## Part2. Issues, Challenges and Ways Forward

### On Green Economies in the Context of Sustainable Development and Poverty Eradication

We use the term "economies" because there is no one model that fits all countries and all societies. Green economies, the definition and implications of which are still under exploration, shall be understood through the overarching paradigm of sustainable development.

Green economies should:

- Serve as one of the tools to implement sustainable development with emphasis on integration of three pillars and coherence among economic, social and environmental policies
- Ensure all people's wellbeing and enhance sustainable development and prosperity of all nations
- Build on sustainable production and consumption patterns as well as resilient social and economic systems that has the adaptive capacity and robustness to handle shocks while maintaining functionality
- Require social justice and equity between and within countries, intergenerational and gender equality
- Foster citizen and civil society participation and empowerment
- Protects the ecological balance and creates economic sufficiency
- Provides decent work and right livelihoods, and ensure that jobs and social benefits are distributed equitably among all peoples
- Conserve biodiversity and ecosystem for current and future generations
- Recognize the economic and social value of environmental resources while avoid leading to purely look at them from market perspective

Green Economies should not:

- Replace sustainable development, shifting attention of states from fully honoring their commitments made
- Impose top down one size fits all approach
- Be transformed into extra conditionality and green protectionism towards developing countries and the poor especially
- A way to put nature in corporate hands, with blind commercialization

We call for replacement of the current inefficient, unsustainable and inequitable economic model, which facilitates a grossly inequitable trading system, fails to eradicate poverty and preserve natural resources. We propose that where the current economy aids inequity, destruction and greed, it should be replaced by an economy that cares for the people, and the planet.

We call for governments to develop (further) national sustainable development plans that provide enabling policies and policy tools, based on the above-mentioned principles in part 1, and taking consideration of sufficient policy space especially for developing countries.

We believe that it is possible to implement a just transition to sustainable economies as fast as possible through an unprecedented level of cooperation and policy coherence at the local, state, national and international levels, by the sharing of real green technologies and know-how, by appropriate restructuring of regulatory, subsidy, taxation and expenditure policies and by addressing fundamental issues like access and technology assessment.

We emphasize financing sustainable development requires significant public financing, financial and technology transfer, private sector investment that are productive and non-speculative in nature and fair and innovative modes of taxation, including a financial transaction tax that is dedicated to support sustainable development activities especially for developing countries.

We believe the need to establish a new way to measure the progress towards a sustainable development with gender-specific and other indicators, integrating them with those of sustainable development rather than only relying on a country's GDP.

We call for establishing stronger partnerships among governments, civil society organisations, private businesses and stakeholder groups for promoting green economies in the context of sustainable development and poverty eradication. Such partnerships need to be within frameworks of accountability and transparency including regulation.

### On Institutional Framework for Sustainable Development

We urge the governments to take more ambitious commitments based on through review and assessment of our progress, to implement Agenda 21 by strengthening or reviving mechanisms from global to local level and ensuring synergy and coherence among various agencies involved in sustainable development.

We call for the global institutional framework for sustainable development that ensure equitable rights and opportunities for all human beings. And countries must recognize the difficulty for developing countries to shift their development trajectory in order to balance the three pillars without a solid economic ground and sufficient support from international community.

We also call upon the Rio+20 process to address sustainable development governance, and involve all the institutions dealing with the 3 pillars of sustainable development in the architecture with support from the entire UN system and relevant mechanisms at each country.

We strongly call for the building of a strong apex body on sustainable development with clear mandate to work at the global level and integrate the work of disparate multilateral bodies working on each of the three pillars of sustainable development. Options that should be explored include transforming the Commission on Sustainable Development into a Council on Sustainable Development under the General Assembly, or establishing a UN Organization on Sustainable Development. The unifying mandate of this body should be the promotion of sustainable development as a fundamental right of all.

We also call upon developed countries to further their leadership to ensure the financial sufficiency for the reform and implementation of international governance. Meanwhile, all countries should take more accountability and moves toward to shared vision of sustainable development.

We call for a strong and systematic monitoring mechanism with technical expertise to ensure the strict enforcement of existing agreements on sustainable development at the global and their enabling laws level. This body should conduct regular assessment at each level and provide specific guidance for countries.

We further stress the significance of civil society organization as a role to bridge governmental institutions and the general public, and ask for more channels to sustainable development governance from decision-making to the monitoring of implementation with sufficient and comprehensive support.

On Other Challenges and Emerging issues:

We are concerned about the challenges and emerging issues across three dimensions and their inter-linkage and mutual reinforcement affect, especially between and among food, water, health, energy, climate change, rural and urban development, financial markets.

#### Climate Change

We call for international collective actions to achieve the global climate protection goal recommended by the science. Based on the CBDR principle, developed countries have to take the lead in deep domestic cuts of GHGs emissions, and provide long term financial support to developing countries; developing countries should alter their development path based on their national context by international cooperation and creating enabling policies and adequate policy and market incentives for low carbon development. Adaptation and capacity building shall be equally emphasized.

We call for institutions to safeguard biodiversity, human rights, local environment, food security and the development rights that shall not be compromised for the sake of climate protection.

#### Population

We affirm that the trend of increasing of global population has to be managed.

We call on governments to start a debate that recognizes the choices we have to make about human population as we consider the limits of the carrying capacity of the planet and the need to enable fair and equitable use of available resources and leave space for wildlife and wilderness. We also call for strong actions on consumption patterns and lifestyles because unsustainable consumption by the wealthy of the world's population deprives the poor of their developmental rights.

#### Education and learning for SD

We are convinced that education is essential to the global transition to a more sustainable world; it should be a centerpiece of international cooperation for Sustainable Development.

We acknowledge the necessity to reaffirm the UN Decade of Education for Sustainable Development (2005-2014).

We affirm that education should address the material, social and development of the spiritual dimensions of human and in its fullest sense must provide the space for value-based sustainable learning.

We are aware that successful education and learning in all its forms are dependent on the full support of governments at all levels, the private sector, policy makers and the civil society.

#### Technology development and diffusion

We call for global and regional mechanisms, such Regional Technology Observation Platforms, in evaluating the impacts of new and untested technologies must be adopted. Such mechanisms must involve communities, civil society and other actors, and provide resources towards providing adequate information and building capacity of countries and communities to assess and monitor the health, biodiversity and environmental impacts of new technologies.

#### On Principle 10 Access to Information, Public Participation and Environmental Justice

We note that streamlining sustainable development (including green economies) governance, draws on the foundations of community participation and we further reaffirm that civic participation have been valuable partners in a broad spectrum of peace and sustainable development activities, with the overriding goal of poverty eradication and the betterment of the human condition, among a number of other causes.

We call for establishing environment management system and citizen participating mechanism at community level, to facilitate community monitoring environment quality and execution of environment laws, participating in policy making process. We encourage promotion of green choice, sustainable consumption at community level and development of urban-rural integrated sustainable development model.

We recognize and reaffirm that the various civil society organizations and members are ready to share responsibility with local and national governments in their communities.

We strongly affirm that meaningful involvement of youth, women and wider civil society in decision-making processes and partnerships, as stressed in Agenda 21, Section 3, are critical to the success of Rio+20 conference and delivery of sustainable development at all levels.

We further call on the Rio + 20 conference to encourage the development of a regional convention on Principle 10, to invite interested states to accede to the Aarhus Convention and to mandate UNEP to develop a robust program to implement the 2010 Bali Guidelines on Principle 10.

## Christensen Global Strategies

Proposed:

Perhaps the greatest need and opportunity at Rio+20 is to begin redirection of capital at scale for sustainable human well-being and restoration of natural systems through adoption of: revised national accounting metrics; new corporate balance sheet standards; and, amended supporting regulations. This proposal asserts that the official declaration produced at Rio+20 should recognize the need to adjust accounting systems to value human well-being. Because business balance sheets are equally in need of change, this issue is already part of the agenda at the World Green Summit, a private sector gathering that Christensen Global Strategies is convening with World Climate Limited parallel to the Rio+20 official meeting. However, conversation among business and government leaders is essential to driving change, therefore we propose to organize an additional conversation with business-government leaders as either a side event or an official government event facilitating conversation and collaboration leading to adjustments in national accounting metrics, balance sheets, and the regulatory frameworks supporting them (e.g. financial disclosure, accounting standards). Thank you for your consideration of this important topic.

Introduction

The Need For A New Capitalist Model

Nations first began quantifying national accounts as a measure of economic health nearly seventy years ago. In that time, Gross Domestic Product became the definitive measure of a nation's well-being. With its emphasis on short-term profits however, GDP captures an overly narrow picture of national health and progress; it utterly fails to measure what we truly value – human well-being.

The economists who developed national account measurements never considered natural resource depletion – natural resources were limitless in their 19th century world. It also never occurred to them that many ecological systems conferred great economic values that should be included in GDP measurements and on corporate balance sheets. Yet, such considerations are imperative in today's world as we watch population increase exponentially, resources dwindle or degrade in quality, and nations jockey for first place in efficiency, sustainability, and innovation. The assessment tools used by almost all nations fail to measure these factors.

This disconnect between outdated metrics and modern-day threats to a stable planet must be fixed. Its exaggerated emphasis on short-term profits skews our capitalist system toward unsustainable practices. Re-aligning the power of capital markets to promote human well-being requires that we encourage four essential actions: investing for the long-term; internalizing externalities; valuing nature; and adopting qualitative metrics for measuring growth.

Progress on New Metrics in Support of Capitalism for the 21st Century

A movement is building among business and government leaders to change how we measure well-being and Rio+20 should support and encourage this transformation so that capital will be redirected at scale to create healthier societies and more resilient natural systems. Among businesses, leaders such as Google are pricing carbon on their balance sheets or like Puma calculating their externality costs for water and carbon with the first-ever environmental profit and loss statement (P&L). Dow Chemical and The Nature Conservancy are working to value nature on Dow's balance sheet, and Generation Investment rewards its investment teams for the long-term performance of their portfolios. Bhutan leads government innovators with its Gross National Happiness index that measures the quality of its people's lives. The Organization for Economic Cooperation and Development is working with governments on revised GDP metrics that measure well-being. All of these signal positive shifts toward a new capitalism – Rio+20 can and should be a powerful platform for accelerating the trend.

The Private & Public Sector At Rio+20: Mobilizing Leadership

We propose and are ready to support the implementation of:

- An event in support of Rio+20 including business and government leaders engaging in a complementary conversation about the future of valuing natural resources and human well-being; and
- Inclusion in the governmental declaration recognition of the need to adjust governmental metrics and value natural resources so as to better support human well-being.

---

## Christian Aid

Christian Aid submission to the Rio+20 conference on the issue of domestic resource mobilisation and taxation.

Comments and questions should be addressed to Dr David McNair [dmcnair@christian-aid.org](mailto:dmcnair@christian-aid.org) +44 20 7523 2034

Christian Aid is a Christian organisation that insists the world can and must be swiftly changed to one where everyone can live a full life, free from poverty. We work globally in over 40 countries for profound change that eradicates the causes of poverty, striving to achieve equality, dignity and freedom for all, regardless of faith or nationality. We are part of a wider movement for social justice. We provide urgent, practical and effective assistance where need is great, tackling the effects of poverty as well as its root causes.

This submission sits under the specific request for comments on the "Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels local, national, regional and international."

Here we focus on resource mobilisation to meet the demands of agreed action plans emerging from the summit. Insufficient financial resources are a major reason for the gaps in implementing the agreed sustainable development commitments and action programmes since the 1992 Rio Summit on Environment and Development. The performance of developed countries in meeting their financial commitments to developing countries has been very disappointing. At the same time domestic resource mobilisation by developed countries has been constrained by the lack of appropriate tax norms and rules, especially at the international level.

Tax plays a crucial role enabling countries to provide basic services, strengthening the accountability between states and citizens. That domestic resource mobilisation is a key element of the self-determination of a country is a view shared by the UN, the EU, and the OECD. These actors also recognise the role of taxation in promoting good

governance, and the importance of non-state actors (civil society, the media and parliaments) in ensuring that revenues are collected and spent equitably and effectively. It is therefore a crucial element of building social and economic development at the national, regional and global level.

Yet revenue mobilisation in many developing countries is very weak. While OECD countries tend to collect 35% of their GDP in revenue, in Latin America the average is 16%.<sup>iv</sup> in Africa the figure is 15.9%.<sup>v</sup> Governments need to be equipped to raise revenue effectively through adequately resourced tax authorities and good domestic tax policy, and by having access to information. Transparency is required so that civil society can monitor revenues and how they are spent.

The ability of countries to collect revenue effectively is systematically undermined by the financial secrecy of tax havens and abuse of transfer pricing rules designed by and for OECD countries in close consultation with Multinational Companies.

#### The scale of the losses

Christian Aid estimates that developing countries lose US\$160 billion each year in tax revenues due to the profit-shifting of some unscrupulous multinational companies and other businesses through 'Transfer Pricing' and 'False Invoicing'. The table below shows estimates of potential losses as a result of these practices.

Lost Tax Revenue from G77 countries to EU and US (million USD)

[ UNDESA/DSD: Please download the original submission to view table]

#### Transfer Pricing

'Transfer pricing' is the name given to a body of rules, practices and processes, involving both domestic law and international law considerations, that aim to determine how transactions conducted between related persons should be treated for tax purposes.

Transfer pricing rules seek to counter a situation where a multinational enterprise ("MNE"), with operations in numerous jurisdictions, obliges its subsidiary based in a 'high tax' jurisdiction to pay fees at artificially inflated rates for goods or services provided by another related subsidiary based in a 'low tax' jurisdiction. The effect can be to 'strip' profits out of the highly-taxed subsidiary and 'earn' them in the lowly-taxed subsidiary, decreasing the overall effective tax rate paid by the MNE in respect of those profits. It is this 'value stripping' that transfer pricing rules seek to counter.

Transfer pricing is governed by the arm's length principle – while related companies may have incentives to charge high or low prices for legitimate business purposes, when trading across borders, this affects profitability and therefore the tax due in a jurisdiction. The arm's length principle requires MNEs to trade with related parties as if those parties were unrelated. While companies are usually required to provide documentation to show that transactions have occurred on an arm's length basis (usually by identifying similar transactions on the open market), applying this standard is resource intensive and requires significant expertise – particularly in relation to intellectual property and intra-company financing where MNEs have a monopoly. Valuable brands and intellectual property can be stored in tax havens to ensure greater profits are declared there.

Recent examples of companies accused of such behavior include SABMiller (accused by development NGO, ActionAid of dodging taxes in Ghana),<sup>vii</sup> Commodity traders ADM, Bunge and Cargill, who were accused by the Argentinean tax commissioner of tax evasion,<sup>viii</sup> and Swiss commodity trader Glencore, recently accused of tax evasion on its operations in Zambia by NGOs who accessed a leaked independent audit report.<sup>ix</sup> The companies involved deny any wrongdoing.

#### Financial Secrecy

Financial and banking secrecy provided by tax havens facilitates tax evasion and avoidance by allowing companies and individuals to hide money offshore. By refusing to share information on account holders, some jurisdictions actively undermine the tax bases of other countries. This occurs not only among the usual suspects such as Caribbean Islands and Alpine tax havens but also occurs in the City of London, and the US state of Delaware.

#### Measures to address tax evasion and avoidance

To shift the balance of power in the international taxation system, developing countries need a greater say in norm setting and the development of international tax rules. To curtail this transfer of income from poor to rich requires greater capacity to monitor transactions with revenue and customs authorities, greater transparency from business,<sup>x</sup> but also the effective exchange of tax information between jurisdictions so that companies and individuals cannot hide money in tax havens away from the sight of tax administrators and regulators.

Christian Aid therefore proposes the following recommendations as part of the new and emerging issues to be addressed at the Rio+20 Conference and also as part of the Institutional Framework for Sustainable Development:

#### Strengthening of the UN tax committee

Currently, international cooperation in tax matters and norm setting with regard to tax rules for multinationals is driven by the OECD. The UN Committee of Experts on International Cooperation in Tax Matters is the most representative forum for developing countries to engage in international tax cooperation issues. Yet it is currently under resourced. This committee should also be upgraded from an expert committee to an intergovernmental body under the auspices of the UN.

#### Strengthening capacity building in revenue authorities

Capacity constraints within revenue authorities are significant. While aid donors and multilateral organizations are engaged in this agenda, it is dominated by the IMF, World Bank and, increasingly the OECD and these organizations do not always represent the best interests of developing countries.<sup>xi</sup> The work of regional organizations such as the Inter-American Center of Tax Administrations (CIAT), the African Tax Administrators Forum (ATAF) UNDP and the UN Committee of Experts on International Cooperation in Tax Matters should be supported and strengthened.

#### Country-by-Country Reporting

A new accounting standard, country-by-country reporting would enable tax authorities, civil society and other regulatory agencies to monitor the activities of MNEs located within their jurisdiction, how their trade is undertaken, and what profits and taxes they declare. Using this data, revenue authorities could compare the trading performance of an MNE operating in their jurisdiction with what it does elsewhere and identify artificial profit shifting.

#### Automatic Information Exchange

A multilateral agreement on the automatic exchange of tax information between jurisdictions, would equip developing countries with the information they need to identify and challenge tax abuse. This would also offer a significant deterrent effect to those considering abusing the tax system by hiding assets offshore. Much progress has been made on encouraging tax havens to share information, but many developing countries have yet to access these agreements. These kinds of information sharing activities currently

occur in Europe through the European Savings Tax Directive, which has since 2005 put in place a working system for multilateral, automatic information exchange. In an improved form it could be used to inspire or serve as a template for a global standard.

## CIDSE

October 2011 2012 United Nations Conference on Sustainable Development (Rio +20)

CIDSE submission to the Rio+20 Zero Draft Document

The context of Rio+20

The 1992 Rio United Nations Conference on Environment and Development established the paradigm that Sustainable Development must be holistic and incorporate social, economic and environment imperatives. For the first time, developed and developing countries agreed to a framework based on mutual rights and obligations. The Rio Declaration on Environment and Development affirmed the “polluter pays”, “common but differentiated responsibilities,” and precautionary principles as essential concepts underlying this framework.

Already ahead of the 2002 Johannesburg Summit, it was acknowledged that progress in implementing Sustainable Development has been extremely disappointing since the 1992 Earth Summit. The hope, born in Johannesburg, that the numerous voluntary multi- stakeholder partnerships, together with governments’ aspirational targets on sanitation, chemicals, fish stocks, and biodiversity, would succeed in implementing Sustainable Development, clearly has failed to deliver in the ten years since.

The environmental crisis is indeed worsening, with the imperious and yet unsolved threat of climate change already impacting the most vulnerable and yet least responsible communities. Positive trends regarding poverty eradication are still contradicted by the persistence of severe inequality between and within states. The partial progress that has been achieved is threatened by the confluence of global crises in food, energy, climate, finance and the economy.

The Rio+20 Conference is thus a key opportunity to perpetuate the legacy of a historical international Declaration and Agenda 21 action plan, which paved the way for the implementation of Sustainable Development policies, and to give a structural answer to the current challenges. It is also an opportune moment for the international community, twenty years after the first Earth Summit, to push forward a credible and efficient pathway towards Sustainable Development and poverty eradication.

CIDSE's Vision

CIDSE is an international alliance of Catholic development agencies working in the north and with partners in the south to promote global social justice and solidarity. CIDSE advocates a shift from models that encourage a material conception of being, illustrated by resource and carbon-intensive consumption along with extreme profits and inequalities, to models that work in favour of human well-being, living simply, in community, giving priority to equity, sustainability, and responsibility. CIDSE’s vision of sustainability is founded on the principle that human beings are stewards of creation, called to care for the environment in a responsible way so as to pass it on to future generations. New models of economy and society need to integrate the concept of finitude. There is a limited quantity of energy and material and a need to share the natural resources that we have both equitably and sustainably. One element to be explored is reorienting consumption and production to the local scale, reflecting the need to consider our ecological footprint, as well as our connection to the environment and to our local region.

A fundamental recognition of the dignity of every human being, with particular attention to the poorest and most vulnerable, is also central to our vision of sustainability. This obligation goes beyond the individual aspect and requires a broader commitment: that each individual contribute to the common good. The common good is the sum of all those conditions of living in community - economic, political, social and cultural - which make it possible for women and men readily and fully to achieve authentic human development. We are meant to be one human family that lives in peace, justice and solidarity<sup>1</sup>.

The need for new models has also been highlighted by efforts to redefine measure of economic performance and social progress (alternatives to GDP), such as the Sustainable Economic Well-being Index, and similar initiatives in Germany and Italy, as well as Bhutan’s Gross National Happiness Index.

The Rio +20 Conference: our expectations

Considering the legacy of the Earth Summit on Sustainable Development policies, but also in view of the shortcomings regarding the implementation of such policies, of the actual converging crises, calling on holistic and structural solutions achieving real change, the Rio+20 Conference must put in place a stronger agenda on Sustainable Development reflecting the ethos behind the Earth Summit, that embraces a rights-based approach, linking the imperative of ecological sustainability with human development and poverty eradication. It must succeed to deliver an agreement on a legally-binding, time-bound and ambitious framework on Sustainable Development, stating clear targets and setting efficient indicators. A focus on “Green Economy” should not become a substitute for the objective of Sustainable Development.

Green Economy in the context of Sustainable Development and poverty eradication

Sustainable Development is first and foremost about people. Economic development and opportunities are central to poor people’s concerns and aspirations, and yet the relationship between growth and poverty reduction is far from certain. Research has shown that the success factors include the fair distribution of income and wealth during the growth process.

CIDSE acknowledges that an overall concept of Green Economy may be able to provide tools to achieve Sustainable Development and poverty eradication. However, the UNCSD must recognise that the focus on Green Economy should not become a shorthand for the concept of Sustainable Development, and that a broad comprehension of Sustainable Development should stay the main focus of the Conference agenda. Whilst we recognize that some aspects of greening of our economies can make a significant contribution to Sustainable Development, it cannot serve as the main strategy to reach Sustainable Development. Moreover existing economic models based on growth have proven to be unsustainable. Therefore a true reflection on Sustainable Development should include a questioning of existing economic trends and shouldn’t be equated with the notion of sustainable growth.

For the Green Economy concept to support Sustainable Development and poverty eradication it must include notably the following principles:

- Green Economy must take into account the 3 aspects of Sustainable Development : environmental, economic and social,
- Green Economy must respect all human rights,
- Green Economy must be fair and equitable to northern and southern countries,
- Green Economy should involve the communities and citizens affected by the proposed policies and projects,
- Green Economy should take into account the protection of natural resources and biodiversity, by eliminating any harmful subsidy,

- Green Economy should question the unsustainable consumption and production patterns, including overall levels of resource use, that led to the current environmental crises,
- Green Economy should not be built on the current economic models based on growth and linking growth to the use of natural resources,
- Green Economy should use indicators other than GDP.

Green Economy roadmaps should not be considered as anything other than a tool. Moreover as soft law does not give us the needed results, international legal frameworks, products norms and regulations have to be part of the toolkit for achieving Sustainable Development.

#### Institutional framework for Sustainable Development

Tackling the current challenges to reach Sustainable Development requires an institutional framework that embraces all its complexities and inter-linkages. It is therefore essential that the institutional framework is sufficiently resourced and influential to guarantee that frameworks and policies such as those on development, ecology, agriculture and food security, for tackling climate-change and regulating finance and the private sector in general are coherent with it. It must also be able to address the fundamental value frames that form the basis of our common humanity and will define our collective future.

The Colombian government's proposal to formulate Sustainable Development Goals (SDGs) is a good starting point in this endeavour. The proposal is a useful attempt to update the existing Sustainable Development agenda to new challenges and reconcile this agenda with concerns for creating a Green Economy. Moreover it rightly emphasizes the need for clear goals and indicators and a process of decentralization and consultation to arrive at commitments that are owned by countries and for which they can be held accountable. Building on the SDGs, creating a new institutional framework will require the following elements:

1. The framework should build on the existing Sustainable Development agenda but also addresses current challenges such as climate change, the finitude of natural resources, increasing global poverty and inequality and today's financial and economic governance crises.
2. The framework should uphold international law and agreements, most notably the UN Charter, the UN Human Rights Conventions, the Convention to eliminate all forms of discrimination against women (CEDAW), the Convention on the Rights of the Child and the Declaration on the Rights of Indigenous Peoples.
3. The framework should include clear commitments which can be translated into national and even community-level goals and indicators.
4. The framework should also include clear operational commitments including gender disaggregated reporting requirements, requirements to undertake human rights impact assessments and public consultations.
5. The framework should be legally binding. Public and private actors should be legally accountable for their actions in fulfilling or undermining the framework's commitments.
6. The framework should include a clear time-frame. This would underline the urgency of implementing sustainable pathways to secure the well-being of present and future generations.
7. The framework should be formulated on the basis of extensive public consultation.

Lessons must be drawn from the formulation and implementation of another such framework: the Millennium Development Goals. Research done by CIDSE's member organization CAFOD with development practitioners whose work was impacted by the MDGs have emphasized that if a framework of public commitments is to overcome the limitations of the MDG framework, it must be formulated after extensive consultation with its final beneficiaries and those potentially affected by it3.

To this end, CIDSE recommends that the Rio+20 outcome document should contain:

1. A clear statement that the UN will play a central role in the governance of Sustainable Development policies.
2. A commitment to ensure coherence of policies in the areas of development, tackling climate change, protecting ecosystems, on agriculture, trade, finance, investment and the private sector with the Sustainable Development framework.
3. Commitment to formulate a global legally-binding, time-bound Sustainable Development Framework by 2015.
4. Commitment to translate the Framework into goals and indicators at the national and local level.
5. Commitment to a process of extensive and meaningful public consultation in formulating the Sustainable Development Framework.

The UN should have a central role in formulating, implementing and securing accountability of this framework. To this end, it would be important to upgrade the Commission of Sustainable Development at the UN to become an Intergovernmental Council. Alternately, a reformed and strengthened ECOSOC could be mandated to take on this function.

The ambition of the Rio+20 Conference: Sustainable Development and poverty eradication On this basis, the Rio+20 Conference must focus its agenda on a consistent and coherent vision of Sustainable Development, able to bring the necessary change and to progress on the way to poverty eradication. This implies to get clear agreements towards binding commitments on the following issues:

#### a. Regarding the private sector :

1. Increased prominence to the role of the private sector must be balanced by concern for its responsibility and accountability. Enthusiasm for partnerships and financing should be matched by equal attention to adequate regulation, and government capacity to supervise and address negative impacts of business models and operations on Sustainable Development. The UN 'Protect, Respect and Remedy' framework and Guiding Principles on business and human rights provide one element of this more comprehensive approach.
2. The requirement of corporate reporting on human rights, social and environmental impacts of domestic and foreign operations, and related contract disclosure.
3. The requirement of Country by Country Reporting as part of the international accounting standards for Trans-National Corporations (TNCs) in all sectors. While such accounting requirements are important for all TNCs, they are needed with the

3 CAFOD. 100 voices: Southern perspectives on what should come after the Millennium Development Goals, March 2011.

utmost urgency for improving governance and domestic accountability in relation to exploitation of oil, gas minerals and other natural resources, because these are finite, non-renewable resources. If these resources are not managed wisely, the development chances of many ordinary people will have been squandered in this generation and in future generations.

b. In the area of food and policies related to trade and agriculture:

1. Agriculture in its multifunctional dimension (economic, social, ecological...) should play a central role in the conference discussions. The sector touches on all facets of sustainability ecological, economic, social, energy...
2. In an effort to guarantee coherence between policy and action, donor governments and international institutions should effectively support the scaling up of agro- ecological modes of production in their development policies and practices, as espoused in the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD) report. Support should be targeted to enable the scaling up of these sustainable modes of production which demonstrate "strong conceptual connection to guaranteeing the right to food" and which have yielded results in contributing to local economic development, food security among the poorest as well as delivering on environmental benefits<sup>4</sup>.
3. The industrial food production system, which is driving force of environmental and climatic changes, contributing to 30 percent of global greenhouse gas (GHG) emissions need to be challenged along with the commodification and commercialization of natural resources. In addition to supply side restructuring there is a need to address our consumption models more generally not only in regards to food, but also energy consumption. Efforts should be made to reduce waste in the food system and increase energy efficiency. Special attention should be paid to the negative impacts of biofuel directives which are compromising the realization of the right to food and putting increasing pressure on land.
4. The FAO Committee on World Food Security (CFS) should be legitimized as the governing body for global food, agriculture and nutrition policy. It should be the central interlocutor on these issues, hence whatever decisions are taken at the Rio conference should be aligned with the processes being driven by the CFS.

c. In the area of climate change:

1. The international community must raise its commitments towards GHG emissions reduction and adaptation efforts, taking into account the CBDR (Common but Differentiated Responsibilities) principle, and commit within the climate talks of the UNFCCC.
2. States should ensure that the needed long term climate finance will be delivered, beyond the pledged \$100 billion per year by 2020.
- 4 Report submitted by Olivier De Schutter, Special Rapporteur on the Right to Food to the Human Right's Council, 16th Session, December 20, 2010.
3. Governments, businesses and civil society should agree on practical steps at local and national levels, to address climate change, both via mitigation and adaptation projects. These projects must be developed on the basis of strong environmental and social safeguards.

d. In the area of finance:

The Monterrey Consensus on Financing for Development must be reaffirmed. At the same time taking into consideration the challenges brought with the magnitude of multiple crises that the world faces, it is important to go further, building on this agenda. This would include:

1. Ending the opacity of the financial system. This opacity undermines Sustainable Development, reducing countries' financial resources. Ending tax havens; sanctioning those jurisdictions that do not comply with international efforts to end financial system opacity; and ensuring greater transparency and reliability of financial data to prevent tax avoidance are some of the broad areas that will need to be addressed to tackle this problem.
2. Putting in place mechanisms to strengthen the financial capacity of countries to deal with crises. Securing international monetary stability; fair predictable and transparent treatment of sovereign debt crises; and reforming the system of Special Drawing Rights are important measures to strengthen countries' ability to weather crises.
3. Regulating financial markets to end speculation and reorient the financial sector to provide credit for activities that contribute to Sustainable Development. A new framework for cooperation on international banking supervision and regulating commodity markets are some of the important issues to be addressed in this regard.
4. New and innovative financial mechanisms should trigger structural and systemic changes which will lead to Sustainable Development. Reform of taxation, removal of harmful subsidies and other measures are needed to discourage harmful activity in the real economy and financial sector, reflecting true costs to environment and society while contributing to greater equity. The European Commission has shown leadership in its proposal for a Financial Transactions Tax within Europe, as a step towards a global FTT. A substantial portion of the resulting revenues should be secured for the global challenges of poverty and climate change.

CIDSE is an international alliance of Catholic development agencies. Its members share a common strategy in their efforts to eradicate poverty and establish global justice. CIDSE's advocacy work covers global governance; resources for development; climate justice; food, agriculture & sustainable trade; and business & human rights - [www.cidse.org](http://www.cidse.org)

## Citizens United for Rehabilitation of Errants (CURE)

Sustainable Development

A statement to the Rio +20 Conference

by Citizens United for Rehabilitation of Errants, (CURE) in special consultative status with ECOSOC

Sustainability of development requires institutional frameworks based on a firm foundation in those social developments which emphasize human rights and promote the common good. Institutions must be structured to encourage multitudes of partnerships for empowerments of those living in poverty, through cooperation.

Some of the key social-development antidotes to corrosion of development and return of poverty are: a social protection floor, decent work, and social services that facilitate them. Foundational social-services include quality programs in health, education, and criminal-justice. Programs to enable all people to have a voice to participate in the social, economic, environmental and political life of the neighborhood, local government, and national government are imperative.

Social Protection Floor

Sustainability depends on a minimal level of social protection against economic collapse and natural disasters. Everyone should be able to access at least basic health, primary education, housing, water, sanitation and other essential services. The Social Protection Floor, sponsored by the International Labor Organization and the World Health Organization, is a key vehicle.

## Health

A sustained economy needs a sustained, healthy population. This includes combating diseases such as AIDS, malaria, and tuberculosis that particularly affect those living in poverty, by implementing the necessary immunization, education and other programmes, and by training health practitioners to identify and treat such illnesses.

Often neglected, is the provision of treatments for drug addiction and for those who are mentally ill, which can be major corrosive problems among those living in poverty.

## Agriculture

Agriculture is particularly vital in many developing countries, and the pay-back from investment can be particularly impressive, if oriented to building a sustainable environment.

We urge the creation of structures of participation that permit dialogue between small farmers, scientists, agribusiness and NGOs to explore technology transfer, and sustainable agricultural practices to improve productivity while restoring the soil and the natural environment.

We urge the development of national and local agricultural policy and implementation plans with budget allocations that address infrastructure – irrigation, farm machinery, transport, storage facilities, etc. to empower small scale farmers, many of whom are women, to produce and market food.

## Education

The strength of the society is directly related to the quality of its education resources. Education must develop the whole person, including respect for community and participation in its function. Since the most important factor in improving education is ensuring that the teachers are properly trained, motivated, and supervised, care for the training and compensation of teachers are of first importance.

Job training aimed at decent work in productive areas that are known to need skilled workers should be a high priority. Development of a green economy depends on the integration of green philosophy and technology in the educational system. Training in small business management and microfinance are valuable additions to empower new and sustainable business capability.

## Criminal Justice

We recommend that States expand justice systems, including mediation and other non-formal dispute resolution mechanisms, in accordance with human rights standards. We further recommend use of restorative justice approaches and community service to restore harmony within the community as opposed to incarceration as punishment.

The family is the core unit of society; hence violence within the family is particularly destructive. The legal rights of women and children must be clear and unambiguous. Laws against domestic violence must be fully enforced, bearing in mind that restorative practices, education, and counseling are appropriate in these cases.

We recommend that all justice and prison systems further organize and support, as a primary and priority function, programs to rehabilitate and reintegrate offenders as contributing members of society.

---

## CIVICUS - World Alliance for Citizen Participation

### Executive Summary

Twenty years ago at the Rio Earth Summit civil society came out in droves to convey the message that achieving sustainable development requires active participation of civil society and cannot be left solely to governments. While the Commission on Sustainable Development already operates in a cooperative and participatory manner, Rio+20 provides an opportunity to strengthen multi-stakeholder participation and directly influence heads of states, summit outcomes and implementation plans. Many believe that the inability to halt or reverse global environmental degradation is attributed to the inadequacies of the global governance system.

Common themes identified by stakeholders include diversifying the types of stakeholders consulted in the pre-conference planning processes and increasing participation of women, minority groups and Least Developed Countries (LDCs). At past summits stakeholders provided significant feedback on summit logistics and strongly felt that civil society activities can no longer be separated from negotiations. In postconference processes stakeholders feel that partnerships among civil society must be strengthened in order to contribute to implementation and accountability of summit outcomes. Summit outcomes must also be action-oriented and linked to international policies like the Millennium Development Goals and Kyoto Protocol.

CIVICUS civil society engagement recommendations for Rio+20

Key recommendations on multi-stakeholder engagement include:

### Pre-Conference Recommendations

- Rio+20 stakeholders should embody a diverse range of participants and should include representation from the nine Major Groups, traditionally marginalised groups and all of the UN five regional groups.
- A document explaining stakeholder opportunities to participate in Rio+20 processes should be produced and shared with stakeholders prior to consultations.
- In the preliminary stakeholder planning stage, a flexible timeline should be created with deliverables, future meetings and working groups.
- Surveys, focus groups and open consultations should be conducted to determine key issues of importance to stakeholders.
- Throughout every stage of the process it is important to provide stakeholders with feedback on how their input and decisions have been implemented and affected courses of action to ensure transparency and accountability. Conference Recommendations
- The summit venues for both stakeholders and governments should be in close proximity to each other (no more than 2 kilometres) and be located in the city centre or other easily accessible area; stakeholder must not be segregated from summit venues where negotiations occur.
- Technology to include remote participants, via webcasts, needs to be a clear priority at Rio+20 and should include training for session facilitators to ensure effective engagement of remote and physical participants.
- Rio+20 organisers need to prioritise creating systems for direct lines of communication with local security.

- Rio+20 organisers need to create more opportunities for strategic engagement in negotiations with decision makers, including providing seats for stakeholders at roundtables and opportunities to submit contributions.
- Rio+20 organisers need to provide funding for under-resourced stakeholders in both the preconference and conference events to ensure a diverse range of representation from the nine major groups, with a particular focus on the indigenous, women and LDCs. Post-Conference Recommendations
- Outcomes for Rio+20 should be linked to international priorities and policies and need to be results oriented with explicit commitments to action.
- Stakeholder engagement should align with country specific outcomes and efforts should be made to link UN country offices with national civil society networks and major group participants.
- To strengthen accountability, systems should be established, with stakeholder input, to monitor and evaluate the implementation of outcomes agreed upon at Rio+20.

#### CIVICUS civil society engagement recommendations for Rio+20

##### Introduction

UNDESA has commissioned CIVICUS to serve as an Organising Partner for the NGO Major Group of civil society stakeholders at the Rio+20 Summit which will take place in June 2012. In this role, CIVICUS submits the following recommendations and guidance on best practices in multi-stakeholder engagement at UN Summits.

CIVICUS has evaluated stakeholder processes and feedback from five preceding UN Summits including the Rio Earth Summit 1992, the World Summit on Sustainable Development 2002 (WSSD), the World Summit on the Information Society 2003 and 2005 (WSIS), the UNFCCC Conference of Parties 15 2009 (COP15) and the United Nations Millennium Development Goals Summit 2010 (UNMDG). CIVICUS also reviewed recommendations for multi-stakeholder engagement using toolkits produced by the Stakeholder Forum and UN agencies, books and articles produced by civil society experts and the Cardoso Report. Conference processes have been divided into three stages – pre-conference, conference, and post-conference – and each section highlights a collection of challenges voiced by stakeholders, replicable practices at past summits and recommendations for improvements at Rio+20.

In the past two decades, particularly since the Rio Earth Summit, the United Nations has made significant efforts to create opportunities for multi-stakeholder engagement and influence in UN events. Equally, as non-government stakeholders have struggled for fuller cooperative engagement at UN Summits, they have provided constructive recommendations for further improvements. We recognise the continuous effort the UN devotes to creating an authentic and engaging platform for multiple stakeholders and trust the recommendations below will help advance multi-stakeholder engagement to a new level at Rio+20. CIVICUS civil society engagement recommendations for Rio+20

##### Pre-Conference

##### Challenges

Reoccurring comments in stakeholder feedback highlighted that stakeholder consultations in summit planning often do not include a diverse range of stakeholders and the number of stakeholders consulted is inadequate. In preparation for COP15 organisers consulted two organisations, Climate Action Network (CAN) and the Global Campaign for Climate Action (GCCA). While these two organisations are highly regarded and represent coalitions of hundreds of members of civil society, there is a lack of diversity in the types of stakeholders consulted. Like many organisations, GCCA was limited to a small team that is responsible for consulting members of the coalition and stakeholders commented that an insufficient number of organisations had the opportunity to influence summit planning. Stakeholders brought up similar representation issues at the WSIS summit. WSIS did produce many replicable practices, but one area stakeholders felt the summit fell short was with representation of developing countries as a whole.

Stakeholder representation is a theme that surfaces regularly in stakeholder feedback and should be continuously evaluated by Rio+20 organisers. WSSD implemented the construct of the nine Major Groups adopted at the Rio Earth Summit and each Major Group was consulted and represented, but stakeholder feedback concluded that there is a need for more representation from women across sectors and not just in the major group committed to women. Additionally, there is no Major Group representing people with disabilities. WSIS stakeholders commented that there is a lack of representation from universities and the private sector, as the categories these groups fall into are often overshadowed by large NGOs and corporations. WSIS worked to broaden the scope of civil society but controversy arose when local governments were grouped with civil society and over twenty “families” were created under the Civil Society Bureau. While expanded representation of civil society is welcomed, it should not become a catchall for stakeholders that do not sufficiently represent the group. Further WSIS feedback stated that national delegations were largely made up of diplomats, telecoms ministries and fixed telecommunications operators, while lacking adequate civil society representation and delegates from national development agencies who could address issues related to health, education and human rights.

Another reoccurring topic brought up by stakeholders in pre-conference processes is the uneven quality of side events at UN summits. Side events put on by multi-stakeholders vary greatly at all summits (COP15, WSSD and UNMDG) and there is a need to enhance collaboration and partnerships between stakeholders in the pre-conference planning to improve both the planning processes and the quality of the events. Replicable Practices

Multi-stakeholder consultation is an essential component of summit preparations. Many summit preparations include consultations of stakeholders six to twelve months prior to the summit and longer in some cases. Examples of replicable practices in the pre-conference stage were emphasised at WSIS as open consultations were conducted to determine both the venue and thematic units. WSIS used a variety of mediums for stakeholder participation including online discussions, participatory meetings and official statements. Stakeholders felt that there was strong representation of the various stakeholder families, coupled with satisfactory opportunities to speak and participate in negotiations. WSIS stakeholders also expressed satisfaction with the strategic use of social media and technology for remote participation leading up to and during the summit.

The UN Millennium Development Goals Summit in 2010 also highlighted examples of best practices in the pre-conference processes. UN-NGLS organised a global online civil society consultation in advance of the hearings to engage a wider sector of civil society. The Global Call to Action against Poverty’s (GCAP) “The World We Want” campaign coordinated NGO preparations that included the presentation of a sign-on letter to the Secretary-General, the international observance of Poverty Action Week and a civil society hearing that took place at the UN during the week of the summit. Other mechanisms included a task force comprised of stakeholders established to advise the General Assembly (GA) president on the formation and CIVICUS civil society engagement recommendations for Rio+20 participation of stakeholders in hearings. The GA also convened hearings with civil society representatives and private sector stakeholders prior to the summit.

It is clear that Rio+20 organisers have already adopted some replicable practices for consulting multistakeholders by implementing an open call for recommendations to allow greater civil society to voice their platforms and influence the zero draft document. In addition, multi-stakeholder participation should be included at intersessionals, informal consultations, regional preparatory meetings and major group activities.

##### Recommendations

- Rio+20 stakeholders should embody a diverse range of participants and should include representation from the nine Major Groups. Efforts should also be made to include

people with disability, marginalised and under-represented minority groups, women in their diversity, faithbased organisations and LDCs. All regions should have proportional representation in line with Member State representation in the UN five regional groups of Africa, Asia, Eastern Europe, Latin America and the Caribbean, and Western European and others.

- Those conducting the consultations need to take into consideration the dynamics, interrelationships, power, influence, abilities, beliefs and cultures of the various stakeholders to ensure the best representation possible at Rio+20.
- A document explaining stakeholder opportunities to participate in Rio+20 processes should be produced and shared with stakeholders prior to consultations.
- In the preliminary stakeholder planning stage, a timeline should be created with deliverables, future meetings and working groups. The timeline can be subject to change, but mapping out expectations ensures transparency and will allow time for collaboration and input from multistakeholders, particularly around planning side events in Rio.
- Surveys, focus groups and open consultations should be conducted to determine key issues that are important to stakeholders. Stakeholders should be consulted on preferred methods of engagement and processes for communication and stakeholders with limited access to internet should be included and accommodated.
- Throughout every stage of the process it is important to provide stakeholders with feedback on how their input and decisions have been implemented and affected courses of action. To ensure transparency and accountability stakeholders need to know that their views were considered seriously. The prompt production and dissemination of results gathered in surveys, focus groups, intersessionals and other consultation processes instils integrity in the process and can generate dialogue on opportunities and challenges.

#### Conference

#### Challenges

Over the past two decades UN summits have continued to work towards improving multi-stakeholder participation and engagement with heads of state, but persistent barriers still prevent meaningful engagements and opportunities to influence negotiations during conference events.

COP15 stands out in recent history as a conference where multi-stakeholders, particularly civil society, faced many challenges in participation at conference events. There were an unusually large number of participants at the conference and the venue could not handle the capacity. This conference made it clear that there is a need to connect stakeholders and constituents to conference sessions using technology, as side events, workshops and dialogues were overcrowded and strained due to the large number of participants. Remote participation via webcasts and other technological mechanisms at Rio+20 would alleviate the overload of physical participants and provide greater access to restricted meetings. At WSIS, while technology was in place to ensure remote participation, stakeholders expressed a need to train session facilitators to engage with both the physical and virtual audience. Stakeholders also suggested there is a need to strategically publicise the opportunity to participate virtually to engage a more diverse sector of remote stakeholders in conference meetings and events.

Logistical issues at COP15 posed many challenges to stakeholders and prevented accredited organisations from accessing conference events and meetings. COP16 logistics posed similar challenges with separate conference venues for heads of state and stakeholders. At COP16, the commute between conference venues took thirty minutes and this drastically limited stakeholder interaction with government officials and decision makers. Similar problems emerged for civil society at the WSSD in Johannesburg. Stakeholders felt their impact on the summit was fragmented due to separate venues and the long commute required to access the venue where negotiations were held. It was not only civil society that was constrained by the logistical arrangements, but governments complained as well, especially those from LDCs. LDCs rely on civil society for support and policy recommendations; therefore organisers cannot continue the practice of separating stakeholders from decision makers at Rio+20.

Security at UN summits is another consistent challenge which resulted in an undesirable scenario at COP15. Local security in Copenhagen was unprepared to handle the huge numbers of conference attendees and resorted to harsh tactics in an effort to maintain control. Similarly, at the WSSD, security officials originally denied civil society access to the convention centre and The Conference of Non-Governmental Organisations in Consultative Relationship with the United Nations (CoNGO) had to negotiate with governments and UN officials to avoid a NGO boycott or walk-out. When organising Rio+20 it is important for organisers to understand the mind-set and approach of local security and create strategic lines of communication for understanding systems and decisions. It is also important to work with local security in Rio to break down stereotypes and recognise that a large, organised group of civil society does not mean anarchy will ensue. When entry to conference events is strained and prolonged or when impromptu restrictions are implemented during the conference, both civil society and security may not understand the implications or decisions behind these and it can lead to a breakdown of confidence and unneeded tension at the summit. The Rio organisers need to establish expectations and strategic systems for engaging with local security to ensure the safety and effective participation of multi-stakeholders. In addition, COP15 stakeholders commented on unorganised and impromptu media stunts inside the conference venue which resulted in restrictions on access to meetings and side events for others. At Rio+20 there is a need for leadership and guidance on strategic and effective delivery of media stunts to prevent problems and restrictions within the venue.

At the original Rio Earth Summit in 1992, stakeholders reported that they felt like ancillary participants and were largely removed from the central politics shaping Agenda 21. Overall, civil society reported that opportunities to influence decision makers were limited and they did not feel engagements were meaningful or produced optimal results to push sustainable development agendas forward. Stakeholders in Rio also felt that civil society representation was unbalanced and the global South was underrepresented. When engaging multi-stakeholders at Rio+20 it is important to develop proportional representation in line with Member State representation in the UN five regional groups. It is also important to provide funding for under-resourced stakeholders to guarantee a diverse range are consulted and have the opportunity to participate.

Finally, there is speculation that there will be restrictions on paper and printed materials at Rio+20 in an effort to be environmentally friendly. While generally this is a good practice, this must be messaged clearly and widely to multi-stakeholders and a strategic system must be established for civil society to disseminate information.

#### Replicable Practices

The WSIS summits and forums have consistently served as models for good use of technology and the remote participation of stakeholders. WSIS has stakeholder participation processes clearly outlined on their website, with timelines and instructions on how to participate. Additionally, WSIS organisers are consulting stakeholders years in advance of WSIS+10 in 2014. At the most recent WSIS forum in 2010, over one thousand stakeholders participated and contributed to event outcomes in a remote manner. Participants stated that the summit seemed truly international with a diverse set of stakeholders.

Every UN summit produces opportunities for learning from summit processes and stakeholder engagement. At WSSD, stakeholders interacted with government officials and participated in summit events throughout the entire two week session instead of being relegated to separate segments. After the challenges faced at COP15 organisers proposed that stakeholder side events, workshops and exhibits be grouped into thematic units to promote cohesion and this proposal was well received by stakeholders. Additionally, at the UNMDG summit multi-stakeholders were allotted four seats in each roundtable to ensure opportunities to influence decision makers.

WSIS conducts a thorough consultation process with stakeholders generally following the UN Rules of Procedure, but also developed a specific multi-stakeholder approach that went beyond typical engagement processes of other UN summits. Specific mechanisms introduced more meaningful engagement with civil society included allowing written contributions from all observers which were placed on the conference website and compiled to be used in negotiations and included in final documents, increasing

transparency of summit processes. Stakeholders also organised themselves and formed a Civil Society Bureau and a Coordinating Committee of Business Interlocutors to more effectively interact with inter-governmental structures of the summit. The organisation of these groups created an opportunity for widespread exchanges of mutual expectations, procedures and strengthened understanding between governments, civil society and business.

Building on the Pre-Conference of multi-stakeholders for Rio+20, stakeholder participation should also be equally included in the three PrepCom meetings. It is further recommended that stakeholders have the opportunity to speak at each plenary session and be allotted seats at roundtables where negotiations take place.

#### Recommendations

- The summit venues need to accommodate the large numbers of people who plan to attend Rio+20 and venues should be no more than 2 kilometres from each other. The venue should be located in the city centre or other area that is easily accessible by various forms of public transportation. Civil society can no longer be segregated from summit venues where negotiations are taking place.
- Technology to include remote participants, via webcasts, needs to be a clear priority at Rio+20 and should include training for session facilitators to ensure effective engagement of remote and physical participants.
- If paper restrictions are implemented at Rio+20, this change must be clearly communicated to stakeholders and there must be strategic coordination for CSOs to disseminate materials. Financial and technical support should be provided to CSOs to ease this transition, particularly indigenous groups or others who may have limited access to internet and technology. UNCSD should also allocate prominent website space where CSO materials and publications can be easily accessed by governments and other participants.
- Rio+20 organisers need to prioritise creating systems for direct lines of communication with local security. Local security should participate in training on tactfully dealing with challenges that might arise at Rio+20 and establish systems for dissemination of detailed information to all levels of security.
- Rio+20 organisers need to create more opportunities for strategic engagement in negotiations with decision makers, including providing seats for stakeholders at roundtables and opportunities to submit oral and written contributions to influence negotiations and outcome documents.
- Rio+20 organisers need to provide funding for under-resourced stakeholders in both the preconference and conference events to ensure a diverse range of representation from the nine major groups, with a particular focus on indigenous people, women and LDCs.

#### Post-Conference

##### Challenges

Stakeholders are increasingly becoming disenchanted with summit outcomes due to the lack of government accountability in implementation. Stakeholders also do not feel they are organised well enough, across sectors, at the national level to influence implementation of summit outcomes in a cohesive and strategic manner, particularly in LDCs. An example of this was underscored at the WSSD where a plan of implementation was developed by civil society, but follow through was limited because partnerships among civil society were not strong enough. Partnership building among multi-stakeholders should be incorporated into all stages of the Rio+20 processes and there is also a need to connect stakeholders with national UN offices for support and coordinated efforts in national follow-up. It is crucial to offer funding for activities related to the implementation of summit outcomes and accountability initiatives within partnerships. Some organisations and partnerships may have greater resources to devote to activities, while those with restricted budgets will encounter problems initiating or participating in partnerships that adequately express their concerns.

Stakeholders at the WSIS and UNMDG summits expressed a need to improve follow-up actions for both stakeholders and governments to ensure accountability from both sides on implementation of outcomes and commitments. Similarly, stakeholders felt that the outcomes of WSSD were ambitious and innovative, addressing the three pillars of sustainable development, but civil society was suspicious because they felt governments were trying to shy away from their responsibilities and leave implementation to the private sector. At the UNMDG summit, stakeholders felt the outcome document was merely aspirational instead of action oriented which presents problems in monitoring implementation and holding governments accountable. If Rio+20 is going to be a successful summit, outcomes must be action oriented and linked to the Millennium Development Goals, Kyoto Protocol and other international policies. Furthermore, the priorities of national governments must adapt to align with summit commitments and relevant UN agencies must also pledge to adapt the agreements of outcome documents into organisational priorities and work programmes.

In addition to monitoring government implementation of summit outcomes, follow-up with stakeholders is an important part of post-conference processes. Documents such as summit reports and webcasts should be widely disseminated and should also be available on summit and UN agency websites for access by greater civil society. Evaluations should also be completed by all contributing participants pertaining to both conference events and engagement in processes leading up to the summit. Stakeholder feedback should then be compiled, disseminated and posted on websites to promote transparency.

#### Replicable Practices

There were five notable documents that resulted from the Rio Earth Summit and two are particularly important to highlight in this context. The Framework Convention on Climate Change sets concrete actions for reducing greenhouse gas emissions and led to the Kyoto Protocol which also outlined formal mechanisms for enforcement. The clear mechanisms for implementation of this convention serve as an example of the action-oriented outcomes stakeholders would like to see from Rio+20. Another major outcome of the Rio Earth Summit was section three of Agenda 21 which organised stakeholders into nine major groups that represent civil society. The nine major groups are recognised as partners in the implementation of outcomes and their participation in summit processes is recommended in all UN conferences. This systematic and thematic organisation of multi-stakeholders has not only proved useful for civil society in participating in UN summit processes, but is also building capacity in stakeholder engagement with the UN. As a result of the Rio Earth Summit and in preparation for the WSSD, a group of experts established a framework on multi-stakeholder processes to ensure transparent, equitable, democratic and gender-balanced processes for summits that require stakeholder participation. This strategic organisation of multi-stakeholders has helped to streamline and strengthen participation and build capacity among a wider range of civil society.

Other replicable practices were used at WSIS and involved organising multi-stakeholders into issue-based caucuses related to summit topics. This practice promotes partnerships and collaboration among stakeholders and helps civil society formulate common positions on relevant issues. The method proved particularly helpful during the first phase of the WSIS summit when the rights of civil society participation were threatened. Stakeholder caucusing not only led to the development of specific viewpoints and recommendations published during the Geneva meeting and after the conclusion of the Tunis summit, but helped to strengthen multi-stakeholder partnerships that continued after the summit concluded.

The WSSD produced the Bali Guiding Principles in the fourth PrepCom meeting to serve as a set of guidelines to shape follow-up to the summit. The guidelines identify specific actions that stakeholders and governments should take in partnership to ensure implementation of summit outcomes. As part of this process, major group commitments and targets were gathered in national, regional and international consultations and commitments were included as part of the summit outcomes. Finally, in order to improve summit processes and engagement, it is critical to conduct thorough evaluations that can inform summit organising and participation at future events. WSIS conducted stakeholder evaluations after each meeting, event and workshop. Follow-up actions were then compiled into a final report that was made publicly available to all

stakeholders and governments.

#### Recommendations

- Non-participating stakeholders should have access to Rio+20 information and reports and dissemination plans should be established during the planning process. Final reports should be posted on the Rio+20 and UNCSD websites.
- Establish proposed outcomes for Rio+20 and link them to international priorities and policies, the Millennium Development Goals, official UN processes and ensure buy-in from relevant UN agencies like UNDP, UNDESA, UNCSD and UNFCCC. Outcomes should be results oriented with explicit commitments to action.
- Set clear targets and processes for follow-up with multi-stakeholders and each of the nine major groups once Rio+20 has concluded. Stakeholder engagement should align with country specific outcomes and efforts should be made to link UN country offices with national civil society networks and major group participants.
- To strengthen accountability, systems should be established, with stakeholder input, to monitor and evaluate the implementation of outcomes agreed upon at Rio+20.
- Organise multi-stakeholders into issue-based caucuses to build partnerships and assist stakeholders in establishing stronger positions on Rio+20 issues during and after the summit.

## Civil Chamber of the Russian Federation

CIVIC CHAMBER OF THE RUSSIAN FEDERATION  
INSTITUTE OF SUSTAINABLE DEVELOPMENT

### SUSTAINABLE DEVELOPMENT: CHALLENGES AND PROSPECTS RECOMMENDATIONS FOR "RIO+20"

Today the world faces new challenges. The modern world development results in a depletion of the natural resources, an increase of negative environmental impact, a deterioration of the biosphere balance. The consequences of the climate change have become perceptible everywhere in the world. It results in a worsening of social problems and sidelines further development.

That is why the need to provide sustainable development is urgent. The core of this idea is the necessity to fit our constantly growing demands in the planet's natural capacity. The idea is not new; it will soon complete 20 years of official life in the world. Few political slogans have lived for so long. Yet its essence will never become outdated. It establishes the rules of the game and is a condition of survival. Meanwhile, lessons are becoming increasingly harder, and their consequences are increasingly expensive. They include the oil spill in the Gulf of Mexico, the recent abnormal heat in Central Russia and many other cases of natural and man-triggered catastrophes. It is getting harder and harder to find certain persons responsible for or a cause of each disaster. It is rather consequence of our self-esteem, our attitude and our wrong behavior.

Deep "ecologization" of the economy on the basis of the key priority of modern development – to increase the value of nature and natural resources, as well as of human life and health is a challenging task in the agenda. Implementation of the sustainable development tasks based on market economy means to ensure market demands on natural resources, ecosystem services and related characteristics of the goods, consumer demands (including by population and State). This measure will enable to stimulate the developed countries to diminish the negative environmental impact as well as to encourage the developing countries into defining ways of their development towards the green economy, preservation and augmentation of natural capital through its capitalization and receiving benefits from the global community. These are the directions that should determine today the priorities of aide in the combat against poverty.

Urgent need to combine both - to fit the growing demands and to minimize the depletion of natural capital has been formulated today as a decoupling idea. It means to reduce energy intensity and resource intensity in economic growth, to widely use renewable energy sources, to modernize production on the basis of innovations. This is the direction that sets today's priorities for growing economies and firstly for the BRICS nations.

It is necessary to encourage modernization in a way of so-called double gain or win-win policy, which is related both to economic efficiency and to reduction of negative environmental impact by human-being. The world experience of such modernization of production shows that this approach not only leads to the improved economic indicators but also to significantly improved living conditions. It is necessary to support and disseminate this experience. This is the core task of modern innovative development. For such purpose it is necessary both to observe strict environmental standards and to encourage economic interest, including all possible instruments, besides to be aware of the importance of such modernization. In other words, modernization should be profitable.

The key area for the global development is energy sector. It is necessary to ensure the safe use of traditional resources and energy efficiency. The use of huge potential to raise energy efficiency means to implement urgent measures to make consumers interested in energy saving at all levels from industries to households.

Modernization should consider enormous potential in the use of renewable energy sources. This means to encourage energy production on the basis of renewable energy sources. The experience of developed countries shows that, with a minimum support necessary to launch this process, it develops further in a "snowball" manner with accelerating speed. This way of development ensures national independence and gives prospects for further development. It is more pressing and promising to use renewable energy sources for domestic needs, including, firstly, energy supply to sparsely populated areas, commitment by the population to use renewable energy sources as additional sources of energy and to use renewable energy sources as auxiliary sources of energy supply in industry.

Resolving the problem of economic modernization should also take into account the enormous potential in developing the system of compensation payments necessary to preserve and augment the natural ecosystems (including forests, wetlands, etc.). Good prospects may be seen in the development of the market of ecosystem services and environmental investments. It is necessary to carry out assessment of the natural services based on the priority to raise value of natural resources and to turn into goods things that have not been considered goods before, including a wide range of ecosystem services and to enter the international market to compensate for the efforts in preserving and augmentation of natural resources. The costs of non-use, protection and augmentation of certain natural resources and services should be included in such an assessment. The mechanism of compensation for ecosystem services should be based on the national commitment to environment protection and on the proper use of the funds allocated by the international community to preserve natural resources and to develop environmentally sound forms of the management of nature (including ecotourism, organic agriculture, renewable resources use). It is necessary to extend market mechanisms of trade of the greenhouse gases emission to all sorts of anthropogenic impact.

This means to work out and pursue a new policy. The starting point in this regard should be that the ecology today is economy. That is why the mainstream development is determined as green economy. It is environmental standards that set directions of innovative development and modernization of production to ensure long-term successful economic development. The priority of economic policy to widely use natural resources and services should be complemented by the environmental policy priority to raise the value of nature and natural resources. Green and low-carbon economy has been tracked by the developed countries. Although a clear policy in this respect is important, it should not be pursued separately from the mainstream development pattern and should be incorporated into strategies, plans, programs and mechanisms of the national

development. Environmental policy priorities, green economy standards should be included into general plans of development aimed at solving social and economic problems of everyone's main concern. It is appropriate to include the implementation of environmental protection measures (organizing protected natural areas, biodiversity conservation, etc.) into foolproof market mechanisms, such as payments for ecosystem services.

The top-priority measure to assess the situation and determine action priorities is to introduce a system of indicators of sustainable development. These are primarily indicators of the resource intensity and energy intensity in economic growth and specific indicators of pollution. Moreover, accumulated environmental damage, resource depletion, landscape degradation and the impact of pollution on human health should be taken into account. It is principally important, especially to determine prospects for development and to assess the use of renewable energy sources, to evaluate ecosystem services (including various ecosystems, biological resources, biodiversity and area of protected natural reserves).

Progress in the dissemination of the ideas of sustainable development and active participation in this process means their adjustment to the specifics of each country. The concepts of sustainable development and the ways of its implementation are different in various countries and will undoubtedly keep changing further on. It is necessary to assess achievements and challenges on the way to sustainable development at the national level.

The success of the implementation of the ideas of sustainable development depends on the pro-active position and awareness by the broader population. This requires educational and outreach activities, targeted work by the media and social advertising. Culture (including cinema, pop music and literature), natural and cultural heritage sites should play a special role to set sustainable development as a priority for the broader public.

Civil society organizations, including both mass NGOs/NPOs and professional institutions of public policy should play a greater role in this regard. This means to develop a broad public movement to support sustainable development as a priority for civil society activities and to set this topic as a key area of support by the businesses and the governments.

The mankind has started to realize that increased social and natural abnormalities are consequences of our wrong behavior and to be aware of the responsibility for the future of the planet. In order to determine priorities for joint action one should refer to the universally accepted rules of conduct, ethic code approved by the global community. An importance to adopt such a document has been underlined as early as in 1992 at the UN World Conference on Sustainable Development in Rio de Janeiro. The core of this document could constitute the elaborated by 2000 through joint efforts "Earth Charter", common view on principles of sustainable development, necessary to provide environmental integrity, social justice, democracy and peace. Today this document has gained a new dimension. A joint support by Russia and the US as the leading countries that initiated the elaboration of the International Ethical Code and a broader approval by other developed countries and the BRICS nations would favour the promotion of the document.

Who should lead this process? Most likely, those for whom it is of special importance. This means to be aware of the necessity to follow such way of development and to have certain economic possibilities to implement it. A number of countries considered for many years as developed economies actively joined this process after the Rio Summit of 1992. We should admit that, although ideas of sustainable development are very pressing for all countries and require joint efforts by the international community, only developed economies are able to ensure serious advance in this direction. Other countries may join them as they grow economically and with an aide by the developed countries. The BRICS nations are probably these States for which this process is the most urgent. There are a several reasons for this: economic growth, abundant natural resources, search for an optimal way of development among them. Priorities for these countries in innovation policy, energy efficiency and economic modernization naturally determine their movement towards sustainable development. These nations are the ones that could become leaders in the movement towards sustainable development.

---

## Climate Action Network-International

The changing climate, with its associated impacts on the environment, economies, social welfare and human lives, is one of the strongest indicators of our unsustainable development path, which Rio+20 must address.

Rio+20 will be an important opportunity for:

- increasing the overall ambition of political commitments on climate change;
- promoting actions and accountability in areas such as the green economy and post-MDG framework that are inseparable from climate change;
- strengthening sustainable development governance structures to include stronger implementation, compliance and enforcement mechanisms including strengthening transparency, citizen engagement and accountability (reflected in Principle 10 of the Rio Declaration) mechanisms at the national, regional and international levels;
- strengthening international governance structures to include stronger implementation, compliance and enforcement mechanisms
- governments, businesses and civil society to agree to practical steps at the local, national and global level that address climate change (both mitigation and adaptation);
- ensure that principles of fairness and equity – based on the original 1992 Rio Earth Summit declaration of 'common but differentiated responsibilities' (CBDR) – are central to sustainable development.

### 1. Increasing political will and ambition:

At Rio, countries must raise their ambition, including developing science based commitments, increased emissions reduction targets and financial commitments, equitable effort sharing, and robust implementation. With political leaders in Rio, this is a key opportunity to raise the overall political will for greater action on climate change. Heads of state and political leaders should come to Rio prepared to:

- Assess 20 years of progress since Rio '92 and take stock of existing greenhouse gas reduction commitments and adaptation efforts, and raise their ambition taking into account the principles of CBDR
  - Elaborate national and sub national action plans that substantially improve governance – overseeing progress and supporting implementation – of sustainable development objectives.
  - Ensure the flow of substantial, predictable climate finance beyond 2012 and well above the pledged \$100 billion per year by 2020.
  - Reform of the UN environmental agencies that strengthen the governance system that delivers an "environment for development". Sustainable development needs a global authority on the environment and stronger implementation, compliance and enforcement mechanisms.
2. A fair green economy: At Rio+20, a clear definition of a fair green economy should be developed, which would exclude false solutions with which we can all work and hold governments to account to at Rio. A fair green economy must balance between the ecological, economic and social aspects of the sustainable development model. It should include decent green jobs, addressing consumption issues,

ending unsustainable practices, fair transition, and be judged by alternative indicators to GDP, such as those based on rights and social justice.

A green economy must address:

1. Empowering workers with access to green jobs: targets and resources for capacity building, green technologies, operational level implementation and training.
2. A transition to a 100% renewable energy and energy efficient economy
3. Equity must be at the heart of the green economy, ensuring the right to development for developing countries while meeting green objectives.
4. Protection of natural capital and biodiversity
5. Address change in production-consumption patterns as the current patterns lead to unsustainable use of natural capital and increasing greenhouse gases emissions.
6. Full participation and consent of communities affected by development projects; and stewardship of natural resources and biodiversity by local communities. Specific demands for Rio+20:

- Commit to clean energy:

A key element of a green economy is a clear definition and short to medium-term actions towards clean energy sources. Energy targets put forward by the UN, while not sufficiently addressing these concerns, can guide local and national-level action on ramping up renewable energy and energy efficiency deployment. In CAN's view, countries should aim to reach the following global targets ideally by 2020, and by 2030 (as UNIDO has put forward) at the latest: o 30% of energy use from renewables; o 40% decrease in energy intensity, and o Universal access to modern energy services and ending energy poverty: clean, reliable and affordable energy services for cooking and heating, lighting, communications and productive uses.

- Remove fossil fuel subsidies and perverse incentives: accelerate the phase out of subsidies in line with the G20 commitment, redirecting revenues to those in need and to support renewable energy and energy efficiency programmes.

- Ensure the formulation of Low-Carbon development Strategies (LCDSs): The development of LCDSs is crucial to ensure the smooth transition to a fair and green economy that secures green jobs and equity based on national circumstances. Governments must agree in Rio+20 on establishing national institutional arrangements and modalities for the formulation of these plans. The plans should include decadal targets between now and 2050 that outline the GHG emission trajectory that each country will take in each major sector, as well as policies and measures needed to achieve these targets.

- Develop a UN-level mechanism or capacity to ensure that emerging technologies relevant to green economies receive prior assessment to ensure they are truly socially and environmentally sustainable in order to avoid resources being diverted into 'false solutions'.

### 3. New finance:

Financing for a green economy is crucial, and governments must identify new sources of finance for these purposes, and ensure funds targeted for specific outcomes, including climate, biodiversity protection and development aid.

In particular, Rio+20 should address:

**Innovative sources:** In addition to budgetary contributions, there is a need for supplementary sources of long-term finance to meet the financing requirements for climate action. As shown by the UN AGF report a range of innovative sources (such as the Financial Transaction Taxes and Special Drawing Rights) can be used to generate the revenues as well as address the need to cut emissions from shipping and aviation.

**Uses:** Forests, mitigation, adaptation, biodiversity conservation (protected areas/marine protected areas- key to boost ecosystem resilience in face of climate change) all must be prioritized for future funding allocation. This should specifically include development models that are sustainable and community-driven such as decentralized water and energy solutions that strengthen resilience to climate change.

**Governance:** Governments must show a clear commitment to improved governance of funds related to climate change and a green economy. The role of international financial institutions generally (including all the multi-lateral development banks and export credit agencies), the UN, bilateral should be carefully evaluated. Engagement of civil society organizations as active observers (or greater) both in the decision-making process and also in monitoring on how the fund can be accessed should be explicitly confirmed.

On climate in particular, the Green Climate Fund (GCF) must play a transformational role both in the way it is governed and operates and in terms of the adaptation and mitigation outcomes it achieves. It should accelerate the shift to low-carbon and climate resilient development pathways by scaling-up resource flows for ambitious and effective climate-related policies and actions in accordance with country-led strategies, and it should incentivise strategic objectives and the achievement of overall national development strategies and the production of development cobenefits.

It is vital that civil society and other stakeholders be full partners, both at the international and national level, in determining the way in which the GCF will finance climate action.

The role of the World Bank as a trustee should be limited to holding the financial assets of the Green Climate Fund, maintaining appropriate financial records, and preparing financial statements and other reports required by the Board of the Green Climate Fund, in accordance with international fiduciary standards. 4. Forests and REDD REDD+ should not be negotiated at Rio + 20 but governments should set an overall goal for halting deforestation in developing countries. We envisage an objective along the following lines:

- All Parties shall collectively aim to reduce greenhouse gas emissions from deforestation and forest degradation of natural forests in developing countries, with the objective of stopping deforestation and degradation of natural forests and related emissions completely, by 2020.

For the conservation of existing carbon stocks, enhancement of carbon stocks and sustainable management of forests a second objective could be:

- All Parties shall collectively aim to conserve existing natural and modified natural forests by 2020, ceasing conversion and instead restoring degraded natural forests. In addition, all parties should undertake the sustainable management of forests and enhance forest carbon stocks.

Safeguards for land-use changes and forestry activities should be fully implemented. In particular, the following already agreed safeguards should be promoted and supported:

- Respect for the knowledge and rights of indigenous peoples and members of local communities, by taking into account relevant international obligations, national

circumstances and laws;

- Actions should be consistent with the conservation of natural forests and biological diversity, ensuring that actions are not used for the conversion of natural forests, but are instead used to incentivize the protection and conservation of natural forests and their ecosystem services, and to enhance other social and environmental benefits.

#### 5. Sustainable Agriculture and Food Security The importance of agriculture

- Global food production is threatened by climate change. Smallholder farmers produce the majority of the world's food, and they are extremely vulnerable to climate change, therefore food security of the majority of the world's population is threatened.

- Globally, agricultural activities associated with intensive high input industrialized agriculture, contribute a significant percentage of greenhouse gas emissions.

#### Policy goals

- Thus, to the greatest extent possible, policies at all levels should be designed and implemented to meet four goals:

1. Sustainably reduce emissions from the agricultural sector;
2. Reduce emissions from the conversion of other land to agriculture;
3. Maintain or increase the security of food supplies;
4. Enable small-scale food providers and other vulnerable populations to become more resilient to climate change.

#### Guiding principles

Countries agreed in the United Nations Framework Convention on Climate Change (UNFCCC) to prevent dangerous climate change: to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner. These agreements require adherence to the following principles in order to be effective:

- In order for small scale farmers to be able to adapt and to build their adaptive capacity, they must be enabled to practice farming systems that are resilient to long term climate change, biodiverse and that strengthen the ecosystems of which they are part. This form of agroecological smallholder farming and other forms of sustainable, ecological and climate resilient food production should be promoted.
- Climate policies that encompass agriculture must include safeguards that protect and promote biodiversity, equitable access to resources, food security, the right to food, and the rights of indigenous peoples and local populations, while promoting poverty reduction and climate adaptation.
- Systems of biodiverse and resilient agriculture need to be developed, demonstrated, tested, and implemented to transform many currently unsustainable agricultural systems into ones that improve the health of ecosystems, communities, and cultures, even in the face of a changing climate.

In the context of food security and sovereignty threatened by climate change, re-establishing global principles for governance of fisheries is crucial, since depletion of fishing stocks, unsustainable fishing and overcapacity of world's fishing fleet will soon impact upon food security in addition to climate impacts on the marine ecosystem.

---

## Climate Change Forum of Minas Gerais

Rio+20

Recommendations from the CLIMATE CHANGE FORUM OF MINAS GERAIS, BRAZIL

Contact: MR. Milton Nogueira da Silva, Executive Secretary. Tel +5531 3225 9922 or Cellular +5531 8828 3225, [nogueiramilton@yahoo.com](mailto:nogueiramilton@yahoo.com)

General Content: What are the expectations for the Rio+20:

It is hoped that the UN system and the world society (government, communities, business, academia) will reach a consensus on a planetary governance for poverty reduction under a green economy regime.

What are the comments on existing proposals:

a. What are the views on implementation:

The three UN conventions - climate change, biodiversity, and desertification- deserve to be put in place, with full commitments and money.

b. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged

The Climate Fund should be strengthened to implement greener economy and drastically reduce the use of fossil fuels and protect agricultural land and water resources. The Fund should be fed, for instance, with contribution from the developed countries or with a carbon tax to be created. The collected funds should be invested to implement the new recommendations of the conference, especially for poverty reduction.

#### 2. Specific Elements:

a. Objective of the Conference:

The conference should adopt a political decision making process allowing all parties to take part and enter into consensus. Focus: poverty alleviation, food security, greener economy and sustainable technologies, under equitable governance for all.

Sectoral priorities:

Biomass energy with guaranteed food security; urban mobility;

Strengthening the transfer of greener technologies among countries.

- b. Green economy : decoupling of energy from GNP; education away from consumerism and wasteful society.
- c. Institutional framework for sustainable development: reinforcement of UNEP.
- d. Any proposals for refinement of the two themes.

---

## Climate Emergency Institute

The Climate Emergency Institute respectfully makes this submission to the 2012 Rio+20 United Nations Conference on Sustainable Development.

By all environmental and economic indications, it looks like this UN sustainable development conference is our best chance to prevent the collapse of all human civilization, for all time.

What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

Our hopes and expectations are as follows. In general, we expect that:

1. All governments will affirm that our Mother Earth (Mother Nature), the community of Earth species, and the future survival of humanity are our most sacred trusts.
2. Nations will acknowledge that a state of global environmental emergency exists due to accelerating atmospheric greenhouse gas concentrations, and that faster-than-projected climate change impacts are coming on top of other ongoing global environmental degradations.
3. Nations will agree that our best hope for survival is the rapid and full implementation of the intentions and terms of the 1992 Rio Earth Summit conventions and agreements. We have no time to "reinvent this wheel."
4. Environmentally destructive subsidies (both direct and indirect) will be stopped forthwith. Direct fossil fuel subsidies will be switched to rapid development of clean, zero-carbon energy.
5. Nations will acknowledge that the loss of the Arctic summer sea ice is potentially catastrophic to the northern hemisphere and to the planet, through loss of albedo cooling on top of committed\* further global warming.

\*The global temperature increase to which we are already committed today is 2.4°C, according to the climate science (Ramanathan and Feng, 2008, PNAS, On avoiding dangerous anthropogenic interference with the climate system). This projection excludes inevitable further warming by large Arctic carbon feedback emissions and excludes the warming from loss of Arctic summer sea ice.

On the global climate change emergency, we expect that:

6. Nations will acknowledge that today's committed additional global warming, accelerating atmospheric greenhouse gas pollution, and unprecedented and still accelerating atmospheric greenhouse gas concentrations mean that the climate situation is "far beyond dangerous interference with the climate system" and risks global climate catastrophe.
  - . "Climate change is coming at us faster, with larger impacts and bigger risks, than even most climate scientists expected as recently as a few years ago."
  - . "The stated goal of the UNFCCC – avoiding dangerous anthropogenic interference in the climate – is in fact unattainable, because today we are already experiencing dangerous anthropogenic interference. The real question now is whether we can still avoid catastrophic anthropogenic interference in climate."
  - . "There is no guarantee that catastrophe can be avoided even if we start taking serious evasive action immediately."
- Dr. John Holdren (now science adviser to the US administration), Meeting the Climate Change Challenge Lecture, 2006, Woods Hole.
7. Nations will agree that the atmospheric concentration of carbon dioxide must be reduced to below 350 ppm of CO<sub>2</sub> (versus 390 ppm today), with equivalent reductions of the concentrations of other long lasting greenhouse gases to avoid global climate catastrophe.
8. Nations will acknowledge that the science is definite\*\*, and that only zero carbon dioxide emissions can possibly allow the atmospheric carbon dioxide concentration to drop.

\*\*IPCC 2007 WG 1: Frequently Asked Question 10.3

If Emissions of Greenhouse Gases are Reduced, How Quickly Do Their Concentrations in the Atmosphere Decrease?

"While more than half of the CO<sub>2</sub> emitted is currently removed from the atmosphere within a century, some fraction (about 20%) of emitted CO<sub>2</sub> remains in the atmosphere for many millennia. In fact, only in the case of essentially complete elimination of emissions can the atmospheric concentration of CO<sub>2</sub> ultimately be stabilised at a constant level."

Our comments on existing proposals for sustainable development:

We applaud the exemplary work of UN Secretary General Ban Ki-moon on the global climate emergency and the great work of the United Nations Environment Program on educating humanity on the rapidly deteriorating state of our planet.

We believe that the economic conversion to sustainable development, as defined by the 1992 UN Rio Declaration and comprehensively planned by Agenda 21, is the best if not only chance we now have for our common survival.

We attach in poster format our latest State of the Climate Science, showing that, as UNEP has said, "the potential for runaway greenhouse warming is real and has never been more clear." — UNEP Year Book, 2009. (For all we know, it may already be too late.)

We attach our report on committed food productivity losses that will result from today's committed global warming and climate change, which shows catastrophic losses for huge human populations and losses for all regions.

Our views on implementation:

The economic and energy conversions demanded by the global climate change planetary emergency are also the measures needed to achieve the objectives of the green economy and poverty eradication. The only way to implement these in short order (or likely at all) is by nations implementing in full the extant agreements that nations made at the 1992 Earth Summit.

On specific cooperation mechanisms:

It has to be recognized that the survival of all populations (of all species, hence crucial biodiversity) living in all regions is now threatened by the rapidly increasing risk of global ecological and world economic collapse. If all nations agree to move to a green ZERO-CARBON economy as rapidly as possible, then the "level playing field" of one global goal and commitment will enable and enhance international cooperation rather than competition.

On the relevant time frame:

We are all in a planetary emergency with no time left for anything but emergency action.

Background

The proposals are good but they all need to be implemented on a global emergency basis.

The international negotiations under the 1992 UN Framework Convention on Climate Change are making no substantive progress. It is therefore essential that global climate change be placed at the top of the 2012 Rio+20 agenda.

In 2007 nations acknowledged the following findings by the UNEP GEO-4 consensus process:

"There are no major issues raised in Our Common Future for which the foreseeable trends are favourable. And, this may threaten humanity's very survival." "Climate change is a global priority, yet there is a remarkable lack of urgency and a woefully inadequate global response."

"The need couldn't be more urgent and the time couldn't be more opportune, with our enhanced understanding of the challenges we face, to act now to safeguard our own survival and that of future generations."

"The systemic destruction of the Earth's natural and nature-based resources has reached a point where ... the bill we hand on to our children may prove impossible to pay."

The 1992 UN Framework Convention on Climate Change is an excellent convention. The clear intention of the UNFCCC is the reduction of global greenhouse gas emissions to ensure climate safety for all future generations. Climate safety is clearly and specifically defined in the Convention.

In 2012, nations must affirm that they are unconditionally bound by the intention of the Convention to prevent irreversible climate change damages (adverse effects) to global ecosystems and to regional managed agricultural systems. They must affirm that they are required to prevent damages (adverse effects) to human population health.

The 1992 Agenda 21 is the "UN blueprint" that nations agreed to and no better plan exists. Nations are expected to reaffirm and make Agenda 21 a binding obligation and a rapid priority. Everything in Agenda 21 still applies today – in fact, even much more so.

---

## Climate Justice Now!

Common statement by World Development Movement (U.K.), Gender Action (U.S.), Global Forest Coalition (Paraguay), Biofuel Watch (U.K.), Jeunes Volontaires pour l'Environnement International (Togo), Centre for Civil Society Environmental Justice Project (South Africa), Ecologistas en Accion (Spain), Plataforma Boliviana Frente al Cambio Climático (Bolivia), PanAfrica Climate Justice Alliance (Kenya), Sustainable Energy & Economy Network, Institute for Policy Studies (USA) on the Outcome of the United Nations Conference on Sustainable Development

The following comment has been produced by members and affiliates of the Climate Justice Now! network. The network numbers more than 1000 organizations in the global north and south. It is a preliminary comment and has not been fully discussed by all members of the network yet. Accordingly, not every recommendation in this comment has been explicitly endorsed by all network members or organizations, but only by those who have signed on below. However, these comments capture many of the ideas and the fundamental consensus, which have been formulated in previous meetings since the CJN! networks' inception and first articulation of the Principles for Climate Justice in 2008.

Accordingly, as representatives of people's movements and independent organizations, deeply concerned about the climate crisis and the limited nature of the solutions that have been advanced at the international level thus far, we are further concerned that the Rio+20 process will continue a process of advancing failed "solutions" to the economic and environmental crises of our times. In a desire to embrace and advance the "green economy," we are concerned that world leaders will not heed the lessons from the implementation of the biggest and newest market in a natural resource—carbon. By ignoring these lessons, the Rio+20 process risks expanding and deepening the climate crisis even further in a vain attempt to "throw money at the problem" instead of finding real solutions. If a "green economy" includes the continued commodification of not just carbon, but water, biodiversity and other natural resources, we are headed down the path of further endangering all life on Earth.

We must recognize that our global economy and every nation's Gross Domestic Product (GDP) does not now accurately count and measure the things we value, nor does it recognize the value of things that must remain free—such as water, air, and the vast diversity of life itself. In an attempt to get an accurate metric of these things nature offers for free, some suggest we should put a price on them and, where the price is too high, trade them in the interest of economic efficiency, and in order to avoid their depletion, degradation, or chemical imbalance. We suggest this is a path fraught with danger.

As some countries and jurisdictions have come to recognize, the blind pursuit of GDP growth underlies many of our current environmental and social crises, including climate change. Growth in GDP does not equal social and environmental wealth, diversity and wellbeing, yet nearly every nation in the world pursues GDP growth as an end in itself.

Rather than questioning the very foundation upon which our global economy is built, "solutions" to the climate crisis, like carbon trading, build on that foundation, continuing to push for GDP growth, so long as pollutants like carbon are traded.

Yet the clearest lesson from the trade in carbon on a global scale is that it is and has been an utter failure, environmentally and socially. Carbon trading entrenches and magnifies social inequities in many ways: The carbon market creates transferable rights to dump carbon in the air, oceans, soil and vegetation far in excess of the capacity of these systems to absorb it. Billions of dollars worth of these rights have been awarded free of charge to the biggest corporate emitters of greenhouse gases in the electric power, iron and steel, cement, pulp and paper, and other sectors in industrialized nations that have caused the climate crisis and already exploit these systems the most. Costs of future reductions in fossil fuel use have fallen disproportionately on the public sector, communities, indigenous peoples and individual taxpayers.

Rather than incentivize more windmills and solar panels, the Kyoto Protocol's Clean Development Mechanism (CDM), as well as many private sector trading schemes, have incentivized cheap carbon dumps, such as eucalyptus plantations that destroy the soil and water tables. These schemes have resulted in the creation of a new tool to disenfranchise people from their land, their forests, and their rights including the right of Indigenous Peoples, as enshrined under the U.N., to free, prior, and informed consent. Land grabs are taking place on a massive scale on the African continent and elsewhere in the developing world in order to take advantage of cheap carbon offsets,

and cheap land for tree farms and biofuel plantations. This in turn has resulted in: destruction of natural forests and their biodiversity, a drop in water tables, and a rise in the price of food, with devastating consequences for the poorest, especially those who have become landless.

Studies and investigations have brought to light massive corruption in carbon markets, such as the hydrofluorocarbons (HFC-23)-reduction schemes<sup>ii</sup>. These schemes have provided huge windfall profits to companies to destroy a powerful global warming gas—HFC-23, which is over 11,000 times more potent than CO<sub>2</sub>. In doing so, they have actually incentivized the continued expansion of the polluting industry that spawns HFC-23, the manufacture of ozone-destroying chlorodifluoromethane (or HCFC-22). The destruction of HFC-23 is not costly; but its carbon offset support has meant a boon for this industry, while doing nothing to reduce the impact of the fossil fuel industries' impacts on local communities. Furthermore, precious time and money has been wasted creating and destroying HFC-23 molecules, while clean, truly renewable energy projects have been starved for cash globally. We cannot afford to waste precious time while entire countries, such as Pakistan, El Salvador, Honduras, Thailand, and others are threatened with inundation due to increasingly common extreme weather events.

The climate crisis is being fueled largely by the exploitation of fossil fuels and the clearing of forests, which releases carbon stored in these natural resources into the global atmosphere. We are fast approaching dangerous tipping points in the global climate system, beyond which there is no return. The vast majority of climate scientists recognize that climate change is both underway and proceeding at a pace far faster than even their worst case scenarios had anticipated.

Despite this clear and present danger, governments, corporations and international financial institutions continue to support and finance fossil fuel exploration, extraction and other activities that worsen global warming, such as forest degradation and destruction on a massive scale. Meanwhile, carbon markets continue to distract policy-makers from meaningful action and only token sums have been dedicated to renewable energy.

When the Kyoto Protocol was signed in 1997, carbon markets were only supposed to comprise a small fraction of the overall action on the climate crisis. Today, carbon trading has become the primary "solution" to the climate crisis, despite its record as a failure. Greenhouse gas emissions have grown at a faster pace in countries that have carbon markets up and running. Carbon offset schemes, such as the Clean Development Mechanism, have been riddled with corruption, perverse incentives to pollute and deforest faster than countries otherwise would in order to artificially raise a baseline from which to "reduce" emissions.

The process of commodifying carbon passes the Earth's capacity to support life into the same corporate hands that are destroying the climate, and puts in charge the same bankers that destroyed the global economy. Gaming the subprime mortgage market resulted in the collapse of the global economy, something nearly every country is now feeling the effects of. Gaming in the carbon market has been underway for several years<sup>iv</sup>. This must be stopped if we are to prevent the next big bubble—a carbon bubble—from bursting, and serious action must be taken now to prevent runaway climate change.

There are other ways forward - ways that recognize and build on the statements of the Rio Declaration of 1992. Key among the items endorsed by all of the world's countries in that document was:

#### Principle 16

National authorities should endeavour to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution, with due regard to the public interest and without distorting international trade and investment.

Carbon trading turns this principle upside-down. Instead of paying the costs, many polluters are in fact profiting from their pollution.

We suggest there are several measures which could be taken to address the root causes of the economic crisis, while also mitigating poverty, and providing finance for the necessary transition to an economy for the people and the planet.

1. Tax pollution—carbon or otherwise—and use the revenue generated to help build local food systems, public transportation, affordable energy for cooking, clean renewable (non-combustion) energy and other pieces of an ecologically grounded and socially just economy. A pollution/natural resource tax should focus as a priority on reducing consumption of energy and resources in an equitable manner. A tax can come in the form of a "tax and dividend," but taxes on pollution should be universally pursued to discourage leakage into other countries.
2. Replace or supplement the GDP with a set of indicators that reflect overall environmental and social wellbeing, such as the Index of Sustainable Economic Welfare or the Genuine Progress Indicator, in order to more accurately measure and value the kind of world we want to build.
3. Reject any scheme in which individuals, groups, corporations or governments profit from placing a price on and gambling with the control over our planet's carbon cycling capacity, our water, our food supply, or other elements essential to life sustaining itself.
4. Remove all subsidies from fossil fuels and biofuels. The U.S. currently provides over \$35 billion in subsidies to the fossil fuel industry. Globally, fossil fuel subsidies amount to over \$250 billion per year—a figure that is more than twice what would be needed (\$100 billion) to provide the entire planet with renewable energy within 10 years. Biofuel subsidies are driving increased demand for land and rising food prices, while contributing to, rather than mitigating, climate change.
5. Finalize the creation of a democratic and accountable Green Climate Fund under the United Nations to channel climate finance from industrialized countries to countries and communities impacted by climate change in the global South. Developed countries have committed to providing \$100 billion per year by 2020 for climate finance – not enough for the scale of the need, but a start. The World Bank, export credits agencies, and all other international financial institutions must be kept out of the Green Climate Fund. Their continued support of fossil fuel projects, extractive industries, and carbon offset programs put them in direct conflict with the goals of a climate fund. Despite being handed the responsibility of providing clean energy finance in Rio in 1992, the World Bank is currently breaking its own records for lending to oil, gas and coal, while providing relatively little in the way of renewable energy lending.

Implement a financial transaction tax (a.k.a. Robin Hood Tax or FTT). By placing a tiny tax on trades in stocks, currencies, derivatives and other financial assets an FTT could slow the rate of speculation in global financial markets and curb instability, while generating hundreds of billions of dollars per year. The revenue from which could be channeled into the Green Climate Fund and used to help finance clean energy, forest protection and reforestation schemes, public health, climate change adaptation, and other development needs. Ideally, an FTT would ultimately be implemented internationally, but countries can (and have) acted on their own to put in place effective financial transaction taxes.

## Climate Leaders India Network (CLeaIN)

### SMART GRIDS FOR SUSTAINABLE DEVELOPMENT

As population and industry grows, the world is building new transmission and gas-fired generation plants to meet demand. Most of our electricity and power coming from fossils has lead to a drastically higher electricity rate, as every homeowner and business owner can attest. Also, with the exponential increase in power consumption in developing countries, power cuts and black outs have become quite prevalent. Net metering becomes important here as it not only increases the reliability and security of power distribution, but also manages load distribution efficiently.

Net-metering: The concept

It is an electricity policy for consumers who own small renewable energy facility like wind, solar power and home fuel cells. "Net" means what remains after consumption and deductions- deduction of any energy outflow from metered energy inflow. The owner receives retail credit for a portion of electricity they generate.

Implementation: (Government and Research role)

The implementation, engineering wise would require a smart grid which is usually an electrical meter that records consumption of electric energy in intervals of an hour or less and communicates that information at least daily back to the utility for monitoring and billing purposes. Apart from that we would require R&D and private players in producing efficient LED, solar panels, wind turbines etc. Government regulations and laws would domestically need to be made friendly to achieve these goals. Fossil fuel subsidy would have to be periodically reduced.

Win-win sustainability: Net metering a vital area for Green economy transition

Green economy essentially means moving from a linear model to cyclical model of use of resources. This can be achieved by integrating production and consumption. This cyclical behavior can be achieved by introducing net metering. This decentralizes production and consumption patterns, distributes right to energy efficiency and energy security across society. Another point in our favor is decoupling energy production and supply from distribution. Thus creating a "flexible", marketing mechanism where small producers benefit when they produce since their meters move backwards. Thus we see this as a progressive green-economy parameter for energy security. Encourage investment in renewable sources of energy from various sections of the society like businesses, organizations and individuals. Help decrease our reliance on fossil fuels thus checking carbon emissions to an extent.

Foster energy efficiency.

Benefit our utilities and can help stimulate economy.

Reduce the burden of energy generation and distribution from the governments.

Help the government to invest funds on rural empowerment, developing infrastructure, social welfare schemes and sustainable development initiatives as the expenditure on installing new thermal/hydro/ nuclear power plants is reduced. Are a sustainable solution to the conflicts between governments and people in various parts of the world as this reduces the need to acquire large chunks of land for installation of new energy projects.

Give a chance to the governments to focus on providing electricity to the regions which are deprived of it; Can result in huge savings to the consumers using it, thereby leader to better standards of living.

Addresses a major emerging challenge energy security by reducing losses in generation, distribution etc. Lays a strong foundation for Green economy by providing opportunities to green businesses.

Implementation: Cases and practicality of the idea. Strengthening Government Role.

Consumer Net Metering is available in California and is favorable to smaller systems that displace the highest cost electricity, and systems wherein the user's demand load may be managed so that there is a net production of electricity during high cost periods. Thailand introduced the first net-metering in 2002. Thus, it's a model that has been successful in both developed and developing nations.

The governments should declare strong commitment for decentralizing the power generation and distribution which can enable the introduction of smart grids.

Stronger reforms should be introduced in financial institutions to enable the funding of renewable energy projects at all levels.

Subsidies and incentives should be announced to the consumers of smart grid systems.

Governments should establish an independent agency for monitoring and managing the smart grids. Power purchase agreements should be issued to individual customers after verifying the installed power plants and checking the metering equipment.

How youth can pitch in?

Education and awareness campaigns need their support.

Formulating pilot drives and replicating successful models.

Addressing and realizing stake-holder ship in existing government policy and affairs Promoting the cause creatively to people and lobbying with domestic NGOs and civil societies and government bodies. Youth should be given higher priority in negotiations and consultation. Green entrepreneurship should be given a boost with youth as leaders in the field.

---

## Climate Sustainability Platform and Supporting Organizations

## SUSTAINABLE ECONOMIES

A proposal for UNCS2012 Zero Draft (Input to Compilation Document):

Thematic Area: Green economy in the context of sustainable development and poverty eradication

Submitted by Centre for Environment and Development and behalf of Climate Sustainability PLATFORM and Supporting Organizations

Introduction:

The proposal for a green economy has lead to division even amongst the environmentally sensitive and conscious groups and sections. This is due to an unsuccessful attempt to repackage and resell sustainable development. The new attempt to present a green economy as a tool for sustainable is now looked with suspicion by many needs to be resolved by the time UNCS2012 convenes in Rio de Janeiro in 2012. The following is a proposal to help and guide the process towards creating a more acceptable proposal on the agenda item on 'Green economy in the context of sustainable development and poverty eradication'

Replacing the Greed Growth Economy - Not to Green Wash the Brown

- The core consideration should be if the Green Economy can replace the greed based economic order and help us face the challenge of climate change and poverty?
- Any attempt to green wash the brown economy should be halted. Therefore, simply making adjustments to polluting technologies and wasteful consumerist market instruments should not be considered as part of a green economy
- Creating a monopoly on the green technology to dominate a green growth-based market economy should not be promoted. All people should have equitable access and capacity to enjoy green, clean and sustainable technologies within an emerging green economic system.

Not Just a Single Economy! Sustainable Economies!

- The green economic system should not promote a single and monopolistic model of a green technology, green market, and Intellectual Property Rights dominated economy.
- The green economy should be viewed as a networked system of decentralized, community based, sustainable economies in a diversity.
- Such a system of sustainable economies should be connecting the rainbow economies across the world and the core idea is that all economies are made sustainable, not just a monopolistic and dominant global economy.

Foundations of a Sustainable Economic System

- Foundations for sustainable economies based green economic system should be based on a common vision for an "equity" based world order.
- Such a system should be committed towards creating 'wellbeing of all'
- Such a system should promote "sustainable consumption & production patterns"
- Such a system should move from a mere "efficiency" focus to 'sufficiency' based 'sustainable development' paradigms
- Such a system should helps achieve Climate Sustainability which is to eradicate all kind of poverty and threats to the environment.
- Such a system should not encourage vertical growth for the creation of few rich and a consuming class, but promote horizontal growth so the wealth is distributed for wellbeing of all.
- Such a system should also need to know define limits to green growth in prosperity.

---

## Club de Madrid

The Members of the Club of Madrid, all democratic former Heads of State and Government,

- having regard to the United Nations Conference on Sustainable Development (Rio+20), to be held in Rio de Janeiro in June 2012, which will focus on two themes: 'a green economy in the context of sustainable development and poverty eradication' and 'the institutional framework for sustainable development',
- having regard to the international environmental related processes, specially the United Nation Framework Convention on Climate Change (UNFCCC),
- recognizing that although progress towards sustainable development has been made since the Rio Summit in 1992, there are still important implementing challenges that need to be faced.
- acknowledging that the objectives of the Rio+20 Conference will be to secure renewed political commitment for sustainable development; to assess the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development; and to address new and emerging challenges;
- recognizing that improving international economic and environmental governance is an equally central issue. Many legitimate actors have been working to conclude crucial international agreements within the existing multilateral structures. In this regard, the Club of Madrid calls to take a strong political stance towards the rapid conclusion of ongoing international negotiations, particularly the climate change negotiations within the UNFCCC, and the Rio+20 process.
- acknowledging the work the Club de Madrid is developing in the programmatic areas of Energy and Climate Change, and Social Cohesion through its Shared Societies project, the Club de Madrid recalls the equal importance of the social pillar, together with the environmental and economic ones, to foster Sustainable Development. To this aim, collaboration with UN DESA has been established within these work strands.
- welcoming that the Rio+20 Summit discusses an integrated approach to address the multiple challenges such as poverty eradication, food, employment, gender equality, climate change and energy supply; since those problems cannot be solved in isolation making cooperation ever more important;
- recalling that Chapter two of Agenda 21 forges a link between democracy and sustainable development, 2.6. Experience has shown that sustainable development requires a commitment to sound economic policies and management, an effective and predictable public administration, the integration of environmental concerns into decision-making and progress towards democratic government, in the light of country-specific conditions, which allows for full participation of all parties concerned.

- building upon the work the Club de Madrid develops in different programmatic areas and incountry project implementation, submits the following series of recommendations in specific areas for its consideration to be reflected in the document outcome of the UN Conference on Sustainable Development

#### Democratic Systems

- Calls for a full implementation of democratic systems as a necessary condition for an effective sustainable development.

#### Food Security:

- Recommends the establishment of a comprehensive coordination mechanism within the UN system and amongst other existing international organizations that will ensure availability, access and affordability of food supplies, notably in the poorest countries of the world.
- Stresses the need to address the interrelated challenge of poverty reduction and food security through integrated local development projects, particularly focused on smallholders and not promoting export crops at the expense of livelihood crops. In this context, particular attention should also be given to increasing the income opportunities for rural populations, especially women, and to supporting non-competitive smallholders to adjust in the face of economic displacement.
- Encourages to foster public-private investments in agricultural research (especially adaptation and mitigation technologies), agribusiness, transportation, and handling and storage infrastructure networks to facilitate access to markets and reduce waste. These efforts should also be supported by ambitious actions on rural education, sanitation and health care.
- Underlines the importance to implement and boost trade and infrastructure in agricultural products so as to allow food to be moved from surplus to deficit regions. This will be particularly important in the face of the climate change challenge.
- Urges the adoption of strong mechanisms to reduce food price volatility and curb speculative tendencies, including data disclosure, coordinated regulation of derivative markets and stabilizing stocks.
- Highlights the importance to adopt improved risk management strategies for the prevention and management of food crises - from weather index-based insurance schemes to improved market and stock information, and from 'Strategic Emergency Food Reserves' (including pooled reserves) to more effective safety-nets and accessible social protection.
- Recommends to ensure financing that will generate substantial benefits and add value in host countries by agreeing on i) a code of conduct for Foreign Direct Investment in agricultural land, and ii) promoting land policies that consider social, economic and environmental concerns.

#### Energy:

- Urges the mobilization of global leadership for the successful and ambitious conclusion of climate change negotiations within the UNFCCC.
- Asks to ensure stable incentives during the long-term energy transition and mechanisms that will correct the adverse effects generated by fossil fuels on the climate system.
- Requests the adoption, in this regard, of strong mechanisms to reduce price volatility, including data disclosure, producer-consumer dialogue, coordinated regulation of derivative markets and stabilizing stocks.
- Calls on the fulfilment of the Pittsburgh and Seoul commitments to phase out fossil fuel subsidies whilst providing targeted support for the poor. Use the resources now being channelled into such subsidies to fund research and transfer of technologies.
- Encourages the enforcement of existing environmental regulations and ensure the establishment of construction and urban planning standards, and others that may be critical for energy efficiency.
- Urges the commitment, within a fixed timetable, to achieving universal access to electricity and modern fuels for the poor as an essential basis for eradicating poverty.
- Asks to guarantee the speedy implementation of a truly multilateral 'Green Climate Fund', in terms of funding and management, and to establish as clear priorities of this fund the promotion of innovation and transfer of clean energy technologies to developing countries
- Emphasises the need to establish a mechanism for the acquisition of patent pools of clean energy technologies and the promotion of knowledge networks, encouraging in this regard triangular North-South-South cooperation.

#### Innovative Financial Mechanisms:

- Calls on developed country members to renew in Cannes their commitment to achieve the 0.7% of GNI target in Official Development Assistance (ODA) within a clear timetable and respect for the principles of aid effectiveness. It is also essential to recognise the need to build public support and understanding.
- Recognizing the growing pressures on ODA resources, recommends the support of existing mechanisms of innovative financing and encourages countries to continue pursuing initiatives in this area.
- Highlights the need for a quantitative jump in the scale of these initiatives and commit to the effective implementation of: i) international financial transaction taxes and ii) an international carbon tax, as the most promising means to secure the resources necessary to effectively address development and climate change challenges. At the same time, requests the identification of ways of using allocations of SDRs to developed countries in support of development cooperation assistance and combating climate change.
- Recognizes the importance of contributors for private-public partnerships, particularly at the national and local levels, through a holistic approach centred on local realities, targeted results, transparency and internal/external verification.

Sustainable and Shared Societies: -Calls on sustainable and shared societies as a central contribution to the achievement of the Millennium Development Goals. A 'shared society' is a socially cohesive society. It is stable and safe, where all those living there feel at home. It respects everyone's dignity and human rights while providing every individual with equal opportunity. It is tolerant and respects diversity. A shared society is constructed and nurtured through strong political leadership. -Emphasizes the need for political stability and democracy, through the involvement of all stakeholders, towards the pursuit of shared and socially cohesive societies and in order to achieve sustainable development. -Calls on an integrated approach of Shared Societies in Rio+20: addressing equality from an economic, and gender point of view, particularly looking at the rights of minorities. -Acknowledges the negative effects of climate change on the poor, and encourages the development of concrete measures to deal with economic disadvantages faced by sections of society who are discriminated against, and ensure equal access to opportunities and resources. -Emphasizes the richness of diversity including environment and culture, as well as the impact of misuse of resources on local communities, particularly on indigenous peoples. -Recommends that

mechanisms for consultation with minorities and marginalized groups are effectively implemented in an inclusive and transparent manner to ensure the appropriate involvement of all stakeholders in the implementation of Sustainable Development. -Recalls the need to ensure the legal frameworks to protect the rights of the individual and prohibits discrimination based on ethnic, religious, gender or cultural difference. -Recommends that physical and urban environments create opportunities for, rather than discourage, social integration as a fundamental pillar of sustainable development -Calls on the recognition that Shared Societies, in which diverse groups and individuals are economically integrated and utilize their talents and skills tend to be more stable societies, enjoy higher economic growth than divided societies, and are best prepared to achieve sustainable development.

## Club France

Manifeste pour une gouvernance territoriale durable, solidaire et humaine.

### PRÉAMBULE

Vingt ans après le Sommet de la Terre de Rio, les acteurs des territoires français (Collectivités, entreprises, associations, écoles, établissements publics) constatent que le bilan des engagements internationaux, pris par les États en 1992, est globalement insatisfaisant. Malgré les nombreux rendez-vous internationaux, l'état des ressources, la pauvreté et les fractures sociales se sont en effet aggravés. A l'occasion de la prochaine Conférence des Nations Unies sur le développement durable (CNUDD), qui se déroulera du 4 au 6 juin 2012, ils réaffirment ainsi la nécessité d'engager une meilleure gouvernance planétaire du développement durable, transversale et partagée, pour redonner sur la scène internationale un nouveau souffle à ce concept.

Le « Club France Rio +20 » (voir la note de présentation ci-jointe en annexe) demande que cette réforme de la gouvernance reconnaisse l'expérience de tous les acteurs territoriaux et leur capacité à agir et à innover efficacement en faveur du développement durable. Depuis près de dix ans, ce sont eux, par centaines de milliers, qui s'organisent pour associer l'ensemble des parties-prenantes autour d'une vision à la fois stratégique et concrète de l'avenir des territoires, surtout urbains. Les 800 Agenda 21 locaux français témoignent d'ailleurs de cette nouvelle génération de contrats entre les différentes échelles de collectivités, les entreprises, le tissu associatif, la recherche, les organismes de formation et les habitants. Cette nouvelle organisation mondiale pourra également s'inspirer du Grenelle français de l'Environnement, impulsé en 2007.

### NOS CONVICTIONS

La France regorge de talents, de forces et de créativité pour construire une société durable, plus respectueuse de l'humain et de son environnement, plus ambitieuse sur le plan social et culturel. Alors que certains enjeux planétaires trouvent une résonance toute particulière dans l'hexagone - vulnérabilité face au changement climatique, disparition des espaces naturels, déclin de l'emploi industriel, vieillissement de la population – de nombreuses initiatives sont engagées par les acteurs territoriaux dans des domaines très variés, comme le recours aux transports collectifs et aux circulations douces, la recherche d'une plus grande efficacité énergétique et l'utilisation des énergies renouvelables, le développement d'une économie solidaire, éthique et responsable, la mise sur le marché de produits innovants, souvent par de petites entreprises, ou encore l'installation d'une réelle contribution des habitants à la conception des politiques publiques.

Ces actions concrètes suggèrent que le développement durable ne se limite pas à un engouement éphémère. Il offre au contraire une grille de lecture opérationnelle pour anticiper les évolutions, participer aux mutations, analyser les risques et les opportunités et investir des marchés porteurs. Toutefois, ces initiatives restent encore trop souvent isolées et l'élaboration d'une culture commune, axée sur l'action, est encore à développer.

Il est aujourd'hui nécessaire de renforcer la cohérence des initiatives portées par l'ensemble des acteurs locaux, publics et privés, pour se doter d'une vision à la fois prospective et partagée de chaque territoire, prendre des engagements ambitieux, élaborer des solutions communes, partager des outils, essaimer les bonnes pratiques et mettre en place un système d'évaluation lisible et pédagogique.

A cet égard, nous prenons acte :

- de la déclaration de Rio sur l'environnement et le développement et du plan Action 21 adoptés en 1992 lors du Sommet de la Terre de Rio,
- de la convention d'Aarhus sur l'accès à l'information, la participation du public au processus décisionnel et l'accès à la justice en matière d'environnement (1998),
- des Objectifs du Millénaire pour le développement (Déclaration du Millénaire - 2000),
- des dix principes du Pacte Mondial des Nations Unies (2000),
- de la déclaration de Johannesburg sur le développement durable et du Plan de mise en œuvre du Sommet mondial de Johannesburg (2002),
- de l'accord de Copenhague issu de la 15e Conférence des Parties à la Convention-cadre des Nations Unies sur les changements climatiques (2009),
- de la norme ISO 26 000, pour la responsabilité sociétale des organisations (2010),
- de la déclaration des Collectivités locales et territoriales françaises en vue de Rio+20 (Assises nationales du développement durable - 2011),
- des engagements des établissements d'enseignement supérieur pour la conférence des Nations Unies de Rio+20 (2011).

L'ambition de ce manifeste est d'exposer ces enjeux et nos engagements pour qu'ils puissent inspirer la gouvernance mondiale du développement durable dont les nouveaux contours et la feuille de route devraient être arrêtés à Rio en juin 2012.

### NOS AMBITIONS POUR L'AVENIR

Pour renforcer le niveau d'exigence et la cohérence de nos initiatives sur le développement durable, nous souhaitons :

- Développer les réseaux d'échange pluri-acteurs qui représentent l'ensemble des composantes de la société civile et expérimentent de nouvelles formes de coopération entre les acteurs locaux. L'objectif est de développer une véritable architecture territoriale du développement durable.
- Renforcer la sensibilisation et la formation des dirigeants du public et du privé, en développant des espaces de savoir et de recherches, dans chaque région, en lien avec les universités et les écoles du territoire. Il s'agit notamment de créer une culture commune du développement durable au niveau local.
- Responsabiliser nos parties-prenantes et user de nos sphères d'influence. Le devoir d'exemplarité auquel nous sommes tenus se conjugue avec un devoir de pédagogie et de responsabilisation de l'ensemble de nos parties-prenantes pour que chaque acteur puisse exercer pleinement ses responsabilités.
- Réfléchir collectivement, territoire par territoire, à des objectifs chiffrés et des échéances à court, moyen et long termes pour répondre aux enjeux du développement durable et pour favoriser les actions menées vers une économie verte oeuvrant pour l'éradication de la pauvreté. C'est sur la base d'une vision positive et partagée du territoire que les résultats seront au rendez-vous.
- Imaginer un système d'évaluation commun, à la fois aux collectivités, aux entreprises, aux associations, aux établissements publics et appropriable par la population, en

élaborant des référentiels partagés, sur un même territoire. Cet instrument permettra d'interroger chaque acteur sur sa réponse aux enjeux locaux du développement durable.

- S'inscrire dans une politique de transparence rigoureuse, à travers la publication régulière de l'impact économique, écologique, social et culturel de nos activités. Les acteurs réaffirment ainsi leur adhésion à la convention d'Aarhus.

- Réfléchir à des mécanismes de financements conjoints sur le développement territorial durable, où chacun des acteurs, publics mais aussi privés, prend part à ses responsabilités. Les collectivités ne peuvent assumer seules le financement des actions de développement durable. Les organismes privés peuvent aujourd'hui y contribuer.

#### NOS SOUHAITS POUR 2012

A l'occasion de la conférence des Nations Unies Rio+20, nous souhaitons que soient mieux articulées les démarches de développement durable du global au local, et du local au global.

Nous demandons à cet effet :

#### AUX ORGANISATIONS INTERNATIONALES, DE :

- Définir une feuille de route à vingt ans, dans la continuité du plan Action 21 défini à Rio en 1992, assortis d'objectifs et d'échéances chiffrés vers une économie verte oeuvrant pour l'éradication de la pauvreté, et reconnaissant l'importance de la gouvernance territoriale et des partenariats entre les acteurs des territoires, dans la mise en oeuvre de cette stratégie.

- Renouveler la gouvernance mondiale du développement durable, en créant une plus grande synergie entre les différentes organisations internationales oeuvrant pour l'environnement, l'éducation, la santé, le commerce, le travail ou encore l'agriculture, tout en créant, en parallèle, une Organisation Mondiale de l'Environnement;

- Réaffirmer le caractère transversal du développement durable, trop souvent compartimenté comme une question environnementale. C'est quand l'environnement se nourrit de solidarité, d'efficience économique, de coopération qu'il s'humanise, prend corps et suscite l'adhésion de toutes les forces vives locales.

- Adopter de nouveaux indicateurs, plus cohérents et complets que le PIB, pour reconnaître les activités de toutes les parties-prenantes et exprimer l'ensemble des dimensions du développement durable (comme notamment la gestion des ressources naturelles, les activités non-monétaires, l'éducation, les travaux domestiques ou encore le bénévolat).

- Confirmer le rôle essentiel de l'enseignement, notamment supérieur, dans la création et la diffusion des nouveaux concepts et savoirs, auprès de toutes les parties-prenantes, nécessaires à la construction d'une économie durable.

- Affirmer une priorité forte à l'égard des territoires urbains compte tenu des évolutions des villes et des grandes agglomérations à travers le monde et des liens nécessaires à entretenir avec les zones rurales dans une logique de développement durable. Mettre tout en oeuvre pour favoriser l'émergence de nouvelles solutions technologiques et de nouvelles organisations pour créer de véritables espaces urbains durables.

#### A L'UNION EUROPÉENNE, DE :

- Enrichir la stratégie européenne du développement durable, et veiller à préciser les objectifs chiffrés et les échéances, en lien avec tous les acteurs, et en cohérence avec les principes de l'Agenda 21 de Rio et les objectifs tracés par la stratégie européenne de développement durable.

- Aider au développement de réseaux de mutualisation et d'échanges sur la responsabilité sociétale des organisations, regroupant l'ensemble des acteurs.

- Soutenir financièrement les démarches de coproduction, comme les Agenda 21, engagées à l'échelle des territoires sur le développement durable.

- Adopter une politique d'aide au développement ambitieuse et concertée avec les pays du sud.

- Promouvoir la recherche et l'innovation pour accélérer le développement d'une économie verte et responsable, pour que l'Europe puisse rester compétitive et garde sa place d'acteur majeur dans le monde. Du soutien apporté aujourd'hui à la recherche naîtront les innovations technologiques et sociétales de demain.

#### A L'ETAT FRANÇAIS, DE :

- Poursuivre la décentralisation, pour renforcer l'efficacité des politiques publiques, impulser et accompagner les changements des modes de production et de consommation, réduire les coûts de gestion et apporter la crédibilité nécessaire à la mobilisation des citoyens et des partenaires locaux sur les questions de développement durable.

- Renforcer la participation des acteurs territoriaux dans la définition des grandes politiques nationales.

- Alléger les procédures administratives et les cadres juridiques d'appels d'offre. Un équilibre entre contrôle réglementaire et le droit à l'expérimentation doit être recherché pour favoriser la mise en oeuvre de projets originaux dans un cadre cohérent.

- Promouvoir le développement des espaces urbains durables, en s'appuyant sur une approche multi-acteurs et une approche globale des besoins de chaque territoire et en recherchant une optimisation du cadre de vie et de la mobilité urbaine.

- Favoriser l'investissement et l'entrepreneuriat socialement et écologiquement responsables en vue de créer des emplois, et cela à tous les niveaux (travailleurs manuels, qualifiés, artisans, entrepreneurs, techniciens, ingénieurs, gestionnaires, etc.), et de diminuer nos impacts et favoriser l'intégration harmonieuse des activités humaines au sein des écosystèmes.

- Favoriser l'intégration du développement durable dans les petites structures, publiques (petites collectivités) ou privées (TPE/PME), en développant l'information, la formation, l'accompagnement et la mise en réseau, et en veillant à développer une politique fiscale adaptée

- Soutenir la coopération avec les pays du Nord comme du Sud qui s'accordent pour partager les mêmes visions et valeurs du développement durable.

Ce Manifeste est la contribution du « Club France Rio+20 », animé par le Comité français pour le développement durable (dit Comité 21). Il a été rédigé de façon collégiale. Toutefois, il n'engage pas nécessairement l'opinion de tous les membres de ce Club.

Ce « Club France Rio+20 » est composé de l'Association des maires de France (AMF), la Fédération nationale des villes moyennes (FNVM), l'Association des maires des grandes villes de France (AMGVF), l'Assemblée des communautés urbaines de France (ACUF), l'Assemblée des communautés de France (AdCF), l'Association française du conseil des communes et régions d'Europe (AFCCRE), les Amis du Global Compact, le Comité français de la chambre de la commerce internationale (ICC France), European Partners for the Environment, la Conférence des grandes écoles (CGE), le Collège des directeurs du développement durable (C3D), le Collège des hautes études en

développement durable (CHEDD), les associations Orée et Décider Ensemble.

## Coastal Zones: 21st Century Challenges

### Context of the Document

This document represents the inputs provided by the authors in order to participate in the construction of the "focused political document" for the Rio+20 outcomes. As part of the effort to construct and achieve the Rio+20 goals, the authors' points of view are comprised of contributions from members of the following major groups: the Scientific and Technological Community, and NGO's Concerning the Sectoral Priority of Coastal Zones.

Coastal zones are the most productive regions in the world, both biologically and economically, but they are also the most populated. They face a harsh future due to greater challenges stemming from hunger, wars, and health related issues threatening populations and countries' economies. These challenges constitute the core of this document. Will nations work together to save these zones that buffer our world? They must be included in the next ten-year agenda before it is too late.

Following the recommendations provided by the "co-chairs' guidance note," this document has been redacted in the form of focused inputs. The material the authors submitted was coded, synthesized, and condensed to create this document. While this document communicates the most significant concerns of the authors as a group, it is not a consensus document. This document enables us: (i) to establish our inputs to the Compilation Document by November 1st, (ii) to propose adapted material to the Rio+20 delegations from various governments through each country's correspondent, and (iii) to publish an extended reference document concerning the sectoral priority of Coastal Zones from the perspective of 21st Century Challenges.

115 authors from the working group "Coastal Zones: 21st Century Challenges" actively participated in the creation of this "Inputs for Compilation Document." They are from 30 countries, and the following Institutions, Universities, Research Centers, and NGO's:

Aristotle University of Thessaloniki, ARUC, Aurecon, Australian National Centre for Ocean Resources and Security University of Wollongong, Australian Rivers Institute, Baltic Environmental Forum, Boskalis Offshore, Brock University, CALCH, CEAB/CSIC, Center of Researches in Material Sciences of Borj Cedria, Centre de Suivi Ecologique, Centro Desarrollo y Pesca Sustentable, CETMEF/DS, Chao Pesca, CNR-INSEAN, Cooper Ecological Monitoring, Inc., Ecole des Hautes Etudes en Sciences Sociales, ESA PWA | Environmental Hydrology, European Commission, Joint Research Centre, Gaz-system, German Association of Aquaculture, Greenpeace, Hellenic Centre for Marine Research, Helzel, IFM-GEOMAR, Institut Universitaire Europeen de la Mer, Jagiellonian University, Kyushu University, Laboratorio Nacional de Energia e Geologia, Latvia Coastal Protection and Restoration Authority, Latvijas Universit-te, LittOcean, Marine Sciences For Society, National Research Institute for Rural Engineering Water and Forestry, Nelson Mandela Metropolitan University, Norwegian Directorate of Fisheries , NUI Galway, OANNES, Oceanografos Sin Fronteras, OGS National Institute of Oceanography and Experimental Geophysics, Pepperdine University, Queen's University, Scripps Institution of Oceanography, Snowchange Cooperative, The Norwegian University of Life Sciences, The Pomeranian Maritime and Vistula River Basin Cluster Association, The Royal Marine Conservation Society of Jordan, UNESCO-IHE, Universidad Autonoma de Baja California Sur, Universidad de Cadiz, Universidad de La Laguna, Universidad de Las Palmas de Gran Canaria, Centro Interdisciplinario Manejo Costero Integrado, Universidad de la Republica-Uruguay, Universidad del Magdalena, Universidade do Algarve, Universidade Federal do Rio Grande, Universidad Nacional Autonoma de Mexico, Universidad Politecnica de Madrid, Universitat Autonoma de Barcelona, Universitat Politecnica de Catalunya, Universite Bordeaux 1, Universite de Moncton, Universite de Picardie Jules Verne, Universite du Quebec a Rimouski, Universite de Versailles Saint-Quentin-en-Yvelines, Universite du Havre, Universite du Quebec a Rimouski, University of Bergen, University of Florence, University of Patras, University of Tartu, University of Ulster, University of Western Australia, Waseda University, and Technical University of Delft.

### Authors Listed in Alphabetical Order:

Octavio Aburto-Oropeza, Mohammad Al-Tawah, Chistos Anagnostou, Christian Appendini, Matias Asun, Juan M.Barragan-Munoz, Robert Battalio, Juan Baztan, Anne Blanchard, Camilo-Mateo Botero, Scott Bremer, Laura Cabrera-Vega, Ana Campos, Donata Canu, Maria-Elena Cefali, Mike Chadwick, Semia Cherif, Omer Chouinard, Katarzyna Chruska, Daniel Conde, Dan Cooper, Alejandra Cornejo, Susana Costas, Louise Coyle, Charlotte Da Cunha, Debora De Freitas, Irene Delgado-Fernandez, Federico Demaria, Javier Diez, Patricia Dominguez, Jean-Marc Douguet, Anne Duperré, Matthieu Dutertre, Raimonds Ernstein, Miguel Esteban, Frederique Eynaud, Elizabeth Figs, Vanessa Finance, Rainer Froese, Noureddine Gaaloul, Jesus Gabaldon, Shari L.Gallop, Marli Geldenhuys, Lea Gracia, Francesco Guercio, Casandra Gutierrez-Galvez, Birgit Hansen, Linda R. ### Introduction

20 years have passed since the Rio Earth Summit in 1992.20 years of efforts to better understand, inform, and improve the relationships between our societies and our planet's coastal zones. These efforts have crystallized into tangible outcomes in the form of improvements in environmental culture and international agreements upheld by over 100 national and transnational coastal zone plans, protocols, and conventions.

While moving forward with these national and international efforts, we realize that the balance between development and stewardship is still broken, and many more efforts are needed to create a harmonious relationship between the use of knowledge in society and our planet's coastal zones. Through the active participation of 115 researchers from 30 countries, the following baseline document has been constructed to highlight the perspectives of academia regarding  Coastal Zones: 21st Century Challenges-h Please consider it our input for the RIO+20 compilation document.

#### (i) Input For Compilation Document

The majority of our planet's population is concentrated in coastal zones, narrow spaces that amplify the most urgent and emerging questions of sustainability and development. In coastal zones, we clearly see the fragility of the three elements that constitute sustainability: world population growth, economic tenuity, and the increase of environmental degradation. Coastal zones are key in illustrating

(a) the challenges our societies face and (b) the potential solutions, priorities, and views regarding the implementation of practices and policies that build upon previous successes. These two points structure the document.

(a) The Challenges That Our Societies Face

Any initiative to truly help society progress sustainably must integrate the limits of the planet and be co-constructed with the affected communities. The consensus is that the challenges we face in coastal zones are mostly anthropogenic or amplified by human activities that clearly transgress ethical limits- Due to human development on the shoreline and in river basins, along with off-shore industrial unsustainable activities, our challenges are:

Red Flag Challenges Impacting Lives of Coastal Zone Residents:

- Malnutrition, hunger, freshwater availability
- Wars and other violent conflicts
- Lack of education
- Climate change and its consequences
- Exploitation of marine living resources
- Toxins in fish and shellfish, and pathogens such as cholera and hepatitis, are threats to human health
- Population growth
- Global economic crises

Challenges in Policy:

- Harmonize the interests of coastal environment users, including local community members, coastal municipalities, regional and/or inter-municipal planning, national, transnational, and international stakeholders, through the continuous improvement of economic-legislative instruments and the elaboration and implementation of coordinated strategies for the use of natural, social, cultural, and institutional resources
- Rethink economic growth and the flows of energy and materials
- Preserve 100% of the areas where the indigenous peoples of the coasts remain, including the Saami, Chukchi, Siberian Yupiaq and many others
- Integrate research and education into the decision making process
- Make information readily and easily accessible to facilitate informed decision-making
- Protect natural and cultural resources at all levels: local, regional, national, and international, while keeping coastal communities safe
- Monitor and control the coastal and littoral maritime traffic, industrial activity, and the related hazards of oil pollution, chemical transport, collision, GIS reduction, and technical failures
- Introduce policies that: make change trends mandatory, protect existing coastal habitats and ecological functions, recover the fishing stocks, and prevent illegal and habitat-destructive fishing
- Prevent over-population in developing regions and minimize damage in already overpopulated areas
- Balance urban growth by using space more efficiently
- Plan sustainable spatial allocation and management for fisheries and aquaculture
- Plan sustainable spatial allocation and management for energy production and supply

Challenges from Pollution and Climate Change:

- Oceanic temperature warming and change in alkalinity
- Decreasing oxygen levels leading to dead zones, species extirpation, and noxious gas emissions
- Seawater intrusion in coastal aquifers
- Coastal and sea pollution caused by wastewaters and solid wastes that have been treated ineffectively or not at all
- Pollution by toxic waste, metals, nutrients, contaminants
- Floods, erosion, and rising sea-levels
- Illegal or little regulated extraction of natural resources to fill increasing demand
- Amplified vulnerability of coastal populations, particularly the economically disadvantaged
- Loss of habitat and loss of biodiversity
- Irreversible ecological destruction
- Toxic blooms due to pollution
- Coral reef bleaching
- Introduction of invasive species
- New diseases among organisms
- Dispel the assumption that the coast is "safe"

#### Challenges in Research:

- Generate an information baseline of coastal ecological and social processes that researchers can measure against
- Take into account the social and human dimensions of uncertainty
- Study in greater depth the interconnectedness of natural systems to better understand how to sustain coastal and oceanic health
- Conduct research in support of management on multiple spatial and temporal scales
- Develop and establish an integrated oceans monitoring network, and create interoperable open-access databases that can provide reliable data on a user community's defined goal(s)
- Interdisciplinary approaches to solve any challenge
- Integrate all stakeholders in the research process
- Develop innovative techniques for the restoration of ecosystem functions
- Evaluate the success of the integrated coastal management political processes and practices on a local to global basis
- Identify and quantify the human-induced stressors acting on coastal ecosystems and populations

#### (b) Potential Solutions, Priorities, and Views Regarding the Implementation of Practices and Policies that Build Upon Successes

#### Economy and Development Models:

- The model of development based on infinite economic growth needs to be questioned:

To what degree do activities on coastal areas facilitate general development and what manner of development is currently needed?

Can development be based on sustainability and how can the socio-economic structure respond to international competitiveness?

- A trade-off between the economy and the environment exists; destructive industries have to be challenged and held accountable for their social and environmental consequences
- G20 announced the preparation of a charter on [sustainable economics](#), [in](#) which we must make explicit how such a charter should be implemented from a global governance perspective

#### Governance, Global/Local Articulation:

- The efforts cannot only come from local governments and communities; the challenges are global in nature
- UN Ocean should be supplemented by other trans-governmental and nongovernmental networks as additional forms of governance
- Intergovernmental Panel on Maritime Basins (IPMB) should contribute to providing governance systems with common and reliable information and promote coherent responses from these systems
- Build strong connections between transboundary maritime basins related to large marine ecosystems and maritime regions of the world
- Apply a deliberative approach that concertates on managing emerging challenges and linking all spatial and temporal scales

#### Collaborative Policy Making:

- The instruments for the implementation of integrated coastal zone management are: an integrated approach to coastal land and marine spatial planning, cross-sectoral and multiregional agreements, public participation, effective cross-border consultation system, monitoring and assessment of socio-economical and ecological changes and trends, comprehensive analysis of sustainable development indicators, financial and legal mechanisms for ICZM implementation, and connected and collaborative decision-making between all administrative levels from global to local
- Move from the theoretical framework into realizing the necessary actions
- Improve the articulation between ICZM and adaptation measures
- Integrate local and traditional knowledge with policy making
- Learn from international experience and practices in integrated coastal management, and adjust lessons to other contexts
- Evaluate the success of the integrated coastal management political processes and practices on a global basis
- Participation of coastal communities is vital, not only to vindicate the legitimacy of strategies, but also to provide them with the opportunity to express their doubts, to rebuild their trust, to learn how to live in a changing environment, and to manage social conflict
- Create respectful partnerships with traditional societies on Earth, as they can provide crucial observations and knowledge regarding emerging challenges
- Make decisions that are compatible with the core values of affected coastal communities and coast-dependent peoples
- Increase interdisciplinary training and cross-collaborations among tertiary programs and teams
- Natural science data must be combined with social science understandings of the places where regulations are to be implemented
- Natural scientists, engineers, economists, lawyers, and social scientists must recognize their responsibility and role in the process and collaborate with each other to achieve common goals

#### Legislation and Regulation:

- Define coastal zones in both spatial and temporal dimensions, since coastal dynamics cast some legal uncertainty on how coastal zones are determined
- Improve and reinforce legal frameworks controlling coastal activities
- Make good practices mandatory for stakeholders; hold elected politicians accountable for their promises
- Coordinate states and various sectors

#### Information, Education, and Awareness:

- Improve the competence of and resources for local and regional coastal zone authorities
- Knowledge must be shared, promoted, and used in order to a) aid society in developing a critical approach, b) exercise pressure on policy makers, and c) develop realistic, sustainable, and feasible policies
- Promote public awareness of the socio-ecological values of the coastal resources and ecosystems

#### Research:

- Encourage the scientific development of new sustainable, useful technologies
- Improve treatment plant performance
- Increase general use of new biodegradable materials
- Long-term studies that identify past and present evolutionary trends of the coast
- Intelligent and sustainable use of marine resources to enable the development of new, sustainable medical and pharmaceutical products
- Develop and establish integrated monitoring networks and coherent forecasting systems that provide coastal managers and policymakers with critical coastal state indicators in order to ensure the safety of coastal communities while assuring the preservation of natural coastal dynamics
- Bring together competence and synergy to develop an ecological sustainable aquaculture in order to protect the biodiversity and environment in the ocean, as well as provide a safe and sustainable source for human food
- Combine infrastructures like offshore wind energy facilities and aquaculture installations

#### Conclusion

A general comment to conclude our document is this: the challenges we face in coastal zones are mostly anthropogenic or amplified by human activities that clearly transgress reasonable limits- We insist on the fact that any initiative to truly help society progress sustainably must integrate the limits of the planet and be co-constructed with the affected communities.

#### Reminder

This document represents the inputs provided by the authors in order to participate in the construction of the [highly](#) focused political document [which](#) for the Rio+20 outcomes- As part of the effort to construct and achieve the Rio+20 goals, the authors' points of view are comprised of contributions from members of the following major groups: the Scientific and Technological Community, and NGO's Concerning the Sectoral Priority of Coastal Zones.

Following the recommendations provided by the [high](#) co-chairs' guidance note, [which](#) this document has been redacted in the form of focused inputs- The material the authors submitted was coded, synthesized, and condensed to create this document- While this document communicates the most significant concerns of the authors as a group, it is not a consensus document- This document enables us: (i) to establish our inputs to the Compilation Document by November 1st, (ii) to propose adapted material to the Rio+20 delegations from various governments through each country's correspondent, and (iii) to publish an extended reference document concerning the sectoral priority of Coastal Zones from the perspective of 21st Century Challenges.

---

## Collectif RIO+20

The Rio Conference that will take place in June 2012 shall consider the matters that human kind is facing today, by focussing on two main issues: the ecological and social conversion of our societies, and thus of our economic system, and the construction of new forms of international cooperation, engaging the responsibility of all actors.

#### A CIVILISATION SHIFT

The world has deeply changed since the Rio Conference in 1992. On one side, the economic space has been globalised. It is today characterised by the raise of emerging countries and by a systemic crisis, which is affecting the long time industrialised countries, but also the poorest ones. It includes ecological, social, economic and political aspects. On the other side, there is a need of a common management of the planet when it comes to climate change, erosion of biodiversity or even inequalities of access to natural resources, considering they are rarer each day. We simultaneously live in an economic unification of the world, conflicts and a doubled competition to corner wealth, and the confrontation to the limits of our planet. Despite the global growth, it is still impossible to apply the engagements defined by the Millennium Development Goals, to fight against the hunger endured by over one thousand million people, to stop the erosion of social protection mechanisms, to shore up the emergence of chronic diseases noticed worldwide, to stop speculation and financial deregulation. These changes have multiple causes and cannot be solved in a situation of economic deregulation. Market economy cannot take environment pressures into account, neither the disparities of resources. Furthermore, the research of financial advantages causes more social and economic differentials, and accelerates ecological instability, contributing even more to an increasing asymmetry of power.

Today's limits of multilateralism show the end of a period in which Nation-States dominated industrial, economic, social and political stakes, thus contributing to the increase of inequalities. Nevertheless, the necessary institutions and instruments used to manage the various issues, which must be dealt with worldwide, are very insufficient, if existing. We must build the means for a real planetary regulation.

Facing OUTDATED thresholds of acceptability and VIABILITY : PREPARE THE TRANSITION TOWARDS A CIVILISATION SHIFT

Preparing the transition towards a new civilisation means firstly defining the values, which correspond to a general interest raised at the level of all human kind. This notion of

general interest must be defined in new terms, inspired on social and cultural diversity. Various experiences in the world, at the initiative of social movements, already draw the different ways of an ecological and social transition in a pragmatic way.

The eradication of poverty and the reduction of inequalities are the first condition to transition

Reducing inequalities and fighting against poverty constitute the first priority. Without significant progress in these issues, countries' social cohesion and political stability are at stake. Without it there will be no individual adhesion, no collective dynamics, no international agreements. The reduction of inequalities involves the establishment of the International Labour Bureau rules, on decent work conditions and the construction of an universal social protection; the reinforcement of national politics in order to reduce income inequalities and a better distribution of wealth; build supportive systems so that a great amount of people count benefit from the right to healthcare, the fair relocation of activities and the establishment of a food and energy sovereignty; the submission of the international economic negotiations to the social and environmental rules; the development of collective consumptions (transportation, housing), connected to efficiency measures and access for all.

Gender, a major transversal issue for transition

The issue of the evolution of social relationships between men and women (Gender) is still the most discarded matter in the systemic crisis, although it is at the heart of both crisis and solutions to solve it. Change the relationships should be a pivot to a strategic discussion on the means to transition towards a sustainable development, which is based on an equal allocation of resources, within the ecological limits of the biosphere. Moreover, women are specific actors and important alternatives to open new paths of social innovation and prefigure a more human and inclusive development.

A global citizenship: from local to global, individual and collective responsibility

The willingness of solidarity and justice will nurture the construction of a collective capacity of action. From this notion of global citizenship, and thus from a common destiny, arises the notion of individual and collective responsibility. It is important to specify the essential components of the new social contract, which will enable the opening of differentiated paths to make transition possible towards fair and sustainable societies... towards a new civilization.

Using resources: optimization, sharing and sobriety

The adaptation of our societies to the limits of the planet will go by the optimisation, but mainly by the sobriety and sharing in the use of resources. Waste is antisocial and anti ecological. This optimisation of the management of resources needs the support to knowledge, to local pilot projects, and an international regulation, which over surpasses today's blind liberalism to integrate superior planet obligations. The notion of ecological space, which articulates sobriety – for the preservation of ecosystems – and equity – in order to satisfy the basic needs of all – promotes a fair and sustainable use of resources.

Recognizing a definition of « global public goods » and « common goods »

From the compelling need to build a vision of general interest on basic goals, it is necessary to agree on the definitions of common goods and also on global goods, making sure that their management obeys to principles that are higher than the rules of competition. Common goods request citizens' commitment and the definition of usage rules. This approach based of cooperation – and not on competition and privatization – is more likely to enable an ecological and social sustainability of societies. Moreover, the preservation of global goods (atmosphere, oceans, health...) can only be possible with intergovernmental agreements, which are applicable to users' communities. That is the reason why the United Nations is the place to define the goods and to promote the experiences of collective reappropriation of these goods.

A SUSTAINABLE END OF CRISIS REQUIRES CRITERIA OF GENERAL INTEREST, TAX INSTRUMENTS FOR TRANSITION, SCALES TO ESTABLISH SOLIDARITIES... THE NECESSARY PRE-REQUIREMENTS OF OUR VISION OF TRANSITION

It is a new vision of development that the Rio+20 Conference shall transmit for societies in ecological and social transition, for a systemic shift. The strength of issues requests major social transformations, which commit all levels of society and can only be possible on a democratic basis.

Ecological and social transition as a way out of crisis

The answer to financial, economic, social and environmental crises is to be found in new paths of development, which will rely on the sobriety of wealthy people's life style; the improvement of living conditions in developing countries by ensuring the access to essential services and to fundamental rights; the distribution of wealth through tax; new production, exchange and consuming processes; the cheap management of non renewable resources; prioritize short circuits of production and distribution; new society and environmental responsibilities for the firms. This path should be created in the perspective of an economic regulation based on principles of general interest, which are imposed on economic and financial logics, and lead not only to economic changes, but also on a regulated economy and an inflexion of individual and collective behaviours. Therefore, new goals, concepts, actors or institutions must integrate ecological sustainability and social justice, and shall not consider green economy as the only approach as it does not include a social dimension, which not only nurtures progress but also technological illusion. It is important that the concept of « green economy » is based on the fundamental principle of « durability », which is contrary to today's characteristics of our societies, based on over-consumption, individualism and priority to short term.

Green economy, as it should be understood, must correspond to new economic and technological social principles, towards the optimisation of the use of resources and the global reduction of material pressure on non-renewable resources.

At the bottom of the economic system stands the construction of sustainable societies, which associate both the well-being of all and the preservation of the planet's integrity; the general improvement of life and health conditions and a just remuneration of Labour; an economy based on functionality which favours the access to consumption goods at the expense of personal property; the coherence of the downstream of technological and professional sectors and technologies which enable the creation of qualified and decent jobs, accompanied by lifelong trainings; the input of local knowledge; natural or semi-natural spaces and habitats by making the entities at the origin of the damages pay for its restoring; the reduction of waste at source and a circular economy with recycling, the development of short circuits specially in the food sector, and long circuits when they are guarantors of a fair remuneration and a low impact on natural resources and environment; the knowledge of resources for a better perception of limits, an ecological management and a better inter- and intra- generational distribution.

The path to prosperity without growth will be long. That is the reason why it is necessary to start it as fast as possible, taking into account the considerable differences between societies in order to enable the access to elementary goods and to decent life and labour conditions, for the whole planet population.

The research for new paths of development needs to establish ecological and social transition as a way out of crisis.

An instrument of transition: the revalorisation of the tax role

Financing public goods, the transition towards societies with less carbon and the preservation of biodiversity, request public resources and the establishment of global taxes, such as the tax on financial transactions.

The need to surpass the use of the GDP growth in favour of more representative indicators of a sustainable development

New indicators, representative of the non-evaluated dimensions by the GDP such as the quality of life or the ecological and social sustainability, must be created. It is not viable to pilot change with indicators, which ignore the reality of the planet's limits.

The crucial role of local authorities in regulation

In a globalised economy, local authorities become the level of creation of solidarities. From a subsidiary point of view, a partnership with local and regional governments is essential to the establishment of viable and balanced responses, which include the organized civil society as a stakeholder when conducting actions. Territories are essential in multi-level governance.

The need to leave a society of consumption which is unjust and predatory regarding the planet and replace it by a relational society

There is no such thing as an optimisation path of the use of resources and of respect of environmental stability with the generalisation of the excessive consumption society model, and thus with a slow progress in education and culture. Today's challenges open a path towards cultural progression, and request a democratic step forward: there are infinite possibilities in this finite world. The infinite is open by the technologies of information and communication, but also by the development of arts, which support human capacities to invent life styles based on solidarity, develop new knowledge and competences, without substituting human and social relations. Relationship with others, social link, access to knowledge, cultural creativity and access to other cultures constitute infinite assets, which are multiplied when shared. Today's consumption society cannot be accessible to the entire human kind as its extension in new emerging counties is incompatible with the respect of the planet's limits (energetic and environmental). Publicity has a key role in today's mechanisms. It distils a promise towards consumers, which consists in promising the improvement of living conditions by the increase of individual consumption. It is thus necessary to open new paths of satisfaction, which are compatible with the constraints of this century, rely on common values, rooted in different cultures and philosophies.

Build a promise to people, put human kind at the centre

Sustainable development must open a successful life perspective, in this century's context. The Rio+20 Conference must send a message of hope for each and every person, in order to enable the change from a civilization of disparities and excess to a cooperative and relational one, representing transition.

Democratic progress, the condition to a reinforced governance based on general interest

A real change in civilisation necessarily requires a democratic progress. The actual change in our civilisation shall answer to this requirement. It is the democratic strengthening that enables to follow the deep upheavals, which destabilise earlier representations regarding economy, technologies, life styles and attitudes. These political progresses must be operated at four levels: at a citizen level, at a grassroots democracy level, at a national level and at a supranational level.

It is thus essential that public politics become a phase of an elaboration largely open to structures of civil society and citizens, but also economic actors, and this specifically because of power asymmetry. Such a construction will assess the orientations to take and will build a strong mandate for the elected, which will facilitate both the decision taking and its application.

rethink international architecture of governance in the united nations for more regulation and new engagements

The construction process of a new world governance requires a reform to be conducted within the United Nations, in order to adapt its architecture and efficiency to all the social and environmental issues. Only an Assembly of States can decide to create new international institutions that are necessary to human kind.

Beyond the Treaty of Westphalia, which founded the international system based on national sovereignty, the transformation of today's civilisation requires the constitution of an international framework above countries which is legally binding. In fact, the engagements taken by a country in an international negotiation will only be obtained if it has the conviction that the others are also in the obligation to respect their engagement. Betrayal can only be possible with the creation of concepts, institutions and a management culture from local to global, intrinsic to multi-level governance.

The present increase of institutions of governance: the United Nations, G8, G20,... increases confusion and leads to inaction

Keeping economic institutions (International Trade Organisation, World Bank, International Monetary Fund) separate from the United Nations leads to, on one side, a political institution without economic and legal power, and on the other side, to an organised economic power based on the financial contribution of countries. The need to re-regulate the world economy requires a more direct link between politics and economy, a balance between people, societies and the biosphere. Firms cannot create this balance. We need to conceive sustainable sectors, which involve traceability on the whole sector of production and exchange.

Rio+20 must be the starting point of a cycle of international negotiations, lead on new bases, which will enable to relaunch multilateralism, establish a negotiation mandate and a global calendar, the constitution of an international commission of management, the establishment of an annual cycle of international negotiations.

Decisions to be taken in the final document of the Rio-2012 Conference

In order to reform the United Nations it is necessary to organise a Conference of highest-level. This reform would consist in enlarging the Security Council; in reforming the Ecosoc in order to guarantee a process of representativeness and participation of local public powers and civil society organisations; in creating an executive organ inside the United Nations, which coordinates the agencies and programs in application of a sustainable development strategy.

A binding legal framework and the establishment of control and sanction bodies

The United Nations must have two types of supranational bodies. On one side, knowledge and control bodies – at a planet level and at a "big regions" level able to establish a recognised report of scientific knowledge, to establish rules for sharing, to observe the respect of global rules and to investigate the responsibilities which originated pollutions and other infringements to rules. On the other side, international jurisdictions that are capable of establishing sanctions against States and multinational firms, whose guilt would be thus established and they would be forced to apply according to an instruments' palette according to an incremental penalty scheme. Finally, we cannot expect to increase the abilities of International Criminal Court regarding the distortions made to environmental heritage if an international environmental jurisdiction is not created.

Establish an Intergovernmental Group of Experts about sustainability

In order to define the conditions for sustainability by integrating its social dimension, and to measure them with indicators dedicated to the finiteness of natural resources and environmental limits, it is essential to establish the equivalent to the Intergovernmental Group of Experts on Climate Changes concerning sustainability.

The reinforcement induced of environment in the framework of an International Environment Organisation

The establishment of an IEO should be operated in three steps.

- Firstly, a reinforcement of the UNEP, of its missions and of its means, enabling it to cover all international conventions on environment; this will enable to coordinate and adapt the various international conventions on environment;
- Secondly, acquire new abilities in terms of sanctions to the firms and States, which suggests the constitution of an international dispute settlement body.
- Finally, the adoption of a treaty for the creation of the IEO, which mentions that the new agency has the power to subsume the activities, the functions and the resources of the UNEP.

The preparation of new international conventions

Especially on the management of international waters and the seabed; the rights of indigenous people; the rights of climate refugees; and the adoption to existing rules regarding the principles of sustainable development.

Towards a new Bretton-Wood in order to establish an international financial regulation to support development

It is necessary to establish an international economic regulation, an initiative that urgently requires a redesign of the actual world governance. This implies the integration of the ITO in the United Nations, including its dispute settlement body; the harmonisation of tax at an international level – in order to curb the crisis, this harmonisation must be done through a treaty that collects the agreement of all countries so it is not circumvented by tax havens –; the adoption of international financing rules for development; the effective application of the developed countries' engagement to allocate 0,7% of their gross national income to development aid; the establishment of a tax on international financial transactions, to guarantee the necessary North-South transfer to move towards a new path for development – its product must be affected according to three purposes: the ADP, the funding of a transaction to economies that are sober in carbon (adaptation and attenuation) and a "fair" transition for industrialised countries; the adoption of the following principles: transparency of developed countries' contributions, the principle of direct access for developing countries, decentralisation of the attribution of funding and the quality control of passed investments.

Our role of Bonn in Rio is to contribute to what could be a citizen's declaration. Only one strong speech expressed in front of the whole world, backed up by media, will be able to give the initial push, essential to the change of paradigm in our societies.

Our Propositions

- A civilization shift
- Facing outdated thresholds of acceptability and viability: prepare the transition
- A sustainable end of crisis requires criteria of general interest, tax instruments for transition, scales to establish solidarities... the necessary pre-requests of our vision of transition
- Democratic progress, the condition to a reinforced governance based on general interest
- rethink international architecture of governance in the united nations for more regulation and new engagements

## Collectivités locales et territoriales françaises

[\[IN ENGLISH\]](#)

Déclaration des collectivités locales et territoriales françaises pour Rio+20

Cette déclaration des collectivités locales et territoriales en vue de Rio+20 a été rédigée dans le cadre des Assises Nationales du Développement Durable en France, organisées par la Région Midi-Pyrénées à Toulouse, en octobre 2011, au cours desquelles elle a été débattue et enrichie.

Ainsi, au terme de ces débats, l'Association des Régions de France, l'Assemblée des Départements de France, l'Association des Maires de France, l'Assemblée des Communautés de France, l'Association des Maires de Grandes Villes de France, la Fédération des Maires de Villes Moyennes, l'Association des Communautés Urbaines de France, l'Association des Petites Villes de France, l'Association des Maires Ville et Banlieue de France, l'Association des Maires Ruraux de France, l'Association Française du Conseil des Communes et Régions d'Europe, l'Assemblée des Régions d'Europe, et les autres réseaux de Collectivités locales souhaitant s'y associer déclarent :

« Les politiques publiques des collectivités territoriales touchent à tous les domaines de la vie, logement, déplacement, emploi, éducation et épanouissement des citoyens. Il nous appartient donc de les développer pour répondre aux aspirations légitimes des populations dans une perspective d'intérêt général en assurant le respect des capacités physiques et biologiques de la planète. C'est avec une vision lucide, acquise grâce à notre expérience de terrain, désireuses de prendre toutes nos responsabilités et animées d'un esprit de coopération avec tous les partenaires concernés, que nous nous présentons devant ce sommet mondial de Rio-2012.

Il vous appartient, États, organisations et agences, autorités publiques de tous niveaux, de nous considérer comme partenaires du développement durable, mais surtout comme acteurs essentiels de la transition à réussir. En effet, la connaissance des territoires, le savoir-faire du développement local, la capacité d'innovation et d'expérimentation, le rôle d'animation au plus proche du citoyen des collectivités locales déterminent largement l'efficacité des politiques publiques.

Rio+20 doit donc être le point de départ d'un processus de transition, lançant un cycle de négociations dans la période 2012-2020 et permettant l'élaboration démocratique et transparente des nouvelles formes de gouvernance au sein des Nations Unies afin de répondre aux défis de l'humanité. Force est de constater que cela ne pourra pas se faire qu'avec une réelle intégration des acteurs de la société civile et des collectivités locales. »

1- Les Principaux enjeux de la Conférence de RIO+20

Depuis la Conférence de Rio en 1992, le monde a profondément changé. L'humanité est directement confrontée aux limites d'une planète dont elle tire ses ressources. Cette confrontation exige un changement de civilisation avec une gestion collective et solidaire de la planète. C'est la condition indispensable de la lutte contre le changement climatique, l'érosion de la biodiversité, l'inégalité dans l'accès à l'eau, à la santé, à l'énergie et aux ressources naturelles. Des enjeux planétaires, dont les Objectifs du Millénaire pour le Développement, découlent le sens à donner à l'action publique pour tous les niveaux de collectivités. Faute de cela, l'accroissement des souffrances humaines, la révolte contre les inégalités risquent de dégénérer en violences. Il convient donc de progresser vers une économie verte, qui optimisant l'utilisation des ressources, permette un partage des richesses plus équitable et soutenable et le développement de tous les peuples.

La mondialisation, fondée sur les principes seuls de concurrence économique et d'intérêts nationaux, débouche sur un accroissement des inégalités faute de mécanismes de régulation. Ainsi, la crise financière devient une crise systémique profonde qui ne peut trouver d'issue qu'à la condition d'apporter des solutions économiques, sociales, écologiques et politiques dans le cadre d'un développement durable.

C'est la raison pour laquelle la conférence qui se tiendra à Rio en 2012 a retenu comme thèmes majeurs l'évolution vers une économie verte, l'éradication de la pauvreté dans le cadre du développement durable et la réalisation de progrès en matière de gouvernance du développement durable. Il est évident que des progrès considérables sont possibles pour réduire les inégalités sociales, diminuer les gaspillages actuels, améliorer nos comportements individuels et collectifs et surtout transformer notre modèle de production et de consommation en direction d'une économie plus écologique et équitable.

## 2- Le rôle des collectivités territoriales

Ouvrir la voie à une nouvelle période de l'histoire humaine marquée par ce double mouvement de confrontation aux limites de la planète et de mondialisation de l'économie implique une quadruple cohérence :

- Une gouvernance mondiale et une régulation qui assurent le droit de tous au développement et l'accès aux ressources ;
- La bonne application des engagements pris par les États, la première et la plus importante des responsabilités des gouvernements ;
- Un rôle accru des collectivités locales et territoriales car elles sont le lieu où les politiques peuvent intégrer les dimensions économiques, sociales et écologiques, et ce dans des processus démocratiques qui mobilisent les citoyens ;
- Une citoyenneté renouvelée dans laquelle chacun(e) construit sa vie par une synthèse originale et individuelle qui allie plaisir de vivre, prise en compte de toutes les dimensions de l'intérêt général (y compris planétaire) et solidarité sociale.

Même si l'interdépendance entre l'humanité et la biosphère rend indispensable en premier lieu la recherche de solutions au niveau mondial, les collectivités locales, quelles que soient leur taille et leurs compétences, jouent un rôle essentiel, à la fois par leur action propre et par leur capacité démocratique d'entraîner le citoyen. Dans une économie mondialisée, les collectivités sont le point d'appui où les solidarités, indispensables à la cohésion sociale se tissent au plus près des besoins des citoyens. C'est également de l'adhésion des territoires locaux et de leurs habitants que dépend la mise en oeuvre effective des conventions internationales.

Les collectivités locales, à travers leurs politiques touchent ainsi à tous les domaines de la vie (habiter, travailler, se déplacer, échanger, s'épanouir, se nourrir, se former, se soigner...). Il leur appartient, avec le concours des autres niveaux territoriaux et internationaux, de les développer pour répondre aux aspirations légitimes de manière durable dans le respect des capacités physiques et biologiques de la planète.

Depuis la conférence de Rio de 1992, les collectivités ont fait la preuve de leur capacité d'action dans la mise en oeuvre du développement durable. Le chapitre 28 de ce programme d'actions pour le XXI<sup>e</sup> siècle appelait à une mise en oeuvre massive des agendas 21 locaux dès le début des années 1990. S'il aura fallu attendre cette décennie en France pour la mise en oeuvre des 1<sup>ers</sup> programmes, les agendas 21 ont permis de lancer une dynamique importante par la suite, en poussant les collectivités à se poser de nouvelles questions et à rechercher des réponses adaptées, cohérentes et partagées. Les agendas 21 locaux sont une des principales traductions de l'intégration du développement durable dans les politiques publiques.

Le développement durable devient la colonne vertébrale qui assure la cohérence des politiques publiques. Reste que les collectivités ont des compétences et des moyens divers. Leur efficacité dépend aussi de la qualité de leur articulation avec les autres niveaux de collectivités. Si la dynamique des agendas 21, pour des raisons historiques, s'est d'abord emparée des questions écologiques et environnementales, relever les défis sociaux, des modes de production et de consommation constituent les challenges de nouveaux projets territoriaux dans un contexte de crises graves.

Ainsi, la question qui est posée aux collectivités est de plus en plus celle de leur montée en responsabilité, notamment pour la préservation des ressources et de l'environnement, de l'exigence d'équité dans la répartition des richesses (revenus, écologiques...), de capacité d'impulsion pour transformer les modes de production et de consommation. Conscientes de leurs responsabilités, elles entendent tenir toute leur place dans l'élaboration et la mise en oeuvre des politiques selon les principes du développement durable.

Mais l'atteinte de ces objectifs est conditionnée à ce que chaque niveau, international, européen, national et infra-territorial assure ses responsabilités propres. Elle est donc conditionnée à :

- l'organisation et l'articulation des différents niveaux d'intervention : la communauté internationale, les États doivent organiser et réfléchir avec les collectivités locales aux modalités selon lesquelles tous coopèrent ;
- l'orientation des ressources financières et de la fiscalité avec le renforcement des capacités d'intervention des collectivités.

La métamorphose en cours de notre civilisation ne pourra dépasser les angoisses et les blocages provoqués que si elle répond à une exigence de justice sociale et environnementale et d'approfondissement de la démocratie. C'est cette avancée démocratique qui permettra de maîtriser les bouleversements profonds des représentations antérieures, qu'elles tiennent à l'économie, aux technologies, aux modes de vie et aux mentalités.

Les collectivités y apporteront leur contribution en associant davantage les acteurs locaux, les diverses collectivités publiques, les entreprises, les syndicats, les ONG, les citoyens à l'élaboration des politiques. La réussite de celles-ci nécessite d'obtenir l'adhésion de chacun et sa contribution active. Or, l'élévation du niveau de formation, les nouveaux moyens de communication, permettent une intervention des citoyens beaucoup plus importante dans la préparation des décisions publiques et leur évaluation et une pluralisation des voies démocratiques. L'importance des enjeux nécessite que les décisions publiques s'appuient sur une élaboration avec la plus large participation possible.

Les collectivités, dans la continuité de la Déclaration des collectivités locales et territoriales françaises pour le Sommet de Johannesburg, réaffirment :

- Leur volonté de contribuer au plan d'action 21, à la Déclaration de Rio+20 selon des principes de solidarité, d'intérêt général, de transversalité et de participation ;
- Le respect de la convention d'Aarhus de 1998, pour développer et favoriser la participation du public à la prise de décision et l'accès à la justice en matière d'environnement ;
- Leur engagement en faveur de la Charte d'Aalborg (1994 et 2004) pour intégrer des principes de la durabilité dans les politiques urbaines locales ;
- Leur appui aux déclarations adoptées en vue des conférences sur le changement climatique (Copenhague, Cancún) ;
- Leur volonté de mettre en oeuvre les engagements de la Déclaration de Dunkerque (2010) sur la transition vers des villes durables ;
- Leur soutien à la Convention européenne des Maires pour une énergie locale durable (2008) ;
- Leur détermination exprimée dans la Charte des maires de France pour l'environnement (2007).

### 3- La mise en mouvement du global au local

La réussite des objectifs qui précèdent nécessitent une progression à toutes les échelles de gouvernance. Ainsi, les collectivités demandent...

- Éradiquer la pauvreté, réduire les inégalités sociales et lutter contre les discriminations, alors même que l'on constate une incapacité à tenir globalement les engagements des Objectifs du Millénaire pour le Développement (OMD), que les inégalités explosent et que la faim touche encore 1 milliard d'habitants. Il faut décider à Rio des Objectifs de Développement Durable complémentaires portant notamment sur l'accès à l'énergie et la recherche de l'autonomie alimentaire des pays.
- Gérer de façon sobre l'énergie et les ressources naturelles et assurer une stabilité des prix des matières premières et des ressources alimentaires, afin de garantir le maintien et le développement des agricultures locales.
- Garantir les équilibres écologiques – la stabilisation du climat à un niveau qui garantisse l'accès à l'eau, à l'assainissement et à l'alimentation et évite des désastres écologiques, ainsi que la protection de la biodiversité, et ce à toutes les échelles, selon un principe de responsabilité commune et différenciée.
- Construire un système de protection sociale au bénéfice de tous les peuples, alors même que la mondialisation de l'économie se traduit par la mise en concurrence des travailleurs des différents pays et la mise à mal des systèmes de protection sociale, là où ils existent, sous la contrainte des exigences économiques.
- Instaurer des mécanismes de régulation au niveau mondial, en matière financière, monétaire, commerciale et fiscale en vue d'apporter une réponse à l'instabilité économique et financière à l'origine de drames sociaux et écologiques.
- Rendre les collectivités parties prenantes des processus d'élaboration des programmes, politiques et mesures mettant en jeu leurs responsabilités dans la mise en place des politiques de développement durable, dont la lutte contre le changement climatique et l'érosion de la biodiversité.
- Donner au regroupement des collectivités territoriales le statut, d'organisation intergouvernementale, dans le cadre de l'Assemblée générale des Nations Unies.
- Constituer un Conseil de Développement Durable qui coordonne à ce titre les agences et programmes opérationnels des Nations Unies.
- Associer les collectivités locales à la négociation des réponses à la crise financière – qui ne les épargne pas – sachant que plusieurs de ses composantes – la spéculation sur des biens communs comme le logement ou l'alimentation, les déficits publics, nécessitent des réformes qui portent sur la fiscalité et les capacités de financement à long terme.
- Permettre aux collectivités locales d'accéder aux financements des banques multilatérales de développement pour la mise en oeuvre des politiques locales de développement durable et la coopération entre territoires.
- Renforcer le soutien aux actions de coopération décentralisée et de solidarité internationale qui s'inscrivent dans des démarches territoriales de développement durable, Agenda 21, Plan Climat...
- Adopter des nouveaux indicateurs, représentatifs des dimensions non évaluées par le PIB comme la qualité de la vie ou de la soutenabilité écologique et sociale (Empreinte Écologique, Indicateur de Développement Humain (IDH) ; Indicateur de Santé Sociale (ISS)...).

Aux institutions Européennes

- De consacrer des moyens financiers nécessaires aux stratégies territoriales de développement durable et de faciliter leur accès aux collectivités locales, dans le cadre des politiques européennes (politique de cohésion, politique agricole commune...).
- De veiller à la préservation de l'autonomie d'action et d'organisation des collectivités pour la mise en oeuvre de services publics à haute qualité et l'accessibilité de tous.

A l'Etat

- Poursuivre la décentralisation en appliquant le principe de subsidiarité, notamment pour la lutte contre le changement climatique et en matière de politique énergétique.
- Octroyer aux collectivités locales la capacité à produire du droit opposable en faveur de l'expérimentation et l'innovation car elles sont le creuset des innovations technologiques et surtout organisationnelles et comportementales.
- Associer les collectivités dans la définition des politiques publiques car elles prennent une place déterminante à leur réussite.
- Faire évoluer la fiscalité pour donner une marge de manoeuvre aux collectivités et leur assurer la prévisibilité indispensable de leurs ressources financières.
- Revaloriser la notion d'investissement social permettant la réorientation des marchés publics en vue des pratiques du développement durable.

### 4 - Les engagements que prennent les collectivités locales

Pour leur part, les Collectivités, par la présente déclaration, s'engagent à :

- S'inscrire dans la continuité de Rio-92 à travers la conception du développement durable liant soutenabilité écologique, justice sociale et promotion des démarches territoriales de développement durable comme l'agenda 21.
- Promouvoir la transition vers des territoires soutenables, solidaires et équitables, assurant un ancrage territorial du développement économique, en renforçant leur résilience selon une gestion écologiquement durable des ressources locales (ressources naturelles, énergies renouvelables...) et socialement responsable (emplois et innovations, technologies vertes...).
- Favoriser l'accès à l'information et assurer la participation des citoyens à la vie publique, à l'élaboration des politiques publiques et à leur évaluation.
- Rechercher l'optimisation, la sobriété et le partage dans l'usage des ressources.
- OEuvrer pour un accès à l'éducation et à l'emploi égalitaire entre toutes les catégories de la société avec une attention particulière pour la question du genre, les jeunes et les personnes en situation de handicap.
- Promouvoir la formation tout au long de la vie pour aider chacun dans les considérables mutations en cours.
- Soutenir une vision multiculturelle et solidaire du développement durable tenant compte de la pluralité des voies de développement dans le respect des cultures, des individus et des savoir-faire locaux et dans le respect de l'intérêt général.

- Faciliter un accès équitable aux besoins essentiels de proximité : eau potable et assainissement, énergie, santé, transports collectifs, logement, etc.
- Utiliser la commande publique comme levier vers le développement durable en développant les services de proximité d'approvisionnement alimentaire et énergétique, l'économie sociale et solidaire, en favorisant la relocalisation d'activités...
- Favoriser l'articulation entre les politiques de développement durable des divers niveaux de collectivités par la coopération inter territoriale.
- Contribuer à travers la coopération décentralisée à renforcer les capacités des pays en développement à progresser vers un développement durable et solidaire.
- Déployer après la conférence de Rio une nouvelle génération d'agendas 21 et autres projets territoriaux de développement durable qui en reprennent les avancées et mettent en oeuvre les principes d'intérêt général.

---

## Collège des Directeurs du Développement Durable (C3D)

Les territoires urbains durables : De l'expérimentation au déploiement de l'économie verte par les entreprises françaises.

Les territoires urbains, qui abritent désormais la majorité de la population mondiale, concentrent également les enjeux du développement durable, aussi bien environnementaux que sociétaux. Ils constituent également l'échelon territorial où les actions des différents acteurs publics et privés peuvent le plus efficacement s'articuler pour développer une économie plus verte tout en contribuant à réduire la pauvreté.

Les Directeurs du Développement Durable des entreprises françaises rassemblés au sein du Collège des Directeurs du Développement Durable (C3D) engagent ainsi leurs entreprises dans des démarches innovantes, le plus souvent en partenariat avec des collectivités locales ou d'autres acteurs de la société civile, pour réduire l'impact environnemental de la construction des territoires urbains et des activités de l'ensemble des acteurs qui y vivent, y passent, y travaillent, s'y divertissent....

Ces approches, plus respectueuses de l'environnement, s'appuient le plus souvent sur des économies de ressources ou de nouveaux modèles économiques qui, en retour, peuvent dégager des réserves de pouvoir d'achat pour les populations les plus démunies et ainsi participer à la réduction de la pauvreté.

Les territoires urbains : enjeu majeur du développement durable, de l'éradication de la pauvreté et de l'économie verte à l'horizon 2032

Notre planète devient urbaine. Depuis peu, plus de la moitié de la population mondiale vit dans des villes. Le taux d'urbanisation devrait atteindre 65% en 2050. Si l'urbanisation était déjà très forte en Europe et en Amérique du Nord, avec des taux d'urbanisation de 75 à 80%, le phénomène s'est étendu aux pays émergents et aux pays en développement.

La quasi-totalité des 2 milliard d'habitants supplémentaire que la terre accueillera d'ici 2050 se trouveront dans des villes et dès 2020, 25 métropoles hébergeront plus de 10 millions d'habitants.

Cette urbanisation, parfois très rapide et chaotique, ne va pas sans difficultés, dans les pays en développement mais aussi dans les économies les plus avancées et les villes deviennent le lieu de cristallisation des problèmes de développement durable.

L'impact environnemental est le plus immédiatement perceptible : pollution atmosphérique et piètre qualité de l'air caractérisent de nombreuses grandes métropoles. Selon la Clinton Climate Initiative, 80% des émissions de gaz à effet de serre proviendraient des villes, les principales sources étant les transports, notamment les véhicules à énergie fossile et les bâtiments. Approvisionnement en énergie ou en eau, gestion des déchets et des eaux usées, transports publics : autant de défi pour les grandes métropoles qui doivent faire face à des besoins très fluctuants au fil du temps, à l'échelle de la journée, de la semaine ou de l'année. Eviter les pénuries impose alors de dimensionner les infrastructures pour faire face aux pointes de la demande et requiert un « surdimensionnement » par rapport à ce nécessiterait la satisfaction de la demande « moyenne », ce qui ne manque pas d'avoir un surcoût économique et environnemental.

La concentration urbaine exacerbe également les enjeux économiques et sociétaux du développement durable : pénurie de logements, exode rural et accumulation de poches de pauvreté à la périphérie ou, comme au Etats-Unis, au centre de certaines villes ; fractures sociales, « ghettoïsation » et isolement ; difficultés d'accès à la ville et à ses services pour les plus âgés ou les handicapés et concentration du dynamisme, de l'activité économique ou culturelle, qui accroissent le déséquilibre entre le cœur de l'agglomération et sa périphérie ou le territoire rural de sa zone d'influence...

La liste des défis auxquels sont confrontés les édiles est longue. Les dimensions de la ville, horizontale ou verticale, la dynamique de population, la concurrence entre les agglomérations en termes d'attractivité économique pour les entreprises et les citoyens sont des facteurs de complexité accrue qui font des métropoles et de leur développement économique et social, respectueux de l'environnement, un enjeu majeur du développement durable de notre planète.

Les territoires urbains sont également le lieu privilégié d'action pour traiter ces questions essentielles du développement durable. Ils concentrent non seulement les populations, mais également les moyens d'action, techniques, humains et financiers. Ils sont également un échelon politique combinant une puissance capacité d'action, une proximité forte et une étendue territoriale appréhendable relativement aisément par l'ensemble des parties prenantes qui peuvent ainsi plus facilement coopérer.

Les grands axes de l'économie verte urbaine

Chacun des grands usages de la ville offre des pistes de développement de l'économie verte.

Se loger

78 % des français considèrent qu'il est aujourd'hui difficile de trouver un logement en France, et 76% anticipent une situation dégradée en matière de logement pour les générations à venir.

En effet, le prix et le pouvoir d'achat sont des questions absolument centrales dans l'accès et le maintien au logement. Or, la raréfaction des ressources et l'augmentation du coût de l'énergie sont des facteurs économiques aggravants, voire des accélérateurs de précarité, qui impacteront non seulement les coûts de construction, et donc les prix de vente des logements, mais aussi les charges d'exploitation.

Le logement de demain doit donc s'envisager de façon tout à fait différente. L'innovation technique et financière est probablement l'une des clés de ce changement de paradigme. La modification des comportements dans les usages du quotidien constitue également un enjeu de premier plan.

D'ores et déjà, les pratiques de la filière sont revisitées, qu'il s'agisse des procédés constructifs ou de l'intégration de la densité dans la ville.

Concernant la construction, le Plan Grenelle Bâtiment impose de concevoir dorénavant les bâtiments basse consommation. Afin que ces nouvelles exigences techniques ne

viennent pas pénaliser économiquement les acquéreurs, de nouvelles façons de construire émergent. La filière sèche industrialisée se développe. Les premières opérations pilotes permettent de livrer des bâtiments basse consommation avec des prix inférieurs de 15% dans des délais de réalisations inférieurs à un an.

Concernant, la densité, de nouvelles conceptions de bâtiments favorisant la bonne adéquation entre le bien vivre chez soi et le mieux vivre ensemble voient le jour. A titre d'exemple, le projet « Habiter le Ciel », pensé par l'Atelier Castro Denissof Casi et Nexity, dans le cadre des travaux du Grand Paris, propose des tours jardins dans lesquelles se marient qualité des logements et qualité des espaces communs partagés. L'idée est celle d'un village vertical avec des maisons superposées dans un ensemble collectif autour de cours résidentielles.

Mieux vivre son logement, et notamment mieux optimiser ses consommations, passe par davantage de services associés. Les bâtiments sont techniquement de plus en plus intelligents. Les systèmes de mesure, de pilotage, voire de délestage des fluides se développent. Dans le cadre de projets de rénovation, apparaissent également de nouveaux types d'engagements, comme les Contrats de performance énergétique qui assurent aux usagers des niveaux de consommations énergétiques maximales.

Les technologies de l'information et de la communication (TIC) apportent des solutions, déployables à grande échelle, pour assurer la maîtrise des consommations énergétiques, voire assurer la gestion des pointes de demandes et contribuer à l'effacement diffus.

Des capteurs et des actuateurs placés sur les principaux équipements consommateurs d'énergie et reliés à une centrale par des réseaux sans fil, à bas débit et à basse consommation (à la norme Zigbee par exemple) permettent de connaître en temps réel la consommation de chaque équipement et de piloter ces mêmes équipements pour ajuster, là encore en temps réel, la puissance appelée au niveau du foyer. Orange et ses partenaires du domaine de l'énergie électrique ont lancé une expérimentation d'un tel dispositif, qui connecté à Internet via la Livebox (box internet) permet le suivi et le pilotage à distance, l'analyse statistique. La connaissance fine et instantanée de la consommation permet non seulement d'optimiser celle-ci, générant des économies et une réduction des émissions de gaz à effet de serre, mais également de maîtriser les pics de consommation, évitant black-out ou recours à des énergies très carbonées.

#### Se déplacer

La mobilité est un élément essentiel pour développer et faire fonctionner les villes durables. Les interactions entre planification, gestion des déplacements et aménagement des espaces publics et privés sont nombreuses et interrogent les acteurs de la ville :

- o Quelles incidences des solutions de mobilité sur le mitage des territoires, ou au contraire sur la densité des pôles d'intérêt ?

- o Comment la forme urbaine, y compris dans sa dimension la plus locale (le bâtiment et la parcelle) influe-t-elle sur les comportements de mobilité ?

L'interface entre urbanisme et transports est un enjeu majeur. De nombreuses solutions d'optimisation sont déjà opérationnelles :

- o la gestion dynamique des voiries et des espaces publics grâce aux outils de simulation, aux systèmes d'information et de pilotage des équipements

- o le développement de l'intermodalité et de l'interopérabilité des systèmes et des services d'aide à la mobilité o le traitement de la continuité des cheminements avec une attention particulière pour les usagers les plus vulnérables et pour les modes actifs – marche à pied et vélo,

- o l'accompagnement des mutations foncières dans les zones à enjeux.

Ces solutions offrent de nombreux bénéfices :

- i. L'amélioration de la disponibilité et de l'utilisation des infrastructures existantes :

- o Pour les routes : en faisant varier la configuration des voies aux heures de pointe grâce à un package d'équipements et de services on limite la congestion, on améliore le fonctionnement de l'économie locale, tout en économisant les ressources qui auraient été nécessaire pour un élargissement ou un nouvel ouvrage (cas du pont de Saint-Nazaire ou du RER routier de Grenoble, France).

- o Pour les réseaux ferroviaires : des études d'optimisation des réseaux existants ont été conduites dans de nombreuses agglomérations françaises. Elles permettent aux populations de pôles urbains secondaires de profiter d'une offre de transport à prix réduit et d'accéder plus facilement à l'emploi et aux équipements publics.

- ii. La réduction de la place de la voiture en ville en développant de nouveaux services aux usagers : réalité augmentée, véhicules en libre service, covoiturage dynamique, ...

- o La révolution urbaine AUTOLIB (Paris et environs, France) : avec 3000 véhicules, le premier service public d'automobiles électriques en libre service développé à l'échelle d'une grande métropole européenne.

- iii. L'aide à la reconversion du patrimoine foncier mutable pour redynamiser la ville, reconquérir des quartiers ou renforcer la cohérence des dessertes et des cheminements.

- o C'est ce que permettent les démarches prospectives sur les fonctionnalités du patrimoine ferroviaire urbain, ou encore la dépollution des friches industrielles.

Pour aller plus loin, il est indispensable de continuer à développer des actions de R&D partenariales

Parce qu'il faut sortir des approches purement fonctionnalistes et technicistes qui depuis plus de 50 ans ont façonné nos systèmes de transport urbains, il est nécessaire de construire de nouveaux outils et méthodes capables d'appréhender les déplacements au travers de la complexité urbaine, de la multiplicité des attentes des utilisateurs et de la diversité des échelles à prendre en compte.

Plusieurs programmes de recherche partenariale nationaux ou européens associant des ingénieristes, des grands maîtres d'ouvrage, des constructeurs et des laboratoires de recherche viennent nourrir l'offre de service aux acteurs des territoires.

« Aspects 2050 », projet soutenu par l'Agence Nationale pour la Recherche (France) en est un exemple : ce projet doit aider les collectivités territoriales à articuler leurs actions sur le système « transport/bâtiment/occupation des sols » qui représente près de 60% des émissions de GES. La cohérence est recherchée avec des objectifs de long terme, du type « facteur 4 ».

#### Travailler

Lieu de concentration de l'habitat et l'activité économique, le territoire urbain concentre également les déplacements entre lieu d'habitat et lieu de travail avec tous les problèmes associés, exacerbés aux heures de pointe : temps perdu et gaspillage énergétique dans les embouteillages, saturation et dégradation de la qualité de service dans les transports en commun, fatigue, avec son impact sur la santé et la productivité...

Les technologies de l'information offrent de nouvelles possibilités d'organisation du travail dans l'espace et le temps. Il s'agit pas tant de développer le télétravail à domicile, qui prive de lien social et que la configuration de nombreux logements ne permet pas, mais de créer de nouveaux espaces, en zones péri-rurales, créant un lieu de travail,

à proximité des lieux d'habitation. Ces éco-centres, espaces hautement numérisés, permettent aux grandes entreprises, de créer, de façon totalement flexible, des bureaux déportés, garantissant confidentialité et sécurité de l'information, tout en créant une convivialité intra et inter-entreprises, et en économisant énergie, temps et argent gaspillés dans des transports individuels ou collectifs saturés.

En plus d'accueillir des salariés de grandes entreprises, ces éco-centres peuvent également héberger de jeunes entreprises ou servir d'espace numérique pour des activités sociales ou pédagogiques.

Des grandes entreprises comme Orange, Nexity, Bouygues, La Poste travaillent avec des collectivités locales à la définition et au prototypage de tels lieux dont le succès passera par un déploiement en réseau nécessitant d'entrée de jeu un nombre critique de lieux et d'utilisateurs. Pour y parvenir, des incitations et impulsions publiques seront nécessaires : mise disposition d'immobilier par les collectivités locales ou soutien à la phase d'investissements des projets comme cela est d'ores et déjà possible dans le cadre du programme des Investissements d'avenir.

Se déplacer pour travailler, ou plus précisément se déplacer moins pour travailler, est un autre champ de développement d'une économie verte qui peut s'appuyer sur des technologies et des services déployés par des entreprises françaises à l'échelle mondiale.

Les progrès dans la qualité d'image et de son, dans la facilité de mise en œuvre et le confort d'utilisation des solutions de vidéoconférence à très haute définition que déploient des opérateurs comme Orange Business Services sont en train de modifier en profondeur les habitudes de déplacement professionnel et de travail collaboratif, apportant qualité, gain de temps, amélioration de la qualité de vie des salariés qui n'ont plus à effectuer de longs voyages et réduction des émissions de gaz à effet de serre.

Dans une prochaine étape, grâce à la mise à disposition de ces dispositifs dans des lieux comme les éco-centres, ouverts à des acteurs économiques de tous types et de toutes tailles, les petites entreprises et les travailleurs indépendants pourront également bénéficier de ses solutions dans une logique de service et non plus de propriété des équipements (économie de la fonctionnalité)

Piloter la ville

Les enjeux du développement durable créent de nouveaux challenges urbains d'ordre environnemental, sociétal et économique. Ils renforcent la pluralité des approches à mettre en œuvre dans la conception et la réalisation des projets urbains. De nouvelles approches se mettent en place progressivement. Capables d'appréhender la complexité urbaine, elles permettent :

- o de raisonner sur plusieurs échelles, du bâtiment ou de l'infrastructure à la grande agglomération, de la parcelle au bassin de vie.

- o de mobiliser davantage de compétences pour aboutir à des projets urbains partagés et porteurs de sens : association de compétences très diversifiées – pluridisciplinaires – et des acteurs et usagers, pour des projets ouverts, co-construits.

Pragmatique et participative, la démarche de pilotage développement durable des projets « Tendem Empreinte ® », développée par Egis en 2010 illustre cette nouvelle approche.

Elle permet de définir collectivement les objectifs, les indicateurs et surtout les actions qui renforcent le caractère durable d'un projet, selon des critères locaux, en cohérence avec les référentiels des échelles supérieures. A chaque grande étape, il est possible de visualiser les bénéfices et les impacts pluridisciplinaires des choix de programmation, de conception, de mise en œuvre et d'exploitation. C'est un outil d'évaluation continue pour mesurer en continu l'écart entre l'intention et la réalisation.

Deux projets de recherche partenariale cofinancés par l'Agence Nationale de la Recherche (française)

- o le projet IMPETUS dont l'ambition est d'apporter aux collectivités des outils d'aide à la décision pour développer des projets d'aménagements urbains. Ce projet associe: Egis (leader du groupement), ICADE, la Ville de Paris, la Communauté d'Agglomération de Lille, des équipes de recherche du CSTB, du Laboratoire Ville Mobilité Transport (IFSTTAR – ex INRETS) et de l'Ecole des Ingénieurs de la Ville de Paris.

- o Le projet RESILIS propose des méthodes et des outils améliorant la résilience des villes. C'est-à-dire qu'ayant développé une politique efficace de réduction des vulnérabilités, elles soient en capacité de recouvrer plus rapidement leurs capacités économiques et de vie après un accident majeur, qu'il soit naturel, industriel ou provoqué. Le consortium Resilis regroupe des ingénieristes du secteur privé (Egis, Sogreah) impliqués dans l'aménagement urbain ou la prévention des risques, des laboratoires de recherche (EIVP - Ecole des Ingénieurs de la Ville de Paris, LEESU - département de recherche en génie urbain de l'Université de Paris-Est, REEDS - département de recherche en économie, écologie, et développement soutenable de l'Université de Versailles - Saint-Quentin-en-Yvelines) et des organismes de recherche (CEMAGREF - analyse des risques, Fondaterra, Fondation européenne pour des territoires durables).

Les entreprises françaises de Bâtiments et Travaux Publics (BTP) et les fournisseurs de matériaux excellent dans les technologies émergentes de réduction des gaspillages énergétiques dans le secteur du bâtiment. Ces technologies qui permettront progressivement de rendre passif et même positif en énergie renouvelable le parc installé seront renforcées par le développement de smart grid qui désigne les réseaux de distribution d'électricité « intelligents ».

Ces réseaux utilisent des systèmes informatiques de manière à optimiser la production et la distribution et mieux mettre en relation l'offre et la demande entre les producteurs et les consommateurs d'électricité. Ainsi, l'apport de ces systèmes informatiques concourront à économiser l'énergie, sécuriser le réseau et en réduire les coûts, tout en diminuant les émissions de gaz à effet de serre. Une expérimentation en grande réelle du premier smart grid sous technologies françaises est actuellement en cours de déploiement à Issy les Moulineaux dans le cadre du projet IssyGrid piloté par Bouygues et Alstom.

Plus globalement, les technologies de l'information et de la communication (TIC) ont un rôle majeur à jouer dans le pilotage de la ville et de ses services, au bénéfice du développement durable. Des réseaux maillés, à faible débit numérique et à très faible consommation peuvent être déployés pour connecter des ensembles de capteurs à des plateformes de services et ainsi superviser différents paramètres liés à l'environnement, à la gestion des flux ou des activités essentielles dans la ville.

L'expérimentation déployée par Orange à Cagnes sur Mer et maintenant généralisée à la Communauté urbaine de Nice permet ainsi de suivre en temps réel différents paramètres liés à la qualité de vie (données météorologiques ; pollution ; niveau sonore).

Une approche globale des territoires et de leurs usages

Des interactions entre projets et territoires nombreuses et souvent stratégiques

Un aménagement bénéfique au fonctionnement d'un quartier peut déplacer des nuisances. La non réalisation d'un équipement peut détériorer l'attractivité d'un territoire à 10 ans. La ville se conçoit dans un ensemble d'interactions avec de multiples territoires, et notamment les territoires ruraux. Des équilibres doivent être trouvés, et régulièrement renouvelés entre l'urbain et le rural : démographie, accès aux services - pourquoi pas à distance - limitation des déplacements subis, partage des ressources, ... Autant d'enjeux qui demandent une planification concertée et des évaluations partagées des politiques mises en œuvre.

Des outils d'aide à la décision pour bien définir et concerter les projets

Il faut savoir investir dans l'amont du projet, dans sa préparation. L'analyse de la valeur, les études de faisabilité, les études socio-économico-prospectives, la planification et la réalisation de schémas directeurs ou scénarios de développement sont autant d'opportunités pour intégrer les préoccupations territoriales et les usages locaux, pour sécuriser la gouvernance et le financement des projets, leur donner un cadre de cohérence

Des exemples positifs existent à toutes les échelles

o La rénovation d'un quartier d'habitation dans une ville de périphérie. Un exemple à Colomiers (France), montre comment une commune peut faire évoluer un programme :  avec une réflexion sur la densité et les rapports avec les quartiers voisins,  en transformant des logiques actuelles de déplacements et de stationnement : partage de l'espace public plus favorable aux modes actifs, prolongement d'un chemin de grande randonnée jusqu'au centre ville, diminution des voiries,  en redéployant un paysage végétal : lieux de pédagogie en faveur de la biodiversité.

