

## Compilation Document - Rio+20 - United Nations Conference on Sustainable Development

At its Second Preparatory Meeting in March 2011, the Preparatory Committee for the United Nations Conference on Sustainable Development (UNCSD) requested the Bureau to initiate an open, transparent and inclusive process, led by member States, to prepare in a timely manner a draft text, based upon all preparatory inputs, to serve as the basis for an outcome document for the Conference.

The second Preparatory Committee Meeting invited all member States, relevant United Nations system organizations, and relevant stakeholders to provide inputs and contributions to the Secretariat in writing by 1 November 2011, for inclusion in a compilation text to be presented by the Bureau to member States and other stakeholders for their comments and further guidance at the second Intersessional Meeting on 15-16 December 2011. This compilation document is to serve as basis for the preparation of a zero-draft of the outcome document, to be presented for consideration by member States and other stakeholders by January 2012.

Inputs received by the Secretariat are contained in a web-based Compilation Document, available at [www.uncsd2012.org/compilationdocument](http://www.uncsd2012.org/compilationdocument), in their unedited versions, preceded by an index of terms to facilitate analysis of material submitted.

## 1st UNESCAP Subregional Forum for Youth Participation in Policy-Making for East and North-East Asia

Youth Statement for the Asia and Pacific Regional Preparatory Meeting for Rio+20

1. We, the youth in Member States of East and North-East Asia, had the privilege to participate in the 1st UNESCAP Subregional Forum for Youth Participation in Policy-Making for East and North-East Asia held on 15-17 August, 2011 in Gyeonggi Province, Republic of Korea.

The Forum provided opportunity for the youth to discuss pressing socio-economic issues of the subregion: 1) gross national happiness; 2) sustainable development; and 3) youth unemployment.

2. Seventy youth from China, Japan, Mongolia, Republic of Korea, and Russian Federation shared a good practice of collaboration among youth organizations and policy-making bodies, and introduced their own method of approaching main problems facing the subregion.

3. The youth participants, who were in the group addressing the issue of sustainable development, touched upon very insightful and influencing discussions on three main pillars of sustainable development, namely economic, social and environmental.

4. In order to produce specific plans and propose concrete policy measures, group members narrowed down various topics into three main areas-climate change and sustainable energy, sustainable infrastructure, and social dimension of sustainable development. An action plan focusing on increased youth participation and contribution on the three key areas of sustainable development was formulated.

5. The participants came to the conclusion that to achieve tangible results in North-East Asia more coordinated action should be accomplished at the subregional level.

6. As universities have been recognized as entities that emit high levels of greenhouse gases (GHGs), making a negative impact on sustainable development, following key suggestions were made to respective policy makers in order to address this issue:

(a) Implementation of universal education in sustainable development, which includes the promotion of youth participation in environmental activities by introducing "environmental service hours" as part of the course requirement;

(b) Establishment of subregional ranking of "green universities" to raise public awareness and prestige of universities, which have made efforts to reduce the level of greenhouse gas (GHGs) and the application of "green ranking" to the general ranking of colleges.

7. To ensure our ideas and objectives from the forum are met even after its conclusion, we request:

(a) The UN to create a "North-East Asian Green University Award" to recognize universities that have made exceptional efforts in reducing GHGs in their respective countries;

(b) National governments to provide grants and/or subsidies to students from environment related majors to provide incentives for more students to pursue education in the field;

(c) Governments to provide easier access to information related to sustainable development;

8. In addition, the youth will take the following actions in order to address issues, concerning sustainable development in our respective countries:

(a) Plan and implement peer-to-peer education through organizing and holding educational youth camps, leadership workshops and so on;

(b) Become the bridge between policy makers and society by monitoring advancements made in the field of sustainable development and informing the public;

(c) Connect with policy makers of our respective countries and create partnerships and forums where a frequent exchange of ideas on sustainable development issues would be achieved;

(d) Create both local and international university networks to share information, adopt common agendas and standards and transfer cross-border knowledge and technology amongst students;

(e) Promote and support the achievement of "green campuses" by creating youth groups on university campuses, maximize the usage of ICT in informing students of university status and their activities toward environment;

(f) Create "green tourism" on university campuses supporting sustainable development for the education of the general public;

(g) Hosting "eco-fairs" not only at local university and community level, but also internationally;

9. As youths hold the key to a brighter future, we can play a vital role in advocating various messages to the community through our active participation to address common issues for the benefit of the present and future generations. Thus, we commit to follow up on the actions that have been proposed during the forum and adopt an eco-friendly lifestyle in our respective countries.

10. We are aware of the importance of sustainable networking to update ourselves on new activities that we committed to implement during the forum in the places we live in. For this, we will be using social networking tools, such as Facebook, Twitter and Youtube.

11. We are confident that our active participation and effort to contribute in the field of sustainable development will bring positive outcomes and will be sustained to engage and empower more youth in the future.

We are one big family, holding a common goal and willingness to address main issues in the region, particularly sustainable development!

---

## 2011 Youth Delegates to the United Nations

Outcome of the panel on Sustainable Development in the Rio+20 processes.

Hosted by the 2011 Youth Delegates to the United Nations

Sponsored by the Permanent Mission of Germany to the United Nations.

On 12 October 2011, youth delegates to the United Nations convened a panel discussion and consultation session held at the German Permanent Mission to the United Nations to discuss and elaborate on the vital role of education for sustainable development in the Rio+20 process and related outcomes. This event attracted participants from various United Nations Missions, Youth representative, NGOs, Youth Organisations, various diplomats, stakeholders and interested young people.

The interactive panel discussion touched on a number of key challenges and opportunities that face the sustainable development agenda including education systems and schools; being one of the most important catalysts for change but slow moving when updating or amending current curriculums. The discussions were followed closely by youth delegates from the Permanent Missions of Germany and Finland, with outcomes of the discussions produced and presented. These were:

Green economies are born in the school yard

In order to transform societies and economies into a more sustainable direction, it is necessary that educational systems respond to the demands for sustainability.

- Curriculums must reflect a strong, sustainable social focus.
- Education for sustainable development must be integrated in teacher training.
- There must be cross-sector collaboration between private, government, and civic society to support education for sustainable development; teachers, schools and organizations.

Young people must be given the tools to build a sustainable society

Establishing green economies and sustainable societies will to a large extent be the responsibility of the current young generation. Young people must be provided with the civic skills and participation opportunities.

- Civic skills are an important component of education for sustainable development.
- Educational systems must provide young people with the information on how their societies work and skills to overcome problems.
- The opportunities of ICT and social media should be utilized.

Implementation of education for sustainable development must be relevant to regional and local circumstances

Sustainable education has a strong social dimension and this should also be reflected in education for sustainable development. Youth in developing economies play a big part in creating sustainable societies.

- Focus must be put on education for sustainable development also in the educational systems of the developing world. As different young people have different access to education it is important to make sure that all have access to education for sustainable development.
- There is an important link between non formal education and education for sustainable development, supporting volunteering and youth-led organizations is an important way to promote education for sustainable development.

---

## 21st Century Clusters

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

Rio +20 Inputs for Compilation Document

21st Century clusters with transformative solutions contributing to a green economy in the context of sustainable development and poverty eradication

Below is the input from the 21st Century Clusters. For more details, background and cases please see: <http://transformative-solutions.net/>

#### Background

Rio+20 present a unique opportunity to shift perspective from problems to opportunities and from incremental improvements in existing systems to transformative solutions (i.e. solutions that provide the services society needs in totally new ways). Structures, legislations and methodologies to identify, encourage and measure incremental improvements among polluting industries already exist. Rio+20 could be the global turning point where structures, legislations and methodologies are introduced and encouraged to identify, encourage and measure transformative solutions. A clear solution agenda would encourage new clusters and networks as well as a new generation of entrepreneurs to step forward and be part of the sustainability agenda.

With a solution agenda future generations might refer back to the conference as Rio2.0 rather than +20. A new approach in a new millennium led by networks that see opportunities instead of problems.

It is imperative that two decades on from the Earth Summit in Rio de Janeiro the discussions on sustainable development take into account today's societal and technology contexts. The

agenda of the last summit as well its outcome were shaped by individuals who had never seen a webpage, sent an SMS message or used a smart phone. Back then few had anticipated the unprecedented uptake of Information and Communication Technology (ICT) and the related socioeconomic benefits. Whereas, at the time of the Earth Summit, there were less than 100 million mobile subscribers around the world, today the number is above 5 billion. This represents nearly four fifths of the world's population. Around 8 trillion SMS messages will have been sent by the end of this year.

With the emergence of the internet of things (IoT) we can expect further breakthroughs. Eight years after Rio+20 there will most likely be around 20 billion connected devices. Society will experience connectivity and access to information that are historically unique. Smart buildings will become net producers of renewable energy, mobile banking will leapfrog the need for a banking infrastructure, and e-commerce will dramatically reduce the need for physical products and services supporting dematerialisation.

Against this technological backdrop, the world's economy will continue to develop at a rapid pace. China might become the world's largest economy during the next 10 years and India home to most people on the planet. In 2050 China will probably have more old people than the entire population of the US. In this situation business as usual is not an option. These developments will bring along new challenges for sustainability, calling for the need to look beyond incremental changes in existing systems to finding new solutions.

The Earth Summit in 1992 focused a lot on end-of-pipe technologies and how companies can reduce their own impact and improve their sustainability performance. Today we still tend to see frameworks that address sustainability from a risk perspective. The methodologies that have been developed predominantly focus on measuring the "negative" impact of industry on sustainability.

#### 1. Expectations for the outcome of Rio+20

The following policy proposals should be reflected in the outcome documents and decisions as they would help accelerate the uptake of transformative solutions and allow businesses to become innovative solutions providers:

##### 1.1 Support for exponential growth of low-carbon/resource efficient solutions

Policy makers should set acceleration targets for low-carbon/resource efficient solutions, not technology-based in order to avoid picking winners, in order to allow exponential growth of such solutions. Too often the exponential growth of low-carbon/resource efficient solutions is seen as a problem as it disturbs old business solutions. Instead, we must recognize highcarbon/resource intensive business solutions as a problem. The need for job creation and innovation should be linked to companies with accelerated sales of low-carbon solutions.

##### 1.2 System solutions

Policy makers should encourage integrated solutions that provide the services we need. Often, converging trends allow for new system solutions that current regulations are undermining. For example, improved insulation, smart lighting, and better solar PV solutions allow for buildings that are net producers of electricity, but only if the policy framework focuses on an ambitious use of system solutions instead of allowing small isolated improvements. As an example, the focus in most countries is on reducing emissions instead of turning buildings into solutions. A Global Feed-In Tariff Programme for system solutions should be considered as a market-based mechanism to help the uptake of system solutions.

##### 1.3 Tipping points for transformative solutions

Policy makers must identify when different incremental improvements reach the point when they can be transformative. E.g., when a building reduces its energy use by 80% it can often meet its energy demand from local renewable energy sources. Further reductions allow a net positive contribution that allows for charging cars or other extra functions. Such thresholds, e.g. 80 percent energy efficiency for buildings, should be identified as they require significant changes in current regulations.

Increased public RD&D, in particular demonstration support, is needed to allow companies to work in new clusters that deliver innovative service solutions when tipping points are reached. This is key for many solar and wind applications as well as many other solutions. In particular there is a big lack of investments in innovative solutions in the developing world since there is so much focus on short-term cost efficiency and easy ways to measure carbon reductions in the current system.

##### 1.4 Supporting low-carbon/resource efficient feedback and avoiding highcarbon/resource intensive feedback/rebound

One of the major challenges today is that most efforts for increased resource efficiency sooner or later result in a situation in which the resources (time, natural resources and money) that are initially saved are re-invested in ways that increase emissions and use of natural resources.

There is an urgent need to develop systems for low-carbon/resource efficient feedback, i.e., a situation in which the savings are used for re-investments in more resource-saving solutions. The massive current and historic subsidies that are making the current unsustainable solutions cheaper than they should be are a major challenge that needs to be addressed. More than 500 billion dollars are used annually to directly support a high-carbon infrastructure, more than twelve times the support for renewables. This is making it hard for transformative solution

providers to compete. The subsidies also result in a situation in which many stakeholders — including policy makers, academics, and media—think that low-carbon solutions are not competitive.

#### 1.5 Rewarding trendsetting for supply of sustainable solutions

Today companies that are leaders are not rewarded. Policy makers must create economic incentives for low-carbon leadership and develop methodologies that allow for measurement of such leadership. Companies helping to accelerate uptake of new technologies should be acknowledged and rewarded in a variety of ways.<sup>1</sup>

#### 1.6 Global collaboration for a 21st century low-carbon infrastructure

Many of the new networking solutions, such as a global network for high definition virtual meetings, require global collaboration to overcome different standards and regulations. Very few such initiatives exist and they are needed to accelerate the uptake of a new generation of services that depends on information and communication technology, the most energy efficient infrastructure humans ever have created. International action programmes must be agreed upon for certain already identified and demonstrated solutions that are ready to roll out large scale, e.g., energy plus housing, smart grid solutions, solar PV solutions, global infrastructure/standards for smart meetings, etc.

#### 1.7 Measure the use of underlying infrastructure and resource demand for different services

Very few policies today measure or support the transformation of the underlying infrastructure. Part of this is probably due to the fact that most emissions assessments do not include the underlying infrastructure; or, when they do, it is separate from the solutions that depend on them. It is time to ensure that assessments include the underlying infrastructure whenever relevant in order to understand the difference between transformative solutions and incremental improvements.

#### 1.8 Carbon distance/How to transport and “moving the sun”/ What to transport

Policy makers should not approach transport as something that should be reduced; focus should be on zero emissions, sustainable use of natural resources and poverty reductions.

First, modal shifts should be prioritized in order to ensure that goods move with the least amount of carbon emitted as a stepping stone toward zero emission goods transport. Second, transport should be approached as an integrated way to ensure optimal production and consumption systems, not as a separate sector.

#### 1.9 From product to service

Policies should focus on the service being provided, not the old technology or old sectors that so far have provided the service.

Transformative solutions require a shift from product to service where everything from airplanes, cars, and books are seen for what they are, i.e., ways of providing services such as business meetings, commuting and, reading. Today many services can be provided in fundamentally different, and magnitudes more efficient, ways. But in order for solutions such as video-conferencing, teleworking, and e-readers to take off, rules and regulations must be based on services.

Public procurement could become one of the most important instruments in supporting transformative solutions. Technology neutral policy making is one key part of this, but policy makers also must really start with the actual service that is needed and not a sub-service that the existing system needs. For lighting, it is important not just to ask for a better light source (i.e., move from incandescent to CFL and then to LED), but to ask how light can be provided in different ways, from architectural solutions to light-emitting fabric.

#### 1.10 Multiple gains with low-carbon results

Many areas in society, health, education, art, sports, marketing, etc., have so far been almost totally left out of the climate/environmental discussions. These sectors have a fundamental impact on how society is structured and are significant drivers of innovation. It is important to support initiatives in such areas that also include a climate/natural resource perspective but also to link smart initiatives to other areas to ensure synergies.

#### 1.11. Nanotechnology and biomimicry for the 21st Century

Instead of brute force we now have the possibility to turn a page and work with nature instead of against it. High-Throughput Atomically Precise Manufacturing is a nanotechnology-based tool that is in front of us and we are the first generation that can simulate this future technology at a physical level, and use our knowledge to guide this upcoming industrial and technical revolution in the direction we want.

In a time of growing tensions, the potential to gather the world around a common challenge should not be ignored. So much of the focus today is on short-term gains (political and economic) that nanotechnology will be difficult to fit into existing structures, but this could also turn out to be a strength. New clusters could be established and new ways of collaboration could be developed. History is the only ultimate judge, but for anyone claiming global leadership in the 21st century, regardless of whether the focus is on poverty, environmental challenges, climate change, innovation or economic development, the prospects for transformative, nanotechnology-based developments must have a central role. The conference in Rio could be the starting point for a new conversation, and for the generation of new clusters and collaboration. At the center of this new conversation about the future will be scenarios of unprecedented, disruptive technological change. It is up to us to focus on what we think is most important, and hopefully this report can inspire action in one

of the most important areas of our time.

The outcome document should ensure that a global task force is created that can help with two things. First, to facilitate increased collaboration between different groups of nanotechnology researchers (even if they do not call them that themselves). Second, identify gaps in current research that needs to be addressed in order to enable sustainable implementation of High-Throughput Atomically Precise Manufacturing.

## 2. Possible structure of the Outcome document

### 2.1 Ensure a sector/service approach in the outcome document

In the 21st century is an urgent need to focus on clusters and companies as solution providers.

A shift beyond the sector approach is called for, where the focus is on the services needed in society. Wherever possible any approach based on sectors, investment guidelines, policy frameworks, rankings, etc., should add a service perspective. While a sector perspective can be helpful for incremental improvements it seldom helps develop or encourage transformative solutions. For most sustainable solutions collaboration is needed between companies from different sectors in order to challenge the way services are provided today.

Introducing a sector/service matrix as the standard approach could help support a shift toward companies as solution providers and ensure that transformative solutions can be identified

**[UNDESA/DSD: Please download the original document to see this table]**

A sector perspective can encourage incremental improvements in existing systems (doing things right) instead of encouraging a sustainable way of providing the things we need (doing the right things). By introducing a sector/service matrix, tensions within and between sectors become easier to understand.

Inviting airline companies to discuss strategies will work fine if improvements in airplanes are the expected outcome, but inviting stakeholders to discuss sustainable meetings would require travel/ meeting agencies, video conference providers, and the airline industry to discuss the best way to provide users with services.

Using a sector/service matrix can also help identify different clusters that may depend on each other and may not always be interested in change. Coal and oil companies can discuss marginal improvements with construction and car companies, but if the focus shifts to sustainable commuting or smart buildings all of a sudden new clusters can emerge and some companies can become less important (or even irrelevant).

**[UNDESA/DSD: Please download the original document to see this table]**

Based on a sector/service matrix it is possible to develop what could be called a "carbon performance of services." This carbon performance could be used to compare different ways of providing light, of moving goods one km, of having a comfortable indoor temperature, etc. This could at a later stage be used to provide Energy/Carbon Service Performance Standards, i.e., standards on carbon emissions for providing a service. Such a standard could spur technology development and create space for new policy instruments.

### 2.2 Establish guidelines for calculations that allow companies to report positive contributions when they provide transformative solutions

The differences in calculating the positive contributions are significant and clearly demonstrate the need for an agreed upon framework for measuring and reporting positive contributions. Two aspects are particularly important to address.

First, the underlying infrastructure. When transformative solutions are introduced, they very often depend on a totally different underlying infrastructure compared with the old way of providing the service. Comparing virtual meetings with air travel requires us to not only understand the difference between video conference equipment and a plane, it also requires us to understand the difference between fiber optic cables and base stations on the one hand and airports, hotels, and roads connecting airplanes with cities, on the other. Similarly, ships and planes are not only very different in terms of the carbon needed by the different vessels to travel a certain distance, a port with renewable energy production is part of one kind of infrastructure and an airport contributing to increased car travel and urban sprawl is part of another.

Second, the dynamic effects, the way consumption of different solutions results in investments that accelerate further reductions of emissions or investments that result in increased emissions.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

These proposals are good in their own way, but they approach the challenges almost exactly in the same way as 20 years ago. This is also necessary, but in addition to that focus needs to be on transformative solutions. They also approach partnerships as collaborations between existing stakeholders rather than new networks.

