean technologies at lower costs. Access to affordable renewable energy technologies and energy efficient products produced in China and better construction materials could help reduce energy consumption, for example.

The transition to a green economy requires changes in strategies and the application of new technologies and management approaches. These changes require new skills, expertise and ways of thinking often lacking in existing institutions. The successful application of new policies and technologies and the facilitation of coordinated actions require a strengthening of the capacities of local and national institutions, and the reinforcement of the role of the private sector and the civil society.

## 3.3 Institutions and governance

The Central Asia governments do not maintain a consistent, well advanced policy focus on mountains, and while the countries recognize the vulnerability of their mountain ecosystems, the protection of these ecosystems could benefit from a linking of the strategies for mountain development to the Rio conventions and to other, broader agreements on trade, economic development, conflict resolution and resource management. The integration of sustainable mountain development into the Rio strategies, programmes and plans would help ensure political attention for mountain concerns, and help establish financial security for the funding of mountain projects.

Following the Bishkek Global Mountain Summit, the role of civil society in sustainable mountain development expanded significantly, and numerous NGOs interested in mountain issues opened an era of regional cooperation. These organizations developed their own areas of expertise and sought their own niches, and as their specialization increased, the cooperation among groups seemed to diminish. The Mountain Societies Development Support Programme, which works throughout Central Asia, takes an integrated approach to sustainable mountain development, and provides a model that other organizations can follow to renew their regional cooperation.

Input for the Rio+20 Compilation Document, 2011-11-01

Envisioning the Great Transformation in an Integral Perspective

Many of the preparatory discussions and documents for Rio+20 fail in painting the big picture:

In order to reach sustainability we need to envision and organize nothing less than the third Great Transformation of our economic system on a global scale.

The term Great Transformation was coined by the Austro-Hungarian political economist Karl Polanyi in 1944 to describe fundamental changes of an economic and societal system as a whole. The first Great Transformation has been the Neolithic Revolution, the second one the Industrial Revolution.

The societal changes which are ahead can't be overestimated. To be able to coordinate efforts towards sustainability we need to have a common understanding of what is needed now: the third Great Transformation towards an economic system which operates within the planetary limits.

A new Civil Contract for a Great Transformation

In May 2011 the German Advisory Council on Global Change WBGU published its flagship report: World in Transition – Civil Contract for Sustainability.

We support the general view presented by the Advisory Council WBGU and suggest framing the Rio+20 discussions accordingly. We need to envision and organize the Great Transformation.

Integral Theory as a common all-inclusive framework

To understand and coordinate the different approaches of different stakeholders we need to have a common all-inclusive framework. We suggest using the Integral Theory<sup>2</sup> for that purpose. The usefulness of an integral approach has already been proven within various UN-activities.