Le projet de rénovation est conduit en partenariat avec les bailleurs sociaux, en concertation avec les habitants du quartier, et en cohérence avec le projet territorial de développement durable. Sa « performance DD » est suivie par la démarche Tendem Empreinte  développée par Egis,

o la R&D pour progresser dans l'approche systémique : exemple de l'appel à projet sur des IEED (Instituts d'excellence dans le domaine des énergies décarbonées)

Un consortium qui rassemble 6 leaders mondiaux et l'Institut de l'Ingénierie s'est organisé pour présenter un projet dont l'objectif stratégique est de pouvoir diminuer de 10% la consommation énergétique des villes par une analyse systémique et pluridisciplinaire au niveau de l'îlot, des « germes de ville » (gare multimodales, grands centre commerciaux...) ainsi qu'au niveau global d'une agglomération. Ce projet est en cours de labellisation par le pôle de compétitivité Advancity (ville durable et éco-technologies urbaines).

L'économie verte pour lutter contre la pauvreté

Emploi et économie verte

L'essor de l'économie verte s'accompagne d'une évolution des métiers et emplois existants, de destruction de certains - associés à un modèle économique fondamentalement non durable – et de création de nouveaux emplois qualifiés, décents et localisés.

Qu'il s'agisse d'énergie, de bâtiment, de transports collectifs, d'agriculture durable, d'accès aux services essentiels, la recherche de produits et services à moindre impact environnemental conduit à imaginer des solutions de production, transport et distribution localisées. La mise en œuvre de cet objectif de relocalisation et de proximité est conduite à la fois par des acteurs économiques (tissu entrepreneurial au sens large) et des acteurs publics (collectivités générant normes, incitations et emplois publics).

Un facteur de succès de la déclinaison localisée d'une politique de soutien à la croissance verte consiste en la capacité de chaque territoire à identifier ses enjeux, promouvoir des activités « vertes » pérennes et assurer la mise à disposition de compétences locales adaptées aux besoins. C'est donc par une politique de formation, d'acquisition des compétences, voire de constitution de champs d'expertises thématiques – calquées par exemple sur la cartographie des pôles de compétitivité - qu'un territoire peut au mieux accompagner l'essor de la nouvelle économie verte tout en garantissant que ses habitants en soient à la fois les acteurs et les bénéficiaires.

Création d'emplois verts durables et décents, filières de formation et de qualification, accompagnement public des initiatives vertueuses... : Pour que le dispositif soit pleinement équitable et soutenable, il convient de le mettre à contribution dans une perspective de réduction de la pauvreté et, spécifiquement, de réduction du taux de chômage. A cet effet, un effort particulier pourra être déployé afin de garantir qu'au sein d'un territoire les citoyens en situation de non emploi soient les cibles prioritaires d'une politique de formation, qualification et retour à l'emploi. La dynamique économique générée par la croissance verte pourra ensuite, en mode croisière, garantir un taux de chômage acceptable dans territoires engagés.

L'accès aux services essentiels

L'essor de l'économie verte dépend notamment de deux éléments prépondérants : l'accessibilité des produits et services « verts » pour le plus nombre, et son application aux secteurs les plus critiques en matière d'impacts environnementaux. Parmi ces secteurs figurent notamment l'énergie, le bâtiment, le transport, l'eau et l'agriculture, les télécommunications.

Il est notable qu'à ces secteurs sont associés des besoins fondamentaux : se loger, se nourrir, se déplacer, auxquels sont associés des enjeux particuliers : conserver un lien social, être en capacité de financer un projet d'amélioration de son quotidien, se prémunir contre certains risques, disposer de mécanismes de couverture sociale adaptés aux enjeux sanitaires, de vieillissement et de dépendance.

Le développement de la technicité, de l'efficacité et des modèles économiques spécifiques des secteurs d'activité de la croissance verte peuvent amener à l'acceptabilité financière de ses produits, à l'opposé de la croyance trop répandue que « le vert est cher ».

En particulier, des modes de production locaux, mutualisés et adaptés aux besoins d'un territoire peuvent permettre de réduire les coûts de production, d'acheminement des matières premières, de transformation et de distribution et donc le prix final des produits et services. C'est particulièrement vrai dans le domaine de l'agriculture, de l'eau et de l'énergie.

Une réorganisation des circuits de production et de distribution s'accompagne d'une refonte de la gouvernance de certains secteurs d'activités qui, de centralisés deviennent localisés

De nouveaux modèles économiques et de nouveaux modes de gestion du cycle de vie des produits peuvent permettre de combiner réduction de l'impact environnemental et accessibilité accrue aux services essentiels. Ainsi, à coté de la mise en place par les 3 opérateurs français (Orange, Bouygues Telecom et SFR) d'offres de téléphonie mobile sans terminal à prix réduits, (car sans prise en compte de la subvention du terminal dans le prix de l'abonnement), Orange a également développé la vente de terminaux d'occasion, totalement reconditionné et garantis, dans ses propres canaux de distribution.

L'implication de la force publique et des collectivités, sous la forme par exemple de partenariats public – privé au niveau des territoires, peuvent permettre l'accessibilité financière au plus grand nombre. Une ingénierie financière adaptée à la croissance verte doit également être développée, mettant en avant des mécanismes d'incitation à l'investissement via des fonds de garantie, d'évaluation du RSI liée aux usages (exemple du coût de rénovation d'un logement compensé par les économies d'énergie réalisées).

Enfin, l'accessibilité financière des produits de la croissance verte est basée sur la capacité des particuliers à investir, emprunter, et se prémunir contre certains risques. Le développement de produits du type micro crédit et micro assurance, adaptés à des besoins précis et contribuant à la réduction des impacts environnementaux est souhaitable en parallèle du développement des processus et de la gouvernance de la croissance verte.

## Facteurs clés de succès et freins à lever

La transition vers une économie verte se fera d'autant plus aisément et rapidement que certains freins seront lever et que l'ensemble des acteurs sauront mobiliser les leviers clés du succès.

Il convient en premier lieu de pouvoir mesurer les progrès globaux vers une économie plus verte et vers un recul de la pauvreté, tout en évaluant l'impact des projets individuels. Au-delà d'un retour sur investissement classique, il importe de pouvoir valoriser les réalisations dans leurs dimensions environnementales et sociétales. Ces indicateurs sont également indispensables pour faciliter les décisions d'investissement dans de nouveaux projets.

Il est également indispensable de disposer d'un cadre législatif, réglementaire ou normatif propice à l'innovation et au développement de l'économie verte : simplification, cohérence, prévisibilité en sont les principales caractéristiques, sans oublier l'indispensable équité internationale, évitant dumping environnemental ou social.

Le troisième levier est d'ordre financier et économique et peut prendre la forme de financement de projets, notamment pour lever des barrières à l'entrée dues au niveau d'investissement requis, ou d'une fiscalité verte.

Enfin, comme un enjeu majeur du développement durable est le changement des comportements et des modes de consommation, un important travail de pédagogie est nécessaire pour vaincre certains préjugés et montrer que l'économie verte ne rime pas nécessairement avec prix plus élevés ou austérité.

## Ce que RIO+20 pourra apporter

Les territoires urbains sont déjà le théâtre de nombreuses expérimentations d'innovations technologiques, de nouveaux usages ou de modèles économiques originaux. L'enjeu est désormais de déployer des pilotes à grande échelle et de généraliser les solutions expérimentées. Rio+20 devrait mettre en place, dans une dimension internationale, des dispositifs facilitant ses passages à l'échelle.

Ces actions peuvent prendre plusieurs formes :

- Soutien financier, par des dispositifs similaires à ceux mis en place par le gouvernement français dans le cadre des « investissements d'avenir » :
- Fiscalité verte, dans un cadre internationalement coordonné et équitable
- Simplification, cohérence et stabilité du cadre législatif, réglementaire et normatif, à l'échelle mondiale de sorte à éviter le dumping social ou environnemental
- Mise en place d'outils de partage et de valorisation des bonnes pratiques et de mise en relation des acteurs (réseaux sociaux)
- Valorisation, au travers de différents outils de communication, des projets au plus fort impact.
- Indicateurs, partagés par les tous les acteurs, permettant de mesurer l'impact des actions, tant au plan global que local, ainsi qu'au niveau des projets eux-mêmes, sur les dimensions environnementales et sociétales. Outre la valorisation des réalisations, ces indicateurs permettront également de faciliter les décisions d'investissement dans de nouveaux projets

Le succès de ses nouvelles approches de l'économie verte dépend non seulement de la solidité et de la pertinence des solutions technique mais aussi, et surtout, de leur appropriation par les utilisateurs finaux, qui passera le plus souvent des changements, parfois radicaux, dans les pratiques d'usages et de consommation. Cela nécessitera un important travail de sensibilisation, d'information et d'éducation, qui bénéficiera des impulsions, des orientations et des ressources que Rio+20 pourra mobiliser.

Les Agendas 21 fournissent un cadre méthodologique permettant de réunir, autour d'enjeux de développement durable, des acteurs d'un territoire dans une démarche de co-réflexion et co-construction.

Ce cadre est issu du premier sommet de la Terre à Rio qui appelait à ce que « toutes les collectivités locales instaurent un dialogue avec les habitants, les organisations locales et les entreprises privées afin d'adopter un programme Action 21 à l'échelon de la collectivité ».

RIO + 20 pourrait, sur la base d'un bilan des expériences Agendas 21 menées dans le Monde, réaffirmer la pertinence de ce dispositif au regard des enjeux d'économie verte et de gouvernance participative, et définir les leviers de succès de l'essaimage des agendas 21 : accompagnement à la mise en œuvre, mise à disposition d'outils communs, simplification de certains phases...

L'implication des acteurs économiques dans les agendas 21 pourrait être renforcée, d'une part par une volonté politique d'associer les acteurs créateurs d'emplois et de produits dans le dispositif, d'autre part par la capacité des entreprises à s'adapter à ces contextes multi parties prenantes.

L'implication des entreprises dans des stratégies de développement durable et de RSE est un moyen parmi d'autres de faire évoluer les entreprises vers la prise en compte de leurs parties prenantes, l'intégration à un territoire, l'évolution de la stratégie au regard de besoins et d'attentes nouvelles.

## SYNTHESE

Les directeurs du Développement Durable des entreprises françaises représentées au sein du Collège des Directeurs du Développement Durable (C3D) ont engagé sur les territoires urbains, lieu de cristallisation des défis du Développement Durable et de concentration des moyens d'action pour les relever, un ensemble de projets innovants et d'expérimentations qui démontrent le potentiel d'une économie verte, qui contribue également à réduire la pauvreté.

L'enjeu est maintenant de passer à une généralisation de ses approches. Rio+20, par la dynamique qu'elle a les moyens de créer au sein des états, de la société civile et du grand public, par les orientations qu'elle définira et par les feuilles de route qu'elle devra tracer, constitue une formidable opportunité de consolidation et d'amplification de ses démarches innovantes. Les entreprises qui les portent sont prêtes à s'engager, en partenariat avec les instances publiques et les autres acteurs de la société civile afin d'en assurer le succès et d'entrer dans une nouvelle phase de développement, centrée sur l'économie verte.

## Commission for Global Road Safety

### Safer Roads at Rio+ 20

A submission to the UN Conference on Sustainable Development

### Summary:

Road traffic crashes kill an estimated 1.3 million people a year and injure between 20-50 million more. More than ninety per cent of casualties occur in middle-income and low-income countries; The United Nations has launched the 'Decade of Action for Road Safety 2011-2020', describing road injury as "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals";

There is growing recognition that improving road safety can also contribute to achieving the MDGs, particularly in relation to child mortality, access to healthcare (on safe roads), and universal access to education (a million children are killed or seriously injured each year in road crashes, the majority as pedestrians). Unicef has urged that action to prevent injuries in the second decade of a child's life should become "a major international health objective";

Addressing road safety will also help to achieve environmental objectives, including action on climate change, particularly through providing a safer road system for users of non-motorised transport, such as pedestrians and cyclists, the most vulnerable road users. Providing safe facilities for non-motorised transport, and encouraging affordable and safe public transport, can reduce demand for modal shift to the car. According to the UN Environment Programme, such policies can make "a large, lasting impact...on fuel use, congestion, air quality and CO2 emissions... It is also one of the most cost-effective actions for saving hundreds of thousands of lives";

Many developing country governments, and large institutions like the World Bank, are beginning to recognise the need to prioritise road safety in the context of a sustainable transport system. But progress is slow. The gap between an institution acknowledging the issue and achieving sustained action can be bridged if road safety is included within the framework of a major international sustainability conference;

The priorities agreed at international fora like Rio+20 set the global agenda and issues that are absent from the agenda are subsequently neglected and under-funded. This is why it is so important that action to improve road safety and promote sustainable modes of transport is included in the agenda and outcomes of the Rio+20 Conference.

#### Safer Roads at Rio + 20

1. The Commission for Global Road Safety is an independent body under the Chairmanship of Lord Robertson of Port Ellen and patronage of HRH Prince Michael of Kent. It was established in 2006 by the FIA Foundation (a UK registered charity) to promote action to reverse the rising tide of road traffic injury and fatality in developing countries. Its 'Make Roads Safe' reports published in 2006 and 2009 called for the first ever global Ministerial Conference, which was subsequently held in Moscow in November 2009, and proposed that the UN mandate a Decade of Action for Road Safety, a proposal which was subsequently approved by the UN General Assembly in March 2010. Amongst the recommendations in the Commission's third 'Make Roads Safe' report, published in 2011, we call on the international community to recognise road traffic injuries as a sustainability challenge in the context of the Rio+20 Conference and discussions on a post-Millennium Development Goals framework.

2. We welcome Rio+20 as an important opportunity to identify the major sustainability challenges facing the world and to contribute to the design of a post-MDG framework that will meet the needs of developing nations in the second and third decades of the 21st Century. We strongly believe that global road traffic death and injury, and the wider but related issue of safe and sustainable transportation policy, must be recognised as sustainability challenges at the Rio+20 Conference. We urge and encourage the secretariat, member nations and participants to include reference to safe and sustainable road mobility in the 'Outcomes Document' of the Conference.

3. Road safety is perhaps not one of the more obvious subjects for consideration at Rio. Yet the absence of road safety from the agenda of the 2002 World Summit on Sustainable Development in Johannesburg, and the consequent neglect of the issue in international development fora, has arguably contributed to the growing toll of death and disability on the world's roads. According to the World Health Organization road crashes kill an estimated 1,300,000 people each year and injure between 20 - 50 million more. The vast majority – more than ninety per cent - of these casualties are occurring in middle-income and low-income countries where road safety awareness and the capacity to tackle the problem is low, and where both traffic levels and road casualties are rising rapidly (Global Status Report on Road Safety, WHO, 2009).

4. Despite the absence of road safety from the mainstream sustainable development agenda there is now a global mandate for action to reduce global road traffic injuries. UN General Assembly Resolution A/RES/64/255 has established the UN Decade of Action for Road Safety 2011-2020 with a goal to 'stabilise and reduce' road deaths by 2020. Our Commission estimates that if this ambitious goal can be achieved up to 5 million lives and 50 million serious injuries could be prevented over the course of the Decade ('Make Roads Safe: A Decade of Action for Road Safety', Commission for Global Road Safety, 2009).

5. In its Resolution proclaiming the Decade of Action for Road Safety, the United Nations General Assembly described road traffic injuries as a "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals". According to leading development experts and international agencies, the impacts of failure to address road safety can go beyond the immediate toll of death and disability to undermine policies on poverty alleviation, child survival and development, and climate change.

6. For example, the Special Adviser to the United Nations on the Millennium Development Goals, Professor Jeffrey Sachs, has recently described road crashes as "a crucial part of the overall effort" to improve the environment and quality of life in developing countries. In an interview conducted for our Make Roads Safe campaign, Prof. Sachs explained that, in his view, "the Millennium Development Goals are a broad framework and road safety has to be part of that. When there is so much death, when there is so much injury, when there is so much of a burden on poor communities, alleviating that is part of the overall strategy of fighting poverty, fighting the deaths of children, helping communities to be safe. And so this is part of the Millennium Development Goal effort" (www.makeroadssafe.org).

7. In a report for our Commission, Dr Kevin Watkins, a former development adviser to Oxfam, the UN Development Programme and UNESCO, estimates that, based on a simple calculation of the relationship between GDP growth and poverty reduction, the economic costs associated with road traffic crashes (at least US\$100 billion a year in for developing countries) are keeping between 12 – 72 million people in poverty. Dr Watkins describes road crashes as 'holding back progress towards the international development targets on a global scale', citing the impact of road injuries on children – 260,000 of whom are killed and at least 1 million seriously injured each year - and the burden on health services of dealing with road traffic injuries as having a serious impact on delivery of MDG goals 2, for universal primary education, and 4, 5 & , covering child and maternal mortality and public health (The Missing Link: Road Traffic Injuries & the Millennium Development Goals, Watkins, K; 2010).

8. Dr. Watkins' analysis is echoed in the 2011 'State of the World's Children' report from the UN Children's Fund. In the report, which focuses on adolescence, Unicef argues that older children have been neglected as a health priority. "Lasting change in the lives of children and young people...can only be achieved and sustained by complementing investment in the first decade of life with greater attention and resources applied in the second", the report concludes. Injury, and in particular road injury, is identified as an area that needs to be addressed. "Injuries are a growing concern in public health in relation to younger children and adolescents alike. They are the leading cause of death among adolescents aged 10-19...many of these deaths are related to road traffic accidents", the authors acknowledge. "Fatalities from injuries among adolescents are highest among the poor...(B)ecause the rate of urbanisation is most rapid in the poorest regions of sub-Saharan Africa and South Asia – which are also the areas with the greatest share of adolescents in the population – averting injuries in the second decade of life must become a major international health objective" (State of the World's Children Report 2011, Unicef).

9. Importantly, in the context of Rio+20, there is growing evidence and recognition that addressing road safety will also help to achieve environmental objectives. In urban areas managing vehicle speed to provide safe and accessible streets for non-motorised transport users, combined with road design measures that protect and encourage walking and cycling (such as pavements, safe crossing points and bicycle lanes), will both reduce casualties amongst 'vulnerable road users' and support greener modes of transport, reducing modal shift to motorised vehicles. Dr Watkins, the author of a major 2008 'Human Development Report' on climate change for the UNDP, also highlights that transport policy "can play a central role in combating climate change not just by creating fuel-efficiency incentives and supporting the development of low carbon fuels, but also by supporting the development of safe public transport and creating the conditions for safe non-motorised transport. When safe sidewalks and cycle lanes are available, people are far more likely to undertake trips by walking or cycling", (The Missing Link: Road Traffic Injuries & the Millennium Development Goals, Watkins, K; 2010).

10. The UN Environment Programme is also urging a change in emphasis in transport planning in developing nations to support and protect non-motorised mobility and to encourage safe and affordable public transport (low income families in developing countries can currently spend up to 25% of their income on public transport), citing the benefits for a range of environmental objectives. UNEP points out that "cities with a better modal mix between cars, public transport, walking and cycling have lower energy use per capita. By incorporating non-motorised transport facilities in the transport grid, a large, lasting impact can be made on fuel use, congestion, air quality and CO2 emissions". Furthermore, UNEP argues that "designating road space for pedestrians and cyclists in proportion to the demand for non-motorised transport is crucial. It is also one of the most cost-effective actions for saving hundreds of thousands of lives. For example, the top two countermeasures for improving safety in Nairobi, Kenya, recommended by the International Road Assessment Programme (iRAP) are pedestrian crossings and sidewalks", ('Share the Road: Invest in Walking & Cycling', UN Environment Programme and FIA Foundation, 2011).

11. Despite the projections of significant increases in car use – with global vehicle ownership doubling in the next ten years, entirely in developing countries - the majority of people in low-income countries or in the significant low-income segments of the population in middle-income countries are unlikely to ever own a car. Yet it is these people who are overwhelmingly affected by road traffic crashes and other consequences of road traffic, including poor air quality (which is estimated to contribute to 800,000 deaths a year). Designing safe transportation, urban planning and land use policies that meet the commuting, social and healthcare needs of this 'green majority' is a pre-requisite for building the 'green economy' of the future and for achieving social justice.

12. This is also increasingly recognised by the World Bank, the largest development agency making transportation loans to developing countries. In its current transport strategy (Safe, Clean, Affordable...transport for development, World Bank, 2008) the Bank highlights the importance of transport policy for achieving many of the Millennium Development Goals, and warns that in "a world with rising levels of greenhouse gases, poor road safety, and the all too frequent spread of communicable diseases along international routes, transport must be looked at anew". In particular, the World Bank warns that neglect of road safety must end, urging that "safety can be made integral to the design and management of the road transport system, just as it is in the management of other transport modes, aviation in particular. However, this concept is not yet accepted in many countries, despite the high economic and human costs of road crashes".

13. Yet it is a concept that is only now beginning to be adopted in the World Bank's own country programmes, and the loans of other multilateral development banks (MDBs). Road projects worth hundreds of millions of dollars are still being approved and implemented with totally inadequate safeguard policies relating to injury prevention. Road safety measures are often presented to client countries as an additional project cost, overlooking the long term benefits and financial returns on investment that will flow from reduced levels of road injury. By treating road safety as a 'luxury upgrade' rather than a core ingredient, client countries are discouraged from opting for safe road design.

14. In our 2006 report our Commission highlighted these failings and called on the World Bank to establish a joint taskforce to mainstream road safety assessment into their road infrastructure investments. In response the World Bank's Global Road Safety Facility did establish such a working group and together with the other MDBs agreed a Joint Statement on 'A Shared Approach to Managing Road Safety' just prior to the First Global Ministerial Conference on Road Safety, hosted by the Russian Federation in Moscow in 2009. The Joint Statement commits the MDBs to "ensure that safety is integrated in all phases of planning, design, construction, appraisal, operation and maintenance of road infrastructure...particularly to improve safe access and protection for vulnerable road users who represent a significant proportion of the people served by the projects we finance". Launching the MDB's Road Safety Initiative, in April 2011, World Bank President Robert Zoellick warned that "unless well-targeted measures are taken, there will be an escalating death toll on the roads in poor countries, which would be a terrible tragedy".

15. The Rio+20 Conference can play a critical role in encouraging such action. As we have shown above, there is now a wide recognition that road traffic injuries are a public health and sustainable development challenge that needs to be addressed, and that doing so will benefit the wider agendas of tackling climate change and working towards the Millennium Development Goals. Yet, despite this growing consensus, road safety and wider issues of sustainable mobility remain on the margins of public policy, lacking vocal advocates within government aid agencies and major institutions and consequently denied the resources needed to assist developing nations to improve their institutional capacity, skills and policies.

16. It is our view that this gap between the growing acknowledgement of the issue and achieving sustained action can be bridged if, for the first time, road safety is included within the framework of a major international sustainability conference. Identifying road traffic injury as a new challenge at the Rio+20 Conference will be invaluable in raising the profile of the issue and helping to institutionalise road safety programmes within middle-income and low-income governments and organisations like the World Bank. As we have seen in the powerful response to climate change and environmental protection following the first Rio summit in 1992, and in the united focus on achieving the Millennium Development Goals that was the major outcome of the Johannesburg Summit in 2002, the priorities agreed at these international fora do set the global agenda and issues that are absent from the agenda are subsequently neglected and under-funded.

17. Until road safety can be integrated into the mainstream of sustainability policy, millions of people will be condemned to unnecessary and preventable violent, painful deaths, or lives blighted by severe disability. This is why it is so important that action to improve road safety and promote sustainable modes of transport is included in the agenda and outcomes of the Rio+20 Conference.

---

## Commissioner for Sustainable Futures of Wales (UK) and Cynnal Cymru

Rio +20 United Nations Conference on Sustainable Development.

Zero Draft Submission

This submission is presented by the Commissioner for Sustainable Futures in Wales (United Kingdom) and Cynnal Cymru, an organisation representing networks and sustainability practitioners across Wales that works in support of our Commissioner for Sustainable Futures.

Wales has had a legal duty to sustainable development since its regional government was established in 1999. As a nation, we have promoted sustainable development in all of our work, and our Welsh Government has made sustainable development its central organising principle. We recommend that other nations and regions also commit to making sustainable development their central organising principle, to ensure that sustainable development is at the heart of everything they do.

The next step for Wales is to introduce legislation to make sustainable development the central organising principle for all public bodies in Wales. We are learning from the experiences of countries around the world about how to turn this from a legislative requirement into successful delivery. We expect that this Sustainable Development Bill will become law by 2014.

In Wales we have a Commissioner for Sustainable Futures, Peter Davies, who is appointed to provide leadership for sustainable development in Wales (<http://www.cynnalcymru.com> commissioner). Peter provides independent advice to the Welsh Government on sustainable development, and is able to convene stakeholders from across Wales to drive action on sustainability.

We recommend that all states and regional governments appoint a Commissioner of their own, who at a minimum is able to act as a focal point for action on sustainable

development across civil society, and who has the power to convene stakeholders to make sustainable development their central organising principle. This role of catalysing and encouraging action will be important in creating support for sustainable development amongst the populations of member states and regions.

We recommend that the United Nations considers developing a global network of Commissioners for Sustainable Futures, to share good practice and enable action across the globe.

We emphasise that to be successful, Commissioners for Sustainable Futures need to be genuinely independent of their government but able to speak with authority to government, and are able to act across all sectors, to see the whole picture of sustainability.

In Wales, the Commissioner for Sustainable Futures is supported by Cynnal Cymru - a network organisation representing practitioners and stakeholders across Wales with an interest in sustainable development. This model is effective as it enables the advice and recommendations of our members, businesses and society to contribute to the advice and evidence the Commissioner for Sustainable Futures provides to government.

As a membership organisation Cynnal Cymru is the hub for an active community of individuals and organisations delivering sustainable development across Wales. We recommend that Commissioners across the world work in partnership with similar organisations in their own countries to ensure that they develop good relationships with practitioners.

We are keen to share our experiences and the lessons we have learned on sustainability in Wales with other nations.

---

## Committee for Nature Conservation Polish Academy of Sciences

### Concept of Continental and Oceanic Protected Areas as a Key to Sustainable Development

The key to the conservation of nature on the global scale is the protection of two fundamental elements: water, as a carrier of the entire life on the Earth, and large earth's surface areas, as measurable values indispensable to the existence of all forms of life.

#### Abstract

Thus far, existing system of nature conservation, which is mainly based on national parks and reserves, is insufficient. These traditional forms protecting wildlife, fresh and saline waters, geological formations and natural landscapes cover too small earth's surface areas on the global scale. Human pressure on ecosystems, which is constantly growing and is strictly connected with economic expansion and population growth, forces us to search for different, bold and far-reaching solutions. Thus, the author proposes a new concept, which divides the world into two parts: economic and protected zones. The latter ones would be in the form of Continental and Oceanic Protected Areas (CPAs and OPAs).

#### Background

Looking back on the Earth Summit in Rio de Janeiro in 1992, it becomes obvious that in reality the conference did not bring about any clear trends in stopping or reversal of the destruction of wildlife and natural resources. This was only confirmed by the next conference in Johannesburg in 2002 and biodiversity conference in Nagoya in 2010. Although the documents, which were adopted in Rio de Janeiro, like Global Action program-Agenda 21, Declaration on Sustainable Development of Forests, Framework Convention on Climate Change, and Convention on Biodiversity, set new directions of thinking and actions in nature conservation, they did not halt the processes of forests and freshwater resources destruction, marine water pollution, or extinction of plant and animal species or whole ecosystems. The main reasons behind these negative environmental changes are: rapid population growth, observed predominantly in countries of high biodiversity (e.g. India, Philippines, Indonesia, Brazil, Mexico); improper land use, causing strong soil erosion (e.g. Madagascar, Haiti, Ethiopia); accelerated economic growth, which results in taking huge areas of land for the urban development with its industrial infrastructure and hydraulic engineering (e.g. China, USA); and military conflicts, creating almost impossible conditions for organized wildlife conservation (e.g. Iraq, Afghanistan, Sudan). Another dangerous factor, which should be taken into consideration, is pollution of the natural environment by chemicals and toxic wastes of anthropogenic origins, which have destructive effects on soil, atmosphere, fresh and marine waters. Uneconomical usage of nature resources such as overexploitation of forests, grasslands, freshwater reserves and soils, is the main cause of droughts, fires, floods, mudslides and hunger in many places all over the world. Traditional national parks and wildlife reserves, which since 19th century have been established for the conservation of nature, have their total surface area too small in relation to whole continents and oceans to make an effective impact on sustaining the ecological balance of our planet in the future.

Biosphere reserves created within the framework of the UNESCO Program "Man and the Biosphere" can be still perceived as rather an experimental program in the matter of man's coexistence with nature than an effective tool for environmental protection.

The NATURA 2000 network of protected areas, which has been recently developed within the European Union, may function relatively well in transformed and mostly synanthropic conditions of Western Europe. However, it would be difficult to implement this idea in vast areas of wilderness in Eastern Europe, where, as in the case of Russia, the nature reserves called "Zapovednik" works extremely well. In recent years, two very interesting initiatives came into existence such as Global 200 and Biodiversity Hotspots. The Global 200 pointed out the worthiest ecoregions of our planet, which deserve protection on account of their different natural values.

While Biodiversity Hotspots catalogues areas of the greatest concentration of biodiversity in the world. However, both above mentioned initiatives focus mainly on biodiversity conservation. The presented here concept of Continental and Oceanic Protected Areas is novel in this respect that not only shows where but also how to protect nature on the global scale. Nature conservation is perceived here in context of its interaction with human economic activities and settlement, thus in the wider dimension than above mentioned initiatives. It involves the regeneration of nature's values, especially freshwater resources, which were destroyed by long-lasting human activities, on the huge surface areas of continents by using native species preserved in refugia. It places emphasis on the global protection of areas, which are strategically important for freshwater sources and soils. It proposes concrete legal solutions in two dimensions: spatial structure and international legislation of CPA and OPA.

#### Concept of Continental and Oceanic Protected Areas

Till now, the protection of areas, which are strategic sources of freshwater such as mountains and zones around watersheds, has not been legally regulated on the global scale and this is one of the main goals of the presented here idea.

The above issues were not dealt with in the UN Convention to Combat Desertification of 1994. The Ramsar Convention did not solve problems concerning the protection of wetlands, as being reservoirs of water, due to the limited territorial range of this Convention and its main focus on only one subject- avifauna protection. Equally important element, which should be protected on the global scale, is soil. It constitutes the base of the natural cycle of life in all ecosystems. Soil is the basis for feeding of mankind and it accumulates more carbon than atmosphere and forests taken together.

Therefore, the author's concept proposes a division of world's areas into economic and protected parts. Protected zones such as: Continental Protected Areas- will be

established to protect nature and especially freshwater resources and Oceanic Protected Areas- will be established to protect the richest and the most interesting primeval marine ecosystems. This idea includes all continents and the World Ocean, and it aims at creating a legally binding, unified global network of vast areas protecting nature with all its aspects in the future.

Inherent in this vision is the assumption that the nature and its resources can be effectively protected only within vast continental and oceanic areas.

Continental Protected Areas (CPAs) constitute a new large-scale form of nature conservation with strictly defined boundaries. Depending on the adopted variants, CPAs can comprise 25-40% of the total area of continents and in the case of Antarctica even the whole continent. The proposed here value of 40% should be accepted as optimal and crucial to provide 9 billion people with sufficient amount of freshwater, for maintenance and regeneration of soil, and to improve climate conditions in the 21st century.

As a priority, CPAs would encompass mountains, zones around watersheds and large catchment areas with wetlands such as to mention a few: the Himalayas, the Tibetan Plateau, Pamir Mountains, Tien Shan, Caucasus, the Sikhote-Alin with the Amur Basin, the Valdai Hills, Dinaric Alps, the Atlas Mountains, the Rwenzori Mountains, the Rocky Mountains, Pacific Coast Ranges, the Sierra Nevada (U.S.), the Appalachians, Andes, Guiana Shield, the Mato Grosso Plateau, the Australian Alps, Amazon Lowlands, Congo Basin, Pantanal, basins of lakes e.g. Superior, Tanganyika, Malawi, Baikal, and Hudson Bay Lowlands, West Siberian Plain with their large peat deposits. They are sparsely populated areas with relatively well-preserved wildlife and extensive woodlands or especially important for the protection of pure freshwater resources.

Furthermore, vulnerable ecosystems with high biodiversity such as grasslands (steppe, savanna), little damaged arid areas like large part of Mongolia, Kazakhstan, Patagonia, Gran Chaco, Eastern and Southern Africa as well as large continental islands with their unique wildlife like New Guinea, Borneo, Celebes, Tasmania, Madagascar, and finally, large river deltas, strategically situated and adjacent to protected sea marine coasts of outstanding natural beauty should also be subjects to special protection within the framework of CPAs.

CPAs have to encompass unique, native or ethnic human cultures, which have preserved their traditional way of living up to now, with protection-e.g. Kalahari Bushmen, Pigmies from Central Africa, Amazonian tribes, Australian Aborigines, Papua New Guinea's tribes, Asia's nomads, the Inuit.

It is also very important to support the traditional agriculture and reforestation. Controversial projects of building dams such as on the Mekong, Salween, Omo and Xingu rivers pose the threat of destruction to whole ecosystems and traditional ways of living of existing there cultures. However, the primacy of the conservation of nature and its resources should be applied over any economic activities within all CPAs. The new building industry ought to be restricted here to already existing settlement units to prevent annexation of further surface areas and to protect the natural landscapes.

It is also necessary to provide wild animals with access to watering places and free migrations. It should be stressed that exploitation of non-renewable ground waters need to be restricted or forbidden within the all CPAs (especially in desert areas in North Africa and Arabian peninsula). The same concerns industrial exploitation of freshwater from mountain glaciers and ice sheets, which are endangered in a natural way by global warming e.g. Greenland. Considering their goals, CPAs should cover from thousands to millions of square kilometers and, if possible, may include whole physical & geographical units.

Major urban, industrialized and mining areas located within CPAs will not constitute their parts but will remain as internal enclaves with strictly defined boundaries and receive a special economic status of so called –Industrial Urban Zones.

Fig.1. The scheme of the Continental Protected Area CPA

[UNDESADSD: Please download the original document to view fig.1]

Another important matter is the far-reaching effect of CPAs on adjacent agricultural, urban and industrial areas, especially in the warm climate zones. CPAs will not only provide them with pure drinking water and water for industrial purposes but also, undoubtedly, have an influence on improvement of climatic conditions especially on the regional scale through its softening, increasing of rainfalls in arid areas and decreasing of air pollution (e.g. Central and South-West Asia, Maghreb, Sahel). This will be possible due to maintaining and to gradual large-scale enlargement of afforested surfaces and the reconstruction of other native vegetations within CPAs.

The main goal of CPAs establishment, in sparsely populated polar-boreal and equatorial regions, is a conservation of nature on a MEGA scale, and also reparation of the environmental damages caused by human activities. In the future, surface waters of boreal terrains would become freshwater reserves for people living in the dry tropical zones. Additionally, protection of vast boreal peat bogs will prevent emission of large amount of methane, which is one of the most important greenhouse gases. Setting-up of CPAs in the moderate and the tropics zones, which are the human domain for millennia, consists in utilizing often the last bastions of nature to restore gradually their native vegetation both forest and graminaceous in ecologically suitable regions all over the particular CPA. It would give a real chance to restore sources of fresh water. This, in turn, would enable the reintroduction of the native animal species into restored environment and the gradual reconstruction of the whole original ecosystems.

However, if these actions are to be effective, the nature protection must be carried out over extensive areas of whole mountain ranges such as Taurus, Mountains of Syria and Lebanon, Atlas, Zagros, Altai, Tien-Shan, Hindu Kush, Sierra Madre, Bolivian/Peruvian Andes, Serra do Espinhaço, Serra Geral, Eastern Ghats, or even more arid, like the Kunlun Mountains, Kopet Dag, Tibesti, Ahaggar, Darfur, Ennedi or the mountains of Arabian Peninsula. These actions should be first undertaken in the mountains and upland terrains characterized by a more humid climate e.g. the Himalayas, Elburs, Pontic Mountains, Annamite Mountains, or more populated Andes in Columbia and Ecuador, Mountains of Cuba and Sumatra, Western Ghates, Qinling Mountains, Nanling Mountains and Mountains in Africa: Fouta Djallon, Mitumba, Muchinga or Abyssinian Highlands, Plateaus: Adamawa, Bie, Azande and Lunda.

Long-term and long-lasting effects of these actions will be significant for the maintaining the hydrologic balance in the neighboring catchment areas of large rivers and lakes, which should be included within CPAs, e.g. the Niger Basin, the Upper Nile Basin, the Okavango with its delta, the Senegal River, the Tarim River or basins of: the Brahmaputra, the upper Uruguay River, and Lakes: Titicaca, Victoria, Tana, Bangweulu, Turkana, Chad, Urmia, Van, Balkhash, waters of Turan

Plain or wetlands of Sumatra.

The regeneration of forests and soils will bring about improvement of fresh water retention and purification through its filtration and biochemical interactions.

There are many examples illustrating interactions and interdependences between large mountain ranges and areas of intensive economic development such as: the Himalayas and Karakoram- the Indus and Ganges Lowlands; the Tibetan Plateau- China's Eastern Lowlands; the Mountains of Kurdistan-the Mesopotamian Lowlands; the Drakensberg-eastern part of South Africa and Lesotho, the Sierra Nevada-Californian valleys; the Mantiqueira Mountains-São Paulo and Rio de Janeiro; the Great Dividing Range- the Australian east coast.

The cooperation among China, India, Pakistan, Bangladesh, Nepal and Bhutan aimed at complex protection of the Himalayas and Karakoram within CPA could bring about spectacular effects and improve not only agricultural conditions but also protect the freshwater resources in the adjacent Indo-Gangetic Plains. Such concerted international actions undertaken to establish CPAs may also address other problems: extensive farming, tourism, difficulties of rural life, freshwater fishery, and spatial planning or nature conservation *sensu stricto*.

Another important matter is the far-reaching effect of CPAs on adjacent agricultural, urban and industrial areas, especially in the warm climate zones. CPAs will not only

provide them with pure drinking water and water for industrial purposes but also, undoubtedly, have an influence on improvement of climatic conditions especially on the regional scale through its softening, increasing of rainfalls in arid areas and decreasing of air pollution (e.g. Central and South-West Asia, Maghreb, Sahel). This will be possible due to maintaining and to gradual large-scale enlargement of afforested surfaces and the reconstruction of other native vegetations within CPAs. The main goal of CPAs establishment, in sparsely populated polar-boreal and equatorial regions, is a conservation of nature on a MEGA scale, and also reparation of the environmental damages caused by human activities. In the future, surface waters of boreal terrains would become freshwater reserves for people living in the dry tropical zones. Additionally, protection of vast boreal peat bogs will prevent emission of large amount of methane, which is one of the most important greenhouse gases. Setting-up of CPAs in the moderate and the tropics zones, which are the human domain for millennia, consists in utilizing often the last bastions of nature to restore gradually their native vegetation both forest and graminaceous in ecologically suitable regions all over the particular CPA. It would give a real chance to restore sources of fresh water. This, in turn, would enable the reintroduction of the native animal species into restored environment and the gradual reconstruction of the whole original ecosystems.

However, if these actions are to be effective, the nature protection must be carried out over extensive areas of whole mountain ranges such as Taurus, Mountains of Syria and Lebanon, Atlas, Zagros, Altai, Tien-Shan, Hindu Kush, Sierra Madre, Bolivian/Peruvian Andes, Serra do Espinhaço, Serra Geral, Eastern Ghats, or even more arid, like the Kunlun Mountains, Kopet Dag, Tibesti, Ahaggar, Darfur, Ennedi or the mountains of Arabian Peninsula. These actions should be first undertaken in the mountains and upland terrains characterized by a more humid climate e.g. the Himalayas, Elburs, Pontic Mountains, Annamite Mountains, or more populated Andes in Columbia and Ecuador, Mountains of Cuba and Sumatra, Western Ghates, Qinling Mountains, Nanling Mountains and Mountains in Africa: Fouta Djallon, Mitumba, Muchinga or Abyssinian Highlands, Plateaus: Adamawa, Bie, Azande and Lunda.

Long-term and long-lasting effects of these actions will be significant for the maintaining the hydrologic balance in the neighboring catchment areas of large rivers and lakes, which should be included within CPAs, e.g. the Niger Basin, the Upper Nile Basin, the Okavango with its delta, the Senegal River, the Tarim River or basins of: the Brahmaputra, the upper Uruguay River, and Lakes: Titicaca, Victoria, Tana, Bangweulu, Turkana, Chad, Urmia, Van, Balkhash, waters of Turan Plain or wetlands of Sumatra.

The regeneration of forests and soils will bring about improvement of fresh water retention and purification through its filtration and biochemical interactions.

There are many examples illustrating interactions and interdependences between large mountain ranges and areas of intensive economic development such as: the Himalayas and Karakoram- the Indus and Ganges Lowlands; the Tibetan Plateau- China's Eastern Lowlands; the Mountains of Kurdistan-the Mesopotamian Lowlands; the Drakensberg-eastern part of South Africa and Lesotho, the Sierra Nevada-Californian valleys; the Mantiqueira Mountains-São Paulo and Rio de Janeiro; the Great Dividing Range- the Australian east coast.

The cooperation among China, India, Pakistan, Bangladesh, Nepal and Bhutan aimed at complex protection of the Himalayas and Karakoram within CPA could bring about spectacular effects and improve not only agricultural conditions but also protect the freshwater resources in the adjacent Indo-Gangetic Plains. Such concerted international actions undertaken to establish CPAs may also address other problems: extensive farming, tourism, difficulties of rural life, freshwater fishery, and spatial planning or nature conservation *sensu stricto*.

Oceanic Protected Areas (OPAs) are a consistent continuation of the idea of creating huge CPAs, which would naturally complement each other and increase effectiveness of thus formed global network. OPAs, being a new large-scale form of nature conservation with strictly defined boundaries, may encompass 20-30% of the entire World Ocean, depending on the variant adopted. The recently postulated 10% target value of marine protected areas is not enough ambitious and impossible for the realization of sustainable development for 9 billion people around 2050. OPAs would comprise first of all: seas with coral-reefs; economically important polar seas and cold sea-currents, species-rich shelf waters; seas and other parts of the ocean, not necessarily species-rich, but considered unique for other reasons: ocean trenches, oceanic and marine areas with surface and underwater volcanic activities; oceanic islands with their surrounding waters; littoral zones, especially with mangroves; waters rich with colonies of the brown algae, which form prominent "subaqueous forests" and are one of the main producers of the Earth's oxygen.

Adopting the above guidelines, it would be highly recommended to place the following areas under legal protection within the framework of OPAs: the whole Red Sea with large part of its coasts; most world mangrove forests; vast areas on the Western Pacific Ocean rich in coral reefs; the region of the Mozambican Canal; the unique Sargasso Sea; a part of the Caribbean Sea; the Adriatic Sea; the whole Southern Ocean around Antarctica; the Arctic Ocean, Baffin Bay and the Bering Sea; and even unique though with sparse wildlife the Black Sea. Additionally, this legal formula would encompass archipelagos of small islands or single islands with extensive marine areas around them such as the islands of Andaman and Nicobar, Socotra, New Caledonia, the Solomon Islands, the Kuril Islands, the Queen Elizabeth Islands as well as waters surrounding already protected islands of Galapagos and Aldabra.

Special protection within OPAs should be provided to seas, waters of open oceans and coastal waters along the continents which are strategic breeding sites and biology for about 70-90% of fish and other animal groups, and which play a fundamental economical role in feeding the world. Thus, it is also important to restore of mangroves and coral-reefs where it is only possible.

Particular attention should be paid to the problem of protecting long coastal zones with river-mouths, which are main migration routes of fish. The main threat for oceans' ecosystems is trawling, which not only destroys the ocean bed on the huge scale but also kills many economically crucial but endangered species.

In a similar way to CPAs, within OPAs, the primacy of the conservation of nature and its resources should be applied over any other human activities. Each particular OPA would be divided into two zones: conservation zone consisting of national parks and reserves (under relevant states jurisdiction) and commonly managed zone (remaining areas), where exploitation of living marine resources would be subject to strict international control.

Similar to CPAs, major urban, industrialized and mining areas located within OPAs will not be their integral part, but will remain internal enclaves- Industrial Urban Zones-zone with strictly defined boundaries.

Fig. 2. The scheme of the Oceanic Protected Area OPA

[UNDESA/DSD: Please download the original document to view fig.2]

#### Conclusion

Formation of a global network of Continental and Oceanic Protected Areas is based on easily understood and simple principles, which would constitute a legally binding international convention and preferably implemented under the patronage and supervision of the United Nations Organization in the future. It seems to be the best option justified by the fact that in the case of OPAs large part of their areas is referred to as the common good of all mankind, and does not come within the jurisdiction of any state.

At present, the conservation of nature, which is solely founded on arguments postulating the need of biodiversity protection motivates neither developed nor developing countries. Only additional coordination and integration of the wildlife conservation with fresh waters and their sources, marine waters and forests protection, preventing soil erosion, spatial planning and rational settlement policy may stimulate people to act practically for their own sake and lead to successful sustainable development.

Restoration of large forest areas, grasslands and soils within some CPAs, destroyed by humans in the past, will considerably contribute to reduce the amount of CO<sub>2</sub> in the atmosphere, which in turn will have positive effect on the stabilization of global climate and conditions of the adjacent agriculture areas in the future.

Summing up, this concept creates new vision of the world economic and agricultural development at the beginning of the third Millennium founded on innovative principles of the coexistence of humans and nature, and if implemented, will allow both sides to survive as long as it is only possible.

## Commons Action for the UN

SUBMISSION BY COMMONS ACTION FOR THE UN, THE ASSOCIATION OF WORLD CITIZENS, INSTITUTE FOR PLANETARY SYNTHESIS, ET AL

### EXPECTATIONS FOR THE OUTCOME OF RIO+20

We suggest that the following statement be used in either the Political Declaration and/or Outcome Document. Support for this recommendation is included in the rest of the submission below.

A Commons Based Approach to Creating a Sustainable "Green" Economy and Implementing Sustainable Development shall be developed at all levels of government so that all stakeholders can participate actively in developing, managing, and maintaining and can then share equitably in the usage and benefits coming from resources that all need to survive and thrive and that must be held in common by the community at large -- be it local, regional or global.

### FULFILLING EXISTING COMMITMENTS AND SHIFTING TO A COMMONS-BASED ECONOMY BASED ON THE WELL-BEING OF ALL PEOPLE AND NATURE

The international community must take the steps needed to fulfill all of the agreements and commitments on sustainable development that have been made during the past twenty years.

Thus, significant improvements are needed to put in place the specific means, mechanisms, and funding still required and to deal responsibly with the following stumbling blocks:

- humanity is exceeding the carrying capacity of the planet and depleting the natural resource base;
- the demands and needs for better living conditions by a rapidly growing global population are escalating;
- the present debt-based economy and neo-colonialism are at war with nature and humanity;
- the present structure of national economies lack the flexibility to include stakeholder interests in an inclusive manner.

Since the above challenges can be met by a commons-based approach, we urge Governments to act forthwith to shift from an economy measured by increases in production and consumption to one based on protecting the global commons, including the well-being of humanity and nature, as addressed by UN Resolution 65/164 on Harmony with Nature.

This would require:

- increasing, with the help of Civil Society, the amount, diversity and availability of those natural and social resources needed for all people to thrive (commons goods);
- the UN to develop within a year a process, including all stakeholders, to place a stable and adequate cap on the use of depletable natural resources;
- involving all people in decision making based on the subsidiarity principle, bearing in mind that people's sense of responsibility will increase to the extent that they are conscious of their own role in addressing today's crises.

The above three points are characteristic of a commons based approach to sustainable development. It is thus essential that such an approach be included as a fundamental basis for implementing the program of action and achieving the goals set forth in the Outcome Document.

As a first step, we recommend that a panel of experts be developed within the UN system, to work with relevant stakeholders including CSOs, to develop and propose a plan to bring about the necessary shift to a Commons Based Approach to Sustainable Development, moving away from unsustainable minority rule and toward democracy and global survival.

### A COMMONS APPROACH TO SUSTAINABLE DEVELOPMENT

Would require and ensure that:

- all people recognize that the Earth is a living system of interconnected components on which all life depends. (UN Resolution 65/164 on Harmony with Nature.)
- if a commons-based economy is to become global, humankind must shift from a win/lose or human-centered win/win orientation to an all-win approach to life that takes into account the well being of all people as well as nature.
- All people, in accordance with international human rights agreements, equitably share the wealth that is derived from Commons Resources, and will enable humanity to fund much needed sustainable development and the transition to a sustainable "green" economy.
- the people as a whole cooperatively and responsibly develop, manage, maintain, and equitably share in the use and benefits coming from resources that must be held in common and managed in a healthy and sustainable manner by the community at large to ensure access by all who need them to survive and prosper, thereby creating Commons Resources.

One of the best examples of a Commons Approach is the Participatory Budget Process that was initially developed in Curitiba, Brazil. Another example, is the participatory local agenda 21 sustainable community planning processes, where interested stakeholders help in developing a plan for the community to become as sustainable as possible. And third, myriad examples can be found in many Sarvodaya communities, ecovillages, "transition towns", cooperatives, and indigenous communities around the globe where collaborative decision making, planning, and implementation are often carried out by the community members as a whole, with the benefits from such processes being equitably shared by all of the people in the community as well. See for example: [www.ecovillage.org](http://www.ecovillage.org) and [www.transitionnetwork.org](http://www.transitionnetwork.org)

A Commons Approach to Sustainable Development includes the following 5 characteristics:

- Commons Goods: those fruits of nature and society that all need to survive and thrive. They include the atmosphere, oceans, forests, biodiversity, all species of life, natural systems, minerals; food, water, energy, spiritual and health care; information, art, culture, society, technology, media, trade and finance
- Commoners: Groups of people who share the resources (users, producers, managers, providers)
- Commoning: inclusive, participatory and transparent forms of decision making and rules governing people's access to and benefit from these commons resources
- Boundaries: specifying community membership and the extent of the resource
- Value: created through the preservation or production coming from these commons goods and resources

#### PRINCIPAL OUTCOMES OF THE RIO+20 PROCESS

The principal elements that the Rio+20 Secretariat has identified are all essential components for a successful outcome of the Rio+20 process and conference. UNCSO does need to develop and put in place the specific means and mechanisms needed to fully implement a green economy roadmap, a framework for action, sustainable development goals, and most importantly a revitalized global partnership for sustainable development.

A complete plan thus needs to be developed that is sufficient to fully fund and implement each of these components. In addition each of them should include and be based upon a Commons Approach to Sustainable Development. Indeed a Commons Approach could provide the fundamental basis for establishing and renewing our global partnership for sustainable development. We include many examples below for how such a partnership could be further developed and carried out.

#### 3GREEN ECONOMY IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT AND POVERTY ALLEVIATION

##### Measures to Shift to a Commons-Based Global Economy

1. Shifting from present economic indicators measuring production and consumption to ones measuring the well-being of people and nature;
2. Placing strongly enforced caps on the use of depletable resources to prevent further degradation;
3. Auctioning permits at source for the use of those resources that fall outside of the cap (this would remove the need to set a specific price on the use of natural resources and allow the price for the exploitation of non-capped resources to be divided by all subsequent users);
4. Shifting taxes onto the use and ownership of land and natural resources and off of labor in order to fund the transition to more sustainable practices. We urge government at all levels to introduce the public collection of the economic rent of all land and all natural resources and to apply the receipts to reducing taxes on wages, goods and services. The Earth Rights Institute offers an on-line course, developed in consultation with UN Habitat, describing how such an approach can be applied. See: [www.course.earthrights.net](http://www.course.earthrights.net);
5. Using the resulting income to restore and replenish depletable resources, recompense stakeholder communities and to establish a global trust to provide a basic income for all people;
6. Recognizing the importance of international agreements such as the UN Charter, the Universal Declaration on Human Rights, Geneva Conventions, International Covenant on Economic and Social Rights, Declaration on the Rights of Indigenous Peoples, Kyoto Protocol and associated Workplans, Agenda 21, and Johannesburg Plan of Implementation that promote democratic participation in planning sustainable development;
7. Implementing the global footprint to assess economic performance (including corporations); 8. Recognizing that Ecocide is a Crime Against Peace and Life (iv) that is prosecuted under universal jurisdiction;
9. Creating a World Environmental Court where crimes against nature can be prosecuted under universal jurisdiction;
10. Implementing in all governmental decision making the all-win principle which recognizes that since all people and all of nature are parts of one integrated whole, the well-being of all people and all of nature are essential to us all.
11. True environmental costs of production and consumption must be internalized into accounting models in order to address the causes rather than simply the symptoms of environmental degradation.
12. Intellectual Property Rights have begun to hamper humanity's capacity to adapt to emerging issues and other global challenges. The extension of their applicability is also used now to hamper progress and further enclose the commons and should not be accepted nor permitted. Open source and General Public Licenses are commons-based alternatives that ought to be instituted instead.

#### INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

##### Fostering responsibility through the subsidiarity principle

Today's crises result from the total actions taken--and not taken--by all people worldwide. The sense of shared responsibility and consciousness of the consequences of their way of life will increase to the degree the principle of subsidiarity is applied. Through transparent, inclusive, participatory, intergenerational, gender-sensitive decision making with regard to those fruits of nature and society that each needs to survive and thrive, each person is confronted by the costs of their actions with regard to commons goods such as clean drinking water, hygiene and waste management.

Also, if people are living in a state of inner or outer poverty, the UN will not be able to achieve its mission and goals. A commons approach to sustainable development must thus be developed in such a way as to lead to inner peace, freedom, and fulfillment of all of the rights contained in the Universal Declaration of Human Rights -- thus overcoming the challenge of both spiritual and material poverty which is a precondition for establishing a sustainable "green" economy.

##### Significantly Strengthening, Funding, and Empowering UNEP

UNEP should be transformed into an adequately funded Specialized Agency with binding and enforceable powers. All people and stakeholders need to be fully included, and their rights protected, in all of the processes and activities carried out by or through a revitalized and empowered UN Environment Agency.

##### Significantly Strengthening, Empowering, and Democratizing CSD

The Commission on Sustainable Development should be transformed into a Permanent Commission under the UN General Assembly and/or the Economic and Social Council should be transformed into a Permanent Sustainable Development Council with the power to make binding and enforceable decisions and actions. Stakeholders and other

interested parties should be integrated fully in all levels of decision-making under and within the processes of the new Commission or Council; and it should be much more participatory in nature.

The new Council should include an Outcome Based Process which focuses on fully achieving the specific goals and commitments that have already been made. This would require that the Council, led by each Chair, focus on a limited number of specific goals at any one time and then proceed to determine and put in place (with the help of the UN Secretariat and interested stakeholders) the specific means, mechanisms, and funding needed to fully implement and achieve each of the targets and goals.

An intergovernmental committee should be set up which includes representatives of, along with the broadest possible input from, civil society and the Major Groups in order to develop recommendations for how the new Council could be structured and operate in a much more effective manner. For example, the existing consensus process could and should be augmented, when necessary, with the use of qualified majority votes.

#### Implementing Local to Global Sustainability Strategies and Action Plans

The UN needs to develop a partnership initiative, protocol, and/or processes to assist all communities and countries in developing and implementing their local and national strategies for sustainability; local and national action plans on Sustainable Consumption and Production; activities related to the UN Decade on Education for Sustainable Development; Poverty Reduction and Strategy Programs (PRSPs); International Court of Justice decisions; UN Decolonization Committee recommendations; and Multi-lateral Environmental Agreements (MEAs). These processes need to include a Commons Approach to Sustainable Development and be brought together and integrated across all levels and sectors of society from the local to the global.

A specific means to provide the funding that was promised in Chapter 28 of Agenda 21 for Local Sustainable Community Planning and Implementation, but which has never been forthcoming, must finally be included in the Rio +20 outcome agreement. A number of commons-based funding mechanisms are suggested and described in the section on Gaps in Implementation below.

#### EMERGING ISSUES

It is often recognized at CSD that many of the Emerging Issues and challenges are interdependent and cross-sectoral in nature. Unfortunately however, implementation is often based on an individual sectoral approach to development. It is thus essential that an integrated, multi-sectoral community based approach be adopted as the primary means for engaging in and implementing sustainable development, particularly in rural areas.

#### Building on Popular Movements and Initiatives

During the past year popular movements with popular demands have arisen around the world. While perhaps not quite as visible, popular movements to create a commons based economy have also been developing, which can not only provide a good response to many of these popular demands but also provide a more adequate response to many of the emerging issues. Governments can support and build on this and thereby develop the goodwill, and provide for the well being, of their people.

Principal 10 of the Rio Declaration and many other UN agreements call for citizen participation in decision-making and implementation and escalating popular demand worldwide calls for equitable sharing of:

1. transparent, inclusive, participatory, intergenerational, gender-balanced governance for the benefit of all people at local through international levels;
2. life sustaining resources;
3. a remuneration/money system where people earn only what accrues from the fruits of their labor, are recognized for their contributions (labour/services), and the vulnerable (women/children/disabled/refugees/fugitives/etc) are cared-for. This system is modeled in many indigenous and local communities which have successfully cultivated and protected commonly held gifts for many generations..

Meanwhile people worldwide are forming commons-based sustainable economies in thousands of localities worldwide -- including indigenous communities, Ecovillages; Transition Towns, the Sarvodaya communities, cooperatives (to which a billion people officially belong), LETS trading systems; commons management of forests; water sources; farmers markets; community gardens; knowledge; culture; media; and the internet -- most of which provide good solutions to many of the emerging issues such as addressing water scarcity, climate change, the need for resiliency, and transitioning to sustainable agriculture.

When linked, these examples already form a skeletal structure for a sustainable world economy. All Governments are thus urged to build on this sustainable economy in embryo to create a global commons-based world economy rooted in universal benefit and the well-being of all people and nature.

In addition, the UN could and should establish a global network of regionally based resource and service centers and training programs to support the development of a multi-sectoral community based approach to sustainable rural and impoverished urban development.

The Global Ecovillage Network has established a number of Living and Learning Centers around the world and Senegal has established a National Ecovillage Agency, based on the development of a regional network of ecovillages which was funded in part by the GEF Small Grants Program, which can provide the model and a basis for creating such a global network and program. The EcoEarth Alliance UN Partnership Initiative is developing and promoting such a model and process and would welcome the support and/or participation of governments and UN agencies.

#### GAPS IN IMPLEMENTATION

##### Citizen Participation

Government representatives at the UN often talk about capacity development and stakeholder participation in implementation. This is urgently needed to overcome the gaps in implementation. The stakeholders are often those who live in a given location. Often they have a better understanding than outsiders regarding what is theirs to manage and use and how to govern it. Empowering them to initiate and take responsibility is needed and that may look different in every culture.

It is also time to put in place active opportunities to support capacity development and reward people economically for their contributions and services. UNDP established a number of Thematic Trust Funds that included funding for capacity building but none of them were sufficiently funded. New means must be established across all sectors to provide opportunities for civil society to be compensated for contributing to implementation.

Approximately 1 billion of the Earth's 7 billion inhabitants are actively participating in cooperatives. These cooperatives often if not usually share the same goals as have been adopted by the UN and provide better results in achieving them than more competitive or hierarchical models. Support for such cooperative approaches is needed to overcome the gaps in implementation.

##### Lack of Funding & Specific Means and Mechanisms for Implementation

The biggest gaps in implementation are probably due, however, to the lack of global support, funding, and specific means and mechanisms that are sufficient to achieve full implementation. Global programs thus need to be scaled up, resources must be provided, and global agreements and conventions established to achieve the agreed targets and goals.

For example, Green Cross has developed model conventions on the right to water and sanitation that are urgently needed to ensure that all people's rights to these basic goods and services are fulfilled.

In addition, the UN Member States adopted the Aichi Biodiversity Targets during the recent 10th Session of the Conference of Parties to the Convention on BioDiversity setting time bound goals and targets to be achieved during the next fifteen years. Now, if sufficient means, mechanisms, and funding for implementation, along with on-going periodic review processes are put in place, we will probably be able to achieve the essential goals that were set.

#### Harmful and Unsustainable Subsidies

The International Institute for Sustainable Development is calling on governments to support and sign on to a Pledge to Phase Out Fossil Fuel Subsidies that undermine sustainable development. This would include a transparent, annual reporting and review process; technical and financial assistance for developing countries; common research and analysis; and Secretariat support. Such an agreement is urgently needed and must be included in the Rio+20 outcome agreement.

However such support and agreements are also needed to deal responsibly with and phase out all harmful and unsustainable subsidies, including those dealing with forests, fisheries, water, and agriculture, etc. The savings thus made from phasing out such subsidies could provide much needed financing for investing in sustainable development.

#### FINANCING THE SHIFT TO A COMMONS-BASED GLOBAL ECONOMY

Here are 4 ways to help restore, protect, and replenish natural resources and fund the shift to a commons-based global economy.

I. Establish an Effective Institutional Framework to Shift to a Commons Based Economy and Manage and Equitably Share in the Use of the Commons Under a Commons Approach to Sustainable Development all people must have access to those gifts of nature and society that they need to survive and prosper. These would be designated as commons goods. They can then be used to finance the shift to a commons based economy and be managed and equitably shared among all people, as follows:

- A strictly enforced cap could be placed on the use of depletable commons goods and resources;
- Trusts would then be established to oversee the caps and manage the resource. The amount of each cap would be determined and set by the stakeholders of each resource. These trusts could be located either within a state or be trans-border, depending on the extent of both the resource and the community of interest;
- Permits for the use of what is available once the cap has been put in place can then be auctioned at source enabling the cost to be spread among all subsequent users and avoiding the complex task of pricing each depletable resource;
- Income from these commons resources can then be used to protect and restore the resource; reimburse those negatively affected by the use of these resources with a small percentage going to the government for provision of the public goods; to invest in transitioning to a sustainable future; to a global trust to restore any damage to the global commons (air, water, land); and/or to provide a basic income for all people.

Broadly speaking, the assessment of commons rent by trusts around the world would require three significant changes:

- Governments could shift their primary emphasis away from issuing corporate charters and licensing the private sector and towards approving social charters and open licenses for resource preservation and social and cultural production processes through commons trusts managed by those who cultivate and protect commonly held gifts.
- Commons trusts would exercise a fiduciary duty to preserve natural, genetic and material commons and to protect, create or regenerate solar, social, cultural and intellectual commons, yet may also decide to rent a proportion of these resource rights to businesses.
- Businesses can then rent the rights to extract and produce a resource from a commons trust, thus creating profits and positive externalities through innovation, competitive products and services, and adjustment of the market to the actual costs of resources. However consent to the use of a Commons should first have to be granted by those that are protecting and/or whose lives depend upon a Commons resource.

#### Management of the Commons at the Global Level

Commons management funds could also be generated at the global level. A rental fee to finance multilateral programs and institutions could be placed on the development or use of many transborder commons, including:

- carbon emissions
- international corporate products
- international investment
- foreign exchange transactions
- international trade
- international airline tickets
- maritime freight transport
- ocean fishing
- sea-bed mining
- offshore oil and gas
- international oil trading
- satellite parking spaces
- electromagnetic spectrum use
- internet
- information flows
- military spending and arms exports
- toxic wastes
- energy consumption

II. Global Atmosphere Commons Trust. This type of a trust could be established based on ideas from the Alaska Permanent Fund for sharing the oil commons with all Alaskans and the thirty-plus years of commons resource management research.

Feasta Sky Trust. A specific proposal has already been developed for establishing a Feasta Sky Trust. See: [www.feasta.org](http://www.feasta.org) One of the largest commons on the planet, our global atmosphere, could serve as the fulcrum to turn our unsustainable and unjust ecological, economic and political situation in a better direction for us all. Emissions permits could be used to provide a right to use of the atmosphere – a resource which would then receive a scarcity value based on the carbon price. Current schemes like the Emissions Trading System (ETS) assume the carbon scarcity rent should go to polluters or governments – but really it should be used to provide for the well-being of all of humanity.

### III. Applying a Commons Management Scheme to Regulate and Equitably Share in the Use of the Global Commons

Elinor Ostrom recently won the Nobel Prize for her studies of commons management practices around the world and how they support sustainability and justice. She has developed a set of principles or rules which ought to be included and addressed in managing the commons.

These could be applied to the idea of establishing global and subsidiary commons institutions – with cooperating climate trusts in each nation -- run by the people's trustees and supported by governments for enforcement of the carbon cap and distribution of the shares and are thus described as such below. However these principles are applicable to the implementation of most other Commons Applications as well. Applying these principles thus requires:

1. Clearly defined boundaries (in this case, targeted and precise measurements of upstream carbon units that can be effectively monitored)
2. Effective exclusion of external un-entitled parties [or illegitimate use] ("leaks" in the carbon measurements must be identified and primary producers of fossil fuels brought into compliance)
3. Rules regarding the use of common resources are adapted to local conditions (each national climate commons institution would decide how much to pay out as dividends to citizens, for poverty alleviation for example, and how much to invest in transition projects and infrastructure)
4. Collective-choice arrangements allow most resource users to participate in the decision-making process (a deliberative charter process with engagement by many citizens would set rules and governance for subsidiary in each nation, including collaboration on a global atmosphere institution)
5. Effective monitoring by monitors who are part of or accountable to users (some of the global revenues would go towards monitoring and enforcement of the global cap on emissions)
6. There is a scale of graduated sanctions for resource users who violate community rules (funding would be cut to national level institutions that were not adhering to the by-laws of their charters; for example companies could be fined for emitting GHG's without the needed 11 pollution permits)
7. Mechanisms of conflict resolution are cheap and of easy access (devised in the charter processes for local, national and global scales)
8. The self-determination of the community is recognized by higher-level authorities (Nation States and the UN must uphold the rules set by such a global atmosphere institution and the subsidiaries in each nation... the process could begin with a few progressive countries leading the way)

### IV. Placing a User Fee on the Use of and Access to Commons Resources

The commons exist and must be recognized on all scales and levels, the micro to the macro. The macro scale concerns the resources which sustain our broader ecosystem such as water, air and soil. These are interdependent and provide the tripod upon which all of life is sustained. Such resources need to be held in common as the rights of all humans. Water quality equals quality of life.

Water and air cannot be for sale, but a graduated use fee established by the cultivators of these commonly held goods could be collected. This fee for equitably sharing in the use of and access to this commons resource should be applied instead of outright "sale" of water and air through cash or "credits". Part of the funds from this can go to ensuring the quantity and quality of the shared resource; with part going to reimburse the stakeholding community and to help provide a basic income for all people.

UN General Assembly resolution 64/292 of 28 July 2010 recognizes the right to safe and clean drinking water and sanitation as a human right that is essential for the full enjoyment of life and all human rights. It is therefore:

- imperative that water sources, springs, head waters and aquifers be held in common by those cultivating and protecting them and
- we connect water quality to industry, access, and land stewardship to ensure that all water is kept clean and available

We urgently recommend that the same status be accorded to all other commons goods as well, without which people cannot survive and thrive.

The UN, along with government at all levels, must provide the means, mechanisms, funding and implementation needed to fully achieve all UN sustainable development agreements and ensure that our basic human right to essential goods and services is provided for all people as well. This will require strong governance, via the adoption and full implementation of specific conventions, programs of action, time bound and enforceable targets, and on-going periodic review processes -- which must be included in the Rio +20 Outcome Documents.

### Concluding Remarks

We must have genuine dialogue about how economy must respect and protect the viability of indigenous cultures and micro-ecosystems and create coherency at the global level between environment, society, and trade - based on the principles of sustainable development. Commoners cannot promote "green" economy while this term "green" is being trademarked, marketed and isolated from participation of those who have cultivated our ecosystems of earth, water, and air for the common benefit. It is not corporations but the people cultivating the commonly held gifts who determine what is environmentally responsible. Environmental standards, measurements, and awards granted in or by international agreements must come from governments that are representative of Peoples cultivating and protecting commonly held gifts, not from corporations who profit from these commonly held gifts.

An environmentally responsible economy cannot be promoted on the global level while poor governance causes violent dislocations to all species of life, including humanity, and even to the earth that sustains us all. Protection of human rights that allows for full enfranchisement and quality participation in cultivating and protecting commonly held gifts is essential for creating an environmentally responsible economy. Commoners can promote the enforcement of all international human rights instruments, including those protecting Indigenous Peoples, and equip all to participate in protecting and restoring the commonly held gifts of nature and in developing a sustainable economy.

We have the resources to solve the world's problems. The problem is not the lack of resources but the unequal distribution of them. What is needed are legitimate democratic governments and opportunities where people can express themselves and contribute their talents to the benefit of themselves and society.

It is important that governments think 'beyond' taking measures primarily by themselves in response to our common global problems and instead recognize the value of input and cooperation by the world's citizens, who have the same goals, but instead of working against, can work in common, to achieve these goals more easily, effectively and

productively.

## CoNGO Committee on Sustainable Development

CoNGO Committee on Sustainable Development, NY

Environmental, social and economic development that meets the needs of the present without compromising the ability of future generations to meet their own needs.

Earth Summit Rio + 20

General Background

Twenty years ago, following the first Earth Summit in Rio de Janeiro, Maurice F. Strong, Secretary General of the Summit, said that “the movement to turn the world from its self-consumptive course to one of renewal and sustenance has unmistakably spread.” He added, however, that “there is not yet a concerted and decisive response to the magnitude and urgency of the task.” As Strong said, “There is still a great deal to do.”

Today these words ring true. There is still a great deal to do! An unsustainable and unjust model of development prevails. It commodifies and exhausts Earth's resources and relies heavily on unequal trade liberalization which favors developed countries and transnational corporations over people, healthy ecosystems, and the needs of present and future generations. A growing inequality exists between the wealthy and those who are impoverished by the lack of access to adequate food, water, energy, land, education and health services.

This growing gap in wealth is recognized as one of the root causes of conflict and violence worldwide. As the Johannesburg Summit acknowledged, these “deep fault lines that divide human society between the rich and the poor, and the ever-increasing gap between the developed and the developing worlds, pose a major threat to global prosperity, security and stability.” The 2012 UN Conference on Sustainable Development (Rio+20) must reclaim and advance an ethical and inclusive global vision that promotes ecological and social integrity, the global common good, and the well-being of all peoples and Earth. Moreover, in the words of the Earth Charter, Rio+20 must move us to realize our “responsibility to one another, to the greater community of life and to future generations.”

Opportunities and Challenges

Mr. Sha Zukang, Secretary General of the upcoming Rio + 20 Conference, said, “Rio + 20 is humanity's chance to commit to a transition to a green economy, to lift people out of poverty. We cannot wait another 20 years.” The 1992 Summit's promise to make “environmental protection...an integral part of the development process” has not been fulfilled, and its call to action document, Agenda 21, which at the time 178 governments agreed to adopt, is largely forgotten. This document provided a framework for action to be implemented globally, nationally and locally by governments, organizations of the United Nations and major groups in every area in which the activity of humans has a direct impact on the environment. Why this failure when the international community has the technological expertise, a clearer, scientifically-based understanding of Earth as a living system of interdependent, interrelated components of which humans are a part, and the financial resources to explore and implement more sustainable modes of development? Clearly, there is reluctance to critique present economic and social systems, as well as a lack of political will for action based on such critiques. The October 2010 Report of the Secretary General, *Harmony With Nature*, “provides an overview of how the life-style of the twenty-first century, through its consumption and production patterns, has severely affected Earth's carrying capacity, and how human behavior has been the result of a fundamental failure to recognize that human beings are an inseparable part of nature, and that we cannot damage it without severely damaging ourselves. ...The philosophy of holism, embodied in the concept of sustainable development, rests on an understanding that all things are interconnected and that nothing occurs in isolation.” Any substantive alteration of one of Earth's components affects the health and vitality of the entire system.

The prevailing economic theory, grounded in limitless expansion and growth, is in contradiction with finite resources. The competition that is a hallmark of the current model has led to ever increasing inequity between the rich and those who are living in poverty, at both global and national levels. Furthermore, at the time of the 1992 Earth Summit, one of Maurice Strong's greatest disappointments was the failure to move firmly enough against the world's industrial-military complex. Since then, the business of war has intensified – destroying human life and well-being, abusing the environment, consuming resources and blocking the United Nations' main agenda of fostering sustainable pathways to peace and security. Therefore, we see the following elements, rooted in an equitable and holistic understanding of the interconnectedness of all of life, as

foundational in the deliberations that will take place during Rio+20.

#### Green Economy

The limitless growth and production model of development must be abandoned. We support a green economy that reflects an integration of the environmental, social and economic pillars of sustainable development; that places equity of access to green technology, jobs and practices for developing countries over green capitalism, which disproportionately benefits developed countries and transnational corporations. "A green economy results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities...it can be thought of as one which is low carbon, resource efficient and socially inclusive."

A green economy must recognize the limits of the free market economy, and favor a more locally-based economy; respect the diversity of cultures, and the consequent need to develop "diverse green economies;" while addressing structural change that would genuinely address the eradication of institutional poverty and its accompanying injustices. In addition, in a green economy GDP cannot be the strategic marker of development to the exclusion of all other indicators. It is important to utilize a variety of indicators, including the Human Development Index (HDI), based on the premise that "people are the real wealth of a nation." The HDI, however, does not currently include any environmental measures in its calculations despite an emphasis on the environment in the 2010 Human Development Report – "human development, if not sustainable, is not true human development."

#### Human Rights and Earth Rights

We firmly advocate a shift from an ethic of exploitation to an ethic of right relationship – an ethic based on the rights of humans and of Earth as essential for individuals, society and ecosystems to flourish. The concept of the rights of nature is also emerging, with the growing awareness of Earth as a living system of interconnected components. This concept highlights the importance of human beings living in a more balanced and harmonious relationship with nature, as opposed to the prevailing relationship of domination. This planetary vision can lead to a just and sustainable peace.

"Earth rights are human rights; they are not separate rights." If people do not have access to clean water, food and sanitation; if people are restricted in their prudent use of land in the name of "progress;" if people are victimized by governments and corporations which engage in unbridled extraction, pollution and devastation of land and bodies of water, then human and Earth rights are violated.

In conclusion, we support the following recommendations that promote an integrated approach to sustainable development:

#### SUSTAINABLE DEVELOPMENT

- Enforce the following principles as referred to in Agenda 21:
  - o Apply the Precautionary Principle to ensure that new products and technologies (e.g., genetically modified seeds) do not have destructive or irreversible damage that results in environmental degradation.
  - o Enforce the Polluter Pays Principle and apply payment to the adaptation and mitigation needs of developing countries.
  - o Guarantee the representation of local peoples, especially Indigenous Peoples, as active participants in decision-making processes to bring about equitable, fair and just sustainable development.
- Acknowledge the human right to water and proper sanitation, and hold accountable those corporations which both deplete and pollute the global water supply.
- Sponsor educational programs for citizens on sustainable development and, specifically, on patterns of consumption and production within each country's context.

#### GREEN ECONOMY

- Endorse the establishment of the proposed Financial Transaction Tax to contribute to climate adaptation and more equitable economies in developing countries.
- End subsidies for fossil fuels and industrial agriculture in order to move toward the end of fossil fuel dependency; and invest in small farmers and agro-ecology.
- Facilitate the transfer of innovative technology from the developed world to assist the developing world in an approach to development that does not rely on fossil fuels.
- Shift from free trade liberalization to the implementation of fair and just trade policies.
- Evaluate global military expenditures and reallocate significant resources to sustainable development, green technology, and financing of climate adaptation and mitigation for developing countries.

#### GLOBAL INSTITUTIONAL ENVIRONMENT FRAMEWORK

- Support the establishment of an effective international institutional environment framework which calls governments and international corporations to transparency and accountability.
- Include environmental measures in the Human Development Index, and encourage the use of a wide range of indicators, beyond GDP and the HDI, to assess development.

## Global Platform for Simplified Life Cycle Annalysis

## Relevance of the theme

According to UNNEP SBCL, globally, buildings are responsible for 40% of annual energy consumption and up to 30% of all energy related greenhouse gases (GHG) emissions. Collectively, this sector is responsible for one third of humanity's resource consumption, including 12% of all fresh water use, and production of up to 40% of our solid waste.

According to UNEP's - Climate Neutral Network Personal and commercial transport consumes about 20% of the global energy supply, 80% of which comes from fossil fuels. Transport infrastructure contributes to social and economic development by enabling trade and providing opportunities for employment, education and leisure.

This data is a global estimate. More specific and detailed information is needed to enable the sector to obtain information of the main impacts of each sector by country and by productive system.

## Proposal

We propose the establishment of an international panel, bringing together companies, governments, academy and NGOs, to establish a Global Platform for Simplified Life Cycle Assessment (LCA), which prioritizes the main challenges of the global socio-environmental agenda and can become a tool for decision making based on the sustainable development of the construction industry.

## The vision

The promotion of sustainability requires that the decisions to purchase products consider the multiple environmental and social impacts throughout their life cycle. Today the amount of information of these impacts are very limited, expensive and of difficult access. In most developing countries information of local products are nonexistent. This lack of information affects all levels of decision making, as strategic plans at national and international levels, individual and community decisions, and even decisions including the international commercial trade. This reality severely limits the effective engagement of industry, commerce, public sector and consumers in general in promoting sustainability as proposed in Agenda 21.

## The context

The Life Cycle Assessment (LCA), promoted by UNEP for several decades, is already a standard tool too quantify the environmental impact of products. The integration of social impacts within the scope is being carried out. Its concept is well established and standardized. The tool integrates all environmental flows (inputs and outputs of materials in production processes),

which allows calculating the environmental impacts and identify the most relevant to each product, as can fundament correct interventions in the process. However, with the proposed scope of the LCA, its implementation process is expensive and complex because it requires the measurement of a large number of variables, many of which require complex equipment and highly specialized human resources that are unavailable in many regions and beyond the financial reach of the majority of economic agents.

These facts have limited the spread of the LCA. A few commercial databases are available in the international market. These data bases include mainly information from developed countries and even fewer companies that detail (environmental product declarations). Only a few countries have public and free databases. In general, the process to update the information is slow, what leads to a decision making based on outdated information. Most data is not detailed to the companies level as its application is beyond most of their technical and economic reach. This lack of information eliminates the supplier's choice based on environmental criteria. Consequently the selection based on price and technical performance remains predominant. This lack of information restricts competition based on sustainability and in many cases suppliers with unsustainable practices gain in market. Finally, the absence of information on company level environmental impacts is an obstacle to market promoted sustainability.

## The challenge

It is therefore a priority to build a free public system open to all society that manages a minimum set of information which are consistent, verifiable and reliable, that is able to support decision of acquisition of products based on multiple criteria, based on simplified life cycle assessment - LCA s. This system should be developed, implemented and managed in a transparent way by bringing together a coalition of government, businesses and the third sector. The effectiveness of this system grows with the number of products and companies that take part on it. The chance of success grows as the system has a simple implementation and simple maintenance which makes it feasible for small businesses in developing countries. The simplicity makes it easy to update the data, another key to its effectiveness.

To have an easy adoption throughout various countries, its implementation should be gradual, starting with basic resources data on a national scale evolving too cover a growing share of the products, and finally incorporating the results of individual companies. A number of aspects or impacts should be included gradually, allowing countries, companies and their customers to learn with the process. International trade level involvement demands standardized methodology, an interconnected data base and universal access.

Although this type of support for a decision system is important too all sectors of the economy, it is particularly a priority for the construction sector, which accounts the largest share of consumption of natural resources, waste generation, energy consumption and life quality. Analysis of environmental performance of products are still being made using methodologies (labels), based on criteria that promotes solutions considered of less impact and which were elected by their authors. Consequently these tools give inconsistent results when compared with each other and do not allow too minimize negative impacts on all projects. In markets where there are multiple labels available it is possible for market players to select the most convenient tool to reach the target. The adoption of labels produced in foreign countries with different realities reduces even more the effectiveness of these initiatives, and can lead to incorrect decisions because of the huge differences between socio environmental agenda between countries and regions. A simple comparison of the CO2 content in electricity which varies an order of magnitude between different countries expresses the limit. Certification methodologies that are based on quantitative information of the impacts along the life cycle of products used in the construction, maintenance and operation off buildings are likely to provide consistent and relevant results. BIM tools can facilitate this analysis, once the data exists.

A successful example of successes is the GHG Protocol. It has an approach to quantification impacts that has gained support of companies, eleven in developing countries. The method opens the possibility of using data that can be collected with relative ease, but also offers generic models to estimate the application, although with more conservative results. The methodology has a growing number of manuals and tools dedicated to specific production processes and adaptations for different countries, which facilitates its application.

Having as a model the GHG Protocol Methodology, the development of a Simplified Methodology for Life Cycle Analysis is a viable alternative too: measure the environmental impact, make the data accessible and introduce a multiple environmental criteria decision as a habit for decision makers.

## Conclusion

Therefore, we propose the establishment of an International Panel that congregates business, government, academy and NGOs, to establish a Global Platform for

Assessment of Simplified Life Cycle Analysis (LCA), through a methodology that addresses the main challenges of the socio environmental global agenda and that to becomes a tool for decision making with a focus on sustainable development of the construction industry.

## Conservation International

The Contribution of Natural Capital to Sustainable Development

Conservation International urges all stakeholders to ensure that the outcomes of the Rio+20 Conference:

- I. Are based on the understanding that natural capital, comprised of ecosystem goods and services and biodiversity, underpins human well-being and is therefore the centerpiece of a healthy, sustainable economy and a critical element for the achievement of sustainable development objectives.
- II. Recognize that effective governance of natural capital through the collaboration of the public and private sectors, civil society and local communities is vital to achieving sustainable development.
- III. Incorporate environmental values that natural capital provides into economic models in order to move towards sustainable development.
- IV. Support the necessary investments for a transformation to a sustainable economy, including traditional and innovative public financing, positive incentives, private investments and market mechanisms that ensure sustainable use and conservation of natural capital.

Synopsis: Recognition of the value of natural capital will underpin the success of outcomes from Rio+20, addressing both conference themes: "green economy in the context of poverty eradication and sustainable development" and the "institutional framework for sustainable development".

Since the first "Rio" meeting of the UN Conference on Environment and Development in 1992, the human alteration of marine, freshwater and terrestrial ecosystems has continued to accelerate at a more intense pace than in any other period of human history. This use of ecosystems has led to gains in physical and human capital, while simultaneously depleting natural capital, composed of the stock of ecosystems that yield flows of ecosystem goods and services. These gains are unsustainable as they do not take into account the limits to ecosystem change and degradation, which will eventually cause declines in physical and human capital as well. Despite increasing understanding and demonstration of the value of ecosystem services, which has been estimated to have an economic value in the range of trillions of dollars annually, almost 60% of these services have been degraded or are used unsustainably, affecting climate regulation, sources and flows of freshwater, food security, human health and biodiversity. These impacts disproportionately affect the well-being of the most vulnerable among us. Over 800 million smallholders, who collectively support up to two billion people and produce half of the world's food, are directly dependent on the healthy functioning of their local ecosystems to support local agriculture and the provision of other goods including water, food, medicines, building materials and fuel. To ensure that the use of natural capital in the pursuit of development does not incur negative consequences for human well-being, sustainable development must integrate ecosystem management into economic, social and environmental planning, investment and implementation.

The outcomes of Rio+20 should specify actions to improve the current state of management and governance of natural capital, from the local to the international level, through effective, multi-stakeholder engagement. It is only with intact and resilient natural ecosystems and ecological processes – consisting of all necessary component species and communities – that we can ensure long-term, sustained ecosystem functioning and delivery of goods and services to support human well-being. Additionally, the outcomes should outline measures to address the fundamental failures of the current economic system and associated institutions to recognize and value natural resources appropriately. Outcomes should also make a clear and robust case for strengthening the enabling conditions needed to achieve healthy ecosystems, economies resilient to global change and sustainable development, key among these being diverse and stable financing including traditional and innovative sources of public finance, private investment and market mechanisms.

Conservation International urges all stakeholders to ensure that the outcomes of the Rio+20 Conference:

- I. Are based on the understanding that natural capital, comprised of ecosystem goods and services and biodiversity, underpins human well-being and is therefore the centerpiece of a healthy, sustainable economy and a critical element for the achievement of sustainable development objectives. A green and blue economy is a healthy, sustainable economy that helps to reach the objectives of poverty alleviation and sustainable development. While a healthy, sustainable economy implies an overall economic transformation, this transformation should be implemented as a combination of multiple, coordinated mechanisms at multiple scales, from the local to the national and global level. Governments should utilize the combination of mechanisms most relevant to their national circumstances that best contribute to human well-being, environmental conservation and economic security. All mechanisms developed should recognize natural capital as essential to human well-being and thus an integral element of sustainable development.
  - II. Recognize that the effective governance of natural capital through the collaboration of the public and private sectors, civil society and local communities is vital to achieving sustainable development. Effective management of natural capital is vital to achieving healthy, sustainable economies at all scales. The need for governance to ensure the maintenance and sustainable use of natural resources is especially acute for low-income countries. According to the World Bank, close to one-third of the wealth of low-income countries comes from their "natural capital" which includes forests, protected areas, agricultural lands, energy and minerals. Countries that manage these natural assets carefully are able to move up the development ladder – investing more and more in manufactured capital, infrastructure and "intangible capital" like human skills and education, strong institutions, innovation and new technologies. For example, between 1995 and 2005 Botswana increased its per capita wealth by 35 percent, in part through good governance and sound management of its mineral wealth. While some countries have also been able to make advancements in development through the destruction and degradation of natural capital, these advancements are unsustainable as countries will reach a critical threshold at which decreases in natural capital will cause economic decline. To avoid reaching this tipping point, the sustainable and inclusive management of natural capital is an essential element in the achievement of sustainable development and poverty alleviation objectives.
- Include multi-level stakeholder participation in natural capital governance frameworks. Effective governance requires deep, inclusive political and social dialogues driving structural transformations in public sector institutional frameworks. However, the responsibility for success should not fully rest on national or local governments, but involve the participation of the private sector, civil society and communities. Sustainable development must also be equitable development, including women, the poor and other marginalized people. Poor, resource-dependent populations are often located in the areas of greatest natural capital richness and have critical information on how to best manage those resources. To be successful, the involvement of all relevant stakeholders in natural capital governance and fair benefit-sharing schemes is therefore essential. The tripling of Madagascar's protected area network in part through local, civil society and private sector efforts demonstrates that significant progress can be made through multiple channels.
  - Support the creation and maintenance of effective ecosystem-based management and protected area systems. Terrestrial, inland water and marine protected area systems worldwide serve to ensure the provision of a range of ecosystem services. The results of The Economics of Ecosystems and Biodiversity (TEEB) study, along with many other studies and field experiences, indicate that the local and global benefits of conservation are clear. Areas under protection help to conserve ecosystem-service benefits

worth more than 100 times their cost, with national-level benefits being 50 times the cost. Fulfilling the Aichi Biodiversity Targets based on this understanding should be a central element of global and regional development efforts, in part through coordinated landscape and seascape management. The Pacific Oceanscape Framework endorsed by the 2011 Pacific Island Leaders Forum as a model for “the international community to work towards integrated oceans management, with the aim of realizing relevant international goals to contribute to the health and vitality of the ocean environment, including through the global network of marine protected areas agreed at Rio+10” could contribute to these efforts.

- Endorse advancements in integrated landscape planning to best make informed land-use decisions. Advancements in spatial planning now enable better understanding of trade-offs and synergies which clearly reveal the value of maintaining natural capital. Integrated landscape planning represents an important tool for basing land-use decisions on robust economic and ecological data given multiple development needs from limited land resources and can often contribute to maintaining natural capital as a component of sustainable development. In the case of reducing emissions from deforestation and forest degradation (REDD+) efforts, spatial planning can identify the areas of land best suited for REDD+ activities by locating key areas for carbon sequestration that also deliver high biodiversity and other social and environmental benefits.

- Promote a system of integrated metrics and indicators. Although large amounts of data are currently collected, there remain significant gaps that hinder the integrated policy making required to progress towards a healthy, sustainable economy. In particular, co-located, integrated data on human well-being, natural capital and ecosystem services and development policies and actions, at appropriate scales, are needed to enable evaluation of tradeoffs and synergies. A portfolio of integrated metrics and indicators that are traceable back to underlying quantitative data is needed to synthesize complex information and effectively communicate the information that is important to policymakers.

III. Incorporate environmental values into economic models in order to move towards sustainable development. The continuing degradation of natural capital is the result of a variety of drivers that impact terrestrial, freshwater and marine biodiversity as well as the underlying failure of our social and economic systems to ascribe values to ecosystem services that accurately reflect their contribution to human well-being. The value of ecosystem services and biodiversity must be considered in planning processes and decision making at all scales, including in the development of strategies for poverty reduction and human development.

- Consider existing research and further explore the social and economic valuation of ecosystem services in comprehensive wealth calculations and national accounting systems. The Economics of Ecosystems and Biodiversity (TEEB) effort points to the general agreement among scientists that the inclusion of the value of natural capital in stock of wealth calculations is a “more meaningful and correct approach” than traditional GDP or income calculations which treat most ecosystem impacts as “externalities.” It is also estimated that in some cases ecosystem services and other non-marketed goods make up to almost 90 percent of the “total source of livelihood of the poor” while in national GDP calculations as little as 6 percent is represented by agriculture, forestry and fisheries. The report emphasizes a tiered approach to put sustainable development into practice by recognizing the value of ecosystem services to human communities, demonstrating such values in economic terms, and protecting these values with appropriate mechanisms and tools. The TEEB report also identifies priority geographic areas to implement these efforts, specifically in terms of communication, valuation, measurements and management, poverty reduction, financial accounting disclosure, use of economic incentives, ecosystems conservation and restoration.

- Integrate information on the value and contribution of ecosystem services into economic accounting systems. Lack of assessment and estimation of the magnitude of the contribution of natural capital to national economies results in the exclusion of nature’s value from policy analysis and precludes the development of management alternatives that recognize the importance of ecosystem services to human well-being. Countries should integrate these values into their macro-economic assessments in order to fully recognize the contributions of ecosystems to sustainable development. One proposed approach to overcome this significant limitation of information and move toward better, more efficient decision-making and planning is the integration of ecosystem service values into income accounts. A recently launched World Bank-led initiative, Wealth Accounting and the Valuation of Ecosystem Services (WAVES), is an important step towards that change. The initiative, whose primary goal is promoting sustainable development worldwide through the implementation of comprehensive wealth accounting, focuses on the value of natural capital and integration of ‘green accounting’ in more conventional development planning analysis.

Address drivers of ecosystem degradation. The drivers of loss of natural capital are either constant or intensifying, bringing us closer to critical ecological limits that pose fundamental costs to economies and undermine human well-being. It is therefore necessary to recognize and address the primary drivers: unsustainable practices in sectors such as agriculture or coastal development, overfishing, pollution, invasive species, climate change and the underlying factors of overconsumption and unrecognized values of ecosystems. Governments should address drivers of ecosystem degradation in their economic planning processes and through additional regulations and incentives. Standards and certification schemes (such as the FSC or MSC) can also provide incentives for the private sector to improve practices and help consumers make informed choices. The private sector can also show leadership by voluntarily adopting efforts to “green” their supply chains, making sure at every step in the production and sourcing cycle that their products and services do not contribute to ecosystem degradation.

IV. Support the necessary investments for a transformation to a sustainable economy, including traditional and innovative public financing, positive incentives, private investments and market mechanisms that ensure the sustainability of natural capital. For sustainable development to be fully achieved, it is necessary that developed countries meet their traditional official development assistance (ODA) objectives. However, in addition to ODA, innovative sources of financing such as transportation levies and new taxation mechanisms should be explored, as these can reduce the impact of sometimes unpredictable public sources of finance. The necessary investments for a sustainable transition to a sustainable economy should include a combination of traditional and innovative public financing, positive incentives, private investments and market mechanisms which ensure measures to conserve and sustainably use natural capital. Creating positive incentive structures, such as payment for ecosystem services schemes, REDD+ and global markets for services, and eliminating negative economic incentives (perverse incentives) for overharvest, pollution, logging, land-use changes or other unsustainable forms of natural capital use and management is a necessary change that will facilitate the recognition and valuation of natural capital by society.

- Expand the role of payment for ecosystem services schemes. Payments for ecosystem services (PES) are mechanisms designed to provide an incentive against degradation and unsustainable use of natural capital by compensating communities and countries for actions associated with restoring, enhancing or protecting natural systems and the ecosystem services they provide. CI has been involved in successful PES projects at the community level, including REDD+ national strategy development in Indonesia, Peru, and Madagascar, a water payment scheme in Colombia, as well as national PES schemes in Costa Rica, Mexico, and Ecuador, all of which have led to increased conservation of ecosystem services and supported sustainable development. For example, by compensating land owners for providing ecosystem services through reforestation, sustainable management, preservation and regeneration activities, Costa Rica’s PES scheme is currently protecting close to 10 percent of the national territory.

- Utilize Conservation Trust Funds for sustainable, long-term financing of biodiversity and its related environmental services. Conservation Trust Funds (CTFs) and similar long-term financial mechanisms can serve as an effective means for mobilizing strategic investment funds for biodiversity conservation, capitalized by international donors, national governments and the private sector at both the national and international levels. They facilitate long-term planning in part because they involve multi-stakeholder governance and are independent of changes in government and shifts in political priorities. To the extent that national and international markets are not able to fully reflect ecosystem values to guarantee their long-term conservation, financial mechanisms such as trust funds are among the only feasible mechanisms to provide for ecosystems’ preservation. Engagement of civil society, private sector, governments and international institutions in joint partnerships are essential to guarantee the success of these mechanisms.

- Eliminate and redirect perverse incentives that finance and legitimize ecosystem degradation. Perverse incentives, or policies and practices that encourage unsustainable behavior, are often the unanticipated side-effects of policies created to achieve other objectives. For example, high subsidies for industrial fishing fleets have encouraged overfishing and resulted in fisheries losing billions of dollars due to huge reductions of the global catch. Incentives which are harmful to natural capital must be eliminated,

phased out or reformed in order to avoid negative impacts. In fact, there are often opportunities to redirect harmful subsidies to provide positive incentives for the conservation and sustainable use of natural capital. Opportunities to develop and apply positive incentives should be explored and pursued. Such incentives serve as a valuable tool to ensure that natural capital considerations are reflected in all relevant economic sectors.

## Consortium for the Sustainable Development of the Andes Ecoregion (CONDESAN)

Sustainable Mountain Development

Draft Regional Report Andes

prepared for the Lucerne World Mountain Conference 10-12 October 2011

20 years of Sustainable Mountain Development in the Andes - from Rio 1992 to 2012 and beyond -

Final Draft v3 - September 2011

Summary

### 1. State of the Andes

- The Andes mountains, understood as the contiguous mountain region of Argentina, Bolivia, Chile, Colombia, Ecuador, Peru and Venezuela, run over 8000 km, down the length of South America, with an area of more than 2,500,000 km<sup>2</sup>, (33% of total country areas) and a population of almost 85 million (45% of total country populations), making the northern part, the most populated mountain region in the world.
- However, the Andes are an incredibly diverse and heterogeneous area, in terms of cultures, biodiversity and economic systems, with large differences between countries.
- Some of the most biodiverse regions of the planet, and areas of highest species endemisms exist in the Andes, important centres of crop origins are also present.
- The Andes are incredibly important for the economies of the seven countries, providing agricultural area, mineral resources, and water (for agriculture, hydroelectricity and domestic use), and some of the largest business centres of South America.
- Some of the poorest areas, and with the most challenging living conditions exist in the Andes, especially in Ecuador, Peru and Bolivia.
- Pressures on natural resources in the Andes result from expanding populations, expanding agricultural areas and intensity, and increasing mineral extraction.
- Climate change will exacerbate other pressures in some mountain areas, for example in more erratic rainfall patterns, changes in water regulation capacity, especially of high altitude ecosystems and in the south, melting glaciers, and changes in climatic suitability for some crops, (although not all areas are equally affected, and some may benefit), and increasing extinction risk to biodiversity.

### 2. Progress on implementing sustainable mountain development, incorporating recommendations

- National policies, resulting from Rio 92 have been implemented in all Andean countries, and at regional level in Andean Community countries, with many favourable aspects for SMD, albeit, not specific to mountains.
- Recent regional level policies (often resulting from above point), decentralisation and increased opportunities for participation of civil society have also played an important role, although dependence on aspects such as electoral periods, governing parties, makes implementation in some areas difficult.
- Regional initiatives on SMD, such as organizations, academic meetings and supranational agreements have increased greatly over the last 20 years and supported awareness raising, knowledge sharing, and implementation of international agreements.
- National parks, protected area systems, other conservation areas, and instruments for biodiversity conservation, both through state and civil society processes, have increased greatly in the last 20 years. Although issues still remain with regard to effectiveness of their protection, the recent participative processes in identifying and declaring sites has undoubtedly furthered awareness of environmental conservation and its importance on livelihoods in mountain regions.
- Mining represents an opportunity for development, but presently is often not implemented in a responsible manner, and benefits do not always reach mountain areas where mining takes place
- Management of water resources in the Andes has seen novel initiatives at a variety of scales, from micro- basin to administrative divisions, but uncertainty in water availability, and conflicts of resource use are still a threat to SMD.
- Approaches to SMD have evolved, e.g. ecosystem approach to biodiversity conservation, increasing importance of livelihood concerns within conservation (e.g. incorporation of more social issues into conservation); international cooperation projects have changed in the last 20 years, with a recent focus on incorporating learning processes into institutional frameworks (e.g. in policies and programmes) at both national, regional and local level.
- Academic and traditional knowledge has played an important role in supporting SMD, gaps still exist in applying knowledge, and although the value of traditional knowledge is increasingly recognised and understood, this does not flow into general practice.

### 3. Key Challenges and recommendations

#### Strengthening institutional frameworks

- Increase dialogue between government sectors, and government levels
- Increase inter-institutional dialogue
- Further institutionalisation of participation instruments
- Raise awareness of mountain issues on political agendas
- Consolidate or create specific mountain initiatives where appropriate
- Regional integration - role of CAN, UNASUR

#### Improving knowledge and information systems

- Increase availability of academic and traditional knowledge for specific SMD purposes and decision making
- Coordinate research priorities for implementing SMD
- Consolidate or create specific national or regional mountain initiatives
- Research and monitoring of climate change adaptation mechanisms, especially with regard to water availability
- Decision support systems - helping to bridge gap between science and policy

## PART 1: SETTING THE STAGE

### 1.1 Introduction

The Andes, the world's longest mountain chain, on the east side of the Pacific ring of Fire, form the backbone of South America and are a major global physiographic feature, influencing climate, seismic energy, biodiversity, human culture and history around the world. The Andes cover a latitudinal length of approximately 6,600 km, from Venezuela to Chile, passing from tropical climates with rainforests on their lower slopes, topped by cold, highland grasslands and snow-capped peaks in the north of the continent, to temperate, seasonal forests and large extents of permanent glaciers in the south. They reach their maximum width of approximately 900 km between Peru and Bolivia at about 15°S, and maximum height at 6962 m in Argentina. Their varied topography, including rugged peaks, altiplanos, or highland plateaus, have played a major role in affecting the geography of human habitation and associated activities such as agriculture and industry, as well as the use of biodiversity in the region. The enormous variety of ecosystems makes the Andean region one of the most biodiverse on the planet. The Andes are a major influence on livelihoods in seven of South America's 14 countries, as a major source of cultivated crops, instrumental in providing water to more than 100 million people, account for a significant portion of the region's GDP, provide energy and have shaped the culture of a large part of a continent. However, many of the mountain region's inhabitants live below the poverty line and pressures such as unsustainable use of highland areas, increasing urbanization and climate change seriously threaten the sustainability of the region's development. This report reviews progress in major issues of sustainable development in the region over the last 20 years as well as providing recommendations for future directions in sustainable mountain development. An added complexity to such a report is the difficulty in attempting to draw regional conclusions from such a large, complex and varied region, where important variations exist between countries.

## 1.2 Characteristics of the Andean region

**1.2.1 Defining the Andes** For the purposes of this report, the Andean region has been defined using a combination of ecosystem classifications (Olson et al. 2001), ruggedness measures (Riley et al. 1999) and altitudinal limits within the seven Andean countries of South America (Venezuela, Colombia, Ecuador, Peru, Bolivia, Chile and Argentina) (Figure 1a). All terrain above 1000 m was included in the contiguous region of the Andean cordillera, as well as very rugged land over 500 m, following categories defined by Meybeck et al (2001) and using montane ecoregions as a guide in certain regions<sup>1</sup>. Different altitudinal limits have been employed to define the Andes, often varying over latitude, from 500 to 800 m (Anderson et al. 2011). In these terms, the geographical focus of this report is the contiguous mountainous region of west South America (Figure 1a), and will be different to many other ecological, geological or even cultural definitions of the Andes, for example, in the inclusion of some mountain ranges of very different geological origin, not always classified as Andean. As defined by this method, the Andes have a latitudinal extension of more than 6,600 km, and occupy an area of 2,728,760 km<sup>2</sup>, or 33.3% of the total area of the seven Andean countries, and 15% of all South America, however marked differences exist at country level (Figure 1b). The Andes reach their maximum altitude in Argentina, at 6962 m on Aconcagua.

Table 1. Summary information for Andean countries

[UNDESA/DSDJ]--Please download original submission to view tables and figures

### 1.2.2 Demography

Currently, the Andes hold a population of approximately 84,500,000 people, or 44.5% of the total population of the seven Andean countries, making them the most highly urbanized mountain region in the world. Current patterns of human inhabitancy of the mountains change considerably from north to south (Figure 1b). In the former, the area of the Andes with regard to the total country area is small, yet a disproportionately large proportion of the country's population inhabit the mountains, while towards the south of the continent the opposite is true, and in Chile, the mountains occupy a large proportion of the country, but are inhabited by a relatively small percentage of the country's population. However, more important than a head count within a geographic delimitation of the mountains, the Andes undoubtedly provide ecosystem services to an even larger proportion of the seven countries' inhabitants, including, for example, all the major cities on the Pacific slope of the Andes, with a further estimated 20 million people also dependent on the Andes.

Over the last 20 years, Colombia has been the most populated country (45m in 2010; DANE 2010a), with Bolivia also maintaining the smallest population (10m in 2010), however, population growth has changed between countries, for example, Argentina and Colombia began the 1990s with similar populations, but Colombia showed a higher growth rate towards the end of the 20 year period. In the northern Andes,

population density has also increased more within the Andean region than outside (Figure 2b). In terms of percentage of countries' populations living in the Andes between 1990 and 2010, this has decreased in Venezuela and Bolivia, increased slightly in Argentina, and remained approximately level in the remaining countries.

Figure 1.

[UNDESA/DSDJ]--Please download original submission to view tables and figures

The percentage of the population has increased in urban areas over the study period, with now between 69% and 91% of the Andean countries' population living in urban areas, compared to 55% to 87% in 1990 (CEPAL 2000a). The highest rates of change correspond to Bolivia and Ecuador, with difference of 13 and 15 percentage points, respectively. The largest cities, the most populated cities (>1,000,000 inhabitants) are evenly distributed inside and outside the Andean region (Table 2), however, many of those outside, including Lima, the most populated city in the Andean countries, depend heavily on the Andes for resources, such as water and electricity. Although the number of regional capitals outside the Andes is considerably larger than within the Andean region, the total population of the cities between the two regions is almost the same (Table 2), and of the total area covered by cities in the Andean countries (calculated from CIESIN 2004), 29% lies within the Andes, implying that urban population density is considerably greater within the Andes than outside. By 2000, between 54% and 77% of total country populations were living in cities of over 20,000 inhabitants (CEPAL 2000b)

### 1.2.3 Environmental characteristics

The Andes represent one of the most biodiverse regions of the world, especially in the north, where estimates of species richness in the Tropical Andes Hotspot are among the highest of any region on the planet (Mittermeier et al. 1999). Multiple climate types, ecosystems and habitats as well as high rates of speciation and presence of physical barriers are in part responsible for this diversity. Endemism is also pronounced, especially in the north, where an estimated half of the 30,000 plant species are endemic to the Tropical Andes biodiversity hotspot (Mittermeier et al. 1999). Further south, the Andean region also contains part of the Chilean Winter Rainfall-Valdivian Forests, where almost 2000 of the approximately 4000 plants are also endemic. The Andes are also important in providing habitat to many migratory species, for example, millions of neotropical migrant birds spend several months of the year wintering in the Andes, or passing through to sites in the Amazon or Southern Cone grasslands.

According to the ecoregional classification (Olson et al. 2001), three major biomes account for more than 75% of the Andean region, 1) dry forests, scrub and deserts (14%), including dry forests of the interAndean valleys and dry scrub at lower altitudes on the coastal side of the Andes in Venezuela, Colombia, Ecuador and Peru; 2) montane grasslands (31%), including paramo in the north from Venezuela to north Peru, and the puna of the Central Andes, as far as north Argentina, and 3) tropical broadleaf forests (29%), including cloud forest along the outer flanks of the Andes in the north to the yungas of Bolivia and north Argentina. Temperate grasslands and broadleaf forests (10% each) make up most of the remaining area, including the Valdivian and Magellanic forests and Patagonian steppe of Argentina and Chile.

The longest rivers originating in the Andes include the Pilcomayo (Bolivia, Argentina), Marañón (Peru), Putumayo (Colombia, Ecuador, Peru), Magdalena (Colombia) and Salado (Argentina), as tributaries of the Amazon in the first three cases, and the Paraná, in the latter. Total glacierized area in the Andes has been estimated at 25,000 km<sup>2</sup> (Dyurgerov & Meier 2005) and 36,700 km<sup>2</sup> (Radić & Hock 2010), representing 3.5% of the world's glaciers (including Antarctica and Greenland) by volume and 5% by area (Radić & Hock 2010). Of these glaciers, about 80% are found in Chile [REF].

#### 1.2.4 Influence of the Andes on the regional economy

Mountains are hugely influential on the economies of the seven Andean countries, albeit with important differences between countries, in part, dependent on the proportion of national territory occupied by the Andes. The Andes contain important mineral resources for nearly all countries, large areas of agricultural land, provide water for agriculture, domestic use and hydroelectric energy production, and house some of the largest business capitals of South America.

GDP per capita in the seven countries has risen over the last 20 years (Figure 3), although effects of economic crises at national (2002, Argentina, Venezuela) or global level (1999, 2009) are evident, and order of magnitude differences between highest and lowest GDP among countries remain throughout the period (Table 1). Ecuador and Bolivia show the smallest increases, while Argentina has risen dramatically, despite the dip in 2002, in part reflecting slightly lower rates of population increase in this country. In terms of the specific contribution by the Andean region to GDP, data are generally unavailable, but an approximation may be made where GDP is broken down by administrative region. [Subnational GDP]

Figure 3. GDP per capita 1990-2010 for Andean countries

[UNDESA/DSDJ]--Please download original submission to view tables and figures

Demographic trends in urban populations over the last 30 years also reflect economic transitions. A general approximation classifies countries according to degree of urban transition CEPAL (2000), with those in mid urban transition having large industrialized areas and characterised by development of tourist and industry sectors, corresponding to Colombia and Peru in the Andes. At the other ends of the extreme are those countries with an advanced urban transition (Argentina, Chile, Venezuela), representing post-industrial settlements with larger proportion of urban populations, and moving towards economies based on services; whereas those considered as having moderate urban transition (Ecuador, Bolivia) have important areas destined towards agriculture and rural activities. Although this may provide general indication of trends, precisions within countries, such as a strong agricultural sector in Argentina, or tourist development in Ecuador, should be taken into account.

Globally important reserves of metals and minerals are found in the Andes, with the mining sector representing a major part of the economies of all seven countries, gaining importance since 1990, with increasing trends in production of minerals (CEPAL Stat). However, its role in national economies is very different to that played by agriculture, for example, in that the activity generally employs less people, and represents a smaller contribution to GDP, but provides a large proportion of the total exports. For example, in Peru, mining contributed 4.1% of GDP in 2010, but accounted for 70% of exports, with metals, almost all originating from the Andes, representing 61%. Direct employment generated by mining activities was just under 1% of the economically active population, and including related service industries would have reached two or three times this figure, but remains small when compared to approximately 30% in agriculture. Growth of mining in Peru, between 1990 and 2010, as a percentage of total exports, has risen by almost 15 points, whereas the direct employment generated by the activity has remained relatively steady at 1% throughout the same period (ILO 2011).

Figure 4. Agricultural production, harvested area (left axis) and chemical use (right axis) in Andean countries, 1990-2008 (CEPAL 2011, FAO Stats).

[UNDESA/DSDJ]--Please download original submission to view tables and figures

Agricultural production in the seven Andean countries reached almost 300 million tonnes in 2009, representing a 75% increase in production since 1990, whereas the area harvested has remained relatively stable over the same time period (FAOSTAT 2010), implying a large increase in yield and agricultural intensity. Pesticide and fertilizer use during the same period showed parallel increases in all countries (Figure 4). The value of agricultural production has also increased in the last 20 years in all Andean countries, with annual growth rates of production value between 2 and 6% (calculated from FAO Stats), with the highest absolute difference between 1990 and 2009 registered in Argentina (\$14,000 m USD), and the highest growth in Peru (6.6% annual growth). For the year 2009, agricultural crops in the Andean countries contributed to between 3 and 13% of GDP (World Bank).

However, without detailed analysis of agricultural production at subnational level (although administrative boundaries are not aligned with the Andean region either), relative importance of the Andes for many products produced in mountain areas or outside is difficult to establish and the above trends may largely represent those in lowland areas. There have certainly been important increases in certain biofuel crops, for example, soybean or palm oil (e.g. in Argentina, Bolivia and Colombia), corresponding largely to areas outside the Andean region. An analysis of mainly Andean crops representing approximately 10% of the total agricultural production value for the seven countries, shows that although value has increased over the last 20 years, production has levelled off and area harvested has slightly decreased. However, important crops, such as rice and maize, cover both Andean areas and lowlands, and are difficult to break down into mountain and non-mountain components. Similarly in livestock, the Andes vary in importance for animals such as cattle, with the lowlands in Colombia, Venezuela and Argentina accounting for much of growth in this area, however, Andean camelids have shown increases in yield and value over the 20 year period in Peru and Bolivia. What is certain, is that water from the Andes, in two of the largest agricultural exporters, Peru and Chile, accounts for almost all water used in this activity.

The importance of the Andean region for agriculture was estimated using two models of cropland area for principal crops in South America (You et al 2000, Ramankutty et al., 2008) intersected with the Andean region, as defined for this report. Overall, the Andes contributed to 15-17% of the total cropland area of the seven countries, with marked differences existing between countries, with the Andes being more important in the north, with large proportions of total crop area in Peru, Colombia and Ecuador

Dams and reservoir infrastructure in the Andes provide water for hydroelectric power and agriculture, with the mountain region holding 76% of the dams in the seven countries (data from Lehner et al 20078), however, most uses of reservoirs in this database are not specified. Hydroelectric energy represents between 7% and 28% of total energy supply across the Andean countries (CEPAL 2004), the great majority of which comes from the mountain region.

#### 1.2.5 Social characteristics and quality of life

A wide range of social groups exist across the Andean countries, including an enormous diversity of indigenous communities, as well as other well defined social groups, such as rural peasant farmers, and Afro-descendants, although the latter are generally settled in lowland, coastal areas, outside the mountainous region.

Democracies have existed in all Andean countries for at least the last 20 years, with some for much longer periods of time, although several abrupt changes of government, have taken place in countries since 1990, such as Ecuador.

Spanish as a common language has also benefitted social dialogue and integration across the Andes, as opposed to nearly all other mountain regions around the world. A variety of indigenous languages are also spoken throughout the region, but with a dominance of Quechua, which unites some 10 million speakers from northern Ecuador to northern Argentina, reflecting a certain degree of social unity, or Andean civilisation, from earlier times, albeit without political integration (Kuiper, 2011).

Multiple and diverse opportunities for coordination of indigenous movements in the Andes have been in recent years with national constitutions recognising the plurality of cultures and autonomy over decisions affecting indigenous, or other native community territories. In this sense, all Andean countries ratified the Convention 169 on rights of indigenous and tribal peoples between 1991 and 2008 (Table 6). Article 15 of this convention relates to obligatory consultation over resources within indigenous territories, as well as the participation of communities in the exploitation and management of these resources. Despite this article being employed repeatedly to defend indigenous rights, to date, only Peru has brought out legislation to implement this measure in law (see section 1.3.4).

### 1.3 Drivers of change in the Andes

**1.3.1 Population pressure and migration** The growing population in the Andes has increased demands on water and resources over the last 20 years. A 57% increase in energy consumption has been registered in all Andean countries between 1990 and 2009 (OLADE 2010), but the contribution of renewable sources of energy has decreased sharply in all countries except Venezuela and Argentina, dropping from 23% to 17% on average (CEPAL, calculated from OLADE 2010). Population pressures on ecosystems, measured in terms of population numbers and accessibility, show high degrees of threat in the Northern Andes at South American level, and in Patagonia where the road network is dense, despite low population levels (Jarvis et al. 2010).

Migration processes have also played a role in changing regional dynamics, with moves towards cities, and migrations to other countries. A lack of water resource management (see section 2.5) has contributed to migrations away from rural areas towards cities, as a result of increasing poverty through worsening agricultural production, soil erosion and scarcity of water, among other issues (Acosta & Alvarez, in press). Hard hit areas include the River Santa basin in Ancash, Peru and River Checua, Cundinamarca, Colombia where in the latter, migration was actually promoted in the higher reaches of the river to detain further deterioration. In terms of international migration, receiving countries are principally the USA and Spain (Pizarro 2011) with Ecuador, Colombia and Bolivia representing the most numerous nationalities of immigrants to the latter country. Since the end of the 1990s, some 11% of Ecuador's population live outside the country, impacts on the economy can be appreciated in that remittances sent from abroad represent the greatest contribution to GDP after petroleum exports (Pizarro 2011). If migrants generally send money back to their regions of origin, then more than 40% of those leaving are from the Andes, given that of five regions where more than 70% of remittances are concentrated, four are in the Andes, making up almost 40% of the total. Effects on family life are also strong, with many children being left behind to be brought up by an older generation. In Colombia the situation is similar, with an important wave of migrations during the 1990s. Remittances in Colombia have increased almost threefold in the last 10 years, reaching 2.7 times the value of coffee exports in 2009. More than 50% of remittances are received in mainly Andean provinces of the country (DNP 2010), with a strong concentration in the Coffee-growing region.

#### 1.3.2 Land use and agriculture

Parts of the Andes have been populated almost continuously for more than 20,000 years (Dollfus & Lavalée 1973), and this long period of human presence with associated changes in technology and land use systems has had a major impacts on natural landscapes. Areas within the Andes, especially the Tropical Andes, form part of at least 10 main centres of crop origin (Balter 2007), with the Southern Andes, also included in some classifications (Mannion 1999). The history of agriculture in the region dates back to at least 9,000 years ago (Dillehay et al. 2007; Piperno & Dillehay 2008), with indications of adoption of important crops such as potato, squash, cotton and possibly maize around this time. In fact, major land cover changes took place in the Andes several millennia ago (Young 2009).

Current changes in land use, strongly linked to agriculture, are responsible for growing pressures on natural systems in the Andes. At a regional level, South America suffered the largest net loss of forest between 1990 and 2010, at about 0.6 hectares per year above Africa for the period 2000 - 2010 (FAO 2010). Between 1990 and 2010, forest extent for the whole of the seven Andean countries decreased by 239,110 km<sup>2</sup>, as reported to the Forest and Agriculture Organization (FAO 2010), representing a decrease of 38% to 35% of country area covered in forest. During the same period, planted forest extent rose slightly, by almost 25,000 km<sup>2</sup> (Figure 10). Forest cover of the seven countries varies considerably, from 10% in Argentina, to over 50% in Bolivia, Colombia, Peru and Venezuela, largely in proportion to their Amazon extents.

In a regional ecosystem map, covering the mountainous region of the northern Andes (without Chile and Argentina), transformed ecosystems were found to correspond to 22% of the area mapped for the period 2000-2003 (Josse et al. 2009). Differences between countries are marked, ranging from 3% of transformed areas in Bolivia to 58% in Colombia, with generally lower percentages of remaining natural ecosystems in the north of the continent, where the transformed area is actually larger than the area of natural vegetation, with the opposite occurring in the Central Andes (Josse et al. 2009).

Food supply from agriculture is subject to increasing uncertainty in areas where climate change could impact negatively in climate suitability for major crops, although changing climates are also predicted to increase agricultural production in some areas, and could increasingly drive agricultural expansion. Emerging issues, such as land grabbing, reducing civil society decision making capacity through reduced land ownership, could also effect the future distribution of agricultural production, however, available information emphasises investments in countries such as Brazil and Argentina, where investments focus on lowlands.

#### 1.3.3 Mining

A common denominator of the seven Andean countries is that their economies are heavily based on mineral extraction. Apart from petroleum and gas, mainly concentrated outside the Andes, the region is affected to different degrees in each country, but areas of high altitude, for example, paramos in the north and puno, further south, are increasingly affected by mining or are under concession. Mining is cited in Peru's CBD national report as a threat for fragile mountain systems (Ministerio del Ambiente 2006). An analysis of mining concessions and exploitation in the northern Andes shows that mining exploitation is currently (2009) concentrated Peru and Bolivia, while large areas have been granted concessions in Colombia and Ecuador, including in national parks in the latter [REF]. The study shows that large areas of montane forest in the four countries are under mining concessions, with up to 75% of humid forest in Ecuador (Cuesta et al. 2009; Figure 6). Only a small area of each concession is actually used for exploitation, although the impacts of the activity, for example in pollution, opening access to undisturbed areas and changes in local social dynamics and economies, are often much further reaching. Conflicts for resources, especially water, are also increasingly common, and with a potential to become more serious as climate change affects water availability. In Argentina and Chile mining projects have caused controversy by destroying glaciers. Although mining has represented an important factor in the development of Andean countries over the last 20 years, social or economic investment in the actual areas of exploitation has not been proportional to the mining effort (e.g. Renaud, 2008). Mining activities have grown in all Andean countries as evidenced by growth in exports of mining products.

Figure 5. Mining concessions and exploitation in the northern Andes (Cuesta et al 2009)

[UNDESA/DSD]--Please download original submission to view tables and figures

Investment in mining has been encouraged by most governments in the region, through legislation or hierarchies of applying legislation and norms. The Survey of Mining Companies, published by the Fraser Institute (McMahon & Cervantes 2011), provides trends on attractiveness of mining policies, based on opinions of mining company high executives. In the last five years, Colombia and Ecuador have both showed increases in potential, according to mining company bosses, Chile remains stable and Bolivia and Peru have shown decreases, possibly due to indigenous protests in Bolivia and new legislation in Peru. In Argentina, the government introduced a packet of laws in the

1990s, paving the way for investment by multinational mining companies, at the same as creating a body for environmental control of mining, but under the control of the same body promoting mining investment, instead of the ministry of environment and sustainable development, or provincial environmental organizations.

Specific safeguards are also present in legislation on mining, for example, in Peru and Colombia. In Peru, a new law requires companies to seek agreement with rural communities for projects that affect them or their ancestral territories, with obvious implications for mining projects, although the right of veto is not included. In Colombia, a new law on mining excluded mining activities in paramo mountain ecosystems, however, its future is uncertain given that it has been declared unconstitutional (for other reasons) and a further limitation is that an exact definition and delimitation of paramos is yet to be produced.

#### 1.3.4 Climate change

Climate change has already affected, and is set to increasingly affect biodiversity and livelihoods in the Andes, for example, in changes in climatic niches and habitats for biodiversity and changes in water availability and climate suitability for agriculture.

Mountain areas have experienced above average warming during the 20th century (IPCC 3), in the Andes this is no exception. Key trends in climate change include increasing temperatures (driven by greenhouse gases), less precipitation, upward shifts in cloud bases, and affecting soil moisture content (CONDESAN 2011 in press, Young 2009), but with different impacts locally (Table 3). Given the close relationship between climate and ecosystems (Rivas-Martínez 2008), ecosystems are expected to change, especially in areas, such as the Tropical Andes, where interannual variation in climate is less than predicted changes in climate (Anderson et al. 2011). Young et al (2011) present a synthesis of the vulnerability of tropical Andean ecosystems to climate change, among those classified as most vulnerable are those with shortest history of human use, paramos (given their location on mountain tops, their area is likely to decline due to invasion of woody plants from lower altitudes and unsuitable soils for immediate colonisation higher up) and cloud forests (base levels of cloud will rise with warming temperatures, leading to less humidity, and also increasing vulnerability to conversion to agricultural uses). However, the high variation in relief may also buffer some impacts of climate change, with large climatic gradients over small areas providing potential sites for colonisation.

Table 3. Expected climate change impacts in the Andean region of countries (National UNFCCC communications)

*[UNDESADSDJ--Please download original submission to view tables and figures]*

Nevertheless, this vulnerability of high Andean ecosystems, such as paramo and puno, to effects of climate change, in addition to more erratic precipitation patterns, increased evapotranspiration and alteration of soil properties, will have serious consequences for their function in surface water provision, (Panorama, Buytaert). The role of Andean forests in water regulation is also important, although uncertainty exists as to how feedback from effects of changes in paramos ecosystems will affect cloud forests, with both higher or lower levels of cloudiness possible (Buytaert et al. 2011).

Evidence shows retreating glaciers in all Andean countries over the last three decades due to atmospheric warming, with the complete loss of numerous glaciers, for example, 145 cases in the Cordillera Blanca of Peru and rates of reduction of 26% between 1970 and 2003, 87% reduction in the Mérida Cordillera in Venezuela in the last 50 years, 27% in Ecuador from 1997 to 2006, and 2 to 5% annually in Colombia over the last 10 years. The annual rate of contribution to rising sea levels from the Patagonian ice fields has doubled in the period 2000-2005, compared to 1975-2000, with reductions of up to 50% in the area of small glaciers in the Argentinean Tierra del Fuego.

Melting glaciers, especially in regions where glaciers become the most important source of runoff during dry seasons, will also affect water availability, as well as risk of flooding. There are already concerns for both drinking water and hydroelectric power in cities such as La Paz, Lima and Quito (Stern, 2006), although the production of glacier runoff is minimal for Colombia and Ecuador (Buytaert et al. 2011), but more important for Peru and Bolivia. Effects will also be felt on Andean valley agriculture (Stern, 2006), including important contributions of meltwater supporting regional economies in the Cordillera Norte and Central in Argentina and Chile (López Arenas & Ramírez Cadena 2010). Decreases in water levels in rivers originating in mountains in the provinces of Río Negro and Neuquén, probably due to reductions in snowfall in the Andes, have already led to 40% reductions in hydroelectricity generation (República de Argentina 2007).

Frequency of extreme climate or weather events in Andean countries (not all necessarily associated with climate change), such as flooding, extreme temperatures, landslides, droughts and wildfires have increased by almost 40% in the period 2001-2010, when compared to 1991-2000, affecting 200% more people, but with a reduction in estimated cost of damage.

Although these figures represent country level, mountains will be especially susceptible to extreme events such as landslide and events will especially affect areas with lower standard of urban living and greater dependence on agriculture (CEPAL 2011, Estado Plurinacional de Bolivia, 2009), for example in Andean regions of Bolivia, Ecuador and Peru, as well as densely populated mountain areas, for example in Colombia and Venezuela (República Bolivariana de Venezuela, 2005). In Bolivia, flooding caused over \$450m US worth of damage in 2007 and 2008, representing 5% of GDP (Estado Plurinacional de Bolivia, 2009).

A study by the International Centre for Tropical Agriculture (CIAT CONDESAN, 2011) modelled changes in climate suitability for principal crops in the northern Andes. Analysis of 25 crops showed reductions in suitable areas of crops for the following countries, in order of magnitude of effects (Venezuela, Colombia, Bolivia). In the case of Ecuador and Peru, some changes could be interpreted as positive, given that 17 out of 25 crops show increases in suitability under both emissions scenarios. In economic terms, Colombia and Venezuela are the most seriously affected countries, with regard to production of coffee and potato, followed by Bolivia. However, Ecuador and Peru, could gain on at least one of five principal crops analysed, with increases in production value of potato in Ecuador, and potato and beans in Peru (Zapata-Caldas et al 2011).

#### 1.3.5 Other drivers

Armed conflict has effected three countries in the Andes over the last 20 years, with internal conflicts in Colombia and Peru, and a border conflict between Peru and Ecuador. Impacts have also been felt in neighbouring countries, especially Venezuela and Ecuador as a result of the Colombian conflict, however, armed conflict cannot be considered as a regional phenomenon during the period of this report. The Colombian conflict began in the 1960s and continues to date, and has effected almost all areas of the Country, including the Andes. Conversely, the armed conflict in Peru, from the 1980s to the early 1990s, was

concentrated in the mountainous regions of the centre south and Amazon foothills of the country. The Peruvian-Ecuadorian war of 1995 had its origins in border disputes dating back to the independence of both countries from the Spanish, although this outbreak, known as the Cenepa War, was localised in the Cordillera del Condor, a mountain range emerging from the Amazon region of both countries towards the Andean foothills.

The armed conflicts have undoubtedly effected sustainable mountain development, but a detailed analysis is beyond the scope of this report. In Colombia, the ongoing armed conflict has limited rural development in many places, especially in areas where a confluence of different armed actors exist. More positively, the peace accord between Peru and Ecuador in 1998, created an propitious environment for integration and development on the border area, including a binational development plan, leading to joint projects in development and conservation, but largely outside the Andes. However, a proposed joint conservation area in the Cordillera del Condor is being discussed and was set out in the peace agreement itself.

The illicit production and trade of drugs still has major impacts on the societies, economies and environment of Andean countries, with especial relevance for Colombia, Peru and Bolivia, although impacts are not limited to the mountains, and supply routes affect all countries. Although armed groups may have initiated without direct links to illicit

trade in drugs, they are now increasingly linked to this trade.

Armed conflict and the illicit drugs trade are some of the transboundary issues affecting the Andean countries, as well as issues such as access to water, security, distribution of benefits and tourism.

#### 1.4 Effects of drivers on biodiversity

A global classification of priority ecoregions, based on a representation approach of biological distinctiveness (Olson & Dinerstein 1998) included 24 of the "Global 200" ecoregions within the seven Andean countries. Of these, 11 have most of their area within the Andean region, and 10 are classified as Critically Endangered, or Vulnerable (Olson & Dinerstein 2002). In total, 46% of the area of threatened ecoregions of the seven Andean countries are within the Andean region (in 33% of total country area).

A study to quantify threats to ecosystems in South America modelled effects of fire, grazing, accessibility, infrastructure, oil and gas, and (recent) conversion to agriculture. High values of specific threats in the Andes mountains, correspond to fires and grazing in the high Andes of Peru, recent conversion to agriculture on the Pacific slope in Colombia, the Andes of Ecuador and Valdivian forests in Argentina and Chile. The highest values for combined threats are in Venezuelan Andes, the eastern cordillera of Colombia, the high Andes of Ecuador and Peru and the forests of Patagonia (Jarvis et al. 2010).

Figure 6. Principal threats to endemic species of the Andes

*[UNDESA/DSD]--Please download original submission to view tables and figures*

Using spatial information on threatened species distributions (BirdLife International 2010, IUCN 2010), the proportion of species threatened within the Andean region was calculated, giving 77% of threatened birds in the seven countries, 91% of threatened amphibians and 59% of threatened mammals occurring in the Andean region. Very high rates of endemism exist among threatened species, given that 57% of all threatened birds, 80% of amphibians, and 34% of mammals are endemic to mountain region. Principal threatening processes include agriculture, affecting the highest percentage of species in the Andes, followed by biological resource use, where mammals have a slightly higher percentage, reflecting greater hunting pressures (Figure 6). Threats to mountain systems mentioned in the thematic reports of Andean countries to the CBD program of work on mountain biodiversity include infrastructure development, mining, agriculture, climate change and invasive species. Trends in threat category show increasing extinction risk between 1988 and 2008, in the case of bird species occurring in the Andean region.

## PART 2: EVALUATING PROGRESS WITH SUSTAINABLE MOUNTAIN DEVELOPMENT: PROGRESS, CHANGES, AND LESSONS LEARNT IN THE REGION OVER THE LAST 20 YEARS

### 2.1 Introduction

The following section evaluates processes contributing to, and limiting, sustainable mountain development in the Andes over the last 20 years. The report focuses on drawing conclusions at regional level, but recognises that the size and heterogeneous nature of the region makes this difficult with regard to many issues. Some differences between countries are highlighted, but it is beyond the scope of this report to enter into a detailed discussion of national dynamics. Furthermore, the section attempts to highlight aspects of international, regional and national agreements, initiatives and legislation playing an important role in sustainable mountain development, but with the understanding that this often implies the specific application of more general policies rather than specific mechanisms themselves existing for mountain issues or regions. However, over the last 20 years, many events and declarations have been made with specific reference to sustainable development in the Andes (Table 3), derived from, and organized through both international and regional processes, providing important platforms for dialogue among different actors, and catalysing new Andean initiatives.

Table 4. Major events and agreements contributing to sustainable mountain development in the Andes

*[UNDESA/DSD]--Please download original submission to view tables and figures*

Finally, this section draws heavily on nine case studies, summarised below (Table 5), and from which thematic components are compared across countries. The coincidence of several themes across the case studies and at two consultative workshops (Appendix 5.1), provides confidence that some general trends can be drawn from this relatively small sample size, and also provides the structure for this section. Furthermore, the case studies were chosen as representative sites across the Andes (Figure 7), both in terms of latitude and altitude, and document relatively long periods of interventions in sustainable mountain development, many of which span 20 years. A further important factor in choosing the case studies was the presence of existing documentation, given that field visits and evaluations were not contemplated as part of this report, although a workshop was held to support their preparation (Appendix 5.1).

**2.2 Policies and institutional frameworks** Sustainable development initiatives in the Andes have been greatly influenced by global and regional events and agreements, including some before the time period of this report. However, the Rio 1992 conference undoubtedly provided a major impetus in positioning sustainable development, and especially its environmental component, on national agendas. This section outlines some of the major global, regional and national mechanisms, while highlighting their significance for the Andean region.

One of the landmark agreements to come out of Rio 92 was the Convention on Biological Diversity (CBD), aimed at biodiversity conservation; sustainable use of biodiversity; and equitable sharing of the benefits deriving from genetic resources. According to article 6, each party is required to develop national strategies and action plans, as a means to implementing all three components of the convention, which all Andean countries had completed by 2003 (Table 6). Countries are currently updating their strategies, in line with the Aichi Biodiversity Targets, although Venezuela has already completed its second version for 2010-2020. Andean countries are also generally up to date with reporting obligations with both the Framework Convention on Climate Change (and Kyoto Protocol) and the Convention to Combat Desertification. Under the latter, national action programmes, as part of commitments acquired within the convention, were completed between 1997 and 2004 (Table 6).

Several programmes of work within the CBD to further the convention's implementation are relevant to conservation of mountain biodiversity, especially those on mountains, protected areas and forests. Implementation of the programme of work on mountains has been mixed within the region, with only three countries completing their thematic reports (Table 6). However, Ecuador has also implemented activities to further the program (Toppe pers comm[Complete with info from EC]). The country thematic reports for this program of work highlight concerns such as centralization of resources and lack of administrative inter-sectoral mechanisms to implement legislation and include national responses, such as management plans and zoning for high Andean ecosystems and protected areas, restoration of forests, priority setting and characterisation of Andean wetlands, decentralization for river basin management (Argentina) as well as several bilateral or regional initiatives.

Other international agreements with specific components on sustainable development in the Andes include the Ramsar Convention on Wetlands, Convention on Migratory species (including an MoU, signed in 2008 by Bolivia, Chile and Peru, to protect migratory flamingo populations and their habitats) and the exclusively Andean Convention for

the Conservation and Management of Vicuña.

The High Andean Wetlands strategy is a regional initiative of the Ramsar Convention, resulting from a contact group of Andean countries, formed in 2002. The strategy aims to conserve and ensure the rational use of High Andean wetlands, which, although highly important in provision of ecosystem services for Andean communities and further downstream, are fragile and vulnerable ecosystems often lacking special attention from governments and other stakeholders (Ramsar 2005). The strategy provides a framework for regional cooperation between all seven Andean countries as well as Costa Rica, covering a projected 10 year period from 2005. Its implementation is supervised by a contact group, including the convention's national focal points, NGO representatives who hold regular meetings. The strategy has successfully focused initiatives on national wetland policies, inventories (including threats), valuation of ecosystem services, management plans and specific site conservation actions, identification of new Ramsar sites, and provided important opportunities for cooperation between countries and organizations. Difficulties in implementing the strategy lie with coordination and communication between different jurisdictions, authorities and sectors related to high Andean wetlands, lack of funding and political support (REF).

The Convention for the Conservation and Management of Vicuña, signed by Argentina, Chile, Bolivia, Peru and Ecuador in 1980, is aimed at their conservation and sustainable use. The agreement is supervised by a committee, meeting annually, and has been successful in protecting wild Vicuña populations, to the point that they were moved from CITES appendix I to II, allowing sustainable exploitation of their wool, providing

important incomes for Andean populations and simultaneously providing incentives to prevent illegal hunting of the species. The agreement has also served to promote technological advances in Vicuña management through its cooperation mechanisms, as well as trade promotion, products by creating a brand and opening markets abroad for Vicuña products.

Table 6. Year of ratification of International and regional mechanisms supporting sustainable mountain development in the Andean region

[UNDESA/DSD]--Please download original submission to view tables and figures

Several supranational political agreements cover the Andean region, including the Andean Community (CAN), a regional integration organisation<sup>11</sup>, Mercosur, primarily a trade and migrations agreement between Argentina, Uruguay, Paraguay and Brazil (and Venezuela awaiting ratification), the Latin American Integration Association (ALADI), also primarily concerned with trade agreements, the Latin American Parliament, with commissions on regional development and the environment; and the Organization of American States (OAS).

Perhaps the most influential in sustainable mountain development have been initiatives within the Andean Community, in terms of supranational environmental policy. The Committee of Environmental Authorities was created in 1998, within the Andean Community, to advise and support the Secretariat in implementing community policy in the environment. At the beginning of the 2000s, the country presidents of the Andean community agreed to establish joint policies in environmental management and sustainable development, also serving to strengthen the Andean Community's negotiating power at international level. In 2001, the document, "Guidelines for environmental management and sustainable development in the Andean Community", established sustainable development as a prerequisite for economic growth, social development and environmental management. These guidelines address specific threats to mountain communities, calling for a sustainable development strategy for mountain ecosystems, especially, for paramos, promoting integral management of soils, water and living resources, employing an ecosystem approach. The strategy has not been completed as such, but an alternative development strategy covering the whole of the CAN region was produced in 2005, with general focus on environment and illegal drug crop eradication, among other aspects.

In 2002, members of the CAN approved the Regional Biodiversity Strategy, launched at the Sustainable Development Summit in Johannesburg. The strategy, put together while most countries were also working on their national biodiversity strategies for CBD, aims to set a basis for common policy in biodiversity, in view of challenges related to free trade agreement negotiations and international environmental agreements. Importantly, the strategy, is an official instrument, representing supranational legislation, and is legally binding to all Andean Community countries.

The Andean Community established a plan to monitor progress of the Johannesburg summit in the areas of biodiversity, climate change and water over the period 2003-2005. Subsequently, the Andean Environmental Agenda 2006-2010 was drawn up, based on three main areas, Biodiversity, Climate Change and Water, with three overarching themes covering sustainable development, education and strengthening trade. The Agenda is also articulated with the Andean Paramo Project (box 2.1.1). A new Agenda is currently being drafted to cover the period 2011-2015, and as opposed to the first agenda, the second version aims to become a legal instrument, similar to the Biodiversity Strategy. Themes of the second agenda will cover biodiversity, climate change and water.

Progress by countries in implementing the first Environmental Agenda is currently being evaluated, and results will be published this year. However, the CAN Secretariat has also facilitated its implementation through the coordination of regional projects, including evaluating changes in land cover, measuring impact of, and developing capacity to adapt, to climate change.

An important consideration for future integration in South America is that both Mercosur and CAN will eventually be superseded by the recently formed, Union of South American Nations (UNASUR), seeking to achieve common policies in issues such as migration, economics, defence and environment, through greater integration of South America as a major bloc on the world stage. The constituent treaty, signed in Brazil in 2008, includes the formation of a supranational parliament, and includes the sustainable development of the region within its objectives. However, a ministerial council on environmental matters is yet to be established, although eight other councils have been formed, on issues ranging from defence, drugs, and infrastructure to health, education and science.

The Organization of American States has also provided impetus for sustainable development in the region over the last 20 years. In the 1990s, as a response to new global priorities, the OAS updated its program on Environmental Protection, to include sustainable development objectives, for example, in the modification of the OAS charter to update the mandate of the Inter-American Council for Integral Development in 1993 (OAS 1993), the inclusion of a special chapter on sustainable development and the natural environment in the Plan of Action of the First Summit of the Americas (OAS 1994), and a subsequent resolution on Sustainable Development, including the creation of an Inter-American Committee on Sustainable Development in 1996 (OAS 1996) as well as the Plan of Action resulting from the first summit of the Americas on Sustainable Development, in Santa Cruz, Bolivia. The Department of Sustainable Development, as an executing body, supports OAS members in the design and implementation of policies, programs and projects oriented to integrate environmental priorities with poverty alleviation and socio-economic development goals (OAS 2011). OAS technical cooperation programs address such areas as river basin management, the conservation of biodiversity, preservation of cultural diversity, planning for global climate change, sustainable tourism, and natural disaster mitigation.

The Mountain Partnership, a type 2 United Nations organization, was formed in 2002 as a result of commitments taken on at Rio+10, and represent an alliance between countries and civil society organizations. CONDESAN, the Consortium for the Sustainable Development of the Andean Ecoregion, hosts the secretariat hub for Latin America. To promote priority themes of the Alliance in Latin America, the Andes Initiative was formed in 2004, and consists of all Andean countries (led by Argentina, Bolivia, Colombia and Peru), a further four countries, and almost 50 other inter-governmental organizations and NGOs. The Andes Initiative (regional section of the Mountain Partnership) provided an important platform for dialogue, regional relations and different initiatives with regard to mountain issues.

The Tucumán declaration of 2007, established an Action Plan for the Andes Initiative, revolving around the following five central themes:

1. Sustainable livelihoods in mountain areas

2. Conservation of ecosystems and preservation of biodiversity and cultural and national heritage
3. Consolidation of institutional capacity in mountain issues
4. Climate change and its effect on mountain areas
5. Cross-cutting issues (education, awareness raising and capacity building, gender, youth and the aged, networks, local participation)

Although declarations and an action plan on sustainable mountain development have been produced for the Andes, follow-up to the declarations and implementation of the plan has not been systematically approached. Difficulties in organising activities within the Andes Initiative relate to the mixed nature and disperse membership of the Partnership, whereby countries and NGOs have equal voice and vote, although the Tucuman Plan of Action was only signed by countries, and a full assembly is yet to be held

The above international agreements have had important repercussions on regional and national initiatives and legislation in the region, with many derived policies and strategies on sustainable development, with some, but not many, specifically focused on mountain issues. In turn, national policies, have also derived subnational or local policies, often linked to decentralisation processes, for example, the national biodiversity strategies, leading to subnational strategies over the last 10 years in countries including Colombia, Chile, Peru and Argentina, allowing integration with local agendas, across different institutions and with participation at community level (Box 2.1.2).

National legislation on the environment has also largely been created since 1992, as well as specific guarantees regarding the environment within political constitutions (Table 7). Moreover, the new Ecuadorian and Bolivian constitutions place emphasis on the rights of nature, as well as specific mention of fragile ecosystems in the case of Ecuador. Ministries of the Environment and/or Sustainable Development are present in all countries, the earliest in Venezuela, since 1976, and many have gone through processes of reform, fusion and/or separation. Environmental legislation in all countries is strong, and some have specific provisions for vulnerabilities which could be applied to mountains. An analysis of national instruments applicable to protection of high mountain ecosystems in the northern Andes (Corporación Ecovera 2010) found 20 effective items of effective legislation in four countries, financial mechanisms such as payment for ecosystem services, tax exemptions for conservation, purchase of land for water production, and participation mechanisms (see below). In terms of water retribution schemes, an analysis of schemes in the Andes found that all had local legal instruments to formalise systems, including municipal bylaws and statutes (Quintero 2010).

National strategies and policies related to mountain ecosystems are also found in several countries, especially for paramos and wetlands, for example in Colombia, Ecuador and Peru. In Colombia, the six-year "Proyecto Andes" of the Instituto Humboldt, produced more than 50 publications, including strategies for the sustainable development of rural mountain landscapes, manuals on biocommerce, guides on Andean fauna and flora and

management plans, based on pilot experiences implemented as part of the project. The former Ministry of Sustainable Development and Planning in Bolivia, published a strategy on "Political Priorities for the Development of Mountain Ecosystems", destined at public and private sectors as well as civil society, as a result of activities during the International Year of Mountains (see below). Argentina has plans for a national policy on mountains, to be drawn up by the Mountain Committee, furthermore, the Strategic Tourism Plan (2005) supports protection of mountain ecosystems, especially with regard to awareness raising (Secretaría de Ambiente y Desarrollo Sustentable 2007). Chile has implemented an altitudinal limit of 1000 m on urban construction in an attempt to protect mountain ecosystems within local legislation of the Metropolitan Region, containing the city of Santiago de Chile (Comisión Nacional del Medio Ambiente 2005).

Decentralisation of functions and autonomy in regional government differs among countries, with notable progress in Colombia, where regional environmental authorities have high degrees of autonomy, favouring participation at local level in environmental management. A further product of decentralisation in Colombia and Peru, results in land-use planning according to river basins, rather than administrative divisions (Box 2.1.1). The Argentinean constitution of 2004 seeks to ensure that decentralised environmental governance has a minimum protection standard, with sectoral laws being introduced from 2002 onwards, on issues such as water, PCBs and industrial residues (di Paola 2006).

Climate change has been incorporated into national policy through a variety of mechanisms, including the creation of government departments, committees, designation of responsibilities to existing institutions, and the production of national strategies and legislation (Maldonado et al 2011). Over the last 20 years, focus has shifted from mitigation, reducing greenhouse gas emissions and promotion of Clean Development Mechanisms, to adaptation and research on the effects climate change, in line with global trends (Maldonado et al 2011). Research has included monitoring stations, for example as part of the Global Observation and Research Initiative in Alpine Environments, with 15 permanent plots established across the High Andes, and a further eight plots planned. More recently, strategies for climate change adaptation have been produced in at least four countries, including at regional level in Peru. Specific focus on mountains includes a side event organized jointly by Chile and Peru at COP 16 in Cancún, Mexico in 2010 on adapting to the impacts of climate change in mountain areas.

The institutionalisation of policies and strategies within national scenarios has gained momentum in recent years, as focus and priorities for interventions have shifted, especially with regard to international cooperation. The importance of inter-institutional approaches, and working simultaneously at different levels (from national to local) has been increasingly recognised, and has facilitated the incorporation of learning from previous or pilot experiences into government agendas at appropriate levels. Experiences in climate change adaptation and forest management from Andean areas show how knowledge is transferred.

#### Box 2.1.1 Changing perspectives of forest management through Swiss cooperation

Forestation with an economic and social perspective, was the starting point in the Andes for over 30 years of Swiss cooperation. Work was prioritised in the Andean region of three countries, Ecuador, Peru and Bolivia, using exotic species, mainly because forestry knowledge in these species was more advanced. At the end of the 1980s and beginning of the 1990s, Andean forest remnants became an important new focus of attention, with studies taking place in native species with forestry potential. Over the next 15 years, work focused on protection of forest remnants in protected areas, from a perspective of combating poverty and reducing pressures on natural ecosystems. At the beginning of the 1990s, the Swiss approach

was novel in linking poverty reduction and forest conservation, given that for many organizations, themes such as these were still treated separately. During this time, a very local strategy was employed, very focused on communities as beneficiaries, with relatively little political involvement. However, this was later identified as a limitation, and deliberate steps were taken in subsequent program to position the issue of Andean forests in national and regional agendas, as well as incorporating lessons learnt from the earlier interventions.

Thus, the ECOBONA programme was established in 2006 with a specific mandate to synthesise previous learning employing a systemic approach (as Andean forest ecosystems) and institutionalize knowledge as a specific five-year exit strategy. The programme, following the prior mandate to combat poverty, also became more focused outside protected areas, using a method of "ecological exchanges". To transfer knowledge, the implementation of this programme was different in that it established a primary contact with intermediate level government from which both national government, and communities and municipal government levels were reached.

In evaluating the relative success of this approach between countries, factors that influenced the programme's outcomes included the size of the country, the level of decentralization, and dependence on the capital city, degree of citizen participation in policy development, and maturity of different levels of government. A further important conclusion, is that while frameworks and guidelines can be useful, the local situation is often very different and programmes must be adapted accordingly.

The International Year of Mountains (IYM) in 2002, provided impetus for a range of activities promoting sustainable development in mountains, foremost of which were the

establishment of national mountain committees in nearly all Andean countries (Table 7), coordinated through the Mountain Partnership. Committees were mostly coordinated through Ministries of Foreign Affairs, with a strong inter-institutional make-up. In most cases, committees were set up at least two years before IYM, after the United Nations decision in 1998. National committees have implemented diverse activities nationally and jointly with other countries, such as research and evaluations of mountain areas, meetings and symposia, health issues in mountains, planning for mountain development, as well as many communications activities to promote awareness of mountains. Mountain committees remained active in most countries after IYM, with Argentina, Peru and Ecuador having particularly active committees, in the case of Colombia, mountain issues were treated by different research institutes, without the need for a specific committee. The Mountain Partnership recently began a 2.5 year project, funded by FAO, to strengthen regional institutional and technical capacity among members of the Andean Initiative, especially by involving mountain committees.

A frequently cited limitation to sustainable mountain development relates to a lack of coordination between or within government sectors, and across decision making levels, from national to local level, for example, between mining and environment sectors. Other examples include overlapping functions in legislation regarding the same issue, in Peru, a mandate for land-use planning was established in regional governments, but then also given to the newly created Ministry of the Environment (Box 2.1.2).

Table 7. Government structure and legislation for sustainable development and environmental management in the Andean region

#### Box 2.1.2 The role of local and regional policies in land-use planning

*[UNDESA/DSD]--Please download original submission to view tables and figures*

### 2.3 Participation, awareness and knowledge

There is no doubt that public awareness in Andean countries on the issues underpinning sustainable development has greatly increased in the 20 years following Rio 1992, particularly regarding the conservation of natural resources, such as water and forests, and its potential impacts on livelihoods. In a context of more opportunities for participation, resulting from both formal and informal mechanisms, as well as more educational opportunities, civil society has played an important role in bringing about changes in mountain areas (Box 2.3.1).

Decentralization of government structures, and transfer of powers, have provided greater opportunities for civil society participation in sustainable development in the last 10-15 years, depending on the country. Participation includes mechanisms for control, denouncement, exercise of rights, access to information and reaching consensus with local government. For example, participative decision making processes in Colombia, include the participation of civil society organizations on the board of the regional environmental authorities, as established in environmental legislation (Box 2.1.2, 2.3.2). The decentralisation process in Ecuador has led to many policies, strategies and a plan for decentralised environmental management, with regional governments having mandates to support protected area management as strategy to guarantee the sustainability and supply of ecosystem services from these reserves (Poats and Suarez, 2007)(Box 2.1.2). In Peru, the participative municipal and regional budgets (2003) allow civil society organizations to propose local government projects and vote on setting priorities among them (Box 2.3.1), with similar mechanisms in Bolivia and Ecuador. In Argentina, the government structure is effectively decentralised, in that the country is a federation of autonomous provinces. The mountain province of Mendoza pioneered environmental legislation, with protection laws established in 1992, especially in establishing and regulating environmental impact assessments, with obvious relation to mining. In 1994, the same province, established a law requiring drivers of all-terrain vehicles to sit an exam on biodiversity conservation, recognising the fragile nature of the ecosystems in the province (Gobierno de Mendoza, 2009).

#### Box 2.3.1 Different approaches to participation in land-use planning

Academic knowledge has also played an important part in sustainable mountain development initiatives in the Andes. There are now many postgraduate level courses offered at universities throughout the Andes on sustainable development, often in connection with subjects such as environmental management and local government, and generally aimed at graduates in a diverse range of subjects. University research is also in a position to make direct contributions to local processes, providing that the relevant dialogue with local authorities and decision makers is established (Box 2.3.2), however, there are still many gaps between research and its application, as well as setting research agendas which are more geared towards local needs (Box 2.3.2).

An important integration process among academics was played by the Association of Andean Mountains (AMA), an academic organization, specifically focused on the sustainable development of the Andean region. AMA's main achievement has been the organization of five international symposia, between 1991 and 2005, on sustainable mountain development in the Andes (Table 4), with the participation of academics, NGOs, community members and government authorities. The symposia provided valuable opportunities for dialogue and exchange of ideas between different actors, catalysing other initiatives, such as the Proyecto Paramo Andino. However, since the last meeting, AMA has been generally inactive, but possibilities exist that CONDESAN will organize the next symposia within the context of its annual meetings.

The use and recuperation of tradition knowledge is also playing an increasingly important role in sustainable mountain development, but does not always occupy the position within academia that it merits, and is often not matched, or integrated against other types of knowledge. Traditional knowledge related to farming practices and water management will become increasing important in issues such as agricultural innovation and climate change adaptation. An important limiting factor to overcome is the relative value placed on traditional knowledge, which can be overcome to a certain extent by recovering pride in Andean cultures and practices (Box 2.3.2). A limiting factor in benefit sharing mechanisms for environmental services is the lack of exchange between academic and practical knowledge (CONDESAN 2011).

#### Box 2.3.2 Traditional and academic knowledge

*[UNDESA/DSD]--Please download original submission to view tables and figures*

### 2.4 Environmental management

The first national parks in the Andean countries were established at the beginning of the 20th Century in Chile and Argentina. National park coverage has grown at a steady rate since the 1970s, with a higher percentage of area covered within the Andean region, than outside (Figure 8), although in absolute terms, the area covered by national protected areas is less within the Andes, representing approximately 40% of the total 800,000 km<sup>2</sup>. Overall, 12% of the Andean region lies within protected areas, compared to 9% outside the Andes within the seven countries, although percentages vary nationally, from 6% of the Argentinean Andean region, to 20% of the Ecuadorian Andes (Table 8). National protected area systems in the Andes. Growth patterns of protected areas show similar heterogeneity, with Chile, Venezuela and Ecuador having already established the majority of their existing protected areas by 1990s, whereas Peru, Bolivia and Colombia showed significant growth over the last 15 years.

The creation of protected area systems, allowing a coordinated approach to biodiversity protection and protecting viable populations of species and representative samples of ecosystems, is the fundamental aim of the CBD Programme of Work on Protected Areas (Dudley et al. 2005). The first protected area systems in the Andes were established in Venezuela and Chile, in 1983 and 1984, respectively, although Ecuador also identified strategies to plan for its protected areas jointly in 1989. The remaining countries implemented systems during the last 20 years, with Argentina completing its proposal in 2003. Nearly all systems allow for the inclusion of private and regional conservation areas, and Colombia has made provision for regional protected area systems at three different levels (see Box 2.1.2). In terms of biome representation by protected, temperate broadleaf forests, of the southern Andes have the highest representation at over 30% of the biome's area, followed by Tropical moist forest (15%) and montane

grasslands(8%). As well as growth in national park areas, the effectiveness of their management must be measured in order to evaluate this component of sustainable development. Schemes have been implemented in some countries (e.g. Colombia), but the recurring limitations of national parks, for example, lack of adequate staff, budgets and management are still present in mountain areas [REF].

Table 8. Proportion of the Andean region within protected areas

Figure 8. Growth of national protected areas within (blue) and outside (red) the Andes, showing dates of creation of protected area systems.

Box 2.4.1 Regional system of protected areas in the Coffee-growing region of Colombia

[UNDESA/DSD]--Please download original submission to view tables and figures

Other conservation areas have also increased greatly over the last 20 years, including international categories within environmental agreements, such as Biosphere reserves (MAB 2011), World Heritage Sites (UNESCO 2011) and Ramsar sites, as well as civil society initiatives such as Key Biodiversity Areas(Eken et al. 2004; Langhammer 2007), Important Bird Areas (Devenish et al. 2009) (Box 2), WHRSN, and Zero Extinction Alliance (Ricketts et al. 2005).

Figure 9. Growth of conservation areas within IEAs (Ramsar sites, World Heritage, Biosphere Reserves) inside and outside the Andes 1970 - 2010

Biosphere reserves, established under UNESCO's Man and the Biosphere (MAB) Programme, consist of protected core areas and buffer zones, aimed at promoting sustainable development. A total of 41 biosphere reserves have been declared in the seven Andean countries, totalling some 550,000 km<sup>2</sup>, of which approximately half lies within the Andes (24 reserves). World Heritage Sites, established within the UNESCO convention of 1972 (UNESCO 1972), aim to protect cultural and natural heritage of outstanding value to humanity around the world. A total of 44 sites have been declared in the Andean countries, of which 23 are in the Andes, with a heavy bias towards cultural sites, with only six sites either natural or mixed. Ramsar sites, established between 1981 and 2009, of the total 74 sites in the Andean countries, totalling 212,651 km<sup>2</sup>, 29% of their area are within the Andes, representing 42% of the number of sites. In all, 75% of sites of all three initiatives in the Andean countries were established between 1990 and 2010. In terms of civil society initiatives, 689 and 566 sites were established over the last 10 years outside, and inside the Andes, respectively, including WHRSN, IBAs and AZE sites.

Strategies and planning for biodiversity conservation have increased greatly over the last 20 years, with all countries in the Andes completing their National Biodiversity Action Plans between 1997 and 2003 (Table 6), which have also led to planning documents at smaller geographical or taxonomical scales, for example, wetland or ecosystem conservation policies, conservation strategies for birds (Ecuador, Colombia, Chile) and regional conservation plans (Table 6). Species action plans for both threatened and non-threatened species have also been produced, with at least 30 species covered in the region.

Red Data books have been produced in all seven Andean countries over the last 20 years, covering species at national level, to date 50 publications have been produced, representing more than 15,000 evaluations. In at least three countries, red lists have been adopted into national legislation, providing different levels of protection to designated threatened species. An appropriate updating cycle, within appropriate biological and administrative timescales (e.g. for lists within national legislation), is important for continued functionality of red lists, and at least three countries have produced second or third editions of red lists over the last 20 years. Multiple editions of red lists also provide a means to measure changes in extinction risk over time, provided that compatible methods are used for each red list evaluation and that changes in category are ascribed to genuine changes in state, rather than resulting from new knowledge.

Civil society initiatives to monitor biodiversity have also increased in the last 20 years, for example, Christmas Bird Counts have accrued data from XX sites in XX countries, of which XX are in the Andes, and the Neotropical Waterbird Censuses have been implemented at least once at more than 1600 sites across the seven Andean countries between 1990 and 2011, but continuity at sites is a limitation in both these initiatives.

Box 2.4.2 Proyecto Paramo Andino

The Proyecto Paramo Andino, coordinated by CONDESAN, and implemented over the last six years by national partners in Venezuela, Colombia, Ecuador and Peru, aims to protect ecosystem services and improve the livelihoods of the inhabitants of the High Andean paramo. The initiative has its origins within the Working Group of Paramos, established in 1999, and project formulation began in 2003. After approval by GEF in 2005, the initiative established pilot projects at 14 sites across the four countries, including the three case study sites of Gavidia, El Angel and Rabanal, focusing on sustainable management, policy, training and education. The project has been successful in catalysing consensus from within local communities in the management of paramo ecosystems, a process which has evolved from an era characterised by a dichotomy between conservation and use (effectively excluding people from conservation), evolving to an approach based on sustainable use, but actually reaching conclusions of strict conservation, in some areas, as initiatives arising from within communities. In this sense, and given the relatively long period of implementation, important results can be attributed to the education component which has been fundamental in bringing about these changes in awareness within local communities, as well as changes in attitude among conservation practitioners. To facilitate replication of successful projects, the initiative has worked to bring together different actors interested in the sustainable development of the High Andes, through events ranging from community meetings to international conferences, as well as setting up a clearing house mechanism where experiences, management plans, legislation and project documents can be accessed. Masters and doctoral students from the region have also been funded through the project.

## 2.5 Exploitation and use of resources

This section examines progress and challenges resulting from the use of resources, with regard to ecosystem services, mining and land use. Central themes revolve around use of water, for example, in regard to retribution schemes for environmental services, and conflicts with regard to use, especially relating to mining. Conflicts could be further exacerbated by changes in water availability due to climate change, and also affect distribution patterns of agriculture.

The constitutions of all Andean countries include state obligations in environmental protection (Table 7), as well as including the provision of the private sector to receive economic contributions for contributing to the protection of natural resources. Only in the case of Ecuador, is it unclear in the new Constitution whether this type of alternative is viable (Quintero 2010). Payment for environmental services is not specifically mentioned in legislation in the Andean countries, but both Colombia and Peru are preparing a strategy and a law, respectively, treating the issue (Quintero 2010). Also, proposals going beyond the solely economic nature of retribution for environmental services propose benefit sharing mechanisms to ensure livelihoods within river basins, based on dialogue and social consensus (CONDESAN 2011). Research on, and implementation of water management and retribution schemes has grown over the last 20 years, and initiatives have been implemented at different scales. In rural mountain areas, lessons have been learnt in the appropriate scale of water management schemes, and advantages have been found favouring an approach based on very small scale basins [REF]. Recently, in a context of climate change, important progress has been made in the incorporation of a systemic approach to watershed management, with communities playing leading roles in the management of natural resources through participatory drafting and implementation of local watershed management plans (Becerra et al 2011).

Although the issue of climate change may have provided such a boost, integrated water resource management has steadily been gaining ground in the region. Until the 1970s, water management in the Andes, was compartmentalised according to sector (e.g. hydroelectric, agricultural or urban use), resulting in highly trained professionals in each area, but did not take into account the needs of other sectors, or the effects of each sector's use on others. Early experiences in water resource management at river

basin scale, taking a more integral approach, in the Andes come from the CVC in Colombia, implementing research in Aguacatal basin in the 1970s, and in Rio Colorado in Argentina (Dourojeanni, 2011).

The river basin approach became more generalised in the 1990s, with the introduction of specific legal frameworks in countries such as Colombia, and Chile, albeit with very different approaches. Brazil's laws on water became a reference for Andean countries, taking the lead from this approach based on integral management of river basins, rather than Chile's more market-oriented laws, allowing property rights for water. In 2000s, countries such as Peru, Bolivia and Ecuador began drafting laws on water, although only Peru has managed to approve a general law on water, with political processes in the latter two countries not favouring the law's approval. Six pilot sites have been set up to test run Peru's new law on water of 2010, where requirements, such as water basin committees (see Box 2.5.1) and river basin delimitation are beginning to be implemented. However, it is widely thought that it will take some 10-15 years for a generalised implementation at national level.

A recent study of experiences in Integrated Water Resources Management (Acosta & Alvarez, in press), found that most initiatives had not implemented activities across the whole river basin, from protecting higher areas, to improving efficiency of water use in lower regions. As a result of priority setting amongst activities, mainly due to budgetary constraints, most initiatives concentrated on protecting upstream regions. However, in other cases, separate initiatives, especially through development projects, had implemented projects on improving efficiency in agricultural use of water, but not as an integrated approach to river basin management. Important factors for successfully converting to integrated water resource management were found to be connected to generating knowledge of the particular river basin; improving educational processes whereby communities learn about the importance of the water cycle and where their water actually comes from (especially for downstream communities, within and outside the Andes); and involving a large number of stakeholders, including regional and local government, water users, water authorities, among others (Acosta & Alvarez, in press).

Two routes generally lead up to the conformation of specific platforms for water management (i.e. participation and shared management), first, as a result of specific problems associated with water (e.g. degradation of ecosystems, scarcity, conflicts of use, pollution) a political process is started, aimed at reaching agreements on solutions and better management, however, disadvantages of this route mean that the implementation of concrete actions is often delayed, with the process becoming an end in itself. Second, specific actions, such as reforestation, or upstream protection, have triggered political processes leading to concerted water management, although in some cases by this route, these processes are not sufficiently strong to become sustainable. A further important contributing factor to improved water management has been the legal instrument to create associations between different regional or local governments (e.g. from the mid 2000s in Bolivia, Peru and Ecuador). Before this was possible, municipalities were not able to invest in upstream protection if these areas were physically outside their administrative region, with the ability to create associations, local governments can implement joint projects, with each municipality or regional government, contributing funds for its execution. Political willingness is an important factor in the success of such associations (Acosta & Alvarez, in press).

Many of the schemes to compensate environmental services revolve around water, with examples at different scales, although mainly still at the pilot stage. In some of the largest cities in the Andes, water funds have been set up, where users pay into funds for the water they receive, as part of the Latin American Water Funds Partnership, established by the Nature Conservancy. The initiative helps to protect Andean forests and grasslands in Quito and Cuenca in Ecuador, Bogotá and Valle de Cauca in Colombia and Lima, Peru (TNC 2011).

In an analysis of environmental services related to water in the Andes (Quintero 2010), participation in different components of retribution schemes was summarised. All schemes followed a cyclical system, broken down into components related to funding, regulation, administration of funds and investment in environmental protection and had legal instruments to formalise them. Actors providing funding included water users, local or regional governments and NGOs or international cooperation with funds administered by private or public banks or trust funds. Types of investment in environmental protection included payment, incentives or credits to landowners for protection; purchase of land, forest conservation or regeneration (mainly implemented by NGOs or local authorities); vigilance, as well as educational activities.

Other mechanisms providing economic retribution for protection of environmental services, appearing in public policies in the Andes, include incentives for reforestation or conservation of forests, tax exemptions, extra water tariffs and royalties from exploitation activities (Quintero 2010). One such program was recently started to protect high Andean ecosystems in Ecuador whose forests have one of the highest deforestation rates in South America (Clisen 2000), threatening ecosystem services and livelihoods among local communities and causing CO<sub>2</sub> emissions of up to 55,000,000 tonnes per year. The "Socio Bosque" initiative, launched by the Ministry of the Environment, aims to provide economic incentives (up to \$30 USD per hectare) to individual owners and rural communities (peasant farmers or indigenous groups) who voluntarily commit themselves to protecting their forests, paramos or other native vegetation for a period of 20 years. In 2009, at the World Conference on Paramos, the program launched a special goal of conserving 65% of the remaining high Andean paramo ecosystems. Inhabited areas of paramos in Ecuador make up 40% of their total area, with a population of some 500,000 people, the remaining area is divided between national parks (40%) and large estates (20%) (MAE 2009).

By 2010, almost 540,000 ha had already been included in the scheme, with an investment of \$2,668,025 USD and 631 agreements signed, of which 91% are with individuals (MAE 2011).

#### Box 2.5.1 Water management

Important progress was made in agricultural innovation at the end of the 1990s and beginning of 2000, with the objective of replacing traditional schemes of research and development, with more participative approaches for renewing agricultural initiatives. New approaches include the participation of social scientists, anthropologists and economists, as well as changing sources of knowledge to include local knowledge systems as well as the academic sector. A recent study analysed 31 cases of agricultural innovation in the Andean countries (above 1000 m altitude), where innovation was directly related to economic growth and poverty reduction in rural areas (see Box 2.5.2), resulting in changes in social organizational systems and agricultural technologies. A lack of connection was found between those implementing innovation and public policies, especially in terms of upscaling initiatives to wider regional environments even though policies in countries such as Argentina, Chile, Colombia and Peru do focus on integrating research and development with the private sector (Montoya, M. P. & Fano, H. in press).

The variety and complexity of traditional farming systems in the Andes (e.g. planting multiple crops on different fields, at different altitudes and exposures), on the condition that they are preserved, and their knowledge passed on, could provide an important pool of farming practices for rapid adaptation to changing climates (Young 2009). In fact, research has showed that pre-Columbian agrarian societies implemented innovations in agricultural strategies and infrastructure in response to both temporary and long-term environmental change and uncertainty (Dillehay & Kolata 2004). However, farming practices may also be forced to change, as a result of climate change induced reductions in water availability through less rainfall or melting glaciers, and in some areas farmers will need to move towards more elaborate irrigation schemes, or become more dependent on livestock, such as sheep or goats (Young 2009).

As discussed above, mining has increased in the Andean region, and is a vital part of economies. The theme is present in almost all the case studies, and in many, has changed local dynamics, but rather than opposing mining categorically, the case studies present responsible mining as a challenge (see Part 3). Nevertheless, in terms of sustainable mountain development, mining, as currently addressed by the case studies, is seen as a direct threat to biodiversity conservation, a source of conflicts in resource use between mining operations and communities, and as creating divisions within communities (e.g. Bebbington et al 2008) as regards their best choices for development (see Box 2.5.2).

The majority of mining-related conflicts revolve around water and land. In areas where water resources are more plentiful, such as paramos ecosystems, pollution problems are potentially more serious, whereas, in areas of water shortage, such as the mountains of south Peru and north Chile, use of water by mining companies competes with undervalued or unvalued ecosystem services or directly with the water needs of communities.

Legislation within the majority of Andean countries (REF) generally treats surface land and subsoil independently, and are even administered by different sectors within the state, often lacking the necessary coordination between them for correct land-use planning. This can lead to complaints on environmental issues caused by mining being treated by sectors outside environmental jurisdictions. For example, in Peru or Chile, complaints made about mining are not treated by agricultural or environmental sectors of government.

An information system to document social and environmental conflicts in Latin America (OLCA) (<http://www.olca.cl/oca/index.htm>) presents a diverse array of mining conflicts in the region, including at least 145 communities, most of which were from the mountain regions (Table 9). However, what is reported often depends on the degree of institutionality and legislation in each country. For example, differences in the constitutional structure of Colombia, compared with Chile or Argentina, favour the former in providing opportunities for social control and making formal complaints or information requests. In Peru, conflicts related to mining, reported to the Ombudsman's Office, rose from 33 to 89 between 2007 and 2009 (Bebbington 2009).

Table 9. Mining conflicts reported by county (OLCA 2011)

Over the last 20 years, mining companies have developed biodiversity and social strategies. However, the effect of these on mining operations and their impact on livelihoods is not clear, given that many appear to be offset strategies, rather than addressing direct operational issues, for example, one strategy aims to have a "net positive impact" on biodiversity. In this sense, biodiversity conservation projects in adjacent areas to mining operations, or infrastructure construction in municipalities where mining takes place have their benefits, but their focus on changing operational procedures or resolving conflicts related to resource use is more limited.

#### Box 2.5.2 Balancing economic alternatives with use of resources

The role of mountain ecosystems in fomenting tourism has resulted in an increased value being given to both altered and undisturbed landscapes, according to different focuses of tourism. Nature and adventure tourism tend to favour undisturbed landscapes, whereas agro-tourism, or that based on rural communities, focuses on cultural or agricultural landscapes. For instance, in Argentina, the declaration of the Quebrada de Humahuaca, Jujuy, in 2003, as a World Heritage Cultural Landscape attracted a greater number of tourists to the area (Box 2.5.3).

Although tourism can be a sustainable activity in the mountains, and considered an ecosystem service, the majority of tourist activity does not comply with criteria of sustainability. However, many initiatives exist to present sustainable models, particularly rural ones, as alternatives for development in mountain regions. The Mountain Partnership, for example, is supporting sustainable tourism projects in frontier regions of Argentina, Bolivia and Chile.

Tourism has grown at an annual rate of almost 3% in the Andean community since the 1990s (IICA 2008), and an influx of tourists in rural areas has meant changes to working routines among rural communities, with many projects implemented in capacity building, training and preparation of tourist products over recent years. Tourism is presented as a complementary, rather than alternative strategy for development, alongside more traditional rural activities or other alternatives for development, an important consideration given the seasonality of the activity. Different types of rural tourism have been identified, ranging from community tourism, where community projects provide a joint service with sharing of benefits, to those based more on individual landowners providing accommodation on rural estates, or in family homes. Many national strategies and plans on sustainable tourism have been released over the last 20 years in the Andes, as well as the conformation of national and regional networks of service providers, academics and government bodies, with regular conferences and meetings on the subject. More specialized types of tourism have also increased across the whole region, such as birdwatching, but especially focused on regions with high rates of endemism, such as the Tropical Andes, with national strategies and guidelines produced, for example in Ecuador.

**2.6 Funding and international cooperation for development** International cooperation (ODA)<sup>12</sup>, has channelled substantial funds for reaching development objectives in the Andean countries significantly over the last 20 years. As a proportion of GDP, development assistance reached maximums of almost 20% in Bolivia, and 3% in the other countries, but is decreasing in the Andean region (Figure 10a), as GDP increases and cooperation remains stable. However, as cooperation agencies realign their priorities (e.g. to other regions such as Africa), it is expected that this source will cease to be a major funder of sustainable development initiatives in the next 10 years, with possibly the exception of Bolivia, with some agencies recently defining exit strategies in some Andean countries (e.g. CSD will shift priority to Bolivia while closing existing operation in Ecuador and Peru). The implications for the region are that more regional sources, for both funding and technical support will need to be found (see Part 3).

With regard to the implementation of Rio 92 objectives in sustainable development, analysis of ODA shows that funding has increased slightly in absolute terms and as percentage of total development assistance in projects with principal or significant objectives related to biodiversity, climate change or desertification<sup>13</sup> (Figure 10b), reaching over 10% of all assistance by 2009. However, the slight increase observed at the end of the 2008 period may be an artefact of obligatory reporting being implemented from this time, as well as reporting cycles and changes in thematic focus, therefore a trend is difficult to diagnose. Individual components of aid to Rio objectives show an increasing trend in funding for both biodiversity and climate change components, and decreasing in desertification-related aid, with climate change overtaking biodiversity only in the last two year period (Figure 11). However, in terms of numbers of projects, more have been implemented in biodiversity related themes consistently over the last 20 years.

Figure 10. a) Development aid as percentage of GDP (OECD, IADB); b) Total ODA funding, and broken down for environment sectors and Rio 92 markers.

[UNDESA/DSDJ]--Please download original submission to view tables and figures

Figures on development assistance for environmental sustainability not only includes specific environmental projects, but also other development projects with environmental components (OECD 2009). Aid for environmental sustainability peaked in 1996 in Andean countries, but has shown an increasing trend since 2005, reflecting aid to Rio objectives over the same period, and reaching over 20% of all development assistance to Andean nations in 2009 (Figure 10b).

Figure 11. Numbers of projects (bars, right axis) and total funding (lines, left axis) for implementation of Rio objectives in development assistance 1996-2009.

[UNDESA/DSDJ]--Please download original submission to view tables and figures

Although climate change is now firmly on the agenda of governments, NGOs and funding agencies, compared to 20 years ago, initiatives formerly focused on desertification may be classified more generally related to water issues and overlap with climate change, perhaps related to a semantic understanding of reporting markers. Development assistance to implement Rio objectives falls into five principal sectors (agriculture, energy, forestry, environmental protection, water), with proportionally more being spent on energy related initiatives (due to climate change related initiatives), and less on forestry related initiatives in the last five year period.

Projects addressing climate change funded by Official Development Assistance (see note 4) in the Andean countries have increased steadily over the last 15 years, to almost

600 projects implemented over the period 2008-2009, with funding increasing from \$45.3 million USD in 1996-7, to \$432.4 million USD in 2008-9, for a total of \$1,215 million USD over the whole period<sup>14</sup>, with over 75% of this funding provided by Germany, Netherlands and Japan, and over 65% corresponding to GTZ, KFW (Germany), MFA (Netherlands) and JICA (Japan).

## 2.7 Conclusions on processes promoting or limiting sustainable mountain development in the Andes

A wide variety of institutional processes have promoted sustainable mountain development strategies in the Andes over the last 20 years, in a progression which can often be tracked from commitments acquired as part of international agreements, leading to incorporation into political constitutions, resulting in national policies or legislation, and implementation at regional or local level. Increasing protagonism at local level has been supported by decentralisations processes. This vertical movement through government levels has been repeatedly singled out as a vital component for effective implementation, especially since this process is a necessary precursor for community participation. It is when this process is interrupted, that limitations are identified to sustainable development, for example, in overlapping authorities, lack of coordination or integration between levels, or separate treatment of such interdependent quantities as water and land.

Participation at regional and local levels has also been a major promoter of sustainable development, enabled through policies which have largely been created over the last 20 years. Limitations are again identified when participation processes are interrupted, for example, through deficiencies in knowledge, budget restraints, corruption and conflict of interests, institutional instability in NGOs and dependence on electoral periods. Experiences from Peru and Ecuador clearly show the positive value of local participation in alliances towards sustainability, but also make evident its incipient fragile nature. As a result, it is important that these processes are firmly institutionalised, but also embedded culturally, in an attempt to prevent loss of confidence in them and ensure effective social control. In Colombia, participation has a longer history, and in some regions this cultural component is already evident, with limitations revolving more around information gaps. Decisions as to when or when not to participate become more important at this stage.

In general, these limiting or promoting institutional factors, are not intrinsic to mountain areas, and would surely be identified in a wider survey of sustainable development at national levels. What is important, though, is to take into account the specific mountain context in their analysis, in that greater levels of poverty may exist, greater vulnerability of biodiversity, greater risk from climate change impacts and water shortage, and greater potential for conflicts regarding resource use. Of course, these statements do not hold across the whole Andean region, and as has been made clear throughout this report, the size and diversity of the Andes make a synoptic regional analysis difficult, but at local level, they certainly compound the limiting factors identified in this report.

A recurring theme revolves around water management and availability, with effects of changing climates contributing to serious challenges ahead for the livelihoods of mountain communities. Examples abound from cases in Bolivia, Peru, Chile and Argentina, where water shortages will require sustainable solutions, above all, within institutional frameworks. Retribution schemes for ecosystem services, such as water provision, from micro-basin level to the scale of cities, have shown great promise, with emerging approaches in benefit sharing, rather than straight economic payment for services.

A second recurring theme is related to resource exploitation, and burgeoning economies of some countries, based on extractive systems. Often related to these cases, is that land-use planning instruments, combined with decentralisation and other favourable institutional frameworks have failed to reach consensus as to the use of mountain resources, whereas they have been very successful in other cases. It is these economic systems that demand a larger quantity of resources of mountains than is sustainable, creating conflicts of interest, which will be exacerbated with reductions in water availability and its consequences. Furthermore, market forces, such as the price of commodities, exert influences which are often uncontrollable at national level, but have wide-ranging effects.

The sustainable exploitation of mountain resources, including for tourism, agriculture and biocommerce (especially with regard to native species), has great potential among the diverse visual scenery and wealth of cultures and species in the Andes. Experiences at local levels, have the potential to provide incomes and improve livelihoods, and could consider high quality, but low volume products. In this respect, certification, denomination of origin schemes and other market instruments, will favour sustainability and alternative exploitation of natural resources. Furthermore, the recuperation of traditional Andean knowledge will also play a key part in alternative income generation from these sources. It should be noted, however, that these experiences are also valuable as local strategies, where export markets are not the prime target.

Environmental management has become stronger in the region since 1992, with many specific instruments for better identification of priorities, better management of ecosystems and better incorporation of livelihoods into conservation schemes, as shown by examples from Colombia and Venezuela. Greater awareness of environmental issues on the part of civil society, has also been a goal of many of these measures, and in turn, has facilitated others.

Many projects have been implemented at national, bilateral and regional level with objectives in-line with sustainable mountain development, including biodiversity conservation, protected area creation, land-use planning, and poverty eradication, among others. On balance, many international agreements have a high rate of uptake among Andean countries, with high compliance in terms of reporting commitments, and important progress in the creation and implementation of derived national policies, action plans on climate change, reports on specific programmes of work. Implementation has also become incorporated into national legislation, in action plans and threatened species protection, for example, as well as national policies. However, indicators for the achievement of environmental Millennium Development Goals in Latin America show mainly negative trends (CEPAL 2010), including the 2010 CBD biodiversity targets (Butchart et al. 2010).

The relative importance of mountains within the different Andean countries somewhat reflects the degree of implementation of sustainable mountain development initiatives. For countries with small mountain areas, such as Venezuela and Argentina, priority is perceived as low, although in the case of Venezuela, the country is much more dependent on mountain systems (e.g. in terms of population and ecosystem services). In the case of countries with a much larger proportion of the Andes making up their territory, such as Ecuador, Peru, Bolivia and Chile differences also exist. For example, in Peru and Chile, the relative priority given to mountains is lower, in Peru, in part due to a large degree of centralization in Lima on the coast, although the city is very dependent on mountain systems. In Ecuador and Bolivia, the situation seems to be more balanced, and in Colombia, where almost the opposite occurs, in that priority is given to mountain systems where the population is concentrated, even though they make up a relatively small part of the national territory. These observations highlight the importance of raising awareness of the importance of mountain systems at national level. For example, the International Year of Mountains played an important part in the formation of national mountain working groups, and creating awareness of mountain issues nationally through diverse activities in all countries.

In addition to awareness, information created on mountains, has been identified as both limiting and promoting mountain development, as a function of its utility in decision making. This depends greatly on its degree of processing and format, as well as the level of communication with the appropriate authorities, at all stages of academic activities, that is, before, during and after research activities.

Experiences have shown when local knowledge is included in initiatives, there is a higher uptake by stakeholders, there is no shortage of local knowledge in the Andes, and combined with an incredibly diverse territory of cultures, species and ecosystems, spanning a mountain range of more than 6000 km in length, a complexity results in multiple dimensions. Tapping this complexity itself, ranging from gene pools and seed banks, to traditional farming practices and indigenous languages, is surely one of the key factors to attain sustainable mountain development with approaches originating in the region.

## PART 3: EMERGING CHALLENGES AND OPPORTUNITIES

### 3.1 Future challenges for sustainable mountain development in the Andean region

Following consultation (see Appendix 2b), and from the conclusions of the above report, the following challenges have been prioritised in terms of sustainable mountain development in the Andean region. Challenges fall into two broad areas (see 3.2), and many imply changes to institutional frameworks or are related to implementing green economies.

- Regional differences and integration

As this report has highlighted throughout, many differences exist between the North and South Andes, and the same is true of the challenges. For example, in the south, mountain issues do not have the same exposure on national political agendas, even in Chile, which has one of the highest proportional areas of mountain region per country in South America. In the north, mountains are more important to livelihoods (not just economies) and increased social participation in the last 20 years has ensured a wider exposure of mountain issues. A further consideration, in terms of regional integration, is the purpose and scope of such integration, given the wide differences between countries. Although exchange of information and experiences in sustainable mountain development among countries of the continent has undoubtedly benefited, it is rather idealistic to envision a complete integration across a wide spectrum of issues. Rather, integration must serve specific purposes, in areas where such integration is both feasible and useful, especially given the difficulties and timeframes of reaching agreements between just four countries in the Andean Community (CAN). Nevertheless, the CAN has played an important role in integration in the north of the continent, especially with supranational legislation, for example, in the Biodiversity Strategy. However, this type of political proximity between countries, for the purposes of joint construction and implementation of policies on sustainable mountain development, will only be possible with an underlying political pact. In this case, the Union of South American Nations (UNASUR), may eventually provide this opportunity, if it takes on and supersedes the role of the CAN (and Mercosur to a lesser extent) across the continent. UNASUR has only just been created as a political entity, and although the potential for such integration is clearly set out in its statutes and proposed commissions, it is still too early to comment on its effectiveness. What is important, however, at this crucial initial stage, is that issues relative to mountains are clearly set out on UNASUR's agenda by the member countries.