Looking at the input so much of it is influenced by the same groups that shaped the Rio agenda and with the same kind of tools. This is valuable input and important documents, but it

is unlikely to generate any new energy, networks or initiatives beyond what current institutions are already working on. If nothing else the Rio+20 conference should allow 5% of the resources to be spent on new ideas and areas, and these should be decided through new tools and networks that are not linked to existing business groups, UN bodies, NGOs, etc. The world is changing fast and new ideas should be promoted.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

---

## Specific Elements

**a) Objective of the Conference:** To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.

---

**b) Green economy in the context of sustainable development and poverty eradication:** views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication

---

**c) Institutional framework for sustainable development:** Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.

---

**d) Any proposals for refinement of the two themes.** Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".

## 21st CENTURY CLUSTERS

Transformative solutions for Rio 2.0: Inputs for Compilation Document

A Framework for Action at Rio+20 and Beyond: October 2011

## LOW CARBON LEADERS

## BEYOND CARBON

Rio +20 Inputs for Compilation Document

21st Century clusters with transformative solutions contributing to a green economy in the context of sustainable development and poverty eradication

Below is the input from the 21st Century Clusters. For more details, background and cases please see: <http://transformative-solutions.net/>

## Background

Rio+20 presents a unique opportunity to shift perspective from problems to opportunities and from incremental improvements in existing systems to transformative solutions (i.e. solutions that provide the services society needs in totally new ways). Structures, legislations and methodologies to identify, encourage and measure incremental improvements among polluting industries already exist. Rio+20 could be the global turning point where structures, legislations and methodologies are introduced and encouraged to identify, encourage and measure transformative solutions. A clear solution agenda would encourage new clusters and networks as well as a new generation of entrepreneurs to step forward and be part of the sustainability agenda.

With a solution agenda future generations might refer back to the conference as Rio2.0 rather than +20. A new approach in a new millennium led by networks that see opportunities instead of problems.

It is imperative that two decades on from the Earth Summit in Rio de Janeiro the discussions on sustainable development take into account today's societal and technology contexts. The agenda of the last summit as well as its outcome were shaped by individuals who had never seen a webpage, sent an SMS message or used a smart phone. Back then few had anticipated the unprecedented uptake of Information and Communication Technology (ICT) and the related socioeconomic benefits. Whereas, at the time of the Earth Summit, there were less than 100 million mobile subscribers around the world, today the number is above 5 billion. This represents nearly four fifths of the world's population. Around 8 trillion SMS messages will have been sent by the end of this year.

With the emergence of the internet of things (IoS) we can expect further breakthroughs. Eight years after Rio+20 there will most likely be around 20 billion connected devices. Society will experience connectivity and access to information that are historically unique. Smart buildings will become net producers of renewable energy, mobile banking will leapfrog the need for a banking infrastructure, and e-commerce will dramatically reduce the need for physical products and services supporting dematerialisation.

Against this technological backdrop, the world's economy will continue to develop at a rapid pace. China might become the world's largest economy during the next 10 years and India home to most people on the planet. In 2050 China will probably have more old people than the entire population of the US. In this situation business as usual is not an option. These developments will bring along new challenges for sustainability, calling for the need to look beyond incremental changes in existing systems to finding new solutions.

The Earth Summit in 1992 focused a lot on end-of-pipe technologies and how companies can reduce their own impact and improve their sustainability performance. Today we still tend to see frameworks that address sustainability from a risk perspective. The methodologies that have been developed predominantly focus on measuring the 'negative' impact of industry on sustainability.

## 1. Expectations for the outcome of Rio+20

The following policy proposals should be reflected in the outcome documents and decisions as they would help accelerate the uptake of transformative solutions and allow businesses to become innovative solutions providers:

#### 1.1 Support for exponential growth of low-carbon/resource efficient solutions

Policy makers should set acceleration targets for low-carbon/resource efficient solutions, not technology-based in order to avoid picking winners, in order to allow exponential growth of such solutions. Too often the exponential growth of low-carbon/resource efficient solutions is seen as a problem as it disturbs old business solutions. Instead, we must recognize high-carbon/resource intensive business solutions as a problem. The need for job creation and innovation should be linked to companies with accelerated sales of low-carbon solutions.

#### 1.2 System solutions

Policy makers should encourage integrated solutions that provide the services we need. Often, converging trends allow for new system solutions that current regulations are undermining. For example, improved insulation, smart lighting, and better solar PV solutions allow for buildings that are net producers of electricity, but only if the policy framework focuses on an ambitious use of system solutions instead of allowing small isolated improvements. As an example, the focus in most countries is on reducing emissions instead of turning buildings into solutions. A Global Feed-In Tariff Programme for system solutions should be considered as a market-based mechanism to help the uptake of system solutions.

#### 1.3 Tipping points for transformative solutions

Policy makers must identify when different incremental improvements reach the point when they can be transformative. E.g., when a building reduces its energy use by 80% it can often meet its energy demand from local renewable energy sources. Further reductions allow a net positive contribution that allows for charging cars or other extra functions. Such thresholds, e.g. 80 percent energy efficiency for buildings, should be identified as they require significant changes in current regulations.

Increased public RD&D, in particular demonstration support, is needed to allow companies to work in new clusters that deliver innovative service solutions when tipping points are reached. This is key for many solar and wind applications as well as many other solutions. In particular there is a big lack of investments in innovative solutions in the developing world since there is so much focus on short-term cost efficiency and easy ways to measure carbon reductions in the current system.

#### 1.4 Supporting low-carbon/resource efficient feedback and avoiding high-carbon/resource intensive feedback/rebound

One of the major challenges today is that most efforts for increased resource efficiency sooner or later result in a situation in which the resources (time, natural resources and money) that are initially saved are re-invested in ways that increase emissions and use of natural resources. There is an urgent need to develop systems for low-carbon/resource efficient feedback, i.e., a situation in which the savings are used for re-investments in more resource-saving solutions.

The massive current and historic subsidies that are making the current unsustainable solutions cheaper than they should be are a major challenge that needs to be addressed. More than 500 billion dollars are used annually to directly support a high-carbon infrastructure, more than twelve times the support for renewables. This is making it hard for transformative solution providers to compete. The subsidies also result in a situation in which many stakeholders — including policy makers, academics, and media—think that low-carbon solutions are not competitive.

#### 1.5 Rewarding trendsetting for supply of sustainable solutions

Today companies that are leaders are not rewarded. Policy makers must create economic incentives for low-carbon leadership and develop methodologies that allow for measurement of such leadership. Companies helping to accelerate uptake of new technologies should be acknowledged and rewarded in a variety of ways<sup>1</sup>.

#### 1.6 Global collaboration for a 21st century low-carbon infrastructure

Many of the new networking solutions, such as a global network for high definition virtual meetings, require global collaboration to overcome different standards and regulations. Very few such initiatives exist and they are needed to accelerate the uptake of a new generation of services that depends on information and communication technology, the most energy efficient infrastructure humans ever have created. International action programmes must be agreed upon for certain already identified and demonstrated solutions that are ready to roll out large scale, e.g., energy plus housing, smart grid solutions, solar PV solutions, global infrastructure/standards for smart meetings, etc.

#### 1.7 Measure the use of underlying infrastructure and resource demand for different services

Very few policies today measure or support the transformation of the underlying infrastructure. Part of this is probably due to the fact that most emissions assessments do not include the underlying infrastructure; or, when they do, it is separate from the solutions that depend on them. It is time to ensure that assessments include the underlying infrastructure whenever relevant in order to understand the difference between transformative solutions and incremental improvements.

#### 1.8 Carbon distance/How to transport and moving the sun/ What to transport

Policy makers should not approach transport as something that should be reduced; focus should be on zero emissions, sustainable use of natural resources and poverty reductions.

First, modal shifts should be prioritized in order to ensure that goods move with the least amount of carbon emitted as a stepping stone toward zero emission goods transport. Second, transport should be approached as an integrated way to ensure optimal production and consumption systems, not as a separate sector.

#### 1.9 From product to service

Policies should focus on the service being provided, not the old technology or old sectors that so far have provided the service.

<sup>1</sup> [http://transformative-solutions.net/2.0/files/material/LCL\\_Trendsetting.pdf](http://transformative-solutions.net/2.0/files/material/LCL_Trendsetting.pdf)

Transformative solutions require a shift from product to service where everything from airplanes, cars, and books are seen for what they are, i.e., ways of providing services such as business meetings, commuting and, reading. Today many services can be provided in fundamentally different, and magnitudes more efficient, ways. But in order for solutions such as video-conferencing, teleworking, and e-readers to take off, rules and regulations must be based on services.

Public procurement could become one of the most important instruments in supporting transformative solutions. Technology neutral policy making is one key part of this, but policy makers also must really start with the actual service that is needed and not a sub-service that the existing system needs. For lighting, it is important not just to ask for a better light source (i.e., move from incandescent to CFL and then to LED), but to ask how light can be provided in different ways, from architectural solutions to light-emitting fabric.

### 1.10 Multiple gains with low-carbon results

Many areas in society, health, education, art, sports, marketing, etc., have so far been almost totally left out of the climate/environmental discussions. These sectors have a fundamental impact on how society is structured and are significant drivers of innovation. It is important to support initiatives in such areas that also include a climate/natural resource perspective but also to link smart initiatives to other areas to ensure synergies.

### 1.11. Nanotechnology and biomimicry for the 21st Century

Instead of brute force we now have the possibility to turn a page and work with nature instead of against it. High-Throughput Atomically Precise Manufacturing is a nanotechnology-based tool that is in front of us and we are the first generation that can simulate this future technology at a physical level, and use our knowledge to guide this upcoming industrial and technical revolution in the direction we want.

In a time of growing tensions, the potential to gather the world around a common challenge should not be ignored. So much of the focus today is on short-term gains (political and economic) that nanotechnology will be difficult to fit into existing structures, but this could also turn out to be a strength. New clusters could be established and new ways of collaboration could be developed. History is the only ultimate judge, but for anyone claiming global leadership in the 21st century, regardless of whether the focus is on poverty, environmental challenges, climate change, innovation or economic development, the prospects for transformative, nanotechnology-based developments must have a central role.

The conference in Rio could be the starting point for a new conversation, and for the generation of new clusters and collaboration. At the center of this new conversation about the future will be scenarios of unprecedented, disruptive technological change. It is up to us to focus on what we think is most important, and hopefully this report can inspire action in one of the most important areas of our time.

The outcome document should ensure that a global task force is created that can help with two things. First, to facilitate increased collaboration between different groups of nanotechnology researchers (even if they do not call them that themselves). Second, identify gaps in current research that needs to be addressed in order to enable sustainable implementation of High- Throughput Atomically Precise Manufacturing.

## 2. Possible structure of the Outcome document

### 2.1 Ensure a sector/service approach in the outcome document

In the 21st century is an urgent need to focus on clusters and companies as solution providers. A shift beyond the sector approach is called for, where the focus is on the services needed in society. Wherever possible any approach based on sectors, investment guidelines, policy frameworks, rankings, etc., should add a service perspective. While a sector perspective can be helpful for incremental improvements it seldom helps develop or encourage transformative solutions. For most sustainable solutions collaboration is needed between companies from different sectors in order to challenge the way services are provided today.

Introducing a sector/service matrix as the standard approach could help support a shift toward companies as solution providers and ensure that transformative solutions can be identified

[\[UNDESA/DSD: Please download the original document to see this image\]](#)

A sector perspective can encourage incremental improvements in existing systems (doing things right) instead of encouraging a sustainable way of providing the things we need (doing the right things). By introducing a sector/service matrix, tensions within and between sectors become easier to understand.

Inviting airline companies to discuss strategies will work fine if improvements in airplanes are the expected outcome, but inviting stakeholders to discuss sustainable meetings would require travel/ meeting agencies, video conference providers, and the airline industry to discuss the best way to provide users with services.

Using a sector/service matrix can also help identify different clusters that may depend on each other and may not always be interested in change. Coal and oil companies can discuss marginal improvements with construction and car companies, but if the focus shifts to sustainable commuting or smart buildings all of a sudden new clusters can emerge and some companies can become less important (or even irrelevant).

[\[UNDESA/DSD: Please download the original document to see this image\]](#)

Based on a sector/service matrix it is possible to develop what could be called a "carbon performance of services." This carbon performance could be used to compare different ways of providing light, of moving goods one km, of having a comfortable indoor temperature, etc. This could at a later stage be used to provide Energy/Carbon Service Performance Standards, i.e., standards on carbon emissions for providing a service. Such a standard could spur technology development and create space for new policy instruments.

### 2.2 Establish guidelines for calculations that allow companies to report positive contributions when they provide transformative solutions

The differences in calculating the positive contributions are significant and clearly demonstrate the need for an agreed upon framework for measuring and reporting positive contributions. Two aspects are particularly important to address.

First, the underlying infrastructure. When transformative solutions are introduced, they very often depend on a totally different underlying infrastructure compared with the old way of providing the service. Comparing virtual meetings with air travel requires us to not only understand the difference between video conference equipment and a plane, it also requires us to understand the difference between fiber optic cables and base stations on the one hand and airports, hotels, and roads connecting airplanes with cities, on the other. Similarly, ships and planes are not only very different in terms of the carbon needed by the different vessels to travel a certain distance, a port with renewable energy production is part of one kind of infrastructure and an airport contributing to increased car travel and urban sprawl is part of another.

Second, the dynamic effects, the way consumption of different solutions results in investments that accelerate further reductions of emissions or investments that result in increased emissions.

### 2.3 What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

These proposals are good in their own way, but they approach the challenges almost exactly in the same way as 20 years ago. This is also necessary, but in addition to that focus needs to be on transformative solutions. They also approach partnerships as collaborations between existing stakeholders rather than new networks.

Looking at the input so much of it is influenced by the same groups that shaped the Rio agenda and with the same kind of tools. This is valuable input and important documents, but it is unlikely to generate any new energy, networks or initiatives beyond what current institutions are already working on. If nothing else the Rio+20 conference should allow 5% of the resources to be spent on new ideas and areas, and these should be decided through new tools and networks that are not linked to existing

business groups, UN bodies, NGOs, etc. The world is changing fast and new ideas should be promoted.

## 350.org

UNCSD RIO+20: 350.org Inputs for the Draft Zero process

### Introduction

To ensure a successful Rio+20 Summit, governments and all sectors of society must come together to restore confidence within the international community with ambitious action to address implementation gaps and take further action on the core principles and goals set forth in the Rio Declaration, Agenda 21, and Rio Conventions. From the perspective of the 350 movement—a civil society movement of young people, artists, civil society organizations, faith communities, and citizens of all kinds in nearly every country of the planet—Hone of the most important aspects defining the success or failure of the summit will be whether it advances international commitment and ambitious action to fight climate change.

The number 350 is the bottom line to define ambitious action to stop the climate crisis. 350 parts per million (ppm) of CO<sub>2</sub> is what many scientists, climate experts, and over 112 national governments say is the safe upper limit for CO<sub>2</sub> in our atmosphere.

Accelerating Arctic warming and other early impacts related to climate change have led scientists to conclude that we are already above the safe zone at our current 392 ppm, and that unless we are able to rapidly return to below 350 ppm this century, we risk reaching tipping points and irreversible impacts such as the melting of the Greenland ice sheet, savanization of the Amazon and major methane releases from increased permafrost melt.

In order to ensure the possibility of a sustainable, equitable future for all, the outcomes of the Rio Summit must include concrete action to mitigate climate change that ensures a stable climate at 350 ppm. Concrete proposals for action from Rio to achieve this include:

### Moving to 100% Renewables

Countries should use the UNCSD2012 to take clear action on moving economies towards 100% renewable energy. This is fundamental to the concept of green economy. It will not be sustainable for economies to continue on their current path burning through nonH renewable resources such as fossil fuels and nuclear energy. Countries must agree upon a vision that ensures clean and renewable energy sources and energy efficiency, developed with involvement and prior consent of local communities.

This vision will need to be coupled with initial concrete actions to trigger incentives for this type of shift within economies and to promote growth of innovation and advancement in the renewable technology sector.

Specifically countries should use Rio+20 to:

- Make a clear commitment to clean energy, based on the principle of common but differentiated responsibilities, that includes:
  - o 30% of energy use from renewable sources globally by 2020
  - o 40% overall improvement in energy efficiency globally by 2020, and
  - o Universal access to modern energy services and ending energy poverty:

clean, reliable and affordable energy services for cooking and heating, lighting, communications and productive uses.

### Eliminating fossil fuel subsidies

- Eliminate fossil fuel subsidies and perverse incentives by 2020, including aid, loans or other subsidies that encourage further development of fossil fuels. This should be in line with the phase out of subsidies agreed upon in the G20 commitment, and revenues should be redirected to support renewable energy and energy efficiency programs, as well as technology innovation in the renewable sector.
- We should also end subsidies to false energy solutions such as “clean coal,” nuclear, and large hydro or any projects where environmental and social impacts outweigh their perceived climate benefits.

### Defining a green and just economy

Green economy is a new concept to be discussed at the Rio+20 summit, and therefore requires definition. In developing a vision for a just, green economy and taking the first steps globally on the concept, countries should commit to action on the following points:

- Equity must be at the heart of the green economy, ensuring the right and access through funding and technological support to clean, sustainable development for developing countries and frontline communities in the Global South and North. We must remember that one size does not fit all and that there are common but differentiated responsibilities on the path to a global sustainable future.
- Providing access to green job opportunities through policies such as setting targets and resources for capacity building, investment in green technologies, and job training for low income individuals.
- The green economy framework must break down barriers to current Intellectual Property Rights issues that impede sharing important renewable and sustainable development technologies, including technologies for adaptation. This could be achieved through varied incentives, such as creating new innovation hubs and ensuring new technologies remain in the global commons to speed the deployment of clean renewable energy around the world.
- A green economy vision should support cities as innovation hubs for best practices in sustainable policy development and implementation. Cities have become leaders of sustainable development design and implementation. Where countries have floundered cities have provided leadership. Countries should explore increased partnerships with city governments and also share best practices at the international level as well.
- Address change in productionHconsumption patterns as the current patterns lead to unsustainable use of natural resources and increasing greenhouse gases emissions. • Establish an international financial transaction tax (FTT). According to The Tobin Tax

– A Review of the Evidence, this could raise as much as 400 billion annually. These funds would be essential to making a real impact on combating climate change and eliminating poverty.

Supporting and empowering civil society to be a partner in implementing sustainable policies

As youth and civil society declared in Copenhagen, "you can't make decisions about us, without us". 350.org works with civil society organizations and in almost every country on earth to build a powerful movement to fight climate change, and through that work we see the powerful local knowledge and organizing capacity that citizens everywhere are utilizing to achieve a sustainable society. Agenda 21 paved the way for substantial and positive changes in the government and nonHstate actor relationship, and has allowed many diverse sectors to begin to work together to ensure a sustainable future. In order for Rio+20 to be a success, civil society involvement must be prioritized, and countries should undertake the following:

- Continue to provide more capacity building opportunities across sectors of civil society and communities in order to empower citizens to have an active part in the implementation process. Where possible, governments should forge specific partnerships with civil society and communities to help implement sound sustainable policies.
- Make public funds available to NGOs that have the ability to help ensure implementation and compliance monitoring where needed.
- Ensure that cooperation mechanisms and government-public partnerships center around best practices and sustainable development in the local context rather than putting a market approach first.

---

## 77 civil society organisations on the Importance of Access to Information and a Free Media to Sustainable Development

31 October 2011

Submission from 77 civil society organisations on the Importance of Access to Information and a Free Media to Sustainable Development

We, the undersigned 77 civil society organisations representing freedom of expression, transparency, journalists, and the media interests around the world, are providing this submission on issues we strongly believe need to be included in the Outcome Document of the United Nations Conference on Sustainable Development (Rio+20).

The Outcome Document will represent an important milestone in the global efforts to realise sustainable development. We urge the UNCSD and member states to put free media, transparency and the free flow of information as central pillars in their efforts to promote sustainable development and the protection of the environment at the upcoming Rio+20 Summit in June 2012. We believe that transparency and the free flow of information, including the right of all to seek, receive and impart information and ideas related to development and the environment, are fundamental to ensuring sustainable development and environmental protection.

In particular, we recommend that the Outcome Document includes a general principle recognising that a free media and an independent civil society, transparency and the free flow of information are central pillars in global efforts to promote sustainable development and the protection of the environment.

The Outcome Document should also include:

1. An agreement for the creation of a new international treaty on access to environmental information, public participation and access to justice, based on Principle 10 of the 1992 Rio Declaration and the United Nations Economic Commission for Europe (UNECE) Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters (Aarhus Convention).
2. Clear and specific targets and deadlines for the adoption and implementation by member states of national legislation on access to information, public participation and access to justice, based on the United Nations Environment Programme (UNEP) Bali Guidelines.
3. Clear and specific targets and deadlines for member states to adopt necessary laws and policies to protect freedom of expression, including freedom of the media, freedom of association and freedom of assembly as well as to repeal those legal provisions that hamper the realisation of these rights, which are fundamental to sustainable development.
4. Clear and specific targets towards the adoption and implementation by all UN agencies, organisations, commissions, programmes, and other UN bodies, of access to information and public participation policies, including effective mechanisms to ensure appeal and compliance.

We fully support the adoption of Sustainable Development Goals (SDGs) which will integrate the above recommendations.

We thank you for this opportunity and offer our further assistance and commitment to the success of the Rio+20 process and conference and the full achievement of sustainable development.

Yours sincerely,

A Seed Japan

Proposal by the Japanese Youth in order to achieve the sustainable development

We, Japanese youth, regard ourselves as to be responsible to the future generations, and with that responsibility, we are proposing the followings to all the stakeholders at Rio +20.

1. Declare to make all the efforts to implement the treaties and initiatives in the UN frame, in which frame the environment, human rights, peace, gender indigenous people and bio-diversity are higher

2. State the followings:

- Demise the finance-centered economic policy, and Promote the Civil-Finance and Social Responsible Investment;
- Reduce the budget on military affairs, and Increase on the education for poverty problem; and
- Withdraw from technology relied on nuclear power and genetic modification, and Promote the technology of renewable energy and organic farming.

A SEED JAPAN (Action for Solidarity, Equality, and Environment and Development) is a Japan based, international youth environmental organisation. The ASEED international campaign was founded in October, 1991 in order to give youth a voice at the Earth Summit (United Nations Conference on Environment and Development), held in Brazil in June 1992. This campaign drew participation from 70 organizations from 50 nations. Following the Earth Summit, ASEED Japan was established as an organisation based on a membership system. A SEED JAPAN strives for a sustainable and fair society and focuses on cross border environmental problems and the social injustices found within these. We aim to change the present pattern of mass production, mass consumption and mass waste, and eliminate the gaps between north and south, different regions, and between different generations. In order to make these changes, the youth of today, who bear the generations of the future, have taken action.

---

## Abu Dhabi Global Data Initiative (AGEDI)

### Eye on Earth Submission

#### 1. Introduction

This preliminary proposal has been prepared on behalf of the Eye on Earth community by the Environment Agency Abu Dhabi (EAD) and the United Nations Environment Programme (UNEP). This joint input to the UNCSD Compilation Document is submitted by the Abu Dhabi Global Environmental Data Initiative (AGEDI).

AGEDI are currently facilitating the Eye on Earth Summit & Exhibition that will be held in Abu Dhabi from the 12th-15th December 2011. Representing the United Arab Emirates (UAE) Government, Environment Agency Abu Dhabi (EAD) will host Eye on Earth in partnership with United Nations Environment Programme (UNEP). The Summit will focus on the critical nature of environmental data and information to ensure robust policy and decision-making. The premise is the need to ensure readily accessible, accurate and relevant data from which to inform sound environmental management, monitoring and performance. Preparations for the Summit have been on-going for over 12 months and outcomes aim to pave the way for future needs with regards to environmental data access, sharing and availability including infrastructure, finance, capability and capacity building and institutional and informal networks.

As an outcome of the Summit and as a Science and Technical focused body, we intend, as AGEDI, and on behalf of the Eye on Earth community, to submit an Eye on Earth Declaration to the UNCSD which addresses the issues, and propose solutions for, access to the necessary environmental and societal data and information by all those who need it. All afore-mentioned participating sectors will be represented at the Summit and provided the opportunity to further collaborate on and contribute to the Eye on Earth submission to the UNCSD.

As this proposal is being submitted prior to the Eye on Earth Summit it will be necessary to re-submit an amended version of this document in December 2011. At this time the outcome of the Summit will be articulated with further contributions from Eye on Earth Summit attendees as representatives and members of the community of stakeholders.

#### 2. Background on AGEDI

The lack of quality, quantifiable environmental data has proven a major hindrance to the global process of achieving sustainable development. The result is that throughout the world socio- economic and environmental decision makers are being challenged to make vital decisions without the necessary data and information being available to them.

Initially contributing to the development and launch of AGEDI was UAE's concern regarding the approach and criteria used for the results of the Environmental Sustainability Index (ESI), produced by the World Economic Forum in February 2002. The UAE in this Index was ranked 141 out of 142 countries, with an ESI of 25.7. It was recognised that the application of non-Region specific measures and associated indicators presented skewed results. The need to ensure readily accessible, accurate and relevant data from which to inform sound environmental management, monitoring and performance was emphasised.

In this spirit, the Abu Dhabi Global Environmental Data Initiative (AGEDI) was launched on 2 September 2002, at the World Summit on Sustainable Development (WSSD) in Johannesburg by the United Arab Emirates (UAE) as a Type II Initiative.

Under the guidance of His Highness Sheikh Khalifa bin Zayed Al Nahyan a Steering Panel was formed and entrusted with the responsibility of preparing the proposal to establish AGEDI. Made public on May 2, 2002, international dialogue then took place which initially promoted the Initiative in the United States and to the United Nations.

Today Environment Agency Abu Dhabi (EAD) champions AGEDI locally, whilst the United Nations Environment Programme (UNEP) champions it regionally and globally. AGEDI works with Partners, Members and stakeholders throughout the world to achieve a more sustainable future through 'best-impact' access to environmental and societal data. AGEDI's focus is on the support of developing countries and emerging economies. Amongst others, Partners include UNEP, UAE Ministry of Water and Environment, Conservation International, European Environment Agency, and the World Wildlife Fund with Emirates Wildlife Society.

#### 3. Eye on Earth Summit

Under the patronage of His Highness, Sheikh Khalifa bin Zayed Al Nahyan, Ruler of Abu Dhabi and President of the United Arab Emirates, Eye on Earth is a global Summit devoted to the issue of greater access to environmental and societal data by all those who need it.

The objective of the Summit is to promote the international agenda for improved access to environmental information, and the ability to use and leverage environmental data and information for the benefit of all communities.

The overall structure of the Summit is as follows:

- (a) a Summit involving multi-stakeholder consultation (with plenary, technical and high-level segments), and;
- (b) a major Exhibition with various side events including   ZGeneration eYe' youth programme. It will also present the One UN Pavilion to reinforce the theme delivering as One.

Further, the Summit will be preceded by the UN Major Groups, Civil Society & Stakeholders Forum which will take place on Sunday 11 December 2011, held by UN Major Groups. This Forum is aligned with the Summit and focused on "Great Access to Environmental and Societal Information" and as such will ensure the inclusion of, and participation by Civil Society in Eye on Earth and its outcomes.

#### 4. General Content

4.1. What are the expectations for the outcomes of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document

UNCSD is expected to produce a revitalised global partnership for sustainable development which, inter alia, will lead to the development of new political structures such as the institutional framework for sustainable development (IFSD).

AGED I wish to emphasise that a revitalised global partnership for sustainable development must pay due attention to the underlying knowledge base for environment and sustainable development including and emphasizing environmental and societal data and information which must, necessarily underpin the institutional framework for sustainable development (IFSD). It is essential that economic, environmental and societal data and information be integrated into the IFSD in order to support decision-making. Collaboration among the relevant data and information providers through network building and strengthening is vital towards achieving this goal. Capacity building is necessary in order to mobilise all countries in this collective effort.

This will require a wide array of coordinated actions by the relevant actors (Government, Major Groups, UN system, international finance institutions, etc). The forthcoming Eye on Earth (EoE) Summit presents a unique opportunity to bring these actors together and focus their attention on defining a set of transformative actions to strengthen the knowledge base for environment and sustainable development.

It is proposed that the actions defined at Eye on Earth be included in the Rio +20 outcome document with specific regard to those actions that address and support the Rio +20 themes of:

- (a) Green economy in the context of sustainable development and poverty eradication;
- (b) Institutional framework for Sustainable Development.

4.2. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalised global partnership for sustainable development, or others

It is submitted that there is an overwhelming and collective need by all existing proposals for environmental data and information. Further that such data and information be accessible as a common knowledge base for decision-making. Finally that it be available to all those who need it.

4.3. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc).

The Eye on Earth (EoE) Summit aims to contribute to UNSCD, with regards to closing the implementation gap in that it will:

- Convene the worlds thought and action leaders to celebrate "best impact" data initiatives from around the globe;
- Converge on key issues to reach consensus on solutions to greater data accessibility;
- Collaborate to strengthen existing initiatives and, where necessary, to launch new ones.

The Summit audience includes:

- (a) United Nations Environment Programmes Major Groups & Stakeholders" Civil Society Individuals representing nine Major Working Groups as Identified in Agenda 21, Chapter 23;
- (b) Government Authorities  Heads of State, Ministers, elected officials, Heads of Environment protection agencies, multi-lateral government institutions, central statistical offices and national mapping agencies;
- (c) Development Assistance and Finance  Executive Directors of development banks, financial and donor organisations, private foundations and Sovereign Wealth Funds as well as individual philanthropists;
- (d) Environmental organisations  Key members of non-governmental organisations, advocacy groups;
- (e) Private Sector  Managing Directors of communications, technology, software and utility based companies and representatives of industry organisations;
- (f) Scientific and Technical Institutes  Spatial Data Infrastructure (SDI) representatives, scientists, researchers, technologists and standards committees;
- (g) Education  Higher education administration, academia, scholars, students, youth
- (h) Media - Key influencers in print, electronic and social media

These relevant actors will be engaged in determining how access to environmental data and information will further implementation, define additional implementation requirements and close the implementation gap.

By creating and facilitating the growth of networks and identifying means for implementation of environmental and societal data initiatives the Summit is expected to achieve the following transformative actions:

- Focus global attention on the importance of data and information for sustainability - thus revitalising commitment to current implementation(s);

- Build collaboration through networking among the institutions that can provide economic, environmental and social information underpinning the knowledge necessary for sustainable development - establishing an informal information infrastructure;
- Re-focus global attention on access to environmental data and information for decision- making - by, inter alia, re-defining and emphasising Chapter 40 of Agenda 21;
- Increase capacity building and technology support to developing countries and countries with economies in transition - initiating models for adoption under the theme of "Green Economy";
- Support the delivery of the UNCSD commitments to be made at Rio +20.

It is proposed that these actions be formalized by Rio + 20.

These will be achieved through the specific outcomes of Eye on Earth which include: · The agreement of and submission to UNCSD of the Eye on Earth agreeing ways and means to strengthen existing environmental information networking initiatives and fill gaps towards informed policy and decision making in support of sustainable development. The Declaration will include but not be limited to a set of defined principles for data and information collaboration.

- A set of White Papers which identify existing issues and barriers to implementation with regard to access to environmental data and information, providing clear direction and leadership in terms of closing the implementation gap in the areas of:

(1) Policy, Governance and Networking;

(2) Content and User Needs;

(3) Technical Infrastructure; and

(4) Capacity building, Education and Awareness-raising

- Actor commitment to a programme of Special Initiatives across:

o Water Security

o Access to Information - Principle 10 (of 1992 Rio Declaration)

o Blue Carbon

o Disaster Resilience, Reduction, Response and Recovery

o The role of financial institutions, aid agencies and sovereign wealth funds in bridging the information gap

o Community Sustainability, Resiliency and Innovation by Design

- A set of recommendations on the future knowledge framework for sustainable development, central to closing the implementation gap will be brought forward to UNCSD at the closing of the Summit: 15th December 2011.

4.4. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant timeframe for the proposed decisions to be reached and actions implemented

Eye on Earth proposes that Rio + 20 define the conceptual framework for a future knowledge base to support sustainable development underpinned by environmental data and information and that this is implemented as a key component of the IFSD.

We envisage that an environmental data and information entity will emerge or will need to evolve. Such an entity would seek to inform and/or provide:

1. Agenda (a data and information driven, knowledge-focused global programme on environment and sustainable development)
2. Secretariat (distributed staff and experts  coordinating centre + nodes)
3. Network (a data  network of networks  at multiple levels and spanning the three pillars)

The Summit preparatory process has already made significant progress on two of these components:

(1) Eye on Earth Agenda

The agenda will comprise of a set of thematic and cross-cutting knowledge based special initiatives. Proposed initiative themes include:

- Eye on Food Security
- Eye on Water Scarcity
- Eye on Principle 10 (of 1992 Rio Declaration)
- Eye on Carbon Mitigation
- Eye on Disaster Resilience, Response and Recovery
- Eye on Earth information system/portal

Concept papers exist on each of the above special initiatives and various teams are working on developing the concepts into larger project proposals to be presented for further contribution and collaboration at the Summit.

(2) Eye on Earth Network

The convening power of the Summit will be used to catalyse collaboration between decision makers from local to global levels.

The key cooperation mechanism is a  network of networks  that brokers collaboration within and between countries involving those institutions that can provide economic,

environmental and social information to underpin sustainable development.

It is proposed that the Secretariat would take the form of a distributed secretariat with staff based at a hub augmented by experts located in participating regions yet to be defined, but potentially available within existing and regional institutions and/or programmes.

## 5. Specific Elements

Summit collaboration and subsequent Eye on Earth Submission to UNCED.

It is proposed that if supported, such an environmental data and information centric network be established within the Rio + 20 Institutional Framework and be defined for sustainable development and in support of the requirements of developing Green Economies.

UNCSD can build upon the outcomes of the Eye on Earth Summit by focusing attention on the requirement for an environmental knowledge base and allocating agenda time to discuss this issue from a policy and institutional level perspective.

It is anticipated that the Eye on Earth Declaration document will be brought forward to UNCSD along with the set of recommendations adopted at the Summit. The current Draft Declaration is included below.

### Draft Eye on Earth Summit Declaration

We the ministers, and high-level representatives of government, having consulted business, academia and civil society present at the first Eye on Earth Summit in Abu Dhabi from 12 to 15 December 2011,

Deeply concerned over the evidence of unprecedented environmental changes at all levels, including possible irreversible changes with potentially negative implications for economic and social development, especially for the poor and vulnerable groups in society.<sup>1</sup>

Conscious that cooperation on exchange of, and access to, timely, credible and relevant information among a wide array of actors is a critical part of the science-policy interface needed for advancing the development and implementation of goals, targets and indicators for sustainable development,

Recalling principle 10 of the Rio Declaration on Environment and Development, which amongst others recognizes that each individual shall have appropriate access to information concerning the environment that is held by public authorities, and that States shall facilitate and encourage public awareness and participation by making information widely available,

<sup>1</sup>From OP 10 UNGA res 63/220 19 December 2008

Convinced that a strengthening of the capacity for managing, exchanging and facilitating access to information in developing countries and countries with economies in transition will help advance the development and implementation of goals, targets and indicators for sustainable development,

Conscious of the opportunities offered by the rapid advancement of information and communications technologies for enhancing information access, exchange and management,

Acknowledging the critical role of existing thematic and geographic networks and systems for exchange of and access to information, including the role of the Group on Earth Observations (GEO) and its land, sea, atmosphere and space-based Global Earth Systems of Systems (GEOSS), and also the role and activities of the Global Spatial Data Infrastructure Association (GSDI) in delivering of spatial data platform to facilitate data and service discovery, access and integration,

Bearing in mind that the United Nations Conference on Sustainable Development in Rio in 2012 represents an opportunity to renew the political commitment to the role of information in advancing sustainable development, including as it relates to the consideration by the Conference of the themes: green economy within the context of sustainable development and poverty eradication, and institutional framework for sustainable development,

Expressing our deep appreciation to the Government of Abu Dhabi for organizing and hosting the first Eye on Earth Summit in partnership with the United Nations Environment Programme.

Declare that we:

1. Aspire to a vision whereby decision-making for sustainable development, is empowered by the availability and equitable accessibility of credible, relevant and timely information;
2. Decide that the objectives of our collaboration are to foster collaboration among relevant networks, systems, institutions and technology providers on the integration of economic, environmental and social information in a shared information system for the advancement of sustainable development by taking advantage of the rapid development of information and communication technologies and by strengthening capacity building and technology support to developing countries and countries with economies in transition;
3. Agree to advance our collaboration based on the following principles:
  - (a) The agenda for cooperation should be flexible, balanced, purpose-driven, issue-focused, and time-bound yet durable and be developed in respect for the diverse range of stakeholders and their governance structures so as to build trust among partners;
  - (b) The modalities for cooperation should be inspired by the subsidiarity principle so that functions are performed in a distributed manner by those best placed to do so and information is kept close to the source in order not to lose knowledge about its use and limitations;
  - (c) That effective mechanisms for the collection, management and dissemination of environmental information are needed and the responsibility for quality assurance of the information lies with those who collect or originate data;
  - (d) Information should be made available in such a way that it avoids unnecessary duplication in data collection, underpins reporting obligations, and supports decision-making;
  - (e) Environmental information should be available to the public, with any exemptions being defined in law and interpreted narrowly having regard to the public interest in disclosure so that access to information is timely, effective and affordable for all interested users;
4. Agree to work with the United Nations in establishing a forum for cooperation among sub- global and thematic environmental information networks with a view to further enhancing their connectivity and effectiveness in supporting assessments, information exchange and decision-making for sustainable development;

5. Decide to work with the Group on Earth Observation and other interested partners in supporting the further development and expansion of the existing interoperability standards for data and information exchange and a system-wide approach to the provision of web- based platforms in support of information exchange;
6. Resolve to support the development of adequate institutional and legislative enabling conditions for furthering the implementation of principle 10 of the Rio Declaration, inter alia based on the Guidelines for the Development of National Legislation on Access to Information, Public Participation and Access to Justice in Environmental Matters;<sup>2</sup>
7. Commit to engage in, and to strengthen existing initiatives already involved in, technical cooperation for capacity building and technology support for access to and exchange of information in developing countries and countries with economies in transition, including by supporting development of networks, regional cooperation, data collection, research, analysis, monitoring and integrated environmental assessment and legislative and institutional frameworks for access to information;
8. Urge the further development of private-public partnerships for use of information and communication technologies and encourage the private sector to use their research and development capacities to enhance the implementation of national and internationally agreed goals and targets for sustainable development; 9. Welcome the Eye on Earth Exhibition, the special initiatives identified and the technical work by the Summit on policy, governance and institutional networking for information exchange; content and user needs; technical infrastructure; capacity building, education and awareness-raising and showcasing applications;

<sup>2</sup>Adopted at the 11th Special Session of the Governing Council/Global Ministerial Forum of UNEP in Indonesia, February 25, 2010

10. Agree to establish the Eye on Earth Facility comprised of the Trust Fund, the Toolkit containing pledges of technology applications, methodologies, and training resources and the distributed Secretariat based on time and resource commitments by partners;
11. Call on United Nations bodies, other international organizations, multilateral and bilateral donor agencies and the private sector to further contribute to the implementation of the special initiatives agreed by the Summit and the actions set out above;
12. Call on UNEP to assist developing countries and countries in transition through targeted capacity building programs in their efforts to develop adequate national legislation that support public access to information in line with the UNEP Guidelines on Principle 10;
13. Resolve to meet before the end of 2013 to review the progress of implementation of the current declaration and consider the directions for further work.

We make these commitments with a view to strengthening the knowledge infrastructure needed to advance human well-being and sustainable development.