- Economic systems

Given the importance of extractive industries in the economies of the Andean countries, and the perceived incompatibility of many of these with sustainable development, a major challenge relates to how resources are valued, and how benefits are distributed. Economic systems need to incorporate the real value of resources, including the full process used to obtain benefit (e.g. extractive industries, water provision) and include retribution systems taking this value into account. Retribution systems and benefit sharing, understood as mechanisms based on dialogue and social consensus, not just economic schemes, must ensure that inhabitants benefit fairly and that ecosystems are adequately protected. For example, in the case of water provision from northern Andean paramos, a sustainable use must ensure protection and/or restoration upstream, often in areas which are far from the largest concentrations of users. In the case of mining, a responsible use must ensure adequate protection measures for ecosystems and inhabitants during exploitation and restoration at the close of activities.

Bringing about changes in economic models is perhaps the hardest, but most important challenge for sustainable mountain development. The challenge of determining the capacity of Andean systems to support these economic models must be addressed under criteria of sustainability. However, given the important mineral reserves still within the Andean mountain region, it seems very unlikely that economic models will change in the short to medium term unless governments radically change their policies.

- Intra- and inter-institutional dialogue

A further major challenge identifies strengthening inter-institutional dialogues at a variety of scales and levels, both within and between public and civil society sectors. With regard to the changes in economic models mentioned above, a lack of dialogue between government sectors has been repeatedly recognised as a major limitation to sustainable mountain development. It is often the case in Andean countries that conflicts of interest and jurisdiction, sometimes resulting from hierarchies of authority, exist between and within the different government departments responsible for the environment, sustainable development, agriculture, mining and petroleum extraction. Improving joint agendas for responsible development is necessary between government sectors, and with the participation of the private sector, which often include multinational companies. Private companies also have an important role to play, and although practices and policies must be regulated by the state, existing private company strategies on biodiversity and social development, for example, could be further aligned with national policy.

- Decentralization

Trends in decentralization have been very positive for sustainable mountain development in many countries, with important benefits to environmental management and civil society participation at different levels. Implementation of strategies derived from international agreements at regional and local level has become a reality over 20 years, with strong local participation. It is often at this level where results are most tangible, for example, in improving livelihoods or in biodiversity conservation, underlining the importance of regional contexts to many development processes. However, maintaining these trends in decentralization and the opportunities for dialogue between national and regional level remains a challenge, given a certain dependence on changes within national politics or on periods of office of regional and national governments (e.g. changes in governors, political parties), rather than a reliance on institutionalised state policies.

- Research agendas and traditional knowledge

Universities have an important contribution to make to achieving sustainable mountain development. Areas where challenges exist include further alignment of research agendas with policy gaps and priorities; more emphasis on including traditional Andean knowledge; and better dialogue with government and NGO sectors. Research is necessary in all areas of sustainable mountain development in order to ensure that decisions are based on sound knowledge, whether its source is scientific or traditional. However, research agendas at universities are not always in line with the priority needs of policy makers. In the case that universities want to contribute to decision-making processes through research results, dialogue is needed on the part of both those who set and communicate the priorities and those who ensure that ensuing results are fed back to decision makers in a suitable format.

Traditional knowledge, for example, social dynamics of Andean families, farming techniques and irrigation systems, are increasingly valued in processes related to sustainable development. The variety of farming techniques, for example, is an important source for adaptation measures related to changes in climate.

Recuperating traditional crops also has untold potential in terms of feeding populations, including up to global scales, given the importance of the Andes as centres of crop origin. Already, small scale-projects have been successful in regaining esteem among communities as to the value of traditional crops, in economic and nutritional terms. Making sure these pilot schemes are communicated and fed back into policy is an important, and sometimes neglected part of a project cycle or loop.

- Specific mountain initiatives

Significant progress has been made in specific sustainable mountain development initiatives in the Andes, both within civil society and the state sector, albeit relatively few exist. A lack of continuity in others, is also, to some degree, an indicator of the relative importance placed on the subject on the part of both public and civil society sectors. Furthermore, there has been little interaction between different initiatives in the region, even though in many, the same actors or focal points are involved. Before creating more specific initiatives in sustainable mountain development in the region, two points should be addressed, the inclusion of specific mountain themes in existing initiatives (and national policies) as a way to increase awareness of the importance of mountains, and to ensure that mountains are treated on a par with other thematic issues, and that greater interaction between existing initiatives makes their implementation more efficient. Nevertheless, there is still scope for more regional initiatives, such as monitoring and information systems, but ensuring that existing institutional frameworks, such as CONDESAN, the Andean Community, the Mountain Partnership, or the Strategy on High Andean Wetlands are used.

Interactions could also span continents, across northern South America and southern Central America, where obvious cultural similarities exist, for example, between Panama

and Colombia, and biogeographic affinities, for example, in paramo ecosystems in Costa Rica and northern South America.

- Regional information sources

Compiled regional information on the Andean countries is generally lacking, and to an even greater extent on the mountain region of these countries. Although much information exists at country level, without time- and resource-intensive processes to consolidate this at regional level (e.g. ensuring compatible scales, methods etc.) comparisons are difficult to draw. This applies to many different topics, from landscape changes to legal frameworks. A regional information system, incorporating monitoring results of environmental, social and economic indicators and compiled, standardized information at regional level would improve decision making processes within existing initiatives.

- Water and climate change

Other challenges cover cross-cutting issues, such as climate change, water and rural livelihoods. Without a doubt, water availability is a critical issue in most of the Andean region, increasingly affected by, and highly vulnerable to, changes in climate. Ensuring adequate water availability throughout the year is already becoming noticeably difficult in some regions. Pilot processes have been successful in increasing water availability through integral river basin and water management, such as alternative irrigation systems. As mentioned above, it is important that these type of projects are adequately communicated and fed back into policy and decision making arenas. At a larger scale, research is still needed to evaluate the full effect of changing climate on glaciers, paramo, puna and montane forests with regard to water availability throughout the region, however, it will be almost a race between obtaining the information and implementing suitable adaptation mechanisms, where possible, undoubtedly with elements of risk involved. An important factor here is to use existing experiences where changes in climate have already led to adaptation measures. In general, research on climate change is still troubled by uncertainty, especially regarding future climate models for the Andes, requiring more emphasis on the development of regional models.

The effects of climate change also need to be considered across policies and initiatives, for example, with regard to large scale infrastructure development related to agriculture (e.g. some projects within the Regional South American Integration Initiative) where changes in climate must be related to crop suitability in the future. As adaptation measures are implemented, a major challenge relates to upscaling or rolling out initiatives after pilots have been implemented without adequate timescales to allow for monitoring to provide sufficient data to assess their effectiveness. However, given the estimated timescales for changes in climate taking place in the Andes, a balance must be reached between waiting for monitoring results and having enough time for implementation. Care must also be taken that other issues are not marginalised by an increasing focus on climate change, for example, with regard to habitat loss, which remains the most important cause of threat to species and hydrology in the region.

- Funding and international cooperation

In terms of funding, international cooperation in the region has remained stable, but decreased as a percentage of GDP in all countries, and is not expected to increase. Some cooperation programmes are also in their final stages as global priorities shift. Moreover, economic crises, for example of 2008-2009, have recently hit North America and Europe harder than South America, and caused instability in funding sources and international cooperation from the north. A new, more strategic model of cooperation, going beyond the traditional approach, needs to be implemented, where cooperation catalyses processes rather than funds projects.

Achieving financial stability, and fairer distribution of wealth is a fundamental factor in achieving sustainable development. In this sense, given the enormous wealth of the region, the challenge is also very related to developing alternative economic models (for example, considering stability rather than growth, as important indicators or that outlined in green economy model) which include both the provision of funding within countries and technical cooperation from within the region as well as South- South cooperation (e.g. with Africa, Himalaya). Models also need to include greater capacity to respond to changing environments (e.g. climate change, financial instability), and systems such as adaptive management could become increasingly important in many different scenarios.

### 3.2 Summary of key challenges and recommendations for sustainable mountain development in the Andes

The key challenges and recommendations are summarised below, grouped into the two broad themes of strengthening institutional frameworks and improving knowledge and information systems, as well as cross- cutting themes.

#### 3.2.1 Strengthening institutional frameworks

- Institutionalised and regulated framework for incorporating real values of renewable and non-renewable resource exploitation into economic models, especially those based on mining and petroleum extraction.
  - o Achieve socially and environmentally responsible mining (combat illegal mining, consolidate regulations, change attitudes), with special focus on ensuring proper conciliation and dialogue between sectors (e.g. mining, local communities, conservation)
  - o Design, implement and/or consolidate retribution systems to protect (restore, if necessary) and transfer benefits to mountain areas and inhabitants from resources generated within them, e.g. regulatory function in water cycle of high Andean ecosystems, royalties from mining in the Andes
- Inter-institutional and inter-sectoral dialogue within and between governments (national and regional level), especially important where conflicts of interests, jurisdictions and authorities exist, e.g. between Agriculture, Environment and Mining authorities within government.
  - o Strengthen or create mechanisms for inter-institutional dialogue within countries, e.g. between universities and local government, between local and national government
- Increase presence of mountains on political agendas
  - o Emphasis on regional participation from mountain areas in the national political agenda
  - o Achieve policies on mountains which are integrated with national policies (not separate)
  - o Consolidate an ecosystem approach to sustainable development in mountain areas, determining compatible and incompatible land uses with sustainable mountain development
- Ensure decentralization continues to provide benefits.
- Consolidate or create specific national or regional mountain initiatives, derived from national policies or regional agreements, in areas such as vulnerability to climate change, biodiversity conservation, monitoring systems, combating poverty, avoiding emigration from mountain areas, etc, using existing frameworks, e.g. Mountain Partnership, High Andean Wetland Strategy, etc.
  - o Build on and consolidate CBD Program of Work on Mountains, ensuring full coverage of this program across Andean countries.
  - o Use regional platforms, such as CONDESAN, to facilitate formulation and implementation of sustainable development strategies
- Improved institutional frameworks for risk management (economic, natural disasters, extreme climate events, etc)

#### 3.2.2 Improving knowledge and information systems

- Integrate local and traditional knowledge into existing mechanisms for knowledge management, e.g. routes for incorporating research results into policy.
  - o Ensure traditional knowledge is adequately covered by university research agendas
  - o Recupérate and create awareness of the real value of knowledge on Andean family dynamics, social structure and farming methods, especially as input for climate change adaptation measures, alternative incomes, improving rural livelihoods, etc.

- Enable research priorities and research results to be communicated between decision makers and research institutes/universities
- Implement a monitoring and information system at Andean level geared to support decision making, incorporating environmental, social and economic indicators (including climate change and adaptation), with participation from universities and governments
  - o Include a special emphasis on planning for extreme climate events in mountain areas
- Achieve further integration of, and dialogue between specific mountain initiatives in the Andes
  - o Revitalise national mountain committees where necessary
  - o Further relations between north South America and Mesoamerica (especially south) building on cultural and biogeographic similarities
- Continue to cover gaps in knowledge of current situations, given that the most important source of uncertainty on future scenarios is due to this lack of information.

Measure volume of flow to measure effectiveness of integrated water resource management, as well as other indicators such as area of forest planted/restored, upstream protection, etc.

### 3.2.3 Cross-cutting challenges

- Year-round water availability, especially in climate change context.
- Implement adaptation measures to climate change, with emphasis on the most vulnerable mountain regions
- Food security - priorities for rural Andean inhabitants
- Land ownership. There is an increasing amount of foreign investment in land in the Andes, especially in the south, if inhabitants do not own land, they are left out of decision making processes.
- Financial stability for sustainable mountain development
- Continued and increasing participation on part of civil society

## 20 years of Sustainable Mountain Development in the Andes

### Executive Summary

#### 1. State of the Andes

<sup>[4]</sup> The Andes mountains, understood as the contiguous mountain region of Argentina, Bolivia, Chile, Colombia, Ecuador, Peru and Venezuela, run over 8000 km, down the length of South America, with an area of more than 2,500,000 km<sup>2</sup>, (33% of total country areas) and a population of almost 85 million (45% of total country populations), making the northern part, the most populated mountain region in the world.

<sup>[4]</sup> However, the Andes are an incredibly diverse and heterogeneous area, in terms of cultures, biodiversity and economic systems, with large differences between countries.

<sup>[4]</sup> Some of the most biodiverse regions of the planet, and areas of highest species endemisms exist in the Andes, important centres of crop origins are also present.

<sup>[4]</sup> The Andes are incredibly important for the economies of the seven countries, providing agricultural area, mineral resources, and water (for agriculture, hydroelectricity and domestic use), and some of the largest business centres of South America.

<sup>[4]</sup> Some of the poorest areas, and with the most challenging living conditions exist in the Andes, especially in Ecuador, Peru and Bolivia.

<sup>[4]</sup> Pressures on natural resources in the Andes result from expanding populations, expanding agricultural areas and intensity, and increasing mineral extraction.

<sup>[4]</sup> Climate change will exacerbate other pressures in some mountain areas, for example in more erratic rainfall patterns, changes in water regulation capacity, especially of high altitude ecosystems and in the south, melting glaciers, and changes in climatic suitability for some crops, (although not all areas are equally affected, and some may benefit), and increasing extinction risk to biodiversity.

#### 2. Progress on implementing sustainable mountain development, incorporating recommendations

<sup>[4]</sup> National policies, resulting from Rio 92 have been implemented in all Andean countries, and at regional level in Andean Community countries, with many favourable aspects for SMD, albeit, not specific to mountains.

<sup>[4]</sup> Recent regional level policies (often resulting from above point), decentralisation and increased opportunities for participation of civil society have also played an important role, although dependence on aspects such as electoral periods, governing parties, makes implementation in some areas difficult.

<sup>[4]</sup> Regional initiatives on SMD, such as organizations, academic meetings and supranational agreements have increased greatly over the last 20 years and supported awareness raising, knowledge sharing, and implementation of international agreements.

<sup>[4]</sup> National parks, protected area systems, other conservation areas, and instruments for biodiversity conservation, both through state and civil society processes, have increased greatly in the last 20 years. Although issues still remain with regard to effectiveness of their protection, the recent participative processes in identifying and declaring sites has undoubtedly furthered awareness of environmental conservation and its importance on livelihoods in mountain regions.

<sup>[4]</sup> Mining represents an opportunity for development, but presently is often not implemented in a responsible manner, and benefits do not always reach mountain areas where mining takes place

<sup>[4]</sup> Management of water resources in the Andes has seen novel initiatives at a variety of scales, from micro- basin to administrative divisions, but uncertainty in water availability, and conflicts of resource use are still a threat to SMD.

<sup>[4]</sup> Approaches to SMD have evolved, e.g. ecosystem approach to biodiversity conservation, increasing importance of livelihood concerns within conservation (e.g. incorporation of more social issues into conservation); international cooperation projects have changed in the last 20 years, with a recent focus on incorporating learning processes into institutional frameworks (e.g. in policies and programmes) at both national, regional and local level.

<sup>[4]</sup> Academic and traditional knowledge has played an important role in supporting SMD, gaps still exist in applying knowledge, and although the value of traditional knowledge is increasingly recognised and understood, this does not flow into general practice.

#### 3. Key Challenges and recommendations

##### Strengthening institutional frameworks

- <sup>[4]</sup> Increase dialogue between government sectors, and government levels
- <sup>[4]</sup> Increase inter-institutional dialogue
- <sup>[4]</sup> Further institutionalisation of participation instruments

- ☞ Raise awareness of mountain issues on political agendas
- ☞ Consolidate or create specific mountain initiatives where appropriate
- ☞ Regional integration - role of CAN, UNASUR

Improving knowledge and information systems

- ☞ Increase availability of academic and traditional knowledge for specific SMD purposes and decision making ☞ Coordinate research priorities for implementing SMD ☞ Consolidate or create specific national or regional mountain initiatives ☞ Research and monitoring of climate change adaptation mechanisms, especially with regard to water availability ☞ Decision support systems - helping to bridge gap between science and policy

## ABOUT CONDESAN

### Lead questions

#### 1. When and by whom was the institution created?

CONDESAN was created in 1993 by a group of institutions that was promoted for the International Potato Center (CIP) and the International Development Research Centre (IDRC). In 1995 it becomes an ecoregional program of Consultative Group on International Agricultural Research (CGIAR).

CONDESAN has evolved into a new organizational structure and since September 2009 it has been an independent regional research for development platform, disengaged from Consultative Group on International Agricultural Research CGIAR and its host center, the International Potato Center (CIP).

#### 2. Why and with which purpose (out of which rationale/necessity)?

In the beginning CONDESAN was created in order to determine appropriate strategies for action to promote the development of Andean agro-ecosystem, which in turn establish a proper relationship between the research actions and stakeholders.

Currently, CONDESAN has mission to mobilize the wealth of the Andes, in order to overcome poverty and social exclusion. It seeks to create and share information and knowledge about the environment in Andean rural societies, to promote policy dialogues with local actors, national governments, and regional organisms, and to strengthen Andean human and institutional capital in order to promote new leaders for sustainable development on the Andes.

#### 3. What has it achieved so far? Which are its major concrete achievements and impacts?

CONDESAN has evolved as a regional organization focusing on issues concerning sustainable development and environmental management. Its activities help to broaden knowledge about natural resources and the way they are used in the Andes and provide spaces for reflection and consultation among Andean communities, civil society, local governments, and national and regional policymakers.

CONDESAN is renowned for its ability to generate regional views and to position, on the public agenda, the main challenges in environmental management that cut across political and administrative boundaries. It is also recognized for its contribution to the political changes in territorial planning (Cajamarca), the water rights laws (Bolivia), the conservation of camelids (Peru), the conservation of Paramo (Colombia, Ecuador, Peru), among others.

InfoAndina, has over 15 years of experience and currently it is recognized by international organizations as leader in the management of information on sustainable development in the Andes. It has an infrastructure of information technology that supports various regional and global initiatives ([www.infoandina.org](http://www.infoandina.org))

#### 4. Which were major obstacles encountered or unexpected supports received?

Retraction of financing from international cooperation for some countries in the region because the international financial crisis and progress in macro economic indicators of some countries in the region. This involves greater efforts to obtain resources, increased fragmentation of projects and more administrative burden.

Increased political polarization in the region for economic models, this polarization can also be found at the subnational level and cause social conflicts and demands of local populations. The speed at which information flows exceeds the rate at which it can be processed and disseminated by conventional means, but on the other hand the costs of infrastructure and connectivity necessary to take advantage the new media make it difficult to use.

#### 5. How has the institutions developed (e.g. changes in scope, magnitude of funding, number of members, geographical coverage, etc.)?

CONDESAN has evolved as a regional organization focusing on issues concerning sustainable development and environmental management in the Andes. So it has participated in national, regional and global projects, in Andean countries: Argentina, Bolivia, Chile, Colombia, Ecuador, Peru y Venezuela.

CONDESAN works in 7 regional initiatives (<http://www.condesan.org/portal/iniciativas>), with the participation about 100 organizations of Andean region, like universities, research institutes, social organizations not governmental, public institutions, foundations and international donors. Therefore, CONDESAN has promoted a networking as well as a multidisciplinary work and the interest in achieving of quality and efficiency in managing of these projects and initiatives, have led to form a diverse team of nearly 40 people in a gender ratio of 53% women and 47% male.

CONDESAN also keeps a strong link with global and regional projects and programs that are related issues for sustainable development of the Andes: Mountain Partnership, Challenge Program on Water and Food, Mountain Forum, Global Water Partnership, Permanent Research Seminar Agrarian, AGRORED, FAO-AIMS, among others.

#### 6. What are future challenges, opportunities, and plans?

The combined effects of the increasing number of investment projects that consider natural capital as a strategic asset, global environmental change, the expansion of large-scale extractive industries, and the evolution of political, economic, and social integration processes on multiple scales, will generate unequally distributed restrictions and opportunities for the different human communities living in the Andean region.

It is imperative to analyze the relations between social and environmental systems in order to have a better understanding of the degree of vulnerability of rural Andean populations. At the same time, it is necessary to maintain a critical approach regarding the significant differences existing among the inhabitants of rural areas.

Extractive activities and their negotiation systems are becoming more and more distant to control of people living in the Andes. This forces to pay attention to the generation of relevant information that facilitates the creation of dialogue spaces between public and private productive sectors, local and national governments and local populations.

However, there is growing interest in issues related to the environment which is encouraging a strengthening of government ministries and agencies specializing in the area. The same is from the private sector where more companies are taking direct action for the environment.

On the other hand, through the development and availability of Technology Information and Communications, facilitates the creation of virtual networks for development. Similarly, there will be an increase in these networks that could build and enrich a growing flow of information and transfer of skills involved in subnational governments.

Cooperation for development is looking again the connection between research and development as a key to improving the impact of the intervention. It is expected to stagnate available resources of international cooperation but the growth of available resources within their own governments to research and development actions. There is a tendency for development grants not only to direct actions to eliminate poverty but also to the consolidation of collective action settings with more integrals interventions and longer term.

In this context, CONDESAN aspires to be recognized as the most effective Andean platform articulating the efforts of multiple actors at different levels. It offers alternatives to the Andean people in order to integrate their development strategies into the environment so they can benefit from the economic opportunities arising from the preservation of biodiversity, secure their food, understand the processes of environmental and sociopolitical change, and participate in the design of adaptation strategies that enable them to improve their well-being.

---

## Consumers International

Consumers International (CI) is the world federation of consumer groups that, working together with its members, serves as the only independent and authoritative global voice for consumers. With over 220 member organisations in 115 countries, we are building a powerful international movement to help protect and empower consumers everywhere.

### Introduction

"Until recently, the planet was a large world in which human activities and their effects were neatly separated within nations, within sectors (such as energy, agriculture, trade, etc.), and within broad areas of concern (such as environment, economic, social). These compartments have begun to dissolve. This applies in particular to various global "crisis" that have seized public concern, particularly over the last decade. These are not separate crises: an environmental crisis, a development crisis, an energy crisis. They are all one".

With these words, in 1987, the Brundtland Commission Report Our Common Future expressed the interrelations of human activities, their impact on the planet and the increasing relevance of the environmental crisis. Everything raised by Brundtland in the above statement applies today, with an even greater sense of urgency. Since the publication of Our common future, consensus around these issues has grown, and new instruments, strategies and methodologies have been developed to confront them. So the obvious question is, why is it taking us so long to come out of the social, economic and environmental crisis highlighted by the Brundtland Report nearly 25 years ago?

Consumers International believes the rights and responsibilities of consumers can and must play a pivotal role in making this great leap to a sustainable future. What and how we consume must be a cornerstone of the transition to a green economy that puts human wellbeing and social equity at its heart, while progressively reducing our individual and collective impact on the environment. As stated by Chapter 4 of Agenda 21: "We must consider the need for new concepts of wealth and prosperity, which allow higher standards of living through changed lifestyles, and are less dependent on the Earth's finite resources and more in harmony with the Earth's carrying capacity."

### Consumer rights and sustainable consumption

Today there is widespread consensus that changes in consumption and production patterns are urgently needed. Achieving sustainable development will require significant changes in our economies and a profound transformation of our current lifestyles. Alongside government and industry, consumers will obviously be a fundamental force in this change.

Initiatives to mobilise consumers behind sustainable consumption have multiplied over the past few years. Businesses, governments, civil society organisations are all involved in the development of consumer education campaigns, new products, labelling and certification initiatives.

In response to these programmes, there has certainly been a shift in consumer understanding and awareness of the environmental and social impact of different consumption choices.

However, effective consumer action is still limited by sparse or misleading product and service information, a lack of effective and clear regulation and a lack of meaningful choice. Too often, consumers who seek to promote sustainable consumption find themselves lost and confused in the face of underdeveloped, scarce and inconsistent standards. Many consumers feel that the actions available to them are also insignificant in the context of government inaction.

Consumers cannot be left alone in this process. Individual efforts are not enough to generate the required social changes. Consumers have to be supported by an enabling framework of policies, regulations and measures that are capable of ensuring a real transition to a green economy that can effectively meet the needs of people and the planet.

CI believes it is essential that governments and the business sector everywhere commit to implementing policies that guide us onto a sustainable course. It is equally essential that consumers are empowered to support sustainable consumption, and can assume their rights and responsibilities in this respect.

### The UNCSD process and the Rio+20 summit

The UNCSD process began at the Rio Summit in 1992, continued through the Johannesburg Summit in 2002, and incorporated the Marrakech process that sought to develop a 10-year framework of programmes on sustainable consumption and production.

The upcoming 2012 United Nations Conference on Sustainable Development offers a new opportunity to generate the change that we are all hoping for. The critical issue now is whether Rio+20 will be able to set governments on a course towards establishing binding multilateral commitments.

In accordance with the UN General Assembly resolution 64/236, the objective of Rio+20 is to secure a renewed political commitment to sustainable development, assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development, and addressing the new emerging challenges. In this context, the member states have agreed to focus on two themes for the Conference:

- (a) A green economy in the context of sustainable development and poverty eradication
- (b) The institutional framework for sustainable development.

CI wishes to see the Rio Conference commit to the policies and targets that help build an economy which provides a better quality of life for all within the ecological limits of the planet.

## Rio+20 commitments

CI calls on governments meeting at the UNCSD summit in Rio, in June 2012, to commit to the following actions:

An explicit commitment to measures that will support sustainable consumption including the full implementation of section G of the UN guidelines for consumer protection.

Support and endorse an ambitious 10-Year Framework of Programmes (10YFP) on Sustainable Consumption and Production (SCP).

In particular, CI calls on governments to commit to the following:

(a) A green economy in the context of sustainable development and poverty eradication:

Full implementation of section G, number 44, of the United Nations Guidelines for Consumer Protection that states: "Governments, in partnership with business and relevant organizations of civil society, should develop and implement strategies that promote sustainable consumption through a mix of policies that could include regulations; economic and social instruments; sectorial policies in such areas as land use, transport, energy, and housing; information programmes to raise awareness of the impact of consumption patterns; removal of subsidies that promote unsustainable patterns of consumption and production; and promotion of sector-specific environmental management best practices".

### Meet consumers' basic needs

<sup>[4]</sup> Governments should commit to facilitate technology, expertise and funds transfers to those countries that require these resources to tackle poverty and secure the achievement of the Millennium

Development Goals. Governments should also commit to address the needs of those consumers within their own country that do not have access to basic needs.

<sup>[4]</sup> Initiate mechanisms to reach the goal of universal access to energy services, following the principles of affordability, fairness and sustainability. Act as role models in their own consumption choices

<sup>[4]</sup> Local and national governments should adopt policies that support sustainability so that consumers can see their actions in the context of a wider movement towards sustainability.

<sup>[4]</sup> Similarly, governments should avoid contradictory or damaging policies that negate action taken by the consumers.

### Act as facilitators

By ensuring regulation and fiscal incentives support sustainable consumption

<sup>[4]</sup> Support sustainable lifestyles through their own national strategies, procurement, planning and operating practices.

<sup>[4]</sup> Ensure financial incentives support sustainable outcomes (eg taxes and subsidies should support environmental and social goals).

<sup>[4]</sup> Apply appropriate market interventions to ensure fair and transparent markets working for sustainable consumption and production.

<sup>[4]</sup> Develop choice reduction policies and legislation that removes from the market the worst performing products or services according to economic, social or environmental impact.

### By informing consumers

<sup>[4]</sup> Governments should fund research and produce information to inform consumers about how to consume more sustainably, and assist them in identifying the material changes they could make.

<sup>[4]</sup> Run targeted information campaigns to raise consumer awareness and empower consumers in relation to the environmental and social impact of consumption patterns, particularly in the areas of food, housing and transport. Information should use tools and insights from branding, psychology, communications and social marketing to engage with consumers effectively.

<sup>[4]</sup> Adopt ambitious Minimum Energy Efficiency Performance Standards (MEPS) and labelling schemes.

<sup>[4]</sup> Include education for sustainable consumption in their national curricula as well as promote consumer education more generally. Hold businesses to account

<sup>[4]</sup> Governments should develop rigorous and transparent standards through accountable processes of multi-sector engagement, and on the basis of scientific consensus, which offer consumers a trusted basis on which to make product and lifestyle choices.

<sup>[4]</sup> Governments should ensure that consumers have independent assurance of product information so that they have confidence that product information is correct and is not misleading.

<sup>[4]</sup> Governments should enact right-to-know legislation, and ensure that companies report on their environmental and social impacts using internationally agreed standards such as ISO 26000. Inclusive policymaking

<sup>[4]</sup> Consumer voices must be heard and listened to in relation to sustainability. At a governmental level, this means government engagement with consumers in policymaking and full recognition of consumers' rights and interests.

<sup>[4]</sup> Consumers should be recruited as active supporters in valid and transparent whole economy approaches, driving innovation, and supporting calls for progressive and smart regulation.

(b) Institutional framework for sustainable development:

Support and endorse an ambitious, 10-Year Framework of Programmes on Sustainable Consumption and Production

<sup>[4]</sup> This 10YFP on SCP should be a coordinated global framework of programmes that in a systematic and integrated manner provides countries with the real opportunity of decoupling economic growth from environmental degradation and increasing the wellbeing of all.

<sup>[4]</sup> If the Rio+20 summit is capable of delivering and ensuring the structural changes needed for a global transition to a green economy, it is clear that all countries will need to take coordinated international action; isolated initiatives will not be able to achieve the required changes. The 10YFP on SCP offers a concrete pathway for this coordinated

action.

Deliver, promote and facilitate an institutional change in the current structures of governance that will ensure a framework for a real transition to sustainability at all levels: international, regional, national and local

<sup>84</sup> Rio+20 must result in sustained, collaborative action that will change the course of unsustainable growth, generate the required bases for a transition to a green economy and improve the wellbeing of millions of poor and vulnerable communities.

<sup>85</sup> While the Rio+20 outcomes must allow for a diversity of institutional approaches and commitments, particularly at the national and local levels, it is critical that all are integrated in a systemic framework flexible enough to accommodate different types of commitments, and reciprocal enough to achieve a strong sustained level of effort. By linking actions and negotiating them as a package, nations are likely to undertake a higher level of effort than they would if acting on their own.

## Coope SoliDar R.L.

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

Rio+20 debe producir resultados que sean fácilmente monitoreados en su cumplimiento.

Debe incluir sectores que no lo han sido hasta ahora y que también brindan sus aportes de conservación como son los pescadores artesanales.

1. Existen aportes a la conservación de la diversidad biológica y cultural marina desde otros sectores que no son los que el movimiento conservacionista han reconocido tradicionalmente.

El sector pesquero artesanal en Costa Rica liderado por Coope Tárcoles R.L., una cooperativa de pescadores artesanales del Pacífico Central, apoyado técnicamente por Coope SoliDar R.L. ha liderado un proceso hacia el reconocimiento de áreas marinas de pesca responsable en donde se promueve un ordenamiento, que establece un balance entre el aprovechamiento pesquero y la conservación, en un marco de valores, rescate y fortalecimiento de la identidad cultural y el desarrollo local. (www.coopesolidar.org; www.consortioportamar.com)

El Plan de Trabajo de Áreas Protegidas del CDB no ha avanzado significativamente en su objetivo de reconocer diferentes formas de gobernanza en áreas protegidas. Se debe apoyar, promover e influenciar a los Estados para que lo hagan y la conservación sea más inclusiva y equitativa.

Por ejemplo, en Rio+20 se debe apoyar el proceso de la COFI-FAO sobre directrices voluntarias para el sector pesquero artesanal, como un fortalecimiento para este sector de forma integral reconociendo sus derechos humanos. Se deben establecer relaciones de coordinación entre las diferentes instancias de Naciones Unidas, logrando acercamientos entre las organizaciones dedicadas a actividades de desarrollo productivo como la FAO con organizaciones de conservación como PNUMA.

Los esfuerzos de la CDB en el reconocimiento de los esfuerzos de gobernanza comunitaria de áreas protegidas debe ser fortalecido y apoyado desde las diferentes organizaciones de naciones unidas.

En cuanto al tema de la equidad de género, se requiere el establecimiento de indicadores de género diferenciados, para valorar los avances o retrocesos, principalmente en materia de cambio climático y acceso a los recursos naturales. Este es un elemento de gran importancia en el avance hacia el desarrollo sostenible.

2. Los pescadores artesanales son una población vulnerable pero que tiene una gran riqueza cultural. Se están haciendo esfuerzos por recuperar su historia y por hacer videos que muestren una cara alegre, positiva y trabajadora.

Los materiales que sean elaborados debe cuidar la imagen de este sector productivo de la sociedad, para que no se discrimine al pescador artesanal o se promueva una imagen distorsionada de esta cultura sino que por el contrario reconozca el ejercicio de este trabajo digno.

3. Las comunidades pesqueras han existido antes de que llegara el desarrollo turístico e inmobiliario. Sus casas han estado cerca del mar para cuidar de los botes y artes de pesca.

El aumento del desarrollo turístico ha producido un desalojo de comunidades costeras en todo el mundo. Este problema debe ser reconocido y atendido de una forma más integral, para que no se pierda su cultura y se encuentren verdaderas alternativas para erradicar la pobreza. Las propuestas de ordenamiento territorial deben ser inclusivos e integrales, de manera que abarquen tanto el mar como el territorio.

4. El principio 10 de la Declaración de Río que establece los derechos de acceso a la información, a la participación y a la justicia ambiental todavía presenta un avance débil.

Este principio debe ser garantizado especialmente para los grupos más vulnerables. Se necesita de un Convenio Global o Regional para desarrollar las directrices internacionales que ya han sido establecidas y el apoyo a los Estados para que avancen en el cumplimiento de este principio y sobretodo sobre su aplicación y cumplimiento.

5.- Las evaluaciones deben de tener indicadores género sensibles en cada uno de sus acápites...es decir deben de considerar los avances, impactos o efectos a nivel de hombres y mujeres.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

Consideramos que el ECOSOC debe incluir los aspectos ambientales, con lo cual se ampliaría su enfoque a algo más cercano al desarrollo sostenible que tiene tres pilares, el ambiental, el económico y el social.

Consideramos que la Comisión de Desarrollo Sostenible se fortalecería si trabaja en el marco del ECOSOC.

El concepto de economía verde ha sido utilizado por Naciones Unidas en la convocatoria sin haber promovido un debate sobre su conceptualización. Esto ha generado mucha discusión y polémica desde América Latina. Por una parte, porque se considera que su utilización excluye los esfuerzos de conservación que desarrollan comunidades y pueblos indígenas; excluye sectores sociales y puede establecer obstáculos para la comercialización de sus productos; y finalmente, su carácter de instrumento para la erradicación de la pobreza no ha sido establecido, ese impacto social no se menciona normalmente, y todavía no queda claro cómo la economía verde es un instrumento para la erradicación de la pobreza.

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

La sinergia entre los tratados internacionales globales debe ser fortalecida.

La coordinación interagencial y los trabajos conjuntos.

Abrir la posibilidad de unificar la presentación de informes de avance por país.

Establecer las estrategias de cumplimiento y aplicación de tratados internacionales integrados.

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

Río+20 debe incluir un cuadro de indicadores que permitan su monitoreo por parte de la sociedad civil y el establecimiento de un protocolo para canalizar los comentarios y observaciones de la sociedad civil sobre las actividades realizadas por su Gobierno.

Estos indicadores deben contar con la diferenciación de género en materia de avance de los acuerdos hacia el desarrollo sostenible.

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

## Coordinating Committee for International Voluntary Service (CCIVS)

Input for the Compilation Document of the UN Conference on Sustainable Development

This input to the compilation of views realized in the preparation of the outcome document of the UN Conference on Sustainable Development is submitted on behalf of the Co-ordinating Committee for International Voluntary Service (CCIVS). CCIVS represents over 160 International Voluntary Service organisations and networks from all over the world: Asia, Africa, America and Europe. CCIVS has been working in partnership with UN agencies since its creation in 1948, and particularly with the UNESCO and the UNV, with whom diverse levels of successful cooperation have been achieved.

The action of International Voluntary Service all over the world is developed in thousands of communities and with tens of thousands of volunteers every year. Their contribution to sustainable development starts from a vision of a world in peace, where human beings live as active and solidary citizens taking care of their environment, cultural heritage and diversity within the principles of mutual understanding and respect. Voluntary Service actions, based on the importance of local participation, development of civil society, non-formal education and global coordination, address environmental, social, educational and cultural challenges through voluntary work, complemented by global campaigns that give support and visibility to the local actions.

Volunteers Organizations play a crucial role in promoting sustainable development and address social issues at all levels, raising awareness and mobilizing public support, as well as supporting the implementation of concrete solutions. Our organizations are committed to contribute further to environmental sustainability and poverty eradication and we are willing to take actively part to a renewed global partnership for sustainable development.

The important contribution of volunteers organizations was already recognized in 1984 by the World Commission on Environment and Development which identified in its mandate to the urgent need to "to raise the level of understanding and commitment to action on the part of individuals, voluntary organizations (...)" (Mandate of the World Commission on Environment and Development). Agenda 21 recognized in 1992 the important contribution of volunteers organizations in "efforts to reduce poverty and improve the quality of life for low-income families", in the context of urban development (Agenda 21, Chapter 7).

The Johannesburg Plan of Implementation of the World Summit for Sustainable Development further recognized the importance to secure funding through all available sources in order to "provide all community members with a wide range of formal and non-formal continuing educational opportunities, including volunteer community service programmes, in order to end illiteracy and emphasize the importance of lifelong learning and promote sustainable development" (WSSD Plan of Implementation, para. 123). It also expressed the commitment of all countries to "enhance partnerships between governmental and non-governmental actors, including all major groups, as well as volunteer groups, on programmes and activities for the achievement of sustainable development at all levels" (para.168).

In the context of a revitalized global partnership for sustainable development, we call governments to recognize in the outcome document of the Rio Conference the specific importance of volunteering. We call governments to identify a set of concrete actions to promote the values of volunteerism and create a supportive environment enhancing the ability of volunteer organizations to contribute to sustainable development.

International institutions should also renew their commitment in order to create favorable conditions for the extension of voluntarism. International institutions should further promote and raise awareness about the benefits of engaging civic engagement and support international cooperation in this field. We also call these institutions to work in closer cooperation with voluntary organizations in the design and implementation of their policies in order to increase the mutual benefits resulting from such cooperation.

Governments and UN institutions should review the implementation, exchange best practices and elaborate a plan of action to ensure the effective implementation of the Recommendations on support to voluntarism adopted by the UN General Assembly (Resolution 56/38), as well as the commitments adopted in the UN General Assembly Resolution on Further initiatives for social development (Resolution S-24/2).

---

## Corporate Sustainability Reporting Coalition (CSRC)

### EXECUTIVE SUMMARY

- Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992.
- A large number of companies now report on their environmental, social and governance (ESG) performance and it has been demonstrated that there is a direct correlation between sustainable business practices and the longer-term financial success of that company.
- At present however, there is no globally accepted rule requiring reporting on ESG performance. Despite the large number of companies publishing such reports, the vast majority of companies fail to do so.
- We proffer that a requirement for a company to consider and report on a sustainability issues will create the right kind of discussions within boardrooms, throughout firms and encourage investors to think about the sustainability of the firm. This will help capital to be allocated to more sustainable, responsible companies and strengthen the long term sustainability of the financial system.
- If a Sustainable Green Economy is to be reached, the time has now come for sustainability reporting to become standard practice. This can be achieved by the UN Conference on Sustainable Development (Rio+20) conference committing to develop a Convention on Corporate Sustainability reporting.
- It is now almost twenty years since the first Earth Summit, as such we believe next year offers a momentous opportunity to move this agenda forward at a global level.

### Progress

Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992. In Agenda 21 of the Conference, governments agreed that business and industry should be 'encouraged to adopt and report on their environmental records, as well as on the use of energy and natural resources'.

We recognise and support the considerable progress that has been made since then.

There have been a number of initiatives under the UN umbrella promoting sustainability reporting. Such initiatives include UN Global Compact, United Nations Environment Programme Finance Initiative (UNEP FI) and the United Nations Principles for Responsible Investment (UN PRI).

There has been progress in company policy, for example, since its launch in 2000, over 8,700 companies have signed up to The United Nations Global Compact, which covers the areas of human rights, labour, environment, and anti-corruption.

There has also been progress in guidance for companies from Governments – such as through the recent further strengthening of the OECD guidelines for multinational enterprises.

And progress by investors – more than 900 institutional investors from 48 countries with over \$30 trillion in assets signed up to the United Nations-backed Principles for Responsible Investment. They were launched just five years ago. All of these investors recognise that that environmental, social, and corporate governance (ESG) issues can affect the performance of investment portfolios.

However, despite this progress, we are still a very long way indeed from the ultimate aim of transparency, comparability and relevance of corporate sustainability reporting.

In other words, these progressive voluntary initiatives have not been enough - for example so far less than two per cent of listed companies have opted into the Global Compact.

### The Transparency and Accountability Gap

Sustainable Stock Exchanges, an initiative by UNPRI, UNCTAD and Global Compact has been urging all stock market listing authorities to make it a listing requirement that companies consider how responsible and sustainable their business model is and put a forward-looking sustainability strategy to the vote at their AGM.

Aside from a few notable examples such as the Singapore, Johannesburg and Istanbul Exchanges, there has yet to see a serious commitment from stock exchanges to make changes to their listing rules. This is reflected by analysis which indicates that at present more than 75% of the companies covered by Bloomberg do not currently disclose their sustainability performance.

It is our belief that stock markets require the support from governments and regulators. This is why we believe this is a relevant issue for the global forum of the Earth Summit.

### The business case for sustainability reporting

According to a recent McKinsey survey, more than 50 percent of executives consider sustainability "very" or "extremely" important in a wide range of areas, including overall corporate strategy.

The internal and external value that companies have found in sustainability management and reporting is widely documented. Sustainability reporting increases innovation and competition and at the same time makes organisations more accountable for their impacts. The evidence for the business case is building as uptake of reporting increases. To cite two examples:

Goldman Sachs is one of the firms to have carried out analysis of the relationship between how companies address ESG issues and the returns they generate. It contends that in a number of sectors there is a direct correlation between sustainable business practices and the longer-term financial success of that company.

WestLB also published a study of the materiality of extra-financial factors based on a sample of 540 European firms. It found evidence of a link between extra-financial risk, cost of capital to a firm and shareholder value. The report suggested that compiling a sustainability report was among the most important catalysts for change – contributing to accumulation of knowledge, questioning of processes and the establishment of suitable structures and practices.

Some organizations are now producing integrated reports, a form of corporate report that brings together financial performance data with material information about an organization's strategy, governance, performance and prospects in a way that reflects the economic, political, social and environmental context within which it operates. An integrated report provides a clear and concise representation of how an organization creates value, now and in the future. In August 2010, the International Integrated Reporting Committee (IIRC) was established to create a globally accepted framework for integrated reporting. The objective is that through integrated reporting many more companies and their stakeholders will become aware of sustainability performance measurement and disclosure and start acting on this information.

#### The market case for sustainability reporting

Markets are driven by information. If the information they receive is short term and thin then these characteristics will define our markets. If companies do not provide an assessment of the broader Environmental, Social and Governance risks and opportunities to which their business model is exposed, then how can the market assess the sustainability of that company's growth?

Recent years have seen an increasing interest from markets in sustainability performance data disclosed in reports. There is considerable evidence that investors require this information and there has also been seen some major investment such as Thompson Reuters and Bloomberg adding to the data set that they provide investors, while rating agencies such as Standard & Poors have created ESG indices for India, Egypt and the MENA region.

Within 60 days after the launch of the product on Bloomberg terminals 11.5m hits on the ESG data points were recorded. At the time of writing, Bloomberg estimates that about one thousand users now use Bloomberg just for ESG analysis. They also report that the number of users is increasing with more conventional asset managers approaching Bloomberg regarding the product.

While the number of reporters is growing, including in emerging economies such as Brazil, China and India, and the quality of reporting improves, sustainability reporting far from achieving its full potential.

At the current rate it would take decades before sustainability reporting is common practice across global markets. This means that regulators, investors and stakeholders know little or nothing of the sustainability practices and impacts of the vast majority of the world's large companies.

Markets will not routinely use sustainability information as long as only a minority of companies report. A critical mass of sustainability information is needed to inform markets and enable performance benchmarking and analysis. Companies that do not report withhold from the markets information that is important for the assessment of medium to long term risk and value. By leaving information gaps and creating asymmetries of information, non-reporting companies impose a cost on the markets and undermine its effective functioning.

The world needs to move from the innovative and pioneering approach of a minority of companies to a true global mainstream practice for all companies.

#### A CONVENTION ON CORPORATE SUSTAINABILITY REPORTING

The Corporate Sustainability Reporting Coalition (CSRC) calls for the member states at the United Nations 2012 Earth Summit to:

- Acknowledge the growing practice of sustainability reporting and recognize that, improving corporate management and performance, facilitating stakeholder engagement, driving innovation and competitiveness represents an essential contribution to the transition towards a Green Economy.
- Note that the increased quantity and quality of data available through sustainability reporting can be a powerful tool to help markets work more efficiently.
- Commit to develop a global policy framework requiring boards of all listed and large private companies to consider sustainability issues and to integrate material sustainability information within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not. The global policy framework (which can take the form of a Convention) should adhere to three key principles:
- Report or Explain – establish a report or explain approach to sustainability reporting policy
- Transparency – enhance transparency by requiring national measures which would mandate the integration of material sustainability issues within the company reporting cycle, in their Annual Report and Accounts;
- Accountability – provide effective mechanisms for investors and all stakeholders to hold companies to account on the quality of their disclosures, including for instance an advisory vote at the Annual General Meeting (AGM).

This is a modest, market-based proposal that we believe represents the next step towards sustainable capital markets.

#### APPENDIX A - POLICY FREQUENTLY ASKED QUESTIONS

##### 1. Are you setting out a standard that all companies must adopt?

No. We merely ask for the support of governments to make corporate sustainability reporting a "report or explain" requirement and for this report or explanation, in whatever form it takes, to be put to shareholder approval at the AGM. However, we are not dictating the form it should take. This will provide corporations with the freedom to define their own reporting and where they determine that it is not necessary, outline why. This will also ensure that the report is based on the board's best thinking.

Those companies yet to explore reporting in this area may review the excellent work already done in this area by the Global Reporting Initiative (GRI) that produces a comprehensive Sustainability Reporting Framework that is widely used around the world, to enable greater organisational transparency and the current discussions in the International Integrated Reporting Committee. It is important to reference the normative frameworks for sustainability offered by UN Global Compact and OECD Guidelines for Multinational Enterprises, as well as the contribution of ISO, PRI, UNCTAD and UNEP. .

##### 2. Why have you focused on asking boards to publish their thinking rather than for example proposing a sustainability reporting regulation?

We do not think it possible to craft a regulation that specifies a sufficiently detailed reporting template on the rich diversity of corporations around the world. Consequently, we have decided against proposing heavy handed regulation that tries to enforce one reporting template. This is also because regulation is often slow moving, lags the market,

and encourages a minimum compliance mentality within the company. We are seeking to stimulate a substantive board discussion on the risks and opportunities to a company arising from sustainable development, as well as the creation of their strategic response. We are also anticipating that some companies will seek to compete on the quality of their disclosure in this area (as, indeed, is already the case).

Equally, however, we do not have blind faith that markets will self regulate toward sustainability. The evidence for spontaneous progress on a purely voluntary basis is that it will be slow.

3. What needs to change within the system if it were to adopt your recommendation?

This will vary for different jurisdictions. For example, where the regional code of Corporate Governance is embedded within the listing rules then this document could be updated, requiring the support of all the bodies that govern this code. Where it is guided by the exchange itself, then the exchange can update the code itself. Where guided by primary legislation, then this will need to be changed. For this reason we adopted a report or explain approach that would set the principle and leave flexibility to national regulators.

---

## CropLife International

Input into Rio+20 Zero

As a member of the Business Action for Sustainable Development (BASD), the International Agri-Food Network, and of the Farming First coalition, CropLife International welcomes this opportunity to submit views regarding the outcome of Rio+20. This submission is largely focused on sustainable agriculture and food security as these are two challenges where CropLife International member companies can make positive contributions in the future. On the broader issues, CropLife International contributed to the BASD submission and supports the views of the broader business group as represented by BASD.

General Questions:

1. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?
  2. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?
  3. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);
1. The Rio outcomes should be focused on: 1) identifying implementation gaps and the existing obstacles to implementation in achieving sustainable development, including obstacles behind the failure to achieve the MDGs; and 2) improving the UN system's coordination mechanism to ensure it is best placed to assist countries in achieving those goals.

The outcomes should represent a focused and relatively short statement of priority areas for government actions and a renewed commitment to achieving the MDGs. It should not represent a top down set of specific actions or best practices but recognise the diversity of situation faced by people around the world and the corresponding need for locally-adapted solutions.

Central to the outcomes and the viability of the recommendations stemming from Rio+20 should be a clear endorsement of a vision of sustainability that is based on the notion on continuous improvement. Sustainability is a continuum in which all parties, globally and across sectors, have a role to play in improving their practices and minimising their impact to move towards greater sustainability. For this reason, it is important that recommendations and policy prescription avoid polarising groups and sectors but seek to establish incentives and a path towards improvement in sustainability along a continuum and across sectors and subsectors.

Rio+20 outcomes should also recognise the important contribution the private sector can make to poverty reduction and emphasise the need to improve regulatory frameworks, promote good governance and invest in innovation as key elements of a successful strategy for sustainable economic growth.

In addition, Rio+20 should build on the Johannesburg outcomes and explicitly support public-private partnerships as a key means of implementation for sustainable development goals. Inclusion of a commitment from the UN system to facilitate the establishment of partnerships; help share information about successful partnerships that can be replicated; and recognise partnerships as a best practice would be a positive outcome.

2. Where possible, the Rio outcome document should build on the consensus reached in previous sessions of the Commission on Sustainable Development and avoid duplicating work carried out in past years. With a view to agriculture and food security specifically, the outcome of CSD17 should be the reference point for Rio+20 language.

Regarding adopting new goals or measurements, concentrating on the already established MDGs, and enhancing the capacity to achieve those should be the main focus area. Measurement and data collection are a challenge for many countries, and it is important resources not be distracted from achieving existing goals by newly proposed statistical requirements (measurements and data).

Establishing a roadmap for progress could aid in establishing priorities without dictating how the goals should be achieved. A helpful roadmap would recognize that locally adapted approaches are essential for different regional conditions. It could also help provide a framework document for all the UN agencies involved to coordinate their work.

Public Private Partnerships, as well as other forms of partnerships (such as private-private) should be recognised as an important path forward to help achieve sustainable development and need to be encouraged.

3. The failure to achieve the MDGs and the obstacles that have contributed to the current condition should be the main priorities of the Rio+20 conference and its outcomes. Governments, with the support of the UN system and input from civil society and business and industry, will need to be the primary agents in addressing these gaps. The private sector can play an important role in helping spur economic growth and reduce poverty. However private sector investment and engagement is often most effective when there are sufficient and appropriate regulatory and governance mechanisms and adequate economic and political predictability – elements which governments must put in place.

The Rio+20 outcome should learn from the past and focus on identifying implementation gaps like regulatory and governance obstacles to sustainable development, and establish priorities and paths (possibly a 'Roadmap') to address them. It is likely that efforts to establish new global indicators or other measures will distract actors from advancing work toward solutions.

Questions from the Secretariat on Specific Elements:

1. Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges. Contributions could include possible sectoral priorities (e.g. energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) and sectoral initiatives that contribute to integrate the three pillars of sustainable development could be launched and endorsed at Rio+20.

2. Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication The contribution below covers question 1 and 2 of the above 'specific elements'. 1-2. The term 'green economy' has been the subject of extensive discussion within the UN and other fora but it remains a term whose exact meaning is still contested. CropLife International, as part of the Business and Industry group, supports the definition put forward by the International Chamber of Commerce

*The contribution below covers question 1 and 2 of the above 'specific elements'.*

1-2. The term 'green economy' has been the subject of extensive discussion within the UN and other fora but it remains a term whose exact meaning is still contested. CropLife International, as part of the Business and Industry group, supports the definition put forward by the International Chamber of Commerce.

Nonetheless, it is important that Rio+20 efforts be focused on productive actions rather than semantics: how to move forward on the implementation of the MDGs and sustainable development more broadly should be the priority.

As a sector, agriculture plays a key role in supporting the economic development and well-being of societies. With a predicted 9 billion people by 2050, agricultural production will have to increase to meet new demands for food, feed, fuel and fibre. Agriculture must not only meet demand – it must also do so while minimizing its environmental footprint and creating sustainable livelihoods for farmers and others along the supply chain.

In a time of food insecurity where the poorest people are most vulnerable, the world must proactively leverage the potential of agriculture to positively contribute to the triple goals of a secure food supply, poverty reduction through improved rural livelihoods, and environmental sustainability. Food sufficiency, quality, availability and environmental footprint must be central elements of any political commitment directed toward the green economy and poverty eradication. Rio+20 outcomes should reflect a continued and long term commitment to achieving food security through increased productivity in agriculture and sound natural resources management.

However, agriculture by nature represents a mosaic of solutions and practices, with no silver bullet and no single 'best practice' able to meet the needs of all farmers. In addition, sustainability is a moving target towards which farmers in different geographies and farming systems are already progressing and they will all need support to continuously improve. Whatever type of agriculture a farmer chooses to adopt, they must be supported by availability of tools, appropriate technology and knowledge, which can be employed under 'good agricultural practices' to optimise productivity, while minimising any adverse impact.

Rio+20 outcomes should thus be focused on the goal of sustainable intensification of food production, and support the role of knowledge, science and technology in achieving this goal. Rio+20 outcomes should endorse the notion that agriculture in a green economy means a broadbased, knowledge-centred approach to development through agriculture.

Comprehensive and practical approaches are needed to progress toward more sustainable agriculture, and the Farming First principles offer a view of how this may be achieved. In the context of discussions on the Green Economy, CropLife International supports the below Farming First recommendations for incorporating agriculture into the Rio+20 agenda on the "green economy in the context of sustainable development and poverty eradication".

1. Poverty reduction: Make agriculture a driver for poverty reduction by ensuring policies link producers to markets and enable value to be created throughout the supply chain to help create income opportunities and diversify rural activities.
2. Focus on enhancing sustainable production and productivity: the world will need to produce more with less to meet demand and reduce its environmental footprint. Increasing production and productivity should be a priority to protect natural resources while meeting demand for food, feed, fuel and fiber.
3. Invest in agricultural research and development, capacity building and knowledge sharing to close the uptake gap for existing tools; ensure new solutions are available for today and tomorrow by incentivising and supporting both public and private innovation.

CropLife International supports the outcomes of CSD17 on agriculture as the basis for any outcome on agriculture for Rio+20.

#### Reducing Poverty

Agriculture can be a potent driver for poverty reduction. The World Bank estimates that GDP growth from agriculture generates at least twice as much poverty reduction than any other sector. Currently 65 percent of people in developing countries are involved in agriculture, and 1.3 billion are small farmers with limited access to inputs, infrastructure and markets. In countries where agriculture represents one of the primary livelihoods, concerted efforts to improve productivity through sustainable practices could change the lives of millions, raising incomes and addressing food security needs.

A dynamic and productive agriculture sector is also essential for the urban sector. In 2010, for the first time ever, more people lived in urban areas than in rural areas globally. Urban populations are dependent on the agricultural sector for most of their consumption, so improving local production and trade is crucial; but it also means a world of opportunities for farmers who can reach the urban market.

Making agriculture a dynamic sector will require the adoption of supportive frameworks and investment in infrastructure and markets. Farmers need to be able to access markets at the local, regional and global level in order to sustain a livelihood from their activities. In some areas, this means improving access to transport, storage and market facilities. In Tanzania, US\$2.4 billion of investment is being directed towards tripling the area's agricultural output and maximising the trade potential of the Dar-esSalaam port for Tanzania's neighbouring landlocked countries. Through the Southern Agricultural Growth Corridor of Tanzania project (SAGCOT), both public and private sector organisations are supporting 20,000 smallholders to become commercial farmers to bring in annual revenues of an estimated US\$1.4 billion into the country.

Access to weather and price information and risk management tools also helps farmers grow better crops, improve their production practices and sell at better prices. For example, in Zambia, the Zambia National Farmer's Union market information system (ZNFU 455) allows farmers to find out the current prices being offered for a commodity by sending an SMS. They receive a response listing prices and buyer codes and they can then make an offer to the best buyer directly by using SMS. In Kenya, another scheme using cell phones offers banking services to farmers as well as support for a crop and input insurance scheme. Farmers can insure a kilogram of maize seed or of fertiliser against drought with an index insurance product. They buy the insurance at a local agro-dealer and receive confirmation of purchase and of any payout through the M-PESA service on their phones. Going forward, the use of ICTs could be expanded to supporting pest control and other extension services.

## Enhancing sustainable productivity

Improving the footprint of agriculture while increasing production needs a concerted effort in two areas: first closing the uptake gap of existing best practices and technologies by focusing on capacity building and knowledge sharing and creating supportive public and private extension services networks; and second investing in agricultural research and development and supporting innovation to provide the solutions for tomorrow and ensure a supportive, science based regulatory framework and policies.

Enhancing sustainable productivity must be the centre of efforts to make agriculture both environmentally sound and economically dynamic– we need to achieve more crops per drop of water, per acre of land, per measure of inputs. This is essential to ensure the surface of land under cultivation does not expand, in order to preserve biodiversity and natural carbon sinks. Climate Change is expected to increase the poverty. The United Nations Convention to Combat Desertification estimates that by the year 2050, half of the current arable land will become unusable. Improved seeds will help to maintain yields under drought conditions and prevent erosion. Producers need to be integrated in value chains and new activities need to be developed in processing and other sectors to improve rural incomes and ensure that growth in productivity translates into better livelihoods. The 2009 Keystone 'Field to Market' research found that gains in yield per acre in the past 20 years in the USA had also been accompanied by significant improvements in the overall efficiency of resource use. The project looked at key crops such as soybean and maize and found reduced use of irrigated water, reduced soil loss, reduced habitat loss, reduced energy use, and lower carbon emissions. The Field to Market study clearly showed that progress has been made by farmers in the path to increased sustainability while enhancing their productivity.

Additionally, efforts should be increased to promote sustainable agri-food systems throughout the lifecycle. In 2010, FAO estimated that poorly developed systems for handling, storage, packaging, transportation, and marketing of agricultural products in developing countries results in post-harvest losses ranging from 15% to a staggering 50%. Investment in food infrastructure and handling could reduce losses and improve food safety. Developed countries also face losses due to food waste from harvest, through delivery to food services, and in households. Waste is worst in fresh produce which delivers vital nutrients to humans around the globe.

Finally, improving farmers' access to inputs and supporting technology uptake and diffusion is essential. In some areas, creative strategies that enable access to existing knowledge networks can make real differences to farmers. For instance, in India, a late December harvest of mustard seeds was causing up to 30 percent of crop to be lost to frost, so breeders worked on a seed with a shorter duration period. This enabled farmers to harvest in early December, avoiding the issue of frost. Farmers also benefited from better prices as they were able to bring their seeds to the market before the usual excess occurred in January.

## Research, Innovation and Capacity Building

Agriculture is a knowledge-intensive sector. Farmers need to have access to training, services, capacity building, and sharing of traditional knowledge that can encourage the production of abundant and nutritious crops and mixed diets. Knowledge helps farmers adopt practices that maximize the efficiency of the inputs they use and help protect the natural resources they depend on. Training programmes should specifically involve women and young farmers in developing countries as essential partners for household nutrition and welfare.

Providing this education to rural communities in a systematic, participatory manner that is maintained, rather than a 'one-off' activity, is essential to improving their production, income and quality of life. Extension services disseminate practical information related to agriculture, including correct use of improved seeds, integrated pest management, including the use of pesticides, fertilizers, farm implements, tillage practices, water management, livestock management and welfare, marketing techniques, and basic business skills to address poverty. Extension is also an essential pillar for rural community progress including support for the capacity building at farm level.

Farmers must constantly adapt, and the challenge of climate change is making that need ever more acute. Investing in research and development, in both public and private sector, is essential to ensure farmers have the tools they need in the future and that the gains obtained in productivity and footprint are not undermined.

Targeted investment in research, combined with supportive frameworks for the roll out, diffusion and uptake of new improved technologies and the products are essential to support continuous improvements in agricultural sustainability. Governments need to support both public and private research by creating supportive regulatory and incentive frameworks that promote not only innovation but collaboration. Global alignment of regulations and these frameworks is vital to support freedom to operate and important trade. Specific efforts to localise and adapt existing scientific knowledge to serve the needs of small farmers in different geographies are also required. In this area, public-private partnerships can play a role but localisation and technology adaptation need to be supported by strong national and regional scientific capacity and active efforts to create markets in order to spur private investment, not only in farming itself but in the agro-food industry that surrounds it.

## Culture Montreal

### LA CULTURE, QUATRIÈME PILIER DU DÉVELOPPEMENT DURABLE

«On ne saisit le sens profond du développement qu'au plan local.» Voilà l'idée qui émanait de l'Agenda 21 local, élaboré et adopté lors du tout-premier Sommet de la Terre, à Rio de Janeiro, en 1992.

Ce document cristallisait la nécessité d'instaurer un nouveau modèle de développement territorial à l'échelle mondiale. Adopté par plus de 170 pays, l'Agenda 21 local a été reconnu comme un outil intégré de planification et de gestion du développement durable et viable à l'échelle des collectivités territoriales, comme un cadre d'action stratégique, comme une innovation dans la gouvernance territoriale. Ce cahier de charges mise sur la participation citoyenne, la mobilisation et la responsabilisation de tous les acteurs.

### Agenda 21 local +20 : l'heure de la Culture

Les vingt années écoulées depuis le Sommet de la Terre de Rio de Janeiro, en 1992, ont permis de valider la pertinence de cet outil. Toutefois, encore peu répandu 20 ans après son adoption (6 500 adhérents en 2002 et surtout dans les pays d'Europe du Nord ), l'Agenda 21 local comporte certaines failles.

Cités et gouvernement locaux unis (CGLU), une instance internationale présente dans 136 des 191 états membres des Nations Unies, dont les membres sont aussi bien des villes que des associations de gouvernements sont des acteurs du développement territorial, reconnaissait la faiblesse d'un document, l'Agenda 21 local, reposant sur une notion erronée de développement.

Se fondant sur la reconnaissance croissante que le monde ne fait pas seulement face à des défis économiques, sociaux ou environnementaux- les 3 domaines aujourd'hui reconnus comme les 3 piliers du développement durable- mais que la créativité, la connaissance, la diversité et la beauté sont les bases incontournables du dialogue pour la paix et le progrès, dans la mesure où elles sont intrinsèquement liées au développement de l'homme et aux libertés, le Bureau Exécutif de CGLU a adopté en novembre 2010 la position politique sur «La culture comme quatrième pilier du développement»

Cette nouvelle approche envisage la relation entre culture et développement durable à travers deux voies:

1. Le développement du secteur culturel lui-même (i.e. héritage, créativité, industrie culturelle, artisanat, tourisme culturel).

2. Garantir sa juste place dans toutes les politiques publiques, en particulier celles en lien avec l'éducation, l'économie, la science, les communications, la cohésion sociale et la coopération internationale.

Parce qu'elle induit au territoire la capacité de se prendre en charge, de s'animer, de se déployer, la culture est indissociable du concept même de développement durable. Tous, nous devons reconnaître le pouvoir de la culture de changer et de transformer les milieux de vie et la société, de galvaniser les énergies hétérogènes afin de faire émerger de nouvelles dynamiques entre les individus, les groupes et les communautés.

Intégrer la culture dans le concept de développement

Le pouvoir de transformation intrinsèque à l'art agit d'abord sur les individus. Même les personnes qui ont un rapport plus contemplatif avec les œuvres et les manifestations artistiques évoquent les transformations spirituelles et comportementales qu'elles expérimentent.

L'accès aux arts et à la culture doit être un projet de société. La participation culturelle du plus grand nombre est un but vers lequel il faut tendre pour éviter que nos communautés se fracturent en fonction des disparités économiques, sociales, linguistiques et culturelles. La participation culturelle sert à valoriser la créativité, la libre pensée et la capacité de vivre ensemble des citoyens. Il faut aussi protéger la liberté d'expression des artistes tout en valorisant leur apport à la société, en reconnaissant et en rétribuant mieux leur travail.

Ainsi, désigner la culture comme quatrième pilier du développement durable et l'intégrer dans l'Agenda 21 local devient de plus en plus nécessaire considérant l'évolution de notre compréhension du développement et les enjeux qui pèsent sur notre monde. Il devient urgent de faire évoluer l'Agenda 21 local afin qu'il permette d'atteindre l'objectif que se sont donné collectivement les signataires, soit celui de bâtir des collectivités justes et prospères, offrant une qualité de vie optimale à leurs résidents, tout en minimisant l'empreinte environnementale de l'activité humaine.

L'agenda 21 de la culture

L'Agenda 21 de la culture, document élaboré par Cités et Gouvernements Locaux Unis (CGLU) et initialement adopté par les membres de l'organisation en 2004, vient combler certaines lacunes de l'Agenda 21 local de 1992 et devrait servir d'inspiration pour une nouvelle mouture de ce document fondateur. Dans sa position politique pour l'établissement de la culture comme 4 pilier du développement durable, le CGLU souligne que le monde «ne fait pas uniquement face à des défis d'ordre économique, social ou environnemental. La créativité, la connaissance, la diversité et la beauté sont autant de fondements indispensables au dialogue en faveur de la paix et du progrès. Ces valeurs sont, intrinsèquement, liées aux notions de développement humain et de liberté». Cet énoncé trouve écho auprès des acteurs du développement; en effet, à ce jour, près de 250 gouvernements locaux ont adopté l'Agenda 21 de la culture à travers le monde. Culture Montréal est d'avis que les bases idéologiques, principes et objectifs de l'Agenda 21 local doivent illustrer ce vaste mouvement pour une approche élargie du développement. Ainsi, l'Agenda 21 local est appelé à évoluer afin d'intégrer pleinement les valeurs, principes et objectifs cités à l'Agenda 21 de la culture.

La reconnaissance de la culture comme moteur de développement

La culture pour tous comme enjeu de développement est au cœur des réflexions des décideurs politiques, chercheurs, acteurs du développement local et citoyens depuis plusieurs années déjà. Au cours de la dernière décennie, on a vu naître et être adoptés des écrits fondamentaux tels que la Déclaration sur la diversité culturelle (2001) et la Convention de L'Unesco sur la diversité des expressions culturelles (2005). La place accordée à la culture dans l'Agenda 21 local doit être le juste reflet de cette mouvance. Nous avons aujourd'hui, collectivement, l'opportunité de reconnaître l'importance de l'art, du design, du patrimoine, des traditions et autres dimensions de la culture, tout comme celle du simple acte de création et de l'expression créative, pour le développement durable et responsable des collectivités. Nous devons affirmer la nécessité de leur présence dans le quotidien de chaque personne; faire valoir leur contribution à une vie citoyenne active, et reconnaître le bien-fondé des politiques publiques et autres initiatives visant la protection, le développement, la valorisation et la pérennisation des richesses culturelles propres à un territoire.

L'engagement de Culture Montréal

Déjà, en 2004, lors de l'adoption de l'Agenda 21 de la culture à Barcelone, Culture a décidé d'en endosser et propager le contenu parce qu'il plaidait en faveur d'un développement culturel intégrant les grands impératifs que sont les droits de la personne, la diversité des expressions culturelles, la démocratie participative et la création de conditions pour la paix.

C'est dans cet esprit que Culture Montréal a entrepris, en 2010, un vaste chantier pour le développement des quartiers culturels dans la métropole. Portant une vision du développement culturel axé sur l'accessibilité, le rayonnement, la diversité et la multiplicité des formes de la culture, nous contribuons depuis à l'émergence d'une vie et d'une dynamique culturelle propres aux richesses et besoins de chaque quartier de Montréal. Nous nous employons à accompagner les citoyens dans une démarche de concertation; à favoriser la collaboration de diverses parties prenantes; à soutenir, favoriser ou promouvoir de nouvelles initiatives culturelles qui intègrent les autres aspects du développement durable. Tous nos gestes émanent de cette conviction que la culture est le pivot d'une économie misant davantage sur la créativité; d'une participation citoyenne engagée et éclairée; d'un sentiment d'appartenance et d'une identification positive au territoire; et de la qualité de vie des citoyens. Pour Culture Montréal, la métropole du Québec atteindra son plein potentiel culturel en permettant l'expression de la vitalité culturelle dans tous les quartiers de la ville, le tout en misant sur la participation citoyenne et la collaboration des forces vives locales et, le cas échéant, régionales et nationales.

Culture Montréal participe également, depuis 2010, au processus de concertation et de consultation mis en place par le ministère de la Culture, des Communications et de la Condition féminine du Québec pour l'élaboration d'un Agenda 21 de la culture pour le Québec. Ce document, dont l'adoption est attendue cet automne, « sera un cadre de référence qui viendra préciser les principes à respecter et les objectifs à viser pour intégrer pleinement la culture dans le développement durable de la société québécoise. Ce document fondateur donnera l'impulsion au renouvellement de notre approche dans le domaine de la culture. Il permettra d'élargir la perspective et de mettre en évidence le rôle global que la culture peut jouer en tant que levier économique, catalyseur de la créativité, facteur de cohésion sociale et élément constitutif de notre cadre de vie. Cela permettra de repenser les rapports de la culture avec tous les secteurs de la société, et ainsi d'établir les assises d'un nouveau chapitre de la politique culturelle du Québec. » Culture Montréal adhère à la démarche du MCCFQ telle que décrite ci-dessus, qui s'inscrit dans la mouvance mondiale initiée par CGLU.

Monsieur Simon Brault, président de Culture Montréal, a par ailleurs eu ces mots lors d'un Forum sur l'Agenda 21 de la culture du Québec, tenu en mai 2011 dans la Ville de Québec:

«Au moment même où trop de gouvernements dans le monde charcutent leurs maigres budgets dédiés aux arts, au patrimoine et à la culture en évoquant la lutte au déficit, cette initiative politique [Agenda 21 de la Culture, ndr] pour affirmer le caractère incontournable de la culture comme dimension du développement durable au Québec mérite qu'on la salue et qu'on y participe. L'Agenda 21 de la culture est un guide de survie urbaine pour le siècle qui commence. Il illustre à quel point, partout dans le monde, les axes du développement culturel sont maintenant redéfinis à partir des villes et des gouvernements locaux. [...] Il [Agenda 21 de la culture] soutient que le développement culturel doit intégrer les impératifs que sont les droits de la personne, la diversité des expressions culturelles, la démocratie participative et la création de conditions pour la paix.»

Recommandations de Culture Montréal à la Conférence des parties pour l'intégration des articles de l'Agenda 21 de la culture dans l'Agenda 21 local

Culture Montréal joint sa voix au concert des nations, gouvernements et membres de la société civile, pour réclamer que le Sommet de Rio de 2012 soit l'occasion de redéfinir la structure conceptuelle du développement durable. Dans cette perspective, Culture Montréal souhaite que la Déclaration finale de Rio +20 intègre la culture comme quatrième pilier du développement durable et que l'Agenda 21 local comprenne, à compter de 2012, un chapitre qui explique la relation entre la culture et le développement durable et un chapitre sur le rôle des gouvernements locaux dans le développement durable.

Afin que la culture devienne vraiment partie prenante de ce cahier de principes guidant les instances territoriales, Culture Montréal, à la suite du CGLU, recommande que la Déclaration finale suggère de créer des mécanismes institutionnels pour analyser plus en profondeur, au cours des prochaines années, la relation entre la culture et le développement durable. On pourrait étudier la possibilité d'une «Décennie de l'ONU sur la culture pour le développement durable».

À propos de Culture Montréal

Fondé en 2002, Culture Montréal est un mouvement citoyen, non partisan, visant la promotion des arts et de la culture comme leviers essentiels du développement de Montréal. Comptant près de 1000 adhérents et doté d'un vaste réseau de partenaires, Culture Montréal tient des activités de recherche, d'analyse, d'information et de représentation politique en lien avec sa mission première. L'organisation est soutenue par le ministère de la Culture, des Communications et de la Condition féminine du Québec, la Conférence régionale des élus de Montréal, la Ville de Montréal, le Conseil des arts et des lettres du Québec et le Cirque du Soleil.

## CyberOustal

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The concept and objective of sustainable development should be revisited, 25 years after its creation by the Brundtland Commission. The objective of "more inclusive development" should add a useful process layer to the more technical objective of sustainable development. The structure of the outcome document should leave room for an ex-post evaluation of the relevance of sustainable development.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

Present proposals are OK, but a rebalancing of the environmental agenda, right now too overloaded with climate change (while biodiversity and ocean conservation get lip service) should be included in the discussions and outcomes.

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

A much broader language diversity should be introduced. Right now, Rio+20 preparation is "anglophone only". This eliminates too many potential stakeholders.

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

Open up to more major languages (spanish and french at the minimum). See the article which I have circulated on the Internet (attached).

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

Open the discussion beyond the sustainable development paradigm.

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

Include more views of the youth and their organizations.

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

More streamlining of Bretton Woods organizations (merge IFC and the rest of World Bank group organizations into one single institution, possibly even merge WBG and IMF). Too many generals right now, not enough foot soldiers.

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

The themes are fine.

Misez sur la case « échec »

Tous les journaux du monde vont en parler à partir du printemps prochain: non, ce n'est pas de la présidentielle française, mais de la Conférence mondiale sur le Développement durable qui se tiendra au Brésil du 4 au 6 Juin. L'événement marquera le 20ème anniversaire de la CNUED de Rio de Janeiro, et le 10ème du Sommet mondial sur le Développement durable qui s'est tenu à Johannesburg, donc, en 2002.

Trois jours pour résoudre les problèmes de mal développement de la planète, c'est court. Mais cette Conférence 2012 (« Rio+20 » dans le jargon international), coûteuse, risque d'être un échec, sauf si des changements profonds se produisent d'ici là.

Contrairement à Rio 1992, "Rio + 20" comme tou(te)s les branché(e)s l'appellent, ne verra pas un afflux record de Chefs d'Etat et de grands dirigeants mondiaux. Il se dit qu'à Rio en 1992, on a connu la plus grande concentration de Chefs d'Etat de l'histoire de l'humanité. On en verra beaucoup moins en 2012 et les pays envoyant leurs premiers ministres en plus de leurs ministres de l'environnement ne seront même pas forcément légion. Un événement majeur et des tendances lourdes se sont mutuellement renforcés pour "plomber" cette Conférence:

- Les effets du 11 septembre 2001 étaient encore peu profonds à Rio + 10, qui était pourtant décevant par rapport à la Conférence de 1992: c'est progressivement que celles et ceux qui croyaient auparavant que les grandes déclarations et les bonnes intentions des riches Occidentaux suffisaient à garder les pauvres des pays pauvres en situation de dépendance et de reconnaissance ont déchanté. Après le 11 septembre 2001, il est devenu clair que les pauvres réclamaient leur part et ne se contentaient pas de miettes envoyées volontairement, au compte-goutte, et parfois même détournées avant même d'arriver sur le terrain (le fameux "syndrome du Colorado"),

- Plusieurs des grandes ONG de protection de l'environnement, en France comme dans le monde, (les "Big NGOs, BINGOs") se sont fait épingle pour manque de transparence de leurs comptes financiers ou pour usage de soutiens de compagnies douteuses sur le plan environnemental (EDF pour la Fondation de Nicolas Hulot, par exemple), mettant ainsi à mal la perception publique des "bonnes ONG" contre les "méchantes institutions internationales",

- Au niveau mondial, le thème du dérèglement climatique a fait une OPA sur les autres grands thèmes du développement durable, en particulier la protection des océans et de la biodiversité. Cette domination par un thème complexe et encombrant - car réclamant des solutions globales que personne ne maîtrise ni même ne veut maîtriser - a eu un grand nombre d'effets pervers: clivages au sein de la communauté scientifique, manque de lisibilité des débats pour le grand public, possibilité pour les pro-nucléaires de réclamer une part du gâteau au motif – faux – que le "nucléaire n'émet pas de CO2, apports de financements considérables au nom de l'urgence de l'intervention avec insuffisamment de systèmes de contrôle de l'utilisation de cette nouvelle manne, et donc risques importants de malversations au nom d'une noble idée. Pendant que l'attention est focalisée sur le dérèglement climatique, les pertes de biodiversité continuent de manière alarmante et touchent beaucoup les pauvres; les océans deviennent la nouvelle frontière et le lieu de toutes les convoitises: production alimentaire, énergétique, minière, avec tous les associés,

- Les puissantes émergentes: Brésil, Russie, Inde, Chine et Afrique du Sud (institutionnalisées comme les "BRICS" et qui, incidemment, abritent la moitié de la population mondiale) sont en train, à coup de taux de croissance économique compris entre 6 et 9% l'an, de révolutionner les rapports de force mondiaux: corruption, croissance et accumulation d'actifs, y compris accaparement de terres au sein des pays les plus démunis sont trois de leurs fers de lance. Parlez-leur de protection locale de l'environnement et, au mieux, ils garderont un silence embarrassé,

- La mondialisation est attaquée de partout et la nouvelle école de la "démondialisation" fait des émules un peu partout. Il est vrai que peu de personnes ont pris la mesure d'un monde où tout va partout et très vite et où il y a plus de points communs entre un riche Portugais et un riche Pakistanais qu'entre un riche Français et un pauvre Français

- L'ultralibéralisme économique et les extrêmes populistes triomphent de plus en plus: mettre des barrières, même légères et légitimes, à la croissance est de plus en plus mal perçu et les grandes (à supposer qu'elles aient été bonnes) intentions du Grenelle de l'environnement en France se délitent dès que le réel frappe,

- Enfin, l'affaiblissement des gouvernements et en particulier la presque universelle "chasse aux fonctionnaires" n'aident pas à la mise en place de protections effectives de l'environnement et des populations vulnérables, protections qui relèvent plus de politiques de développement "soft" que d'aménagement "hard". C'est un constat bien pessimiste, mais fondé sur une histoire et beaucoup d'espoirs déçus. Bien entendu, la vie continue, des pays comme la France sont beaux, peu pollués, aux risques du nucléaire près et ont un patrimoine naturel en bonne santé; les BRICS, tout doucement, comme le secteur privé international, apprennent, bien souvent à la dure, qu'ils ont une "responsabilité sociale et environnementale". A ce titre, l'arrivée de la norme ISO 26000 sur la RSE est une bonne nouvelle, tout comme le sont le refus de la corruption des élites politiques par le printemps arabe; les extrémismes religieux vont peut-être se diluer dans les "queues de comète" des grandes religions.... Donc, même si Rio + 20 est un flop, il y aura une vie après Rio + 20 et même Rio + n.

Mais si, en fait, en osant le matricide, c'était le concept même de développement durable qui était en question? Oui, Mme Brundtland a eu une intuition géniale en 1987 en mariant développement économique et protection de l'environnement. Oui, cette fusion a aidé et influencé les militants et les professionnels pendant 25 ans, mais le concept de développement durable, extrêmement technique et biaisé "environnement naturel", trop absolu et trop détaché d'un projet politique au sens noble et originel du terme, n'a-t-il pas assez vécu et été institutionnalisé pour que nous puissions songer à une nouvelle révolution de paradigme? Personnellement, je tiens pour la mise en place d'un développement plus inclusif, un mode de développement à objectif relatif et progressif dans lequel, consciemment, on implique systématiquement et honnêtement de plus en plus de parties prenantes, avec des règles du jeu robustes et transparentes, dans tous les moments clés de la décision, du suivi et de l'évaluation des politiques collectives (publiques et des grandes entreprises privées): un peu la démocratie suisse, la propreté réelle en plus..

Voici quelques changements qui permettraient de sauver Rio+20 : une meilleure transparence des financements des grandes ONG environnementales, un rééquilibrage des thèmes environnementaux mondiaux (la fin de la suprématie du dérèglement climatique), une prise de conscience par le Brésil, la Russie, l'Inde, la Chine et l'Afrique du sud de l'impérieuse nécessité de lutter contre leurs propres pollutions et leur corruption endémique, la formation d'un vrai partenariat public-privé pour le développement durable.

Il est peu probable que ces changements se produisent avant la Conférence ; il faut cependant, pour celles et ceux qui le peuvent, se rendre au Brésil en juin prochain, avec un esprit ouvert et sans craindre de remettre en question le dogme du développement durable, formidable découverte conceptuelle de Mme Brundtland à la fin des années 80, mais sans doute trop technique et trop absolu pour guider l'humanité dans le 21ème siècle. Il est impératif de dépasser ce concept et de porter à la conférence des volontés et des thèmes plus politiques et plus inclusifs.

## Deep Sea Conservation Coalition

Protecting the Deep Seas: Recommendations to the United Nations Conference on Sustainable Development (Rio +20), 4-6 June 2012, Rio de Janeiro, Brazil

### Recommendations

Measures for Deep-Sea Conservation in Areas Beyond National Jurisdiction The Deep Sea Conservation Coalition (DSCC) urges that the States at the United Nations Conference on Sustainable Development (Rio+20) call for the following measures to address the threats posed by unsustainable fishing practices to the deep seas:

1. States and regional fisheries management organizations/agreements (RFMO/As) should immediately cease authorizing vessels to fish in areas where there is not full implementation of the United Nations General Assembly (UNGA) resolutions 61/105 and 64/72 with respect to the management of deep-sea fisheries in areas beyond national jurisdiction.
2. Any high seas bottom fishery that is not in full compliance with existing UNGA resolutions should be considered illegal, unreported and unregulated (IUU) and market States should treat it as such.

3. In view of the weight of scientific evidence, the United Nations Conference on Sustainable Development (UNCSD, Rio+20) should agree that the single most destructive fishing method in areas outside national jurisdiction—deep-sea bottom trawling on the high seas—is phased out within 3 years.

In addition, it is clear that more transparency is required by flag States and RFMO/As, including in the conduct, public availability and review of impact assessments of bottom fisheries in the high seas.

#### Measures for the High Seas, Including the Deep Sea

States at Rio+20 should agree to initiate a negotiating process towards a new implementing agreement under the United Nations Law of the Sea Convention (UNCLOS) for the protection, conservation and sustainable use of biodiversity in areas beyond national jurisdiction. Such an agreement should include:

-  A framework for the conduct of comprehensive prior environmental impact assessments (EIAs) and strategic environmental assessments (SEAs), together with ongoing and regular monitoring of the marine environment;
-  Identification, designation and management of a global network of high seas marine protected areas (MPAs), including in particular no-take reserves and consistent with the criteria agreed under the Convention on Biological Diversity (CBD);
-  Implementation of the precautionary principle and ecosystem based approach in decision making and fisheries management; and
-  The reform of RFMOs to incorporate a broader ecosystem conservation focus.

#### Brief Overview of Bottom Trawling

The DSCC is a coalition of over seventy non-governmental organizations concerned about threats to deep sea biodiversity. The DSCC was founded in 2004 to address the issue of bottom trawling on the high seas in the absence of an effective governance regime.

The DSCC is focused on achieving three overarching goals:

- i) To substantially reduce the greatest threats to life in the deep seas;
- ii) To safeguard the long-term health, integrity, and resilience of deep-sea ecosystems; and
- iii) To promote the development of effective governance regimes to ensure the protection and preservation of the marine environment in areas beyond national jurisdiction.

The protection of biodiversity in the deep sea in areas beyond national jurisdiction – the high seas - has been extensively debated by the UNGA and other international fora. The method are among the most destructive in fishing, akin to clear cutting the forest across an entire mountain range to hunt wild birds.

Trawl nets with heavy doors and rollers are dragged across the ocean floor, crushing coral, sponges other bottom (benthic) structures and lifeforms as they go. Deep sea species in general are slow growing and slow to breed, meaning that fishing in the deep sea is, with very few exceptions, unsustainable in terms of targeted species, as well as bycatch species such as deep-sea sharks. The deep-sea corals, some of which are thousands of years old, are easily damaged and can take many decades or centuries to recover.

In addition to the damage caused, deep-sea fishing on the high seas is neither economically significant nor substantial in terms of global fisheries catch production. In 2008, the United Nations Food and Agriculture Organization (UN FAO) published a report that estimated the high seas bottom fishing fleet in 2006 was no more than a few hundred vessels, catching some 250,000 tonnes of fish. This catch was valued at approximately 450 million dollars, representing a mere 0.3% of the marine capture fisheries worldwide.

#### Brief History of Bottom Trawling in the United Nations

The conservation community began calling on the UNGA to declare a moratorium on high seas bottom trawling in 2002. The call to action was based on science showing bottom trawling to be the single most destructive fishing method for deep-sea marine life on the high seas.

In 2004, the UNGA adopted Resolution 59/25 calling on high seas fishing nations and RFMO/As to take urgent action to protect vulnerable marine ecosystems (VMEs) from destructive fishing practices, including bottom trawl fishing, on the high seas. Two years later, UNGA Resolution 61/105 adopted in December 2006 went a step further, committing nations that authorise their vessels to engage in bottom fisheries on the high seas to protect deep-sea fisheries and VMEs, inter alia:

-  conduct prior impact assessments of bottom fishing on the high seas;
-  manage bottom fishing activities to prevent significant adverse impacts to VMEs;
-  close areas of the high seas to bottom fishing where VMEs are known or likely to occur unless the fishing in these areas can be managed to prevent harm to such ecosystems;
-  ensure the long-term sustainability of deep-sea fish stocks and species; and
-  implement measures in accordance with the precautionary approach, the ecosystem approach and international law.

International Guidelines for the Management of Deep-Sea Fisheries in the High Seas were then negotiated under the auspices of the UN FAO and adopted in August 2008. These Guidelines established agreed standards for States detailing how to implement the UNGA resolution requirements, including conducting impact assessments for high seas bottom fisheries and measuring the impacts.

In 2009, the UNGA reviewed implementation of the 2006 resolution and strengthened it (resolution 64/72), committing States and RFMO/As to fully implement the resolutions on an urgent basis, and calling for another full review in 2011. This resolution both reaffirmed previous commitments and called for additional actions. The new resolution made it clear that if the crucial steps, such as prior impact assessments are not carried out, then fishing should not be allowed to continue, and that this applies to all high seas bottom fisheries, including already established fisheries as well as fisheries in new areas.

A UN workshop to review the implementation of these measures took place in New York in September 2011. The Moderator's Report from this meeting noted that it was generally recognized that while some progress had been made, including the establishment of new RFMO/As and the adoption of measures by RFMO/As to limit bottom fishing activities to existing fishing areas, further actions were needed to fully implement the resolutions. Despite the progress achieved, further efforts were needed to fully implement the resolutions. In short, there is compliance in the Southern Ocean around Antarctica, where deep-sea fisheries are well regulated and bottom trawling is not allowed. However, in no other area has full compliance with the resolution been achieved. Shortcomings in implementation include absence of impact assessments,

insufficient area closures and ineffective move-on rules, which require vessels to move away if VMEs are encountered. With regard to deep-sea stocks, challenges in the adoption of measures to ensure the long-term sustainability of deep-sea fish stocks, include difficulties in determining the sustainable level of fishing effort, high levels of discards and bycatch and the vulnerability of some stocks to fishing.

Since the 2006 resolution, scientific evidence of the fragility of deep-sea fisheries and VMEs has grown. It has become increasingly clear that deep-sea bottom trawling continues to be the single most destructive activity to high seas fish populations and VMEs. Furthermore, bottom trawl fishing in the deep sea is overwhelmingly viewed by the scientific community as unsustainable.

---

## Development Alternatives with Women for a New Era (DAWN)

Women's Major Group Statement:

Asia Pacific Regional Preparatory Meeting for Rio+20

19-20 October 2011 (Seoul, South Korea)

We, the Women's Major Group representatives at the Asia Pacific Regional Preparatory Meeting for Rio+20 call on governments to reaffirm their commitments to Agenda 21 and the Beijing Platform for Action, and fulfill their obligations to the Convention on the Elimination of all forms of Discrimination against Women (CEDAW) and the International Covenant on Economic, Social and Cultural Rights. We also call on governments to respect recent international agreements including the 2009 UN Conference on the World Financial and Economic Crisis and its Impact on Development where the causes and effects of the global economic, food and ecological crises were discussed and urgent measures adopted to achieve a less volatile macroeconomic environment for sustainable development, including making economic policies compatible with human rights obligations.

On the road to Rio+20, we invoke the principles enshrined in these instruments – especially non- discrimination and substantive equality and their linkages to gender, economic and ecological justice. We assert the need for a radical change in mindset necessary to steer humanity off the course of repeated crises and self-destruction. To this end, we make the following six points:

First, we are alarmed by the complete disregard for women's human rights and gender equality in the Draft Asia Pacific Regional Statement. This is a regression from gaining an entire chapter on Women in Agenda 21 and a chapter on Women and the Environment in the Beijing Platform for Action. Governments in the Asia Pacific region must recognize that gender is cross cutting in development processes and that gender equality is vital to the achievement of sustainable development.

Second, we wish to reframe the "green economy" as "sustainable economies". We reject current economic models pursued in the name of efficiency and economic growth, but are in fact driven by profit and greed, and have resulted in unprecedented levels of poverty, inequality and food insecurity that disproportionately affect women. Instead we are working to realize "sustainable economies" that are gender just and enable long-term social and well-being outcomes for present and future generations, especially marginalized groups such as indigenous, ethnic and sexual minority groups.

As women comprise half the world's population and also count among the poorest, a "sustainable economy" must recognize women's paid and un(der)paid contributions to economic production, must generate sustainable livelihoods by which women can realize the full enjoyment of their human rights, including sexual and reproductive rights, and prevent all forms of discrimination and violence in women's exercise of their economic rights and co-stewardship of the earth's resources. Central to this is women's unmediated right to access, own, control and benefit from productive resources and assets, which includes land, water, seeds, energy sources, livestock, financial resources, public subsidies and appropriate technologies.

Third, women farmers must be recognized as co-managers of community resource bases and co- decision-makers in determining the use of natural resources and the distribution of benefits arising from them. They must be assured of capacity development in bio-diverse ecological agriculture including humane sustainable livestock and fisheries production, necessary rural infrastructure, appropriate technologies and marketing skills for their economic autonomy. We further seek from our governments a commitment to the rapid reduction and elimination of toxic substances and highly hazardous pesticides and fertilizers, while steadily phasing-in non-chemical approaches.

There is much to learn from gender-responsive good practices on agro-ecology and sustainable natural resource use and management that strive for balance and synergy between humans and nature. It must also be recognized that woman can capacitate "sustainable economies", with their indigenous and traditional knowledge systems which should be protected from appropriation and exploitation by big business.

Fourth, as marginalized and excluded groups, women bear the harshest impacts of the current climate crisis, including increased ecological and economic displacement. States must address the gender- differentiated impacts of climate change while ensuring greater and more meaningful participation of women in the climate deliberations and outcomes, and in adaptation and mitigation strategies.

Fifth, distressed migration is a phenomenon across many countries in our region, with women comprising the bulk of those who migrate from rural to urban areas and from developing to developed countries. Governments must address the huge social costs resulting from distressed migration by addressing women's economic deprivation and environmental degradation.

Sixth, women are greatly concerned by corporate driven technological solutions to climate change that are harmful to the planet and people. Such technologies must be subject to rigorous, transparent and participatory assessments including the implications on women's and children's health and well-being.

We take a firm position against nuclear energy as one of the 'solutions' to the energy crisis. It is neither clean nor sustainable, as many nuclear disasters have already so painfully pointed out. States must immediately phase out nuclear energy and seek fresh and up-scaled financial resources to shift the world to green (renewable) energy, which will benefit all of humankind.

In closing, we expect nothing less from Rio+20 than a commitment to promoting sustainable development and gender equality in ways that go beyond the limited "add women and stir" approach, and which genuinely recognize women's co-leadership and co-stewardship. Toward this end we call for sex disaggregated data and gender budgets to assure equitable resource allocation.

We further insist on the full realization of the Rio Principles including the precautionary principle, common but differentiated responsibilities, polluter pays, and Principle 10 on access to information and justice. We, the Women's Major Group call on all our governments to take action now.

---

## Developpement Sans Frontieres- DSF

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The below recommendations were agreed upon at the Regional Consultation Meeting of Civil Society Organizations and Major Groups of Western Asia, facilitated by UNEP ROWA, that met on 9 and 10 October 2011 in Dubai in preparation for Rio +20 Summit and the 27th Meeting of the Governing Council/General Ministers of Environment Forum (GC-27/GMEF),

The participants recalled Rio Declarations (1992), Agenda 21 and the Millennium Development Declarations (2000),

Recognized and stressed on their calls to enhance international co-operation in order to overcome the global development and environmental challenges,

Emphasized the key role of committed international co-operation in promoting fair trade, improving the quantity, quality and effectiveness of overseas development aids to developing countries,

Recognized the latter's contribution in supporting sustainable development initiatives, protecting and sustaining natural resources and their efficient use and reforming the production and consumption patterns and facilitating not only the transfer of environment-friendly technologies but its indigenization,

Discussed Rio+20 agenda items and agreed on the following:

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

Recognizing Principle 10 of Agenda 21, we stressed the need to mobilize the efforts of governments, major groups, civil society and the concerned UN organizations, including UNEP to:

1. Enhance the role of civil society organizations and stakeholders in influencing environmental related policies nationally, regionally and internationally.
2. Develop consultation and follow up mechanisms with civil society organizations and major groups in West Asia (ROWA), build their capacities and develop a centralized information network to exchange expertise and best practices among them.
3. Develop mechanisms to present, raise and discuss the output of the regional consultation meetings (statements) in global arenas, particularly at the Governing Council/ Global Ministerial Environment Forum (GMEF).
4. Enhance the role and representation of the Regions in the Major Groups and Stakeholders' MGS Facilitating committee similar to the MGS representation with regard to status (full rather than an observer status) and membership terms

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

we stressed the need that Green Economy should:

1. Achieve social justice, eliminate poverty, enhance social integration, create job opportunities and provide basic requirements for human welfare;
2. Ensure optimum and wise use of natural resources with high efficiency while protecting them from all forms of adverse practices and activities in order to ensure their sustainability for future generations;
3. Halt unsustainable production and consumption practices which hinder sustainable development, and curb activities that aggravate the greenhouse effect and climate change impacts in order to sustain safe living on earth.

Accordingly, we highlighted the following:

1. Green Economy is one tool to achieve sustainable development objectives and principles, and not a substitute. It is a means and not an end by itself.
2. The need for developing nations to acquire environment-friendly technologies which enable them to embark in the transition to green economy and to indigenize these technologies to ensure their sustainability.
3. Not to use Green Economy as a vehicle to impose taxes or non-tariff barriers as a form of hidden protectionism by developed countries.
4. Enhancing, activating and institutionalizing the concept of corporate social responsibility (CSR) in building capacities and eliminating poverty, provided that this concept relies on respecting human rights, all international conventions and agreements related to economic, social and cultural rights as well as the Universal Declaration on the Right for Development.

More specifically, on West Asia front, we emphasized the need for:

1. Promoting regional co-operation to meet the region's needs through prioritizing the economic development programs and the implementation mechanisms in the transition to Green Economy.
2. Laying down a mechanism for regional co-operation in the sector of renewable and/or alternative energy.
3. Catalyzing technology transfer within the region to ensure proper transfer and indigenization along with capacity building and training.
4. Encouraging investment in scientific research through the provision of incentives to companies (within the region and with developed countries), ensuring the participation of different segments of the society, supporting scientists and funding researchers in the region.
5. Adopting high quality control/quality performance standards in managing the process of transition to Green Economy and beyond.
6. Integrating sustainable development concepts in the educational and training curricula at different levels.
7. Empowering civil society organizations and promoting their participation along with governments and private sectors in sustainably managing the various natural resources in the different stages of planning, execution, monitoring and evaluation.
8. Making use of and direct the resources available in Waqf funds among other resources, including Zakat, etc. (in accordance with Shari'a guidelines) as well as some Arab development funds (sovereign funds) to implement sustainable development programs that serve in minimizing disparities and eliminating poverty.
9. Reviewing, updating and enforcing environmental legislations at the national and regional levels.
10. Integrating the environmental dimension into national policies, strategies and programs to realize the objectives of sustainable development.

Based on the above, we emphasized that Green Economy should spring from a vision that takes into consideration the specificities of local communities (particularly developing nations) through defining their economic and social development priorities and implementation means. The latter shall be based on enhancing productive sectors in the framework of Green Economy in a way that would meet local needs; create new green job opportunities, realize effective social participation in development and ensure just distribution of development outcomes, reduce poverty and marginalization and increase social welfare.

In this respect and within the strategies of transition towards Green Economy, we highlighted the need for adopting the following priorities:

1. Production and consumption trends: to urge nations to change their consumption and production patterns and behaviors to be more sustainable, in line with Agenda 21, by facilitating and promoting initiatives that adopt environment-friendly production trends and conscious consumption practices.
1. Renewable energy: to urge states and empowering them technologically to use different types of renewable energy, such as solar energy, wind, waves among other forms of alternative clean energy resources available in the region.
2. Green building: to urge states and promote the application of the green building policies and tools in the private and public sectors through developing and adopting environmental specifications and standards (such as the use of environment-friendly materials as well as energy and water efficient techniques).
3. Clean means of transport: to urge states to provide reliable public transport infrastructure and operations and promote the use of environment-friendly means through extending incentives.
4. Water management: to urge governments to develop integrated water resource management strategies, and specifically improving the efficient utilization of both conventional non-conventional water resources to the largest extent possible through recycling and reusing of treated effluent of all degrees, as per appropriate specifications, in different sectors such as agriculture and industry.
5. Waste management: to urge governments to adopt the integrated waste management approach aiming at reducing waste generation at source, through rationalization of consumption patterns, adopting of the green production inputs and concepts, using high quality commodities, reducing the use of packaging materials; segregating and reclaiming urban waste; ending with safe disposal of toxic waste.
6. Sustainable natural resource management: to urge governments to employ and use integrated regional planning basics for use of land and conserving biodiversity habitats, establishing genetic banks, promoting organic agriculture, reducing the use of agricultural chemicals to safeguard human health and the quality of environment.

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

While stressing the importance of the efforts made by different organizations towards developing International Environment Governance (IEG) within the United Nations system, we emphasized the need to enhance the framework of sustainable development to ensure equity and transparency in line with the international law, through the following:

1. Initiating and developing sound science policy and planning interface; hence crafting environmental and development policies and programs based on strong, credible integrated and coherent science base.
2. Strengthening the Committee of Sustainable Development (CSD) and upgrading it into a "Global Council for Sustainable Development", empowered to oversee the implementation of international conventions and resolutions, particularly Agenda 21, the MDGs and related international conventions. This would enhance cohesion, co-ordination and harmonization among them and hold the governments and other relevant entities subject to regular monitoring.
3. Enhancing UNEP's role and mandate through upgrading its status to be one of the UN organizations similar to WHO and ILO, among others.
4. Encouraging the developed countries to meet their declared commitments during Rio 1992 and Johannesburg 2002 Summits towards the developing countries in order to enable the latter fulfill their needs to achieve the Agenda 21 and the MDGs and overcome the threats hindering the implementation of their sustainable development plans.
5. Finding and developing innovative sources of funds, and securing diversified, sustainable and predictable funding.
6. Promoting the principles of good governance and rejecting all forms of corruption at the various local, national, regional and global levels while empowering the monitoring role of civil society organizations in this respect.
7. Ensuring the participation of civil society organizations and other stakeholders as well as ensuring transparency and accountability at all levels (local, national, regional and global), based on principle 10 of Agenda 21 within the global environmental governance system through:
  - Securing means to respond to the needs of countries which lack good governance mechanisms and regulations.
  - Building capacities in democratic governance and developing national professional and scientific capabilities through the provision of resources, training and education.
  - Setting standards for transparency and accountability and disseminating best practices.
  - Crafting guidelines and standards that promote civil society and stakeholders' participation, and advocate for establishing sustainable development councils both at the local and national levels.
8. Adopting comprehensiveness to ensure that all significant environmental threats are appropriately addressed, through mechanisms that ensure:
  - Continuous evaluation of the state of the environment and technological developments in order to assess and address urgent problems and emerging threats;
  - Developing early warning systems, building and enhancing capabilities to promptly respond to and rectify environmental threats at various levels (local, national, regional and global) in a co-ordinated and precautionary manner

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Statement/ recommendations of the West Asia Regional Consultation Meeting of Major Groups and Stakeholders in Preparation for Rio + 20 and the 27th Session of the Governing Council/ Global Ministerial Environment Forum (GC-27/GMEF)

9-10 October 2011, Dubai, United Arab Emirates

We, the participants in the Regional Consultation Meeting of Civil Society Organizations and Major Groups of Western Asia, met on 9 and 10 October 2011 in Dubai in preparation for Rio +20 Summit and the 27th Meeting of the Governing Council/General Ministers of Environment Forum (GC-27/GMEF) as well as the Global Major Groups and Stakeholders Forum (GMGSF-13),

Abiding by Rio Declarations (1992), Agenda 21 and the Millennium Development Declarations (2000),

Recognizing and stressing on their calls to enhance international co-operation in order to overcome the global development and environmental challenges,

Emphasizing the key role of committed international co-operation in promoting fair trade, improving the quantity, quality and effectiveness of overseas development aids to developing countries,

Recognizing the latter's contribution in supporting sustainable development initiatives, protecting and sustaining natural resources and their efficient use and reforming the production and consumption patterns and facilitating not only the transfer of environment-friendly technologies but its indigenization,

Discussed Rio+20 agenda items and agreed on the following recommendations:

First: Institutional Framework for Sustainable Development (IFSD) and International Environment Governance (IEG)

While stressing the importance of the efforts made by different organizations towards developing International Environment Governance (IEG) within the United Nations system, we emphasized the need to enhance the framework of sustainable development to ensure equity and transparency in line with the international law, through the following:

1. Initiating and developing sound science policy and planning interface; hence crafting environmental and development policies and programs based on strong, credible integrated and coherent science base.
2. Strengthening the Committee of Sustainable Development (CSD) and upgrading it into a "Global Council for Sustainable Development", empowered to oversee the implementation of international conventions and resolutions, particularly Agenda 21, the MDGs and related international conventions. This would enhance cohesion, co-ordination and harmonization among them and hold the governments and other relevant entities subject to regular monitoring.
3. Enhancing UNEP's role and mandate through upgrading its status to be one of the UN organizations similar to WHO and ILO, among others.
4. Encouraging the developed countries to meet their declared commitments during Rio 1992 and Johannesburg 2002 Summits towards the developing countries in order to enable the latter fulfill their needs to achieve the Agenda 21 and the MDGs and overcome the threats hindering the implementation of their sustainable development plans.
5. Finding and developing innovative sources of funds, and securing diversified, sustainable and predictable funding.
6. Promoting the principles of good governance and rejecting all forms of corruption at the various local, national, regional and global levels while empowering the monitoring role of civil society organizations in this respect.
7. Ensuring the participation of civil society organizations and other stakeholders as well as ensuring transparency and accountability at all levels (local, national, regional and global), based on principle 10 of Agenda 21 within the global environmental governance system through:
  - \* Securing means to respond to the needs of countries which lack good governance mechanisms and regulations.
  - \* Building capacities in democratic governance and developing national professional and scientific capabilities through the provision of resources, training and education.
  - \* Setting standards for transparency and accountability and disseminating best practices.
  - \* Crafting guidelines and standards that promote civil society and stakeholders' participation, and advocate for establishing sustainable development councils both at the local and national levels.
8. Adopting comprehensiveness to ensure that all significant environmental threats are appropriately addressed, through mechanisms that ensure:
  - \* Continuous evaluation of the state of the environment and technological developments in order to assess and address urgent problems and emerging threats;
  - \* Developing early warning systems, building and enhancing capabilities to promptly respond to and rectify environmental threats at various levels (local, national, regional and global) in a co-ordinated and precautionary manner.

Second: Green Economy

In view of UNEP's definition of Green Economy as one "that results in improved human well-being and social equity, while significantly reduce environmental risks and ecological scarcities. In its simplest expression, a green economy can be thought of as one which is low in carbon, resource efficient and socially inclusive (...). The concept of a green economy does not replace sustainable development, but there is growing recognition that achieving sustainability rests almost entirely on getting the economy right<sup>1</sup>"; and despite the reservations of some CSOs and MGS on this definition<sup>2</sup>, we stressed the need that Green Economy should:

1. Achieve social justice, eliminate poverty, enhance social integration, create job opportunities and provide basic requirements for human welfare;
2. Ensure optimum and wise use of natural resources with high efficiency while protecting them from all forms of adverse practices and activities in order to ensure their sustainability for future generations;
3. Halt unsustainable production and consumption practices which hinder sustainable development, and curb activities that aggravate the greenhouse effect and climate change impacts in order to sustain safe living on earth.

Accordingly, we highlighted the following:

1. Green Economy is one tool to achieve sustainable development objectives and principles, and not a substitute. It is a means and not an end by itself.
2. The need for developing nations to acquire environment-friendly technologies which enable them to embark in the transition to green economy and to indigenize these technologies to ensure their sustainability.
3. Not to use Green Economy as a vehicle to impose taxes or non-tariff barriers as a form of hidden protectionism by developed countries.
4. Enhancing, activating and institutionalizing the concept of corporate social responsibility (CSR) in building capacities and eliminating poverty, provided that this concept relies on respecting human rights, all international conventions and agreements related to economic, social and cultural rights as well as the Universal Declaration on the Right for Development.

More specifically, on West Asia front, we emphasized the need for:

1. Promoting regional co-operation to meet the region's needs through prioritizing the economic development programs and the implementation mechanisms in the transition to Green Economy.
2. Laying down a mechanism for regional co-operation in the sector of renewable and/or alternative energy.
3. Catalyzing technology transfer within the region to ensure proper transfer and indigenization along with capacity building and training.
4. Encouraging investment in scientific research through the provision of incentives to companies (within the region and with developed countries), ensuring the participation of different segments of the society, supporting scientists and funding researchers in the region.

5. Adopting high quality control/quality performance standards in managing the process of transition to Green Economy and beyond.
6. Integrating sustainable development concepts in the educational and training curricula at different levels.
7. Empowering civil society organizations and promoting their participation along with governments and private sectors in sustainably managing the various natural resources in the different stages of planning, execution, monitoring and evaluation.
8. Making use of and direct the resources available in Waqf funds among other resources, including Zakat, etc. (in accordance with Shari'a guidelines) as well as some Arab development funds (sovereign funds) to implement sustainable development programs that serve in minimizing disparities and eliminating poverty.
9. Reviewing, updating and enforcing environmental legislations at the national and regional levels.
10. Integrating the environmental dimension into national policies, strategies and programs to realize the objectives of sustainable development.

Based on the above, we emphasized that Green Economy should spring from a vision that takes into consideration the specificities of local communities (particularly developing nations) through defining their economic and social development priorities and implementation means. The latter shall be based on enhancing productive sectors in the framework of Green Economy in a way that would meet local needs; create new green job opportunities, realize effective social participation in development and ensure just distribution of development outcomes, reduce poverty and marginalization and increase social welfare.

In this respect and within the strategies of transition towards Green Economy, we highlighted the need for adopting the following priorities:

1. Production and consumption trends: to urge nations to change their consumption and production patterns and behaviors to be more sustainable, in line with Agenda 21, by facilitating and promoting initiatives that adopt environment-friendly production trends and conscious consumption practices.
1. Renewable energy: to urge states and empowering them technologically to use different types of renewable energy, such as solar energy, wind, waves among other forms of alternative clean energy resources available in the region.
2. Green building: to urge states and promote the application of the green building policies and tools in the private and public sectors through developing and adopting environmental specifications and standards (such as the use of environment-friendly materials as well as energy and water efficient techniques).
3. Clean means of transport: to urge states to provide reliable public transport infrastructure and operations and promote the use of environment-friendly means through extending incentives.
4. Water management: to urge governments to develop integrated water resource management strategies, and specifically improving the efficient utilization of both conventional non-conventional water resources to the largest extent possible through recycling and reusing of treated effluent of all degrees, as per appropriate specifications, in different sectors such as agriculture and industry.
5. Waste management: to urge governments to adopt the integrated waste management approach aiming at reducing waste generation at source, through rationalization of consumption patterns, adopting of the green production inputs and concepts, using high quality commodities, reducing the use of packaging materials; segregating and reclaiming urban waste; ending with safe disposal of toxic waste.
6. Sustainable natural resource management: to urge governments to employ and use integrated regional planning basics for use of land and conserving biodiversity habitats, establishing genetic banks, promoting organic agriculture, reducing the use of agricultural chemicals to safeguard human health and the quality of environment.

In light of the above, and recognizing Principle 10 of Agenda 21, we stressed the need to mobilize the efforts of governments, major groups, civil society and the concerned UN organizations, including UNEP to:

1. Enhance the role of civil society organizations and stakeholders in influencing environmental related policies nationally, regionally and internationally.
2. Develop consultation and follow up mechanisms with civil society organizations and major groups in West Asia (ROWA), build their capacities and develop a centralized information network to exchange expertise and best practices among them.
3. Develop mechanisms to present, raise and discuss the output of the regional consultation meetings (statements) in global arenas, particularly at the Governing Council/ Global Ministerial Environment Forum (GMEF).
4. Enhance the role and representation of the Regions in the Major Groups and Stakeholders' MGS Facilitating committee similar to the MGS representation with regard to status (full rather than an observer status) and membership terms.

---

## Donor Committee on Enterprise Development's (DCED) Green Growth Working Group

The Rio+20 summit in June 2012 will further substantiate the concept of sustainable development by discussing the idea of a green economy in the context of sustainable development and poverty eradication.

The complex double challenge of reducing poverty as well as mitigating environmental degradation and the impact of climate change requires economic growth while shifting economic development to greener paths. Such strategies have been termed green growth strategies. They promote growth and income opportunities with a minimal negative environmental impact.

Under the overall umbrella of the Green Economy, there are several strategies, promoted by international organizations at micro and macro level, which are reinforcing each other in their aim to stimulate sustainable consumption and production, private sector development and social welfare while minimizing the impact on the environment.

The private sector is the key driver for green growth, as its investing and innovating capacities are crucial for the transition to a resource- and energy efficient low carbon economy. The vast majority of the necessary funding will have to be borne by businesses, ranging from multinationals to domestic micro, small and medium-sized enterprises. So far, however, contributions by the private sector to green growth have not been adequately considered to realise a green economy.

In addressing the role of the private sector in green growth, the Donor Committee for Enterprise Development (DCED) has gathered valuable experience. The DCED is a forum that unites 21 donors and UN agencies to promote sustainable poverty alleviation through the development of a dynamic private sector. The DCED, particularly its Green Growth Working Group, intends to create initiatives enabling the private sector to generate environmentally sound and climate friendly growth in line with overall development goals such as job creation. Its members assist developing countries in taking appropriate policy responses to tap the private sector's potential for green growth.

## Recommendation 1:

Private sector development must be considered a pre-requisite to reduce poverty while countering climate change and environmental degradation at their root: the patterns of production and consumption.

## Tapping New Opportunities for Private Sector Development

The private sector's investing and innovation capacities are decisive for the transition towards a resource- and energy-efficient low carbon economy. Green growth in the private sector counters climate change and environmental degradation at their root: The patterns of production and consumption.

Especially in developing countries, green growth is rather an opportunity than an obstacle to private sector development. Greening the economy can be recognized as a chance for decent job creation and as an engine for economic growth. Thereby, increasing offer and demand for green products and services can be met while alleviating poverty.

As green growth demands skilled professionals, there are new opportunities for decent and gainful employment and for the reduction of poverty. To meet the growing demand for skilled labor and to ensure a sustainable poverty reduction, a smooth reallocation of workers and key labor markets and training policies are needed.

Increasing resource and energy efficiency of the private sector is not only important for an environmental friendly development, but also significantly determines the competitiveness of private companies. Therefore, green growth should be promoted as a competitive advantage. Decoupling economic growth from impact on the environment can be achieved via greening existing industries and creating new green industries providing environmental products and services such as material recovery, recycling companies, waste management, wastewater treatment, air pollution control, renewable energy equipment, energy conservation, chemical leasing, etc.

Adaptation to impacts of climate change can also be a competitive advantage, as it offers opportunities to develop markets and to expand market shares. Extreme weather events and changing resource availability create the need for a diversified, resilient, and innovative private sector that provides products, services, and technologies to adapt to climate change. While the private sector needs to adapt to a changing environment, it has yet been reluctant to invest in possible solutions. This lack of investments can partially be explained by the absence of financial incentives and inadequate framework conditions that need to be addressed by policy makers.

## Recommendation 2:

Especially in a development context, „Greening“ the economy has to be recognised as an opportunity for decent job creation and as an engine for growth.

## Green Finance and Investment

Green investments can increase costs of production in the short run. Hence, incentives for green investments are needed. A regulatory environment conducive for strengthening the capacity of the financial sector for providing green loans, grants, seed funds etc. can encourage investments in low carbon, resource-efficient production technologies and climate adaptation.

Moreover, insurance services can reduce the risk of extreme weather events and help enterprises to cope with effects of climate change.

Furthermore, financial institutions can use sustainable indices to promote green investments. Foreign direct investment in green sectors can also be essential in funding investments in green sectors. That can be achieved through supporting the creation of emission trading platforms and markets for green equity investments.

## Recommendation 3:

Attracting foreign direct investment, particularly in green sectors, is crucial to accelerate green growth.

## Policies for a business enabling environment

A conducive policy framework is needed to activate the private sector's potential for green growth. A smart mix of market-based instruments, regulatory measures and public investments including demand policies (e.g. public procurement) is needed to design appropriate enabling conditions. Environmental aspects must be integrated into development strategies and private sector development programs to foster a structural change.

Such policies should create appropriate incentives to stimulate the business case for investment in greener production and service facilities. However, the price for pollutants, energy and resource-inefficient goods and services is often lower than the cost to society and the environment, creating market failures. Different policy options, including market-based instruments, can provide necessary incentives for green investments and less use of environmentally harmful substances.

Green growth depends on institutional settings, available resources and local environmental issues. Additionally, emerging and developing countries face different challenges and opportunities. As the design of green growth strategies very much depends on the specific local context, there is no blueprint for a green private sector development. Therefore, programs need to be aligned in accordance to the specific conditions.

## Recommendation 4:

There is no blueprint for “greening” private sector development. The specific design of Green Growth strategies very much depends on the local context. Private sector development needs to be aligned with the respective structure of the economy; policy instruments need to be well-adapted.

## Innovation and technology

Innovation can help to decouple economic growth from environmental degradation and will lead to new ideas and new business models, thus contributing to green growth. For example, energy efficient technologies can reduce energy demand and have proven to be less expensive than traditional technologies for poor consumers.

The private sector drives innovation. However, a suitable environment is needed for green innovation. Support should be provided for national learning and innovation hubs that bring together business sector, academia and knowledge sector, and government. Many policy instruments used in private sector development can have significant effect on the use and adaptation of green technologies. Among other things, green innovation requires transparent and stable market signals such as environmental taxation. Such signals stimulate the creative potential of the private sector and enhance the innovation and diffusion of new environment friendly technologies.

## Risks and trade-offs

Green PSD strategies must consider trade-offs between economic and environmental or social goals. Increased costs or reduced privileges and subsidies create relative ‘winners’ as well as ‘losers’. It is necessary to identify vulnerable groups and potential resistance and provide alternative solutions to increase stakeholder commitment and political feasibility.

Jobs in energy- and emission-intensive industries are likely to suffer from a transition to a green economy. Green growth strategies need to consider a smooth transition of workers from the emission-intensive sectors, often concentrated in certain regions, to green industries.

Risk and trade-offs of green growth policies need to be well analyzed, in order to assess the dynamic effects and the political economy of reforms. As with the phasing out of subsidies for fossil fuels, such assessments often point to strategies that are socially acceptable and economically attractive.

#### Recommendation 5:

The inclusion of private sector stakeholders in developing countries is essential to ensure the coherence of Green Growth policies with development objectives.

#### Potential contributions of Development Cooperation

To raise awareness, development agencies can encourage firms to establish profitable environmental management system or provide sector specific information about expected climate impacts and adaptation requirements.

Development agencies can build capacities and support partners to design and implement effective policy measures, for example to establish green financial products, to facilitate environmental fiscal reforms, or to develop markets for goods and services reducing climate induced risks while harnessing opportunities for businesses.

In order to provide incentives to produce green products, donors and development agencies can facilitate technology transfers from industrialized to low-income countries. Especially small and medium-sized enterprises should profit from business development services and know-how along the entire value chain. Furthermore, development cooperation should contribute to providing enterprises with access to attractive funding options.

In addition, development agencies can assist businesses in low-income countries to gain additional income from carbon markets through e.g. CDM or other financing instruments such as public private partnerships and microfinance.

#### Recommendation 6:

Structural changes in emerging economies must be supported by integrating environmental aspects into development strategies and private sector development programmes. Thereby, increasing demand for green products can be met while alleviating poverty.

#### Concluding Remarks

Significant contributions by a strong and competitive private sector are necessary to successfully address the double challenge of reducing poverty as well as mitigation environmental degradation and the impact of climate change. For a successful transformation to a green economy, the private sector must develop green products, services and technologies which reduce the risks of climate change and environmental degradation while intensifying efforts for adaptation to climate change. At the same time, it must increase income opportunities for the poor.

Decision-makers in Rio 2012 should adequately consider the role of the private sector for green growth. It is private sector development today that will tip the scales for a green economy tomorrow!

In order to ensure coherence of green growth policies, the consultation of representatives from the private sector in developing countries remains essential. Likewise, development agencies can provide proof of how green growth can be an opportunity also for developing countries. For Rio 2012 and the implementation of decisions taken, the DCED will be happy to contribute its experience gained worldwide in many good practice examples.

---

## Earth Charter International

### Earth Charter International Recommendations for the Zero Draft of the UNCSD (Rio+20) Outcome Document

#### Summary of Recommendations

1. Express responsibility to future generations by implementing the precautionary principle and establishing Ombudspersons for Future Generations at global, national and local levels.

2. Create a green economy based on strong sustainability and adopt alternative economic indicators to GDP that include social well-being and ecological integrity.

3. Acknowledge the fundamental importance of shared ethical and spiritual values in making the transition to a sustainable way of life.

4. Adopt a sustainable development goal focused on sustainable production and consumption.

5. Ensure that proposals for a new institutional framework for sustainable development, and related global governance reforms, include a mandate of trusteeship for global common goods on behalf all peoples, the greater community of life, and future generations.

6. Ensure that all have access to quality education for sustainable ways of living.

7. Make Climate Justice a guiding principle in efforts to address global climate change, ensuring that the benefits and burdens associated with climate change are distributed equitably, with special concern for the rights of the poor, indigenous peoples, and other vulnerable peoples.

8. Provide supportive mechanisms for a Just Transition – ensuring the right to sustainable development. Introduction

Recalling the recommendation by the 1987 report of the World Commission on Environment and Development (the Brundtland Commission report) for creation of a “Universal Declaration on Environmental Protection and Sustainable Development” in the form of a “new charter” with principles to guide nations in the transition to sustainable development, and the promotion of values that encourage consumption standards to which all can aspire within Earth’s carrying capacity.

Recognizing that the adoption of such an ethical Charter was a goal of the preparatory process for the 1992 Rio Earth Summit and that, since then, too little progress has been made in implementing governments’ commitments to sustainable development.

Realizing that the need for a stronger global ethical framework to guide sustainable development has only increased. Mindful that the Earth Charter was drafted and launched by a global civil society initiative under the leadership of the Earth Charter Commission, and that the Earth Charter has been endorsed and recognized by thousands of

organizations including UNESCO and the IUCN.

Recognizing that the September 7 Declaration of the 64th Annual UN DPI/NGO Conference in Bonn articulates a broadly supported civil society agenda for the Outcome Document of the United Nations Conference on Sustainable Development. Recalling, as stated in this Bonn Declaration, 'that the Earth Charter, together with the Culture of Peace, can play a vital role in helping to inspire renewed political commitment expected for Rio + 20 and to guide the transition to a sustainable, just and peaceful society with respect and care for the entire community of life.'

Affirming the recommendation by the European Economic and Social Committee that 'the Summit [Rio+20] should recognize and support the Earth Charter as a means of inspiring commitment and action by individuals and organizations around the world.'

Affirming that the Outcome Document from Rio+20 should acknowledge the importance of a comprehensive ethical framework - as exemplified by the Earth Charter - as a guide for sustainable development and ensure that governments make good on past commitments to Agenda 21, the Millennium Development Goals, and other intergovernmental agreements.

We, on behalf of Earth Charter International and its network of supporting organizations and individuals, submit the following recommendations for inclusion in the Zero Draft Document:

**Recommendation 1 - Express responsibility to future generations by implementing the precautionary principle and establishing Ombudspersons for Future Generations at global, national and local levels** As defined by the Brundtland Commission report, sustainable development requires we meet the needs of the present without compromising the ability of future generations to meet their own needs, within the limits imposed by the capacity of the biosphere to absorb the effects of human activities. This universal responsibility for intergenerational equity is expressed in Earth Charter Principle 4 which calls us to Secure Earth's bounty and beauty for present and future generations.

The Bonn Declaration calls for the establishment of Ombudspersons for Future Generations at global, national and local levels, who will advocate for sustainable development as envisaged and defined by the Brundtland Commission ('... to enhance the well-being and prospects of present and future generations to meet their needs, and to serve as an auditor at the heart of governments and deal with citizen's complaints'). As a comprehensive ethical framework, The Earth Charter provides shared values and principles that can help guide their work.

In taking responsibility for future generations, we must recognize the threat they face if too little is done to protect our environmental security. Reduced access to water, rising sea levels, management over degrading pastoral lands and the ever-increasing gap between rich and poor fanned by unsustainable development increase the risk that communities across the planet will be caught in the middle of conflicts associated with control of our dwindling natural resources. Implicit in the call for Ombudspersons for Future Generations is a deep commitment to implementing the precautionary principle as adopted in the Rio Declaration and the UN Framework Convention on Climate Change, amongst other international agreements. The Earth Charter's formulation of the precautionary principle is pro-active and progressive:

6. Prevent harm as the best method of environmental protection and, when knowledge is limited, apply a precautionary approach.

- a. Take action to avoid the possibility of serious or irreversible environmental harm even when scientific knowledge is incomplete or inconclusive.
- b. Place the burden of proof on those who argue that a proposed activity will not cause significant harm, and make the responsible parties liable for environmental harm.
- c. Ensure that decision making addresses the cumulative, long-term, indirect, long distance, and global consequences of human activities.

**Recommendation 2 - Create a green economy based on strong sustainability and adopt alternative economic indicators to GDP that include social well-being and ecological integrity**

The Earth Charter provides a strong definition of sustainable development, recognizing the three standard pillars [social, environmental and economic] but organizing them in a particular way. "Environment" is not merely the resource base for human consumption, not just one of the three factors to be considered. Rather, it incorporates the greater community of life including human beings and the life-support systems on which we all depend. This shift to a broader life-centered perspective marks one key difference between "weak" and "strong" sustainability. Furthermore, the social dimension (articulated in the Earth Charter in terms of principles for economic and social justice, democracy, non-violence and peace) represents a set of pre-requisites and goals for sustainable development rather than negotiable or merely optional considerations (Bosselman and Engel, 2010).

There are obvious classes of goods which are privately owned, traded on markets, and for which there is a real market price. Undoubtedly, for these goods, fixing market failures is a pre-requisite to advancing sustainable development (Bosselmann et al., 2011). Earth Charter principle 7d addresses one critical market failure, viz. Internalize the full environmental and social costs of goods and services into the selling price, and enable consumers to identify products that meet the highest social and environmental standards. However, such pricing, and attempts to fix other market failures, must not disadvantage or bring harm to developing countries. Therefore, coupled to any market based mechanism introduced as part of green economic reform must be a commitment to the principle of common but differentiated responsibilities and capabilities; as articulated in the Rio Declaration and the UN Framework Convention on Climate Change, among other international agreements. For example, approaches to pricing greenhouse gas emissions must follow the principle of common but differentiated responsibilities (see Recommendations 7 and 8).

The Bonn Declaration recognizes that market and institutional failures take the form of prices that do not reflect their true environmental and social costs, underinvestment in natural, human, built and social capital, harmful and perverse subsidies, restricted access to information about production technologies and their impacts, lack of democratic economic governance, increasing unemployment and inadequate indicators of progress. We support the Declaration's call for replacement of the current inefficient, unsustainable and inequitable economic, monetary, financial and commercial models with policies that advance rather than detract from sustainable development goals and that build rather than deplete the stocks of natural and social capital on which human well-being ultimately depends. As noted by the Declaration (see also Bosselmann et al. 2011), where the current economy aids inequity, destruction and greed, it should be replaced by an economy that cares for and enables a flourishing Earth community inclusive of all people, the greater community of life, and future generations.

The Bonn Declaration calls for the establishment of an intergovernmental negotiating committee to create a framework convention on corporate environmental and social responsibility (CSR) for the accountability of corporate investments for all companies listed on stock exchanges worldwide (287-290).

We support this call and, informed by our partnership with the Global Reporting Initiative, recommend that the following Green Economy Coalition recommendations be adopted in this framework convention:

- Commit to develop a global policy framework that requires all listed and large private companies to consider sustainability issues and to integrate material sustainability information within their reporting cycle and in their Annual Report and Accounts or explain why if they do not;
- Recognize the need for a process that builds on data available through sustainability reporting, leading to the development and adoption of macro-level, multi-disciplinary metrics such as the Sustainable Development Indicators that, beyond GDP, would allow a more comprehensive measurement of wellbeing, environmental health and the progress made towards a green economy; and

- Commit to develop and implement new ways of measuring national <sup>16</sup>wealth<sup>16</sup> beyond money, specifically with new indicators on societal wellbeing and environmental health. GDP itself must subtract externalities and report net incomes per capita. UNCSD should reach agreement on a deadline to endorse common methods and practices, with a view to producing global standards, so that nationally defined indicators can be comparable at the international level and with appropriate tools for monitoring and assessment.

#### Recommendation 3 - Acknowledge the fundamental importance of shared ethical and spiritual values in making the transition to a sustainable way of life

There is wide international agreement that sustainable development requires economic development, social transformations, and environmental restoration and protection. In addition to these three pillars of sustainable development, there is a fourth pillar: a shared vision of ethical and spiritual values that inspires and guides cooperative action for change. Shared values awaken a sense of common purpose and build community spirit. In an increasingly interdependent world, achieving the environmental, economic, and social goals associated with sustainability requires worldwide collaboration, and cooperation is not possible without shared values and a sense of common purpose. The vision of a sustainable future as an inclusive social and ecological ideal that is good, right and just is what is needed to inspire strong commitment and drive change.

The emergence throughout the world of a new ethical and spiritual consciousness that supports the transition to a just, sustainable and peaceful world is one of the most promising developments of the last sixty years. The ethical and spiritual values associated with this new consciousness have been given expression in many intergovernmental and civil society declarations such as the Universal Declaration of Human Rights, the World Charter for Nature, the Rio Declaration, and the Earth Charter. The Earth Charter identifies the basic spiritual challenge that the world community must address if it is to make the transition to strong sustainability when it states:

We must realize that when basic needs have been met, human development is primarily about being more, not having more. This guideline is, of course, entirely consistent with the teachings of all the world's great wisdom traditions.

The values associated with human rights, cultural diversity, social and economic justice, a culture of peace, intergenerational responsibility, and respect and care for the greater community of life, are all part of what <sup>16</sup>being more<sup>16</sup> means in the 21st century. In addition, the Earth Charter recognizes the importance of reverence for the mystery of being, compassion, love, hope, and the joyful celebration of life. Being more in the spirit of these values and ideals is the only sure path to a sustainable world.

We might represent the four pillars of sustainable development as People, Planet, Profit and Pnuma (i.e. spirit) with the latter representing our possibility of awakening to a sense of wonder and interconnectedness with all life and of establishing, as the last Earth Charter principle (16f) states, & right relationships with oneself, other persons, other cultures, other life, Earth, and the larger whole of which all are a part.

#### Recommendation 4 - Adopt sustainable development goals focused on sustainable production and consumption

Earth Charter Principle 7 urges us to Adopt patterns of production, consumption, and reproduction that safeguard Earth's regenerative capacities, human rights, and community well-being. Sustainable development must provide all with access to the resources necessary for a fulfilling life. The following recommendations from the Bonn Declaration spell out key targets for realizing the recommendations of Principle 7, including 7f which encourages us to Adopt lifestyles that emphasize the quality of life and material sufficiency in a finite world:

- By 2020, consistent with the Biodiversity Strategic Plan adopted at the 10th meeting of the Conference of Parties to the UN Convention on Biological Diversity, the human ecological footprint is reduced so that it remains within the Earth's biological carrying capacity. In accordance with the principle of common but differentiated responsibilities, we call on nations and populations engaged in wasteful overconsumption to reduce their impacts and help increase the consumption of vital goods and services for impoverished nations and peoples, so they also can enjoy reasonably high standards of living that provide equitable access to health care, decent work opportunities and education;

- By 2020, governments should promote production processes that reflect the best available technologies for eco-efficiency, recycling, remanufacturing, reuse of waste materials, product durability and longevity. Wasteful practices such as planned obsolescence are identified and eliminated. Public procurement standards and incentives reward leading corporations that share and disseminate best green practices worldwide. By 2020, the majority of the world's goods and services are procured by governments from sources certified by objective third parties as sustainably produced; - Further, establish a set of Millennium Consumption Goals for the period 2012-2020 towards creating an intergenerational and internationally shared right to equitable consumption opportunities and ensuring quality of life and wellbeing of all people by 2020, while eradicating all kinds and levels of poverty, respecting animal welfare and embedding sufficiency based sustainable economies. (442-463)

#### Recommendation 5 - Ensure that proposals for a new institutional framework for sustainable development, and related global governance reforms, include a mandate of trusteeship for global common goods on behalf all peoples, the greater community of life, and future generations

Various options have been proposed for institutional reform in support of sustainable development including a consortium for environmental sustainability that strengthen UN CSD, creation of a new, specialized normative and operational agency, and creation of a new umbrella organisation for sustainable development with universal membership. All are legitimate options with advantages and potential for positive outcomes. Whatever proposal for institutional reform the world's nations agree to at Rio+20, a critical question is the mandate under which it is established. We recommend that a core component of the mandate should be a trusteeship function over global public goals and common goods on behalf of all peoples, the greater community of life, and future generations.

The first four principles of the Earth Charter provide one articulation of the necessary goals:

1. Respect Earth and life in all its diversity;
2. Care for the community of life with understanding, compassion, and love;
3. Build democratic societies that are just, participatory, sustainable, and peaceful; and
4. Secure Earth's bounty and beauty for present and future generations.

Global common goods include obligations for maintaining the integrity of planetary boundaries and the ecological wellbeing of all, overseeing markets to ensure that they are protective of non- market common goods, and ensuring impartiality between all interests individual, civil society, corporate, and national.

The basis for these duties is well articulated in the Preamble of the Earth Charter: Earth, our home, is alive with a unique community of life. The forces of nature make existence a demanding and uncertain adventure, but Earth has provided the conditions essential to life's evolution. The resilience of the community of life and the well-being of humanity depend upon preserving a healthy biosphere with all its ecological systems, a rich variety of plants and animals, fertile soils, pure waters, and clean air. The global environment with its finite resources is a common concern of all peoples. The protection of Earth's vitality, diversity, and beauty is a sacred trust.

The notion of an international institution exercising a trusteeship function is not new. Indeed, under the auspices of the UN, a Trusteeship Council was enacted to act on behalf of states transitioning from colonisation to independence. This Trusteeship Council was mandated to speak for the yet-to-be state entities which had no legal standing or representation. The Trusteeship Council acted on behalf of entities that were not legally recognized. An obvious parallel can be drawn between the functioning of this

Council and a global trusteeship function as part of a new or revised institutional framework for sustainable development.

Recommendation 6 - Ensure that all have access to quality education for sustainable ways of living

Education for Sustainable Development (ESD) was a major, and neglected, priority of Agenda 21. Tasked with coordinating the UN Decade of Education for Sustainable Development, UNESCO's effort to promote ESD through formal educational institutions, as well as many non-formal and media based educational/advertising enterprises, is making an important contribution. However, universal access to quality education (let alone ESD) for both boys and girls, even at the primary level, is an elusive goal.

The Bonn Declaration noted that the shift to a sustainable society is deeply dependent on the educational system, and affirmed that education should address the material, social and spiritual dimensions of human development, and in its fullest sense, education must provide the space for value-based sustainable learning. There is an overwhelming need for the world community to reaffirm the UN Decade of Education for Sustainable Development as proposed in Bonn Declaration, 416-418.

The importance of access for all to quality education for sustainable development is articulated in Earth Charter principle 14:

Integrate into formal education and life-long learning the knowledge, values, and skills needed for a sustainable way of life.

- a. Provide all, especially children and youth, with educational opportunities that empower them to contribute actively to sustainable development.
- b. Promote the contribution of the arts and humanities as well as the sciences in sustainability education.
- c. Enhance the role of the mass media in raising awareness of ecological and social challenges.
- d. Recognize the importance of moral and spiritual education for sustainable living.

Recommendation 7 - Make Climate Justice a guiding principle in efforts to address global climate change, ensuring that the benefits and burdens associated with climate change are distributed equitably, with special concern for the rights of the poor, indigenous peoples, and other vulnerable peoples

There is wide agreement in the international scientific community that anthropogenic (human caused) climate change is occurring as a direct consequence of the burning of fossil fuels, the destruction of forests, and additional activities that increase the concentration of carbon dioxide and other greenhouse gases in the atmosphere. There is also compelling evidence that climate change is already having a damaging impact in some regions and that it will cause great harm to people and to Earth's ecosystems and biodiversity. It presents a grave threat to present and future generations. The people who will suffer most are those who have done the least to bring global climate change about. They are the poor and to a large extent populations in the low-income nations in the global South, especially future generations in these countries.

In fulfilling its common but differentiated responsibilities with regard to global climate change, the international community has the moral responsibility to protect human rights and advance justice. Climate Justice employs a rights-based framework to focus attention on and address issues of social and economic justice created by the harmful impacts of climate change on the environment and human development. Fundamental to Climate Justice are effective initiatives to curb global warming by reducing greenhouse gas emissions and lowering atmospheric concentrations to safe levels. Climate Justice requires an equitable distribution of the benefits and burdens associated with global climate change, with special concern for the rights and sustainable development of the poor and all other vulnerable peoples, including indigenous peoples. Climate Justice also gives special attention to gender equality.

Recommendation 8 - Provide supportive mechanisms for a Just Transition ensuring the right to sustainable development

There will be costs in making the transition to a low carbon, green economy in the pursuit of sustainable development. Some States and actors are better able to bear those costs than others and are more resilient to transitional changes. In the process of change, the most vulnerable must be supported and protected. Developing countries must have access to appropriate financial and technical assistance, citizens and communities must also have access to education and training for sustainable ways of living. Institutions at all levels (national and international) must be democratic and accountable. As much as possible, decisions should be made by those most affected by them. Institutions must be transparent and participatory, enabling civil society to hold them accountable, with (as noted by Earth Charter Principle 13d) effective and efficient access to administrative and independent judicial procedures, including remedies and redress for environmental harm and the threat of such harm.

Concluding comments

The Rio+20 conference provides an important opportunity for the world community to recommit to the values and principles of sustainability and forge new sustainable development initiatives. International cooperation between all sectors is critical if progress is to be realized. As noted in the concluding section of the Earth Charter & Every individual, family, organization, and community has a vital role to play. The arts, sciences, religions, educational institutions, media, businesses, nongovernmental organizations, and governments are all called to offer creative leadership. The partnership of government, civil society, and business is essential for effective governance.

The Earth Charter serves as a road map to achieving a just, sustainable and peaceful future for all people and future generations. It addresses the strong relationships that exist between human health and wellbeing and the environmental challenges we face including climate change, a lack of water and food, the loss of biodiversity, and forced migration. The protection of Earth's environment is a foundation of humanity's survival.

Rio+20 must be seen as not a one-off event but the beginning of a new phase in our collective efforts to advance strong sustainability. To quote the concluding words of the Earth Charter: Let ours be a time remembered for the awakening of a new reverence for life, the firm resolve to achieve sustainability, the quickening of the struggle for justice and peace, and the joyful celebration of life.

---

## Earth Child Institute Nepal

I am writing from Nepal in support of three billion young people who are worried about their -- and their planet's -- future. The current degradation and exploitation of our Earth's resources is simply unsustainable, and world leaders must respond in full measure when they meet next June in Rio de Janeiro.

First, we need all world leaders to recognize the urgency of the current situation. They need to understand and inform their own people about the dangers of not acting to move us toward a green economy and a more sustainable future. Youth are worried about the inequity and corruption that contribute to the overtaxing and mismanagement of critical natural resources and ecosystems and undermine the basis for ensuring decent livelihoods for the next generation. The United Nations should urge presidents and prime ministers from every nation to commit as early as possible to come to Rio and to initiate their preparations for the Earth Summit.

Second, world leaders must deliver more in Rio than another agenda with lofty goals for a distant future. Over the last half-year, young people meeting around the world have called out the weak implementation of scores of existing treaties and action plans adopted at previous summits. These young people are demanding that the next Earth Summit instead generate specific commitments to real actions from governments at all levels, corporations, communities and civil society groups. I agree, and the United

Nations should ensure that we are holding everyone accountable for their promises.

Third, governments and corporations need to commit to major new investments in education, employment and empowerment of young people in the transition to a green economy.

We cannot wait another generation for sustainability; the world's young people need their leaders to act now.

## Earth Institute, Columbia University

Compilation Document Input from The Earth Institute, Columbia University Rio +20 United Nations Conference on Sustainable Development November 1, 2011

Contributors: Lauren Barredo, Claire Bulger, Mary-Elena Carr, Nancy Degnan, Glenn Denning, Gregory Fienhold, Terri Harris, Tim Johnston, Klaus Lackner, Upmanu Lall, Art Lerner-Lam, Andrew Miller, Vijay Modi, Carolyn Mutter, Shahid Naaem, John Peacock, Lisa Phillips, Tamara Plummer, Richard Plunz, Rita Ricobelli, Carey Russell, George Sarrinikolaou, Peter Schlosser, Eve Solomon, Samantha Tress.

### INTRODUCTION

The Earth Institute, Columbia University welcomes the opportunity to contribute to the compilation document being prepared in advance of the Rio+20 United Nations Conference on Sustainable Development.

We are now a crowded, interconnected, global society, with seven billion people struggling to find a foothold on a highly vulnerable planet. The challenges of feeding the world, keeping it safe from persistent epidemic diseases such as malaria and AIDS and new and emerging diseases such as Swine Flu and SARS, conserving biodiversity, mitigating and adapting to climate change, water and food scarcity, and combining economic progress with local and global environmental safety are the defining challenges of our time. Hunger, poverty, and environmental degradation often are underlying causes of conflict and violence.

We are in a new global era, termed the Anthropocene, and one that will come to be known as the Age of Sustainable Development. Our security, even our survival, will depend on the world forging a triple commitment: to protect the environment, to end extreme poverty; to ensure human rights for all.

In 2012, world governments will reunite in Rio de Janeiro, 20 years after the historic conference at which they signed the first comprehensive treaties to fight human-induced climate change and to stop the loss of biodiversity. There have been modest achievements, especially in developing the basis for these challenges, but far too little has been accomplished.

The programs of the Earth Institute are underpinned and guided by the premise: the world has the scientific and technological know-how and resources to raise living standards in a sustainable manner and solve humanity's most urgent problems, ranging from ending extreme poverty to mitigating and adapting to climate change, to managing freshwater scarcity and reversing biodiversity loss and environmental degradation. The Earth Institute's complex transdisciplinary work, which is grounded in hundreds of research projects carried out and implemented in locations worldwide, validates this perspective and highlights the pressing sectoral priorities and exciting and innovative initiatives that are described in this document.

The Earth Institute believes that the priorities of the Rio +20 Earth Summit ought to be the following:

1. Re-double efforts to stabilize the human population by encouraging countries to take responsibility for rapidly growing populations. Human population can be stabilized by decreasing child mortality rates; providing free or affordable contraception; empowering women to make their own choices, and promoting well-being through education and jobs.
2. Set an international policy goal to create new, better technologies with the capacity for global sustainability. Six priority sectors requiring new technologies in order to begin to act sustainably are (1) power, (2) transport, (3) agriculture, (4) natural resource management (e.g., water, fisheries, biodiversity), (5) infrastructure and development, and (6) industry. This technological overhaul requires new public-private partnerships and governmental commitments to generate and allocate resources sufficient to achieve the necessary scale of technological and behavioral change.
3. Develop a global framework that supports existing and future technological development. Market forces alone are not strong enough to support widespread change.
4. Achieve economic growth at a lower impact on the planet by targeting public-private partnerships to achieve shared global goals.
5. Approach global environmental challenges, such as climate change, water depletion, emerging disease, and biodiversity loss, by engaging in joint problem solving and brainstorming with countries instead of pursuing negotiations.
6. Create an indicative, but not rigid or central, plan of action for dealing with the global sustainability crisis.

### A. SECTORAL PRIORITIES FOR SUSTAINABLE DEVELOPMENT

#### 1. Biodiversity

Proliferate increased understanding of the role of ecology in long-term sustainability in order to inform political, social and economic decision making. The Earth Institute is particularly concerned with the effect of climate change on biodiversity loss; mass extinction; emerging diseases such as West Nile Virus, Hanta Virus, Swine flu and Avian flu; habitat loss due to conversion, fragmentation, and degradation; and the unsustainable use of ecosystem services.

#### 2. Climate Change

- a) Delineate options for mitigation and adaptation so societies can respond proactively to anticipated impacts of climate change and variability;
- b) Develop a framework to provide policy analysis and advice to stakeholders and policymakers;
- c) Optimize climate and energy policies by studying and comparing real or modeled results of different international policies;
- d) Delineate and share mitigation opportunities for high-emitting industries, such as aluminum, iron and steel, cement, and natural gas and oil systems;
- e) Develop and implement proactive strategies for near term climate prediction and risk mitigation, as a central path for adaptation;
- f) Develop the next generation of carbon capture and storage technologies; and

g) Develop country-specific methodologies for systematic assessment and comparison of the costs and benefits of adaptation options across diverse regions and sectors.

### 3. Energy

Focus on technologies that will improve energy efficiency and thus reduce carbon emissions. The abundance of fossil fuels that are low in cost, but high in carbon emissions, provides a strong incentive to explore opportunities for capturing the carbon dioxide that is produced in the combustion of fossil fuels and keeping it out of the atmosphere.

### 4. Natural Hazard Risk Reduction

Given the increasing frequency of occurrence of natural hazards and disasters, the Earth Institute's priorities for understanding and mitigating the risks caused by natural disasters are as follows:

- a) Advance predictive and forecasting capability for hazard and risk;
- b) Build sustainable hazards monitoring networks;
- c) Build local research and applications capacity for natural hazards risk reduction;
- d) Provide worldwide access to information about human and environmental systems in order to predict, prevent, and respond to environmental risks;
- e) Assist in establishing well-designed mechanisms, which are built into sustainable development strategies, in order to transfer dynamic and evolving scientific knowledge to policy discussions;
- f) Enable governments and humanitarian organizations to better locate need and allocate resources in the aftermath of disasters;
- g) Assist the international community in shifting from a culture of response to preparedness by outlining key measures of preparedness, response, recovery, and rebuilding incentives that can help mitigate risk and exposure, and impacts on a nation's GDP.

### 5. Sustainable Agriculture Priorities

- a) Help scale up the African Green Revolution to reach one-quarter of smallholder farmers in Africa producer of smallholder farmers in Africa
- b) Ensure long-term food security and poverty reduction through diversified and value-added agriculture;
- c) Improve nutritional security, diet diversity and food safety in rural communities by developing food- based solutions that are embedded within a wider food systems framework and respect cultural preferences;
- d) Communicate evidence-based science on agriculture, the environment, and human nutrition to the general public;
- e) Provide education, capacity strengthening, and professional development for students, faculty, scientists, and practitioners engaged in issues around agriculture and food systems;
- f) Accelerate the adoption of effective and appropriate sustainable agriculture initiatives by providing funds for smallholder farmers, especially those in developing countries. Minimize negative impacts of the global food system on the environment while increasing positive impacts, without compromising food security; and
- g) Accelerate the adoption of effective and appropriate sustainable agriculture, environmental, and nutrition policies - and necessary financing - by international organizations, national governments, and aid agencies through high-level advocacy;
- h) Develop data driven models to assess and manage the food system at multiple scales;
- i) Ensure long-term food sovereignty through enhancements of local- and regional-scale food system infrastructure initiatives.

### 6. Sustainable Water Priorities

As worldwide populations grow and affluence increases, the demand for food and water is on the rise. At the same time, climate variability and change are making it difficult to provide water where and when it is needed. Floods destroy communities in one part of the world, while in another people trek miles every day just to get enough water to survive. The pervasiveness of water scarcity makes it one of the most difficult challenges we need to address in the 21st century. Principles of water allocation, planning, and governance need to be revised to promote efficient water use as part of a sustainable development strategy. The Earth Institute considers global water management priorities to be the following:

- a) Develop a predictive capability for water resource assessment on the local, regional and global levels that recognizes changing climate, demographics and water needs;
- b) Develop a capacity for the analysis of public and private investment in water resource development;
- c) Develop appropriate technologies for the storage, treatment and conveyance of water to improve reliable, cost-efficient access, as well as policy instruments that encourage efficient and equitable water use, and test them in real world settings to substantiate their applicability;
- d) Develop and disseminate the results of research on water use, in order to support global water resource development and decision-making, through direct engagement with decision makers and through media that influence the behavior of farmers and others who ultimately determine water use and pollution; and
- e) Address sustainable water challenges in key hot spots. The Earth Institute is currently focused on water challenges in the Indian subcontinent, Brazil, Africa, China, and the United States.

### 7. Education

Educate a new generation of students dedicated to the fundamental links among the natural sciences, technology and social practices, and the values and beliefs that influence decision-making in a world where economic development, globalization, and a fast-growing population has led to significant pressure on the environment.

## B. EARTH INSTITUTE SECTORAL INITIATIVES THAT CONTRIBUTE TO INTEGRATING THE THREE PILLARS OF SUSTAINABLE DEVELOPMENT

### 1. Food security

- a) The Agricultural MOdel Intercomparison and Improvement Project (AgMIP)

The Earth Institute's Center for Climate Systems Research and the NASA Goddard Institute for Space Studies are spearheading the Agricultural Model Intercomparison and Improvement Project (AgMIP), a major international effort to assess the state of global agricultural modeling and to understand climate impacts on the agricultural sector.

The goals of AgMIP are to improve substantially the characterization of risk of hunger and world food security due to climate variability and change, and to enhance adaptation capacity in developing and developed countries.

To achieve these goals, AgMIP is establishing a robust and rigorous research framework that connects climate, agriculture, economic, and information technology communities; this open framework encourages collaboration and provides a useful test bed to investigate climate products through the lens of agricultural impacts. AgMIP is also establishing significant research opportunities to engage interdisciplinary teams in Sub-Saharan Africa and South Asia.

The three-year project places regional changes in agricultural production in a global context that reflects new trading opportunities, imbalances, and shortages in world markets resulting from climate variability and change as well as other driving forces of the food system. It also builds capacity for continuing agricultural assessment and management in developing countries under variable and changing climate conditions. AgMIP is supported by the United Kingdom Department for International Development in partnership with the United States Department of Agriculture.

## 2. Millennium Development Goals (MDGs)

When 189 world leaders met at the United Nations in September 2000, they were inspired to adopt the Millennium Declaration, which included bold targets in the fight against poverty, disease and hunger. In 2002, UN Secretary-General Kofi Annan asked Jeffrey Sachs, Earth Institute director, to direct the UN Millennium Project and identify feasible approaches to achieving these ambitious goals. Since then, under his leadership and with the help of a global network of partners, the Earth Institute has achieved both in rural and urban areas of African countries by the universally endorsed target date of 2015.

By harnessing the efforts of over 700 scientists, researchers and staff and developing thirty cross-disciplinary centers, the Earth Institute has become the world's academic leader in developing innovative approaches to address complex problems with a special emphasis on the needs of the world's poorest citizens. Scientists at the Earth Institute have focused on basic human needs such as food security by introducing innovative technology, management and policy tools to improve environmental quality, nutrition and farmers' incomes through sustainable agricultural practices, examined water pollution and groundwater depletion and developed strategies to combat climate variability, nutrition and farmers' incomes through sustainable agricultural practices, science-based interventions and local ownership is an effective means for alleviating extreme poverty, regardless of agro-ecological or political conditions; (2) reaching the benchmarks proposed in the MDGs the-ground, concrete investments that enable communities to lift themselves out of extreme poverty; and 4) scientific evidence can and should be used to impact policies at the local, national, and international levels.

This emphasis is evident in the results of the Earth Institute's demonstration projects: physicians and epidemiologists from the health team working in close collaboration with engineers on information technology designed to provide real time data management and monitoring that will improve information systems; agronomists and nutritionists studying the linkages between health and nutrition to better improve both agricultural systems and health outcomes; and all of our teams developing ground-breaking systems and tools that are dramatically improving the quality of life in developing communities, and which will continued to be scaled up and made sustainable through joint advocacy and national policy efforts.

3. Natural Hazards Risk Reduction Basic research at the Earth Institute's Lamont Doherty Earth Observatory is focused on developing the forecasting and predictive skill for several hazardous phenomena, using observations from global, regional and local monitoring networks, computational modeling from first principles, and, in some cases, bench work in laboratories. Generally speaking, it is instructive to separate the discussion into impacts of life in developing and the expected events that follow well-understood probability distributions. The former can be understood with comprehensive scenario modeling, while the latter are nearly constant reminders of the need for effective preparedness.

a) Building Sustainable Hazards Monitoring Networks The Lamont-Doherty Earth Observatory is part of an international effort to build sustainable earthquake monitoring networks, which combine national network operations with well-developed global technological infrastructure.

The past few decades have seen an explosion in global environmental monitoring, comprising both synoptic satellite observations, as well as in situ technologies deployed on land and in the oceans. National monitoring strategies play a critical role in global observations. In the best case, national monitoring capacity is part of the global federation of networks, which reduces the technical barriers to data sharing and international research and educational collaborations. National networks are frequently capitalized after a major disaster, when global financial assistance is readily available. Under such circumstances, little thought is given to the sustainability of these modern technologies given the inherent capacity of national institutions to run them. Thus it is important to develop the national education and training programs that in the long run are needed to maintain and utilize the critical information supplied by monitoring networks. It is axiomatic that international research and education collaborations, coupled to indigenously-developed, nation-specific scientific strategies, provide rationale and motivation to support the operations of national monitoring networks.

For example, in Bangladesh, Lamont-Doherty Earth Observatory geophysicists have combined forces with faculty from the University of Dhaka and several government institutions to deploy modern seismological and geodetic instrumentation to support national earthquake hazard assessments. This activity is supported by the United States National Science Foundation and the United States Agency for uake hazard assessments. This research and international development assistance. The Earth Institute has initiated preliminary discussions about building sustainable earthquake monitoring networks with Latin American Countries, several south and East Asian countries, and African countries. Support is provided by the United States National Science Foundation, the US Geological Survey, US AID and other institutions.

b) Building local research and applications capacity for natural hazards risk reduction Research and education collaborations, including specialized training programs, promote a long-term, sustainable approach to building the local science and technology capacity required for national natural hazard risk reduction programs. Such programs are aided by developed-nation investments in international research. Lamont has participated in the NSF-USAID PIRE and PEER initiatives, as well as basic international collaborations. In particular, a team from Marine Geology and Geophysics led by Donna Shillington is working to develop an earthquake program in Malawi funded by the NSF Continental Dynamics Program; the Seismology and MG&G divisions, led by Michael Steckler, are working in Bangladesh with Continental Dynamics and USAID funding, to address the issues of earthquakes and sea level rise; and the Tree Ring Lab, led by Brendan Buckley and others, is working in uakes and sea level rise; and the on monsoons, extreme storm events, climate change.

c) Developing predictive and forecasting skill for natural hazards Lamont-Doherty Earth Observatory scientists are conducting basic research across all potentially hazardous phenomena, namely: earthquakes, tsunami, volcanoes and landslides; tropical cyclones and severe storms; flooding; and drought. Under the rubric that the past is the key to the future, Lamont has built perhaps the world's best group in paleoclimate. In particular, there is research on developing chemical and biogeochemical proxies for past atmospheric temperature and chemistry, which are providing new understanding of climate over the past several million years, encompassing several cycles of glaciation and deglaciation. There is basic research on earthquake cycles, which may soon offer robust, decadal-scale forecasting skill. And, of course, there is considerable research on current day ocean and atmospheric interactions, directed toward an understanding of the physical and chemical parameters that control climate. There is no uniform approach to natural hazard predictability. Each potentially hazardous process comes with its own collection of observational and theoretical constraints. However, Lamont researchers are adept at rectifying probabilistic estimates of multi-hazard exposures so that a full-spectrum hazard assessment can be done at national levels.

## d) Knowledge transfer

Institutions such as the Lamont Doherty earth Observatory can act as honest brokers in establishing well-designed mechanisms, which are built into sustainable development strategies, in order to transfer dynamic and evolving scientific knowledge to policy discussions, either with international development organizations (such as our work on the "Natural Hazards Hotspots" report for the WOrld Bank and the UN) or with individual countries (work in Haiti, Dominican Republic, Bhutan). The 2010 Haiti Earthquake demonstrates the need to expand this kind of work around the world.

The fault that ruptured in the 2010 Haiti earthquake was identified as a potential hazard in a 2008 publication in the scientific literature. Although the results of that work were communicated to the highest levels of the Haitian government, there was neither the institutional capacity, nor the local technical resources to pursue preparedness and mitigation strategies. Scientific results are deeply embedded in traditional means of communication, but there are few international or national frameworks to transfer this knowledge into actionable advice. Training, and research and educational collaborations can help, in part. More importantly, there should be mechanisms to integrate scientific knowledge and policy.

To help avoid a similar situation in the Dominican Republic, the Earth Institute's Urban Design Lab is leading a national risk assessment project with the President and many state agencies, which can be replicated in other disaster-prone areas. Flooding, hurricanes and earthquake risks can reduce a country's capacity for infrastructure development, but by quantifying a country's risk exposures and applying figures to their current national plans of action, governments can reduce the actual and perceived impacts of natural disasters. The UDL's work in the DR attempts to re-focus the country from a society of response to a culture of preparedness by outlining key measures in: quantifying preparedness, (2) impacts on the nation's GDP

## 4. Water

The Earth Institute's water mission is to creatively tackle the issue of global water scarcity through innovations in technology, public policy and private action.

## a) Climate Variability

The Columbia Water Center and the International Research Institute for Climate & Society are developing predictive tools and analytical methods to help stakeholders make better-informed decisions on cropping choices, infrastructure design, and water resource management. In much of the world, the high variability of precipitation creates significant challenges for the appropriate management of water.

These challenges are likely to increase in an era of long-term climate change. Groundwater provides a natural buffer to drought, but it is currently being mined in many places leading to a long-term disaster that has to be addressed. The role of climate in determining where and when floods occur is an emerging research area with potential benefits in risk mitigation.

## b) The Global Flood Initiative:

Floods and storms cause the most average annual damage and loss of life of all natural hazards. As climate changes, intense rainfall events are expected to increase in frequency, and coastal flooding to become more rampant. The Earth Institute is launching a new initiative on the climatic prediction of the space and time occurrence of floods across the globe, and of strategies to address these risks through technological, financial and communication instruments. The growing threat of floods to global supply chains has been shown by the recent events in Pakistan, United States, Japan and Thailand. An integrated approach to prediction, response, recovery and engineering design from a global scale is sought to address both local and global risks.

## c) Water Resources in India

India is facing a massive water crisis. The roots of the crisis in the region are in efforts to achieve food security through intensive, yet inefficient agriculture. The result is the largest groundwater mining in the world, at the same time that surface water canals experience high losses. The energy used for pumping groundwater contributes to loss of access for other sectors. Water, energy, and food availability are linked concerns in India, and must be addressed as such. The Columbia Water Center research is working to change this situation by working with farmers, governments, and corporations, through innovation in irrigation strategies for farmers, changes in national cropping patterns, and changes in electricity pricing policy.

## d) Water Resources in Brazil

The Columbia Water Center works with partners in Ceará, Brazil to address the dual challenges of inefficient water management and the high cost of supplying water to rural areas. Climate forecasts and developed decision tools are being used for regional water allocation in order to reduce risk. A process for planning and building efficient, inexpensive water infrastructure for rural communities was developed and implemented. This has been adopted by state agencies to scale up rural water development.

## e) Safe Water Access

The Earth Institute fosters research on how to address persistent natural pollution of groundwater in Bangladesh and elsewhere that has created a massive health crisis. Researchers have explored the pathways of exposure as well as behavioral and other methods to supply safer water. Earth Institute researchers also target novel methods of biological wastewater treatment that are efficient and contribute to a reduction of greenhouse gases

## C. GREEN ECONOMY AND SUSTAINABLE DEVELOPMENT

The Earth Institute is committed to promoting green economy by strengthening the interplay among scientific research, government and the private sector. One powerful way to combine the strengths of each of these sectors is through government support for basic research in renewable energy, waste treatment, recycling and water filtration. As the ensuing technologies enter the marketplace, they become engines for greater environmental protection, green job creation, sustainable urban design, and prosperity.

## D. INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

As resource use is exploding, water consumption is rapidly increasing around the globe, and earth systems nearing tipping points, hundreds of millions of lives are now at stake. A technological road map is needed toward sustainable production and consumption, but such a guide does not yet exist even in a basic form. Depending on the setting, the solutions may involve the need to deploy technology or to change behavior of key actors through appropriate incentives. Innovative mechanisms such as a carbon levy tax, payments for ecosystem services, an African green revolution, as well as a plan to fund research and development and to aid the required transition for poor economies. To meet these pressing needs regional cooperation is required. The complexity and global nature of the problems we are confronting make country-by-country efforts insufficient. Indeed, a massive intellectual effort led by the expert community worldwide is what's needed. Scientists must plot a path toward de-carbonizing the global economy, preserving and restoring natural resources, rebuilding and investing natural as well as built and human capital, answering questions about climate change, determining which technologies are viable, and ultimately coming up with a plan that takes the world toward energy and food supplies that are much less dependent on fossil fuels by mid-century. The Earth Institute, Columbia University is committed to this endeavor through its research initiatives and education programs, as well as its unparalleled global reach across all sectors and a network that encompasses all levels of government, multinational organizations, academia, NGOs, cultural institutions, and the private

sector.

## Earth Law Center

Submission by Earth Law Center to the U.N. Conference on Sustainable Development

### INTRODUCTION

Earth Law Center is a 501(c)(3) public benefit organization dedicated to advancing Earth-based laws, economic structures, and governance systems that reflect the intrinsic rights of the natural world to exist, thrive and evolve. Earth Law Center staff has considerable expertise in advancing sustainable environmental laws and policies at the local, state and federal levels, particularly with respect to water and waterways. We welcome the opportunity to submit these inputs and contributions for inclusion in the compilation document that will advise the zero draft of the outcome document (Zero Draft) for the U.N. Conference on Sustainable Development (UNCSD or Rio +20).

### SUMMARY

Earth Law Center urges decision-makers to highlight the following objectives in the Zero Draft, and to prioritize them for adoption and action at Rio +20:

- Support Earth-based governance, in particular by recognizing and implementing in law the rights of ecosystems and species to exist, thrive and evolve.
- Endorse and promote adoption of the Universal Declaration of the Rights of Mother Earth and actively support its implementation globally.
- Re-define “sustainable development” and the “green economy” within the context of Earth-based laws and governance systems that recognize the rights of the natural world, rather than within the limited, injurious context of human-centered, unlimited economic growth and short-term, individual human gain.
- o To ensure this objective is achieved, re-name and re-focus “sustainable development” as “sustainable communities,” a term which includes both human communities and the wider communities of the natural world.
- o This re-focusing is needed to ensure that all elements of sustainable communities are considered. The current, market-based approach distorts communities to serve the economy. Elements of sustainable human communities include not just the economy, but also culture, societal/familial relations, healthy food, clean drinking water, sanitation, housing, necessary medical care, democratic governance, education, meaningful and appropriately rewarded labor, spirituality, civic duty, volunteerism, etc. Sustainable environmental communities similarly require healthy nutrients, clean water, biodiversity, restoration in the face of destruction, and thriving, connected habitats. The economy must be viewed as serving human and environmental communities, not the reverse.
- o Implementation strategies for these goals should also be identified and supported; including, for example, water rights held by waterways, agro-ecological methods of food production, and a global financial transaction tax to support strategy implementation.
- Refine the institutional framework to reflect Earth-based governance strategies that achieve “sustainable communities.” The existing three pillars – Environment, Society and Economy – reflect false assumptions about the need for and likelihood of unlimited economic growth, and its place in a sustainable community. These assumptions must be reconsidered, and the three pillars should be revisited within the context of humans’ actual interrelationships with other Earth inhabitants. A healthy environment is the most overarching need; without it, human society, and its subset the human economy, cannot function. A new, “sustainable communities” institutional framework should be supported by nested structures, with environment supported by society, which in turn is supported by not only economy but also by the other elements of sustainable communities.

As the last several decades have shown, tinkering with rather than ending our addiction to ecosystem- and species-fueled, “unlimited” growth on a finite planet will inevitably fail. The focus now should be on reworking our overarching governance systems to embrace the goal of sustainable communities, rather than contorting our communities to serve runaway, increasingly destructive growth. We only avoid this necessary work with the proposed, misplaced focus on “sustainable development” and “green” economy as our end goals. By contrast, a successful, Earth-based governance system will necessarily include appropriate development within Earth’s limits, and a truly “green” economy. Such an economy would implicitly accept humans’ place within the interconnected web of our relationships with other Earth systems, rather than perpetuate our illusory mastery over them.

Each of these points is discussed in more detail below.

### DISCUSSION

Support Earth-based governance, in particular by calling for recognition and implementation in law of the rights of ecosystems and species to exist, thrive and evolve.

Despite achieving some notable successes over the years, our current environmental laws and agreements, including past efforts of the UNCSD, have been unable to prevent increasingly grave challenges such as climate change, depleted waterways, and disappearing species and natural habitats – all of which contribute to the growing human populations without clean water, safe shelter, healthy food or other basic necessities. These dilemmas result in large part because our overarching legal and economic systems treat the natural world as property that can be exploited and degraded, rather than as an integral ecological partner with its own rights to exist and thrive. They assume that the environment will be protected if humans take from it a little less, and a little less quickly. But this simply slows, never stops, the downward slide.

The environment is increasingly registering its objections to this legal and economic mismatch. Climate change is the most direct protest, one that disproportionately impacts the most disadvantaged and marginalized human communities. Since we are inextricably intertwined with our environment, this trend does not bode well for us either.

The false dogma of “humans over nature” needs to shift to allow us to recognize our interconnectedness with the natural world and acknowledge its rights to exist and thrive. By creating a legal system that incorporates and respects ecosystem rights, we will prompt planning and actions that ensure that we truly live sustainably, for the benefit of all humans and of the natural world that sustains us.

However, despite protestations to the contrary in the UNCSD draft documents and elsewhere, protection of nature is generally subsumed to the incessant driver of economic growth. Such anthropocentrism is out of step with science, and leads to a dangerously unbalanced relationship between humans and the rest of the community of life on Earth.

The 2011 U.N. background report, *Toward a Green Economy*, illustrates the dilemma of attempting to improve environmental protection by further forcing environmental “protection” efforts to fit within a market economy system that is causing the destruction. For example, the report asserts on page 15 that:

the most prevalent myth [about “greening” the global economy] is that there is an inescapable trade-off between environmental sustainability and economic progress. There is now substantial evidence that that the greening of economies neither inhibits wealth creation nor employment opportunities.

The document is correct that there should be no trade-off between environment and economy, in that no economy can flourish without a healthy environment, on which we are utterly dependent. However, the document fails to ask the correct questions about how to address the current imbalance between an economy predicated on runaway growth and an environment being destroyed by that economy. Instead, it simply assumes without question that such an economy must continue; stating, for example, that such hesitant actions as "market-based incentives" can be used to course-correct the incessant drive toward depletion of the natural world.

The far better course would be to ask and analyze more searching questions about the kind of world that we want to achieve through these types of international exercises, and more narrow questions about related topics such as the nature of "wealth creation" (that is, why we assume that wealth must be defined by current economic indicators rather than by other metrics, and why the increase in economic wealth must continue unabated). For example, as Polanyi posits in *The Great Transformation*, the distribution of good and services need not be for the purpose of maximizing economic wealth, but instead would be put to better use providing for biological and social needs.

The failure to date of the process to ask and answer these types of searching questions results in a flawed strategic analysis that fails to examine necessary alternatives or provide appropriate metrics for assessing progress. As just one example, the Water chapter of UNEP's *Towards a Green Economy* report lists indicators of "progress towards a green economy" on page 121; of the five indicators listed, not one calls for measuring progress on improvements to waterway or water-dependent ecosystem health. This is particularly disturbing in light of the fact that the same report also points to an aggregate decline in waterway and aquifer health worldwide (page 130). Environmental health appears as a mere afterthought to the process of current efforts to further monetize the Earth's systems. The end result will inevitably center on a haggling over the prices that stakeholders with funds are willing to pay, rather than a serious effort to assess what environmental health looks like and to determine how to change our lifestyles to reach and maintain that goal. Treating the environment as afterthought to pricing will be not only to the detriment of the natural world, but also to we humans who depend on it.

We strongly recommend that the UNCSO and the Zero Draft raise and answer these searching questions, rather than defaulting to the process equivalent of rearranging the deck chairs on the Titanic. Only a governance system based on a humble acknowledgment of our place within a web of inter-relationships with other humans and natural world – one that recognizes that a healthy Earth is fundamental to continued, flourishing human existence – can be deemed "sustainable." An operating system premised on "development" as the end goal of the exercise in defining "sustainability" is not equipped to ask and answer the urgent questions about how we should conduct our lives in an era of growing scarcity.

Accordingly, we urge decision-makers to include in the Zero Draft and to strongly support a system not of market-based governance, but of Earth-based governance, which recognizes the intrinsic value of the natural world apart from its benefit as a "resource" for human use. Such a governance system would respect Earth's limits and would continually evolve to reflect new science on the workings and boundaries of Earth's systems. It would incorporate an ongoing analysis of ethics for the purpose of developing decision-making criteria, such as use of the precautionary approach and assignment of the burden of proof in disputes. Finally, Earth-based governance would recognize and implement in law the rights of ecosystems and species to exist, thrive and evolve, including rights of ecosystems and species to representation at such international gatherings as UNCSO, and it would appropriately protect the environment's right to restoration for human-caused destruction.

The development and implementation of Earth-based governance will in time create its own feedback loop – one where science and ethics drives law, which drives culture, which drives further evolution in law, science and ethics – until the law and the culture meet, and we cannot envision a time where our laws relegated the natural world to second-class, "property" status. Along this path, "environmentalism" itself will evolve from a subset of the population acting to safeguard the planet, into a deeply-felt awareness in the hearts and minds of all individuals, an awareness that further guides our self-governance over how we live our lives and make our daily choices to achieve not only sustainable, but indeed flourishing, environmental and human communities.

Endorse and promote adoption of the Universal Declaration of the Rights of Mother Earth and actively support its implementation globally.

As noted above, the false dogma of "humans over nature" needs to shift to make way for a legal system that incorporates and respects ecosystem rights. Such a system is essential to prompt planning and actions that support sustainable communities, not simply continued infinite economic growth incorrectly characterized as "sustainable."

Fortunately, models are cropping up for legal systems that can steer us in the right direction. For example, the Ecuadorian Constitution at Articles 71 and 72 endows the environment with inalienable rights to "exist, persist, maintain and regenerate its vital cycles, structure, functions and its processes in evolution." The Constitution further grants individuals the legal authority to defend these rights on behalf of the environment. This language acknowledges the interdependence between humans and environment, and respects both sides of that tightly-knit relationship. Its provisions were first tested in a successful case earlier this year, in which the court found that the Vilcabamba River's constitutional right to flow had been violated by destructive road development practices, and ordered that the river's flow be restored.

The precedent set by the Ecuadorian Constitution also led to the adoption, led by Bolivia, of an international Universal Declaration of the Rights of Mother Earth. Following the failure of U.N. Conference of the Parties in Copenhagen to achieve meaningful progress in combating climate change, the Bolivian government organized an alternative conference for communities, NGOs, lawyers, academics, scientists and governments from around the world. This conference, held in Cochabamba, Bolivia in April 2010, was attended by 35,000 people from 140 countries. At the end, participants adopted a Declaration of the Rights of Mother Earth, which recognizes Earth as a living being with rights to life, to the continuation of vital cycles and processes, and to restoration from destructive human activities. The Declaration was formally presented to the United Nations in an April 2011 General Assembly event, and provides a sound structure for establishing actions and strategies to achieve healthy, sustainable human and environmental communities.

Accordingly, we urge UNCSO decision-makers to endorse and promote adoption of the Universal Declaration of the Rights of Mother Earth in the Zero Draft, and to call for its active support and implementation globally. As Article 7 of the Universal Declaration of the Rights of Mother Earth states:

[T]he rights of each being are limited by the rights of other beings and any conflict between their rights must be resolved in a way that maintains the integrity, balance and health of Mother Earth.

Human rights, including to a sustainable economy, must by definition be in harmony with Earth's systems and consistent with the rights of nature to exist, thrive and evolve. The Declaration thereby appropriately seeks to rebalance our relationship with the Earth from one that is destructive to one that is mutually enhancing, for the benefit of the whole Earth community.

Re-define "sustainable development" and the "green economy" within the context of Earth-based laws and governance that recognize the rights of the natural world. Re-name and re-focus "sustainable development" as "sustainable communities," a term which includes both human communities and the wider communities of the natural world.

As discussed above, Earth-based governance, rather than inherently flawed market-based governance, should be the focus of international decision-makers in ensuring the future well-being of people and ecosystems. It cannot be argued that current UNCSO efforts to better define "sustainable development" and a "green economy" are equivalent to ensuring the well-being of people and planet, because they fail to: (a) deeply question whether the current, injurious economic system is either beneficial and viable, or (b) consider different metrics for ensuring healthy people and planet.

We accordingly challenge decision-makers to evaluate the flaws of the market-based approach by re-naming and re-focusing "sustainable development" as "sustainable communities," a term that includes both human communities and the wider communities of the natural world. Only by changing the lens by which the analysis is conducted

can we begin to see the inherent flaws and limitations of the current effort to contort environmental and societal well-being into a system focused on protecting markets and unending economic growth.

This re-focusing is also needed to ensure that all elements of sustainable communities are considered; i.e., not just the market economy. Elements of sustainable human communities include not solely the economy, but also culture, societal/familial relations, healthy food, clean water, sanitation, housing, necessary medical care, democratic governance, education, meaningful and appropriately rewarded labor, spirituality, civic duty, volunteerism, interaction with the natural world, etc. Sustainable environmental communities similarly require healthy nutrients, clean water, biodiversity, restoration in the face of destruction, and thriving, connected habitats. The economy must be viewed as serving human and environmental communities, not the reverse, as is the case with the current effort and background documents.

#### Examples of the Implications of a Misplaced Focus on Development over Sustainable Communities

One example of the implications of the ongoing and expanded focus on economic development rather than sustainable communities is seen in the flawed definition of the "green economy" itself, which fails to commit to successful, Earth-based sustainability. UNEP's 2011 report, *Towards a Green Economy* defines a "green economy" as "one that results in 'improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities'" (page 16). This definition first clearly emphasizes human well-being over environmental health, disregarding the science and ethics of behaving as if the environment were our property rather than essential, connected partner on this Earth. Second, by failing to tackle the inherently flawed foundational assumption that continued economic growth is possible and desirable, the definition prevents meaningful progress in achieving well-being for all humans and human communities. Rather, in the words of the Occupy movement, it benefits the 1% at the expense of the 99%. Again, as we are all connected, this failure bodes ill for the population as a whole. Finally, unpacking this definition further, we see additional implications of a failure to consider grounding the economy in Earth-based governance, in that the definition side-steps achieving environmental health and settles instead for "reducing environmental risks and ecological scarcities." Achieving an undefined "reduction" in environmental injury can easily be achieved on paper to further serve runaway economic growth, with no meaningful, sustainable achievement of environmental health and sustainability in reality.

The Water chapter of the *Towards a Green Economy* report further illustrates the practical implications of a "green economy" that is neither "green" nor protects the economy. Page 137 lists various strategies for enhancing water supplies and notes that each is "consistent with the development of a green economy," which it then defines as "seek[ing] to minimise the impact of economic activity on the environment." While minimizing the impacts of our current market economy on the environment is an essential first step, it should not be the end goal, particularly when that same economy is destroying essential waterways and aquifers (see, e.g., examples on page 131). Instead, the end goal should be a healthy environment, and by association healthy human communities. The current, narrow focus on the economy as the driver of success, rather than the reason for failure, will only continue to prevent us from seeing this basic end goal, to the detriment of all.

A strategy-level example of the flaws in the proposed "green economy" approach is the growing effort to use "payment for ecosystem services" as a tool to achieve sustainability. While we should, of course, better appreciate the many benefits that ecosystems and species provide us, converting ecosystems and species into monetary values threatens to trap us in the same market-based web that created the environmental destruction that we are trying to prevent. If ecosystems or species are threatened, the argument broadly states, we should translate the issue to monetary terms and write a check, thus solving or avoiding the problem. However, this fails because of at least three unexamined logical and practical flaws. First, by subsuming the environment within the market economy, rather than appropriately nesting the economy within the overarching need for a healthy environment, "payment for ecosystem services" (PES) will always prioritize market protection over the environmental health. Second, and as a practical matter, by monetizing the environment and its services, the argument shifts from environmental health to money and cost. The negotiation becomes not about "how do we achieve environmental health," but about "how much are stakeholders are willing to pay and who will profit" – an entirely different conversation that is unrelated to sustainability. Finally, the arguments for PES ignore the fact that water, in particular, is essential to life itself, and its acquisition cannot in many cases be subsumed within a simplistic "willingness to pay" metric. This is particularly true for people on fixed, limited or no incomes, and for the environment, whose water needs are already marginalized by the report's focus on human-centered market economics as the solution to human water needs.

An application-level example of the flaws in the proposed "green economy" approach is provided by Australia, referenced in the report as a potential success story due to its environmental water buy-back program (pages 142-143). However, since the release of *Green Economy*, the Australian National Water Commission released its own assessment of this National Water Initiative (Sept. 2011, <http://www.nwc.gov.au/>). This assessment characterizes the auditing and accountability safeguards around the \$1.3 billion Aus spent to date to buy back water from farmers for the environment as "weak," and resulting in no detailed evidence that the buy-back has delivered ecological benefits. This is a particularly disturbing finding given the amount of public money spent to date, and the amount (\$500 million Aus) still due to be spent this year. The report further finds that "[t]he necessary science to link environmental watering with ecological outcomes is generally weak and there is a lack of transparent reporting results." This unfortunately is not surprising given the blithely placed mistrust in the market to cure water ills. Unless the focus is on the waterways and aquifers themselves and their needs, science will take a back door to the market process, with inevitably disappointing results. The report finally concludes that the rapidly-expanding and essentially unregulated coal seam gas mining industry in Australia, which like its U.S. counterpart fracking uses enormous amounts of water, must be brought under the National Water Initiative "as a matter of urgency." Given the political and market pressure to expand coal seam gas mining in Australia, this advice is unlikely to be heeded soon. Again, the misplaced focus on markets distracts decision-makers and the public from the task at hand – determining the existing desired health of waterways and aquifers, and governing ourselves accordingly. Such Earth-based governance includes allocating actual, enforced water rights to waterways for the water they need for their own survival – not simply to serve human needs.

One California-specific example of the costly implications of a misplaced trust in the market to solve water problems was uncovered in an investigative report by California journalist Mike Tauger. As discussed further in his multi-part report on "Pumping Water and Cash from the Delta" (see, e.g., [http://www.mercurynews.com/breakingnews/cj\\_12439808](http://www.mercurynews.com/breakingnews/cj_12439808)), the investigation uncovered significant manipulation of public funds set aside for environmental uses to enrich specific individuals and corporations, with little to no environmental benefit. An excerpt from the investigative report illustrates the inherent danger in relying on market-based solutions to redress the problems created by market-based strategies:

As the West Coast's largest estuary plunged to the brink of collapse from 2000 to 2007, state water officials pumped unprecedented amounts of water out of the Delta only to effectively buy some of it back at taxpayer expense for a failed environmental protection plan, a MediaNews investigation has found.

The "environmental water account" set up in 2000 to improve the Delta ecosystem spent nearly \$200 million mostly to benefit water users while also creating a cash stream for private landowners and water agencies in the Bakersfield area.

Financed with taxpayer-backed environment and water bonds, the program spent most of its money in Kern County, a largely agricultural region at the southern end of the San Joaquin Valley. There, water was purchased from the state and then traded back to the account for a higher price. . . .

No one appears to have benefitted more than companies owned or controlled by Stewart Resnick, a Beverly Hills billionaire, philanthropist and major political donor whose companies, including Paramount Farms, own more than 115,000 acres in Kern County. Resnick's water and farm companies collected about 20 cents of every dollar spent by the program.

Those companies sold \$30.6 million of water to the state program, participated as a partner in an additional \$16 million in sales and received an additional \$3.8 million in checks and credits for sales through public water agencies, documents show.

In summary, if the market system is our operating system, then its most talented manipulators will inevitably profit from it, at the expense of the environment and sustainable human communities. In other words, money will find a way to enrich, not to serve. We need an operating system premised on other metrics of what a flourishing life on Earth means to people and planet; one that does not relegate decision-making about the planet's lifeblood – water – to those who have the money and associated power to decide.

The Towards a Green Economy report offers up numerous other implications of the single-minded focus on the economy, including conclusions that arise in other ways from the report's analytical blinders. As a final example, the report states without irony in the Water chapter on page 134 that "[d]esalination has the advantage that it is climate independent." By focusing only on costs, the report misses the otherwise obvious climate-related implications of desalination. These include not only desalination's significant contribution to the greenhouse gas emissions that fuel climate change, but also the unknown implications of sea level rise on the siting of the ocean-side desalination facilities, infrastructure and transport systems. The report's blithe conclusion also ignores the increasing inability of island nations to obtain the fuel needed to support desalination facilities due to both rising costs and to port facilities also impacted by sea level rise.

A continued focus on the failed monetization policies of the past will only exacerbate such analytical and implementation problems. Only a careful, thorough assessment of the flawed operative assumptions that led us to a world where rivers now run backwards (page 131) will uncover long-term, sustainable solutions that ensure a healthy environment and healthy human communities.

#### Examples of Strategies to Implement Earth-Based Governance that Support Sustainable Communities

Earth Law Center accordingly urges decision-makers to include in the Zero Draft and support a re-focus on sustainable communities, which will yield the contours of a truly "green" economy along with each of the other elements of sustainable human and environmental communities, as articulated above. Current economic metrics such as GDP only reinforce environmental and societal degradation at the hands of ever-increasing growth. Seeking the definition of an economy that fits within a larger definition of "sustainable communities," rather than one premised on infinite growth, requires a different judgment of economic welfare. For example, a number of U.S. towns and cities, including Pittsburgh, Pennsylvania with a population of over 300,000, have assessed the local environmental costs of further runaway economic growth and adopted laws that grant local control to prevent destructive new development. These laws also grant legal rights to the natural world to be healthy, thrive and evolve, which further support the municipalities' recognition of the value of a healthy environment and healthy communities apart from the monetary drive of the markets. Such communities and states around the world are fighting to regain control over their own, Earth-based definitions of "sustainable," efforts that should be encouraged by the UNCSD.