#### Draft Eye on Earth Summit Declaration

We the ministers, and high-level representatives of government, having consulted business, academia and civil society present at the first Eye on Earth Summit in Abu Dhabi from 12 to 15 December 2011,

Deeply concerned over the evidence of unprecedented environmental changes at all levels, including possible irreversible changes with potentially negative implications for economic and social development, especially for the poor and vulnerable groups in society.<sup>1</sup>

Conscious that cooperation on exchange of, and access to, timely, credible and relevant information among a wide array of actors is a critical part of the science-policy interface needed for advancing the development and implementation of goals, targets and indicators for sustainable development,

Recalling principle 10 of the Rio Declaration on Environment and Development, which amongst others recognizes that each individual shall have appropriate access to information concerning the environment that is held by public authorities, and that States shall facilitate and encourage public awareness and participation by making information widely available,

Convinced that a strengthening of the capacity for managing, exchanging and facilitating access to information in developing countries and countries with economies in transition will help advance the development and implementation of goals, targets and indicators for sustainable development,

Conscious of the opportunities offered by the rapid advancement of information and communications technologies for enhancing information access, exchange and management,

Acknowledging the critical role of existing thematic and geographic networks and systems for exchange of and access to information, including the role of the Group on Earth Observations (GEO) and its land, sea, atmosphere and space-based Global Earth Systems of Systems (GEOSS), and also the role and activities of the Global Spatial Data Infrastructure Association (GSDI) in delivering of spatial data platform to facilitate data and service discovery, access and integration,

Bearing in mind that the United Nations Conference on Sustainable Development in Rio in 2012 represents an opportunity to renew the political commitment to the role of information in advancing sustainable development, including as it relates to the consideration by the Conference of the themes: green economy within the context of sustainable development and poverty eradication, and institutional framework for sustainable development,

Expressing our deep appreciation to the Government of Abu Dhabi for organizing and hosting the first

Eye on Earth Summit in partnership with the United Nations Environment Programme.

Declare that we:

1. Aspire to a vision whereby decision-making for sustainable development, is empowered by the availability and equitable accessibility of credible, relevant and timely information;

<sup>1</sup>From OP 10 UNGA res 63/220 19 December 2008

2. Decide that the objectives of our collaboration are to foster collaboration among relevant networks, systems, institutions and technology providers on the integration of economic, environmental and social information in a shared information system for the advancement of sustainable development by taking advantage of the rapid development of information and communication technologies and by strengthening capacity building and technology support to developing countries and countries with economies in transition;

3. Agree to advance our collaboration based on the following principles: V (a) The agenda for cooperation should be flexible, balanced, purpose-driven, issue-focused, and time-bound yet durable and be developed in respect for the diverse range of stakeholders and their governance structures so as to build trust among partners;

- (b) The modalities for cooperation should be inspired by the subsidiarity principle so that functions are performed in a distributed manner by those best placed to do so and

information is kept close to the source in order not to lose knowledge about its use and limitations;

(c) That effective mechanisms for the collection, management and dissemination of environmental information are needed and the responsibility for quality assurance of the information lies with those who collect or originate data;

(d) Information should be made available in such a way that it avoids unnecessary duplication in data collection, underpins reporting obligations, and supports decision-making;

(e) Environmental information should be available to the public, with any exemptions being defined in law and interpreted narrowly having regard to the public interest in disclosure so that access to information is timely, effective and affordable for all interested users;

4. Agree to work with the United Nations in establishing a forum for cooperation among sub-global and thematic environmental information networks with a view to further enhancing their connectivity and effectiveness in supporting assessments, information exchange and decision- making for sustainable development;

5. Decide to work with the Group on Earth Observation and other interested partners in supporting the further development and expansion of the existing interoperability standards for data and information exchange and a system-wide approach to the provision of web-based platforms in support of information exchange;

6. Resolve to support the development of adequate institutional and legislative enabling conditions for furthering the implementation of principle 10 of the Rio Declaration, inter alia based on the Guidelines for the Development of National Legislation on Access to Information, Public Participation and Access to Justice in Environmental Matters;<sup>2</sup>

7. Commit to engage in, and to strengthen existing initiatives already involved in, technical cooperation for capacity building and technology support for access to and exchange of information in developing countries and countries with economies in transition, including by supporting development of networks, regional cooperation, data collection, research, analysis, monitoring and integrated environmental assessment and legislative and institutional frameworks for access to information;

8. Urge the further development of private-public partnerships for use of information and communication technologies and encourage the private sector to use their research and development capacities to enhance the implementation of national and internationally agreed goals and targets for sustainable development;

9. Welcome the Eye on Earth Exhibition, the special initiatives identified and the technical work by the Summit on policy, governance and institutional networking for information exchange; content and user needs; technical infrastructure; capacity building, education and awareness- raising and showcasing applications;

10. Agree to establish the Eye on Earth Facility comprised of the Trust Fund, the Toolkit containing pledges of technology applications, methodologies, and training resources and the distributed Secretariat based on time and resource commitments by partners;

11. Call on United Nations bodies, other international organizations, multilateral and bilateral donor agencies and the private sector to further contribute to the implementation of the special initiatives agreed by the Summit and the actions set out above;

12. Call on UNEP to assist developing countries and countries in transition through targeted capacity building programs in their efforts to develop adequate national legislation that support public access to information in line with the UNEP Guidelines on Principle 10;

13. Resolve to meet before the end of 2013 to review the progress of implementation of the current declaration and consider the directions for further work.

We make these commitments with a view to strengthening the knowledge infrastructure needed to advance human well-being and sustainable development.

<sup>2</sup>Adopted at the 11th Special Session of the Governing Council/Global Ministerial Forum of UNEP in Indonesia,

February 25, 2010

## Access Initiative

Submission by The Access Initiative (TAI)

for UNCSD 2012 (Rio+20)

I –Introduction

The Access Initiative (TAI): TAI is the world's largest network of civil society organizations working to ensure that people have the right and ability to influence decisions about the natural resources that sustain their communities. TAI is 12 years old and represents over 250 civil society organizations in over 50 countries. This is our formal input to the Rio+20 compilation document and it is based on rigorous and robust assessments we have done on Principle 10 related laws, institutions and implementation in each of our countries, our three demands (3D) campaign in the run up to Rio+20, and our active participation in preparatory meetings, regional meetings and high level meetings leading to Rio+20. This submission is also supported by 180 individuals from all over the world who have signed a petition to UNDESA supporting the proposals contained here. The petition and individuals are set out in Annex 1.

Principle 10 of the Rio Declaration:

The right to obtain information, right to participate in decision-making and the right to seek justice are a bundle of valuable rights which we call 'access rights'. The access rights have their origins and roots in human rights recognized by a number of international instruments, including the Universal Declaration of Human Rights. These rights were recognized in Principle 10 of the Rio Declaration and are fundamental to good environmental governance. Progress has been made in many countries through "access delivery mechanisms" such as environmental impact assessment procedures, pollution release and transfer registers, freedom of information laws, public comment and hearing procedures, zoning and planning procedures and environmental courts and tribunals.

But many gaps remain and need to be filled. Weak implementation of access rights has come about because governments have failed to provide the political will, necessary institutional and legal infrastructure and resources necessary for their full realization. Deliberate obstruction by vested interests that have inequitably benefited from closed and unaccountable governance regimes has contributed to the failure. Even where access rights are supported by national laws, secretive bureaucratic cultures have thwarted their full enjoyment by citizens. The lack of capacity building for government and civil society and the absence of basic information systems are two other factors that have prevented the wider enjoyments of the benefits of Principle 10.

**[UNDESA/DSD: Please download the original document to see this image]**

We believe that the accountability and implementation gap needs to be addressed through the setting up of a binding legal framework for Principle 10. The lack of adequate

commitment and progress even after twenty years since the Rio Declaration of 1992 is a telling sign that Principle 10 will remain unimplemented unless a time bound legally binding international or regional mechanism is put in place to make it happen. Further and fuller reasons supporting our proposals are to be found in the paper we issued with Article XIX titled "Moving from principles to Rights".

**[UNDESA/DSD: Please download the original document to see this image]**

The full implementation of Principle 10 (letter and spirit) nationally, regionally and globally will provide the necessary enabling environment for sustainable development and good governance. There are numerous documented benefits that flow both to government and citizens when access rights are implemented, respected and enjoyed in full. Good governance will ensure that developmental decisions are responsive to citizen needs and demands, that sustainability and social equity considerations are given due consideration by decision-makers, that corruption is eliminated or minimized, that the voice of the poor and marginalized are heard and that government is accountable to citizens.

## II - What We Want from Rio+20

The two main themes for Rio+20 are (a) the institutional framework for sustainable development (IFSD) and (b) green economy in the context of sustainable development and poverty alleviation. Principle 10 is fundamental to both of these themes and provides the underlying and enabling conditions for the success of Rio+20 outcomes. In 2011 we launched the Three Demands Campaign (3D Campaign) because we were concerned that the Rio+20 preparatory meetings were only focusing on international environmental governance (IEG) when the UN mandate for Rio+20 set a much wider agenda in IFSD and we wanted to ensure that national environmental governance (NEG) was included in the discussions (see below for results of the campaign). In the context of NEG, Principle 10 has received supportive mention in the submission of governments, civil society organisations as well as in the outcome documents of international gathering leading up to Rio+20 (See Annex 2). In this context, here are our suggestions for Rio+20:

1. Structure of the Outcome Document: We expect the political document adopted at Rio+20 to be (a) visionary (b) build on the Rio Declaration, Agenda 21 and the Johannesburg Plan of implementation, (c) identify the gaps in achieving the goals set by these decisions and (d) spell out concrete steps that will be taken by governments in the next decade to fill these gaps. With regard to NEG and Principle 10 we outline below the key gaps that need to be filled and the priority measures that need to be taken.

2.2. Concrete Proposals – Moving from Principles to Rights: For the reasons stated below, we propose that the outcome document acknowledge in unequivocal terms, the importance of Principle 10 of the Rio Declaration for solving environmental issues and advancing sustainable development. We propose that the document contain:

<sup>[6]</sup> A clear mandate to the UN secretariat to commence negotiations on a UN framework convention on Principle 10. A framework convention will set out the basic standards and goals for state parties under Principle 10, require regional bodies to initiate negotiations on regional conventions containing binding obligations including compliance and monitoring mechanisms and establish a timeline for the negotiation of the regional conventions. A framework convention could incentivize national and regional Principle 10 reforms with added privileges, benefits and recognition for nations that pursue them.

<sup>[6]</sup> Alternatively, a mandate to UNEP regional offices or UN Regional Economic Commissions and encouragement to other regional inter- governmental organizations to negotiate regional or sub-regional conventions on Principle 10. This proposal is also reflected in the 3D campaign results below.

<sup>[6]</sup> A clear mandate to UNEP (as an interim priority measure) to develop a robust program for promoting the Bali Guidelines for the Development of National Legislation on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters (2010) adopted by the UNEP Governing Council and for building the capacity of governments and civil society to implement the said guidelines.

<sup>[6]</sup> The constitution of a task force comprised of civil society representatives, governments and UN Agencies to develop, within one year, a universal set of guidelines, procedures and institutional reforms applicable to UNEP and other UN Agencies implementing Principle 10 in UN agency decision-making to be applied in their day to day work and deliberations.

<sup>[6]</sup> We expect the outcome document to set out a time frame for the completion of these commitments and mandates. We also highlight below, four other initiatives that will further the goals of principle 10 which may be featured in the informal space at Rio+20.

3.3. Further Concrete Proposals – 3D Campaign: As part of the 3D Campaign, civil society coalitions and partners all over the world (currently in over 30 countries) collectively developed and made three top national environmental governance demands from each of their governments. A number of demands stood out, either called for by a number of countries, or urgent in nature. These demands ranged from legal reforms to practice changes and are listed in our interim report. All of these demands should find a place within the Rio+20 outcome document and should be included in the zero draft.

<sup>[6]</sup> Regional Conventions on Principle 10: Many countries have regulations requiring access in major areas of environmental concern. Yet much of the time, these laws remain unenforced and accountability mechanisms are weak. Civil society organizations in many countries feel that an international mechanism to mutually raise one another to a higher level of performance would improve access at the national level. This proposal is also reflected in those set out above.

<sup>[6]</sup> Improving Environmental Assessment Practice: A common request in many countries was expansion and improvement of access to information and public participation in environmental impact assessments (EIA). While EIA procedures useful for decision-making they are by no means sufficient means for ensuring sustainable development. However, when EIA processes are used they need to be transparent and participatory and accountable. This is often seen as one of the most important means of improving decision-making and environmental quality of new development.

<sup>[6]</sup> Broad Legal Reforms for Access: In some countries, coalitions felt that all three access rights could be addressed in an overarching legal reform, rather than in piecemeal legislation, as has been the practice in many countries.

<sup>[6]</sup> Environmental Databases: In a number of participating countries, regulations call for the regular publication of environmental data and related information. However, many of these regulations have gone unimplemented with tremendous gaps in data collection, analysis, and publication.

<sup>[6]</sup> Environmental Courts: Environmental courts provide what can be an effective and cheaper means of dispute resolution than regular courts. Specialized attention to environmental laws and increased scientific expertise can mean that victims of pollution may be able to have their environmental complaints addressed in a faster, cheaper, more predictable manner.

<sup>[6]</sup> Citizen Enforcement: In many countries, law enforcement officers are spread thin, with little ability to prioritize among serious environmental issues. For that reason, a number of countries felt the need for citizen enforcement of environmental laws and rights. We request that governments establish citizen suit provisions allowing for citizen enforcement of laws.

4. Reasons for our Proposals - Implementation Gaps & How to Fill Them: National environmental governance (NEG) improvements should include better coordination among government agencies, clear environmental laws and more efficient bureaucratic procedures. At the heart of good NEG is Principle 10 – which requires more open, inclusive

and accountable decision-making.

In our first submission to the Rio+20 processes in response to UNDESA's 2010 questionnaire, we identified a number of gaps in Principle 10 implementation. Foremost among the gaps in implementing Principle 10 are:

- weak implementation across all three pillars of Principle 10 (information access, public participation and access to justice);
- weak laws on public participation and access to justice; and
- the lack of affirmative legal rights for empowering the poor and marginalized groups to have a voice and say in decisions that affect them.
- 

We also provided good examples of Principle 10 implementation and practice including examples of progressive access to information laws from Mexico and India and good practice examples from countries that have signed the Aarhus Convention. Philippines and Indonesia have recently established environmental courts to provide greater access to justice on environmental matters, while Chile is reforming its environmental impact assessment laws to ensure that poor and marginalized people have more voice and access to the decision-making process. Thailand is revising its public participation laws to improve public engagement spaces. While there is progress in some countries, in others access rights are being curtailed.

There are plenty of examples of good practice and guidelines and tools to help governments and civil society implement Principle 10 – what is needed is political commitments, a framework convention, serious and urgent law and institutional reforms at the national and regional levels and funding for governments and civil society to work on improving laws, administrative capabilities, and building the capacity of civil society to use the access rights more effectively.

5. Comments on Existing Proposals: A number of governments, civil society organisations and international organizations have acknowledged the importance of improving transparency, citizen engagement and accountability (Principle 10) as part of the Rio +20 Agenda. These include several governments, the European Union, the Declaration from the 4th Meeting of the parties of the UN European Economic Commission's Aarhus Convention (Chisinau Declaration) and the resolution from the European Union Parliament. Additionally, several UN documents acknowledge the importance of Principle 10 and the need to fully implement it. In particular the Synthesis Report of the Secretary General, the UNEP Report on the Green Economy, UNECLAC Report for the Regional Consultation, the Beijing High Level Consultation texts, the Latin America and Caribbean Regional Meeting Statement, and The Chair's text from the UNESCAP Asia Pacific regional meeting in Seoul. For a summary of these statements see Annex 1.

6. Statements have also been made in support for full implementation by civil society groups including the Stakeholder Forum, Article XIX, ourselves, and the NGO, Women's and Youth Major Groups. Many call for a global Principle 10 convention. Others support regional Principle 10 conventions. These proposals and submission together signify broad based support for moving from principles to rights enshrined in national laws and practiced by government institutions and civil society – rights that enable people to obtain environmental information held by governments and corporations, rights that enable people to engage in government decision-making on the environment and rights that enable people to hold decision-makers accountable for their decisions.

#### III - IFSD: Formal and Informal Initiatives on Principle 10

There are formal and informal initiatives that will improve national environmental governance and move Principle 10 to concrete enforceable rights. These are:

1. As part of the 3D Campaign, civil society coalitions and partners all over the world (currently in over 30 countries) collectively developed and made three top national environmental governance demands from each of their governments. Several Governments, including South Africa, Jamaica and Hungary have agreed in writing to implement at least one of these governance demands. These demands form a framework for action across countries and in regions. A formal mechanism to share experiences, capacity building, training etc can be built from these demands and government commitments.
2. Co-led by USA and Brazil, the Open Government Partnership (OGP) consisting of eight founding governments and civil society issued a declaration of principles on open government in September 2011 on the margins of the UNGA. Dozens of other government are expected to join the partnership in March 2012 when they meet in Rio for their second meeting. Each partner government has developed a set of time bound commitments to improve open government, including commitments on environmental governance. This specific cooperation mechanisms could allow for an environmental caucus to be developed that will look specifically at improvements in the passage of freedom of information laws and implementation efforts; discuss the use of technology to improve transparency and citizen participation as well as provide a framework for collaboration which is subject to accountability peer review mechanisms
3. The USA and some other governments are considering the establishment of an International Partnership for Environmental Governance (I-PEG) either as a caucus within OGP or as a free standing partnership. The purpose of this partnership will be to improve national environmental governance by improving the clarity and effectiveness of environmental laws, improving the coordination and efficiency, of institutions responsible for promoting sustainable development, increasing transparency, citizen engagement and accountability of sustainable development decision-making and reducing corruption.
4. It is likely that Eye on the Earth Summit (Abu Dhabi Dec-2011 multi-stakeholder meeting) will affirm the need for full implementation of Principle 10 and launch a special initiative to implement Principle 10 globally. The initiative will include sharing of good practices, capacity building, monitoring and assessment of Principle 10 implementation.

#### IV - The link between the Green Economy and IFSD

If a green economy is to be a tool for achieving sustainable development and poverty eradication we need to highlight the importance of improving national environmental governance. Achieving sustainable development will require making policy decisions that involve balancing competing interests and reaching environmentally sustainable, economically sound and socially equitable outcomes. If decision making processes are secret, non-participatory and unaccountable, a few selected and powerful interests will influence policy and developmental decisions. Principle 10 and good national environmental governance which recognizes coordination, efficiency, transparency, engagement and accountability becomes a foundational and enabling requirement for the success of a green economy and sustainable development.

#### SUSTAINABLE DEVELOPMENT GOALS

For the green economy in the context of sustainable development and poverty eradication to succeed, we believe that sustainable development goals (SDGs) that eventually become part of the Millennium Development Goals in a post 2015 world would help set global targets that nations can strive for. But these goals cannot be confined to thematic goals covering water, oceans, pollutants etc. SDGs must include clear good governance goals as well. If such goals cannot be negotiated in time for the Rio+20 meeting, at the very least, a process should be established to negotiate such goals in the lead up to the review of the Millennium Development Goals in 2015. This will ensure that we have real targets that the international community and national governments can work towards. Governance goals are currently not reflected in the MDG framework. In this regard we recommend that the Rio+20 examine carefully the proposals submitted by Colombia and the goals enunciated in the Bonn Declaration from the 64th UN-DPI Conference of over 1200 civil society organisations. We propose the following four good governance SDGs be included in the Rio+20 outcomes or a process for their negotiation be put in place at Rio+20:

**[UNDESA/DSD: Please download the original document to see this image]**

## ACCESS TO INFORMATION

By 2022, governments will enact and implement Freedom of Information laws giving people the right to obtain accurate and truthful information held by their government, especially on the environment. Governments will actively make available to all stakeholders useful, accurate and truthful well publicized data and information in appropriate formats and languages, including on the internet. These laws should include whistleblower protection and should extend to information disclosure by corporations.