The Zero Draft should include these and other implementation strategies consistent with a goal of "sustainable communities" grounded in Earth-based governance. An additional example of such an implementation strategy involves allocations of water rights to waterways and aquifers in amounts sufficient to meet their environmental needs. The Towards a Green Economy report characterizes existing efforts in Oregon and Australia as allocation of such water rights (page 142; see also above discussion regarding Australia's program). Both, however, in fact fall short in achieving this goal, in part because both are limited by the acquisition of sufficient funds to obtain the water needed for environmental sustenance. True water rights for ecosystems would depend only on the ecosystems' needs, not on the availability of funds to feed those needs. The funding becomes an impediment to achieving this goal because of society's flawed operating assumption that water is property to be used for human benefit, as if humans were somehow separate from the rivers that they are draining to dust. Rivers have a right to flow, independent of human needs, and we must adjust ourselves accordingly or face the implications of those decisions in the form of increasingly disappearing supplies.

In a related example, the U.N. General Assembly and the Human Rights Council have now both recognized the human right to water and sanitation; these mandates should similarly be strongly supported and advanced at Rio +20. However, is not possible to protect the human right to water and sanitation without recognizing the inherent rights of nature and other species to be healthy, thrive and evolve. Thus, protection of the human right to water first requires protection of waterway and aquifer health and the integrity of hydrologic cycles. However, the disturbing trend of corporate privatization of water impedes progress in this area. Resolution E/2005/29 calls upon the UNCSD to review the implementation of international water and sanitation decisions at its session in 2012 (p. 19, paragraph 4). The Council of Canadians' 2011 "Review of Private Sector Influence on Water Policies and Programmes at the United Nations" found evidence of significant corporate lobbying and influence in past water-themed discussions and proceedings of the UNCSD, including during processes of the World Summit on Sustainable Development in 2002. By addressing corporate pressures at Rio +20, decision-makers will have a greater opportunity to explore the full range of options that exist for addressing the global water crisis, consistent with Earth-based governance.

Other examples arise from consideration of the roles of the distribution of good and services. As noted above, this distribution process need not be for the purpose of maximizing wealth, but instead could be for the purpose of providing for biological and social needs – that is, for global well-being. One example of such an implementation strategy that is consistent with Earth-based governance is promotion of agro-ecological methods of food production to replace the growing trend toward corporate food industrialization. In 2009, the International Assessment of Agricultural Science and Technology for Development concluded that "the way the world grows its food will have to change radically" and argued for an agro-ecological approach to food production as the most effective route to meeting the world's increasing food needs. This four-year, UN-sponsored project included the work of 400 researchers and was funded by \$12 million from the World Bank. Increasing concentration of the corporate industrial food complex causes environmental destruction, exacerbates land distribution inequalities and exacerbates poverty. We cannot continue to degrade our soil with genetically modified mono-crops and their requisite fertilizer-pesticide packages and expect soils to support yields to perpetually feed our growing population. Agro-ecological methods of food production sequester carbon in the soil, promote biodiversity and promote local food sovereignty, and should be supported in the Zero Draft.

Finally, the World Bank and other international financial institutions have used the same flawed ideology that supports tax havens to promote lower tax structures in resource-rich developing countries. Implementation of an international financial transactions tax would raise much-needed funds for countering environmental destruction (such as climate change) and human poverty, and would help slow commodities speculation that has taken a significant toll on human and environmental victims.

Refine the institutional framework to reflect Earth-based governance strategies that achieve "sustainable communities."

The 1972 Stockholm Declaration articulated three "pillars" to sustainable development: Environment, Society and Economy. The 1987 Report of the World Commission on Environment and Development: Our Common Future further defined sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs." Though well-intentioned, these approaches have failed to achieve their objective of transforming environmentally destructive, market-based governance systems into sustainable, Earth-based governance, for the reasons discussed above. Indeed, the pace of climate change impacts, species and habitat devastation, and other environmental problems has increased over this time.

We urge decision-makers to re-think both the purpose and structure of this institutional framework effort. First, as already addressed, the goal should not be one of only slightly curbing the runaway-growth market economy, but instead one of ensuring sustainable human and environmental communities served by a "green" economy that accounts and respects for the limits of the Earth.

Second, use of the three pillars implicitly assumes that each is equally significant in achieving sustainable communities. This assumption is contrary to science, which demonstrates our interconnectedness, and indeed contrary to economics, in which the current market-based growth is fueled by the continued availability of natural "resources," including a favorable climate. As just one example among uncounted others, in a 2009 study published in the Proceedings of the National Academy of Sciences, scientists predict that climate change may cause yields of corn, soybeans, and cotton in the U.S. to decrease by as much as 80% by 2100. A healthy environment is simply essential to human survival and well-being.

A different framework is needed, one that reflects both the reality of our interdependence and our Earth-based vision of healthy, sustainable human and environmental communities. The outer structure supporting the desired “sustainable communities” goal should be Environment, given our dependence on healthy Earth systems for our own survival. The individual pillars supporting this outer Environment structure would be the various elements of a healthy environment, including sufficient healthy nutrients and clean water, biodiversity, restoration in the face of destruction, and thriving, connected habitats.

Society necessarily follows as a nested framework structure within the outer Environment framework, where Society refers to human societies implementing Earth-based governance systems that support a flourishing planet. For instance, as Towards a Green Economy notes on page 19, “the link between ecological scarcity and poverty is well-established”; this is true for Society as well, which is impacted directly and indirectly by rising poverty rates. Society is more than money or markets, and the proposed, Earth-based governance system should reflect all elements of thriving human societies. The internal pillars supporting Society should represent each of these elements, including but not limited to: culture, societal/familial relations, healthy food, clean water, sanitation, housing, necessary medical care, democratic governance, education, meaningful and appropriately rewarded labor, spirituality, civic duty, volunteerism – and the economy, as just one of these numerous elements. Again from Polanyi: “the control of the economic system by the market . . . means no less than the running of society as an adjunct to the market. Instead of economy being embedded in social relations, social relations are embedded in the economic system.” We made choices in arriving at the point now where the markets are running society and environment. We can choose differently, and re-envision a market that serves the planet as a whole, and sustainable communities in particular.

In sum, we must not continue to contort our environmental protection efforts to meet the market economy. We need to reinvent the economy to reflect the fact that we are interconnected beings with our environment, and we must govern our behavior – including our economic behavior – accordingly. The primary impediment to success is the faulty underlying assumption that the environment is property to do with as we wish, to fuel the economic growth that we (again, wrongly) assume can and must continue unabated into the future. With the recommendations above, Rio +20 decision-makers can begin to rectify this foundational error and begin a road to planetary recovery and long-term sustainability.

\* \* \*

As Ambassador Pablo Solón states in the 2011 book, The Rights of Nature:

We are facing a debate in the United Nations among those that . . . advocat[e] the path of the market, [versus] the path of recognizing and respecting the larger system of the planet Earth on which we all live. . . . The future of humans and Nature depends on the path humanity chooses.

Decision-makers have an unprecedented opportunity at Rio +20 to adopt Earth-based governance as the guiding operating system for a new “sustainable communities” movement that reflects our interconnectedness with, and dependence on, the Earth’s natural systems. Earth Law Center urges decision-makers to incorporate the above inputs and contributions into the Zero Draft for this seminal event, launch this movement through strong public support for Earth-based governance, and work to ensure its implementation for the benefit of all Earth’s inhabitants.

Thank you again for the opportunity to submit these comments. If you have any questions or would like additional information, please do not hesitate to contact us.

## Earth Summit 2012 Japan

EarthSummit Japan 2012

Website: <http://earthsummit2012.jp> email: [contact@earthsummit2012.jp](mailto:contact@earthsummit2012.jp) United Nation University bldg. 1F, GEOC, 5-53-70 Jingumae, Shibuya-ku, Tokyo 150-0001, Japan

With international society entering the 21st century, we need to address prompt resolutions for deep global issues. We are attempting to resolve various issues by pushing sustainable development forward, but in order to do so we need to consider how development became unsustainable. More specifically, the major premise for measures going forward must discover the cause for the rise of over-development and mal-development and formulate appropriate countermeasures. Through multi-stakeholder dialogue for RIO+20, EarthSummit2012 Japan makes following proposals, distilled from Japan based on our cultural background of harmonious coexistence with nature.

### INDEX 1. proposals for Green Economy (p2)

#### 1.1. Rule-making for use of natural capital; User-recovers principle (URP)

#### 1.2. An indicator for use of natural capital ; Ecological Debt

#### 1.3. Designing Eco-Wealth

#### 1.4. Green Info Structure

### 2. Expectations for outcome of RIO+20 (p7)

#### 2.1. Comments on UNEP proposal for "Green Economy"

#### 2.2. Green economy for Aich-Target

#### 2.3. Post GDP indicator

#### 2.4. Launch of study for new pattern of economic development for Post MDGs era.

### About us / Earth Summit 2012 Japan (p14)

#### 1. Proposals for Green Economy

#### 1.1. Rule-making for use of natural capital; User-recovers principle (URP)

We propose User-recovers principle (URP) as principles to secure sustainable management of renewable natural capital. URP is a simple and strong principle that captures the economic and social characteristics of renewable natural capital correctly, and it gives the right incentives to users for a sustainable management. The basic idea of URP is that those who exploit renewable natural capital deviating from the pace of its regeneration have a responsibility to help their restoration process and to bear costs that are imposed on others during the restoration.

The functions of URP can be summarized in three aspects:

1. URP provides users with a practical conduct code that corresponds to the dynamic nature of regeneration. Regeneration is processed by ecosystem and its pace obeys the laws of nature. Thus the way we utilize natural capital should fit with the reproduction cycle of natural capital. However, as is often the case for soil, forests, grass fields, fishery and underground water, the open-accessibility of such capitals may cause a situation like "tragedy of commons". That is, pursuing optimal strategies of each user resulting in over-exploitations and harming social welfare. Traditional commons have avoided this problem through establishing local rules of communities. But today's commons are utilized by broader entities including multi-national enterprises operating outside the coverage of such rules. These entities often pursue shorter-term interests than optimal pace for local communities and nature because they can easily find and move to other places even if the commons would be degraded and extinct. Thus the institutionalization of URP gives internationally-shared code-of-conducts applied to the broader entities even across borders.

2. URP defines the allocation of responsibilities for recovery.

In most cases, the costs and benefits of renewable natural capital are distributed unevenly among locations and societies. Such capitals support human life in two ways; providing ecosystem goods such as foods or fuel, and providing ecosystem services such as regulation of atmospheric chemical composition, flood control, erosion control, waste treatment, pollution control, detoxification, and nutrient cycles. Ecosystem goods can be harvested and consumed by specific economic entities, while ecosystem services support life of wider range of people as public or quasi-public goods unless the capitals are harvested. URP allocates responsibilities among people differently according to the pace of use. Assume there are two entities that benefit from forest ecosystem; woodman and farmer. The woodman maintains the forest and harvests timber, while the farmer grows crops utilizing water cultivated through the well-kept forest. If the woodman harvests timber in a sustainable pace, the user in URP is the farmer and should pay the maintenance costs to the woodman. But once the farmer over-exploits and degrades the forest, the both parties have to wait until the forest recovers itself, or just help the restoration process mostly through costly ways such as ecosystem investigation or plantation. In this case, the user in URP is the woodman and should bear the recovery costs and also pay the opportunity costs to the farmer. In both cases the costs can be transferred to end consumers through value chains.

3. The third function of URP is to foster employments and innovations.

The responsibilities and rewards allocated through URP create various business opportunities related to the sustainable management or recovery of natural capital. For example, the maintenance of the forest creates jobs of thinning down congested trees. Or the recovery may call for forestry innovations that accelerate the restoration process.

#### 1.2. An indicator for use of natural capital; Ecological Debt

Display the amount of Ecological debt to enable socially responsible decision

International rules of natural capital compensation are not yet clear. Biodiversity offsets mechanism and ecological footprints are one of the famous methods to treat them but their scopes are limited. In particular, it is considered extremely important to reflect the economic value of ecosystem services, such as green accounting, in the national accounting system to recognize the negative impact of development on the natural environment.

Ecological debt is one of effective ways to communicate and compare the depreciation of natural capital. Concerning natural capital in particular, it is important to introduce the idea of the speed of regeneration and incorporate it into the method of evaluating natural capital, in addition to its stocks and resource productivity. Ecological deficit is the difference of the depreciation of capital and capital restoration. Ecological Debt is stock concept of ecological deficit which is measured by waiting time for recovery. Economic Externalities can evaluate not only money but also time measurement. Many of the natural capital are difficult to assume it's willing to pay. Such a case, it is easier to measure waiting time to recovery from depreciation of capital. URP rule require natural capital users to eliminate their ecological debt. But if users can't recovery by one selves all ecological debt, user have to swap their debt to others debt. Swapping their debt to others debt which have expertise, user can clean up them easier. And total social cost to eliminate all debt will decrease.

Consumers and merchants will be the main user of information of ecological debt for stopping degradation of natural capital. To enable consumer and merchants to be socially responsible, it is essential to establish international standards on how we display the degrees of sustainability of natural capital that is utilized for the production of goods and services in everyday life. Thus we propose a concept of ecological debt, which is to display the amount of natural capital utilized for manufacturing products and the "waiting time" needed until the capital has become ready to use again. In other words, ecological debt shows us how much forest or soils this product use in its production process and how long we have to wait until the forest or soil regenerate itself. We can calculate "ecological debt" using the accumulated knowledge and information of LCA and integrating them from the viewpoint of recovery time.

#### 1.3. Designing Eco-Wealth minimizing Ecological debt

Design of products and services are required to provide solutions for our lifestyle under more stringent resource constraints. Departure from era of mass production and consumption is inevitable and above more, (conceptual breakthrough) of product design that can turn our constraints into new value is necessary. Yet, for these products to spread and sustain in our society, they must become deeply embedded in our lifestyle. Being conscious of limitation in natural capital on the earth, we must promote a virtuous cycle of improving sustainable product designs and shifting our lifestyle towards sustainability. Therefore, we propose a multi-stakeholder initiative attended by product designers, worldwide research institutes, enterprises, traditional craftsmen, consumers working on the following measures.

A). Design Conceptual Breakthrough: redesigning the wealth of our society based on the principle of minimizing the natural capital recovery period Ecological debt.

Design products and services based on principle of minimizing Ecological debt by LCA approach.

People will need a new concept of wealth "Eco-Wealth". We emphasize the necessity of social investment measured by Eco-Wealth concept, that will lead to healthy and full life of all humankind, especially and primarily in the area that will minimize the household waiting time and the time credit index. Investments in basic infrastructures such as road, rail, water and sewerage, electricity grids must calculate "Ecological debt" prior to the investments. For example, "Eco-Wealth" is proposed. Goods and services necessary for our lifetime, that will be used sustainably over generations, particularly those that will be used longer than the recovery time of the originating natural capital is defined as "Eco Wealth". Historically speaking, for example, the cathedral city of Cologne, European ancient cities, Japanese tea house, these objects, not only sustain over generation but also evolve and increase their value over time. (However, we should note that the term does not apply to objects whose value is based on rarity, such as antiques, rather than the functional value of these objects.) To develop Eco-Wealth, we must make the durability of the product and the recovery time of the natural capital used in the product measurable, which will promote innovations and lifestyle designs based on the Eco-Wealth.

B). Research collaboration among relevant institutes to the sustainable designs and finite formulation and development of common protocols.

Lead redesigning the wealth based on Eco-Wealth --- long time stationary success.

Universities and research institutes currently working under the ethics of finite designs should strengthen cooperation by sharing research results and collaboration projects through building common platform.

In order to spread products designed for easy recycle and reuse, we must distinguish between areas which we can encourage innovation through competition among

businesses and areas which need cooperation among businesses. For the latter, we must aim to minimize the social cost on natural capital by creating a common protocol to share product designs, production processes and components that will facilitate recycle and reuse.

C). A mechanism for promoting responsible voluntary behaviors of consumers:

For the resolution of global issues, the role of consumers is important and it is necessary to promote civil education for consumers to encourage their responsible and voluntary behaviors. Furthermore, it is vital to raise awareness by environment communication represented under the label of the environment. In order to make consumers interested and influence their daily choice of goods and services, the development of environmental labels, promotion of environment communication and the implementation of environmental education, led by the state and involving all stakeholders including the private sector, are needed.

Companies will be able to innovate, design lifestyles, and develop products based on ecological debt (waiting time to recovery) indicators.

In order to promote product design under constraints on resources, launching the Finite Design Initiative to Support a Sustainable Society with the participation of research institutes, product designers, business corporations, traditional craftsmen and consumers, etc., of various countries for such efforts as

- (1) Closer cooperation among institutions concerned with finite design research;
- (2) Development of common product protocols conducive to finite design (develops and share common product protocols concerning processes and parts that serve as the pivots of recycling and reuse);
- (3) Diffusion of the top-runner format; and
- (4) Visualization of the degree of sustainability of natural capital utilization (visualize the degree of sustainability of natural capital utilization by quantitatively showing the amount of natural capital required for the manufacture of goods and services consumers make use of in their everyday life and the waiting time for their recycling).

#### 1.4.Green Info Structure to simulate and manage natural capital

Define a standard of information structure, Green Info Structure, using the concept of Ecological debt.

In order to achieve green economy, it is essential to create the information infrastructure that all relevant stakeholders can easily access and update the data in a decentralized way. We propose to construct the "Green Info Structure" and standardize it internationally. Green Info Structure is a multilayer management system of the information of natural capitals.

The first layer is a comprehensive database of natural capital. The United Nations and its member states should construct the database as an international joint project and share them with all relevant stakeholders.

The second layer is the provider of information. Most of natural capital can provide value flows like ecosystem goods or services in the local context. Furthermore some types of natural capital are embedded in the life of local community and can only exist with the help of people living there. So the local entities like local authorities, research institutions, or civil organizations can access the latest information on the current conditions of the capital. Thus it is important to design the database in a decentralized structure, so that such local entities can easily update the information accumulated in the database.

The third layer is the user of the database. That is, companies, NGOs, research institutes, and other relevant stakeholders may easily access the database and utilize it in their activities or strategies. Or they can take advantage of the database to provide plainer information about the current situation and prospects of natural capital to the public. Also, the database can be used to calculate Ecological Debt that we argued above. Thus the database should include the information needed for the estimation of Ecological Debt, that is, the stock amount of various natural capitals on the planet and their regeneration rate. For example, the database will help not only business use but also personal purchasing use.

#### 2. Expectations for outcome of RIO+20

##### Constraints of Growth due to Rapid Deterioration and Depletion of Natural Capital

To avoid "The limits to Growth," and recognize forests, soils, fisheries, water, and the resulting ecosystem is vital to all human beings for their healthy and full life. The Convention on Biological Diversity has grown to 193 members, while the Cartagena Protocol on Biosafety has been developed (Nagoya-Kuala Lumpur Supplementary Protocol on Liability and Redress to Cartagena Protocol on Biosafety were adopted in October 2010) and the Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization and the Aichi Target concerning biodiversity conservation have been agreed upon. However, global assessments, such as the Millennium Ecosystem Assessment and the Global Biodiversity Outlook indicate that the situation surrounding biodiversity is still deteriorating.

Humanity is ushering depletion and degradation of natural capital in exchange for rapid accumulation of industrial and financial capital. As a result, the rarity of these capitals has reversed comparatively, especially in recent years with developing and emerging countries at the heart of a sharp rise in global consumption, wherein the amount of available natural capital per capita is decreasing while being surpassed by the increasing pace of consumption. At this current development pattern, we fear that the world population will no longer be able to support itself by the time it reaches 9 billion. Consequently, we face the urgent task of raising collective awareness among all people based on the need that we discover the extent of constraints we must subject ourselves to due to depletion and degradation of natural capital, as well as the nature of the content, speed, and scale of changes we must make to our development patterns.

Hungers affecting more than one billion people as well as response to poverty are pressing issues. As the recent financial crisis and surge in food price showed how an incident in industrialized countries instantaneously worsen hunger in low income countries, under the current globalized world a peril at one place can propagate around the world at a glance of a second leading to a global crisis, marginalizing the livelihoods of the poor dependent on weakened natural capital. Furthermore, as the natural capital per capita falls, there are high risks of circumstances surrounding the low income countries to worsen. Additionally, creation of decent job opportunities for 700 million workers that will emerge by 2025, is a pressing issue.

##### 2.1. Comments on UNEP proposal for "Green Economy"

Earth Summit 2012 Japan recognizes importance of green economy for the following reasons:

1. Economic activities underlie environmental problems;
2. Under constraints on resources and climate change, we need an economy that is well aware of these constraints.
3. The greening of the economy prompts changes in people's values and individual choices and also encourages people to seek sustainable lifestyles.

Transition to green economy based on conservation and sustainable use of natural capital is inevitable.

Suggestions made by international organizations including UNEP and OECD are:

1. Tools and policies that may help stocking of natural capital and improving capital efficiencies
2. Encouraging shift to green industry that is highly labor intensive. Capable of capacity building, income improvements, and even empowerment through community participation
3. Solution that both developed and developing countries could be proactive in

These points are commendable and we support the direction of these points.

However, there are limits in the existing proposals on the following points:

1. Neither shared understanding nor direction are shown for how the population growth and resulting degradation of natural capital may constrain our economic growth patterns, and choices we are left in terms of its contents, scale and speed. How to foster a common understanding on this issue among the entire human race is not shown.
2. Interpretation of natural capital is misleading when it treats natural capital like other artificial capitals, mainly consisting of private goods, and lacks understanding of natural capital, those especially renewable and sharable ones, in its economic and social values.
3. They are narrowly focused on reforms in manufacturers through public investments and lacks the view point of consumers, namely how the green economy will affect the lifestyle and preferences of the mass consumers and how companies and societies can contribute to the change. Household is the minimal but the most important sector notable for starting green revolution for 7 billion individuals.

## 2.2. Green economy for Aichi-Target

Improve natural capital resilience and adapt the speed of natural capital.

Biodiversity and natural capital that support economic activities are significantly deteriorating at present. We need an economic mechanism that reflects the cost of the deterioration of natural capital and risks to people, including future generations; and

It is desirable to promote the utilization of sustainable ecosystem services based on the Aichi Target and Nagoya Protocol adopted at the tenth meeting of the Conference of the Parties to the Convention on Biodiversity (CBD-COP10) held in 2010. Implement appropriate policies effectively, make policy linkages based on biodiversity, promote meaning and value of biodiversity and the UN Decade on Biodiversity, as well as take precautionary approaches to decision making.

Following are necessary efforts and procedures for promoting green economy:

1. Secure funding for biodiversity and sustainable development. The greening of finance and agriculture, forestry and fisheries is also an important issue. Increase number of green jobs that contribute to the environment and biodiversity in conjunction with the shift of industrial structure (just transition).

For example, Rice paddies play key role for resilience of Natural Capital in Asia. (CBD and Ramsar Convention recognized that paddies fields are important wetland for biodiversity.) Especially, Winter-flooded Rice Paddies (Fuyumizu-tambo) are one of best practice of investment for biodiversity and food productivity.

2. Establish new Consumption styles that does not break down the balance of natural capital; Provide information that encourages each individual to make purchase decisions on the basis of information on the environment, etc.; Efforts should be promoted while monitoring progress with appropriate indicators.
3. It is necessary to position the perspective of Communication, Education and Public Awareness (CEPA) as basis of efforts toward green economy for synergy effect between CEPA activities to achieve the Aichi Target under the Convention on Biodiversity and promote the U.N. Decade on Biodiversity and each country's obligations concerning the public awareness, education and training concerning the Framework Convention on Climate Change and the U.N. Convention to Combat Desertification.
4. Share good practices from around the world in terms of biodiversity and conserving and recovering ecosystems, using biological resources in a sustainable manner, fair and equal distribution of benefits resulting from the use of genetic resources, providing appropriate monetary resources and encouraging capacity building. For example, eco-tourism to encourage both local understanding of bio-diversity and local revitalization is a good example that includes CEPA perspective. The Japan Genki Awards show good examples of community-based initiatives in eco-tourism, and other model cases in creating sustainable society.

(Photo: NPO Kamiechigo-Yamazato-Fun Club Japan Genki Awards2010; School of farming for urban family.)

Example: The Tohoku Green Renaissance Project

Japan would like to provide as reference to the discussions on sustainable development in Rio +20 the example of The Tohoku Green Renaissance Project in which the sustainable use of natural capital has been used as part of the earthquake reconstruction effort that is seeking to quickly restore the core industries of the disaster-affected areas, including agriculture, forestry and fisheries, while balancing biodiversity conservation with development, based on the traditions and culture of these local areas. The spirit of transnational and trans-regional Kyoujyo (mutual assistance) illustrated in the wake of the earthquake and tsunami represents the exact stance required to build a sustainable society.

[http://gema.biology.tohoku.ac.jp/green\\_reconst/TOP.html](http://gema.biology.tohoku.ac.jp/green_reconst/TOP.html)

## 2.3. Post GDP indicators

Since the 1990s, based on the limitation of GDP as a measure of economic and social development, the international community has developed various sustainability indicators that incorporate environmental factors and social factors. Recently, some international organizations have made efforts to incorporate stock and status of resource productivity of natural capital into the assessment of economic cycle. Population growth and degradation of natural capital is occurring. International community has not come to common understanding of degree of current and future constraint of development. We must examine a scale of how much content rate in the range of speed of sustainable development, and establish the operational indicators to measure. As a prerequisite for green economy, it is necessary to consider natural capital in terms of economy. Fundamentally, further consideration among the international community will be encouraged, aggregating the green economy indicators being examined by Satellite System for Integrated Environmental and Economic Accounting (SEEA), OECD and UNEP. As part of such framework for sustainability indicators, we propose to introduce the concept of regeneration speed and incorporate it as part of the evaluation method of natural capital of the indicators discussed here, in addition to the amount of natural capital stock and resource productivity. Tools to promote the greening of the economy are broadly divided into regulations and incentives, management tools and voluntary efforts, and the following tools are considered effective: Develop indicators to measure quality of life that substitute conventional GDP growth indicators.

Sustainability indicators should include natural capital stock, resource productivity and reproduction speed. Incorporate environmentally sound production technologies, products and services into the social system through implementation of indicator in forms of eco point and top-runner programs.

#### 2.4. Launch of study for new pattern of economic development for Post MDGs era.

International community should agree to create a team for assessment of development patterns, involving researcher from various fields and stakeholders. These study results will be published in 2013, which can be used as basis for the consideration of the framework for the post MDGs.

This team should examine; 1. Options of development pattern, 2. Assessment of MDGs and measures beyond 2015, 3. Projection costs difference among timing of start , 4. A new chance bringing innovation and economic opportunity. Etc.

We are interested in economic developments with personal network development.

Following are utilities to design bottom up pattern of economic development.

##### 1. Focus on role of individuals:

The role of individuals is important. Every organization in the world is formed by individuals and often an individual belongs to multiple major groups. Individuals are required to have awareness as a consumer in compliance with purchasing for a sustainable green economy, choice of time, and choice of policies. Although individuals have certain roles at work, in private and in community, the key to all the changes is the individual's action based on firm awareness that they as an individual have the final responsibility.

Key players of sustainable society are individuals. Every decision will be made by each of you. Each of us must learn more about sustainability and execute responsibility for our common future.

A) If the significance of a green economy becomes clear to individuals, it will lead to actions. With the awareness that the final responsibility of sustainable development lies in individuals, it is important to link this to a life style change.

B) Through more intensified interaction among peoples and societies at grassroots level, people will have more open access to acquiring scientific knowledge and experiences that are not necessarily available in their localities. By being able to access these wealth of human capital, personal life quality and capacity will be enhanced. In return, people can output socially innovative ideas to bring changes to society, and provide services and create new wealth to re-invest in enriching life of others.

C) The international community must encourage an enabling environment and new systems to support entrepreneurship and innovations that are setting the models of conservation and sustainable use of natural capital in pursuit of a healthy and fulfill lifetime. We propose the following:

- i. Empowerment, put spotlight on individuals' initiatives
- ii. Encourage creation of communities to encourage such individual capacity building and innovations
- iii. Information sharing and capacity-building systems which lead to individual empowerment
- iv. Social media to enhance participative democracy
- v. Risk management of green business, investment in capacity building in such management

##### 2. Provide Effective Incentives:

Expansion of preferential tax, financial and fiscal treatment of and commendation systems for business corporations and organizations, etc. that promote the development and diffusion of environment-friendly technologies and products, evaluation and announcement, etc. of efforts by business corporations, appropriate application of accounting standards.

##### 3. Design BOP business model:

Sustainable base of the pyramid (BOP) business is in the spotlight to eradicate poverty from the perspective that supporting people living in poverty in their employment, business launching and livelihood and thereby enhancing their purchasing power should help their economic growth as well as business expansion. It is necessary to help raise awareness about examples of advanced cases and develop frameworks for supporting BOP business in consultation with stakeholders involved.

##### 4. Utilize international standards and guidelines:

Utilization of international standards as tools for realizing the green economy is also effective. It is important to position ISO26000 issued in November 2010 as a tool to give shape to the green economy in organizational management and promote it at an international level.

##### 5. Shift to PRI Finance:

In order to develop the capital market to support the green economy, urge institutional investors around the world to embrace the Principles for Responsible Investment (PRI) and ask them to enhance the transparency of their investment behaviors. Furthermore, business corporations compile corporate reports that integrate financial as well as sustainability issues, and governments and exchanges institutionalize such reports.

##### 6. Develop social media:

In promoting sustainable development and to support role of individuals, it is important to encourage the reform awareness of citizens and companies on which the media has the biggest influence. Defining the media as an important stakeholder and clarifying its role is crucial. In addition, not only the one-way communication as was in the previous model, but mutual communication such as social media that promotes a participatory society is important.

As we head into the 21st century, intellectual productivity and its impact on human life greatly intensified. Technological advancement of mobile phones, ever-growing webs of social networks in cyber space changed the way people communicate, work, and defines principles of life. It has shortened travel times and uplifted barriers that once exist between peoples and societies. It inter-connected people and made an open learning environment latterly available. More than ever, people across borders can share and understand what society is demanding as definitions of full lifetime, enabling us to offer innovative ideas to create sustainable society under a common and shared vision.

##### Message

On March 11, M9.0 earthquake hit the eastern part of Japan. More than 15 thousand people died and 8 thousand are still missing. Cities and towns were totally destroyed by 40 meter Tsunami, or even disappeared as if nothing had been there.

But we were not devastated only by a natural disaster but also by what we had created for ourselves. Four nuclear reactors in Fukushima, which had long been supplying large amount of electricity to the Tokyo economic area, had brought about serious meltdown and hydrogen explosion. They have emitted more than 77 tera Bq of radioactive particles into the air, soil, and ocean, which will undermine our children and grand children physically and mentally for decades.

Through the ruin of our towns and contaminated rubbles we see the end of a paradigm which Japan, and the global economy, had long been standing upon. We built a society on a thin ice of extremely complex social system, sacrificing profound relationship with Mother Earth and sacrificing our own culture and spirits. As a result, in our wealthy society more than 30 thousand people kill themselves every year since 1990s.

A recovery we started is entirely different from the one we experienced after the World War. We have to rebuild ourselves as a true sustainable society and show alternative solutions. We believe it is a responsibility of the world largest economies that had long been exploiting the earth and the people, and as a responsibility of the only country that experienced two atomic bombs and the worst nuclear accident in the human history.

Earth Summit 2012 Japan is, on behalf of the Japanese citizens, willing to involve ourselves strongly in the process for Rio+20, and to make valuable contributions to its ambitious project of creating a new paradigm. Especially, we hope what we learn and start from our ground zero will contribute to the long journey of human kind toward a sustainable future where 7 billion people live together in peace and harmony.

Masahiro Sato

President, EarthSummit2012 Japan

About EarthSummit2012 Japan

EarthSummit2012 Japan is a non-profit multi-stakeholder organization that provides policy proposals, civil actions, and inclusive platforms for the process leading up to Rio+20 in Japan. It was established in August 2010 and consists of about 50 staff members from different sectors such as government, NGOs, social enterprises, academics, and students.

Our Activities

Policy Analysis & Proposals / Social Actions / Platform Making / Awareness Raising

Our Network

EarthSummit2012 Japan is carrying on its activities in partnership with various organizations or individuals in Japan. We are making policy proposals to the government including the establishment of the Domestic Preparatory Committee for Rio+20, which ensure the multi-stakeholder participation to the process. We also coordinate a cross-sectional network of NGOs called the Rio+20 NGO Network. Furthermore, we contribute the awareness raising of citizens or companies through holding a variety of events or providing timely information concerning Rio+20 in cooperation with medias or academic community.

## Earth System Governance Project

rio+20 policy brief

Transforming governance and institutions for a planet under pressure

Revitalizing the institutional framework for global sustainability: Key Insights from social science research

Global environmental protection has featured high on the international political agenda since the United Nations (UN) Conference on the Human Environment in 1972. Yet, despite more than 900 environmental treaties coming into force over the past 40 years, human-induced environmental degradation is reaching unprecedented levels. Human societies must change course and steer away from critical tipping points in the earth system that might lead to rapid and irreversible change, while ensuring sustainable livelihoods for all. This requires a fundamental transformation of existing practices. If we are to achieve more sustainable development in the future, we have to reorient and restructure our national and international institutions and governance mechanisms. Incrementalism will not suffice to bring about societal change at the level required; the world needs structural change in global governance.

The 2012 UN Conference on Sustainable Development must become a major stepping stone towards introducing a stronger institutional framework for sustainable development. We urge decision makers to seize this opportunity to develop a clear and ambitious roadmap for institutional change and bring about fundamental reform of current sustainability governance within the next decade. This policy brief outlines the core areas needing most urgent action.

Summary of key points and policy recommendations

- Strengthen international environmental treaties: Governments must engage in structural reforms in how international environmental negotiations are conducted and treaties designed. Present and future treaties must rely more on systems of qualified majority voting in specified areas.

- Manage conflicts among multilateral agreements: International economic institutions must advance transitions to a sustainable economy, including by multilaterally harmonized systems that allow for discriminating between products on the basis of production processes, based on multilateral agreement. Global trade and investment regimes must be embedded in a normative context of social, developmental, and environmental values.

- Fill regulatory gaps in international sustainability governance: New or strengthened international regulatory frameworks are needed in several areas, including on emerging technologies, water, food, and energy.

- Upgrade UNEP: Governments need to engage in negotiations for the up-grading of UNEP to a specialized UN agency, along the lines of the World Health Organization or the International Labour Organization.

- Better integrate sustainable development policies within the UN system: Governments need to support overall integrative mechanisms within the UN system that better align the social, economic and environmental pillars of sustainable development.

- Strengthen national governance: New policy instruments are a promising complement to regulation if carefully designed. But they are not panaceas.

- Streamline and strengthen public-private governance networks and partnerships: The CSD and other bodies need a stronger mandate and better methodologies for the verification and monitoring of partnerships. Despite the growing role of non-state actors, there is still a strong need for effective and decisive governmental action.

- Strengthen accountability and legitimacy: Novel accountability mechanisms are needed, including mandatory disclosure of accessible, comprehensible and comparable data about government and corporate sustainability performance. Stronger consultative rights for civil society representatives in intergovernmental institutions should be introduced.
- Address equity concerns within and among countries: Equity concerns must be at the heart of the institutional framework for sustainable development. High consumption levels in industrialized countries and in some parts of the emerging economies require special and urgent action. Financial transfers from richer to poorer countries are inevitable, either through direct support payments for mitigation and adaptation programmes or through international market mechanisms, for example global emissions markets.
- Prepare global governance for a warmer world: Global adaptation programmes need to become a core concern of the UN system and governments.

-

#### STRENGTHEN INTERNATIONAL ENVIRONMENTAL TREATIES

Recent research on factors that foster the creation and effectiveness of international environmental treaties has led to important insights into how to improve the international governance system. International treaties are most effective when they:

- state precise goals, criteria and benchmarks for assessing progress;
- are designed to be flexible and adaptable to changes in the problem and context;
- have formal procedures to ensure new scientific information is taken up quickly; and
- systematically collect information about the effectiveness of the treaty and review this information regularly.

Governments can also speed up treaty negotiations by conducting them within existing institutions and by breaking down problems into smaller negotiation packages. Negotiators can sometimes sacrifice substance and stringency to reach 'shallow' but inclusive agreements that can be built on later; e.g., through framework-plus-protocol approaches, tacit-acceptance procedures for amendments, and formalized mechanisms that help develop soft law agreements into hard law. Such measures will lead to an incremental improvement of the system of international environmental agreements. We urge governments to draw on the lessons of past treaty-making exercises to improve their functioning.

While incremental change is important, it is not sufficient. More transformative reform is needed urgently. Introducing a stronger reliance on qualified majority voting would be a positive step, since political systems that rely on majority-based rule are quicker to arrive at far-reaching decisions. At the international level, experiences with qualified majority voting are rare and will need to be restricted to clearly specified areas to ensure the support of all countries. One route is the double-weighted majority voting developed in the treaties on stratospheric ozone depletion, which accept majority decisions yet also grant veto power to North and South as groups of countries.

#### MANAGE CONFLICTS AMONG MULTILATERAL AGREEMENTS

Conflict among different treaties – both within sustainability policy and beyond – has recently become a major concern.

Here, governments must strengthen the capacity and mandate of environmental treaties (including their secretariats) to collect, disseminate and exchange information on links with other treaties. Treaties with similar objectives need formal mechanisms for joint negotiation and management. Furthermore, the requirement to respect and support the objectives of (other) multilateral environmental treaties should be accepted as a general principle.

It is particularly important to manage conflicts between economic and environmental treaties, with reforms of the institutional framework for sustainable development brought in line with the ideal of the 'green economy'. Environmental goals must be mainstreamed into the activities of global economic institutions, while global trade and investment regimes need to be embedded in a normative context of social, developmental and environmental values. Discriminating in world trade law between products on the basis of production processes is critical, if investments in cleaner products and services are to be encouraged. Such discrimination should be based on multilateral agreement to prevent protectionist impacts.

Fill regulatory gaps in international sustainability governance

In addition to strengthening existing treaties, there are numerous areas where new frameworks are needed.

One is the development and deployment of such technologies as nanotechnology, synthetic biology and geoengineering. These emerging technologies promise significant benefits, but also pose major risks for sustainable development. They therefore need an international institutional framework to support forecasting, transparency and information-sharing on new technologies; further develop technical standards; help clarify the applicability of existing treaties; promote public discussion and input; and engage multiple stakeholders in policy dialogues. Such a framework must ensure that environmental considerations are fully respected.

Initially, multilateral action on emerging technologies could take the form of one or more framework conventions.

Global water governance also needs a stronger and more coherent multilateral framework, since it remains the remit of several UN agencies and civil society organizations. Global food governance must be strengthened as well. Regulatory challenges here include international management of food safety and nutrition, the coordination of climate change adaptation in food systems, limits on commodity speculation, and standards to guide private regulation such as certification and labeling schemes. Furthermore, energy governance requires strong oversight by global bodies whose activities are currently dispersed and poorly coordinated.

#### Upgrade UNEP and UNCSD

International environmental organizations play vital roles in governance for sustainable development, but need further strengthening. Many reform proposals have been submitted in recent decades. Some of the more radical proposals – such as an international agency that centralizes and integrates existing intergovernmental organizations and regimes – are unlikely to be implemented and would yield uncertain gains. However, most of us see substantial benefits in upgrading the United Nations Environment Programme (UNEP) to a specialized UN agency for environmental protection, along the lines of the World Health Organization or the International Labour Organization.

At the same time, it is important to increase the integration of sustainable development policy within the UN system and beyond. The UN Commission on Sustainable Development (UNCSD) was created to fulfil this role, but its political relevance has remained limited.

Governments must take action to support mechanisms within the UN system that will improve integration of the social, economic and environmental pillars of sustainable development. An upgraded, strengthened CSD that includes meaningful participation from all branches of government, is one route to consider.

## Strengthen national governance

"When designed carefully, new policy instruments are a promising complement to regulation, but they are not panaceas."

The shortcomings of international institutions largely reflect those of domestic policies. An effective institutional framework for sustainable development requires critical institutional innovations at the national level. New policy instruments – often involving nonstate actors – have become popular as a means of overcoming problems in implementing regulations, since they are often seen as being more flexible. However, questions remain about their transparency, equity implications and long-term effectiveness. When designed carefully, new policy instruments are a promising complement to regulation, but they are not panaceas. Success lies in developing packages of different instruments, and in evaluating the effectiveness of these in their own terms as well as in relation to alternative options.

## Streamline and strengthen public–private governance networks and partnerships

"...few of the 300-plus partnerships for sustainable development formed around the 2002 Johannesburg Summit have delivered on their promise..."

The past few decades have seen tremendous growth in new types of governance, such as public–private partnerships or transnational labelling schemes. Yet the effectiveness of these novel mechanisms remains uncertain.

Research indicates that few of the 300-plus partnerships for sustainable development formed around the 2002 Johannesburg Summit have delivered on their promise. Overall, the partnership approach has not met its expectations in contributing to the Millennium Development Goals and furthering participation and implementation. Insufficient funding, ineffective organizational structures, lack of quantitative targets and weak accountability systems have also limited its effectiveness. To strengthen such partnerships, UNCSD and other agencies need a stronger mandate and better methodologies for the verification and monitoring of progress.

Labelling and certification schemes can advance sustainable development by enabling markets to support environmentally sound business practices. To be effective, these need multiple stakeholders, appropriate national regulatory frameworks, built-in accountability mechanisms and consumer demand. Governments play a crucial role through regulations that create incentives for certification, focused procurement policies, legitimization of measures and involvement in monitoring sustainability effects. International organizations can also play a powerful role in catalyzing novel forms of private and public–private governance.

Novel mechanisms such as the Clean Development Mechanism or Reducing Emissions from Deforestation and Forest Degradation (REDD) can contribute to sustainable development when they are seen as supplementary to, rather than a replacement for, governmental action.

To ensure equitable distribution of benefits and to minimize the risks associated with them (e.g. to indigenous people or biodiversity), international, national and local bodies must have strong institutional oversight. Governments must work towards improving institutional capacity, increasing representation of local stakeholders, changing the uneven monitoring of claimed benefits, and rebalancing global and local benefits.

New types of transnational cooperation among local public authorities (e.g. cities) are becoming important and many such authorities have taken significant action towards addressing the causes and consequences of global environmental risks. Governments must provide a political mandate that recognizes their diverse contexts and guides practical action on the ground as well as supporting collaboration and developing local capacity and financial resources.

Despite the growing role of nonstate actors, there is still a need for effective and decisive governmental action, both at the national and intergovernmental level. Governance beyond the state can be a useful supplement but still requires governmental support.

## Strengthen accountability and legitimacy

"...governance accountability can be strengthened when stakeholders gain better access to information and decision-making..."

Both intergovernmental and novel non-state-driven institutions face increasing pressures for improved accountability and access to decision making. There is no universal formula to increase accountability and legitimacy across all sustainable development institutions. In general, governance accountability can be strengthened when stakeholders gain better access to information and decision-making, for example through special rights enshrined in agreements, charters and codes, and stronger participation in councils that govern resources, or in commissions that hear complaints. International environmental, developmental and economic institutions must adopt such novel accountability mechanisms more widely. Stronger consultative rights for civil society representatives in intergovernmental institutions can be a major step forward. This requires appropriate mechanisms that account for imbalances between countries and for power differentials between different segments of civil society, and that ensure appropriate accountability mechanisms for civil society representatives vis-à-vis their constituencies.

While greater transparency and information disclosure can empower citizens and consumers to hold governments and private actors accountable as well as providing incentives for better sustainability performance, transparency does not always deliver on its promises.

Disclosed information is often inaccessible, inconsistent or incomprehensible. Governments and private actors must ensure that disclosure obligations go beyond 'business as usual' to stimulate a change in existing unsustainable practices.

## Address equity concerns within and among countries

The institutional framework for sustainable development must address questions of justice, fairness and equity. Regarding equity within countries, there may be a trade-off between effectiveness/ efficiency and equity. However, this presents a false dichotomy in most complex environmental problems, which are inherently political in nature. Legitimate and transparent democratic processes are needed to allow societies and communities to choose policies they see as being equitable and effective.

Poor and marginalized communities are most vulnerable to global environmental change but seldom have a voice in policymaking.

Relevant processes should therefore promote participation of the poor in policy preparation, implementation, monitoring and adaptation.

At the international level, equity and fairness need to be at the heart of strong and durable international regimes. Equitable progress towards globally sustainable development requires greater action by the richer nations. In particular, governments and societies in industrialized countries need to accept that global environmental change has fundamentally increased global interdependence and (further) transformed the international system.

Also the rapidly industrializing countries in the South need to actively determine their role and position on sustainable development governance and to direct their development pathways towards a green economy.

Overall, financial transfers from richer to poorer countries at unprecedented levels are inevitable, either through direct support payments for mitigation and adaptation programmes based on international agreement or through such mechanisms as global emissions markets. Novel financial mechanisms like transnational air transportation levies for sustainability purposes could also contribute.

The organization of global funding for sustainable development lacks consistency and inclusiveness, with most funding agencies having different interests, rules and general policies. Policy coherence is often weak. Governments and funding agencies need to revisit existing funding mechanisms to increase policy coherence and strengthen the voice of the recipient countries.

Prepare global governance for a warmer world

Complete mitigation of global environmental change is already out of reach, so the new institutional framework for sustainable development must include governance for adaptation. Research indicates that the adaptability of local communities is stronger when the governance system itself is adaptive. Institutional frameworks with multiple centres and levels of authority may foster the adaptive capacities required.

Strong informal networks and public participation in planning, implementation and review are all important and governments and international institutions should support adaptability in local governance mechanisms.

At the global level, the institutional framework seems ill prepared to cope with the consequences of massive global change that will affect such major systems as food, water, energy, health and migration, and their interactions.

While massive changes, for example in sea level, may not be imminent, future dangers can be minimized if institutional reform is planned and negotiated today. Global adaptation programmes thus need to become a core concern of the UN system and governments.

Conclusion

"We need to have a 'constitutional moment' in world politics..."

We need to have a 'constitutional moment' in world politics, akin to the major transformative shift in governance after 1945 that led to the establishment of the United Nations and numerous other international organizations, along with far-reaching new international legal norms on human rights and economic cooperation.

The 2012 Rio+20 Conference offers both an opportunity and a crucial test as to whether such conferences can bring about substantial and urgently needed change in the current institutional framework for sustainable development.

## East London Green Jobs Alliance

Input for Compilation Document, Rio+20 Summit 2012 About us

The East London Green Jobs Alliance is a coalition of trade unions, NGOs, community based organisations and green businesses working together to create green and decent jobs for East London citizens. The East London Green Jobs Alliance is anchored by the Otesha Project UK and Unionlearn SERTUC.

We seek to stimulate the local green economy and provide training and job opportunities for local people – especially the young and unemployed. We do this through:

- Campaigning for all jobs to be greener and have a living wage
- Developing greener job policy and practice
- Creating leadership in London on green jobs
- Supporting new green enterprises
- Developing a pilot project that aims to work in partnership with employers, training providers and other support agencies in the formation of a 'green jobs pipeline' Principles

Our work is shaped by two basic principles: 1. Equal opportunities for all – greener jobs and training like everything else must provide opportunities for everyone

2. Equity for people and planet – greener jobs and training must support social and environmental justice locally, nationally and globally

To achieve the stated aim of the transition to a green economy we make the following recommendations to the Rio+20 compilation document: The transition to a green economy must be based on:

1. Equalities – Many of the potential green growth areas like construction and engineering do not adequately reflect the potential workforce. The under-representation in apprenticeships and employment in these sectors must be addressed to ensure access to job opportunities by all disadvantaged groups. A recognition that climate change and energy prices will hit the poorest sections of society hardest.

2. Fair and decent jobs – The move to a green economy must be based on fair wages and decent terms and conditions of employment. These should include opportunities for career progression, and rights to health and safety and trade union recognition.
3. Co-ordination and coherence – The current policy is characterised by short-termism and uncertainty that is hampering progress. Stimulating demand for jobs and training requires a long term strategic approach in areas like low carbon sector incentives, and procurement policies.
4. Communication and engagement strategy - Partnerships across civil society at global, national and local level are needed to promote training, job opportunities and inclusiveness.
5. A Just Transition – Workers and communities must be consulted about the opportunities and threats to employment in each sector of the economy. Provision to re-train and up-skill in good time must be built in to all jobs and sectors at risk from a transition to a green economy.

The East London Green Jobs Alliance welcomes comments on the content of this proposal. Please email comments to: [hanna@greenjobsalliance.org.uk](mailto:hanna@greenjobsalliance.org.uk)

## Eco-Accord

Proposals for Rio+20:

### Sustainable Development Needs a New Impetus

Almost twenty years ago the UN Conference on Environment and Development was held in Rio de Janeiro and launched the unique global process for transition to sustainable development. Rio process gave a powerful impulse for understanding and re-thinking of the realities of the modern world, threats to its existence and how to resolve the crisis. As Rio-92 follow-up a lot of action at all levels have been implemented with many positive results. However, in total the humanity failed to reverse the dangerous trends, which continued to deepen.

We urge governments at Rio+20 Summit:

To recognize the need to intensify efforts for transition to sustainable development. It is necessary to decide on launching elaboration of global Sustainable Development Goals for the period starting from 2016. Every country should set its targets for achieving of SDGs and develop a strategy to meet the targets.

International assistance to meet Millennium Development Goals and Sustainable Development Goals should be increased. All developed countries should respect their earlier made commitments on allocation of 0.7% of GNP to official development assistance. These commitments should be reaffirmed at Rio+20 Summit. In parallel, it is necessary to focus on improvement of efficiency of the assistance provided, on mobilisation of national sources and on search for innovative funding mechanisms. In the course of selecting spheres of international development assistance, donor countries and international finance institutions should account for decisions of Rio+20, in particular the ones pertaining to transition to "green economy".

Transition from "brown economy" to "green economy" is vital:

1. Rio+20 should declare setting a course for transition to "green economy". It is necessary to develop and approve a clear system of "green economy" indicators at the international level and a cumulative "green economy" index relying on these indicators.
2. Governments should commit to provide favourable preconditions for transition to "green economy", including use of market mechanisms and incentives for private investments into development of "green businesses", improvement of the legal framework, tax reforms, focusing governmental procurements and expenditures in spheres that stimulate green economic sectors and imposing limitations on expenditures that destroy the natural capital base, termination of inefficient subsidies.
3. By 2013, all countries should develop Roadmaps for transition to "green economy" and agree on cooperation in exchange of information, best practices and on assistance in capacity building. A Roadmap should stipulate phased implementation of specific measures to alter existing production and consumption patterns, accompanied by clear indicators and deadlines.
4. Many developing countries and transition economies require assistance for elaboration and implementation of policies of transition to "green economy". Relevant capacity building programs should be developed at the international level, including inter alia practical recommendations and best practices of different countries.
8. Policies for transition to "green economy" should not pursue environmental objectives only, they also should address social problems, poverty eradication, public health, social equality and job creation. Needs of the poorest and most vulnerable groups should be accounted for, as well as development needs of developing countries and transition economies.
9. Large scale actions are needed to enhance understanding of "green economy" concept and policies by different stakeholders, including governmental bodies (ministry of economic, environmental and social blocks), business community and the general public. "Green economy" should be integrated into education curricula. Earth Charter as an ethical code of sustainable development can be used. The Decade of Education for Sustainable Development should be extended beyond 2014 with a focus on education for green economy.
5. Assessment of ecosystem services should become a key element of sustainable development. Further development of monetary valuation of ecosystem services and incorporation of costs of these services into operational economic models are the key tasks, that, if addressed, would allow to stop ecosystem losses. It is necessary to build a complex of legal, administrative and economic mechanisms at local, regional, national and international levels. Measures, that allow to do it, should form the framework of roadmaps of sustainable development at all levels and should be incorporated into national state reporting systems. The Intergovernmental Platform on Biodiversity and Ecosystem Services should be provided with a clear institutional framework, resolutions of the Biodiversity Convention on funding mechanisms and inter-sectoral interaction should be implemented.
6. International community should intensify efforts to address one of the most pressing threats - climate change. Actions in the sphere should pay more attention to boreal forests - a global and generally stable carbon sink. Existing climate conventions do not account for carbon conservation functions of boreal forests. In future climate treaties, artificial restrictions on carbon offsets for carbon sequestration by boreal forests should be lifted.
17. At Rio+20 Summit countries should agree on gradual phase-out of inefficient subsidies to fossil fuel. Fossil fuel subsidies do not promote efficient and rational use of energy resources, they contribute to climate change and make application of renewable energy unprofitable. Such steps should account for potential social consequences and should be accompanied by relevant reforms in interests of the whole society, including the most vulnerable social groups. As bio-fuel production can also create problems

for sustainable development, in particular food price rise, it is necessary to review national measures of supporting bio-ethanol production and use and, if it is necessary, to reduce them substantially or to withdraw them completely.

10. A framework convention on sound chemicals management, relying on existing international and regional chemical treaties should be developed. The framework convention should seek to minimise, by 2020, adverse health and environmental impacts of chemicals production and use. Such legally binding international treaty would allow to use a comprehensive approach to management of hazardous chemicals and waste, to enhance national and international actions for sound chemicals management and for implementation of key activity dimensions stipulated by Agenda 21.

14. It is necessary to secure a sufficient number of ratifications to ensure that Ban Amendment to the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal will become effective by 2016 (the amendment provides for the global ban on export of hazardous waste to developing countries, including electronic waste). The international community should forever ban transformation of developing countries into a toxic waste dump. Developed countries have sufficient financial resources to address problems of sound hazardous waste management within their national borders.

11. Human health should be central while implementing priority objectives of environmental degradation including depletion of natural resources, poor water and air quality result in the rise of some chronic disease. Vulnerable groups are most affected. Urgent measures are needed to treat and prevent chronic diseases caused by environmental impact on human health as well as elaboration of international regulatory base on environmental and health risk assessment with further economic assessment of these risks. We call on governments and international organisations to develop an awareness raising and educational system on environmental health issues focused on women and the most vulnerable groups on a first- priority basis.

12. Governments should intensify their efforts to ensure food security. It is necessary to intensify activities for establishment of regional systems of food reserves for humanitarian emergencies, that might be also used to mitigate adverse consequences of sharp volatility of food prices. In order to reduce food losses and waste after harvesting, it is necessary to provide for opportunities of access of developing countries and economies in transition to modern technologies of processing, storage, packaging, transportation and marketing of agricultural products. Countries should promote active application of agro-environmental agricultural practices that improve harvest yield, improve nutritional value of products and reduce countries' reliance on application of pesticides.

12. It is necessary to develop, by 2020, a global program for elimination of accumulated environmental liabilities, providing for allocation of necessary and sufficient funding to address priority problems. A polluter pays principal should be fully implemented to ensure producer responsibility. Control of the program implementation should be supported by relevant legislative frameworks at the international and national levels. Priority attention should be paid to addressing the problem of accumulated hazardous industrial waste, including stockpiles of banned and obsolete pesticides and agricultural chemicals, as well as mining waste. It is necessary to implement comprehensive actions for rehabilitation and safe use of contaminated areas, accounting for economic and environmental prospects of their further use.

16. The transition to green economy necessitates greening the trade. Trade should not be an obstacle, it should become a tool of green economy. Governments should agree to change multilateral trade system, to make it a promoter of sustainable development to the maximal extent possible in particular, new rules are necessary in the sphere of regulation of subsidies and investments that would encourage their "desirable" forms in terms of transition to "green economy" and discourage "undesirable" ones.

15. At Rio+20 Summit countries should agree on development of global institutional mechanisms, promoting international R&D cooperation in all spheres associated with "green growth", and accelerating dissemination of technologies in developing countries and transition economies. It is necessary to adjust the international regime of protection of intellectual property rights, including inter alia a broader application of compulsory licensing practices, and higher incentives for development and dissemination of innovations to make economy greener.

Transition to green economy requires improvement of governance

18. Transition to green economy necessitates improvement of governance at all levels. Governments should acknowledge the need to strengthen UNEP and to enhance its status to that of a specialised UN agency.

19. National Sustainable Development Councils should be established in every country and should operate on a transparent basis with participation of all stakeholders. It is necessary to develop performance indicators for NSDCs, to ensure their regular reporting and monitoring of their activities.

20. To develop, by 2015, a Global convention on access to environmental information, public participation and access to justice on environmental matters. Access to information and public participation are necessary for open and responsible governance and decision-making. A swift development of the Convention and its entry into force would allow to guarantee efficient public participation in development of green economy. The Convention should provide for commitments on launching Pollutant Release and Transfer Registers (PRTPs).

21. It is necessary to establish a specialised ECOSOC unit on sustainable development. In particular, such unit might assess progress in terms of green economy indicators/indices, and produce surveys of countries' sustainable development/green economy policies at the base of national materials and external assessments.

Recommendation have been prepared by Eco-Accord in cooperation with EECCA (Eastern Europe, Caucasus and Central Asia) Trade and Sustainable Development Network) with contribution of Association for Sustainable Human Development (Armenia); Biotica (Moldova); Severtsev Institute of Ecology and Evolution (Russia); Rostok (Russia); Volgograd-Ecopress (Russia); Oxfam (Russia); EKA (Russia); Rainbow/Youth for Environment and Sustainable Development ; Russian Chemists Union; Institute of Water Problems, Russian Academy of Scientists; Institute of Humanitarian and Economic Problems of Food Security (Russia); Academy of Quality Problems (Russia); Dubna Regional Environmental Center (Russia); InterEcoPravo Center (Russia); Moscow State University (Russia); Center for Forest Ecology and Productivity, Russian Academy of Scientists (Russia).

## Eco-Forum Global

Contribution by the Eco-Forum Global to a Successful Rio+20 Conference

October 2011

The Eco-Forum Global is a China-based organization committed to creating effective dialogue and generating new paradigm and new actions to foster green development opportunities worldwide.

For the past three years, the Eco-Forum Global has convened groups of committed people, enterprises and organizations from inside and outside China to engage in productive dialogue on green economy and sustainable development.

New Future - Objectives of the Conference

Rio+20 provides a unique opportunity for the world to review and complete the past 20 years of efforts on sustainable developments, and more importantly, to open up a new future.

The world is facing unprecedented challenges and uncertainty. The eco-system is increasingly vulnerable and uncertain. Eco-security is becoming a top priority for governments, organizations, business and individuals. The existing development model that we are familiar with has not provided with any effective solutions to deal with the crisis.

The reality is that the gap between the rich and poor, and the gap between who is in need and who has not are enlarging at faster pace.

Human beings must demand a fundamental shift in paradigm of the ways we live our life, conduct our business and govern ourselves.

We must have the courage to confront ourselves with the reality and face where we have failed. The next step is to reinvent the governance structure, take powerful actions, and make paradigm shift.

We call for reaching authentic and sweeping consensus to live in a new world of eco-civilization.

#### Green Development and Eco-civilization

We advocate for ecological civilization. We are going beyond the industrialized civilization and moving into eco-civilization. This is a huge mission, as big as civilization changes.

Eco-civilization represents a fundamental shift about how we live our daily life, how we conduct our business, and how we exist to the nature we live in.

Countries of different origins and culture traditions are capable of making unique contributions to a new world of eco-civilization.

Eco-civilization is the direction. We must create a new future, not just wait for something to fall on us.

#### Opportunities Now Present - Green Economy in the context of sustainable development and poverty eradication

We are convinced that green economy should not be merely viewed as new "tools" or new "approaches" to fulfill the goals of sustainable development. Green economy, while people could differ on its definition, must be viewed as a powerful context in which we carry out economic activities.

Green economy offers operable models and frameworks to grow innovative and sustained efforts. Green economy is the pathway to eliminate poverty and to develop harmonious relationship with the environment we are living within.

Green economy demands creativity. Green economy is way more than simple branding or slogans. It is innovative act. It is a promise to create and deliver. In China and many other places in the world, local economies are experimenting very interesting new models for sustainable development. We need to aggregate, exchange, expand and re-innovate all these best practices from local to global.

Green economy demands collaboration at an unprecedented level we probably have never seen. There is no shortage of new approaches, new access, and new models for us to adopt. We need to become experts in building trusts and finding partners through formal or informal dialogues.

Green economy itself demands opportunities to grow suitable growth models. We have discovered some exciting stories where new technologies, which would have not been adopted by maturing business in other countries, were successfully launched by entrepreneurial and its transnational business partner. The unique market opportunities available in developing countries make it possible and even easier to grow green technologies.

The experiences and efforts that are being made in countries like Brazil, Russia, India, China, South Africa should be given much bigger attention. Mature models and experiments should be pruned for implementation at bigger scales.

In the end, taking on Green Economy demands courage. Green economy is not immune from risk of failures or mistakes. Excessive worries or debates about what is fair and what is not block actions and cause delays. Fear of blame and fear of failures are making gaps bigger and bigger. It is time to let go of complaints and suspicions and re-honor our commitments.

#### New Environment to Invent - Institutional Framework

It is unthinkable that we can produce the outcome intended by Rio+20 if good governance and strong leadership are lacking.

We need an innovative governance system. The experience of the past twenty years proves that non-governmental organizations and other major groups must be given much bigger space and right of voice, which is determinative to the effectiveness of the new institutional framework.

At the very basic levels, eco-security must be realized through effective governance and enforcement. Eco-security transcends national borders and demands full efforts at local, regional and national levels.

At the global level, we advocate for establishing new international structures to implement the sustainable development goals. We are open and are willing to support people who make irrevocable promises and hold themselves accountable to courageous, responsible and measurable results. Whether the new structure is in the form of World Environmental Organization, or United National Sustainable Development Council, the key is to empower the new organization to adopt and supervise the execution of new initiatives.

Fundamentally, green economy in the context of sustainable development and poverty eradication are closely tied to the institutional framework because any meaningful changes require a new environment to be provided by strong leadership.

Inter-governmental working mechanisms at regional, national and global levels will continue to operate at higher level of productivity. For example, the governmental organizations must provide pro-innovation legal environment, enforce high regulatory standards.

The leadership at local, regional and national levels must at least focus on the following aspects:

- Promising market and accessibility.
- Social stability
- Social, economic or environmental systems generating demands or needs of applications

- Adequate information and proper access to information
- Educated workforce with proper skills and appropriate awareness
- Clear economic development priorities

#### Beyond Rio+20

What is more important than Rio+20 is what we do and what we deliver after Rio+20. We need to generate ongoing breakthroughs and honor the legally binding commitments we all have made.

It is critical that the Outcome Document must set mandates for what each of us is going to accomplish beyond Rio+20.

The challenges we are facing are enormous. We need to dramatically free up huge creativity and energy from the vast population on the earth.

To have sustainable development job done, we must ongoing re-educate ourselves and empower new generations to come.

In the pathway of green development, we must keep turning the new ideas into true success. We need to be courageous in front of failures, need to learn how to work with teams, mobilize all resources and promote our ideas and commitments. True innovation and entrepreneurship go beyond good ideas and bursts of passion.

With re-commitment firmly in hand, we must group together much more closely and we need to exchange ideas much faster and much more efficiently.

We are committed to be a hub for partnership and foundation for eco-civilization. We are open and committed to partner with all stakeholders to powerfully deliver the results.

## eco-union

Organization: eco-union (Barcelona, Spain)

Contact: Jérémie Fosse, President eco-union & Director Global Eco Forum

E-mail: [jeremie.fosse@eco-union.org](mailto:jeremie.fosse@eco-union.org)

Web : [www.global-ecoforum.org](http://www.global-ecoforum.org) & [www.eco-union.org](http://www.eco-union.org)

Report prepared by Mourad Gahnen, Idoia Arauzo & Jérémie Fosse (eco-union), with the support of Ester Xicota & Mathieu Durrande (ecodigma), Virginia Domingo (CADS), Gusman Catari (UAB), William Benthall (Esade), Sergi Rovira, among others collaborators.

Note: this report has not been fully revised by all participants of the Global Eco Forum and might be subject to change. Latest versions in English, Catalan and Spanish will be published at [www.global-ecoforum.org](http://www.global-ecoforum.org)

### 1. Presentation of Global Eco Forum

#### 1. Scope and methodology of the forum

The Global Eco Forum is an independent, annual and international multi-stakeholders conference around sustainability. It offers an open space for collective and systemic reflection towards environmental sustainability and emerging think-to-action tank of current and future opinion leaders and actors for change towards sustainable development in the Catalan, Spanish and Euro- Mediterranean region. It includes international dialogues between representatives of business, NGO's, government and academia as well as thematic workshops to explore in depth key topics in a collaborative way.

The Global Eco Forum is a project organized by eco-union, a not for profit and independent Spanish NGO created in 2005 in Barcelona focused on education, research and innovation for Sustainability. The Global Eco Forum has the support of a multi-stakeholders and multi-level advisory committee with more than 50 sustainability experts from NGO's, government, business and academia, to prepare the key topics and participative sessions of the Global Eco Forum. It is mainly funded by Catalan and Spanish government with the active support of Mediterranean bodies such as IEMed and UfM.

#### 2. Last 2011 edition focused on Rio+20

This Global Eco Forum 2011 aimed to open a process of debate and dialogue of the civil society aimed at the preparation of the Earth summit Rio+20 in 2012. From this dialogue and workshops was defined the forthcoming vision and recommendations to UNCSD draft zero towards a global sustainable development of Catalan, Spanish and Euro-Mediterranean region. The Global Eco Forum 2011 took place in La Pedrera, Barcelona, from 25th to 26th of October 2011, with more than 350 participants and 50 speakers from Catalonia, Spain and various Mediterranean countries (Italy, Greece, France, Palestine and Egypt). Main plenary sessions were live streamed on internet and recorded for further diffusion in our on-line social network. Previous to this high profile event, a meeting of the advisory committee took place the 14th July 2011 with more

than 40 participants, to prepare the participative sessions on Green Economy within the Global Eco Forum.

### 3. Participants and key debates

Some of the speakers and participants includes key representatives from Euro-Med thinks tanks (Anna Lindh Foundation, IEMed), government (Catalonia and Spain), Multinationals companies (Danone, Havas), SME's (eco entrepreneurs), NGO's (Greenpeace, WWF, IUCN), Academia (UAB, Esade), among others. The key questions explored in this forum were

- What is the meaning of Green Economy and governance of Sustainability in our own social and cultural context, i.e. Catalonia, Spain and Euro-Mediterranean region?
- What are the expectations and recommendations of the civil society towards Rio+20 Summit?

## 2. Challenges and recommendations for sustainable development

### 1. State of the (un)sustainability

We believe that nowadays it is vital to reduce the consumption of resources in the planet and in our region (Catalonia, Spain, Euro-med). The current consumption trend in term of resources is enormous and the effort that should be made is extremely worrying. The Global Eco Forum stresses that it has been well proven that there is a strong correlation between natural resources consumption and economical growth on one side and between technological progress and consumption on the other side. Growth and energy go hand in hand. The only slight consumption reduction we observed in some European countries recently was due to increased importation from China or economic recession but not due to our efforts to move to a greener economy. Technological progress has always come with more natural and energy resources use; this has been a standard through history because of the well - known "rebound effect".

### 2. Weakness around sustainable development

The analysis of the current situation of the euro-med region regarding the transition toward a sustainable society leads to observe that everywhere local sustainable initiatives are happening but there is no general map or systemic/inclusive approach.

Objectively, the overall picture is one of an endless growth model which is unsustainable and will surely collapse in the next few years. The majority still believes in "developmentism" (with a certain obsession for big infrastructures), "productivism" and consumerism" as being the most important drivers for (economic) growth, missing the link with inclusiveness, general well-being, happiness and prosperity. In this panorama of the euro-med region some causes and responsibilities of this were identified:

#### ■ Incoherent governance

The ambiguity at best or hypocrisy at worst that many institutions and decision makers say one thing but end-up doing another is a major issue. Many opposite signals have been sent to society, for example with speeches enhancing the importance of renewable energy but at the same time charging taxes against it or pleading for a responsible agriculture but financing an extensive one contrary to this. This kind of simple observation that the citizen can easily make is a clear indicator at different levels of the ambiguous and incoherent path taken by decision makers regarding a transition toward a sustainable model of development.

The evidence suggests that there has not been a serious change of paradigm understanding and its corresponding attitude with the majority of decision makers. The private and public sectors show the same incoherence, they often keep the sustainable economical approach as a vision and simply talking about it (communication and marketing departments) but with not enough impulse to integrate it to the decision moment and to implement it. Even the U.E. itself gives incoherent signals sometimes with two conflicting attitudes: for example financing transition tools and steps toward sustainability but, at the same time financing some big infrastructure which are questionable for sustainability and local development.

#### ■ Undefined institutional framework

Beside the creation and superposition of several networks and unions (Union for the Mediterranean, Barcelona process) we still don't have a sufficient institutional framework. Most of these organizations are still in the process of defining their role and structuring themselves, their link to civil society is also generally weak or "under construction".

The actual biggest challenge is the enormous gap between a globalised and structured finance sector leading the paradigm of the very short term and the on going and slow process of construction of a regional and global governance. This gives an obvious systemic advantage to short term economic benefit planning over long term sustainable development strategies.

How we manage an interconnected world with the governance processes lagging behind is one of the questions the forum is highlighting. All these aspects led us to an important fragmentation and limitation in term of decisions that remains at the margin of the system being constantly questioned by 'classical' approach of modern environmental conservationist (ecological) advance is often restricted by another conflicting parallel decision.

#### ■ Insufficient legislation

Governments have failed to create a legal framework which would help the investment in cultural, social and natural capital. As a result there is not enough protection of these common goods from predation and captation from some selected entities using it to create easy private benefit. The lack of regulation has led in numerous cases to an obvious exploitation of "all what it is useful" from some actors on a very short term plan in a complete disregard to sustainability.

The multilateral governance forums such as the protocols in Kyoto, Montréal, etc. have shown to be ineffective at reaching agreements and just as weak at implementing them. The lack of legislation framework set us back unfortunately to a dominant law of the mightiest (strongest). Working with regulation on the tax systems (paying/getting tax refunds for good/wrong environmental behaviours) is broadly recognized by our participants (see Workshops) as the wiser and most relevant and powerful tool to reach some results in our transition toward sustainable development.

#### ■ Negative economic conjuncture

The current economic phase, made up of the so-called economic crisis\* (in the north), economic 'crisis' and governance redefinition in the south of the Mediterranean area, seems to worsen the tendencies of decision makers to give priority to short term thinking and take decisions which are against Sustainable Development paradigm. A radical change of paradigm is needed in this precise moment. However it looks unlikely that weak decisions makers would have the courage and capacity to make it happen.

#### ■ Absence of a strong and shared vision

The same problems of cultural, social and environmental aspects connect south and north of the Mediterranean Sea. Human, cultural and natural capital is object of a predation from individual and private interest which forbids any sustainable management. There is no integration of these cultural social and ecological costs for human society in the current models.

### 3. Main transversal recommendations for sustainability

The forum leads us to a set of transversal recommendations to reach true sustainability:

- Create human capital: to get a critical mass of people with the knowledge and understanding of what is at stake.
- Push for collective intelligence processes: to produce initiatives backed by enough people with good awareness of sustainability.
- Choose a governance that has a strategic vision (long term): to use the human capital wisely and the collective intelligence processes to walk toward changes.
- Create systems and structures: to implement and monitor the whole path between strategic vision/principles and the field.

### 4. Main strategic recommendations for sustainability

Our forum through several dialogues and workshop suggests some specific and strategic recommendations for Euro-Med region:

- Create a shared vision in which new common enemies (e.g. climate change, pollution, water scarcity, desertification, etc.) are identified and are fought together.
- Develop a genuine process of planning together and harmonize legislation to respond to the common environmental challenges
- Guarantee transparency of the tax system and products environmental impact rather than only with subsidies and complex public policies.
- Promote equality among stakeholders (even when there no real equality: e.g. income distribution) and show equal respect for all parts (including the less experienced and powerful).
- Collaborate with civil society to play a major role in sustainable development and strive to achieve a win-win situation
- Prioritize on practicalities to make tangible progress at short and medium term and to maintain the commitment of citizens and politicians for more radical long term objectives.
- Empower the consumer and engage businesses to achieve societal transparency and corporate responsibility, key to good governance.

### 5. Final conclusion to implement sustainability

A decisive and collaborative action of the citizens, public and private sector is required. A change of the type of economic, social and environmental model in which we live is needed. For this, it is necessary to possess the capacity to develop lobbying tools to change the current development model but it is difficult unless a majority share the diagnosis and a vision of the future. In this sector we need leadership and courage to change from civil society.

### 3. Green Economy for sustainable development

#### 1. Scope and methodology

In order to define and boost green economy both at Mediterranean, Spanish and Catalan level, specific highly participate workshops have been undertaken with around 60 experts of sustainability from academia, government, NGO and private sector, divided around six sub-themes directly linked to green economy. All participants were asked to suggest to make the transition toward a greener economy on the following main recommendations.

#### 2. Concrete Recommendations

- 1) Support to existing economic sectors that generate green work places, such as renewables and energy efficiency, water cleaning and distribution, waste recycling,...

At Euro-Med workshop:

- Development of green urbanism, such as city mobility sharing systems that reduce pollution, less congestion and improve productivity and well-being of the population.
- Creation of sectorial clusters of excellence to identify and promote regional and national skills.

At Catalan workshop:

- Clear and stable business regulation to generate a long term vision and give time for the pay-back of the investment.
- Strategic alliances between big and small actors to access major projects and re-launch of a new industrial productive sector.
- Promotion of active public policies to identify, prioritize key sectors according to efficiency/competitiveness criteria

- 2) Support to new emerging green sectors, such as eco-entrepreneurship, eco-tourism, eco-mobility...

At Euro-Med workshop:

- Green screening community to match production and demand in new sectors and increase transparency of products and services.
- Increase capacity of the public administration to support green entrepreneurs (set KPIs) and boost innovation in new green businesses

At Catalan workshop:

- Labels and funding for green enterprises: definition and differentiation, giving access to funding through business angels and venture capitals
- Promotion of entrepreneurship and innovation at different levels of education and training, learning from experience, losing fear to risk/failure
- Promoting networks for transfer of knowledge and business opportunities: services to entrepreneurs, voluntary legislation, dissemination of success stories, green competitions, promoting of sector cooperation

3) New Public Policies to green the economy', such as green taxes, elimination of bad subsidies, green regulation...

At Euro-Med workshop:

- Achieve support from all stakeholders on climate change improving climate literacy to have a multi-national agreements and stop leakages (rebound, carbon leaks, green paradox & effectiveness)
- Promote renewable energies reducing price gap between fossil and renewables through subsidy reform (no more hidden subsidy on fossil fuels) and shift taxes from labour to environmental damages.
- Implement a package of whole and integrated green economy policies across all key sectors (housing, food, transport, energy...) including education policy and pollution taxes, green investment and investment on social sector.

At Catalan workshop:

- Implementation of new environmental taxes instead of subsidies: internalisation of externalities, adjusting prices relating to environment impact (fair transition)
- Promotion of voluntary accords in the private and public sector (without stopping legislation) as a driving force to reactivate economy
- Raising awareness around green products and services: eco-entrepreneurs associations, club of ethical and green procurement, eco-consumers associations

4) New indicators to foster transition towards green policies beyond GDP

At Euro-Med workshop:

- Select a group of ten indicators (balanced score cards) as main indicators of new economy increasing transparency and consensus among stakeholders.
- Link the political strategy to concrete indicators and specific targets (short, medium, long term) agreed among citizens, politicians and other key stakeholders.

At Catalan workshop:

- Public consultation process with experts about definition and objectives of the green economy
- Integration of social and environmental impact in the cost of products and services

5) Raising citizen awareness around green economy challenges and opportunities

At Euro-Med workshop:

- Honest, coherent and shared narrative from governments and other stakeholders about our common future to restructure the economy. promote green economy and integrate systemic change

At Catalan workshop:

- Public campaign to create positive expectations about the change process towards green economy
- Promotion of transparency through labelling to positively influence buying decision, promoting competitiveness towards sustainability and giving power to consumers.
- Social cooperation within civil society: co-responsibility to change and to implement green economy

6) Training and education for sustainability

At Euro-Med workshop:

- Review and sharing of best practices of formal, informal and non-formal education for sustainability to inspire and promote collective knowledge
- Create guides, frameworks and tools to improve eco-innovative learning practices (action-oriented, holistic approach, learning from failure) in existing campuses and curriculums.
- Creation of new eco-universities to boost radical innovation from start without resistance from existing structures, and inspire other campuses.

At Catalan workshop:

- Integration of the sustainability concept in the educational curriculums plans in all levels: university, vocational training, primary school...
- Development of a life-long learning plan about sustainable development basic skills: professional recycling, eco-entrepreneurship, vocational training
- Promoting global and local research on education for sustainable development

3. Main conclusions on green economy

The analysis of the outputs of the workshops on green economy highlights two key transversal issues: 1) the central role of tax policy reform to create the stimulus for green economy and 2) the basic role of education initiatives (formal, informal non-formal).

In the first workshop on green economy for euro-med region, participants have raised the idea of the creation of a new university specialised on sustainability as well as the fact of having an honest narrative from governments about our common future. Adequate pollution taxes systems, package of policies integrating all sectors (housing, food, transport, energy...) as well as increasing the number of city mobility sharing system initiatives were very well backed.

In the second workshop focused on green economy for Catalonia, the participants stressed the urgency of environmental taxes policy. Incorporate the social and environmental costs in the economy are seen as a basic and transparent measure. The second major aspect is the integration of sustainability at all levels of education (university, vocational, primary and secondary) .

3. General conclusions

As seen previously, the Global Eco Forum has been able to define collectively key recommendations on green economy and good governance of sustainability in Catalonia, Spain and Euro-Med region as inputs for Rio+20 draft zero.

We are fairly concerned that general awareness around this Earth summit is still very low in the society and we need to make sure that our main political, economic and social leaders are present at the maximum level, not only from environment but also finance, education, research, health and other key sectors of our society.

In the Euro-Med region, a specific task has to be made to include and educate new leaders coming into power after Arab spring revolution. The success of building a common sustainable agenda in the Mediterranean area would be a strong positive message sent to the rest of the world due to the high diversity and historic challenges within this region.

Finally the outputs of Rio+20 has to define a clear, transparent and legally binding roadmap with specific quantified targets, resources and deadlines similar to the Millennium Development goals.

## ECOJURE

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

1. Objeto: Desarrollar esquemas de financiación de las actividades de monitoreo y control de riesgos ambientales a través de estructuras asociativas público privadas, a partir de la contribución de quienes generan los riesgos.

2. Contexto: Buena parte de los países en desarrollo exhiben marcos legales relativamente bien diseñados, con escasa aplicación práctica de sus lineamientos. Las limitaciones presupuestarias de los gobiernos son señaladas usualmente como causa de la limitada implementación. Por otro lado, existe una tendencia sostenida hacia una mayor presión económica desde los gobiernos hacia el sector privado que explota dichos recursos. Sin embargo, esos recursos no se encuentran adecuadamente direccionados hacia los objetivos de prevención de impactos socio ambientales.

El panorama actual de la gestión de áreas protegidas presenta un agravamiento de la asimetría existente entre quienes desarrollan las actividades de explotación de recursos naturales y quienes se desempeñan en la gestión de las áreas protegidas, en términos de recursos humanos, acceso a la tecnología, acceso a la capacitación y en definitiva el acceso a los recursos económicos.

Deviene necesario fortalecer los mecanismos financieros existentes para lograr una respuesta oportuna a las crecientes amenazas, de manera tal de asegurar la capacidad de las áreas para asimilar los cambios que se producen en el entorno. Es sabido que el esquema de fondos orientados a solventar los daños una vez ocurridos no resulta efectivo para asegurar la resiliencia de los sistemas naturales, ni para disuadir la externalización de costos ambientales.

3. Propuesta: Normalmente los particulares pagan (a través de impuestos, tasas, contribuciones o en general mediante instrumentos económicos de variada naturaleza) por el aprovechamiento de ciertos componentes del ecosistema. Sin embargo, es un hecho evidente que la creación de riesgos supone en cabeza del Estado una carga ampliada de las actividades de monitoreo y control. Desde esta perspectiva, se postula un incremento de los recursos económicos proporcional a los riesgos que son creados y asignados a través de mecanismos eficaces.

Para tal fin es necesario desarrollar una matriz de financiación de las actividades de monitoreo y control que pueda integrar las siguientes variables.

a) Niveles de Riesgo de las distintas actividades sobre los ecosistemas relacionados.

b) Identificación de las actividades de monitoreo y control asociados a los distintos niveles de riesgo.

c) Desarrollo de una metodología de línea de base del sistema administrativo vigente en un territorio determinado para los fines de monitoreo y control ambiental.

d) Cuantificación sistemática del diferencial de gestión ambiental que demanda la actividad riesgosa para el ambiente.

e) Integración de sistemas de monitoreo y control con la debida participación del gobierno, las empresas y la sociedad civil.

f) Costeo de las actividades asociadas a la ejecución de los sistemas.

g) Administración público-privada del sistema de monitoreo y control.

h) Instrumentación de sistemas de fideicomisos para permitir que dichos esquemas de administración apoyen el sistema de administración de riesgos ambientales.

A través de esta propuesta se espera que:

<sup>[2]</sup> La creación de riesgos por los particulares no comporte una externalización de costos hacia la Administración y, por extensión hacia los contribuyentes.

<sup>[2]</sup> La administración de los riesgos tenga suficiente grado de transparencia frente a la sociedad civil y con ello pueda verificarse una tendencia hacia la reducción de la conflictividad socio ambiental.

<sup>[2]</sup> Pueda establecerse de la mejor manera posible la debida diligencia exigida y adoptada por los particulares frente a los riesgos ambientales que ellos crean.

<sup>[2]</sup> En aquellos casos donde, a pesar de las precauciones empleadas, acaezcan eventos dañosos para las personas o el ambiente, puedan éstos ser advertidos con prontitud a fin de adoptar las medidas necesarias e identificadas con la mayor precisión posible las relaciones de causalidad implicadas en cada evento.

4. Rol de la comunidad internacional – Fortalecimiento de aspectos institucionales y mecanismos financieros: Proporcionar esquemas metodológicos en materia financiera e institucional que faciliten la implementación de estas matrices de financiación de la actividad de control suplementaria que es consecuencia de los mayores riesgos planteados por el desarrollo de la actividad ejecutada por particulares.

Los organismos financieros internacionales están llamados a cumplir un rol central en el desarrollo de estos esquemas de desarrollo sustentable, basado en su conocimiento de las herramientas a nivel nacional, comparado y global, así como de su mandato en la materia.

De la misma manera, el desarrollo de estas matrices de financiamiento debe realizarse en estrecha cooperación con las organizaciones no gubernamentales en todos los niveles que resultan centrales para identificar las asimetrías que actualmente se presentan entre los riesgos asumidos con la autorización gubernamental para realizar ciertas actividades y la limitada capacidad de monitoreo, control y acceso a la capacitación de los sistemas públicos, como también de la sociedad civil.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

En relación a lo establecido en la Resolución 64/236 con respecto a los temas de la conferencia, se sugiere focalizar en el desarrollo profundizado de mecanismos financieros para asegurar la asignación efectiva de las contribuciones económicas tanto del sector privado como del sector público para la prevención de daños al ambiente.

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Título de la Propuesta: Desarrollo de matrices de financiamiento de actividades de fortalecimiento del monitoreo y control de riesgos ambientales.

1. Objeto: Desarrollar esquemas de financiación de las actividades de monitoreo y control de riesgos ambientales a través de estructuras asociativas público privadas, a partir de la contribución de quienes generan los riesgos.

2. Contexto: Buena parte de los países en desarrollo exhiben marcos legales relativamente bien diseñados, con escasa aplicación práctica de sus lineamientos. Las limitaciones presupuestarias de los gobiernos son señaladas usualmente como causa de la limitada implementación. Por otro lado, existe una tendencia sostenida hacia una mayor presión económica desde los gobiernos hacia el sector privado que explota dichos recursos. Sin embargo, esos recursos no se encuentran adecuadamente direccionados hacia los objetivos de prevención de impactos socio ambientales.

El panorama actual de la gestión de áreas protegidas presenta un agravamiento de la asimetría existente entre quienes desarrollan las actividades de explotación de recursos naturales y quienes se desempeñan en la gestión de las áreas protegidas, en términos de recursos humanos, acceso a la tecnología, acceso a la capacitación y en definitiva el acceso a los recursos económicos.

Deviene necesario fortalecer los mecanismos financieros existentes para lograr una respuesta oportuna a las crecientes amenazas, de manera tal de asegurar la capacidad de las áreas para asimilar los cambios que se producen en el entorno. Es sabido que el esquema de fondos orientados a solventar los daños una vez ocurridos no resulta efectivo para asegurar la resiliencia de los sistemas naturales, ni para disuadir la externalización de costos ambientales.

3. Descripción: Normalmente los particulares pagan (a través de impuestos, tasas, contribuciones o en general mediante instrumentos económicos de variada naturaleza) por el aprovechamiento de ciertos componentes del ecosistema. Sin embargo, es un hecho evidente que la creación de riesgos supone en cabeza del Estado una carga ampliada de las actividades de monitoreo y control. Desde esta perspectiva, se postula un incremento de los recursos económicos proporcional a los riesgos que son creados y asignados a través de mecanismos eficaces.

Para tal fin es necesario desarrollar una matriz de financiación de las actividades de monitoreo y control que pueda integrar las siguientes variables.

a) Niveles de Riesgo de las distintas actividades sobre los ecosistemas relacionados.

b) Identificación de las actividades de monitoreo y control asociados a los distintos niveles de riesgo.

c) Desarrollo de una metodología de línea de base del sistema administrativo vigente en un territorio determinado para los fines de monitoreo y control ambiental.

d) Cuantificación sistemática del diferencial de gestión ambiental que demanda la actividad riesgosa para el ambiente.

- e) Integración de sistemas de monitoreo y control con la debida participación del gobierno, las empresas y la sociedad civil.
- f) Costeo de las actividades asociadas a la ejecución de los sistemas.
- g) Administración público-privada del sistema de monitoreo y control.
- h) Instrumentación de sistemas de fideicomisos para permitir que dichos esquemas de administración apoyen el sistema de administración de riesgos ambientales.

De esta manera se propicia:

-  Que la creación de riesgos por los particulares no comporte una externalización de costos hacia la Administración y, por extensión hacia los contribuyentes.
-  Que la administración de los riesgos tenga suficiente grado de transparencia frente a la sociedad civil y con ello pueda verificarse una tendencia hacia la reducción de la conflictividad socio ambiental.
-  Que pueda establecerse de la mejor manera posible la debida diligencia exigida y adoptada por los particulares frente a los riesgos ambientales que ellos crean.
-  Que en aquellos casos donde, a pesar de las precauciones empleadas, acaezcan eventos dañosos para las personas o el ambiente, puedan éstos ser advertidos con prontitud a fin de adoptar las medidas necesarias e identificadas con la mayor precisión posible las relaciones de causalidad implicadas en cada evento.

4. Rol de la comunidad internacional – Fortalecimiento de aspectos institucionales y mecanismos financieros: Proporcionar esquemas metodológicos en materia financiera e institucional que faciliten la implementación de estas matrices de financiación de la actividad de control suplementaria que es consecuencia de los mayores riesgos planteados por el desarrollo de la actividad ejecutada por particulares.

Los organismos financieros internacionales están llamados a cumplir un rol central en el desarrollo de estos esquemas de desarrollo sustentable, basado en su conocimiento de las herramientas a nivel nacional, comparado y global, así como de su mandato en la materia.

De la misma manera, el desarrollo de estas matrices de financiamiento debe realizarse en estrecha cooperación con las organizaciones no gubernamentales en todos los niveles que resultan centrales para identificar las asimetrías que actualmente se presentan entre los riesgos asumidos con la autorización gubernamental para realizar ciertas actividades y la limitada capacidad de monitoreo, control y acceso a la capacitación de los sistemas públicos, como también de la sociedad civil.

5. Refinamiento de los temas de la Conferencia: En relación a lo establecido en la Resolución 64/236 con respecto a los temas de la conferencia, se sugiere focalizar en el desarrollo profundizado de mecanismos financieros para asegurar la asignación efectiva de las contribuciones económicas tanto del sector privado como del sector público para la prevención de daños al ambiente.

CONTRIBUTION POUR PRENDRE PART A LA CONFERENCE SUR LE DEVELOPPEMENT DURABLE

A/INTRODUCTION

Bien que l'éducation à l'environnement soit faite depuis plusieurs années, la plupart des populations ignorent les problèmes environnementaux en particulier en Afrique.

B/DESCRIPTION

Pour que les populations soient bien informées sur la dégradation de l'environnement afin qu'elles fassent des actions concrètes pour le protéger, la multiplication des actions éducatives de proximité s'impose.

Sensibiliser les populations sur ce que c'est que l'environnement, l'état de dégradation de l'environnement, les dangers de la dégradation de l'environnement, les méthodes de protection de l'environnement, le bien fondé de la protection de l'environnement par les meetings, les séminaires, les conférences débats, les films, les sketches, etc.

Réinstaurer l'éducation environnementale dans les programmes académiques (écoles primaires, collèges, lycées, universités etc ...).

Publier largement les résolutions des précédentes rencontres sur le développement durable car la plupart des populations ignorent ces résolutions.

C/CONCLUSION

L'éducation à l'environnement doit précéder toute action de protection de l'environnement.

PRESENTE PAR:

Koffi AKOUTSE

DIRECTEUR DE L'ONG ECOLE ET VIE

Input to Zero Draft for Rio+20: towards the Outcome of the United Nations Conference on Sustainable Development

1st November 2011

Any proposal taken forward at Rio+20 must address the basis of human survival: biodiversity, ecosystem resilience and the importance of trying to address climate change, by sharply and immediately reducing emissions.

This means rapidly phasing out fossil fuel burning as well as protecting and, where possible and appropriate, restoring and trying to regenerate ecosystems. In fact it means changing our models of economic development from energy intensive to low energy models, with major implications particularly for industrialized economies.

As the Global Biodiversity Outlook, 2010, says:

The action taken over the next two decades will determine whether the relatively stable environmental conditions on which human civilisation has depended for the last 10,000 years will continue beyond this century. If we fail to use this opportunity, many ecosystems on the planet will move into new, unprecedented states in which the capacity to provide for the needs of present and future generations is highly uncertain.

We cannot “eradicate poverty” without first attending to the basic needs of life: clean water, accessible and nutritious food and access to land on which to produce it. In addition we need to protect the ecosystems that are fundamental to the planetary “web of life”

Furthermore, as the the International Assessment of Agricultural Knowledge Science and Technology for Development (IAASTD) says:

Climate change, which is taking place at a time of increasing demand for food, feed, fiber and fuel, has the potential to irreversibly damage the natural resource base on which agriculture depends. Climate change is affecting the distribution of plants, invasive species, pests and disease vectors and the geographic range and incidence of many human, animal and plant diseases is likely to increase. A comprehensive approach with an equitable regulatory framework, differentiated responsibilities and intermediate targets are required to reduce GHG emissions. The earlier and stronger the cuts in emissions, the quicker concentrations will approach stabilization.

... Successfully meeting development and sustainability goals and responding to new priorities and changing circumstances would require a fundamental shift in AKST [Agricultural Knowledge Science and Technology], including science, technology, policies, institutions, capacity development and investment. Such a shift would recognize and give increased importance to the multifunctionality of agriculture, accounting for the complexity of agricultural systems within diverse social and ecological contexts. It would require new institutional and organizational arrangements to promote an integrated approach to the development and deployment of AKST. It would also recognize farming communities, farm households, and farmers as producers and managers of ecosystems.

These extracts emphasize the urgency of real and immediate cuts in emissions, which should be strongly emphasized by Rio+20.

Agroecological approaches to food production must be prioritised.

There are many potential, highly beneficial synergies to be derived from agroecological approaches. Many of them are already apparent in smallscale agricultural systems, pastoral and fishing systems and fisherfolk systems. They can help to address the need for more employment, provide more nutritious and accessible food, and boost local economies through local food production and markets, with the generation of additional employment around food production. Besides these advantages there are many more: the conservation and generation in situ of locally adapted varieties of fruits, vegetables and staple crops, regained control over food production at local level, closer contact between producer and consumer. And there are major ecological benefits too: adding organic matter to soils, improving soil structure and capacity to retain moisture, rebuilding the soil food web that is basic to the production of nutritious food and which has been so seriously undermined by industrial agriculture and related inputs. Agroecological approaches are basic to the concept of food sovereignty.. Agroecological systems can also play an important role in addressing climate change.

We urgently need political will and policy frameworks for all this.

However, we find the quality of debate leading up to Rio+20 disappointing. There is a lack of discussion about the fundamental issues mentioned above. The Rio+20 process needs to build on the insights gained in the conventions that were established in 1992 on climate, biodiversity and desertification.

### Green Economy

We believe that the term green economy needs far clearer definition. Currently it is used very loosely, without explanation and becomes more like a slogan than a meaningful term. It often appears to seek to conflate two things that are currently in deep conflict: the ecology of the planet and the economic model that is based on externalizing the costs of the destruction of ecosystems, biodiversity, soils, water in order to generate profits.

The term sustainable development is ambiguous, but the term green economy is even more so. This means that we are not ready to discuss a 'green economy roadmap'. As noted above, we have to define what we mean by a green economy first. Unfortunately the time available to prepare for the Rio+20 meeting and to discuss the issues is so limited that the debate is unlikely to mature sufficiently in time. Key principles towards an acceptable definition include: justice, equity, equality, accountability, transparency, inclusivity, ethics. However, without the relevant policy frameworks, these also become mere slogans. Rio+20 should begin the process of developing such frameworks. Two principles derived from the Convention on Biological Diversity should be basic here: the Precautionary Principle should be applied to the evaluation of new technologies and approaches and the principle of Free Prior Informed Consent is also crucial to generate inclusivity and to ensure that the wisdom of indigenous peoples and local communities is able to inform decisions taken at international level. This must be genuine otherwise it risks being merely the Engineering of Consent.

Civil society in all its rich diversity needs to be included more centrally in discussions of how we move forward but it is difficult for civil society to participate effectively. This is a major issue with the Rio+20 process and in different ways is a problem for all the UN instruments that urgently needs to be addressed by opening more spaces for civil society participation.

### Precautionary principle and technology development

Some see the development of technology as a way to address the multiple challenges of climate change, biodiversity loss, and the need to provide food and energy. However, we believe that applying genetic engineering, synthetic biology, nanotechnology or geoengineering as solutions is more likely to compound than solve our problems. We do not have sufficient understanding of the dynamic systems or climate and biodiversity for which these solutions are proposed. However our multiple crises are being used as a means to try and force acceptance of their use. In the face of increasing pressure to apply these technologies prematurely and inappropriately, we believe that it is urgent to apply the precautionary principle to such technologies for assessing new technologies before they are deployed.

### Biodiversity and climate offsets and Payments for Environmental Services

Attempts are being made to solve problems our economic model has caused to the planetary ecosystem by developing market instruments such as climate (carbon) and biodiversity offsets and other ecosystem-related (e.g. water) offsets and market-based Payments for Environmental Services. This approach is deeply flawed and will not address our multiple crises. Carbon offsets at best maintain the same level of emissions, and more often increase rather than decrease overall emissions. Further, they are a distraction from taking meaningful action.

Biodiversity offsets risk fragmenting and undermining the integrity of ecosystems. The term ecosystem services is increasingly used instead of ecosystem functions. The term "services" immediately connects to the idea of marketing such services and the idea that they can be priced and set in order of importance. However, ecosystems function as interactive wholes. We believe this market approach is extremely dangerous to biodiversity and the integrity and resilience of ecosystems.

Addressing the power of corporations

Many civil society organizations saw the Earth Summit of 1992 as an opportunity to prioritise discussion of how to control corporations. However, this did not happen. The UNCTC was absorbed into UNCTAD and work on the proposed code of conduct for corporations was suspended in 1993. At the Johannesburg Earth Summit in 2002, governments acknowledged the need for global rules for global corporations. Since then, it has become ever clearer that we need to control corporate power. Corporate social responsibility is not the way forward: we need binding regulation, not voluntary commitments that are more public relations than substance.

At Rio 2012, governments should agree to the development of a binding global instrument that ensures full liability for any social or environmental damage corporations cause.

Sustainable and Competitive Tourism at Rio + 20 and the London Olympics 2012 Connecting Sustainable Tourism

- Building a Mosaic of the Global Green Economy

through Responsible, Sustainable & Competitive Tourism |V

An Olympic Effort at Rio+20

Submission to Rio + 20 Outcome Process Deadline 1st November

UNCSD Secretariat Dsd@un.org

Mr Authur de la Cruz Delacruz@un.org

Ms Tonya Vaturi Vaturi@un.org

From: Ecotrans - DestiNet Executive UN Type II Partnership

Prepared by: Gordon Sillence, Executive Director

30h October 2011

Summary - Expectations of the Outcomes

In order to move from words to action, and thinking on the level of using the Rio + 20 process to help to shape a peace-based, global green economy to meet current world-wide challenges, this paper presents a clear strategy to achieve this by prioritizing sectoral activity related to tourism sustainable consumption and production. Its offers a practical outcome of Rio+20, building a showcase Global Mosaic of Responsible, Sustainable and Competitive Tourism and then planning to use large-scale events to mainstream peace, responsibility and sustainability messages through developing this mosaic. This mosaic would model a solutions-based approach to restructuring the global economy as global peace-based, green economy, using tourism stakeholder activities;<sup>1</sup> cross-cutting socio-economic power as an instrument for sustainable development, as well as ensuring the sustainability and competitiveness of local and global tourism offers in an uncertain future. It calls for the governments who signed the Olympic Truce Resolution this October 2011, who are also attending Rio +20 to work together to shape an international sustainable tourism campaign that delivers a map of the global responsible and sustainable tourism offer as a strategic path to the green economy. The UN Type II DestiNet Partnership set up after WSSD in 2003 and working on item 43 of the JPoI, has been dealing with these issues for the past decade, and can report on how this can be achieved as an outcome of the UN Agenda 21 Rio+20 event in June next year.

The outcome of Rio should have a very practical working model of sustainable production and consumption, a solutions-based model that takes into account current food, financial and environmental crises and the Millennium goals targets. The mosaic of the sustainable tourism supply chain, including businesses, destinations and travellers good practice shows a path to global cultural and environmental exchange, and economic equity. The aim would be to invite governments to shape this model for Rio+20 and then mainstream the message by the London Olympics in July-August 2012, bringing together the dimension of the need for a peace based global economy that moves us from a culture of violence to a culture of peace. Therefore Rio+20 should declare the six week Olympic Truce period that UN Members have just voted for as a time to mobilize inter-cultural exchange as a catalyst for sustainable development, using tourism and sport to bring the sustainable development agenda a mass audience to speed up progress on the millennium goals.

This proposal is based on Ecotrans Network for Sustainable Tourism Development participation in WSSD 2002 and the authors;<sup>1</sup> previous engagement in WSSD in Johannesburg in 2002 when working as a Commission staff member of DG Enterprise Tourism Unit alongside the EU team of 50 people listed to attend, and now acting as executive director of the DestiNet Sustainable Tourism Portal UN Type II Partnership. See [www.destinet.eu](http://www.destinet.eu).

Background - Development of the DestiNet UN Type II Partnership

Guided by Agenda 21 and EU SDS I & II implementation policy lines, the European Environment Agency followed through on the WSSD by creating a UN Type II Partnership with the UN WTO, UNEP and the Ecotrans Network for Sustainable Tourism Development, with the aim of building a portal for sustainable tourism knowledge networking to achieve the WSSD plan of implementation. In 2005, the Portal was further specified in DG Enterprises;<sup>1</sup> innovation in tourism process as a knowledge networking tool to

develop learning areas and regional clusters in the field of tourism-based sustainable consumption and production. Now the Portal has been through an 8 year development cycle, is operating at a global scale, and is host to the Commissions' latest efforts in the field of sustainability and competitiveness to develop a European-level virtual tourism observatory concept and on-the ground, working regional tourism innovation clusters in Europe.

In March 2011 the DestiNet Portal team demonstrated a complete supply chain mosaic of sustainable tourism at Berlins ITB1. Currently the Portal houses a growing list of 387 European examples of certified and awarded sustainable tourism products and services in its Best Practice Atlas of Excellence (the worldwide database contains over 500 examples). Included in this are 70 EDEN award winners - shortly to be updated to list all 98 current winners. This forms the world's leading best practice knowledge base to showcasing the field of sustainable tourism

Introduction: Progress Assessment, Remaining Gaps - Agenda 21/WSSD follow through

Helping to shape the next ten years of global policy-making at Rio+20, this proposal deals with a decade of policy and market developments in the field of sustainable tourism, providing a contribution to planning actions centred on Agenda 21/SDS follow through at Rio+20 and the London Olympics next June and July 2012. The UN has set the agenda of Rio +20 to focus on the two key themes the Green Economy and Institutional Change. To face multiple challenges of economic and social instability, increasing levels of violence and civil wars, climate change, etc, the concept of a peace-based, knowledge-driven green global economy will be a strong feature of Rio+20, as will the value system of good governance. The EU has been a leading force in many respects on these issues, being founded on the concept of forging European peace, creating a global knowledge economy for its businesses and citizens, and heading the world in terms of certified green tourism businesses and protected area networking, within the framework of its own SDS good governance process.

As part of a synthesis of a decade of the Agenda 21/EU SDS implementation efforts of UN, EU, national, regional, local governments, global businesses, NGOs and other civil society groups - all working on sustainable development issues, this action is designed to meet long term Agenda 21 and WSSD policy coherence, following through on stakeholders WSSD commitments. At the same time it provides support for a number of existing initiatives by creating synergy through their combination.

Sectoral Priority -Building the Green Economy through Showcasing Sustainable Tourism

The frameworks of both the green economy and institutional change discussions taking place in the run up to Rio+20 will both be better informed though the action Taking Sustainable Tourism Small Businesses to the Global Stage A Mosaic of the Global Green Economy. Using tourism activity as a motor for the green economy and institutional change, the aim would be to develop a global mosaic of responsible, sustainable and competitive tourism as part of the national contributions to Rio+20 and the London Olympics.

Promoting the Mosaic - Specific Cooperation Mechanisms

Under the heading Taking Sustainable Tourism Small Businesses to the Global Stage A Mosaic of the Global Green Economy, a map of international certified and awarded tourism destinations, products and services can be developed and then showcased at Rio+20 and the London Olympics. The global offering of peaceful, green, diverse tourism destinations of excellence can be broadcast by taking certified SMEs to the international market place at these two events alongside other certified and awarded tourism products and services. Rio+20 and the Olympics bring the theme of human excellence and our greatest challenges together, and the temporal coincidence of the two globally significant events next year offers great potential.

In order to realize this action, the following practical ideas can be implemented:

- 1) This knowledge can be attractively displayed as a stand with promotional paper-based and audio-visual material, and delivered at the Rio+20 event.
- 2) A series of short commercial style video adverts for sustainable tourism destinations can be made, linking destinations of excellence to relevant Olympic athletes and prominent politicians supporting tourism, culture, peace and sporting initiatives (cf Hungarian president, Lord Sebastian Coe).
- 3) A workshop at Rio+20 can be held on the theme of sustainable and competitive business development based on tourism, showcasing examples of excellence throughout the overall tourism supply chain and in destination good governance.
- 4) A short video on the role of tourism in creating peace can be made, calling for a peaceful global world in which all nations and their citizens can benefit from better tourism business the world over.
- 5) A partnership strategy can be used to broadcast the materials in Rio and then in London. Partners would include media, tourism business stakeholders, NTOs, NGOs and global institutes.

Modeling an Institutional Framework with Agenda 21 Good Governance Values Prosperity through Peace for People in Need

The key messages of Johannesburg were based on the slogan "People, Prosperity and Planet", moving the narrower initial focus of sustainable development on environment to include broader socio-economic and cultural sustainability. Ten years on, we have identified that a peace-based global economy can deliver 2 trillion dollars a year to the global economy with a 25% reduction in conflict<sup>1</sup>. It is this money that could be used to construct a new institutional framework of sustainable development that would be fleshed out with agricultural, industrial, energy and transport sustainability innovations around the global to local tourism supply chain and destination management infrastructure.

The process to achieve this this would involve helping make the London Olympics a time of global peace using the six weeks of designated peace during the Olympic competition as a contribution to realize the Millennium goals, and to celebrate the best of human nature whilst creating a unique business opportunity for global responsible/sustainable tourism in participating countries. If linked to Rio+20, the London 2012 Games will open the floodgates of cultural understanding and exchange in the spirit of the Millennium Declaration. A tourism bonanza can be created during the Olympic media coverage of each country, to put responsible and sustainable tourism businesses and destinations from Africa, Asia, Latin America and elsewhere on the international consumer map<sup>2</sup>. This action would benefit both residents as visitors and host countries as global destinations. In the spirit of making the national contribution to tourism activity and development more responsible, sustainable and competitive, each participating country can profile its responsible/sustainable tourism offers in an Olympic showcase of the best that country has to offer on a safe and welcoming global tourism trail. This second map (alongside the map of Global Destinations of Excellence) can be created for the Rio+20 event and as preparation for the Olympics, aiming to show how the Agenda 21/WSSD sustainable tourism process is developing globally, and then take it to mainstream markets.

Three specific actions to achieve this would be:

„h Support for a Responsible & Sustainable Tourism Business & Destination Support Travel Initiative - showcasing community-based responsible and sustainable tourism best practice offers next to a country's Olympic icons. Responsible tourism can be targeted at the poorest nations of Earth to give a boost for local communities to benefit from global tourism opportunities for economic, cultural and environmental recovery.

„h Support for the VISTAS Peace through Tourism Award<sup>3</sup> an international award to highlight those countries which works most towards to Peace, with the aim of

developing the peace-based green global economy.

„h Use the Global Peace Index<sup>4</sup> as the basis for monitoring the Olympic peace after Rio+20, as a practical outcome of Rio +20, and further develop the DestiNet UN Type II Partnership Sustainable Tourism Platform as technical tools to manage the implementation.

#### Conclusion

To avoid being seen as just a talking shop process, the outcome of Rio should have a very practical working model of sustainable production and consumption, a model that takes into account current food, financial and environmental crises and the Millennium goals targets. This proposal shows the possibility of the creation of a mosaic of the sustainable tourism supply chain, including businesses, destinations and travellers good practice showing a path to global cultural and environmental exchange, and economic equity. The aim would be to invite governments to shape this model for Rio+20 and then mainstream the message by the London Olympics in July-August 2012, bringing together the dimension of the need for a peace based global green economy that moves us from a culture of violence to a culture of peace. Therefore Rio+20 should declare the six week Truce period that UN Members have just voted for as a specific time to mobilize inter- cultural exchange as a catalyst for sustainable development, using tourism and sport to bring the sustainable development agenda a mass audience to speed up progress on the millennium goals.

Please contact Gordon Sillence or Herbert Hamele to discuss this proposal further.

Gordon.destinet@ecotrans.de Herbert.hamele@ecotrans.de www.destinet.eu

## Edmund Rice International

This submission, from Edmund Rice International (ERI), a faith-based NGO with offices in Geneva and New York, draws on the work of several thousand colleagues, who, based on their faith, are working for social justice and ecojustice in over thirty countries, and building a global network to protect and promote human rights and ecological sustainability.

The RIO+20 Conference is undertaking, in its Outcome document, two major tasks: to re-design previous work on sustainable development into a more coherent and effective movement, and to meet new challenges. ERI is proposing a possible philosophical framework for this document, and a sharper focus for its goals.

#### The Need for Integration of Themes in the Rio+20 Outcome Document

The two major themes for Rio+20, the Green Economy and Sustainable Development Governance, seem to lack coherence. Is Green Economy to replace Sustainable Development in our language? Both promote an ongoing dualism between ecological and economic language, where 'Green' is pitted against 'Economy' and 'Sustainable' against 'Development'. Yet ecology and economics are both science-based disciplines, dealing with energy flows in systems. The Outcome document can reflect the fundamental unity that guides the energy flows.

Some acknowledgement is needed in the Outcome document of the relationship between ecology and economics, with economics being depicted as embedded within ecology. As both disciplines involve human reflection on human behaviour, including human interaction with the environment, the Outcome document can include both disciplines within a perspective of human freedom and human rights, working within a more fundamental respect for human limitations.

There are many documents already in circulation that integrate human aspirations within the limits of natural systems. ERI would suggest the Earth Charter is one that uses clear concise language to outline the fundamental issues, and its principles could underpin the Rio+20 Outcome document.

From both a faith-based and science-based perspective, the Earth Charter neatly includes the major issues facing the human race. It can serve as a philosophical context for the Outcome document.

While the Rio+20 Conference itself proceeds from an ethical imperative, it is important to highlight the ethics that proceed from the Earth Charter perspective. If 20% of Earth's people consume 80% of the available resources, and if Climate Change is largely the result of this 'overdeveloped' 20% using these resources unsustainably, there is clearly a call for rational acknowledgement of this responsibility, and commitment to resolving the imbalance and the damage done by it. As all decisions have consequences, the ethical commitments by States, as enshrined in the Outcome document, need to specify outcomes, timeframes, and sanctions for non-compliance.

#### The Need for New Language

ERI suggests the last fifty years of international debate has left the word 'development' in semantic tatters. While the world celebrates twenty-five years of 'the right to development', others are saying, more bluntly: 'Development causes Climate Change. Climate Change prevents development. We need a new paradigm.' The Outcome document can address this challenge by dropping the term 'sustainable development'.

ERI proposes that sustainability could well replace 'sustainable development' in the Outcome document. The term has a secondary meaning, of 'financial self-sufficiency', in some circles, but the Outcome document can address the inclusion of balanced accounting within ecological sustainability.

ERI's experience is that sustainability can be applied effectively as a guiding principle to large systems (such as nations, global economies, corporations) as well as to micro-systems (such as individuals, households, local centres). It is measurable (through such instruments as the Ecological Footprint, Carbon Footprint, Water Footprint, etc) and universally applicable, with variations in local climate and soils factored in.

Sustainability can emerge in the Outcome document as a personal, group, social, national, regional and global goal, thus providing unity to all the aspirations and recommendations. It avoids the 'parallel politics' of a 'global governance mechanism for sustainable development'. Yet it provides clear, measurable criteria for all nations and groups, and lends itself to easy monitoring and assessment. It also avoids the resistance to such notions as 'no-growth economics, or 'reverse development', and stimulates human creativity, including the technological, in its achievement.

#### Recommendations

1. That the Outcome document adopt a philosophical framework that presents human aspirations within the limitations of natural systems, with principles such as those outlined in the Earth Charter being used to unite the goals and recommendations on governance and energy flows.
2. That the Outcome document adopts a structural perspective that embeds economic principles within ecological principles.
3. That the Outcome document enshrines the ethics of the Earth Charter principles in specific commitments, within clear timeframes, by States assuming responsibility for their actions.

4. That the Outcome document strengthen the ethical framework of the decisions made by specifying the sanctions that will apply if States do not meet their obligations within the agreed timeframe.
5. That the Outcome document adopts the term 'sustainability' as its overarching goal, and does not use 'sustainable development'.
6. That the Outcome document uses sustainability as the single pillar of national progress and human advancement.

## Education Dialogue Group ( EDG)

A Rio narrative from the Education Dialogue Group (EDG), formed around the Co-Chairs four key questions, with the four responding EDG key issues.

1. What are the expectations for outcomes of Rio +20 and what are the concrete proposal including views on the possible structure of the outcome document?

Educations response to unsustainable development has been substantial, arising from Rios call to re-orientate education systems toward sustainable development. Conjoining the three pillars of sustainable development: environment, society and economy, across curricula, campus and communities to develop the emerging pedagogy and practice of Education for Sustainable Development (ESD), or even more holistically the Welsh Education for sustainable development and global citizenship, has mandated education systems to develop policy and practice aimed at forging a sustainable future. The resulting systems change has affected every level; the competencies of ESD educators, the transmission of ESD practice and the genesis of lifelong ESD learning across formal and informal learning . From the initial UK Government panel frameworks, responses across learning sectors have diverged, with an added focus on culture across Higher Education and on inclusion in the youth sector, but successes are manifold, with trends including:

- i. Awareness of the moral imperative for ESD in Higher Education.
- ii. A vision of schools in UK as leading children and communities in ESD.
- iii. The recognition of the value of human, natural and social capitals in education.
- iv. An increased awareness of the importance of the relationship between children and their local environment.
- v. A search for new directions for education.

ISSUE 1: 'Re-orienting education towards sustainable development' must accelerate, if Rio+20 is to achieve the transformational effect of Rio; a new Chapter 36 is fundamental to sustainable development exerting continued influence over education systems.

The impact of all this could be lost unless Rio+20 calls on governments to redouble their efforts and build on the valuable work that has been undertaken to date.

2. What are the comments, if any, on existing proposals e.g., a green economy roadmap, framework for action, SD goals, a revitalised global partnership for SD or others?

The details of the nature of the transformation, into a world which conserves its environmental/ natural, human and social capitals; the limits we set collectively for that growth; the indicators of success such as well being (in the North) or poverty reduction (in the South), and the indicators of failure such as climate change, loss of biodiversity, increase in natural disasters, human health failures and human migration i.e. the narrative of the green economy, will be negotiated through the Major Groups across the globe. However, the realisation of that future will be via learning and change at each system level: the personal, institutional, community, administration, national, transnational and pan national. 12 The landscape has changed; Climate change is a reality for many, while the developed world plans for both mitigation and adaptation simultaneously, even in our schools.

ISSUE 2: To transform, or green, the economy and hence society; we must transform our education systems; coupling curriculum (skills, attitudes and values) campus and community aspects of formal education, along with informal and non-formal learning, to that new agenda.

3. What are the views on implementation and how to close the implementation gap which relevant actors are envisaged as being involved? Governments, Specific Major groups, UN systems?

Emerging challenges include youth poverty and alienation across the globe and the time may be right to update Chapter 25 11 with its focus on youth participation, youth employment and youth human rights, to incorporate current Youth Caucus views<sup>6</sup> around the need to turn crises into opportunities. Rio 1992, agreed 25 overarching principles 5, including youth participation (Principle 21) but youth engagement continues to be a challenge, and this, combined with youth poverty and the well documented need for the developed world to reduce its global footprint requires this Summit to re-address this issue, as a priority.

ISSUE 3: A Future generations principle is needed, to uphold the rights of future generations to meet their needs and ensure that the Youth of today are engaged in decision making for their future, with the subsequent appointment of an ombudsmen for future generations, at national and international levels, to uphold that principle and advocate for complaints.

4. What specific co-operation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented? Rio + 20 comes two years before the end of the UN Decade for ESD (DESD) in 2014, and three years before the Millennium Development Goal deadline in 2015 . In UK planning frameworks for ESD run to 2020, but the background on Carbon emissions timescales are complex, with 2020, and 2050 offering milestones. Complex change is already underway and Rio+20 must draw fully on the experience of Agenda 21 and the wealth of evaluative documents drawn together by WWF-UK<sup>13</sup>, and through the DESD3 . Similarly resilience, both individually and at the community level, enabling both adaptation and mitigation, is proving necessary for sustainable development being generated through new social movements like Transition Towns<sup>13</sup> and the rise of volunteering in the north and participation in community education in the south<sup>14</sup> .

ISSUE 4: ESD momentum, and the centrality of children, must be maintained and the proposal to form a Sustainable Development Board to oversee the One United Nations country programme, integrating measurement of childrens well being with food production and sustainable development would ensure that this is safeguarded during the transition from the the Decade for ESD and the Millennium Development Goals.

At the most fundamental level, can faith in the future only be restored through education? drawing on learning from other cultures and time periods, enabling the limitless innovation required for humanitys survival?

Education Dialogue Group History

Earth Summit The Education Dialogue Group was originally set up by UNEP-UK in 1991 to prepare for the Rio Earth Summit. For the Earth Summit it produced the

publication: Earth Matters. It also input to the preparations to the UK Government for the preparatory meetings for Rio and Rio itself. Although Agenda 21 didn't recognise the Education Community as a Major Group UNED-UK did. Therefore from the beginning of its existence UNED-UK had a position on its Executive for the Education Community.

In 1994 The Education Task Group (now know as the Education Dialogue Group) developed the Education 21 concept which was focused on two deliverables;

- Recognition for the Education Community as a Major group; embracing representatives of all those individuals (and groups) with a commitment to education in support of sustainable development.
- Amendments to chapter 36, of agenda 21, identifying the rights and responsibilities of the education community; across formal and non-formal sectors.

In 1995 the group set up the education caucus at the UN as part of the CSD NGO Steering Committee and lobbied for the objectives mentioned above. In 1996 the ETD and the Education caucus successful sought for the UNESCO Task Managers report to be rejected at the CSD. It was the view of the community that UNESCO had not fulfilled its objectives in Chapter 36. In 1996 it also organized a major conference in preparation for the five year review of Agenda 21. WSSD Preparations For WSSD the group working in the UK hosted a number of events and developed a template to enable a review of Chapter 36 of Agenda 21. It also held a Conference with South Bank University to prepare input to the UK Government and also to the relevant UN Task Manager. Its objectives for WSSD there three fold:

- Recognition for the Education Community as a Major group;
- A new chapter for agenda 21 identifying the rights and responsibilities of the education community;
- A Decade for Education for Sustainable Development Education.

Out of these three it achieved the Decade and has education community mentioned as another key stakeholder group iV the closest to Major Group status yet.

Rio + 20 The EDG continued to meet regularly until 2008, with annual meetings in 2009 and 2010, convened around iVthe Green New Deali and Rio+20 respectively. It continues to operate as a national list-serve, fulfilling its original function of connecting international policy with national implementation.

## Egis

Egis : concevoir des constructions et des territoires durables au service des populations locales

Egis ancre, depuis plus de 60 ans, son action au cœur de l'intérêt général et de l'innovation, participant ainsi à la réduction des inégalités par la création de valeurs au niveau des territoires.

Imaginer et accompagner des solutions d'aménagement durables, avec et au profit des populations, c'est la contribution d'Egis à une économie plus responsable.

Groupe d'origine française réalisant 800 millions € de chiffre d'affaires dont près de 50% à l'international, Egis intervient dans les domaines de l'ingénierie et du conseil dans le domaine de l'aménagement des territoires (transports, ville, bâtiments, eau, énergie, environnement, industrie). Egis a également une forte et longue expérience en matière d'aide Publique au Développement.

Akteur du développement des territoires à travers son savoir-faire et sa stratégie d'innovation, sur des sujets comme la ville durable, l'adaptation au changement climatique, l'inter modalité dans les transports, l'efficacité énergétique ou encore la biodiversité, le groupe s'attache à faire de sa politique de responsabilité sociale le « marqueur » de sa stratégie de développement, en cohérence avec la politique de son actionnaire de référence, la Caisse des Dépôts.

Avec 11 000 collaborateurs, dont 7000 dans l'ingénierie, Egis intervient dans une centaine de pays. Il est le seul groupe dans l'ingénierie française de la construction à figurer dans le classement des 10 premiers européens et des 20 premiers mondiaux.

Parce qu'il conçoit et contrôle chaque année des investissements de l'ordre de 10 milliards € de travaux, l'effet de levier d'Egis est très significatif sur l'aménagement durable des territoires. Son intervention en amont des projets et son rôle de prescripteur lui permet de proposer des critères de minimisation de l'empreinte environnementale des travaux et de l'exploitation des ouvrages, tout comme une approche globale et intégrée de la performance environnementale, énergétique et sociale.

Par la variété de ses différents métiers (conseil, ingénierie, montage, exploitation), Egis est organisé pour répondre aux enjeux de Rio + 20. Son impulsion en faveur d'une croissance verte passe par l'aménagement durable, la solidarité entre territoires et la préservation des milieux naturels et participe ainsi à la réduction des inégalités et à la lutte contre la pauvreté dans le monde.

EGIS : L'EXPERIENCE ET L'INNOVATION AU SERVICE DE L'AMENAGEMENT RESPONSABLE

Une expérience d'acteur dédié à l'accompagnement des territoires

L'expérience et le savoir-faire d'Egis dans tous les domaines qui touchent le cadre de vie des citoyens (transport, aménagement, bâtiment, environnement, énergie, eau, santé...) permettent d'alimenter par des critères objectifs le débat démocratique sur les projets d'aménagement durable des territoires.

Egis, de par ses différents métiers, accompagne ses clients, tant en France qu'à l'international, de l'amont des projets jusqu'à l'aval des réalisations. Ce positionnement unique permet à Egis de capitaliser et de valoriser l'expérience acquise sur l'ensemble du cycle de vie des ouvrages et d'avoir une compréhension globale des défis en termes de maîtrise environnementale, d'efficacité économique et d'équilibres sociaux.

De par son positionnement en amont des projets et son rôle de conseil et de prescripteur, Egis joue un rôle important et différenciant dans l'orientation des investissements réalisés par ses clients. Pour préserver et améliorer le sort de notre planète, il est essentiel de se poser la question de comment le faire le plus en amont possible dans la définition, le choix et la conception des aménagements et infrastructures qui contribuent au développement du territoire. C'est pourquoi l'accompagnement d'Egis auprès des financeurs s'attache à proposer des options techniques établies tout autant sur la base de critères relatifs au développement durable qu'au regard de critères financiers. L'allotissement des projets doit être approché de façon plus globale et intégrée. Il s'agit ensuite que les constructeurs, concepteurs, maîtres d'œuvre soient sélectionnés sur des critères de même type afin d'être les garants de l'optimisation environnementale et sociale des projets dont ils ont la charge.

En tant que maître d'œuvre, l'approche pluridisciplinaire d'Egis basée sur toute une palette de compétences (ingénieurs de différentes spécialités mais aussi économistes, environnementalistes, paysagistes, urbanistes ...) permet de concevoir des projets en objectivant autant que possible leurs dimensions économiques, sociales et environnementales.

Par ailleurs, Egis bénéficie de près de 60 ans d'expérience sur des grands projets de développement financés par des bailleurs de fonds internationaux : interventions s'inscrivant explicitement dans les stratégies nationales de réduction de la pauvreté et les Objectifs du Millénaire.

Egis, à travers son institut de formation, Forhom, contribue à la réduction des inégalités, à la lutte contre la pauvreté et à la bonne gouvernance, à travers des dizaines de formations réalisées chaque année, en France et à l'étranger, auprès d'une centaine de cadres de haut niveau d'institutions publiques africaines, qui relayent dans leurs propres pays, ces approches, et valeurs lorsqu'ils mettent en place des projets et des politiques.

Une politique volontariste d'innovation

Egis mène une politique volontariste d'innovation pour se mettre en capacité de proposer aux donneurs d'ordre des outils d'aide à la décision et des solutions opérationnelles permettant de relever les défis socio-économiques, énergétiques et environnementaux des territoires : ville durable, adaptation au changement climatique, optimisation du trafic pour réduire les émissions de gaz à effet de serre, économies d'énergie, choix des matériaux et des technologies ...

La force d'innovation du groupe trouve ses racines dans la combinaison de plusieurs facteurs-clés : une écoute des besoins des clients et des partenaires, des compétences spécialisées de haut niveau sur tout le cycle de vie des ouvrages, une fertilisation croisée sur ses différents métiers et une longue expérience de la mise en œuvre opérationnelle de terrain.

Pour étayer ses politiques d'innovation et de responsabilité sociale, Egis participe activement à de nombreux programmes de recherche partenariale nationaux et européens avec des grands maîtres d'ouvrage, constructeurs et laboratoires de recherche. Egis poursuit également une logique de dialogue constructif avec ses parties prenantes (création d'un comité d'orientation développement durable à l'échelle du groupe en 2010).

Notre volonté : transformer la responsabilité inhérente à nos métiers en leitmotiv de nos ambitions d'excellence et d'innovation

Pour les années à venir, Egis veut être précurseur pour redéfinir la place et le rôle de l'ingénieur : nous devons réinterroger le rôle du concepteur et le poids du prescripteur vis-à-vis de la dépletion de l'ensemble des ressources disponibles sur la planète : énergies fossiles et épuisement des matières premières. Parallèlement, Egis souhaite œuvrer, avec l'aide des pouvoirs publics français, auprès des pays émergents, des bailleurs de fonds et des grands groupes de construction, pour changer la culture du moins-disant économique, archaïque et obsolète, au profit du mieux disant en développement durable.

Dans la structuration de ses compétences, Egis entame la réécriture systémique de ses compétences en développant des offres de service transversales, organisées par flux essentiels, dans leur logique de cycle de vie : énergie, eau, matériaux, économie du projet.

Pour chacune de ces thématiques, Egis souhaite catalyser des approches qui concourent au recyclage et au retraitement, à la reconversion et à la rénovation, comme de façon globale à l'économie de moyens. Dans le cadre de son cahier d'acteurs Rio +20, Egis portera plus particulièrement l'accent sur :

l'aménagement des villes pour répondre aux enjeux démographiques,  
l'accompagnement des autorités locales dans leur développement et la lutte contre la pauvreté,  
la protection de l'environnement pour préserver les capacités de développement des territoires,  
la facilitation de l'accès à l'énergie pour tous,  
le respect et le partage de la ressource en eau.

## LES PISTES D'EGIS POUR UNE CROISSANCE RESPONSABLE

### 1. Aménager les villes pour répondre aux enjeux démographiques à venir

L'exigence de nouvelles approches

Les villes sont diverses par leur histoire, leurs conditions géographiques, topographiques, climatiques, sociales, économiques et culturelles. La réflexion et l'action sur le devenir d'une ville lui sont donc spécifiques. On ne peut définir de façon normative ce qu'est ou devrait être LA ville durable.

Cela impose de sortir des approches purement fonctionnalistes et technicistes qui depuis plus de 50 ans ont façonné nos villes. Construire une ville véritablement durable nécessite des approches plus étendues et intégrées, capables d'appréhender la complexité urbaine, la multiplicité des attentes de ses utilisateurs et la diversité des échelles à prendre en compte.

La conception de tous les composants qui constituent la ville : l'urbanisme, l'énergie, le déplacement, le paysage, le cycle de l'eau doivent se traiter de façon interdépendante avec un objectif majeur : le confort et la performance environnementale et ceci dès la conception.

De la ville à l'homme, de l'homme à la ville pour un projet urbain porteur de sens

Ainsi, il n'est plus possible de venir plaquer des solutions techniques « clés en main » sans trop se préoccuper des contextes et problématiques locales. Chaque problème urbain est spécifique et complexe et nécessite écoute, inventivité, transversalité et respect de l'esprit du lieu.

Egis s'attache particulièrement au développement de solutions innovantes pour réduire la vulnérabilité des villes et des bâtiments vis-à-vis de la demande énergétique, des enjeux climatiques et sanitaires.

Grâce à son expérience, sa multidisciplinarité et sa R&D, Egis a développé des solutions d'aménagement et de design urbains, innovantes et modernes, recherchant la cohérence entre la planification des transports et l'aménagement et basées sur les plus-values culturelles et physiques de chaque lieu.

Exemples de réalisations

A titre d'exemple, Egis a conçu, en partenariat avec le cabinet Valode et Pistre, le master plan d'Akademia City, ville durable qui a pour objectif d'accueillir en 2025 près de 325 000 habitants sur 1300 hectares, en périphérie d'Ekaterinbourg.

Pour la Banque mondiale, Egis a conduit une étude pilote pour accompagner plusieurs grandes villes d'Afrique du Nord (Alexandrie, Tunis, Rabat, Casablanca) pour leur adaptation au changement climatique.

Egis accompagne l'agence djiboutienne de développement social pour la mise en œuvre du projet de développement urbain intégré de Balbala et l'appui à la décentralisation (Djibouti).

Solutions innovantes et recherches partenariales

Tendem Empreinte : outil de pilotage de la performance développement durable des projets

Egis a mis au point une démarche innovante, Tendem Empreinte®, pour optimiser la performance durable des projets d'aménagement. Pragmatique et participative, cette méthode définit les objectifs, les indicateurs et surtout les actions qui renforcent le caractère durable d'un projet. A chaque grande étape, il est possible de visualiser les

bénéfices et les impacts pluridisciplinaires des choix de programmation, de conception, de mise en œuvre et d'exploitation.

Egis assure le leadership de programmes de recherche partenariale ambitieux sur la ville durable :

IMPETUS (programme Villes Durables – Agence Nationale de la Recherche) : élaboration de référentiels, d'indicateurs et d'outils d'aide à la décision pour des projets d'aménagement d'une ville durable associant mieux qu'avant le bâti et la mobilité.

projet URBACONCEPT (pôle de compétitivité Advancity) : conception d'une plateforme collaborative proposant aux différents acteurs de l'urbain de partager des outils (bases de données, maquette numérique ...) permettant de travailler de manière plus collaborative sur la planification, l'éco-conception, la construction et la gestion de la ville. RESILIS (programme Villes Durables – Agence Nationale de la Recherche) : développement de la résilience urbaine grâce à l'amélioration des aides à la gouvernance des systèmes urbains en cas d'événements extrêmes, par exemple climatiques.

## 2. Accompagner les autorités locales dans leur développement et la lutte contre la pauvreté

La consolidation de régimes démocratiques et de la bonne gouvernance politique passe par la promotion d'un cadre politique et administratif rénové, l'adoption des principes de transparence, de déconcentration et de décentralisation, mais aussi par l'appui à l'émergence et au renforcement d'une société civile forte et responsable.

Inscrite dans les objectifs du millénaire pour le développement fixés par les Nations Unies, l'assistance technique fournie par Egis va de la définition des programmes jusqu'à leur évaluation en visant trois objectifs : augmentation du niveau de vie des communautés, appui au débat démocratique sur les projets et qualité de la gouvernance.

La bonne gouvernance, la sécurité financière, juridique et technique à long terme des grands projets apparaissent essentielles pour leur appropriation par les territoires et leur contribution aux dynamiques de solidarité territoriale.

Egis est aujourd'hui reconnu comme un spécialiste du processus de décentralisation et du renforcement de la capacité des pouvoirs publics à structurer leur territoire et à organiser les transports ou encore l'approvisionnement en eau et en énergie.

### Démarches exemplaires

Assistance technique en appui au Commissariat aux Droits de l'Homme, à la Lutte contre la Pauvreté et à l'Insertion en Mauritanie

Ce programme de développement local en faveur des communes de l'Assaba et du Guidimakha contribue à la réduction de la pauvreté des deux wilayas (collectivités publiques territoriales) par le renforcement des capacités des communes à développer, en partenariat avec tous les acteurs locaux, un niveau d'investissement soutenu, en vue d'assurer à la population des services durables répondant à leurs besoins.

### Réduction de la pauvreté en zones rurales au Tchad

Le projet, tout en cherchant à accompagner le processus naissant de décentralisation au Tchad, a pour finalité de contribuer à améliorer les conditions de vie et à réduire la pauvreté en zones rurales. Le rôle d'Egis, comme opérateur d'une composante du projet, est d'abord celui d'un ensemble capable de concevoir, de promouvoir et d'animer une véritable démarche de développement local.

Assistance technique à l'Agence d'exécution du Programme de développement rural du bassin agricole du Moungo Nkam (Cameroun)

Le Programme de développement rural du bassin agricole du Moungo Nkam (PDRBA Moungo-Nkam) a pour objectif global de contribuer à la réduction de la pauvreté par un appui à la relance de la production agricole, un renforcement des capacités des acteurs locaux et un soutien à la réalisation d'infrastructures socio-économiques essentielles.

## 3. Protéger l'environnement pour préserver les capacités de développement des territoires

Il est réellement possible de redonner une place à la nature dans nos projets. Pas celle d'un sanctuaire, mais bien d'un écosystème qui rend des services économiques et sociaux. Cela concerne aussi bien les grands ensembles, les zones protégées, les trames vertes et bleues, que la biodiversité plus commune des villes et de leurs abords. Au-delà des approches classiques d'inventaire et de plans de gestion, Egis a développé de véritables savoir-faire dans l'éco-conception d'infrastructures et d'ouvrages qui développent des fonctions positives en faveur de l'environnement et participent à une économie circulaire : création de biomasse, cohabitation d'activités, maîtrise de risques sanitaires ... Autant d'atouts qui renforcent l'acceptabilité des projets et facilitent le dialogue dans les situations complexes.

### Démarche exemplaire

Projet de traitement des déchets à Conakry (République de Guinée)

Egis a été choisi en juillet 2011 par le Ministère Délégué à l'Environnement et aux Eaux et Forêts de la République de Guinée pour prendre en charge la maîtrise d'œuvre de conception et de travaux et le suivi d'exploitation du projet de traitement des déchets de la ville de Conakry (déchets ménagers, industriels spéciaux et hospitaliers).

Egis a proposé des solutions techniques adaptées pour réhabiliter la décharge, récupérer et traiter, selon les normes européennes, les déchets. Le projet prévoit ainsi la création d'un centre de tri (avec emploi local) et une aide à la construction d'une école. Les installations de traitement des déchets seront en partie financées via des dispositifs de « crédit carbone ».

## 4. Favoriser un accès à l'énergie pour tous

Egis intervient à l'international sur les thématiques Kyoto comme la réalisation d'électrification rurale en utilisant des énergies renouvelables ou la mise en place de politiques industrielles de production propre.

En matière de conseil, Egis a développé différents outils permettant d'aider les décideurs territoriaux à définir leur politique énergétique dans le domaine des énergies renouvelables.

Parmi les projets exemplaires développés par Egis, on peut citer les études de modélisation de l'énergie des vagues pour l'installation d'usines houlomotrices sur l'île de la Réunion, l'étude de micro-centrales hydro-électriques sur les bassins versants atlantiques centre et sud au Maroc ou encore l'assistance technique à maîtrise d'ouvrage pour le Programme Régional Solaire Photovoltaïque du Tchad.

Par ailleurs, Egis est conseiller technique auprès de Waste to Energy, projet mené en partenariat avec le « R20 – Regions for Climate Action », émanation de l'ONU-UNDP dont l'objectif est d'encourager la création de production d'électricité renouvelable dans les pays en développement.

## 5. Mieux respecter et partager la ressource en eau

Egis mène de nombreux projets en lien avec la gestion de l'eau (alimentation en eau potable, assainissement, aménagement des cours d'eau...), un domaine sensible et vital pour les populations locales.

Pour ce faire, Egis est en capacité de mobiliser des équipes pluridisciplinaires : environnementalistes, écologues, ingénieurs en ouvrages portuaires et de protection du littoral, architectes, paysagistes, urbanistes et géographes...

#### Démarches exemplaires

Le projet d'irrigation dans la région de Phan Ri et Phan Thiet, vise à développer la production agricole et ainsi réduire la pauvreté dans une des zones les plus sèches au Viet Nam (Province de Binh Thuan).

En qualité de pilote d'un groupement international, Egis fournit une assistance technique au Ministère des Ressources en Eau et de la Météorologie du Cambodge pour l'élaboration et la mise en œuvre de sa politique sectorielle de l'eau. Le projet vise à développer l'agriculture irriguée dans les zones rurales défavorisées du nord-ouest du pays par la mise en place d'un système de gestion intégrée des ressources en eau.

#### Eco-conception portuaire : le projet GIREL

La réduction de l'impact des zones portuaires sur la biodiversité a été à l'origine d'un appel à projet de recherche lancé par l'Agence de l'Eau Rhône Méditerranée Corse (AERMC), le Pôle mer PACA et l'IFREMER. Le Grand Port Maritime de Marseille a répondu en partenariat avec Egis (associé à CDC biodiversité) en lançant le projet GIREL sur les 3 000 ha de la zone portuaire. L'objectif est de diminuer l'empreinte écologique d'un port industriel d'au moins 50% à partir de 2014. Ce projet constitue une innovation majeure car le concept d'éco-conception d'infrastructures portuaires n'a jamais été exploré en France ou en Europe.

#### SYNTHESE

Depuis 1960, Egis a développé des compétences opérationnelles lui permettant d'être aujourd'hui un acteur global du conseil et de l'ingénierie. Sa vision, sa présence internationale et son approche intégrée viennent nourrir les enjeux de Rio + 20 à travers cinq pistes :

- 1 Aménager les villes pour répondre aux enjeux démographiques
2. Accompagner les autorités locales dans leur développement et la lutte contre la pauvreté
3. Protéger l'environnement pour préserver les capacités de développement des territoires
4. Favoriser un accès à l'énergie pour tous
5. Mieux respecter et partager la ressource en eau

Par cette démarche de responsabilité, Egis participe à un développement soutenable des pays dans lesquels il opère et à la lutte contre la pauvreté à travers la création de valeur générée par les projets où le groupe est impliqué. Egis est un acteur à la disposition des Nations Unies et de tous les acteurs publics et privés, en France et à l'international, qui entendent contribuer concrètement à ces objectifs.

## ENDA Tiers Monde

Rio + 20 sur le sentier d'un développement plus durable

Par Jean-Philippe Thomas, ENDA Tiers Monde<sup>1</sup>

Le mouvement international de prise en compte de la planète Terre et de l'environnement date de 1972 avec la première Conférence des Nations Unies sur l'Environnement Humain (CNUEH, Stockholm - Suède). Les questions écologiques entrent de plein pied dans les préoccupations internationales avec la mise en place du Programme des Nations Unies pour l'Environnement (PNUÉ). Le contexte est favorable, puisque c'est à la même période que le Club de Rome lance l'objectif de « Halte à la croissance ». Egalement, le pas est donné puisque les dirigeants de la planète s'engagent à se rencontrer tous les dix ans pour faire le point sur l'état de la Terre. Après l'échec de la Conférence de Nairobi en 1982, dû aux tensions sur le plan international, tous les espoirs se reportent sur la Conférence de Rio, en 1992. Les résultats de cette Conférence des Nations Unies sur l'Environnement et le Développement (CNUED) sont considérés, par tous, comme une réussite puisqu'il en ressort le programme d'Action 21 (avec plus de 2500 recommandations) et trois conventions majeurs : Changements climatiques, biodiversité et lutte contre la désertification. Le développement durable est né.

En 2002, le « Sommet Mondial sur le Développement Durable » (SMDD, Johannesburg), organisé par les Nations Unies, a, au-delà des bilans, pris des décisions dans les sens du développement durable, entre autres, sur l'eau, l'énergie, la santé, l'agriculture et la diversité biologique. Il faut y ajouter le renforcement des partenariats entre le nord et le sud et entre les secteurs publics et privés. Ce sommet s'inscrit dans une trajectoire de lutte contre la pauvreté consacrée, deux années plus tôt (2000), par l'adoption aux Nations Unies des Objectifs du Millénaire pour le Développement (OMD).

Que se prépare t-il alors pour Rio+20 en 2012 ? Au vu des premiers débats préparatoires et des premiers attendus, en particulier sur la notion « d'économie verte », des tensions existent et marquent l'absence de consensus. Force est alors de s'interroger sur le type de trajectoire que l'on veut maintenant imprimer au développement durable.

Des réponses existent, nous en proposons ici (point 1), en mettant en exergue (point 2) les enjeux pour l'Afrique (principalement les tendances lourdes). C'est en ce sens que l'on peut nourrir le débat et des propositions dans le processus de préparation de Rio+20.

1 Jean-Philippe Thomas, Docteur d'Etat en sciences économiques, est membre du Secrétariat Exécutif d'ENDA Tiers Monde (Siège à Dakar). Il a dirigé le Programme « Energie, Environnement et Développement » d'ENDA et collabore depuis plus de 20 ans avec cette organisation sur la problématique « Climat-Développement » principalement dans le cadre des pays d'Afrique. Il était auparavant enseignant-chercheur, successivement aux Universités Paris V et Paris XI. Il a également dirigé l'IUT Gestion de l'Université du Maine. Il est l'auteur de

nombreux articles et documents de position.

- Remerciements à Jean-Pascal Corréa ainsi que les autres collègues d'ENDA pour leurs commentaires.

Rio+20 – J-Ph. Thomas

voir :

C'est d'ailleurs de cette manière qu'ENDA Tiers Monde, créée dans la mouvance de la Conférence de Stockholm, il y a presque quarante années, a constamment participé aux différents sommets de la Terre en apportant ses contributions aux débats et aux positions et en mobilisant les membres des sociétés civiles des pays du sud. Le « développement d'abord » et la lutte contre la pauvreté ont toujours été, pour ENDA dans ce processus, le centre des préoccupations<sup>2</sup>.

1 - Les attendus de Rio + 20 sonnent t'ils l'échec des approches actuelles du développement durable ?

Dans sa présentation la plus succincte, le sommet des Nations Unies sur le développement durable (2012), dit Rio+20, a pour objectif de « garantir le renouvellement des engagements politiques avec le développement durable; évaluer les progrès vers les objectifs accordés au niveau international sur le développement durable et relever des

défis nouveaux et émergents ». Ce type de déclaration souffre de peu de commentaires, c'est la phase bilan, évaluation et prospective.

En revanche, la définition des deux thèmes spécifiques à aborder, d'emblée, pose problème.

« Le sommet mettra également l'accent sur deux thèmes spécifiques: une économie verte dans le contexte de l'éradication de la pauvreté et le développement durable, et une structure institutionnelle qui favorise le développement durable » - <http://www.uncsd2012.org/rio20/> et <http://www.earthsummit2012.org>

Les pays en développement engagés sur la voie d'un développement plus durable depuis plusieurs décennies doivent aborder ces thèmes avec une certaine circonspection. En effet, l'introduction du nouveau « paradigme », qui consiste à tout repeindre en « vert » (de l'économie verte aux emplois verts via la croissance verte et autres), dans les discours officiels ne masque t'elle pas la remise en cause du sentier de développement durable sur lequel les PED se sont, à grands efforts, engagés. Ces nouvelles appellations, fortement influencé par les travaux de l'OCDE sur la « green economy » méritent un détour afin de cerner quelles sont les originalités et les valeurs ajoutées qu'elles apportent (ou n'apportent pas) dans l'analyse et l'opérationnalité.

L'expérience des cinquante dernières années doit conduire à une certaine prudence sur l'appropriation de nouvelles notions : croissance économique, écodéveloppement, croissance zéro, ajustement structurel, objectifs du millénaire, développement durable. Les changements d'appellation sont-ils des changements de paradigme pour des politiques identiques ?

2 Par exemple, pour la Conférence de Johannesburg, « Le développement d'abord : un pré-requis pour un monde plus durable ».- Jean-Philippe Thomas et Youba Sokona, ENDA, Dakar, 2002.

Rio+20 – J-Ph. Thomas2

Le développement durable, issu du premier sommet de la terre en 1992, constitue un projet collectif mondial qui faisait le pari de jouer sur les synergies entre mondialisation des échanges, développement et environnement avec, en toile de fond, un changement de modèle de développement tant au Nord qu'au Sud. Il se basait sur un abord homogène et non hiérarchisé des aspects économiques, sociaux et environnementaux du développement, les « trois piliers ». Cette notion mettait fin à l'économisme à tout crin de la période des « trente glorieuses » abondamment relayé par les banques multilatérales de développement, le Fonds Monétaire International, les agences bilatérales et l'OCDE. L'objectif de croissance économique primait alors sur toutes les autres composantes du développement, en particulier sur ses aspects sociaux et environnementaux. Avec le développement durable prend donc fin la primauté économique du développement qu'on retrouvait d'ailleurs dans les paradigmes antérieurs de croissance ou d'ajustement structurel.

Or, Rio+20 remet en exergue l'économie (dite « verte ») par rapport aux deux autres composantes du développement : le social et l'environnement : «Le sommet mettra également l'accent sur... une économie verte » (cf. première partie des deux objectifs de Rio+20). En d'autres termes Rio+20 remet en cause l'approche du développement à partir des « trois piliers » du développement durable. On aurait pu tout aussi bien privilégier l'approche du « contrat social » et des transformations comme développée par le German Advisory Council on Global Change (« World in transition, a social contract for sustainability ».- WBGU, Berlin, 2011). Bref, le retour à la primauté de l'économie n'est pas neutre. Quatre explications peuvent être avancées :

1. Comme le note l'IDDRI (RA 2010) la gouvernance du développement durable, institutionnalisée par le Sommet de la Terre de Rio en 1992 et ses trois conventions (Désertification, Biodiversité, Changements Climatiques), a subi des transformations profondes au cours de la dernière décennie, marquée à la fois par la diffusion large de l'idée de développement durable dans les discours et des résultats insatisfaisants, sinon décevants. En d'autres termes, le développement durable a été largement mis

à mal par les vingt dernières années.

2.L'imprécision de la notion dont on a mieux défini et opérationnalisé les contours depuis Rio a subi, de plein fouet les chocs de la mondialisation qui ont rompu les liens et les soutiens qui se tissaient entre les trois « piliers » - économiques, environnementaux et sociaux ; Il en est de même en ce qui concerne les objectifs du millénaire alors que l'éradication de la pauvreté doit rester un objectif majeur et non un simple « contexte » de l'économie verte.

3.La notion de durabilité du développement n'a jamais été profondément admise par les secteurs économiques et financiers, en particulier le secteur privé et les économistes « libéraux ». L'avatar de la responsabilité sociale et environnementale de l'entreprise est plus un argument de positionnement commerciale vis-à-vis des

Rio+20 – J-Ph. Thomas3

consommateurs, de plus en plus soucieux de ces dimensions, qu'une réelle prise en compte de la durabilité du développement ;

4.Au stade actuel, le financement du développement durable à partir des seules contributions des Etats (Aide Publique au Développement – APD ou fonds dédiés et additionnels, comme pour les changements climatiques) subit une contrainte majeure liée, pour partie, aux crises financières successives et l'endettement rencontrées par les pays développés. Les marges de manœuvre des pays et de la communauté internationale, appelées encore « flexibilité » comme dans le Protocole de Kyoto, relèvent principalement de l'implication du secteur privé et de tous les mécanismes permettant de faire jouer l'effet de levier sur l'investissement privé.

Sous ces aspects, il fallait, pour Rio+20, retrouver un discours mobilisateur pour les secteurs privés. C'est sur ces bases que s'est construit le discours des Nations Unies pour Rio+20 en s'appuyant sur les travaux réalisés par l'OCDE qui s'était employé depuis plusieurs années à développer des processus de recherche et de concertation dédiés à la « green economy » ; Il faut souligner que ce discours a été largement relayé, en matière de lobbying, par des ONG internationales comme le WWF.

Le retour à la primauté de l'économisme devenait un message incontournable et majeur. Or, le risque est grand de marginaliser les aspects environnementaux et sociaux et de rentrer de plein pied dans les scénarios« A1 » de l'IPCC, dits de convergence par croissance, à savoir une tendance d'évolution qui privilégie l'économie et le matérialisme par rapport aux aspects environnementaux et sociaux du développement.

Ceci est conforté par le « flou » qui est donné de la notion d'économie verte. Point de définition mais des descriptions d'approches. Quatre, selon le rapport général du Secrétariat des Nations-Unies :

- 1.L'analyse des défaillances du marché et l'internalisation des externalités ;
- 2.L'approche systémique des structures économiques et leurs impacts sur le développement durable ;
- 3.Les objectifs sociaux et l'examen des politiques qui doivent réconcilier les objectifs sociaux avec les autres objectifs de politique économique ;
- 4.Le cadre macroéconomique et les stratégies de développement avec l'objectif d'identifier la dynamique des « sentiers » vers un développement durable.

En d'autres termes, on constate qu'analyse macroéconomique, analyse systémique, analyse institutionnelle et analyse des régulations formeraient ici la base « théorique » de l'économie verte. A partir de là, la présentation du Secrétariat Général passe directement aux aspects pragmatiques des approches en proposant une liste d'options politiques ; liste

Rio+20 – J-Ph. Thomas4

dans laquelle les décideurs des pays en développement peuvent puiser leurs bonnes pratiques. Cette liste, présentée sous forme de sept « tracks3 » dans le document du Secrétariat, est reprise ci-dessous, en prenant des exemples de type de politique ; elle est très hétérogène et on en cherche encore la logique ou l'architecture générale.

(a)Vérité des prix avec suppression des subventions, évaluation des ressources naturelles et taxes environnementales (pollueur-payeur). L'objectif est d'internaliser les externalités, de soutenir la consommation "durable" et de motiver les « bons » choix dans les affaires.

(b)Réformes des taxes environnementales basées sur l'expérience des pays européens. L'idée de base étant de supprimer les taxes sur les « bons » facteurs de production (comme le travail) pour les appliquer aux « mauvais » facteurs (comme la pollution), ce qui doit permettre d'obtenir un double dividende en corrigeant les externalités environnementales tout en « boostant » l'emploi ;

(c)Politiques publiques pour promouvoir le « verdissement » des affaires et des marchés “;

(d)Appui public ciblé en matière de recherche et développement dans les domaines des technologies “saines” pour l'environnement, pour une partie, en vue de compenser les investissements privés pré-commerciaux dans le domaine de la recherche et du développement et, pour une autre partie, en vue de stimuler l'investissement dans les domaines critiques (comme les énergies renouvelables) qui peuvent potentiellement bénéficier d'économies d'échelle et, enfin, en vue de compenser les biais actuels des recherches sur les technologies « sales » ou « hasardeuses » ;

(e)Investissement public dans des infrastructures durables (transport public, énergies renouvelables, reconfiguration des infrastructures existantes et des bâtiments en vue d'en améliorer l'efficacité énergétique) et restauration du capital naturel en vue de le maintenir et, là où c'est possible d'en augmenter le stock ;.

(f)Investissement stratégique via le financement du développement du secteur public, des programmes de mobilisation et de partenariat afin de poser les fondations d'une croissance économique autoentretenue et durable sur le plan social et environnemental ;

(g)Politiques sociales pour réconcilier les objectifs sociaux avec les politiques économiques proposées ou existantes.

Des analyses plus poussées sont, malgré tout, proposées. En particulier, celle du

« Stakeholder Forum » en introduction aux approches systémiques et celle du Secrétariat lui-même sur l'évaluation et les coûts des services écosystémiques. On pourra y revenir.

3 “green stimulus packages; ecoefficiency; greening markets and public procurement; investment in sustainable infrastructure; restoration and enhancement of natural capital; getting prices right; and eco-tax reform”. Objective and themes of the United Nations Conference on Sustainable Development - Report of the Secretary- General, pages 12-17, mars 2011.

Rio+20 – J-Ph. Thomas5

Pour nous, ce qui découle de cette liste, c'est principalement qu'il devient impératif d'élargir les « piliers » du développement durable à deux critères supplémentaires, à savoir la technologie, cf. (d) principalement, et l'institutionnel. Cela rejoint explicitement le cadre d'analyse du développement durable qu'a déjà proposé ENDA et qui se trouve largement corroboré par les conclusions du UN High-Level Dialogue on the Institutional Framework for Sustainable Development, (July 2011, Solo, Indonesia, attending by 300 policy makers, diplomats, NGOs and experts). Following Martin Khor, Third World network (TWN) « The main consensus was that there has been a big implementation problem – the goals of sustainable development have not been implemented, either at the global level (such as in the UN, or IMF and WTO) or in national policy making.

A major reason is the weakness of absence of institutions. The UN's Commission on Sustainable Development, the main agency to follow up on the 1992 Rio Summit, has too small a secretariat and meets for only three weeks in a year.

All three sustainable development pillars – environment, economic and social – are very weak at the UN. The agencies interact too little, if at all, with one another. The governments do not have adequate fora, such as a powerful UN economic committee to discuss the financial crisis and economic recession, or a UN environment committee with authority to act.

This weakness is also reflected at the country level. National councils of sustainable development were set up after Rio 1992, but many have not functioned well. Economic policies are still made with little regard for the environment”.

L'institutionnel, avec sa part de gouvernance et de cohérence des politiques, était jusqu'ici le grand absent du développement durable. Les cinq piliers du développement durable peuvent ainsi être présentés comme suit :

Rio+20 – J-Ph. Thomas6

Les options politiques proposées par le rapport du Secrétariat correspondent alors à un ensemble de liens entre les cinq « piliers » du développement durable ; on peut citer, à titre d'exemple :

Lien économie – environnement : (a), (b) et (c)

Lien technologie – économie : (d) et (e)

Lien social – environnement – économie : (f)

Institution - social – économique : (g)

Bref, plutôt que de verdir à tout prix le vocabulaire économique, Il nous semble préférable de renforcer l'approche développement durable déjà largement utilisée par un bon nombre de pays.

Il s'agit donc de partir des trois piliers du développement durable (économique, social et environnemental) et d'y adjoindre, selon notre démarche, deux critères supplémentaires afin de combler le manque d'exhaustivité, quand on s'en tient aux trois piliers traditionnels. Ces deux critères correspondent à la technologie et à l'institutionnel (donc la gouvernance), dernier critère qu'on retrouve d'ailleurs dans la seconde partie des thèmes à aborder à Rio+20. Pourquoi ne pas les englober dès maintenant dans une approche étendue et renforcée du développement durable ? C'est ce que nous proposons.

A titre d'exemple et pour opérationnaliser la démarche, une fois les cinq critères définis, on en pose les conditions de durabilité en y adjoignant les indicateurs de vérification. Il en serait de même pour toutes actions politiques qui relieraient deux ou plusieurs de ces critères.

## Critères Développement Durable

Critères	Conditions de 'durabilité'	Indicateurs (exemples)
Economique	Efficience/Efficacité	- Valeur produite > valeur consommée - Valeur ajoutée (VA) - PIB (productivité des facteurs)
Social	Équité	- Répartition de la VA (ou PIB) - Population pauvre bénéficiaire - Réduction pauvreté (% femmes, enfants)
Environnemental	Viable/Conservation	- Émissions GES, stockage de carbone - Synergies désertification, biodiversité, ...
Technologique	Propre	- Émissions, stockage de carbone - Synergies désertification, biodiversité, ... - Degré de pollution
Institutionnel	Coherence/Régulation	- Convergence des actions & politiques - Gouvernance - Degré de conformité des processus

Rio+20 – J-Ph. Thomas 7

Selon la nature des activités à analyser en termes de durabilité, une sélection de critères et d'indicateurs pourra être opérée. Deux exemples :

- Au niveau macro-économique, on privilégiera les trois critères-piliers plus le critère institutionnel.
- Au niveau d'un projet, il est conseillé d'adjoindre la technologie qui joue un rôle prépondérant sur la durabilité du développement de l'activité.

En conclusion provisoire, on peut avancer qu'une définition plus précise du développement durable à partir de critères et d'indicateurs serait plus conséquente, comme base de travail pour Rio+20, plutôt que de s'ouvrir à de nouvelles notions, comme l'économie verte, dont on sait déjà qu'on a beaucoup de mal à en définir les contours. Les nombreux travaux et les innovations politiques (en particulier dans les pays émergents) qui ont opérationnalisé la notion de développement durable constituent des matériaux sur lesquels on peut largement s'appuyer pour lever les ambiguïtés actuelles de la notion. On participerait ainsi à la refondation de la notion de développement durable en tenant compte des sentiers de développement différents des diverses catégories de pays.

## 2 - Rio+20 : Enjeux et propositions pour l'Afrique

Faire des propositions, c'est tout d'abord tenter de s'accorder sur une vision commune reposant sur les tendances « lourdes », à long terme, partagées par le plus grand nombre.

Nos propositions ne sont donc pas exclusives, elles sont une première étape dont les caractéristiques majeures doivent être enrichies et partagées par le plus grand nombre.

Les tendances « lourdes » sur lesquelles s'appuie ce premier cadre d'analyse sont résumées ci-dessous :

1. Le développement de l'Afrique est mu par une évolution démographique très en dessus des moyennes mondiales. Les projections comparées, d'ici 2050, pour la population mondiale, celle de l'Afrique, de l'Afrique de l'ouest et d'un pays comme le Sénégal, sont révélatrices des disparités « Monde versus Afrique ».

Les projections de population

	Mi-2009	2050
Monde	6,8 milliards	9,5 milliards
Afrique	1 milliard	2 milliards
Afrique de l'ouest	297 millions	623 millions
Sénégal	15,2 millions	26 millions

Rio+20 – J-Ph. Thomas 8

Le doublement de la population africaine au milieu de ce siècle va jouer un rôle moteur à tous les niveaux : pression sur la satisfaction des besoins de base, incluant la sécurité alimentaire, sur le dimensionnement des infrastructures, sur l'occupation des sols, etc. Dans chaque pays, les décideurs doivent largement intégrer la variable « population » et ne pas se contenter, comme c'est souvent le cas, de reporter des extrapolations purement linéaires. Le grand défi lié à l'accroissement de la population est tout à la fois de résorber les inégalités actuelles d'accès aux services et aux infrastructures de base et de répondre, en même temps, aux mêmes besoins des nouvelles générations. Cela nécessite, entre autres, un changement radical des modes de production et de consommation, principalement dans les pays du nord et un développement endogène de ces mêmes modes dans les pays du sud, en particulier en Afrique ; tous les scénarios prospectifs de la croissance par convergence du nord et du sud sont unanimes sur ce point.

2. L'urbanisation croissante, à forte composante d'exode rural, tend, en Afrique, à remplacer le modèle lignager rural par des comportements de plus en plus sensibles à l'épargne et à la capitalisation monétaire ou matérielle. L'investissement des ménages devient plus économique que social, cela est particulièrement vrai dans le domaine de l'accès à la propriété individuelle. Il est difficile aujourd'hui de juger de l'irréversibilité ou non de cette transformation ; en effet, si cette modification de comportement est significative chez l'encadrement et la classe moyenne, il n'en reste pas moins que l'urbanisation génère une nouvelle forme de population, dite périurbaine, dont les comportements de consommation sont difficiles à classer car relevant généralement d'une très grande pauvreté. Le risque majeur des capitales africaines est de développer des villes « à deux vitesses », opposant les populations

Rio+20 – J-Ph. Thomas9

aisées aux populations pauvres. Ce phénomène peut être amplifié par le fait que les villes sont confrontées à la double nécessité de lutter immédiatement contre les premiers effets du changement climatique (vagues de chaleurs, pollution, etc.) tout en définissant des plans d'action et d'adaptation à plus long terme. Selon « Le changement climatique et les villes : premier rapport d'évaluation du Réseau de recherche sur le changement climatique en milieu urbain », (Cambridge University Press, 2010), quatre secteurs sont particulièrement vulnérables face aux impacts du changement climatique, et devraient par conséquent concentrer l'attention des politiques d'atténuation et d'adaptation : les systèmes énergétiques locaux, l'approvisionnement en eau, les transports, et la santé publique.

La ville durable sera celle qui unifie, qui réduit les inégalités d'accès aux services de base, qui permet de satisfaire les besoins urbains de manière durable, en particulier en limitant les émissions de gaz à effet de serre et en créant les conditions de la résilience urbaine aux effets néfastes des changements climatiques.

3. La décentralisation administrative et institutionnelle qui s'opère dans la plupart des pays africains à l'heure actuelle est révélatrice de la nouvelle configuration des centres de décision. Le rôle économique et social des Etats tend de plus en plus à s'effectuer dans des pôles de subsidiarité comme les collectivités locales ou territoriales. Cette dévolution, en multipliant les centres de décision, sera effective lorsque ces centres de décision décentralisés jouiront pleinement des possibilités de planification, de collecte de l'imposition et d'accès direct à des sources de financement nationales ou internationales (financement direct « Climat », par exemple).

L'exemple des fonds « Climat ».

Par tradition centralisatrice, les programmes de développement sont régis par les ministères de tutelle. Les financements « climat » n'échappent pas à la règle dans la quasi-totalité des pays africains. Les banques de développement multilatérales et les agences, en particulier s'adressent à des pays dits « clients » responsables de la mise en œuvre des activités financées. Il existe, malgré tout un certain nombre d'actions décentralisées dans le cadre de coopération avec des collectivités locales ou via les ONG qui appuient des collectivités locales ou des activités à la base dans des quartiers de grandes villes ou en milieu rural.

Perpétuer ces circuits dans le domaine du climat génère le risque que les populations les plus vulnérables, de par les échelons administratifs à franchir, ne soient jamais les bénéficiaires des fonds qui, pourtant, leur sont destinés. Or, comme on le sait, l'adaptation aux effets des changements climatiques correspond à des activités tout d'abord étroitement liées à celles de développement et, ensuite, ayant pour objet de permettre aux populations d'apprendre à faire face et à anticiper sur les effets néfastes des changements climatiques.

Un des critères incontournable de bonne gouvernance des fonds « climat » réside dans le fait que ces financements soient effectivement utilisées par et pour les populations. Il s'agit donc de définir des niveaux de subsidiarité dans l'affectation des fonds en fonction des lieux où se décident les plans, programmes et activités de développement. C'est une remise en cause importante de la manière dont sont gérés et administrés aujourd'hui les financements internationaux. L'échelle uniquement nationale ne garantit pas l'efficacité de l'appui.

Rio+20 – J-Ph. Thomas10

Lorsqu'une collectivité locale définit son plan de développement local dans lequel elle intègre l'adaptation aux effets des changements climatiques (mainstreaming climat et développement) elle doit pouvoir accéder directement aux sources de financement, et assurer la gouvernance tant des activités que du financement de celles-ci. Les populations qui relèvent de cette collectivité peuvent alors directement apporter leur critique (positive ou négative) sur l'effectivité des actions par rapport aux objectifs qui avaient été définis de manière participative par les parties prenantes, en particulier la société civile.

La décentralisation de la gouvernance va de pair avec l'ouverture de l'accès direct aux financements pour les collectivités décentralisées ayant des objectifs de développement formalisés.

4. Au niveau international, face aux processus de mondialisation/globalisation, se pose avec une grande acuité le problème de la gouvernance mondiale pour l'économie, le commerce, le monétaire et financier, l'environnement, et disons, par extension, tous les biens collectifs mondiaux. S'il existe un consensus sur deux défis majeurs - l'éradication de la pauvreté et la sauvegarde de la planète – la diversité des formes de capitalisme actuel (avec plus ou moins d'Etat ou de marché) engendre des dérégulations en chaînes matérialisées par les suites de crises (financière, des matières premières, de l'immobilier ou du foncier,...) que rencontre l'ensemble des pays du monde, certes à des degrés divers. Ce qui signifie que les réponses obtenues jusqu'à aujourd'hui par rapport aux défis sont très en deçà des objectifs poursuivis. Le bilan dressé par les Nations Unies, cinq ans avant l'échéance des objectifs du millénaire (OMD), est très mitigé, car il est peu probable que l'ensemble des objectifs soient atteints. Il en est de même de la sauvegarde de la planète pour laquelle les attermoissements des négociations sur un agrément post 2012 sur le « Climat » conduisent à des choix d'objectifs de réchauffement climatique très au dessus des recommandations de la communauté scientifique, si l'on veut effectivement lutter contre le réchauffement de la planète.

Inverser la démarche

Sous les aspects développés ci-dessus, les populations les plus pauvres, en particulier en Afrique, voient leurs vulnérabilités économiques, sociales et environnementales augmenter. Il faut donc inverser la démarche, c'est-à-dire avoir une vision plus holistique des défis en intégrant (mainstreaming) la lutte contre la pauvreté et celle contre les changements climatiques que ce soit sous les aspects d'adaptation (résilience) ou d'atténuation (limitations des émissions de GES).

Les limites du marché, en tant que mécanisme de régulation sont maintenant admises, c'est ce que l'on appelle la crise de la régulation « libérale ». La question des mécanismes d'une nouvelle régulation se trouve ainsi posée. C'est le retour du débat marché/Etat, mais au niveau international. Quelle institution peut jouer à l'international ce rôle de régulateur. Des réponses partielles sont données, les Conventions sur l'environnement, en particulier le Climat, en sont un exemple. Mais

Rio+20 – J-Ph. Thomas11

au niveau global, la réponse de la communauté internationale est, depuis plusieurs décennies, constituée par les divers « G », réunions informelles des Présidents de Nations auto désignées, puisqu'au départ constituées uniquement de pays industrialisés (G8). Ce que d'aucun appelle une « Diplomatie de connivence<sup>4</sup> », constituait jusqu'à aujourd'hui le mécanisme ultime de la régulation mondiale basée principalement sur l'évaluation par les pays industrialisés du rapport de force avec l'ensemble des autres pays, ce qui permettait aux pays membres de trouver « entre eux » des arrangements (connivence) pour une « meilleure » régulation mondiale. Mais ce comité de pilotage rigide ne peut survivre à la montée des pays émergents comme la Chine, le Brésil, l'Inde ou l'Afrique du sud, qui représenteront, en 2015, 60% du PIB mondial et presque 50% de la population mondiale. L'extension du comité est en cours (G20), principalement pour répondre à la pression des pays émergents. Cette extension répond aux contestations de plus en plus marquées sur bon nombre de problèmes entre les pays industrialisés et les pays émergents qui ne partagent pas le même sens des responsabilités au niveau mondial. Quoiqu'il en soit, ce système oligarchique n'est pas durable et c'est un des enjeux de Rio+20 de proposer une configuration institutionnelle de gouvernance mondiale qui, de notre point de vue, doit permettre à chaque pays du monde d'être représenté et d'avoir « une voix » dans la régulation mondiale. Cette participation de tous est le gage de la réussite, à long terme, de l'entreprise. Il n'est pas sûr que les propositions actuelles de mise en place d'une Organisation Mondiale de l'Environnement (OME) soit une bonne réponse (même partielle) à la problématique posée, même si les solutions sont à chercher du côté du multilatéralisme.

5.Regarder au-delà des financements. Depuis des décennies, le débat international est focalisé sur les aspects du financement du développement, en particulier autour de l'engagement des pays industrialisés de consacrer 0,7% de leur PIB à l'Aide Publique au Développement (APD). Vécue au nord et au sud comme une sorte de « charité ou générosité organisée », le débat s'est heureusement élevé sous de meilleurs auspices autour du financement des Biens Collectifs Mondiaux (BCM). Leur prise en compte devient une nécessité équitablement partagée entre le nord et le sud sous forme d'une approche coopérative entre les pays développés et ceux en développement. Tous les pays ont intérêt à ce que ces biens et services, bénéfiques à tous, soient pris en charge au niveau de la planète : l'environnement, les dépenses dans et pour « l'humain » et la politique mondiale.

Plus encore, et si on prend l'exemple du Climat, on le sait, les pays en développement n'ont pas de responsabilité historique dans les concentrations actuelles de gaz à effet de serre dans l'atmosphère. Les financements internationaux engagés pour répondre aux défis climatiques constituent, pour les pays développés,

4 « La Diplomatie de connivence ».- Bertrand Badie. Editions de la Découverte, Paris. 2011.

Rio+20 – J-Ph. Thomas12

la voie choisie pour éponger leur dette climatique, en tant que responsables historiques du phénomène. Encore faudrait-il que ces financements :

i)soient suffisants et accessibles tant aux Etats qu'aux communautés de base et aux collectivités décentralisées,

ii)soient intégrés dans les plans de développement aux différents niveaux mentionnés.

Toutefois, de même que la lutte contre la pauvreté ne peut se réduire à des financements qui satisfassent les objectifs du millénaire, de même le financement de la lutte contre les changements climatiques ne peut se résumer à des financements de projets ou de programmes d'adaptation ou d'atténuation.

Il faut engager la transformation de ces visions actuelles en initiant ou en inventant des politiques de développement durable à partir des expériences déjà développées dans un certain nombre de pays afin que les objectifs de lutte contre la pauvreté et contre les changements climatiques prennent corps dans un ensemble cohérent et durable. Comme le note l'IDDRI (RA 2010, page 30) « les pays où la pauvreté recule significativement,... ce sont des politiques intérieures financées par la croissance qui en reçoivent l'essentiel du mérite, et non la générosité des contribuables des pays de l'OCDE ».

C'est bien ainsi sur la voie d'une transformation des modes de développement qu'il faut s'engager pour répondre aux besoins des plus pauvres et accroître leur résilience face aux changements climatiques. Ce faisant, on s'éloigne des débats sur le financement international du développement pour se rapprocher des problématiques de développement endogène.

Ces cinq tendances lourdes (enjeux ou défis) annoncent déjà ce qu'on peut proposer pour l'Afrique à Rio+20

Bâtir sur l'existant et se projeter sur les vingt années à venir, telle doit être la toile de fond de la réflexion. Cette vision à long terme dépasse le cadre purement politique car ce sont tous les acteurs qui sont concernés, en particulier la société civile. Devant les interrogations des Etats sur ce que doit être Rio+20, la société civile se doit d'apporter ses réponses et tout d'abord convaincre la classe politique quant à la nécessité de respecter ses engagements sur le développement durable.

Donc Rio+20 c'est avant tout l'ensemble des acteurs, des parties prenantes et des populations concernées.

Rio+20 – J-Ph. Thomas13

Notre avenir ne peut découler ou être scellé par un document de plusieurs centaines de pages longuement discuté et amendé par des représentants des Etats.

Le processus se veut inverse5 :

1.Il faut d'abord, dans chaque pays, convaincre les politiques de respecter leurs engagements : qu'avez-vous fait des Agenda 21 ? Pourquoi les objectifs du millénaire ne sont pas atteints dans tel ou tel secteur ? Quel est votre bilan sur la lutte contre la désertification, contre les changements climatiques ? etc. C'est la première étape.

2.Il faut ensuite montrer ce que nous faisons et ce que nous avons réalisé dans le domaine du développement durable, l'assainissement, les énergies renouvelables, la gestion participative des ressources naturelles, la santé, l'accès à l'eau, la lutte contre l'érosion des sols et des côtes, etc.

Cela existe effectivement, il faut le montrer en s'appuyant sur les critères du développement durable tels qu'on les a définis afin de démontrer la durabilité des démarches. C'est la deuxième étape.

3.Enfin, troisième étape, voilà ce que nous pourrions faire en multipliant par 10 ou par 100 nos activités durables et ainsi étendre celles-ci à un maximum de populations. Mais pour cela, il faut que, vous, les politiques et gouvernants, vous vous engagiez plus au-delà, que vos engagements dans des choix politiques soient plus forts tant au niveau international qu'au niveau national.

Notre démarche aura d'autant plus de poids qu'on saura mobiliser, en amont, de nombreux partenaires. En d'autres termes, faire comme le Brésil, mobiliser en amont pour démontrer la force de nos propositions.

En résumé, la voie de Rio+20 est formée de trois composantes :

i) opérationnaliser de manière plus précise et concrète la notion de développement durable à partir de ses cinq piliers : l'économique, le social, l'environnemental, le technologique et l'institutionnel ;

ii)s'inspirer des tendances lourdes, en particulier celles concernant l'Afrique, afin d'éviter des propositions ou recommandations reposant sur des visions de court terme alors que l'empreinte des évolutions de la population, de

5 Voir en particulier « Options futures ».- n°4, 2011.

Rio+20 – J-Ph. Thomas14

l'urbanisation, de la décentralisation, des nouvelles régulations et de la primauté du développement endogène, dessinent des transformations à long terme plus durables ;

iii) proposer, à partir des expériences et de l'existant en Afrique, ce que les engagements de Rio+20 doivent apporter aux populations africaines selon un calendrier réalisable. Il faut alors un maximum de mobilisation des parties prenantes pour soutenir ces propositions.

Dakar, août 2011

## Environmental Association for Universities and Colleges (EAUC)

Environmental Association for Universities and Colleges - UK

Input for the Compilation Document of the UN Conference on Sustainable Development Rio+20, 2012

The Environmental Association for Universities and Colleges - EAUC is the sustainability alliance for the United Kingdom. Established in 1996 the EAUC comprises 312 UK universities and colleges plus another 160 governmental, professional and support organisations and private companies.

Our vision is a university, college and learning and skills sector where the principles and values of environmental, economic and social sustainability are embedded.

Our Mission is to lead, inspire and equip Members and stakeholders with a shared vision, knowledge and the tools they need to embed sustainability within curriculum and operations.

To develop a position to inform the Rio +20 submission, in October 2011 the EAUC conducted a survey of its members. We had a very significant response reflecting the aspiration (and frustration) from within the TE sector to play a more significant part in leading change. In addition to the survey a consultation event was held at the University of Exeter. I am grateful to EAUC Board Member Harriet Sjerps Jones at the University of Exeter for leading the EAUC response.

Why the critical role of Tertiary Education Institutions to Global Sustainable Development must be central to Rio+20 discussions

The role that tertiary education can, should and does play in achieving sustainable development has often gone unrecognized and/or under represented. In the past two decades, it has become clear that tertiary education institutions:

- Provide relevant and critical education to our future government, business, industry, education and community leaders. By integrating sustainable development into curriculum, skills training and student development, tertiary education will equip the future with people who have the ethical principles, knowledge and capacity to positively impact the global economic and educational systems, to eradicate poverty and improve access to education for all;
- Are critical homes for the research that provides sustainable solutions to the complex problems of development. Indeed, Secretary Ban Ki-moon pointed out in his call for the world's academic community to find solutions to global hunger, water shortages, and energy issues, "the academic community can help us connect the dots"; and
- Serve as the "test beds" for examining the context in which innovative sustainability practices are executed. As these institutions implement a variety of context-specific sustainability practices through education and operations, they demonstrate the viability of these practices and provide models for sustainable development.

However, Education for Sustainable Development (ESD) is still not being supported at the national level. This is the conclusion of the UNESCO first report on the DESD (2009). International frameworks such as the UN DESD and UNFCCC have presented ESD models but these have not been implemented or supported by national agencies particularly in further and higher education.

In light of this, it is recommended that:

 Tertiary institutions and governments alike should provide resources and funding to facilitate the fundamental shift to embed sustainability in the curriculum, research, and operations of tertiary education. The development of tools, resources and appropriate professional development for academics and institutional leaders are required for this fundamental shift in our collective approach to sustainable development to be successful;

 Each tertiary institution within developed countries should partner and work with a tertiary institution from a developing country, for the purpose and mutual benefit of research, knowledge and resource exchange. Each institution should make this partnership explicit through registering on a dedicated UNCSD page, though we do have concerns that this could become a meaningless window-dressing exercise.

 Every tertiary institution should commit to sharing and learning from one another in the spirit of international partnership and long-term global societal benefit.

 Tertiary institutions will act as a locus for catalytic research, learning and action for a transition towards a 'Green Economy'. We are divided over the use of the words 'green economy' or 'green growth' as to many of us this still emphasises economy and growth, and could neglect the importance of social value like social capital and community participation.

 The EAUC would like to see Rio Plus 20 provide incentives and governance frameworks to ensure that the role of education and learning for sustainability is understood by national agencies and supported through grants and other incentives particularly within FE and HE.

 Actions and implementation frameworks are being identified for Climate Change, Biodiversity, MDGS and similar thematic areas. ESD should have a similar set of actions and implementation framework which identifies what constitutes progress in ESD in TE (amongst other sectors).

Iain Patton, Chief Executive, Environmental Association for Universities and Colleges

## Environmental Commissioners of Canada and Quebec

Submission by the Environmental Commissioners of Canada and Quebec to the United Nations Conference on Sustainable Development (Rio+20)

Lessons in Good Governance: Performance auditing and reporting from the Environmental and Sustainable Development agenda in Canada

For consideration at the Second Earth Summit 2012 Intersessional

## Executive Summary

- This paper provides observations and lessons learned on good governance from the work of two independent Commissioners of the Environment and Sustainable Development in Canada.
- Environment and sustainable development (ESD) audits can play a critical role in providing practical, objective, and rigorous examinations of how environmental and sustainable development laws, regulations, policies and programs are managed and implemented, and how they achieve their intended objectives at the sub-national, national, and international levels. Audits support good governance by advancing accountability.
- Comparing observations made in ESD audits of the Canadian Kyoto Protocol Implementation Act and of Canada's implementation of its obligations under the Montreal Protocol on Substances that Deplete the Ozone Layer illustrates that good governance and accountability are critical factors in the success of domestic and international legal instruments.
- Existing and future multilateral environmental agreements should integrate implementation and accountability mechanisms, and a performance reporting framework.

## Background

Since the United Nations (UN) Conference on the Human Environment, held in Stockholm in 1972, governments around the world have been working to address environmental issues through the creation of national and sub-national government departments, agencies, policies, programs, regulations, and expenditures, and through the creation or adaptation of international institutions, treaties, and soft law (for example, international declarations). A key step in this process was the 1992 UN Conference on Environment and Development (UNCED) in Rio de Janeiro and its action plan Agenda 21. Although multilateral environmental agreements and institutions were established, current scientific assessments indicate that many ecosystems are worse off now than they were 20 years ago. These assessments also reveal that environmental degradation is proceeding at accelerated levels.

During this same period, people have formed growing expectations that organizations affecting the environment should be accountable for their actions. Many people now believe that representations that governments make in the field of environment and sustainable development should be subject to independent audit to assess how well these tools are implemented.

## Purpose

This paper is submitted as a contribution to the discussion on the second theme of the Rio+20 conference, "the institutional framework for sustainable development". It addresses the second objective on assessing progress to date and the remaining gaps in the implementation of sustainable development. This paper shares perspectives obtained from the work of the Environmental Commissioners of Canada and of Quebec, with a view to improving the implementation of environmental policies, programs, regulations, and partnerships. It is hoped that these lessons will be particularly useful to countries that are still developing their environmental governance frameworks and institutions.

## Audit and good governance

Good governance is essential for ensuring that commitments to environmental protection and sustainable development produce credible results. National and sub-national (provincial) environment and sustainable development audits play a critical role in supporting good governance by advancing accountability and by providing practical, objective, and rigorous examinations of how environmental and sustainability laws, regulations, and programs are managed and implemented at the national and international level against their objectives and targets.

Audit and performance reporting provide a well established, internationally accepted, and respected means of finding out if governments have done what they said they would do. These tools can help hold governments to account for implementing policy commitments and program delivery, and can lead to improvements in the implementation of international and domestic agreements.

## Issues Identified in Environmental Audits and Evaluations

The Commissioners of the Environment and Sustainable Development of Canada and of Quebec have been conducting their work for many years. The two Commissioners have identified a number of common issues in their audits of government programs and activities. A 2011 survey of the 71 nation states that are members of the International Organization of Supreme Audit Institutions (INTOSAI) Working Group on Environmental Auditing identified key issues observed in environmental audits. (See Appendix A for an overview of the work of the Commissioners and of INTOSAI.) Responses to the survey echo many of the issues that the Commissioners identified and can be summarized as follows:

- Lack of coordination between sub-national levels and the national level. Through the audits conducted, it has been noted that since environmental problems occur at all levels, actions must involve municipal, regional, and national governments. There is a need to improve integration and coordination between governance institutions at different levels. When local entities are involved in implementing national policies, it is essential that credible and verifiable means exist for reporting on how these funds were spent and what results were achieved, in the interest of transparency and accountability for national funds and results.
- Insufficient assessment of environmental impacts of government policies and programs. Audits have noted that governments are not using policy tools to ensure more timely consideration of environmental outcomes or negative impacts before large sums are committed to a policy, program, or project. Many governments do not yet widely use high-level regulatory impact assessment or strategic environmental assessment, or they do not use them effectively to inform policy decision making.
- Lack of analysis (economic, social, and environmental) supporting decisions. In some audits, the findings have noted that policy makers are not taking into account the three pillars of sustainable development—economic, social, and environmental aspects—when making decisions. Several audits have found that full-cost accounting is rarely done. Sustainable development governance requires robust analysis and better integration of economic, social, and environmental policies, and recognition of tradeoffs, particularly within the broader development planning frameworks.
- Lack of long-term planning to implement environmental policies and programs. Audits have noted that issues requiring long-term planning to resolve, such as climate change adaptation, do not have corresponding planning processes or plans in place. This situation may lead to a planning and accountability gap that can increase the risk of not meeting long-range commitments.
- Inadequate financial management of environmental policies and programs. Audits have noted that financial management problems can be caused by several factors: insufficient planning, resulting in high, incorrectly anticipated costs of delivering environmental policies and programs that then require large amounts of additional unanticipated funds; lack of an appropriate financial management framework to support the implementation of environmental policies and programs; lack of financial management skills; and misuse of funds.