## PUBLIC PARTICIPATION

By 2022, governments need to ensure that voluntarism and citizen engagement are incorporated in all global, national and local action plans for implementation of sustainable development and human well-being, to commit to the creation of an enabling environment for citizen engagement and voluntary action, and will include mandatory public participation in

- (a) major development project approvals and environmental impact assessment procedures,
- (b) drafting of national level sustainable development policies, laws and regulations and
- (c) administrative decisions such as pollution permitting.

## ACCESS TO REDRESS AND REMEDY

By 2022, governments will adopt and implement laws ensuring effective access to judicial and administrative proceedings concerning sustainable development, including redress and remedy. In particular, they will ensure that the costs of such proceedings are reasonable and affordable to affected people and that access to such proceedings is available through expansion of legal standing and other means to interested people and organizations.

**ENVIRONMENTAL JUSTICE FOR THE POOR AND MARGINALIZED** By 2022, governments will adopt laws that obligate government agencies to take appropriate measures to provide information and engage affected people living in poverty, women and other disadvantaged groups when making sustainable development decisions.

## Annex 1

Worldwide Open Public Petition to UNDESA and the Rio+20 Bureau

## WHAT WE WANT FROM RIO+20

## Sustainable Development Governance Goals &amp; Commitments

For the reasons set out in this open public petition, we the undersigned individuals and organizations support the three demands (3D) campaign facilitated by The Access Initiative and joined by scores of civil society organizations from around the world and request UNDESA and the Rio+20 Bureau to include the following five sustainable development governance goals and commitments in the compilation document and zero draft of the Rio+20 outcome documents: Sustainable Development Governance Goals & Commitments

1. A clear mandate to regional UN Economic Commissions and UNEP regional offices and a request to other regional bodies to negotiate Regional (or sub-regional) Conventions on Principle 10 by 2022: Many countries have regulations requiring access to information, participation and justice in major areas of environmental concern – the substantive rights enshrined in Principle 10 of the Rio Declaration (1992). Yet much of the time, these laws remain unenforced and accountability mechanisms are weak. Civil society organizations and citizens in many countries feel that an international mechanism to mutually raise one another to a higher level of performance would improve access at the national level. Civil society in six Latin American countries (Bolivia, Costa Rica, Ecuador, El Salvador, Guatemala, Mexico) called for their governments to begin the process of negotiating a regional convention for Principle 10, something with a similar form and function to the United Nations Economic Commission for Europe (UNECE) Convention on Access to Information, Public Participation, and Access to Justice in Environmental Matters (The Aarhus Convention). Similar calls have also come for the development of a regional convention in Southeast Asia. UN ECLAC in a recent report has listed such a convention as an important step to improving the implementation of Principle 10 of the Rio declaration.
2. A commitment by governments to enact broad and comprehensive legal reforms for access to information, public participation and access to justice in environmental matters by 2022: As part of these reforms, government commitment to adopt laws obliging agencies to take appropriate measures to provide information and engage affected people living in poverty when making sustainable development decisions. In some countries, civil society and citizens feel that all three access rights could be addressed in an overarching legal reform, rather than in piecemeal legislation, as has been the practice in many countries. For example in Thailand there are calls for the updating of the legal code to more accurately reflect its “access-friendly” 2007 Constitution. In Costa Rica there are calls for a wholesale “access law” which would close many of the gaps and loopholes in prior environmental laws. Finally, in Indonesia there are calls by civil society for complete implementation of the Environmental Protection and Management Act No. 32 of 2009 which holds the promise of greatly improving transparency, participation, and accountability but remains, in large part, a paper tiger.
3. A commitment by governments and the UN to Improve Environmental Assessment Practice by 2022: A common request by civil society and citizens in many countries is the expansion and improvement of access to information and public participation in environmental assessment. This is often seen as one of the most important means of improving decision-making and environmental quality of new development. However, in many countries, this development is carried out in secret or important decisions are hidden from the public.
4. A recognition of the importance of environmental databases and the commitment to establish by 2022, international standards and protocols for collection, analysis, dissemination and uptake of environmental information: In a number of countries, regulations call for the regular publication of environmental data and related information. However, many of these regulations have gone unimplemented with tremendous gaps in data collection, analysis, and publication. Civil society and citizens have called for central national databases of environmental information in Benin, Brazil, Chile, South Africa, and Trinidad and Tobago. The Eye on the Earth Conference December 2011 will address this issue.
5. A commitment by governments to establish low or no cost, efficient and effective environmental dispute resolution citizen enforcement mechanisms (e.g. Environmental Courts and citizen suit): Environmental courts and tribunals provide what can be a cheaper means of dispute resolution than regular courts. Specialized attention to environmental laws and increased scientific expertise can mean that victims of pollution may be able to have their environmental complaints addressed in a faster, cheaper, more predictable manner. In many countries, law enforcement officers are spread thin, with little ability to prioritize among serious environmental issues. For that reason, a number of progressive governments have created citizen suit provisions allowing for citizen enforcement of laws. Citizen enforcement supplements government enforcement of environmental laws. Annex 1: Petition Signatory List <http://www.change.org/petitions/what-we-want-from-rio20>

## ActionAid International

ActionAid International

Submission to UNCSD 2012 (Rio+20)

### Introduction

Many developing countries suffer from increasingly unstable environments with severe consequences for their people. Loss of biological diversity, natural resources and areas fit for human habitation would be huge challenges for even the most developed countries. But challenges are even greater when countries are confronted with the simultaneous tasks of climate change, improving governance, strengthening national application of human rights, ensuring growth and reducing inequality.

Almost 20 years after the United Nations Conference on Sustainable Development in Rio (ECO 92), the world is facing an unprecedented intersection of crisis in: energy, climate, food and finance. The crises are interlinked and caused by the current and dominating model of development. From production to consumption, populations are using more natural resources and consuming more, at an exponential rate. At the same time, climate change is putting additional strain on natural resources such as water and arable land. The rush to increase biofuels production has further linked food and fuel crises, putting increased pressure on land and agricultural resources without realizing the promised environmental gain. And the continuous rise of the world's population, which has reached 7 billion, will increase the strain on our natural resources.

Within this context, the United Nations has decided to host another UNCSD, in 2012, to rethink the model of development and to propose new ways to transform our economy into a more sustainable and environmentally friendly. Some have called this the "green economy". UNCSD also searches for a new and better institutional framework, in which countries can continue the debate how best ensure a just and equitable transition to this green economy.

ActionAid believes that the UNCSD presents a new opportunity to evaluate the actions and policies that have led to the intersecting crisis. Through its work on the ground with local communities around the world, and particularly in Africa, Asia and Latin America, ActionAid has seen how the increasing promotion of export-oriented industrial agriculture, the use of agrochemicals inputs, new technologies without proper impact analysis, human induced climate change, and the use of large amounts of land and natural resources have contributed to inequality, poverty and hunger and has increased soil degradation and harmed our environment. Moreover, the lack of investment in smallholder farming, in particular, women smallholder farmers together with weak social protection policies, diminishes countries' possibility to develop a sustainable and equitable model of production.

Women pay a high price in our current model of 'development.' Women farmers have little or no access to land, credit, agricultural research or extension and are often excluded from cooperatives. Access to financial services including social transfers in the case of marginal farmers and loans and credit for smallholder farmers is essential so that they can pay for inputs, improve farming and develop small business enterprises to empower themselves economically.

8 out of 10 of the world's smallholder farmers are women and it is these farmers who produce half the world's food. In Africa, this rises to as much as 80%. Women smallholder farmers play a key role in feeding 2 billion people. Also sustainable agriculture based on smallholder farming not only provides more employment it also increases productivity, without degrading the natural resources it is based on.

Climate change, as mentioned above, is creating further stresses on food and water supply while degrading our environment. According to the IPCC, in some countries in Africa, yields from rain-fed agriculture could be reduced by up to 50% by 2020 as a result of climate change; scientists estimate that already global production of key staples, such as wheat and corn, has fallen by 3.8 per cent and 5.5 per cent respectively over the last three decades, as a result of climate change; and 75-250 million people across Africa could face more severe water shortages by 2020. Tragically, while industrialized nations are largely responsible for the current human induced climate change, it is poor countries and communities who are suffering the most from its impacts. A transition to a green economy will require, in part, a transition away from fossil fuels to truly clean and renewable energy, and a just transition is only possibly by providing adequate financial and technical support to developing nations and communities to help make this transition in a sustainable manner.

ActionAid sees Rio+20 as an opportunity to demand real national actions and international commitments that actually does eradicate hunger and poverty, and saves the environment.

The Rio+20 Conference will focus on two themes: a green economy in the context of sustainable development and poverty eradication, and the institutional framework for sustainable development.

### Green Economy

According to the UN, the Green Economy can be defined as one that results in improved well-being due to a greater concern for social equity, environmental risks and scarcity of natural resources. However, the concept is still in discussion within the different Parties. There are four aspects of the green economy:

- one addresses this issue through the analysis of market failures,
- another has a systemic view of the economic structure and its impact on the relevant aspects of sustainable development,
- a third is focused on social goal (employment, for instance) and examines policies necessary to reconcile social objectives with other objectives of economic policy,
- and fourth with respect to macroeconomic and development strategy with the aim of identifying dynamic path to sustainable development.

There have been discussions and proposals for a Green New Deal or a new set of sustainable goals, in order to increase countries' wealth by reducing environmental risks and to drive growth with new forms of eco-efficiency and new clean technologies, directing the flow of capital to low carbon sectors. Instead of tackling the real causes of unsustainability, this debate may lead to false solutions.

For example, a rush towards large scale use of biofuels without adequate research into their social and environmental impacts has led to increased food prices and in many cases failed to deliver the promised reduction in greenhouse gases.

A transition to a green economy must include the transition to truly clean and renewable energy, but must also be based on a more sustainable model of production and consumption. Sustainable agriculture, especially agroecology, must take a central role in the discussions.

### Institutional Framework

The Institutional framework relates to a system of international governance for sustainable development, for example, global institutions responsible for developing, monitoring and implementing policies on sustainable development around the three pillars: social, environmental and economic. A deep analysis shows that the current system has some

flaws, such as the lack of a legally binding mandate on the institutions that deal with the matter. UNEP (United Nations Environment) has the status of the program, has no authority within the UN system, and the mandate of the Commission on Sustainable Development overrides the UNEP, which culminates in a competition between instances instead of collaboration.

This issue must be addressed taking into account the profound changes in the international system, where different interests besides governments, such as corporate are in place. This is essential to stop the privatization of these processes to enlarge the debate and to include the interests and rights of ordinary citizens.

ActionAid recommendations for the outcome document

Rio+20 will be an important opportunity for:

- Transforming the current hegemonic production model into a climate resilient sustainable agriculture model. In other words this means a transition to a new model;
- Ensure that technologically driven approaches are rigorously tested before implementation. The use of genetically modified organisms, geo-engineering and other technologies should be delayed until we have a full analysis of their social and environmental impacts
- Ending the commodification of natural resources, such as water, soil and biomass.
- Better soils and a more fair distribution of lands and wealth.
- Ending mandates for unsustainable biofuels.

#### 1. Transforming the current hegemonic production model into a climate resilient sustainable agriculture model

ActionAid believes that climate resilient sustainable agriculture offers an efficient and real solution to combat poverty while at the same producing few greenhouse gas emissions (as compared to conventional agriculture, which contributes roughly a third of all GHG emissions) serving as a power tool for adaptation to climate variability.

Climate resilient sustainable agriculture integrates several goals including environmental management, farm profitability, and the prosperity of communities. It refers to the ability of farms to produce food indefinitely, without damaging soils and ecosystems, or human and social capital.

Climate resilient sustainable agriculture encompasses approaches such as agro-ecology, low external input, agroforestry, organic agriculture, integrated crop and water harvesting in dry land areas. It also can mitigate climate change through carbon sequestration and offers a genuinely low GHG emission alternative.

Conclusions from the UN agricultural panel, IAASTD, are very clear. The problems facing the global food supply are enormous; therefore "business as usual is not an option." In a world heading towards 9 billion people the solution for the enormous challenges lies in, what the IAASTD calls, "agro-ecological multifunctional agriculture", i.e. agriculture based on organic methods (though without necessarily being subject to organic certification). Unlike industrial agriculture, climate resilient sustainable agriculture can simultaneously reduce agricultural GHG, make food supplies more resistant to climate change, improve soil and water resources, and feed a world in 2050 of 9 billion people without agriculture occupying even more land.

UN Special Rapporteur on the Right to Food, Olivier De Schutter, concludes in a new report that "...agroecology, if sufficiently supported, can double food production in entire regions within 10 years while mitigating climate change and alleviating rural poverty. The report therefore calls States for a fundamental shift towards agro-ecology as a way for countries to feed themselves while addressing climate- and poverty challenges. "

A fundamental shift to climate resilient sustainable agricultural practices, according to De Schutter, would help to eradicate poverty and hunger, and to stimulate inclusive and broad based economic growth, since growth in agriculture is known to be more effective to generate growth in other sectors as well as providing increased yields per hectare, because climate resilient sustainable agricultural practices are based on local seed corn and traditional farming methods, which provide ample opportunities for local communities to grow themselves out of hunger. Additionally, it is essential to find ways to link smallholder farmers with the growing urban population so that they can gain access to healthy, nutritious food.

Bearing this in mind, ActionAid calls for:

- Public investment to strengthen sustainable agriculture and to facilitate this transition process through exchange of experiences between smallholder farmers, for example, especially women and youth.
- Building and strengthening public policies and laws to support sustainable agriculture.
- Securing poor women farmers' access to and control over land.
- Appropriate extension services and training, building staff capacity on climate resilient sustainable agricultural methods and technologies.
- Additional public finance, through innovative mechanisms, to help smallholders build resilience in the face of climate change.

#### 2. Interrupting the use of new technologies, such as GMO's , until we have an analysis of their social and environmental impacts

During the end of the last century and the beginning of this XXI century, a massive concentration of corporate power has taken place. Unprepared, the UN has lost its capacity to track technologies and to monitor the transnational corporations who own and/or control them. Just after the first Rio Earth Summit, governments abandoned the ability to advice on the cost, safety, and utility of different technology options, with failure or surrendering of both UN Centre for Science and Technology for Development (UNCSTD), and the UN Centre on Transnational Corporations (UNCTC). So, there was no intergovernmental capacity to identify trends among the world's largest private enterprises (although UNFCCC is discussing the creation of technology Centre and Network, but without taking this issue too much into account). In other words, on the eve of the biotechnology and genomic revolutions the international community is still very far to start this debate and it has been pushed away from the process.

There is no certain knowledge on how GMO's, specially terminator seeds, and other new technologies produced by geo-engineering can affect the environment and the health of populations.

ActionAid believes the world should adopt a precautionary approach and have a moratorium on this kind of technology until there is enough scientific proof that there is no negative impact of using GMO seeds, or using geo-engineering and nanotechnologies.

By doing this the international community would live up to one of the central principles they agreed to at the last Rio conference in 1992. Principle 15 states the precautionary approach in order to protect the environment: "where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation."

### 3. Ending the commodification of natural resources, such as water and soil

Commodification of water and soil has been presented as a solution to climate issues; but it is a false solution. This mechanism diverts attention from the real problem, which is the need to build a new development model.

ActionAid believes that the Rio+20 should resist the commodification and commercialization of nature and all offset markets that would include agriculture and soil carbon sequestration in the carbon market. Such market-based mechanisms do not address the root causes of greenhouse gas emissions from agriculture but tend to provide perverse incentives to polluters and benefit the emitters.

Instead of market-based financing mechanism, developed countries must commit to new and innovative sources of public finance (via the UNFCCC), such as a tiny tax on the financial speculation, tax on shipping fuel or airline tickets, redirection of fossil fuel subsidies, or use of Special Drawing Rights.

### 4. Better soil and a more fair distribution of land and wealth

The current productive model contributes to land and wealth concentration. There is growing international recognition that public or private domestic or cross-boundary land grabs are destructive of the environment and food security. The estimated 80 million hectares involved in land deals transactions could be made available to peasants and family farmers.

Today, the industrial food chain leads to an annual loss of topsoil amounting to 75 billion tonnes and costs the world \$400 billion. Peasant soil conservation systems utilizing naturally occurring soil microorganisms are responsible for fixing 140-170 million tonnes of nitrogen W equivalent to \$90 billion in chemical fertilizers.

Policies must support these conservation strategies. Improved land management, especially using sustainable land management, could increase agricultural GDP between 3% and 7%.

In this context, ActionAid believes that in Rio+20 it is necessary to discuss a fairer distribution of land and a productive model that promotes the inclusion of smallholder farmers, income distribution and access to education and health, among other basic rights. Once more, governments must show a clear commitment to improve poor people's lives.

### 5. Ending mandates for unsustainable biofuels

Rio+20 has an important role to play in ensuring that biofuels production and consumption globally does not encourage land grabs, threaten food security, escalate food price volatility and contribute to greenhouse gas emissions (GHG). The report on food price volatility prepared by the FAO, the World Bank and other international organizations at the request of the G20 takes a firm position against increases in biofuel production, and the use of mandates and financial incentives that encourage growth of the industry.

Biofuels overall now account for a significant part of global use of a number of crops. On average, in the 2007-09 period that share was 20% in the case of sugar cane, 16% for vegetable oils, 15% for corn, and 4% for sugar beet. As food supply is diverted to biofuels while world demand for food continues to rise, it is clear that biofuels contribute to increasingly volatile food prices and pressure on land.

While biofuels can potentially be produced and consumed in a sustainable way for local use, current biofuel policies in several G20 member states and regional blocs to which G20 states belong are not sustainable.

For example, implementation of the European Union's Renewable Energy Directive will require that around 9 per cent of transport fuel come from biofuels by 2020. This will mean a tripling of today's levels of consumption. Much of this will be imported from other regions, and the EU has not put in place robust safeguards to ensure that such imports do not adversely affect food security or provoke increased land-grabbing. In addition, EU policy does not ensure that this biofuel use will actually deliver a reduction in greenhouse gas emissions.

The United States biofuels policy is also unsustainable. Corn ethanol is the dominant biofuel produced and consumed in the US. Due to a triple incentive structure including a mandate for production and blending targets, subsidies and a protective tariff, almost 40% of the US corn crop is diverted from food and feed to fuel. Although farmers have increased corn yields, the combination of the rising demand for corn and weather shocks has depleted corn stocks and resulted in record breaking corn prices. Since many countries are heavily dependent on corn imports from the US for food and feed, the rising price of corn paid at the global level has had a devastating impact on local markets. US biofuel policy is also leading to increased greenhouse gas emissions.

Better protection for agricultural land and biodiversity areas are also needed globally. In Brazil, the government has approved Agro-ecological Zoning (ZAE) for sugarcane to certify that ethanol doesn't cause deforestation. The zoning project has identified approximately 64.7 million hectares of land suitable for sugarcane cultivation. However, the expansion of sugarcane in these designated areas may displace food production activities and push cattle- raising into the Amazon region. There are no guarantees that cultivation in these more sensitive environmental regions will not result in negative impacts such as indirect deforestation or contamination by pesticides.

Eliminate targets, mandates and financial incentives (such as subsidies and tax exemptions) that encourage the expansion of unsustainable industrial biofuels production.

- Accelerate scientific research on alternative paths to reduced carbon emissions and improved sustainability and energy security, including improved energy efficiency.
- Implement proven solutions including increasing fuel efficiency of cars and investing in public transport.
- Ensure that all biofuels, whether domestically produced or imported, meet strict social and environmental sustainability criteria that ensures that their production and consumption does not compromise food, land and workers' rights and that they result in lower net greenhouse gas emissions than fossil fuels when considering the full life-cycle of the biofuel production process. This must include realistic analysis of the impact of indirect land use change on greenhouse gas emissions. The analysis of biofuels must be specific to both the type of crop grown and the location where it is produced.