- Lack of enforcement of domestic environmental legislation. National and sub-national audits have indicated that environmental laws are not self-executing. Governments must ensure compliance with domestic environmental legislation by taking appropriate, effective, and proportionate policy measures. This approach requires administrative capacities and strong government commitments to implement and enforce the regulatory framework.
- Deficient monitoring and reporting systems. Audits have noted that high-quality accountability and reporting systems are often lacking. Evaluation of key policy choices, and of the effectiveness and efficiency of the instruments used to implement them, is not always in place. Without good evaluation, it is difficult for governments to report and measure their progress toward sustainable development and to identify where further policy action is needed.
- Lack of environmental data for decision making. Audits have noted that government bodies do not have sufficient and robust environmental data to support their policy and program decisions and to evaluate their performance against objectives. There are problems with the availability, timeliness, quality, and accuracy of data. Overall, there is a lack of knowledge and information on ecosystems and their responses to pressures; and a failure to use the existing information adequately to support management decisions. Independent environmental audits can collect and report information for decision makers where information is lacking.

#### Lessons learned for good governance and accountability

Drawing from these identified issues, we can point to core lessons learned for effective implementation of environmental commitments. For years, the Commissioners of Environment and Sustainable Development in Canada have stressed the importance of applying the principles of good governance—effective accountability mechanisms, adequate transparency, credible reporting, and protection of the public interest—to federal programs, partnerships, and practices. More than ever, we believe these principles are key to future success of national and international law, policies, plans, and programs, and to determining whether commitments made by governments to address environmental and sustainable development objectives are being met. In practical terms, the design of these instruments and measures must:

1. Provide a plain language description of the commitment and what it means in terms of intended outcomes and results.
2. Identify the new actions that are needed, along with those already under way, complete with realistic timetables and milestones.
3. Assign clear and specific roles and responsibilities to the departments and agencies at all levels that are responsible for these actions.
4. Establish concrete performance expectations and indicators of progress.
5. Provide the necessary resources to implement the actions that have been identified.
6. Monitor and review progress that is made.
7. Report to the public regularly and in a transparent way.

#### Lessons in good governance – Comparing audit observations for the Montreal Protocol and the Canadian Kyoto Protocol Implementation Act

In 2011, the Canadian Federal Commissioner of the Environment and Sustainable Development conducted an audit of Canada's Kyoto Protocol Implementation Act. The Commissioner found that the federal government had not put in place the management systems and tools needed to achieve, measure, and report on reductions of greenhouse gas emissions. The report noted that key elements were missing, such as clear roles and responsibilities, goals and objectives, and effective performance measurement—including transparent financial reporting and quality assurance on greenhouse gas emissions reported. The report found that Canada's Climate Change Plans are not in compliance with the federal Kyoto Protocol Implementation Act and that Canada is not on track to meet its target for greenhouse gas emissions under the Kyoto Protocol.

In 1997, the Office of the Auditor General of Canada conducted an audit of the federal government's implementation of the Montreal Protocol on Substances that Deplete the Ozone Layer and found that Canada had met—and, in some cases, exceeded—its obligations under the Montreal Protocol. The Montreal Protocol has been remarkably successful in achieving its objectives to date at the international and national levels. As a multilateral environmental agreement, it broke new ground in many areas and is often hailed as a model for solving environmental issues of a similar nature. Many factors have contributed to its success to date, including the following:

- mandatory data reporting facilitated tracking of countries' performance against their commitments and country-to-country comparisons;
- clear, measurable phase-out targets and schedules allowed for effective measurement of progress;
- the adoption and application of alternative technologies were greatly facilitated through cooperation and collaboration initiatives, including bilateral assistance projects, industry-led workshops and technical assistance, and government-to-government training;
- the establishment of the Scientific Assessment Panel provided an effective forum for obtaining and reporting consensus among international scientists and research institutions and for supporting policy decisions;
- special provisions for developing countries, based on the principle of mutual but differentiated responsibilities, such as a grace period for phase-out of Ozone Depleting Substances (ODS) and direct financial assistance through the Multilateral Fund.

These examples illustrate that good governance and accountability mechanisms are important factors in the success of international legal agreements and national governments' implementation of their respective obligations.

#### Aspirations for Rio+20 outcomes

We believe that more effective accountabilities and implementation mechanisms would ensure more effective agreements and outcomes. For this reason, we submit the following for consideration at the Rio +20 conference:

- Existing and future multilateral environmental agreements could include enhanced implementation and accountability mechanisms. These mechanisms could be built into the agreements and a performance reporting framework could be established. The UN Convention on Biological Diversity's Strategic Plan and its Aichi Biodiversity Targets may provide useful examples.
- International, national and sub-national audits and progress reporting can play a critical role in supporting good governance by advancing accountability, and providing practical, objective and rigorous examinations of how environmental and sustainability policy, programs, regulations, targets and laws are managed and implemented.
- Existing national and international mechanisms could be enhanced, or new ones designed to enhance accountability and transparency could be created.
- Capacity building and institutional development in developing countries should be enhanced in the field of environmental governance, and performance auditing and reporting.

## Appendix A

### Background on the Commissioners

The Commissioner of the Environment and Sustainable Development, within the Office of the Auditor General of Canada, and the Commissioner of Sustainable Development of Quebec are independent officers of democratic legislatures. During the course of their work over the last 20 years, they have studied, observed, audited, and verified the extent to which their governments have made and kept their commitments to protect the environment and to promote sustainable development through domestic and international commitments and agreements.

Since it was established in 1995, the federal Commissioner of the Environment and Sustainable Development (CESD) has produced over 100 performance audits and studies on environmental issues ranging from air and water quality to climate change, hazardous spills, and species at risk. The CESD has examined the implementation of federal regulations, programs, partnerships, and multilateral environmental agreements.

Also, the CESD has played an important role in the oversight of the implementation of the federal government's climate change plans and the Federal Sustainable

Development Strategy - the latter calling for the integration of environmental, economic, and social factors in all decisions governments make. The CESD also manages a transparency and accountability tool, known as the environmental petitions process, which raises environmental and sustainable development issues to the ministerial level within and, at times, between departments.

The Commissioner of Sustainable Development in Quebec makes comments and recommendations concerning the application of Quebec's Sustainable Development Act, which established a management framework within the provincial government to ensure that its powers and responsibilities are exercised in the pursuit of sustainable development. The Commissioner's objectives include raising awareness of sustainable development issues to parliamentarians, ensuring accountability of provincial departments in relation to their sustainable development action plans, and integrating the principles established by Quebec's Sustainable Development Act in the evaluation criteria used in value-for-money auditing.

The International Organization for Supreme Audit Institutions (INTOSAI) is the professional association of Supreme Audit Institutions (SAIs) in countries that belong to the United Nations or its specialized agencies. INTOSAI established the Working Group on Environmental Auditing ([www.environmental-auditing.org](http://www.environmental-auditing.org)) in 1992. At INTOSAI's most recent triennial International Congress of Supreme Audit Institutions, held in 2010 in Johannesburg, South Africa, the resulting Johannesburg Accords noted that "[by] exercising the highest values of professionalism, independence, objectivity and transparency, and through effective cooperation, Supreme Audit Institutions can make significant contributions toward addressing sustainable developments issues that are becoming increasingly regional, and even global, in nature."

---

## Environmental Law Institute

### Environmental Emergencies

Environmental emergencies are increasing in both severity and frequency, and are an emerging issue for the United Nations Conference on Sustainable Development ("Rio+20"). In this context, the Environmental Law Institute proposes the following points for consideration in the Zero Draft Compilation Document:

Environmental emergencies cause substantial harm to human life and national economies, and developing and operationalizing international frameworks for environmental emergency response and preparedness is a priority.

The impacts of environmental emergencies on human health and national economies extends beyond the tally of lives lost and property damaged. Disasters frequently destroy critical infrastructure, such as a ports or power plants, or release toxins that cause persistent health problems and can burden a country for years or decades to come. Minimizing these impacts is critical to preserving human health and welfare and safeguarding national economies. Therefore, it is imperative that government agencies and other actors at all levels recognize the threat posed by environmental emergencies and take measures to prevent, minimize, and respond to them.

The international framework for environmental emergency response and preparedness needs to be strengthened to account for the increasing frequency, greater damage, and changing geographic distribution of environmental emergencies, particularly in light of climate change and urbanization.

As environmental emergencies increase in scope and severity—especially due to climate change and urbanization—the likelihood that they will overwhelm a nation's capacity to respond is amplified. As such, the international framework addressing disasters needs to be strengthened. Currently, the frameworks result in gaps and overlaps in aid which negatively impact and decrease efficiency of response efforts. Greater coordination and sharing of information, expertise, and resources will strengthen the international preparedness and response frameworks to ensure more effective international assistance.

Climate change and urbanization will influence the changing vulnerabilities of communities and countries around the world. They also present new opportunities for improving response and preparedness as increased attention is paid to environmental emergencies. Failure to address the changing needs in environmental emergency response and preparedness could result in more costly outcomes. The international community needs to anticipate these changes and develop a global framework that meets these challenges.

The international community needs to build capacity of local responders, particularly in large cities, and integrate local response with national, regional, and international response systems.

Coordination between different levels of response improves the effective and efficient use of resources for assistance. Local responders often know the area and the people most affected, and are the first on the scene. In order to optimize international assistance, local responders need to possess the tools and knowledge necessary to request national or international support (taking into account the need prerogative of national authorities for managing international relations). Likewise, international responders would benefit from earlier notification and more clear direction to minimize aid overlap. Measures that facilitate greater communication and integration are needed to improve coordination and effectiveness.

### Natural Resources and Post-Conflict Peacebuilding

Since the 1992 Rio Earth Summit, post-conflict peacebuilding has emerged grown rapidly, with experiences in many countries. Natural resources are essential to post-conflict economic development, stabilization of security, social equity, and good governance. The actions that are taken – or not taken – in post-conflict peacebuilding substantially affect whether a country successfully transitions to a path of sustainable development or it relapses into conflict.

The Environmental Law Institute (ELI) submits the following comments for consideration in the Zero Draft Compilation Document for the United Nations Conference on Sustainable Development ("Rio+20"). These comments might best fit within the "Emerging Issues" discussion, but could also be relevant to "International Governance for

Sustainable Development.”

War is inherently damaging to sustainable development, and many post-conflict countries struggle with the transition from conflict to sustainable development; post-conflict peacebuilding seeks to lay a foundation for durable peace and sustainable development.

- Since the 1992 Rio Earth Summit—and the end of the Cold War—there has been a rapid growth in post-conflict peacebuilding. Efforts to help countries to recover from war have had been uneven, and the risk of relapse into conflict is significant. In the 2011 World Development Report, the World Bank noted that “every civil war that began since 2003 was a resumption of a previous civil war.” Moreover, natural resource-linked conflicts are more likely to relapse into violence than other conflicts, and do so twice as quickly.

- Conflicts are often linked to natural resources. Natural resources may be one of the root causes of the conflict. The extraction and trade in natural resources often finance conflict. Since 1990, natural resources have fuelled conflict in at least 18 countries. Scorched earth tactics, land mines, and other military strategies often target natural resources during conflict.

- The international community is devoting increasing attention to the emerging issue of how to design and implement peacebuilding initiatives to more effectively support the transition to sustainable development and prevent relapses to conflict.

- From the outset, peacebuilding requires a long-term view that integrates economic, social, and environmental dimensions. Such a holistic approach is needed to avoid exacerbating existing tensions or creating new, unintended consequences that could undermine the transition to a durable peace. Effective management of natural resources is essential to post-conflict peacebuilding because post-conflict societies rely on natural resources for food security, livelihoods, economic development, basic services, and other peacebuilding objectives.

- Natural resources can be important to almost every aspect of post-conflict peacebuilding.

- To establish security in post-conflict situations it is imperative to secure the trade in conflict-linked natural resources. Disarmament, demobilization and reintegration (DDR) can use natural resources to provide a source of civilian livelihoods for former combatants (particularly as farmers, but also in other resource-dependent sectors).

- The livelihoods and food security of many post-conflict situations are tied to the sustainable management of natural resources because a majority of the population often works in agriculture, forestry, fishing, artisanal mining and related fields.

- The economic development of post-conflict countries may also depend substantially on the extraction and processing of natural resources, such as timber, oil and gas, minerals and cash crops.

- Natural resources are essential to providing basic services such as drinking water, hydropower, and inland water transport.

- Governance and the rule of law can be supported through shared management of natural resources using inclusive political processes in local, national, and regional resource management institutions. The planning and implementation of post-conflict peacebuilding have often failed to adequately address natural resources, which has undermined the effectiveness of peacebuilding.

- There have been many experiences, largely ad hoc, from which we can learn to improve the effectiveness of peacebuilding initiatives.

- Many of these experiences have been analyzed by a global initiative led by the Environmental Law Institute, United Nations Environment Programme (UNEP), the University of Tokyo and McGill University. This project assesses more than 150 case studies of peacebuilding initiatives from around the world, authored by 230 researchers and practitioners in 50 countries, and it disseminates the findings in a six volume series of books. While individual peacebuilding experiences have been successful, the bulk of the case studies point to the need for approaches that better integrate natural resources.

To strengthen the effectiveness of post-conflict peacebuilding, institutional and operational approaches need to be developed and implemented to mainstream natural resource management into peacebuilding efforts.

- The institutional and operational approaches suggested herein would improve institutional learning, build capacity, mobilize expertise to provide technical assistance, consider natural resources in the assessments of specific post-conflict situations, and increase coordination around natural resources.

- Learning—More systematic approaches are needed to collect, analyze, and disseminate information on managing natural resources to support peacebuilding on an ongoing basis.

- Capacity building—To operationalize lessons learned on managing natural resources in post-conflict settings, it is necessary to build the capacity of post-conflict countries and the bilateral, multilateral, and nongovernmental organizations that support them. This would include staff trainings, workshops for partner organizations, operational guidance on both strategic and project levels, templates for contracting guidelines, monitoring and evaluation strategies tailored to natural resource management in post-conflict settings, and checklists for conflict-sensitive natural resource management.

- Mobilizing expertise for technical assistance—Searchable rosters of experts and pools of experts on call could help to mobilize the expertise necessary to provide post-conflict technical assistance on a range of natural resource-related issues. These experts may include both in-house staff and external experts.

- Considering natural resources when assessing specific post-conflict situations—For each post-conflict situation, careful analysis is needed to identify whether and how specific natural resources should be integrated into peacebuilding strategies. This analysis should identify conflict-linked natural resources and address them in the peacebuilding strategy. Planning processes should consider which natural resources can support the security, economic, social, and governance needs of the specific post-conflict situation. Natural resources that could constrain proposed peacebuilding activities must be evaluated before peacebuilding activities are initiated.

- Coordination—Natural resources can provide as-yet underutilized opportunities for coordination around a resource. Although coordination among local, national, and international actors is essential to effective and efficient peacebuilding, there has been very little coordination to date, particularly at the operational level.

Programs and projects should coordinate through donor conferences, during program or project design, and throughout the implementation process. Evaluations of programs and projects should consider whether there has been effective coordination with the other initiatives and communities that rely on or affect the same resource.

A publicly available database of projects and the natural resource or resources relied upon or affected would allow post-conflict countries, donors, and other actors to more readily identify with which groups they should coordinate.

Implementation of the Transboundary Environmental Impact Assessment principles into the Zero Draft document – TEIA as a relevant environmental policy instrument for sustainable development

#### Rio Principles on Transboundary Impact Assessment Should be Strengthened

Achieving sustainable development will require enhancing international cooperation in assessing the environmental impact of economic activities, specifically the impact that may occur due to climate change.

Transboundary environmental assessment procedures are an opportunity for climate-vulnerable countries to consult with local governmental authorities during the planning phases of economic activities about possible impacts that may affect their sustainable future or even their existence.

With the aim to help mitigate the adverse effects of climate change and provide opportunities for vulnerable states to be heard, we call for global discussion on TEIA in relation to (1) climate change impacts, (2) the determination of the methodology and established threshold for triggering the transboundary procedures, and (3) the obligation for States to take action if there is a finding of negative transboundary impacts.

An Environmental Impact Assessment (EIA) (or Strategic Environmental Assessment - SEA) is an important tool for making critical predictions about the costs, risks and benefits involved in a proposed activity. This tool can raise public awareness of the effects of climate change. It can also be a test in determining whether a state has fulfilled its duty of due diligence to avoid causing harm to another state. The importance of the TEIA was recently recognized also by the International Court of Justice judgment Case concerning Pulp Mills on the River Uruguay (Pulp Mills).

In order to improve global climate policy and decision-making with potential climate impact, we propose revisiting the Rio Principles concerning transboundary environmental impact. The principles should be strengthened and applied more consistently to encourage effective participation by climate-vulnerable states in impact assessment procedures.

#### Practical Challenges in Conducting Transboundary Assessments

While TEIA is firmly established within international law and practice, there are several issues regarding its application.

Firstly, there are no clear and defined standards for the application of EIA in a transboundary context. There are no thresholds for the obligatory assessment setup, and the potential use of the TEIA is in most cases dependant on the national EIA legal provisions. Furthermore, in the context of climate change, there is no methodology on how to assess a project's impacts on the climate.

Although international agreements about EIA exist, the legal provisions are fragmented and thus the use of EIAs and TEIAs varies from state to state. The application of the TEIA principles should no longer be dependent on national law only. It could be agreed that it is nearly impossible to establish a single comprehensive procedure for impact assessment "[d]ue to variation in political regimes, natural systems, and cultural values." Nevertheless, if uniform and consistent standards of TEIA are to be achieved among states, a multilateral cooperation is needed. Possible solutions include the development of TEIA treaties that explicitly cover climate change impacts and, as an initial step, for the states to consider becoming parties to the Espoo Convention and the Protocol on SEA.

Among these challenges another problem exists relating to the notification and consultation procedures. Once it is established that a TEIA is required for a proposed activity, the next challenge is to determine the scope of the EIA and to what extent "affected states" should be involved in the process. There is no universal rule regarding the procedures governing the notification process and the extent to which an affected state is allowed to participate in the TEIA, if at all. The notification and consultation procedures remain vague for states that are not party to the transboundary agreements.

#### Case Study: Transboundary Assessment on Climate Impacts

The low-lying island nations are among the states most threatened by climate change. A recent case has demonstrated a possible way for these nations to be included in the decision-making process of the major emitting countries such as the EU Member States.

In a landmark intervention in 2010, the Federated States of Micronesia (FSM) requested a TEIA of the Prunéřov II brown coal-fired power plant in the Czech Republic. It was the first-ever "transregional" use of transboundary Environmental Impact Assessment (EIA). FSM asserted its right to be heard as a sovereign because the plant's greenhouse gas emissions may contribute to potential and possible climate change impacts.

FSM was able to participate because the Czech EIA law uses a broad definition of parties eligible to initiate and participate in a transboundary EIA procedure. The Czech law allows any state whose "territory can be affected by significant environmental impacts" to initiate and participate in a TEIA. In addition, the Czech EIA law requires a project's developer to include, as an obligatory part of a project's documentation, an assessment of the project's climate impact.

While some of the other European countries — for example, Germany, Netherlands, Austria, Norway, or Sweden — have EIA laws with similarly broad participation rights, other countries restrict transboundary participation to signatories of the Espoo Convention or members of the EU (in the context of SEA). The island nations, therefore, have inconsistent access to transboundary procedures worldwide.

The Czech Ministry of Environment finally issued an affirmative EIA statement on the project. The statement declares that FSM submitted its viewpoint and it summarizes the fact that FSM expressed its disagreement with the climate protection and the Best Available Technique (BAT) compliance elements of the plan. An assessment of climate impacts of the plan took place and although FSM concerns were officially denied in the final statement, the developer of the plan, the CEZ company, is obliged to save over 5 million tons of CO<sub>2</sub> emissions from its other projects over the next 25 years.

FSM's involvement in the EIA process for the Prunéřov II Power Plant in Czech Republic is a unique example, and we believe it is important to build on this experience.

#### Conclusion

Climate change is a cross-cutting issue, and there is no common strategy on how to tackle it, nor there is established instrument for addressing its adverse effects.

International agreements contain general commitments, but many questions related to mitigation of climate change remain. Needless to say, an easy solution is not in sight.

Already, island nations such as FSM are threatened by tidal surges, destruction of food crops, coastal erosion, submersion of islands and reduced water supply to rivers.

These environmental threats are likely to be exacerbated by climate change, and affected states cannot afford to wait.

It is our belief that the international community should give guidance regarding current obstacles to effective use of TEIA in the context of climate change. Moreover, in our opinion, TEIA as a cooperative transboundary tool should be firmly established in the system of the international law.

RIO+20 is envisaged as a Conference at the highest possible level having an impact on the whole globe. It is our belief that the promotion of the TEIA within this global forum has its place and can lead to the effective policy instruments that will help us towards a more sustainable future and climate justice. This concept falls under the focus of the Conference that will include the institutional framework for sustainable development. We suggest that the TEIA principles should be included in the Zero draft document and should be included in the later discussion and negotiations during the Conference.

Contacts: Environmental Law Service / Ekologický právní servis, Jan Šrytr, lawyer, jan.srytr@eps.cz

#### The Environmental Law Service (ELS)

ELS is a public interest law organisation founded in 1995 in Brno, Czech Republic. The vision of ELS is that of a free society that enables everybody to aspire to personal happiness while being aware of their responsibility to the public, including the state of the Earth. ELS lawyers support those who seek to protect their rights and the interests of the public. We protect human rights and advocate the rule of law, the transparency of state power, and the responsibility of corporations for consequences of their actions. ELS has represented pollution victims of ArcelorMittal steel plants, helped Polish municipalities to fight against relocation to give way to Europe's biggest coal mine, assisted Bulgarian grassroot organisations to craft legal strategy against the plans of Dundee Precious Metal company to use cyanide technology in local gold mines, and tested the

first ever trans-boundary environmental impact assessment based on climate change concerns, in the case between the Czech Republic and Federated States of Micronesia regarding the biggest Czech coal-fired power plant, Prunéřov.

## Environmental Management for Livelihood Improvement Bwaise Facility (EMLI)

### Environmental Management for Livelihood Improvement Bwaise Facility

Environmental Management for Livelihood Improvement Bwaise Facility (EMLI) notes with concern the historical, new and emerging challenges Africa as a continent faces ever since Rio conference in 1992. Some of these challenges include the continent's vulnerability to climate change, ecosystem and biodiversity loss, accelerating desertification, HIV/AIDS and Malaria, declining fish stocks, wide spread pollution, unregulated toxic chemicals and hazardous waste, poverty, immigration control, unemployment, energy and food crisis.

Furthermore, Africa water towers are drying up at a much more precedent rate for example the drying of Lake Chad, the erosion of the Nile Delta, the declining Lake Faguibine in the Niger River Basin and falling water levels in Lake Victoria and unreliability and predictability of African rains despite efforts to setup early warning systems.

Despite efforts to implement commitments from Rio in 1992, stem political momentum to achieve the Millennium Development Goals, the continents' efforts are still futile to realization of the level of development attained by other continents. In this retrospect, the United Nations Conference on Sustainable Development (Rio+20) MUST reinvigorate the commitment of the global community to concentrate on leap-frogging Africa to a continent sustainably developed and equitably sharing the global space.

Governments should commit on the following so as to leap frog Africa to a sustainably developed continent;

African civil society including the Major groups be fully engaged in processes towards during and after Rio+20 through; regular inclusion in national delegations; recognizing rights of indigenous peoples; granting full access and participation during negotiations and establishing predictable financial mechanisms so as to enhance representation and participation

#### 1. Green economy in the context of sustainable development and poverty eradication

Ensure that green economies enhance human well being, narrows the gap between rich and poor, create decent green jobs

Ensure that actions and mechanisms to achieve a green economy do not increase social inequalities, exacerbate negative socio-economic environmental impacts such as monoculture and land grabbing BUT address structural limitations that always put women, youth and vulnerable groups at disadvantaged position

Ensure that National Development Plans be the driving policy instruments towards realizing a green economy baring in mind that this transition be sector specific such as through waste management, forestry, agriculture and tourism The African 10-Year Framework of the Programme on Sustainable consumption and production be implemented and the necessary technical and financial support availed with a mechanism taking into consideration national action plans Ensure that tariff, non-tariff barriers and market distortions are removed from least developed countries especially Sub-Saharan African countries trade in environmentally-sustainable goods and services

Provide access to energy especially renewable energy by ensuring that 35 percent of Africa's rural population has access to energy by 2020

Establish a global mechanism building on the United Nations Convention on the Law of the Sea (UNCLOS) to regulate and protect oceans, seas and coastal zones and also reduce fishing pressure, restore productivity and prevent any form of pollution

#### 2. Institutional framework for sustainable development

At global level, a clear coordinated framework of United Nations agencies be strengthened with the Commission on Sustainable development elevated to a status of a Council with decision making mandate whereas United Nations Environment Programme transformed into a specialized institution for the environment based in Nairobi, Kenya

An implementation mechanism be established with Long term, scaled up, new and additional, predictable and adequate funding, capacity building, technology development and transfer frameworks that will see more practical undertakings in the next 20 years with poverty eradication, youth employment and food security high on the agenda

A more precise, clear and actionable indicator framework for sustainable development be developed fully integrating systematic assessment and reporting on the main environmental and human dimensions challenges and constraints, building on and incorporating existing assessments such as Human Development Index

Promote sound management of chemicals and waste especially e-waste through availing the required technical and financial support so as to implement national and regional strategies on chemicals management

At Regional level, The New Partnership for Africa's Development (NEPAD) be revitalized, implemented and monitored with actionable indicators so as to ensure effective vertical and horizontal linkages, as well as effectiveness implementation of NEPAD's Principles, Programme of Action, Priorities and desired Outcomes

Ensure full implementation of the right to access to environmental information, participation and justice enshrined in Principle 10 of the Rio Declaration

At National level, National Sustainable Development Councils/Forums be revived and further strengthened with the necessary financial and technical capacity so as to address the challenge of integrating economic, social and environmental pillars through ensuring multi-stakeholder engagement

## Environmental Pillar of Social Partnership

### 1. Introduction

The Environmental Pillar of Social Partnership in Ireland welcomes the opportunity to contribute to the Rio +20 Conference on Sustainable Development. The Environmental

Pillar is one of the 5 National Social Partners established by the Irish Government to enable civil society interaction with government. The Environmental Pillar is an advocacy coalition made up of 27 national Irish environmental NGOs.

The major outcomes of the Rio Conference in 1992 "The Earth Summit" included the Rio Declaration, Agenda 21, and the Sustainable Forest Principles. For the first time at international level, it was agreed that economic development must incorporate principles like environmental sustainability, public participation, human rights and poverty reduction. The outcomes of the Earth Summit made it clear that protection of the environment was essential for the well-being of societies and the economic systems that they create. The fundamental concept of sustainable development has evolved since and is best described by means of the "Russian doll model". This model shows human society evolving from and entirely reliant on the environment from whence it came. It also shows the economic systems that were created by humanity as a subset of human society and one that can be and has been changed to suit the needs of the time.

Human Society emerged from, and is entirely reliant for its survival on, the natural environment. Economic systems are created to serve society and can be changed by society. Human society on its present course, with a rapidly growing population, and with an economic system based on an ever increasing use and abuse of natural resources, is destined to destroy the natural systems on which it relies.

In recent developments, a Universal Declaration of the Rights of Mother Earth has been drafted and the Ecuadorean Constitution (2008) and Bolivia's Law of the Rights Of Mother Earth (2011) both now recognise the Rights of Nature. "in an interdependent living community it is not possible to recognize the rights of only human beings without causing an imbalance within Mother Earth."

Some progress has been made since 1992 including through the elaboration of regional, national and local sustainable development strategies, the adoption of a binding agreement on Climate Change, the progression of the Convention on Biological Diversity and associated international, national and local biodiversity Action Plans, and the ratification of the Aarhus Convention on environmental democracy by 44 states in the UNECE region. In developing countries, the Rio Declaration allowed for the incorporation of Human Development considerations and greatly influenced the Millennium Development Goals (MDG) agenda. However wealth is increasingly concentrated in the hands of a small percentage of the population, undermining the sense of solidarity necessary for concerted efforts to resolve the global crises of poverty, environmental degradation and economic chaos.

Overall, though, 20 years on, tangible change has been negligible as evidenced by the collection of global crises today: crises in democracy, global economics and finance, climate change, accelerating biodiversity loss and food security. While much has been achieved through the MDGs, sadly over 1 billion people continue to live in absolute poverty worldwide while the international framework which is expected to help them is fragmented and incoherent. Agenda 21 has largely been paid only lip service, and has failed to integrate the key challenges of sustainable development in to various sectors. The Convention on Biological Diversity has driven some progress and raised profile of the global biodiversity crisis however biodiversity loss continues at an unprecedented rate. The Sustainable Forest Principles are still not being implemented or progressed.

Even though the agenda for the Rio +20 conference is somewhat restrictive and lacking in vision, the 20th anniversary still represents a major opportunity for states to re-commit to and prioritise the fulfilment of the principles which underpin the Rio Declaration and to agree and implement a programme which moves humanity forward in that direction.

However, political will to fulfil commitments has waned since 1992 and the institutional framework for making real progress on sustainable development is inadequate.

For this to change, the involvement of major groups and stakeholders will be critical in the preparatory process and in the conference itself, as civil society will play a central role in gathering support and momentum for dealing with the global challenges discussed there. Civil society will also bring knowledge, expertise and resources as well as advocacy skills that will promote the environmental and developmental priorities and obligations, helping to ensure the following outcomes as the absolute minimum required to tackle the many crises facing humanity and nature:

- 1.1 an explicit expression of the need for a seismic shift in the prevailing economic model to one based on the understanding of the limits to growth, together with an outline mechanism for moving towards a new model;
- 1.2 a reiteration of commitment to implement the principles of sustainable development contained in the Rio Declaration of 1992, together with timelines for action;
- 1.3 a clear statement that sustainable development will underpin the narrative for a "post Millennium Development Goals" framework;
- 1.4 a declaration of the rights of nature.
2. Responses to specific questions
- 2.1. What have been the main successes/failures in progressing sustainable development since the Earth Summit in 1992; what are the key remaining gaps and how do you think Ireland should best address these issues?
- 2.1.1. Cross-cutting Issues

If humanity is to survive and flourish then the kind of radical thinking that marked the Earth Summit needs to be turned into action. Twenty years on, the public and the public authorities at all levels of governance still need to be informed and educated about the real issues that face them. The "bread and circuses" that make up much of what is provided by both the public and privately owned media, together with their continual reference to members of the public as "consumers", drives society further towards the brink of social and environmental collapse. The continual and inexplicable emphasis on basing all decisions on the pursuit of continual GDP growth underlies this myopic drive towards the destruction of our life support systems. The measurement of our success as a society needs a new yardstick based on well-being and environmental integrity. We need to measure qualitative not quantitative growth.

The main failure then has been the lack of integration of the principles of the Rio Declaration and Agenda 21 in to all sectors and policy drivers (e.g. finance, construction and development, energy, transport planning, agriculture and forestry).

By contrast and taking Principle 10 of the Declaration as a positive example of where action has occurred, the UNECE countries together with the Environmental NGOs developed the Aarhus Convention in 1998. This regional convention has had and is continuing to have significant impacts on EU governance as well as on that of the 44 Parties. However Ireland, some 13 years later, remains the only EU country yet to ratify it. Despite this latter fact, in 2008, Ireland decided to be the lead country in the establishment of the Aarhus Convention Taskforce on Public Participation a body that has the potential to lead the way in developing all aspects of civil society engagement with decision-making, at a time in history when it is absolutely essential to develop new ways of having conversations. The implementation of agreements and commitments on Sustainable Development emanating from the Earth Summit has been disappointing. Compliance and enforcement procedures are at best inadequate and in most cases non-existent. RIO+20 presents an opportunity to revisit agreements and commitments made in 1992 and to consider how we will deliver on these, both collectively and individually. Furthermore governments will be expected to make firm commitments on how to tackle emerging issues.<sup>3</sup> Ireland could lead the way by for example in promoting compliance and enforcement procedures/mechanisms, and new approaches to tackling emerging issues. Ireland must show the political will to fulfil commitments made in 1992.

The establishment of Comhar as the National Sustainability Council with its 5 stakeholder pillars was one of the shining lights in the general gloom during the property bubble "boom". Sadly the Council is to be disbanded in December 2011. Some of the functions and resources of Comhar are to be transferred to the National Economic and Social Council (NESC). Whilst it is a major step forward that the issue of sustainability is now to be discussed and researched in NESC which is an advisory body directly to the Government, it is currently unclear how much of the valuable work initiated by stakeholders within Comhar will continue, including the Biodiversity Forum, and the Ramsar committee.

The Biodiversity Forum exists to monitor the implementation of the National Biodiversity Plan. The new Plan has recently been signed by cabinet and is due to be published very soon. The National Biodiversity Plan outlines Ireland's actions to fulfil CBD commitments that arose from the Rio Earth Summit to halt the loss of biodiversity, as well as actions to be taken by various state agencies to address the biodiversity commitments and some of the major ECJ rulings against Ireland on compliance with the Birds and Habitats Directives.

It is enormously important to continue to facilitate stakeholder participation in the delivery of the new National Biodiversity Plan and in the monitoring of the implementation of the plan. The Forum has been run as a working group of Comhar and as such will now need to be housed and appropriately resourced elsewhere if Ireland is to ensure successful delivery of the NBP actions.

If, as proposed, Comhar is being subsumed in to NESC, then the Biodiversity Forum should also be run as a working group of NESC. This would be likely to facilitate improved participation of the social partners in the implementation of the National Biodiversity Plan. Similarly, the Ramsar Committee should also be considered in the new arrangements.

ENFO (the Environmental Information Office), once an international example of best practice in information dissemination, was effectively axed in all but name in 2009. ENFO was a well known and utilised source of environmental information. If we are to see growing public awareness of the likely impacts of climate change, biodiversity loss and degradation of essential services provided by the environment ('ecosystem services'), then a well-resourced environmental awareness strategy is needed to replace ENFO. The roll out of additional ENFO points is a welcome development although these will need to be more active and more dynamic in their approach to disseminating environmental information and education than is currently the case. Environmental NGOs have been very successful in providing environmental education, in a manner that facilitates real public engagement at minimal cost. This should point towards greater resourcing and inclusion of these groups in the making and implementation of an environmental awareness strategy. Involving the public in decision-making requires as a prerequisite both active and passive availability of information. Involving the public is essential to the effectiveness of the hard decisions that will have to be made over the years ahead.

## 2.1.2 General Areas of Concern

Some general areas that have not received the attention they badly need include:

2.1.2.1 Implementation of European environmental law has been extremely poor in Ireland, with 6 ECJ cases currently open against Ireland for failures to implement wider ranging environmental safeguards including EIA and biodiversity protection. This is a strong indicator of Ireland's lack of strategic and resourced approach to strengthening sustainable management of our natural environment and is one of the key issues that needs to be addressed by Ireland to achieve the SD objectives.

2.1.2.2 GDP is a totally inadequate measure of progress or development. Unfortunately there is very little political will or commitment to change this, nor a sense of urgency to achieve goals set in 1992. There is still no widely accepted environmental index or measure.

2.1.2.3 We rarely see equity mentioned as a necessary ingredient for achieving sustainable development.

2.1.2.4 There needs to be greater investment into public involvement in sustainable development. The institutional framework to catalyze this is very important at local, national and international levels.

2.1.2.5 Education, information and participation generally relies more on the informal sector than the formal sector we need to work to change this.

2.1.2.6 Business and Industry are central to our lives and there are great opportunities as well as great obligations. Since RIO 1992 there has been much erosion of state influence and regulation.

2.1.2.7 The social partners must be actively involved in greening the work environment.

2.1.2.8 A policy framework to make technology available to Less Developed Countries is needed. This would for example contribute to a sense of equity.

## 2.1.3 Energy and Climate

Since 1992, Ireland has made limited progress in the area of clean energy and actually gone backwards in terms of climate change. Current projections indicate that Ireland will only meet its Kyoto obligations as "a direct result of the current economic recession" and is likely to miss annual obligations under the EU's 2020 target after 2015.4 Advances in the share of renewables in Ireland's energy mix are welcome but are clearly not sufficient in terms of delivering overall greenhouse gas emissions reductions. Energy efficiency measures are also progressing but need to be accelerated if Ireland is to meet its international emissions reduction targets.

Energy policy must integrate climate change concerns if greenhouse gas reduction targets are to be met. Energy policy should also address the challenge of energy security. In 1990 Ireland imported 68% of its energy and this has increased to 89% in 2008, peaking at 91% in 2006. Moreover, Ireland is heavily dependent on the importation of oil and gas which leaves it very vulnerable to increases in the prices of these commodities on the international markets.

The work of the Sustainable Energy Authority Ireland in promoting the move away from fossil fuels and reducing energy inefficiencies has been a positive if limited force. Work on an energy "pay as you save scheme" should lead to a pilot soon.

## 2.1.4. Local Agenda 21

The establishment of the County and City Development Boards as the engines of Local Agenda 21 would have been a positive step, but the limited terms of reference given to them left them largely without an environmental remit. Efforts made by the Environmental Pillar to introduce Sustainability into the actions of these bodies are generally being greeted by the members of the Boards with interest and by some with enthusiasm. However, unlike the movement to add social inclusion to the work of the CDBs, there is no significant support from Government for the move to incorporate sustainability into their Terms of Reference. Sustainable Development: A Strategy for Ireland, published in April 1997, provided for local authorities to complete Local Agenda 21 Plans for their areas. Each county council and county borough was to have a designated Local Agenda 21 Officer, and these were to be networked at regional and national levels. Sadly this strategy achieved very little, and needs to be reviewed and replaced with a new strategy at the earliest possible time. There are good examples of local authorities taking local initiatives, such as Dublin City Council, Roscommon County Council etc.

The role of county and city based Community Forums needs to be enhanced in order for the wider community to engage with the governance structures more effectively at

the local level.

## 2.1.5. New Directions for Ireland

Instead of trying to get from the earth as much as we can, as fast as we can, paying as little as we can to get it, we must start trying to nurture it, like we would a bountiful garden. Ireland with a relatively small, well-educated population should avoid invasive/destructive technologies/industries.

GM food crops and Hydrological Fracturing "fracking" (for oil/gas) are examples of technologies that give short term monetary gains to a few, and cause long-term problems/crises for humanity, biodiversity and planet. The Earth is the living system that sustains our species. All living systems have their limits; and the complex biosphere that supports us is gradually being pushed towards a number of very serious tipping points.

## 2.2. What contribution can the current focus on the green economy contribute to advancing sustainable development, particularly from an Irish perspective?

### 2.2.1. Green Economy

A 'green economy', by itself, does not incorporate many of the other core principles of sustainable development. A "sustainable" development model must not just respect environmental boundaries, but also promote social justice, reduce poverty and inequality, encourage inclusive and participatory decision-making and be based on clear principles and mechanisms for accountability. Furthermore, the definition of a green economy proposed by the UNEP and supported by the European Commission does not represent a significant departure from the current economic model which is driven by the over-consumption of scarce natural resources. While the promotion of the 'green economy' may well move states towards sustainable development, its reliance solely on efficiency (as per Europe 2020 Strategy) fails to address the fundamental change required to move to sustainability. A green economy can be seen as one which is low carbon, resource efficient and socially inclusive. Our existing economic model and our current focus on it will not deliver a green economy.<sup>6</sup>

Many hi-tech aspects of the "business as usual" Green Economy include the use of "rare earths", the reserves of which are in countries with large indigenous hi-tech industries such as China, or in conflict zones such as the Congo. Other reserves are in countries where the EU is attempting to undermine the development of local industries through forcing the removal of export duties on raw materials. There are many ethical and sustainability issues here. Ireland must collaborate with the other states in tackling the many accelerating global crises. The participants at the Rio+20 Conference must work to establish mechanisms to protect the less developed countries and the global biosphere from the kind of resource grabbing that is the latest expression of colonisation, exploitation and empire building.

In a green economy market prices must adequately reflect environmental costs, and fiscal policy must shift taxation from work to resource consumption.

#### 2.2.1.1. A 'green' economic system must promote social equity, gender equity and inter-generational equity.

A truly sustainable 'green economy' functions within the limits of the planet, and ensures a fair distribution of resources among all countries and social groups - as well as between men and women. We need an economy that provides incentives for zero-waste, low-carbon economies that enhance and restore the natural environment, while also providing new 'green' livelihoods, employment and entrepreneurial opportunities for women as well as men. The 10 Year Framework Programme (10-YFP) on Sustainable Consumption and Production (SCP)<sup>7</sup> implementation should be an important part of the basis of for the development of Green

Economy policies. 2.2.2. Climate and Energy The green economy should represent the internalisation of climate change and clean energy issues into each national economy, in addition to other environmental concerns. The focus on the benefits of moving towards a low carbon, energy efficient economy and the accompanying business opportunities is important but should not detract from the fundamental objectives of avoiding catastrophic climate change, decarbonising the energy sector and addressing the risks of energy security.

2.2.3. Agriculture The agricultural sector in many parts of the world needs thorough review from the perspective of the green economy and maintaining food security for all, preserving the natural capital of the land and its biodiversity resources, and promoting resource efficiency. There is a particular need to manage and conserve water resources better. New targets are needed in these areas. Effective measures for better, more transparent functioning of agricultural markets should be introduced. The volatility of and unacceptable increase in food prices must be combated. The use of renewable resources in energy production must not happen at the expense of global food supply. Security of food supply should be ensured by maintaining stocks at regional level. We should also aim to make more use of residual biomass from agriculture and food production. The protection of soils as a fundamental resource should take centre stage in the debate on food production.

2.2.4. Marine Environment The marine environment is characterised by pollution, overfishing and overexploitation of other marine resources. Conference participants should mandate the competent UN bodies to initiate a new international process to strengthen and coordinate existing mechanisms for protecting the marine environment and to protect fish stocks, marine

biodiversity and other marine resources more effectively than under existing arrangements. The introduction of Marine protected areas over 20% of the world's oceans should be a high priority. This would create an estimated 1 million jobs worldwide and contribute to preserving fish stocks and establishing a sustainable fishing industry and marine food resource.

2.2.5. Natural Resource management and Biodiversity protection are key issues of environmental sustainability, underpinning agricultural productivity, tourism, climate change adaptation. Ecosystem services are enormously valuable and currently undervalued in Ireland despite making a huge contribution to flood alleviation, climate regulation, soil fertility, water quality and fisheries, to name but a few.

## 2.3. Can the green economy contribute towards Ireland's efforts in assisting developing countries and what priorities should we be addressing in this regard?

2.3.1. As a wealthy country, Ireland should take the lead in developing a genuinely green economy. The benefits for developing countries are multiple but include:

2.3.1.1. Avoidance of the negative impacts of climate change

2.3.1.2. Avoidance of destructive and exploitative extraction of natural energy resources

2.3.1.3. Technology transfers that allow developing countries to "leapfrog" to a low-carbon economic model

2.3.1.4. Demonstration of a successful, low-carbon developed country

2.3.1.5. In order to achieve a truly green economy, we need better regulation of international financial actors and financial flows.

### 2.3.2. Specific instruments to achieve a greening of the economy:

2.3.2.1. New indicators for well-being. It is in the interest of youth and future generations, that bold steps will be taken towards a green economy in the context of sustainable development and poverty eradication. In order to achieve the transition to green economies, the actual political implementation of concepts such as new indicators for

measuring development and the internalisation of external costs must be ensured and backed up by effective governance systems.

2.3.2.2. Planetary boundaries must be assessed and made the basis of decision- making on the using of best available scientific knowledge, whilst always taking into account the precautionary principle.

2.3.2.3. The introduction of a global Financial Transaction Tax, to contribute to financing protection of our global commons and of sustainable development and investments in green and inclusive economies. E.g. a "Robin Hood Tax" or a "Tobin Tax"

2.3.2.4. Eco-efficiency instruments are important, but there is also an urgent need for 'sufficiency' instruments (social innovation, caps on resource use etc.), especially in the Northern countries to tackle the over-consumption of - and excessive pressure on - natural resources.

2.3.2.5. If a green economy is to be a tool for achieving sustainable development and poverty eradication we need to highlight the importance of improving national environmental governance. Achieve sustainable development will require making policy decisions that involve balancing competing interests and reaching good compromises. If decision making processes are secret, non-participatory and unaccountable, a few selected and powerful interests will influence policy and developmental decisions. Principle 10 and good national environmental governance which recognizes coordination, efficiency, transparency, engagement and accountability becomes a foundational and enabling requirement for the success of a green economy and sustainable development.

2.3.3. Independent Technology Assessment The need for a Multi-stakeholder technology assessment for existing and emerging technologies mechanism that guarantees prior informed consent and rights of communities impacted by the financial flows, timely information, effective participation, and redress mechanisms. At Rio+20, Ireland should commit to such an agreement for assessment and monitoring of new technologies before their widespread use – e.g. geo-engineering. 2.3.4. Nuclear & uranium lifecycle control Based on the UNEP foresight report, governments must start developing legally binding mechanisms to address the cost of decommissioning and clean-up of nuclear power-plants, nuclear waste and uranium mines. Currently, most countries have no funds to pay for decommissioning of closed nuclear power- plants or containment and clean-up of uranium mining tailings, causing long- term, inter-generational and partly cross-border pollution and security risks for water, food, and eco-systems. To this end there is a need to develop a global strategy to address the risks that nuclear energy and the whole uranium cycle, such as mining and waste disposal, pose to global environment and human lives and health, and decide on an effective and rapid global government response. In particular:

2.3.4.1. the establishment of a UN rapporteur on uranium and nuclear risks.

2.3.4.2. the establishment of a global financial mechanism to redress and clean- up of damage and pollution of nuclear and uranium lifecycles;

2.3.4.3. the establishment of an independent institutional framework to document, monitor and assess the environmental damages and risks of nuclear and uranium activities and increased lifecycle control. Such an institution must assure effective public participation, transparency and access to information.

2.4. What impacts can the EU 2020 strategy, and in particular, the Resource Efficiency Flagship Initiative, have on advancing sustainable development in Ireland and what priorities should Ireland establish in implementing the Initiative?

#### 2.4.1. Energy

Energy is a key input into any economy. As such, efforts to improve efficiency in energy consumption should be a priority for the Irish government. Implementation of the EU Resource Efficiency Flagship Initiative in Ireland should focus on increased investment in R&D in clean energy technologies.

Priorities should include:

2.4.1.1. A serious effort to integrate all sectors of the economy/govt. depts. behind this initiative and develop a coordinated strategy and action plan in through a fully transparent, consultative and adequately funded process.

2.4.1.2. A serious effort to move quickly and ensure adequate funding is in place.

2.4.1.3. Society must be encouraged and empowered to participate actively at all stages of this initiative from design stage to evaluation and monitoring

2.4.2. The Irish government should set strong energy efficiency targets and create regulatory certainty to ensure the necessary investment.

2.4.3. A strong and effective climate law will ensure a whole of government approach to climate change mitigation that moves away from a silo mentality within departments. The three main planks of climate legislation are targets, carbon budgets and an expert committee on climate change. Legislation should contain and be supported by Climate Change Strategies.

2.5. How should we pursue improvement of governance under the four headings below? Which areas should be prioritised? Is strengthening UNEP necessary? Do you think that changes are also needed in the way sustainable development is managed at the UN level?

2.5.1.1. The UNEP needs to be strengthened and allocated sufficient resources in order to fulfil its remit.

2.5.1.2. A serious effort to put in place procedures for compliance and enforcement of environmental law is urgently required. Compliance was not mentioned in the Helsinki outcome document.

2.5.1.3. The proposal for an International Court for the Environment should be considered.

2.5.2. Sustainable Development Governance which needs to be reinforced and mainstreamed within the UN system.

2.5.2.1. Strong International Environmental Governance is needed. This can be achieved by:

2.5.2.1.1. Upgrading UNEP with new responsibilities and resources, proposals include:

2.5.2.1.1.1. Upgrade from a programme to a specialized agency

2.5.2.1.1.2. Strong programme on Sustainable Consumption and Production under UNEP

2.5.2.1.1.3. Further strengthen the Trade and the Environment activities of UNEP

2.5.2.1.1.4. Further strengthen civil society participation in UNEP, by applying the Aarhus Convention Guidelines on 'public participation in international environmental policy processes'

2.5.2.1.1.5. Upgrade the mandate of Panel of Natural Resources (under UNEP), to govern better the use of natural resources and the fair distribution of those.

2.5.3. International Environmental Governance is weak, largely due to institutional fragmentation, and needs to be strengthened. Over the past decade attempts to improve environmental governance have been made – most recently as part of high-level consultative group under the aegis of UNEP; however, progress has been difficult.

2.5.3.1. Establish a trusteeship for the transitional governance of the global commons until they are adequately governed by legally binding rules. This should have a clear mandate to negotiate effective structures at national and international levels for the governance of global commons.

2.5.3.2. A Strong Technology Assessment Body. The need for inter-disciplinary approach, the application of precautionary principle and the rights of the impacted communities must be at the heart of the work of the assessments.

2.5.3.3. Rio+20 presents a unique opportunity to develop institutional arrangements necessary to the effective implementation of the precautionary principle.

2.5.3.4. Decision-making based on best available science urgently requires systematic research on planetary ecological boundaries, which must be used for the assessment at the international level of the impact of emerging practices and technologies.

2.5.3.5. Decision-making needs to be framed by the system perspective of sustainable development impacts. Furthermore, the development of an insurance scheme for social and environmental risks would enable to the pricing of such risks.

2.5.3.6. Establish an ombudsperson for future generations at the UN level, e.g. as part of a strengthened mandate for UNEP or in combination/rotation with other UN bodies

2.5.3.7. Establish an ombudsperson for future generations at national levels with the mandate to work independently from the heart of government monitoring and ensuring that long-term goals and the rights of future generations are guaranteed in all policy decisions and their implementation.

2.5.3.8. A serious effort to put in place procedures for compliance and enforcement of environmental law is urgently required. Compliance was not mentioned in the Helsinki outcome document! The proposal for an International Court for the Environment should be considered.

2.5.3.9. Citizen Enforcement: In many countries, law enforcement officers are spread thin, with little ability to prioritize among serious environmental issues. For that reason, a number of progressive governments have created citizen suit provisions allowing for citizen enforcement of laws.

2.5.4. International Economic and Social Governance is addressed by a number of institutions, international financial institutions such as the International Monetary Fund and World Bank, regional development banks, and other bodies such as the World Trade Organisation.

2.5.4.1. In order that a truly green economy is established based on the fundamental principles of sustainability then these bodies will at the very least need to be radically reformed and given new terms of reference. Whilst such important bodies are operating on the GDP growth model with a few green tinges, it will be very difficult for open economies such as Ireland's to break the downward spiral. Ireland should therefore work to create this change.

2.5.5. Non-State Actors (the "Major Groups") have an important role which include indigenous people, women, youth, workers, farmers, local government, the scientific community, business and industry. Their role and impact has been limited in scope and there is a need to strengthen it. There is a need as well to strengthen the role of business which is already active in committing to greening their operations, with many companies are embracing sustainable development in their operations and corporate governance.

2.5.5.1. A successful transition to a sustainable economy depends on it being accepted and supported by civil society. The involvement of civil society will be critical in the preparatory process for Rio+20, in the conference itself and in the follow up to the conference. CSOs bring knowledge, expertise, credibility and advocacy skills to the table. In this regard, Parties and Signatories to the Aarhus Convention are required to enable the involvement of the public in international fora. Ireland should take a lead on this by including its civil society representatives in the national delegation.

2.6. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

2.6.1. The focus on the Green Economy as a major part of the conference would be a hopeful one if it includes any radical thinking. However if the business as usual input of the EU is a sample of the level of ambition for the conference then the Environmental Pillar would have very low expectations.

2.6.2. The political document adopted at Rio+20 to be (a) visionary (b) build on the Rio Declaration, Agenda 21 and the Johannesburg Plan of implementation, (c) identify the gaps in achieving the goals set by these decisions and (d) spell out concrete steps that will be taken by governments in the next decade to fill these gaps.

2.6.3. To focus on particular targets Ireland should for example support the move for three new framework conventions

2.6.3.1. Regional conventions for the implementation of Principle 10 of the Rio Declaration

2.6.3.2. Corporate Social Responsibility based on the ISO 26000 outcome

2.6.3.3. Develop the Precautionary Principle into a framework convention to include issues on emerging technologies, bio-engineering and nano-technology.

2.6.3.4. Maintaining or achieving adequate food security, energy security, and resource security for all current and future generations in a world of increasing population and limited natural resources is one of the biggest new challenges facing the world in the century ahead. Ultimately, qualitative economic growth is needed that helps to eliminate poverty and social injustice whilst preserving natural resources for future generations. Establishing institutional structures for meeting this challenge should be a central issue for the 2012 summit.

2.7 What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

2.7.1 In order for any of these proposals to succeed there is a need for a major shift in the awareness and understanding of the issues that need to be resolved. Time is not on our side. The oncoming climate chaos and the likelihood of the 6th great extinction barely register on the political horizon.

2.8 What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

2.8.1 Environmental law, at international, regional and national level(s) is not working. We need law that is affordable, intelligible, accessible, predictable, and clear to all - Law that is legally certain.

2.9 What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed

decisions to be reached and actions to be implemented?

2.9.1 An international court for the environment,

2.9.2 Ombudsman for the future generations at a national and international level

2.9.3 Governance The rights of access to information, public participation, and access to justice are essential to sustainable development. The 1992 Rio Declaration provided for these rights in Principle 10 and Agenda 21 helped the move towards establishing these rights in many countries. Renewed commitment is needed to establish these rights in every country. The use of regional conventions following the example of the Aarhus Convention in the UNECE region should be prioritised to enable this. The Rio 2012 Summit provides an opportunity for governments to transform Principle 10 from aspirational goals into actionable rights. Governments and civil society should use the opportunity to commit together in adopting, implementing, and exercising these rights in support of sustainable development. The 2012 Summit's focus on the theme of improving institutional frameworks should galvanize nations to improve their national environmental governance, develop international instruments giving legal force to Principle 10, and implement these principles into international bodies' decision-making processes. The lead on this latter point should be taken by the parties and signatories to the Aarhus Convention<sup>8</sup>.

2.9.4 Robust International Framework. The main aim of the conference should be to establish a robust institutional framework within the UN system for implementing the conference decisions, a framework which would have on-going responsibility for promoting sustainable development throughout the world and for driving an action programme to green the global economy over the coming years. The emerging concept of a new top-level Sustainable Development Council, involving all the countries of the world, that would report directly to the General Assembly and integrate and strengthen the work currently done separately in the UN ECOSOC and CSD should be supported by Ireland.

2.9.5 Measuring progress towards a greener economy: Parameters need to be established that give a clear indication of the progress that is being made towards greater sustainability. Methods should be developed for measuring economic progress in terms of improvements in human welfare and quality of life, with reference to the fight against poverty, the creation of decent working conditions and preservation of the natural environment. In particular, methods must be agreed for measuring the use of various kinds of natural capital in the soil, water and different ecosystems that results from economic activity.

This also raises the question of the current disconnect between consumption and the environment which has led to the struggle to find a "value for the environment. This lack of valuation and subsequent bypassing of the market has translated into increased environmental vulnerability with a marked degradation of ecosystems and the loss of biodiversity. Thus, it is necessary to allocate consideration to this by using previous models and studies, such as The Economics of Ecosystems and Biodiversity study (TEEB)<sup>9</sup>, to develop a means by which the value of the environment can be measured using tried and tested methodologies, so as to decrease the current environmental degradation that is occurring due to its lack of market value. A healthy biodiversity is crucial to the economic success of Ireland with the National Biodiversity Data Centre stating that Biodiversity accounts for €2.6 billion of Ireland's economy annually from the goods and services it provides.<sup>10</sup> Therefore in our current economic context it is imperative that we document, understand and take advantage of our rich biodiversity, and for this to occur a new method of managing natural capital must be initiated. The same arguments apply globally.

2.9.6 A timetable for establishing a system to measure progress towards a green economy should be agreed at the summit

## Introduction

The most dramatic technological transformation in history - involving information technologies, biotechnologies and engineering - has occurred since the first Rio Earth Summit in 1992; during the same period, however, governments have systematically downsized or eliminated their capacity to understand science and monitor technologies. While technology has thus far played an extraordinarily prominent role in preparatory documents for Rio+20, technology's potential contribution to sustainable development and/or new Green Economies cannot be realized as long as the world lacks trusted and transparent mechanisms - at global, regional and national levels - for technology evaluation. The absence of such mechanisms incites distrust and invites disaster.

At Rio+20, governments need to adopt forward-looking strategies that will make tangible progress toward sustainable development through policies empowered to:

1. Assess in a comprehensive way the social, economic and ecological impacts of new technologies and to share information about them;
2. Ban geoengineering (the large-scale technological manipulation of the Earth's systems as they affect the climate; and
3. Support small-scale peasant-led agriculture that reduces waste, protects biodiversity and enables rural livelihoods.

All of this must be accomplished with the active participation of civil society groups, especially the communities that are most likely to be affected by decisions at the Summit.

## 1. Technology Assessment: Orphaned in Rio

In the lead-up to the 1992 Rio Earth Summit, the Swedish government prepared a proposal for a global facility called "SIESTA" (Stockholm International Institute for Environmentally Sound Technologies Assessment). Somewhere on the road to Rio, the initiative went to sleep but, nevertheless, Agenda 21's Chapter 34<sup>1</sup> called for regional capacity-building for technology assessment.

Post-SIESTA developments " "While we've been sleeping." A year after Rio, the UN all but eliminated its Center for Science and Technology for Development (UNCSTD), moved the remnants from New York to UNCTAD in Geneva, and, simultaneously, eradicated its Centre on Transnational Corporations (UNCTC), thus terminating the minimal global capacity that had existed to monitor and advise on new technologies and on private sector technology transfer. In other words, as IT and biotech ushered in the so-called "Knowledge Economy," the UN gave itself a frontal lobotomy.

Since the Earth Summit... ·IT: From a handful of clunky mobile phones in 1992, there is now a cell phone for everyone; almost half of Africa has a mobile, up from one in five six years ago; and, more than 800 million people are on Facebook;

·Biotech: At a cost of \$60-\$100 million per trait, biotech has invented herbicide-tolerant crops, Terminator seeds that die at harvest forcing farmers to buy seed every season; and (under development), Zombie seeds that can only regenerate when immersed in proprietary chemicals;

·Knowledge Economy: We're being told that we are moving from the "Knowledge Economy" of the late 20th century to the "Green Economy" of the 21st but the real change is

in ownership and control. The world's markets sell 10 billion products based upon an estimated 100,000 chemicals based upon 100 elements and the four nucleotide bases that comprise DNA. Whoever controls the chemical elements and the A, C, G and T of DNA controls the fate of sustainable economies;

·Genomics: The speed and cost of mapping the human genome has dropped from 13 years and \$1.3 billion to 14 days and \$5000 en route to 15 minutes and a few hundred dollars soon after 2012;

·Nanotechnology: Governments have spent more than \$50 billion on nanotech R&D; the cost of carbon nanotubes has dropped by a factor of 20 since 2001; there are thousands of consumer products; and, there is no agreed nanotech definition or regulation;

·Synthetic biology: Undergraduates with \$400 gene synthesizers can download templates to build DNA while scientists can create self-replicating artificial microbes and six letter DNA; six of the world's top 10 energy corporations have partnerships with synthetic biology start-ups, as do six of the world's top 10 grain traders and six of the world's top 10 chemical corporations.<sup>2</sup>

·Robotics: Amateurs with \$1300 3-D printers can collaborate to build unmanned aircraft (drones) in seven days for around \$8000;

·Convergence: Governments and scientific institutions are predicting the unification of "Bits, Atoms, Neurons and Genes" (BANG) as the next Industrial Revolution transforming trade, economies and industrial production;

·Engineering: Industry now displaces more earth per annum than is lost through natural erosion; the annual runoff from aquifer mining nearly matches the sea level rise from the "melt" of Polar glaciers; and there is 3 to 6 times more water dammed than in natural rivers;

·Geoengineering: Since 1993, governments and/or corporate consortia have conducted a dozen major ocean fertilization experiments and are proposing solar radiation management techniques that could alter global or regional climates.

The greatest technological transformation in history has occurred over the last 20 years while governments systematically downsized or eliminated their capacity to understand science and monitor technologies.

The Case for Technology Assessment: A trusted, transparent pathway for technological advancement could be beneficial for societies, governments and those introducing new technologies. Major innovations inevitably lead to Schumpeter's "creative destruction," but innovators and their backers seek to minimize risk. Especially, re-insurers and investors welcome steps that make government intervention and/or public responses more predictable.

Stabilizing the Playing Field and Getting Off the Rollercoaster: From very different vantage points, both science and society feel they have had a rough ride the last couple of decades. The rollercoaster has almost derailed leaving not only scientists but start-ups and venture capitalists technologically traumatized. A few socially and financially costly examples - all since the 1992 Earth Summit - follow:

·1996: Mad-cow disease/Bovine spongiform encephalopathy (BSE) (UK);

·1996: GM crops (Europe/global);

·2001: Hoof and mouth disease (UK/Europe);

·2006: Nanoparticles (Germany, China/global);

·2007: Agro(bio)fuels (global);

·2009: Intellectual property distortions (global);

·2010: Deep water drilling (USA/global);

·2011: Nuclear power (Japan/global).

1996 - Mad-cow disease/Bovine spongiform encephalopathy (BSE): Although British regulators knew in the 1970s that the public was being exposed to BSE, the information was covered up until 1996<sup>3</sup>. The fallout from the regulatory failure has meant continuing societal distrust in the UK and Europe.

1996 - GM crops: Civil society initially warned that the biotech industry was developing herbicide-tolerant plant varieties in 1981. Governments and societies were nevertheless shocked when, in 1996, the first genetically modified crops were planted. In several parts of the world, small-scale producers immediately opposed the GM seeds as a potential threat to their environment, their health and their markets. Likewise, many food retailers and their customers opposed GM foods in the absence of credible scientific evidence that the products were safe - or had even been tested. Because some governments adopted the precautionary principle while others simply adopted the technology, markets and global trade became uncertain and many parts of the food system suffered. All parties agree that the story of the introduction of GM crops is now the textbook example of how governments and industry should not function.

2001 - Hoof and mouth disease: The regulatory scandal and financial losses from the 2001 outbreak of foot and mouth disease in the UK (and then Europe) severely undermined citizen confidence in government regulation. In the end, the outbreak's cost totaled \$16 billion in the UK, where 7 million sheep and cattle were killed. Governments haven't learned from 15 other outbreaks of the virus - including another in the UK in 2007. According to the US government, the risk of an accidental escape of foot and mouth disease virus from a federal lab is 70% over 50 years at a cost of around \$9-50 billion. The US National Academy of Sciences said the government's estimate was low.

2006 - Nanoparticles: The estimated annual global market for nanotechnology varies widely between about \$100 million and \$100 billion and predictions for the near-term range from hundreds of billions to almost \$3 trillion. There is agreement, however, that governments have spent more than \$50 billion on nanotech R&D since 2001 and industry is now outspending governments in nano research. Several thousand products - including foods, pesticides and cosmetics - are in the marketplace today. Where so much money has been spent (and so many products are already on the shelf), it is unlikely that governments will respond well to scientific concerns for health and environmental risk. Even today, there is neither an inter-governmentally accepted definition of nanotechnology nor agreed methods for measuring or evaluating nanoparticles. In 2006, a housecleaning product called "Magic Nano" was briefly on shelves in Germany but was withdrawn almost immediately when nearly 100 consumers telephoned poison-control centers concerned that the product had caused respiratory and other problems. In the absence of any agreed definition, industry insisted that the product was not actually "nano" and while the product was removed, nanotechnology companies insist the experience had nothing to do with nanoparticles. More recently, seven female workers in China who were exposed to a polymer/plastic ingredient in an adhesive paint containing nanoparticles became sick with breathing problems; two of them died. A team of Chinese scientists examined the lung tissue of all seven women, found nanoparticles lodged in cells of the lungs and concluded, cautiously, that the seven cases raised concerns that long-term exposure to some nanoparticles could be related to serious damage to human lungs. Again, absent rules and regulations and definitions, there is no certainty as to the role of nanoparticles. The only certainty is that nanotechnology is virtually unregulated anywhere in the world.

2007 - Agro(bio)fuels: In October, 2011, a special report commissioned by the High-Level Panel of Experts of the UN Committee on World Food Security concluded that the world food price crisis that became evident at the end of 2007 was greatly exacerbated by the rapid rise in production of so-called biofuels. Since 2007, governments around the world have been engaged in internal and external debates on the biofuels issue. From the beginning, industry and some governments have insisted that a second or third generation of biofuels would soon be available that would allow governments to feed people and fuel cars simultaneously. Every growing season has witnessed new pronouncements of the imminent arrival of these new technologies. Four years and almost a billion hungry people later, the world is still waiting. If the UN had had a technology assessment capacity in place, the biofuels illusion would not have prevailed and 170 million additional people would not have gone hungry.

2009 - Intellectual Property Distortions: More an ongoing dilemma than a singular event, IP is a different kind of regulatory failure. There is widespread agreement that the intellectual property system, rather than facilitating innovation, is a financial and legal barrier to new technologies. The very system that was constructed to propel creativity, we were told, is now - obvious to all - one of its worst enemies. This is not a situation where the physician can heal himself. According to a 2009 study, total US corporate profits from patents (excluding pharmaceuticals) average around \$4 billion annually - but the associated litigation costs are \$14 billion per year.

2010 - Deep Water Drilling: The BP Gulf of Mexico oil disaster of 2010 is well documented. Less known is that in 2008, a near-disastrous offshore gas leak in Azerbaijan led to the biggest personnel evacuation in the driller's history. The company was BP and a WikiLeaks disclosure says that officials at the time blamed the leak on faulty cement casings - the same problem identified in BP's Deepwater Horizon spill 18 months later. Hubris has no memory. BP estimates that the cost of the Gulf of Mexico spill could reach \$40 billion. Between 2007 and 2009 there were 381 fires (reported) on oil rigs in the Gulf of Mexico - about one every three days. Every year, 760 million litres of oil spill into the world's oceans - that's an annual BP Gulf disaster.

2011 - Nuclear power: The Fukushima tragedy that began March 11, 2011 is the latest in a succession of scandals that has befallen the commercial nuclear power industry since its inception in 1953. The Fukushima facility was assessed to be tsunami-resistant because a high cliff separated the construction site from the ocean. Immediately following this assessment, however, the cliff was removed to allow boats to bring heavy equipment to the site. Following the tsunami, Fukushima was plagued by a number of other technical and political failures. The nuclear power industry's situation worsened when subsequent studies revealed that 88 of the world's 442 operational nuclear plants have been built on seismic faults. Additionally, for almost 60 years, the industry has struggled with nuclear waste disposal. Despite constant assurances, no country has solved the problem. The UN's 2011 World Economic and Social Survey reported that the industry has been beset with problems since its Cold War beginnings. The industry originally adopted nuclear submarine standards that prioritized compactness and mobility - both irrelevant to the industry. The decision caused enormous difficulties, delays and cost overruns. By the 1970s, the nuclear companies were confronted with new regulations every day, forcing the near-collapse of one of the world's most powerfully-backed technologies.

In preparation for Rio+20, governments and UN agencies have focused on further elaborations of the concept of sustainable development and/or proposals for new Green Economies. The potential for new technologies has played an extraordinarily prominent role in preparatory documents. UNEP's report (Towards a Green Economy) references technology 655 times while the UN's World Economic and Social Survey ("The Great Green Technological Transformation") mentions technology over 1200 times. While these documents focus, importantly, on technology transfer and capacity-building, such a heavy emphasis on new technologies must include a strengthened global, regional and national capacity to monitor and assess the technologies. To do otherwise would be to incite distrust and invite disaster.

Elements of Technology Assessment - the dual track imperative:

Enormous financial and political interests are often mobilized to block "game-changing" new technologies from disrupting the status quo; or, as often, to propel new technologies into the marketplace prematurely to gain first-mover advantage. Given the importance of new technologies in government and social planning, "backup" assessment mechanisms are necessary. The intergovernmental assessment system must be supplemented by a civil society mechanism that can offer alternative perspectives. In brief...

- Intergovernmental assessment;

- Civil assessment.

Intergovernmental assessment: Decisions at Rio+20 should ensure that the United Nations will expeditiously develop the institutional capacity to identify and monitor significant technologies, and to provide assessment of the technologies' social, economic, cultural, health and environmental implications. This should be done at the time of the application to release a new technology and, preferably, in advance of such an application in order to minimize waste and risk. Monitoring and assessment of new technologies should be based on the Precautionary Principle, and led by designated working groups, including a diversity of experience in science and other forms of knowledge, as well as a range of stakeholders. Reports of working groups should be submitted to an intergovernmental body that facilitates the full participation of civil society. The working group's report should be appended to the final report and recommendations of the intergovernmental body. The intergovernmental body should also monitor and report on the diversity of available technologies and the safe archiving of technologies no longer (or seldom) in use.

Civil assessment: Recognizing the power and impact of major new technologies, governments and the United Nations should encourage the formation of dynamic civil society mechanisms that can offer an independent monitoring and assessment capacity to accompany intergovernmental processes. This initiative should encourage the formation of self-organized civil society mechanisms at the regional and inter-regional level that could guide Technology Observation Platforms (TOPs) capable of undertaking regionally-relevant reports on technology risks and opportunities to be considered by the intergovernmental body identified above. Secondly, governments and the United Nations should encourage the formation of a "Technopedia" as an open access, web-based technology assessment tool monitored and maintained in the participatory style of Wikipedia.

Technology Assessment's Place in the Multilateral Firmament:

Given the pace, power and complexity of new technologies, "due diligence" requires that governments seeking technology transfer or capacity building or funding science and technology (through grants, tax breaks and/or intellectual property policy, etc.), have effective capacity for technology monitoring and assessment. Recognizing the global impact of many new technologies developed at the national level, there is obvious need for - and efficiency in - technology assessment at global and regional levels. There are several ways in which this could be accomplished:

- Treaty - International Convention for the Evaluation of New Technologies (ICENT);

- Mainstreaming across the UN system;

- CSD/ECOSOC expanded capacity;

- UNGA Office of Technology Assessment; ·Special Rapporteur on the Right to Innovate/Imitate

Treaty - International Convention for the Evaluation of New Technologies (ICENT): The negotiation and implementation of a discrete treaty for technology assessment might ultimately prove to be the most efficient and least costly mechanism for global technology monitoring. ETC Group has drafted the template for such a treaty that governments may wish to consider. It is possible that Rio+ 20 could adopt a process and timetable for Treaty negotiation. However, it would likely involve a 5-10 year negotiating process.

Mainstreaming across the UN system: The United Nations has constructed a number of science/technology instruments in recent years that offer useful elements that could evolve into technology assessment mechanisms. In every case, however, the scope or "terms of reference" of the instrument is restricted to a specific field such as agriculture or climate or biodiversity. While it is entirely possible to enlarge the mandates of some of these initiatives and to link them together, the task of creating and maintaining these linkages may prove more difficult than establishing a unique entity.

Some examples of existing scientific instruments...

·IPCC (Intergovernmental Panel on Climate Change): a very large community of scientists collaborating on the assessment of the science of climate change that has achieved broad social and governmental support almost everywhere in the world. However, the IPCC has only been mandated to review existing studies about climate change - not to evaluate new technologies. It would be difficult - and possibly dangerous - to add to the IPCC's burden by giving it the responsibility to evaluate climate-change related technologies.

·SBSTTA (Subsidiary Body on Science, Technology and Technical Advice): Both the CBD (Convention on Biological Diversity) and the UNFCCC have scientific subsidiaries that offer a combination of scientific and political advice to their respective Conferences of the Parties (COPs). In effect, the SBSTTAs have functioned as intersessional bodies for the COPs rather than as scientific advisers.

·IAASTD (International Assessment of Agricultural Science, Technology and Knowledge Systems for Development): At the request of governments at the Johannesburg World Summit on Sustainable Development (Rio +10), FAO, the World Bank, governments and UN agencies collaborated to create an extraordinarily broad assessment of agriculture, which included input from small-scale producers and considered different knowledge systems. The report has won broad support. Rio+20 should ensure that this work carries on either as an independent entity or that it be built into another evaluation mechanism.

·HLPE (High-Level Panel of Experts on Food and Agriculture): In 2009, the UN/FAO Committee on World Food Security (CFS), in conjunction with FAO, established the HLPE as a widely representative panel of experts to examine critical issues and to provide independent reports to the CFS. Thus far, the panel has worked remarkably well and has earned the respect of diverse stakeholders. While the mandate of the HLPE is broad, it does not include the full range of new technologies that could impact the earth and its inhabitants.

·IPBES (Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services): Initial meetings to establish the IPBES are still underway and the outcome remains uncertain. IPBES is expected to have a strong mandate to address biological diversity and ecosystems services and this could readily include the assessment of technologies affecting these systems. However, its future relationship with the IPCC on climate change or the HLPE on agriculture remains to be negotiated. Nevertheless, if one of the predicted outcomes of Rio is an enlarged UNEP with additional resources and membership - and responsibility for IPBES (not yet decided) - then it would be important to make sure that technology assessment is part of its new agenda. In sum, while each of the initiatives identified above can play a useful role contributing to technology assessment, either their mandate or their history limits their ability to function on a global cross- or multi-technology platform. Because its role and work are still being negotiated, IPBES may be the one exception that could be given wider duties.

CSD/ECOSOC expanded capacity: Were governments in Rio to agree to expand the mandate and strengthen support for the current CSD into a Council on Sustainable Development - or to commit additional resources to ECOSOC - then it would be logical to place a committee secretariat for technology assessment within the revitalized body.

UNGA Office of Technology Assessment: Perhaps one of the most straightforward and attractive options would be to establish an Office of Technology Assessment (OTA) attached to the UN General Assembly. The OTA could undertake studies and report directly to the General Assembly. The OTA would need a strong secretariat and resources commensurate with its task, and governments in Rio would have to move carefully to ensure that the OTA is capable of meeting its mandate.

Special Rapporteur on the Right to Innovate/Imitate: Appropriate technologies, if carefully evaluated and globally shared, could help us develop more sustainably and meet the Millennium Development Goals. It is well established that current systems of technological innovation and dissemination are failing the global South, and that developing countries encounter many obstacles in accessing appropriate technologies, and being able to use, maintain and develop them. This is an overlooked human rights issue: the right to share in the benefits of scientific progress (or, more prosaically, the right to innovate and imitate) are established within Article 27 of the Universal Declaration on Human Rights and Article 15 of the International Covenant on Economic, Social and Cultural Rights. The creation of a position of a Special Rapporteur on Article 27 could help document the human rights dimensions of technological developments, encourage appropriate technology transfer policies, warn of rights violations that new technologies might entail and highlight the right of all human beings to share in the benefits of scientific progress. Governments at Rio+20 should agree to establish this position and ensure it has the resources it needs to fulfill its mandate effectively.

Governments, at Rio+20, should agree to convene, within three years, a UN Innovation Summit to fundamentally re-examine and evaluate mechanisms for the promotion of innovation through diverse knowledge systems.

The Road from Rio: It will be important for governments and civil society to know what has been accomplished in the Rio process. We believe the following are reasonable indicators of progress or failure for the advancement of technology assessment within the United Nations:

We have made progress if Rio...

- Adopts a Technology Assessment Mechanism at the global level (at least), and/or;
- Accepts a negotiating process and timetable to establish a mechanism, and/or;
- Identifies potential locations and a process/timetable for discussion.

We have failed if Rio...

- Invites agencies/treaties to consider tech assessment in upcoming meetings, and/or;
- Concedes only that technology transfer does not exclude assessment, and/or;
- Sets no process/timetable for further discussions.

## 2. Geoengineering - Planetary Technofix?

Geoengineering is the intentional, large-scale manipulation of the Earth's climate systems by artificially changing oceans, soils and the atmosphere. Simply put, geoengineering is a technological fix for climate change on a planetary scale - one that may have devastating environmental, economic and social impacts, particularly in the global South.

The idea of re-engineering the planet used to be the stuff of science fiction, but a group of increasingly vocal advocates and policymakers in Western capitals is rapidly

moving these controversial ideas from the margins to the mainstream of climate policy. Controversial experiments are being proposed and no international authority is overseeing decision-making. The list of governmental and intergovernmental bodies now dealing with the topic is growing: Parliamentary and Congressional Committees in the UK and USA, the US Government Accountability Office, the UK Royal Society, the US National Academies, the Intergovernmental Panel on Climate Change, the Convention on Biological Diversity, the London Convention and Protocol.

The peoples and countries and peoples that will be the first to suffer the impacts of these experiments have not been consulted. The 193 Parties to the Convention on Biological Diversity were alarmed enough at COP 10 in Japan in October 2010 to adopt a moratorium on geoengineering activities that could threaten biodiversity and have transboundary impacts. Rio+20 needs to buttress that decision with a firm global ban on the testing and deployment of all geoengineering technologies in the absence of a clear international consensus. The legal precedents exist in international arms control.

Disarming the Weather Warriors: Most discussions on the governance of geoengineering have revolved around the potential applicability of various international legal regimes to specific geoengineering techniques (e.g., London Convention and Protocol on Ocean Dumping, the Convention on Biological Diversity, the Vienna Convention on the Protection of the Ozone Layer and its Montreal Protocol. While these treaties are useful tools, a more comprehensive and simple solution, in keeping with the spirit of the moratorium adopted by the CBD in October 2010, would be to ban the testing and deployment (through any form of in situ experimentation) of all geoengineering technologies either through the ENMOD treaty (on environmental modification) or drawing on our experience with disarmament. This would allow theoretical research, computer modeling and laboratory tests to proceed but would draw the line at real-world experimentation.

A ban on geoengineering testing could be negotiated during the remaining months of the preparatory process and adopted at Rio+20. Alternatively, states at Rio+20 could signal their intention to submit a resolution to the UN General Assembly banning geoengineering. A General Assembly resolution could launch negotiations on a treaty or even form the basis for a treaty, which would then be opened for formal signature and ratification. A treaty would specify that no Party could engage in the real-world experimentation of geoengineering technologies. An international body, akin to the International Atomic Energy Agency, would then have oversight and inspection powers in order to ensure compliance. This could be a new or an existing body with an expanded mandate.

Under the Nuclear Non-Proliferation Treaty (1968), which 190 states have ratified, non-nuclear weapons states agree not to seek or manufacture nuclear weapons and nuclear weapons states agree to engage in disarmament talks. The only states that do not honour the ban on military research are the five nuclear powers that are the permanent members of the Security Council (USA, China, Russia, UK, France) and the four other states that have more recently acquired nuclear strike capability (India, Pakistan, Israel, North Korea). The Comprehensive Nuclear Test Ban Treaty, which has been ratified by 155 states but has not yet entered into force, prohibits all nuclear explosions. Parties also agree to prohibit any such testing in areas under their jurisdiction and refuse to participate in any way in such tests.

The Chemical Weapons Convention (CWC) is an arms control agreement that outlaws the production, stockpiling and use of chemical weapons and it has been ratified by 185 states. The Biological and Toxins Weapons Convention expanded the Geneva Protocol, which prohibited the use (but not the possession) of biological weapons. Currently, 165 states are bound by its provisions, which prohibit the development, use and stockpiling of the instruments of biological warfare. While both these treaties have weaknesses, particularly in terms of their monitoring and compliance mechanisms, the basic framework of the treaties is relevant to geoengineering: What is prohibited is not the actual biological agents, but rather their uses. What is made illegal under these conventions is the preparation for the waging of biological warfare. The parallel that can be drawn with climate modification through the deliberate, large-scale technological manipulation of the Earth's systems is straightforward: It is the testing of technologies that purport to engineer the climate at a large-scale that would be prohibited, not the actual materials or processes that would be used.

Advocates for geoengineering sometimes argue that a ban or even an international governance system cannot be adopted because the technologies have not yet reached a stage of maturity, and scientific exploration should not be hindered by "premature" regulation. This argument is wrong-headed. What the history of the nuclear arms race shows is that problems are created precisely because some states already possess the technology. The reason the Comprehensive Nuclear Test Ban Treaty has not entered into force is that an insufficient number of states with nuclear technology have signed on. Likewise, the "new nuclear states" resent having restrictions on testing that the "old nuclear powers" do not have. This is seen as inequitable and ineffective. With geoengineering technologies at a stage of relatively immature development, the world actually has a small window of opportunity to prohibit them before financial and geopolitical interests become entrenched.

#### Nine Questions to Debate Before Considering Geoengineering Deployment

Intergovernmental discussion on geoengineering should include careful consideration of each of the following nine questions. ETC Group offers preliminary thoughts:

I. How intrinsically risky is geoengineering? The risk is proportional to the planetary scale upon which it would operate and, like nuclear war, its effects are not reversible or predictable. Scientists agree that the outcome of geoengineering cannot be certain, therefore, the risk is commensurate with that of nuclear war.

II. Are the risks evenly distributed among regions and peoples? Scientists agree that the impacts of geoengineering would be uneven and probably unpredictable within and between hemispheres and continents. People would also be differently vulnerable depending upon their livelihoods, locations and mobility (wealth). Marginalized people in fragile environments - exposed to extreme hydro-meteorological events and circumstances - would experience disproportionate risk.

III. Could geoengineering's development/deployment negatively impact other responses to climate change? All parties recognize that the prospect of even temporary technological fixes to climate change encourages some governments and industries to lower their (already weak) commitment to mitigation and adaptation. Further, if technological alternatives are thought to be "cheaper", other options and funds will attract less support. There are also direct impacts on other mitigation responses, such as less effective solar power in the presence of solar radiation management techniques.

IV. How will decisions be made? This is unknown. However, as with nuclear weapons and other major global military and economic issues, geoengineering decisions will be made by those who have power. Because geoengineering could conceivably be undertaken by just one (or a few) countries, multilateral endorsement is not a prerequisite for action.

V. What is our experience with responsible global crises management? Humanity's only comparable experience is with war. Powerful governments have never left such decisions to an inter-governmental vote. These governments have conducted ocean and stratospheric nuclear testing without UN support. It could be argued, of course, that hunger, disease and poverty are also global crises requiring a coordinated multilateral response. At least since the 1960s, we've been told that these problems are financially and technically solvable. Concerted, constructive action has been rare.

VI. What is our global record with equitable problem-solving? Governments have negotiated thousands of treaties that achieve practical solutions to practical problems. The solutions have sometimes been equitable. However, when it comes to the "big" issues of war and peace, justice, or equitable distribution, humanity has very few beneficial experiences to draw upon.

VII. What are the mechanisms for the participation of less powerful parties and those regions and peoples that could be most negatively impacted? The issue has not been addressed. There have been discussions about governance in general, but proponents of geoengineering have not developed any mechanisms to meaningfully engage marginalized peoples or countries.

VIII. What risk is there that scientific advice could be superseded by short-term political interests? As climate change shows, scientific advice is routinely marginalized or distorted to meet immediate political interests. Scientists lose control of their information/advice the moment it encounters the political agenda. This distortion has been consistent: from the health effects of tobacco, asbestos and radiation to BSE and nuclear safety today (see below, Table 1). The greatest consistency, however, is that scientists have failed to learn from history.

IX. What is Plan C if geoengineering fails or exacerbates climate change? Good question. No answers - just wasted time and money.

The Road from Rio: Rio+20 affords all of the world's governments their best opportunity to make a clear statement on the unacceptability of geoengineering. If the message from Rio is not clear, some governments and some companies will pursue ocean fertilization and/or solar radiation management research that could threaten the environment and well-being of other peoples. The following might be considered indicators of governments' views coming from Rio:

We will have made progress if Rio...

- Makes a clear statement that geoengineering is unacceptable, and/or;
- Adopts text hostile to geoengineering with no loopholes, and/or;
- Welcome/approves the existing CBD moratorium without reservation, and/or;
- Exposes geoengineering as a controversial and dangerous initiative being pursued by parties sidestepping climate change obligations.

We will have failed if Rio...

- Calls for further scientific experimentation in geoengineering techniques, and/or;
- Implies that "all options" must be "on the table," and/or;
- Asks one or more scientific "taskforces" to study and report.

### 3. Agriculture - The BioMasters' Greed Economy?

ETC Group supports the important emphasis given to agriculture in Agenda 21 and agrees with governments that food and agriculture must play an essential role in the movement toward sustainable economies. We believe that the IAASTD report, requested by governments during the 2002 World Summit on Sustainable Development, is the basis for strengthening the role of small-scale producers in achieving Food Sovereignty. We also commend the leadership of the UN Food and Agriculture Organization (FAO), International Fund for Agricultural Development (IFAD), World Food Program (WFP) in restructuring the Committee on World Food Security (CFS), ensuring the full participation of small-scale producers, civil society and multilateral institutions, including the Consultative Group on International Agricultural Research (CGIAR), and creating new policies and new governance structures for food and agriculture. The High- Level Panel of Experts (HLPE) established to work with the CFS has also made an important contribution. We believe that the revitalized CFS - guided by the findings of the IAASTD - is the appropriate body to work with governments to develop sustainable economies for food and agriculture. Governments should give consideration to the CFS model as a possible template for the development of any new or revised environmental mechanisms that may result from the Rio+20 conference.

The Need to Shift from Food Chains to Food Webs:

Today, six corporations (Monsanto, DuPont, Syngenta, Dow, Bayer, and BASF) control 71% of crop chemicals, 58% of commercial seed sales; and, with their biotech partners, control 77% of the world's so-called "climate-ready" crop patent claims. The six-company oligopoly stifles innovation, encourages energy waste and promotes their polluting chemicals.

The industrial food chain offers the same sadly simplistic solution to all the problems it creates: governments and consumers must give them more money to develop technological "quick fixes" that will give agribusiness the power to adjust food supplies to climate change; reduce greenhouse gas emissions; conserve the world's diminishing water resources; safeguard biological diversity, and; feed 9 billion people in 2050. All governments need to do is suspend their common sense and trust the oligopoly that has made our food system so unsustainable and left almost 1 billion people hungry. In reality, it is sound policies - not unproven science fiction - that will address humanity's needs. Below are 20 practical policy initiatives that can be implemented now that will immediately strengthen food sovereignty, reduce environmental damage and support the innovative work of peasant producers.

Fundamental policies for the land and people

1. Restore public support for agriculture to address the food crisis. Corporate concentration in the food chain has, since at least the 1970s, severely reduced public- sector support for both research and rural development. Agricultural assistance declined from \$8 billion in 1984 to \$3.4 billion in 2004 (2004 US\$). Governments should cooperate to place an annual \$5 billion surtax on the food oligopolies over at least the next 25 years to recoup a portion of these losses. The recovered funds should go directly to peasants' organizations to support their initiatives.
2. Convert "land-grabs" to peasants' fields. There is growing international recognition that public or private internal or cross-boundary land grabs are destructive of the environment and food security. The estimated 80 million hectares of land involved in these transactions should be made available to peasants and converted into 26.7 million farms of roughly 3 hectares each.
3. Convert biofuel land to food. In 2007, both the US and EU devoted \$11 billion to state subsidies and tariffs in support of biofuel production. As of 2006, 14 million hectares (1%) of all arable land was being used for biofuel production (providing only one half of 1% of global primary energy use.) New policies should transfer biofuel land to 4.6 million landless or land-poor peasants (3 hectares each) - potentially doubling farm production (average farm size in Africa and Asia is currently 1.6 ha). The \$11 billion annual subsidy should support agro-ecological developments on the farms.
4. Secure sufficient, nutritious and appropriate food for at least 9 billion people by 2050. Today, the cereals used for animal feed could meet the annual caloric needs of more than 3.5 billion people. The current world population is 7 billion. There is no technological barrier to meeting our future food needs.
5. Adopt policies that reduce soil erosion to protect long-term food security. Today, the industrial food chain leads to an annual loss of topsoil amounting to 75 billion tonnes and costs the world \$400 billion. An oligarchy of ten global fertilizer companies discourages good soil management. Peasant soil conservation systems utilizing naturally occurring soil microorganisms are responsible for fixing 140-170 million tonnes of nitrogen - equivalent to \$90 billion in chemical fertilizers. Policies must support these conservation strategies. Improved land management, especially using peasant techniques, could increase agricultural GDP between 3% and 7%.
6. Reduce crop losses: Today, annual food losses equal more than half of the world's cereals crop (2.3 billion tonnes), meaning unnecessary production of roughly 500 million tonnes of GHG. Food losses in industrialized countries range between 90 and 111 kg per person per year. New policies should immediately lower OECD crop losses by 90% -

at least to sub-Saharan African and South Asian levels of 9-11 kg per person per year.

#### Policies to transform the food chain into a food web

7. Strengthen the food web and break up the food chain. Oligopoly in agricultural inputs reduces efficiency and discourages the resiliency necessary to respond to new health and environmental challenges. Competition policies must break up the food chain. New policies must encourage market diversity and research support for agro-ecological systems. Market diversification, for seeds alone, could reduce prices by at least 30%, saving the world's peasants more than \$9 billion per annum.

8. Advance the rights of women food producers: Women account for 60 to 80% of peasant growers and produce 90% of food in Africa and about half of all food worldwide. Yet in sub-Saharan Africa, only 15% of landholders are women and they receive less than 10% of credit and 7% of extension services. Policies that address gender inequalities could, conservatively, increase over yield by 2.5% to 4% and bring 100 million people out of hunger.

9. Diversify food processing and retailing. Today, the largest supermarket oligopolies control 40-50% of the food market in Latin America, 10% in China, 30% in South Africa and 50% in Indonesia. The leading 100 processors control 77% of global packaged foods and 10-11% of world retail food sales. Peasant systems feed 70% of the world - including the most vulnerable. Competition policies should eliminate oligopolistic practices. New policies must diversify consumer options, reduce the need for processing and support local food storage and distribution.

10. Improve the North's Food/Energy Ratio to Match the South's: Today, on average, OECD states use up four kilocalories (kcal) of energy to produce one kcal of food whereas, in general, the global South takes one kcal of energy to produce one kcal of food. OECD government should consider incentives (including negative tax pressure) to bring the industrial food chain's energy consumption at least into alignment with peasant food production. This would amount to a massive saving in fossil fuels and greenhouse gas emissions.

11. Reduce freshwater waste in food and beverage processing industries. Five global food and beverage corporations - Nestle, Danone, Unilever, Anheuser-Busch, and Coca-Cola consume enough water to meet the daily domestic needs of every person on the planet. Today, it takes, for example, 12,000 L of water to produce and process one-half kilo of chocolate. The water required to produce 65 million kg of ground beef - the amount recalled and destroyed due to food safety violations in the United States in 2008 - was equivalent to the water required to irrigate 100,000 hectares of dry land for one year. Peasant production models that privilege local consumption waste little or no water. Policies must prioritize local consumption and heavily tax wasteful processing companies.

#### Policies to shrink agriculture's environmental footprint and improve health

12. Improve health and reduce environmental damage. Today, the average adult in an OECD country eats an unnecessary and unhealthy extra meal each day (roughly an extra 750 calories). About 25% of the energy and water - and the associated greenhouse gas produced - used in OECD countries goes to "waste food." At least 50% of OECD adults are overweight or obese. Obesity costs OECD states almost \$300 billion per year - an amount that is more than enough to meet all of the Millennium Development Goals by 2015, with around \$100 billion leftover.

13. Reduce OECD meat and dairy consumption. According to UN estimates, demand for meat and dairy products will double by 2050. Per capita OECD meat consumption is 10 times that of the global South. A 25% reduction in livestock product consumption worldwide would reduce our GHG emissions by 2.5%.

14. Eliminate waste and environmental devastation in the fisheries industry. Today, industrial fish farming takes 6 tonnes of wild fish to produce 1 tonne of fishmeal and between 1.5 and 3 tonnes of meal to harvest 1 tonne of farmed salmon. Peasant fishers and family fishponds recycle nutrients and have almost no waste. Policies must incorporate this waste into industrial fish farm taxes.

15. Strengthen urban and peri-urban food systems. Today, British consumers throw away 243 L of water per day in wasted food. This amounts to 6% of total UK water usage and one and a half times more than personal daily fresh water needs. Today, 25 to 30% of fresh water - about 45 billion L - in urban areas is lost through leaky pipes costing municipalities \$14 billion a year. The urban water wasted through leaky pipes could provide the water needs of 200 million people or 4.5 million urban micro-gardens. If the 243 L of water lost each day from food thrown away were available to urban gardeners it could produce 18,000 tomatoes per annum, 3,240 lettuces every 60 days, 900 cabbages every 90 days or 9,000 onions every 120 days. Policies should promote urban agriculture (including its access to safe water) that will improve water efficiency, recycle wastes, and support nutrition.

#### Policies to encourage innovation and diversification in the food web

16. Support in situ peasant conservation strategies. There is general agreement that the adaptation of agriculture to climate change will depend upon the conservation and introduction of crop wild relatives. Current efforts, however, are only collecting 700 species. Peasants conserve 50-60,000 species of wild relatives. Their in situ conservation and community breeding must be supported.

17. Encourage breeding and production of underutilized crops. Today, the industrial food chain concentrates on 150 species with almost all research going into 12 species. The peasant food web breeds and nurtures 7,000 food crops, offering enormous potential to respond to climate change. Policies must strengthen their efforts to diversify the food web.

18. Restructure research priorities to support peasant breeding. Over the last half-century, industrial breeders have produced about 80,000 plant varieties (including 7,000 from international research centres). Almost 60% of private commercial breeding has been ornamental. Over the same period, peasants have contributed close to 2.1 million food and feed varieties. Policies must surrender breeding direction to peasant organizations, duplicate gene bank accessions for peasant breeding and inter-farm exchange, and eliminate monopolistic regulations that inhibit innovation.

19. Promote resilient livestock breeds and species diversity: Today, 3-4 multinationals control breeding stock for each of the four key livestock animals (cattle, pigs, broiler chickens, laying hens and turkeys). In total, about 100 breeds account for almost all commercial meat and dairy production. Furthermore, three agribusinesses account for 43% of veterinary medicines and three others control 25% of industrial feeds world-wide. While the industrial food chain continues to narrow the range of species and breeds available to meet climate changes, peasants maintain 40 livestock species and 7,616 breeds that may otherwise become extinct. Policies must support peasant conservation and breeding of these animals and the rights of traditional livestock keepers.

20. Conserve and promote marine and freshwater fishing. Today, industrial fisheries commercialize 363 species and the industrial system has wiped out 20% of all freshwater species while overfishing virtually all popular marine species. Peasant fishers protect and harvest more than 22,000 freshwater species alone. Policies must strengthen support for peasant fishers.

#### The Road from Rio:

We have made progress if Rio...

·Calls for the full involvement of small-scale producers' organizations, and/or;

- Commends the CFS as the template for other UN bodies and treaties, and/or;
- Proposes a process/timetable for the continuation of IAASTD, and/or;
- Condemns land grabs and agrofuels, and/or;
- Criticizes "top-down," "technology-driven" industrial agriculture. We have failed if Rio...
- Calls for further research on "intensive smallholder production," and/or;
- Champions "new technologies" to address climate change, and/or;
- Identifies CGIAR as the model for research, and/or;
- Proposes nothing more than "multi-stakeholder" initiatives or "public-private partnerships," and/or;
- Leaves opening for land grabs and/or agrofuels.

#### 4. Conclusion

The months leading up to Rio+20 in June 2012 are a time of risk and opportunity. Current governance structures for sustainable development in the UN system suffer from a lack of coordination among institutions; a lack of effective representation for most governments; and an absence of involvement of civil society and social movements. Rio+20 offers a real opportunity to strengthen democracy and peoples' participation within the UN system, and to take three crucial steps forward: (1) establish a pathway for precautionary, inclusive technology evaluation; (2) ban geoengineering; (3) and commit to support small-scale peasant-led agriculture. [\[UNDESA/DSD: Please download the original document to see this table\]](#) ENDNOTES: 1 Agenda 21, Chapter 34 took a holistic approach to technology transfer, underlining the importance of adequate information on environmentally sound technologies as well as improving access to them, strengthening South countries' technological capacities, information and choices. Governments agreed to enhance the transfer of technologies, to build capacity, to foster successful long-term partnerships, to revalorize indigenous knowledge, to foster public sector research, and to build capacity for technology assessment and to finance technology transfer. Virtually none of this has been done and the technology gap between North and South has continued to widen, while high-risk technologies enter the globalized marketplace with inadequate attention to their medium- and long-term social, economic and ecological impacts.

ETC Group is an international civil society organization (CSO), addressing the socioeconomic and ecological issues surrounding new technologies that could have an impact on the world's poorest and most vulnerable. We investigate ecological erosion (including the erosion of cultures and human rights); the development of new technologies (especially agricultural but also new technologies that work with genomics and matter); and we monitor global governance issues including corporate concentration and trade in technologies. We operate at the global political level. We work closely with partner civil society organizations and social movements, especially in Africa, Asia and Latin America.

ETC Group has consultative status with the United Nations Economic and Social Council (ECOSOC), Framework Convention on Climate Change, Food and Agriculture Organization (FAO) and FAO Committee on World Food Security, Conference on Trade and Development (UNCTAD), and Convention on Biological Diversity (CBD). We also have a long history with the Consultative Group on International Agricultural Research (CGIAR).

## Ethos Institute

Proposals from the Signatories Institutions for Brazil, Civil Society and Government positioning to the negotiations to the United Nations Conference on Sustainable Development (Rio+20)

### CONTEXT

The UN Rio+20 Conference, as we all work to guarantee its success and effectiveness, is a privileged experience to discuss measures and mechanisms to implement decisions and agreements firmed 20 years ago, at the Rio(Eco) 92 Conference. The latter was able to advance themes previously proposed, still in an elementary way, at the Stockholm Conference, in 1972, and to produce a robust set of agreements among nations, expressed under the 27 Principles of the Rio Declaration, the Agenda 21, the Declaration of Forest Principles and the Conventions on Biological Diversity, Climate Change and to Combat Desertification. It also opened the way to later agreements, such as the Millennium Declaration and the Millennium Development Goals, the Johannesburg Plan of Implementation, the Latin American and Caribbean Initiative for Sustainable Development, the Monterrey Consensus of the International Conference on Financing for Development, the Doha Declaration, the Barbados Programme of Action for Sustainable Development of Small Island Developing States, the Mauritius Strategy and the Bali Strategic Plan for Technology Support and Capacity-building. It will be Rio+20 responsibility, therefore, to build a substantial political agreement, increasing the implementation capacity of the multilateral agreements previously signed and provide effective mechanisms to decisions already taken.

There are expressive contextual differences between the last big conferences (Stockholm, 1972 – Rio, 1992 – Johannesburg, 2002) and the 2012 summit. The first three represented, in their discussions and decisions, parallel worlds in relation to the economic context to which they were immersed in. The Stockholm Conference took place at the end of the period of real effectiveness of the Bretton Woods institutions and preceded two oil crises (1973 and 1979) that changed the global economy. Rio92 occurred along with the process of economic deregulations, the overcoming of national frontiers and the reduction of social protection networks, in contradiction with the sustainable development effort. The agreements generated from Rio92 were fundamental, but were not implemented, as they contradicted the logic of a growing globalization that also tried to sustain itself. The Johannesburg Summit happened at the climax of the movement of financialization of the global economy, when the world's capital was allocated predominantly in service of its own reproduction. In each of these historical moments it was verified a disparity among the summit's proposals and deliberations and daily decisions from governments and businesses. With these, the traditional economic vision and logic predominated over the political agreements.

Rio+20 will face the challenge and the opportunity to analyze the global crisis – started in 2008 and unfolded in 2010/2011 –, taking into account the exhaustion in the traditional development model and the reinforced imposition of short term economic imperatives over political decisions, proposing a change of course based on sustainable development principles and imperatives. Surely, there will be conflicts of interests and of visions, being the responsibility of more advanced voices, Brazil among them, to defend a political affirmation in its multilateral dimension with impacts in internal orders, also leading to the end of the crisis. In this sense, concrete proposals must be presented to internalize decisions in the real politics and in the real economy, in their global and local dimensions, observing the principle of non-regression in relation to previous commitments. If Rio+20 is not able to construct the path, there will be a great risk to miss the accumulation of all decisions mentioned above, which are fundamental in building a fairer, inclusive, whole, and environmental friendly global order. With this context, and with this spirit, we offer the following suggestions, proposing the internalization of Rio92 decisions in the political sphere, as well as the economic sphere through the adoption of goals and concrete actions that, we believe, will contribute to overcome the crisis and to build a new development paradigm.

### 1. CONSTRUCTION OF THE TRANSITION TO A GREEN ECONOMY IN A POVERTY ERRADICATION CONTEXT

Given the accumulation of compromises and agreements shown above, as well as the difficulties in implementation imposed by choices based on a short term financial-economic vision, it is necessary to develop a road map to internalize compromises in the economic order, internally and externally, fostering a transition agenda to a green, inclusive and responsible economy. These concepts are understood as follows:

A green economy seeks to ensure a friendly relationship between society's production processes and natural processes, promoting conservation, restoration and the sustainable use of ecosystems, treating the services they offer to life as assets of public interest.

An inclusive economy seeks to meet the needs and the rights of all human beings, promoting a balanced development among financial, human, social and natural capitals, equitable distribution of wealth and of income-generating opportunities, access to public goods and services, securing decent life conditions for all the population, eradicating poverty and reducing social inequalities.

A responsible economy seeks to strengthen a set of humanistic and universal principles and values that sustain the democratic functioning of societies and markets, through the development of ethical and integrity values, promoting a transparency culture and mechanisms to fight corruption.

For the internalization of compromises in national economies, we propose that all participating countries at the United Nations Conference on Sustainable Development (Rio+20) commit to adopt the following directives:

- i. Adoption, progressively, of a new national accountability standard to measure development, while the United Nations system develops a standard that could, in the medium term, be adopted by all nations (according to item 2.ii). The new national standard should redefine the concept of prosperity at a national level, considering not only the effective GDP (for mediation) and the potential GDP (for planning purposes), but also the costs of natural assets and services implied in the production of goods and availability of services, the social impacts resulting from the growth model adopted and the level of national income vis-à-vis the local population's access to adequate sanitation, health, education, consumption, mobility, culture and well being. The new national standards should, therefore, measure the natural, social, human and financial capitals, modeled in the studies developed by the Stiglitz-Sem-Fatoussi Commission and by research conducted by Ethical Markets in partnership with GlobeScan (Beyond GDP);
- ii. Pricing of carbon and the creation of an internal carbon market. It is suggested to study the adoption of a local standard for carbon pricing, considering the characteristics of local markets and economic agents, as well as the creation of an internal carbon market so the agents can operate and contribute to the achievement of national emission reduction goals;
- iii. Payment for ecosystems services. It is suggested to study forms of pricing of natural resources and environmental services as a way to make individual perceptions and market controls effective, leading to productive systems that considers the closed, full cycle of production and the sharing of generated benefits from the use of biodiversity and of traditional knowledge;

iv. Establishment of Minimum Operating Standards. It is suggested to study and define local minimum sustainable operating standards for public national companies and utilities, as well as national companies that operate internationally (in issues such as decent work relations – inclusion of minorities and equality –, socio-environmental practices compatible with sustainable development and production's closed cycle), or submitting them to global minimum operating standards, when these are already established (see item 2.1.v). National states must also create conditions in order for multinational corporations to operate locally based on their best world standard, when this is above the local or global minimum. Furthermore, it is suggested to include among the minimum operating standards – as a requirement for large national companies that operate internationally, as well as to public companies and utilities – the public annual disclosure of sustainability activities modeled in global reporting standards (e.g. GRI) or a justification of impossibility of report;

v. Inclusion of four aspects in the decision-making process: social, environmental, economic and ethical, encouraging a culture of peace and solidarity among nations and translating in concrete objectives on poverty eradication, reduction of inequalities, promotion of decent work and of a system of integrity and combat against corruption;

vi. Linkage between public and private actions in developing and follow through with the national plans. Additionally, the articulation between governments, intergovernmental organizations and non-governmental organizations, market and civil society based (major groups) is also fundamental for the transition to a new economic model;

vii. Adoption of sustainable purchasing policies for governments, in a way to redirect local production, as well as measures that encourage both production with less pressure on natural resources, low emissions and decent work conditions – studying differentiated taxation regimes to encourage it – as well as new consumption patterns, establishing mechanisms that promote the acquisition of more sustainable products. At the same time that production patterns are shifting, it is imperative that there is a change of culture and behavior from consumers. In this sense, it is suggested to promote a responsible advertising that act as guidance to consumers, according to the proposed by the EthicMark Award for Advertising that Uplifts the Human Spirit and Society. Finally, it is necessary to encourage the sustainable treatment of waste from producers as well as consumers, and the financing of R&D process to develop sustainable products;

viii. Effective investments, public and private, in a new education model focusing on developing values and culture aiming to develop citizens aware of their socio-cultural heritage, of their position in relation to the environment and of their power to influence and their responsibility as citizens, voters, parents, consumers, investors and entrepreneurs. Assessment mechanisms of the internalization of concepts and practices from a student perspective can be particularly effective in this sense;

ix. Incorporation to regulation tools, inducing the planning and development of sustainable cities, through urban and rural infrastructure investments, such as greater sanitation coverage, depollution and recovery of water resources, promotion of a sustainable urban transportation system and energy generation from a diversified and renewable matrix.

Even as the plans are of national character, it is encouraged, whenever possible, the exchange of experiences and the search for cooperation among countries.

## 2. CONSTRUCTION OF A NEW INSTITUTIONAL FRAMEWORK

Regarding the internalization of commitments in national and international politics, we understand as fundamental:

2.1 A real commitment from countries to align their national planning and development agendas with sustainable development criteria, through the elaboration of national plans on sustainable development, to be presented to the new “umbrella body”, to be created within the United Nations (see item 2.2), within a deadline convened with the parties (suggested, initially, two to four years).

The plans should be adapted to the different local realities and should contemplate, necessarily, a minimum agenda, consisting of goals in:

- a) Reduction of ecological footprint, considering reducing the consumption of resources, the impacts on ecosystems and their conservation and restauration;
- b) Poverty eradication and reduction of social, political and economic inequalities, translating into access to goods, income and public services;
- c) Implementation of a system of integrity and transparency for the commitments in public- private relations, including a mandatory public annual disclosure of sustainability policies and practices by multinational corporations, public companies and utilities, or justification of impossibility of report.

It will be the responsibility of the United Nations the Encouragement and Support of National Plans and to promote spaces for sharing and exchanges that provoke synergies and scale gains, through:

i. Establishment of a International Fund to guarantee the feasibility of the national plans, which could be based on: the proportional contributive capacity of member countries of the United Nations, advancing the agreement (during the 34 Session of the UN General Assembly , 1980), which was never fulfilled, of 0.7% of GDP from developed countries, to 1% of GDP ; resources from the rights of maritime and air space usage; and a tax of 0,05% on speculative international financial transactions (Tobin Tax). These resources would be redistributed according to voluntary goals and commitments agreed by nations, submitted to external and independent accountability.

ii. Adoption, by the UN, of a new national accountability standard to measure development and monitor the national voluntary plans, taking into consideration recent research– among which we highlight the works of the Stiglitz-Sen-Fitoussi Commission and the studies conducted by Ethical Markets in partnership with GlobeScan (Beyond GDP) –, as well as the experiences from the various nations and blocs of nations on defining their internal prosperity and development standards (according to item 1.i). The accumulation of these researches and information, and their thorough evaluation should develop, in the medium run, into a new standard that can be adopted by all nations;

iii. Pricing of carbon and creation of a global carbon market. It is suggested to study the adoption of a global standard for carbon pricing, as well as the creation of a global carbon market. Both the carbon pricing and the operational model of the carbon market shall consider countries' experiences and the overall information from the implementation of the Clean Development Mechanisms (CDM), within the Kyoto Protocol context;

iv. Payment for ecosystems services. It is suggested to study forms of pricing of natural resources and environmental services as way to direct production systems to a closed cycle. Experiences from countries and blocs will serve as reference for global definitions that shall also consider the effective access to biodiversity and the sharing of generated benefits from its use, in accordance with previous commitments (Convention on Biological Diversity);

v. Establishment of Global Minimum Operating Standards. It is suggested to establish, at a global level, minimum operating standards for multinational corporations (in issues such as decent work relations – inclusion of minorities and equality –, socio-environmental practices compatible with sustainable development and production's closed cycle); Furthermore, it is suggested to present annual disclosure reports of sustainability activities modeled in global reporting standards (e.g. GRI) or a justification of impossibility of report;

vi. Redefinition of a Geography of Technical and Scientific Cooperation, suggesting the coordination of efforts and the creation of networks that encourage the exchange of experiences, expertise and skills among regions that are similar geographically (organized by biomes), geopolitically, and by their development stage, in a way to create synergies and accelerate scale gain, with a resulting lowering of costs to the transition agenda.

2.2 Overcoming the current global institutional failure, modifying the institutional framework both in the national and global spheres, in a way to eliminate the imbalance among

the four sustainable development dimensions (social, economic, environmental and ethical). Only the creation of a new institutional framework can offer the mechanisms of coordination, cooperation, evaluation and control necessary to an ambitious transition agenda.

In this sense, it is proposed to strengthen the management systems in the social, environmental and ethical dimensions within the United Nations, and the creation of an “umbrella body” responsible for planning, coordination, encouragement and implementation of sustainable development commitments. This new body, that shall have a hierarchical level comparable to the Security Council level and absorb the Commission on Sustainable Development, shall provide directives to other bodies, agencies and programmes within the United Nations system, specially: ECOSOC, UNEP, UNDP, WTO, WCO, ILO, UNIDO, UNCTAD, FAO, OHCHR, UNPA and UNESCO. The new body shall also articulate policies and efforts from multilateral financial institutions (International Monetary Fund and the World Bank), settle disputes, mediate conflict of interests and litigate within the International Court of Justice and the International Criminal Court, gather and provide subsidies to other multilateral organizations (such as G20 and G77), and maintain a dialogue and consulting forums with non-governmental organizations (market and civil society based), guaranteeing legitimacy to decisions and process.

Besides being responsible for the encouragement and support to the agendas and national plans, this new multilateral institutional architecture would intervene in all situations of social, financial, food, energy, environmental, and cultural crises and in any other issues related to sustainable development.

## Eurodad

Driving sustainable development through public procurement

Eurodad submission for the Rio+20 compilation document

Public Procurement can be a major driver of sustainable development and should therefore be on the Rio Summit's agenda. Public procurement accounts for at least 15 percent of global GDP. It is the largest share of government spending besides wages. Moreover, it a section of the economy which is directly under public control, and can be directed towards achieving development goals. Thus, if wisely used, it is a major policy tool for driving sustainable development, in both developed and developing countries.

Sustainable Public Procurement (SPP) is often defined as a process whereby organizations meet their needs for goods, services, works and utilities in a way that achieves value for money on a whole life basis in terms of generating benefits not only to the organization, but also to society and the economy, whilst minimizing damage to the environment. SPP takes developmental, social and environmental criteria into account and makes public procurement contribute to reaching the Internationally Agreed Development Goals.

The relevance of SPP has already been identified by the World Summit on Sustainable Development in Johannesburg in 2002. The Johannesburg Plan of Implementation contains an SPP chapter. However implementation since then has been limited. Several UN Member States conducted smaller, more fragmented reforms but scope, depth and speed of reforms leave much room for improvement. The European Union is considering adopting some SPP approaches to modernize its own procurement policy, but has a narrow focus on the environmental dimension.

SPP implementation in developing countries is promoted under the Marrakesh process, but just a small number of countries participate in pilot programs. Most larger public procurement reform programs in developing countries are designed, funded and implemented by the World Bank. Independent research found that SPP criteria are hardly ever considered in technical assistance provided. Consequently, the laws, institutions and human capabilities resulting from such programs do not enable developing countries to apply SPP in practice. This has received criticism from experts who argue that the ongoing process of building functional systems offers a unique opportunity, to develop and implement the most modern SPP procurement systems, in line with the concept of sustainable development.

International debate about 'best practice' in procurement largely takes place in a donor and IFI-dominated discourse – at the OECD Task Force on Procurement – and the concept of SPP does not feature much in this influential policy-making process. Neither do SPP criteria feature in diagnostic tools for procurement systems developed by the Task Force, such as the Methodology for the Assessment of Procurement Systems (MAPS), which have been developed by this Task Force.

The Rio Summit can give a new impetus to Sustainable Public Procurement. The Outcome Document should include:

- A deepened and strengthened global agreement on sustainable public procurement.
- A detailed roadmap, targets and timelines for reform.
- The commitment to found a new UN-hosted Global Partnership for Procurement – to replace the OECD Task Force on Procurement – which builds on the SPP concept and draws on the experience of UN organizations such as the UNDP, UNCTAD, UNEP and the ILO, works with parliaments and civil society, and ensures that in future SPP principles guide public procurement reforms in both developed and developing countries.
- The commitment to mainstream SPP criteria in diagnostic tools used for assessing procurement systems.
- The commitment to reform procurement practices of bilateral aid agencies, multilateral development banks and international organizations. This implies full untying of aid

grants and development loans, using and strengthening SPP country procurement systems of partner countries or giving preference to local and regional procurement; and taking developmental, social and environmental considerations into account.

## Euromontana

From Rio 1992 to 2012 and beyond: 20 years of Sustainable Mountain Development - What have we learnt and where should we go?

### Key messages

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably.

We assert that mountains are territories with a future and opportunities for Europe and the world. They have much to deliver to society at large and have great potential for smarter, greener and more inclusive development. They are also distinctive areas, because of their altitude, their steep slopes, their low population density, their challenges and their opportunities, and consequently should be addressed specifically. We call for public and private investment in these areas. The return on investment might indeed take longer in these areas than in urban areas or lowlands, but the investment itself will undeniably be more sustainable.

At the same time, these mountain territories are faced with a number of challenges. Indeed, the ability of mountain systems to provide essential goods and services for all of humanity is increasingly under threat from climate change, globalization, a chronic lack of investment, ongoing land degradation in some areas, the absence of an integrated approach to territorial development in many countries, and increasing trends to the concentration of population in ever bigger agglomerations. We recognize that, despite the progress that has been made in promoting sustainable development in many mountain regions, most national and international development agendas still tend to treat mountains, if at all, as marginal environments.

On the basis of its experience in the field of sustainable mountain development, its role in development of mountain policies at European, national and regional level, and its specific economic, environmental and social contexts, EUROMONTANA recommends that the United Nations, in the discussion at UNCSD, to be held in Rio de Janeiro in 2012:

- „h recognise the specific role of mountains and the corresponding need for integrated mountain development policies and targeted investment;
- „h recognise in particular the role provided by mountain ecosystems in providing services that support and enhance the Earth's sustainability, and the key role that mountain communities play in delivering these services, by developing concepts of payment and compensation for ecosystem services, and implementing such concepts, and considering the economic value of services provided in the general interest (green accounting);
- „h integrate the assets of mountain regions in processes leading to sustainable development and green Economies, recognising that a geographical differentiation is needed; to identify therefore the conditions required to fully unleash mountain development potential and invest to secure that these conditions exist;
- „h adopt a multi-sectoral, multi-level and multi-stakeholder approach enabling the UN to direct its Sustainable Development policy towards concrete areas of interest and to identify and strengthen entities for cooperation and the implementation of such policies at the appropriate levels, whether regional, local or mountain range,
- „h promote networks and partnerships of mountain stakeholders at all levels (governmental, civil society, private sector) and encourage the relevant national and international organisations to consider mountain-related concerns.
- „h to support mountain-specific observation, research, knowledge development and awareness on environmental, economic and social aspects of mountain areas.

### Mountains can deliver green growth

Mountains and their economies are particularly well placed to deliver green growth, due to their rich natural and cultural heritage. They are the water towers of the world and major reservoirs of biodiversity and natural resources. Due to their topography, altitude and large forest areas, the renewable energy potential in mountain regions is superior to that of many lowland areas; though this also represents a challenge for landscape and biodiversity. As mountain agriculture provides many high-quality products and services, including organic or environmentally friendly farming and extensive rangelands, this sector, often in cooperation with others, can serve as a laboratory for the conservation of biodiversity in balance with human use of resources and interest. Mountains are also among the most exposed to global change. This means that greening the economy is important for mountain economies to reduce their vulnerability and to increase local added value and employment as well as secure synergy between economic growth, environmental protection and social progress.

With their natural and cultural diversity and importance for downstream regions in terms of resources and ecosystem services, mountain areas are important innovation motors in Green Economies, particularly in sectors where they are ideally placed to invent new and promising solutions, such as green transport, renewable energy supplies, life sciences, new forms of food supply chains, sustainable tourism, or remote service delivery.

However, innovative institutional arrangements are urgently required to foster governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, and the mainstreaming of mountains into overall national development and conservation processes.

This requires in particular:

- „h major investments to assemble the conditions allowing these areas to fully and sustainably exploit their potential, notably in the sectors of environmentally-friendly transport, energy, ICT and services of general interest;
- „h a multi-sectoral approach aiming, inter alia, at adequately rewarding the provision of ecosystem services from mountain areas in the general interest, where necessary by correcting market failures related to the specificities of mountain territories. Land managers such as farmers and foresters should, in particular, be equitably remunerated for the provision of public goods resulting from their economic activities .
- „h general support to the development of initiatives adding value to mountain products (food, crafts) and services (tourism) in relation to their specific cultural and environmental features.

Euromontana has elaborated, in relation to these issues, recommendations on how to remunerate positive externalities provided by mountain land managers; foster the innovation potential of mountain areas; support development of sustainable tourism renewable energies, and services of general interest in mountain areas. It also has developed the European Charter for Mountain Quality Food products, launched at the European Parliament in 2005 and signed by almost 70 governments and organisations. This should lead to the adoption soon of specific protection for mountain food products at European level, opening the way to a specific market segment for mountain quality products, expected by many consumers.

### Mountain development can contribute to a more inclusive global development

Enhancing global political commitment that translates into increased investments tailored to mountain regions will directly benefit mountain communities, some of which are very poor, and indirectly humanity as a whole. Mountain regions are likely to contribute widely to social innovation, thanks to their intense community life. Their governance and cooperation models are often unique, but may also provide valuable models for other regions. Furthermore, sustainable mountain development is a component of a more

balanced territorial and place-based development which is highly needed and likely to contribute to a more even and socially sustainable distribution of population and wealth on Earth.

A more inclusive and place-based approach to development requires the adoption of a multi-stakeholder approach and a multi-level governance approach.

Across the world's mountains, the numerous networking entities active at different (governmental, NGO, research level, development agencies) demonstrate a strong identification in the search for sustainable development solutions for mountains. The dynamism of the Euromontana network, bringing together different sorts of actors at different levels, since its creation in 1996, is a good demonstration of this. The UN can build on the European expertise in this respect including European networks, inter-governmental conventions such as Alpine or Carpathian conventions, as well as emerging institutions in mountain research and policy development.

The UN must also promote the development of multi-level governance. Mountain ranges are functional areas whose geographical extent often overlaps multiple administrative boundaries. Euromontana is convinced that a focus on functional areas such as mountain ranges can help UN Sustainable Development policies to approach environmental and Green Economy challenges on a regional level, according to the Local Agenda 21 concept (thinking globally, acting locally). Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends, strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

\*\*\* Euromontana is the multi-sectoral association for cooperation and development of mountain areas. It embraces regional and national mountain organisations throughout greater Europe, including regional development agencies, local authorities, agriculture organisations, environmental agencies, forestry organisations and research institutes. Euromontana's mission is to promote living mountains, integrated and sustainable development and quality of life in mountain areas. In order to achieve this, Euromontana facilitates the exchange of information and experience among these areas by organising seminars and major conferences, by conducting and collaborating in studies, by developing, managing and participating in European projects and by working with the European institutions on mountain issues. Euromontana is a member of the Mountain Partnership, former focal point for Europe for the FAO Sustainable Agriculture and Rural Development in Mountains project, member of the UN ECOSOC, observer at the Alpine Convention, and provides expertise in groups advising various EU Institutions.

Asociacion Europea de Autoridades Políticas de Regiones de Montaña

European Association of Elected representatives from Mountain Regions

AEM's position paper on RIO +20 conference – The crucial role of mountains in the achievement of Rio +20 objectives

The European association of elected representatives from mountain regions (AEM) welcomes the RIO + 20 conference and especially the consultation of the stakeholders in preparing this event that can be a milestone similar to the Earth summit in 1992. In the outcomes of this previous conference, mountain territories' issues have been acknowledged, thanks to Chapter 13 of Agenda 21. This highlight has permitted the creation of numerous organization dedicated to the preservation and the valorization of mountain territories and people.

Europe's mountain ranges have similar issues to other mountain ranges on the rest of the planet. Ecosystems are in danger, as well as the quality of life of mountain people. In spite of Chapter 13, mountains are still in critical condition, because of the climate challenge but also because of the economic conditions (crisis, lack of access to services). Moreover, "one size fits all" policies do not take into account mountains added costs and specificities. To sum up, mountains deserve a specific attention but they are still too often considered as only rural or strictly marginal.

AEM has been contributing to the European debate for more than 20 years. Our association has called for a better acknowledgment of mountain specificities within European policy making.

For a long time, policies related to mountain territories have mainly focused on tourism and agriculture (e.g. natural disadvantage compensations from the CAP). However, AEM's lobbying has contributed to a shift. Indeed, the Lisbon Treaty (adopted in 2009) now grants a specific attention to regions with a permanent natural or demographic disadvantage, such as mountain regions (art.174). Mountains are also naturally considered as a key element of the EU official objective of territorial cohesion (art.3). As a consequence, it is now established in the Treaty that European mountain territories should benefit from a particular attention from all of EU sectoral policies (art. 175).

Green Growth and mountain regions

In 2010, the European Union has launched a new global strategy. Europe 2020 defines EU's priorities for the next 10 years which are gathered in three broad objectives: smart, inclusive and green growth.

Green economy is also the main theme on RIO +20 agenda. AEM fully agrees on the fact that a new model of sustainable development must be set up in order to tackle the climate change challenge.

AEM has lead numerous works that prove that mountain territories have a lot of assets regarding this objective and, hence, will have a role to play at the EU but also at the global level. Besides agriculture and tourism, mountain assets are obvious: they include most of the water resources (which implies most of the hydroelectric production), a large part of the wood industry, many specialized and precision industries, flexicurity as a result of pluriactivity and seasonality, local development through formation and a great biodiversity. The economic profile of mountain regions is deeply linked to environment, biodiversity and landscape, while at the same time ecological innovation and green growth are becoming a major dynamic at the European and international level (as RIO +20 proves it).

AEM argues that mountain ranges have to renew and promote their economic potential considering their environmental assets and their traditional know how. Of all territories, mountain regions are aware of the importance of the mitigation and the adaptation to climate change. This issue has to trigger new model of endogenous development. Such sustainable development must be based on mountain assets, be well balanced between preservation of ecosystems, as it will be a key element to green growth and the

production of carbon free energy.

Because of its specificities and its wealth in natural asset, mountain territories can become pilots for new initiative based on green growth and social inclusion.

However, the environmental challenge is far from being abstract. It implies that every territory, every ecosystem, must be taken into account and must be the target of tailor made policies. As a result, mountain people and stakeholders have to be associated to the policy making in a broad multilevel governance based system.

Multilevel governance, cooperation and territorial cohesion

AEM calls for the setting up of a multilevel governance that associate every level of government and stakeholders to the policy making. In Europe, "one size fits all" policies that do not take into account the territory have proved to be misadapted, with the failure of the Lisbon Strategy. This type of governance could also be implemented at the global level for environmental issues. New academic works lead by the University of Geneva on Regional Environmental Governance show that cooperation between regions with the same ecosystem is mandatory to tackle climate change and shape adapted policies. Mountain ranges have the particularity to be often transboundary. They request a special type of governance that could then be implemented at a global scale. Once again, mountain ranges request cooperation, which will be a key element for the success of RIO +20 and the following initiatives. However, such a model is not "mountain exclusive" and should be applied at a global scale.

With the Lisbon Treaty, the European Union has adopted a new objective: territorial cohesion. This aim goes hand in hand with the need of multilevel governance and cooperation. Territorial cohesion stipulates has assets and should then contribute to EU strategies. No region should be left behind as every territory has potentials. To achieve this, a key element is the concept of functional area. Each area should be defined according to its territorial cohesion. The actual EU debate on macroregional strategies is another sign of this tendency. Macro regions aim at creating more synergies between the various strands of the cohesion policy, in a more efficient and relevant way than with segmented sectorial policies. There is a clear interregional added-value regarding the European territorial challenges "transform diversity into strength" and development of macro-regional strategic approaches that clearly fits to mountain ranges. The integration of policies, the acknowledgment of territorial cohesion both go beyond traditional administrative border would also be great inputs to RIO +20.

Conclusion

AEM understands that RIO +20 will not include mountain orientated initiatives, as the earth summit did. However, in order to reach a model of endogenous development, mountain ranges need reinforcement and development of regional, national and international (multilevel) governance that articulate mountains and lowlands, facilitate transboundary coordination and support capacity building and the exchange of good practices for innovation and sustainable development. Mountain territories are different. They need a specific attention granted by the Earth Summit even if it has not been sufficient, as mountain ranges are still treated as marginal environments.

Green economy and the new focus on environment is positive news for mountain ranges. They have a lot of assets to valorize. But environmental issues imply a new model of governance and a focus on each territory specificity.

Since 1991, AEM brings together elected representatives, from mayors to members of the European Parliament, local and regional authorities from mountain areas, as well as various similar networks. AEM gathers, directly and indirectly, members from 12 000 municipalities, 100 provinces, 50 regions from 11 European Member States. The composition of the Executive Board is based on a political and geographical balance.

---

## European Cancer Patient Coalition (ECPC)

October 31, 2011 Re: Contribution to Rio + 20 Outcome Document

Dear Ms. Tonya Vaturi , Dear Mr. Arthur de la Cruz

The European Cancer Patient Coalition welcomes the opportunity to contribute to discussions on the Rio + 20 Outcome Document. We recognise that behind the Rio Conference is a commitment at the highest levels of Member State Governments to focus on areas of society where policies to promote innovative mechanisms and solutions that could help to generate increased development and to tackle poverty.

We would encourage the delegates to put a strong emphasis on health, especially on Non- communicable Diseases. As you are aware, this issue is just barely on the radar screen of economic policy-makers, who most often do not see that NCDs pose a threat to development, economic growth and poverty alleviation. Over the next 20 years, NCDs will cost more than US\$ 30 trillion, representing 48% of global GDP in 2010, and pushing millions of people below the poverty line. For example:

-Cancer: an estimated US\$ 290 billion in 2010 rising to US\$ 458 billion in 2030.

-Cardiovascular disease: an estimated US\$ 863 billion in 2010 rising to US\$ 1.04 trillion in 2030.

As it will be evidenced by our contribution below: a unified front is needed to turn the tide on NCDs. Governments, but also civil society and the private sector must commit to the highest level of engagement in combating these diseases and their rising economic burden. The economic impact of not dealing with NCDs, in particular cancer would be devastating to developing economies and health care systems alike.

Therefore, in order to achieve positive economic impact and growth as well as in a number of other policy areas for developing countries, we advocate that it is essential that the international community adjust the framework so as to include actions on NCDs in particular cancer on Rio+20.

Yours Sincerely,

Francesco De Lorenzo ECPC Vice President FAVO

ECPC Contribution to Rio + 20 Outcome Document

Overview

i. The current focus of the structure for the future RIO+20 Conference does not take into account sufficiently the economic burden of health inequalities nor the economies benefits that can be realized through the establishment of effective health systems so as to tackle poverty and ill health for future generations. Health impacts several economic outcomes: wages, hours worked, labour force participation, early retirement, labour participation of those caring for a ill member of the household, education outcomes (good health in childhood reduces school absenteeism and early drop-out rates.

ii. In the area of health, priority should be given to focus on Non Communicable Diseases (NCD): they are responsible for the majority of disability adjusted life years lost and therefore threaten the economic viability of developing countries. The World Economic Forum has identified NCDs as the second most severe threat to the global economy in terms of likelihood and potential economic loss. Currently, more than 60% of all deaths worldwide stem from NCDs. Health inequalities have been estimated to cost the EU around €141 billion in 2004 or 1.4% of GDP, when taking into account labour productivity lost and costs to social security. A recent study conducted by the American Cancer Society estimated the cost of DALYs due to cancer worldwide in 2008 at US\$ 895 billion (John & Ross, 2010).

iii. An improved management of NCDs would render the biggest positive impact in terms of increased well-being, economic growth and in a reduction of the economic burden of non-communicable disease.

iv. The economic impact of not dealing with ill-health would be devastating to developing economies and health care systems alike. Therefore, in order to achieve positive economic impact and growth, it is essential that the Rio+20 agenda adjust its framework so as to address Health and the issue of Non-Communicable Diseases.

v. The most cost effective solution to reduce NCDs are through public health interventions that take a health prevention approach, which address the determinates of health (nutrition, alcohol, tobacco, physical activity and the social determinants of health.). vi. Addressing this imbalance through projects to combat health inequalities, potential discriminating legislation and attitudes, to raise awareness and improve data collection should be a strong priority for the inclusion of this in Rio+20 Conference. Furthermore, by tackling the economic burden of diseases and health inequalities, the Rio+20 could accomplish much towards achieving the goal of ensuring sustainable health systems and relieving the economic burden that this has on developing countries.

In the following pages, we have provided suggestions to the questions posed in the Guidance Document on the 'Inputs for Compilation Document'.

Question 1: What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

#### ISSUE 1: REPRESENTATION AND ACCOUNTABILITY FOR A HEALTHY POPULATION

i. While the emergence of the G-20 at the level of heads of states and governments provide the opportunity for strengthening global economic and financial governance to a kind of a steering committee of the global economy.

ii. Nevertheless, institutions need to be legitimate and have credible enforcement power in order for global governance to work. The G-20 seen to be effective, needs to deliver a good solution to the serious problem of health imbalances in developing countries. G20 nations represent around 88% of world GDP and 65% of the population. However, 35% of the world's population and 80% of countries do not have a voice around the table.

iii. Additionally, the world population is increasing. The UN projections indicate that there will be approximately 2 billion more people by 2050. In addition, the share of those aged 60 and older has begun to increase and is expected to grow very rapidly in the coming years. Since NCDs disproportionately affect this age group, the incidence of these diseases can be expected to accelerate in the future. Increasing prevalence of the key risk factors will also contribute to the urgency, particularly as globalization and urbanization take greater hold in the developing world.

iv. In the Report by the Secretary General for the Preparatory Committee for the United Nations Conference on Sustainable Development, 17-19 May 2010, the report stated that 'The concept of sustainable development is like a bridge. It seeks to bring together not only the three domains — economic, social and environmental ..Development is the midwife of sustainability, just as sustainability is the life support system for development'.

v. There is now a growing body of evidence to support the principle that the bridge to sustainable development is through a healthy population which will allow sustained economic growth, and evidence indicates that well directed investment designed to improve the health of a population is one of the most cost-effective means of stimulating gross domestic product (GDP) growth. For example, the WHO has identified a set of interventions they call "Best Buys".

vi. The commonality of the challenges facing the developed/developing countries and the opportunities for growth through better health make a strong argument for its inclusion within the Rio+20. Health has a particular value as a unique bridge and offer an important complement to the orientation of Rio+20 and reinforces its focus as outlined in Resolution 64/236 which states that the focus of the Conference will be on 'the following themes of sustainable development and poverty eradication and the institutional framework for sustainable development".

vii. Most of this burden of disease is preventable, given the will and resources to do so; the means to address the relevant risk factors is known: what is needed is more innovation in the application of these means to populations. Improving the health status of the people worldwide is very largely a challenge to health promotion (which includes health education, health protection, and disease prevention), and health inequalities need to be addressed also in the context of improved systems of health promotion. Other policy areas, such as tax, education and transport, are important for achieving a reduction of risk from lifestyle determinants. . Policy of health professionals is for instance connected to vertical policies such as labour- and migration policies, which determine the efficiency of healthcare professionals. Another important policy area to bring about an efficient healthcare system is research, which can help develop new instruments, one example being e-Health. 1

#### - EXPECTED OUTCOME 1:

##### 1.1 Inclusion of Health and Health Indicators

i) To meet the aspiration of the G+20, we need to improve the well-being of all people, so that they can actively participate to the societal and economical

world. There is a need to promote the value of healthcare to the wider economy. ii) Indicators should be coherent with the aims of the UN Declaration on Non-

Communicable Diseases and the Millennium development Goals. iii) Objectives should either be seeking to produce outcomes and recommendations that feed directly into future policy development or be used to augment the implementation of health policies.

iv) For example in Europe, three areas of ill-health (cardiovascular diseases, cancer, and neuropsychiatric disorders) are the cause of 74% of deaths in Europe, and contribute 54% of the overall disease burden in Europe, as calculated in Disability Adjusted Life Years (DALYs). The most effective way to make improvements in these three areas would be to focus on the underlying determinates of health.

a. there is considerable coincidence between the risk factors for these conditions which need to be influenced and improved if the disease burden they create is to be

reduced which can be tackled at the international level

through the WHO. 1.2 Involvement of Civil Society – Patient Organisations

i) National control mechanisms should not only depend on agents of horizontal accountability (the system of checks and balances in the partner country and the capacity of state institutions to provide oversight and to audit the use of public resources), but also on mechanisms of vertical accountability (mechanisms used by citizens and non-state actors such as civil society, nongovernmental organisations and the media to hold government to account).

ii) Capacity development of NGOs and the media with regard to budget scrutiny and audit reports should be actively supported by the EC.

iii) Support mechanisms of social accountability such as for instance social audits, participatory budgeting and citizen report cards to increase the accountability of government not only to parliament, but most importantly to its citizens.

## 2: 'HEALTH IS WEALTH'

### 2.1 Funding

i. Funding from the international community has been widely recognized as crucial if the world's poorest countries are to stand any chance to "safeguard their hard-won economic gains". The financing gap was estimated by the IMF in September 2009 for low-income countries in 2009–10 as likely to increase by around US\$25 billion a year. In January, the World Bank's Chief Economist estimated that poorest countries that rely on subsidized loans may require an additional \$35 billion to \$50 billion in funding just to maintain pre-crisis programs.

### 2.2 Health Expenditure

i. In Europe, health expenditure accounts for nearly 10% of EU Gross Domestic Product and is one of the biggest economic sectors in the EU. The health sector employs one in 10 workers in the EU, with a higher than average proportion of workers with a tertiary level of education and is on the leading edge of innovation and technology. The sector plays a major role in achieving the EU 2020 targets for smart, sustainable and inclusive growth.

ii. According to the recent report by the World Economic Forum and the Harvard School of Public Health: 'Over the next 20 years, NCDs will cost more than US\$ 30 trillion, representing 48% of global GDP in 2010, and pushing millions of people below the poverty line'. Therefore, if no measures are put in place to tackle NCDs, this estimate cost of US\$ 30 trillion will contribute to the overall burden of poverty on developing countries. As such, there is a growing attention to the potential economic benefits of improvements in population health. The report by the WHO Commission on Macroeconomics and Health report in 2001, demonstrated that health improvement can be seen as a key strategy for income growth and poverty reduction in low-income and middle-income countries.

iii. This is far from new: historically, one of the origins of the public health movement lies in the awareness that the prosperity of nations is partly dependent on the health of their populations.

### 2.3 Health is Wealth

i. We would emphasize that "Health is Wealth" and point out that by achieving good health, a developing economy can be more viable and competitive. Health is the greatest wealth, expresses the understanding that illness is a real economic cost and good health is a precondition for full productivity. This requires an active engagement of many policy sectors, not only of the public health and healthcare systems but also of many other policy areas, including education, social security, working life, city planning and so forth. Without implementing this action, it is estimated that 'the period 2011-2030, the total lost output from the four NCD conditions that are the focus of the UN High-Level meeting and mental health conditions is projected to be nearly US\$ 47 trillion.

### 2.4 Health in All Policies

i. An integrated approach to health is therefore necessary. We need to ensure that a health dimension remains in the core of all policies in general, but especially in innovation and research policy, social policy, regional policy, education policy and agriculture policy.

ii. Developing synergies with all sectors is crucial for a strong development policy. Member States of the UN have acknowledged that the challenge of maintaining a sustainable healthcare system cannot be met without more integration in other policy areas such as employment, social, regions, agriculture and research including innovation. Health is very unevenly distributed across society. In all countries, significant inequalities in health exist between socioeconomic groups in the sense that people with lower levels of education, occupation and/or income tend to have systematically higher morbidity and mortality rates.

## - EXPECTED OUTCOME 2:

i. Health should be included on the agenda Rio+20 Conference and Agenda. This should be introduced as a cross-cutting approach so as to avoid "silo trap":

ii. Suggest the inclusion of a holistic approach to health and ill-health: from an increased understanding of what determines health and what determines ill-health, citizens can be encouraged and supported to lead healthy lives by pursuing the former and avoiding the latter. This builds resilience and resistance in citizens so they can remain healthy, resist stressors that could potentially make them unwell and thus enable them live longer productive and independent lives.

iii. The Rio+20 should support health policies which are based on evidence and provide a stimulus with which to implement recommendations and policies to improve citizens health, address entrenched health inequalities, which, as an outcome, will ultimately lead to sustainable health systems.

iv. To ensure that the IMF deliver its package of measures to assist low-income countries, and monitor the IMF's disbursements to those countries, and the conditionalities attached to them so as to realize health gains

## ISSUE 3: CLEAR TARGETS AND INCLUSION OF HEALTH

i. One of the main sources of criticism on the previous meetings was the lack of clear targets. This allowed the building-up of unsustainable levels of health imbalances that is destabilising for development and reduces global welfare.

ii. Many of the policy orientations articulated by this forum would have to be implemented by the relevant international institutions. Effective global economic and financial governance would, thus, require continuation of intensive reforms in the existing institutions, and also increased collaboration with NGOs such as patient organisations.

iii. The international community should reaffirm the economic burden that NCD will have on developing countries as they have done through the UN Declaration on Non-Communicable Diseases.

## - EXPECTED OUTCOME 3:

i. Support a concentrated prioritisation approach. In the past, it was insufficiently transparent, vested interests are poised to dominate, and there has been duplication of efforts without proper evaluation. The choices of priority need re-appraisal so as to

ensure that they meet the health need of the citizens. ii. Programme should support health in all policies which are based on evidence and provide a stimulus with which to implement recommendations and policies to improve citizens health, address entrenched health inequalities, which, as an outcome, will ultimately lead to sustainable health systems.

iii. Including an objective better regulation and harmonization of health development policy aimed at simplifying and improving existing regulation in order to enhance the design of new regulations and reinforce rule compliance and effectiveness in line with the needs of the different peoples

Question 2: What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, revitalized global partnership for sustainable development, or others?

#### ISSUE 1: SUSTAINABLE DEVELOPMENT AND HEALTH

i. Current development policy is based on the principle that the good health of a population is a precondition for meeting the basic objectives of prosperity, solidarity and safety. All peoples should have access to universal, quality health care, including preventive healthcare, and healthcare should be patient-centred and based on scientific evidence.

ii. To ensure social cohesion, inequalities in health both between and within countries should be reduced. Because of the multidisciplinary character of health issues, Health Policy has to be well coordinated with other policies, and new partners such as the private sector and civic society must be involved.

iii. Additionally, please refer to comments in Q1 as a contribution to the response to this question.

#### ISSUE 2: CLIMATE CHANGE:

i. Potential adverse effects of climate change on human health include both direct and indirect effects. Direct effects concern impacts on the human organism, for example in consequence of heat waves or extreme weather events.

ii. In particular the elderly and people with a weakened immune system and children are at risk. High pressure weather conditions in the summer can increase ground-level ozone causing mucous membrane irritation and respiratory problems. Indirect effects and risks are caused by environmental changes. These include improved living conditions for vectors of disease pathogens, the possible geographical extension of allergenic plants and animals and influences on food and drinking water.

iii. Besides measures addressing health effects of climate change, attention should be paid to synergies and possible antagonisms between climate change mitigation and air pollution control so as to prevent diseases such as cancer.

iv. Although successful reductions in the levels of several air pollutants were achieved, particulate matter and ozone remain a major environment-related health concern, linked to a loss of life expectancy, acute and chronic respiratory and cardiovascular effects, impaired lung development in children and reduced birth weight.

#### ISSUE 3: GREEN ECONOMY

For a green economy, the following policy options are proposed:

i. Provide additional funds for cross-border collaboration across Member States to improve ambient air quality. Address the synergies, as well as the conflicts, between air quality management and other policy areas such as climate change mitigation.

Establish a coherent policy framework for indoor air policies and support the development of worldwide guidance on indoor air quality.

ii. Adopt a systemic approach to chemicals assessment which, besides addressing and energy use, toxicity and eco-toxicity, should also include material, water a transport, release of emissions as well as waste generation.

iii. Fill knowledge gaps concerning mixture toxicity and the contribution of chemical exposure to the total burden of disease especially cancer.

iv. Involve citizens through education and participation.

v. Improve regulations concerning labelling to provide transparent information for consumers on food and nutrients (nutritional labelling, health claims, clean labelling).

Question 3: What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

In the 'Synthesis report on best practices and lessons learned on the objective and themes' by the Preparatory Committee for March 7th/8th, it stated that 'Political commitment is best measured through legislation Factors such as budgetary allocation, development of institutions and stakeholder participation are strong indicators of political commitment translated into action. Quantitative indicators (such as budgetary allocation and financial support) can be effective.'

i. Stakeholder Involvement: Both because smaller and poorer countries will need to be part of any lasting solution to the global imbalance problem and because corrective action by systemically significant G-20 members will necessarily impose externalities on these states, the G-20 quickly needs to find a credible way of bringing these voices into its deliberations. It could do this either through a constituency based system such as through the use of a bicameral system where the G-20 could be made accountable to a body such as the UN General Assembly.

ii. Civil Society Involvement: At the national level, key strategies for increasing patient empowerment and enabling meaningful patient participation in healthcare and effective self-care. Such empowerment will be an essential element of future healthcare over the next 20 years as health is predicted to shift increasingly towards a home and community environment and towards using eHealth and ICT based solutions for patient- centred chronic disease management.

iii. Implementing Best Practices from Other Member States: New effective preventive strategies are currently available that offer the potential to reduce the morbidity and mortality from this cancer in low- and medium-, as well as high-income countries. Surveillance, including high-quality cancer registries, linked to screening and vaccination registries is essential to track the impact of these prevention strategies and to provide the foundation for advocacy, national policy and global action.

In the Report of the Secretary General, the report stated that 'There is evidence of progress towards convergence between the economic and social pillars, but evidence of convergence between those pillars and the environmental pillar is far more limited and the overall picture is one of divergence; progress to date is also threatened by the series of crises that affected the global economy starting in 2008'.

i. For the policy area "resource efficiency", the following policy options are proposed:

- a. Increase the relevance of resource efficiency, e.g. by proposing a directive on resource efficiency, which could contain quantitative resource efficiency targets and/or provisions for preparing resource efficiency plans.
- b. Provide financing for projects which focus on resource-free ways to satisfy consumer demands, sustainable lifestyles, immaterial services and the efficient use/maintenance of products.
- c. Put more focus on how to cover consumer needs in an immaterial way and on how to provide low-resource consumer services.
- d. Develop the ecosystem services concept further and make use of it when assessing materials, products and processes.

Question 4: What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

#### 1) Focused Measurable Impacts

If spending programmes are to have any measurable impact, they need to be concentrated on selected activities that are identified through strategic planning according to a rigorous set of priorities. The number of priorities should be commensurate with the available budget, as having too many priorities will reduce the chances of achieving impact in any individual area.

If spending programmes are to have any measurable impact, they need to be concentrated on selected activities that are identified through strategic planning according to a rigorous set of priorities. The number of priorities should be commensurate with the available budget, as having too many priorities will reduce the chances of achieving impact in any individual area.

- Developing sharper priorities that are driven by stakeholder expectations and citizens' needs as well as meeting policy goals and high standards of probity; monitoring its activities against not only the aims of each project but also the overall aims of the programme decision;
- Communicating its priorities and actions more crisply to stakeholders, and targeting tailored messages to members of the wider public health community.
- Understanding what is required to deliver this would be facilitated by developing a logic model capable of tracing the precise causal relationships that are anticipated to connect the programme activities to its intended outcomes.'

#### 2) Possible approaches to ensure implementation

i. education of health and finance ministers of countries on the association between healthy populations and GDP growth, on the main health challenges in preventing such good health, and on potential actions within countries, needed to remedy these;

ii. financial incentives by international community,

iii. involving the inactive countries in the design of the call for projects, the call for projects. Their participation will ensure that projects will meet health needs in their country, thus increasing the possibility that local stakeholders will apply for projects;

iv. assisting countries not involved to develop relevant capacity (especially public health capacity) where serious capacity deficiencies are identified; and specifically targeted towards low-GDP countries (for example leadership development in health, or change management courses) could increase the number of participants from low-GDP countries and awareness of the Programme and its activities.

v. organising high-level conferences or technical consultations about Health topics in countries with low participation levels as an instrument to deliver impulses and mobilise country representatives

vi. tackling language barriers which occur in the comprehension of terminology and applying it in the national context;

vii. more involvement of essential stakeholders in countries, e.g. a special initiative to educate and to collaborate with academic institutions and civil society representatives in MS, at which worldwide plans and priorities could be publicised;

---

## European Committee of the Regions (CoR)

93rd plenary session

14 - 15 December 2011

DRAFT OPINION

of the  
Committee of the Regions

CONTRIBUTION OF THE EU'S LOCAL AND REGIONAL AUTHORITIES  
TO THE UN CONFERENCE ON SUSTAINABLE DEVELOPMENT 2012 (RIO+20)

---

Rapporteur: Ilmar Reepalu (SE/PES)  
Member of Malmö Municipal Council

---

Reference document

Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions Rio+20: Towards the green economy and better governance COM(2011) 363 final

I. POLICY RECOMMENDATIONS

## THE COMMITTEE OF THE REGIONS

### A. General remarks

1. welcomes the decision of the UN General Assembly to convene a United Nations Conference on Sustainable Development at the highest possible level in June 2012 in Rio de Janeiro (UNCSD or "Rio+20" Summit), with the objective of securing renewed political commitment for sustainable development, assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major previous summits on sustainable development, and addressing new and emerging challenges. It will do so in the context of two specific themes: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development;

2. calls on all those involved in the Rio +20 conference and its follow-up to ensure the success of the conference and achieve real progress for sustainable development;

3. has emphasised on different occasions the importance of measures and changes to support and develop the work on sustainable development. The CoR is of the opinion that all players – global, within the European Union as well as national, subnational and local governments – have a shared responsibility in creating a sustainable society that is responsive to the natural resources available. The CoR's members, cities and regions, have an important role to play in this and are to a large extent the driving forces in the work devoted to bringing about sustainable development, not least due to their proximity to EU citizens;

4. therefore calls for explicit reference to and empowerment of subnational governments and local authorities<sup>1</sup> in all Rio+20 deliberations. Subnational governments and local authorities need to be actively involved in both in the preparation of, during the Summit and in its follow-up and implementation. Member States are encouraged to establish forums with subnational governments and local authorities for preparing for Rio+20;

5. calls upon the European Council and the European Commission to work out a clear and unified EU position for the UN conference and ensure that the political agreements reached in Rio de Janeiro will also lead to concrete action; declares, in this connection that public involvement, competence and power on a local and regional level is a basic precondition for a sustainable society. In order to support this, the principles of subsidiarity and proportionality must be respected and developed between all layers of governance, from the global via the European Union's planning and decision-making process to the national and sub-national levels. Subnational governments and local authorities must be recognised fully adequate partners in the efforts for a sustainable development, both when preparing for the UN conference and when implementing its results;

6. calls for explicit recognition by the Rio+20 Summit of urbanisation as one key emerging challenge the world needs to address. Urbanisation is of particular relevance to subnational governments and local authorities, as they are at the forefront of dealing with the challenges and opportunities it poses. Since the beginning of this century the majority of the world's 6 billion people live in cities. World population may rise from the current 6 to 9 billion people by 2050 and some scenarios predict that 60 per cent of this population will live in cities by 2030. This trend is especially apparent in developing countries or countries in rapid transition. Sustainable urban development requires a holistic and integrated approach to managing economic, environmental and socio-cultural dimensions of development within a spatial and physical framework. The CoR recommends stronger efforts to develop and support sustainable urban development;

7. emphasises that 'sustainable development' is based on social, environmental and economic factors being in harmony and that combating poverty and social exclusion must be just as much a key concern of the Rio+20 conference as conserving resources, combating climate change and other goals of environmental policy;

8. would like to see greater efforts to produce, evaluate, present and disseminate good examples of sustainable urban development. There is a substantial demand for the exchange of experience and a transfer of knowledge, concerning both institutional factors and a holistic and integrated system approach in the planning and decision-making processes. Good urban governance, spatial planning, systems for land management, legislation and policies, financing, public and private cooperation, public participation, education, training and information are all areas in which there is a significant need for the exchange of experience and transfer of knowledge between cities and regions on a global scale;

9. wishes to emphasise how important it is to focus on and develop the connections and the interaction between cities and their surroundings. A growing population in cities results in heavy demands on production and supply of goods, for example foodstuffs, as well as the accompanying management of waste products and refuse. A concrete example of the need for greater cooperation between cities and their surroundings is the management of biological waste, where functioning systems are needed for the return of plant nutrients to agricultural land in order for the biological ecocycle to work within a closed loop;

10. believes that education, training and dissemination of information are of crucial importance to increase public awareness. The development of learning programmes is especially important for the transition that is needed, including not only technical knowledge on specific aspects, but also on a holistic and integrated system approach;

11. wishes to point out that many of the challenges and concrete measures facing the international community in its work on creating sustainable development cannot solely be solved by new technology and increased financial investment. Measures are also needed to build knowledge in order to adapt and change people's behaviour, consumption patterns, etc.;

12. stresses that both traditional and social media are particularly important in this regard. Measures should be taken to support the development of these media as tools for exchanging information, mobilising people, linking up initiatives and creating critical public groups, thus promoting a sustainable society;

13. underlines that one of the tools used in the efforts to achieve a sustainable society is the town twinning. Many twinning projects are already in place or are being established on local and regional level. A number of players are involved in this processes on both a national scale, within the European Union and internationally. Twinning is an especially effective tool when it has tangible content, aims to be sustainable and involves national governments and local authorities in a north – south perspective. The CoR believes that further efforts are required, to coordinate existing efforts and to improve the evaluation and dissemination of experience;

### B. Enabling the transition to a green economy

14. wishes to point out that sustainable development with the three dimensions economy, ecology and social constitutes the basis for growth, more job opportunities, a green economy, greater prosperity and a cleaner and healthier environment; 15. notes that the current economic system is outstripping the planet's capacities when it comes to the sustainable use of resources and that, increasingly, the European Union is becoming an importer of fossil fuels and raw materials. So me of these are of strategic importance for the present and future of the EU but may run short in future decades. This makes an economic shift towards a mode of development that is more sustainable and more responsive to these resources imperative;

16. expressly stresses that the transition to a more sustainable pattern of development does not only represent a problem but, on the contrary, offers a whole series of opportunities particularly when environmental improvement and the generation of economic and social value added are considered in terms of potential synergy. The opportunities must be made use of through appropriate measures in the fields of economic policy, education and social change;

17. concludes that under the current financial conditions in the European Union and internationally, efforts should be made to achieve a sustainable economy and create sustainable employment conditions;

18. recommends that the Rio+20 Summit delivers a new alternative model to measure growth and welfare beyond GDP. This is necessary in order to re-orient the debates on policies and achieve fundamental change in the way 'progress' is understood. Indicators are needed that take into account climate change, biodiversity, resource efficiency and social inclusion;

19. is convinced that the EU in particular can play an important role at the UN conference if it can go there itself with a good example: its bargaining position would be strengthened if it set itself ambitious goals on the road towards a 'green economy', for example in the areas covered by the Europe 2020 Strategy Flagship Initiative "A resource-efficient Europe";

20. supports the proposal of the European Commission that the Rio+20 Summit should adopt a green economy roadmap that sets targets and appropriate indicators, formulates both direct international action and a clear framework for global, EU level, national and local initiatives, and includes as well as a timeline for their implementation;

21. believes that the roadmap should include a specific section on Green Local Economy, which recognises the key role played by subnational governments and local authorities in the transition to a green economy. This section should in particular address the major challenges of urbanisation and green urban economy, promote an international Covenant of Mayors and Regions, and support decentralised cooperation for development by subnational governments and local authorities;

22. requests that the many successful cases of subnational governments and local governments promoting a green economy should be included in the Rio+20 green economy toolbox that is proposed by the European Commission;

23. recalls the important role and many activities of the local and regional tiers in the area of development aid and decentralised cooperation in close cooperation between the CoR, its members and the EU Commission, such as the CoR's "Atlas", the web portal and the so-called "Assises of decentralised cooperation";

24. would like to see measures on a global level to support the development of an environmentdriven business sector, which could be brought about by:

- supporting the development of green technology and green solutions, among other ways through increased investments in R&D, including investment that, by applying the ecosystem service approach, aims to contribute towards protecting biodiversity and (re)developing ecosystems while simultaneously generating new economic opportunities,
- implementing measures to facilitate the export and import of green products and services on a global level and promoting smart work,
- imposing environmental, climate and ethical demands in connection with public
- encouraging the development of industrial ecology and the circular economy (from cradle to cradle), which aims to close production and consumption cycles, thus placing the materials necessary for these processes within a closed loop, in order to minimise the extraction of natural non-renewable resources,
- developing and implementing methods for functional procurement,
- coordinating and developing models for the environmental certification of goods and services produced by companies by means of comparative life-cycle analyses for goods and services, etc.,
- coordinating and developing models for environmental management systems for companies and organisations, by means of environmental accounting for instance, and
- producing new models for the financing of green solutions and green companies;

25. reiterates that one of the key challenges today is to radically reduce our climate impact, both at global and local level, while at the same time securing energy supplies and ensuring prosperity. Municipalities and regions have major roles in this process. Cities and regions in the European Union are assuming responsibility for a broad range of initiatives aimed at reducing climate impact, securing energy supplies and adapting to climate changes. The Cancun agreements, adopted in December 2010, recognise local governments as governmental stakeholders and open access to international financing mechanisms for cities. Subnational and local governments need to be actively involved in national climate action plans and expect access to financial support;

26. emphasises that measures must be taken to protect, secure and redevelop key resources, materials and natural capital. In particular, the CoR would like the Rio+20 Summit to place a special focus on water. Access to water is a rapidly growing problem and a major challenge, especially for big cities. The CoR therefore supports the establishment of an international partnership on water to tackle this problem and refers in this connection to its recommendations on the role of local and regional authorities in promoting sustainable water management (Opinion CdR 5/2011 fin);

27. emphasises the need to improve the governance and the protection of the marine environment and oceans and consider that it becomes one of the key pillars of the Rio Framework, aside climate and biodiversity;

28. highlights the European Commission's comment that "the sustainable use of land and agriculture will be a cornerstone of the green economy", and therefore takes the view that sustainable urban development and spatial planning mean minimising the extent to which productive agricultural land is built on in such a way that it cannot be used for farming in the future;

29. believes that to enable the transition to a global green economy, large-scale financial resources have to be mobilised. Taxation and pricing should better reflect environmental costs and benefits. The CoR reiterates its calls for mainstreaming the polluter pays principle for a series of specific and tightly scheduled steps for eliminating all environmentally harmful subsidies by 2020. This would free up extra funds for other activities. In addition, reduction targets and efficiency standards like those which have been developed in the EU for a range of products and processes should be applied at international level;

#### C. The institutional framework – towards better governance

31. recommends a transformation of the United Nations Environmental Program (UNEP) into a World Environment Organisation (WEO). Transforming UNEP into a UN Specialised Agency would create a global multilateral environmental organisation, as the most promising way forward to improve international environmental governance. It should have a revised and strengthened mandate and operate on an equal footing with other UN specialised agencies. Moreover, it should include an implementation arm, decentralised at regional or national level, and aimed at providing countries, subnational governments and local authorities with more direct support on effective implementation of Multilateral Environmental Agreements, such as on climate change or biodiversity;

32. also recommends the creation of a Sustainable Development Council (SDC) instead of the existing Commission for Sustainable Development (CSD). The aim of this proposal is to achieve better governance, a common view and coordination in the work on sustainable development on all levels;

33. supports the development of Sustainable Development Goals (SDG), in particular those with a long-term perspective, following the example of the Millennium Development Goals. A broad political commitment based on common goals should be then broken down into a set of specific and concrete targets and ways of measuring them;

34. insists that the Rio+20 Summit recognises that governance needs to include all government levels, from the local and the subnational, via the national and regional, to the global. Rio+20 should subscribe to a consequent multilevel governance approach, based on interaction, synergy and complementarities between all governance levels;

35. draws attention to the fact that within the Rio Conventions, subnational governments and local authorities have recently been given increased recognition of their special status as governmental institutions, including for example their recognition as "governmental stakeholders" in the Cancun Agreement, and Decision X/22 of COP 10 CBD

"Plan of Action for Subnational Governments, Cities and Other Local Authorities". The CoR was an active supporter of these developments;

36. requests that subnational governments and local authorities need to have a place in the institutional framework for sustainable development alongside national governments and UN entities. The CoR deplores that in the current international governance architecture, despite their specific role in governance, their representation at UN bodies is often putting them on the same level as civil society and business as other major groups;

37. suggests in this regard that the Rio+20 Summit mandates UNEP (or the future World Environment Organisation), or the Sustainable Development Council (SDS) to create a standing committee for subnational and local governments as a new structure that adequately reflects multilevel governance and offers a permanent mechanism of consultation of and cooperation with subnational governments and local authorities across the world. The Committee of the Regions could serve as a model in this respect;

38. recognises that responsibilities and roles of the subnational and local levels differs widely, both within the European Union and globally and local and regional self-governance is constantly developing. It is therefore necessary to bear these differences in mind when trying to involve local and regional governments as closely as possible in the processes of developing sustainable societies;

39. wishes to stress the importance of common views and coordination to be developed in the work for sustainable development on a global level. In this process, cities and regions are principal players. An important platform for coordination and exchanging experience is the Covenant of Mayors;

40. stresses that the emphasis of the European Commission on the private sector should not divert attention from the need for the Rio+20 Summit, the EU and Member States to promote sustainable development governance at the level of subnational and local public authorities, including the empowerment of citizens;

41. wishes to emphasise the importance of making citizens the focal point in working towards a sustainable society. Therefore the goals and measures of this process need to be adapted to different regional and local situations. The dialogue concerning both physical and financial measures as well as changes in consumption and behaviour must be based on the existing conditions at regional and local levels. Action is required to support the direct participation of citizens in working for a sustainable society, such as

- developing consultative processes and creating meeting places for dialogue and the exchange of experience,
- supporting regional and local development projects, both nationally and internationally, and
- raising the level of knowledge and insight concerning the need for joint efforts to achieve a sustainable society;

42. would like to see the Rio+20 Summit to support the promotion of environmental democracy globally. This could be done by the Aarhus Parties reiterating at Rio+20 their willingness to open the Convention to the whole world, but also in other ways – for example by supporting the introduction of other regional conventions like the Aarhus one, or initiating negotiations on a global Convention on Principle 10 of the Rio Declaration;

43. would like to see a development and revival of the Agenda 21 work. Rio+20 should define the future governance frameworks necessary to further develop Local Agenda 21 in this respect. The local Agenda 21, which was initiated after the Rio Summit in 1992, is a good example of a grass-roots process that has produced good and lasting results in the form of both concrete measures and greater insight into, and increased involvement in, sustainability issues among society's players. The insight and participation of citizens is the basis of the local Agenda 21. In many cases local Agenda 21 work has lead to new green jobs;

44. would like to see in particular better knowledge support to the regional and local levels. In order for the work for a sustainable society to be effective, all players need an accessible planning and decision-making basis. This is also important in connection with follow-up, evaluation and feed-back of the results and experience gained in the work for a sustainable society;

45. expects that the Commission in its continued work in preparation for the Rio+20 Summit will develop and strengthen the dialogue with the CoR and its members. The CoR hopes that the EU delegation to the Rio+20 Summit will include an appropriate number of delegates from the CoR.

## European Environmental Bureau (EEB)

UNITED NATIONS CONFERENCE ON ENVIRONMENT AND DEVELOPMENT (RIO+20)

Rio de Janeiro, June 2012

Submission by the European Environmental Bureau to the 'zero draft' of the outcome document

### Introduction

The European Environmental Bureau (EEB) is the largest federation of environmental organizations in Europe. It comprises more than 140 environmental groups from almost 30 countries in Europe with a combined membership of some 15 million environmentally concerned citizens. The EEB seeks to promote sustainable development, participatory democracy and environmental justice.

The Rio+20 Conference provides a crucial opportunity to renew the global commitment to sustainable development at a time when many governments are deeply preoccupied with the tackling economic problems.

A starting point for any negotiation at UNCSD should be that much has already been achieved internationally in terms of agreed targets and plans, but that just as much remains in terms of implementation. For example, the Rio Conventions on climate, biodiversity and desertification, as well as Agenda 21 and the outcome of various UN summits on e.g. social development (Copenhagen 1995), women (Beijing, 1995), and financing for development (Monterrey, 2002), all include proposals for sustainable development that are more or less just as valid today as when agreed. For Rio+20 to be successful, improved implementation should be a focal point for deliberations and agreements and in particular developed countries should commit to strengthened implementation and support. UNCSD should reaffirm already agreed principles, such as those in the 1992 Rio Declaration, but even more so, agree on how to realise what has been agreed. In doing so, the greening of the economy, new institutions and treaties should be put at the forefront of any outcome.

### Green economy

The Rio Conference should adopt an approach to greening the economy based on full respect for ecological constraints. Developed nations and emerging economies in particular should commit to adapting their societies so as to live within those constraints so as to allow the less developed nations the possibility to realise their legitimate aspirations to developing their societies.

We generally support UNEP's definition of a green economy as one that "results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities" and consider it key to underline reduction of problems to within planetary boundaries without neglecting or sidelining poverty eradication and equity.

The green economy should not be regarded as a green part of the total economy. Rather entire economies need to be 'greened'. The natural environment provides the basis for all life and thus for all economic and social activity. It is therefore dangerous to regard the environmental, social and economic aspects of sustainable development as more or less equal 'pillars' between which compromises must be struck. All three aspects are important and furthermore interrelated but without fulfilling certain environmental goals, namely those related to staying within planetary boundaries and avoiding the triggering of ecological tipping points, it will be impossible to reach other important goals in the social and economic pillars. The economy should rightly be seen as a circle within the social circle, in its turn within the ecological circle.

A truly green economy implies the use of new ways of measuring success in economic development in which the quality of life and related parameters, rather than GDP, play the dominant role.

Advances in science mean that sustainability can increasingly be quantified. We begin to be able to assess the quantity of resources that can be taken from the environment, and the quantity of outputs (emissions, wastes etc) that can be absorbed by the environment, on an indefinite and ongoing basis. With this knowledge, and with an ethical framework based on the principles of sustainability and equity, we are able to develop the concept of each person's entitlement in principle to consume and to emit those resources for which there is a planetary limit. This concept should, as a starting point, guide our understanding of sustainable development and the green economy. It implies that in the developed world we do not only need to promote resource efficiency, but also to achieve absolute and in some cases substantial reductions in our use of scarce resources. The notion that the green economy is one in which we accelerate our way beyond ecological constraints through innovation is attractive but not necessarily entirely valid, even though we do not exclude such win-win outcomes from innovation.

The science of sustainability also requires us to address the issue of projected population levels and to promote policies with a view to ensuring that eventually, in order to ensure a better quality of life for future generations and with full respect for human rights, human population levels do not exceed the carrying capacity of the Earth.

Most governments strive for economic growth while at the same time professing to believe in the concept of sustainable development. However, the assumption that economic growth can be sustained at the same time as the human population moves to living within ecological constraints and poverty is eradicated seems to be based on ideology or wishful thinking rather than on science. It is true that the wise application of increased wealth can result in the reduction of ecologically destructive impacts. However, empirical evidence suggests that this rarely happens, at least not automatically, and that periods of economic growth are often accompanied (for example) by increased consumption of resources and increases in polluting emissions. This is not to argue against economic growth per se (indeed, the alleviation of poverty, which is a key priority, often depends on economic growth), but rather to argue that the kind of growth that has occurred in the developed world to date is not compatible with living within environmental limits and therefore not with sustainable development. On the other hand, the transition to sustainable development might result in increased economic growth, but if so growth is neither the desirable objective nor the means for accomplishing such a change, merely an outcome of less value than other welfare-related parameters. The important thing is not whether the economy grows or not, but rather that economic incentives and institutions develop in a way that promotes transition to sustainable development.

Many instruments already exist which contribute to greening economies, though in many cases these are not sufficiently robust and need to be strengthened. Experience shows that legally binding approaches tend to be more effective than voluntary approaches. Despite this, pressure from commercial interests has led to deregulation or has prevented the introduction of further regulation where there is a demonstrable need for it. Apart from having negative consequences for the environment, this tendency tends to penalise the progressive parts of industry. The right kind of regulation can provide confidence for green investment and stimulate the creation of green jobs.

The EEB regards two broad strategies as central to greening the economy, in particular in developed countries, namely phasing out environmentally hazardous subsidies and imposing internalising environmental taxes, preferably within the framework of a green tax reform which could amount to some ten percent of developed nations' tax base within a decade.

Considering primarily developing nations, nearly a billion people in the world are starving and about 1.4 billion are living without access to electricity. The green economy must provide measures to guarantee food security, the right to clean water and access to electricity without jeopardizing the planetary boundaries. It is urgently needed to reform agricultural policies, stimulating a development away from resource intensive, in some cases heavily subsidised, agriculture, while facilitating sustainable agricultural and agro-ecological practices. The world's many smallholder farmers need access to appropriate resources and fair markets.

In many parts of the world, energy consumption must decrease (definitely that based on fossil and nuclear fuels) and there is a great potential for energy savings and for improved efficiency due to technological innovation. A green economy must grasp these opportunities and set signals securing definite energy reductions, while supporting the poor parts of the world with more electricity. It is very unlikely that poverty will be combated successfully without proper access to electricity for poor people. Access to clean energy for all will require large amounts of financial transfers in the form of grants.

Taking into account the effectiveness of legally binding measures, the Rio+20 Conference should result in commitments to the development of a number of legally binding instruments:

- At national level, mechanisms such as environmental impact assessment and strategic environmental assessment have proven to be valuable in ensuring that environmental factors are taken into account in the process of development. The Conference should launch negotiations towards an international treaty on environmental assessment, embracing decision-making at both the strategic and project levels.
- The emergence of new technologies posing new threats to health and environment justifies the introduction of a new treaty on technology assessment, based on the precautionary principle.
- An agreement to phase out environmentally hazardous – in particular fossil and nuclear fuel – subsidies is needed.
- An agreement on setting up environmentally effective and socially friendly fiscal incentives, in particular in terms of environmental taxes should be introduced.
- An agreement on mobilising and operationalising a wide-range of innovative sources of finance for eco-social development is also needed.

#### Institutional framework for sustainable development

The institutional framework for sustainable development needs to be strengthened at all levels: international, regional, national and local.

At international level, the status of UNEP should be upgraded to that of an international organization equivalent to, for example, the International Labour Organization or the World Health Organization. The mandate of the UN Economic and Social Committee should be revised to reflect the overarching goal of sustainable development. The international financial institutions should be obliged to report to it on their activities. International environmental treaties should in general be made superior to e.g. trade treaties.

Multilateral financing bodies, such as the World Bank, as well as international trade law, investment policies and bilateral investment treaties, should be reshaped to make trade and investments work for sustainable development, including human rights, social equity and protection of natural resources.

To implement the possible Rio +20 outcomes, sufficient finance, technology and related capacity building will be needed. The principle of common but differentiated responsibilities should be acknowledged and for many developing countries support from other countries is a prerequisite. To cover the financial need, there is a need to develop and operationalise new innovative financial mechanisms.

The Rio+20 Conference should be used to strengthen the legal framework for sustainable development at the international level with respect to a number of specific areas, including the seas and oceans and the field of chemicals:

- Even seas that are within national jurisdictions do not enjoy adequate legal protection, but the situation is much worse with respect to the high seas and oceans beyond national jurisdiction, where no appropriate legal framework has ever been designed to guarantee their protection from human activities. In 1992, heads of state and governments put high on the agenda two crucial environmental global challenges: climate and biodiversity. 20 years after the Earth Summit, a new deal for the seas and the oceans should be sealed. Such a treaty could regulate access to marine genetic resources.
- A new international treaty on chemicals built on, in particular, the Strategic Approach to Integrated Chemicals Management (SAICM), Agenda 21 (chapter 21), and the Basel, Rotterdam and Stockholm conventions, needs to be established. Such a treaty should establish a clear phase out objective for all hazardous substances, in particular substances of very high concern (SVHC). Furthermore, an automatic export and import ban for all SVHC identified is needed. A differentiated timeline for developing countries may be established if necessary on these points. However, mandatory obligations for all countries are needed to share the chemicals data with third countries. Moreover, any new agreement should recognise and meet the challenges following from exposure to cocktails of chemicals and should place vulnerable groups, not least children, in the focus and design protective measures for such groups. One function of strengthened global environment institutions could be to establish a UN-based International Chemicals Inspection Agency, to facilitate and implement any global chemicals regulation. Green chemistry should be an integral part in the discussions on transforming the world economic system into a "green economy".
- We call for the establishment of an intergovernmental negotiating committee to create a framework convention on corporate environmental and social responsibility (CSR) for the accountability of corporate investments for all companies listed on stock exchanges worldwide and take into account the ISO 26000 standard on corporate accountability.

At national and sub-national levels, sustainable development governance is enhanced by national councils for sustainable development. The Rio+20 Conference should promote the establishment of such councils where they do not exist. Where they do exist, they should be adequately resourced and should be afforded sufficient status to ensure that they have a meaningful influence on government policy. The Conference should also promote the institution of ombudsperson for sustainable development. This is a valuable model which should be applied more widely.

The Rio +20 Conference should also agree on an ambitious work program to operationalise additional innovative sources of finance needed to meet the financing requirements for sustainable development.

#### Engaging and empowering civil society

One issue that is linked to both of the major themes of the Conference, namely the green economy and the institutional framework for sustainable development, is the key role

that civil society can and must play in promoting sustainable development. A true greening of the economy cannot take place without the basic mechanisms for democratic governance being in place. Similarly, an institutional framework that supports sustainable development must be transparent and allow for participation of the public through democratic governance structures.

This principle is widely recognised and received global endorsement in 1992 with the adoption of Principle 10 of the Rio Declaration on Environment and Development. However, more than 19 years since the adoption of Principle 10, its implementation remains uneven at best. The most significant progress has been made in Europe and Central Asia where 44 States are Parties to the Aarhus Convention. The adoption in 2010 of guidelines on Principle 10 under the auspices of UNEP was also an important step forward, despite their non-binding nature.

Governance needs to be made more transparent and participatory at all levels. At national and sub-national levels, this should be achieved by development of a global treaty on environmental democracy guaranteeing public rights to information, participation and justice, building on the 2010 UNEP Guidelines and drawing on the example of the Aarhus Convention.

As regards civil society participation in international processes, this should be strengthened through the development and adoption of a set of global guidelines establishing recommending minimum standards for civil society participation in international decision-making processes related to sustainable development. Such guidelines could draw on relevant instruments such as the Almaty Guidelines adopted under the Aarhus Convention.

The Rio+20 Conference should launch negotiating processes for both of these instruments, with a view to their adoption by 2016.

In addition, the Conference should encouraged interested States to accede to the Aarhus Convention or to develop similar regional conventions.

1 November 2011

## European Population Alliance

Population Growth: the Neglected 'Green' Issue

A Text for Rio+20

"Population stabilization should be a priority for sustainable development": Kofi Annan, former UN Secretary-General. (Key Recommendation of GHF 2009).

"Either we reduce our numbers voluntarily, or nature will do it for us brutally": Maurice Strong, Secretary-General first Earth Summit, Rio, 1992.

"It's no use reducing your footprint if you keep increasing the number of feet": popular saying.

### 1. Population Growth as a Multiplier of all Other Environmental Problems:

Each additional person: needs more food, water, energy, land, timber and minerals; and produces more waste, CO<sub>2</sub> and pollution; the rich consuming and polluting more than the poor. Thus rising populations: increase soil exhaustion, erosion, desertification, habitat destruction, deforestation, aquifer depletion, CO<sub>2</sub> emissions, sea level rise, climate change and chemical pollution; and reduce the finite and dwindling natural resources available per person, increasing long term poverty. Thus all environmental, and most economic problems become harder, and ultimately impossible, to solve with ever more people. Population stabilisation is a necessary, but not sufficient, condition for sustainability.

### 2. The 'Sustainable Development Goal':

Impact (on the environment) = Population x Affluence (resource consumption) x Technology – the 'IPAT' function. Thus long-term biophysical sustainability requires: improved technology, giving greater resource efficiency; and reduced resource-consumption by the rich; and stable or reducing populations. Smaller populations can sustainably consume more resources per person than larger ones, while remaining within the biophysical limits of a finite planet; and indefinite growth being physically impossible, it is certain that population growth will end in any case at some point. This can only happen: either (preferably) sooner by fewer births; or later by more deaths, overwhelming any attempt at a 'Green Economy'.

### 3. Population Growth as a Variable, not a 'Given':

As the global population passes 7 billion in 2011, its growth (at 80 million per year, 10,000 per hour) is clearly a driver of all thenew and emerging challenges. The UN nowproject the population for 2050 between 8.1 and 10.6 billion – a range of 2.5 billion, or the Earth's entire population in 1950. Clearly sustainable prosperity will be far easier to achieve, the nearer to 8.1 bn the population stabilizes. This will need priority, and resources: in developing countries for non-coercive family planning and women's education and empowerment programmes; in developed countries for public information programmes/incentives, aiming to balance reproductive rights with social and environmental responsibilities to current and future generations.

### 4. Resources for Family Planning:

There are currently 215 million women (and rising) with an unmet need for family planning (FP). Total world aid for FP is only 10% of the Goldman Sachs bonus pot – a derisory figure. EU aid for FP is 0.4% of total EU aid. Priority for FP is low, partly because the 'population' problem has in recent years been marginalised as one largely of sexual and reproductive health and women's rights; whereas in reality it affects the long-term prospects of success for all programmesacross all Departments. Some 40% of all pregnancies world-wide remain unintended. The cost of meeting the unmet need for FP, some \$6.7 bn per year, is less than Americans spend on Halloween.

### 5. Action at Rio+20 - a draft Text:

Ignoring the population multiplier guarantees ultimate failure for all sustainable development initiatives, since ever-rising populations will overwhelm any development gains. To address this, the following draft text for Rio is proposed:

[The Conference]

Recognises: that all population growth, especially in developed countries, increases impacts on the environment, and reduces the natural resources available per person; that population stabilization in all countries is therefore a necessary condition of biophysical sustainability; that prospects for sustainable development will thus improve, the sooner population can be stabilized within ecologically sustainable limits; and that this can best be achieved by non-coercive population stabilization/reduction policies in all countries, comprising the provision of family planning and women's education and empowerment programmes to meet all unmet need for contraception, and the promotion of a cultural shift in favour of smaller families;

Calls on:

- All Governments to give priority to the introduction, promotion and resourcing of such programmes;
- All Governments to implement a programme of assessment and evaluation, both of their resources relevant to the well-being of their people, and of the impact of population growth on it;
- Donor countries to give priority to support of these programmes.

## European Students' Forum (AEGEE)

European Students' Forum

Contribution to the Outcome Document

United Nations Conference on Sustainable Development 2012

November 1, 2011

Focus and scope of the input to the Outcome Document

AEGEE - Europe focuses its input on the shaping of a green economy and sustainable lifestyles. This document deals with a set of practical actions judged as required for a timely transition to a sustainable future for the planet Earth and its future generations. A variety of actors are involved in this process. These actors interact in a network structure. Below both actions and structure are treated and a number of interventions are recommended.

Networked Institutions: inter-disciplinary, inter-ministerial, and inclusive decision-making

Several inputs to the Outcome Document have asked for a better focus other than the 'Institutional framework' for sustainable development, which is argued to be overly general or unclear. We propose to focus on the decision-making tools and approach used within and across the institutional spheres of government, industry, university, and civil society. Regardless of the different institutional functions they have, there are common grounds for reforming their decision-making. This has implications in terms of network structure within and across these institutions.

The process of deciding on future actions shall encompass the three pillars of sustainable development: economic, social and environmental sustainability. Accordingly, the indicators used to support decision-making need to include these three dimensions. For instance, 'Green Public Procurement' is developing new indicators to include environmental sustainability in the public procurement processes. These types of integrated measurements shall be diffused to other institutions and settings. Any organization specializing in such activities has a profitable advantage to exploit. Yet, in order for these measurement and practices to be widely diffused, the networks across different institutional spheres should be increasingly integrated in order to share practices and knowledge on the development and use of such indicators.

Decision-making shall become increasingly networked. Collaboration and integration of knowledge perspectives are key to a knowledge-based world. This is because no single actors may have full access to necessary knowledge and resources for decision-making and implementation of programmes and actions. The three pillars of sustainable development are inherently different from a knowledge and socio-cultural perspective. These perspectives need to be integrated. Therefore decision apparatuses shall become more horizontal, inter-disciplinary, inter-ministerial, and inclusive of multiple stakeholders.

How to enable these decisions on structural changes? Network analyses of decision-making relations should be increasingly adopted to foster more agile structures where information flows and decisions are taken more efficiently. This is all about surveying and visualizing networks within and across different institutions, so that interventions to increase the agility of these networks can be implemented. Network science and analytic tools are readily accessible and well developed for practical use.

Connecting the disconnect between Youth Organizations and Companies

"Youth will be one of my topmost priority in my second term as Secretary General for the next five years" (UN Secretary General, 2011).

More than 50% of the world's population is constituted by young people under the age of 30. This includes the current and future youth. More than a quarter of the world's population is aged 10 to 24 and accounts for 1.8 billion people (UNFPA 2011). Most of this young population is concentrated in developing countries.

Policy-makers and civil society argue, to a different extent, that youth shall be the "latest engine" of a green economy and active citizenship. Yet, young people at large currently play a marginal role in the building of a green economy.

Youth are daily users of a range of products and services in developed as well as developing countries accounting for a large share of the so-called "bottom of the pyramid". The user role co-evolves with lifestyles which are one of the key drivers of current societies and economies. A green economy shall be built upon green lifestyles co-mingling with new patterns of product design and use. Young people are carriers of new lifestyles. They are able to think out of the box. They can be a source of innovation for establishing greener lifestyles and impulsing the transition to a green economy.

The user experience, flexibility and creativity of young people may turn out to be a widely accessible resource to capitalize on. Youth organizations are increasingly interconnected worldwide and often tied to universities and public organizations locally. To different extents, they are also naturally connected with other organizations within the civil society. Yet, there is still a key disconnect between youth organizations and producers.

Youth organizations may collaborate with companies adhering to the UN Global Compact and the World Business Council for Sustainable Development in order to identify new ways of using or adapting their products and services, and green needs these companies could satisfy. Networks of collaborations need to be established and backed with institutional support at the international, national and local level in order to provide legitimacy to their activities. The overall outcome is the collaborative shaping of new patterns of production and use, and the education of future generations to establish a greener society and economy.

Training and incubation of social entrepreneurship and youth-led sustainable development are increasingly available within youth organizations and other civil society. Some initiatives are also backed with the support of companies which recognize the potential of youth and their ideas. These trends need to be recognized and increasingly supported by International Organizations within the UN system and beyond. This institutionalization may generate further public and private funding of such kind of activities, and a higher connectivity among youth organizations and companies. Overall, the above considerations show a potential to be unleashed: the link between innovation and youth employment in the shaping of green economy and lifestyles.

#### Economic and tax-based incentives

A system of economic and taxation-based incentives shall be created to support the transition to a green economy. This system is to be linked to both production and consumption patterns. Its first aim is to foster greater adoption of clean technologies, products, and services by making them more economically convenient vis-à-vis competing ones. Its second aim is to foster cleaner production by making 'environmental dumping' and carbon emissions expensive. The system could use an adaptive system that adjusts the levels of taxes and incentives by covering most of the budget required for the incentives via the environmental tax revenues.

This system would be highly beneficial on the market, as it would make environmental friendly products spread more easily among consumers. A deregulated market can only play a limited role in supporting the green economic revolution, if not adequately supported by an innovative fiscal system: even in the most advanced societies, early adopters account for a limited market share, and significant effects on the environment can be achieved only when the masses adopt the innovative and more environmental friendly solutions. The system would also have a beneficial effect on the production system, as it would cause a race among companies to continue technological innovation, to raise occupation in R&D and to increase efficiency and environmental compatibility of products, thus not waiting for the market to adjust to the available supply, but continuously driving innovation in a virtuous cycle.

Certainly these measures are difficult to be set up. This is due to the tensions between environmentally-friendly incentives and free economic competition both on the consumption and production sides. These tensions are linked upstream to international trade and Foreign Direct Investments (FDI) flows and need to be fixed. This will result in increasing case-based law feeding the transition to green regulatory settings at the local, national and international levels. It is necessary for WTO law to move forward from the status quo.

#### Carbon tax

A carbon tax would be part of the needed policies, to implement worldwide, to readjust the panel of energy resources, and to internalize the environmental effects of production cycles. This becomes even more urgent given the on-going degradation of environmental conditions, and the need to act quickly on the market to rebalance the panel of resources used in energy production and other production cycles. Besides, a carbon tax, together with the system of incentives described above, would reduce the consumption of new materials, and support an efficient system of reuse and recycling, reducing the need for landfills and the contamination of adjacent land and water resources.

#### Reduction of greenhouse gas emissions

It is necessary to define the imposed reductions in Greenhouse Gas Emissions and to respect such a plan. A plan for reducing greenhouse gas emissions should be architected, including a timeline with intermediate steps and a system of enforcement that are applied to countries that do not comply with this regulation.

#### Energy efficiency

A strategically important field includes the definition of standards for energy efficiency. It is necessary to define a system of legally-binding standards for energy efficiency in all fields: energy production and consumption, production cycles, heating and air conditioning, consumers' appliances, insulation of buildings, transportation, etc. Technologies that do not comply with the energy efficiency standards should be banned from the market. Energy efficiency standard should be revised no later than every 3 years to define the following steps and deadlines.

#### Sustainable transportation

Transportation on average accounts for one third of energy consumption and pollutant emissions worldwide, and is responsible for severe health damages to the world's population. We ask to the current leaders a strong commitment to reorganize the transportation sector, and set up the basis for the long term investments that will ensure rebalancing the mode share for short and long distance travel, reducing the prevalence of private vehicles and other polluting means of transportation. To do this, we ask a strong commitment to give priority and to support the development of public transportation systems and reduce accessibility to destinations by cars. A possible way of financing the required investments in this sector would be the introduction of an "environmental fee", which could be set at 0.05\$/liter which would be charged in every country, and that would generate significant revenues to be used entirely to finance investments in public transportation.

#### Education

An important role is associated with the definition of education programmes, to develop an environmentally-driven culture, and to understand that the creation of a better future, first of all, goes through the respect for the environment. These programmes need to be coupled with investments in the green economy. Further education, both formal and non-formal, should develop on the links between lifestyles, environmental protection, poverty eradication, and economic development.

#### Support to research and development

It necessary to prioritize funding for R&D aimed at advancing science and technology to the benefit of the three pillars of sustainable development. Research on systems (e.g. city, transportation, water cycle system etc.) should be increasingly funded, requiring higher inter-disciplinarity, coherently with the institutional structure proposed above.

## European Youth Forum

European Youth Forum  
Contribution to Outcome Document

United Nations Conference on Sustainable Development 2012

### Introduction

The United Nations Conference on Sustainable Development, known as "Rio+20" as it comes 20 years after the 1992 "Earth Summit", will be profoundly significant for young people. During this conference world leaders are expected to renew a political commitment to sustainable development, assess the progress made to date in sustainable development policies and make profound, binding decisions to address new and emerging challenges that threaten the progress and development of young people and future generations. The conference will aim to overcome the often disconnected but equally important dimensions of sustainable development: social, environmental and economic sustainability. A coherent and interlinked strategy is needed in order to make real progress.

Current and previous generations have put our future at risk. Concerted and cross-cutting action is required in the name of inter-generational solidarity, the future prosperity and health of humankind, and the preservation of our bases of living. With this in mind, this resolution will closely analyse the two core themes of the conference, the green economy in the context of sustainable development and poverty reduction; and the institutional framework for sustainable development, and will evaluate them from a youth perspective, and emphasise the need to actively involve youth in the development, adoption, implementation and evaluation of policies at all levels. It will also propose a number of actions that need to be taken to safeguard the economic, social and environmental future of everyone, including the young people of today.

### Green Economy in the Context of Sustainable Development and Poverty Eradication

The importance of the Rio+20 Conference in pushing forward the sustainable development agenda and addressing the shortcomings of the past 20 years is difficult to understate. In the light of the failure of multiple recent summits and major conferences dealing with environmental issues and bearing in mind that – despite the urgency – a "green revolution" on a global level seems unlikely to be achieved in just one 3-days summit, binding agreements must be made in Rio to ensure that young people will be able to live in stable environments in years to come.

A "green" rhetoric and minor financial adjustments to facilitate a moderate increase of investment in renewable energy and technologies that may slow climate change are not enough. The environmental, legal, structural and economic measures decided upon in 2012 must be governed with regard for young and future generations around the globe, rather than aiming to placate the demands of the time in the most moderate way.

The recent global economic crisis has yet again discredited unsustainable economic practices that have little regard for future consequences. Employment opportunities need to be developed in new sustainable industries and technologies. In recent years some work has been done to invest in green entrepreneurship and encourage the growth of sustainable consumption and production patterns. In this regard the work of young people and other actors in changing traditional business paradigms from a simple focus on economic capital to a focus on social and environmental capital should be embraced.

There must also be a new educational focus on sustainable development, recognising the need to instil the sense of common responsibility for our future, enabling change in consumer patterns and thus production patterns and develop international solidarity. Through education for sustainable development, young people in particular can reflect on their role and responsibilities in a global society and on the contribution they can make to social justice.<sup>2</sup> Making this a reality presents a number of economic and political challenges and will require significant institutional restructuring, but it is clear that only major action will be enough to address global economic, environmental and social challenges, such as the increasing social and health impacts of climate change.

Green industries provide an opportunity for job creation and economic growth for both developed and developing countries. In Europe alone, by increasing investment from 18% to 22% of GDP towards green industries, in particular the reorientation of the energy grid towards renewables, a construction boom could be generated that would increase economic growth rates by up to 0.6% a year and create a further 6 million jobs.<sup>3</sup> The move from fossil and other finite energy resources to clean renewables also has huge potential benefits for developing countries. However, it is important to stress that not all forms of renewable energy production are sustainable, especially when related to deforestation, the loss of biodiversity, impacts on food production and security and social exploitation. The European Youth Forum therefore calls for a change in perspectives and major global economic restructuring to accelerate the transition to sustainable and green industries. To do this, governments must continue to develop and adapt the current financing mechanisms to allow for further research, development, technological cooperation and adaption. These industries must remain open to young people and seek to harness the creativity and innovation of a new generation that is more dedicated to attaining sustainable development. There must also be greater exchange and openness with regards to research, policies and practices on sustainable development issues, particularly between industrialised, emerging and developing countries.

### Sustainable resources for All

A key concern of young people is the management of natural resources as current patterns of consumption are jeopardising young people's future, with both the rate of consumption and the distribution of remaining resources giving cause for consternation. Natural resources must be managed in a way that does not compromise future generations' needs. A new framework of sustainable consumption and production patterns needs to be established to ensure equality in access to, and consumption of, resources. The continued depletion of the planet's marine and land ecosystems is unacceptable and directly challenges the development and security of current and future generations. For example, although the rate of deforestation has slowed over the last 10 years, each year an area roughly the size of Costa Rica is still destroyed. Similarly, due to a lack of regulation around 85 percent of fish stocks are exploited or in danger of extinction. Governments and the multilateral negotiations should focus their discussions on green economy, and more specifically on greening growth. Growth will remain the driver of international development, but we need to urgently move towards environmentally sustainable growth patterns to ensure the right to well-being of young and future generations.<sup>6</sup> To address these issues a simultaneous approach is required of involving local communities and youth at grassroots level, enabling them to be actively engaged in sustainable resource management; at the same time the role of international institutions in regulating the consumption of natural resources must be strengthened, also by involving all stakeholders, including youth, in a meaningful way.

### The Right to a Future

One of the core principles of a green economy must be the need to improve social wellbeing through simultaneously achieving greater economic stability and ensuring the fulfilment of human rights, including the right to safe water, thus improving the living conditions of millions of young people globally. Poverty eradication remains a core issue with regards to social wellbeing. The Millennium Development Goals are far from being achieved with around 900 million people still living in extreme poverty, a significant amount of which are children and young people.<sup>8</sup> Economic measures to tackle poverty must shift from simply generating capital that may trickle down to the poorest of society to furthering human development, closing the gap of inequality and creating decent jobs for all.

While it is understandable that a large focus is placed on the environmental and economic aspects of the green economy, only an integrated approach which values human development, in particular social-economic relations in society, will provide global sustainable development.

Climate change in itself is increasingly affecting human wellbeing globally. The warming of the earth's climate threatens to increase heat related mortality, malnutrition and starvation from destroyed crops. It will also rapidly increase desertification, destabilising food security and commodity prices and increase the scarcity of resources. As a result there will most likely be a large increase in the number of environmental migrants as people try to escape the day to day realities of climate change.<sup>9</sup> Without agreement on appropriate mitigation measures, environmental and economic migration risk leading to social conflicts, civil unrest and has a high potential to destabilise already fragile states.. This can be prevented by developing coherent and comprehensive strategies implemented at all levels and which include all relevant stakeholders. Only with a radical paradigm shift in terms of the international economy to green growth and assisting affected countries in dealing with climate change and poverty, as well as an investment in green technologies and education on the impacts of climate change, can these issues be addressed. Young people and youth organisations, as those who are most affected by these issues and the most vulnerable demographic in terms of poverty and health inequalities must be given a core role in the decision making processes at all levels and throughout all stages.

#### Institutional framework for sustainable development

In terms of the institutional framework, the integral nature of the three interdependent and mutually reinforcing pillars of sustainable development are crucial. These encompass economic development, social development, and environmental protection. A key reason that progress since the Earth Summit in 1992 has been haphazard is that international institutions have lacked the necessary powers to enforce sustainable production, encourage sustainable lifestyles, reduce social and economic inequalities, encourage the necessary investment in green industries and build up infrastructure that can deal with the effects of climate change. A fully-fledged and appropriately funded International Sustainable Development Organisation with universal membership and a strong mandate is required in order to ensure that environmental issues are addressed in a holistic way, integrating and strengthening the work done separately by the UN, the Economic and Social Council (ECOSOC) and the Commission for Sustainable Development (CSD) and ensure that the balance between economic, social and environmental interests is brought to a functional level. Regardless of the final format of such a body, it needs to be ensured that its work contributes to the well-being of everyone. Such an organisation must be truly global in its character, involving also the weakest and most vulnerable stakeholders including an intergenerational approach with a focus on youth participation.

Until such an organisation is established immediate reforms can be taken including the reform of the United Nations Environment Programme (UNEP) which must be strengthened with a clearer mandate and remit. Similarly, despite some good analyses of environmental, social and economic issues over the past 20 years the CSD is no longer effective in its present form. A more powerful structure within the UN system is required in order to give sustainable development the prominence that it deserves.

A key issue with regards to decisions that are made now is that those that will be most effected by future environmental damage and the economic and social instability in the future do not have a voice. Political decisions are firmly rooted in short-term thinking and a danger of a new green economy is that it will be "business as usual" with the business sector stretching weak, short-term environmental restrictions to the very limit. For this reason an International Ombudsman for Future Generations must be established to ensure the representation of the interests of future generations with the authority to rule on all areas relating to sustainable development.

The United Nations and its Agencies and Programmes remain the most relevant space to deliberate and decide on issues of global importance such as sustainable development and human rights. Any institutional reform of the UN in this regard must integrate sustainable development throughout its structures, rather than limiting it to the remit of the Economic and Social Council. Sustainable development needs to become one of the core areas of the work for the General Assembly, any attempts to departmentalise the issue should also be avoided. Reform is also required to further integrate the role of young people in UN decision-making processes, ensuring that young people and their representative organisations from across the world have an equal and strong say. Unless young people and their organisations are part of the setup, the implementation of decisions and the necessary changes in the mindset towards a more sustainable future will be difficult to achieve.

#### Environmental Justice

Since the 1992 Earth Summit countries have adopted carbon trading schemes, essentially charging polluting industries for the carbon they produce. The largest and most ambitious carbon trading scheme is that of the European Union, other schemes also exist in Australia, New Zealand as well as parts of Canada and the United States. The European Youth Forum believes that these schemes must be significantly strengthened and that industries of all sectors should pay the full price for their carbon footprint. A harmonised scheme must be developed and implemented throughout all industrialised, emerging and developing countries to ensure that "environmental dumping", where developed countries outsource polluting industries to countries with less strict laws, is stopped. Europe can and must lead the way with regards to concrete action on climate change by reducing carbon emissions by 30% on 1990 levels by 2020. This is the minimum recommended level as endorsed by leading experts and, in this regard, the current EU target of 20% is simply not enough. In order to truly achieve sustainable development long-term Sustainable Development Goals need to be established, building on the model of the Millennium Development Goals, setting a clear roadmap for the future in a way that measures human development that goes beyond simply Gross Domestic Product and other wealth indicators.

#### Conclusion – Youth Matters

Unfortunately the role of youth and youth organisations is too frequently overlooked in sustainable development processes. Youth were given "major group" status over 20 years ago, but this needs to be developed into a representative body. Youth organisations are important actors in the development field and actively contribute to sustainable development by providing development education, breaking down barriers between young people, engaging in dialogue at all levels, ranging from the local to the global level, and changing consumption patterns in younger generations and leading by example in an intergenerational dialogue. Youth organisations that are democratic and youth-led, such as those represented in the membership of the European Youth Forum, are truly representative of the interests of young people and must be given a core role in the Major Group for Children and Youth.

Young people need to be fully recognised as important stakeholders in all levels of decision making processes that affect them, not just because they will have to endure the extreme economic and social consequences of climate change and the depletion of natural resources, but also because they can help find solutions to current problems by contributing a new and fresh perspective. In this regard youth organisations must be given a central role as decision shapers and co-implementers, not only in Rio+20 negotiations but in the entire cycle of managing and governing a sustainable global society for centuries to come.

---

## European Youth Meeting

## STATEMENT

### OF THE EUROPEAN YOUTH MEETING FOR SUSTAINABLE DEVELOPMENT 2011.

#### Introduction

Young people from around Europe and the world gathered from 19 to 24 July 2011 to participate at the European Youth Meeting on Sustainable Development (EYM2011) held in Tallinn. The meeting was part of the build up to the United Nations Conference on Sustainable Development (Rio+20) to be held in June 2012 in Rio de Janeiro.

This document is a record of the discussion that took place during the meeting and forms part of the process of developing a global youth position ahead of Rio+20. Participants were representatives of youth organisations and young individuals from all fields of work and life. This statement is intended as a clear and strong message to mobilise young people across the globe ahead of Rio+20.

The participants focused on the first Gretheeme n econoo f mRyio+20: in the contexu t of sustainable development and poverty eradi. Theyc woratikoned on the following seven topics:

- Natural resources
- Education for sustainable development
- Urban development
- Agriculture
- Renewable energy
- Waste management
- Social wellbeing

This document contains the key challenges and the ways forward from each topic. Best practices were also explored and have been made available separately.

The meeting recognises that all these topics are intermærelated with particular synergies between Natural Resources, Urban Development, Agriculture, Renewable Energy and Waste Management. The meeting also particularly noted that Social Wellbeing and Education have a crosscutting application and should be attached to all areas of sustainable development. Furthermore, in synthesising the discussions, common areas and shared ways forward have been clustered under the most relevant topic. No area should be seen in isolation, and overlapping topics have been cross-referenced.

#### 1. Natural resources

##### Key challenges

##### Lack of distribution of information

Transforming our mind-sets to use natural resources more sustainably in our daily lives is one of the key challenges of our century. Informed, educated and aware people are more conscious and more likely to respect natural resources. A circular rather than a linear approach should be brought into peoples utilization and behaviour of natural resource management. We borrow from nature rather than own it.

##### Mismanagement of natural resources

Natural resource use is currently oriented to a short-term perspective. Long-term vision must be instated to ensure the availability of natural resources for current and future generations. Young people have the responsibility to ensure that governments, institutions as well as the private sector commit to manage natural resources in a sustainable way, as we will be inheriting any mismanagement and associated problems.

##### Access to natural resources

Unequal distribution of natural resources is a fact, however, it is civil society's responsibility to cooperate and ensure that they are equally accessible to everyone. Natural resources essential to life should be available to and protected for everyone regardless of their location, economic situation or socio-cultural background, in particular indigenous peoples.

##### Transfer of knowledge and technology

Although the technology to manage natural resources sustainably is available, it is accessible only to a restricted number of actors. Moving towards global green economy, information sharing and mutual exchange needs to be largely developed and improved. Moreover, human know-how and infrastructure are essential for a successful implementation of knowledge transfer.

##### The link between trade and natural resources

A fair and green economy is essential for sustainable development. It is a challenge as well as a solution to link trade and natural resources, as the trade of natural resources determines their management. The Doha Development Round as well as other global platforms has to include a strong sustainability perspective.

##### Ways forward

##### Changing mind-sets

States, youth-led organisations, and young individuals should aim to raise awareness on the sustainable use of natural resources among youth by different media & networking on topics such as: spreading best practices of sustainable behaviour, promoting integrated educational systems, changing the focus on material consumption to valuing natural resources as a global commons rather than a commercial amenity.

##### Good governance of natural resources

In order to attain a long-term vision on sustainable management of resources, research and development needs to be improved, exchanged and made accessible to decision makers. A strategic approach has to be followed by all institutions and the decisionmæmaking process needs to adopt a multi-stakeholder approach to ensure accountability

and participation.

Multi-lateral process for fair and secure access to natural resources

In order to improve fair and secure universal access to basic natural resources, we have to ensure commitments to international treaties by member states through ratification and implementation by 2030. The establishment of a monitory body is suggested to prevent land grabbing and penalize unfair large scale corporate land acquisition.

Enabling transfer of knowledge and technology

Transfer of knowledge and technology requires national and international finance mechanisms. Technological innovation should be encouraged through research and development and made accessible to all stakeholders. New knowledge and technology that is highly effective in the protection of natural resources or in the provision of access to the most vulnerable persons should not be withheld, patented or privatized.

Introducing sustainable resource management into current trade systems

Multilateralism and multi-stakeholder approaches are essential to avoid contradiction between environmental agreements and trade policies. The international trading system must be transparent and equitable. The conclusion of the Doha Development Round as well as Rio+20 must link trade and natural resources. Local sourcing of natural resources should be actively encouraged.

## 2. Education for sustainable development (ESD)

Key challenges

Lack of engagement outside the formal education system

Only a small proportion of youth is engaged in ESD. The challenge is to reach people in the first place, as well as to inspire and educate them. Without this process youth are inhibited from becoming agents of change for a more sustainable world.

Lack of support for non-formal ESD

There is a lack of funding for non-formal ESD, as well as a lack of effective partnership and collaboration between government and civil society organisations (CSOs) working to implement ESD. There is also a lack of political will to increase the quality of non-formal ESD.

Implementation of ESD

It is a challenge to implement ESD at all levels of the formal educational system, including kindergartens, primary and secondary schools and higher education, as well as driving schools and professional training centres. Part of this challenge is not only to include ESD in the curricula but to take a multidisciplinary approach, providing equal gender access and integrating ESD across all subjects.

Inadequate teacher training

There is a need for more quantity of and quality in teacher training in the area of ESD. This teacher training is essential in order to engage more people in ESD and have a larger impact.

Monitoring and evaluation

There is a need for methods and indicators to measure the impact of ESD in both formal and non-formal education, in order to improve its implementation and ensure that it reaches the targeted groups.

Ways forward

Simple, short and attractive campaigns

Run by CSOs (including youth-led groups), these campaigns will target youth to encourage debate on sustainable development. The funding should come from the national body\* according to the national ESD strategy (\*explained later on in the document). The experiences and materials of existing simple, short and attractive campaigns should be exchanged.

Creating more networking opportunities

To give CSOs access to knowledge, experience sharing, support for their projects, creating new and merging existing ideas and projects, an open source based network is required. There is a need to create or improve umbrella networks such as youth councils and forums for youth CSOs, that act as national and regional representatives for the CSOs. These CSOs should meet regularly for sharing experiences, new ideas and create policy proposals for youth activity in ESD, from grassroots to the top. Creation of a national body and a national ESD strategy A national body, including representatives of youth organisations, should be created for the allocation of funds for ESD projects, in line with national SD, regional and global policies. More cooperation and collaboration between research organisations and other Civil Society groups should be encouraged to present new ideas and emphasize existing national policies on ESD.

ESD implementation and integration into the curricula on all levels of education

Governments should ensure the efficient implementation and integration of ESD in all levels of the education system and in all subjects by 2015, the final year of the MDGs. To achieve long-term and high impact change in society, the teacher training institutions should also include specialised and integrated training on sustainable development. Schools should be transformed into comprehensive learning environments, where sustainable lifestyles are promoted daily, hence imparting practical skills on sustainable living.

Global partnership for ESD

Effective partnership between developing and developed countries should be promoted through open coordination methods. This should be implemented on regional and global level by 2015 and beyond, using existing experience from international platforms of UNESCO and regional cooperation organisations.

Evaluation and monitoring

An online form is created where all people who participate in formal or non-formal ESD will be registered. After participating in SD projects or activities, they will register the activity online. Registration of participation can be done either by the person themselves or by the direct educator or project manager. This is an effective way of measuring

approaches, success and the long-term effects of ESD on people attitudes and behaviour.

### 3. Urban development

#### Key challenges

##### City planning

City planning is not being done with the appropriate independence of city planners, but under the influence of interest groups, technical and financial difficulties. Implementation of already existing best practices, know-how and case studies in the future planning is not ensured. There is a lack of a holistic approach in terms of changing citizen behaviour, mentality and attitudes. There is no transparency in environmental budgeting and expenditures.

##### Transportation

Intensive urbanisation and daily migration lead to mobility inefficiency. Public transport coverage cannot meet the needs of the rapid dynamic of cities. Lack of eco-friendly transportation leads to pollution and health hazards. Modern technologies such as GPS and GIS are not used enough in order to improve the mobility efficiency.

##### Housing, work and services

Cities are occupying new spaces instead of re-adjusting and re-using existing ones. Jobs and services such as health, education, culture and recreation are not in close proximity of residential zones. There is a lack of symbiotic planning in cities as an organic entity at the neighbourhood scale, where all the needs of the population are at a reachable distance. This would reduce movements and therefore general traffic issues.

##### Waste management, water and energy distribution

Public services cannot meet the needs of growing population. Out-dated network systems lead to great loss of resources.

##### Green architecture

Green architecture still is not a standard, rather an option. Planning policies and architectural practices neither require, nor encourage the development of cities according to principles of sustainability.

#### Ways forward

##### City planning

Urban spaces should be re-designed and adjusted into new multifunctional contents. City planning must not endanger the social and cultural heritage of cities and should be co-ordinated with rural development. We encourage cities to implement already existing good practices and methodologies, as well as certification and confirmation of cities efforts toward sustainable urban development. We call for participatory decision-making approaches in order to build trust between cities and their inhabitants.

##### Transport

Cities should focus on fast, frequent, effective and renewable energy powered transport that is affordable and accessible for different social groups in all city areas. Authorities should be exemplary and supportive in using more eco-friendly means of transport in cities such as bicycles, electric and hybrid cars, carpooling, park and ride, and increase awareness among the population. Satellite technologies must be used for route optimising and monitoring systems.

##### Housing, work and services

Policymakers should develop residential areas with locally provided services contributing to social cohesion. In these areas local businesses, manufacturing of goods and urban farming should be integrated. This will reduce the need for commuting and create a closer link between the urban population and the products they consume.

##### Water, energy and waste management

Public funding programmes should aim at raising efficiency and modernisation of supply networks and households. Also, awareness on sustainable consumption and saving technologies should be raised through information campaigns. Furthermore, the cities must secure reuse of resources, primary waste separation, waste collection coverage and ensure adequate treatment.

##### Green architecture

Governments should promote the introduction of innovative and sustainable technologies in architecture through financial incentives and technical standards. These standards should include national criteria, indicators and benchmarks that will serve as the base of sustainable green architecture along with a pool of available green features.

### 4. Waste management

#### Key challenges

Lack of awareness of waste creation and ways to minimize it People are unaware of the actual amount of waste they produce in their everyday life and therefore they have no intention to reduce waste.

Imbalanced culture of consumerism, which leads to increased waste production

Present consumption externalizes the costs of the full production cycle, thus producing too many short lifecycle products. Consumers remain unaware of waste production during this process.

Long-term thinking and investments is overshadowed by short-term profit

Investment is often focused on short-term profit rather than sustainable profit. This prevents infrastructural development in waste management systems.

Lack of responsibility for resource lifecycle

The responsibility of manufacturers to the production of waste is often limited and ends after the sale of goods. Consumers have little access and no legal responsibilities to reduce, reuse and recycle.

Few economic incentives for waste reduction

Economic and legal frameworks do not encourage sustainable production. Cradle-to-cradle design and production is often provided with less incentive than cradle-to-grave.

Ways forward:

Raising awareness to minimise waste

Awareness of methods for waste prevention and reduction should be raised using multiplying effects. Governments should finance more studies and research on waste management. Zero-waste-school programs should be established at a national level and implemented at a local level. Companies and workplaces should invest in strategies to decrease their waste production, including information towards and participation of employees.

Balancing consumerism and production cycles

The production process should be made more transparent by introducing uniform global standards and labelling systems for the whole product lifecycle. The lifecycle of resources and products should be extended by increasing the quality of products and by creating re-use centres, where broken products can be repaired, recycled and resold. At these centres, craftsmanship professions would be revived and the centres would eventually become self-financing.

Promoting long-term and sustainable investment

A higher tax rate on disposable single-use products should eventually lead to a shift towards manufacturing of more reusable products. An international program should enable capacity building and sharing of knowledge and skills to countries with a lack of sufficient infrastructure for recycling. An online database for secondary resource exchange could foster local cooperation and resource management between businesses.

Foster responsibility regarding the lifecycle of products

A legal framework for extended product lifecycle should be created in order to increase responsibility of manufacturers and consumers. It should lead to a larger scale production of versatile products and product components such as universal chargers. Products must have a spare parts catalogue available, where the price of spare parts must be cheaper than the product itself. Re-use or use of recycled products should be promoted and disposable products should be phased out.

Increasing economic incentives for resource management

Government should implement sanctions for excessive packaging and non-biodegradable packaging. Tax breaks should be granted to manufacturers that use recycled sources for the production of their goods. Separate food waste collection in every urban area at a very favourable price should be organised. Local government should ensure material flow (resources) rather than final disposal (landfill in general) by increasing landfill taxes and banning waste export.

5. Agriculture

Key challenges

Oil dependency

The agriculture industry is heavily dependent on oil for the production of fertilisers, transportation of products, and the heating of greenhouses. In the time after peak oil, this will pose an increasing challenge to productivity and profitability.

Socio-economic inequalities

Small-scale farmers have to compete with agro-multinationals. Food prices are determined on the international market in a game of supply and demand, but with huge differences in negotiation power among producers and between producers and buyers.

Price structures

There is a lack of transparency as to what causes the large and sudden jumps in food prices. Also, externalities such as the ecological cost of long-distance transportation are not fully taken into account in the price.

Biodiversity and the challenges of biotechnology

Deforestation for agriculture leads to a loss of biodiversity. The increasing use of GMOs also decreases biodiversity, as well as the fact that the funds invested in the development of GMOs are therefore excluded from other endeavours.

Depletion of water food resources

Many commercial fisheries are getting depleted. There is a need for an international regulation of fishing rights in coastal and international waters.

Soil and fresh water management

Over 70% of global fresh water is used for agriculture, often in unsustainable ways. The increasing use of chemical fertilisers and pesticides lead to degradation of soil quality. Deforestation often leads to erosion of the soil, further reducing the fertility of the land.

Land use competition

The use of land for production of food crops conflicts with many other interests, especially the production of agrofuel crops, feed crops for livestock, cash crops for export and the preservation of natural environments.

Ways forward

To promote the sustainable use of natural resources in agriculture and food systems

Greater efforts should be made to improve awareness of resource utilisation in land and water ecosystems. Furthermore, appropriate policies and economic incentives must be designed and implemented to ensure that the sustainable use of natural resources is achieved.

To plan and implement a worldwide transition to systems of sustainable post-oil agriculture

Appropriate policies and economic incentives must be designed and implemented to deliver a transition from conventional monoculture-based and input-intensive agriculture to agro-ecological, biodiverse farming systems. This should include but not be limited to decentralised, small-scale, organic, permaculture, and urban systems of agriculture.

To empower disadvantaged rural people and their communities

Appropriate policies and regulations must be designed to empower small-scale and subsistence farmers. These must promote rural development by ensuring social inclusion, universal access to tools and vocational training, and more equal power distribution between producers and buyers.

To ensure inclusive governance and decision-making processes

Meaningful participation of vulnerable stakeholders, such as women, indigenous peoples, landless rural workers, and small-scale farmers should be increased in agri-food governance, policy-and decision- making processes, from a local to a global level.

To strengthen the global partnership that supports adaptation to climate change

Increase availability of existing knowledge and technology to farming communities in regions vulnerable to the effects of present and projected climate change such as decreasing rainfall, rising temperatures and more frequent natural disasters.

## 6. Social Wellbeing

### Key challenges

Lack of widespread access to quality and affordable health care

Health is presently focused on the physical aspect and often excludes mental and social wellbeing. The main challenges are the effect of human activity and climate change on human health. The current symptomatic rather than preventative approach, the lack of awareness and education on health related issues as well as lack of widespread access to quality and affordable healthcare are also challenges to tackle.

Lack of social cohesion and solidarity

Cohesion and solidarity between different groups in society, while essential to social wellbeing, is often neglected. The gaps between rich and poor, men and women, and different ethnic groups are large. These social divisions encourage misunderstanding, lack of cooperation, and even cause conflicts.

Lack of individual participation in civil society, politics, and the media

Many people do not feel empowered to make decisions that affect them. Areas that lack participation include the labour market, politics, volunteering and media. Barriers to participation include poverty, lack of access or opportunity, apathy, and lack of awareness. Participation between different groups and sectors of society is also lacking, for example between individuals, and corporate and civil sectors.

Lack of appropriate education

Education is currently considered in a limited context, instead of being lifelong and encompassing both formal and non-formal methods. Education is not updated to reflect local cultures and evolving ways of learning, is not universal or affordable, and local learning opportunities are often mismatched to the local employment market.

Lack of respect for cultural and individual diversity

Equality is seen as a human right, but many people are discriminated for such things as their sexuality, gender, race, religion and culture. Diversity and equality are endangered by competition for resources, fear of the unknown, political manipulation, feelings of superiority and a lack of interaction between different groups.

Unemployment and related discrimination

The right to work, financial autonomy, adequate working conditions and a healthy work-life balance are crucial to social wellbeing, yet are unachieved by many. It is difficult to connect basic work rights for people within an international consensus. The relation between work, unemployment and human rights is still unclear. The ILO is a tool to tackle these issues, but it is still not used to its full potential.

### Ways forward

Health: Pollution and awareness

All polluters must pay and repair the damage they create, as measured by independent agencies. This money should be used for victim compensation and research and development. An international court on pollution should be created. Awareness campaigns should spread information on pollution and its sources, nutrition and healthy lifestyle, hygiene, HIV/AIDS prevention, and other local issues.

Promoting and establishing social cohesion

Governments should increase support for organisations and activities that promote solidarity through grants, interest free loans, or tax incentives. Primary school programs can teach children about other cultures and groups to inspire feelings of solidarity and responsibility towards others. Moreover, governments should enable mobility within and between countries in order to facilitate meeting others of different backgrounds.

Participation in society, politics, and the information society

Civil society should be able to meet governments and take part in co-decision making on matters that affect them. In the interest of this, youth forums should be strengthened and where they do not exist established; in order for youth to meet, discuss issues and come up with a unified position. Youth forums should be demographically representative and should emphasize a frequent renewing of participants.

Education and personal development

Incorporate youth into the design and management of the education system in order to adapt to new ways of learning. Increase the cooperation with professionals and provide quality information on career and internship opportunities. Promote non-formal educational methods and social participation by including volunteering and/or entrepreneurship as a part of school curricula.

#### Exchanges for cultural and individual diversity and equality

Governments should arrange and finance exchanges in order to develop and promote diversity and equality. These exchanges can be realised on an individual, group or social media level. Interacting and seeing life through the other person's eyes will increase cross-cultural awareness, understanding of social contexts and solidarity.

#### Employability and sustainable values in companies

Corporate actions and policies must reflect sustainable values. Relevant topics such as entrepreneurship, diversity and corporate social responsibility should be reflected in educational curricula and professional training. Furthermore, companies should have inter-generational and intercultural transmission of knowledge based on educational approaches inter alia peer-to-peer learning, non-formal education, and mentorship.

### 7. Renewable energy

#### Key challenges

##### Overconsumption

Current energy consumption in industrialised countries has increased to an unsustainable level. Technologies to reduce energy consumption have not yet been implemented successfully. In addition, there is a lack of awareness on sustainable way of usage.

##### Profitability of renewable energy

Subsidies of fossil fuels do not enable energy resources to be compatible. New technologies for renewable energy and upscaling plans for current renewable energy are not sufficiently supported.

##### Decentralisation

The market is dominated by a limited number of players, leading to centralised energy supply. Energy production on household level is not actively encouraged, disincentivising small-scale renewable energy initiatives.

##### Different countries realities

The effectiveness of the renewable energy resource varies in different local circumstances. There is a current lack of locally suitable implementation plans for renewable energy.

#### Ways forward

##### Reducing our energy footprint

In order to achieve a carbon neutral world by 2050, major steps need to be taken within the next ten years. More economically developed countries have to take a higher burden of reducing their energy consumption. We must achieve 80% of all energy to come from renewable sources by 2050. The EU should unilaterally increase its emission reductions targets from 20-30% by 2020.

##### Activating the private energy production sector

Governments should give economic incentives to the private sector to encourage investment in renewable energy, such as tax exemptions, low interest loans, seed funding, and Feed-In Tariffs. Subsidies and tax exemptions to the fossil fuel sector should be phased out. Research and development should be supported, and the resulting knowledge and technology shared with developing economies.

##### Investing in the implementation of a smart electricity grid

In order to enable the transition towards local renewable production of electricity, investments have to be made in the development and implementation of a smart grid allowing efficient production coordination and two-way electricity transport. Following the German policy of Feed-In Tariffs, the guaranteed access of net-producing systems to the grid should be regulated.

##### Taking into account and taking advantage of country specifics

All countries have specific realities, which need to be taken into account when investing in renewable energy technology and infrastructure. All countries need to research the potential they have for renewable energy, and start supporting the investments into these areas. The unleashed potential of solar energy in the south of Europe and wind energy in the north of Europe should be utilised to its full potential. Networks between countries to support the transfer of technology, knowledge and energy infrastructure need to be implemented.

##### Researching and addressing the possible negative aspects of renewable energies

The negative side effects of the production of each renewable energy source should be researched in order to benchmark and fully assess the sustainability of each source. Social and environmental aspects should be taken into account in the development, advancement and implementation of renewable energy technologies. Rio+20 should decide on international ethical guidelines and regulations for production of agrofuels and the usage of biomass as an energy source.

---

## Eurostep

#### Contribution to the Zero Draft of the outcome Document for Rio2012

The future of the world, its 7 billion people and the generations to come will be determined by the way in which we respond to the significant challenges that confront us. Our current practices are threatening our very existence. The same sense of urgency was expressed 20 years ago at the 1992 Rio conference. Unfortunately, despite the adoption of strong commitments and appropriate plans of action for sustainable development, implementation has been limited. The political will needed from the international community to respond effectively to the urgent challenges identified in 1992 has not been forthcoming. While there have been some important achievements resulting from previous conferences the overall trends are negative.

Human activity has been the major cause of the environmental, social and economic problems that we face. The present challenges cannot be tackled in isolation and

responses must be global.

Rio2012 constitutes the best opportunity to give renewed political impetus to putting in place effective measures for working towards effective sustainable development practices. This will require the adoption of comprehensive and binding internationally agreed time bound commitments and strategies. These must build on the agreements reached in 1992 and 2002.

Countries have common but differentiated responsibility for contributing to current unsustainable practices, and for the consequence unsustainable use of the world's natural resources. This must have implications for responses that are needed. Developed countries must fundamentally change their own development model so as to ensure their economies are sustainable and enable, rather than obstruct, the implementation of sustainable approaches to development of others, not least developing countries. The particular situations of developing countries must be fully recognised and assistance provided in order for them to be able to develop sustainably in full respect of their sovereignty and democratically agreed priorities.

High-income countries must show their willingness and determination to bring about real changes that radically transform the way economic development is envisaged. Emerging countries that are growing quickly and transforming their economies must take on the increased responsibility that this brings for ensuring sustainable practices are at the core of their strategies. Greening the Economy alone will not bring about sustainable development.

Increased liberalisation has shown its limits. In too many instances economic growth has increased inequalities with poorer sections of societies benefiting least. Humandevlopment and environmental protection must be at the core of analysis and actions for sustainable development to be achieved.

Adherence to human rights, the effective promotion of equitable societies, ensuring better regulation of economic and financial activities to ensure conformity with principles of sustainable development, increasing the coherence between the three pillars of sustainable development, protecting the environment and enhancing democratic participation and accountability are key elements for a sustainable world. They should be reflected in the outcome document of Rio2012. Ambitious actions and strengthening the institutional framework for ensuring appropriate implementation and compliance with commitments made must be agreed upon at Rio2012.

## 1. Introduction

At the Rio Earth Summit in 1992 the international community adopted a set of principles and obligations in response to the global challenges to pursuing sustainable development. These addressed development and environmental protection, as well as the need for global responses to the supranational problems of poverty, social inequity, desertification, global warming, loss of biodiversity and deforestation. The Rio Summit endorsed the principles of sustainable development including that of common but differentiated responsibilities, with a view towards an equitable use of the world's finite resources for the benefit for all.

As the world prepares for the 2012 United Nations Conference on Sustainable Development (UNCSD) that will mark the 20th anniversary of the Earth Summit the need to tackle global environmental problems and to put in place a just and sustainable management of the world's resources has become more urgent than ever before. Too many people, particularly people living in poverty and vulnerability do not have access to their basic rights because of the disastrous consequences of unsustainable practices. While there has been increased consciousness about the challenges facing the global community, and some actions have been taken to promote sustainability, overall there has been a marked failure to implement the commitments made at the Rio 92 Summit despite the recognition at that time of the urgent need to adhere to the principles adopted by the international community.

The failure extends to the Johannesburg Plan of Action of 2002 and other UN Summit outcomes related to the social and economic dimensions of sustainable development. This includes the commitments of industrialized countries to provide the means (financial resources and technology transfer) to implement the Earth Summit's agreements that they have failed to honour. Industrialised countries have also failed to provide the leadership needed to change production and consumption patterns, particularly in their own countries, that are crucial for sustainability to be achieved.

Human activity has been the major cause of environmental degradation, climate change and social disparities, which are threatening our very existence. Scientific and technological developments have brought unprecedented benefits to large numbers of people, particularly in so-called 'advanced regions' of the world, but with the consequence of unsustainable ways of living. The development path pursued by the world's wealthiest nations has drawn disproportionately on the planet's non-renewable natural resources and continues to do so. This responsibility for creating the current global challenges must be fully understood and recognised and actions to achieve far-reaching transition must be undertaken. This requires radical and urgent transformation in current approaches to the economy and to patterns of production and consumption that are promoted towards a low carbon economy and sustainable lifestyles.

Rio2012 constitutes a major opportunity to give new impetus to promoting an approach that can fulfil the principles of justice, equity and sustainability. These are fundamental for the future. The outcome of Rio2012 must build on the principles and commitments adopted in 1992 and 2002, which constituted major progress in the way in which economic development should be understood. The summit will take place in a context where successive crises illustrate the increasing vulnerabilities that we collectively face, largely resulting from the accumulating effects of past economic, financial and development strategies and practices. These crises have a devastating impact on increasing numbers of people around the world, particularly in poorer countries and communities. Their negative impact on strategies to promote sustainable, just and equitable development will grow, and be exacerbated by the interconnections between the different crises. Our collective ability to respond to these challenges requires drastic changes to policy approaches in line with the principles adopted in 1992.

The stated commitment and willingness of some countries to make Rio2012 a success is to be welcomed. However, acknowledging the need for radical changes in approaches to the economy are fundamental to a successful outcome. Our collective ability to move towards a sustainable planet will only be achieved when we address the inequalities that are the source of injustice experienced by people and communities in different parts of the world.

We believe that the concept of Green Economy, for which there is no common understanding and conceptualization at the global level, gives too much emphasis to environmental aspects of sustainability, but may fail to address the equally critical questions of social equity, economic justice and political inclusion. It relies too much on changes in practice that are more ecologically sustainable than in the past, and the use of new technologies that contribute to this objective, but do not address fundamental changes that will impact on all aspects of our lives. Changes based only on modifications to existing approaches will neither tackle the root causes of poverty nor imbalances within the current macroeconomic system that are central to past unsustainable practice.

## 2. Recognizing the principle of Common but differentiated responsibilities and its implications as a prerequisite for sustainable development

As nations that enjoy relative wealth, and which have consumed a disproportionate share of the world's natural resources to achieve their position, high income countries need to demonstrate their commitment to make the far reaching changes needed to achieve global sustainability. They need to act both towards their own economic, social and ecological framework, as well as in their interactions with the rest of the world.

Acknowledging in international agreements and practices the special situation and needs of developing countries must also be systematic in compliance with Principle 11 of the 1992 Rio Declaration. Sustainable development standards, objectives and priorities should fully take into account "the environmental and development context to which they apply".

Since the actions of industrialised nations have contributed most to creating the global environmental problems we collectively face, they should actively assist developing countries in mitigating and adapting to the adverse effects they now face, not least to climate change that is one of the results. The provision of adequate financial resources and facilitating technology transfer (providing that the precautionary principle is fully recognized and applied) are urgent obligations to be taken, but by no means the only actions needed.

Because of the disproportionate influence that high income countries have on international relations, as is increasingly the case for emerging economies too, and because of the impact of their policies on other countries' development, Policy Coherence for Sustainable Development must be recognized as a guiding principle at Rio2012 and appropriate mechanisms must be put in place to control compliance with this principle.

Putting in place the actions needed to address the threats to sustainability requires an analysis, understanding and acknowledgement of challenges. In preparation for Rio+20 every country, region and the global community as a whole must update past analysis and clearly define the problems we face today.

Taking the actions necessary to change approaches to the economy, and to put in place effective mechanisms for the sustainable management of natural capital and resources will inevitably impact on economic actors. The Green Economy will create new "green jobs" but will also destroy "brown jobs". Thus, during the transformation process towards the Green Economy some individuals, groups, communities and countries will lose<sup>2</sup> whereas others will win. This has to be addressed by identifying those affected, quantifying their losses and benefits against a business as usual scenario and creating compensation mechanisms.

### 3. The limits of the Green Economy

Tackling inequities is central to Sustainable Development

International definitions of sustainable development, to which the international community subscribes<sup>3</sup>, are rooted in the Brundtland Commissions original definition of sustainable development namely "development that meets the needs of the present without compromising the ability of future generations to meet their own needs". In this perspective, sustainable development is about improving the well being of both present and future generations, which in turn is concerned with social, economic and inter<sup>4</sup> <sup>5</sup>generational justice.

Eradicating poverty, diminishing inequalities, striving for more inclusive and just society, an adherence and respect for the environment and ensuring accountability should be core pillars and goals of any sustainable development strategy<sup>4</sup>. This requires the effective representation of developing countries in international fora. It also requires increased participation by citizens, civil society organisations and other stakeholders at all stages of public policy formulation and implementation – be it local, national regional or international. A transformation is needed in the way we design and implement policies as well as in the way we do business; systematic evaluation of long term versus short costs and gains, based on sustainable development principles and objectives, should be undertaken and transparency ensured by making the results available to stakeholders and concerned citizens.

Transforming economies so that they draw less on finite natural resources and utilize increased proportions of renewable resources is an important aspect of any strategy for achieving sustainable development. A "Green" economy less dependant on natural resources will continue to promote inequity unless other fundamental changes are also made. Delinking can even exacerbate inequalities if ownership and control of new technologies remain in the hands of existing dominant economic actors. Broader approaches are needed that ensure sustainability, and in which social dimensions of the economy, and the right to development are explicitly recognized<sup>5</sup> and addressed. This will promote a balance between human development and environmental responsibility as equal and interdependent pillars of sustainable development. Furthermore, it necessitates acknowledging that actions taken within national boundaries can cause environmental, social and economic impacts beyond national jurisdictions, requiring cooperation in the development of international law that allows for independent judicial arbitration in such cases<sup>6</sup>.

Strategies to achieve Sustainable development must go beyond resource efficiency and technological innovations

By analysing the example of the EU's position towards Rio+20 the general limits and concerns over the concept of Green Economy can be highlighted. The idea of rethinking the conventional model of economic progress is envisaged by the EU<sup>7</sup>. This rethinking is primarily based on the notion of a transformation to a Green Economy which is closely linked to the concept of efficiency, as developed in the Europe 2020 strategy<sup>8</sup>. The EU's flagship initiative "A resource efficient Europe" is emphasised by the Commission and the Council as being particularly relevant for the EU's position towards Rio+20. While the overall objective of this initiative of "ensuring a more sustainable use of natural resources" is an important factor, and valuable proposals for policies and strategies such as decoupling natural resources use from economic growth and phasing out environmentally harmful subsidies are put forward, much emphasis is placed on technological innovations. An approach that relies too much on technological innovations, but remains fundamentally unchanged will invariably fail<sup>9</sup>. The impact of technological innovation can be positive for sustainable development but we must acknowledge the limitations as well as there remains the potential for detrimental unintended side.

Relying too heavily on the magic bullet of technological innovation to mitigate the consequences of current unsustainable practices allows governments, the private sector and citizens to believe that fundamental change is not necessary, and to consequently avoid taking responsibility for their unsustainable practices. It also carries risks from unintended side effects that trigger new challenges to the sustainability of the ecosystem. These risks could be magnified without adequate and rigorous verification of the potential impact of these new technologies, particularly where their promoters seek early deployment ahead of any competitors, so as to maximise benefits to themselves. Fully respecting the precautionary principle should be the absolute priority. New innovations (i.e geo<sup>10</sup> <sup>11</sup>engineering techniques, nano<sup>12</sup> <sup>13</sup>technology or synthetic biology) have the potential to contribute to sustainability, but must be subject to rigorous systematic impact assessments<sup>10</sup> that are subject to independent external evaluation, where there is scientific uncertainty and the possibility of irreversible damage (Principle 15 of the 1992 Rio declaration),.

Furthermore, sustainable development is a concept that goes beyond resource efficiency. While recognising that the question of efficiency needs to be addressed in any economic model, radical reforms are needed to the current model if the multi dimensional aspects of sustainability are to be properly addressed. Reforms that deal with production and consumption patterns, social and political rights as well as economic practices towards more regulation and equitable redistribution of resources are needed.

Natural capital must be protected and managed under different economic mechanisms

The current definition for the Green Economy<sup>11</sup> adopted by the EC and the Council of the EU focuses on growth and job creation. Such an approach does not in itself tackle inequity, essential to achieve sustainable development, or necessarily result in the eradication of poverty. In addition, the ambition to eradicate poverty by investing in natural capital is unlikely to be realized in an economic system that prioritizes monetary value. Although it is argued that this provides the best mechanism for ensuring an efficient use of the resources, in reality the emphasis on generating monetary returns tends to promote short<sup>12</sup> <sup>13</sup>term gain rather than longer term objectives including inter<sup>14</sup> <sup>15</sup>generational justice. Speculative tendencies are inherent within current predominant economic approaches which can be detrimental to sustainability, particularly as the "natural capital" on which the world's sustainability depends is seen as an opportunity to generate financial gain through speculation. Current economic approaches encourage the acquisition of such assets by private interests whose primary interest will be in generating profit, and not as an asset for long term preservation, or sustainability. Their true value will be grossly misrepresented.

Natural capital is essentially the stock of natural ecosystems that yields the flow of valuable ecosystem goods or services into the future. With this in mind, natural capital must be maintained and managed under fundamentally different economic mechanisms than those we currently have in place. The promotion of recycling and reuse of natural

resources as a more sustainable approach for the use of those resources requires regulatory intervention. In an economy that is driven by growth and depends on increases in production, the demand for material input grows.

Policy promoting the notion of natural capital must serve to change fundamental behaviours that lead to the exploitation and degradation of natural capital. A sustainable management of natural capital, and the kind of investment required for natural capital to be utilised as a sustainable asset requires a regulated, redistributive and resilient economy that serves to eradicate poverty by placing the principle of equity at its core.

There is an urgent need to revert to sustainable production and consumption patterns, and the limitations of the earth's resources must be acknowledged. The value of natural capital must be integrated into the economy, but not as a disposable commodity. This value, and the quantifiable costs associated with its use should be fully reflected in costs of production. This will impact on patterns of production and consumption, and would contribute to more sustainable practices.

The Convention on biodiversity signed at the Earth Summit must be adhered to and strengthened so as to protect and restore the genetic resources of our planet and natural habitats which are crucial to human wellbeing. A system of governance is needed to prevent any further irreversible damage.<sup>12</sup>

Natural capital is an asset that belongs to everyone, over which a system of democratically accountable stewardship is entrusted to ensure they serve the interests of all, in the present and in the future. If the concept of the Green Economy is to be meaningful it must derive from an approach that is people centred, sustains and protects the ecological basis of our planet of which we are a part, and on which we depend.

The current definition must be broadened to one that places the characteristics of a social economy<sup>13</sup> and ecological protection at its core.

Trade should serve poverty eradication and sustainable development

Trade needs to be fair and pursued through sustainable practices. The global trading system is dominated by prominent and powerful trading interests, who have disproportionate leverage in the setting of trade rules. In this context the adoption of new restrictions promoted by major trading nations in the name of sustainability raise concerns over their potential use as additional conditionality towards countries with less leverage in the trading system. It is already difficult for many producers in developing countries to access global markets, the promotion of sustainable development should not be used to increase this trend and constrain the development of already poor countries. Much of the scepticism from developing countries regarding the Green Economy is based on concerns that new restrictions will be inappropriately used by more powerful trading nations for trade protectionist purposes. In particular, rich countries may use this to justify unilateral trade measures against the products of developing countries, or to impose product and technological standards that impact on producers in developing countries. Trade should be a supportive tool to processes of sustainable development, while avoiding green protectionism between countries (as stated in Principle 12 of the 1992 Rio Declaration). For those purposes, trade agreements that organize global trade flows should be revised and reshaped for the benefit of developing countries, including allowing developing countries more flexibility to support agro-ecological agriculture in order to reflect the principle of special and differential treatment and ensure the right of countries to regulate for the benefit of sustainable development objectives.

#### 4. Equity, Empowerment, Human rights and Democratic Participation as central to sustainable development

The first Principle of the Rio Declaration on Environment and Development stated that "human beings are at the centre of concerns for sustainable development". In this perspective promoting social, gender, economic and environmental equity, the reduction of inequality and the observance of human rights should be the basis of any development strategy. This requires the acknowledgement of (disproportionate) responsibility for the consequences of past and current actions and practices, and a commitment to make the changes necessary to ensure sustainability.

This can only be achieved by engaging citizens in such processes of change (Principle 10 of the 1992 Rio Declaration), pursued with full transparency and accountability. Ensuring access to information, raising awareness on sustainable development issues and improving participation of citizens and stakeholders in decision making processes are key elements for sustainable development; a development based on democratic ownership and accountability. The present major challenges will only be overcome by bringing coherence and harmony between global sets of goals, actions and regulations with bottom-up approaches retaining the focus at the local level. As these global challenges are interrelated, enhancing coherence between policies must be the overall priority at the global, regional and local level. A human rights based approach to development priority should be taken to addressing poverty in financing and development strategies with a particular focus on women.

#### Food security

A challenge facing the world is to feed 9 billion people by 2050. The majority of people living in absolute poverty live on small farms. Yet small holder farmers are responsible for growing much of the world's food. Agro-ecological<sup>14</sup> approaches to agriculture have proven effective in increasing yields while at the same time acting to protect the environment. Efforts to ensure sustainable development need to include these small farmers. Recognition must be given to the role of women who produce 60-80 percent of food in most developing countries. They are responsible for preparing food, and are the primary caregivers.

A woman's nutritional status is critical not only to her own health but also to her ability to maintain a secure livelihood and ensure that her children are properly nourished and healthy. Women therefore play a critical role in tackling food and nutrition security, and ensuring sustainability. Food production however, is not necessarily synonymous with production of nutritious foods. As such they have a perspective and understanding that is crucially important for defining effective approaches that help ensure sustainable development. Meeting increased demand for food must primarily be about producing the right type of food, foods that contribute to dietary requirements.

#### Energy

Access to energy is fundamental to achieving poverty eradication and is a prerequisite for social and economic development. The huge potential in developing countries to develop and rely on renewable energy is acknowledged by many. However, the choice of strategy towards harnessing this potential will be critical for determining whose interests that are really being served.

Globally 1.5 billion people are currently without access to electricity, the majority of them living in rural areas. Achieving increased equity in access to reliable and affordable sources of sustainable energy is central to reducing inequalities and enabling people to fulfil their potential. There is a predominant use of traditional biomass fuels for cooking which impacts on health and contributes to environmental damage.

According to forecasts the need for energy is going to exponentially increase in the coming decades. For poverty to be addressed and sustainable development ensured, prioritization needs to be given to providing access to renewable energy through small scale decentralized energy projects. There is a particular need for this in many least developed countries. Giving undue prominence to large scale energy programmes for which the primary objective is not the provision of access to the majority must be treated with caution. In addition, the sustainability of controversial energy generating schemes such as biofuel, nuclear energy or hydroelectric must be assessed not only on their projected carbon emissions, but also on their social, economic and ecological impacts in both the short and long term.

Furthermore, to ensure that energy access will benefit people living in poverty the particular social, economic and environmental situations in those countries should be assessed and taken into account in establishing strategies and targets. The rights of communities must also be fully respected. Improving energy efficiency in industrialised

countries and helping developing countries to achieve efficient use of natural resources is also crucial to ensure sustainable development. Diversifying energy sources is important for energy security; over relying on one source of energy for power generation such as hydropower or imported fossil fuel cannot ensure sustainable access to energy. There is an urgent need to scale up investments in small scale decentralised energy projects, renewable energy and energy efficiency practices.

Policy coherence for sustainable development is also an important concept to take into account and comply with in this context; countries' energy needs and their strategy for ensuring sustainable energy supplies must not be pursued in conflict with the needs of people in developing countries<sup>15</sup>.

#### Social protection and justice

Social protection is recognised as an aspect of the right to livelihood and social security. In a number of developing countries social assurance schemes are being put in place, mostly for formal sector employees.

In most countries the majority of people remain outside the system, including those living in poverty, with the least security and most vulnerable. The promotion of decent work is an important part of the social protection agenda and encompasses a broad set of issues, but for most developing countries additional provisions will need to be put in place for all parts of society to be covered.

In the context of the preparations for Rio+20 social protection and equity can be seen as being critical for developing a Green Economy. A sustainable Economy cannot be achieved without involving all parts of a society, without empowering people, without educating people, without social justice and people subject to living in poverty. Social protection needs to be extended to all as a right, and not just to those in formal employment. The provision of universal social protection is a role in which the international community as a whole must take responsibility.

5. Going beyond GDP is imperative to correctly measure sustainable development The domination of GDP per capita as a principal indicator of a country's development is inadequate for assessing the well being of its population. New indicators that go beyond GDP need to be used in order to

These indicators should fully take account of and integrate the three dimension of sustainable development. Well being should be redefined and human and environmental health in addition to the quality of life and social equity should be measured. Further, while it is important to widen the concept of well-being beyond income, the sustainability component needs to be measured as depletion (or renewable use) of "assets". While this is not an easy task, science is well advanced in the case of the atmospheric "space" and its depletion by gas emissions and in the case of fisheries. Unsustainable production and consumption patterns can be identified and changes in them can be measured.

These should also build on already existing initiatives such as the Human Development Index, the Better life Index, the Basic Capabilities Index, the Stiglitz commission's proposals or the International System for integrated Environmental and Economic Accounting (SEEA), amongst others.

#### 6. Financing for sustainable development

Despite the world's current financial challenges significant levels of financing will be required from advanced countries for the implementation of strategies to achieve effective approaches to sustainability.

The private sector has an important role to play in this respect, within the context of a regulated framework, but this cannot be a substitute for public financing.

Commitment to achieve the development aid target of 0.7% of GDP by 2015 must be renewed; such promises need to be kept for developed countries to retain their credibility. The commitment for new and additional finance towards tackling climate change also needs to be recognised within this context.

New forms of innovative financing that have been under discussion for more than a decade can also be an important contribution towards the implementation of sustainable development strategies. The proposal for a financial transaction tax (FTT) should be taken forward, not only as a mechanism to generate financial resources but also as one means to reduce instabilities from speculation.

Ultimately the ability to effectively utilize much of these financial resources will rely on mechanisms that enable collective action to be pursued by the international community as a whole. These mechanisms need to operate with integrity and in accordance with principles underlying the concept of sustainable development.

Taxation systems need to be revised so that they promote sustainability. Taxation has an important redistributive role, and this needs to be encouraged in the outcome of the Rio 2012 conference. It can also encourage sustainability by penalising unsustainable practices and encouraging goods ones. These systems must be based on the principle that polluter pays, and all subsidies that undermine sustainable development must be eliminated. Sustainable practices must also be encouraged while more equitable distribution of the fruits of economic growth must be ensured. In developing countries, assistance should be provided to enable efficient tax systems to be put in place. In our current economic system too often taxation schemes favour unsustainable practices and contribute to increasing inequalities, this must change.

#### 11 7. The Role of the Private Sector in a Changing Economic Paradigm

Private sector actors are central to economic activity – as producers, service providers, and innovators.

They serve society, promote development and are crucially important for enabling a sustainable economy to be realised. Their ability to perform these roles depends on their viability, and on their ability to generate financial returns on their activities. Through their activities they contribute to the welfare of society, and respond to consumer demand. However, their need to remain viable and to generate financial returns does not automatically lead them to pursue sustainable practices. Recognition of the need for a regulatory framework is well established. The role of the private sector in promoting sustainable economies requires appropriate regulatory frameworks

Distinctions also need to be made between different actors within the private sector and the roles that they play. The role that small local enterprises play within their local community is very different from that of a transnational corporation with their leverage over markets, products, consumption patterns, trade rules, and indeed decisions taken by governments. Between these two extremes lie many variations.

Too often regulatory regimes in many countries are inadequate – in terms of environmental, social and financial policies. In addition tax systems are often not in place, ineffective, and/or distorted This enables private sector interests to be pursued, which are intrinsically driven by profit making, and which are not necessary compatible with sustainable approaches, or with promoting social justice. Some donor policies and current economic approaches tend to reinforce this situation, in part to encourage foreign investment.

For the contribution of the private sector towards sustainable development to be maximised there is a need for adequate regulatory mechanisms to be in place. A regulatory framework must ensure that private interests respect environmental sustainability. Modifying regulations so as to provide incentives that merely "encourage private green investments" without attaching obligations to private sector's activities (European Commission's communication) will not be enough. A proper assessment of human rights and environmental implications of present and future activities should be systematically undertaken, with appropriate actions being available to counter adverse results. In addition, solutions such as capital and trade regulations across all developed countries have yet to prove their validity and the first steps in that direction have been met

with financial speculation and abuse of the system leading to windfall profits for private agents.

Applying the UN principles of Corporate Social Responsibility, establishing independent control mechanisms and ensuring democratic accountability as well as implementing the UN "Protect, Respect and Remedy" Framework for business and human rights should be made mandatory at Rio2012. There is also a need to establish binding country by country financial reporting as an international standard applying to all multinational companies, to adopt automatic, multilateral information exchanges which take account of the needs of developing countries, and sanctions should be imposed on countries that practise banking secrecy and make transactions to such jurisdictions.

Sustainability will only be possible through promoting social and economic justice for all, and where public rights are given preference over corporate privileges. The rights of indigenous peoples require special attention, and the importance of their participation in debates and actions for sustainable development should be fully recognized and promoted, as stated in Principle 22 of the Rio92 Declaration on Environment and Development.

#### 8. The institutional Framework for Sustainable Development

The international community must identify goals, targets and indicators for sustainable development that are based on and incorporate the three dimensions of sustainability. It must also recognise the importance of achieving the Millennium Development Goals (MDGs) as an important essential step towards achieving sustainable development. The conference must recall the commitment to the achievement of the MDGs by 2015. New sets of commitments and goals for sustainable development should not be used as a substitute for the MDGs but build on them and reinforce the potential for their achievement. Reforms must be adopted that strengthen the international institutional framework so as to ensure the implementation of commitments by the international community. The global mechanism overseeing the implementation of sustainable development objectives should be strengthened by increasing the scope of its mandate and enhancing its capacity to ensure compliance with international commitments made on sustainable development. Such mechanisms must be transparent, accountable and adhere to democratic principles. They must encompass in a coherent manner the three dimensions of sustainable development and not favour one at the detriment of the two others.

This could include establishing an ombudsperson or commissioner to safeguard environmental and social conditions for present and future generations both at UN level and replicated nationally. At national level, ensuring better coherence and consistency between different policy portfolios such as trade, environment, economy, finance, development or social cohesion is a priority. The same applies at international level, linkages between institutions or organisations working on trade, development, finance or environment must be enhanced and an integrated, consultative and participatory approach to sustainable development must be adhered to. The participation of all stakeholders should be encouraged and ensured in all relevant fora and at every level.

#### 9. Conclusions

The recent crises have shown the limits of our economic model, one that has been promoted for decades by the world's most powerful nations. Despite increased trade and economic growth, inequalities between and within nations have not diminished but on the contrary have increased<sup>17</sup>.

Increased liberalisation will not deliver development, understood as a multidimensional concept encompassing economic, environmental and social progress, and even less sustainable development, a development where the notion of intergenerational equity determines the way policies are shaped and implemented.

On the contrary this model has led to increased instability, the emergence of multiple crises in part resulting from an inadequate global regulatory framework, an over emphasis on personal accumulation of wealth and inequitable global mechanisms, environmental degradation and increasing social inequalities. Our development model can only be sustainable by undertaking profound radical changes in the way we envisage economic development. The concept of the Green Economy is interesting through an environmental and economic point of view but it is too restrictive; it does not encompass the level of change needed for sustainable development nor does it sufficiently integrate the social dimension of sustainable development.

The structural imbalances in the global economic system that perpetuate inequalities and trap millions in cycles of poverty must be addressed. Redistributing power and putting in place democratically managed control and regulatory mechanisms that seek to enhance and protect public rights as opposed to corporate privileges are of crucial importance.

The purpose of policy should be to put people at the centre of any strategy and to ensure social, economic and environmental security. Sustainable development needs a proper balance between the three pillars of sustainable development and promoting equity. This will not only address poverty and contribute to economic development but has the potential to reduce conflict and foster increased tolerance. Sustainable development in all its manifestation must be central. A nation's policies should promote sustainable development without undermining that of other nations.

Rio2012 is an important opportunity to build on past commitments and secure their implementation. Governments need to recognise the urgent need to effectively address the challenges of past and present unsustainable practices and to commit to the far reaching changes that are necessary to place human development and environmental protection at the core of international relations and of the development model.

Contributions from stakeholders should be taken fully into consideration to ensure a good outcome at Rio2012. Unsustainable practices affect all of us and enhancing citizens' and stakeholders' participation is a key principle of sustainable development (principle 10).

Adopting binding internationally agreed time bound commitments and strategies for their achievement must be the ultimate objective of the Rio2012 conference. To achieve this requires the involvement of government leaders at the highest level. Countries must be represented at the level of Head of State and/or Governments in order to give the conference the importance it deserves.

October 2011

---

## EvK2CNR

Mountains around the world supply a considerable number of ecosystem services of which we know partially the potential. In Italy, for example, mountain regions contribute about 20% to GDP. In order to recognize, value and capture of benefits deriving from mountain ecosystem services, and anticipate the threats to which they might be exposed it is important to constantly monitor in a rigorous and scientific way the natural capital from which these services are produced in order to preserve their flow. Italy, through Ev-K2-CNR, is contributing to this endeavour at the international level with the SHARE Project (Stations at High Altitude for Research on Environment).

Mountains host a wide range of ecosystems, different in quantity and quality and generally in a good state of conservation. These differences are so many that they are recognizable from regional scale down to valley level. This kind of richness in terms of diversity stands as a warning light to escape from the temptation to find monocausal explanations.

Considering the need of a reliable valorisation and preservation of the Natural Capital in mountains and also the abovementioned ecological, economic, and cultural diversity

(Human Capital) of the global mountain systems, it is recommended to establish regional centres of excellence and knowledge since approaches to Green Economy in mountains shall be designed according to local conditions and must be context appropriately, taking into account the specificities such as environmental fragility, vulnerability and low economies of scale. The creation of a network of multilevel integrated databases on global, regional and local scale with standard, reliable and certified data on Natural and Human Capital will represent a fundamental tool for the calculation of the economic values and the identification of the different development models.

## FAIR & Sbilanciamoci

### INDICATORS FOR A MORE SUSTAINABLE AND INCLUSIVE WORLD

Joint signature by FAIR and Sbilanciamoci!

The world is faced with more and more urgent major challenges questioning the living conditions of humanity, first of all the climatic disorders, but also the lack of very unequally distributed resources, water, food, energy. The Rio+20 conference offers an opportunity to mobilize, collect and coordinate national and international wills to move towards the solution of these challenges.

To do this, we need multiple indicators, economic, ecological and social ones, to fight against thirst, starvation, the multiple dimensions of poverty, environmental pressure, and for the respect of human rights. Widely available indicators (GDP) or biased ones (ANS, Adjusted Net Savings) are in fact irrelevant to take these challenges into full account, either to alert the world opinion, or, finally, to guide and coordinate the national and international policies needed.

Early in the 2000s, the FAIR (French acronym for Forum for other indicators of wealth) and Sbilanciamoci collectives have been thinking and acting on indicators of wealth, inequality, welfare and sustainability. We will mention quickly the extent of the shortcomings of the dominant indicators (1). Then we will consider the method to select more relevant indicators in order to alert the public opinion and to guide national and international policies (2). Finally, for some global issues, we will suggest first possible indicators in order to bring them under discussion (3). At the end of this document, we rapidly develop some complementary points and specify what the FAIR and Sbilanciamoci collectives are.

#### 1 Inadequate or misleading monetary indicators dealing with global challenges

Monetization, or evaluating with the same monetary unit, seems, at first sight, to be a very convenient tool for making commensurable goods and services that enhance the well-being (which is a positive aspect), and deterioration of the natural heritage or pollution due to production and transportation (which is a negative aspect). But at the same time it is a dangerous instrument because it develops the fiction that it is possible to make equivalent, and thus to add very different dimensions of well-being or ill-being. Even worse, monetization gives the illusion that it would be possible to compensate these damages to the environment through investments or additional consumption. But such valuation conventions are the basis of the dominant economic indicators, like GDP (and their more or less green variations) and the ANS, which add quite dissimilar values and so, may mislead us about the meaning of progress.

##### The GDP and its growth

Therefore we consider that, whatever the potential statistical usefulness of GDP in its domain of validity, it should not serve as a benchmark for policy-making, since it does not make a distinction between useful and harmful production. Moreover, the GDP indicator has contributed to conceal a number of major threats, including the environmental degradation that has spawned the ecological crisis and climate change to which the whole of humanity is now exposed. We welcome the fact that a number of renowned economists have underlined several of this indicator's drawbacks and expressed their criticisms of the GDP growth objective, which has made a major contribution over the last few decades to pushing our societies against the wall which now stands in our way.

##### The Adjusted Net Savings (ANS) and the "green GDP" expressed in monetary units.

These indicators may draw the attention of the economists who tend to evaluate everything in money. We believe that these indicators are inadequate to face the challenges of sustainability, not transparent and incomprehensible to non-specialists. They would necessarily lead to the same mistakes as those resulting from the excessive use of GDP. You should know that because of the assumption founding these composite indicators (the total substitutability between the economic, human and natural capital), countries that follow clearly an environmentally unsustainable path (China, USA) obtained much better results than poorer countries with low environmental footprint!

#### 2 How to choose appropriate indicators?

We have to build benchmarks for another world and for the transition. They must have a high legitimacy and they therefore cannot be defined from above even by the most renowned experts. We must thus dig in the participatory and deliberative democracy to define and to choose them. To do this, the right to speak up has to be given to the citizens involved (NGOs, trade unions, movements and civil society networks). It is up to such collectives to say what accounts, what can emancipate, what core values should underlie politic, economic, social and environmental choices, and what the indicators must be considered in order to lead us in the right direction.

#### 3 Some first proposals for possible indicators to put in the debate

FAIR and Sbilanciamoci do not intend to propose a list of solutions. This would be contrary to their approach favoring an indicator democracy. But as part of the involved civil society, we wish to point out the indicators that in our opinion deserve attention in the context of RIO + 20 and could be put into debate.

- National indicators of greenhouse gas emissions (per capita and total) in CO2 equivalent, using the method of "carbon footprint" of a population, which accounts for the "carbon imported" by the population (See for example <http://data.worldbank.org/indicator/EN.ATM.CO2E.PC> )
- A composite indicator of environmental pressure: the ecological footprint (per capita and total) for the major renewable resources converted to "global hectares" or to "global acres" (cf. tables of ecological footprint and biocapacity, 2007, in [http://www.footprintnetwork.org/en/index.php/GFN/page/footprint\\_for\\_nations/](http://www.footprintnetwork.org/en/index.php/GFN/page/footprint_for_nations/))
- Indicators of water consumption, according to the "water footprint" method considering "imported water".
- Indicators of deforestation.
- Physical indicators of biodiversity (see the EU report entitled "Halting the loss of Biodiversity by 2010: Proposal for a first set of Indicators to monitor progress in Europe", EEA Technical report No 11/2007" in: [http://reports.eea.europa.eu/technical\\_report\\_2007\\_11/en/Tech\\_report\\_11\\_2007\\_SEBI.pdf](http://reports.eea.europa.eu/technical_report_2007_11/en/Tech_report_11_2007_SEBI.pdf)).
- Indicators of malnutrition and of the degree of populations' food security. See for example: <http://www.combat-monsanto.co.uk/spip.php?article478> .
- Indicators of national energy consumption (per capita and total) and the degree of energy dependence and sovereignty of the people.

- Indicators of rights and freedoms for all, drawing particularly from the proposals of the ILO Decent Work. (<http://www.ilo.org/integration/themes/mdw/lang--en/index.htm> , and <http://www.emploi.belgique.be/moduleDefault.aspx?id=23882>) and from the ideas of the Stiglitz Commission on this point.

- Indicators of income inequality such as the Gini index and indicators assessing the level of the informal economy in each country.

- Indicators of inequality and human poverty, including for example the Inequality-adjusted HDI (IHDl) and the Gender Inequality Index (GII) from the UNDP (Human Development Reports in the world, see the latest edition 2010, <http://hdr.undp.org/en/reports/global/hdr2010/> ).

## COMPLEMENTS

### About FAIR

The FAIR (Forum for Other Indicators of Wealth) Collective gathers some fifty scholars and activists thinking critically on the issues of the economic and societal progress indicators. The Stiglitz Commission was set up in 2008 by the French President to explore the limitations of current measurement indicators of socio-economic performance. FAIR was formed following the establishment of the Stiglitz Commission in order to ensure that existing work on these issues is taken into account. It also aims at ensuring that civil society is broadly involved in the Commission's deliberations.

FAIR actors state, in the conclusion of their manifesto translated into several languages and adopted in early December 2008: « It's by giving meaning to non economic trades and to "what matters the most for us" that we will be able to redefine the notion of wealth, to refund sharing rules, but also how to account or to redistribute in an appropriate way. We will be able to restore its fair place - not the whole place - to the economy. »

See for more information <http://www.forum-fair.org/>

### About Sbilanciamoci

Sbilanciamoci is an Italian coalition of 50 civil society organizations working on economic alternatives, globalization, peace, human rights, environment, fair trade and ethical finance. Since 2000, Sbilanciamoci has developed an alternative regional indicator called QUARS and, each year, applies it to elaborate an annual report reviewing the Italian Budget Law and to develop alternative proposals about how to use public expenditure for society, environment and peace arguing for social and environmental priorities. Sbilanciamoci! promotes national debate through the weekly web journal sbila

nciamoci.info. See for more information <http://www.sbilanciamoci.org/about-us/>

### An assessment of the Stiglitz Commission Report according to FAIR

The FAIR collective welcomes the publication of the report from the "Stiglitz Commission", formed on the initiative of the President of the French Republic. Overall, this report sends out a useful signal in as much as it calls into question the excessive dominance of GDP as an indicator to guide public policy.

However, two aspects of the report remain highly problematic. First, the report's conception of sustainable development is focused on the specific needs of future generations while ignoring two essential elements: on the one hand, the current unbearable social impact of the economic policies in place and, on the other hand, the demands of governance and democracy that should be taken into account in global wealth indicators.

The second problem concerns the role played by monetized indicators, which is excessive in our view. This is particularly the case of a proposed indicator derived from Adjusted Net Savings (ANS, developed by the World Bank), which is poorly suited, lacking in transparency and ungraspable for non-specialists. It would necessarily lead us to fall into the same misguided ways as those we should be seeking to correct. The report has been compiled as if the make-up of the Commission had rendered it unable to put into perspective what monetary accounts can tell us about human progress and "sustainability".

More information concerning the FAIR's statement on the Stiglitz Commission Report in: [http://www.idies.org/public/FAIR/FAIR\\_release\\_english.pdf](http://www.idies.org/public/FAIR/FAIR_release_english.pdf)

## SOME ASSESSMENT OF THE ANS AND GREEN GDP ACCORDING TO FAIR

### The "Green" GDP and other monetized indicators

One of the ways suggested to go beyond GDP is an improvement of the system of national accounts in terms of social and human progress and sustainable development objectives. At the forefront of these initiatives, "green GDP" is an extension of the GDP to which monetarily expressed variables are added or subtracted.

Although several of these indicators monetarily assess the cost of the environmental degradation and resources depletion, they are not in themselves synonymous with sustainability. They do not explicitly indicate the distance which separates the current situation from a goal of sustainability. The Adjusted net savings (ANS) claims to bridge this gap. This sustainability indicator developed by the World Bank aims at measuring the net change in wealth over a year. Derived from the traditional measure of gross national savings (share of national income not consumed during the year), ANS deduces an estimate of the consumption of fixed capital, the estimate of the depletion of natural resources and damage due to global pollution. The current expenditures in education are added to reflect the investment in human capital. As in the Green GDP, the value of changes in wealth is monetarily valued. For its promoters, a negative ANS launches a signal of over-consumption of capital in relation to a goal of sustainability. It is nevertheless a great mistake.

In fact, these indicators assume that the various capitals can be substituted to one another. In doing so, they are part of a "weak sustainability" approach, where the physical constraints of the ecosystem, easily violated by investments and technological improvements, somewhat contribute to shape collective and individual behavior. Other indicators, like the Ecological Footprint, are based instead on stronger sustainability conceptions.

These radically different visions might explain that many advanced economies accumulate a huge ecological debt, according to their Foot Print, even though their ANS presents them as sustainable.

### What monetary value to assign?

Both the "green GDP" and the ANS share a monetary unit of account. Summing monetary variables is often presented as a less arbitrary mode of aggregation than bringing together variables with assigned weights in a composite heterogeneous variable. Though, monetizing is often more questionable than explicit and democratic weighting.

First of all, currency means price. But giving a price to goods and services whose nature is not to be monetary exchange objects (domestic work or volunteer services, ecosystem services, etc.) is just as arbitrary as to grant them an explicit weight. Secondly, even in the case of market exchange, prices do not always take into account the whole costs for the society: for example, prices of goods that generate negative externalities underestimate these costs. Thus the economic value poorly or wrongly reflects social wealth. More fundamentally, can we reduce everything to a quasi-monetary value, with the risk, especially, of reducing the natural patrimonies of goods, gifts and activities to paid services? The choice to monetize is not neutral because in this choice the market is supposed to provide the central point for determining the monetary value

and thus the price of activities and assets.

However, determining the well-being that goods and activities bring to the society is not the exclusive characteristic of markets! Other methods, much more democratic, are needed, opening up the possibility of assessing their positive or negative impacts, including environmental pressures through the ecological footprint.

#### The limits to monetizing the living

The biological richness is largely ignored by our indicators of monetary wealth. Strictly speaking, as a 2005 United Nations report said, "a country could devastate its forests and deplete its fisheries resources, this would only show an increase in GDP despite the obvious loss of natural capital" (Millennium Ecosystem Assessment, 2005). Some people, like the banker Pavan Sukhdev (2008), do not hesitate to say that this lack of monetary value of nature "is one of the underlying causes of its degradation." With the monetary valuation (PES, Payments for Ecosystem Services), the ecosystem services become externalities since they provide benefits which are not paid for. Payments for ecosystem services fail to account for value in a broader sense, beyond monetary value, and obliterate other social and ecological qualities. Finally, giving payments for ecosystem services disregards ecosystems complexity in order to facilitate market transactions based on a single exchange value (and imposes a market-driven conservation for biodiversity).

Several studies have provided findings these last years. Following the Stern Report, which has been trying to assess the global warming medium and long-term cost, the Sukhdev report (commissioned by the European Commission), or also the Chevassus-au-Louis report (2009) (commissioned by the French Government), have recently supplied the news. The Sukhdev report estimated for example that the current changes of terrestrial and aquatic ecosystems, as a result of human activity, could eventually cost \$ 100 billion a year and destroy 27 million jobs.

However, the process of giving a monetary value to nature finds its limits. The evaluation of actual services provided by nature, such as crop pollination by bees (that a group of researchers recently estimated at \$ 150 billion per year, Gallai and al., 2009), might go on. But the process becomes more difficult in the case of values less directly related to production: how much, for example, is the estimated loss of a living species that has no market value, directly or indirectly? In order to answer this question, economists often use surveys based on the populations' willingness to pay: the estimated value is based on the average price that people interviewed are willing to spend, for example, for preserving a species or protecting a medium. These valuation methods are the subject of criticism (Milanesi, 2010).

Many aspects are very difficult (or impossible) to accurately assess with a monetary approach. This approach may thus be limited, still for a long time, to a utilitarian approach, focusing on its service to the human economy. However, the report of the Millennium Ecosystem Assessment (2005) is unambiguous in this regard: why we want to protect biodiversity will largely determine the degree of protection that we will choose. Non-utilitarian and non-monetary values set more ambitious conservation objectives than utilitarian values do. What we do for biodiversity is therefore a societal choice, not just an economic choice.

## FAIRTRADE International

Contribution to Rio + 20 United Nations Conference on Sustainable Development

#### About us

Fairtrade is a global movement with a people first approach to trade. We tackle poverty and injustice by offering producers a better deal and an opportunity to improve their lives and invest in their future. In 2010 around 1.2 million farmers and workers in over 60 countries benefited directly from Fairtrade sales.

Fairtrade also offers consumers a powerful way to reduce poverty through their every day shopping. The international FAIRTRADE Certification Mark is the most widely recognized ethical label globally. Products carrying the FAIRTRADE Mark have met Fairtrade Standards, which are designed to address the imbalance of power in trading relationships, unstable markets and the injustices of conventional trade.

Fairtrade International (FLO) is an independent, non-governmental, not for profit organization working to secure a better deal for producers and is part of the wider Fair Trade movement<sup>1</sup>. Fairtrade International sets international Fairtrade Standards, organizes support for producers around the world, develops global Fairtrade strategy, and promotes trade justice internationally. For more information see [www.fairtrade.net](http://www.fairtrade.net).

#### Introduction

The resolution that endorsed the Earth summit 2012 re-affirms that "changing unsustainable patterns of production and consumption (...) are overarching objectives of and essential requirements for sustainable development". It further reiterates that "fundamental changes in the way societies produce and consume are indispensable for achieving global sustainable development and that all countries should promote sustainable consumption and production patterns, with the developed countries taking the lead and with all countries benefiting from the process (...)".

The Brundtland report already spelt out the clear link that exists between sustainable consumption and sustainable development. Although this link was reinforced in Agenda 21, there has been no shift in our consumption patterns in the last few decades. Unsustainable production and consumption patterns have led to severe environmental and social degradation. Moreover, the current economic model allows grossly inequitable trading relations to continue and fails to eradicate hunger, deliver sustainable livelihoods or development opportunities to people in developing countries. A "race to the bottom" ensues, with the environmental and social effects all too apparent.

More and more consumers are bucking the global trend and, through their daily purchases, are supporting schemes like Fairtrade that give farmers and workers better terms of trade, enabling them to improve their production practices, have more stable incomes and invest in their communities. Through Fairtrade, producers are able to access markets that recognize their efforts to improve their social and environmental practices, but that also recognize them as equal trading partners.

As the summit approaches, the proposals to move towards a green economy (in the context of sustainable development and poverty eradication) are welcomed. It is concerning, however that although everyone agrees that sustainability is an economical, environmental and social issue, the focus still lays chiefly on environmental matters. The current argument is that human-wellbeing will increase at the same time as the move towards a green economy takes place. Reality shows however that this is not the case. Principle 5 from the Rio Declaration on Environment and Development states: "eradicating poverty is an indispensable requirement for sustainable development".

#### Fair Trade as best practice

The increasing popularity of Fair Trade in the last two decades shows people's appetite to consume more sustainably from an economical, environmental and social point of view. It also demonstrates that a different economic model is possible. Rio + 20 presents a unique opportunity to change the trajectory of current consumption and production

patterns.

On sustainable production

At the end of the supply chain, producers feel the pressure to deliver goods and services at increasingly low prices. But sound environmental and social production practices can only be achieved when they are economically feasible.

We call on governments to

- Promote the achievement of sustainable livelihoods through the payment of fair prices and the empowerment of small scale men and women producers as a keystone to achieve a sustainable and humane food system.
- Promote producers' access to trade under Fair Trade conditions and facilitate access to schemes such as Fairtrade, which empower producers to trade their way out of poverty.
- Support the creation of an enabling environment that allows Fair Trade producers to comply with market expectations in a greener economy through appropriate funding mechanisms (i.e. funding for adaption to climate change).

On sustainable consumption

In the context of a green economy, the sustainable consumption agenda focuses on the need to minimize the environmental impact without considering the possibility to maximize the social and economic impact of our purchases. The plight of disadvantaged producers in developing countries, particularly small scale men and women farmers, continues to be an important global issue as poverty and inequality abound. We call on governments to

- Acknowledge that sustainable consumption needs to consider the minimization of the environmental impact of purchasing decisions as well as the maximization of the social and economic impact of our purchases.
- Implement national sustainable procurement policies that include sourcing Fair Trade products. Fair Trade procurement guidelines pertaining to cotton uniforms, food, and beverage products need to be included in the traditional government procurement policies, and complement green procurement at the national and sub-national scale.
- Promote mutual supportiveness between trade and sustainable development, providing positive incentives for Fair Trade products or products that comply with certain environmental, social and human rights standards, in particular by ensuring fair revenues for producers and living wages for agricultural workers.

On the role of the private sector in sustainable development There is an increased expectation and support to the private sector as an actor to deliver sustainability outcomes.

We call on governments to continue supporting

- The private sector's role in development under the premises that it contributes to the human development of the people living in the areas where these interventions take place. In particular, we call on governments to prioritize the involvement of women and men smallholder farmers and other small scale private actors in such partnerships.
- Credible, transparent, multi stakeholder governed and owned certification systems like Fairtrade Trade can deliver sustainable outcomes, but only if an international, enabling policy environment is put in place to foster partnerships between all actors. This includes not only national governments but also local authorities, consumers and the private sector in global supply chains. We call on governments to send their Heads of State or Government to Rio + 20, and commit themselves to the above mentioned "Calls on Action".

## Faith based organisations, by Franciscans International

This joint statement is the contribution of a coalition of faith based organisations<sup>1</sup>.

The Rio+20 Conference will take place at a crucial moment when our global community is facing a multidimensional crisis.

We reaffirm the importance of Principle 1 of the Declaration of Rio which states "Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature".

We also recognize that all human beings are part of an ecosystem comprising all living beings on earth, therefore both humans and nature must be at the center of our attention, when we work for human development in a sustainable way. All living beings are entitled to a healthy and productive life in harmony with each other.

We stand for a holistic and ethical approach. The human person is a created being, as are nature and all its creatures. Not only are men and women good, but so too are all created beings and ecosystems. The Earth and cosmos don't belong to humanity but to God. Men and women need to be responsible for caring for creation.

Abuses committed because of arrogance and greed lead to injustice which results in suffering for all creation. In the context of a liberal market ideology, everybody works for his/her own interest primarily. Some will profit and many others will not. As long as free markets and maximization of profit are the only agreeable basis for a market economy, greed and non-solidarity are necessary prerequisites for its functioning.

(1. faith based organizations: Franciscans International, Congregation of Our Lady of Charity of the Good Shepherd, Dominicans for Justice and Peace (Order of preachers), Edmund Rice International, Daughters of Charity, Vivat International)

We draw two criteria from this perspective: justice and the common good. Recognition and respect for the legitimate rights of individuals and peoples are at stake. The common good is "the good of all of us, made up of individuals, families and intermediate groups who together constitute society. It is a good that is sought not for its own sake, but for the people who belong to the social community and who can only really and effectively pursue their good within it. To desire the common good and strive towards it is a requirement of justice<sup>2</sup>. We highlight the need to link environmental issues with the common good. In order to take into consideration individuals as well as peoples, it is necessary to use a human rights based approach.

### OUR CONCERNS

The mainstream economic system is a market-based approach. Any single good is commodified. In the same logic, the human being is trafficked. Economic wealth is not the

only value. You cannot trade the value of a forest or a human body.

The “business as usual” system is predominant and contravenes strongly the Rio Declaration statement:

“All states and all people shall cooperate in the essential task of eradication of poverty as an indispensable requirement for sustainable development, in order to decrease the disparities in standards of living and better meet the needs of the majority of the people of the world.”<sup>3</sup>

Our statement addresses the theme: “Green Economy and the eradication of poverty”.

UNEP currently states: “For the purposes of the green Economy Initiative, UNEP has developed a working definition of a green economy as one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities”.

The Green Economy, while positive in principle, raises some concerns.

Economic growth is not the problem. The economy needs to generate benefits. The concern is about equity and shared benefits. “The world's wealth is growing in absolute terms, but inequalities are on the increase. In rich countries, new sectors of society are succumbing to poverty and new forms of poverty are emerging. In poorer areas some groups enjoy a sort of ‘super development’ of a wasteful and consumerist kind which forms an unacceptable contrast with the ongoing situations of dehumanizing deprivation. The scandal of glaring inequalities continues”<sup>5</sup>.

The Green Economy should be regarded as a mechanism which addresses social issues for eradicating poverty and environmental protection, rather than as a particular type of economic system. Climate change increases this growing chasm of inequality. It also calls all peoples to a new degree of partnership, where traditional knowledge is valued and where scientific knowledge is shared.

This will require the implementation of the Principle of Common but Differentiated Responsibilities (Principle 7 Rio Declaration). This will enable less developed countries to make a technological leap, bypassing environmentally harmful stages of the development process, and moving directly to green technology.

We are living in a world with limited material resources. The production of ever more goods and services is only possible at the risk of the collapse of the earth's ecosystems as such. Green Economy must address the question of production and consumption patterns.

As environmental issues are global in scope, States need a system of global governance to develop and adopt a common policy on Sustainable Development, so as to ensure an effective implementation by public and private actors.

As the world has been experiencing a series of global crises, for instance the food crisis, banking crisis and is beginning to feel the effects of the climate crisis, it is crucial that we seek to protect the most vulnerable from shocks that affect their livelihoods and their rights to development and wellbeing. The provision of a social protection floor ensuring access to cash transfers and social services is an essential element of a comprehensive sustainable livelihood approach to development in the 21st century.

Access to information, public participation in decision-making and access to justice on environmental matters (Principle 10 of Rio Declaration) is a prerequisite to empower peoples, to respect self-determination, and to promote a rights-based approach. Women should be part of the process equally with men. In many countries, they are the custodians of the family, of the environment, and of traditions (Principle 20 of Rio declaration).

The United Nations Declaration on the Rights of Indigenous Peoples advocates “free, prior and informed consent” (Article 19) to recognize indigenous peoples' inherent and prior rights to their lands and resources and to respect their legitimate authority to require that third parties enter into an equal and respectful relationship with them, based on the principle of informed consent.

## OUR RECOMMENDATIONS

- 1) We call for an ambitious strategy and fundamental reforms which will fill the gap of lack of accountability of governments in implementing agreements and meeting their international responsibilities to address Human Rights obligations.
- 2) We call for all States to put in place a social protection floor for people living in poverty.
- 3) We call for the equal participation of women in all decision-making processes.
- 4) We call for all States to implement the Principle of Common but Differentiated Responsibilities.
- 5) We call for a renewed framework which will take into account the free prior and informed consent of Indigenous Peoples in all policies that affect them, at local, regional and national level.
- 6) We call for all States to recognize the inherent value of every human being and of the natural environment.
- 7) We call for all States to ensure that the shared benefits of the economy assure the common good and are not merely for personal profit.

---

## Farmers

Farmers Major Group Submission to Rio +20

### Introduction

Farmers represent one-third of the world's population and one-half of its poor. Support for farming contributes to social and economic growth, including reducing poverty and hunger in developing countries, and fostering rural development and employment. Farmers and fisherfolk provide multiple goods and services to society, such as production of food, fibres, delivery of ecosystem services, and land stewardship.

### Call for Action

1) Increase the proportion of overseas development assistance focused on agriculture and rural development to 20%. Encourage countries to meet their commitments in IqAquila, CAADP (Comprehensive Africa Agriculture Development Programme), and other regional commitments. Reduce poverty by supporting smallholders since farmers represent one half of the world's poor and despite high profile promises, woefully few resources have truly begun to flow to help farmers break the poverty cycle. Agriculture and rural development must be treated in a holistic manner including establishing enabling conditions for investments for sustainable development in rural areas, which prioritize the needs of small scale food producers, including women, indigenous peoples, peasants and the rural poor.

- 2) Use a knowledge-based approach of best practices that sustain production and minimize the negative impacts of farming activities on the environment. Committing to increasing support for participatory approaches to farmer-to-farmer training, and participatory extension systems. Modern extension services must increase their capacity for two-way information sharing between experts in research and farmers themselves who have essential information on farming. Research and extension should be functionally linked and there should be pluralism in the approaches to implementing this form of education. Mobilisation of the scientific, donor, business, NGO, and farmer communities are needed to improve knowledge sharing. Recruiting, training, and retaining young people to farming and agricultural sciences is essential.
- 3) Develop new approaches to reward farmers for ecosystem services that also foster sustainability and address poverty by enabling smallholder farmers to break the subsistence cycle and include women farmers in these approaches.
- 4) Rural Women need equitable access to secure land tenure; programs to address poverty, worklessness, and poor educational options; foster value added and collective marketing options; and increase their participation and representation in farm organisations and politics. Women account for 60 to 80% of peasant growers and produce 90% of food in Africa and about half of all food worldwide. Yet in sub-Saharan Africa, only 15% of landholders are women and they receive less than 10% of credit and 7% of extension services. Policies that address gender inequalities could, conservatively, increase yields on women's farms by 2.5% to 4%.
- 5) Guarantee the rights of farmers to participate in decision making processes in all aspects of agriculture processes including research, production, distribution, pricing, marketing, standard setting, policy making and regulation of the agricultural commodities market, and empower them to exercise these rights.
- 6) Agriculture must be enabled to nourish all people and communities, both today and in the future, with healthy, diverse and culturally appropriate food that respects animal welfare and the integrity of natural ecosystems at both the local and global level.
- 7) Prompt the creation and development of regional, national and local agricultural policies, in collaboration with representative farm organisations. These must be able to provide a framework adapted to developing sustainable agricultural production, to mobilise investment, accompany the development of local production, open up rural areas, ensure the viability of agricultural activity which guarantees a fair income for farmers, the installation of young farmers and the renewal of generations and strengthens farm organisations.
- 8) At the same time, the reduction of post harvest losses, food waste and excessive consumption are essential to improve health and reduce environmental damage. Today, the average adult in an OECD country eats an unnecessary and unhealthy extra meal each day (roughly an extra 750 Cal). About 25% of the energy and water and the associated greenhouse gas produced used in OECD countries is wasted. At least 50% of OECD adults are overweight or obese. Obesity costs the OECD states almost \$300 billion per year an amount that is more than enough to meet all of the Millennium Development Goals by 2015, with around \$100 billion leftover.
- 9) Ensure small scale food producers, pastoralists, indigenous peoples, peasants and the rural poor are provided with enhanced access to information as a basis for decision-making; access to justice; and free, prior and informed consent for both policy development and implementation actions on the ground, including issues that pose a threat to local food security and tenurial rights such as land-grabbing.
- 10) Reference the recent and successful work of CSD-17 as negotiated text and develop means to implement the outcome. Agriculture and the Green Economy All three aspects of sustainable development social, economic, and environmental remain equally important. The goal must be to: continuously improve agriculture around the world through knowledge sharing to improve the lives and livelihoods of farmers while reducing the footprint of farming.

#### The social aspect

Achieving Millennium Development Goal #1 of alleviating poverty and hunger demands a focus on agriculture to:

- Develop policies with farmer-centered approaches;
- Understand, analyze, and appreciate the knowledge of farmers at the local level;
- Focus research on farmers' needs and involve participatory processes with farmers;
- Popularize new policies, extension programs, practices and technologies to beneficiaries in their languages and considering the farmers' level of education;
- Ensure that investments made in agriculture must be beneficial to local communities;
- Develop special, culturally-sensitive programs for women smallholder farmers and indigenous communities;
- Engage youth in current social and economic transformations, including farming;
- Increase access to health and social services in remote areas;
- Fight against all kinds of social inequalities.

#### The economic aspect

Considering the fact that farmers feed the planet and contribute to the world economy, it is shocking that they are the first victims of food insecurity and chronic poverty. Accordingly, policy makers must:

- Empower farmers in organizational frameworks and encourage them to organise in marketing groups;
- Evaluate agricultural improvement not only in terms of production but also in terms of farmers' income indicators;
- Analyze and take care of their decisions' impact on local farmers;
- Consider the impact of the agricultural sector on national economies, and allocate budget to this sector matched with its real value;
- Reduce administrative costs of agricultural programs so that beneficiaries can benefit from them;
- Ensure international and regional markets don't impede local ones;
- Develop infrastructure in rural areas where agriculture is done.

#### The environmental aspect

It is vital to safeguard our natural resources such as land, water, air, forests, animals and others. So, human beings have to:

- Control exploitation of natural resources;
- Increase resource efficiency, particularly of nutrients and water;
- Create a better collaboration with farmers, the scientific world and environmental policy makers;
- Use practices which improve our biodiversity, soil quality, and watershed management;
- Encourage breeding and production of underutilized crops;
- Foster sustainable and humane livestock management and encourage good animal husbandry;
- Focus research on new practices which address climate change, sequester and store carbon in the soil and reduce releases from waste materials and energy sources;
- Clearly explain environmental issues in easy terms understandable by a farmer;
- Regularly inform farmers on weather conditions to allow them to plan their farming activities accordingly;
- Respect equity and equality principles on natural resources use and benefits.

#### Governance

1) Sustainable Development is a valuable concept that requires a unique mechanism for governance linked to ECOSOC. It is important to remain focused on approach that integrates all elements of sustainable development.

2) Science and scientific review and research are vital to policy development in sustainable development and sustainable agriculture. This is needed in international, regional, and national policy making and decisions should be science-based. Research is needed into all forms of agriculture and respecting traditional knowledge. Funding for community-based knowledge systems, such as participatory extension services, must receive equal priority to agricultural research and development, both public and private.

3) UN specialist agencies, such as FAO, IFAD, and WFP, must retain leadership in their areas of core expertise. Agriculture requires better co-ordination throughout the UN system under the leadership of the specialist agencies.

#### Emerging Issues

1) Disaster Risk Reduction is more than forecasting disasters. It is creating resiliency to cope with change and challenge. A particular focus is needed on disaster risk reduction for smallholder farmers and those affected by long and short term climate change.

2) Drought and Desertification is increasing. Programming must support better rain water harvesting, more efficient use of water in agriculture, and crops better adapted to dryland conditions. Targets for reclamation of lands are essential.

---

## Farming First Steering Committee

Agriculture for a Green Economy: improved rural livelihood, reduced footprint, secure food supply

The transition to a green economy is fundamental for addressing the social, environmental, and economic pillars of sustainable development.

As a sector, agriculture is essential to the green economy. With a predicted 9 billion people by 2050, agricultural production will have to increase to meet new demands, for food, feed, fuel and fibre.

Agriculture must not only meet demand – it must also do so while minimising its environmental footprint and creating sustainable livelihoods for farmers and others along the supply chain. In a time of food insecurity and with the largest share of its population in developing countries living in rural areas, the world cannot afford to ignore the potential of agriculture to achieve the triple goals of a secure food supply, poverty reduction through improved rural livelihoods, and environmental sustainability through reduced footprint of production and climate change adaptation.

Agriculture by nature represents a mosaic of solutions and practices, focused on farmer needs and knowledge sharing. Sustainability is a moving target towards which farmers in different geographies and farming systems are already moving and they will need support to continuously improve.

Agriculture for a Green Economy:

improved rural livelihood, reduced footprint, secure food supply

Agriculture in a green economy means a broad-based, knowledge-centred approach to agricultural development. Key to achieving this goal is a focus on:

- Addressing implementation gaps through support for knowledge sharing; and advisory and training services;
- Ensuring agricultural policies are based on science;
- Supporting productivity through innovation and best practices.

The Farming First coalition supports the implementation of the outcomes of CSD17 on agriculture as the basis for any outcome on agriculture for Rio+20.

#### 1. Reducing Poverty

Agriculture can be a potent driver for poverty reduction. The World Bank estimates that GDP growth from agriculture generates at least twice as much poverty reduction than any other sector. Currently 65 percent of people in developing countries are involved in agriculture. 1.3 billion of them are small farmers, with limited access to inputs, infrastructure and markets<sup>1</sup>. In countries where agriculture represents one of the primary livelihoods, concerted efforts to improve productivity through sustainable practices could change the lives of millions.

A dynamic and productive agriculture sector is also essential for the urban sector. In 2010, for the first time ever, more people lived in urban areas than in rural areas globally. Urban populations are dependent on the agricultural sector for most of their consumption, so improving local production and trade is crucial; but it also means a world of opportunities for farmers who can reach the urban market.

Making agriculture a dynamic sector will require the adoption of supportive frameworks and investment in infrastructure and markets. Farmers need to be able to access markets at the local, regional and global level in order to sustain a livelihood from their activities. In some areas, this means improving access to transport, storage and market

facilities. In Tanzania, US\$2.4 billion of investment is being directed towards tripling the area's agricultural output and maximising the trade potential of the Dar es Salaam port for Tanzania's neighbouring landlocked countries. Through the Southern Agricultural Growth Corridor of Tanzania project (SAGCOT), both public and private sector organisations are supporting 20,000 smallholders to become commercial farmers to bring in annual revenues of an estimated US\$1.4 billion into the country.

Access to weather and price information and improved seeds also helps farmers grow better crops and sell at better prices. For instance, in India, a late December harvest of mustard seeds was causing up to 30 percent of crop to be lost to frost, so breeders worked on a seed with a shorter duration period. This enabled farmers to harvest in early December, avoiding the issue of frost. Farmers also benefited from better prices as they were able to bring their seeds to the market before the usual excess occurred in January.

## 2. Enhancing sustainable productivity

Improving the footprint of agriculture while increasing production needs a concerted effort in two areas: first closing the uptake gap of existing best practices and technologies by focusing on knowledge sharing and creating supportive extension services networks; and second investing in innovation and research to provide the solutions for tomorrow and ensure agricultural policies are science-based.

Enhancing sustainable productivity must be the centre of efforts to make agriculture both environmentally sound and economically dynamic – we need to achieve more crops per drop of water, per acre of land, per measure of inputs. This is essential to ensure the surface of land under cultivation does not expand, in order to preserve biodiversity and natural carbon sinks. Producers need to be integrated in value chains and new activities need to be developed in processing and other sectors to improve rural incomes and ensure that growth in productivity translates into better livelihoods.

The 2009 Keystone 'Field to Market' research found that gains in yield per acre in the past 20 years in the USA had also been accompanied by significant improvements in the overall efficiency of resource use. The project looked at key crops such as soybean and maize and found reduced use of irrigated water, reduced soil loss, habitat loss, energy use, and lower carbon emissions. The Field to Market study clearly showed that progress has been made by farmers in the path to increased sustainability while enhancing their productivity.

Additionally, efforts should be increased to promote sustainable agri-food systems throughout the lifecycle. In 2010, FAO estimated that poorly developed systems for handling, storage, packaging, transportation, and marketing of agricultural products in developing countries results in post-harvest losses ranging from 15% to a staggering 50%. Investment in food infrastructure and handling could reduce losses and improve food safety. Developed countries also face losses due to food waste from harvest, through delivery to food services, and in households. Waste is worst in fresh produce which delivers vital nutrients to humans around the globe.

## 3. Innovation, Research and Extension services

Agriculture is a knowledge-intensive sector. Farmers need to have access to training, extension services, and sharing of traditional knowledge that can encourage the production of abundant and nutritious crops and mixed diets. Knowledge helps farmers adopt practices that maximise the efficiency of the inputs they use and help protect the natural resources they depend on. Training programmes should specifically involve women farmers in developing countries as essential 'gatekeepers' for household nutrition and welfare.

Providing this education to rural communities in a systematic, participatory manner is essential to improving their production, income and quality of life. Extension services disseminate practical information related to agriculture, including correct use of improved seeds, fertilisers, tools, tillage practices, water management, livestock management and welfare, marketing techniques, and basic business skills to address poverty. Extension is also an essential pillar for rural community progress including support for the organisational capacity of farmers' groups and the formation of co-operatives.

Modern extension services must increase their capacity for two-way information sharing – between experts in research and farmers themselves who have essential information on farming. Research and extension should be functionally linked and there should be pluralism in the approaches to implementing this form of education. Mobilisation of the scientific, donor, business, NGO, and farmer communities are needed to improve knowledge sharing, as well as local, reliable SME's such as agro-dealers to be able to adopt new practices and technologies.

The Empowering Smallholder Farmers in Markets (ESFIM) programme promotes this collaborative approach to research. Working in eleven developing countries, the initiative both partners farmers' organisations with local researchers to voice their requirements more effectively, and provides farmers' organisations with information and knowledge that will strengthen their ability to collect, organise and exchange experiences and knowledge.

Farmers must constantly adapt, and the challenge of climate change is making that need ever more acute. Investing in research and development, in both public and private sector, is essential to ensure farmers have the tools they need in the future and that the gains obtained in productivity and footprint are not undermined.

Targeted investment in research, combined with supportive frameworks for the roll out, diffusion and uptake of the products of research are essential to support continuous improvements in agricultural sustainability. In particular, research on the needs, aspirations and knowledge of smallholders in the developing world can help ensure agricultural solutions are appropriate for local conditions. Interdisciplinary research into agricultural production, supply chains and consumption needs to be supported to ensure a holistic approach to agricultural development.

The Farming First coalition supports prioritising the following areas of research:

- Conduct agronomic research related to water availability, soil fertility and post-harvest losses, as well as climate change challenges
- Conduct research into crop varieties needed by the poorest and most vulnerable regions
- Promote farmer-centred research in accordance with their needs
- Explore alternative and efficient uses for agriculture products and by-products along the value chain • Support research on the nutritional quality of foods.

## Recommendations to Policymakers

As global leaders prepare to meet at the Rio+20 (UNCSD) summit in 2012, they should not neglect the central role of agriculture in delivering a green economy and to the role of farmers as drivers of these changes.

Comprehensive solutions are needed for sustainable agriculture, and the Farming First Principles offer a comprehensive view of how this may be achieved. In the context of discussions on the Green Economy, Farming First supporters offer the following recommendations for incorporating agriculture into their agenda focusing on the "green economy in the context of sustainable development and poverty eradication".

1. Poverty reduction: Make agriculture a driver for poverty reduction by ensuring policies link producers to markets and enable value to be created throughout the supply chain to help create income opportunities and diversify rural activities.
2. Focus on enhancing sustainable production and productivity: the world will need to produce more with less to meet demand and reduce its environmental footprint. Increasing production and productivity should be a priority to protect habitat.
3. Invest in training, knowledge sharing, extension services, as well research and development to close the uptake gap for existing tools and ensure new solutions are available for tomorrow.

## Farming First Principles

### A Call for Action

Farming First provides a call-to-action for policy-makers and practitioners to develop a locally sustainable value chain for global agriculture. It emphasises the need for knowledge networks and policies centred on helping subsistence farmers to become small-scale entrepreneurs. The framework highlights six interlinked imperatives for sustainable development.

1. Safeguard natural resources. Land management should be improved through the widespread adoption of sustainable practices of land use.

- Conservation agriculture can be used to prevent soil erosion and land degradation.
- Manage watersheds and water use more efficiently.
- Protect wildlife habitat and biodiversity through an integrated ecosystems approach.
- Provide incentives for improving ecosystem services.
- Promote a sound management of chemical substances, including through the improvement of health and safety conditions for agricultural workers.

2. Share knowledge. While much of the knowledge needed to improve global agriculture already exists, including within remote indigenous communities, it often does not reach those farmers that could benefit most.

- Increase the level of education on crop and natural resource management for farmers and agricultural workers, including women.
- Take substantive measures to eliminate child labour and make sure children benefit from decent work conditions and access to education.
- Promote the development of village-based knowledge centres.
- Provide access to scalable information technologies for farmers, including women and young farmers, to receive weather, crop, and market alerts, as well as other early warning systems to help them make the right decisions for sustainability and productivity.
- Establish open and transparent two-way exchanges that capture the 'voice of the farmer' in the process of policy formulation and implementation.

3. Build local access and capacity. Fundamental resources should be available to farmers, including women and young farmers, to help them manage their production process more reliably and at less cost.

- Secure access to land and water resources, especially for women farmers.
- Provide rural access to microfinance services, especially to microcredit.
- Build infrastructure – particularly roads and ports - to make supplies available to farmers.
- Establish training programmes in infrastructure management, operations and maintenance for local and regional settings.
- Improve access to agricultural inputs and services, including mechanical tools, seeds, fertilisers, and crop protection materials.
- Encourage and co-ordinate multiple local actors to ensure information and supplies get into farmers' hands.
- Invest in bioenergy to achieve energy security and rural development through sustainable, local production.

4. Protect harvests. In many of the poorest countries, 20-40% of crop yields are lost because of inadequate pre- and post-harvest support. Likewise, vast quantities of food are squandered during the production and consumption phases of the food chain.

- Build local storage facilities and transportation mechanisms, including cold chain storage for food preservation.
- Localise the application of agronomic knowledge, pestidentification and meteorological information.
- Educate the public on sustainable consumption and production needs and behaviours, including the need to reduce food waste.
- Provide risk management tools to support farmers in managing weather and market variations.

5. Enable access to markets. Farmers need to be able to get their products to market and receive equitable price treatment when they do.

- Provide remote access to up-to-date market pricing information.
- Develop well functioning markets through transparent information, fair prices, sound infrastructure and reduced speculation.
- Encourage co-operative approaches to marketing for smallholders.
- Improve smallholder farmers' marketing skills through entrepreneurship training.
- Reduce market distortions to improve opportunities for all strata of agriculture worldwide.

6. Prioritise research imperatives. Achieving sustainable agriculture requires intensified, continuous research, prioritising locally relevant crops, stewardship techniques, and adaptation to climate change.

- Conduct agronomic research related to water availability, soil fertility and post-harvest losses, as well as climate change challenges.
- Conduct research into crop varieties needed by the poorest and most vulnerable regions.
- Promote farmer-centred research in accordance with their needs.
- Improve productivity through the responsible use of science and technology.

- Establish public-private research collaboration around integrated solutions.
- Increase investments from governments and business towards relevant R&D.
- Explore alternative uses for agriculture-based by-products along the value chain.

#### About Farming First

Farming First is a global coalition calling for a broad-based, knowledge-centred approach to increase agricultural output in a sustainable and socially responsible manner. The coalition includes scientists, farmers, engineers, business, and NGOs.

For more information on Farming First's work on climate change, please visit our website at [www.farmingfirst.org/climatechange](http://www.farmingfirst.org/climatechange)

## FDI World Dental Federation

Statement by the FDI WORLD DENTAL FEDERATION to the UN Conference on Sustainable Development

Rio+20, June 2012

FDI World Dental Federation, Geneva, Switzerland

Contact: Jean-Luc Eiselé, FDI Executive Director; [jleisele@fdiworldental.org](mailto:jleisele@fdiworldental.org)

---

Statement by FDI World Dental Federation: Oral health – an essential component of poverty eradication and sustainable development

FDI reiterates its commitment to the principles outlined in the 1992 Rio Declaration on Environment and Development, and of Agenda 21. In particular, we believe that human health and well-being must be a central tenant of any global agreement made at the UNCSO Rio+20.

The World Health Organization recognised the relevance of oral conditions in a World Health Assembly resolution in 2007 and adopted an action plan for oral disease prevention (WHA60/R17). We urge governments to act on this resolution, which also includes a plea for strengthened global collaboration.

The Political declaration of the High-level Meeting of the General Assembly on the Prevention and Control of Non-communicable Diseases (NCDs), adopted in New-York on 19th September 2011, recognized that oral diseases pose a major health burden for many countries and share common risk factors with NCDs, notably unhealthy diet (particularly high sugar consumption), tobacco, and harmful alcohol use, related to poverty and social inequalities.

Furthermore, FDI applauds the Political Declaration on Social Determinants of Health, adopted in Rio de Janeiro on 21st October 2011, reiterating in Art 16.4 "the important policies needed to achieve both sustainable development and health equity through acting on social determinants." FDI fully supports item C.42 of the Objectives of the Rio+20 conference (A/CONF.216/PC/): "Poverty eradication and enhancement of the livelihoods of the most vulnerable deserve priority in measures promoting a green economy transition."

FDI recommendations for the UN Conference on Sustainable Development

Focus on poverty eradication and the institutional framework for sustainable development

In the final outcome documents of UN Conference on Sustainable Development, FDI would like to see:

-  Clear recognition that the prevalence of oral diseases should become a key indicator for poverty eradication and sustainable development
-  Strong support for all measures contributing to a reduction of common risk factors for NCDs such as unhealthy diet, tobacco, harmful alcohol use, and lack of exercise.
-  A focus on the environmental, economic and health benefits of adopting a collaborative approach to the prevention of oral diseases within the institutional framework for sustainable development.
-  Develop policies and strategies to support effective and sustainable 'green dentistry' initiatives, which emphasise the lifecycle approach.

These recommendations derive from:

The link between health, poverty eradication and sustainable development

Evidence and experience have demonstrated that health and sustainable development are closely linked. Whilst acknowledging the considerable improvements achieved in development and poverty eradication, FDI regrets the limited progress made in bringing together historically independent social, environmental and economic policy at a national and international level.

This should place health at the centre of the international negotiation process as a necessary precondition for sustainable development and fundamental to social, environmental and economic development. Such an approach should address the social, environmental and economic determinants of health as a means of reducing health inequities through the integration of health into all outcomes of the summit. These should call for the provision of access to medicines, health services, adequate food and clean water for drinking and sanitation. FDI looks to Rio+20 to enhance and further validate the social determinants of health as a core concept in sustainable development.

We urge governments to ensure that all people have equal access to at least basic oral care and prevention through the integration of oral diseases into the context of poverty eradication and NCDs. The recognition of oral health as part of global priorities would provide a strong basis for concerted national and international action. It is imperative that global, comprehensive strategies to eradicate poverty must include oral diseases; in addition, effective prevention strategies should also address the social determinants of health.

The scale of the challenge

Oral diseases are some of the most common chronic diseases, affecting more than 90% of the world's population. They have a significant impact on overall health, mental and physical well-being, as well as on child development and educational performance. Moreover, the prevalence and severity of oral diseases are on the rise due to lifestyle

changes, particularly in low- and middle-income countries, which can least afford to deal with the consequences.

With many countries reaching a critical threshold of development in the near future, it is even more important to address the rising trend of lifestyle-related diseases in the context of sustainable development before it is too late.

In terms of health economics, oral diseases are the second to fourth most expensive area of national health budgets. However, for large segments of the world's population, oral conditions remain untreated due to unavailable or unaffordable oral health care services. The socio-economically disadvantaged suffer most from oral diseases, as they do from other chronic diseases; oral and general health are closely interrelated and conditions like cardiovascular disease, HIV/AIDS, diabetes, arthritis, low-birth weight infants, underweight children and malnutrition all have significant links to oral conditions.

The need for enhanced global collaboration

As a member of the World Health Professionals Alliance WHPA the FDI strongly recommends addressing workforce planning, health system strengthening and collaborative practice for oral health as integral part of national planning. An intersectoral approach to poverty eradication should include prevention of oral diseases and will have significant benefits in terms of strengthening health system care delivery and improving access to care; thus resulting in measurably improved health outcomes.

FDI World Dental Federation

Tour de Cointrin, Avenue Louis Casai 84,

Case Postale 3,

1216 Genève-Cointrin,

SWITZERLAND

[www.fdiworldental.org](http://www.fdiworldental.org)

FDI World Dental Federation is a membership organisation composed of more than 200 member National Dental Associations and specialist groups, altogether representing more than one million dentists worldwide. The FDI vision is leading the world to optimal oral health, acknowledging that oral health is a fundamental part of general health and well-being. This vision is brought to life through being the global voice for oral health and delivering excellence in oral health policy and promotion, continuing professional education, and access to care.

The FDI's Mission Statements are:

 To be the worldwide, authoritative and independent voice of the dental profession

 To promote optimal oral and general health for all people

 To support the member associations in enhancing the ability of their members to provide oral health care to the public

 To advance and promote the ethics, art, science and practice of dentistry

The organisation is governed by a Council of delegates from member associations that are elected by a General Assembly during the FDI Annual World Dental Congress. Five standing committees carry out work in the key areas of communications and member support, dental practice, education, science, and world dental development and health promotion. FDI World Dental Federation is a non-governmental organisation (NGO) in official relations with the United Nations (UN) and the World Health Organization (WHO).

## Federal Institute for Less-Favoured and Mountainous Areas

Thomas DAX and Gerhard HOVORKA,

Federal Institute for Less-Favoured and Mountainous Areas (BABF),

Vienna, Austria

[thomas.dax@babf.bmlfuw.gv.at](mailto:thomas.dax@babf.bmlfuw.gv.at)

[gerhard.hovorka@babf.bmlfuw.gv.at](mailto:gerhard.hovorka@babf.bmlfuw.gv.at)

24 October 2011

Sustainable Mountain Development

(Contribution for the compilation document towards Rio+20)

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the recognition of the need for mountain-specific development strategies has risen in many regions. As the demand for goods and services from mountains has grown considerably a stronger targeting of respective policies is sought. Moreover, the ability of mountain systems to provide essential goods and services for all of humanity is increasingly under threat from ongoing land degradation, a chronic lack of investment, climate change and globalization.

The Federal Institute for Less-Favoured and Mountainous Areas (BABF), a Mountain Partnership member, recognizes that despite the progress that has been made in promoting sustainable development of mountain regions, national and international development agendas still treat mountains, if at all, as marginal environments. As a result, poverty rates are in general higher than in non-mountain areas, depicting the excessive dependency of mountain regions on development centers. Regional initiatives to foster innovation and cooperation of mountains have started, but need further policy incentives and priorities for enhancing effectively the development process.

A positive example for international efforts to support sustainable mountain development and promote mountain ecosystem goods and services at the institutional framework level and green economy in the context of sustainable development and poverty eradication in Europe is the Alpine Convention (partners: eight alpine member states and the European Union; see: [www.alpconvention.org](http://www.alpconvention.org)). Recently similar transboundary activities were established in other mountain ranges like the Carpathians ([www.carpathianconvention.org](http://www.carpathianconvention.org)) and the Balkans and the Dinaric Arc (<http://www.mtnforum.org/en/content/towards-network-mountain-protected-areas-balkans->

and-dinaric-arc) and others. Specific support for mountain farming and organic farming are of crucial importance for sustainable development in mountain areas in Europe.

In the context of a Green Economy, new opportunities for investments by the private sector are emerging in mountain regions, especially in sustainable agriculture and forestry, and ecosystem goods and services. However, innovative institutional arrangements are urgently required to trigger governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, as well as the actual mainstreaming of mountains into overall national development and conservation processes. Future action has to reflect increasingly the linkages to food supply and food sovereignty issues at a global scale.

Enhancing the global political commitment that translates into increased investments tailored to mountain regions will directly benefit poor mountain communities and indirectly humanity as a whole. Hence, sustainable mountain development, notably through integrated and socially inclusive policies, activities for a fair distribution of natural and human resources, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential for the future of sustainable mountain farming, integrated development in mountain areas, people living in mountain areas and also people living in lowlands depending on mountain ecosystem services.

---

## FEED BRAZIL 2012

### FEED BRAZIL 2012

#### General Content:

The UN Rio+20 Conference will consider two important themes: a green economy in the context of sustainable development and poverty eradication, and the institutional framework for sustainable development.

#### Executive summary for submission

This submission, evolved from a workshop and subsequent related meetings held October 2011, in Norway arranged by the Norwegian University of Science and Technology (NTNU), Department of International Affairs; in co-operation with the Norwegian Ministry of Education and Research and the Norwegian Year of Science, and in association with the OECD Steering Group on Governance of International Co-operation in Science, Technology and Innovation to Address Global Challenges (STIG). There was representation from a wide range of interest groups including universities, research organisations and private companies.

One of the main issues considered was "International Co-operation in Science, Technology and Innovation to address global challenges: Food, Water, Energy and Community." In addition to this was the issue of "Making it Happen."

The aim of this submission is to raise awareness of the need for sustainable case studies in the field that demonstrate ways to resolve or ameliorate environmental issues associated with food production. We aim to test a new innovative environmentally friendly greenhouse that is suitable for arid or urban areas where water is an issue. A green socio-economic business model is being designed for this project as part of the plan to integrate the project into the local community and reduce poverty.

The FEED BRAZIL 2012 submission is a live demonstration project, currently evolving. FEED stands for Food and Energy Eco Dynamics. The submission is being lodged by a multi-disciplined working group that attended the workshop and subsequent meetings in Norway. The Working Group Committee for FEED BRAZIL 2012 include representatives from: Hydro ASA (international aluminum company); Westvik Innovation Foresight & Communication (social and business development consultant); Life Synthesis AS (technical advisor for innovative greenhouse building system); Phoenix Planning Design AS (sustainable development consultants); with Norwegian University of Science and Technology (as the proposed educational and scientific partner); Lindum ASA (consultant for engineered eco-systems for food production); and SINTEF Water and Environment (as the proposed advisor on water systems).

Ongoing meetings and workshops are planned for November and December 2011, with the aim of forming a steering committee for a Government/Private cooperative project. This will include representation from relevant government institutions; local grass roots organisations; educational and research organisations as well as other appropriate new partners to deliver the project in the first half of 2012, so that a presentation can be made to the Rio +20 Summit on progress of this case study.

The following comments for the Rio +20 Summit developed out of issues that were discussed at the workshops. They are presented from the FEED Working Group.

a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

Support for new methods of food production to address the impacts of climate change.

The impacts of climate change are increasing at an alarming rate and the unpredictability of droughts, storms and temperature fluctuations are having a major impact on food production. We need new approaches on how we can supply food and nutrition. It is important after 20 years of talking since the first World Summit in 1992 that steps be set in place to reduce or ameliorate the impacts of man on the environment be given support and made a matter of priority.

Existing technology and traditional methods of farming alone are clearly not coping, so new innovative ways that will help reduce the impact of man on the environment need to be found. Science, Technology and Innovation have an important role to play in the process of developing and testing innovative radical solutions. However, for the solutions to be truly sustainable, they also need to be integrated into a social and economic framework.

It should be noted that the concepts outlined in the Rio 1992 World Summit, Agenda 21, Item 31.1 are just as relevant today as when they were first made.

#### SCIENTIFIC AND TECHNOLOGICAL COMMUNITY INTRODUCTION

31.1. ...The cooperative relationship existing between the scientific and technological community and the general public should be extended and deepened into a full partnership. ....Decision makers should create more favourable conditions for improving training and independent research in sustainable development. Existing multidisciplinary approaches will have to be strengthened and more interdisciplinary studies developed between the scientific and technological community and policy makers and with the general public to provide leadership and practical know-how to the concept of sustainable development. .... ;

a. It is recommended that the RIO+20 Summit resolve:

1. that projects using the principles in accordance with Agenda 21, Item 31.1, should be supported and encouraged by their relevant Governing bodies.

2. that there is a need for multinational policy initiatives for developing new modes of governance of international research and innovation projects for addressing global challenges.

b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

b. It is recommended that the RIO+20 Summit resolve:

3.to note that many of the global challenges faced by the world today are caused by systemic failure consisting of social, economic, cultural, biological, technological and/or environmental factors, and that there are impact-chains between challengeslike climate change, energy supply, water access, food delivery and health. This means that global challenges cannot be adequately addressed by single actors, or by the use of one technology or one instrument only.

New knowledge and new technologies are needed, as well as new insight into the feedback loops of these systems. Governments and relevant international organisations and enterprises should therefore be encouraged to strive towards developing new and improved modes of governance of international research and innovation collaboration, and to fund and coordinate such research and innovation processes.

c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

c. It is recommended that the RIO+20 Summit resolve:

4.that as part of the search for solutions to the impacts of climate change, Government and Private initiatives should be more flexible and expand their criteria for funding developing innovative technology and new multi-partner workgroups that create a green economy in the context of sustainable development and poverty eradication.

d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

d. It is recommended that the RIO+20 Summit resolve:

5.to note that innovative projects that inspire and encourage people to find alternative and sustainable solutions that involve joint Government, Private and Community projects such as FEED Brazil 2012 are very important in the process of demonstrating that we can start to have an impact on the environment and social fabric, now rather than later.

6.To note the findings of a future report to be presented at the Rio +20 Summit on the implementation of the FEED BRAZIL 2012 project.

Specific Elements: a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges. Contributions could include possible sectoral priorities (e.g., (e.g., energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) and sectoral initiatives that contribute to integrate the three pillars of sustainable development could be launched and endorsed at Rio+20.

Refer to the proposed case study proposed for northeast Brazil for first half of 2012, described in the Section b, below.

b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication

## MAKING IT HAPPEN

Case Study for sustainable food production using innovative greenhouse technology and development of a local green economy.

FEED BRAZIL 2012 is the first of a planned series of Proof of Concept global field tests by the FEED (Food and Energy Eco Dynamics) initiative, who are coordinating innovative approaches in agriculture and aquaculture production and developing socio- enterprise.

It is proposed to deliver a progress report on economic, social and environmental issues to the RIO +20 conference in June 2012.

The aim of the project is to show how Science, Technology and Innovation can make a substantial contribution in relieving chronic food shortage sustainably within the context of a green economy. We will study a radically new and innovative greenhouse that is carbon neutral and uses soap bubbles for insulation will be studied in a proof of concept test case. This will involve field tests of energy consumption and production yields analysis to understand how efficient the new technology is in comparison with traditional existing production.

The objectives of the project include:

- making a demonstration field test project (Proof of Concept) in northeast of Brazil.
- producing food in a sustainable way in areas where normal agriculture is not possible due to poor and infertile soil conditions;
- testing and developing an innovative greenhouse that reduces the amount of water required during the food production process;
- developing new business models for social economic enterprises;
- bringing a SIA perspective (Social Impact Assessment) into the project from start to give basis for foresighted recommendations of the possible impact on life quality of persons and communities affected;
- working with NGOs, local media, youth and women's organisations to deliver the project;
- creating a FEED college/training scheme as part of the business development program; and

·lead the way globally to demonstrating innovative solutions in food production while respecting the environment.

#### Delivery of project

To find a solution to food production and develop a green economy in the context of sustainable development and poverty eradication, it is necessary to form multi-disciplined teams to deliver the project.

There are a number of components to this venture, which will be a combined Private / Government project. New partnerships are required and a draft outline of partners required is outlined below:

a.Steering Committee and a Project Management team;

b.establishment of a training scheme for the business and delivery partners who will do the growing of the food. This will be done with a company or organization who specializes in working with grass root community groups who will deliver the project.

The program also needs to be prepared in conjunction with the NTNU;

c.liaison with interested parties, including National and local participants;

d.design resolution of a new innovative greenhouse. This will be done with a commercial industrial company as part of their CSR program;

e.development of an electrical and ICT program for control of the greenhouse environment. This needs to be prepared in conjunction with NTNU.

f.development of efficient water technology in co-ordination with SINTEF.

g.select a suitable agriculture institution to advise and develop programs for growing agriculture and possible aquaculture crops;

h.establish growing with organic fertilizer made from organic waste and investigate suitable bio-fuel technology for medium sized socio-enterprise projects with Lindum.

i.conduct a foresighted SIA study to address social and cultural possible impacts, both positive and negative, with a primary purpose to bring about optimal and sustainable effects of FEED Brazil 2012 for all the involved parties

An outline timetable for FEED BRAZIL, 2012 is shown below:

·Initial Norway Workshops 1 & 2, held 5 October 2011, NTNU in Trondheim and 19 October 2011, in Oslo.

·Co-ordination meetings November in Oslo.

·Workshop 3 to be held in week between 5 and 10 December 2011.

·Project meetings in Brazil early 2012.

·Site work March/April 2012

#### Expansion of the roles and expectations of FEED BRAZIL 2012 participants

1.Steering Committee, consisting of members of different partnership organisations would need to be assembled to oversee the running and delivery of the project.

2.The main competencies or elements to be addressed to create a demonstration project include:

a.project management team. A project management team would be required to co-ordinate and support the running of the each project. Initially it is important to keep this structure simple;

b.funding of different components should be sourced from one or a number of different sources including Government, private or socio-enterprise funding to deliver the project;

c.creating new partnerships between established local grass roots organisations and international organisations to create support with local and high level government national support for these demonstration projects;

d.providing education support to local grassroots organisations, who will develop local businesses to grow and distribute food produced to people who need it;

c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels <sup>100</sup> local, national, regional and international.

#### The way forward.

There will be a second group workshop to establish the Steering Committee to supervise the project. A Project Organisation needs to be formed to manage and deliver the project. In addition to the above a number of co-operative ventures will be formed after a demonstration version of the greenhouse has been built and tested.

Various funding sources need to be considered. Possible source of funding include using CSR funds provided by larger companies to test of new concepts. Also funds used for community training and education could be directed to the project for education component required to deliver the project.

Discussions will be held with Government officials to consider the option of government support for delivering the project as a joint project with established NGO's organisations.

It is important that local people participate and take ownership of these schemes so that are embraced and become an integral part of the local community.

#### Conclusion - Making it happen

We aim to deliver a working proof of concept, environmentally efficient solution to the challenge of delivering food to people and communities who need it, using less water and reducing the carbon footprint normally associated with agriculture work. The delivered concept will be a key contribution to establishing a green economy in the context of sustainable development and poverty eradication.

d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development.

The proposal from the FEED Brazil +20 Working Group, is a proposal for action and solutions to the focus of the UN Rio +20 Summit Conference aim of achieving:

a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development"

FEED BRAZIL 2012

Submission Working Group:

The submission is being lodged by a multi-disciplined working group that attended the workshop and subsequent meetings in Norway. The Working Group Committee for FEED BRAZIL 2012 includes representation from:

- Hydro ASA (international aluminum company);
- Westvik Innovation Foresight & Communication (social and business development consultant);
- Life Synthesis AS (technical advisor for innovative greenhouse building system);
- Phoenix Planning Design AS (sustainable development consultants); with
- Norwegian University of Science and Technology (as the proposed educational and scientific partner);
- Lindum ASA (consultant for engineered eco-systems for food production); and
- SINTEF Water and Environment (as the proposed advisor on water systems).

## FIA Foundation

Safe and sustainable mobility – the new development challenge

A submission to the Rio+20 UN Conference on Sustainable Development

1. The FIA Foundation is a UK-registered charity with an international remit. Our charitable objectives include road safety, sustainable mobility and the environmental sustainability of vehicles. The FIA Foundation is a partner, together with the UN Environment Programme, the International Energy Agency and the International Transport Forum, of the 'Global Fuel Economy Initiative' (GFEI) which promotes policy and technical solutions to improve vehicle fuel economy with the objective of reducing average fuel consumption across the global car fleet by 50% by 2050. The FIA Foundation is also a partner in the UNEP-led 'Partnership for Clean Fuels and Vehicles' which recently announced the elimination of leaded fuel from almost all countries in the world. This Partnership, established following the 2002 Johannesburg Summit, is an excellent example of the types of focused public/private initiative that should result from the Rio+20 Conference. The FIA Foundation was also the founder of the Commission for Global Road Safety, which has also made a submission to this Conference. We associate fully with the comments and recommendations of the Commission for Global Road Safety.

2. The FIA Foundation welcomes Rio+20 as an important opportunity to identify the major sustainability challenges facing the world and to contribute to the design of a post-MDG framework that will meet the needs of developing nations in the second and third decades of the 21st Century. The UN Conference on Sustainable Development must acknowledge the forecast of dramatic growth in vehicle use over the coming decades. It has taken more than one hundred years to reach a global vehicle population of 700 million vehicles. Yet it is predicted that another 700 million vehicles may be added to the world's roads by 2020, a doubling of automobiles in a period of less than ten years, with the growth taking place entirely in middle-income and low-income countries (Booz & Company, Automotive Forecast 2011). Unless political leaders take an active, and unlikely, decision now to attempt to prevent these market forecasts with severe restraint measures much of this anticipated vehicle growth will occur, with consequent impacts on urban air quality and congestion; fuel supply and security; greenhouse gas emissions; and road traffic fatalities and injuries. There is therefore a compelling and urgent need to put in place policies and practices to ensure that cars are as safe, clean and fuel-economic as possible, and also to prioritise the safety, health and access to mobility of non-motorised transport users who, across the developing world, will remain in the majority.

3. As part of this action global road traffic death and injury, and wider issues of safe and sustainable transportation policy, must be recognised as sustainability challenges at the Rio+20 Conference. The FIA Foundation encourages the secretariat, member nations and participants to include reference to safe and sustainable road mobility in the 'Outcomes Document' of the Conference and to use Rio+20 as a platform to launch new initiatives for road injury prevention.

4. According to the World Health Organization road crashes kill an estimated 1,300,000 people each year and injure between 20 - 50 million more. The vast majority – more than ninety per cent - of these casualties are occurring in middle-income and low-income countries where road safety awareness and the capacity to tackle the problem is low, and where both traffic levels and road casualties are rising rapidly (Global Status Report on Road Safety, WHO, 2009).

5. Despite the absence of road safety from the mainstream sustainable development agenda there is now a global mandate for action to reduce global road traffic injuries. UN General Assembly Resolution A/RES/64/255 has established the UN Decade of Action for Road Safety 2011-2020 with a goal to 'stabilise and reduce' road deaths by 2020. The Commission for Global Road Safety has estimated that if this ambitious goal can be achieved up to 5 million lives and 50 million serious injuries could be prevented over the course of the Decade ('Make Roads Safe: A Decade of Action for Road Safety', Commission for Global Road Safety, 2009).

6. In its Resolution proclaiming the Decade of Action for Road Safety, the United Nations General Assembly described road traffic injuries as a "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals". According to leading development experts and international agencies, the impacts of failure to address road safety can go beyond the immediate toll of death and disability to undermine policies on poverty alleviation, child survival and development, and climate change (The Missing Link: Road Traffic Injuries & the Millennium Development Goals, Watkins, K; 2010).
7. There is growing evidence and recognition that addressing road safety will also help to achieve environmental objectives. In urban areas managing vehicle speed to provide safe and accessible streets for non-motorised transport users, combined with road design measures that protect and encourage walking and cycling (such as pavements, safe crossing points and bicycle lanes), will both reduce casualties amongst 'vulnerable road users' and support greener modes of transport, reducing modal shift to motorised vehicles. Dr Watkins, who was the author of a major 2008 'Human Development Report' on climate change for the UNDP, also highlights that transport policy "can play a central role in combating climate change not just by creating fuel-efficiency incentives and supporting the development of low carbon fuels, but also by supporting the development of safe public transport and creating the conditions for safe non-motorised transport. When safe sidewalks and cycle lanes are available, people are far more likely to undertake trips by walking or cycling", (The Missing Link: Road Traffic Injuries & the Millennium Development Goals, Watkins, K; 2010).
8. The UN Environment Programme is also urging a change in emphasis in transport planning in developing nations to support and protect non-motorised mobility and to encourage safe and affordable public transport (low income families in developing countries can currently spend up to 25% of their income on public transport), citing the benefits for a range of environmental objectives. UNEP points out that "cities with a better modal mix between cars, public transport, walking and cycling have lower energy use per capita. By incorporating non-motorised transport facilities in the transport grid, a large, lasting impact can be made on fuel use, congestion, air quality and CO2 emissions". Furthermore, UNEP argues that "designating road space for pedestrians and cyclists in proportion to the demand for non-motorised transport is crucial. It is also one of the most cost-effective actions for saving hundreds of thousands of lives. For example, the top two countermeasures for improving safety in Nairobi, Kenya, recommended by the International Road Assessment Programme (iRAP) are pedestrian crossings and sidewalks", ('Share the Road: Invest in Walking & Cycling', UN Environment Programme and FIA Foundation, 2011).
9. Despite the projections of significant increases in car use the majority of people in low-income countries or in the significant low-income segments of the population in middle-income countries are unlikely to ever own a car. Yet it is these people who are overwhelmingly affected by road traffic crashes and other consequences of road traffic, including poor air quality (which is estimated to contribute to 800,000 deaths a year). Designing safe transportation, urban planning and land use policies that meet the commuting, social and healthcare needs of this 'green majority' is a pre-requisite for building the 'green economy' of the future and for achieving social justice.
10. The Rio+20 Conference can play a critical role in encouraging such action by building on recognition that road traffic injuries are a public health and sustainable development challenge that needs to be addressed, and that doing so will benefit the wider agendas of tackling climate change and working towards the Millennium Development Goals. Rio+20 can play the invaluable role of bringing road safety and wider issues of sustainable mobility in from the margins of public policy, by highlighting the cost-effective contribution safe and sustainable transport can play in helping to achieve many development goals.
11. The FIA Foundation believes that Rio+20 should aim to foster networks for practical outcomes across a range of policy areas contributing to safe and sustainable mobility. Our positive experience as a member and donor of the 'Partnership for Clean Fuels and Vehicles' (<http://www.unep.org/transport/pcfvl/>) has demonstrated the potential of focused campaigns and initiatives harnessing the combined strengths of governments, institutions, NGOs and the private sector. The PCFV has succeeded in its goal of eliminating leaded fuel. It is now leading the global effort to reduce sulphur content in fuel. Partnerships of this kind (with funding support from OECD governments, corporations and philanthropies) should be established to focus on specific, solvable aspects of road safety, vehicle environmental performance and many of the other important issues considered in Rio.
12. In the area of road safety, for example, public/private partnerships such as the Global Helmet Vaccine Initiative [www.GHVI.org](http://www.GHVI.org) (working to increase motorcycle helmet wearing) and the Latin New Car Assessment Programme [www.latinncap.org](http://www.latinncap.org) (an independent vehicle crash test programme in Latin America) have the potential to prevent many thousands of deaths and injuries. The 'Share the Road' initiative led by UNEP and the FIA Foundation, working for policy and design solutions to improve access to safe walking and cycling in Africa, is an example of a hybrid safety and environmental programme which, if brought to scale, could make a significant positive impact on the liveability of cities and prevent some modal shift to motor vehicles. The new Road Safety Fund [www.roadsafetyfund.org](http://www.roadsafetyfund.org), established by the WHO for the UN Decade of Action for Road Safety and co-managed by the FIA Foundation, is fostering connections and funding partnerships to support this kind of activity. The Rio+20 process should be used to encourage and develop this type of partnership.
13. Safe and sustainable mobility has not had a voice at previous global development conferences. The FIA Foundation is pleased to be supporting the 'Safer Roads at Rio+20' coalition which argues for safe and green mobility to be included in the policy toolkit that emerges from Rio+20. As a new global development challenge, and as an essential element of the 'green economy', safe and sustainable mobility must be a new priority for the international community at Rio+20. The compelling moral and environmental case for action - as both vehicle numbers and global road fatalities are predicted to double in the coming years, with the the burden in injury and other health impacts falling overwhelmingly on the poor - means this is an issue that can no longer be ignored.

---

## Finnish Association for Nature Conservation (FANC)

For a just and fair one-planet politics!

In the summer of 2011, Finnish Association for Nature Conservation ran a project targeting the nine major groups of the UN sustainable development governance to collect views on what must be achieved in the Rio+20 summit. We gathered views from the representatives of all the nine major groups as well in a seminar as in an online survey.

The proposals were presented to the Finnish parliament in a parliamentary hearing in September 2011, and they have been used as a basis for these answers.

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

The starting point for the Rio+20 has to be a just one-planet politics. To get started with sustainable development and Rio+20, it's high time that we focus on the essentials: food and water, energy, and democracy. Thus, we need the following:

- Food and clean water for all. The poorest fifth of the world needs all our support in securing the basic necessities of life for themselves.
- The basic needs of the people must be guaranteed. The consumption of the natural resources will not be sustainable, until at least a basic safety net for the people in the global south can be provided. A social security system that fulfills at least the basic needs would probably curb population growth and the use of natural resources.
- The on-going mass extinction must be stopped by 2020 and a carbon neutral society created by 2050. Apparently, the first steps taken in Johannesburg in 2002 are not

enough. This work needs to continue in Rio in 2012.

- Energy consumption must fall heavily in the industrialized countries. Reducing emissions is not enough, because energy consumption produces also indirect emissions. To lower the environmental impacts, the energy consumption of the richest fifth of the world must be made reasonable at once.

- From the power of capital to the power of people. Transition from the power of capital to the power of people is a prerequisite for a sustainable future. The poorest must be given the power to decide on the use of the world's resources, too. Instead of prioritizing the growth of the capital we must prioritize the well-being of the weakest.

More concretely:

- The developed countries must acknowledge their ecological debt and stop adding to it. The citizens in these countries must be directed to adopting a less consuming lifestyle.

- A convention on the use of natural resources and a strong international panel on natural resources is needed. Annual quotas for resource use and emissions and a global environmental tax on energy should be implemented.

- It is necessary to establish the United Nations Environment Organization (UNEO), an International environmental court, and a Council for future generations, and to promote the UN Commission on Sustainable Development to a Council, like the Human Rights Council. Taking the environmental crisis and the well-being of future generations seriously requires a new kind of a strong and democratic international governance.

b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

The society must free itself from the obsession of economic growth, because an indefinitely growing GDP is incompatible with environmental sustainability. Green and service-intensive economy can be sustainable only when its material basis and natural resource consumption are shrinking globally. We need:

- Global progressive environmental tax. We need progressive environmental taxes in order to promote social security, equality and environmental protection. These taxes function as effective economic incentives and generate revenue for the state. Income tax works well for that purpose, but energy taxes and luxury taxes on consumption need to be developed further.

- Global basic income for women. A basic income of two dollars a day for every woman and girl would be one of the most efficient ways to increase well-being and curb population growth.

- Abolition of harmful subsidies and arms race. Cutting fossil fuel subsidies, indirect subsidies to nuclear power, and excessive armament would release hundreds of billions of euros for investments in a sustainable future.

c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

- Restricting the influence of multinational corporations. Twenty years after Rio, the climate emissions are still growing, the extinction of species is accelerating, and global economic inequality is higher than ever. The single most important reason to this is the strong opposition of the multinational corporations to the implementation of the Rio agenda. In the future, the lobbying by corporations and their interest groups has to be transparent. The connection of corporations to the decision-making process has to be communicated clearly to the citizens, e.g., in the form of an open and mandatory register.

d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented? " Protecting the rights of civil activists. In many countries, activists working for a sustainable and just future are being persecuted for their actions, at worst even murdered. Protecting civil activism and the rights of civil activists is a fundamental task of all the states that must not be neglected.

\*\*\*\*\*

(For additional points, see the joint proposal submitted by the Finnish Service Center for Development Cooperation, the "Finnish NGOs' Contribution to Rio+20 Bureau Compilation Document")

Mr. Jouni Nissinen

Head of environmental protection

Finnish Association for Nature Conservation

cell. +358-40-828 1881

jouni.nissinen@sll.fi

About us:

The Finnish Association for Nature Conservation (FANC) is the largest membership-based environmental non-governmental organization in Finland. FANC has over 30,000 individual members in almost 200 local member associations in 15 district organizations all over the country. It has similar but bigger sister organizations in the other Nordic countries Sweden, Denmark, and Norway. FANC works on nature conservation and environmental policy on the municipal, regional, national, and EU levels. Important fields of work are forest protection, climate change prevention and sustainable energy policy, mire and water protection, sustainable production and consumption and ecological fiscal reform, management and protection of cultural landscapes, land use issues and protection of endangered species, and waste policy and chemicals.

FANC is a member in several international coalitions, such as Coalition Clean Baltic (CCB), European Environmental Bureau (EEB), World Conservation Union (IUCN), OCEAN2012, Climate Action Network (CAN), Green Budget Europe (GBE), Taiga Rescue Network (TRN), and Northern Alliance for Sustainability (ANPED). More information: [www.sll.fi/english](http://www.sll.fi/english)

## Fondazione Eni Enrico Mattei (FEEM)

FEEM contribution to the Rio+20 Compilation Document

An economic research perspective on the green economy in the context of sustainable development and poverty eradication

## Key global challenges

According to the UNEP definition (2010), a green economy is 'one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities...'.

Existing threats to the environment - directly and indirectly related to human activities - can seriously affect socio-economic systems. These threats often intensify environmental and socio-economic vulnerability, particularly in the poorest regions of the world, thus impairing sustainable development and a balanced path towards a world green economy.

The relationship between growth, poverty eradication, the society, and the environment shows complex dynamics and multifaceted dimensions, involving different systems and sectors of production, and varied models of consumption, carrying out different economic, environmental, and distributional impacts worldwide.

Even if it is often difficult to disentangle them, the following key challenges can be identified, providing scope and guidance for research and policymaking.

· Climate change - Climate change is probably the most urgent and debated global challenge, affecting many domains and cutting across other challenging issues. To reach the ambitious 2° target accepted by the international community in Cancun, it is necessary to implement massive and timely mitigation policies globally, stabilising GHGs emissions at the levels deemed consistent with the target by the scientific community. Adaptation actions must also be planned and implemented, particularly in the most vulnerable world regions that are already suffering from the effects of climate change. From an economic perspective, key issues to tackle the climate challenge are:

- The design of a more effective system for climate governance, possibly leading to an international agreement on climate policies.
- A better understanding of the economic dimension of existing and new mitigation instruments and technologies for climate stabilisation and the overall economic valuation of alternative international climate strategies, including the assessment of current governments' pledges.

- The assessment of the full costs of climate change impacts and adaptation, aiming to provide a comprehensive and integrated assessment of climate impacts and policies, accounting for landuse, forestry cover, atmosphere, biosphere modules, and other complex feedback dimensions.

- The inclusion of uncertainty in the mutual responses of climate and socio-economic systems.

- A clearer understanding of climate finance, investigating the nature, (i.e. public vs. private), and the amount of financial efforts needed to support the technological transformation towards a low-carbon economy and to adapt to the impacts of climate change. The design of an international carbon market, as well as the additionally of climate funds, are two priority issues, which call for a strategic partnership and cooperation between private and public finance.

· Energy - Energy is clearly intertwined with climate change, due to the fundamental role played by energy in generating greenhouse gas emissions. In a world where more than one billion people still live in energy poverty without access to clean cooking facilities, access to energy is key to pursue poverty eradication and sustainable development. While energy is crucial to feed the developing world and the rapid economic growth of emerging economies, as well as to maintain the high consumption standards in the developed world, a real technological 'revolution' in the energy sector is needed to meet the climate challenge. Energy systems vary widely across countries, given their level of development and their endowments of primary energy sources. Crucial issues to be addressed in this area are:

- Energy poverty

- The affordability and security of energy supply

- The development of a reliable system for international energy governance

- A better understanding of the drivers of energy demand, globally as well as regionally

- A better understanding of the dynamics of innovation, diffusion, and adoption of energy technologies

- A detailed representation of the energy systems at the country level

- The environmental impacts of energy production and consumption, including global warming and impacts on local air pollution, land-use, and water utilisation

· Biodiversity - Biodiversity is a measure of the health of ecosystems and is in part a function of climate, being thus directly affected by climate change. Biodiversity loss potentially poses high damages to human health and well-being. Our well-being is totally dependent upon the continued flow of ecosystem services such as: food, fibres, clean water, healthy soil and carbon capture. These services are predominantly public goods with no markets and no prices, and are rarely detected by our current economic compass. Valuation efforts on ecosystem services are often undertaken and available at the micro level. The key challenge is to scale up from the micro to the macro dimension, to help policy makers understand the economic value of ecosystems and assess the full benefits of alternative policies, both at the global and local level.

· Land-use - Land is a scarce resource and competition in the use of land places land-use at the centre of the climate-energy debate. The use of land indeed fulfils basic needs, namely food security, feeds the growing appetite for cleaner energy and supports forestry and sustainable forests practices. Bio-fuels and their expansion contribute to cleaner energy production and compete with land-use for food production. This competition is deemed responsible for the increased volatility of food prices, with perverse economic effects particularly on developing economies. Regarding forestry, reducing and/or preventing deforestation is one of the mitigation options with the largest and most immediate carbon stock impacts in the short-term at the global level. Proponents of bio-carbon sequestration activities stress that land-use, land-use changes, and forestry (LULUCF) initiatives, if properly designed can bring important multiple benefits to climate change mitigation, biodiversity conservation, rural development, and poverty eradication in developing countries. There are several important methodological issues regarding the design of these initiatives including baselines, monitoring, permanence, and insurance, which are still at the centre of the policy debate. Synergies and trade-offs between these competing land-uses must be further studied and analysed in an integrated way.

· Water - Water is also a scarce resource, precious to agriculture, forestry, biodiversity, and more broadly, to the ecological balance, although rarely priced in the market. Water will be directly affected by climate change since climate extremes will lead to a higher frequency of droughts and flooding in various regions of the world, and sea-level rise will severely damage coastal areas and small island states. A more efficient and effective management of water resources and coastal zones is needed. Furthermore, water should be included in the integrated assessment of policies towards a green economy.

· Migration - Human migration induced by climate change is a potentially relevant and massive phenomenon, affecting the socio-economic systems of both sending and

receiving regions. Direct effects of climate extremes in rural and coastal areas, or indirect effects of climate change, such as diminished opportunities in agriculture due to productivity losses, may trigger out migration of labour, inducing rural-urban as well as international migration. A better understanding of the socio-economic and environmental dynamics at play is crucial to design effective policy answers.

#### Key methodological challenges

- Integrated assessment - Given the strong interdependencies described above, socio-economic science must be able to provide an integrated assessment of the key dynamics at play between the economy-energy-climate systems. The integrated assessment should aim at capturing all the interactions across issues and sectors, identifying potential synergies and trade-offs in order to guide effective policies. Integrated assessment should account for land-use, forestry, water and biodiversity, atmosphere and biosphere modules, human health and labour migration.
- Full life cycle assessment - On the path to a green economy, the full life cycle of economic activities should be assessed, accounting for external costs throughout the whole production chain, to be able to compare the real net benefits of alternative environmental policies.
- Welfare indicators - The quantitative measurement of a green economy should move beyond GDP, capturing the three fundamental dimensions of sustainable development, namely the economy, the society, and the environment, as well as their potential trade-offs. Welfare indicators that move beyond the pure economic dimension should become the benchmarking instruments for policy assessment, bringing the equity perspective into the framework.
- Data consistency - Monitoring, reporting, verification, and consistency of data across world countries and regions should be enhanced in many sectors key to green growth. Often data are not reliable and not comparable.
- Dealing with uncertainty - Uncertainty is a central feature of climate science, which inevitably, in the interaction between the climate and economic systems, pervades several dimensions of future economic and development scenarios. Uncertainty should be incorporated in the economic assessment of development policies. More emphasis on the study of the probability of extreme events and natural disasters may help to address climate uncertainty, outlining emergency plans and doing contingency planning should worst-case scenarios occur.

#### Research input and policy insights for a world green economy from selected ongoing FEEM research projects

##### Research inputs

· Over the years FEEM has developed and refined robust modelling tools addressing both mitigation and adaptation policies to advance knowledge in the economics and policy of climate change. These modelling tools aim to fill the existing gaps and address the key challenges previously identified in this area of research. On the mitigation side, FEEM has built the energy-economy-climate WITCH model (World Induced Technical Change Hybrid Model). WITCH is specifically designed to assist in the study of the socio-economic dimensions of climate change and to help policy makers understand the economic consequences of climate policies. On the impact side, FEEM investigates climate change impacts on the world economy through the use of ICES (Intertemporal Computable Equilibrium System), a model designed to assess the final welfare implication of climate change impacts, capturing the production and consumption substitution processes at play in the social-economic system as a response to climate shocks. Essentially focused on modelling and policy analysis, the following selected projects aim at assessing the full costs of climate change impacts and adaptation, and of existing and new mitigation instruments and technologies for climate stabilisation, in order to provide a comprehensive integrated assessment of climate policies. Within the same modelling frameworks some of the projects highlighted also investigate the issues of climate and energy policy governance and climate and energy-related innovation and technological change:

- Impacts Quantification of global changes - Global-IQ
- Vectors of Change in Oceans and Seas Marine Life, Impact on Economic Sectors - VECTORS
- Low climate IMpact scenarios and the Implications of required Tight emission control Strategies - LIMITS
- Innovation for Climate chAnge mitigation: a study of energy R&D, its Uncertain effectiveness and Spillovers - ICARUS
- PARadigm SHifts Modelling and INnovative Approaches - PASHMINA
- Diffusion of Climate-Friendly Technologies. The Role of Intellectual Property Rights, Human Capital and Environmental Policy - ClimTech

· With the aim to provide a useful tool to measure welfare beyond-GDP, FEEM has developed the FEEM Sustainability Index (FEEM SI). The FEEM SI is an aggregate index through which novel techniques summarise and merge the information derived by a selection of relevant sustainability indicators to assess welfare. Thanks to its foundation in a recursive-dynamic computable general equilibrium model, ICES-SI, the FEEM SI can provide future assessment of sustainability as well as a past one, building a dynamic and comprehensive picture of the sustainability of world countries through time. Since it is possible to compute the index under different economic, social, and environmental assumptions, the FEEM SI can be used to assess the sustainability of alternative policies of economic, social, or environmental in nature, both in a snapshot and through time. A new version of the FEEM SI will be released in December 2011, presenting several methodological advancements, among which, a novel indicators' aggregation methodology based on experts' elicitation techniques.

· Building on earlier work on the design of a methodology to assess the external costs of energy (the ExternE project series), FEEM has followed up on this stream of research leading the EXIOPOL project - A New Environmental Accounting Framework Using Externality Data and Input-Output Tools for Policy Analysis. The main research products of this project include: a detailed Environmentally Extended Input-Output database, covering 43 individual countries plus the aggregation of the rest of the world, to perform full cost accounting and impact assessment of different activities; policy relevant case studies; and the comparison of different methodological approaches to environmental accounting. EXIOPOL thus provides precious tools and data for a comprehensive analysis and a full life cycle assessment of a broad set of economic activities in Europe.

· To bring a more realistic view into modelling and in the design of future scenarios, FEEM has initiated a research stream on the development and application of experts' elicitation techniques. Within the ICARUS project, aimed to provide a unique analysis of energy related innovation mechanism, expert elicitation methods will be used in order to assess the potential effectiveness of technology-specific R&D. ICARUS carries out a systematic process of collection and elaboration of qualitative and quantitative estimates from the experts, drawn from the world of business and institutions. This process characterises the uncertainty dimension of innovation in selected technologies, including Solar PV and CSP technologies, nuclear, and bio-fuels. Expert elicitations' results will be used as building blocks to shed light on a number of disguised areas relevant for the modelling community, improving the models capacity to project a more realistic image of the world. The same methodology will be used within the TEaM Project -Technology Elicitations and Modelling Project. The project aims to integrate the data sources on technology supply, with expert elicitation techniques and to share them with the Integrated Assessment Modelling community.

· To enhance communication and cooperation among the different communities involved in sustainable development issues, FEEM is involved in several research networks.

As an example, FEEM leads the dissemination activities of the Network of Excellence LIAISE- Linking Impact Assessment Instruments to Sustainability Expertise, aimed to build a bridge between science and policy in the field of impact assessment for sustainable development. Among the various activities of the network, a toolbox on available instruments for impact assessment has been designed and made freely accessible to practitioners working in the field.

#### Policy insights

- An integrated assessment approach in economic research aims at enhancing harmonised and integrated policies towards a world green economy. Policies should be harmonised not only across sectors, but also around the most challenging issues, such as climate change. The system of governance of the relevant policies should allow for integration and cooperation at the regional and international levels.
- To pursue a green economy approach, the assessment of development policies should move beyond GDP, by benchmarking new measures of welfare. 'Beyond GDP' indicators should account for environmental and social externalities of economic activities, reflecting the concept of social equity.
- The modelling of the transition to a low-carbon green world, under multifaceted dimensions of uncertainty, requires a long-term perspective. Based on the outcome of research, policy recommendations also require a long-term horizon. Policy makers should start adopting a longer-term perspective, implementing policies that may become effective beyond their political lifetime.
- Policy should communicate more effectively to science, to the business sector, and to the civil society to involve all key stakeholders in the difficult path towards a green economy. Efforts from both the demand and supply side are absolutely necessary. Only a productive cooperation between science and policy can build and provide the right incentives and motivations along that path, communicating also through the media.
- Policy should be aware that a public-private alliance is desirable to address more effectively many of the key challenges identified such as: climate finance, the support to R&D investment in new energy technologies, the implementation of full life-cycle assessment analysis in many economic sectors, and the more efficient management of natural resources such as: water, biodiversity, and ecosystem services.

---

## Food & Water Watch

Submission to the Zero Draft Outcome Document for the UN Conference on Sustainable Development (Rio+20)

Endorsed by 10 organizations on 5 continents, collectively representing over 1.5 million people.\*

As members of the global movements for climate, water and food justice, we wish to echo those who are expressing deep concern for the false solutions proposed in the name of reducing carbon emissions and combatting global warming. Market mechanisms that commodify nature have not only failed to reduce global warming at a sufficient rate, but serve to create ownership of and profitability from natural resources that belong to the global commons and must be protected in the public trust.

The delicate balance among the earth's ecosystems is the basis of survival for all species, including humans. Yet the health of these ecosystems has been subjugated to economic growth with little recognition of their inherent relationship. There is broad agreement that we must reduce carbon emissions, clean up polluted water sources and preserve biodiversity, but until we change our paradigm, our efforts will be insufficient.

The undeniable effects of climate change are driving recognition that the earth has a tipping point and cannot support status quo patterns of production and consumption. Increased droughts, flooding and erratic weather patterns are severely impacting hydrologic cycles and food production. Global warming will be felt most acutely by the poor. Achieving the parallel goals of reversing global warming and feeding our growing global population will require transparent, participatory, community-centered solutions that prioritize both the human rights to water and food, and the right of the earth to maintain ecosystem balance. There is enough food to feed the global population and there is enough water to quench the world's thirst, but there is not yet the political will to make it happen.

#### Green Economy in the Context of Sustainable Development and Poverty Eradication

The "Green Economy" has become a controversial term used broadly without clear definition, though it has been used most commonly to encompass strategies that counter environmental damage through market mechanisms. As such, it should not be used in any CSD documents unless and until a definition is established by consensus of the General Assembly prioritizing those mechanisms which do not commodify nature.

Nonetheless, the focus of the CSD with respect to the three pillars of sustainable development should be to lower global carbon emissions while meeting the needs of the poorest. Developed countries must help finance developing countries to address human rights violations that emerge from natural resource deficiencies accelerated by climate change. An economy based on nuclear energy, oil and coal, genetic engineering, toxic chemicals or the overexploitation of our forests and seas will never be sustainable or green. Instead, a fair green economy is one that provides sustainable livelihoods for all while fully respecting ecological limits.

#### The Human Right to Water and Sanitation and Climate Change

It is not possible to protect the human right to water and sanitation without recognizing the inherent rights of nature and other species. Thus we must first prioritize source water protection and the integrity of hydrologic cycles. The UN General Assembly and the Human Rights Council have now both recognized the human right to water and sanitation and the CSD must advance this mandate in Rio. We strongly support the call of the Special Rapporteur on the human right to safe drinking water and sanitation in stressing the value of applying a human rights framework as it specifically targets those with greatest need and prioritizes non-discrimination.

According to the World Health Organization, about 20 percent of the world's population lives in countries where water is scarce. By 2025, 800 million people will be living in countries or regions with absolute water scarcity (when demand outpaces supply), and two-thirds of the world will live in water stressed areas.

The problem of water scarcity is being driven by many factors, including climate change, population growth, pollution and misuse of water resources, all of which must be addressed in an integrated manner. By 2050 we will likely reach 10 billion people and without increased conservation, this will require 80 percent more water supply to meet our needs for household consumption, agriculture and industry.

It is generally estimated that 70 percent of global fresh water use is for agriculture and irrigation, and much of that is for animal feed. Approximately 20 percent of water is used by industry while less than 10 percent is used by households for basic health and sanitation. This highlights the fact that any effective conservation efforts must target agriculture and industry. Household consumption has been found to be relatively inelastic because barring the purchase of energy-efficient appliances, people require a static amount of water for drinking and bathing.

Pollution, in the form of human and animal waste and toxic chemicals, must also be addressed. One out of three urban dwellers are without access to sanitation. And of the almost 10 million chemicals known today, approximately 100,000 chemicals are used commercially for agriculture, industry and household use.

"Virtual water" refers to the water used in the production of crops or manufactured goods for export. If a country exports a water-intensive product to another country, it amounts to exporting water, which decreases the amount of water available in the home country. While this may seem like an innocuous step in global trade, many countries are using their most productive land to grow cash crops for export, regardless of the impact on water depletion and ability to feed the local population.

As awareness grows of freshwater limitations, so too does the drive to profit from this scarce resource. Private sector advocacy towards establishing water markets, water trading schemes and speculation is increasingly succeeding and is being helped along by financially constrained governments, often with the hope that outsourcing responsibility will bring private financing.

Private water companies have often been unable to meet obligations to shareholders while also meeting their obligation to maintain and expand water systems and to provide acceptable quality water at affordable prices. Private companies have little incentive to expand access to potable water when large sectors of the population are poor and unable to pay market rates.

The only long-term solution for achieving universal water is to establish government policies that use tax dollars to finance water infrastructure and to use cross-subsidies to make water access affordable. When only twelve percent of the world's population uses 85 percent of the world's water, we have clearly failed in justly distributing the most essential resource to life.

#### Agriculture Policy, Food Sovereignty and Climate Change

We have created a global agriculture system that rewards industrial food companies for producing luxury foods for those who can afford them. Millions of dollars are spent in northern countries to combat the health effects of obesity, while in other parts of the globe, millions of people are dying of hunger or malnutrition.

The dueling paradigms for combating global warming are mirrored in the debate over feeding the world. On one hand, some believe that transferring the latest technological advances, most of which are capital intensive, to every corner of the world will improve agricultural productivity and thus solve the problem of hunger. In this view, hunger is caused by lack of sufficient production.

However, there is ample evidence that hunger is primarily caused by distribution and power dynamics. The vast majority of agricultural technology is privately owned, capital intensive, and dependent on finite resources.

In 2009, the International Assessment of Agricultural Science and Technology for Development<sup>10</sup> or IAASTD report<sup>11</sup> concluded, the way the world grows its food will have to change radically and argued for an agroecological approach to food production. The four-year, UN-sponsored project included the work of 400 researchers and was funded by \$12 million from the World Bank.

This elaborate report rocked the status quo by concluding that an agroecological approach is the most effective route to meeting the world's increasing food needs, starkly contrasting the strategies promoted by industrial agriculture firms that claim bioengineering will feed the hungry. When 80 percent of global food is grown by small scale farmers, an agroecological approach is, by definition, better suited to adapting to local conditions and generating agricultural production from locally available resources, and without the same heavy reliance on capital. In that sense, agroecological systems are neither traditional nor industrialized but are uniquely appropriate for their conditions.

Concentration of the industrial food complex is legion. This increasing concentration also has serious impacts on land tenure distribution and thus exacerbates poverty. We cannot continue to degrade our soil with genetically modified mono-crops and their requisite fertilizer-pesticide packages and expect yields to perpetually feed our growing population.

#### Corporate Influence at the UN and in the CSD Process

We are deeply concerned that the corporate sector is increasingly impacting policy debates within the UN system. While there is certainly a role for business in implementing sustainable development practices and decreasing their environmental footprint, corporations are pushing for the implementation of market mechanisms from which they can profit. Particularly in the water sector, corporations are using the CEO Water Mandate to promote a private market system for water delivery and access at the expense of the public and the poor.

This close relationship between corporations and the UN legitimizes the growing influence of these corporations on policy, both at the UN and at the state level.

Resolution E/2005/29 calls upon the CSD to review the implementation of international water and sanitation decisions at its session in 2012 (p. 19, paragraph 4). A Review of Private Sector Influence on Water Policies and Programmes at the United Nations by the Council of Canadians found evidence of significant corporate lobbying and influence in past water-themed discussions and proceedings of the CSD, including during processes of the World Summit on Sustainable Development in 2002. The CSD must work to correct and prevent the presence of corporate conflicts of interest in international water governance. By addressing corporate pressures at Rio +20, governments have a greater opportunity to explore the full range of options that exist for addressing the global water crisis. This includes viable options of private sector participation in the provision of water and sanitation services, often presented under the guise of greening the economy.

#### Financing Climate Change Mitigation and Adaptation

The World Bank and other international financial institutions have used the same flawed ideology that supports tax havens to promote lower tax structures in resource-rich developing countries. Mining companies across Africa are failing to pay royalties and are avoiding billions of dollars in taxes. The IFIs should begin by stopping tax avoidance, corporate tax subsidies, secret contracts, speculation and creative accounting that pit one country against another and propel a race to the bottom. Even a fraction of this money would go a long way toward providing basic services for everyone.

Implementation of an international financial transactions tax could potentially raise millions of dollars for countering climate change and poverty, and would slow the speculation that has rocked commodities markets.

We recommend the following Sustainable Development Goals:

- A mandate that states develop national water plans that include source protection at the watershed level and a human rights framework for achieving water and sanitation provision, including sufficient quantity, quality and affordability guidelines.
- Governments must raise the priority of providing safe water and sanitation to their people by financing water infrastructure and sanitation with tax dollars and applying cross-subsidies to make water affordable to all. Likewise, Northern countries should help finance these goals in less developed countries.
- Agroecological methods of food production should replace the growing trend toward industrialization. Such methods sequester carbon in the soil, promote biodiversity and promote local food sovereignty.
- The UN must implement a strong set of system-wide standards and safeguards to prevent and address corporate conflicts of interest, based on the existing Guidelines on Cooperation between the United Nations and the Business Sector. This must include a grievance procedure for concerned parties to raise

questions about private sector engagements in UN proceedings on water and to ensure appropriate action and receive coordinated responses to the issues raised.

- Implement a financial transactions tax and use the funds to combat climate change and poverty.

We also support the following objectives, targets and possible actions proposed by the UN Secretary General's Advisory Board on Water and Sanitation:

Objective:

Ensure universal access to sanitation and safe drinking water through the adoption of plans for accelerated implementation of all dimensions of the human right to water and sanitation: safety, availability, accessibility, acceptability, affordability, non-discrimination, participation and accountability.

Proposed targets:

- Universal access to basic sanitation and improved water sources by 20xx
- Universal access to safe drinking water by 20xx
- Development of good quality services in cities at a rate that exceeds the rate of urban growth
- Drinking water networks to supply water continuously (24/7) in order to ensure safety and availability of water

Objective:

Common vision of wastewater management. Governments together decide to strengthen their respective actions on pollution of freshwater by adopting a shared vision of urban, industrial and agricultural wastewater management including collection, treatment and water reuse.

Proposed target:

- Reduce the percentage of wastewater that is not collected safely from households
- Reduce the percentage of wastewater that is discharged into the natural environment without treatment
- Increase the percentage of urban wastewater that is treated for safe reuse in agriculture and industrial processes
- Reduce the amount of water pollution arising from agriculture
- Reduce the amount of water pollution released by industry

Possible Actions:

- Establish or strengthen national policies and regulations for wastewater collection, treatment and discharge in order to ensure that individual and collective practices and systems are sufficient to protect health of individuals against potential contamination by others and by economic activities and to protect natural ecosystems against harmful pollution
- Get organized to monitor and stimulate at national level progress of wastewater collection and treatment by collective systems and individual facilities
- Get organized to monitor and control potential contamination of drinking water sources by manmade pollution
- Introduce or strengthen laws and other forms of regulation to support the reduction of pollutants and make water reuse possible, including the recovery of positive substances
- Request the United Nations Environmental Program (UNEP) or another UN agency to collect national statistics on wastewater management and report on its global progress.

Submitted by:

The Columban Center for Advocacy and Outreach (CCAO) promotes the social justice priorities of the U.S. region of the Missionary Society of St. Columban. We represent Columban missionaries: Catholic men and women who work with and serve those who are poor in fifteen countries worldwide, as well as communities in the U.S. Through advocacy, solidarity, and education, the CCAO is dedicated to raising the peace, social justice and ecological concerns of the people with whom we live and serve. We represent 30,000 individuals in the United States. The Council of Canadians, founded in 1985, is Canada's largest citizens' organization, with over 70 chapters across the country. We work to protect Canadian independence by promoting progressive policies on fair trade, clean water, energy security, public health care, and other issues of social and economic concern to Canadians.

FIVAS: The Association for International Water Studies. FIVAS is a civil society organisation working to monitor consequences of water projects and construction in the global South. Our focus is on the topics of water as a human right and hydropower. Based in Norway, FIVAS has an active body of skilled volunteers working on varying projects, but no formal members.

Food and Water Watch is a non-profit, nongovernmental consumer rights organization based in Washington, D.C. with 15 satellite offices in the U.S., Europe and Latin America. We fight for safe food and clean water through public education, legislative lobbying and by supporting local campaigns for local control of food and water resources. We collectively represent over 300,000 consumers.

Our Water Commons is a collaborative program of On the Commons, an organization formed in 2001 to advance commons-based solutions that will help achieve environmental restoration, social justice, global cooperation and a brighter future for all. OWC seeks to transform societal decision making for water stewardship towards participatory, democratic, community-centered systems that value equity and sustainability as a strategy.

The Polaris Institute seeks to enable social movements to re-skill and re-tool themselves to fight for democratic social change in an age of corporate driven globalization. The Institute works with citizen movements in developing strategies and tactics to unmask and challenge the corporate power that is the driving force behind government public policy making on economic, social and environmental issues. In so doing, the Institute serves as a catalyst with constituency-based social movements, increasing their capacity to do their own strategic campaign planning on issues of vital concern to their members and allies. The work of Polaris with social movements is carried out on both a national and an international basis, representing more than 5000 people.

The United Church of Christ, Justice and Witness Ministries is one of four Covenanted Ministries in the UCC, which helps local congregations and all settings of the church

respond to God's commandments to do justice, seek peace and effect change for a better world. We represent over one million congregants.

The United Church of Christ, Global Ministries commits to a shared life in Christ and to an ecumenical global sharing of resources and prophetic vision of a just and peaceful world order, joining with God<sup>™</sup>'s concern for the poor and oppressed. This commitment will be reflected in common decision-making for the mission program which will visibly witness to the oneness of mission in and through the Church of Jesus Christ. We represent over one million congregants. Women's International League for Peace and Freedom (US Section) was founded in 1915 during World War I, with Jane Addams as its first president. WILPF works to achieve through peaceful means world disarmament, full rights for women, racial and economic justice, an end to all forms of violence, and to establish those political, social, and psychological conditions which can assure peace, freedom, and justice for all. WILPF works to create an environment of political, economic, social and psychological freedom for all members of the human community, so that true peace can be enjoyed by all. In the U.S. we represent approximately 2,300 members.

Youth for Unity and Voluntary Action (YUVA), founded in 1984, is a registered non-profit making, voluntary development organisation working in the interest of poor and the marginalised in urban and rural areas on the issues of housing, livelihood and rights of urban poor children, women and youth and informal workers through action organization, capacity building, research and advocacy at Mumbai City, State and National levels. Based in India, YUVA is accredited as an NGO with general consultative status with the United Nations Economic and Social Council (UNECOSOC).

## Ford Foundation

Submission to the Secretariat for the United Nations Conference on Sustainable Development for the Zero Draft of the Rio+20 Compilation Document from the Ford Foundation

### Purpose

The Ford Foundation is pleased to provide this input "for inclusion in a compilation document to serve as basis for the preparation of zero draft of the outcome document" from the United Nations 2012 Conference on Sustainable Development ("Rio+20"). This document represents a summary of submissions developed by Foundation grantees for inclusion in the formal agenda for Rio+20.

The Ford Foundation's overarching interest in the Rio+20 Conference is to secure renewed and strengthened political commitment for sustainable development. In pursuing this objective, the Ford Foundation is supporting a wide range of civil society organizations (CSOs) that are promoting policy efforts and public leadership to advance several major agendas within the Rio+20 process, including:

- Sustainable and Equitable Cities/Urbanization;
- An Inclusive Green Economy Agenda that includes the Global South;
- Indigenous Peoples' Rights to Natural Resources and Sustainable Livelihoods;
- Strengthening the institutional framework for sustainable development by seeking greater transparency at the G20 and improving alignment with the goals of Rio+20 and the sustainable development conventions associated with the 1992 Earth Summit;
- An Agreement regarding Corporate Social Responsibility.

Towards these ends, the Foundation has supported CSOs to: 1) develop white papers that identify urgent emerging challenges and opportunities, which have served as a basis for recommendations to be incorporated into the Rio+20 zero draft process; 2) build networks of stakeholders to expand and facilitate participation in the summit process; 3) achieve consensus on priorities for CSO networks and decision makers; 4) identify implementation challenges and gaps to be addressed through the Rio+20 process; and 5) advocate for reforms in policies and practices to their local, regional, and national governments, international decision-making bodies, and across sectors (e.g., the private sector, the media, researchers).

### Ford Foundation contributions to Rio+20 Theme One: The Green Economy in the Context of Sustainable Development and Poverty Eradication

The Ford Foundation's mission is to promote social justice and reduce poverty. Therefore, all Foundation-funded activities regarding Rio+20 focus on the green economy within the context of sustainable development and poverty eradication. These are described more fully below:

- Sustainable and Equitable Cities/Urbanization. The Foundation is working with a group of grantees called the Sustainable Cities Working Group to advance sustainable urbanization strategies that also increase economic opportunity and reduce poverty. The group's main message is that the ways in which we collectively grow and manage our cities will largely determine the quality of life for billions of people and the fate of the planet's sustainability. This working group has submitted several concrete proposals for consideration in the zero draft process that address implementation gaps, new partnerships, and new institutional frameworks, including:
  - o The creation of a UN Green Jobs Coordinating Group to ensure that the green economic efforts of relevant bodies within the UN system are well-coordinated, mutually reinforced, and integrated. This would be supplemented by a UN Green Jobs Best Practices Unit, which would collect and disseminate information to an international audience.
  - o Improved transparency, accountability, and inclusiveness regarding the sustainable urbanization process at the local level and the expansion of international legal mechanisms, including but not limited to the Aarhus Convention, to improve accountability at all levels of government.
  - o The creation of National Incentive Funds for Integrated Urban Region and Municipal Planning (similar to the US government's Partnership for Sustainable Communities); Funds to Invest in Innovative Financing Models for Inclusive and Sustainable Urban Development; and National Urban Sustainable Planning and Development Commissions to accelerate and improve the practice of sustainable urban and regional planning.
  - o A sustainable transportation goal that enables nations to commit to targets like reducing transport sector greenhouse gas emissions by 40 percent between a 2005 baseline and 2050; reducing by half the number of traffic fatalities in the world by 2025; and increasing access to affordable and sustainable modes like public transit, walking, and cycling.
  - o Ensure the public availability and utilization of data on urban operations and conditions, including information on water, sewer, transportation, housing, and other systems.
  - o Relying on available data, persuade national, regional, and local governments to adopt sustainability and poverty reduction performance indicators that can be tracked over time.
- An Inclusive Green Economy Agenda focusing on the Global South. The Foundation is working with CSOs—mostly Brazilian organizations—to develop a green economy

agenda that focuses on inclusion and equity. This would include:

- o Community Rights to Forest Resources: The Foundation is supporting efforts by communities to secure their rights to own and manage forests. Globally, community ownership of forests has increased significantly since the first Earth Summit in 1992, which has allowed significant improvements in livelihoods and the environment. The foundation suggests that the United Nations consider adopting a target of increasing the forest area under formally recognized ownership or control of forest communities by 100 million hectares by 2017.

- o The Ford Foundation supports indigenous and traditional peoples' efforts to guarantee their rights over territories and natural resources, as stated in the indigenous peoples' organizations recommendations for Rio +20 in the Letter of Manaus (24 April 2011): "The Green Economy proposal which will be a theme for discussion at Rio + 20, has not been clearly defined, and there are many concerns expressed by Indigenous Peoples. There is, for example, a concern that it will be used by Corporations and States to continue to replicate the same destructive and exploitative 'economic development' models that have caused the current global economic, environmental and climate crisis. Indigenous Peoples have the opportunity to define and implement their own holistic concepts of development in the context of, inter alia, Articles 3, 20, 25, 26, 31, 32, 33 and 37 of the UN Declaration on the Rights of Indigenous Peoples, and taking into account equity, human rights and traditional knowledge principles and the concept of well-being as defined by Indigenous Peoples themselves. Our proposed model of development with culture, identity, self-determination and territory will be presented by Indigenous Peoples and should be carefully considered by States, at the Rio + 20 Conference."

- o The Ford Foundation supports the Brazilian Civil Society participation in the Brazilian Government National Commission for Rio +20 process. This Commission, headed by the Ministries of the Environmental and Foreign Affairs, is a multi-stakeholder organization and produced a document to be submitted as the Brazilian Contribution for Rio+20.

- Indigenous Peoples' Rights to Natural Resources and Sustainable Livelihoods. [From the aforementioned Letter from Manaus]: "International standards like the UN Declaration on the Rights of Indigenous Peoples affirm that development is social and cultural, as well as economic. Indigenous Peoples maintain the right to define and freely pursue our own vision of development based on our needs, priorities, traditional understandings and responsibilities, including the cultural and spiritual relationships with the Natural World, our ancestral territories and the ecosystems that have sustained us since time immemorial."

- An Agreement Regarding Corporate Social Responsibility. The Foundation is exploring opportunities to assist in the development of a Convention on Social Responsibility as an outcome from Rio+20. It would include the mandatory requirement for companies listed on the stock exchange to produce sustainability reporting so as to ensure four key principles:

- o Transparency: companies should be required to integrate material sustainability issues within their reports and accounts;

- o Accountability: there should be effective mechanisms for investors to hold companies to account on the quality of their disclosures, including through an advisory vote at the Annual General Meeting (AGM);

- o Responsibility: Board duties should explicitly include setting company's values and standards, and ensuring that its obligations to its shareholders and other stakeholders are understood and met;

- o Incentives: Companies should state in remuneration reports whether the remuneration committee consider ESG factors which are of material relevance to the sustainability and long term interests of the company when setting remuneration of executive directors; aligning remuneration with the interest of the shareholders, including customers and employees. Additionally, companies should be required to present their Corporate Sustainability Strategy to a separate vote at its AGM. The future convention should draw on experiences and content from the Global Compact, Sustainable Stock Exchanges initiative, Carbon Disclosure Project and the OECD guidelines. Governments may wish to look anew at the proposed Chapter 41 of Agenda 21 from 1991. This was called "Transnational Corporations and Sustainable Development"; it was submitted at Rio for consideration by the UN Center for Transnational Corporations.

Ford Foundation contributions to Rio+20 Theme Two: Institutional Framework for Sustainable Development.

Several proposals regarding institutional frameworks to strengthen the pillars of sustainable development are listed above. In addition, the Foundation proposes the following:

- Improved Alignment between the goals of the UN system and the G20. The Foundation is working with partners to improve alignment between the Group of 20 (G20) Development Action Plan (DAP) and the goals of the Rio+20 Summit. Improving coordination between the G20 and the United Nations system—particularly the UN Environment Program, the UN Development Program, the UNFCCC, and UN-WOMEN—has important implications for the writing of global rules on finance, sustainable development, and transparent and effective governance, particularly in light of the fact that the G20 stipulates that its growth frameworks should be implemented and financed by the United Nations and international trade, finance, and development institutions. But currently the G20's growth frameworks lack an integration of the three indispensable elements of sustainable development relating to the natural environment, the economy, and poverty reduction. If its orientation and growth frameworks are not revamped, the G20 could work at cross-purposes with the 2012 Earth Summit by increasing, rather than helping to close, the wide gap between the aspirations and commitments to sustainable development and the implementation performance of nations and institutions. However, such re-orientation can only occur if the G20 becomes an open, transparent and accountable body. At present, in contravention of Rio Principles (e.g., Principle 10 on Public Participation; Principle 20 on the role of women in sustainable development), the G20 operates behind closed doors, excluding 173 UN member countries and civil society.