Ensure that any further study on the relations between biofuel production and food, agriculture and the environment or proposals for "flexible mandates" which would adjust existing mandates during times of food price stress should be done with the active engagement of civil society. The FAO's Committee on Food Security would be the ideal venue for further exploration on these issues, and recent studies by its High Level Panel of Experts offer insights on biofuel policies.

## Active Remedy Ltd

The role of mountains in regulating Earth's climate and fresh water systems is vital for the sustenance of all life, as all of Earth's rivers originate in them. Healthy mountain ecosystems are the foundation for global health and stability. Therefore when considering sustainable development and green economies the health and balance of the global fresh water system is the most important issue that needs to be imminently addressed and raised to a level of paramount importance. All life on Earth and all economies are dependent upon this. Glaciers form the water towers of Earth. Over the last century, mountain glaciers worldwide have, on average, been seriously decreasing in length and volume. Glaciers worldwide have been retreating so rapidly that they may almost completely disappear within fifty years. In mountain regions high altitude forests, through the action of precipitation and transpiration, play a key role in the creation of snow. Certain indigenous mountain plants such as the Oak play a major role in cloud seeding. Without this process, functioning, the amount of snow is massively reduced and glaciers cannot be fully replenished. These glaciers and snows are also important because they act like a mirror reflecting solar radiation. As they melt, the mirror thins and more solar rays penetrate through to the Earth, increasing Earth's temperature. As this ice melts, it also increases the quantity of water vapor in the atmosphere. Water vapor (H<sub>2</sub>O) is a very powerful greenhouse gas, which normally stays in the atmosphere for no more than nine days. However if it is not brought to Earth through precipitation, it remains in the upper atmosphere and increases the problems of the greenhouse effect. Earth's hydrological system, unlike coal, uranium and oil, is a fast regenerating system. Given the right ingredients, of mixed indigenous mountain forests, it can be rebalanced and maintained indefinitely. The stability of Earth's rivers and water tables depends upon maintaining the integrity of watersheds. These, in turn, depend upon the healthy biodiversity of high altitude forests. It has been recognized that the protective function of stable forest cover is vital for safeguarding them. It is recorded that only 25% of mixed indigenous mountain forests are still intact worldwide. This implies that 75% of the world's indigenous mountain forests have been removed. These forests are the natural mechanism, which would normally be involved in making the mountain snows and replenishing the glaciers. The global fresh water system and hence all of life on Earth is utterly dependent upon them.

Therefore, to save the glaciers from melting all together and Earth's rivers from drying up, it is a matter of great urgency to protect, conserve and restore indigenous mountain forests worldwide. However mass deforestation along with monoculture pine programs have left these regions seriously eroded, denuded and polluted. As rains wash away the scanty remaining soils, the task becomes more difficult and in some places impossible. Nevertheless there are techniques which could be used and prove to be successful if implemented swiftly. Utilizing the knowledge of mountain people and working together with them is essential for success. Using a combination of methods ranging from traditional conservation knowledge, companion planting, green corridors and Permaculture techniques, the regeneration of these forests could conceivably be accomplished. Local mountain communities could be organized into collectives using cooperative methods for replanting, managing and maintaining these forests. Regenerating and protecting indigenous mountain forests would increase employment and create green economies within mountain regions. 'Payment for Environmental Services' schemes could be used to support mountainous countries and communities to establish and protect indigenous mountain forests as this assures the protection of the global fresh water system. In the light of this, the detrimental effects of hydro-dams on the environment in these regions should also be reconsidered. Along with all life on Earth, hydro-dams are dependent upon healthy glacial flow. With melting glaciers they are no longer as reliable as when they were first conceived. Some that have been built in the Andes are already proving to be ineffective as glaciers have decreased. Given the quantity of high quality free solar energy in mountain regions, it would be beneficial to replace hydro-dam electrical projects with solar power projects. There is no greater urgency today, than to protect, regenerate and conserve biodiversity in mountain regions.

## Advisory Group on International Environmental Governance (The UNEP Major Groups and Stakeholders)

Submission to the UNCSD Bureau as input to the Zero Draft

Outcome Document for the UN Conference on Sustainable Development (Rio+20)

from the

UNEP Major Groups and Stakeholders

Advisory Group on International Environmental Governance

31 October 2011

The UNEP Major Groups and Stakeholders Advisory Group on International Environmental Governance (<http://www.agieg.net>) consists of 9 experts and their alternates named by the Major Groups and 6 experts and their alternates from the regions, working in their personal capacities. It was created by the UNEP Major Groups Facilitating Committee with UNEP support to be a body through which input from major groups and stakeholders could be channelled into the International Environmental Governance (IEG) processes leading to Rio+20. It prepared an information document for the UNEP Governing Council (UNEP/GC.26/INF/19\*, January 2011), and now offers these proposals for the draft outcome document for the UN Conference on Sustainable Development. These proposals are a compilation of submissions from a range of major group and regional perspectives, and do not represent a consensus of all members of the Advisory Group. Rather they reflect the diversity and sometimes contradictory nature of the perspectives of major groups and stakeholders. Contributors to this paper who support its submission include Neth Dano (NGO - Action Group on Erosion Technology and Conservation ETC), Sascha Gabizon (Women - Women in Europe for a Common Future WECF), Laura Martin Murillo (Trade Unions and Workers - SustainLabour), Sébastien Duyck (Youth - Service Civil International), Satishkumar Belliethathan (Farmers - Horn of Africa Regional Environment Centre), Lucy Mullenkei (Indigenous People and their communities - Indigenous Information Network), Maria Ivanova (Local Authorities - Environmental Governance Project), Mehdi Ahmed Jaaffar (West Asia - Environment Society of Oman EDO), Robert Bakiika (Africa - Environmental Management for Livelihood Improvement Bwaise Facility), John McDonald (North America - Institute For Multi-Track Diplomacy) and Philip Vergragt (North America - Tellus Institute) and Arthur Dahl (Europe - International Environment Forum). The Business & Industry Major Group (Thomas Jacob) contributed to the drafting but disassociated itself from the final document.

Objective of the Conference

RENEWED POLITICAL COMMITMENT

There is a huge tension between the nation-state and the forces of globalization, with the nation-state as the dominant organizing institution of governance and decision-making, while being limited by its own sovereign bounds from impacting directly on global forces. Efforts at global regulation must necessarily reflect compromise among the varying sovereign interests, and therefore often fall short of what any given state or interest would wish. One result is that the UN has failed to meet Agenda 21's objectives

for environment and sustainability, demonstrating that governance by State action, and a private sector regulated only at the national level and dominated by financial and trade institutions, are inadequate in a world of global markets and environmental problems. To deliver more consistently and globally against those objectives requires a more inclusive approach to governance that more effectively harnesses the variety of actors and rights holders. Renewed political commitment to multilateral action by governments is essential, but must be supported by measures to build trust among governments that their engagements will be respected. Peer review and accountability mechanisms should be complemented by a clear role for civil society and rights holders, including all the major groups.

To address the integration of issues across sectors, the existing structure of nation states and intergovernmental organizations needs serious rethinking and restructuring, with new cross-linkages reflecting interconnected problems, and bottom-up as well as top-down modes of functioning. Single-issue approaches are no longer effective when all problems are reflections of complex systems interactions. States and intergovernmental organizations should open up to wider partnerships and collaborations with all non-state actors, especially rights holders and civil society in all its diversity, to enable practical solutions to emerge. Only through such collaborations will it be possible to mobilize greater resources, reach the public more widely and deeply with information and educational programmes, build capacity and empowerment at multiple levels, and observe, analyze and report on the complex interlinked processes of natural and human systems as a basis for collective reflection on the further actions required. Each Rio+20 decision, partnership and initiative needs to incorporate explicitly the economic, social and environmental dimensions of sustainable development.

Green Economy in the context of Sustainable Development and Poverty Eradication

## GOVERNANCE FOR INNOVATION IN A GREEN ECONOMY

### Basis for Action

Achieving sustainability through a green economy implies both top-down and bottom-up governance processes. Institutional innovation needs to begin with the basics and systematically build up a sequence of actions to create confidence in the new institutions. Governance reform has to be fundamental as it needs to change core structural elements, but reform has to be incremental as only sequential steps can lead to systematic change. Systematic and well thought-out incremental reform at multiple points and levels in the overall system can do much to advance effective, fundamental reform. Global businesses need consistency in sustainable practices and standards to function in global markets, which should be encouraged by intergovernmental institutions. Governance for a green economy is also relevant at the local level, where green economic activities should be characterized by ecologically sound, socially equitable, transparent and democratic business and consumption practices. Contributing to these are not only the evolving practices within business and industry, but also local policies, multi-stakeholder grassroots experiments, local entrepreneurs and social enterprises. Such experiments and practices should be endorsed by national and state policies, as well as through international frameworks and mechanisms. Public policies should contribute to voluntary business sustainability and responsibility, stimulating and rewarding innovation in this direction.

### Objectives

To create governance mechanisms that provide an enabling framework for a green and equitable economy, thus stimulating and rewarding business and community innovation and local experimentation.

### Activities/Proposals

1. Governments should provide a clear framework of incentives and regulations to encourage more sustainable economic activity, while removing distorting and unsustainable subsidies as determined by the World Trade Organization.
2. Adopt the 10-year Framework of Programmes on Sustainable Consumption and Production as negotiated to closure during CSD-19, supported by a global research programme to develop means of implementation.
3. Intergovernmental organizations should deliver norms, models and guidance and catalyze workable and predictable state-level regulatory governance with reasonable international consistency, to facilitate and reward evolution of economic activities in private, public and social enterprises toward a more level global framework for sustainability.
4. Establish a global centre or policy bank of expertise and technical assistance to help governments adopt public policies to stimulate non-statutory above-compliance standards of social and environmental performance, so that governments can adopt more such policies and learn from them.

## GOVERNANCE FOR A SOCIAL DIMENSION IN A GREEN ECONOMY

### Basis for Action

To address concerns that the green economy might ignore the social dimension of sustainability, governance mechanisms for the green economy should insure that it includes not only green technologies, infrastructure, investments and jobs, but also a more equitable and nurturing rights-based and inclusive society with chances for everyone to earn a living wage in decent working conditions, partake freely in democratic political activities, and increase their own well-being, as well as the well-being of their communities and of the entire planet. The participation of young people, women, poor and low-skilled workers is important.

The operative economic models have demonstrated fundamental flaws in repeated financial and economic crises, vulnerability to speculation, and excessive debt. In many traditional cultures there was no concept of private property, but alternatives based on shared rights and responsibilities, community decision-making and reciprocity. As part of institutional arrangements, an international process is needed to explore alternative value systems and indigenous economic models and ask what they may have to offer to a more equitable and sustainable global to local economy that goes beyond the present economic paradigm. Global financial governance needs restructuring based on principles of equity, transparency, accountability and democracy.

### Objectives

To ensure that governance for economic reform addresses social issues founded on principles of justice, equity, transparency and accountability.

### Activities/Proposals

1. Launch an international consultation on alternative economic models, cross-cultural and indigenous perspectives, including a review of the underlying purposes of the economy and the values by which it operates.
2. Accelerate the consideration of the necessary international regulation of the financial system to control excessive speculation, ensure just taxation including socially-progressive and environmentally friendly tax reforms, and provide a stable framework for international banking, investment and commerce.
3. Create institutional rules to support the expansion of mutual credit systems and complementary currencies at the community level.

### Institutional Framework for Sustainable Development

## ETHICAL FOUNDATIONS FOR SUSTAINABILITY

## Basis for Action

While States through the United Nations have made a major effort to define moral standards and ethical principles in the UN Charter, the Universal Declaration of Human Rights, and many other instruments and declarations, these too often remain abstract ideals when faced with political expediency. Moral and ethical paradigms remain challenged in providing sufficient direction for society in times of rapid change and growing inequities, resulting in increasing difficulties with law enforcement, security and governance. Globally, there is a generalized lack of accountability, posing a challenge in building consensus on governance mechanisms. Civil society can play an important supporting role to governance in this area by contributing to an ethical framework for decision-making and drawing attention to the ethical implications of policy proposals. The UN needs mechanisms to express the fundamental interests of all humanity, assisting its member states to see that global sustainability is in their national interest, and raising the level of debate. Decisions that are justified by reference to ethical principles like justice and equity will also have a better chance of receiving the adherence of the peoples of the world in their implementation. In the context of Rio+20, there is a risk that the issue of green economy merely displaces the main questions, failing to acknowledge problems of poor governance, corruption and human and environmental exploitation, rather than going back to core human values of respect for biodiversity, a moral obligation to ensure inter- generational sustainability, and a faith, belief, or rights-based reverence for the relationship between nature, local territories, and the individual's own sense of identity and culture.

## Objectives

To keep ethical principles at the heart of UN governance, and to ensure that decision- makers have available the relevant principles and ethical implications when taking decisions and approving proposals and programmes.

## Activities/Proposals

1. Establish a UN Permanent Forum on Ethics, patterned after the Permanent Forum of Indigenous Peoples, to provide a space for systematic consultation on the ethical implications of issues, proposals and projects before the Security Council, the General Assembly, and other UN organs. Membership would be open to faith-based, spiritual and other organizations of civil society with an ethical focus, that accept the principles of the UN Charter and other instruments, including freedom of conscience for all peoples, and that renounce prejudice, bigotry and violence. Their involvement in UN processes would implicate them more directly in finding constructive solutions.
2. Create a UN Office of Ethical Assessment in the Secretariat, similar in function to the Offices of Technology Assessment that have operated effectively at the national level, to be staffed by experts knowledgeable in the major religious and ethical perspectives, and to draw on outside consultants as necessary. The office would assemble and codify all the ethical principles adopted by intergovernmental processes as the framework for its work. It would prepare reports on the ethical implications of policy-relevant issues at the request of the organs of the UN system, the secretariat, and member governments. It could also provide ethical input to scientific advisory processes. It must be able to operate with complete independence from any political pressure or interference in its work.

## THE ROLE OF CIVIL SOCIETY

## Basis for Action

The rise of civil society is among the most significant developments of institutional evolution since UNCED. Civil society has developed its engagement on all fronts and at different levels, providing leading forums, pioneering in implementing, advocating for a shift in paradigms, and actively pushing to introduce reforms globally and regionally. Civil society organizations are effective in program design, implementation and monitoring. They have proven experience and success in fundraising for diverse projects, and possess strong advocacy skills. Most manage well and harness local expertise and skills. Indigenous peoples in particular are holders of valuable traditional ecological knowledge which can make an important contribution to sustainable environmental, social and economic policy making. On the monitoring side, civil society organizations have effectively played a watchdog role, worked with and pressured governments, and advocated for more progressive agendas. Civil society reaches from the local to the global level, and is able to leverage linkages and information, and to mobilize ideas and resources across sovereign boundaries. Indeed, it is this adaptation of civil society to leverage the forces of globalization that represents the major opportunity for advancing sustainability globally. The Major Groups defined in Agenda 21, ranging from business and industry to labour to indigenous peoples, have provided a working mechanism for inputs to the Commission on Sustainable Development and other UN processes. It is time to acknowledge their constructive role, and to increase civil society participation in UN processes with greater responsibility and direct engagement in discussion forums. Institutional arrangements for sustainability should capitalize on the unique global capabilities of all the major groups and civil society. The reformed Committee on World Food Security (CFS) under the auspices of the Rome-based UN agencies provides an existing innovative model for civil society participation in decision-making, as do the various industry-specific initiatives to advance sustainability practices throughout entire value-chains within global markets. The UNEP Major Groups and Stakeholders Advisory Group on International Environmental Governance is an example of civil society expert input to intergovernmental processes.

## Objectives

Civil society, including the spectrum of interests represented as UN Major Groups, should be enabled and supported to provide input in its various forms: data collection and analysis, improving management and decision-making processes, reflecting on the role of the various actors, and agenda-setting and policy development. It should advocate for environmental justice, provide expertise and analysis, intellectually challenge government counterparts, mobilize public opinion, and legitimize decision-making mechanisms.

## Activities/Proposals

1. Allow substantive involvement of civil society in discussion and policy-making processes, including granting major group representatives full access and active participation (not only observer status) in international/regional/national conferences and forums, and establishing processes to engage them in negotiations.
2. Develop inclusive and transparent guidelines/standards for civil society engagement in these forums and processes across the UN system and intergovernmental institutions, including special sessions for presentations by civil society.
3. Set up expert advisory groups from civil society at the highest level of UN bodies to participate in policy development.
4. Recognize the major role of civil society in scientific advisory processes, giving weight to scientific expertise (including the social sciences) as well as indigenous and local knowledge with relevance to sustainability.
5. Include civil society representatives regularly in national delegations to intergovernmental deliberations.
6. Implement the principles of transparency and access to information, meaningful opportunities for public participation, especially by parties at interest, and accountability as fundamental elements of institutional arrangements for sustainability, and provide access for civil society parties at interest to effective legal remedies, mediation and dispute settlement mechanisms at the international level, such as a complaint procedure (like at the Human Rights Council) and a dispute resolution mechanism (like at the World

Trade Organization).

7. Support knowledge generation and sharing among key players, civil society and social movements within and across countries.

8. Empower indigenous peoples as stewards of nature, particularly ensuring land rights and using the international system and instruments to constrain behaviour by nation-states and the private sector that is undermining indigenous governance, value systems and sustainability.

9. Create a viable and stable financial mechanism to assist and support the participation in international governance of civil society organizations from the global south and of those constituencies that are most directly affected and might not have the means to participate without encouragement and support.

10. Link the institutional arrangements for sustainability to the educational processes, media and institutions of civil society that play an important role both in building the human and institutional capacity to implement sustainability and in preparing public opinion to support the necessary actions to ensure equity and protect environmental systems and resources.

## LOCAL AND SUB-NATIONAL GOVERNMENTS

### Basis for Action

Local authorities were included as a Major Group of civil society in Agenda 21, but they are governments and have a legitimacy similar to national governments. Since sustainability requires multilevel governance at the local through global levels, the institutional arrangements for sustainability should include a place at the table for all levels of government and not just nation-states. Many cities today have populations and economies larger than most nation-states, and local governments are critical to implementing sustainability. Sub-national governments (regions, provinces, states, cantons, etc.) also have important responsibilities and are closer to their citizens.

### Objectives

To base institutional arrangements for sustainability on a multilevel concept of governance.

### Activities/Proposals

1. Acknowledge that local and sub-national (regional) governments have a democratic legitimacy comparable to national governments and an important role in implementing sustainability. Institutional arrangements for sustainability should include representation of multiple levels of governance including local, sub-national, national, regional and ultimately global levels.

2. Provide concrete mechanisms in local and sub-national governments for civil society and rights holders to participate actively in the development, implementation and monitoring of sustainable development strategies.

## ENVIRONMENTAL GOVERNANCE AND INSTITUTIONS FOR SUSTAINABILITY

### Basis for Action

UNEP was created in 1972 to catalyze the integration of environment into all parts of the UN system. In this it largely succeeded. Today there is a need to integrate sustainability into all parts of the UN system so that they all see sustainable development as part of their fundamental mandate. This will only happen if there is an entity with this catalytic responsibility across the economic, social and environmental dimensions. UNEP success was due in part to the use of the Environment Fund to support other agencies in implementing environmental activities within their areas of responsibility. A similar financial mechanism would facilitate the transition to sustainability today. UNEP would continue to be the environmental voice in the UN system. Also, a new more inclusive approach to national sustainable development strategies is needed, since few countries complied with the recommendations in Agenda 21, and implementation was poor.

### Objectives

To create an entity or process in the UN responsible to advance the pace and coordinate the integration of sustainability into all activities under UN auspices, with a funding mechanism to support this action.

### Activities/Proposals

1. Establish an office, programme or council at a high enough level in the UN structure to influence all parts of the UN system, charged with integrating sustainability into all UN activities through expert advice, review and evaluation, and policy-making.

2. Create a Sustainable Investment Fund supported by innovative financial mechanisms, to provide investment capital for environmentally-responsible and equitable projects of international organizations, regional and national governments and the private sector.

3. Encourage the adoption of global, regional, national and local Sustainability Strategies constructed with input from multistakeholder dialogues, including a comprehensive sustainability and equity vision, and a strategy and pathways how to get there. The strategy could include an analysis of local strengths and weaknesses, external threats and opportunities, as well as local assets. Such a mechanism would foster trust among stakeholders, create a long term perspective, and inspire a positive outlook towards change.

4. Increase the efficiency of multilateral governance by synchronizing and streamlining the number of intergovernmental meetings needed to oversee treaties and agreements, and rationalizing treaty secretariats to improve coherence and optimize financial management.

5. Secure collective commitment for the establishment, at the national level, of offices for Ombudspersons for Future Generations. These independent institutions would be mandated to take part to the assessment of long-term impacts of policies, to seize the justice system in case of projects undermining the position and resources of future generations, and to respond to citizen petitions.

6. Establish an independent office for a High Commissioner for Future Generations within the UN system with both an advisory role with respect to long terms impacts of UN policies and decisions, and a mechanism to respond to citizens' petitions on transboundary and international environmental issues. The office could be assisted by an Intergenerational Assembly to facilitate a global foresight process. It could also enable the establishment of Ombudspersons for Future Generations at the national level, including supporting the capacity of developing countries to implement this proposal and providing a forum for the exchange of best practices.

## INTERNATIONAL GOVERNANCE AND DEVELOPING COUNTRIES

### Basis for Action

Institutional arrangements must ensure fair multilateral negotiations, taking into account financial, economic and power asymmetries, moving toward a more coherent principle- and rule-based institutional structure with universal participation. Developing countries' priorities <sup>(a)</sup> meaning an integrated approach to poverty eradication, development and environment <sup>(b)</sup> should figure more prominently and be embedded within sustainability policies, supported by more effective governance. A set of clear and enforceable rules would also ensure that fairness and equity in terms of benefit and burden sharing, guided by the principle of common but differentiated responsibility, are built in and that decision making is based on democratic principles. The obligations of industrialized countries to advance more sustainable production and consumption patterns should also be negotiated, decided and complied with.

Resource consumption, biodiversity loss and climate change are aggravating poverty and instability and reducing options and opportunities for developing countries in the future. The vulnerable, poor, and disempowered peoples cannot rely on market mechanisms, because they cannot invest or discount the future. They need rights to protect their lives and livelihoods. In the present global market economy, the poor will lose out to the rich in the distribution of increasingly scarce resources. Mechanisms for international management of trade in resources for the collective benefit of all peoples and the planet will be the best means to protect the interests of the weak against exploitation by the powerful, and ultimately to ensure the equitable distribution of resources in the common interest. Such management must aim both to reserve adequate resources for poverty reduction and to ensure sustainability for future generations.

Institutions and actions at the regional level can respond more effectively to the specificities and needs of developing countries within their regions. Some regions have organized effectively, as with the Secretariat of the Pacific Regional Environment Programme (SPREP) and some of the Regional Seas Programmes. Africa has struggled to go beyond policy prescriptions to actions by governments for implementation.

#### Activities/Proposals

1. Ensure that the rules of procedure for intergovernmental processes in the institutional arrangements for sustainability protect the rights and clarify the responsibilities of all nations as an expression of global solidarity, while ensuring that planetary requirements for sustainability take precedence over limited national interests.
2. Strengthen the capacity of countries of the South to implement effective sustainability policies, in particular with regards to the rule of law, through technical assistance and advocacy of justice and rights, and ensure integration of environmental considerations therein.
3. Integrate global environmental objectives in national sustainable development and poverty eradication strategies, with assistance from the UN to developing countries to move effectively towards a sustainable development path that integrates economic progress, social progress and equity, and environmental protection.
4. Launch a process to consider the implications of essential resource (including food and energy) shortages and price volatility on the poor, and to explore mechanisms to ensure access to the requirements for life regardless of ability to pay, while stimulating local subsistence activities and job creation.
5. Provide a supportive international framework for regional programmes, conventions and intergovernmental organizations, and ensure that they have a place alongside nation- states in the institutional arrangements for sustainability.

### SCIENCE AND DECISION-MAKING

#### Basis for Action

The deep gap between scientific rationality and political expediency is often perceived to be great. Yet the best available scientific understanding of the planet and its environmental and socio-political processes is an essential foundation for decision-making at all levels of governance. The scientific questions need to be developed in cooperation with developing countries, and with as much input and involvement as possible of their scientists, including social scientists and holders of traditional knowledge. A responsive scientific assessment component in institutional arrangements for sustainability will help improve the capacity of developing countries to understand, manage, conserve and sustainably utilize their human resources and environmental systems, especially their natural ecosystems, the impacts of climate change, and the poverty/environment nexus. Committed North-South cooperation in a global research network and scientific assessment can both compensate for the often- weak scientific infrastructure in developing countries by providing collective access to scientific information, and assist in reducing the knowledge gap by building capacity for environmental assessment and reporting in all regions. It should facilitate access of developing countries to appropriate scientific knowledge, technologies and policy responses that respond to their specific needs and situations, and be supported by stable financial and technical components.

#### Objectives

To ensure that action for sustainability is supported by the best scientific advice available, at all levels of governance.

#### Activities/Proposals

1. Establish a UN Office of Technology Assessment advisory to the UN General Assembly, with independent status and funding, to conduct research, investigate trends and make future studies, to trace present and future consequences of technological innovations like geoengineering, biotechnology, new materials, information and communication technology, etc., and to translate these studies into policy recommendations.
2. In all international scientific assessments, implement transparent selection processes for the best natural and social scientists, ethicists, and holders of environmental and human dimensions knowledge, with disclosure of any affiliations, and apply procedures to arrive at the best consensus or peer-reviewed scientific information.
3. Create a UN mechanism similar to the UN Statistical Commission to establish criteria for all international scientific review and assessment processes, to verify their methodologies, and to build national capacity to participate in such assessments.
4. Ensure that scientific assessments build to a fully integrated assessment of planetary sustainability, including systematic reporting on the main environmental and human dimensions challenges and constraints, incorporating existing assessments but also considering the interactions among all environmental systems and human impacts.

### GOVERNANCE BEYOND NATIONAL SOVEREIGNTY

#### Basis for Action

Areas beyond national sovereignty, including the high seas and the atmosphere, are subject to some of the most extreme forms of unsustainable use, including overfishing and atmospheric pollution. Global trade and wide-ranging fishing fleets have rendered regional fishing agreements inadequate. Discussions of individual moratoria on technologies posing grave threats to the planet and the people (such as geoengineering), without sufficient technology assessment or global agreement on their implementation, demonstrate the need for an institutional framework for assessment and governance of these areas. The development of mechanisms for collective international responsibility and governance of the global commons, with due respect to the precautionary principle, would not infringe on national sovereignty and could begin to build confidence in operational management of resources by global institutions in the common interest.

## Objectives

To establish an international mechanism for governance of global commons issues not already subject to global processes, to complement the present governance by nation-states and to fill the gaps in existing international arrangements.

## Activities/Proposals

1. Building on the Law of the Sea, establish a coherent global mechanism for the regulation of ocean fisheries mandated to reduce fishing pressure to the capacity of the resource, and ultimately to restoring the productivity of the seas. The mechanism should include provisions for high seas marine protected areas, and for environmental impact assessment and regulation of activities such as seabed mineral extraction beyond national jurisdictions.
2. Build on the moratoria on geoengineering, ocean fertilization and Terminator technology agreed at the CBD by establishing an objective international procedure for technology assessment for proposals with potential planetary impact, coupled with a mechanism within the UN for collective approval of the testing and implementation of such technologies, and a requirement for international insurance of the risks of adverse consequences. The mechanism could be an Office of Technology Assessment advisory to the General Assembly, or a rejuvenated UN Centre on Science and Technology for Development.
3. Seek the opinion of the International Court of Justice on whether manipulating the environment through geoengineering could be in violation of the Environmental Modification Treaty of 1978, or whether a new legal framework is required.
4. Complement the scientific and technological assessment of new technologies with social and economic assessments of winners and losers from the application of such technologies, and wide public consultation with affected groups and civil society.

## Advocates for Youth

The world population reached 7 billion this year and forty-three percent of those 7 billion are under the age of 25. Today's generation of young people is the largest in history and as a result they have a critical role to play in adapting to climate change, helping mitigate the impact, and engaging governments, the private sector, civil society, and other stakeholders to set targets for a sustainable future.

Climate change has a disproportionate impact on women, particularly young women. In low and middle income countries, adolescent girls and women account for more than half the agricultural labor force and are also the primary stewards for collecting water and fuel. This heavy involvement in resource management greatly increases the risks for women and girls when their environmental stability is threatened. For example, women must walk farther to collect water, work harder to produce crops from dry soil, and cope with various natural disasters such as drought and flooding in addition to disease. Access to sexual and reproductive health and rights (SRHR) education, information and services is an effective mechanism to mitigate the impacts of climate change in the context of ensuring sustainable development.

Worldwide there are about 215 million women with an unmet need for contraception. In some areas, young women between the ages of 15 and 19 are twice as unlikely to have access to contraception. Lack of access to family planning and reproductive health services and information can have severe negative outcomes. Annually, there are about 53 million unintended pregnancies and for young women aged 15 to 19, pregnancy is the leading cause of death with complications of childbirth and unsafe abortion being the major factors. When women and young girls are empowered to manage the timing of their childbearing, they will be able to invest in more resources and in their children. As such, investing in young people and their reproductive health and gender equality can help put countries on a path to accelerated economic growth and equitable development.

Using recent data on emission, program effectiveness, and program costs, climate change economists found that responding to the unmet need for family planning and supporting girls' education was much less costly than low-carbon energy development options, including solar, wind, and nuclear power, second-generation biofuels, and carbon capture and storage. Family planning and girls' education programs were found to be cost-competitive with forest conservation and other improvements in forestry and agricultural practices. In addition, empowering women would reduce carbon emission significantly, providing eight to fifteen percent of the reductions needed to avert climate change. Furthermore, for every \$1 (USD) spent on international family planning efforts, governments save up to \$31 in health care, water, education, housing and other costs because women who are in good health are better able to get the education and resources they need to provide for themselves and their families.

Meeting the SRHR needs of young people around the world can contribute to comprehensive strategies to combat the effects of climate change as well as ensure sustainable development for a greener future.

As such, we strongly recommend the following:

- Make sexual and reproductive health and rights, particularly among youth, a sectoral priority to renew commitments from governments, the private sector, and civil societies.
- Invest in rights and evidence-based comprehensive sexuality education and youth-friendly sexual and reproductive health services to support young people's ability to make informed responsible decisions about their sexual and reproductive health.
- Challenge the global architecture of climate change, and its technology focus, and shift the discussion to a more human rights-based adaptation approach. Such a strategy would better serve the range of issues pivotal to improving the health of women worldwide and thus helping lead to a sustainable future.
- Ensure meaningful youth participation in the planning, design, and implementation of program and policies, especially those relevant to SRHR, climate change, and sustainable development.

## African Council of Touring and Automobile

The African Council for Touring and Automobile (ACTA) is a regional body under the auspices of the FIA that represents members of automobile, touring and motoring organizations within the continent. One of the main objectives is road safety, which affects all member countries with devastating effects in varying degrees.

Road safety is a serious concern globally, a major public health problem, a leading cause of disability with an estimated 1.5 million people dying every year and 50 million injuries. The Millennium Development Goals (MDGs) will be reversed by the predictable and avoidable violent deaths on our roads, which is more pronounced in low and middle income countries where political will to recognize and address the problem, lack of resources retards any meaningful progress. As an essential component of sustainable development, developing countries must begin to recognize the need to prioritize road safety in the interest of a sustainable transport system.

The Rio+20 conference can play a significant role in laying the ground work for continued support and incorporation in all international meetings in future, as there is now a wide recognition that road traffic injuries are a public health issue and a development challenge that needs to be addressed. In doing so there will be benefits not only of addressing the road carnage but also tackling climate change and working towards the Millennium Development Goals.

Until road safety is integrated into the mainstream of sustainability policy, millions of people will be condemned to unnecessary and preventable violent, painful deaths. This is why it is so important that action to improve road safety and promote sustainable modes of transport is included in the agenda and outcomes of the Rio+20 Conference.

The urgency of the interventions is demonstrated by the UN Secretary General in his address to the UN General Assembly, when he stated as follows, "Recognition is growing about the critical development and public health challenge posed by road traffic deaths and injuries. I call all member states, international agencies, civil society organization, businesses and community leaders to ensure that the Decade of Action for Road Safety leads to real improvements."

## African Wildlife Foundation (AWF)

### A. Expectations for the outcome of Rio+20

The African Wildlife Foundation (AWF) recognizes the stated objective of the Conference - to secure renewed political commitment for sustainable development, and assess the progress to date and implementation gaps of targets from WSSD, and the underpinning themes for the conference - (i) green economy in the context of sustainable development and (ii) institutional frameworks for sustainable development. In order for a meaningful roadmap to be achieved at Rio+20, AWF expects the following outcomes:

- Recognition of the accelerating scale of threat to global sustainability and the urgent need for all actors to commit to changing patterns of consumption, resource use, income inequality, population growth and other key drivers of unsustainability.
- Member States and Major Group commitment to recognize the need to replicate, scale up and speed up implementation of the multiple successful sustainable development initiatives that have been tried and tested since WSSD, for which lessons will be shared at Rio+20.
- All constituencies of WSSD continue to build global experience of pathways to sustainable development by identifying and disseminating tested and working implementation models and toolkits that can be rolled out to address the three pillars of sustainable development in priority sectors, notably land use, agriculture, water, forests, energy, protected areas and climate change.
- Member States, the UN, IGOs and Major Groups ensure their actions and investments deliver standards and practices required to achieve sustainable development, and penalize actions which do not deliver such standards and practices.
- All constituencies work together in implementation partnerships that build on clearly defined roles for local, national, international and non-State actors in ways that create synergies for financing, skills development and technology transfer. The frameworks should enhance north-north (N-N), north-south (N-S), south-south (S-S), transatlantic, developed-developing world, SIDS and LDCs collaboration.
- Member States, Major Groups and IGOs ensure that the issue of equitable benefit sharing is addressed holistically to encourage the developed world to offer green growth technologies and fairer access to markets, and give real incentives to developing countries to safeguard the ecosystem services that benefit the global community.
- Member States agree to a definition of the term 'green economy' which encompasses more than a 'low carbon economy', and is instead framed in terms of an economic system which maintains and restores ecosystem services, human well-being and social equity.

### B. Comments on existing proposals and views on implementation approaches

The documented lessons learned from actions implemented since WSSD in Johannesburg point to challenges to achievement of set targets. AWF notes the good, though somewhat ad hoc, achievements of specific initiatives, particularly those focusing on the advancement of energy efficient technologies and reduction of fossil fuel consumption, as well as those to promote sustainable agriculture. The implementation arrangements – of policy, financing and institutional partnerships - that drive documented successes need to be disseminated and replicated in order to speed and scale up achievement of the three pillars of sustainable development in an integrated manner. Recognizing the integrated nature of the challenges we face, and the value of bringing diverse views to the table when creating solutions, AWF supports the establishment of 'smart partnerships' that combine a conducive policy regime, appropriate financing mechanisms and the right skills and technology set as key to the achievement of the thematic goals of Rio+20. It is imperative that the public, private and local community sectors come together in partnerships for joint initiatives with costs and benefits for such interventions being equitably shared. Furthermore, the N-S, S-S, and other partnerships that bring developing & developed working partners together will help with technology transfer and breaking the digital divide.

More importantly, the role of developed economies (USA, Europe, Japan), emerging and fast growing economies (China, India, Brazil, South Korea, South Africa, etc), and developing economies (Africa, SIDS, etc) should be clearly defined and each 'partner' should be accountable for deliverables commensurate to their capacity to provide financial, natural capital or both. The threats to sustainability are global and the entire global community needs to take action in order to curb the unintended negative consequences through coordinated sustainable development approaches to green economic development. Another critical tier for partnerships is the multilateral international financial institutions (IFIs) that fund sustainable development programs. IFIs should ensure their investments are enabling the transition to an economy which maintains and restores ecological systems, human well being and social equity.

### C. Partnership arrangements and implementation tools for successful sustainable development actions

AWF emphasizes and recommends the need for strategic partnerships that bring together actors that have complementary (not competing) competencies re: conservation and development agencies; public and private sector actors; local, national and international actors. The past has been characterized by poorly coordinated actions, and by unbalanced participation among national versus international actors. As such, it has been difficult to systematically measure the cumulative impact of these dispersed

sustainable development initiatives on the environment or on poverty reduction.

AWF believes that there are now many examples of how to address the key issues of the priority green economy sectors of sustainable energy, food security and sustainable agriculture, technology transfer, climate change mitigation & adaptation, and biodiversity conservation. But existing success stories remain the exception, rather than the rule. For a complete transition to a green economy, the post- Rio+20 period must usher in an era of better coordinated and targeted financing, smart partnerships for implementation, transparent benefit sharing mechanisms.

## Agora Partnerships

Overview: Agora Partnerships

At Agora Partnerships, we envision a future that harnesses the latent power of the world's best early stage entrepreneurs to grow businesses that can fight humanity's most intractable problems: Poverty, inequality and degradation to our ecosystem.

Our mission is to create a dynamic, global community of impact investors, volunteers, supporters, and exceptional small business entrepreneurs united around one goal – to accelerate the growth of small businesses in poor countries that have the most potential to create positive change for their communities and the world.

We believe in human potential for good. We believe the world needs more innovation and more companies focused on people, profit, and planet. We believe that people with optimism and purpose are the world's most important resource.

We identify and support these people – regardless of background or connections – who represent society's greatest chance of converting opportunity into economic and social progress. We help them at the most critical time when they need it most – at the early stages of their careers when they are poised for growth.

[\[UNDESA/DSD: Please download the original document to see this image\]](#)

Our approach to development is different from traditional project-based, centrally planned approaches. We use technology, social and professional networks, and market signaling to connect entrepreneurs with the social, human, and financial capital they need to create a more sustainable world.

"Human Potential + Capital = Impact" is the equation that guides our work.

We look at impact in terms of social value generation (jobs, products or services that make lives better, economic growth, power of role models) and environmental impact (low carbon footprint, taking into account future generations in business decisions.)

Human potential means focusing our efforts on people with the vision, leadership and execution ability to make a positive difference in their communities. Capital is the fuel that unleashes potential.

There are three important kinds of capital all entrepreneurs' need. First, growth capital from private investment – this is key and there is very little of it in the developing world for early-stage businesses. Second, social capital –the relationships that support an individual or community, including the cultural norms and values that inform these relationships. Third, human capital – the knowledge, skills and understanding leaders and teams use to make the day-to-day decisions that lead to success. When capital is brought to entrepreneurs who can use it to attack social problems it creates tremendous impact at very little cost to the public.