- Creation of a new Chamber for Cities within a new Sustainable Development Council. This Chamber would fully recognize the leadership role that mayors and other local executives continue to play to advance the practice of sustainable and inclusive urbanization. In fact, it would present an opportunity for cities to define a different role in achieving sustainability worldwide. By providing official status to the world's mega-city mayors and other local officials, this Chamber would represent a formal and high-level way to provide an institutional home and leadership for sustainable urbanization efforts. Participating local officials can focus on pragmatic means of implementing green and inclusive development strategies.

- Forwarding the concerns noted by indigenous groups regarding changes to the UN-CSD: [From the aforementioned Letter of Manaus] "The proposal to upgrade the UN Commission on Sustainable Development to a new Council, similar to the Human Rights Council, while it may elevate discussions on sustainability within the UN system; it could also have the potential to reduce the space for Indigenous Peoples to participate and be part of any negotiation process. The experience with the recent creation of the Human Rights Council, from the former Commission on Human Rights, confirms the potential for reduced opportunities for participation. This is an issue that requires further discussion and analysis particularly in relation to the development of guiding principles, taking into consideration UN Declaration on the Rights of Indigenous Peoples, current Indigenous-related UN mechanisms, as well as the role of self-governing bodies and autonomies within Indigenous territories."

## Foreningen for Internasjonale Vannstudier (Association for International Water Studies) - FIVAS

FIVAS - The Association for International Water studies

## Contribution for the Rio+20 Compilation Document

## Food and water Security

There are today 2.6 billion people lacking access to improved sanitation, out of these are 1 billion slum dwellers without access to toilet facilities. 1 in 7 lack access to clean drinking water. The MDG on safe drinking water and sanitation is among those furthest away from fulfilment. Water is a global common good, shared by current and coming generations. Protection of source water and the integrity of hydrological cycles are key to a sustainable water usage. We strongly support the call of the Special Rapporteur on the human right to safe drinking water and sanitation in stressing the value of applying a human rights framework. Access to improved sanitation and safe drinking water are key to health and to economic development. Good management of water and sanitation underpins sustainable developments social, economic and environmental pillars.

Agriculture is responsible for 70 % of all freshwater withdrawals. More food must be made with less water. Agriculture must therefore be the focus for means of water conservation in all areas facing or approaching water scarcity. It is imperative that water systems for farming, both in irrigation and livestock care become more efficient.

Water based sanitation is costly to install and dependent on scarce water resources. Development of Productive Sanitation could hugely improve the process of providing improved sanitation by bypassing or alleviating the problems of high investment cost and water intensity associated with traditional sewage-based systems. CLTS - community led total sanitation is a tried and effective bottom up approach to productive sanitation which includes a focus on changing habits and a culture of good sanitation which is a prerequisite to health effects of sanitation projects.

Ensuring universal access to sanitation and safe drinking water through the adoption of plans for accelerated implementation of all dimensions of the human right to water and sanitation are therefore necessary.

## Recommendations:

- Low-impact solutions such as mechanic treadle pumps, drip irrigation, decentralized rainwater harvesting and groundwater recharging should be made priority of international organizations and national governments redirecting resources from high impact large scale projects.
- Strengthening water, energy and food security for the poorest population groups requires a shift of financial resources, research and institutional support from large, centralized projects to decentralized, small-scale projects that can be managed at the local level.
- Innovative mechanisms, including smart subsidies, should be implemented to ensure sanitation provision for the very poor.
- Supporting government policies for sustainable financing of water infrastructure, such as tax financing and cross-subsidies, are important in transnational and national processes.

## Energy Security D Renewable Energy and Energy Efficiency

Hydropower will make up a considerable proportion of renewable energy. It is vital for environmental sustainability that an investment in renewable energy is paralleled by an investment in energy efficiency. Large hydropower construction is costly and has adverse consequences for subsistence, bio diversity and commercial fisheries. Large Dams are also empirically known to under deliver on goals of energy generation. Dams are also found to cause emission of greenhouses gasses several decades after their construction, in tropical areas potentially at dual the rate of coal plants on a kWh basis.

Building large dams and other centralised water and energy projects may still be appropriate under certain conditions. Mandatory guidelines on environmental and social aspects are a prerequisite, the guidelines recommended by the World Commission on Dams are the most appropriate framework for decision making on water and energy projects. Future development strategies need to include this framework.

Wind, small hydro, solar and geothermal technologies represent good alternatives for small scale bottom up energy projects. These projects empower poor people and promote climate resilience. There needs to be a recognising that small scale energy projects are not intended to meet the same generating capacity as large scale projects, but are an alternative approach based on the principles of sustainability and empowerment.

## Recommendations:

- Before energy programs are initiated national governments and international organizations should carry out participatory assessments of all needs and options including the including the principles of Free and Prior Informed Consent. These assessments should integrate social, environmental and economic aspects with equal weight.
- Low impact solutions, such as small scale projects and energy efficiency, should be made priority of international organizations and national governments redirecting resources from high impact large scale projects.
- Intergovernmental organizations and national governments should ensure the use of mandatory social and environmental standards for project selection and implementation.
- Intergovernmental organizations, national governments and parliaments should explicitly acknowledge and guarantee the customary and formal rights of local communities to their land, water, forests and other resources in their infrastructure strategies. This includes the right of indigenous peoples to free, prior informed consent (FPIC) regarding projects on their lands.

---

## Forest Stewardship Council

Contribution Forest Stewardship Council to outcomes of the Rio+20 Conference

In particular on "green economy in the context of sustainable development and poverty eradication"

Oaxaca/Mexico, Bonn/Germany, 27 September, 2011

## Context

The Forest Stewardship Council (FSC) underlines key messages from UNEP in its Green Economy report of 2011: "Forests are a foundation of the green economy, sustaining a wide range of sectors and livelihoods".

"Short-term liquidation of forest assets for limited private gains threatens this foundation, and needs to be halted".

FSC agrees with UNEP in setting as objectives of a green economy: "improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities". This clarifies that economic activities need to respect ecological constraints but have clear social objectives.

FSC works in conjunction with and complements initiatives that aim to reduce deforestation and forest degradation globally and increase the total forest cover, also as part of climate mitigation and adaptation policies.

The urgency for responsible forest management is compelled by increased demand for forest products to sustain fundamental needs such as providing energy source, construction material, and other purposes.

UNEP describes certification of sustainable forest management, such as FSC, as a promising development, a relevant contribution to shift the trends. However, it needs to be applied at a much greater scope, in particular in the tropical and sub-tropical areas. It concludes that "There are reasons for optimism, but greening the forest sector requires a sustained effort. Various standards and certification schemes have provided a sound basis for practising sustainable forest management, but their widespread uptake requires a strong mandate and consistent policies and markets.

As Party to the Convention on Biological Diversity, the majority of UN governments have, in Nagoya last year, committed themselves to the "Aichi Biodiversity Targets" for 2020. These include the aim to halve the (annual) rates of losses of forests, "and where feasible brought close to zero", and to significantly reduce degradation and fragmentation. Sustainably managed forests will also contribute to "ensuring conservation of biodiversity", as well as the restoration of 15% of currently degraded ecosystems. The Parties have committed themselves to develop or update, by 2015, national biodiversity strategies and action plans to help implementing the Aichi targets.

FSC calls for inclusion of a "Certification Support Pledge" in the outcomes of the Rio+20 Conference, with the following text:

Governments recognise that forests are a foundation of the green economy, sustaining a wide range of sectors and livelihoods; that forests also form an essential part of the world's ecosystems and play a crucial role in mitigation of, and adaption to, climate change. They are alarmed about the ongoing deforestation and forest degradation in many parts of the world. They are aware of the increased demand for forest products and the opportunities and threats this will create. Responsible forest management therefore is essential to protect environment, biodiversity and ecosystem services, ensure the respect of social and human rights, guarantee proper wages and prosperity and contribute appropriately to the domestic economies. Forest certification is complementary to nature conservation and provides a promising environmental, social and economic alternative to practices that result in destructive forest exploitation and deforestation.

Therefore, all governments taking part in the Rio+20 Conference, pledge concrete and systematic support and promotion of transparent, effective, balanced multi stakeholder governed forest and chain-of-custody certification systems, in all parts of the world, with special attention to tropical and sub-tropical rainforests. They do this in line with their individual responsibilities and possibilities, towards their domestic forests, as actors on the public procurement markets, as guardians of internal markets, as decisionmakers on consumer information criteria, and as initiators and supporters of development and training assistance at home and/or abroad. They recognise that forest certification can strengthen local economies, ensure the rights and interests of indigenous peoples and local communities and avoid the destruction of forests, their ecosystem services and their biodiversity, and, drive continuous improvements, provided it is based on robust principles, applied through transparent and balanced participatory, multi-stakeholder governed, processes, and includes independent, on-the-ground, monitoring, reporting and verification.

Governments engaged in Rio+20 commit to include support for credible forest certification in their national biodiversity strategies and action plans as well as in other plans focused on limiting or reducing the ecological footprint of their societies, including integrated product procurement policies.

They will furthermore support the success of such forest certification systems by aligning public procurement practices at all levels with certified forest products and services, as well as promote certified products with their citizens.

Those governments engaged in development cooperation with other countries, commit to include forest certification in their programmes, supporting the development of forest dependent local economies, social rights, and environmentally sound forest management.

Government activities to implement this pledge could include:

On the ground: develop and enforce appropriate policies and regulations for responsible forest management and guarantee efficient and effective controls; create favourable conditions for robust and balanced multi-stakeholder based forest certification schemes such as FSC (examples existing in South Africa, Brazil, Guatemala), including tax incentives for certificate holders (such as in Peru).

On the ground: support responsible forest management practice through education and training; support development of curricula to help people understanding the values of healthy forests and green economy; and . where appropriate - for training to understand processes of voluntary certification based on participatory processes. On the ground: where forests are public, seek FSC certification of these forests and demonstrate responsible management including stakeholder engagement.

On the ground: actively support and encourage FSC oriented multi-stakeholder decision making processes to achieve FSC Forest Management certification of private and community forests.

On the ground in other countries: promote and support assistance to forest management certification processes by social development organisations, in particular in the tropical and subtropical countries.

On the markets: inform and mobilise consumers to differentiate between products based on social and environmental impact, and to understand that forest products from questionable origin contribute to irresponsible forest management practices such as overharvesting, degradation, illegal activities, and violation of worker and human rights. Give confidence by identifying credible certification schemes that deserve consumer preference in public procurement policies.

On the markets: practice green public procurement, in a credible manner, and support a large, reliable market for certified products, including by setting progressive targets. On the FSC website we will present progressively examples of supporting activities governments have already been engaged in, in particular in/tropical and semi-tropical forests (<http://www.fsc.org/casestudies.html>). What is FSC:

The Forest Stewardship Council (FSC) is an independent, non-governmental, not for profit organization established to promote the responsible management of the world's forests. FSC is a unique forum where stakeholders from around the world meet and through strong multi-stakeholder processes define essential social and environmental criteria for forest management. These fundamental principles are realized in forests worldwide through FSC certification. Through programs, services and solutions that support FSC certification, the Forest Stewardship Council empowers organizations, businesses and communities to support forest management that meets the social, economic and ecological needs of present and future generations. Find more information at [www.fsc.org](http://www.fsc.org).

## Fórum Empresarial RIO+20 (Brazilian Forum Empresarial)

CARTA DE RECOMENDAÇÃO E PRINCÍPIOS DO FORUM EMPRESARIAL RIO+20 PARA A UNCSD-2012

(CHARTER OF RECOMMENDATION AND PRINCIPLES OF FORUM EMPRESARIAL RIO+20 TO UNCSD-2012)

Nós, membros participantes do FÓRUM EMPRESARIAL RIO+20, atendendo à chamada pública de contribuições para a UNCSD-2012, entendemos que, para a perfeita aplicação e efetividade da Economia Verde, associada ao conceito de desenvolvimento sustentável, tornam-se necessárias ações, procedimentos e princípios que devem ser observados por qualquer ator da Sociedade Global, de acordo com as seguintes considerações:

1. Pretendemos alcançar o desenvolvimento sustentável, com equilíbrio entre o social, o econômico e o ambiental, que devem sempre estar inter-relacionados, e de acordo com o princípio da responsabilidade comum porém diferenciada.
2. Entendemos que a abordagem da idéia de " Economia Verde" não pode se desvincular dos princípios do Direito do Ambiente.
3. Os membros do FÓRUM EMPRESARIAL RIO+20, entendem que é necessário alcançar um compromisso básico para os seguintes temas:
  - a) Diminuição e posterior erradicação da pobreza extrema.
  - b) Restaurar a harmonia com o ambiente natural
  - c) Desenvolver ações que fomentem a geração de empregos verdes ( Green Jobs)
  - d) Integrar o conceito de desenvolvimento sustentável a um compromisso entre a empresa e a sociedade.
  - e) Aumentar a valorização dos investimentos e incentivos na área de P&D, com ênfase as atividades que envolvam a Economia Verde.
4. Reconhecemos a soberania dos países em relação ao acesso ao patrimônio e aos recursos genéticos, devendo estes países responsabilizar-se também pela segurança.
5. Reconhecemos a necessidade de defesa das matrizes energéticas mais limpas, com condições de contribuição para a diminuição do aquecimento global.
6. Entendemos que o Estímulo aos individuais, pequenos e médios empresários pode se configurar através das práticas decorrentes da Economia Verde.
7. Reafirmamos a essencialidade do desenvolvimento de práticas empresariais em respeito aos direitos difusos e transindividuais, destinadas a geração de oportunidades de emprego e renda para os idosos, crianças, adolescentes, deficientes físicos, consumidores e todos os cidadãos sujeitos de direito.
8. Entendemos que as práticas empresariais de sucesso que abordem o desenvolvimento sustentável devem ser disponibilizadas a todas as empresas que ainda não tiveram acesso, observados os sigilo industrial e comercial.
9. Entendemos que as Empresas devem se integrar aos processos de urbanização das áreas de seu entorno, considerando os princípios internacionais da Cidade Sustentável.
10. Entendemos que as ações empresariais devem sempre levar em consideração o conhecimento tradicional associado e o conhecimento ancestral, com ênfase à educação ambiental não formal.
11. Reconhecemos a necessidade de envolver a educação ambiental em todos os níveis de ação dos setores da empresa.
12. Entendemos que os sistemas de gestão ambiental devem considerar os modernos conceitos de Economia Verde, considerando os seus três pilares essenciais.
13. Reconhecemos a necessidade de perfeita interação entre as políticas públicas e as ações empresariais quando o objeto se tratar de gestão de resíduos sólidos.
14. Entendemos que a Gestão Integrada de Resíduos Sólidos é um instrumento essencial à economia verde e à diminuição da pobreza.
15. Reconhecemos que a Logística Reversa contribui para a implementação da economia verde e é um fator de grande importância e essencialidade à diminuição dos índices de pobreza no Planeta.
16. Entendemos que as bacias hidrográficas são essenciais à manutenção da vida no Planeta e essenciais ao desenvolvimento de uma economia verde associada ao compromisso socioambiental, porém o acesso aos recursos hídricos deve ser abordado de acordo com a característica individual de cada bacia.
17. Acreditamos que a bacia aérea é um meio de essencial importância à vida no Planeta e deve ser conservada de acordo com as modernas práticas da economia verde, com observância de suas características locais.
18. Entendemos que a agricultura é essencial à eliminação da fome e pobreza no Planeta, desde que respeitadas as práticas de economia verde.

Rio de Janeiro, 01 de Novembro de 2011. \_\_\_\_

ENGLISH VERSION

CHARTER OF RECOMMENDATION AND PRINCIPLES OF FORUM EMPRESARIAL RIO+20 TO UNCSD-2012 We, participating members of the FORUM EMPRESARIAL RIO+20, given the public call for contributions to the UNCSD-2012, we understand that for the perfect application and effectiveness of the Green Economy, linked to the concept of sustainable development actions become necessary, procedures and principles to be observed by any player in the Global Society, according to the following considerations: 1. We aim to achieve sustainable development, with the balance between social, economic and environmental, which should always be interrelated, and in accordance with the principle of common but differentiated responsibility. 2. We believe that the approach of the idea of "Green Economy" can not unlink the principles of Environmental Law. 3. The members of the FORUM EMPRESARIAL RIO+20, it is necessary to understand achieve a basic commitment to the following themes:

- a) Reduction and eradication of extreme poverty. b) Restore harmony with the natural environment c) Develop activities that promote the generation of green jobs (Green

- Jobs) d) Integrate the concept of a commitment to sustainable development between the company and society.
- e) increase the valuation of investments and incentives in R & D, with emphasis on activities involving the Green Economy.
4. We recognize the sovereignty of countries over access to assets and genetic resources, these countries should also take responsibility for security.
  5. We recognize the need for defense of the cleanest energy matrix, in terms of contribution to the reduction of global warming.
  6. We understand that the stimulus to individual, small and medium businesses can be configured through the practices arising from the Green Economy.
  7. We reaffirm the essentiality of the development of practices business rights with respect to diffuse and trans, for the generation of employment opportunities and income for the elderly, children, teenagers, disabled, consumers all citizens and legal subjects.
  8. We believe that successful business practices that address sustainable development should be available to all companies that have not had access, subject to confidentiality industrial and commercial.
  9. We understand that companies should integrate the processes of urbanization of its surrounding areas, considering the principles International Sustainable City.
  10. Entendemos actions that business should always take into consideration the traditional knowledge and ancestral knowledge, with emphasis on environmental education and informal education.
  11. We recognize the need to engage in environmental education all levels of action in the company.
  12. We understand that the environmental management systems should consider the modern concepts of Green Economy, considering their three pillars.
  13. We recognize the need for perfect interaction between the public policies and business actions when the object it is management of solid waste.
  14. We understand that the Integrated Solid Waste Management is a essential tool for green economy and poverty alleviation.
  15. We recognize that contributes to the Reverse Logistics implementation of the green economy and is a major factor importance and essentiality to the decrease in poverty rates the Planet.
  16. We understand that watersheds are essential to maintenance of life on Earth and essential to the development of a green economy associated with social and environmental commitment, but access to water resources must be addressed in accordance with the individual characteristics of each basin.
  17. We believe that through an air basin is of essential importance to life on the planet and must be kept in accordance with the modern practice of green economics, in compliance with their local characteristics.
  18. We understand that agriculture is essential to the elimination of hunger and poverty on the planet, in compliance with the practices of economy green.

Rio de Janeiro City, 2011. 01st. November.

## Forum Umwelt und Entwicklung

### Contribution to Rio+20 Zero Draft

Almost twenty years after the Earth Summit in Rio 1992 the stock-taking of global achievements for sustainable development leaves a bleak picture. Environmental degradation and depletion of natural resources have worsened and are likely to cause conflicts and insecurity for future generations. Widespread poverty as well as constrained development possibilities exist especially where the poorest countries and communities suffer the most from the global demand on resources and adverse environmental impacts. The development paths of the North and South remain alarmingly unsustainable well beyond the carrying capacity of the planet and do so at an increasing pace. The world, especially political actors in industrialised as well as in industrialising nations, has failed to deliver sufficiently on securing sustainable livelihoods for all within safe planetary boundaries. Even in view of the combined environmental, economic and food crisis, so far there is no sufficient political ambition in sight to address them adequately.

The UN Conference on Sustainable Development (UNCSD) in Rio 2012 needs to generate the necessary political will to change course. The world must embark on a socially and ecological sustainable green economy path that achieves sustainable development and poverty eradication and breaks with the business as usual scenario. Bold actions are needed to achieve social and economic equity and environmental sustainability. This implies that deliberate decisions have to be made in order to create enabling policy environments, to redirect public and private funds that have catalysing effects to boost truly green economies that are able to deliver on basic societal needs such as energy and food for all in the north and south. Active governmental measures to strengthen the right to development for the poor and to support the most vulnerable groups are fundamental to decrease vulnerability to social and economic changes as well as the effects of distorted ecosystems for example climate change.

Governments should send their Heads of State or Government to Rio+20 and make following commitments:

#### 1) Sustainable Development Goals (SDGs)

The Rio summit offers the possibility to deliver an internationally agreed vision of development that catalyses fundamental changes in our economies towards more social and economic equity and environmental sustainability while ensuring poverty reduction focusing on the most vulnerable groups. Green economy might be seen as an useful tool to embark on a sustainable economic pathway with specific and ambitious goals to catalyse structural change.

Heads of states and governments therefore need to commit to a set of global Sustainable Development Goals (SDGs) to be achieved by 2030 - complementary to the Millennium Development Goals (MDGs).

The global community should agree on a mandate for the UN to develop the SDGs further and to define their scope. The scope must not fall behind internationally agreed targets and include short-term milestones in order to ensure immediate implementation and avoid gaps in political commitment due to election cycles. SDGs should be based on the following principles and cornerstones:

- Avoid unintended consequences of conventional decision making and overcome traditional sectoral approaches by avoiding solutions that aggravate problems in other sectors (Nexus-approach).
- Incorporation of guiding principles of sustainable development by other international finance and trade institutions, including those in- and outside the UN system.
- Measuring of societal goals beyond GDP growth that integrates societal well-being and preservation of natural capital and environmental resilience.
- Implementation of Rio+20 roadmaps established by every nation by 2015 with ambitious and clearly identified short term milestones leading to national SDGs. These roadmaps could be supplemented by national action plans addressing specific political areas as for example national low and zero carbon action plans for emerging and industrialised economies including national specific renewable energy and energy efficiency frameworks to be implemented and operational by 2030.
- Self-Commitment of Governments on national Rio+20 roadmaps and SDGs that clearly show national contributions to the achievement of the global SDGs.
- Mechanisms monitoring the achievement of national Rio+20 roadmaps and SDGs by a designated UN-Body sufficiently mandated assess the level of national achievement and provide policy recommendations.

## 2) Green Economy

Green Economy being part of sustainable development needs to be understood, as a system of economic activities to deliver societal goals of providing justice and equity, i.e. sustainable and improved human well-being and livelihoods for all, while fully respecting the ecological limits of planetary boundaries and without exposing future generations to significant environmental risks and ecological scarcities. Investing in greening high impact sectors and services, investing in people and in natural capital must go hand in hand. As a tool to embark on a sustainable economic pathway it supplies for a fair and equitable transition of today's economies and values and governs natural resources. In order to achieve this, heads of states and governments need to commit to a green economy that encompasses:

- Elimination of subsidies harmful to climate and environment by 2020 - especially subsidies on fossil fuels and in the agricultural and fishery sector.
- Reduction of greenhouse gas emissions to reach the goal of limiting global warming to two degrees above the pre-industrial age level.
- Access to sustainable and renewable energy for all by 2020 for basic needs, inter alia by promoting community-owned decentralized energy supply.
- Socially or community control of basic living supplies such as water supply and incorporation of water use in frameworks of other sectoral approaches.
- Ensure food security for all by promoting sustainable agricultural and fishing practices and committing to policies and market mechanisms that support small-scale agriculture and fishery to manage sustainable food production.
- Preservation of ecosystems and their biodiversity in order to provide key ecosystem services to achieve food, water and energy security.
- Stop deforestation and preserve natural forests as well as modified natural forests by 2020 and implement policies and measures that stop the drivers for deforestation including safeguards to land use changes.
- Restoration of ecological and natural resources including forests as the base of economic activity including eroded soils.
- Address gaps in ocean governance for areas beyond national jurisdiction and establish a global network of Marine Reserves until 2017.
- A financial system that contributes to the realisation of human rights as agreed in the International Covenant on Economic, Social and Cultural Rights
- A trade and investment regime providing the necessary policy space for regulation in order to make it work for environmental protection, human rights, equity and justice.
- Regulations and incentives to promote sustainable production and consumption patterns.

## 3) Institutional Frameworks for Sustainable Development

The objective to reform the institutional framework for sustainable development must be to fundamentally improve governance, accountability & liability.

In order to achieve this, heads of states and governments need to commit to:

- Strengthening the governance system by upgrading the UN Environment Programme through strengthening and extending its mandate to include means for consultancy of countries willing to enter a transformation process as well as better implementation, compliance and enforcement mechanisms.
- Creating a Sustainable Development Council (SDC) in order to coordinate the existing structures relevant to sustainable development in UN and outside the UN system and to monitor the progress in achieving SDGs on a global and on national levels.
- In order to achieve political acceptance of the sometimes difficult transition process participative and democratic principles should be developed, promoted and safeguarded.

## Framework Convention Alliance (FCA)

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The Framework Convention Alliance (FCA) was created in 1999 and is made up of over 350 non-governmental organisations from more than 100 countries working on the development, ratification and implementation of the international treaty, the World Health Organization's (WHO) Framework Convention on Tobacco Control (FCTC).

Renewed political commitment to sustainable development at all levels –social, economic, and environmental – is critical to address emerging global challenges and achieve progress on internationally agreed development goals.

In this regard, FCA would like to highlight that non-communicable diseases (NCDs) cause more than 36 million deaths annually, which represents 63% of all global deaths.

NCDs result in enormous human suffering and its economic consequences are staggering. Unless efforts to tackle NCDs intensify, cumulative economic losses to low- and middle-income countries (LMICs) from the four main groups of NCDs are estimated to surpass US\$ 7 trillion over the period 2011-2025.

Tobacco use is the one risk factor common to the main groups of NCDs. It kills more than 15,000 people a day and accounts for one in six of all NCD deaths. To date, more than 170 countries have become Parties to the FCTC. The treaty's measures are cost-effective, affordable and some of them, such as tobacco taxes, also revenue-generating. Yet implementation of the FCTC has been slow – tobacco control measures require more than just a health sector response. Whole of society commitment to accelerate implementation of the FCTC is needed and new approaches combining the social, economic, and environmental spheres are critical.

FCA urges the Rio+20 Conference Secretariat and the participating countries to consider the adoption of the following statement in the Conference Final Declaration:

We reiterate our commitment to accelerate the implementation by the State Parties of the WHO Framework Convention on Tobacco Control (FCTC) and encourage countries that have not yet done so to consider acceding to the FCTC as we recognize that substantially reducing tobacco consumption is an important component of economic, social and environmental sustainable development strategies at the global, regional, national, and community levels.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

RIO+20 COMPILATION DOCUMENT: FCA SUBMISSION

The Framework Convention Alliance (FCA) was created in 1999 and is made up of over 350 non- governmental organisations from more than 100 countries working on the development, ratification and implementation of the international treaty, the World Health Organization's (WHO) Framework Convention on Tobacco Control (FCTC).

Renewed political commitment to sustainable development at all levels social, economic, and environmental is critical to address emerging global challenges and achieve progress on internationally agreed development goals.

In this regard, FCA would like to highlight that non-communicable diseases (NCDs) cause more than 36 million deaths annually, which represents 63% of all global deaths. NCDs result in enormous human suffering and its economic consequences are staggering. Unless efforts to tackle NCDs intensify, cumulative economic losses to low- and middle-income countries (LMICs) from the four main groups of NCDs are estimated to surpass US\$ 7 trillion over the period 2011-2025.

Tobacco use is the one risk factor common to the main groups of NCDs. It kills more than 15,000 people a day and accounts for one in six of all NCD deaths. To date, more than 170 countries have become Parties to the FCTC. The treaty's measures are cost-effective, affordable and some of them, such as tobacco taxes, also revenue-generating. Yet implementation of the FCTC has been slow tobacco control measures require more than just a health sector response. Whole of society commitment to accelerate implementation of the FCTC is needed and new approaches combining the social, economic, and environmental spheres are critical.

FCA urges the Rio+20 Conference Secretariat and the participating countries to consider the adoption of the following statement in the Conference Final Declaration:

We reiterate our commitment to accelerate the implementation by the State Parties of the WHO Framework Convention on Tobacco Control (FCTC) and encourage countries that have not yet done so to consider acceding to the FCTC as we recognize that substantially reducing tobacco consumption is an important component of economic, social and environmental sustainable development strategies at the global, regional, national, and community levels.

## I. CONSTAT: 20 ANS APRES RIO, OU EN SONT LES OCEANS?

Lors du Sommet de la Terre de 1992, le chapitre 17 de l'Agenda 21 est adopté et consacre entièrement aux océans. Premier pas pour l'action, il presageait déjà de la préoccupation grandissante sur l'état de nos océans. Pres de vingt ans plus tard, un tout récent rapport publié en juin 2011 par l'IPSO (International programme on the state of the oceans) a tiré la sonnette d'alarme : la santé des océans est dans un état inquiétant, menaçant la vie marine dans des proportions jusque là grandement sous-estimées. De la santé des océans dépend pourtant la santé sur la terre:

- Ils absorbent et stockent une grande quantité du CO<sub>2</sub> de la planète.
- Ils génèrent la majorité de l'oxygène présent dans l'atmosphère.
- Ils déterminent grandement le climat et le temps.
- Ils abritent une grande majorité des formes de vie sur la terre.

## Des pressions humaines croissantes

Longtemps considéré comme inépuisable et infini, notre monde océanique est pourtant à la croisée des chemins. Subissant de plein fouet un large ensemble de pressions d'origine humaine, sa capacité de résilience est en grand danger. De nombreux scientifiques craignent ainsi qu'une crise d'extinction massive ne les frappe rapidement de plein fouet. On assiste en effet à la destruction d'une grande partie de la chaîne alimentaire qui façonne l'équilibre chimique de la planète. La destruction des barrières de corail, sur lesquelles reposent l'alimentation et l'économie de millions de gens, est à cet égard frappant.

Trois grands phénomènes perturbateurs peuvent d'ores et déjà être identifiés:

- Le dérèglement climatique

Selon le GIEC, le réchauffement climatique tend à diminuer la capacité de séquestration du carbone des océans et cette augmentation des concentrations de dioxyde de carbone dans l'atmosphère provoque une acidification des océans. Les conséquences de ce changement de la chimie des océans sur les organismes marins sont encore mal connues mais constituent une menace réelle pour la survie de certaines espèces. L'effondrement du plancton risque d'entraîner une perturbation majeure des capacités d'absorption du CO<sub>2</sub>. La faune benthique est en outre fortement liée au recyclage du carbone et à la minéralisation du fond des océans; elle contribue ainsi à la genèse des nodules polymétalliques.

- La contamination quasi généralisée des mers et des océans

Ces pollutions industrielles, agricoles et menagères apportées par les cours d'eau et les canalisations représentant selon le PNUE environ 80% des pollutions marines. Le cas des déchets en plastique est à cet égard marquant. D'après un rapport du PNUE de 2006, chaque kilomètre carré de nos océans contiendrait 46000 objets en plastique flottant en surface au entre deux eaux.

Mers et océans sont ainsi le réceptacle d'une grande partie des déchets humains, par la voie des fleuves, du ruissellement, des « retombées » atmosphériques, de rejets directs côtiers ou maritimes. Une fraction croissante de ces déchets est toxique pour l'environnement et la santé humaine ; même pour des substances largement interdites comme les PCB, compte tenu de leur durée de vie.

- L'exploitation non soutenable des ressources marines

La majorité des stocks halieutiques sont aujourd'hui en surexploitation, avec en parallèle un développement forcé de l'aquaculture qui a des impacts non négligeables sur les milieux marins. L'exemple du thon rouge en Méditerranée est probablement l'exemple le plus frappant de la surpêche. Mais les pressions peuvent être multiples. L'effondrement des stocks de cabillaud en Atlantique nord-ouest sont également liés à des éléments naturels - modification du milieu avec le réchauffement climatique. Sans compter que les impacts socioéconomiques de disparition de pêcheries entières sont considérables.

Par ailleurs, les mers et les océans sont les victimes d'une exploitation non durable liée par exemple au pétrole, au granulats ou autres extractions de ressources minières, autant d'activités humaines dont les impacts environnementaux sont bien loin d'être sans conséquences.

## Une foulditude d'acteurs aux compétences limitées

Les organismes qui ont compétence sur le monde marin sont nombreux et peu coordonnés:

- Nations Unies - Océans: agence placée sous l'égide de l'ONU devant favoriser les coordinations entre notamment la Convention sur le droit de la mer (dite Convention de Montego-Bay) et les dispositions du chapitre 17 de l'Agenda 21 concernant les mers et les océans.

-AIFM (Autorite internationale des fonds marins): administre les ressources des fonds marins et de leur sous sol au dela des zones de juridiction nationale.

-FAO (Organisation mondiale de l'agriculture et de l'alimentation) : s'occupe de peches et d'aquaculture, mais sans pouvoir de gestion.

-OMI (Organisation maritime internationale) : marine marchande.

-Commission oceeographique intergouvernementale de l'UNESCO (Organisation des Nations Unies pour la culture, la science et l'education) : tente de faire avancer les sciences marines.

- OMC (Organisation mondiale du commerce) : peut intervenir sur le secteur de la peche au les barrieres tarifaires sont tres basses.

-CCNUCC (Convention cadre des Nations Unies sur le changement c1imatique)

- CCDB (Convention cadre des Nations Unies sur la diversite biologique)

-CNUDM (Convention des Nations Unies sur le droit de la mer) avec son Tribunal international du droit de la mer.

- CITES (Convention internationale sur le commerce international des especes de faune et de flore sauvages menacees d'extinction)

-Commission baleiniere internationale

-Convention internationale sur les especes migratrices d'animaux sauvages

-Programme sur les mers regionales du PNUE (Programme des Nations Unies pour l'environnement) .

-Etc ...

Au total, pres de 140 traites internationaux concernent les oceans. Dans ces conditions, il est difficile d'avoir une vision integree des problematiques maritimes.

Une incoherence du cadre d'action

Malgre le nombre des organes de gouvernance mis en place, l'environnement marin ne cesse de se degrader. L'imperieuse necessite d'accéder de maniere soutenable aux ressources de l'ocean et de les exploiter doit presser la communaute internationale a revoir en profondeur le systeme de gouvernance des oceans. L'Assemblee Generale des Nations a par ailleurs constamment attire l'attention des Etats sur le besoin d'arneliorer la cooperation et la coordination a tous les niveaux (regional, national et international). Des 1996, la Commission developpement durable du Comite economique et social des Nations Unies avait en outre identifie la specificite des oceans et des mers justifiant une gouvernance specifique.

La situation actuelle encourage l'heterogeneite des reqlementations autant que des modes de gestion. Les mandats souvent etroits des divers organismes et conventions entrainent des grandes insuffisances autant dans l'elaboracion des regles que dans leur mise en œuvre. Quant aux relations entre ces divers organismes, elles sont quasi inexistantes. Des lors, aucune coherence n'existe et chacun s'occupe de ses propres affaires, sans en reterer aux autres.

L'immobilisme flagrant de la Convention des Nations Unies sur le droit de la mer (CNUDM)

Difficilement adoptee en 1982, elle est souvent consideree comme la « Constitution des oceans ». Elle ne dispose cependant que de tres peu de preconisations environnementales et les clauses specifiques a l'environnement sont beaucoup trop generales et imprecises pour etre reellement efficaces. Sans compter que c'est bel et bien le principe fondateur de cette Convention, la liberte de circulation, d'exploitation et le refus de toute autorite prevalant sur celle des Etats, qui est au final en grande partie responsable du declin des pecherles et de la grande menace qui pese aujourd'hui sur la biodiversite marine et les geo-ecosystemes marins.

Au final, aucun Etat ne peut pretendre a l'utilisation exclusive des oceans et en refuser l'acces aux autres ; et aucune police ne s'y exerce autre que celle des Etats, et ce dans des limites tres etroites (lutte contre la piraterie, trafics de drogue).

Il convient cependant de noter que cette Convention a ete adoptee dans un contexte international particulier de guerre froide ou l'accord du plus grand nombre impliquait de faire des concessions.

C'est des lors en faveur de la liberte que s'est construit progressivement le droit de la mer. La CNUDM distingue ainsi differentes zones oceaniques avec des domaines de competences distincts :

-La mer territoriale : la largeur ne doit pas depasser 12 milles marins.

-La zone contigue : entre 12 et 24 milles marins.

- La zone economique exclusive (ZEE) : comprend la zone contigue et jusqu'a 200 milles marins.

- La haute mer : au dela de la ZEE. C'est a partir de cette zone que cesse de s'appliquer la competence des juridictions nationales.

Lors de la troisieme Conference des Nations Unies sur le droit de la mer en 1967, l'Ambassadeur de Malte propose d'interdire l'exploitation et l'extraction des ressources minieres par les Etats dans les zones au-dela de leur propre juridiction. Il en appelle a « un patrimoine commun de l'humanite ». Avec l'adoption de la CNUDM, ce principe s'applique aux seules ressources minieres de la zone (au -dela des juridictions nationales), qui sont alors encadrees par l'AIFM (Autorite internationale des fonds marins). L'emergence progressive d'un droit international de la mer a ainsi permis de reglementer les espaces oceaniques et leurs ressources pour les Etats cotiers adjacents. Pres de 70% de l'espace marin demeure pourtant aujourd'hui toujours soumis au principe de liberte d'exploitation, qui conduit facilement au pillage pur et simple des ressources. Et le transport maritime, qui assure pres de 80% des echanges mondiaux, echappe pratiquement atout controle en haute mer, ce qui menace egalement la sante des mers et des oceans.

C'est que lors de l'adoption de la Convention, les signataires sous estimaient aussi probablement l'enjeu de la protection de la biodiversite marine au-dela de la ZEE.

La CNUDM prevoit la reunion des Etats parties, sur le meme modele que la CCNUCC ou la CCNUDB. Ils sont helas releques aun examen purement budgetaire et administratif et influencent peu l'evolution du droit de la mer. Ils n'ont pratiquement aucun role sur les questions politiques de fond. L'ONU a un role a jouer pour faire evoluer le droit de la mer. Mais en l'absence d'un cadre institutionnel integre autant que de mecanismes de surveillance et de mise en oeuvre appropries, il est difficile de proteqer reellement le milieu marin.

Objectif Rio: adopter une feuille de route ambitieuse pour nos oceans

Face à cette situation, l'action contre le dérèglement climatique et contre les pollutions, notamment telluriques, concordent avec tout un tas de comportements, de politiques publiques et d'activités économiques à l'œuvre sur nos territoires. L'engagement du mouvement associatif France Nature Environnement est donc intimement lié à tout ce qui peut avoir un effet sur la santé de nos océans et le partage des richesses qui en sont issues.

En mettant à l'ordre du jour de la Conférence Rio+20 à la fois l'économie verte et la gouvernance internationale du développement durable, les Nations Unies ont laissé une grande place à tout un tas d'enjeux planétaires majeurs. La protection des océans a la particularité d'être au cœur de multiples défis environnementaux, économiques et sociaux de notre temps. La situation actuelle n'est plus tenable et constitue une menace pour l'humanité.

Cependant, force est de constater que la gouvernance des océans, et plus particulièrement de la haute mer, est le parent pauvre des politiques environnementales internationales. Rio+20 devrait saisir l'occasion d'une mobilisation de la communauté internationale pour adopter une feuille de route ambitieuse pour nos océans.

## II. PROPOSITIONS: ADOPTER UNE GOUVERNANCE INTERNATIONALE EN HAUTE MER

La haute mer est aujourd'hui la dernière frontière du droit international. De fait elle est définie négativement : le régime de la haute mer s'applique à l'espace constituant la zone internationale des grands fonds marins s'étendant au-delà de 200 milles (art. 87 de la CNUDM), à l'exclusion du sol et du sous-sol. Le régime applicable à cette colonne d'eau est fondé sur un principe de liberté (art. 87 de la Convention). Il s'agit donc d'un espace libre de toute souveraineté alors que l'on peut le considérer comme le bien commun de tous.

Si la grande majorité des défis environnementaux de l'humanité font l'objet d'une attention particulière de la communauté internationale, la liberté de la haute mer semble intouchable tant les considérations militaires et les appétits financiers y sont attachés. Cette situation doit cesser au plus tôt. Tout comme le climat ou la biodiversité, les océans, et plus particulièrement la haute mer, représentent un défi global qui ne pourra trouver de solution qu'à une échelle internationale. Ce constat est d'ores et déjà partagé :

-Une étude parue dans le dernier numéro de Proceedings of the National Academy of Sciences, souligne l'urgence de la mise en place d'un cadre légal international pour la protection de la biodiversité en haute mer et l'utilisation des ressources génétiques marines.

-En juin 2011 la dernière réunion des parties du Groupe ad hoc de l'ONU sur les questions liées à la conservation et à l'usage durable des ressources marines au-delà des juridictions nationales s'est pour la première fois entendue pour qu'un accord multilatéral puisse rapidement être adopté.

Faire face à une situation critique de la biodiversité marine

La biodiversité marine est d'une grande richesse, pour une large part encore totalement inconnue, et concerne à la fois le sous-sol et le sol marins, la colonne d'eau, la surface de l'eau et la colonne d'air. La tentation est souvent grande de séparer la biodiversité terrestre de la biodiversité marine. On observe ainsi des situations ubuesques comme sur les îles Galapagos. Aujourd'hui, près de 97% de ces terres sont protégées alors que les espaces marins aux alentours sont totalement ravagés par la surpêche. Mais les écosystèmes dépendent grandement les uns des autres, de la terre à la mer (ZEE et haute mer) : c'est le cas par exemple de l'avifaune, bien souvent oubliée.

Cette forte interdépendance des écosystèmes et la difficulté à les protéger dans le cadre juridique actuel s'illustrent notamment par les problèmes des stocks de poissons dits « chevauchants ». La situation alarmante de certains stocks de ressources halieutiques a d'ores et déjà conduit des États riverains (Canada, Argentine, Chili) à revendiquer des compétences dans la zone de haute mer adjacente à leur ZEE ou à leur zone de pêche au nom de la conservation des pêcheries.

La dégradation de cette biodiversité marine s'aggrave ainsi aujourd'hui dans un espace jusqu'alors considéré comme inépuisable : la haute mer. Les progrès techniques et les appétits commerciaux ne cessent de repousser les limites de l'exploitation des fonds marins. Toujours plus loin, toujours plus profond, y compris au-delà des zones de juridiction nationale. Dans les faits, il y a désormais une accélération des autorisations de permis minier à l'échelle planétaire et pas uniquement sur les nodules polymétalliques (encroûtements ferro-manganifères, sulfures hydrothermaux, diamants, phosphates, etc.)

La principale pression exercée sur les espèces est le prélèvement d'espèces ciblées et non ciblées, essentiellement d'océan à la pêche, tandis que les autres pressions importantes concernent la perte ou la détérioration des habitats et la pollution. De grands changements océanographiques liés au changement climatique, notamment l'acidification des océans, la montée du niveau de la mer et l'augmentation de la température de la mer, sont susceptibles de devenir de plus en plus importants dans les décennies à venir. L'introduction d'espèces non indigènes et les déchets divers représentant également des pressions inquiétantes.

Les plus importantes pressions affectant le milieu marin sont la perte d'habitats, causée par exemple par l'aménagement du littoral, l'extraction minière et pétrolière ainsi que les projets d'exploitation de ressources minérales à grande échelle (méthane par exemple), ainsi que par le chalutage de fond. Au large des côtes d'Afrique de l'ouest, l'extraction du pétrole et du gaz offshore se développe sans qu'aucun des pays riverains ne soit en mesure de contrôler les méthodes et les actions des compagnies pétrolières. Les toutes nouvelles extractions de Total au large de l'Angola en sont un exemple marquant.

Ainsi, depuis plusieurs décennies, l'industrie pétrolière, ayant désormais accès aux techniques de forage à grande profondeur, est à l'avant-garde de l'exploitation des ressources fossiles profondes. Pour l'instant limitée aux ZEE des 200 ou 350 milles (plateau continental), la question fait rage pour l'Atlantique. Les États Unis n'ont toujours pas ratifié la Convention sur le droit de la mer et ne reconnaissent donc toujours pas l'autorité de l'Autorité internationale des fonds marins.

Aller plus loin que la Convention sur la diversité biologique

Entre Convention sur le droit de la mer et Convention cadre sur la diversité biologique, difficile de savoir à qui se raccrocher pour protéger la biodiversité marine au-delà des zones de juridiction nationale. L'adoption du Protocole de Nagoya sur l'accès et le partage des avantages semble avoir donné une réponse diplomatique mais claire : cela relève du champ de compétence de la Convention sur le droit de la mer.

Une Décision spécifique a en effet précisé à la marge les enjeux de coordination entre la CNUDM et la CCNUBD et indique :

-« Qu'il convient d'identifier et d'évaluer les menaces à la diversité biologique dans les aires marines au-delà des juridictions nationales. »

-« Qu'il convient de coopérer avec l'Assemblée Générale des Nations Unies, et en particulier avec le Groupe de travail ad hoc informel étudiant les enjeux liés à la conservation et à l'utilisation soutenable de la diversité biologique au-delà des juridictions nationales ; et de soutenir les parties signataires ainsi que les organisations internationales compétentes en matière d'enjeux scientifiques et techniques pour l'identification de zones marines écologiques et biologiques significatives, en accord avec le droit international, et notamment la Convention des Nations Unies sur le droit de la mer. »

Cela signifie qu'en l'état actuel du droit international, la grande majorité des formes de biodiversité planétaire ne relève d'aucun cadre de protection spécifique. 65% de la surface des océans est totalement laissée à l'abandon. Situation qui permet de relativiser l'apparent succès du Protocole de Nagoya.

Définir un statut juridique pour la haute mer

L'usage durable des ressources biologiques et genetiques requiert des mesures de protection en haute mer. Tous les organismes onusiens produisent de maniere relativement isolee du droit de la mer ou de la biodiversite sans qu'aucun n'ait la capacite d'englober les aspects environnementaux de la haute mer (connaissance, suivi, reglementations, exploitations, controles et sanctions...) Une gouvernance specifique doit etre envisagee.

La Convention cadre sur la diversite biologique a ete concue dans une approche essentiellement territoriale, visant des activites qui s'exercent sur des espaces juridiquement appropries. Au sein des zones economiques exclusives, et sous reserve d'une adaptation des legislations nationales, la CCOS encadre la protection de la biodiversite marine. Au-dela, c'est le vide juridique de la « zone ».

La Convention sur le droit de la mer applique quant a elle nous l'avons vu le principe de liberte totale en haute mer et de facto conserve competence sur cet espace. En l'etat actuel des equilibres geopolitiques, il semble cependant plus qu'improbable d'engager une reforms en profondeur de la CNUDM. Un protocole additionnel devrait permettre de donner un statut juridique specifique a la haute mer, impliquant sans aucun doute une remise en cause du sacro saint principe de liberte. A partir de l'article 15 de la CCNUDB sur l'acces et le partage des avantages tires de l'utilisation des ressources, ce protocole pourrait proposer en outre un partage specifique des benefices qui pourraient etre reinvestis dans la protection du milieu marin. L'AIFM (autorite internationale des fonds marins) pourrait avoir competence pour une telle mise en oeuvre. Ou un organe subsidiaire directement rattache a l'ONU.

Enfin, les Etats du pavillon pourraient sanctionner les navires soumis a leur juridiction. Malgre les difficultes d'une telle option, des protocoles additionnels aux Conventions regionales existantes pourraient egalement etre signes engageant en haute mer les Etats riverains des mers regionales. Cette approche ne devrait cependant pas empecher de penser la regulation internationale dans une demarche cooperative. La gestion des biens communs merite une regulation multilaterale laissant le plus possible de cote les tentations des Etats a grignoter des competences en dehors de leur ZEE.

Reguler l'acces anarchique aux ressources genetiques marines

La course aux ressources genetiques marines est lances depuis plusieurs annees et semble s'intensifier. La sonnette d'alarme est tiree regulierement, sans qu'une reelle volonte politique ne parvienne a controler les velloutes de nombreux industriels (souvent soutenus par les Etats) sur les ressources genetiques de la haute mer et des fonds marins.

Au Sommet de la Terre en 2002, les Etats se sont engages a promouvoir le partage loyal et equitable des benefices provenant de l'utilisation des ressources genetiques, dans le cadre des negociations de la Convention sur la diversite biologique. Ils ont egalement encourage la mise en place de procedures sous les auspices du Cornite Intergouvernemental sur la Propriete Intellectuelle et les ressources genetiques (ICIP) et de l'Organisation mondiale de la propriete intellectuelle (OMPI). Ils se sont en outre engages a promouvoir des mesures pratiques permettant l'acces aux resultats et aux benefices provenant des biotechnologies basees sur les ressources genetiques (echanges d'experts, formation de personnels, developpement d'institutions de recherche, etc.), toujours dans le cadre de la Convention sur la diversite biodiversite.

A plusieurs reprises, le def emergent de l'acces et le partage des ressources genetiques marines, notamment en haute mer a ete identifie:

-Sommet de la Terre en 2002 : une plus grande action sous l'auspice de la Convention cadre sur la diversite biologique avait ete reclamee. Dont nous venons de voir les limites avec l'adoption du Protocole de Nagoya n'ayant aucune competence en haute mer.

-Rapports annuels sur les oceans et le droit de la mer depuis 2007: l'importance des ressources genetiques marines a ete constamment mise en lumiere par le Secretaire General des Nations Unies.

La capture d'especes nouvelles en haute mer est libre d'acces et les captures peuvent etre exploitees dans le respect des regles de la CNUDM : tous les produits issus de ces captures ainsi que les process mis en oeuvre peuvent beneficier d'une protection par des brevets en toute legalite, dans les limites de l'accord sur les droits de propriete intellectuelle qui touchent au commerce de l'OMC (Adpic).

- Controler le brevetage des ressources genetiques marines

Les avancees technologiques recentes dans l'observation et l'echantillonnage de l'ocean ont permis le developpement considerable de la bio-prospection de zones vierges d'exploration en haute mer. De plus, la mer est une source extraordinairement vaste de diversite genomique, avec 34 des 36 phylums3 principaux (« embranchements » animaux) decrits a ce jour sur Terre. Consquence : une augmentation spectaculaire du nombre de brevets et d'applications associees a des gimes d'organismes marins. L'augmentation du nombre de brevets est dix fois plus rapide que la description de nouvelles especes marines.

Le champ d'applications est vaste : plus de la moitie des brevets vise des applications biomedicales (55%), les autres domaines sont notamment l'agriculture et l'aquaculture (26%) et l'industrie cosmetique (7%). Un nombre grandissant d'applications concerne les domaines de l'eco-toxicologie, de la bio-remediation et de la production d'agro carburants.

Les octrois actuels de brevets sont grandement contestables. Aucune Convention ou protocole d'accord ne lie la CCDS, la CNUDM et l'ADPIC. Le vivant sauvage est aujourd'hui considere comme une marchandise alors que les regimes juridiques en vigueur n'ont pas ete pensés pour integrer cette forme particuliere qu'est l'exploitation des oceans, notamment en haute mer.

- Reglementer strictement l'activite de bio-prospection

La bio-prospection interesse des domaines tels que:

-La recherche medicale sur les substances a fonction anti cancéreuse et anti tumorale ou sur les substances permettant de traiter le VIH-Sida.

- La recherche contre des maladies infectieuses telles que le paludisme.

-Le developpement de nouvelles enzymes a utiliser dans les processus industriels et manufacturiers, le traitement des dechets, etc.

Malgre l'absence de donnees fiables, plusieurs etudes ont estime la valeur commerciale de cette nouvelle activite. Selon une etude de la Commission europeenne de 2005, la biotechnologie marine etait estimee en 2004 a 2,2 milliards d'euros (hors aquaculture, algues et industries de traitement afferentes).

Les impacts environnementaux de l'activite de bio-prospection tout autant que le bio-piratage sont bien loin d'etre neutres et sont insuffisamment analysees. L'obtention de composés actifs necessite un approvisionnement en matiere premiere (l'organisme marin vivant) souvent dans des rapports de un a un million, ce qui avec la destruction potentielle (meme partielle) de l'environnement sous marin et marin de ces organismes provoque des impacts aujourd'hui peu connus. D'ores et deja, la vulnerabilite des communautes faunistiques en cas d'exploitation miniere sur des surfaces relativement restreintes est connue. Une telle exploitation pourrait conduire a l'extinction des biocenoses dans le cas des ecosystemes des fonds d'encroulements riches en cobalt.

En Australie, l'evaluation de l'impact environnemental du prelevement d'echantillons biologiques aux fins de recherche, de developpement technique et economique est une

condition préalable aux autorisations de bio-prospection. L'Australie a en effet mis en place dans sa zone économique exclusive un accord d'accès et de partage de ses ressources marines, et dispose ainsi d'une réglementation spécifique. L'Union européenne est quant à elle en panne alors même que le principe de précaution doit s'appliquer dans le cas par exemple de l'exploitation minière.

Renforcer la transparence pour une meilleure mobilisation des citoyens

De fait, cette situation d'attribution profite aux États privilégiés et à quelques entreprises de ces États, qui continuent dans un relatif anonymat leurs travaux, travaux en partie financés par des fonds publics. La France fait partie de ces États très actifs dans le domaine de l'exploitation des ressources marines et génétiques.

En l'absence d'information et de transparence sur ces activités, les citoyens et les associations sont dans l'expectative et ne disposent que de très faibles informations précises sur la nature des recherches entreprises, autant que sur les modalités d'utilisation à des fins privées et commerciales de ces recherches. La société civile au sens large est exclue de ces approches et les débats sont limités à des enceintes très fermées. Or, le poids de la société civile peut influencer les gouvernements et sa mobilisation devrait permettre de modifier l'équilibre des forces en présence.

Élargir les compétences de l'AIFM

À un moment où la concurrence pour l'accès aux ressources naturelles s'exacerbe, est-il possible de renforcer la préservation des milieux marins tout en développant les activités extractives? L'équilibre est difficile à concilier.

L'Autorité internationale des fonds marins est probablement une première clef d'entrée pour entamer une réglementation internationale de protection de la biodiversité en haute mer. Placée sous l'égide de la CNUDM, elle est la seule à avoir une compétence spécifique sur certaines ressources de la haute mer. Elle est chargée de veiller à ce que les avantages économiques tirés de l'exploitation des ressources minérales des fonds marins internationaux soient partagés par les exploitants et la communauté internationale. L'appellation « patrimoine commun de l'humanité » ne concerne donc bien que les ressources minérales, liquides, solides ou gazeuses (Art. 133 de la CNUDM) à l'exclusion des ressources vivantes qu'elles soient. Pour l'ensemble des autres activités liées à l'exploitation des ressources marines et des ressources génétiques, le statut juridique est celui de res nullius. Elles sont librement exploitables par le premier venu. Cela encourage la surexploitation (et ce d'autant plus que chaque espèce est peu représentée).

L'AIFM pourrait voir ses compétences élargies :

- À l'ensemble des ressources biologiques et génétiques en haute mer.

- Aux activités de bio-prospection.

Afin de garantir la plus grande transparence et efficacité d'une telle gouvernance, le mouvement associatif France Nature Environnement souhaite que des parties prenantes émanant des associations de protection de la nature et de l'environnement participent activement au suivi de la mise en œuvre de ces nouvelles compétences. Cela nécessitera une refonte radicale de ses conditions de fonctionnement.

Une modification profonde des conditions d'accès aux ressources génétiques et minières des grands fonds marins est enfin indispensable pour que dans un proche avenir la législation et les réglementations sur l'exploitation des nodules polymétalliques et d'autres ressources comme les sulfures polymétalliques et les cratères de cobalt intègrent l'obligation d'entreprendre des études d'impact environnemental des activités industrielles ou scientifiques.

Créer un réseau mondial d'aires marines protégées

Dans le plan d'action de Johannesburg de 2002, les États se sont engagés à mettre en place un réseau mondial d'aires marines protégées d'ici à 2012. À Nagoya, un objectif de 10% de zones marines et côtières, y compris en haute mer, a été adopté. Le chemin sera long : moins de 1% des océans sont aujourd'hui concernés par les aires marines protégées contre plus de 10% des zones terrestres aujourd'hui protégées. Atteindre ces objectifs nécessitera sans aucun doute l'appui d'un cadre juridique nouveau pour la haute mer.

- Une première étape dans l'Atlantique sous l'auspice de la Convention OSPAR

Une première avancée importante a été permise avec la désignation de 6 A.M.P. en haute mer en 2010 dans l'Atlantique. Une des zones envisagées, la zone de fracture « Charlie Gibbs » est une section particulièrement complexe de la dorsale médio-atlantique qui se trouve entre l'Islande et les Açores. Dans cette zone, la dorsale médio-atlantique présente de nombreux pics d'une profondeur inférieure à 1500 m et elle offre à la faune benthique le seul substrat dur à ces profondeurs en plein océan Atlantique Nord.

L'aire « Charlie Gibbs » dans les eaux subarctiques a été amputée de 160.000 km<sup>2</sup> et est toujours en cours de négociation, notamment en raison des revendications récentes sur le plateau continental océanique déposées par l'Islande. La France a joué un rôle actif dans le sauvetage partiel de « Charlie Gibbs » et a proposé que le réseau des A.M.P. se prolonge jusqu'en Arctique. Une feuille de route a été acceptée pour que les négociations se poursuivent sur la protection de la colonne d'eau au-dessus du plateau continental revendiquée par l'Islande.

- Quelle gouvernance adopter pour ces aires marines protégées?

Il reste à mettre au point le principal : de quoi, comment et par qui ces Aires marines seront-elles protégées? Un certain nombre d'organismes dans le cadre de la CNUDM, y compris la Convention OSPAR, partagent les mandats des mesures de protection de ces zones : il faut donc déterminer les principes communs de la protection des écosystèmes marins vulnérables dans ces zones, au moyen d'une coopération et d'une collaboration internationales. Ce type de mesures conservatoires ne doit en aucune manière entraîner une forme de revendication nouvelle de territoires au-delà des zones de juridiction nationale.

Un réseau écologiquement cohérent d'AMP bien gérées soutient l'écosystème au sens large. Les espèces et habitats d'une AMP dépendent des processus se déroulant en dehors de cette AMP et y contribuent. Ces rapports sont souvent complexes et s'établissent à une échelle plus grande que les écosystèmes terrestres et présentent une importance particulière pour les espèces très mobiles, telles que certains oiseaux de mer, mammifères marins et poissons. Un réseau écologiquement cohérent d'AMP implique, entre autres, la sauvegarde de zones importantes pour certaines étapes du cycle de vie.

Quelle que soit la solution retenue, le temps presse. L'exploitation industrielle des nodules polymétalliques et des gisements contenus dans les amas sulfures n'est plus qu'une question d'année, voire de mois. Les richesses en hydrocarbures de l'Arctique poussent les pays riverains (le Canada, les États-Unis, le Danemark, la Russie et la Norvège) à empêcher l'établissement de toute mesure de protection de la région. Mais sous l'effet des changements climatiques, des populations de poissons, comme les maquereaux de l'Atlantique du nord-est, remontent déjà vers le nord en quête d'eaux plus froides.

Améliorer les connaissances scientifiques du milieu marin

Les connaissances sur la biodiversité des zones côtières peu profondes se sont beaucoup améliorées au cours des dernières décennies, mais d'importantes lacunes subsistent concernant les organismes et les communautés vivant dans des zones de plus grande profondeur. Il est probable que les bactéries et les virus jouent un rôle crucial de « force motrice » dans les chaînes alimentaires et les cycles biogéochimiques, mais ce phénomène n'est pas suffisamment bien compris.

La compréhension de leur réaction aux changements environnementaux causés par les activités humaines, notamment le changement climatique, comme celle des habitats des eaux profondes et de leurs fonctions pour les espèces et les communautés benthiques comportent des lacunes importantes. Des initiatives majeures de recherche exploratoire continuent à être nécessaires afin d'aborder les diverses lacunes et de soutenir les efforts de protection et de conservation des écosystèmes et de la biodiversité. On ne protège bien que ce que l'on connaît.

Le futur IPBES autant que le GIEC actuel doivent intégrer toujours plus d'éléments sur la connaissance de nos océans.

## Friedrich-Ebert-Stiftung

### CONFERENCE REPORT

#### RETREAT FOR PERMANENT REPRESENTATIVES ON THE UN CONFERENCE ON SUSTAINABLE DEVELOPMENT

October 2011

- The Retreat was organized by Friedrich-Ebert-Stiftung (FES) and held in Greentree, Long Island, United States, on 30 September-1 October 2011

- Representatives of 35 member states attended the Retreat as well as the Under-Secretary-General for Economic and Social Affairs and Secretary General of the Rio+20 Conference, Ambassador Sha Zukang; the Director of FES, Dr. Werner Puschra; and other representatives from FES and UNCSD Secretariat.

- Two experts also participated in the meeting: Dr. Michael Dorsey, expert on environmental studies from Dartmouth College, and Mr. Soogil Young, Chairman of the Presidential Committee on Green Growth of South Korea

#### 1. Introduction

The objective of the Retreat was to provide an informal platform for candid, constructive dialogue among Member States on what Rio+20 can and should deliver. The core agenda of the retreat included discussions on: (i) identifying what the world needs from Rio+20; (ii) identifying critical areas of divergence and convergence among Member States; (iii) examining how best to integrate the objective and themes of the conference by creating synergies among them; and (iv) fostering a common — and concrete — vision of the Conference outcome.

This Conference Report Summary provides a succinct record of the views expressed during the Retreat with the purpose of facilitating further discussion during the UNCSD preparatory process.

#### 2. Main Topics of Discussion

The deliberations were preceded by the opening statements of Mr. Sha Zukang and Dr. Werner Puschra. Both underlined the need to respond to the millions of people worldwide who need sustainable development to get out of poverty and encouraged participants to identify concrete actions towards a green transition and sustainable consumption and production. They also drew attention to the importance of an adequate institutional framework conducive to implementation and pointed out the relevance of appropriate and sufficient means of implementation.

The presentations of the two keynote speakers focused on green economy and green growth. Dr. Michael Dorsey advocated for concrete proposals for a green economy which recognize the finite limits of the planet and address economic inequality between and within societies and generations. He cautioned that 20th century biodiversity “prospecting” had profited neither firms nor communities. Mr. Young explained the Republic of Korea's national strategy and institutional framework for green growth. A number of initiatives have already kicked off, including restoration of rivers as well as projects on wind, solar and tidal energy. Rep of Korea is aiming at reducing substantially the reliance on oil and coal as energy sources and achieving a 30% reduction of GHG emissions by 2020.

The discussions elaborated on expectations for Rio+20, covered the two themes of the Conference and exchanged views on the content and format of the outcome document of the Conference as well as the procedures to facilitate agreement in the negotiation phase. A summary of these discussions is presented below.

#### 3. Expectations for Rio+20

Many participants mentioned that UNCSD should cover broad sustainable development issues, benefit from the experiences gained in the past and build a strong vision for the future in order to achieve sustainable development within planetary boundaries. Human well-being should feature at the center of the debate at Rio+20, as well as a concern for the weakest members of the international community. A success in Rio will require that all countries have a stake in the conference outcome, which can be achieved by looking holistically at issues including inter alia climate change, energy access, food security, natural disasters, migration, and others. The broad nature of sustainable development calls for active engagement of different ministries in the conference and, as many participants noted, the engagement of the finance ministries is a difficult challenge.

#### 4. Principles

Many participants underlined that the Conference should not renegotiate the principles of sustainable development, but rather reiterate the Rio principles, including Agenda 21 and the Johannesburg Plan of Implementation. In this regard, the principle of intergenerational equity, as outlined in the Brundtland report, and the principle of common but differentiated responsibilities were particularly emphasized.

#### 5. Integration of the three pillars

There was a general consensus on the need to ensure integration of the three pillars of sustainable development. It was noted that this would require a conducive institutional framework in the form of a high level body with the mandate to bring together agendas pertaining to three pillars of sustainable development. This will mean the participation of different ministers, and not only environment ministers, in the sustainable development fora. This is going to be a big challenge, but could possibly be addressed by, for instance, providing a specific role and mandate to different ministries in sustainable development bodies.

#### 6. Implementation

Re-affirming the commitment to sustainable development should begin with delivering on the existing commitments. CSD is currently the only intergovernmental body

mandated to review implementation of the sustainable development agenda. Any reform should ensure that this element is not only maintained but further strengthened. Monitoring implementation – through for example setting up timelines, benchmarks and SD goals – can be an important vehicle to push implementation.

#### 7. Involvement of all stakeholders

Participation of all stakeholders was perceived by many participants as crucial to the success of the conference. In particular, Major Groups<sup>1</sup> have an important role to play and thus more innovative ways should be found to involve them in both the preparation of the conference and the conference itself. In addition, some participants mentioned that the Conference could provide a platform for voluntary initiatives, pledges and commitments from both private sector and civil society, especially in the four days between the Third PrepCom and the Conference.

#### 8. The role of media, education and information

Education and the media have an important role to play as key elements for reenergizing societies in the area of sustainable development, especially as behavioral shifts will be necessary. Regional commissions and regional organizations as well as parliamentarians and local authorities are also major players in disseminating information on sustainable development.

#### 9. Partnerships

Several participants emphasized the need to reinvigorate the enthusiasm in partnerships and to enhance their role and effectiveness in triggering sustainable development and ensuring implementation. Ways to outreach to civil society and the private sector in particular should be explored. Some participants suggested the creation of a platform at the Conference for announcing concrete partnership initiatives by all stakeholders. Partnerships were considered especially important for addressing the vulnerability of certain groups of countries, like LDCs, SIDS and mountain countries, since they often find themselves on the receiving end of the negative impacts of global problems (such as land degradation, desertification, drought and the impact of melting of glaciers).

#### 10. Monitoring progress

Some participants were of the view that the world should be able to translate its vision of sustainable development into universal sustainable development goals (SDG), complemented with a concrete action plan, timeline and roadmap to insure implementation. However, any monitoring process should rely on a good balance between national sovereignty and universal commitments. To achieve this balance, a suggestion was put forward to have each country create a program emphasizing its own national priorities. Then, a tailor-made system at the international level could contribute towards monitoring these programs.

#### 11. Sustainable Development goals

Many participants indicated that sustainable development goals (SDG) could be relevant for priority areas like food security, energy, agriculture, water, sustainable cities, among others. There were however two main concerns: (i) initiating an SDG framework prior to 2015 could undermine the MDG process; (ii) getting the negotiations on technical issues regarding SDGs and agreeing on SDGs may prove infeasible.

To address these concerns, two alternatives were suggested: (i) to launch the process of SDGs at the Conference without agreeing on the SDGs themselves; or (ii) to agree at the Conference on SDGs on relevant areas not covered by the MDGs. In the latter option, the post-2015 development agenda could then encompass some SDGs as well as those MDGs which are lagging behind. Overall, participants emphasized the need for further discussion on the relation between MDGs and SDGs to make sure that the two processes will not compete with each other. There was also some discussion on how the Rio+20 outcome will fit into the post-2015 agenda. Integrating SDGs in this framework could contribute to making this agenda conducive to sustainable development.

#### 12. Green economy

The discussion on a green economy in the context of sustainable development and poverty eradication stressed the need for a new paradigm for economic growth, reflecting social, distributional and environmental dimensions. In particular, it was recognized that GDP growth does not automatically translate into poverty eradication and should not be used as the only standard measure for development. Some suggested the need to revisit this concept in its entirety while building on existing initiatives. Others underlined that concerns of developing countries still have to be addressed, especially loss of jobs, new conditionalities, flexibility of implementation and policy space. Important issues of adequate financing, technology transfer and capacity building were also discussed with reference to green economy. One participant cautioned about putting a price on the environment and on natural resources as the pursuit of sustainable development should respect the right of nature

#### 13. Institutional framework for sustainable development

Real political commitment was considered fundamental to effectively reforming institutions and moving away from business as usual. The discussion suggested a balanced approach between reforming existing institutions and creating new structures to support and complement existing ones. It was also proposed that the reform should be pragmatic: revising the UN charter is a lengthy process and thus a reform of the ECOSOC may not be a wise way forward. However, the IFSD reform should not be seen in isolation of the ongoing ECOSOC reform. Other proposals for reforming the current institutional architecture on sustainable development included:

- a. To create an intergovernmental forum at a high level – like a SD council – with a mandate covering the three pillars and the inter-relations among them to ensure that there is an intergovernmental body mandated to review implementation of the sustainable development agenda;
- b. To integrate, in a more coherent manner, relevant parts of the UN system;
- c. To engage all stakeholders in the institutional structures made responsible for sustainable development;
- d. To engage the IFIs in the development and implementation of the sustainable development agenda;
- e. To increase the participation of ministries of finance, development, social affairs and foreign affairs in the sustainable development fora by creating a specific role for them in the intergovernmental body on sustainable development;
- f. To strengthen the role of the UN agencies and Regional Commissions on the ground in order to enhance implementation;
- g. To strengthen the environmental pillar by: (i) strengthening UNEP, especially its scientific base; (ii) transforming UNEP into a specialized agency with a coordination mandate over all environmental conventions; (iii) addressing the political aspects of the environmental pillar by setting meetings of environmental institutions in New York, where the political agenda is set.
- h. To establish an effective bridge between science and policy-making by creating a space to discuss the state of the planet, where the scientific evidence can be assessed to inform policy makers.

#### 14. Planetary champion

With the objective to safeguard the “state of planet”, several participants mentioned that the planet needs a sustainable development champion. This “champion” could raise awareness and mobilize political support. In this regard, a proposal was made to appoint a high commissioner for sustainable development.

#### 15. Means of implementation

It was noted that implementing sustainable development and transitioning towards green economy will require substantial resources — finance, technology transfer and capacity building. Those are most necessary for the countries with the least capacity, especially LDCs. There were proposals for: strengthening international cooperation for sustainable development; relying on traditional forms of cooperation such as ODA; using public resources to leverage private sources of financing; but also using new and innovative sources of financing. There was also one proposal to establish a tax on international financial transactions.

#### 16. Outcome document

There was a general call for a forward-looking, action-oriented document, focused on practical results and leading the world to a sustainable future. It should reach to the people and not be constrained by policy and technical language. Participants suggested that the outcome document should reiterate political commitment; be based on the Rio principles, including the principle of common but differentiated responsibilities; take stock of progress and gaps including new challenges; include a road map on green economy with flexibility for countries to apply their own options; address the institutional framework of sustainable development; and outline a way forward for accessing resources, ensuring technology transfer, and strengthening capacities. Poverty eradication should assume center stage of the agreement.

#### 17. Structure of the outcome document

There was recognition that the structure of the outcome document is important and should be discussed and agreed upon at an early stage. Several suggestions on the structure were put forward during the Retreat:

- a. To organize the document according to key overarching concepts such as poverty eradication, integration of the three pillars, etc.;
- b. To structure the document following a sectoral approach (the Monterey Consensus document could be a possible model for consideration);
- c. To start the document by providing a vision followed by the action plan (on the latter, the principle of “simpler the better” is preferable);
- d. To divide the document on the vision, the goals and the institutions;
- e. To build the document around five major blocks, namely (i) an introduction noting agreed principles, (ii) a list of goals related to energy, food, and others, (iii) a green economy roadmap, complemented by a toolbox (regulations, certification, public procurement, etc.), (iv) a section on institutional framework for sustainable development; (v) a section on cooperation for development that includes capacity building, technology transfer and financing.

#### 18. Negotiations

To expedite convergence of views and compromise solutions, participants suggested avoiding a “rolling text” that is being constantly changed with everybody adding to the text. Instead, the co-chairs should control the process and propose the revised text on the basis of discussions during negotiations. The Bureau co-chairs should make sure that the discussions remain focused. Some participants encouraged as much informal contact as possible, using the available time to understand differences of opinion on critical issues. It was also judged useful to reflect on how to support negotiations by establishing an informal consultation with the major groups.

## Friends of the Earth England, Wales and Northern Ireland (EWNI)

Submission from Friends of the Earth

England, Wales and Northern Ireland

Recommendations concerning resource efficiency: measuring our resource use

Desired outcomes:

That governments commit to measuring their consumption of natural resources with a view to managing consumption within limits of equitability and sustainability.

The challenge – why bother measuring how much we’re using?

As a species we are using ever more of the world’s finite resources, with developed economies in particular consuming well more than is equitable or sustainable in a resource constrained world. This for many is also a security issue since it has left some, Europe in particular, highly dependent on imported resources than other global region. In spite of this we remain hugely wasteful –Europe throws away over 5 billion euro’s worth of valuable resources every year. The Earth’s ability to sustain humanity’s

increasing rate of consumption is being pushed to the limit. Through their overconsumption developed economies in particular are playing a massive role in degrading the natural environment on which we all depend.

Friends of the Earth EWN is calling for all economies to measure their use of resource use. The most developed should measure across four resource categories: land, water, materials and greenhouse gases (GHGs), and adopt policies to increase resource efficiency, such as higher recycling targets. The least developed economies could adopt a more limited system of measurement such as limited to materials flows only. Developed economies in particular should devise long-term targets and strategies in order to reduce their use of the world's resources.

#### How to measure resource use

Given that no major economy currently measures its total use of resources, it is difficult for targets to be set or policies to be evaluated. A 2009 study by Friends of the Earth Europe and Sustainable Europe Research Institute (SERI) in Vienna looked at how to measure Europe's use of resources in a way that is achievable and comprehensive. It concluded that the best way would be to use four indicators:

- Land (in hectares), including land used outside the EU (for example to grow crops for food or energy sources).
- Material (in tonnes), including those used to make products that are imported into Europe (sometimes called the material rucksack of products). Data sources allow this figure to be broken down into different forms of materials, for example biological and mineral resources.
- Water (in litres), including water used outside the EU to produce imported products (eg cotton).
- Greenhouse gas emissions created by consumption (in CO<sub>2</sub> equivalent), which includes both Europe's Kyoto emissions, and the carbon footprint associated with imported products.

These indicators already exist in research literature, and they are all quite transparent, measuring clear physical quantities.

The indicators do not directly measure impacts on biodiversity. But they can be used to highlight issues that need to be investigated. For example, if a new policy such as a biofuel target or reform of the Common Agricultural Policy results in a measurable big increase in EU land use, then there should be further investigation. Nor do the indicators address issues of hazardous chemicals or pollution; but it has been found that specific regulation (such as the REACH chemicals policy) is more effective in this area.

#### How would these indicators be used?

- The indicators can be used by governments to set targets, measure progress, establish policies and assess the impact of policy changes.
- Companies can use them to assess and improve the resource use associated with their products and activities.

As global population grows, and standards of living rise in many countries, the pressure on the world's resources – whether land, materials, water, or the climate – becomes ever greater. This pressure will affect people, the environment, governments and businesses around the world.

The Rio+20 conference must respond to these trends and seize the opportunity to set in train an ambition to accurately assess and reduce humanity's resource use. The indicators that Friends of the Earth and SERI have developed provide a workable and effective way of helping governments measure and reduce their consumption of natural resources. By advocating the adoption of these resource-use indicators the Rio+20 Conference will be taking the first steps to developing a decarbonised and highly resource efficient global economy, with the benefits for people, the environment and the economy that would bring.

#### Recommendations concerning sustainable agriculture and food sovereignty at Rio+20

20 years after the Rio Summit, the global food system is in deep crisis. Industrial agriculture, based on monocultures and heavy inputs of chemicals, fossil fuels, water and land is depleting our common natural resources at a rapid pace and is causing a host of environmental problems including climate emissions, loss of biodiversity, loss of genetic resources and destruction of soils. At the same time, 20 years of deregulated agriculture and liberalised agricultural markets are destroying small scale family farming, which is the primary method for most of the world's population, especially some of the most vulnerable communities, to feed themselves. The combination of industrial agriculture and global governance and trade models that are based on food as a tradable commodity rather than as a Human Right that States must uphold have left nearly a billion people hungry. The rest are increasingly being fed with unhealthy diets which is creating global health crises.

Viable food systems already exist. Small scale food producers provide the food for about 70 per cent of the population today, and there is widespread recognition that taking into account the needs of small holder farmers is vital to feed a global population in the future. Yet marginalisation of small scale farmers in policy making and investment combined with a focus on producing for export markets means most of the poor and hungry in the world today are small farmers in rural areas. 10 The global market is failing to feed them. Therefore we need policies that allow small scale food producers to feed themselves.

At the same time agro-ecological methods of production have been shown to have the potential to reduce climate emissions, reduce hunger and poverty, restore biodiversity and soils as well as improve livelihoods. The 2008 International Assessment of Agricultural Science and technology for Development report stressed the importance of agro-ecological farming combined with systems that work for small scale farmers as the way forward to a sustainable food system in the future.

#### Desired outcomes:

- 1) Give strong and increasing support to small scale, agro-ecological and other forms of sustainable, ecological and humane food production, research in this area and enabling conditions, to ensure a shift away from environmentally and socially destructive industrial food production in order to produce enough and healthy food for the projected 9 billion people or more;
- 2) Regulate, encourage and support the transformation of industrial and other forms of unsustainable agriculture towards smallholder based agroecological and other forms of sustainable, ecological, low energy food production;
- 3) Recommend a new global trade system that prioritises countries abilities to feed their populations and achieve the Right to Food over trade agreements, investments treaties that undermine this;
- 4) Support the development of comprehensive short and long-term national and regional food security strategies to address high food prices and volatility. These strategies should include a wide range of agricultural and price policies and instruments, adapted to specific national and regional contexts and the transition to agro-ecological practices;
- 5) Support food sovereignty as the overall framework for food and agricultural policies; 6) Emphasize the important role of the organizations of small scale food producers in decision making on food and agriculture;

- 7) Welcome the reformed UN Committee on World Food Security (CFS) as the primary as the foremost inclusive international and intergovernmental platform for food security, with a mission based on defending the right to food;
- 8) Start to develop a work plan for implementing the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD);
- 9) Resist the commodification and commercialization of natural resources and carbon trading, such as REDD+, the Clean Development Mechanism (CDM), that would include agriculture and soil carbon sequestration in speculative market schemes
- 10) Support the adoption of a UN Declaration on Peasant Rights;
- 11) Support the implementation of the UN Declaration on the Rights of Indigenous Peoples;
- 12) Condemn multi-genome patent claims and encourage governments to block or rescind such claims;
- 13) Focus research spending on agriculture on agro-ecology and small scale farming as well as improving local and traditional crop varieties and peasant breeding instead of biotechnology, GM crops and a narrow focus on genetic breeding;
- 14) Underline that the principle of common but differentiated responsibilities must be respected;
- 15) Call on Governments to stop the global land grab and return the more than 80 million hectares of land that has been taken from small scale farmers, pastoralists, indigenous communities with immediate effect;
- 16) Abolish all incentives for the production of bio fuels including targets and mandates;
- 17) Recognise the environmental damage and inequitable consumption patterns promoted by industrial, grain fed livestock systems. Support integrated, low input, humane farming systems;
- 18) Take action to reduce overconsumption of meat and dairy products in the industrialised world;
- 19) Promote resilient livestock breeds and species diversity; and re-introduce traditional and local animals on farms;
- 20) Break-up oligopolies in agricultural input corporations and in the food retail sector;
- 21) Promote and encourage improvement of traditional plant and seed varieties, stop monopolistic genetic patents and halt planting of genetically modified crops.

Recommendations concerning the implementation of Principle 10 of the Rio Declaration

Desired outcomes

- 1) The Rio+20 Conference should take a decision to start negotiating a global treaty on Principle 10 of the Rio Declaration, in order to have a text ready for adoption in 2017. The negotiation process itself should be transparent and participatory.
- 2) The Rio+20 Conference should (a) encourage the development of regional treaties on Principle 10 along the lines of the Aarhus Convention, and (b) encourage interested States to accede to the Aarhus Convention and its Protocol on PRTR, both of which are open to accession by any UN Member State.
- 3) The Rio+20 Conference should request UNEP to provide assistance to countries to enable them to better implement the Bali Guidelines on Principle 10, and invite donor governments and institutions to provide financial assistance for this purpose.
- 4) Any new instruments or processes established pursuant to the Rio+20 Conference should be 'Principle 10-proofed', i.e. they should contain provisions and/or requirements promoting effective access to information, public participation and access to justice in relation to their subject matter.
- 5) In its conclusions on the institutional framework for sustainable development, the Rio+20 Conference should invite the governing bodies of and Parties to international treaties relating to the environment, including but not limited to multilateral environmental agreements, to ensure that the substantive outcomes under such instruments promote effective access to information, public participation and access to justice.
- 6) The Rio+20 Conference should adopt a set of guidelines guaranteeing minimum standards for civil society participation in international decision-making processes.
- 7) Such Guidelines could build on the Almaty Guidelines adopted under the Aarhus Convention and Agenda 21 and would address, inter alia, the following issues: definition of civil society, openness of meetings, access to documentation, modalities of participation (right to circulate proposals, right to make interventions, right of peaceful assembly, etc), access to justice (grievance mechanisms, Ombudsperson institution for international forums), capacity building and funding.

Recommendations concerning Energy Access and Climate Change

Climate change is one of the greatest threats we face, driven by our combustion of fossil fuels for energy. Yet 2.7 billion people still rely on traditional biomass for cooking, heating or lighting, a figure that is not set to improve by 2030 if we continue current policy trajectories. Of those, 1.3 billion do not have access to electricity. If Rio+20's focus on the 'green economy' is genuinely about sustainable development and poverty eradication, it needs to find a way of addressing the energy needs of the 2.7 billion people while not contributing to climate change; in short, a transformation away from fossil fuels.

Friends of the Earth welcomes the focus given to energy access as a means of development, seen through Ban Ki-moon's three Rio energy goals, as well as 2012 being the Year of Sustainable Energy for All. He rightly acknowledges the need for a 'clean revolution'. However, if this is to be a revolution the whole world benefits from, then we need to find synergy between policies; doubling the share of renewable energy in the mix by 2030 will not deliver it; doubling the rates of improved energy efficiency will not do it; and a target of universal energy access by 2030 will condemn too many to poverty for too long. Focusing on energy access means focusing on decentralised, off-grid energy that empowers local communities and democratises energy. The IEA, REN21 and the World Bank have all shown that a renewable-powered decentralised mini-grid is cheaper, more efficient and more socially and environmentally sustainable than either extending the grid or using diesel. Climate change also necessitates addressing on-grid energy and ensuring 100 per cent of new capacity is renewable (currently 50 per cent), while we also try and replace the dirtiest sources of fossil fuel energy.

Moving to a renewable future will require heavy levels of investment. The IEA sees \$18 trillion needing to be spent by 2035 – or \$1.2 trillion a year – to stand a 50 per cent chance of keeping temperatures within 2 degrees of pre-industrial levels. We currently spend \$500 billion. Yet research by UN-DESA shows that investing \$1.5 trillion in the next 10-15 years would bring down the cost of renewables to become cheaper than fossil fuels, making them the default choice for energy investment in developing and developed countries, and making the economic case to keep fossil fuels in the ground and catalysing the 'clean revolution'. Both the IEA and UN-DESA say the market alone will not deliver this scale of funding in the small time-frame required, therefore it needs to be an upfront public investment.

Desired outcomes:

#### UNCSD IN RIO 2012 SHOULD

1. Lay the foundations for a global policy that can deliver the principles of community- focused energy access, development, and tackling climate change, while realising that each country needs to define its own energy needs according to those principles and must be supported in doing so.
2. Adopt best practice through using the most effective and successful public policies for increasing the uptake of renewable energy. Research by the IPCC, Deutsche Bank and others has shown that nationally appropriate feed-in tariffs (FITs) have led to the widest uptake of renewable technology.
3. Recognise the principles of Common but Differentiated Responsibility in any mechanism designed to address sustainable development and poverty eradication. This means richer, industrialised countries recognise their historical advantage from cheap, abundant consuming fossil fuels, and pay this climate debt to developing countries through new and additional finance as well as the transfer of technology.
4. Look to innovative sources of finance rather than emphasising the private sector, as conservative estimates place potential revenues from the redirection of fossil fuels, levies on bunker fuels, IMF Special Drawing Rights, a financial transaction tax and curbing tax avoidance (among others) between at least US\$400-US\$600.
5. Avoid the increasing reach of international corporate interests over satisfying the basic needs of the world's poor. Any effort to tackle energy access and climate change cannot lead to wide-spread privatisation and the transfer of wealth from South to North under the pretence of green growth. Socially, economically, and environmentally just policies should form the basis of a green economy if it is to deliver sustainable development and poverty alleviation.
6. Ensure the right principles are followed when drawing up and evaluating policies, not prioritising metrics such as value for money or carbon savings as they will skew policies away from genuine developmental gains and clean, affordable energy access. If done well, rolling out renewable energy can stimulate local economies, employment and poverty alleviation.
7. Involve civil society at each stage of the conceptualisation, design and implementation of any mechanism addressing energy access and renewable technology as they will be best placed to comment on what needs should be addressed as well as which principles should be prioritised.
8. Prioritise community-owned energy projects that catalyse local-level democracy and development. With regards to rural electrification, the use of co-operatives in Bangladesh, Nepal and even the United States have shown they increase participation, bring down energy costs and are overall more effective at delivering energy access and development.
9. Follow best practice in including accompanying enabling policies to ensure civil society partakes fully at a local, national and international level in any policy mechanism, including but not limited to providing the capital, institutions and working culture that facilitate capacity building and empowerment.
10. Respect and promote the rights of local communities and Indigenous Peoples, including rights to self-determination and self-government; the right to free, prior and informed consent; the right to management and customary use of natural resources; land rights; and rights of redress.
11. Establish a process for selecting eligible technologies that is transparent and participatory and take full account of the environmental and socio-economic impacts, including in countries and communities where the raw material inputs will be produced. 12. Ensure good governance, including participation of affected workers and communities in the development of policies and measures to tackle climate change, and transparency, accountability and democratic control over decision making.
13. Ensure jobs and decent work by minimising job losses, maximising opportunities for job creation, and protecting pay conditions and health and safety for workers; protect low- income groups, and guard against the creation of further economic and social injustice. 14. Ask those with experience and expertise in the areas of providing energy access to communities. Large, centralised fossil fuel companies like Eskom or Duke Energy should not be included in high level panels addressing sustainable energy for all.

#### Recommendations concerning Land Use Planning

Goals for sustainable development could be set into national legislative frameworks to ensure that a clear trajectory of action is undertaken. There is an implementation gap which could be addressed by focussing land-use planning systems, particularly land-use plans held by local governments, on the delivery of sustainable development. This means that policy- making and decision-taking on the ground would work towards addressing resource use, food security and energy access and climate change, and ensure public participation.

---

## Fundação Brasileira para o Desenvolvimento Sustentável

### Guidelines for a Green Economy

Submission to the United Nations Conference on Sustainable Development

Rio de Janeiro, 4-6 June 2012

The FBDS is a nonprofit organization, founded in 1992 by 24 major business groups whose prime objective is to promote sustainable development. FBDS's mission is to spread best practices in sustainability and environmental management through knowledge generation, contributions to public policy formulation, and implementation of consulting projects, in order to influence key stakeholders.

In 2011, the FBDS has led a nationwide effort in conjunction with major Brazilian corporations with the purpose of detect barriers and set up guidelines for the transition to a green economy<sup>1</sup>, based on the report Towards a Green Economy (UNEP). The process involved the academy, corporations, and discussions with major stakeholders and produced a set of recommendations to government and corporations. Those relevant to the Rio+20 context were selected and are now being submitted to the UNCSD2012 to be taken into account for the "zero draft" document.

The Conference should encourage countries to adopt the following guidelines in the energy, water resources, transport, solid waste, agriculture, forests, and finance areas when developing their domestic policies:

#### Energy

- To quantify GHG emissions from fossil fuel, and take actions intended to incorporate the externality costs of such energy option for suppliers and consumers, as a form of encouraging a more rational use of those sources of energy, through the regulation and/or market mechanisms.

- To develop a renewable sources market (wind and solar energy, small hydroelectric power stations, biomass) in the mid and long term, making them more competitive and ensuring remuneration for investors, cutting risks and bringing more investors to this area. In addition to specific auctions for renewable energy suppliers, potential options include feed-in tariffs and other tax methods aimed at promoting positive impacts linked to renewable energies.

- Governments and multilateral credit entities should promote the increasing use of biofuels, with programs that encourage offering and enabling the technological changes required by the demand. It is important to use the best practices in the industry without affecting each country's main ecosystems.

- To develop the research on renewable energy sources to be applied in industrial processes, urban solutions, facilities, etc. Governments should develop a tax system intended to encourage research and corporate investment in training skilled professionals in this area, in addition to offering adequate resources for the realization of these goals.

efficient equipment, and installing of intelligent home meters are actions considered crucial by specialists for promoting energy efficiency. Governments should be more restrictive regarding the commercialization of inefficient equipment.

- Overall access to good quality energy (and renewable energy, whenever possible) is critical for social inclusion. Programs intended to abolish energy exclusion can improve the quality of life of populations with low human development index, while creating higher energy efficiency by reducing the consumption of less efficient energy sources, like firewood.

#### Water Resources

- To tax water consumption, whenever and wherever possible, respecting the characteristics and limitations of each region, as a way of encouraging efficient actions regarding its use. The permanent measurement of water consumption, in addition to measures to fight its illegal use, is a crucial action to rationalize the employ of water resources.

- Resources obtained from water consumption taxation should be invested in incentives aimed at basin recovery and waters supply protection. Additional incentives worth investment include environmental services aimed at safeguarding watersheds, protecting riparian Forest, and reforesting degraded areas.

- Water resources should be managed in a decentralized and transparent system with the ability to implement management and regulation of economic tools and methodologies intended to survey the various uses of said resources.

- Since irrigation is a key factor when it comes to the use of water resources, with considerably inefficient processes, it is important to use more efficient irrigation techniques which rationalize water consumption and draw on local expertise.

- Sewage collection and treatment systems are critical for protecting water resources and their long-term availability, thus preserving the quality of drinking water. Nations must universalize their sanitation systems through different solutions aligned with local characteristics and needs.

#### Transports

- To develop a governance model in the freight transport sector which better defines the accountabilities and responsibilities of sectorial policy makers on planning and regulation, of executive agents, establishing additional control and incentives so that businesses and individuals may use newer, more efficient vehicles, and the tax system may discourage inefficient corporate logistic decisions.

- To boost investments in transport facilities and adjust them to the domestic needs (especially in developing countries) using more efficient forms of transport whenever possible, focusing mainly on the planning activity (by developing the capability of the various modes and of intermodal transport integration), on the execution (using more sustainable and durable goods, respecting the labor law and offering skilled manpower training), and taking into consideration the need of maintenance and inspection for the adequate use of transport systems.

- Urban mobility should be planned in conjunction with land use occupation, encouraging the supply of public and private services near major intermodal integration stations, and the rational displacement of city inhabitants. The planning should also include incentives for rational use of private vehicles, collective transport quality inspection, and the optimization of the various modes, so as to explore the capabilities of each mode and their complementarities.

- Fare integration, together with system predictability and information available to users (like the time it takes to arrive to bus stops or train stations) and the exclusive use of urban facilities in some cases should prevail in public transportation, thus encouraging the use of public transportation system instead of private transportation.

#### Solid Waste

- To promote the integrated management of urban solid waste, taking into account the solid waste management hierarchy (non generation, reuse, recycling, composting, final disposal), specific characteristics of each location; to plan the integration of the entire chain involved on a long term basis, and to train local management teams.

- The solid waste management improvement should take into consideration the activity of low income people who make their living from inadequate waste disposal processes. With the implementation of selective collection, volunteer delivery sites and the entire well-planned recycling chain, these people could be included in the process, thus adding to the enhanced use of recycled material and the upgrading the living conditions of such workers.

- It is necessary to invest in the improvement of databases, which should contain reliable information showing the real situation of cities, and enabling the quantification of the goals to be attained, including the amount of required investments. This could facilitate waste management planning in individual countries and the establishment of goals to be met.

- All agents (communities and both the private and public sector) involved should be aware of their shared responsibility in waste management. This awareness should not simply refer to information, but rather to a cultural change as well, since some good practices, like food waste reduction and choosing more durable or reusable goods, have not been quite well perceived yet by part of the population. It is important to promote green consumption policies among individuals, corporations and public entities, with consumption goals for products made with recycled material, whenever feasible.
- To propose motivational actions to the recycling industry, including the development of industrial clusters for these activities and lower taxes for recycled products.
- Setting goals for the acquisition of recycled material goods, especially for major state-owned corporations and governments. This practice would be influential in the public sector by showing the best practices to be adopted by other businesses when purchasing their products.
- To take into consideration, whenever feasible, the incineration of nonorganic and nonrecyclable waste associated with steam and/or energy generation, especially in big cities, and invest in composting and biomethanization for the correct use of naturally biodegradable organic waste.

#### Agriculture

- To improve actions related to the use of technologies intended for agricultural production sustainability, offering incentives to producers adopting good agronomic practices planned to minimize greenhouse gas emissions, in addition to improving the productive processes and rearranging the energy matrix with the purpose of reducing greenhouse gas emissions.
- To increase the industry competitiveness, intensifying technological developments in sustainable production systems, soil-plant system, microbiology and recovery of degraded areas.
- To improve the quality of agricultural products: the market requires special products with a low degree of impact on the environment which causes no risks to human health from chemical contamination (pesticide remnants) and biological contamination (presence of pathogenic microorganisms).
- To improve the production processes and rearrange energy matrices with the purpose of reducing greenhouse gas emissions.
- To offer compensation for environment services provided by small farmers or family farming. Farmers should be rewarded for preserving the environment either with payment in money or with production incentives.
- Implementation of studies on Climate Risk Zones as a basis for a public policy focused on an efficient production regionalization.
- To establish special lines of credit to benefit the modernization of properties, offering a climate insurance coverage to farmers in investment operations, based on the Climate Risk Zones.

#### Forests

- Governments should encourage businesses to adopt decentralized policies for developing the forest base, with the purpose of avoiding extensive monoculture and increasing the participation of farmers in its supply, promoting social inclusion.
- To further the consumption of forest chain products as an alternative to the mineral chain. To issue a nationwide campaign showing the environment edges arising from the energetic use of planted forests.
- Governments should work together with forest management organizations in order to denounce and prevent degrading work practices or any other questionable social practices.
- Deforestation is a major source of GHG emissions, mainly in tropical developing countries. Therefore, it is very important to develop new projects, and consolidate and integrate existing ones, which seek to generate income from the maintenance of forests and protected areas. The main initiative at this moment is the payment for environmental services (particularly REDD), which promotes economic incentives for environmental preservation.
- To create strategies that foster sustainable use of natural resources and the development of forestry activities (such as sustainable forest management), associated with social inclusion programs. Governments should also create incentives for the implementation of technologies that improve the productivity of non-wood forest goods, including technical assistance to small-scale producers.
- It is essential to plan the expansion of agricultural activity to occur primarily in already modified or degraded areas, thus preventing the clearing of new locations. In order to succeed in this effort, governments should enforce preservation laws, consolidate a network of protected areas and promote the use of more advanced technologies for the management of agriculture and livestock, restoring the productivity of abandoned or underutilized land.

#### Finance

- Development of green criteria applied to government fiscal incentives in times of crisis, so that the actions intended to reduce the impacts of economic slowdown on society do not include environmentally predatory measures. The transition to a green economy requires a high amount of investment, and such anti-crisis packages are a helpful tool to do it.
- Increasing the financial support to infrastructure works in developing countries is a key factor to their sustainable development. However, governments should outfit their control and inspection institutions on a proportional basis (especially in the environmental sector) so that the benefits arising from such works are not overcome by the project's negative impacts.
- A tax reform which promotes a clean technological innovation, the preservation of valuable natural resources, and the payment of environmental services, in addition to a social cost price internalization in goods and services, is a key factor for the financial system to allocate - on an optimum and sustainable basis - the resources available for investment and consumption. A system intended to foster sustainable materials and solutions in public purchase bids should also be considered an efficient strategy to encourage the private sector to adopt better practices.
- The finance system regulation should search and promote high social-environmental indicators solutions, punishing investments and financial resources applied to predatory solutions with a high social cost.
- Governments should encourage financial institutions to expand micro-credit participation in their portfolios, as a form of offering banking system benefits to disadvantaged people, thus promoting the development of entrepreneurial actions within those communities. It is crucial that such expansion comes together with education and information policies regarding the system operation and its risks.

TALLER PARTICIPÁ EN RÍO+20

CONCLUSIONES

11 y 12 de octubre de 2011

Megaciudades argentinas hacia Río+20

11 de octubre de 2011

Se realizó una mesa redonda con las autoridades ambientales de la Ciudad de Buenos Aires, La Plata y Rosario, ciudades en franca expansión territorial, para que puedan compartir sus perspectivas en materia de estrategias de Desarrollo Sostenible y asimismo pensar en propuestas desde un eje común hacia la Cumbre de Río + 20. Los expositores fueron:

- Lic. Javier Corcuera, Presidente de la Agencia de Protección Ambiental del Ministerio de Ambiente y Espacio Público de la Ciudad de Buenos Aires.
- Lic. Sergio Federovisky, Presidente de la Agencia Ambiental de La Plata.
- Ing. Cristina Marozzi, Directora General de Planificación y Gestión Ambiental de Rosario.

La facilitación de la mesa redonda estuvo a cargo de Daniel Ryan, Director de Política Ambiental y Desarrollo Institucional de FARN.

PRINCIPALES EJES DEL DEBATE

Es posible identificar tres ejes centrales alrededor de los cuales giraron las exposiciones de los panelistas y el debate posterior:

1. En primer eje se refirió a la cada vez mayor importancia de las megaciudades (dado los mayores niveles de consumo, generación de infraestructura, impacto sobre el territorio, etc.) como escenarios centrales en los cuales abordar la problemática de la sustentabilidad global, y por ende la creciente relevancia que los gobiernos y actores locales van asumiendo en relación a esta agenda.
2. En segundo lugar, se planteó que si bien las ciudades son escenarios centrales, la gestión local tiene limitaciones para abordar la problemática de la sustentabilidad, por ejemplo, en su capacidad para modificar estructuralmente pautas de producción y consumo.
3. En este contexto, se subrayó la necesidad de la innovación en términos de políticas y formas de abordar la problemática de la sustentabilidad. Por ejemplo, se planteó que las megaciudades deberían asumir un rol más activo en las negociaciones internacionales, lo cual puede ayudar a mover la agenda de sustentabilidad global, superando los bloqueos que se dan entre los Estados nacionales. Asimismo, se enfatizó la necesidad de la cooperación y mayor articulación entre los gobiernos locales que forman estas megaciudades. A título de ejemplo, se planteó la necesidad de avanzar con políticas conjuntas de compras gubernamentales sustentables, la necesidad de generar estrategias conjuntas para intervenir en escenarios de riesgos y emergencias ambientales, y en generar políticas comunes para tratar la relación salud, pobreza y ambiente.

Esta actividad contó con los auspicios de las autoridades de las tres ciudades que conformaron el panel de análisis y diálogo

Gobierno de la Ciudad Autónoma de Buenos Aires

La República Argentina hacia Río+20

12 de octubre de 2011

El objetivo de la actividad fue analizar el contexto internacional y los procesos que se están generando en nuestro país para la próxima Cumbre de la Tierra Río+20, mediante un diálogo participativo, intersectorial y plural entre los distintos actores involucrados en la temática del desarrollo sostenible.

Esta actividad constó de una mesa redonda gubernamental y otra intersectorial sobre la República Argentina hacia Río+20. También se desarrollaron talleres participativos sobre Gobernabilidad y Economía y un plenario final.

MESA REDONDA RELATIVA A LAS PERSPECTIVAS DEL ESTADO HACIA RÍO+20 Y LA ELABORACIÓN DEL DOCUMENTO PAÍS

La primera mesa congregó a autoridades gubernamentales del ámbito nacional quienes presentaron su visión respecto de Río+20, los desafíos relativos a nuestro país en el contexto regional e internacional y los principales aspectos del documento país que se presentará a Naciones Unidas. Los expositores fueron:

- Emb. Silvia Mérega, Directora Área Ambiental, Ministerio de Relaciones Exteriores
- Dra. Silvia Revora, Subsecretaría de Planificación Ambiental, Secretaría de Ambiente y Desarrollo Sustentable
- Dr. Maximiliano Moreno, Director de Negocios Multilaterales, Ministerio de Agricultura de la Nación.
- Lic. Juan Ignacio Paracca, Secretaría de Energía de la Nación.
- Ing. Rodolfo Burkart, Dirección Nacional de Conservación y Áreas Protegidas, Administración de Parques Nacionales (APN).

Facilitación: Lic. Miguel Pellerano, Consejero Regional UICN Sur

PRINCIPALES CONCLUSIONES DE LAS EXPOSICIONES DE LA MESA

- De cara a Río+20 es importante abordar los encuentros en el marco de un proceso participativo con una mirada intersectorial y diversa. Es una oportunidad que no se debe

dejar pasar para una evaluación de lo que hicimos estos 20 años, quiénes queremos ser, cómo relacionarnos con el planeta y cuál será el legado para las generaciones futuras. Río+20 nos invita a plantearnos dónde estamos y cómo seguir adelante.

- Río+20 llega en un momento de profundas transformaciones cuando se están superando los límites biofísicos del planeta, en una crisis económica, donde ya se cuestiona el modelo económico vigente, donde se incrementa la relevancia de las economías emergentes. Este proceso de cambio debería comprender dinámicas democráticas e inclusivas donde se debe incorporar a aquellos excluidos a través de un proceso participativo que contemple los aspectos sociales en vinculación con lo ambiental y lo económico.
- Se planteó la necesidad de debatir las bases de un nuevo modelo de gobernabilidad y economía. Argentina, como presidenta del G77 tiene la capacidad de liderar este proceso a través de espacios de diálogo y articulación entre la sociedad civil y el Estado.

#### MESA REDONDA ACERCA DE LAS PERSPECTIVAS DE LOS DISTINTOS SECTORES HACIA RÍO+20 Y LA ELABORACIÓN DEL DOCUMENTO PAÍS

Esta mesa congregó a representantes de la sociedad civil, el sector privado, académico y gremial quienes presentaron su visión respecto de Río+20, los desafíos relativos a nuestro país en el contexto regional e internacional y los principales aspectos del documento país que se presentará a Naciones Unidas. Los expositores fueron:

- Lic. Roque Pedace - Amigos de la Tierra, miembro del Foro del Buen Ayre
- Dr. Sebastián Bigorito - Director Ejecutivo del Consejo Empresario Argentino para el Desarrollo Sostenible (CEADS)
- Ing. Diego Luzuriaga - Cofundador y Director Ejecutivo de Equitas Ventures, Director de la Maestría en Dirección Estratégica y Tecnológica del Instituto Tecnológico Buenos Aires (ITBA)
- Lic. Joaquín Turco, Asesor de la Secretaría de Relaciones Internacionales de la Central de Trabajadores de la Argentina (CTA)
- Dra. María Eugenia Di Paola, Directora Ejecutiva Fundación Ambiente y Recursos Naturales (FARN).

Facilitación: Lic. Pablo Lumerman, Director Ejecutivo Fundación Cambio Democrático

#### PRINCIPALES CONCLUSIONES

- Se mencionó y analizó la propuesta de agenda del PNUMA en materia de economía. Se destacó la importancia de dirigir el capital hacia una economía distinta, aunque surge como principal desafío el consensuar y ponerse de acuerdo entre todas las partes.
- Río+20 tiene que ser visto como un proceso que refuerce la agenda internacional, debemos trabajar en una articulación que incluye lo público, privado, el mercado y los consumidores.
- Se planteó el tema de los fondos de inversión social y la necesidad de fomentarlos para darle entidad al concepto ya que se habla mucho y aplica poco.
- Se ratificó que el camino hacia la sustentabilidad es con justicia y equidad.
- Al analizar la actualidad ambiental se observan avances en algunos aspectos y deudas en varios temas de la agenda nacional e internacional.

#### TALLERES PARTICIPATIVOS

##### GOBERNABILIDAD

- Internacional

Se identificaron cuatro ejes en el diagnóstico: debilidad institucional, desarticulación entre instituciones e instrumentos generados, aumento en los conflictos ambientales y limitados espacios institucionales para dirimir este tipo de conflictos. En relación al primer eje del diagnóstico, se planteó la necesidad de jerarquizar y fortalecer el PNUMA. En relación al tema de los conflictos ambientales, se propuso la creación de tribunales internacionales ambientales.

En relación al Principio 10 de Río, se observaron pocos avances en materia de accesos y participación ciudadana y se propuso la generación de un convenio internacional/regional. Sitio web: [www.farn.org.ar](http://www.farn.org.ar) Twitter: @ambienteactual Facebook: Farn Argentina para la implementación del Principio 10. Se planteó la necesidad de seguir trabajando en la definición de desarrollo sustentable.

- Nacional

Existe un aumento de planteamientos que pretenden debilitar los ámbitos de gobernabilidad ambiental nacional y la legislación nacional de presupuestos mínimos de protección ambiental. Este es especialmente verificable en ciertos ámbitos provinciales, que son más plausibles de influir por intereses económicos. En este sentido, se planteó la necesidad de no retroceder en lo ya logrado en cuanto legislación de presupuestos mínimos.

En el aspecto institucional, se debe fortalecer los espacios federales y jerarquizar la Secretaría de Ambiente (se planteó en ascenderla a la categoría de Ministerio).

También resulta necesario entrecruzar la legislación ambiental con leyes sectoriales anteriores a la normativa ambiental (Ley de Fauna, Pesca, Código de Minería, Agricultura, Ganadería, Industria) y generar más presupuestos mínimos de protección ambiental, porque se identifica una tendencia de debilitamiento de este tipo de instrumentos.

Es menester fortalecer el proceso de reglamentación de las leyes de presupuestos mínimos (que se lleven a cabo aquellas pendientes y que se destinen mayores recursos a las leyes ya reglamentadas), por ejemplo en el caso de la Ley de Bosques, que no percibe la totalidad del dinero establecido en el Fondo de Compensación.

Se propuso la creación de juzgados y fiscalías ambientales, como así también la figura de Ombudsman ambiental para facilitar el acceso a la justicia de los grupos vulnerables.

##### ECONOMÍA VERDE

Para la mayoría era un tema nuevo, con contenidos diversos y que implica un cambio de paradigma, produciendo una tensión entre lo deseable y la realidad. En lo real es un concepto muy limitado pero en lo deseable se trató de buscar una definición que genere armonía entre diferentes sectores en relación al desarrollo sustentable, el crecimiento, la equidad social y el cuidado de los recursos naturales.

La metodología de trabajo en la mesa fue la discusión en pequeños grupos previa a la puesta en común con el resto de los participantes de la mesa. En una primera

instancia se enumeraron cuáles son las principales dificultades que se perciben para promover políticas económicas que integren criterios de sustentabilidad ambiental, social y erradicación de la pobreza. Las mismas se dividieron en 4 pilares: políticas, económicas, de información y culturales.

Entre las primeras, aparecen dificultades como la falta de voluntad política, el lobby de las empresas multinacionales y la resistencia al cambio, la amenaza sobre el empleo, el choque de intereses sectoriales, colectivos e individuales, la necesidad de inclusión social y de políticas públicas que incluyan al medio ambiente. Asimismo se observa que los países desarrollados transfieren las externalidades generadas por sus actividades productivas a los países no desarrollados y la escasa participación de la sociedad civil y comunidades originarias en el modelo de desarrollo.

En lo económico, se observó la falta de mecanismos compensatorios, la interposición de barreras para-arancelarias y restricciones comerciales, la falta de incentivos fiscales y económicos (por ejemplo para cambiar matriz energética), el avance de la frontera agropecuaria, la falta de valoración de los servicios ecosistémicos y las externalidades negativas.

Entre las dificultades informativas se destacaron la falta de datos en torno a la huella ambiental de algunas actividades, la falta de fondos para desarrollo e innovación, la asimetría en la información y la falta de información pública sistematizada. Entre las culturales se mencionó la importancia del compromiso y de medidas políticas específicas que deberían tomar los gobiernos (nacionales, provinciales y municipales), como por ejemplo fomentar un transporte eficiente y generar un cambio cultural en relación al consumo responsable.

A continuación se trabajó en relación a las medidas y políticas específicas que podrían tomar los distintos niveles gubernamentales para la promoción de una economía verde. En lo que respecta a las áreas de inversión a ser priorizadas el listado incluye sectores como la energía renovable y sostenible, ecuación y concientización, consumo responsable, transporte, investigación, agricultura sostenible, fortalecimiento de la sociedad civil (con una importante consideración de los pueblos originarios), procesos de certificación ambiental (a nivel público y privado) y el mapeo de oportunidades de inversión en función de los servicios ecosistémicos (con su consecuente valoración económica).

La modificación de la política impositiva se abordó desde distintos puntos de vista. El primer cambio a introducir se relaciona con un crecimiento exponencial de los tributos en función del nivel de contaminación en la producción, bajo la premisa de "el que contamina paga". El destino de la recaudación sería el transporte sustentable. Asimismo, el sistema tributario debería combinar impuestos a la renta con impuestos al consumo con el objetivo de reducir el consumo de los productos más nocivos, y con un especial énfasis en las explotaciones primarias, por ejemplo fomentando la eficiencia energética en detrimento de la contaminación ambiental y el uso irracional de los recursos. Se propone introducir un esquema de premios y castigos diferenciando a las empresas por tamaño y tipo de explotación. Es primordial, facilitar un mayor flujo financiero a las iniciativas de la sociedad civil por ejemplo, mediante políticas de exención en el impuesto a las ganancias. A nivel internacional se mencionó la necesidad de un impuesto a las transferencias financieras y evitar el uso de temas ambientales como barreras para-arancelarias (ej. Impuesto al carbono).

Se evaluaron los cambios que se deberían promover desde el sector privado para alcanzar una economía sostenible. Aquellas herramientas de mayor relevancia fueron el establecimiento de estándares de calidad y certificaciones, buenas prácticas y responsabilidad social empresarial (entendida como ética laboral, ambiental, comercio justo e inclusión social), como un método de penetración de mercados y reconocimiento de los productores con prácticas sustentables. Asimismo se destaca la importancia de la visión en cadena, es decir, el establecimiento de compromisos mínimos sectoriales y la generación de manuales de gestión ambiental y seguridad e higiene. También extender la responsabilidad del productor a todo el ciclo de vida del producto. Desde el sector financiero, sería importante contar con créditos e incentivos para el desarrollo sustentable. Por último, se analizaron las acciones del consumidor y políticas para un consumo responsable, social y ambientalmente. Satisfacer las necesidades básicas es el punto inicial a través de una política de inclusión social. El acceso a la información es primordial y ofertar alternativas que fomenten el consumo sustentable como por ejemplo, infraestructura ferroviaria para disminuir el uso de automóviles. Otras políticas fueron el diferimiento impositivo y/o premios para el consumo responsable y publicidad restringida para aquellos productos no ambientales, así como la reducción de packaging y la separación de residuos en origen.

## Fundación Compromiso

Buenos Aires, 31 de octubre de 2011

CIUDADES SUSTENTABLES 2011

En el año 2011, Fundación Compromiso desarrolló un trabajo territorial en el que más de 1000 representantes de la sociedad civil, del sector público y del empresariado debatieron el concepto de desarrollo sustentable y las competencias de los actores para la producción de políticas públicas en la construcción de ciudades sustentables.

Las Jornadas Regionales tuvieron lugar en Rosario, Salta, Mendoza, Misiones, Rio Cuarto, Bariloche y Buenos Aires. El próximo 15 de noviembre, en la ciudad de Buenos Aires, tendrá lugar la XVII Jornada Argentina de Articulación Pública Privada:

Ciudades Sustentables 2011, donde, además de integrarse los aportes de las jornadas regionales, se debatirán los ejes de la Conferencia de Naciones Unidas Rio +20, que se desarrollará en 2012. Una oportunidad importante para redoblar el compromiso con un desarrollo que nos permita vivir mejor a todos.

Más información en:

<http://www.compromiso.org/2011/xvii-jornada-argentina-de-articulacion-publicoprivada-ciudades-sustentables-2011>

A continuación se presenta un pequeño informe del recorrido territorial desarrollado en la Argentina con los objetivos de:

- Promover la convergencia de la Empresa, el Estado y la Sociedad Civil, para la generación de políticas públicas que construyan un desarrollo sustentable con inclusión social.

- Contribuir a la visibilidad de experiencias de nuestro país y del contexto regional e internacional respecto de la conformación de las ciudades sustentables.

1) Contexto: el rol de los actores en la construcción del desarrollo sustentable A partir de la segunda década del siglo XX, el crecimiento poblacional en las ciudades se aceleró hasta cobrar niveles alarmantes. En el año 2025 dos terceras partes de la población vivirá en ciudades. Este proceso de urbanización trajo aparejadas una fuerte degradación ambiental y una agudización de la pobreza.

Las grandes ciudades suelen ser los principales centros de actividad económica, pero también fuente de grandes desequilibrios sociales. A la contaminación del aire, el agua y el suelo se le suman los déficits de servicios básicos. En América Latina y el Caribe, millones de personas viven en ciudades sin acceso a servicios de agua potable y saneamiento básico. El tratamiento de residuos sólidos urbanos es, en general, completamente deficiente y el aumento de basura compromete el ambiente, causa enfermedades y lleva a la muerte a millones de personas. Las plantas de tratamiento de aguas servidas, los vertederos industriales, las industrias contaminantes, los basurales se encuentran ubicados en las comunidades más pobres. A esto se le debe sumar problemas vinculados con el acceso al empleo, la educación, la vivienda y la

salud. La inequitativa distribución del impacto ambiental se relaciona con la desigual distribución de la riqueza: ambiente y pobreza se retroalimentan en un círculo negativo, potenciando los conflictos socio ambientales. Los problemas vinculados a la contaminación industrial llegan a ser tan evidentes que el entusiasmo inicial por la radicación de fábricas ha dado paso paulatinamente al rechazo de estos emprendimientos, poniendo en jaque muchas veces a la actividad económica.

Las condiciones en las que se encuentran las ciudades llevaron a pensar una nueva forma de planeamiento, de accionar, alrededor del mundo se comenzó a hablar de la sustentabilidad de las ciudades. Una ciudad sustentable es aquella que promueve actividades económicas y patrones de consumo que no dañan el ambiente. Tiende a un aprovechamiento estratégico del suelo con perspectiva de mediano largo plazo, garantizando áreas verdes y espacios deportivos y recreativos. Asegura el acceso al empleo decente y a viviendas dignas, con servicios de agua y saneamiento de calidad, así como a buenos servicios de salud y de educación, con niveles aceptables de seguridad ciudadana.

El desarrollo sustentable es una responsabilidad compartida entre diferentes sectores de la sociedad, a fin de hacer converger, de una manera positiva, la actividad productiva, el desarrollo social y el impacto ambiental en pos de una mejor calidad de vida para las actuales y futuras generaciones.

De esta forma, el concepto de sustentabilidad combina tres dimensiones: la dimensión productiva, la dimensión social y la dimensión ambiental. Si lo pensamos como un triángulo, éste está en constante tensión, procurando generar un equilibrio entre la eficiencia económica, el cuidado ambiental y el impacto social. Es este equilibrio el que nos permitirá pensar en largo plazo, en el futuro de las ciudades y en el futuro de las próximas generaciones.

Cómo lograr el equilibrio? ¿Cómo recorrer el camino hacia la sustentabilidad? La respuesta a estas preguntas es la articulación público-privada, es decir, la coordinación y articulación de esfuerzos entre el Estado en sus diferentes niveles – nacional, provincial y municipal –, el sector empresarial y las organizaciones de la sociedad civil en pos de construir estrategias de desarrollo que lleven a una mejor calidad de vida. La calidad de las políticas públicas en general y dirigidas al desarrollo sustentable, en particular, va a depender de la calidad de los procesos de articulación público-privada. Es imprescindible profundizar la interacción entre el Estado, la sociedad civil y el mundo empresario. Estos procesos de articulación de actores plantean tres desafíos: el primero es la construcción de confianza, el segundo es la superación de las asimetrías, económicas y de acceso a la información y el tercero es la construcción de capacidades que permitan la convergencia de acuerdos cuando existen intereses contrapuestos.

Esto lleva a que los distintos actores redefinan sus roles con respecto al desarrollo sustentable. En primer lugar, proponemos recuperar la política como camino para definir el rumbo y sostener el desarrollo de cualquier territorio. La política no es cosa exclusiva de los políticos, es patrimonio de todos. Los procesos de articulación público privada para la producción de políticas públicas son procesos políticos. Tienen una dimensión técnica, metodológica, pero son fundamentalmente procesos políticos y sus resultados son resultados políticos.

Respecto al Estado, es necesario fortalecer su liderazgo y centralidad en la planificación del desarrollo sustentable. Sin embargo, hoy no puede afrontar los desafíos del desarrollo sustentable en soledad. Es importante generar desde el Estado los dispositivos y lazos con los diferentes actores sociales y políticos que legítimamente pueden aportar a la calidad de las políticas públicas, tanto en su diseño, implementación y evaluación.

Por otro lado, la rentabilidad no es el objetivo exclusivo de las empresas. Para que exista un compromiso con el desarrollo sustentable se debe poner en valor y darle contenido a la responsabilidad social empresarial (RSE). La RSE debe ser el compromiso de las empresas con el desarrollo sustentable de su territorio.

Respecto a las organizaciones de la sociedad civil no deben ser consideradas un camino alternativo al Estado en la aplicación de las políticas sociales ni complemento del mercado en aquellos territorios donde al mercado no le interesa llegar. Las ONGs debemos repensar nuestro rol a la luz del nuevo contexto mundial. En este nuevo desafío las organizaciones deben jugar un papel de promotor y facilitador de la articulación de los diferentes actores que deben participar activamente en el desarrollo sustentable de nuestros territorios y ciudades.

Finalmente, este proceso necesita del acompañamiento activo de la academia, fundamentalmente que las universidades pongan el conocimiento al servicio del desarrollo sustentable en sintonía con las necesidades y demandas de la sociedad. Para que la articulación público-privada se dirija eficientemente hacia el desarrollo sustentable, se debe bajar el concepto de sustentabilidad al territorio, ya que son los procesos de sustentabilidad local los que están desempeñando un papel cada vez más importante en el logro de objetivos globales. Cada territorio es único, la forma que tomen los actores, la forma en que se relacionen y la dinámica de las variables productivas, sociales y ambientales – las tres puntas del triángulo – dependerá del contexto social, histórico y político. Es así que cada ciudad debe darle su identidad al proyecto; utilizar el conocimiento y las experiencias comunes y compartidas para conjugar esas variables y los actores de forma concreta y en relación a su realidad local.

2) Metodología y actividades desarrolladas Durante 2010 Fundación Compromiso inició una línea de trabajo territorial que permitió analizar los procesos de constitución, desarrollo y sostenibilidad de experiencias de Articulación Público-Privada y evaluar su impacto en la generación de desarrollo local sustentable con inclusión social. Es en la profundización de dicho análisis que, a lo largo del año 2011, tomamos este espacio para abordar la temática de las Ciudades Sustentables. Para ello, se realizaron seis Jornadas Regionales a lo largo y ancho del territorio argentino (Salta, Misiones, Rosario, Río Cuarto, Bariloche, Mendoza) y un Seminario de Desarrollo Sustentable y RSE en la ciudad de Buenos Aires.

Nuestro trabajo territorial tiene como objetivo profundizar el diálogo y habilitar nuevos espacios de participación para autoridades, tomadores de decisiones, expertos internacionales y ciudadanos sobre el desarrollo y monitoreo de políticas orientadas a conocer el «estado del arte» de la sostenibilidad en nuestras ciudades, a poner en común lo hecho y lo no hecho, los alcances, las limitaciones y los desafíos; y generar un proceso de construcción colectiva que culminará en la Jornada Nacional a desarrollarse el próximo 15 de noviembre.

En consonancia con la misión de Fundación Compromiso, los participantes de las Jornadas y del Seminario alcanzaron un total de más de 1000 personas, de los cuales 380 provenían del sector empresario, 250 del sector público y 400 de las organizaciones de sociedad civil. Asimismo, estas organizaciones públicas y privadas se nuclearon bajo una diversidad de áreas relacionadas con el ambiente (uso de suelo, gestión de residuos, etc.), la educación, la salud, el empleo, la planificación, la vivienda, el marketing, la comunicación y los derechos humanos.

En cada Jornada se organizaron dos momentos principales:

El primer momento, de carácter expositivo, consistió en un panel de expertos en el que especialistas presentaban su visión acerca de distintos aspectos de la sustentabilidad, entre ellos, la planificación territorial, el diseño urbano y las ciudades que queremos para el futuro, el rol de las organizaciones sociales, los empresarios y el Estado en el camino hacia la sustentabilidad y la articulación de estos actores, y un panel de casos donde representantes del sector público, organizaciones locales e internacionales, empresas y academia presentaron casos exitosos de articulación público-privada hacia el desarrollo de ciudades sustentables. (consultar los programas de las Jornadas Regionales en:

<http://www.compromiso.org/2011/xvii-jornada-argentina-de-articulacion-publicoprivada-ciudades-sustentables-2011>)

El segundo momento, de carácter participativo, se centró en el trabajo de Mesas de Diálogo y Construcción Colectiva. Se desarrollaron tres actividades: la construcción grupal de una definición de sustentabilidad, la determinación y priorización de los principales problemas del territorio que deberían ser abordados desde la política pública y

un juego de roles alrededor de un conflicto socio-ambiental.

3) Algunas conclusiones Existe una preocupación y un deseo de que el desarrollo sustentable sea un asunto público. De esta forma, surge como un desafío la concientización de la ciudadanía en este aspecto. También es importante trabajar en las formas de incidencia en la política pública que cada sector puede lograr. Es necesario comprender que todos y cada uno de los actores pueden contribuir en la construcción de la sustentabilidad.

A su vez, existe un consenso entre los participantes respecto al concepto de desarrollo sustentable: implica responsabilidad, equidad, inclusión y equilibrio, debe tener en cuenta necesidades colectivas y particulares, debe desarrollar un compromiso con la preservación de los recursos y el ambiente y debe beneficiar a las actuales y futuras generaciones.

A la hora de señalar los problemas prioritarios del territorio, existen algunos problemas comunes a resolver en una primera instancia (si bien cada región definió problemas particulares):

1. En primer lugar, los distintos grupos señalaron la existencia de marcos normativos inadecuados, antiguos e ineficientes para enfrentar los problemas que obstaculizan el desarrollo sustentable.
2. En todas las regiones existe una creciente preocupación por el manejo inadecuado de los recursos forestales, hídricos y energéticos.
3. Finalmente, se observó que, para abordar estas temáticas, se necesita una distribución equitativa de los servicios sociales y una gestión urbana del territorio que tenga como foco el desarrollo sustentable.

Respecto a la gestión de conflictos socio-ambientales, se reconocieron obstáculos que se interponen en el planteo de soluciones viables. Estos radican principalmente en los intereses contrapuestos del Estado, los empresarios y las organizaciones de la sociedad civil. Por un lado, las empresas, que generalmente son las señaladas por causar contaminación, se sienten sancionadas y desprestigiadas, lo que genera la oposición activa a cualquier tipo de solución. La sociedad civil desconfía del discurso de las empresas y, junto con ellas, responsabilizan al Estado por no encontrar una solución viable. Por otro lado, el Estado impone obstáculos burocráticos que dificultan la presentación de la problemática y su solución.

En este marco se identificó una falta de competencias de los actores (en los tres sectores) para:

- Identificar, precisar y analizar problemas comunes (planificación situacional / diagnóstico)
- Favorecer la definición de rumbos compartidos (estrategias)
- Identificar oportunidades para la creación de valor público en situaciones no tradicionales (innovación)

#### 4) Algunos desafíos planteados

A partir del desarrollo de las Jornadas, los participantes se concientizaron e incorporaron el concepto de desarrollo sustentable y comenzaron a definir un camino crítico para transitar la brecha desde la planificación territorial tradicional a una que concilie la inclusión social, el equilibrio ambiental territorial y el impulso productivo. Quedó de manifiesto que:

- la sustentabilidad no es una opción, sino un camino que no tiene retorno;
- el objetivo principal es generar valor público;
- todos los países y sus componentes locales tendrán que pensar y buscar soluciones propias para atender a esta cuestión;
- es necesario redefinir y redirigir la política pública hacia el desarrollo sustentable con una mirada de mediano y largo plazo; incluyendo la participación de todos los actores;

Para ello se necesita:

- a) un gobierno efectivo y transparente que trabaje junto con una ciudadanía informada y participativa;
- b) nuevas instituciones y formas de planificar políticas públicas en red, espacios multidisciplinares, multiactorales y multisectoriales;
- c) la construcción de indicadores concretos que nos permitan saber desde dónde partimos y que nos permitan producir metas y objetivos mensurables de hacia dónde vamos; y
- d) abordar el tema de la sustentabilidad desde una escala territorial.

Tomando en cuenta la información que se generó en las Jornadas Regionales y el Seminario de Desarrollo Sustentable, reconocemos que la sustentabilidad y su desarrollo en las ciudades deben asumir un carácter particular en cada país, región, ciudad, pueblo y comunidad, no extrapolar modelos y experiencias sin antes realizar una reflexión crítica de los mismos.

Esta experiencia de reflexión a través de las diferentes regiones y junto a actores diversos, sumada a la Jornada Nacional a realizarse el 15 de noviembre próximo, constituyen un aporte a la discusión que se realizará en Río+20, ya que pone en valor la visión que cada territorio tiene con respecto al desarrollo de ciudades sustentables; sus problemas y desafíos.

Fundación Compromiso, octubre 2011.

---

## Fundación Ecología y Desarrollo (ECODES) - Ecology and Development Foundation

Propuestas de ECODES (Fundación Ecología y Desarrollo) al Zero Draft de Río + 20:

S.O.S.: Es urgente devolver el sentido a las palabras para construir una Economía Sostenible En ocasiones, el éxito de una palabra puede vaciarla de contenido. Eso es, en cierta medida, lo que puede estar ocurriendo con expresiones como sostenibilidad o desarrollo sostenible. Por eso, es preciso recuperar el sentido de las palabras y reivindicar su contenido.

La apuesta por la sostenibilidad suponer reconocer que existen límites al crecimiento y que, por tanto, debemos repensar nuestro modelo de desarrollo situando la sostenibilidad en el centro del debate. Así, si queremos construir una auténtica Economía Verde, es necesario desarrollar nuevos nichos de mercado y reverdecer la

economía en su conjunto. Por otro lado, apuestas estratégicas de Naciones Unidas como los Objetivos de Desarrollo del Milenio, cuyo cumplimiento debería apoyarse al máximo desde Río + 20 no serán posibles si no se adopta la sostenibilidad como elemento clave del desarrollo. Estos objetivos no son ninguna utopía: el propio PNUMA afirma que el acceso a agua potable y saneamiento estaría garantizado si se destinara a estos fines, durante 4 años, tan sólo el 0,16% del PIB.

En el caso del agua, estamos ante un elemento transversal, y por lo tanto, estratégico en la búsqueda de nuevos nichos de empleo verde y en el reverdecimiento del conjunto de la economía. El agua tiene una estrecha relación con la producción de alimentos, con la calidad de los ecosistemas, con la producción de energías renovables, etc. Es clave visibilizar los potenciales retornos del ciclo del agua y hacerse preguntas tales como ¿Cuáles son los retornos económicos de un acuífero contaminado? ¿Y el de uno de buena calidad?

Para poder extraer todo el potencial que el agua encierra, es necesario actuar activando las tres palancas del cambio. Para Ecodes, este trabajo debe hacerse teniendo como objetivos las siguientes METAS:

1. Hacer efectivas las metas y compromisos recogidos en los Objetivos de Desarrollo del Milenio.
2. Garantizar la implementación del Derecho Humano al Agua, instando a los Estados a su reconocimiento en el derecho interno.
3. Objetivos de Desarrollo sostenible

Para conseguir estas metas, es imprescindible construir una gobernanza política para la globalización económica, donde los Estados, poseedores de la legitimidad democrática, marquen el rumbo de la política internacional, y el resto de actores contribuyan a estos objetivos de manera proporcional a su responsabilidad. Esta idea de corresponsabilidad, liderada desde lo público, debe servir para activar las tres palancas del cambio social, de manera que las metas planteadas se puedan alcanzar.

**LAS TRES PALANCAS DEL CAMBIO:** Regulación pública, incentivos de mercado y cambio cultural. Regulación pública:

Lo público es más que lo estatal:

El concepto de lo público va mucho más allá de lo estatal. Público es todo aquello no busca exclusivamente el beneficio privado, bien sea mediante la acción de los Estados o de la sociedad civil, que actúan en defensa de lo colectivo. En este sentido, experiencias como las Juntas Comunitarias de Agua en Latinoamérica han demostrado ser una buena alternativa para garantizar el acceso al agua y al saneamiento en esos territorios. El apoyo a estas experiencias, en sus distintas vertientes, es crucial para estas zonas del planeta.

Desde lo público también se genera empleo:

En el mundo existen buenas y malas experiencias de gestión pública y privada del agua. Sin embargo, pocas veces se pone en valor lo que las empresas públicas están aportando. En España hay buenos ejemplos de empresas públicas que hacen transferencia tecnológica, gestionan de manera eficiente y son capaces de reportar beneficios a sus respectivos municipios. Son, por tanto, creadoras de empleo y riqueza.

Prioridad: una buena Gobernanza

Más allá de los modelos de gestión que se puedan adoptar, es crucial insistir en la idea de una buena gobernanza, destacando la transparencia y el control. La disyuntiva entre regulador y gestor ha presentado enormes carencias en los casos en los que se ha implementado. De ahí que sea necesario recuperar la capacidad del Estado para actuar, sin hacer dejación de responsabilidades, diseñando e implementando políticas públicas que garanticen el servicio desde el compromiso con la sostenibilidad y la equidad.

Por otro lado, a nivel de cuenca, la experiencia española de las Confederaciones Hidrográficas como garantes de la unidad de cuenca puede ser exportable a otros sitios. Estas entidades deberían reforzarse, además, desde la participación de todos los usuarios y la transparencia en la gestión.

**Incentivos de mercado:** El mundo financiero al servicio de la sostenibilidad

Construir un modelo económico al servicio de las personas y el bienestar, poniendo a las finanzas a trabajar por la sostenibilidad:

Para ello, se deberá Incentivar la Inversión Socialmente Responsable con productos financieros ad hoc que ayuden a construir la economía verde del agua.

Además, es necesario reformar los mecanismos de financiación del FMI y del BM, con un porcentaje de los fondos destinado a la gestión del agua, y condicionados por criterios de transparencia y la lucha contra la corrupción.

**Replicar, donde sea posible, iniciativas exitosas:**

En el mundo existen experiencias que han demostrado su viabilidad, cuya replicabilidad debería estudiarse. En concreto, queremos hacer énfasis en dos:

- Las experiencias de Pagos por Servicios Ambientales desarrolladas e implementadas en América Latina.
- La iniciativa francesa desarrollada mediante la Ley Oudin, como herramienta de solidaridad hídrica con el sur, que permite a los municipios donar un porcentaje de la factura del agua para proyectos de solidaridad relacionados con el acceso al agua potable y al saneamiento.

**Definir el papel de la iniciativa privada:**

Las experiencias que han existido ya de colaboración público - privada, nos han enseñado que es necesario establecer claramente las reglas del juego, marcando desde lo público los criterios a seguir y teniendo siempre la transparencia en el frontispicio de cualquier actuación.

Estas alianzas público – privadas han demostrado ser una buena herramienta para buscar soluciones de manera conjunta, aportando desde cada ámbito la experiencia recogida. Por tanto, debe seguir apostándose por este ámbito de colaboración, pero siempre desde la definición de roles.

**La tríada mágica: eficiencia – ahorro – reutilización.**

En momentos de crisis como los que vivimos, ya no es suficiente con hablar de ahorro. Es necesario ir más allá y apostar por las tres variables: eficiencia en el uso de los recursos, ahorro y reutilización donde sea posible.

**Cambio cultural y de valores:**

Las metas que hemos planteado en este documento suponen un replanteamiento del modelo de desarrollo actual. La magnitud de este desafío hace que no sea posible asumirlo sin una profunda transformación cultural que parte de los valores que rigen nuestras sociedades. Para ello, es necesario:

**Un esfuerzo pedagógico:**

Que Administraciones Públicas, medios de comunicación, centros de investigación y ONGs, hagamos un esfuerzo por hacer entender el significado de la buena gobernanza y la economía verde.

Que seamos capaces de poner en valor la “excepcionalidad” del agua, que está en lo pre-racional, es constitutiva de la vida, ejemplifica la hospitalidad, y en buen número de ocasiones, ha jugado un papel de unión y comunicación entre los pueblos.

**Una apuesta por la participación:**

Que involucremos a todos los actores del cambio. En este sentido, experiencias como “Zaragoza con el agua”, en la que se han conseguido más de 100.000 compromisos ciudadanos con el uso eficiente del agua, pueden ser una referencia.

Este documento se ha elaborado con las conclusiones del taller: "Agua y Economía Verde: propuestas al Zero Draft de Rio + 20", organizado por Ecodes en el marco de la "Conferencia Internacional de ONU-Agua: Agua en la Economía Verde en la Práctica: Hacia Rio+20" organizada por la Oficina de la Década del Agua de Naciones Unidas. Queremos agradecer a la Oficina de la década del agua de Naciones Unidas, así como a todos los participantes en el seminario, su dedicación y trabajo desinteresado.

## Fundación Lonxanet

SUSTAINABLE CO-MANAGEMENT OF FISHING RESOURCES:

SUSTAINABLE SEAS AND RESPONSIBLE CONSUMERS

Submitted by Fundación Lonxanet, Spain

28 October 2011

Contact: Antonio García Allut [antonio.garcia.allut@fundacionlonxanet.org](mailto:antonio.garcia.allut@fundacionlonxanet.org), Chairman, Fundación Lonxanet para la Pesca Sostenible

Website: <http://www.fundacionlonxanet.org>

### INTRODUCTION

Fundación Lonxanet (Spain) is grateful for the opportunity to provide input for inclusion in the compilation document to serve as basis of the Zero Draft for the UN Conference on Sustainable Development (UNCSD 2012).

As the World Summit on Sustainable Development (WSSD) was underway in Johannesburg in September 2002, Fundación Lonxanet para la Pesca Sostenible was created in North West Spain, in part to respond to the WSSD's call for the creation of an international network of Marine Protected Areas (MPAs). Fundación Lonxanet is an innovative initiative that promotes a change in the mind-set of artisanal fishermen to minimise the loss of living marine resources and achieve sustainable development.

We work with artisanal fishing communities and organisations whose livelihoods depend on any water system (rivers, lakes, estuaries, seas and oceans) from Spain, Latin America and Africa. We develop and promote best practices both by and for artisanal fisherfolk and give visibility to their efforts and contributions to a more sustainable sea and world.

### RELEVANCE TO THE CONFERENCE ON SUSTAINABLE DEVELOPMENT 2012 (UNCSD 2012)

Fundación Lonxanet welcomes the efforts to address the sustainable use of marine resources as a central theme of UNCSD 2012. We concur with the view that major conferences on the environment and sustainable development cannot ignore the importance of healthy seas for sustainable development, especially in light of the role played by artisanal fisherfolk in global food security, including what some have described as the blue economy.

Our proposal is fully consistent with the goals and objectives of UNCSD 2012 as well as with the Millennium Development Goals. The proposal departs from our assessment that progress achieved to date for sustainable seas and oceans has been insufficient and, that there is a gap remaining in the implementation of ocean-related outcomes from past major summits on sustainable development, especially the commitment in Johannesburg to establish and maintain an international network of Marine Protected Areas. Our proposal relates directly to key issues listed in the Co-Chairs' Guidance Note for inputs for Compilation Document: oceans, food security, biodiversity, sustainable consumption and production (including the "green jobs") and adaptation to climate change. This successful experience stems from Lonxanet's initiative and works accompanying artisanal fishermen, and contributes to the integration of the three pillars of sustainable development: social, economic and environmental.

Within this framework, Fundación Lonxanet facilitates the development of processes aimed at aligning artisanal fisherman and the State in the common goal of a sustainable management of fishery resources to achieve social, economic and environmental benefits for both fishing communities and society in general. The creation of symmetric spaces of dialogue between the state and the fisheries sector promotes a change in the fishermen's mind-set leading to co-responsibility of the future of the oceans, empowering and involving them in the management of fishery resources under an adaptive and ecosystemic approach.

### CONTEXT: CAUSES AND CONSEQUENCES OF THE GLOBAL FAILURE IN FISHERIES GOVERNANCE

Living marine resources in the world are in a critical state. According to the UN FAO, 80% of the world's fisheries are at risk due to excessive fishing efforts. Within this percentage, 52% are completely exploited, 19% is over-exploited, and 8% has been depleted. Although virtually all governments acknowledge the gravity of the problem and are making efforts to regulate the exploitation of these resources with sustainability criteria, the global state of the oceans and its resources continues to deteriorate. In accordance to the FAO's analysis, only 1% of the world's fisheries appear to be recovering from past over-exploitation. The European Union, with the largest Exclusive Economic Zone in the world, 88% of its fisheries are over-exploited and 69% are in danger of depletion.

The problems and its consequences can be summarised in six points:

(1) Market forces that favour overfishing, (2) Overfishing and depletion of resources, (3) Increasing impacts of climate change; 4) Pollution, environmental degradation of coastal ecosystems and biodiversity loss; 5) Failure of governance in resource management, since it is centralised and hierarchical, (6) Loss of oceans' resilience. This leads to the following consequences: a) Depletion of fishery resources; (b) Crisis of artisanal fisheries sector and local communities; c) Loss of future expectations for the families of those fishermen who abandon fishing: emigration and depopulation; d) Loss of food sovereignty and security.

An over-centralised management model, where the artisanal fisherman neither participates nor is represented, brings about an incompatibility between the sustainability objective pursued by the States and maximising fishermen's economic objectives favoured by market forces.

The world fish trade sources its products in developing countries to be sold in developed countries. Therefore, the fishing industry and consumer markets in the most developed countries are the main contributors to the fall in resources from the world's coastal, sea and ocean ecosystems. In accordance with the principle of "common but differentiated responsibility" enshrined in the Rio Declaration of 1992, these countries have a special duty to correct and avoid this dramatic situation. Increasing controls on fishermen to correct bad practices is not enough. It also requires a more equitable and sustainable redistribution of fishery resources as a public good between the fleets exploiting them, to correct social imbalances affecting artisanal fisherfolk.

Artisanal fishing is often characterised by relatively low impact practices on marine ecosystems, using more selective fishing gear, with a less destructive impact on habitats, less fuel consumption and less fishing effort, far below that of industrialised fishing. Furthermore, as showed by FAO statistics, it should be taken into account that artisanal fishing employs a large number of the people who play a very important role in the social and cultural life of most coastal countries.

To address the abuses and excesses of the market, producers and consumers must be made co-responsible. Yet to date the impact of the majority of awareness policies and

campaigns applied to fishermen and consumers remains low.

#### WHAT HAS BEEN DONE, WHAT HAS BEEN ACHIEVED

Over the last decade, with a systemic, participatory and bottom-up approach that empowers local artisanal fishing communities through human, economic, social and environmental projects, Fundación Lonxanet has developed ways to minimise the obstacles to sustainable development that artisanal fisherfolk and fish workers have encountered and to develop locally workable conditions that favour comprehensive sustainable development.

The Fundación Lonxanet initiative started as a pilot project in the region of Galicia, North West Spain, which included the creation of two Marine Protected Areas of Fishing Interest co- managed equally by artisanal fishermen and the public authorities. In addition, a marketing company was created to directly distribute sustainable seafood produced in this area to consumers, with a view to increasing the revenues of the artisanal fishermen and, at the same time, protecting and conserving their resources ("from a sustainable sea to a responsible consumer"). All of this led to the creation of the international Network of Artisanal Fishing communities for Sustainable Development (RECOPADES), active in Europe, Latin America and Africa.

These experiences demonstrate that dialogue and collaboration between public authorities and artisanal fisherfolk is not only possible but successful. Placing the artisanal fisherman at the heart of fisheries management on an equal footing with the public administration has opened a consolidation process regarding new ocean governance. This experience has important benefits for the coastal ecosystem and for society in general. A greater involvement of fisherman has been achieved regarding environmental sustainability goals. The catches of certain species have been greatly increased. Conflicts have been reduced and the fishermen feel involved and co-responsible for their future, applying sustainability criteria in fisheries management. They are being referenced as an example of sustainable experience at an international level.

Our experience to date shows how the involvement of fishermen in the co-management of fishery resources and the green economy can be a means to achieve sustainable development in its three dimensions (social, economic and environmental), together with the eradication of poverty. This is its added value, in line with the Co-Chairs' Guidance Notes, asking to emphasise what has worked and how to build upon success to seize opportunities for possible elements of an agreement in the outcome document.

The proposals we present here address the implementation of a series of guidelines that promote a convergence of state and fisheries towards sustainability as a common goal. It represents a very important step to build an active and participatory citizenship, co- responsible for the management of natural resources.

#### EMPOWER ARTISANAL FISHERMEN FOR SUSTAINABLE DEVELOPMENT AND THE GREEN ECONOMY:

We urge the UNCSD 2012 to express in Rio the necessity and their willingness to empower artisanal fisherfolk to both participate in similar processes and in resources management in order to address the changes in production and consumption models that have failed to secure the sustainability of fishery resources worldwide. We also urge the states to enable that fishermen and state representatives go hand in hand in the process of co-management of fisheries.

The approach we request UNCSD 2012 to support comprises a series of measures to promote processes of change in the artisanal fishing sector that can lead to a culture of sustainability and can be applied in a wide range of contexts and scales, with a convergent and coherent view about the future of artisanal fishing and the collective interest of their communities:

- <sup>[4]</sup> Respect for fishermen's local environmental knowledge in the design of management plans for fishery resources.
- <sup>[4]</sup> Action plans, with a bottom-up approach, and participatory processes to build trust and encourage the participation of small-scale fishing communities with a leading role.
- <sup>[4]</sup> Empower partnerships and networks with other fishing communities and other actors (governments, NGOs, companies, public administrations, etc.) at local, national or international level.
- <sup>[4]</sup> Promote, as a result of the required mind shift, artisanal fisherfolk as custodians and guardians of the living marine resources and their habitats.

Based on RECOPADES' experience, we urge UNSCD 2012 to encourage and support:

- <sup>[4]</sup> Artisanal fishermen's involvement in the process of change through projects that promote the co-responsibility of future fishery resources, promoting a thinking where they consider themselves trustees and custodians of the sustainability of marine resources and their habitats for future generations.
- <sup>[4]</sup> The creation of opportunities for participation and dialogue between states and the artisanal fishing sector directed towards the co-management of fisheries, by promoting the participation of artisanal fishermen in the diagnosis, planning, management and monitoring of artisanal fishing.
- <sup>[4]</sup> The creation of Marine Protected Areas of Fishing Interest, co-managed as a suitable tool in different contexts, giving the central role of sustainable management to the artisanal fishermen and giving them prominence and visibility in their efforts to develop projects aimed at sustainability.
- <sup>[4]</sup> The promotion of differentiated marketing of artisanal fishing as a denomination-of- origin product with added social and environmental value.
- <sup>[4]</sup> The transfer of sustainable development methodologies and knowledge among artisanal fishing communities and organisations worldwide and the sharing of successful experiences, in order to disseminate and enhance the good practices developed by artisanal fishermen.
- <sup>[4]</sup> Bestowing artisanal fishermen a more equitable representation in Regional Fisheries Management Organisations so they can defend the sustainability of resources.

#### ANNEXE: THE CASE FOR CO-MANAGED AREAS OF FISHING INTEREST

##### Challenges:

- <sup>[4]</sup> There is excessive competition for fishery resources.
- <sup>[4]</sup> Exploitation costs grow higher due to the increase in fishing efforts and the decrease in resources.
- <sup>[4]</sup> Control and audit systems are inefficient despite high investment from public administrations.
- <sup>[4]</sup> Tensions between fisherfolk and public administrations often impede the necessary spirit of mutual understanding and compromise.
- <sup>[4]</sup> In certain regions, these tensions can be aggravated by short-term local political interests within both the fishermen's representative organisations and the public administrations. This can result in favourable treatments for some organisations which create obstacles for comprehensive agreements with the artisanal fishing sector as a whole.

<sup>EN</sup> Fisheries management systems, influenced primarily by industrial fisheries' interests, fail to address the complexity of artisanal fishing communities and the variety of fishing gear and interests.

<sup>EN</sup> The majority of current management models fail to involve artisanal fisherfolk and their knowledge.

<sup>EN</sup> Illegal fishing contributes to worsening the situation.

Proposals: Co-managed Protected Areas of Fishing Interest represent...

<sup>EN</sup> Pilot projects, managed by a management body made up equally of public administrations and artisanal fishermen, in order to create a more complete and co- responsible scenario to build a new shared decision culture between the state and civil society.

<sup>EN</sup> Opportunities for consolidation of this entire scenario, through continuous dialogue and negotiation between artisanal fishermen and public administrations to accomplish the sustainability objectives identified.

<sup>EN</sup> A response, from the artisanal fishing sector itself, to the lack of productivity of the coastal ecosystems on which they depend.

<sup>EN</sup> A practical formula to reduce excessive competitiveness for limited resources.

<sup>EN</sup> A tool to avoid the over-exploitation of fishery resources.

<sup>EN</sup> An effective way to address administrative loopholes and the pace of bureaucracy, biased in favour of capital-intensive industrial interests, and local specificities.

<sup>EN</sup> A bottom-up opportunity for artisanal fisherfolk to be partners for sustainable development, thus minimising the management costs, which, in most cases, make the current system unsustainable.

## Fundacion Santa Lola

Aportes de REPÚBLICA DOMINICANA.

CAMINO A RÍO + 20: LA CUMBRE.

Objetivo: Presentar las aportaciones de la República Dominicana a la Secretaría de la Conferencia de las Naciones Unidas sobre Desarrollo Sustentable de las propuestas-país para tratarse en la Cumbre de Jefes de Estado y de Gobierno Río + 20.

Tomadas. Por la Fundación Santa Lola, Avenida Freddy Prestol Castillo #13, San Pedro de Macoris, República Dominicana.

Descripción: Estas opiniones son concretas, conforme lo establece el párrafo 20 de la Resolución 64/236 de la Asamblea General de las Naciones Unidas.

1- ¿Cuáles son las expectativas en relación con los resultados de Río +20 y qué propuestas concretas hay a este respecto, incluidas opiniones sobre una posible estructura de documento final?

La Fundación Santa Lola, se ha convertido en la Organización de la Sociedad Civil que ha representado a la República Dominicana en eventos pre-Río +20, convirtiéndose en Punto Focal para dichos movimientos. Dentro de la postura oficial, tanto del país caribeño, como de los hermanos latinoamericanos se resumen un interés de:

- a. Se cumplan los puntos tratados, acordados y firmados.
- b. Que comience la transición y el abordaje en Dominicana del tema de la Economía Verde, es decir, que se profundicen los estudios y se empiecen a implementar empleos verdes y producción y consumo sostenibles, que generarán un resultado positivo al planeta.
- c. Tener la "Educación Ambiental" en las currículas educativas de los países latinoamericanos, (en especial República Dominicana, que es el caso que estamos trabajando), para de una vez y para siempre tener formación desde la escuela de las prácticas adecuadas para cuidar el medioambiente.
- d. Que la población dominicana se EMPODERE y adopte estilos de vidas sustentables, cuyas buenas prácticas ambientales lleguen a todos.
- e. Crear un Plan de Acción o Agenda de Acción Nacional, que involucre a los principales actores sociales, políticos y económicos de Latinoamérica (especialmente República Dominicana), donde haya previo una Consulta Nacional, que permita a los participantes opinar, sugerir y asimilar los conceptos, compromisos y acciones derivadas de la Declaración que surja de la Cumbre de Río + 20.
- f. Que el gobierno dominicano reconozca que el tema de Desarrollo Sostenible no está reservado única y exclusivamente al cuidado del medioambiente; sino que también aborda los problemas de salud, educación y economía latentes en la población.
- g. CUMPLIR, CUMPLIR Y CUMPLIR, dando información previa de qué se hará y por qué e informaciones posteriores qué se hizo y por qué. ¡Se puede!

POSIBLE ESTRUCTURA DEL DOCUMENTO FINAL: En ese documento, poco importa la cantidad de texto vertido, sino la calidad y el contenido benefactor para el planeta, donde los gobiernos son quienes juegan el papel principal (por su VOLUNTAD POLÍTICA) y la sociedad civil es quien, agita, motiva o desmotiva a una población que se deja confundir por otros problemas materiales, sin enfocar que el problema medioambiental es por hoy y por siempre: un riesgo de subsistencia, pues depende de lo que hoy se hace para ver los frutos (cizaña o trigo) mañana.

2- ¿Cuáles son las observaciones, en caso de que las haya, en relación a las propuestas existentes?

República Dominicana es un país permisivo a la firma de todos los acuerdos y resoluciones (en demasía), sin embargo el punto negativo es el cumplimiento de todo aquello que se firma, pues nos llenamos de trabajo y le damos mérito o importancia a temas relevantes, pero no tan riesgosos. Hablar de los daños al planeta, lo enfocamos como un riesgo, porque son nuestras acciones las que permiten que el lugar donde vivimos pueda desaparecer.

Los gobiernos, mejor que nadie, tienen que conocer para qué da y para qué no da su país; por ello tiene que saber qué firma y por qué lo firma. La declaración, no es sólo el resultado de una cumbre, de un encuentro, es el cambio en papel, es la motivación a la acción; pues de las propuestas existentes queremos: CUMPLIMIENTO.

Los temas que se traten en la Cumbre de Río +20, son importantes, sin embargo no todos los países los dominan igual. El caso de República Dominicana, tiene como punto neurálgico el carecer de centros de reciclaje, pues no surte todos los efectos esperados cuando clasificamos los plásticos/enlatados, papel/cartón y otros materiales, ya que

quienes se encargan de recoger los desperdicios municipales todo lo ligan en una zona llamada Vertedero. BASURA CERO, por ejemplo, que fue tratado en el Congreso Latinoamericano de Jóvenes "Camino a Río +20" es un proyecto que la Fundación Santa Lola define "fenomenal y apto para una cultura de producción responsable de basura", empero es imposible que la sociedad civil difunda esta campaña, hasta que el gobierno dominicano o empresas (tanto nacionales o internacionales) se instalen como centros de reciclajes. OBSERVACIÓN A LA CUMBRE: Enfocar la realidad de todos los países, clasificando lo que se tiene y lo que no se tiene y que la Comunidad Internacional pueda ayudar a países como República Dominicana a cumplir con sus metas, por medio de suplir sus carencias.

Otro interesante punto a observar es el hecho de la EDUCACIÓN AMBIENTAL. Si bien la Agenda 21, hace mención de los principales temas ambientales como son (atmósfera, montañas, desiertos, bosques, mares, océanos, agua, biodiversidad, entre otros), no hay un programa educativo a implementarse en los países dentro de sus currículas educativas. Una recomendación sería, que las Naciones Unidas elabore una Resolución o Declaración (según corresponda) con temas, actividades y observaciones. Que la misma sea realizada por un equipo multidisciplinario de expertos en el área. Y no hay duda, que debe de haber un tiempo, de unos 5 años, para implementar definitivamente la Economía Verde, en lo que se capacitan profesores, se preparar los centros educativos, etc.

El tema de ECONOMÍA VERDE, tiene una esfera de trascendencia para el desarrollo, y lo es la producción y el consumo sostenible. La Fundación Santa Lola en República Dominicana, es de criterio que la producción es necesaria, ahora bien se necesitan estándares de calidad que protejan y cuiden el medioambiente. Y luego una cultura de consumo, de igual forma responsable. Habrá una Economía Verde que logre el desarrollo sostenible, cuando se empiece a ver el empleo, como un hilo conductor al avance del pueblo, es decir, que se humanicen los trabajos, que la gente sea un empleado, no un objeto, que se creen patrones ambientales, donde se protejan los recursos naturales y los ecosistemas, que se invierta en educación pre-asignación de un empleo verde, que se rindan cuentas, que se inspeccione o supervise, que haya responsabilidad social ambiental.

3- ¿Qué opiniones existen sobre la implementación y sobre cómo reducir los desfases al respecto? ¿Cuáles son los agentes cuya participación se contempla?

De lo antes planteado, entendemos que las legislaciones y los organismos existen hoy, por hoy, pero o no tienen claro sus funciones o simplemente no las cumplen. La implementación de lo que aquí surja, conjuntamente con otras herramientas internacionales (que estén en uso y en vigencia) tienen que ser debatidas a lo largo y ancho de los países. Debe de crearse una especie de CONSULTA NACIONAL o DIFUSIÓN NACIONAL, donde se presente qué es la declaración que surja en Río de Janeiro, pero también que sean todos los miembros de la comunidad, sociedad civil quienes se sumen a ello. Si una ley no está clara o no se ha creado, pues que el Congreso de la Nación que se encargue de hacerle los trabajos pertinentes, pero que no se convierta en un limbo de cumplimiento. Agentes de Participación.

Gobierno

•Ministerios •Congreso

SOCIEDAD CIVIL ORGANIZADA

•Organizaciones nacionales e internacionales

Gente Comun •Local •Nacional •Regional

Sobre los agentes de participación, entendentendemos que el PRINCIPAL responsable del cumplimiento de la declaración es el GOBIERNO, a través de sus Ministerios y el Congreso Nacional. Necesita para ello "Voluntad Política". El SEGUNDO actor es la SOCIEDAD CIVIL, donde organizaciones no gubernamentales nacionales e internacionales se unan a una sola voz para denunciar los incumplimientos, las fallas, los deterioro, etc. Y el ultimo, pero no menos importante es EL PUEBLO, su gente comun en lo local, regional y nacional que se empodere, como senala la Agenda 21: Saber + querer = Actuar.

4. - ¿Qué mecanismos de cooperación específicos, arreglos de asociación u otros medios de implementación están previstos utilizar y cuál es el plazo pertinente para que se adopten las de apliquen las medidas?

En el referido congreso en Cordoba, Argentina: "Camino a Río", se creo la iniciativa, que luego se convirtio en estrategia denominada: "De Río a la Gente", que no es mas que la creacion de una plataforma virtual para la comunicacion entre instituciones, para que estas a su vez desarrollen actividades con el enfoque de cumplir lo tratado en Río + 20, es decir que se realicen actividades, encuentros, reuniones virtuales, entre muchas otras cosas. De Río a la Gente es involucrar a la gente común y corriente, que no puede ir a las reuniones ni gubernamentales ni no gubernamentales, pero que son quienes producen el daño o la mejoría al planeta donde vive... De Río a la Gente es más que una estrategia de corto plazo, es cumplir paso por paso, es presionar a los gobiernos, es... la DECLARACIÓN hecha institución.

FUERA DE RELIEVE. En Dominicana, los temas más latentes, son los siguientes.

1- Seguridad alimentaria. La alimentación es un fuerte en sectores marginados e inhóspitos a Santo Domingo (la capital), donde abunda el hambre, la pobreza y el hacinamiento. La pobreza golpea a muchas áreas de la población dominicana.

2- Escasez (por un lado) y derroche (por otro) del AGUA. Dominicana está dividida por clases sociales. La menos pudiente, sufren de escasez, mientras que la más pudiente, la derrocha por no tener conocimientos del ahorro del agua.

3- Desastres Naturales (poca capacitación) y falencia a la adaptación del cambio climático.

LIC. CLAUDIO CORDERO.

Director General F. Santa Lola, Rep. Dominicana.

## GDF SUEZ

GDF SUEZ's contribution to Rio+20

As a leading company in the energy and environmental services sectors, GDF SUEZ wishes to offer all its expertise to contribute to the Rio+20 preparations. In particular, GDF SUEZ develops its businesses around a model based on responsible growth to respond to today and tomorrow's major economic, societal and environmental challenges: meeting energy needs, ensuring the security of supply, fighting against climate change and optimising the use of natural resources. Based on this experience, GDF SUEZ would like to make the following proposals with regard to the main expectations for this Summit.

### KEY MESSAGES

-Rio+20 deliverables should be concrete and focus on efficient and credible commitments and solutions, supported by alliances of stakeholders, including governments, business and civil society. As the business sector plays a major role in the success of the implementation of international commitments, it must be recognized as a key player

capable of articulating and applying new and complex business models aligned with sustainable development goals.

-As business requires predictability and regulatory certainty, stable legislative contexts and market mechanisms have to be set up appropriately in order to support the sustainable business development. For GDF SUEZ, these are more specifically related to mitigating the GHG emissions through energy efficiency and the development of low carbon energies (e.g. natural gas) and free carbon energies (renewable energies), circular economy, the city of tomorrow, preserving biodiversity, and, on the societal side, ensuring the access to energy for all.

-In order to promote the sustainable economical growth, new financing models will be required. Open rules, based on trade and investment, are critical enablers to achieve the objectives in the most effective and efficient way. Investment in infrastructure projects (energy, water, waste, transport) is an important instrument for the support of sustained economic growth. Public-Private Partnerships (PPPs) can provide effective ways to deliver infrastructure projects, to provide public services and to carry large-scale innovation as well as supporting the deployment of clean technologies.

-GDF SUEZ's contribution to Rio +20 has been set up in accordance with the ONU guidelines.

## GENERAL REMARKS ON THE RIO+20 PROCESS

### A. EXPECTATIONS FOR THE OUTCOME OF RIO+20 AND CONCRETE PROPOSALS

The Rio+20 summit should constitute a unique opportunity to:

- review progress achieved and renew political commitment on the principles agreed during the related previous UN summits in Stockholm (1972), Rio de Janeiro (1992) and Johannesburg (2002),
- develop a common view on remaining gaps and identify emerging challenges, and
- take concrete actions to address these gaps and challenges.

Significant progress on sustainable development issues is essential to meet the challenges of today and tomorrow. Global and substantial shift of developed, emerging and developing economies towards a more responsible, fair, inclusive and low-carbon economy is essential. Indeed, these are the pillars of the "green" growth concept. A major issue is the establishment of global governance which allows discussing, and dealing with, this global concern. The implementation of sustainable development, as a human development goal, requires moving from a major item on the political and business agenda into large-scale concrete, workable and affordable solutions accessible to all. Rio+20 deliverables should be concrete and focused on efficient and credible commitments and solutions, supported by alliances of stakeholders, including governments, business and civil society:

1. energy efficiency, cleaner energy mix, circular economy are topics on which long-term commitments from all stakeholders can build a major milestone for future work on achieving sustainability;
2. research and innovation need to be reinforced on topics such as smart grids / networks, CCS, renewable energy, fuel cells, power storage...
3. concrete solutions to provide universal access to essential services (energy, water, mobility, ...) and to reduce poverty must be embedded in workable sustainable development road-maps. Social and economic development must be a key objective on the path towards responsible growth;
4. globally, our economies require more visibility, transparency and a supportive international framework for businesses and communities already engaged on the path towards workable sustainability;
5. effective, transparent and reliable market mechanisms that are capable of valuing and financing different dimensions (ecological and social externalities) of the green economy must be established to support sustainable business activities and to foster resource efficiency (including financial resources).

Rio+20 should engage stakeholders towards achieving global sustainability goals and accelerate the pace of the reorientation of our economies on the road to a greener and more responsible development model, with differentiated but shared responsibilities of mature, emerging and least developed countries.

### B. COMMENTS ON EXISTING PROPOSALS

#### Sustainable growth roadmap

A clear, consensual, comprehensive regulatory framework should be established to shift the current economic paradigm of markets towards efficient, responsible and greener growth. Such a framework should combine several sets of regulatory incentives for smart greener investments, helping to establish an increasingly globalised and efficient carbon market as well as spurring smart and responsible end-use of energy and resources.

In a context of fiscal efficiency, public spending should focus on supporting sustainable growth, without technological prejudices, notably by promoting a resource-sustainable economy and, more broadly, the circular economy. Inefficient and environmentally harmful subsidies should be abandoned in favour of promising low-carbon technologies and markets.

A greener growth should also be a responsible, socially inclusive growth. Local development, access to energy and poverty eradication programmes should combine human well-being, wealth and environment protection, and economic and resource-use efficiency, with a long-term outlook.

This shift in the economic paradigm will have a positive effect on employment. Firstly, "green jobs" specifically to provide environmentally-friendly services and technologies, and secondly, jobs in any sector would indirectly be "greened". Therefore, the net job creation within sustainable growth strategies should remain positive. Continuous efforts in pedagogy, education and training are necessary to mobilise people in this direction within the public and private sectors, and in civil society.

#### Sustainable Development objectives

If we are to achieve a successful transition to a greener and more responsible economy, it is essential to build ambitious, comprehensive and differentiated objectives, on specific themes, shared among the business community, civil society and governments.

Possible themes might include : energy, water, food security, agriculture, sustainable cities, forestry, biodiversity, social matters; as these are key areas for sustainable development.

With regard to the objectives, open dialogue, accountability and shared but differentiated responsibility between parties and stakeholders are key success factors. The "Energy for a Sustainable Future" report, prepared by the UN Secretary-General Advisory Group on Energy and Climate Change, provides interesting and concrete examples of objectives in the energy field that could be part of the Rio+20 agreement. E.g.: expanding energy access, scaling up efforts to increase energy efficiency and

clean energy efforts to meet the climate challenge and achieve the Millennium Development Goals.

#### C. IMPLEMENTATION AND RELEVANT ACTORS TO BE INVOLVED

UN bodies and other Intergovernmental agencies are key players in this system. However, they need to better coordinate actions between themselves and with other external stakeholders. National and local governments, and local communities, must be involved in order to ensure synergy of policies and actions and thus spur global sustainable development and integration.

The private sector must be recognized as a key player that is capable of articulating and implementing new and complex business models aligned with sustainable development goals. The private sector can make a substantial contribution in the design and implementation of actions by UNCTAD and other UN entities if it is formally involved.

Informing, educating and involving the civil society in the definition and implementation of sustainability goals is key: changing consumer patterns, developing new solidarity mechanisms or making education the centrepiece in the global shift towards greener and more responsible societies. Individual responsibility plays a major role in engaging on a more sustainable path and should be put forward as such in the process of change.

Finally, one possible deliverable of Rio+20 could be the establishment of a "cooperative platform" allowing for the engagement of all stakeholders on relevant tools and instruments to support the transition to a responsible and sustainable economy, and allowing for reviewing progress.

#### D. TIME FRAME FOR THE PROPOSED DECISIONS AND ACTION PLANS

The Sustainable Growth Roadmap (see answer to question B), focused on various specific themes, should include a set of targets and a timeline for the implementation for each target. Global sustainable development objectives concerning, for example, energy efficiency or greenhouse gas emissions should be envisaged in the long term (e.g. up to 2050), but the roadmap should also contain intermediate targets to be reached if we are to succeed with such major shifts in our economic development.

Especially in the short term, public financial resources are limited, therefore solutions that spur resource and economic efficiency and the engagement of the private sector based on market solutions and public-private partnerships are, more than ever, essential. The contribution of all stakeholders, including civil society, in this effort, is also necessary.

#### SPECIFIC ELEMENTS RELATED TO THE OUTCOME OF RIO+20 PROCESS

##### E. KEY ITEMS FOR THE SUSTAINABLE DEVELOPMENT AGENDA IN THE ENERGY AND ENVIRONMENT SECTORS

Among the items on which Rio+20 should focus, we would like to underline the following:

###### Sustainable business

- Development of Sustainable Business activities and, especially, resource efficiency (including financial resources) depend on an appropriate market design that allows the financing and valuing of different dimensions of sustainability and that are specific to each country and/or region.
- Smart local solutions, savings in resources or energy efficiency measures, as well as projects that were implemented under the global carbon market, can illustrate the concept and show that efficient environmental markets are essential to sustainable development.

###### Renewable energies

- Renewable energy is a key driver for the achievement of a sustainable and low-carbon economy. Currently, the main requirements for the development of an efficient and affordable energy production from renewable sources are :
  - o R&D related to renewable technologies, in order to attain levels of competitiveness which can fairly compete with fossil fuel technologies.
  - o Stable legislative contexts and market mechanisms which allow developing and extending further renewable technologies worldwide.
- The development of intermittent renewable energy capacities should be accompanied by measures that guarantee the security of supply, e.g. natural gas backup and reserve capacities, for example via incentives such as capacity remuneration or capacity markets, without generating market distortions.
- The large deployment of renewable energy sources should be well integrated within the market functioning, with transparency of costs for consumers (including related grid and backup costs) and enough stability to foster investments, without compromising the profitability of non-subsidised sources of energy. Taking into account the maturity of the technology, a gradual decrease of financial support – without retroactivity – and a review of specific priority rules should be envisaged.

###### Energy efficiency

- Energy efficiency is one of the major tools towards a sustainable world. In preserving resources, it provides environmental benefits in lowering local pollutions as well as in the reduction of greenhouse gas emissions.
- Energy efficiency also brings economical, technical and political benefits to governments by reducing the need for energy infrastructure, pushing towards innovation and decreasing dependence on imports.
- To achieve progress on this subject, governments should:
  1. launch awareness campaigns and support capacity building of the necessary skills.
  2. introduce legislations, regulations and mandatory codes to cost-efficiently phase out inefficient technical solutions (buildings, devices, ...) and enforce them. These requirements should also be tightened over time.
  3. set up the necessary frameworks for an energy efficiency market with subsidies to include externalities as required.
  4. show the way in applying energy efficiency measures for their own operations (transport, buildings, etc.).

###### Biodiversity

- Rio+20 should plead for the adoption of a process to develop agreed baselines and a commitment to adopt targets for resource mobilization at COP 11, provided that robust baselines have been identified and endorsed, and that an effective reporting framework has been implemented following COP 10 in Nagoya.

- Unfortunately, COP 10 in Nagoya failed to agree on targets for increased resources to implement CBD decisions (Strategic Plan 2011-2020). The necessity to mobilise financial resources, by innovative financing for example, is a pending issue to be tackled at Rio+20.
- There is a need to integrate biodiversity policy into other sustainable development policies. For instance, a new level could be reached by setting up a global unifying framework for developing joint activities, joint mechanisms among the three Rio Conventions. Circular economy: Reduce / Reuse / Recycle In order to facilitate the transition to a resource efficient green economy, governments should:
- Develop incentives to support the adaptation of business models for more resource-efficient societies and businesses.
- Lead extensive analysis and work on environmentally harmful subsidies.
- Set up regulatory frameworks that are conducive to investments in secondary raw materials use by industry and society.
- Elaborate a consistent reporting and benchmarking framework of environmental performance of the States, especially in the fields of resource efficiency (material recovery, efficient use of natural resources, particularly water, across key areas: agriculture, industry and urban water supply and the most sensitive raw materials : paper, metals, etc.).

#### The city of tomorrow

- Due to demographic evolution, the world will be sustainable if cities are.
- Responsible agriculture and sustainable rural development is fundamental to the sustainable development of cities.
- The discussion at Rio+20 largely evolves under the term "green". On our way to sustainable urbanisation, a broad and common understanding of 'green' is necessary, adequately addressing social, economic and environmental dimensions of sustainability.
- Urban development requires an integrated approach, inviting all urban stakeholders at all stages, from conception to implementation.
- Improved technology and competitiveness are prerequisites for innovation for sustainable and greener cities. Governance and finance priorities need to be set accordingly.

#### GHG emissions reduction

- The progressive development of a global carbon market based on an international framework is necessary, where all major GHG emitting countries take binding commitments, and other countries make comparable efforts in reducing GHG emissions, following the principles of common but differentiated responsibilities and respective capabilities. Continuous action to establish an efficient global carbon market, in combination with ambitious GHG reduction targets, must assure that mitigation is achieved at the least cost, that adequate technologies are developed and transferred, and that developing countries obtain adequate financial support for the implementation of their mitigation policies. Under such premises, ambitious global GHG mitigation can be achieved and distortion of competitiveness or international carbon leakage, as well as global economic burden, can be minimised.
- When most competitive solutions are also the most emitting ones, we need an incentive to invest in cleaner technologies and sustainable solutions, and several tools could provide visibility to invest, such as the floor price of CO<sub>2</sub>, carbon taxes or sectorial regulations. Such solutions are capable of promoting global economic integration, trade and growth, while effectively combating climate change, and spurring the development of renewable energies, energy and resource use efficiency, new technologies and smart grid applications. They need to be based on global cooperation, a strong commitment on CO<sub>2</sub> emissions and efficient and transparent regulation which avoid unnecessary bureaucracy and arbitrariness. Access to energy for all

A call to eradicate extreme poverty and hunger by the year 2015 is among the seven Millennium Development Goals (MDG) adopted by the United Nations in 2000. Eleven years later, this challenge, though well known and appreciated by all, remains intractable: in 2011, 1.4 billion people have no access to electricity; 2.7 billion people rely on traditional biomass fuels for cooking; 880 million people are without access to drinking water, and nearly 2 billion individuals are without sanitation services. While generally focused on developing countries, the question of access to energy also affects developed countries where it is cause for social concern and a question of poverty level. Meeting universal energy access targets will require economical growth, social development and mobilisation of additional finance. Business investment and private finance can play a major role if the broader financing architecture is well-designed and appropriate consideration is given to the quality of the regulatory and investment climate, which significantly drives the risks and returns associated with these investments.

- Business has a role to play alongside public institutions and governments in meeting development challenges. While various major companies have already implemented such programs, they remain limited and generally deal with consumer goods only.
- We encourage the development of a 4P methodology for Participatory Public-Private Partnerships and expertise in the so-called "Base of Pyramid" (BOP) and Social Business projects in order to promote energy access for the very poor, as well as the development of innovative financial mechanisms in the private and public sectors.
- When it comes to basic goods such as energy, however, the issue is to build jointly sustainable businesses with high social impact rather than "selling to the poor." Suitable business models need to be promoted to support social entrepreneurs through investments and technical and managerial expertise.
- To be viable, this approach must encourage an innovative business model that could be integrated either in the core business of the company or as social business. Market-based solutions should be encouraged and also be in favour of the development of new energy sources and new technologies.

#### F. THE GREEN ECONOMY IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT AND POVERTY ERADICATION

Sustainable development embraces three dimensions: social, economical and environmental, and none of these dimensions can supplant the others. Within the business context, we envisage sustainable development, on the one hand, as helping to reduce non-financial risks, and on the other hand, as creating value through the new opportunities of sustainable business. The green economy is based on this sustainable business, and efficiently developing the green economy is a means of achieving sustainable development.

Sustainable growth strategies and associated action plans should be based on a global sustainability policy framework, and be tailored to lead to a low-carbon, resource efficient, and socially inclusive economy. This framework should result from a consensus between stakeholders, and sustainable growth policies should be backed by a pro-active financial engagement from governments. Cooperation between international organisations, governments, regulators and companies is crucial for the success of greener growth strategies and action plans. Both the public and the private sectors should clearly engage towards all other stakeholders (customers, shareholders, employees, civil society, the environment...) onto a more sustainable path, which would lead to green, economically efficient and socially responsible long-term growth. Concerning action plans for the energy, water and waste sectors, we would like to emphasise the crucial role of items such as end-use efficiency, the role of R&D in new, green technologies, and the need for a clear pro-investment regulatory framework to help these new technologies take off and eventually become economically viable. Within the energy sector, end-use efficiency measures are essential for the transition from volume to value, a requirement of the green economy. Also, definition of Global Public

Goods, governing principles for Public-Private Partnerships, could be targeted at Rio+20.

Several in-depth studies on greening the energy sector and the economy as a whole have recently been released (IEA, OECD, UNEP). These analyses put forth propositions for concrete measures to be taken to curb climate change and to reorient the economy on a more sustainable path. Therefore, proposals for green strategies already exist and often result from international consensus between experts and stake-holders, and these could be considered by UNCSD. Our businesses are already advanced on many of the sectors of the green economy agenda: CCS, renew-able energy (notably hydroelectricity, photovoltaic, wind farms, biomass, geothermal, wave and tidal energy...), recycling and reducing resource use. A better coordination between market players, engaged in those sectors, and green policies promoters, is essential in order to ensure profitable growth for the sectors involved.

#### G. INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

Sustainable development involves economic, social and environmental issues. There is, at present, an array of organisations within and outside the UN system working on the challenges of making sustain-able development and poverty eradication a foreseeable reality. Strong existing entities, such as the WTO, the World Bank, the OECD, the IMF etc., are capable of pushing the sustainable development agenda by systematically integrating social and environmental issues within their policies and their actions.

However, such an approach could be leveraged by a more robust and active management of sustainable development issues and it appears that there is a global consensus on this analysis. There is a clear ne-cessity to better coordinate the international governance of major sustainable development mat-ters. Strengthening and consolidating UNEP, providing it with more financial and human re-sources, direct input from the civil society, in particular from the business community, with enlarged powers to enforce decisions and to shape policies and bring guidance would be an impor-tant step.

Finally, we support the empowerment of local governments for more sustainable development action.

#### H. PROPOSAL FOR THE REFINEMENT OF THE TWO PRIORITY SUBJECTS: FINANCING SUSTAINABLE INFRA-STRUCTURE PROJECTS

In order to accelerate the development and deployment of key technologies, new financing models will be required. Carbon financing will bridge some of the gap, but multilateral development financing and other policy incentives will help accelerate deployment. Open rules, based on trade and investment, are critical enablers of the substantial increase in technological dissemination and financing that will be re-quired to move to more sustainable low-carbon, resource and energy-efficient pathways addressing en-vironmental responsibility while promoting economic growth and social development.

Investment in infrastructure projects (energy, water, waste, transport) is an important instrument to support sustained economic growth. Public-Private Partnerships (PPPs) can provide effective ways to deliver infrastructure projects, to provide public services and to carry large-scale innova-tion, as well as supporting deployment of clean technologies. At the same time, PPPs are effective ve-hicles for the long-term structural development of infrastructures and services, bringing together dis-tinct advantages of the private sector and the public sector, respectively. Financing the sustainable economy is a critical element and a prerequisite for long-term success. In or-der to make longer term investment decisions in this direction, business requires predictability and regulatory certainty. As long as these enabling conditions are directional only, and without regulatory and market certainty, investments in 'green economy initiatives' will be slow and compete with invest-ments for conventional activities.

It is important to establish workable solutions to finance the huge expansion of the energy matrix in developing and emerging countries with clean or carbon efficient established technologies in the short term, complemented with more innovative, transformational technologies for cleaner energy solutions in the mid and long term. Given the large volume and the speed of the ongoing evolution, ef-fective solutions must be established in the short term. A combination of NAMAs with a revised CDM can allow an immediate start and help to minimize the installation of new fossil-fuelled infrastruc-ture.

The principles and rules for such a solution exist under the CDM, and if applied and expanded effec-tively, the private sector will be able to drive significant global mitigation. On the contrary, if such incentives are not provided in the short term, these countries will compromise their emission profile for decades, and the aggregate economic present and future cost of mitigation will obstruct sustainable global economic growth.

---

## Gender and Education Office (GEO) of the International Council for Adult Education (ICAE)

Adult learning and education policies need to maximize the positive role that learning can play in technological and industrial change for mitigation and adaptation plans. To avoid jeopardizing the right to decent work for all, education and adult education will play a crucial role to change radically the ways we produce and consume.

Moreover adult education and education in general support a planet where nature is not taken as a capital to be exploited for furthering economic growth; where citizens become more vigilant and proactive at both global and local level; and where clean and safe energy is secured for all. Adult learning must include a holistic view that recognizes the interdependence of environmental, social, cultural and economic perspectives, and poses challenges that demand collective sharing of responsibility – both at local, regional, national and global level. The framework for equality and social justice prevails, when we overcome all forms of discrimination, and where patriarchy is overcome.

Environmental and social justice requires that states set urgent priorities that guarantee the right to education for young people and adults, and especially the fundamental right to basic education without discrimination, providing these key rights the legal status they deserve, and to allocate the resources required for their full implementation.

---

## Generalitat de Catalonia

Barcelona, October 25th, 2011

Taking as a reference the United Nations Conference on Environment and Development held in Rio (1992), given the relevance of the results achieved.

Affirming the need to promote a new international agreement in line with the Millennium Development Goals and the agreed international development goals.

Taking advantage of the unique opportunity offered by the United Nations Conference on Sustainable Development (Rio+20), and, in particular, the invitation of the organisers to contribute to the compilation document for the zero draft, which will serve as the basis for negotiations.

Taking into account that the Government of Catalonia, local governments and other government bodies have attribution of powers, and as such, responsibility, in areas that are key to sustainable development and green economy.

Considering the progress made by Catalonia in applying pioneering policies in matters of sustainable development and development cooperation, and being aware of the barriers to be faced in order to implement a green economic model.

Having assessed the contributions made by a wide range of economic, social and scientific actors as well as other government bodies, through the process of dialogue and debate surrounding Rio+20, Recognising that, in order to face the current economic, environmental and social challenges and respond to the effects of unsustainability, new cooperation and governance models are required on an international scale, as well as a comprehensive vision of human activity and the planet.

1- We call upon the need to update the international environmental governance system and to fully incorporate a multilevel and multi-stakeholder governance that allows the socio-environmental challenges and problems related to the provision of global public assets to be faced. This new governance must ensure participation from the whole of society (citizens, non-governmental organisations, businesses, trade unions, public institutions, the third sector, scientists) and, consequently, effectiveness and efficiency in the implementation of policies.

2- We demand that subnational governments are taken into account in the United Nations system, both in defining the political and technical agenda and in implementing the agreements reached, considering the importance of the role of these governments in attaining sustainable development, in line with this new governance model.

3- We affirm the importance of territorialising the agreements reached and, as a result, the need of creating sub-systems of governance on a regional scale, to facilitate their implementation and make available the corresponding regionalised economic funds. Therefore, we demand the recognition of the Mediterranean region as a priority area in terms of the complexity of the environmental, social, political and economic challenges that must be faced.

4- We stress the fact that education for development is an essential tool in the new international environmental governance framework, both for social transformation in the north and the eradication of poverty and inequality in the south. In addition, education for development facilitates the understanding of north-south relations and promotes values and changes in habits that favour solidarity, social justice, sustainable human development, sustainable production and consumption models, democracy and transparency.

5- We reiterate our support for the Parties of the United Nations so that Rio+20 sets the basis for the shift towards a green economy that a) contributes to the progress towards sustainable development, the eradication of poverty, and human progress, and b):

- ▶ Harmonises economic development with the improvement of the wellbeing and quality of life of citizens, the preservation of the environment and intra- and intergenerational solidarity.
- ▶ Recognises that the planet's resources are finite and, therefore, uses them in an efficient and sustainable manner; promotes responsible consumption; contributes to the conservation of natural capital; and guarantees equal access to resources.
- ▶ Internalises the environmental costs and recognises the benefits of ecosystem and biodiversity services.
- ▶ Increases resilience to social, environmental and economic risks and prevents forced migrations and the displacement of environmental refugees.
- ▶ Guarantees firm support for research and innovation in sustainability, to be able to face future challenges.
- ▶ Integrates global environmental objectives into economic competitiveness policies.

6- We encourage the Parties of the United Nations to ensure that the outcome document of Rio+20 highlights the importance of green employment and its promotion, as an opportunity to advance toward social cohesion. Green employment should be understood as decent employment where all economic sectors (both emerging and traditional) integrate sustainability. That is why education and training in sustainability at all levels must be considered as key elements in enabling the full development of these essential sectors.

7- We demand the valorization of the rural world and its placing in the model for a green economy, in light of its economic, environmental and social function. We underline the importance of producing and distributing quality and sustainable local agricultural products, the value of traditional knowledge, and the concept of the nature stewardship. We recognise the need to advance towards the development of new collaborative mechanisms and instruments between the public and private sector (including social and economic actors), especially in the form of multi-stakeholder partnerships, in order to develop and implement policies for a green economy.

8- We state that Rio+20 offers an opportunity to improve competitiveness and facilitate the inclusion of sustainability criteria in economic and fiscal instruments: a) by promoting the innovation of efficient products, services and technologies in using resources and preserving biodiversity, and b) by progressively phasing out environmentally harmful subsidies.

9- We recognise the need to advance towards the development of new collaborative mechanisms and instruments between the public and private sector (including social and economic actors), especially in the form of multi-stakeholder partnerships, in order to develop and implement policies for a green economy.

10- We support the establishment of an ambitious international agreement on green economy in the framework of Rio+20 to be ratified by the Parties of the United Nations, which includes a) a compulsory roadmap that sets quantified objectives to be met within a given timeline, b) the identification of policies, c) the development of lines of action, and d) the establishment of the necessary economic resources.

11- We demand, in line with the European Union, the opportunity and need to develop the resulting green economy roadmaps on a regional and local scale, which encompass the success achieved in the deployment of sustainability policies promoted by regions and cities, especially thanks to the Agendas 21.

12- We consider essential that subnational governments are included, within the future institutional framework for sustainable development, with complete recognition of their governmental status, and, as such, that they take part in the established participation and accreditation processes within the United Nations.

## German National Committee for the United Nations Decade of Education for Sustainable Development

The German National Committee for the United Nations Decade of Education for Sustainable Development (DESD, 2005-2014) calls upon to integrate and highlight (in the Rio + 20 Conference as well as its outcome document and possible follow-up) the prominent role of education, public awareness and training for sustainable development in moving societies towards sustainability.

A strategy aiming at achieving sustainability based only on political regulation, technical innovation and economic incentives is not sufficient. Sustainable development requires a comprehensive change in mindset and the acquisition by all citizens of forward-looking competencies in accordance with fundamental values - such as intergenerational and global justice - which only education can bring about. The 1992 Rio Conference and the 2002 Johannesburg World Summit on sustainable development recognized that Education for Sustainable Development (ESD) represents a significant path towards achieving sustainability.

Working towards sustainable development is always learning for sustainable development which is why ESD aims to enabling everyone to acquire the values, competences, knowledge and skills required for engineering sustainable societies and green economies today and tomorrow. The goal of the DESD is to integrate Education for Sustainable Development throughout educational systems and learning contexts. This is in accordance with Chapter 36 of Agenda 21, the Johannesburg Declaration, the UN General Assembly Resolution 57/254 as well as the "Bonn Declaration" adopted at the UNESCO World Conference on education for sustainable development held in 2009 in Bonn, Germany.

The particular importance of ESD in the framework of a green economy was recognized in the joint statement by Heads of UN agencies on Green Economy from 2009 "Green Economy: A Transformation to Address Multiple Crises": "The shift towards a green economy requires education for sustainable development including training in new job skills and newly required health systems." ESD contributes to poverty eradication and the shift towards a green economy through the acquisition of so-called green skills but also thanks to the promotion of more general competencies like long-term and critical thinking, interdisciplinary approaches to problem-solving as well as the ability to act autonomously and participate in social decision-making processes. ESD encourages and supports life-long learning. Education for Sustainable Development doesn't happen only from 6 years old on and until the learner leaves the formal education system. It starts during the early childhood where the basis for future learning is laid out and continues in non-formal and informal settings during the entire work life and beyond.

Political decision makers at national and international levels will only be in a position to commit to sustainable development in the long term if citizens recognize the importance of this societal objective and therefore support and requests further efforts in the field of sustainable development. ESD has an essential role to play in this regard and needs to be highlighted at the Rio + 20 Conference. The German National Committee for the DESD 1 June 2011 calls for the outcome document of the Conference to integrate ESD - not only as example for inter-sectoral themes but as a main strategy for achieving sustainability and green economies. The German National Committee further calls upon the UN system and Members States to use the opportunity of the Rio + 20 Conference to discuss and plan follow-up activities to the UN Decade of ESD beyond 2014.

The German National Committee for the UN Decade of Education for Sustainable Development was appointed by the German National Commission for UNESCO on the basis of a unanimous resolution by the Bundestag. The National Committee is the main decisional body for the national implementation of the DESD in Germany.

---

## Global Alliance for Incinerator Alternatives (GAIA)

GAIA is a worldwide alliance of grassroots organizations, non-governmental organizations, and individuals who recognize that our planet's finite resources, fragile biosphere and the health of people and other living beings are endangered by polluting and inefficient production practices and health-threatening disposal methods.

We oppose incinerators, landfills, and other end-of-pipe interventions. Our ultimate vision is a just, toxic-free world without incineration. Our goal is clean production and the creation of a closed-loop, materials-efficient economy where all products are reused, repaired or recycled back into the marketplace or nature. GAIA's membership-based network brings together more than 650 grassroots groups, non-governmental organizations, and individuals in 90 countries, all of whom have signed on to the above shared vision statement.

Together, we are calling for changes in production, consumption, and waste disposal practices that are core to the goals of the Rio +20 Conference.

To achieve true sustainability and poverty eradication, we need to shift our economic paradigm away from the current "take-make-waste" system of resource destruction. In its place, we can reclaim long-held human values of resource conservation and equity, caring, trust, justice, and diversity – and build the local living economies that will be essential to ensuring that life on earth is harmonious with nature while all people's material needs are met. Changes in lifestyles and production systems must be global. The affluent, who consume disproportionate resources and are responsible for most pollution, bear a greater responsibility and must take proportionate steps for change.

GAIA asks governments engaged in the Rio+20 process to commit to full-scale investment in inclusive Zero Waste systems, with a transition goal for 2040. Our demands include:

### 1- Transform the economy to reclaim resources and revalue community well-being

Create and use development indicators other than GDP—which does not take into account environmental impact, sustainability, equitable distribution of resources, unpaid labor, or quality of life. Stop the export and import of cultures of overconsumption. Emphasize forms and indicators of development that take into account social and environmental well-being, such as those being explored by the OECD and various governments.

Ensure that all products and materials are returned back to the marketplace or nature at the end of the use, emphasizing the "best and highest use" principle in materials management decisions. Revive and strengthen rural life and livelihoods, recognizing that growth of urban areas is driven by poverty and concentrates consumption and waste generation.

### 2- Prevent waste in the first place, and reduce hazardous materials

Reduce the use of energy, materials and natural resources in the lifecycle of products and packaging, and reduce waste generation, toxicity and pollution by investing in green chemistry and clean production. Discourage disposable and toxic products and processes.

Promote local economies based on the provision of public use, rental and lending services, and the reuse of products.

### 3- Design for recycling and reuse

Increase the durability, safety, reuse, recycling and recyclability of goods, recognizing that recycling conserves resources, saves energy throughout the materials lifecycle, and prevents pollution.

Promote extended producer responsibility for products and packaging to inhibit and punish the practice of planned obsolescence or intentional wasting.

#### 4- Ensure best and highest use for organics

Put composting, biogas, and animal feed programs in place that return all organic matter, uncontaminated, to the environment to provide a healthy basis for a toxics-free agriculture. Such programs are critical, given the high percentage of organic material in most metropolitan waste streams.

Avoid using biomass resources for energy and fuel, creating a demand that will further deplete forestry and soils.

#### 5- Respect the rights of recyclers

Prioritize programs that, following the proximity principle, create green, sustainable, local jobs. Waste workers, whether private-sector, public-sector, informal or entrepreneurial, must be accorded due respect and integrated into comprehensive materials management strategies.

Promote social inclusion in activities related to waste management, particularly the dignification of urban recyclers, fostering the internalization of their positive environmental impacts.

#### 6- Invest in the future we want, and support real solutions through public policy

Guarantee that public funds and international and national legislation support increasing reuse, recycling and composting combined with ecodesign in order to guarantee that any product can be safely repaired, reused and /or recycled at the end of its life.

Shift current subsidies from extraction and waste disposal to resource recovery, creating significantly more jobs, while distributing income more equitably.

#### 7- Promote innovative community-led programs that protect public health

Encourage the adoption of materials recovery techniques and processes that are local, safe, and respectful of local and indigenous cultures; where technology transfer occurs, it must respect the sovereignty and rights of local communities.

Give communities real participation in the materials recovery programs; include them in the design, implementation and monitoring of the programs, pay attention to their needs and ideas. Zero waste policies and programs contribute to social cohesion and enable the active participation and involvement of communities in the transformation of development patterns and sustainability building.

#### 8- No incineration! Put technology at the service of people

Phase out incinerators and other end-of-pipe waste technologies, which are expensive, inefficient, and highly hazardous to human health. Such technologies undermine a Zero Waste economy and are incompatible with Zero Waste.

---

## Global Alliance for the Rights of Nature

SUBMISSION FOR EARTH SUMMIT / RIO +20

By The Global Alliance for the Rights of Nature

[www.TheRightsofNature.org](http://www.TheRightsofNature.org)

To achieve true sustainability, fundamental changes in laws and governance around the world are necessary – to move us from our current path of environmental harm and destruction, to one in which humankind's relationship with nature is re-established. The Global Alliance for the Rights of Nature supports such change through the worldwide adoption of the Universal Declaration of the Rights of Mother Earth and laws securing the Rights of Nature, such that the rights of ecosystems and natural communities – upon which all life depends – are given the highest societal value and protection in law.

Overview of submission:

We urge the organizers of Earth Summit/Rio +20:

- to call upon all States, regional bodies, organizations and individuals participating in Rio +20 to adopt the Universal Declaration of the Rights of Mother Earth and to actively support its implementation through law; and
- to include Plenary and working sessions on how to facilitate sustainable development in harmony with Nature by recognizing, implementing and defending the rights of Nature/ Mother Earth.

The Global Alliance for the Rights of Nature

The Global Alliance for the Rights of Nature (the "Alliance") is a worldwide movement working to create and strengthen human communities that respect and defend the Rights of Nature or Mother Earth (see).

Executive Committee and Advisory Committee Members of the Alliance include: Dr. Vandana Shiva (Navdanya), Cormac Cullinan (EnAct), Bill Twist (The Pachamama Alliance), Natalia Greene (Fundación Pachamama) Mari Margil (Community Environmental Legal Defense Fund), Dr. Peter Burdon, (University of Adelaide School of Law, Australian Wild Law Alliance), Christopher Stone, (University of Southern California School of Law), and Alberto Acosta Espinosa (Economist).

Rights of Nature - Restoring natural balance for a sustainable future

Sustainable development requires humans to live in harmony with Nature

The objectives of the Earth Summit/Rio+20 are to secure renewed political commitment to sustainable development; to assess progress towards internationally agreed goals on sustainable development and to address new and emerging challenges.

Human development can only be sustainable if the social demands and needs of humanity are balanced against the need to maintain the integrity, health and functioning of natural systems. Our legal systems define parameters of acceptable behaviors and actions, how we humans relate to each other and to the world around us. In most countries, legal systems treat nature as property to be bought, sold and consumed. Under such laws, human concerns invariably prevail over Nature and the carrying capacity of natural ecosystems instead of being weighed against the needs of ecosystems and other beings in order to strike an appropriate balance.

Contemporary approaches to governance have failed

The international community has been attempting to stop and reverse damaging changes to the environment for more than three decades, and particularly during the last two

decades since the 2002 "Earth Summit". During this period an unprecedented volume of environmental treaties and laws have been adopted and implemented at the international, national, provincial / state and municipal levels. These have been almost universally ineffective in preventing humans degrading the ecological systems on which they and other species depend on for wellbeing. Indeed many negative trends continue to accelerate.

A new approach is required to achieve ecologically sustainable societies

One of the reasons why contemporary legal and governance systems have failed is because they have not been designed to facilitate and legitimate the unsustainable exploitation of Nature. For example, defining Nature as property has entrenched exploitative relationships between humans and Nature. Until this changes improving the efficiency or effectiveness of these systems will not stop and reverse environmental degradation. In other words, it will not be possible to achieve ecologically sustainable societies and to restore the harm done to the planet, without fundamentally restructuring governance systems.

In order to insure an environmentally sustainable future, humans must reorient themselves from an exploitative and ultimately self-destructive relationship with nature, to one that honors the deep interrelationship of all life and contributes to the health and integrity of the natural environment. An essential step in achieving this natural balance is to create governance systems that see and treat Nature as a fundamental, rights bearing entity and not as mere property to be exploited at will. Breaking out of the human-centered limitations of our current legal systems by recognizing, respecting and enforcing Rights of Nature is one of the most transformative and highly leveraged actions that humanity can take to create a sustainable future for all.

Benefits of recognizing rights of Nature

Recognising, respecting and enforcing rights for Nature will enable the legal machinery of the State to be used to require humans to negotiate the terms of their relationships with Nature and to establish new norms. Instead of entirely rebuilding the governance systems of industrialized societies, these systems can be re-oriented to promote living in harmony with Nature by widening the range of legally protected rights. Historically most social movements that have brought about dramatic improvements in human society have been brought about in this way, including the emancipation of slaves and the recognition of rights of indigenous peoples, women and children.

Legal systems built on the premise of Rights of Nature change the status of natural communities and ecosystems from being regarded as property under the law to being recognized as rights-bearing entities. These laws recognize that natural communities and ecosystems possess an inalienable, fundamental right to exist and flourish.

Residents of communities where Rights of Nature have been adopted possess the legal authority to enforce those rights on behalf of those ecosystems. In addition, these laws require the governmental apparatus to remedy violations of those ecosystem rights.

Rights of Nature laws eliminate the authority of a property owner to interfere with the functioning of ecosystems and natural communities that exist and depend upon that property for their existence and flourishing. They do not stop development; rather they stop development and use of property that interferes with the existence and vitality of those ecosystems. Rights of Nature lays the foundation for truly sustainable development to occur.

The time is now for Nations of the world to reexamine the systems that are the underlying cause and reinforcement of unsustainable practices that are undermining our natural systems. Recognizing Rights of Nature offers a viable, framework for sustainable development on our planet.

The Global Alliance for the Rights of Nature formed in 2010 to build a worldwide movement to recognize and implement the Rights of Nature.

## Global Campaign for Climate Action (GCCA)

NEW, CLEAN RENEWABLE ENERGY FOR SUSTAINABLE DEVELOPMENT

Submitted: November 1, 2011

CONTACTS:

Kelly Rigg, Executive Director, Email: [Kelly.Rigg@tckctck.org](mailto:Kelly.Rigg@tckctck.org)

Laura Williamson, [laura.williamson@helio-international.org](mailto:laura.williamson@helio-international.org) HELIO International

Lettemieke Mulder, [Imulder@FIRSTSOLAR.COM](mailto:Imulder@FIRSTSOLAR.COM)

Paul Horsman, Campaigns Director, [Paul.Horsman@tckctck.org](mailto:Paul.Horsman@tckctck.org)

Wael Hmaidan, Executive Director IndyAct, [Whmaidan@indyact.org](mailto:Whmaidan@indyact.org)

Introduction:

Thank you for the opportunity to provide input into the Zero Draft for the upcoming United Nations Conference on Sustainable Development (UNCSD 2012), also known as Rio +20.

The organizations listed below represent a wide range of perspectives and interests, united in our strong support for sustainable energy access for all. At a time when climate change threatens the lives and livelihoods of ourselves and future generations, we believe there should be no trade-off between poverty alleviation and sustainable development; we must tackle both at the same time.

We therefore welcome the fact that Energy for Sustainable Development has been identified as a key issue by the Preparatory Committee for UNCSD 2012. We also welcome the designation by the UN of 2012 as the International Year of Sustainable Energy for All. Within this context, it is our hope that UNCSD 2012 can adopt goals and targets, including time-tables for their implementation, that are visionary and inspirational, while at the same time effective, realistic and anchored in national commitments. Goals, targets and time-tables can be realistic only if they move the world away from business as usual, and put us on a track that is effective in tackling climate change.

Our proposal for the outcome document of UNCSD 2012 reflects in part our concern for the insufficient progress by parties to the UNFCCC to establish a fair, ambitious and binding international climate agreement that is sufficiently solid and strong to protect the climate. This is the key objective of the Climate Convention as defined in its Article 2: "stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. Such a level should be achieved within a time-frame sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner." We have already exceeded the atmospheric concentration of greenhouse gases that is considered a limit beyond which we will experience "dangerous climate change" and the need for urgent action grows daily.

Our submission also reflects the progress made since the World Summit on Sustainable Development of 2002 on the development and deployment of clean and renewable energy technologies. In 2010, renewable energy accounted for \$211 billion in new investments an increase of 32% from the previous year.

We therefore propose that UNCSD 2012 builds on the renewable energy sector's success to give new impetus to the efforts to secure an international climate regime that can work with the environmental constraints and imperatives that have been identified by the Fourth Assessment of the IPCC.

The Rio+20 alternative

Whilst UNCSD 2012 is an opportunity to look back at the last twenty years since the Rio Earth Summit of 1992, it is most importantly an opportunity to choose the track that we want to take for the next twenty years. Based on economic, social and environmental indicators, the choice governments will face in Rio is summarized here.

In order to take the right track, the Green Economy must:

1. Empower workers and give them access to green jobs: targets and resources for capacity -building, green technologies, operational level implementation and training;
2. Accelerate transition to a 100% renewable energy and energy efficient economy through effective government policies, education, investments in research and development etc.
3. Promote equity and justice at the heart of the green economy, ensuring the right to development for developing countries while meeting green and poverty eradication objectives;
4. Protect and conserve natural capital and biodiversity, and equitably share the benefits from their exploration and sustainable exploitation;
5. Effectively address the need for changes in production-consumption patterns first and foremost within the countries member of the OECD, in line with the concept of common but differentiated responsibility enshrined in the Rio 92 agreements; and
6. Enhance the full participation and consent of communities affected by development projects, and the stewardship of natural resources and biodiversity by local communities.

Climate Change and energy

A Green economy based on fairness, social welfare, and environmental integrity needs to be powered by green energy – that is energy that provides the services needed without destroying the local, regional or global environment or negatively impacting people. 100% Green energy means zero carbon, zero deforestation, sufficient to satisfy needs, and empowering local communities.

Delivering truly sustainable energy requires a re-think of the way we produce, use and distribute energy. We need to produce energy using renewable sources, we need to use energy efficiently and we need to have efficient local distribution networks and smart grids. Many reports (for example IPCC, UNEP, UNDP) recognise this and various scenarios have been produced that show how these changes can be implemented.

Consistent across these scenarios, reports and case studies is the clear need for supportive government policies. In other words, the barriers to the uptake of green energy sources are mainly political not technological. In this context, we urge governments to seize UNCSD 2012 as the opportunity to create a political environment that eliminates the obstacles and barriers and to commit to clear targets and timetables to provide the framework that will encourage the uptake of clean energy systems (energy efficiency, renewable technologies and decentralised schemes). This must go together with the removal of policies that undermine and suppress them (such as perverse subsidies; legal frameworks that support large centralised dirty power; loans and aid that support fossil and/or nuclear fuels). Existing barriers include lack of appropriate policy or poor policy implementation; inadequate fiscal and subsidies policies, difficulty accessing finance; inappropriate grid integration and infrastructure; poor planning, and lock-in of existing technology.

A renewed political commitment is needed because voluntary measures alone do not deliver what is required. Governments must lead and set the framework to send the necessary signal to the markets. Renewable energy targets

As identified in the UN Secretary General's report on the promotion of new and renewable sources of energy there are a number of long-term energy scenarios that provide

projections for renewable energy in primary energy, final energy, electricity generation and electric generating capacity. Governments need to set the framework to achieve the most ambitious targets.

Therefore, as a first step towards UNCSD 2012, we call on the Bureau and Secretariat to include the following elements in the compilation document and ultimately the Zero Draft for discussion in the coming weeks, in order to facilitate discussions and decision on these key issues:

- Vision: UNCSD 2012 should agree a long-term vision that bases the green economy on 100% clean and renewable energy sources and on energy efficiency, to guide and inspire policy decision-makers, and trigger incentives.

- Effective commitment to clean energy: we need a commitment to short and medium term actions which will implement this vision. We recommend by 2020, globally:

- o 30% of energy use from renewables up from 16 % as outlined in REN21's 2011 Renewables Global Status Report;

- o 40% decrease in energy intensity, and

- o Universal access to modern energy services and ending energy poverty: clean, reliable and affordable energy services for cooking and heating, lighting, communications and productive uses.

These goals require national, sub-national, municipal, and/or corporate actions to achieve them and should be implemented immediately (within a 2 to 5 year time scale) putting countries onto an ambitious pathway. The International Renewable Energy Authority (IRENA) and relevant national renewable energy authorities and organisations could play an important role in working with governments to develop national action plans as well as sharing best practices and progress.

Some key actions are identified below:

- Removal of fossil fuel subsidies and perverse incentives including aid, loans or other subsidies that encourage the further development of fossil or nuclear fuels: accelerate the phase out of subsidies in line with the G20 commitment, redirecting revenues to those in needs and to support renewable energy and energy efficiency programmes.

- National renewable energy targets, stable Feed in Tariffs or other incentive policies, local RE plans, corporate energy efficiency and GHG reduction goals, etc

- Establish an international financial transaction tax (FTT): which could raise as much as \$400 billion annually that would make a real impact on combating climate change and eliminating poverty.

#### Conclusions

A renewed political commitment is needed. Voluntary measures have not delivered what is needed, nor will they be able to do so at the rate required. Governments must lead and set the framework to provide the necessary signal because what is at stake is too important to leave to laissez-faire.

A key lesson of the last 20 years is that delays cause more pain whether that is economic, environmental or social. However, first we need to acknowledge where we have failed and why; then we need to agree that the situation is urgent and that change needs to happen rapidly. Then, governments must commit to the policies and measures needed to change direction with targets and timetables that translate into real actions and behavioural changes that start from day 1 after Rio.

We are committed to contribute to putting these measures, targets and actions into practice and offer cooperation and engagement as change will need multi-stakeholder approaches and partnering

---

## Global e-Sustainability Initiative (GeSI)

### GeSI response to public consultation on Rio+20

The Global e-Sustainability Initiative (GeSI), representing over 30 of the world's leading vendors and service providers of the Information and Communication Technology (ICT) sector, welcomes the opportunity to provide input to the public consultation on Rio+20. Our response addresses two areas: cooperation mechanisms and implementation tools that encourage transformative ICT solutions, and the expected outcomes of Rio+20.

#### 1. Cooperation mechanisms and implementation tools that encourage transformative ICT solutions

It is imperative that two decades on from the Earth Summit in Rio de Janeiro the discussions on sustainable development take into account today's societal and technology contexts. GeSI is calling on all Rio+20 stakeholders to fully recognise and take advantage of the role of transformative ICT solutions in fostering sustainable development and addressing 21st century challenges like climate change. Companies should no longer only be seen as a source of environmental problems, but certain sectors, such as ICT, should also be viewed as solution providers and "positive" contributors to the sustainability debate.

In particular, GeSI appeals to Rio+20 stakeholders to:

- Ensure that Rio+20 recommendations and structures created do not ignore, or undermine, emerging ICT solutions.
- Take advantage of existing and widely deployed ICT infrastructure. Most countries have national ICT and broadband plans, yet the utilisation of this infrastructure to deploy services and solutions that benefit sustainable development is largely untapped.
- Create an enabling policy framework that supports the deployment of ICT to deliver solutions, for example, in the areas of e-health, smart grids, transport and mobility, food and agriculture.

#### 2. Expectations for the outcome of Rio+20 GeSI's expectations for the outcome of Rio+20 relate to a number of areas. Specifically, we call on stakeholders to:

- Focus on delivering the services that society needs, and not necessarily the traditional ways of providing them.
- Recognise the importance of including transformative ICT solutions in Rio+20 outcome documents and processes.
- Set targets for sustainability contributions of transformative ICT solutions.
- Encourage a policy framework that includes transformative ICT solutions.
- Encourage engagement of the private sector, in particular to foster innovation and dematerialisation perspectives through modern technological advances.

## Transformative ICT Solutions

The landmark report "SMART 2020: Enabling the Low-Carbon Economy in the Information Age" gave a clear picture of the key role that the ICT industry plays in addressing climate change globally and facilitating efficient and low-carbon development. While ICT's own sector emissions will nearly double by 2020, the strategic application and diffusion of ICT solutions in other business sectors can reduce total global emissions by as much as 15 per cent. These savings are five times larger than the total expected emissions from the entire ICT industry and with more focus on transformative solutions this contribution could be significantly larger.

Examples of sectors where transformative solutions can help reduce emissions by 80 per cent or more include:

- Smart transportation: Radio tags can be attached to items in a cargo and their journey tracked from manufacturer to warehouse and to shop. This makes it easier to move goods and stock more efficiently. Using ICT could help cut emissions from distribution and transportation by 1.52 billion tonnes. ICT can also facilitate decentralised and on-demand production that reduces the need for transport and storage to almost zero. In a similar way ICT can make commuting much more efficient while teleworking is even better and can support a much more resource efficient way of working.
- Smart grids: Connected electricity supply grids can be controlled so that energy is sent to industries and homes in the most efficient way, accelerating the uptake of renewable energy. By 2020, this could reduce carbon emissions by two billion tonnes. Smart grids can also support decentralised renewable energy distribution and the accelerated uptake of electric cars.
- Smart buildings: By using ICT in buildings for managing light and heat systems, resources consumption can be adapted to match demand in real time. Smart buildings could save 1.7 billion tonnes of emissions. ICT can also help a shift in approach where connected buildings in cities become net producers of renewable energy.
- Smart motor systems: In factories, the motors used to power machines such as pumps or conveyor belts can be made "intelligent" through the use of ICTs. With ICTs, emissions from motor systems could be reduced by 0.97 billion tonnes of carbon emissions, worth EUR €68 billion.
- Dematerialisation: Further savings can be achieved from the potential of ICTs to enable dematerialisation- replacing high-carbon physical products and services with virtual alternatives. For example, e-commerce leads to dramatic reductions of physical transport and could avoid more than a billion tonnes of carbon emissions. Virtual meetings and remote working will also significantly reduce carbon emissions caused by travel, saving half a billion ton of carbon emissions without any major investments.

## Global Ecovillage Network (GEN); US Citizens Network for Sustainable Development; and the Association of World Citizens

### FULFILLING PRIOR AGREEMENTS ON SUSTAINABLE DEVELOPMENT AND ACHIEVING SUSTAINABLE RURAL DEVELOPMENT

Rob Wheeler

Global Ecovillage Network

Investing in Sustainable Rural Development

While there has been a much needed focus on sustainable urban development in the Rio+20 and the 10YFPs Sustainable Consumption and Production processes, it is unconscionable that there has been so little attention paid to such community based development in rural communities and villages. This is especially troublesome when one considers that 70% of those facing extreme poverty live in rural areas. These people often face multiple problems that span across sectors, including such emerging issues and challenges as hunger, climate change, resource scarcity, natural disasters, and poverty. There is thus an urgent need to improve access in rural communities to energy, water, sanitation, healthcare, educational opportunities, agricultural markets, and transport, etc. and to do so in a sustainable manner.

Tens of millions of villagers are leaving rural areas every year to seek opportunities in cities that are not adequately prepared to provide for them, many because the conditions they faced in the rural area were becoming untenable. However, it has been repeatedly shown that an integrated multi-sectoral community based approach to sustainable rural development, such as has been developed in many ecovillage communities, can provide an effective way to overcome poverty, provide much needed access to goods and services, and re-establish sustainable practices and lifestyles.

It would make far more sense to provide opportunities and improve conditions in rural areas, while simultaneously addressing development needs in impoverished urban communities, than to have to provide such services for even more people in urban communities where the resources are already stretched so thin.

It is thus essential that more significant resources are invested in rural communities to support capacity development and an integrated, multi-sectoral community based approach to sustainable rural development. These resources could then fund and provide access to such things as renewable energy, green building and sustainable agricultural practices, access to clean water and sanitation, and good livelihood opportunities, etc.

As Article 37 in the Secretary-General's Gap Report states, "new evidence has emerged to suggest that climate change is a more imminent danger, and also that a number of other environmental trends have worsened far more rapidly than anticipated and that some "planetary boundaries" might even have been exceeded. Challenges have been exacerbated in developing countries by poverty, competition for scarce resources, the rapid pace of rural/urban migration, and the concomitant challenges to provide food, infrastructure and access to basic health, water and energy services."

Fortunately, all of these challenges can be addressed in a systematic manner using an integrated, multi-sectoral community based (or ecovillage) approach to sustainable rural and impoverished urban development.

The report goes on to state that, "While financial and other commitments of international support have been made, they have neither achieved greater coherence nor always been fully realized in practice. While the participation of Major Groups has become the norm, there is limited success in scaling up or replicating promising multistakeholder initiatives."

"In summary, one of the biggest challenges ahead for green economy initiatives will be to move from small-scale demonstration projects to policies and programmes with broad benefits at national and international levels."

We thus recommend that the international community support the development of a global network of regionally based resource and service centers coupled with training programs around the world in order to assist and support local communities in developing and implementing an integrated multi-sectoral, community based approach to sustainable rural and impoverished urban development in the regions and areas where they are most needed.

The Global Ecovillage Network and EcoEarth Alliance UN Partnership Initiative are well situated and have the experience needed to set up and help develop such a global

network of resource and service centers and training programs. Indeed we are already working with UNITAR on facilitating some of its training programs. We have established quite a number of Ecovillage Learning and Living Centers around the planet (<http://gen.ecovillage.org/education/livinglearningcenters.html>). And we have developed an Ecovillage Design Curriculum and on-line and on-site Training Programs which have been created by the Global Ecovillage Educators for a Sustainable Earth. See: [www.gaiaeducation.org](http://www.gaiaeducation.org)

Ecovillages provide one of the best examples for how we can live sustainably and adopt sustainable production and consumption practices as there is on Earth.

In rural communities interlinkages are perhaps more apparent and important than elsewhere; and yet approaches to development often if not usually address just one sector at a time. However this is not the case in ecovillage communities. We now know that agriculture is directly dependent upon and linked with our energy choices, energy choices are then linked with the built environment and green building practices. These then are linked closely with waste management and access to clean water, along with ecosystem services and restoration. And all of the above are then linked with education for sustainable development, recreational and cultural activities, small scale entrepreneurship, and access to financial services such as micro-credit. And if it is not yet apparent all of the above are directly dependent upon and can contribute to Sustainable Consumption and Production and creating a Green Economy.

In an ecovillage community all of these components are intentionally designed to support one another and to be built and operate in as sustainable a manner as possible. These communities usually include renewable sources of energy, which they often produce themselves, green building practices utilizing natural and locally based materials, biological waste systems, water catchments and harvesting, organic or sustainable agricultural practices, shared resources and facilities, cooperative recreational and cultural activities, and they often include efforts to restore and sustain the natural environment, etc.

The "involvement of all stakeholders" that the UN so often encourages has to include those living in rural communities and support is seriously and urgently needed for "means of implementation, technology transfer, and capacity building" for those living in these rural areas and communities as well.

Sustainable Rural Development must thus be included as one of the primary Programme Areas in the 10 Year Framework of Programmes; and support for it in a cross sectoral integrated manner must be included as one of the primary outcomes of the Rio+20 conference and process.

#### Addressing Existing and Emerging Challenges in a Sufficient Manner

Similarly, many UN studies and reports indicate that significant increases in providing resources and capacity development would provide major benefits in addressing emerging issues and global challenges that are particularly acute in both rural communities and impoverished urban areas. For example, UNEP has found that, "More than one and a half billion people have gained access to clean drinking water since 1990 – but due to stress on fresh water resources nearly three billion people now live in regions facing water scarcity. And more than one third of the growing urban population in the developing world now live in slums."

In addition, almost half of the developing world population still lack improved sanitation facilities; and in rural communities women often have to wait until night to go to the fields to take care of their personal needs. In the water and sanitation sector the greatest challenge over the next two decades will probably be the implementation of low cost sewage treatment that will at the same time permit selective reuse of treated effluents for agricultural and industrial purposes.

Indeed we know that in some cases close to 90 per cent of the GDP of the poor is linked to nature or natural capital such as forests and freshwaters. Thus it is appropriate that the Green Economy Report cites India, where over 80 per cent of the \$8 billion National Rural Employment Guarantee Act, which underwrites at least 100 days of paid work for rural households, is invested in water conservation, irrigation and land development. It is this type of a program that can help rural people meet their basic human needs. Thus, some type of a global program like this needs to be included as an outcome of the Rio +20 process in order to address urgent development needs.

UNEP's Green Economy Report also indicates that re-directing just a tenth of a percent of global GDP per year can assist in not only addressing the sanitation challenge but conserve freshwater by reducing water demand by a fifth by 2050 compared to projected trends.

Similarly, investing about one and a quarter percent of global GDP each year in energy efficiency and renewable energies could cut global primary energy demand by nine percent in 2020 and close to 40 percent by 2050. Providing access to renewable energy in rural areas particularly makes a lot of sense as they are typically distributive in nature.

Indeed UNEP found that the "Savings on capital and fuel costs in power generation would under a Green Economy scenario, be on average \$760 billion a year between 2010 and 2050."

A Green Economy would invest \$100 billion, up to \$300 billion a year until 2050, in agriculture in order to feed nine billion people, while promoting better soil fertility management and sustainable water use to improve biological plant management. And scenarios indicate that this would result in an increase in global yields for major crops by 10 per cent over current investment strategies.

It is thus essential that Time Bound Targets be established to meet such sustainable development goals as this and that sufficient funding, on the scale indicated, be put in place in order to achieve these targets and goals.

#### Providing Funding and Resources for Capacity Building and Implementation

UNEP's Green Economy Initiative also indicates that "in regards to food security, we are seeing neither widespread understanding of the nature of the problem, nor globally collaborative solutions for how we shall feed a population of 9 billion by 2050. Freshwater scarcity is already a global problem, and forecasts suggest a growing gap<sup>2</sup> by 2030 between annual freshwater demand and renewable supply. The outlook for improved sanitation still looks bleak for over 2.6 billion people; 884 million people still lack access to clean drinking water."

"Although the causes of these crises vary, at a fundamental level they all share a common feature: the gross misallocation of capital. During the last two decades, much capital was poured into property, fossil fuels and structured financial assets with embedded derivatives, but relatively little in comparison was invested in renewable energy, energy efficiency, public transportation, sustainable agriculture, ecosystem and biodiversity protection, and land and water conservation."

"Indeed, most economic development and growth strategies encouraged rapid accumulation of physical, financial and human capital, but at the expense of excessive depletion and degradation of natural capital, which includes our endowment of natural resources and ecosystems. By depleting the world's stock of natural wealth – often irreversibly – this pattern of development and growth has had detrimental impacts on the well-being of current generations and presents tremendous risks and challenges for future generations."

Again it is essential that the UN and its Member States take sufficient action to deal fully with these challenges that have been well known for at least the last twenty years.

The WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation also states in its Progress Report on Sanitation and Drinking Water: 2010 Update that, "The development path should maintain, enhance and, where necessary, rebuild natural capital as a critical economic asset and as a source of public benefits, especially for poor people whose livelihoods and security depend on nature."

"It is a myth that a green economy is a luxury that only wealthy countries can afford, or worse, a developed-world imposition to restrain development and perpetuate poverty in developing countries. Contrary to this perception, we find there are a plethora of examples of greening transitions taking place in various sectors in the developing world, which deserve to be emulated and replicated elsewhere."

Again, it is essential that the UN put in place much more resources and specific means and mechanisms for capacity development, investment for implementation and development at the community level, and training and resource programs. So many times the UN supports the development of model programs and best practices, but usually there is not much funding for scaling up these best practices and success stories and for replication.

It is thus time to put in place the means and mechanisms needed to support capacity development and reward people economically for their contributions and services. UNDP established a number of Thematic Trust Funds that included funding for capacity building but none of them were sufficiently funded; and it did not seem like they supported many civil society initiatives. New means must be established across all sectors to provide opportunities for civil society to be compensated for contributing to implementation.

One program that we believe has been quite successful is the GEF Small Grants Program. The Global Ecovillage Network - Senegal received \$650,000 from the Small Grants Program for 13 villages (\$50,000 per village) to implement and carry out a series of activities in an integrated, multi-sectoral community based approach to development after the Johannesburg World Summit for Sustainable Development. This has resulted during the past ten years in Senegal creating the first National Ecovillage Agency and the intention to carry out the ecovillage development model in all of the villages throughout the country.

#### INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

It has been recognized at the United Nations that insufficient progress has been made in integrating sustainable development into policymaking and implementation at all levels. It is thus most important that the UNCSD conference secretariat, Bureau, and UN Member States focus significantly on what would be required to fulfill and fully achieve the agreements and commitments that have already been made; and that this include a focus on how sustainable development could become the basis for policymaking and implementation at all levels of governance.

This should start with global support for fully implementing the Local and National Strategies for Sustainability; and a goal needs to be set to ensure that all of these Strategies are based on achieving the Multilateral Environmental Agreements (MEAs) and all of the other sustainable development agreements.

In particular we want to draw attention to Chapter 28 of Agenda 21 and its commitment to provide international financial support to local agenda 21 processes around the world, which has never been forthcoming and still needs to be provided, along with the failure of the UN community to follow Capacity 21 with the planned Capacity 2015 program - which should have continued to support UN Member States in implementing their national sustainability strategies as required and needed.

International programs and processes also need to be established as a primary outcome of the Rio+20 process to provide financial assistance and support all countries and communities in fully developing and implementing their local and national sustainability strategies; action plans on sustainable consumption and production; participation in the UN Decade on Sustainable Development; and all other international sustainable development agreements in an integrated fashion.

All of these programs and activities must also be based on the need to make a complete transition to full sustainability as rapidly as possible, along with achieving all of the MEAs and sustainable development agreements.

We also call on the UN to complete an agreement and enabling resolution on the Global 10 Year Framework of Programmes (10 YFPs) on Sustainable Consumption and Production as soon as possible; to include civil society initiatives as primary programs within the initial 10YFPs; to include a primary focus on Sustainable Rural Development in the 10YFPs; and to develop a supportive global program and review process to ensure that all countries develop and implement local and national action plans for SCP.

The Rio+20 process should also focus specifically on each of the earlier agreements that have been made and particularly on what would be needed to fully achieve each of them. Indeed a first step should be to agree that sufficient means, mechanisms, and funding must be put in place to fulfill and achieve each of them; and a process needs to be developed through the Rio+20 preparatory process to ensure that this is done.

Most importantly, a synthesis of the accumulated knowledge on sustainable development over the past two decades, in the form of a dynamic stocktaking exercise, could be undertaken with the objective of providing a sound basis for thinking ahead on how to address 21st century sustainable development challenges.

The UN Secretariat and agencies should thus be tasked to do a full scale analysis, article by article, of the extent to which each of the commitments made in Rio and Johannesburg has or has not been implemented or met, along with a full on evaluation as to what would be needed to fully achieve and fulfill each and every one of these commitments. This should then be coupled with an analysis of the failure of the governments to come up with the required funding mechanisms, along with a full on discussion as to what could be done to rectify this so that adequate funding and funding mechanisms are finally put in place that are sufficient to fully achieve all of the commitments that have been made. All stakeholders should be invited to contribute to this analysis in a proactive manner.

The Secretary-General's Gap Report includes a number of important findings, including that, "There are several critical gaps with regard to the fulfillment of national and international commitments, although a number of achievements have been made. While countries have expanded their menu of policy options, this has not led towards greater policy coherence. While integrated planning or policies and national sustainable development strategies have become acceptable, their impact remains limited because of ad hoc and inconsistent application."

"While important institutions have been established to promote or monitor the integrated pursuit of sustainable development, many have not received adequate support, some have languished, and most have not been able to synergize well with complementary processes or institutions."

"UNCSD will provide an opportunity to seek ways to strengthen knowledge creation and sharing with all major groups with a view to ensuring wise sustainable development decision-making and governance at the local, national, regional and global levels. " This is an opportunity that the United Nations, the Bureau, DESA, and the Governments must take advantage of; but if focused, proactive efforts are not made it will probably be missed.

"As of 2009, 106 countries have reported that they are currently implementing national sustainable development strategy (NSDS), but these are rarely viewed as the principal vehicles for policy coordination. In practice, a number of coordinating and planning mechanisms have been used in developing countries, often in parallel, and with similar or overlapping tasks, including conventional development planning, PRSP, UNDAF, DWCF, NCS, NEAP, and others. The resulting proliferation undermines their very purpose by weakening and fragmenting the efforts to introduce coherence."

It is thus essential that a support mechanism and process be developed (such as the Capacity 2015 program that was never implemented) to ensure that all countries and most communities have the resources and support needed to develop and carry out their strategy plans. And in addition, all local strategies should be linked with national strategies which should be linked as well with the SCP Action Plans, and with programs on Education for Sustainable Development at the local, national, regional, and global levels. There needs to be synergy, coherency, and collaboration throughout.

In addition, the Rio+20 Outcome Document should call for the adoption of a Commons Based Approach to Sustainable Development to ensure the equitable sharing and

benefits from the use of the Local to Global Commons.

Finally, if the UN and world community wish to create a Green Economy then we should put forward and focus on the requirements that are needed in order to achieve such a green and fully sustainable economy. Then the UN needs to set and agree on such goals. This should be required in order to fulfill and live by the Rio Principles. This would also require that we focus on achieving such prerequisites as:

Zero Waste Transitioning rapidly to 100% renewable energy Extended Producer Responsibility coupled with cradle to cradle production and consumption practices and including all externalities in all SCP processes Living within the Carrying Capacity of the Earth Getting the incentives right by shifting taxes onto Land and Natural Resources Phasing out the use of all toxic chemicals Restoring the Natural Environment Etcetra

In addition, a global protocol, convention, implementation process and secretariat needs to be created to assist all countries in fulfilling the commitment to phase out all harmful and unsustainable subsidies as soon as is possible.

## Global Footprint Network

Realising a green economy, especially in the context of sustainable development and poverty eradication, will not be possible if humanity continues to consume more biological resources than the Earth can provide each year. Sustainable development can only occur when all humans can have fulfilling lives without degrading the planet. But nations cannot plan for what they do not measure. Living well within the means of one planet will require better indicators of progress than a fixation on Gross Domestic Product.

Therefore, the outcomes of Rio+20 should include:

- A commitment by all countries and international institutions to annually track and report national and global levels of natural resources and their consumption rates, both total and per capita, as part of standard economic and social welfare statistics
- Similar agreement to prioritise national and international policies that most contribute to achieving annual natural resource consumption rates smaller than those resources' annual regeneration rates

The concepts of Ecological Footprint and biocapacity present one way to monitor these trends. They are a transparent and rigorous standard for natural resource accounting, supported by continual improvements to their scientific methodology, and reviewed on an ongoing basis by an independent committee of scientific researchers and practitioners from throughout the world. Additional independent reviews of the Ecological Footprint and biocapacity methodology have been conducted by numerous governments, universities, and research institutes. Much progress has also been made to harmonize them with the United Nations System of Integrated Environmental and Economic Accounting (SEEA).

The United Nations Development Programme, and several countries, are already beginning to implement the above recommendations, using Ecological Footprint and biocapacity as part of their set of indicators. It is in the self-interest of the rest of the world's governments to follow their lead, in pursuit of a green economy.

## Global Issues Division of the German Institute for International and Security Affairs (SWP)

Introduction A Sustainable Development Council

In the Run-up to Rio 2012: Options for Reforming the UN Sustainability Institutions SWP Comments

Marianne Beisheim, Birgit Lode, Nils Simon

At the 2012 United Nations Conference on Sustainable Development (UNCSD), the UN institutions that deal with sustainable development are to be restructured. This offers an opportunity to implement long overdue reforms. The planned restructuring should follow the objective to improve the visibility and priority of sustainability themes in the UN system. An important building block in these reforms might be the founding of a Sustainable Development Council (SDC) to replace the politically weak UN Commission on Sustainable Development (CSD). The UN General Assembly could pass a resolution establishing such a council as its subsidiary organ.

The UN Conference on Sustainable Development is scheduled to take place in Rio de Janeiro in June 2012. The objective of the summit is to create the political framework for rapid transformation of the global economy into a green economy." This will require, first of all, the right economic incentives, and second, a reform of the Institutional Framework for Sustainable Development (IFSD). The United Nations system in its current form is incapable of providing adequate support for the restructuring measures needed to foster the development of a green economy. But how would the institutional architecture in the area of sustainability have to change in order for such a sweeping transformation to succeed? To date, the discussion has focused on transforming the United Nations Environment Programme (UNEP) into a fully fledged United Nations Environment Organization (UNEO or WEO). Besides the EU, an increasing numbers of countries are working toward strengthening the environmental pillar of the UN system. In addition, the Commission on Sustainable Development (CSD) needs to be reformed

The Commission on Sustainable Development—A Toothless Tiger

The CSD was founded in 1992 following the conclusion of the UN Conference on Environment and Development in Rio. It is charged with monitoring progress in the

implementation of its outcomes, including Agenda 21 and the Rio Declaration on Environment and Development. Furthermore, it is responsible for providing political guidance to follow-up the Johannesburg Plan of Implementation, adopted in 2002. Currently, it is not fulfilling either of these functions convincingly. As one of nine functional commissions of the United Nations Economic and Social Council (ECOSOC), the CSD is not in the position to effectively perform its assigned role as a monitoring mechanism, much less to take on political leadership. Its strategy of working with seven two-year cycles, with each cycle focusing on selected thematic clusters, has indeed contributed to the desired topical focus. Yet at the same time, this has hindered the capacity of the CSD to respond flexibly to current developments.

Like the fifteenth session of the CSD in the year 2007, the nineteenth session in May 2011 ended without producing tangible results—the best evidence of how urgently a reform of the Commission is needed. The delegates did reach broad agreement on the content of a Ten-Year Framework of Programmes on Sustainable Consumption and Production (10YFP). They also achieved consensus in other areas of sustainable development that had been under discussion for some (transport, chemicals, waste management, and mining). Nevertheless, they failed to adopt a final version of the text due to disagreements over technological cooperation and the language on the rights of people living under foreign occupation. CSD-19 thus marked the lowest point to date in the history of an institution that was founded with high expectations. Reform of the CSD is absolutely essential for it to be able to fulfill its original mandate and support the global transformation towards a green economy.

#### Reform Goals

A reformed institutional framework for sustainable development should fulfill two key functions. To strengthen the UN institutions' ability to successfully implement effective sustainability policies, it should, first of all, provide high-level proactive leadership and political guidance. The United Nations can only accomplish what its Member States empower it to do. To this end, meetings should be attended by policy makers who have the authority not just to reach minimal consensus but also to negotiate ambitious and, wherever possible, binding targets that include timetables for implementation. Second, it is indisputable that, finally, decisions need to be implemented more consistently. This calls for effective mechanisms of monitoring and compliance management. To achieve both of these goals, there are several conceivable options for strengthening sustainability governance. Current discussions revolve around how the CSD, whose work to date has been inefficient, can be strengthened, enhanced, or indeed replaced. Overall, the reform proposals aim at making sustainability policy a higher priority within the UN system. In the past, there was a tendency to keep adding more new institutions instead of carrying out effective reforms of the existing institutions. The UN has succeeded in acting in a more coordinated way in the public time sphere—for example, with UN Water or with the Chief Executives Board for Coordination (CEB). However, these institutions have contributed little to providing political leadership or improving implementation. The existing strategy has been inadequate to meet present challenges in the area of sustainability policy.

#### A Council for Sustainable Development

A key building block for stronger UN sustainability institutions might be created by transforming the CSD into a Sustainable Development Council (SDC). This option is now even being discussed at official level in the preparations for Rio 2012.

So far, the CSD has been a subsidiary organ under ECOSOC auspices, reporting to it, and therefore suffering from the latter's weakness. The Economic and Social Council may make recommendations and draft agreements but cannot make binding decisions. ECOSOC, for its part, reports to the United Nations General Assembly (UNGA), which exercises the actual political control. The new SDC is to be given a stronger mandate and positioned at a substantially higher level within the UN system. A number of options for this were discussed in July 2011, when high-ranking representatives of Member States, UN institutions, and civil society organizations met for talks in the Indonesian city of Solo.

The first option was that an SDC could be set up on the model of the UN Human Rights Council (HRC) as a subsidiary organ of the General Assembly. This could be accomplished through a resolution of the UNGA, and would therefore not necessitate a revision of the UN Charter. The SDC could make recommendations directly to the General Assembly, which would then subsequently have to approve these. The implementation of UNGA resolutions would thereafter rest in the hands of the SDC. A council established in this way should meet at the same time as ECOSOC, thus each year alternately in New York and Geneva. This would improve the opportunities for coordination within the United Nations. A group of pioneer states", which still remains to be launched (e.g. a "UN Sustainability Group"), could use such a framework to act as a catalyst for this process. This solution would guarantee high visibility for sustainability policy. At the same time, the new Council would be in a more prominent position to exercise political leadership.

A second option might be to realign the the High-level Segment of the Economic and Social Council. While it is already dealing with important economic, social, and environmental matters, it still lacks a specific focus on issues of sustainability, or rather an explicit nexus between the three pillars of sustainable development. This alternative would not require a revision of the Charter. Arguably, there would be the risk that the problems of ECOSOC, which is itself in need of reform—due among other things to its cumbersome decision-making processes and lack of effective political power—would have a negative impact on the SDC. In principle, however, it is conceivable that efforts to address sustainability issues could be enhanced by these kinds of high-level meetings, whether they involve the participating ministers in ECOSOC or the heads of state and government attending UNGA. This could provide the framework to generate the necessary political will and leadership in order to promote the outcome reached at the Rio 2012 conference.

A third option would be to fundamentally reform the Economic and Social Council itself. It could be renamed and its focus redefined by expanding its authority to cover environmental issues. It could thus replace the CSD. A reform of ECOSOC would be highly desirable in principle and has been attempted numerous times in the past. In order to change the ECOSOC mandate, however, one would need a two-thirds majority in UNGA and the ratification by two-thirds of all UN Member States, including the five permanent members of the Security Council. Most notably the minimum number of successfully concluded ratification processes would make this option a tedious and protracted procedure. But even without amending the Charter, ECOSOC in the final outcome document in Rio could be called upon to mainstream sustainability issues into all of its fields of activity.

Fourth, the currently inactive UN Trusteeship Council, being a principal organ of United Nations and thus established on the same level as the General Assembly and ECOSOC, could be transformed. Compared to the other reform proposals, this option would provide the highest-ranking formal framework for sustainable development within the UN system. But this, too, would require a change in the UN Charter. This makes the first option—the Council for Sustainable Development as a subsidiary organ of the General Assembly—the most promising reform option for Rio 2012.

#### Membership and Voting Rights

Up to now, the adoption of recommendations is in the hands of the 53 Member States of the CSD. Each member has one vote; a simple majority shall suffice. When the new SDC is being established, the seats are to be allocated—just as they are in the CSD or HRC—to create a governing body with a geographically balanced quota. Again, each member would have one vote. As a rule, the members of the SDC would be expected to seek unanimous recommendations to lend more weight to their decisions. Only when no consensus appears attainable are majority decisions to be made.

Another option would be to introduce innovative procedural rules to prevent impasses and to avoid biased decisions. Linking decisions that entail financial costs to a double weighted majority, as is done in the Global Environment Facility (GEF), would be conceivable. This would require, in addition to a 60 percent majority of all Member State votes, a 60 percent majority of the total contributions.

One could also consider models in which the voting rights are allocated to stakeholders that are particularly affected by decisions. Here, the nine Major Groups of the CSD

could be granted voting rights. This could be accomplished by means of a “third chamber within the SDC (see below). In certain cases, recommendations could be adopted with a double or—when there are relevant financial consequences— triple majority. This would significantly increase the legitimacy of decisions and more effectively integrate civil society organizations being crucial for implementation and oversight.

#### Improving Coordination

In the past, the UN has taken important steps to better coordinate the work of its numerous organizations, programmes, and commissions. The Chief Executives Board for Coordination (CEB) is a body of 28 UN institutions—primarily UN specialized agencies—that was established to ensure, on the highest level, a coherent and efficient world organization. Apart from this, there are other groupings including various institutions, such as the United Nations Development Group (UNDG), chaired by the United Nations Development Programme (UNDP) and the UNEP-led Environment Management Group (EMG). All three bodies have the stated aim of coordinating the set of issues pertaining to sustainable development. Additionally, there are thematically organized coordination groups such as UN Water, UN Energy, and UN Oceans.

Within the new Sustainable Development Council, a bicameral system could help to further integrate the thematically relevant bodies. The first chamber (State Chamber) would consist of UN Member States, and the second of UN organizations and programmes (Organization Chamber). In the first chamber, the Member States of the SDC would engage in dialog and discuss joint positions and draft recommendations for resolutions which, in the future, may be adopted by the UNGA. The second chamber would have no voting rights, but would work in parallel to provide internal coordination within the UN. It could work with various committees to facilitate voting processes that are as targeted and thematically focused as possible. The UN Development Group and the Environment Management Group could be integrated into these committees. This would benefit not only the coordination of the numerous multilateral environmental treaties and environmentally relevant UN institutions; it would also produce an added value by creating a joint segment linking the two chambers, thereby fostering exchange between the international community and the UN system and thus enable more precisely tailored political governance. Moreover, a high-level Interagency Sustainable Development Committee” could play a coordinating role both in preparing for sessions of the SDC and, subsequently, in ensuring that recommendations are implemented swiftly. Furthermore, it should be considered whether a third chamber representing civil society organizations (Civil Society Chamber) would be a meaningful addition.

#### Enhancing Participation

One positively evaluated area of the CSD’s activity is its cooperation with civil society. The new SDC should build on these elements and allow for the comprehensive participation of external stakeholders. The CSD understands the term civil society” in a broad sense being the set of persons, institutions, and organizations that pursue a common goal—namely, to drive forward an objective in the area of sustainable development through their ideas, campaigns, and demands. Potential actors may be individuals, religious groups, academic institutions or NGOs. The total number of civil society organizations involved in the CSD’s processes is an impressive 2,096. In terms of quality, too, the Commission at present has important mechanisms in place to engage civil society. For example, the nine Major Groups of the CSD have the opportunity to participate in the sessions of the Commission upon registration prior to the opening of the meeting. They receive access to the essential documents beforehand; and at the actual meetings, they have certain options to present their views. They are so closely involved that they are even allowed to participate in talks at the ministerial level. These mechanisms should be further developed, since after all, stakeholders are the driving force behind issues of sustainable development. They are able to mobilize a wider public when it comes to adopting and implementing international agreements.

Involvement of civil society could be strengthened, inter alia, by creating binding provisions for early participation in all relevant processes. The rules for participation should be adapted so that representatives of civil society in general are permitted to attend meetings unless no more than one-third of the Member States vote against this. All of the CSD’s nine Major Groups should be involved in the consultation processes, with all three pillars of sustainable development being equally represented—that is, taking into account environmental, social, and economic groupings. The question as to who is to represent which interest would be coordinated by the groups themselves, for instance, through forums such as the longstanding Conference of NGOs in Consultative Relationship with the United Nations (CONGO), or newer ones such as the mainly Internet-based Stakeholder Forum for a Sustainable Future. Assistance would have to be provided to groups from the global South to enable them to participate in the meetings.

In the new SDC, the consultation processes would need to be improved in order for them to be considered relevant and effective by the Major Groups. A particularly far-reaching model aims (in line with the International Labour Organization) at equal voting rights for civil society. This demand would have little prospect of success. The Major Groups could nevertheless be given the opportunity, for instance, through an additional third chamber of the SDC, to submit proposals on the wording of recommendations and to comment directly on the existing drafts. The basis for such participation so closely linked to the negotiation process would be better access rights to relevant information. Following the model of the Aarhus Convention, access to review procedures could ensue, which then apply if access to information has wrongfully been refused. Following a meeting in Bonn at the beginning of September 2011, organized by the UN Department of Public Information (DPI) in cooperation with NGOs, the civil society side demanded the appointment of a high-level Ombudsperson for Future Generations. This person would advocate for sustainable development in general, as well as investigating complaints received from civil society.

In addition to the formal involvement of a necessarily limited number of civil society representatives, the SDC should create informal forums so as to be able to regularly put its work up for discussion before a wider public.

**Improving Partnership Management** After the Johannesburg Conference in 2002, partnerships with industry and civil society should assist the United Nations in implementing the hitherto agreed objectives concerning sustainable development more quickly. Within the framework of such partnerships, knowledge of sustainable production processes could be disseminated, voluntary standards and certification tools developed, or independent projects financed and implemented. Similarly, for Rio 2012 plans are already in place to establish new green economy partnerships. It is not a case of reinventing the wheel— what is crucial is to learn from past experiences.

There are currently 348 partnerships of this type registered with the CSD. Politically, they have been controversial from the outset. While some expected them to generate an innovative and effective impetus, others feared a profit-oriented privatization of public services or the greenwashing of private sector business activities. What has been missing so far is a sobering appraisal of the results achieved by these initiatives. The CSD only registers the partnerships without being in any way involved in or evaluating their activities. Critical observers estimate that over half of the partnerships are dysfunctional.

The Rio Conference offers an opportunity for improvement here. In order to make partnerships an effective instrument, the new SDC should manage and monitor them from the very beginning. It would be useful to have clearly defined and transparent (sustainability) criteria for selecting the initiatives that the UN would like to (continue to) support. The partnerships would then be evaluated according to these criteria. The SDC should ask the initiatives to submit a report of activities based on these criteria at least biannually, referring to existing evaluation reports where applicable. The activity reports would then be published on the SDC’s website equipped with a comment function. Civil society would thus be able to exercise its monitoring role in a highly visible manner.

An evaluation system of this type would make it possible to identify which partnerships are actually effective and which are unproductive. Negatively evaluated initiatives would first be contacted and then excluded if they do not respond appropriately. The insights gained from the evaluation could then also feed into future initiatives. This would have the desired effect of scaling up successful models.

#### Further Developing Peer Reviews

In order to enable the objectives and agreements on sustainable development to be implemented more reliably in the future, innovative accountability tools are required. On the one hand, these must be effective and, on the other hand, accepted by states that have remained skeptical to date. A voluntary peer review mechanism could drive forward implementation of sustainability policies.

Peer reviews are based on constructive learning processes that make it possible to both provide quality assurance and raise awareness. They are conducted by external expert peer reviewers, who are just as familiar with the matter as those whose work is being evaluated. Ideally, peer reviews should have a mediating role. They should be kept less formal and take into consideration the diversity of the problems arising upon their implementation. Peer reviews can and are intended not to force implementation but at best advance it. Final, legally binding assessments or sanctions imposed at a higher level are not an integral part of the procedure.

Peer reviews are still a relatively new instrument in politics. A distinction should be drawn between expert and stakeholder reviews. The former are periodically conducted by representatives of political and administrative bodies. These include, for instance, the high-level UN Annual Ministerial Review (AMR) of development policy objectives and achievements that is conducted during the annual sessions of ECOSOC. Conversely, peers from relevant social groups are involved in the stakeholder variant. Thus, since 2006, the UN Human Rights Council has executed the innovative stakeholder peer review process of the Universal Periodic Review (UPR). The situation of human rights in all UN Member States is evaluated at four-year intervals. The UPR of the Human Rights Council not only distinguishes itself through its universal character. It is also still unique in that NGOs can play an active part by contributing to the report and participating in the meetings of the UPR Working Groups. Such a peer review mechanism with a wide range of opportunities for participation by civil society could also assist an SDC in advancing implementation of national and regional sustainability policies. To avoid putting on a show, these processes should not necessarily be based in New York. Representatives of all nine Major Groups recognized by the CSD should be invited, as well as peers from the southern countries. Broad participation of this type would also serve to disseminate the results of the reviews as widely as possible. The high expectations associated therewith could then in turn promote the swift implementation of the recommendations.

Financing and Capacity Building Finally, the Sustainable Development Council should have its own financial resources in order to be able to iron out weaknesses of multilateral development cooperation in a targeted manner. Insufficient funding still presents a serious obstacle to development cooperation. Consequently, if the UN sustainability institutions are to be strengthened, significantly more financial resources must be made available. This is the only way to guarantee that the UN organizations fulfill their mandates and drive forward sustainable development through activities ranging from the global to local level.

In the face of tight budgets in industrialized countries, new sources of revenue are urgently required to enable the necessary transfers to be made. A tax on financial transactions, for instance, would allow considerable resources to be acquired in a relatively short time—this option is being discussed more and more seriously. Market-based financial instruments such as payments for ecosystem services (PES) will also be on the agenda of Rio 2012.

What should be avoided is establishing a new fund and essentially supplementing the numerous existing funds by yet another underfinanced one. An ambitious solution would be to interlink the Global Environment Facility with the SDC. At the same time its presently available funding, about one billion US dollars per annum, must be increased significantly. This would allow the facility to continue its present activities, while at the same time also breaking new ground, primarily with regard to technology transfer and the necessary capacity building. Thus, developing countries would be able to follow “green” development paths without having to take the resource-intensive and emission-heavy industrialization route.

Colombia has proposed supplementing the Millennium Development Goals with Sustainable Development Goals (SDG). Should this meet with approval in Rio, the SDC could accompany and monitor the operational implementation of the new goals in the medium term.

#### Countdown to Rio 2012

The deadline for submitting proposals to the UNCSD Secretariat for the Zero Draft of the Rio outcome document is November 1, 2011. This means that the opportunities to make an impact continuously dwindle. Consequently, specific proposals for a target-oriented and ambitious restructuring of the UN sustainability institutions should be developed now. The first two meetings of the Preparatory Commission for the UNCSD were disappointing in this respect. It was not until the above-mentioned meeting in Solo in July 2011—less than a year before Rio 2012—that the debate became more lively and creative. The remaining months should be used to develop specific proposals, to gain support for these, and then to introduce them into the official preparatory process. The objective of the Rio outcome document should be to recommend that the

UN General Assembly adopts a resolution approving the establishment of an SDC and, at the same time, calling upon the ECOSOC to dissolve the CSD. It would make Politik good strategic sense for Brazil as conference host to introduce this proposal. This would also be a logical step because the SDC is compatible with Brazil's original plan for Rio 2012 of founding an umbrella organization for environment and development. Germany and the EU should support the creation of a new Council. This would send a message to developing countries that the environmental pillar of the United Nations but also push for forcefully enhancing the institutional framework for sustainable development.

---

## Global Kids

Dear UNCSD Secretariat,

I am writing in support of three billion young people who are worried about their — and their planet's — future. Joblessness brought on by over-exploitation of our Earth's resources and inadequate democratic decision-making is a clear indication that the status quo is unsustainable. I am calling on governments to respond to this emergency in full measure when world leaders meet next year in Rio de Janeiro to discuss the fate of the planet.

Exploitation of scarce ecological resources has led to corruption, global inequity and a damaging pattern of “brown” investments, and it cannot be the basis for ensuring secure employment for the next generation. Meanwhile, governments and consumers consistently fail to recognize that our planet has boundaries, exacerbating them through perverse subsidies and an unsustainable food system that cannot meet our growing needs. These trends must change.

First, we need all world leaders to recognize the urgency of the situation by attending the Earth Summit and educating their publics about the dangers of not acting. The United Nations should urge Presidents and Prime Ministers from every nation to commit resources and attention as early as possible in preparation for their participation at the Earth Summit.

Second, when world leaders come to Rio, they must deliver more than another agenda with lofty goals for a distant environmentally-responsible future. Young people from 118 countries recently called out the challenges with the hundreds of existing commitments, pledges, treaties and action plans. In their “Bandung Declaration”, they highlighted “weak implementation, corruption and the lack of transparency and accountability” as key failures of the international system. The Earth Summit, these young people demanded, should generate real actions on the ground from national and local governments, corporations, communities, and civil society organizations. I agree, and the United Nations should create a global registry of sustainability actions to track our progress and ensure we are holding everyone accountable.

Third, governments need to enable young people to take the lead in creating a green economy. Youth around the world are increasingly disenchanted by high unemployment,

corruption, massive subsidies to established industries, and lack of corporate responsibility. To overcome this unlevel playing field, governments need to make investments in education and training and in creating employment and entrepreneurial opportunities for young people.

We cannot wait another generation for sustainability: the time for talk is over.

## Global Policy Forum Europe

Statement by the Civil Society Reflection Group on Global Development Perspectives on Rio+20 and beyond

31 October 2011

The following statement has been produced by the Civil Society Reflection Group on Global Development Perspectives. It is a pre- liminary statement and has not been fully discussed by all members of the Group yet. It is "work in progress". Therefore, not every recommendation in this statement was explicitly endorsed by each member of the Group. But the statement captures the ideas and the fundamental consensus, which were formulated in the previous meetings of the Reflection Group. The more comprehensive final report of the Group will be published in spring 2012. Members of the Reflection Group are: Alejandro Chanona , National Auto- nomous University of México;; Barbara Adams, Global Policy Forum;; Beryl d'Almeida , Abandoned Babies Committee Zimbabwe;; Chee Yoke Ling , Third World Network;; Ernst Ulrich von Weizsäcker, International Resource Panel;; Danuta Sacher, terre des hommes Germany;; Filomeno Sta. Ana III, Action for Economic Reform, Philippines;; George Chira , terre des hommes India;; Gigi Francisco, Development Alternatives with Women for a New Era;; Henning Melber, Dag Hammarskjöld Foundation, Sweden;; Hubert Schillinger, Friedrich-Ebert-Stiftung, Germany;; Jens Martens, Global Policy Forum Europe;; Jorge Ishizawa , Proyecto Andino de Tecnologías Campesinas, Peru;; Karma Ura , Centre for Bhutan Studies;; Roberto Bissio, Social Watch;; Vicky Tauli-Corpuz , Tebtebba Foundation;; Yao Graham , Third World Network Africa.

### I. The world in need of fundamental change

1. We live in a world in turmoil. Too many people are tossed around in a global boom and bust, a global casino gambling with our livelihoods, our security, our futures and our planet.

2. We live in a world where the top 20 percent of the population enjoy more than 70 percent of total income and those in the bottom quintile get only two percent of global income. Gains from economic growth and globalization have been unevenly shared. In most countries, the rich have become richer at the expense of the middle class and low-income groups. Unfettered economic growth has further increased social inequalities even though it has generated the resources to do the opposite and finance more equitable access to public and essential services. Persistent poverty, unemployment, social exclusion and higher levels of inequality are threat- ening care systems, social cohesion and political stability.

3. We live in a world where 50 percent of carbon emissions are generated by 13 percent of the population. Fast spreading unsustainable production and consumption patterns have been linked to the rapid depletion of natural resources, including clean water, as well as to unequal sharing of the promised "benefits" of economic growth and expanding trade. They have led to global warming that produces rising sea levels, higher frequency of extreme weather conditions, desertification and deforestation. For bio-diversity, the loss of envi- ronmental heritage is permanent. We have exceeded the ecological limits and ignore the planetary boundaries. With the climate change threat we are already living on borrowed time. However, we refuse to cut back on emissions and allocate the scarce resources to those who have not yet benefitted from their exploitation.

4. All too often national and international policies have not aimed to reduce inequalities. Their dedica- tion to stimulating economic growth has provided the incentives to exploit nature, rely on the use of fossil fuels and deplete biodiversity, undermining the provision of essential services as countries compete in a race to the bottom offering lower taxes and cheaper labor as incentives.

5. Persistent discrimination locks women in precarious reproductive work and violence. Women, espe- cially the poor, remain socially discriminated and in many places are deprived of their bodily, reproductive and sexual rights. This makes them more vulnerable to exploitation and violence inside and outside their homes. Care work which is often undertaken by women within households, is given no value or recognition. Women's livelihoods and productive activities that include all forms of health care work are often left unprotected and unsupported. All these are made more distressed during times of economic crises and by policies that favor profit over social provisioning.

6. Biodiversity and the bounty of nature, while cherished, are not respected, protected or valued. Communities and populations that seek to live in harmony with nature find their rights ignored and their live- lihoods and cultures jeopardized.

7. Why has this happened? Certainly it is not because of a lack of awareness or attention of policy makers at the highest levels. The climate change danger, cited in the mid-1980s at a conference of the WMO, was brought center stage in 1987 by the Brundtland Report, as was the urgency of biodiversity loss. The momentum carried to the Rio conference in 1992, which launched framework conventions on climate change and biodiversity as well as on desertification. It also adopted the Rio Declaration principles, the Forest Principles and a plan of action, Agenda 21. The global conferences of the 1990s focused on issues of human rights and social equity and adopted blueprints to tackle injustices from social exclusion and gender discrimination. In the Millennium Declaration of 2000, member states committed themselves "to uphold the principles of human dignity, equality and equity at the global level" as "a duty to all the world's people, especially the most vulnerable and, in particular, the children of the world, to whom the future belongs".

8. Over the last 20 years, however, the ideals and principles of Rio have been overshadowed, as implementation has mostly not occurred. Similarly, a host of international commitments to human rights and gender justice have not been fulfilled. World product per capita has more than doubled in the last two decades, yet with widening disparities. Globalization has yielded millions of poor quality jobs. Financial and commodity speculation has undercut food security and turned millions of hectares of land away from growing food and into unsustainable uses. Little has been done to change patterns of production and consumption that pollute, erode biodiversity and lead inexorably to climate change. 45 countries with a total population of 1.2 billion people have managed to achieve social indicators that are better than the world average with per capita emissions of CO2 from fossil fuels below the world average. And none of them are labeled as "high income". Yet, similar to other middle-income countries and those considered as "least developed", they often find their space for making domestic policy choices to achieve sustainable development squeezed by external demands, conditionalities and impositions that press them to take steps such as to slash tax rates and spending on social services.

9. Economic policies have on many occasions contradicted the commitments made to rights and sustainability as they and their related national and international institutions occupy the apex of governance domains. They have relied too much on markets to allocate societies' resources and distribute their wealth, singling out GDP growth as the ultimate measure of well-being. The result has been increased concentration and bigger market share ratios of a few transnational corporations, including in the food and medicine sectors.

10. This deliberate policy choice of hands-off came to a head when, ignited in the USA, it exploded into the global financial crisis in 2008, intensifying inequalities further as the resulting job losses and income cuts hit low-income groups disproportionately. Yet, relentlessly, the policy responses squeezed societies and communities further, relying on the same market actors that had been wrong before, paying little or no heed to the already fragile human and ecological systems, and pushing societies and communities to the breaking point.

11. Despite evidence that counter-cyclical policies acted as effective shock absorbers and enhanced resilience, many governments have sacrificed social expenditures to neo-liberal orthodoxy and a stronger dependence on financial markets. The costs of inaction and the mal-action of business as usual are amassing a mountain of social and ecological liabilities. High unemployment especially of young people, increasing food prices and widespread unfairness have created a climate of social and political tension and unrest in many countries. In countries around the globe, from Cairo to Manhattan to New Delhi, people take to the streets to express their anger with the status quo and their unwillingness to accept it any longer. Their motives and goals may differ according to the unique circumstances they live in – but their demands are all similar: greater justice and more freedom from the pressure of the “markets” and their faithful agents.

12. Why is governance failing us so badly? States have reneged on their democratic values and governments have become less accountable to the people. Universal norms and standards are being ignored or side-stepped by new rules that favor markets. Risks are being borne by those who had no role in taking them while a new classification of “too-big-to-fail” has re-ordered the distribution of public resources. We are confronted with a hierarchy of rights with those protecting human and eco systems relegated to the lowest rungs. This situation finds its parallels in governance at the national and international levels. Further, the fragmented global governance has led to missing the big picture and setting low demands that treat symptoms not causes.

13. Decades of wrong-headed policies and the impact of multiple policy failures have inevitably highlighted the role of the state and how important it is. Responses to the failure of the financial system show that the state can act and will act quickly in the face of perceived disaster with money and policies. But, the required stronger role of the state must be based on democratic legitimacy and accountability and be balanced by effective participation of civil society.

We are living in a period of turmoil, facing societal and ecological disaster. We demand of states that they act now promptly and effectively in the face of this disaster.

## II. Reconfirming the foundation of sustainability: The framework of universal principles and rights

14. The need for universal principles. Every concept of development, well-being and progress in societies is based on a set of fundamental principles and values. These values are rooted deeply in our culture, our ideologies and our belief systems. We are convinced, that there is a set of universal principles and values that is shared by most of us. Common principles and values build the foundation of societies. We acknowledge the diversity of cultural expressions as a value in itself that has to be protected and promoted. In times of globalization and growing global interrelationship between societies, economies and people, universally agreed principles are the precondition for living together in justice, peace and in harmony with nature.

15. A set of existing principles as common ground. There is no need to invent principles and values of this kind. In national constitutions as well as in various international treaties, declarations and policy statements of the United Nations, governments have agreed upon certain fundamental principles, which are essential to societies and international relations. We propose the following set of eight principles as the foundation for a new sustainability rights framework:

» Solidarity principle. Solidarity has been a widely accepted principle in many national constitutions to govern the relationship of citizens within a country. Central to this concept is the equality of citizens and their shared responsibility for a common good. In the notion of solidarity, assistance is not an act of charity, but a right of every woman, man and child. Solidarity differs radically from charity and philanthropy. In times of globalization, this concept has been transferred to the international level. In the Millennium Declaration, governments listed solidarity as one of the core values: “Global challenges must be managed in a way that distributes the costs and burdens fairly in accordance with basic principles of equity and social justice. Those who suffer or who benefit least deserve help from those who benefit most.” Today, the notion of solidarity is accepted as a key principle in various international agreements such as the United Nations Convention to Combat Desertification from 1994.

» Do no harm principle. Originally a key principle of medical ethics reflected in the promise of the Hippocratic Oath “to abstain from doing harm”, this principle has become relevant to other areas. For instance it has been included in humanitarian principles of UNICEF since 2003 and has been adopted in a code of conduct of major humanitarian organizations. In essence, the commitment to implement policies in a way that they do no harm to people or nature should be regarded as a guiding principle in all policy areas and at all levels.

» Principle of common but differentiated responsibilities. This principle marks one of the milestones of the Rio Declaration from 1992. Its Principle 7 states: “In view of the different contributions to global environmental degradation, States have common but differentiated responsibilities. The developed countries acknowledge the responsibility that they bear in the international pursuit of sustainable development in view of the pressures their societies place on the global environment and of the technologies and financial resources they command.” For the first time in history, governments recognized their differential present and historical contribution to environmental degradation and, thus, their differential obligation to pay for the remediation and mitigation. By including the historical dimension it goes beyond the principle of “special and differential treatment” based on economic capabilities and needs, as contained in WTO Agreements. The principle is a key element of the Kyoto Protocol but its application must not be limited to the climate negotiations.

» Polluter pays principle. The simple message of this principle is that the costs of pollution have to be borne by those who cause it. This principle has been part of international environmental law since the 1970s, and was reaffirmed in the Rio Declaration, Principle 16: “National authorities should endeavor to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution (...).” While this principle is widely acknowledged in international environmental law, it should be applied in other areas as well. In the context of the recent financial crisis, many asked for the “polluters”, i.e. the banks and the financial industry, to bear the costs of the crisis. As the European Commissioner Michel Barnier said: “I believe in the ‘polluter pays’ principle. We need to build a system which ensures that the financial sector will pay the cost of banking crises in the future.”

» Precautionary Principle. This principle states that in the absence of a scientific consensus if an action or policy has a suspected risk of causing harm to people or nature, the burden of proof that it is not harmful falls on the proponents of this action or policy. It is also laid down in the Rio Declaration, which says in Principle 15: “In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” After Rio this principle has been incorporated into many other international agreements, such as the Cartagena Protocol on Biosafety from the year 2000 with regard to the transboundary movement of living modified organisms and their products.

» Subsidiarity Principle. According to this principle political decisions must always be taken at the lowest possible administrative and political level, and as close to the citizens as possible, in order to ensure that women and men fully participate in decision-making. This idea is a core element of concepts of federalism and one of the central principles in the treaties of the European Union. Indigenous peoples regard this principle as an essential tool to preserve their identity, diversity and cultures. The principle recognizes the inherent democratic right to self-determination for people, communities, and nations, but only as long as its exercise does not infringe on similar rights of others.

Therefore, it must not be misused as an argument against central governmental action at national or international levels, but must always be applied in combination with the other principles, in particular the solidarity principle.

» Principle of Free, Prior and Informed Consent. According to this principle communities have the right to give or withhold their consent to proposed projects and actions by governments or corporations, that may affect their livelihood and the lands they customarily own, occupy or otherwise use. This principle is a key element of the United Nations Declaration on the Rights of Indigenous Peoples from 2007 and recognized in the ILO Convention on Indigenous and Tribal Peoples in Independent Countries (169/1989). However, this principle is not limited to the rights of indigenous peoples. It is also laid down in the Rotterdam Convention on the Prior Informed Consent procedure for certain hazardous chemicals and pesticides in international trade from 1998. This convention provides, inter alia, for importing countries to receive information on a chemical being exported from a country that has banned or severely restricted it for health or environmental reasons.

» Principle of peaceful dispute settlement. This principle is a core element of the UN Charter, which says in Article 2: "All Members shall settle their international disputes by peaceful means in such a manner that international peace and security, and justice, are not endangered." In the Manila Declaration of 1982 governments reconfirmed that the peaceful settlement of disputes should represent one of the central concerns for states and for the UN (A/RES/37/10, 15 November 1982). These eight principles shall build the cornerstones of a universal sustainability rights framework. They are interconnected and must not be applied in isolation.

16. The essential values of freedom, equality, diversity and the respect for nature. In addition to the core set of universal principles, there are fundamental values, which are also essential to international relations. Governments referred to some of them in the Millennium Declaration. They include, inter alia:

» Freedom. Men, women and children have the right to live their lives in dignity, free from hunger and from the fear of violence, oppression or injustice. Democratic and participatory governance based on the will of the people best assures these rights. But there are limits to freedom – namely where the freedom of our peers is touched. "Freedom is always the freedom of dissenters" (Rosa Luxemburg). And freedom has its limits in the principle of "do no harm".

» Equality. No individual and no nation or group must be denied the opportunity to participate in and to benefit from development. Equal rights and opportunities of women and men must be assured. Equality includes the concept of intergenerational justice, i.e. the recognition that the present generation shall only meet its needs in a way that does not compromise the ability of future generations to meet their own needs.

» Diversity. Human beings must respect one other, in all their diversity of belief, culture, language, looks, sexual orientation, and gender. Differences within and between societies should be neither feared nor repressed, but cherished as a precious asset of humanity. A culture of peace and dialogue should be actively promoted.

» Respect for nature. Prudence must be shown in the conduct towards all living species and the use of natural resources. Only in this way can the immeasurable riches provided to us by nature be preserved and passed on to our descendants. The current unsustainable patterns of production and consumption must be changed in the interest of our future welfare and that of our descendants. Respect for nature means much more than sound management of the human environment: it means that all living species have intrinsic rights. They should not be regarded as objects of human interaction but as subjects with value that goes beyond use and exchange. This understanding of nature as a living system is reflected in the thinking and believe systems of indigenous peoples, for instance in the concept of Buen Vivir.

17. Failure to translate the principles into practice. While all governments agreed to these principles in general, they have mostly failed to translate them into enforceable obligations and specific policies. If governments had taken the solidarity principle seriously, poverty and hunger could have been reduced dramatically;; if they really accepted the principle of common but differentiated responsibilities, the Copenhagen climate summit would not have ended in such a disaster;; and had they complied with the precautionary principle, nuclear catastrophes such as those of Chernobyl and Fukushima could have been avoided.

18. Turning principles into rights. In order to ensure the functioning of a society and create safeguards against tyranny, values have to be translated into law, rights and legally binding obligations. At international level, the human rights system plays a key role in turning moral values into legal rights. Of particular importance is the International Bill of Human Rights that includes the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the International Covenant on Economic, Social and Cultural Rights. Equally significant are the Convention on the Elimination of all Forms of Discrimination against Women and the UN Convention on the Rights of the Child. More recently, these key documents have been complemented by the Convention on the Protection and Promotion of the Diversity of Cultural Expressions (2005) and the UN Declaration on the Rights of Indigenous Peoples (2007). Together with the Declaration on the Right to Development (1986) and complemented by the core set of principles we mentioned above, these documents can form the normative framework of a holistic concept of sustainability, well-being and societal progress.

19. Rebalancing Rights. While the norms of the international human rights system are generally accepted and ratified by most countries of the world, there is still a huge implementation gap. Even worse: while states and their organs at national and international levels too often failed to respect, protect and fulfill human rights, over the last two decades they have strengthened corporate rights and the rights of capital. They promoted the free movement of capital, but restricted the free movement of people;; they strengthened the rights of transnational investors, but weakened the rights of people affected by these investments. Transnational corporations may nowadays sue governments at international fora for any change in the rules, including health regulations, that affect their actual or planned profits, but people are hindered from suing companies for the pollution and other harmful practices inflicted upon them. There is an urgent need to rebalance rights, i.e. to reclaim human rights as the normative foundation of policy, and to roll-back the rights of capital in relation to the rights of people.

20. Filling the gaps in the rights system. There are not only gaps in the implementation of rights but also gaps in the international rights system itself. Certain principles and values, such as the principle of intergenerational justice and the respect for nature are not explicitly translated into (codified) rights yet. There is a need of intensified debate and research on how to include the concepts of the rights of nature and intergenerational justice in the international normative system and turn them into practice.

21. From theory to practice: Translating principles and rights into strategies, goals and policies. To translate fundamental principles into internationally agreed rights and obligations is only the first step. The next is to formulate political goals and strategies to implement these rights. Here, public policies play a crucial role. Democratically legitimized public authorities, particularly governments and parliaments, have the main obligation to implement a rights-based approach of sustainability, well-being and societal progress. They must not transfer this obligation to the private sector or to civil society.

### III. Redirecting policies towards present and future justice

22. Consequences from the failure to translate principles and rights into policies. In the past decades governments agreed formally on an almost comprehensive set of sustainability principles and human rights, but they failed to bring their policies effectively into line with them. Instead, policies are still too often sectorally fragmented and misguided with an overreliance on economic growth and self-regulation of the "markets". New concepts like "green growth" are at best attempts to treat the symptoms of the problems without tackling their root causes. What is therefore needed are fundamental changes at three levels:

» Changes in the mindset, the guiding concepts and indicators of development and progress.

» Changes in fiscal and regulatory policies (at national and international levels) in order to overcome effectively social inequalities and the degradation of nature and to strengthen sustainable economies.

» Changes in institutions and governance mechanisms (at national and international levels).

23. Changing the dominant mindset. The mindset of many opinion leaders and political decision-makers worldwide is still focused on economic growth and market-driven solutions as the panacea for all economic, social and environmental problems in the world. Governments are not (and should not be) in a position to change the dominant mindset by command and control. But they are obliged to draw lessons from the failures of the past and reformulate the overall objectives of their policies and related concepts and metrics that guide them. Instead of subordinating their policies to the overarching goal of maximizing GDP growth, the leitmotif of their policies should be to maximize the well-being of the people without compromising the well-being of future generations by respecting the planetary boundaries.

24. New metrics for sustainability and societal progress. Consequently, governments should recognize the need for new metrics for sustainability and societal progress beyond GDP to guide their policies. They should actively promote the research and discourse on alternative metrics at national and international levels, within a specified timeframe, and with broad participation of civil society. The discourse should build upon existing initiatives, for instance the report of the Stiglitz-Sen-Fitoussi Commission, Measuring Australia's Progress (MAP), and the Gross National Happiness Index of Bhutan. It should also take into account the current revision of the System of Environmental-Economic Accounts (SEEA) coordinated by the Statistics Division of the UN Secretariat.

25. Sustainable Development Goals. The 1992 Rio Summit demanded further work on the definition of indicators of sustainable development which would be the basis both for defining the concept and establishing common international goals. Two decades later, more progress has to be achieved. Links have to be established to the human rights framework which sets clear goals, for instance on the rights to food, to health, and to education. Therefore, the debate should not be about these goals, as they have already been agreed upon, but about the "when" and the "maximum available resources" (including those of international cooperation) to ensure their progressive realization. Any formulation of Sustainable Development Goals that does not adequately address the human rights aspects and the sustainability aspects simultaneously and in a balanced way risks derailing the comprehensive sustainable development agenda without any compensatory gains.

26. Commitment to policy coherence for sustainability. In order to translate the universal sustainability rights framework outlined above into practical policy at national level, governments and parliaments should adopt binding commitments to policy coherence for sustainability as well as strategies for implementation and monitoring. Based upon the core set of universal principles, such as the precautionary principle, the "do no harm" principle, and the solidarity principle, all public policies should be redirected towards human rights and sustainability and subject to sustainability and human rights impact assessments.

27. A new Charter on the Right to Sustainable Development. In order to bundle the core set of fundamental principles and human rights to a normative framework of sustainability, well-being and societal progress, we propose to adopt a new Charter on the Right to Sustainable Development. This Charter should also refer, inter alia, to the World Charter for Nature (1982) and the UN Declaration on the Rights of Indigenous Peoples (2007), and update and upgrade the Declaration on the Right to Development from 1986. The new Charter should emphasize the commitment of governments to policy coherence for human rights and sustainability. It should reconfirm the obligation to progressive realization of human rights using the maximum available resources and expand it to the right to sustainable development and the rights of future generations. It should acknowledge the concept of planetary boundaries. And finally, it should confirm the principle of fair burden sharing and equitable per capita rights towards the global commons and to the emission of greenhouse gases, taking fully into account the historical responsibilities of societies.

28. Redirecting fiscal policies towards sustainability. Fiscal policy is a key instrument of governments to turn the rights-based approach of sustainability, well-being and societal progress into practice. The actual priorities of governments are reflected more clearly in public budgets than in government declarations and action programs. Moreover, the composition of state budgets allows inferences to be drawn about the political influence of different interest groups: Is the military dominant? Are business interests pushed through? Or is public spending focused on the needs of the majority in a society and correcting gender imbalances? In recent decades, we witnessed the erosion of public finance in many countries, which resulted in a growing inability of governments to provide the necessary public goods and services in support of people's welfare and care systems, thus failing to respond effectively to the aggravated social and environmental problems. Therefore, there is an urgent need to strengthen and redirect public finance.

29. Taking the four "R's" of fiscal policy seriously. Fiscal policy can basically have four purposes: The raising of revenues in order to provide the necessary public goods and services;; the redistribution of income and wealth from the richer to poorer sections of society ;; the repricing of goods and services in order to internalize ecological and social costs and discourage undesirable behavior (such as currency speculation);; and the justification for citizens to demand democratic representation ("no taxation without representation") and accountability . Unfortunately, governments have rarely taken advantage of these aspects of a pro-active fiscal policy. On the contrary, they have often participated in a global tax race to the bottom (particularly with regard to corporate taxation). They have given preference to indirect taxes, like an undifferentiated value-added tax, which have regressive effects and have increased inequalities, and they hesitated to introduce effective taxes on environmentally harmful resource consumption. We need steps towards country-specific eco-social fiscal reforms, taking into account, inter alia, the following aspects:

- » Emphasizing progressive taxation: A basic requirement for strengthening public revenues is a broad based system of progressive taxation. In line with the principle of common but differentiated responsibilities taxation should be based on the ability to pay;; rich individuals, transnational corporations and large landowners should be taxed accordingly. A flat and undifferentiated value-added tax is regressive, burdens the poor, and therefore should not constitute the centerpiece of the tax system. Any form of indirect taxation should be designed in a way that it is sensitive to the poor's welfare by introducing progressivity (e.g. by taxing luxurious consumption) and mitigating the regressive features.
- » Greening the tax system: A key element of any eco-social fiscal reform should be the shift from the taxation of labor to the taxation of resource consumption. Following the polluter pays principle, a system of eco-taxes should particularly increase the "price of pollution", the use of fossil fuels and other non-renewable energies, and the emission of greenhouse gases.
- » Effective taxation of corporations: An essential element of an efficient tax system includes the effective taxation of corporations. Tax exemptions or fiscal incentives for transnational corporations, particularly in export processing zones, are counterproductive and an inefficient instrument to attract foreign direct investment. They should be eliminated, if possible in an internationally coordinated way.
- » Initiatives against tax evasion and illicit financial flows: In many countries illicit financial flows, tax avoidance and corruption continue to prevent the establishment of a sustainable system of public finance. A bundle of national and international measures is needed to strengthen fiscal authorities, close tax loopholes and prevent capital flight. These include:
  - › Supporting governments in creating more efficient and fair tax structures and fiscal authorities.
  - › Effective measures against the manipulation of transfer pricing.
  - › Mandatory country-by-country reporting standards for transnational corporations, with the US American Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act) from July 2010 as an initial step for the extractive industries.
  - › Binding rules for the automatic exchange of tax information between state agencies.
  - › Effective support for stolen assets recovery as described in the United Nations Convention against Corruption.

› Banning financial transactions in tax havens and secrecy jurisdictions.

› Applying the polluter pays principle to the financial sector – introducing a Financial Transaction Tax: Demands raised for many years for the introduction of a financial transaction tax have gained additional relevance through the current global financial crisis. Such a tax can contribute to a fairer distribution of burdens by involving the financial sector, which caused the crisis, in covering the costs of coping with it. The tax should be levied on trading shares, bonds, derivatives and foreign currency on the stock exchange, at trade centers and in over the counter (OTC) transactions. Imposition of the tax ought to be internationally coordinated and performed by the responsible national fiscal authorities, but individual countries or groups of countries should be encouraged to start applying it even before it becomes global. In order to ensure that tax revenue is not exclusively used to cure budget deficits but also spent for environmental, development and rights purposes, a substantial part of the revenues should be earmarked and distributed through a fund under the auspices of the United Nations.

30. Reallocation of government spending. Parallel to the necessary changes on the revenue side of the budget, any effective eco-fiscal reform requires fundamental changes on the expenditure side as well. Too often public money has been spent for harmful or at least questionable purposes. By redefining priorities public spending policy can become a powerful tool to reduce social inequalities and remove discrimination and to support the transition towards sustainable production and consumption patterns. This includes the following steps:

› Abolition of harmful subsidies: While subsidies can be a useful temporary mechanism to compensate vulnerable sectors for unexpected distortions or to promote desirable activities, every year governments spend hundreds of billions of dollars on harmful subsidies particularly in the agricultural, water, energy, forestry and fishery sectors. Public money is used at home and abroad (through multilateral development banks) to lower the price of fossil fuels, to support agricultural exports, or to subsidize transnational investments. These kinds of subsidies not only have detrimental social and environmental effects;; by artificially lowering the prices, they often reduce the profitability of local industries and the production of renewable energy. In essence, the negative effects of subsidies are three-fold. They absorb a substantial portion of state budgets that could otherwise be used for better purposes;; they contribute to environmental damage by creating misleading consumer and production incentives;; and they have negative distribution effects. Therefore, governments should commit to time-bound targets to phase out all subsidies that support unsustainable production and consumption patterns or otherwise violate the do no harm principle as soon as possible.

› Strengthening public spending to stimulate sustainable production and consumption: Not all subsidies are harmful. On the contrary, subsidies can play an important role in supporting emerging local industries and introducing environmentally friendly technologies. Well-targeted subsidies can have positive redistributive and environmental effects. Governments should substantially strengthen public subsidies in areas such as renewable energy, sustainable and affordable public transport systems, eco-efficient housing, social infrastructure and consumption subsidies to poor households.

› Cutting military spending: Military expenditures absorb a significant share of state revenues in most countries. In 2010 they reached a total historic high of USD 1.630 trillion. By reducing military budgets, large sums of money could be freed up for funding environmental and social programs. A precondition for this, however, is strengthened support for conflict prevention, peaceful conflict resolution, and if needed, peacekeeping and peacebuilding. At the same time, the largest armsproducing countries (in particular the five permanent members of the Security Council) have a responsibility to improve the control and regulation of their arms exports and to support a Global Arms Trade Treaty.

› A universal social protection floor for all: Access to social security is a human right (Art. 22 of the Universal Declaration of Human Rights). But it is also an economic and political necessity, for a working social security system reduces poverty, strengthens the purchasing power of the people and hence domestic demand, and prevents social tension and societal conflicts. A publicly financed minimal set of basic social security ought to exist in every country. It would be a necessary condition to prevent people from falling into poverty as a result of economic crises. Therefore, governments should implement the concept of a universal social protection floor, as promoted by the ILO. It should be based on the following four pillars:

› Universal access to public healthcare for all.

› Guaranteed state allowances for every child.

› A universal basic pension provided by the state for persons in old age or with disabilities.

› Guaranteed state support for unemployed and underemployed people living in poverty.

› Public provision of essential services: After years of a global trend towards privatization and deregulation, public authorities have to reclaim the responsibility to provide essential services for all citizens, including freshwater supply, sanitation, education, healthcare, shelter, public transport, communication, and access to energy. Governments should substantially increase the spending level in these areas. With sustainable stimulus packages governments should invest in targeted infrastructure programs in order to increase energy and resource efficiency. Following the subsidiarity principle, priority should be given to promote decentralized models of water and renewable energy supply, with strong public oversight, and to reduce the market power of oligopolistic public or private suppliers. In order to pay attention to the rights and interests of indigenous peoples and local communities, public authorities and private companies must respect the principle of free, prior and informed consent in all infrastructure projects.

› Strengthening participatory, gender and human rights budgeting initiatives: Free access to budgetary information as well as effective control are essential to increase the accountability of governments to their citizens in their use of public funds. Governments should therefore ensure the effective participation of civil society in budgetary planning. Whether and to what extent governments are actively promoting gender equity in their budgets should be determined with the help of genderbudgeting approaches. Similarly, governments should assess if budgets are complying with their obligation to promote, protect and fulfill the economic, social and cultural human rights.

› Using public procurement policies to promote sustainability: Public authorities from the local to the global level have an enormous purchasing power. So far they were guided mostly by criteria of cost-effectiveness. However, more and more public procurement operators try to influence the production methods and products of their suppliers by introducing environmental, social and human rights standards. In addition, procurement policies could be used to specifically strengthen the local economy by supporting domestic suppliers.

› Using sovereign wealth funds to finance sustainable investment: Assets under management of sovereign wealth funds increased to USD 4.7 trillion in July 2011. There was an additional USD 6.8 trillion held in other sovereign investment vehicles, such as pension reserve funds, development funds and state-owned corporations' funds. There is an enormous potential to invest these assets in accordance with specific sustainability objectives. Governments should authorize the decision-making bodies of these funds to introduce binding sustainability criteria to guide their investment policies.

31. A new global system of financial burden sharing beyond ODA. Even with a fundamentally strengthened system of public finance with increased tax revenues and reallocated public expenditures, in many countries the maximum available resources will not suffice to fulfill the social, economic, cultural and ecological rights of the people. External funding will therefore still be required. The current system of financial transfers is based on the concept of aid (Official Development Assistance - ODA). It is characterized by paternalistic relationships between rich donors and poor "partners". Despite all attempts to increase "ownership" and "aid effectiveness", these financial flows are often unpredictable, volatile, tied to products and services from donors and subject to conditionalities. This concept of aid is misleading, as its justification is charity instead of rights. Governments have to overcome this concept of aid and establish a new normative framework of burden sharing between rich and poor countries based on

the solidarity principle, e.g. in form of a universal fiscal equalization scheme. Models for this type of compensation or equalization already exist on the national and regional level. In Germany, for example, regional inequalities are to be compensated by a concept of financial adjustment between the federal states. In the European Union cohesion and economic equalization are financially supported by a compensatory structural policy. Such a model would be consistent with the International Covenant on Economic, Social and Cultural Rights (ESCR). The realization of those rights is a responsibility of governments "individually and through international assistance and co-operation, especially economic and technical, to the maximum of available resources." The prioritization of resources for ESCR also applies to international assistance.

32. A compensation scheme to pay off climate debt . The second pillar of a new normative system of financial transfers should build on the polluter pays principle and the principle of common but differentiated responsibilities. This is particularly relevant in order to allocate the costs of climate change. In accordance with these principles, those countries, that are responsible for the damage that the excessive emission of greenhouse gases is causing – and will be causing in the future – have to compensate for the costs. They have accumulated climate debt that they will have to pay off over the coming years and decades. The compensation schemes should be guided by the principles of fair burden sharing and equitable per capita rights, taking fully into account the historical responsibilities of societies.

33. Beyond the 0.7 percent target. Changes in the normative framework of financial transfers will also affect the so-called 0.7 percent target. In 2010 the 0.7 percent target experienced its 40th anniversary of non-fulfillment, since the governments in the UN General Assembly set the target in 1970. The decision was based on the then dominant concept of modernization. It was felt that a "big push" in foreign capital was needed to allow so-called developing countries to "take off" towards enduring economic growth. At that time, experts from the World Bank estimated the capital gap at around ten billion dollars, equivalent to around one percent of the GDP of the so-called industrialized countries. In 1969 the Pearson Commission recommended giving so-called developing countries 0.3 percent of the GDP in form of private capital and 0.7 percent in the form of ODA. This marked the birth of the 0.7 percent target.

Today, this 0.7 percent figure has only symbolic political importance as an "indicator of solidarity". The 0.7 percent target cannot explain what the fulfillment of the sustainability rights framework will actually cost, how much the respective countries could contribute themselves and how much external capital would be needed to fill the gap. All estimates of the external financial needs along with the new and additional resources required for climate mitigation measures and climate change adaptation show, however, that the financial transfers needed go well beyond the 0.7 percent of the GDP mark. The justified criticism of the original context on which the 0.7 percent target was based in no way legitimizes turning away from international obligations. We need to change perspectives, to move away from an aid-based approach to a rights-based approach of external public finance. Further development of the UN General Assembly resolution from 1970 to adjust the normative framework of financial transfers to the realities of the present is long overdue. This could take place in the context of the proposed Charter on the Right to Sustainable Development.

Proposals for new and more predictable forms of financial transfers are not new. The "North-South: A Programme for Survival" report, issued in 1980 by the international Brandt Commission proposed to raise revenues for development by 'automatic' mechanisms, which can work without repeated interventions by governments. "We believe that over time the world must move to a financial system in which a progressively larger share of such revenues is raised by these means. The fact that revenues are raised automatically does not, of course, imply that their transfer should be automatic; on the contrary, they should be channelled through an appropriate international agency or agencies (...)." More than 30 years after this visionary report, it is time to turn these ideas into reality.

34. Strengthening the rule of law to promote sustainability. Setting rules and standards is a central task of responsible governments and a key instrument of active policy-making. Over the past 30 years however, governments have too often weakened themselves by policies of deregulation and financial liberalization. Instead, they trusted in corporate voluntarism and self-regulation of "the markets". Public standard-setting and regulation have often been denounced as command and control policies. But only unfettered financial markets made the current financial meltdown possible, weak antitrust laws allowed transnational banks to become too big to fail, and the inadequate translation of the precautionary principle into mandatory technology assessments led to the catastrophes of Fukushima and elsewhere. In response to the recent financial and food crises governments started to introduce new rules and standards, as in October 2011 the U.S. Commodity Futures Trading Commission, which has set modest rules to limit excessive speculation in commodities. But much more remains to be done to restore public rights over corporate privileges and to strengthen the rule of law in the interest of present and future generations.

#### IV. Towards inclusive, accountable governance

35. The need to overcome fragmentation. To date the approach to sustainable development governance has been one of governing the three pillars of sustainable development in their own zone, complemented by coordination across them. This is attempted at all levels – global, regional, national and sub-national – and in cooperation with non-state actors, primarily civil society, indigenous peoples and the private sector.

Sustainable development has been viewed as a linking concept designed to facilitate a dialogue between those whose primary concerns relate to the environment and those who see their role as promoting growth and development. This approach has emphasized coordination and dialogue, but does not have a strong institutional basis for decision-making and policy change across the three pillars. Nor has it addressed human rights, inequalities and social exclusion. In practice, the environmental pillar dominates the dialogue, the economic pillar dominates impact and the social one is largely neglected apart from the limited way it is addressed through the MDGs.

Decision-making and policy development are severely handicapped by this hierarchy among the three pillars as global economic governance does not adhere to the mandates of the human rights regime or the requirements of sustainable development. The hierarchy among the three pillars is also reflected in the measures used for policy prescriptions and budget allocation. These have low-level social goals; the progress metrics count only dollars and externalize social and environmental costs. These metrics favor the private sector and penalize the public purse. We are not measuring sustainable development, but mainly economic growth.

To overcome the fragmentation of governance for sustainable development and ensure policy coherence, it is essential to re-arrange and re-configure the institutional arrangements that cover all aspects of the policy cycle: agenda setting, policy analysis and formulation, decision-making, implementation, and evaluation.

36. Towards a Sustainable Development Council. Adopting sustainable development as an overarching concept requires an apex institution that subsumes all other notions of development and can infuse the essence of rights and sustainability into the agenda of all developmental and environmental bodies. This institutional configuration of sustainable development must guide the work of global institutions in integrated decision-making, policy action, implementation and review. It cannot be left to ECOSOC. Many recommend a Sustainable Development Council directly reporting to the General Assembly on the lines of the Human Rights Council. This Council would have a remit that extends to all three pillars of sustainable development - the environmental, the economic and the social.

The council's jurisdiction would extend to all multilateral bodies, including the international financial institutions. The new council would be charged with overseeing the reporting process supported by an enhanced Universal Periodic Review (UPR).

37. A Universal Periodic Review on Sustainability. The new Sustainable Development Council should be equipped with a Universal Periodic Review mechanism so that all countries report on measures to achieve sustainable development, covering all relevant issues linked to human rights, trade, macroeconomic policy, the environment, financing and political participation. The UPR concept should be enhanced to consider information provided not only by governments, but also by other stakeholders, such as civil society and the private sector. Information on reports and Universal Periodic Review findings would be made widely available through information channels that actively target all relevant stakeholders.

38. Upgrading the Committee on Development Policy. As presently constituted, the Committee for Development Policy (CDP) is a subsidiary body of the Economic and Social

Council of the UN (ECOSOC). It provides inputs and independent advice to the Council on emerging cross-sectoral development issues and on international cooperation for development, focusing on medium- and long-term aspects. The 24 members of the Committee are nominated by the United Nations Secretary-General in their personal capacity, and are appointed by the Council for a period of three years. Membership is geared to reflect a wide range of development experiences as well as geographical and gender balance. The CDP should be upgraded to undertake research and provide independent advice on policies of sustainable development that fully integrate the three pillars and on emerging issues that require inter-governmental attention and action. It should establish ad hoc working groups or task forces to deepen and supplement its work and include members from organizations with a proven commitment and track record in the relevant issues including from civil society and indigenous peoples.

39. International Ombudsperson and Special Rapporteurs. There are some key areas of sustainable development and intergenerational justice where the international governance system lacks the appropriate normative standards and oversight. We support the recommendation to establish the institution of an Ombudsperson for intergenerational justice/future generations. In addition, the function of Special Rapporteurs should be used to examine, monitor, advise and publicly report on problems, such as land rights, technology access and use, and fisheries, and develop recommendations not only on specific cases but also for new or upgraded norms. This could be a special procedure of the newly constituted Council for Sustainable Development.

40. Overcoming the governance gaps at national level. A major challenge for more effective governance at the global level is the lack of coherence at the national level. Effective international arrangements cannot be determined or strengthened without commitments and coherence at the national level, and in all countries. Restructuring ECOSOC or creating a new Council will be a futile exercise if it is not "owned" by effective national counterparts and placed in an influential governance position vis-à-vis other ministries and interests. The new governance mechanism at national level could include, for example:

» A new "Sherpa for Sustainability". Responsibility should be taken by the head of state or government to increase policy coherence for sustainability. He or she should establish a "Sherpa" function for sustainability. This function/position should have cabinet rank to ensure coordination among government ministries and authorities.

» A Parliamentary Committee on Policy Coherence on Sustainability. To secure oversight and public accountability, a Parliamentary Committee on Policy Coherence on Sustainability should complement the "Sherpa" function. These high-level institutions in the executive and legislative branches of the state will provide the necessary national presence and representation at the relevant fora of global governance for sustainable development. Their positions and perspectives should be prepared by a permanent and meaningful consultation process with broad constituency participation that reflects the cross-sectoral dimensions of sustainable development.

» An Ombudsperson for Future Generations. The appointment of Ombudspersons for Future Generations could bring the sustainability agenda straight to the heart of governments and policymaking. The Ombudsperson could engage directly in the policy-making process and assesses the longterm effects of policies from an integrated perspective. Only an independent body without the requirement to be re-elected by current voters can fully focus on the long-term analysis and represent it without any hesitation.

## Global Universities Partnership for Environment and Sustainability (GUPES)

Global Universities Partnership for Environment and Sustainability (GUPES)

### INPUTS FOR RIO+20 CONFERENCE ZERO DRAFT OUTCOME DOCUMENT

Role and contributions of Higher Education in Sustainable Development recognizing the Rio+20 themes of Green Economy in the Context of Sustainable Development and Poverty Eradication (GESDPE) and Institutional Framework for Sustainable Development (IFSD)

Universities around the world are increasingly embracing strategies and initiatives focused on promoting environment and sustainable development focussed learning and research, campus sustainability, interdisciplinarity sustainability programmes and social responsibility. Higher Education has been identified globally as a critical agent in furthering sustainable development in society; particularly towards strengthening a knowledge economy and transformative practices associated with sustainable development and poverty eradication. (e.g. Rio Principles, Talloires and Tbilisi Declarations, Earth Charter, Treaty on Environmental Education for Sustainable Societies and Global Responsibility, Getting it Together: interdisciplinarity and Sustainability in the Higher Education Institution, UN Decade of Education for Sustainable Development, 2005-14).

The current environmental and economic crises highlight the urgency to develop and equip a cadre of leaders familiar with issues, challenges and solutions in relation to GESDPE and IFSD. These crises require a new kind of critical thinking to engage with uncertainty, and in the crafting of sustainable development models which reduce human ecological footprints, promote social equity and inclusiveness, strengthen economic fundamentals and reduce poverty. In addition, holistic thinking and understanding of current and future sustainability challenges are imperative. Academia can lead efforts that support social, economic and environmental innovations within and beyond campuses locally and globally, thereby generating large multiplier effects. Universities are well positioned for these efforts as they prepare immediate, energetic and alert leaders for following generations.

The Global Universities Partnership for Environment and Sustainability (GUPES) is a framework designed to address this need, bringing together over 100 Universities from across Africa, Asia and the Pacific, Latin America and the Caribbean, West Asia, Europe, and North America. Collaborative learning and action for sustainability networks, international communities of students, faculty and university leaders to foster environmental creativity and innovation are facilitated through the GUPES platform. In addition to concrete environmental benefits, the global GUPES platform offers intrinsic social and educational value.

The implementation of best practices developed by universities in their surrounding communities serve as teaching and learning tools, since they create new forms of research and teaching for applied science, technology, and engineering. As local and global centres of innovation, these efforts can spread ideas, experiences, technologies and practices to communities around the world who may otherwise not have access to such resources/experiences.

At the core of GUPES is the role Universities can foster for critical thinking e.g. on emerging ethics and values towards the next generation of planetary leadership.

#### Contribution of Universities to GESDPE:

1. Conceptualize, develop and apply the fundamentals of green economy at various levels, while addressing issues of scale, scope and power, through engagement with communities;
2. Develop metrics for measuring and evaluating the extent and progress in green economy initiatives at different levels;
3. Promote iterative and critically reflective processes to address issues of consumption, production and sufficiency, using culture as an aspiration;
4. Undertake Life Cycle Analysis as a key part of the Green Economy, through alternative models and options for eco-literacy, green education, green jobs, etc.;
5. Take a lead role in identifying local solutions for local challenges in the context of GESDPE; within a wider global context of sustainable development and poverty reduction.

#### Contribution of Universities to IFSD:

##### 1. Leadership:

Create intellectual capital and environmental leadership on critical environmental and sustainability issues and foster opportunities for sustainable development, whereby universities provide effective and efficient social learning platforms to shape actions, policy, legal frameworks and governance at local, national, regional and global levels.

##### 2. Institutions:

Generate innovative ideas and solutions on institutional change and mechanisms and processes for advancing sustainable development, taking into account current and future problems and prospects affecting humanity and the planet;

Develop institutional frameworks to effectively influence policy through knowledge generated at universities and systematically interacting with policy stakeholders, thereby facilitating inter/intra-generational connections/collaborations; Graduate a next generation of green leadership imbued with awareness and responsibility of contemporary environmental sustainability issues, innovative tools, expertise and networks.

##### 3. Research:

Conduct interdisciplinary research that can influence policy and practice, including translational research in addressing current and future sustainability challenges;

Conduct research that supports ongoing innovation in education, training and wider social learning systems that strengthen/fast-track re-orientation of societal structures;

Implement applied/action research aimed at alleviating communally identified and prioritized social, economic and environmental challenges at various levels, such as reduction of carbon emissions and reduced energy consumption.

##### 4. Teaching and Curriculum:

Integrate basic principles into education viz., equity, ethics, respect, social and ecological justice, thereby reaffirming agreed commitments, e.g. Earth Charter;

Review and renew curriculum and teaching methods to support learning that articulates with, and critically engages with new forms of knowledge, inter-disciplinarily, and with stakeholders, including business and civil society, including methods which encourage hands-on and minds-on learning;

Develop curriculum innovations and methodologies for successful teaching and learning in a changing knowledge environment;

Utilization of "living lab" applied and constructive teaching and learning models, that include interaction with local communities;

Ensure opportunities for values of empathy and innovation to emerge in university practice as well as critical reflections on the role of universities on sustainability; Transfer of appropriate science and technology and practical skills which encourage critical thinking and innovation.

##### 5. Community engagement:

Jointly research and apply sustainability initiatives with local communities.

##### 6. Practices:

Implement institutional (on-campus) sustainability practices (e.g. reducing carbon footprints) to transform campuses into green/sustainable campuses and adaptation approaches/strategies to impacts/risks of climate change.

#### University Action Recommendations to be included in the Zero Draft:

1. Increase awareness of GESDPE and IFSD at higher education for renewed political commitment;

2. Create institutional culture of sustainability and sustainability leadership at Universities;
3. Collaborate in new areas of knowledge generation, such as promoting systemic, inter-disciplinary and transdisciplinary approaches to research, teaching and learning on environment and sustainability issues;
4. Broaden service learning and outreach locally, nationally and internationally through the Global University Partnership for Environment and Sustainability (GUPES);
5. Create research, solution expos and other centres to support key aspects of GESDPE and IFSD application at Universities;
6. Transform university campuses into sustainable/green campuses, while connecting with local communities;
7. Re-orient university curricula to include concepts of Education for Sustainable Development (ESD) supportive of GESDPE and IFSD;
8. Seek out, support and recognize alternative networked sources of environmental leadership at Universities (e.g. student leadership);
9. Student-led/oriented/influenced higher education in the context of Greening of Universities;
10. Establish a sustainable cycle connecting Green Education, Green Jobs and Green Economy.

Universities can provide platforms where people and institutions move away from 'Business as Usual' to 'A Transformational Paradigm Change of Sustainability'.

Universities must be empowered to elaborate the concept, principles and parameters for a 'Green Economy in the context of Sustainable Development and Poverty Eradication'.

Universities are capable of adopting holistic and systemic approaches to promote relevant knowledge, teaching and learning in the transition towards the application of GESDPE and IFSD concepts.

There is an urgent need to recognize and prioritize the role of Universities as key hubs that facilitate transformational change towards sustainable and resilient societies.

---

## Global University Network for Innovation (GUNi)

### GUNi'S INPUT FOR RIO+20

#### Input on UNCSD Compilation Document

1. Expectations of Outcome: What are the expectations for the outcome of Rio +20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

In the Outcome Document, two key aspects for the construction of sustainable development should appear: the role of knowledge and its use, and the role of education in the construction of a sustainable future for humanity and the planet:

#### - The Role of Knowledge:

We are on the verge of a change in the model of civilization, which cannot be constructed from the old paradigms of a system which has already met its limits. Sustainability involves the development of a new culture that attributes a different kind of value to knowledge and that questions the assumptions on which we are sustaining the comprehension of the world and the human dynamics in it.

The major contribution of higher education to sustainability is the co-creation of pertinent knowledge for the understanding of reality, and of doing it with anticipation so as to play a proactive and committed role in the transformation and positive change of societies.

The role of higher education as agents of social transformation and how its visions and actions could be re-oriented towards a new understanding of knowledge, broadening the scope of the use of knowledge in society to facilitate the emergence of better and positive contributions to global human coexistence.

Renew thought for society: break the conformity of thought by proactively criticizing the world of ideas. Transform the paradigms and beliefs established in social, economic and political systems, how we organize our community and how this is reflected in our education systems.

Analyze the ethical, social and environmental implications of the advance of knowledge: Increase the resources invested in analyzing the impact of science and technology and augment the capacity to absorb their expansion, in all aspects of human life.

#### - The role of Education:

Education is the key for change: sustainable development is a learning process, a way how people is prepared to live and to understand the world they live in. Rethink how we prosper, specially how we do it collectively and then we have to reconsider how we are educating and for what purpose. Now is the moment to widen the scope of education and research in society and to move beyond creating socio-economic wellbeing towards the transformation of society as a whole and the creation of a sustainable global community.

2. Comments on Existing Proposals: What are the comments, if any, on existing proposals: e.g. a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

HEIs can contribute to a green economy and to sustainable development goals by providing the lessons learnt by its research, through the training of the professionals of the future, and by introducing technological advances.

#### - Research

Experiences and lessons learned: provide solutions through research and through higher education experiences on sustainable development. Democratize access to knowledge and research: provide open access to expert knowledge, making it as useful as it can be for international organizations, UN system, governments, civil

associations and citizenry. Move to the idea of socially relevant knowledge as human heritage.

Networking and research for local needs and global challenges: Cooperation and co-creation of knowledge and technology. Local needs require local proposals in global frameworks, and global challenges require global solutions that are locally acceptable. However, global solutions can come from local experience and vice versa. Explore how to link scientific research and political decision making related to collective well-being.

- Training and development of professionals that can lead the shift towards sustainability

Go beyond educating professionals to educating citizens: The mission of higher education is to prepare critical professionals, with ethical awareness and civic commitment. Know how to contribute to the common good through professional practice. Educate for locality, democracy, citizenship, intercultural dialogue and relations, peace building, sustainability, global social justice and a deep understanding of life's dynamics. Make links with previous levels of education. Introduce complexity, uncertainty and transdisciplinarity in the training and in research, towards a holistic vision of reality. Link different areas of knowledge in order to understand complex issues and find solutions to the great problems in the local and global context.

- Technology

Incorporate sustainability in the creation of technology: shift paradigms from individual competitiveness, economic profitability and a short-term focus to the collective, with social and human benefits and sustainable in the long term.

3. Views on Implementation: What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.) It is necessary to shorten the time in which knowledge reaches society. The democratization of knowledge and education must bring better decisions and actions based on a suitable use of knowledge.

The access to education and specially to higher education is an indicator of human development and there is a co-relation between education and the eradication of poverty (source: GUNI Reports on Higher Education in the World).

4. Implementation Tools and Timelines: What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Open up to society: proactive engagement in dialogue with citizens and the rest of social, cultural and economic stakeholders. Create a true knowledge-based society through engagement with society as a whole. Provide a plurality of expert advice in dealing with green economy, poverty and the sustainable development goals. The creation of real partnerships for the co-creation of knowledge and answers to problems and to co-create visions for the future. Partnerships between higher education institutions (at all levels or scales), partnerships with the community stakeholders, and partnerships with governments, NGOs, civil associations, etc. Become cosmopolitan centres of global culture: build bridges between different cultures and sources of knowledge. Knowledge is no longer produced exclusively by and consumed within universities. Instead, their task should be to connect different kinds of knowledge, forging links between knowledge and citizenship.

The Role of Tertiary Education

HEIs can play a significant role in building a sustainable paradigm. They may help in facing local and global challenges, facilitating society to answer major global challenges. Their vision and action could be reinforced with a role review towards the creation and distribution of socially relevant knowledge in education and research and in the relationship with communities. They can support, and even anticipate, ways for action to play a proactive and committed role in rebuilt societies.

Higher education can prepare people to handle complex realities in a simple way and they should integrate emotional abilities with instrumental and knowledge related abilities. They can train people to learn to learn; to fully understand uncertainty and change; to handle a vast and complex universe of data from many sources and of many different natures; and to discriminate between information, knowledge and wisdom. They can train people to understand what we are, what we are like and how to be, both as individuals and as a group, and to manage their own education and development throughout life. It is an education based on the development of the individual. It is about learning to be, to know, to do, to live together and to transform oneself and society. All this implies personal, family and societal well-being; respecting and searching for knowledge and wisdom; engagement in productive work and recreation; social justice and cohesion; inter-cultural and international co-operation and peace; food security; active citizenship; futures thinking; responsible lifestyles; sharing of resources; and adaptability.

## Gray Panthers

Gray Panthers Statement on Rio+20 2012

Green Economy, Sustainable Development and Poverty Eradication

June 4-6, 2012, nations will come together in Rio de Janeiro for the Earth Summit to discuss sustainable development and search for agreeable outcomes. In order to achieve a win-win agreement, we must understand the problems and the needs and work together to achieve mutually acceptable goals.

Problems and needs

The following regions have identified the described problems in achieving a green economy and sustainable development:

Asia & Pacific Region: Depletion of fresh water resources; industrial pollution; poor waste management; rising sea level; marine and ocean resources management problem; and inefficient institutions and governance.

Latin America & Caribbean Region: Lack of science / technology knowledge and financial resources; high poverty rates without basic services and adequate medical care; small island states need knowledge of disaster prevention and preparedness through education and media communication. Call for the creation of more efficient parameters for assessing a country's wealth and appeal for a global institutional mechanism to foster sustainable development.

African Countries: Need to meet the growing demand for water, food and health and to create employment to reduce poverty. Major employment opportunities are in natural resource-based sectors such as agriculture, the mineral sector, forestry, fisheries and tourism. However, African countries face threats of environmental degradation, including deforestation, soil erosion, desertification, loss of biodiversity, depletion of fish stocks and effects of climate change; Lack of information, expertise and technology.

Arab Region: The food crisis, water scarcity, large population growth and the absence of waste management are the main problems. Need to improve education and promote vocational training. Call for national country analyses on country-specific strategies for greening economies.

The UNECE Region: focuses on helping countries of Eastern Europe, Caucasus and Central Asia and of South-Eastern Europe to improve their environmental standards.

Propose "Green Bridge" Partnership Program to enhance cooperation among Asia, Europe, and the Pacific and to encourage transfer of clean technology, joint investments, exchange of experiences, and the preservation of common ecosystems.

Gray Panthers recommendation for sustainable solution:

Gray Panthers believes there is no "one-size-fits-all" approach for greening the economy and poverty eradication. Only through collective action and partnership from governments, private sector, local authorities, and civil society can countries achieve sustainable outcomes with the help of international experts and UN agencies. Countries can improve efficiency and delivery of water systems, desalinization processes and waste management system. They can promote near carbon free activities, renewable energy, sustainable transportation and agriculture.

Gray Panthers offers the following recommendations:

1. Agree on an international green economy roadmap with CO2 emission commitments and financial support commitments.
2. Make nation country-specific strategies be inclusive, partnering with the private sector, civil society, academia and local authorities. Partner with regional economic communities as well as international institution and UN agencies. The strategies must be people-centered and be included in national laws.
3. Set up targets and indicators for a green economy for environmental and resource assessment, environmental qualities of life, job creation and market signal.
4. Create an expert council and establish periodical environmental performance review mechanism to monitor and evaluate at all stages of programming.
5. Share the best practice experiences. Example are Kawaa village solar energy electricity service; India's rainwater harvesting technique; Australia's Astana Water Action (AWA) that centralized networks for urban waste water collection and treatment as well as drinking water supply. Another example is Singapore's water and sanitation utility for rain water catchment, reclaimed water, and desalination systems.
6. Use shared environmental information system (SEIS) to register all the above activities. SEIS serves as a constant reminder of commitment and progress of achievement. SEIS improves transparency, avoid overlapping activities and serves as networking and educational tool for carbon footprint, sustainable consumption and production, and sustainable life style.

We are one world. We are black, white, yellow, brown, indigenous, men and women, young and old, rich and poor. We are citizens of developed countries, developing countries, in public or private sectors, businessmen or consumers, NGOs or expert institutions. We all have human rights. Gray Panthers believes human rights for all are the basis for sustainable development and poverty eradication. We call upon member states to fully utilize the existing accomplishments, best practices, and recommendations to negotiate in good faith to achieve a win-win agreement for all.

---

## Green Budget Europe

Environmental Fiscal Reform (EFR)

The key to achieving a green economy

GBE demands for the Rio+20 summit

- Removal of market distortions which work against the environment and climate change mitigation, by means of the internalisation of external costs, must be agreed to constitute a fundamental principle of a green economy by governments in Rio.
- EFR - the abolition of environmentally harmful subsidies and the introduction or increase of environmental taxes - must be identified as one of the most central and fast instruments for the realisation of a green economy. All governments must make a concrete commitment to implement EFR in the immediate future.
- Industrialised countries should lead the way by committing to raise the share of environmental taxes in overall taxation to at least 10% and phase out all environmentally harmful subsidies - both by 2020.

Green economy - a fig leaf for business as usual?

A green economy is one which ensures that the market treats humanity, the environment and capital, at least on an equal basis, in terms of taxation, legislation, accounting, and so on. Green economy has become the new buzzword in sustainable development. However, neither the requirement to fundamentally reform the way our economies work, nor the urgency of making such changes to prevent dangerous climate change and irreversible environmental deterioration are reflected in the current policy discourse. For the concept not to become a meaningless mantra or, worse, to be misused as a fig-leaf for a capitalism painted green and stripped of the social objectives of sustainable development, concrete principles and objectives for a green economy must be agreed upon by governments at the Rio+20 summit. Our ecological objective is clear: to avoid catastrophic environmental change, humanity must stay within defined planetary boundaries for a range of earth-system processes. These planetary boundaries have already been overstepped in relation to CO2 concentrations in the atmosphere, radiative forcing, rate of biodiversity loss, and the amount of nitrogen removed from the atmosphere for human use. Consumption of natural resources is also rapidly reaching unsustainable levels - Europeans today consume an average of 16 tonnes per year, while the UNEP International Resource Panel estimates that global annual consumption of 6 tonnes per capita is sustainable. The realization of a green economy will require a number of policy measures. However, the most fundamental must be to ensure that prices tell the ecological truth and provide steady incentives for environmental improvements, particularly by correcting market distortions that encourage pollution and the depletion of natural resources. EFR is an essential tool for the realisation of this process and should be at the centre of the move to a green economy. Other market based instruments should not be ruled out, but they do not act with the force and speed of EFR.

EFR as a tool to bring about radical change

The IPCC's Fourth Assessment Report in 2007 identified market distortions as one of the most significant barriers to climate change mitigation. Because the market price of certain environmentally damaging goods and services does not reflect their environmental, social and economic costs, false prices in the market encourage polluting or high-emitting behaviours. Costs not internalised in market prices have to be paid by those populations most vulnerable to climate change and environmental deterioration, as well as by future generations.

EFR redistributes the burden of taxation, and reforms mechanisms within the fiscal system, so that environmentally harmful activities become more costly, thus creating appropriate price signals for producers and consumers to reduce pollution and inefficient energy and resource use. EFR can therefore correct market failures, because it includes the costs of environmental and social damage or resource use in the price of a particular pollutant or resource, e.g. by means of a tax, or as a result of the removal of an environmentally harmful tax exemption or subsidy. Correcting these market failures improves economic efficiency and raises additional revenues, which be used e.g. to reduce the tax burden elsewhere, for poverty alleviation, or to reduce budget deficits and thus contribute to solving the current fiscal and economic crisis.

Implementing comprehensive EFR means that a country's spending and annual budgeting, its taxation policy, and the markets within and beyond its borders, are designed and act in such a way that they protect the environment. Thus, EFR harnesses the power of the market – one of the most influential mechanisms policy makers can use to change behaviour, particularly that of diverse and diffuse actors – to reduce environmental damage. Markets and price signals which consistently act in favour of environmental protection and greener economic development will change the way we produce and consume goods and enhance energy and resource efficiency.

There is considerable evidence that the relative price changes resulting from EFR as a stand-alone instrument can achieve significant greenhouse gas (GHG) emissions reductions. Indeed some EU countries, e.g. Sweden and Denmark, have achieved conclusive decoupling of GDP growth and GHG emissions. Econometric modelling has demonstrated that global cooperation on the introduction of a radical environmental tax reform in 2010 could cause GHG emissions to decline by as soon as 2020 with relatively low impacts on GDP growth (Ekins 2009). In the absence of alternative policy proposals predicted to bring about anything close to this level of emissions reduction, we can ill afford to ignore the case in favour of EFR.

Environmental fiscal reform in developing and industrialising economies EFR tends to be overlooked in the context of industrialising and developing economies, in spite of the fact that it has the potential to make even rapid economic development in e.g. the BRICS, compatible with environmental and sustainability goals.

In these countries, where governments collect comparatively low levels of tax revenue, it may be preferable to use environmental taxes to raise additional revenues for e.g. health or welfare, rather than to implement a green tax shift.

Environmental taxes have a particular appeal in the context of developing and industrialising economies, as they are often easy to implement, difficult to evade and have low administrative costs. A tax on transport fuels, for example, can use collection mechanisms already in place for excise duties and target a small number of taxpayers, thus keeping evasion to a minimum. Additionally, most environmental taxes are designed to be progressive. This is the case for transport taxes, for example, particularly in lower income countries where motorisation rates are low. Where regressive impacts are a concern, flanking measures can be implemented – e.g. compensation mechanisms or support in switching to alternative technologies or behaviours – to protect the socially vulnerable from the impact of increased energy or resource prices.

Environmental taxes will drive the economy towards sustainable growth, helping developing and industrialising economies to avoid the mistakes of the industrialised economies, their over-consumption of resources and land, their unlimited increase in GHG emissions, their production of water pollutants and landfilled waste, and their disproportionate impact on the planet. A common argument against the expansion and increasing reliance on the environment as a stable source of revenue is the concern that revenues will fall over time. However, many of these tax bases are extremely large and will be available long into the future, e.g. energy, waste, water, materials, land values, etc. To deal with such concerns and minimise the rebound effect increased use of energy / resources in response to increased efficiency environmental tax rates can be progressively increased in line with gains in e.g. resource or energy efficiency to maximise the dynamism of price incentives to change behaviour over time (see e.g. Weizsäcker 2009). Furthermore, environmental degradation constantly assumes new forms, which call for new taxes.

#### Phase-out of environmentally harmful subsidies

Government budgets in many developing and industrialising countries are lower than in the industrialised world and on average, tax revenues amount to a much smaller proportion of GDP than e.g. in the European Union. Thus it is all the more important that these countries do not spend their limited revenues inefficiently or unnecessarily, or in a way that contradicts other policy goals. Prime examples of wasteful spending are environmentally harmful subsidies (EHS). These often entail additional government spending or lost revenues due to favourable tax treatment of practices which effectively counteract environmental policy or support unsound environmental practices. EHS are a way of paying polluters to pollute the very opposite of the polluter pays principle. Neither industrialising and developing countries, nor those industrialised countries with severe budget deficits, can afford to spend scarce revenues on environmentally damaging practices.

Removing subsidies in energy, water, fisheries and agricultural sectors alone would save 1-2% of global GDP every year, revenues which would be freed up e.g. for investment in low-carbon industries and green technologies (OECD 2011). The phase-out of global fossil fuel consumer subsidies by 2020 would incentivise greater rates of energy efficiency and a shift to renewable energies and so reduce global CO2 emissions by 6.9% by 2020 the combined emissions of France, Germany, UK, Spain and Italy (IEA 2010).

The sheer scale of spending on EHS highlights the potential of reform to turn around the way our economies work - simply by changing the way governments spend money. Subsidy reform also has multiple benefits alongside environmental improvements, including more efficient public spending, fewer market distortions and policy contradictions, and health and welfare benefits. Subsidy reform and its associated benefits can make a significant contribution to the necessary 'leapfrogging' of developing and industrialising economies onto a greener development path.

#### Summary

If the Rio+20 summit is to secure renewed political commitment for sustainable development, it must also muster political commitment to secure the means of realising sustainable development - and this should include serious political commitment to implement EFR.

We often say that money makes the world go round. If we accept this basic premise, then EFR, which seeks to harness the power of money to incentivise changes in the behaviour of producers and consumers, must surely be amongst the most powerful tools of all. EFR not only offers governments the means to cope with their often large and increasing budget deficits, but also to radically reform and green the global, national and local economies. Radical EFR is one of the most feasible means of preventing dangerous and irreversible climate change, as it deals with obstacles to change - market failures - and uses the power of the market economy itself as the driving force for reform.

## Green Cross International

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

- For the Rio+20 Conference to result in a plan for transformative action to put the global community on the path to sustainable development. We can no longer afford a process that merely creates new treaties and conventions. The time has come to put the spotlight on individual and collective actions of governments to achieve sustainable development goals.
- For country representatives and state leaders to use this platform and announce specific and incremental (new) sustainable development initiatives, challenges, commitments and how they can work as part of a global, inter-governmental framework to promote an effective means of sustainable development.
- For the Rio+20 ambitious and action-oriented outcome document to be politically-binding and to recognize the imminent threat of exceeding our planet's natural limits. It must recommit governments to act on their promises and ensure that these are sufficient to address the scale of the challenges that we are facing to ensure development path that

is truly sustainable – for the sake of their populations and of humanity as a whole. Such political commitments must be aggregated and presented in an appendix of country commitments to the outcomes document for a global registry of sustainability actions. Adequate enforcement mechanisms must be incorporated.

- For the document to provide specific solution-paths commensurate with the declared ambitions of the Summit. For example, the document could envisage the curtailment of military expenditures and propose such proceeds be invested meeting Millennium Development Goals and other initiatives that promote sustainable development, particularly in the global south. Two decades since the end of the Cold War, over 20,000 nuclear weapons still exist, with many on high alert and each much deadlier than those that devastated Hiroshima and Nagasaki in 1945. Almost US\$105 billion was projected to be spent on nuclear weapons in 2011, up from US\$91 billion in 2010. Shifting such monies away from weapons to sustainable development would have profound impacts on the lives of over 3 billion people and would promote security and stability around the world. Spending US\$105 billion annually over five years could:

- o Lift 1 billion people out of poverty.
- o Allow 60 million more children to live past their 5th birthdays.
- o Supply 700 million people with clean drinking water.
- o Give 1.3 billion people access to basic sanitation.
- o Provide 280 million children with proper nutrition.

- For the document to reflect the need to re-invent our measures of progress and recognize the need to incorporate “externalities” in decision making models. Following the 2008-09 economic crisis, we need to re-invent our operating models in a way that is transparent, inclusive, environmentally sound and socially fair. Speeding up the phase-out of subsidies for practices that are destructive socially and to the environment must be identified as a priority.

- For the adoption of the Earth Charter as a fundamental document to promote and reinstall principles of shared ethical and spiritual values in making the transition to a sustainable way of life.

- Skepticism over the world’s ability to achieve the Millennium Development Goals is unacceptable. A new vision and energy is needed to report and monitor how to achieve these goals to ensure their noble aspirations are fulfilled.

- Expanding the set of five thematic clusters for reporting, as proposed by Resolution 64/236 to include “security in the context of sustainable development.”

- For Green Cross International to be given the mandate to report biennially on our subject matter area, that being the nexus of environmental degradation, insecurity and poverty eradication, and to monitor how sustainable development practices can achieve positive gains in these areas.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

- The outcome document for Rio+20 must stress the need for a holistic response to our sustainable development challenges, one that ensures a systemic approach to security, poverty and the environment.

- Greening of the economy is just one part of what must be a multi-layered response. As a starter it will incorporate a dramatic increase in resource productivity, a reduced reliance on fossil fuels and a switch to alternative and renewable sources of energy. We cannot be fooled into thinking such “economic greening” will be the silver bullet for sustainable development. Rather, this is just a step on the road towards sustainability, and the global community must invest equal energy in securing peace, eradicating poverty and protecting our natural resources.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

- All sectors of modern society, governments, corporations and civil society, must contribute to the process of sustainable development.

- We must first close the gap between rhetoric and reality. In celebrating the green successes of corporations and governments we must ensure that their actions truly represent progress for the sustainability agenda.

- A dramatic increase in resource efficiency and waste reduction is a top priority. Waste is the enemy of sustainability. Smart energy and smart water initiatives must be celebrated to enable the access to alternative and renewable energy sources and safe drinking water globally. Systemic solutions must be implemented to reward institutions and corporations that adopt behaviors that are socially and environmentally desirable.

- A mechanism of accountability and enforcement is needed to ensure governments and economic groupings keep to their promises and commitments when it comes to sustainable development.

- The contribution of civil society in advancing sustainability objectives must be recognized, promoted and given a more meaningful, actionable role in implementing sustainable development measures globally.

- In recognition of the short-term limitations of political cycles, sustainability must be given a permanent platform that transcends these time limitations in order to allow the implementation of socially desirable objectives with longer-term horizons, including those of future generations.

- The capabilities of the United Nations, through the Commission on Sustainable Development and other mechanisms, must be enhanced to allow for greater actionable leadership to advance sustainable development objectives. Climate change and environmental degradation require adequate a more effective institutional framework that should be determined at the highest possible level and warrants the involvement of the UN Security Council.

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

- Civil society organizations, as representatives of the global community, must be enabled to cooperate in a more effective and meaningful manner when it comes to global sustainable development initiatives. This can be fostered within the existing United Nations system.

---

**Specific Elements**

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

- For the document to provide specific solution-paths commensurate with the declared ambitions of the Summit. For example, the document could envisage the curtailment of military expenditures and propose such proceeds be invested meeting Millennium Development Goals and other initiatives that promote sustainable development, particularly in the global south.

- Expanding the set of five thematic clusters for reporting, as proposed by Resolution 64/236 to include "security in the context of sustainable development."

- For Green Cross International to be given the mandate to report biennially on our subject matter area, that being the nexus of environmental degradation, insecurity and poverty eradication, and to monitor how sustainable development practices can achieve positive gains in these areas.

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

- Greening of the economy is just one part of what must be a multi-layered response. As a starter it will incorporate a dramatic increase in resource productivity, a reduced reliance on fossil fuels and a switch to alternative and renewable sources of energy. We cannot be fooled into thinking such "economic greening" will be the silver bullet for sustainable development. Rather, this is just a step on the road towards sustainability, and the global community must invest equal energy in securing peace, eradicating poverty and protecting our natural resources.

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Green Cross International was created in 1993 in response to a call made during the 1992 Rio Earth Summit to create a Red Cross for the environment that would apply the emergency response model to ecological issues and trans-border environmental crises. Today, Green Cross operates in over 30 countries and works through advocacy and on-the-ground projects to address the nexus of environmental degradation, security and poverty eradication.

Two decades since the idea for a Green Cross was floated, we return to Rio for the 2012 UN Conference on Sustainable Development as a fully-fledged global organization, determined to help maximize the outcome of Rio+20.

#### Conclusion

Green Cross recognizes the United Nations position that eradicating poverty, changing unsustainable patterns of production and consumption, and protecting and managing the natural resource base of economic and social development are overarching objectives of and essential requirements for sustainable development.

This same premise was also well understood in 1992, but clearly not enough has been done in the 20 years following to respond to such realities.

We cannot afford to allow another two decades pass without taking urgent, concrete action on these fronts. Failure could result in irretrievable consequences. Success, however, can ensure a brighter future for humanity today, tomorrow and in the future, as well as for the planet that sustains us.

## Green Economy Coalition

Green Economy Coalition Submission to UNCSD Zero Draft Text

1 November 2011

### 1. Introduction

The Green Economy Coalition<sup>1</sup> (GEC) brings together trade unions, consumer organisations, NGOs, academic institutes, businesses and UN bodies. We represent different constituencies, we specialise in different areas and we come from different parts of the world. Despite our diversity we have come to understand that the multiple crises we face as a global community are not only interconnected, but share the same systemic root causes. We have come together because we share a common vision and a joint mission. This submission represents the broad consensus across the coalition. The 2012 UN Conference on Sustainable Development comes at a critical point in history. The time has come to take action and to provide the kind of leadership that for too long has eluded us. We must be able to look back on 2012 as the year when we set in motion a new economic pathway to steer finance back to its true role of serving, not dominating, real economies<sup>2</sup>, in order to restore resilient ecosystems and generate prosperous communities for all.

Our vision is one of a resilient economy that provides a better quality of life for all within the ecological limits of the planet

Our mission is to accelerate a just transition to a green and fair economy

We wish to see the Rio 2012 conference commit to the policies and targets that help build an economy that provides a better quality of life for all within the ecological limits of the planet. The GEC calls on governments to agree to the following targets:

1. By 2015, to have created a clear plan on how to end poverty, with an agreed target for its achievement
2. By 2015, to produce national green economy roadmaps founded on the principles of sustainable development, that include nationally self-identified targets to double the number of 'green and decent jobs' as a result of sustainable investments and decent work policies
3. By 2015, to deliver all ODA commitments on the part of both developed and developing countries
4. By 2015, to have developed relevant metrics to measure societal and environmental 'wealth', beyond GDP and macroeconomics. This should be signed and implemented

by all states by 2020

5. By 2020, to mainstream ecosystem values into central banks, International Financial Institutions, national planning and corporate accounting

6. By 2030, achieve the UN's objective for sustainable energy<sup>3</sup> to provide universal access to modern energy services, doubling energy efficiency and doubling the share of renewable energy in the world's energy supply

2. Green economy in the context of poverty eradication and sustainable development

#### Principles

The transition to a green economy will be specific to the economic, political, cultural and environmental context of each country; no 'one size fits all'. To understand these different contexts and visions, the Green Economy Coalition has supported a series of national dialogues in India, Brazil, the Caribbean and Mali. Each process generated distinct conversations, which addressed the particular challenges and opportunities of different national contexts. However, a number of converging themes have emerged across all of the dialogues. Above all there is an acute frustration at the failure of the present economic and financial order to move the world closer to sustainability and shared prosperity.

The national dialogues have emphasised that the transition must be built on the following principles: SUSTAINABLE DEVELOPMENT

Sustainable development remains the most important and relevant development paradigm for dealing with the converging economic, ecological and climate crises. However, bringing attention to the economic components of development through a focus on 'green economy' is a useful lens and should prompt more sustainable economic management, particularly concerning consumption and production. A transition to a green economy must be a vehicle for achieving sustainable development.

#### EQUITY

The current financial and economic system has failed to adequately address the immense inequity, both within and between countries. Inequity is a considerable barrier to achieving progress towards more sustainable lifestyles. A green economy must include a more equitable development model. A green economy must eliminate poverty and make the lives of the poor more secure and their livelihoods less precarious. It must generate new opportunities for small and micro-entrepreneurs, including those working in the informal economy, and recognise unpaid, voluntary work and all forms of wealth that are beyond money. It must commit to trade equity by creating new opportunities for developing countries in domestic and foreign markets, rather than setting up standards of production and verification that developing country exporters cannot meet.

#### RESILIENCE

The means by which governments, businesses and financial institutions have pursued economic growth through unsustainable uses of natural resources and patterns of consumption have left people and the environment vulnerable and exposed. A green economy must build resilience into ecosystems, societies and the economy itself. In order to build resilience into societies and the economy, a green economy must build strong social protection systems including social transfers, income security, health security, child benefits, maternity protection, unemployment benefits, good quality essential public services, adequate nutrition, housing and education. It must make natural resource-dependent sectors productive, durable, respectful of natural limitations and capable of providing employment opportunities. It must generate new jobs and training for all economic actors including those in the informal sector, young people and women. It must support SMMEs, CSOs, voluntary work and communities.

#### ACCOUNTABILITY

We will only reach a more equitable and sustainable economy for all actors, including governments, if businesses are made accountable for their actions and decisions. Business models based on externalising costs to taxpayers and future generations must be phased out. Markets must be better regulated, with good practices rewarded and bad practices penalised. Appropriate incentives for the private sector based on full-cost pricing and lifecycle costing need to be generated and enforced, particularly for SMMEs. Economic textbooks and business school curricula must be modernised, and financial asset managers re-trained and re-certified accordingly.

#### CITIZEN EMPOWERMENT

Economic and financial decision making has been consolidated in the hands of a few powerful stakeholders. Green economies will need to be owned and defined by a range of economic actors that includes workers, consumers, small producers and entrepreneurs, women and young people. This will require an empowered civil society that has the capacity and the knowledge to allow these actors to actively participate, shape and monitor decision making at all levels.

#### 3. Rio 2012 commitments

With these principles in mind, the Green Economy Coalition members urge governments to commit at Rio 2012 to the following areas of change:

i. IMPROVING GOVERNANCE AND MEASUREMENT: green economic governance will redefine 'progress' in light of environmental and societal needs, and make governments, businesses and citizens accountable for their actions

- Commit to develop and implement relevant ways of measuring national 'wealth' beyond money, specifically with new indicators on societal wellbeing and environmental health. Global metrics should build on and develop the work already carried out by NGOs and governments including the Nine Planetary Boundaries, Ecological Footprint, Stiglitz Report, the OECD's Better Life Index and Genuine Progress Indicator, the Canadian Index of Wellbeing, the Millennium Development Goals dashboard and the Calvert-Henderson Quality of Life Indicators, to measure the sustainability of income through access to a range of indicators including health, education, political decision making, security and the fair allocation of resources, all of which should be publically displayed on websites. Beyond the Stiglitz report, GDP itself must subtract externalities and report net incomes per capita. UNCSO should reach agreement on a deadline to endorse common methods and practices, with a view to producing global standards, so that nationally defined indicators can be comparable at the international level and with appropriate tools for monitoring and assessment.

- Commit to the concept of Sustainable Development Goals, linking to the relevant ways of measuring national 'wealth' on societal wellbeing and environmental health (including development and environmental objectives such as poverty reduction, energy access, footprint reduction, planetary boundaries, water management, resource efficiency, food production, agriculture and ranching, marine and fisheries). Any agreed set of SDGs should have universal targets and transparent public indicators for both developing and developed countries, and involve active participation on the part of all stakeholders.

- Commit to global and regional convention(s) as well as national commitments to fully implement Principle.

- All large private and public enterprises should be required to internalise all external costs, and report on their environmental and social impacts and contribution to wellbeing, or explain why they do not. We call on governments, international bodies and major groups including business to:

" Acknowledge the growing practice of sustainability reporting, and that improving corporate management and performance, facilitating stakeholder engagement, driving innovation and competitiveness all represent an essential contribution to the transition towards a Green Economy.

" Note that the increased quantity and quality of data available through sustainability reporting helps markets work more efficiently.

" Commit to develop a global policy framework that requires all listed and large private companies to consider sustainability issues and to integrate material sustainability information within their reporting cycle, and in their Annual Report and Accounts - or explain why if they do not. The global policy framework, which could take the form of a Convention, should adhere to three key principles:

o report or explain - establish a report or explain approaches to sustainability reporting policy;

o transparency - enhance transparency by requiring national measures that would mandate the integration of material sustainability issues within the company reporting cycle, in their Annual Report and Accounts;

o accountability - provide effective mechanisms for investors and all stakeholders to hold companies to account on the quality of their disclosures, including for instance an advisory vote at the Annual General Meeting (AGM).

" Recognize the need for a process that builds on data available through sustainability reporting, leading to the development and adoption of macro-level, multi-disciplinary metrics such as the Sustainable Development Indicators that, beyond GDP, would allow a more comprehensive measurement of wellbeing, environmental health and the progress made towards a green economy.

" UN member states should commit to using their power and influence within international economic bodies such as the World Bank, IMF, and WTO, in order to update their economic and financial models and to enable these bodies to play their full part in the global transition to a green economy.

- Expand support for certifications that use a balanced multi-stakeholder, science-based approach and operate with a transparent system allowing for certification and trade of goods, and that come with robust, independent and reliable verification requirements. Further, commit to develop certifications based on these principles for goods that are currently not covered, as well as for carbon trading. Ensure these mechanisms bring together governments, business, trade unions and civil society in order to foster certification criteria clearly grounded in science. Ensure that implementation, evaluation and monitoring of certification standards are open and transparent, inclusive and democratic in a way that consumers and producers can trust. Develop and enforce mechanisms for supporting achievement of certification by sustainable producers, including smallholders, in the developing world.

- Governments commit to supporting national and regional multi-stakeholder dialogues for a green economy. Our work has clarified that there is no one definition of a green economy. In order that green economies both prosper and meet the needs of local conditions they require national civil society and business engagement, action and the new forms of governance this will stimulate. We urge governments to support national multi-stakeholder dialogues and processes. By June 2012, GEC will have supported dialogues and follow-up processes in several countries and regions, from which it is expected that more specific calls for commitment may arise to meet particular needs. These processes and others like them need to be supported.

ii. DRIVING INVESTMENT AND FINANCIAL FLOWS: a green economy is one that will drive investment and financial flows towards restoring our environment and generating a better quality of life for all

- All public procurement contracts should include specifications for labour and environmental sustainability standards. Well-designed purchasing rules will stimulate a critical mass of demand for more sustainable goods and services, drive innovation across the supply chain and generate green, decent jobs.

- All financial transactions including foreign exchange transactions and foreign exchange derivatives should be subject to a Financial Transaction Tax<sup>7</sup> (FTT). Some funds levied from the tax should be ear-marked for the commitments from UNCSD.

- Pledge to phase out subsidies that undermine sustainable development.

- Support financial market reform to put an end to short term trading, ensure safe and fair financial services for consumers, and ensure that long term sustainability is mainstreamed into all financial services. In particular via support for newly established international oversight groups such as the Financial Stability Board, as well as the underlying framework contained in Basel III by including protection of ecosystem stability.

- Introduce fiscal policy, incentives and state owned investment vehicles, bonds and guarantees to drive increases in private investment flows towards resource efficiency and renewable, reliable and sustainable energy and water supplies in developing countries.

- Phase out the use of publicly funded communications infrastructure in high-frequency trading, naked credit derivatives and excessive leverage to prevent finance bubbles.

iii. INVESTING IN NATURAL CAPITAL: investing in, protecting and building the resilience of our ecosystems and biodiversity, for today and for future generations

- Strengthen and invest in government processes responsible for natural resource management and ecological restoration, and particularly in the natural systems on which poor and indigenous communities depend for their livelihoods, including drylands, wetlands, forests, freshwater water bodies and seas:

" Restore and safeguard ecosystems that provide essential services related to water, including along rivers, around lakes, in mountains and on steep slopes, and in coastal areas such as headwaters, floodplains, flooded forests, wetlands, aquifers' recharge zones, riparian vegetation and mangroves, as set out in Target 14 of the CBD Strategic Plan.

" Halt and reverse forest loss. Paying to preserve forests is a sound investment in order to sustainably provide goods (food, medicine, timber, construction materials) and services (preserving watersheds, stabilising soil and preventing erosion), as well as significantly contributing to greenhouse gas emission reduction.

Investing in the REDD+ mechanism under the UNFCCC, while ensuring the active participation of all affected communities and relevant stakeholders and that all carbon-markets are transparent and verified to prevent fraud and manipulation, offers a unique opportunity towards greening the economy. Any focus on carbon sequestration and storage should not outstrip the wider ecological values of forests, and such payments should not come at the expense of investments in energy efficiency or renewable energy. " Comply with Target 11 of the CBD Strategic Plan and use protected areas as a means of preserving the ecosystem services that are enjoyed by people in broader landscapes and seascapes.

" Prioritize the rehabilitation of degraded, abandoned or underperforming lands rather than farming in new areas.

" By 2015, significantly strengthen and invest in multi-stakeholder processes responsible for allocation and sustainable management of resources, highlighting the role of indigenous and traditional knowledge of sustainable natural resource management; for example by standard-setting for forest management certification, and land-, sea- and water-use planning within and between countries, as well as on the high seas.

" Commit to creating community owned natural resource management, thereby providing decent jobs for all.

" Mainstream ecosystem values into economic planning and all accounting systems. Commit to meeting Target 2 of the Biodiversity Aichi Targets: "by 2020, at the latest, biodiversity values have been integrated into national and local development and poverty reduction strategies and planning processes and are being incorporated into national accounting, as appropriate, and reporting systems". The Global Partnership for Wealth Accounting and Valuation of Ecosystem Services (WAVES)<sup>9</sup> offers a strong foundation for further strengthening this important area of work.

Develop appropriate economic and reporting tools, markets, incentives and policies, including Payment for Ecosystem Services (PES), to account for and maintain the benefits of ecosystems and of water, energy and food security for livelihoods and economic development. These should target not only corporations, but also local entrepreneurs, in order to generate new green businesses and 'green' existing ones.

- By 2015, there needs to be an international agreement on metrics to define a healthy natural system, involving all relevant stakeholders, and building on and bringing together work on the Millennium Ecosystem Assessment, Nine Planetary Boundaries, the European Parliament and Commission's Beyond GDP 2007, ecological footprinting and other measures. iv. INVESTING IN PEOPLE: a green economy is one that allocates environmental benefits and costs fairly to achieve a more just and equitable society
  - Support the establishment of and access to financial assets for rural and urban poor, and for SMMEs, by means of user-friendly schemes for financial services (such as micro-credit, meso- financing, credit unions, cell phones).
  - Actively promote equitable ownership and workers' rights across the economy, including in emerging industries, ensuring that social protection and dialogue are integrated into the core of decision-making.
  - Invest in education, training, skills development and capacity building to ensure a just transition for all workers.
  - Invest in building innovation systems in developing countries so that local capabilities for meeting and exceeding the MDGs can be improved over the longer term.
  - Encourage all countries to include a comprehensive program of value-based, holistic, interdisciplinary and practical education for sustainable living in their curricula, teacher training, school activities and consumer education activities.
  - Ensure the implementation of the UN Guidelines for Consumer Protection, in particular section G on sustainable consumption.
  - Increase investment by at least US\$35 billion worldwide in renewable energy capacity in developing countries, with international cooperation on the development, transfer and dissemination of technologies designed to facilitate energy-efficient, resource-efficient, low carbon and low-entropy economic development. Focus on supplying people in rural areas with greater access to reliable, affordable and sustainable energy supplies.
  - Commit to providing technical and financial support for public renewable energy systems and projects including community owned ones. Enhance grid policies to link the urban poor with power supplies from existing sources, while focusing on decentralised and mini-grid systems for the rural poor and villages.
  - Support small sustainable farmers in developing countries through measures that maximise their contribution to food and water security, environmental protection, livestock health and welfare, and climate adaptation. These measures would include access to markets, knowledge and information, along with well-designed technological assistance to increase the productivity of smallholders.
  - Introduce a Social Protection Floor for the most vulnerable members of society. Provide the poorest communities with a "protected" income, with social protection systems that can reduce poor families' pressure on natural resources. Recognise and account for unpaid work<sup>10</sup>.
  - All countries, both developed and developing, must meet ODA commitments by 2015. To date, only 10 out of 33 donors from the OECD's Development Assistance Committee have met or exceeded the 0.7 per cent target for ODA. ODA remains the main source of foreign capital in the Least Developed Countries (LDCs) and in turn can help to leverage private investment for the sectors, such as manufacturing and infrastructure that will lead a transformation to a green economy.
- v. GREENING HIGH IMPACT SECTORS AND SERVICES: a green economy is one that is driven by green economic services and industries that provides decent work, new employment prospects and affordable sustainable consumption alternatives
- Commit to producing national green roadmaps, founded on the principles of sustainable development, that generate green and decent jobs for all. The roadmaps must include a self- identified target to double the number of 'green and decent jobs' thanks to sustainable investments and decent work policies. They must also delineate a clear path to achieving more sustainable patterns of consumption. National green economy roadmaps must target all high impact sectors and systems (food, housing and cities, transport, energy and infrastructure), and be made in partnership with all relevant stakeholder groups including workers and their representatives, consumers, young people, the poor and women. Roadmaps should transform informal work into decent work and recognise the role of unpaid work.
  - Commit to the UN's objective for sustainable energy to provide universal access to modern energy services, doubling energy efficiency and doubling the share of renewable energy in the world's energy supply by 2030.
  - Introduce appropriate fiscal policy and incentives to drive additional increases in private investment flows towards resource efficiency and renewable, reliable and sustainable energy supplies in all countries.
  - Regulate, encourage and support the transformation of unsustainable agricultural practices, towards those with a greater emphasis on smallholder-based agro-ecological practices and other forms of sustainable, ecological and humane food production. Governments should, in cooperation with farmers' and peasants' organizations, support small farmers access to land, water, local seeds, local markets, credit, agro-ecological technologies and participatory education schemes.
  - Invest in food security and sustainable small-scale food production beyond the l'Aquila commitment period, and outline a clear strategy for spending the money to enable the scaling up of proven sustainable approaches. National plans should deliver bottom-up vulnerability assessments and link them with community-level adaptation projects.
  - Task the Committee on Food Security (CFS) to draw-up a set of sustainability trend indicators (including at minimum soil, water resources, biodiversity, food security and nutrition) for selected crops and farming systems that are most critical to world food security. By 2015, all governments should also have established participatory monitoring and evaluation processes at the local level and compiled by the national level, in order to annually review and report on progress against these sustainability trend indicators to the CFS and/or other global governance bodies as relevant.
  - Increase efficiency in the food system by reducing waste in the production, distribution and consumption of food.
  - Actively promote more sustainable consumption patterns in developed economies, including more balanced diets that are less rich in meat, fish and dairy.
  - Make the sustainable consumer choice the easy choice by phasing out high-impact products and services.

- By 2014, establish an institutional framework that will pay for the transition from depleted to recovered fisheries, ensuring the growth of sustainable fishing industries and providing re-skilling, income security and employment opportunities to workers that might be affected by the transition.
- Improve public transport and seek to reduce dependence on the private car.
- Tax aircraft and shipping fuel.
- Regulate misleading and exploitative advertising, and curb advertising to children.
- Realise water-related commitments under the 2002 Johannesburg Plan of Implementation including the adoption of integrated water resources management and water efficiency plans, paying special attention to public water utilities, water demand management, and the development and use of more efficient water supply technologies and infrastructure.

---

## Greenpeace

A just and fair Green Economy

Greenpeace expectations for the United Nations Conference on Sustainable Development at Rio de Janeiro, 4-6 June 2012

Almost twenty years after the Earth Summit in Rio de Janeiro we face a paradox: We know solutions are available and affordable, that investments in clean technologies are rising, that deforestation can be stopped, and food provided for all if governments have the will. We also know development in both North and South remains deeply unsustainable.

Despite the Rio Conventions and hundreds of other multilateral agreements on sustainable development, resource extraction keeps growing, climate change is spiralling out of control, water is getting scarce, oceans are facing a state of emergency, deforestation is destroying livelihoods, toxic pollution is increasing, and we are gambling with our global food system by releasing genetically modified crops. Governments have talked a lot about sustainable development over the last decades, but at the same time are still encouraging environmental and social destruction with close to US\$ 1 trillion dollars-worth of harmful subsidies a year, covering everything from fossil fuels to fertilizers and fisheries. Corporate polluters and destructive industries are allowed to profit from over-exploitation of resources while people are left to pay the bill with their health, homes and livelihoods. Governments are bailing out greedy banks, but failing to mobilise finance and rescue packages for the planet and the poor.

To be clear: governments have failed since Rio. But they must not take the blame alone: too many corporations have stood in the way of sustainable development. Asia Pulp and Paper has undermined effective forest protection in Indonesia, while Volkswagen has fought against the climate protection rules we need in Europe and the US, to name but two. The finance industry has succeeded in making the taxpayer pay for its bad decisions and is stopping governments from effectively regulating global financial markets.

Governments will face a lot of – justified – cynicism about sustainable development and the broken promises of 1992 as they prepare to return to Rio de Janeiro in 2012. People will be watching if the “Green Economy in the context of sustainable development” is merely a new label masking business-as-usual, or will be turned into a rallying cry for finally delivering the transformational change we need.

A fair and just Green Economy is achievable. But it requires action. Promoting sustainable practices is essential. But, above all, governments must put a decisive end to unsustainable practises. An economy based on nuclear energy, oil and coal, genetic engineering, toxic chemicals or the overexploitation of our forests and seas will never be sustainable or green. Instead, a fair green economy is one that provides sustainable livelihoods for all while fully respecting ecological limits – our planetary boundaries. In a truly Green Economy, the economy will be a mechanism to deliver societal goals, and economic growth as an end goal in and of itself will be abandoned. The transformation is still taking place too slowly, but the good news is, it is already proven. Brazil has shown that it is possible to cut deforestation rates through effective governance and good business practices: Deforestation in the Brazilian Amazon has declined year on year and 2011 it was at its lowest ever level. But this year, the Brazilian government's monitoring system picked up a 37% increase in deforestation compared to 2010 in Mato Grosso state as a result of a move to change the Forest Code, the main law in Brazil that protects the forests. The changes would allow an amnesty for past forest crimes, creating an incentive for illegal activity now and leading to an increase in deforestation before the law has even been changed. Brazil must decide whether it wants to be known as the nation leading the path to sustainable prosperity and zero deforestation, or as a nation that showed that deforestation could be halted, but failed to do so to cater to short term special interests.

The energy sector, a fundamental building block of any green economy, is already changing. In Germany, for example, of all installed power capacity in the last decade, 81% was renewable. The Energy Revolution scenario<sup>1</sup> Greenpeace has developed together with business partners shows that globally we can deliver energy to more people, especially the poor in developing countries, cut emissions by more than 80% by 2050 – and create more jobs doing so, by investing in energy efficiency and renewable energy instead of fossil fuels and nuclear power. By implementing the Energy Revolution, governments can help businesses create 3.2 million more jobs by 2030 in the global power supply sector alone. In South Africa 149,000 direct jobs could be created by 2030, 38,000 more than the current government's plan.

An Agenda for 2012

The outcome document adopted at Rio in 2012 must not be about rewriting the Rio Declaration or Agenda 21. Instead we need honest stock taking on where we are with the existing commitments and who is responsible for our falling short. This must include addressing the excessive increase in corporate power the world has witnessed since Rio 1992. The limits of voluntary, bottom up approaches given the scale of the challenges must be fully acknowledged.

At Rio de Janeiro in 2012 governments must change the dangerous course we're on. Sustainable Development Goals should be launched to form the basis of development within planetary boundaries. The time-horizon for the goals should be no longer than two election periods at most, to ensure immediate implementation and avoid gaps in political commitment.

Concretely, governments should commit to the following steps towards a fair and just Green Economy:

### 1. Fundamentally improve governance, accountability and liability

- Strengthen the governance system that delivers an “environment for development” by upgrading the UN Environment Programme to specialized agency status. Sustainable development needs a global authority on the environment and stronger implementation, compliance and enforcement mechanisms
- Commit to corporate accountability and liability. Today governance gaps created by globalisation provide a permissive environment for wrongful acts by companies. At the Johannesburg Earth Summit in 2002, governments acknowledged the need for global rules for global corporations. At Rio 2012, they must agree the development of a global instrument that ensures full liability for any social or environmental damage global corporations cause. Corporations themselves must take full responsibility for their supply chains

- Agree on creating strong regulation and control of financial markets and introducing restrictions on speculators and speculative products to stop harmful practices that lead to rising resource and commodity prices and an accelerated depletion of natural resources with dramatic consequences for poor people and small economies. Agree on introducing new fiscal instruments, such as a Financial Transaction Tax, that can slow harmful speculation and deliver much needed finance for development and environmental protection
- Agree on a phase-out of environmentally and socially harmful subsidies within this decade, including subsidies to fossil fuels, forest destruction, nuclear power, agrochemicals and other toxics, the meat industry and destructive fishing practises through socially just transition plans
- Agree to bring the absolute consumption of renewable and non-renewable resources and the impacts of their extraction within planetary boundaries in a fair and equitable manner
- Commit to a complete social and environmental review of the global trade system in order to stop the world trade system from undermining environmental and social objectives

## 2. Providing clean and safe energy for all

- Commit to providing access to clean and safe modern energy for all by 2020, with clear and comprehensive implementation measures, adequate funding provisions, and an acknowledgment that decentralised renewable energy is the best way to meet the needs of the poor
- Make a 100% renewable future possible by endorsing a long-term goal of powering the world economy with 100% sustainable renewable energy. Governments must specifically commit to pursuing the most ambitious pathway outlined by the IPCC Special Report on Renewable Energy enabling 80% of the world's energy needs to be met by renewable energy by 2050. By 2030, the world needs to get 40% of its energy needs from sustainable renewables and improve energy intensity by 50%
- Agree on a global feed-in tariff programme, to support renewable energy investments in developing countries
- Commit to deliver, individually and jointly, sustainable energy action plans that include mid- and long-term targets for renewable energy and energy efficiency; regulatory frameworks that prioritize energy efficiency and ensure priority grid access and stable growth of investments into renewable energy; creating a level playing field including by phasing out all subsidies to fossil fuels and nuclear energy with timebound and socially just transition plans and the introduction of pollution and CO2 pricing for fossil-based energy
- Ensure the flow of adequate and predictable climate finance beyond 2012 and well above the pledged \$100 billion per year by 2020

## 3. Protecting the world's remaining forests by addressing the drivers of deforestation

- Commit to zero deforestation by 2020. This requires commitment and actions by both governments and businesses around the world. All countries and companies must end policies, subsidies and corruption that drive deforestation and instead fund the transition to a zero deforestation economy. In order to reduce pressure on forests, all countries and companies need to address demand-side causes of deforestation and implement policies and measures to reduce and ultimately stop the production, trade, import and consumption of goods stemming from deforestation and degradation (including unsustainable timber, palm oil, and other commodities). Policies, measures and investments must support participatory multi-scale conservation and land use plans, meet the needs and rights of forest dependent indigenous peoples and local communities, and support forest uses that protect biodiversity, carbon, and ecosystem values and services

## 4. Feeding the earth to feed the world

- Commit to increasing support to small scale food producers and farming communities, who are essential in feeding the world. This should be done through policy and market instruments that enable the development of thriving ecological farming systems, while reducing the market power of big agribusiness over land, seeds, inputs and processing. Ecological farming has the potential to produce 30% more food per hectare than industrial agriculture but realising this potential requires a substantial shift in investment
- Agree to better regulate the use of agrochemicals to prevent harm to people and the environment and to set appropriate fiscal policies to reflect the true environmental and health costs of intensive agriculture. Agree to set ambitious national targets for reducing consumption of chemical fertilisers and pesticides and to promote and incentivise the wider uptake of ecological farming systems
- Provide a mandate to the UN Committee on World Food Security (CFS) to develop a workplan for taking forward the recommendations of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD) in the context of improving global food security, including advising governments on specific measures and establishing an ongoing mechanism to track and report on progress towards ecological food and farming systems around the world. Countries should also commit to establishing their own structures and mechanisms for following up the implementation of the IAASTD with full stakeholder participation, especially of small scale food producers

## 5. Filling the Gaps in Oceans Governance and Stopping Overfishing

- Address gaps in oceans governance that are hampering progress on marine protection. A new implementing agreement under the UN Convention on the Law of the Sea (UNCLOS) is needed for the conservation of marine biodiversity and sustainable management of human activities in areas beyond national jurisdiction. It should be based on the precautionary principle and the ecosystem approach and provide for the establishment and management of marine reserves in areas beyond national jurisdiction
- Commit to cutting overcapacity of the world's fishing fleets and providing priority access to fish resources for low-impact small-scale fisheries. The world fishing fleet is able to catch up to 2.5 times the maximum sustainable yield. Yet the cumulative power of the global fleet is still increasing at a rapid rate. Bringing fishing yields to a sustainable level necessitates decisive measures to eliminate the excess capacity. Reduction efforts should be focussed on large-scale vessels and be flanked by ensuring priority access for small-scale fisheries<sup>2</sup>
- Promote and invest in sound economic and sustainable fishing practices that maximize benefits to local communities. Stop industrial large-scale fleets using unsustainable fishing techniques using access agreements to exploit the Exclusive Economic Zones of coastal states, while leaving them with very little economic and social benefits
- Implement a global network of Marine Reserves, which is essential to conserve and restore the health and productivity of the oceans and to maintain vital ecosystem services and food security for hundreds of millions of people<sup>3</sup>. At the Johannesburg Earth Summit in 2002, governments agreed to establish networks of Marine Protected Areas (MPAs) by 2012. Yet today MPAs cover less than 6% of territorial seas and only 0.5% of areas beyond national jurisdiction. At a time when ocean ecosystems all over the world – including coral reefs, seamounts and other sensitive habitats – may be reaching tipping points, establishing networks of large-scale marine reserves becomes an indispensable tool to building resilience in ocean ecosystems. Conserving 20-30% of global oceans through a network of MPAs could create a million jobs and sustain a marine fish catch worth US\$70-80 billion/year. Eventually, the global network of marine reserves needs to cover 40% of the oceans

## 6. Eliminating Hazardous Chemical Use

- Supplement and strengthen the existing commitments<sup>4</sup> by agreeing to a goal of zero discharge of all hazardous substances within one generation, based on the precautionary principle and a preventative approach to chemicals management with the substitution principle at its core and producer responsibility to drive innovation in Green Chemistry and Toxics Use Elimination. This is crucial to rescue and heal our precious waterways and other fresh water sources
- Agree on a related implementation plan to (a) establish a dynamic priority hazardous substance list for immediate action, compiled from all the existing commitments and treaties and the lists of OECD and the EU, (b) establish intermediate targets, (c) establish a publicly available register of data about discharge emissions and losses of hazardous substances
- Commit to providing adequate resources and frameworks for implementation, including: (a) identify priority substance restrictions, (b) introduce requirements of mandatory audits and planning (c) provisions of technical help and appropriate financial incentives (d) research and support for innovation in green chemistry Rio+20 must deliver for the people and the planet. The transition to a green economy must be fair and equitable, lift people out of poverty, respect planetary boundaries and commit to a decent jobs agenda. As global climate-damaging emissions need to peak within a few short years, we cannot afford to make insufficient progress for another two decades. The time for action is now.

## Grupo de Trabajo Intersectorial de Educación Ambiental (GTIEA)

Carta de Guarullos a los representantes de los Estados Miembros de las Naciones Unidas

Nosotros, ciudadanos del Municipio de Guarulhos del Estado de San Pablo en Brasil, que venimos construyendo de forma participativa un referendun para las directrices que norteen la consolidación de sociedades sustentables envolviendo el poder público, iniciativa privada, tercero sector y comunidad en general , presentamos la presente "Carta de Guarulhos" a los representantes de los Estados Miembros de las Naciones Unidas, que se reunirán en Rio de Janeiro, en la Conferencia por el Desarrollo Sustentable, en Junio de 2012, como contribución para la consolidación del documento final de la ONU para esta Conferencia

#### Preámbulo

Nosotros, ciudadanos guarullenses representantes de los diversos segmentos públicos e privados de la ciudad, reunidos en Foros y Seminarios organizados por el Poder Público de forma participativa con la sociedad , como el Workshop Internacional de Educación Ambiental en agosto de 2011 , el 4º Encuentro Municipal de Educación Ambiental, consultas públicas para la consolidación de la Política Municipal de Educación Ambiental y las Audiencias Públicas para discusión de Políticas Públicas Ambientales, consideramos que:

1. La velocidad, dimensión y complejidad de los cambios que la familia humana viene estableciendo en su relación con el medio ambiente y la biosfera caracterizan una necesaria condición de responsabilidad conjunta nunca antes enfrentada;
2. La gestión socioambiental, teniendo en vista la sustentabilidad, cabe a todos los segmentos de la comunidad de forma participativa e interdependiente, no más a este o aquel segmento, o solamente al compromiso individual de cada ciudadano;
3. Los modelos de desarrollo vigentes están pautados en modelos económicos excluyentes e incompatibles con la sustentabilidad, todavía promoviendo la mercantilización de la vida a pesar del discurso de las economías verdes emergentes;
4. Bajo la vertiente de la visión sistémica y de la interdependencia, entendemos tener, como municipio, la responsabilidad de contribuir para evitar todo y cualquier tipo de desequilibrio socioambiental, buscando la preservación y la conservación del Planeta;
5. La actual condición límite en que el Planeta se encuentra demanda la consolidación de sociedades bien preparadas para concretizar nuevos modelos civilizatorios que primen por la ética y por los valores de justicia y dignidad para con todos los seres vivos de la faz de la Tierra.

Adoptamos la presente Carta comprometiéndonos a divulgarla ampliamente en todas las instancias organizativas del Municipio y a considerar sus principios en nuestra gestión socioambiental, demandamos a los Representantes de los Estados Miembro de las Naciones Unidas que consideren estos principios en la redacción del documento final de la Conferencia.

#### Principios de la Carta de Guarullos

1. Que cada ciudadano, donde esté viviendo y actuando, debe asumir para si el compromiso de ser responsable conjuntamente con la comunidad a la cual pertenece en lo que dice respecto a la calidad das relaciones que establece consigo, con los otros y con el medio ambiente;
2. Que la actitud de cada hombre u mujer esté permeada por los principios que constan en el Tratado de Educación Ambiental para Sociedades Sustentables y Responsabilidad Global, en la Carta de la Tierra, en la Carta de las Responsabilidades Humanas y en la Declaración de la Madre Tierra;
3. Que el Gobierno o Poder Público sea sensible a las necesidades de la comunidad que le dio legitimidad y que en la práctica de una Cultura por la Paz, pueda viabilizar justicia social y ambiental para todos;
4. Que sean las comunidades locales, en un sentido de responsabilidad global y consolidando nuevas formas de hacer políticas publicas, las que decidan, juntamente con el poder público, con relación a las formas sustentables de gestionar el medio ambiente, garantizando condiciones de equilibrio y bien integral estar para todas las formas de vida.

5. Que la educación formal y no formal desarrollada pueda promover la autonomía y la criticidad de las comunidades desarrollando sentimientos de responsabilidad conjunta.
6. Que la Educación para Sociedades Sustentables y Responsabilidad Global este presente en la vida cotidiana, en la gestión educacional, en la gestión política, económica y ambiental, garantizando equilibrio ambiental, equidad económica y justicia social.
7. Que todos los recursos naturales sean entendidos como bienes de uso común, habiendo la responsabilidad conjunta local, regional y planetaria en su gestión.
8. Que las formas de producción y consumo del sistema económico global estén al servicio de la vida y no al contrario para que no se continúe mercantilizando la vida.

## Guiana Shield Facility (GSF)

### Guiana Shield Facility (GSF)

The Guiana Shield Facility (GSF) is a multi-donor funding facility, which aims to support the conservation and sustainable development of the unique ecosystems of the bio-diverse Guiana Shield eco-region.

The operating premise of the GSF is that by providing incentives for the conservation of the unique ecosystems of the Guiana Shield towards ensuring the long-term delivery of its globally important environmental services will contribute to poverty reduction and will help an eco-region beset by threats such as: (i) legal deforestation, (ii) legal mining, water pollution, social and health problems connected to mining, poaching of wildlife, and lack of a coordinated framework for planning, priority setting and management of natural resources.

The ecosystems of the Guiana Shield have in recent times been increasingly threatened by many problems that are common to all the countries in the Guiana Shield. To support national level conservation and sustainable, a common front is needed as well as attractive alternatives to natural resources exploitation. The Paramaribo Declaration of 2002 emphasised the uniqueness of the eco-region and its importance with regard to ecosystem services. In addition, it emphasised that "the burden of conservation must be supported by the international community and should not fall on the countries of the region alone". This implies that there should be a compensation system for Guiana Shield countries for conservation of their ecosystems, which is a key objective of the GSF.

This principle is already recognised by the existing international conventions, in particular the Convention on Biological Diversity (CBD) and the United Nations Framework Convention on Climate Change (UNFCCC). The UNFCCC states that "the parties should protect the climate system for the benefit of present and future generations of mankind on the basis of equity and in accordance with their common but differentiated responsibilities and respective capabilities." The CBD stresses "the importance of and the need to promote, international, regional and global cooperation among states and inter-governmental organisation and the non-governmental sector for the conservation of biological diversity and the sustainable use of its components." The Convention also stresses that "the extent to which developing country Parties will effectively implement their commitments under this Convention will depend on the effective implementation by developed country parties of their commitments under this Convention related to financial resources and transfer of technology."

The innovative idea of the Guiana Shield Initiative (GSI) – precursor to the GSF - was to link these transfers to the efforts of those responsible for maintaining the integrity of the ecology of the Guiana Shield as one of the last large (250 million hectares) intact tropical rain forest areas in the world and therefore from a climate, a biodiversity and a freshwater perspective of global significance. This was not a classical form of the rich developed countries giving to the poor developing countries, but a transfer from the world community to those managing a global public good, under existing (and binding) legal arrangements. A substantial benefit of this is not only that it is rooted in international law and thus of a long-term nature, but also that is an arrangement between equal partners.

From 2006-2010, through the GSI, the UNDP in partnership with the European Union and IUCN National Committee of the Netherlands (IUCN NL), piloted an incentive scheme for conservation and sustainable development from 2006-2010. The incentive scheme included ecosystem services contracts, innovative remote sensing technology coupled with ground monitoring and which was based on the Millennium Ecosystem Assessment and the DPSIR framework, and culturally appropriate benefit sharing.

The thrust of the contractual agreements was that the contract holder (ecosystem manager) and the associated local communities, which depend on the natural resources / ecosystem services provided by the ecosystem, were compensated or rewarded for maintaining and managing those resources or services. The GSI applied the basic level approach to the incentive scheme, which included the costs for monitoring of ecosystem services as well as benefit sharing with the stakeholder local communities.

Three services: climate regulation (carbon sequestration), biodiversity and freshwater were studied. Monitoring of these services was carried out on the basis of selected indicators at the eco-regional level and at the level of pilot sites using radar remote sensing tools and ground truthing. At the eco-region scale, the monitoring objective was to provide up-to-date information on land cover and vegetation (changes), with a particular focus on forest cover. At the pilot site scale, monitoring was focused on status and trends of the three ecosystem services. Where equipment and materials for monitoring were lacking at the pilot sites, they were provided by the GSI.

In the basic level approach to PES, allocation of resources for benefit sharing tied to independently verified and reported delivery of ecosystem services is very important for empowerment, participation and building social capital of local communities.

In 2010, the GSI evolved into the GSF, which will over the next four years, seek to build national ownership and partnership with donors and other key partners, and strengthen the GSF as an eco-regional framework for the conservation and sustainable development of the Guiana Shield eco-region.

The global significance of the Guiana Shield eco-region and its ecosystem services was, is, and will be the rationale for transfers between the international community and those responsible for maintaining the ecological and cultural integrity of the Guiana Shield. So far, the ecological significance has been best documented by the Priority Setting Workshop (PSW) held during the first GSI Phase in April 2002 in Paramaribo, Suriname. During that workshop, biodiversity, geology, watersheds, protected areas, forestry, mining, infrastructure, non-timber forest products, socio-economic pressures, etc., were described and mapped by 200 regional and international scientific and policy experts. The 2002 PSW exercise also served as the scientific basis of the Paramaribo Declaration signed and adopted on 9 April 2002, to guide the further development of the GSI.

On the 27-28 October 2011, a high level team of State and non-State actors met in Paramaribo and reviewed the 2002 PSW to learn what has changed in terms of implementation of the agreed actions as well as new pressures and threats. The 2011 Workshop was unanimous in its expression of support for the PSW process and recognition of the GSF as the delivery mechanism of financial support to efforts to conserve and sustainably development the Guiana Shield eco-region at all scales. It is highly anticipated that the GSF will form part of the deliberations at Rio+20.

The Guiana Shield Facility: A UNDP-EU led multi-donor partnership for conservation and sustainable development

The EU has allocated over EUR 3 million in AIDCO grant funds through the UNDP for the conservation and sustainable development of the Guiana Shield eco-region. The Guiana Shield is an eco-region of regional and global significance. It has an area of 2.5 million km (250 million hectares), which accounts for about one- quarter of the world's

remaining tropical rain forests, of which 80-90% is still in pristine condition. All or parts of six countries (in alphabetical order: Brazil, Colombia, French Guiana, Guyana, Suriname, and Venezuela) share the geographic area of the Guiana Shield. According to the Paramaribo Declaration, it ranks as one of the world's last wild places.

In ecological terms, the Guiana Shield eco-region is of global importance. It is made up of several unique ecosystems that:

- Store approximately 10-15% of global freshwater supply
- Store about 50 billion tonnes of carbon
- Support an estimated 20,000 vascular plant species, of which about 35% is endemic
- Provide habitat for rich biodiversity, including 975 species of avifauna, 282 mammalian species, 280 reptilian species, 272 amphibian species and 2,200 fish species.

Despite their wealth of natural resources, the countries of the region have high levels of poverty, external debt and weak institutional capacity, all of which often cause governments and local populations to choose economic activities which are short-term income generators, but which may not be sustainable (e.g. exploitation of oil, gold, diamond, and tropical hardwoods, and undertaking of big infrastructure projects). Through the GSF, a comprehensive regional planning process for the conservation of the Guiana Shield is being assembled to complement individual country efforts to manage common problems and pursue region-wide human development.

The Guiana Shield Initiative (GSI) has pursued since 1993, the goal of promoting the sustainable development of the Guiana Shield eco-region by means of an integrated eco-regional management framework so as to enable the countries and their local communities to finance, develop, manage and benefit from the natural resources by maintaining climate regulatory integrity, conserving biodiversity and protecting watersheds.

The operating premise is that preserving ecosystem functions will benefit stakeholders at the local, national and global levels and indeed help fulfil national obligations under the multilateral environmental agreements and the relevant regional arrangements.

In the long run, by preserving nature and therefore natural livelihood resources, a significant contribution will be made towards poverty alleviation and resource management by the local/indigenous inhabitants. Regulatory ecosystem services are public goods, and are the responsibility of, foremost national governments and inter- and supra-national structures such as the UN and EU. The global climate is a clear example.

## Health and Environment Alliance (HEAL)

Response of the Health and Environment Alliance HEAL to the Rio+20 consultation

As the leading European not-for-profit organisation addressing how the environment affects health in the European Union, HEAL welcomes the organisation of the UN conference on sustainable development and has very high hopes for the Rio+20 process.

Twenty years after the Rio conference, the world is still very much on an unsustainable path, with dire consequences for our health.

Citizens all around the world are looking onto the political decision-makers to show leadership at Rio+20 in order to tackle the urgent environment and health challenges that we face. It is very important that the conference results in concrete and legally binding outcomes to bring real benefits to people's health and the planet. The transition to a green economy must be fair and equitable, lift people out of poverty, respect planetary boundaries, commit to decent jobs agenda and improve and promote people's health.

Health is recognised as a key goal of sustainable development in the first principle of the Rio declaration, which states that "Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature."

However, twenty years later, we believe there is an urgent need to make "health" central to the Rio+20 process and outcomes, potentially by creating a fourth pillar at the center of economic, social and environmental pillars in order to concretely link this agenda more explicitly to what people care most about - their own health and that of their community.

The consequences of environmental degradation on our health are well known and the science continues to grow on the myriad impacts (for example the burden of disease from noise or chemical pollution, also the problem of health impacts of chemicals mixtures and endocrine disruptors). In parallel, well known environmental health hazards continue to harm people across the planet such as asbestos, persistent organic pollutants (POPs), mercury and electronic waste to name just a few. It is therefore important to reverse the toxic legacy for health today and tomorrow and to ensure equity and the protection of those most vulnerable (those living in poverty, children, women).

Four concrete ways to make the foreseen Rio+20 Declaration reflect this health dimension are provided below.

The cost of inaction: health impacts of environmental degradation and the rise of chronic diseases

Chronic diseases - cancer, cardio-vascular diseases, chronic respiratory diseases and diabetes - account for over 63% of deaths globally. The number of chronic disease cases has risen in the last years and is expected to increase further. In Europe, chronic diseases are responsible for 86% of deaths. Environmental pollution is one of the key factors in the occurrence of chronic diseases.

In September, UN Heads of State and governments adopted the political declaration of the high-level meeting of the General Assembly on the Prevention and Control of Non-communicable diseases. The resolution highlights that “the global burden of non-communicable diseases constitutes one of the major challenges for development in the 21 century, which undermines social and economic development through the world”.

Since Rio+20 puts a strong focus on greening the economy and linking sustainable development and poverty eradication, the challenge from chronic diseases and ways to tackle them cannot be left out of the agenda. This means first of all to highlight the health impacts of environmental degradation and how they intersect with poverty.