At our core (and in our name) we recognize the most effective and efficient way to create long-term, scalable impact is through "partnerships". In our history, Agora has incorporated hundreds of partners in the field of entrepreneurship development, social entrepreneurship promotion, impact investing, and social and economic development. Agora is a proud founding member of the Aspen Network of Development Entrepreneurs (ANDE), whose 120+ membership body has been instrumental in shaping an agenda for Impact Investors and technical assistance providers of Small and Growing Businesses (Sibs). We have consulted and worked with other organizations at the cutting edge of thinking about entrepreneurship and development, including the Clinton Global Initiative; the Draper Richards Kaplan Network; Ashoka; the Aspen Global Leaders Network; the Yale World Fellows Program; the BMW Young Leaders network; the Latin American Angel Association network; and the Young Global Leaders network of the World Economic Forum. Literally thousands of organizations, entrepreneurs, students, investors, and policy makers have contributed to building Agora Partnerships' thinking, culture, and scope of work.

For Rio we propose the Agora Accelerator Program.

### Agora Accelerator Program

The Agora Accelerator is an intensive, 6-month program designed to give outstanding small businesses poised for expansion access to the social, human, and financial capital needed to accelerate their growth. It includes workshops, seminars, consulting, and mentoring in a variety of areas ranging from leadership development, to marketing, to investor pitch development, and culminates in an Impact Investor Conference giving participating entrepreneurs the opportunity to pitch to impact investors.

Agora's Accelerator program builds on our work in ecosystem development and impact investment. The program's mission is to help small companies in extremely poor, risky, not particularly entrepreneurial environments – the kinds of places that scare away traditional investors or would-be entrepreneurs – but that desperately need more innovative businesses.

We find the best, early stage impact entrepreneurs in Central America and Mexico and work to help them grow their business, attract growth capital, and maximize their positive impact on the world.

The Accelerator Program is designed to execute with these specific strategies:

- 1) Enhance impact entrepreneurs' opportunities for growth success by
  - a. Serving as a sustainable business leadership platform through coaching them on measuring social impact
  - b. Customizing the program to meet their development needs
  - c. Rigorously preparing them to meet investor expectations for due diligence
- 2) Build a self-sustaining community of impact entrepreneurs, mentors, partners, and impact investors by
  - a. Actively recruiting and engaging community members in mentoring, knowledge-sharing, coaching, and networking

b. Facilitating the development of long-term relationships between community members

3) Create a strong bridge between impact entrepreneurs and impact investors by

a. Serving as a capital-raising platform for entrepreneurs and as a pipeline for investors

b. Effectively matching entrepreneurs with investors

c. Remaining engaged post-investment through monitoring social impact and the investment relationship

4) Through the Agora Venture Fund (AVF), the first early-stage impact investment fund in Latin America and through our partnership with Thrive Capital, provide direct access to financing to the best Impact Entrepreneurs. Through these Capital initiatives, we are committed to growing the field of early stage impact investing and using our investor network to constantly improve the Accelerator Program.

Agora Accelerator Companies and Impact Entrepreneur Examples

[\[UNDESA/DSD: Please download the original document to see this image\]](#)

Agora Entrepreneurs have the vision, leadership, and execution skills to lead fast-growing, competitive companies in some of the poorest regions of the Western Hemisphere. What makes them different from mom and pop businesses, or even regular high growth companies, is their commitment to impact. Agora Entrepreneurs run companies that solve social problems. Their hope is to create something much bigger than themselves – something that can materially make people's lives better. They are bringing light to those without electricity and sustainable housing to those whose homes have been destroyed, or developing organic pesticide solutions that hold the promise of revolutionizing the region's agricultural sector and supply chains that preserve and enhance the region's resources. They do these things because they're the right things to do and because it's also good business. We support them because they represent a more efficient method to combat the scourges of poverty, inequality, and climate change than any other method we have seen.

Agora Entrepreneurs participate in the Accelerator program, measure IRIS-based social and/or environmental metrics, publicly report on them, and will be among the first entrepreneurs to be rated by the Global Impact Investing Reporting Standards (GIIRS).

Companies in the Agora Accelerator generate social impact with a productivity and efficiency rarely seen in traditional development programs. That's because Accelerator companies use the power of business to align market forces in ways that deliver impact – helping customers buy products that help local communities, creating jobs and opportunities for people struggling to feed their families, delivering products and services – like housing or solar power – that dramatically improve people's lives.

One such company is CO2 Bambu. For marginalized populations living in Nicaragua's most remote areas, living conditions are poor and stable housing is difficult to come by. To fill this void of adequate shelter, CO2 Bambu constructs sustainable housing using bamboo as the primary raw material. Maintaining bamboo farms as a means of capturing carbon is an integral part of their operations. In doing so, the organization creates a triple-bottom line model, creating economic, social and environmental good. In addition to addressing a greater portion of the base-of-the-pyramid housing market in Latin America, CO2 Bambu are also demonstrating themselves to be a reliable partner in post-disaster reconstruction efforts, most specifically now by securing contracts in Haiti.

What keeps Agora, and the Accelerator program going, are the powerful mission-driven entrepreneurs, such as Ben Sandzer-Bell, founder of CO2Bambu, that bring business and social good together to create positive change. Another example of such entrepreneurs are Manuel and Juan, founders of Quetsol, who are motivated by the implication access to power has in terms of safety, business productivity and education, for those who, until now, have lacked it.

[\[UNDESA/DSD: Please download the original document to see this image\]](#)

Quetsol is providing renewable energy solutions (primarily solar-based) to the poorest, most remote regions of Guatemala – communities that would otherwise lack access to electricity. Through innovative products and the latest technology, Quetsol satisfies energy needs in a sustainable manner at a lower economic, environmental, and social cost. Quetsol aims to bring light to the massive number of Guatemalan homes still without and then expand into other Latin American countries, where market and distribution dynamics are fairly similar.

At Agora Partnerships we believe that the single best way to fight poverty and inequality is to invest in such companies as the two introduced here – companies with good business practices that are deliberately addressing social and environmental problems, and to support such entrepreneurs who have the vision, leadership, and execution skills to lead fast-growing, competitive companies in some of the poorest regions of the Western Hemisphere.

By providing holistic and integrated support, including using technology and social networking, Agora works to promote investment and education, and provide visibility and support to businesses that can drive sustainable development in their communities. Through programs such as the Accelerator, Agora is changing how people access opportunity in the world's poorest countries and is accelerating the emergence of a strong community of successful impact entrepreneurs in Central America.

Areas where governments could help move the needle

There has been extensive research done around the world by such prestigious organizations such as the Kaufmann Foundation, ANDE, Technoserve, the Rockefeller Foundation, and others around the role governments can play to help promote a Culture of Entrepreneurship, and stimulate a dynamic entrepreneurial environment where financing and technical assistance are available. This is usually through a combination of public-private partnerships, business and industry group liaisons with public policy makers, and larger private sector groups, both foreign and domestic, that incorporate SGBs into their supply chains. Agora Partnerships has extensive networks of these organizations that have participated in this dialogue around the world and looks forward to making them an active part of this dialogue.

We are prepared to propose a group of people whose involvement can shape a dialogue focused on concrete actions to be suggested to a group of policy-makers and governments.

Some macro areas of support may include:

Promoting a Culture of Entrepreneurship

Small and growing businesses in developing countries are crucial for providing employment, building supply chains, and spurring local consumption. However, a variety of factors, including closed business and social networks, and limited resources, often make it difficult to launch new ventures in the communities that most need them.

Problems of scale and risk have prevented the SGB sector from growing and created the "missing middle" – composed of small businesses that are too large for microfinance and too small for commercial bank loans. Agora Partnerships has worked tirelessly to understand the scale and risk problems, and has proposed concrete solutions like the Accelerator program, to attack these issues head-on. Much more work is needed, however, to scale these solutions to target markets across the SGB spectrum, as well as

geographically. Governments need to understand that initiatives promoting the growth of start-up and early stage enterprises require more than just good policies at promoting exports, promoting macro-economic stability, or promoting foreign direct investment. One key issue to accept is the fact that some of these policies themselves are inherently risky, and do not always meet success themselves; creating a tolerance and positive feedback loop where failure happens is a systemic change that needs to occur. Israel, Colombia, Uruguay, and Chile are fantastic examples where government led initiatives have been key in stimulating early-stage business development.

In creating an environment where entrepreneurship can flourish, it is also important to celebrate entrepreneurial role models, particularly for women and under represented groups, and to create more support networks for entrepreneurs.<sup>1</sup> An example of such a form of celebration is The Sustainable Business Leadership Prize – LIDERES – that was launched in Nicaragua by Agora and various key partners to inspire a new generation of local impact entrepreneurs and investors. LiderEs celebrates impact entrepreneurs who, through their businesses, create social or environmental value for their community. Winners receive capital, media exposure, and free strategy consulting to increase their impact. Similar initiatives to celebrate entrepreneurship could be developed all over the world and could greatly benefit from government support and involvement.

Lastly, developing programs to teach children and adults of all ages about enterprise also plays a key role in fostering an entrepreneurial spirit.<sup>2</sup> In Latin America, where the majority of the students attend public universities, policy-makers need to ensure that state-run universities are committed to a strategy to foster entrepreneurship.<sup>3</sup> Other institutions including technical training institutes, private foundations, business chambers, and civil society organizations must also become engaged in activities that nurture entrepreneurship.<sup>4</sup>

There are various ways in which governments could help support the advancement of small and growing businesses. Initiatives might be most effective in focusing on helping generate, and provide access to capital for growth both in terms of financial, as well as human and social capital.

#### Financial Capital

One approach to addressing the existing lack of access to financial capital is the development of new early-stage sources of capital, and more alternatives to the traditional commercial banks, offering both loan finance and support.<sup>5</sup>

A successful example of one such government initiative is the K (Kreditanstalt für Wiederaufbau), a German development bank with a long experience in financing SMEs in Germany. 80 percent of its capital is owned by the German national and regional governments. It is one of the biggest providers of capital to MFIs and runs two key initiatives that indirectly help bring affordable capital to SMEs in the developing world.<sup>6</sup>

Another important component of this area is ensuring that the fiscal system is both stable and predictable, and that it does not disadvantage small companies, but aims

<sup>6</sup> White, Jonathan M., Glenn Yago, and Daniela Roveda. “Transatlantic Innovations in Affordable Capital for Small- and Medium-Sized Enterprises: Prospects for Market-Based Development Finance”. The German Marshall Fund of the United States. October 2007.

to use tax incentives to encourage them instead.<sup>7</sup> New businesses can have easier access to working capital through deferrals or exemptions from tax payments during the early years of operations.<sup>8</sup> Tax incentives can also be effective in encouraging venture capital to invest in new firms and to encourage the creation of networks of informal private investors.<sup>9</sup>

The Inter-American Development Bank also identifies the following “instruments that can be used to reduce the financing difficulties that entrepreneurs face when starting a new business:

- Reforms can be made in the capital markets to make it easier for venture capitalists to recover their investments.
- Systems to reduce the imbalances in the information available to investors are needed.
- The costs of bankruptcy can be reduced by means of guaranteed loans and restructuring opportunities for new businesses.”<sup>10</sup>

#### Human and Social Capital

While restricted access to financial capital has been widely acknowledged as one of the major barriers to growth for SGBs, there is still another major challenge, which may be less obvious but just as problematic: access to talent.

Finding great talent is an enormous challenge in poor countries where the workforce has not had the opportunity to get an advanced education. As an early-stage entrepreneur, assembling a team that will be able to help you accomplish your mission and drive your business can be a major constraint to growth. Even finding the right professional talent can be difficult – lawyers, accountants, bankers, mentors, entrepreneur peers, (affordable) strategy consultants – all of whom are key players in early stage entrepreneurship.

This area of developing, and enabling access to human and social capital covers a wide range of potential government action, including the formal education system<sup>11</sup>, networks of advice centers designed to encourage the growth of small businesses<sup>12</sup> and the acquisition and development of talent to drive entrepreneurship.

One part of the solution could be creating talent funds where governments would subsidize a third party to bring talent to an organization as capital for growth, as

<sup>12</sup> "Encouraging social and commercial entrepreneurship: What can governments do?". Proceedings of the second World Entrepreneurship Forum Lyon, November 2009

opposed to investing financial capital. This third party actor takes on a risk by bringing top talent to a company that could not afford such talent on their own. However, in this proposed scenario, if the talent performs, the talent investor realizes a payback based on the achievement of previously agreed upon performance milestones. Meanwhile, the company has the benefit of working with top talent at an early stage of the business, and thereby has more of a chance to grow to a point where they are able to attract the right talent without a third party actor.

Labor laws also play a key role in the development of local talent and potential entrepreneurs. Laws should be designed to allow for efficient hiring and firing to enable optimization of talent acquisition, retention and development. They should also grant motivated individuals access to quality part-time employment and even volunteering opportunities to start developing their skill set at an early age and despite time constraints such as simultaneously pursuing an education, raising a family, etc

#### Building the field of Impact Investing

Agora Partnerships has been committed from day one to building the field of Impact Entrepreneurship promotion and Impact Investing as key parts of an economic and social development strategy. With our support of over 4000 SGBs and millions of dollars of capital attracted to the sector, we have a wide range of experiences to contribute. More importantly, we are blessed to have built the global partnerships to propose action-oriented policies, and help local partners execute those policies.

Examples include the Agora Venture Fund (AVF); the Agora Accelerator Program; the founding of the Aspen Network of Development Entrepreneurs (ANDE); and the ecosystem development undertaken with USAID and Technoserve in Nicaragua to help launch and grow new and early stage ventures with social impact.

Programs such as AVF and Thrive have made significant contributions. AVF has made perhaps the smallest equity investments of any fund in Latin America – as small as \$25,000. Average annual sales for AVF companies at the time of investment are less than \$200,000 with an average entrepreneur salary of about \$12,000. The AVF has made a total of 11 investments in companies ranging from foot clinics to vegetable processing to shoe manufacturing.

Thrive is a unique and innovative program that makes interest-free loans to small businesses in the "missing middle" – too large for microfinance and too small for commercial bank loans. These loans are strictly allocated toward the purchase of machinery and equipment. Recipient businesses repay Thrive loans not in cash, but rather by donating in-kind products, services, and vocational training to the poor in their communities. The average loan disbursed is slightly less than \$10,00, but the effect of the loan is enormous: on average, entrepreneurs hire 95% more employees after the loan is made.

The Thrive program is overseen and funded by the Arthur B. Schultz Foundation, who enlists field partners to disburse and monitor the loans. The partnership with Agora was formed in 2010, and in the last 12 months, Agora disbursed funds to five companies, and is anticipating extending funds to 10-12 new small businesses in the near future.

#### Recent Agora Accomplishments

[\[UNDESA/DSD: Please download the original document to see this Graph\]](#)

#### Accelerator Program Results

The first Accelerator in 2010 saw 9 companies as participants with total sales of over \$2.5M in 2010 (averaging at \$276,000). While in 2010, their companies were totaling 250 employees; the projected number of total employees for 2013 is 600 or more. The entrepreneurs were seeking a total investment of more than \$4.2M. Within 48 hours of the first annual Accelerator Investor Conference, the Accelerator had helped catalyze over \$3.5M in potential impact investments, and every investor who participated in the investor conference began performing due diligence on at least one of the companies presented.

The inaugural class of the Accelerator was composed of companies from four Central American countries, with the majority being located in Nicaragua. While their background and industry focuses varied, their intentions to grow their bottom lines while having a social impact in their communities are consistent.

Social metrics for the Accelerator 2010 captured salary increases, trees planted, KW/hrs produced with renewable energy, women and children impacted, low-income populations served, bank accounts opened, environmentally-friendly homes built, water saved and waste recycled.

#### Enterprise Development: Strategy, Networks, and Capital

- Business Consulting, Coaching, and Advice: Over 60 businesses received indepth, professional consulting, including 30 ventures matched to 213 volunteer business consultants, and over 300 entrepreneurs received coaching and advice. Over 30% of all entrepreneurs receiving support are female.
- Business Creation: 8 new businesses launched after consulting.
- Access to Growth Capital: 18 Agora-supported companies received financing, 8 directly from AVF and 10 from third party sources. Agora has attracted over \$700,000 in growth capital to small businesses in Nicaragua.
- Sustainable Business Growth: 83% of start-ups resulting from Agora's process were still functioning one year after launch and 91% of firms that received consulting from Agora increased sales in the last year. 64% of firms saw their sales increase by over 20%.
- Job Creation: An estimated 500 full-time jobs have been directly created or sustained by Agora-supported businesses (52% women, 48% men). Overall, over 1,000 indirect jobs have been created or sustained by suppliers and distributors of Agora- supported companies.
- Wealth creation: 51% average increase in profits in firms receiving consulting from Agora and a 36% increase in average wages in Agora portfolio firms.

#### Education: Creating a Culture of Entrepreneurship

- MBA Support: Over 200 MBA consultants have logged more than 10,000 consulting hours with Agora entrepreneurs. Additionally, Agora has hosted 18 summer associates and fellows in Nicaragua and 35 summer associates, interns, and volunteers in D.C.

- Seminars: Provided 53 entrepreneurship promotion and education events on topics such as corporate social responsibility, “how to position your brand”, “venture capital as an alternative source of finance”. Over 2,800 entrepreneurs have attended these events.

- Media Outreach: Developed Spanish language website and videos to educate entrepreneurs. Locally, Agora has promoted a culture of entrepreneurship through 70+ local, Spanish language media appearances and news articles. Internationally, Agora promoted entrepreneurship in Nicaragua through media coverage in publications such as Business Week and the Miami Herald.

- Business Competitions: Partnered with Citi Foundation, SNV, AVINA, TechnoServe and others to sponsor the LiderES business contest, the first prize for sustainable business leadership in Nicaragua. Agora has also been a key partner of Idea Tu Empresa, a TechnoServe-run business plan competition with over 400 participants in 5 years. Additionally, Agora staff members have served as judges and mentors in 8 business plan competitions for small and growing businesses.

#### Building the Field

- Partnerships: Globally, Agora has played a central role in advancing the burgeoning community of organizations committed to development through entrepreneurship: Agora is represented on the Executive Committee of the Aspen Network for Development Entrepreneurs (ANDE); and with its colleagues, has participated in and presented a commitment to the Clinton Global Initiative. Agora is a proud partner of USAID, TechnoServe, the Rockefeller Foundation, and the Draper Richards Foundation, and has collaborated extensively with the Argidius Foundation.

- Network Building: Agora has also worked to develop networks and support systems among entrepreneurs within Central America. With support from ANDE’s Capacity Development Fund, Agora helped design and execute the first annual ANDE Latin America Conference to build the movement for small and growing businesses. Co-founder Ricardo Terán is a fellow in the Central America Leadership Initiative (CALI), giving Agora very strong connections to business and non-profit leaders in the region. Agora has also collaborated with Link Angel Investor Network in Costa Rica and “First Tuesday’s”, an entrepreneur network in El Salvador. Agora recently founded the Women’s Entrepreneur Experience Exchange, which is working to create a strong network of female entrepreneurs. Agora is also an active leader in Nicaraguan Young Entrepreneurs Association and Empeñe Nicaragua, a network of universities, non-profits and government institutions promoting entrepreneurship in Nicaragua. Agora participated on the planning committee of the Pathways to Prosperity Women’s Entrepreneurship Conference, hosted by the US State Department in Washington, DC, and organized and moderated the “access to finance” panel. With City’s support, Agora will also be able to collaborate with Centro Empresarial Pellas on entrepreneur initiatives that promote business development in Nicaragua and strengthen entrepreneurship locally, particularly in the Tourism sector.

- B-Lab Sponsorship: Agora is a founding B Corporation. B Lab created a comprehensive assessment tool to evaluate a firm’s social and environmental impact on each of its stakeholders. Agora teamed up with the Rockefeller Foundation to adapt B-Lab’s method to small firms in developing countries.

Raising Awareness: Since its inception, Agora co-founder Ben Powell has been awarded the Dalberg I-Qube Award for innovation, impact, and inspiration in the development field; testified before the U.S. Congress on Poverty and Inequality in the Americas; and been profiled as an innovator in Milken Institute report “Transatlantic Innovations in Affordable Capital for Small- and Medium-Sized Enterprises: Prospects for Market-Based Development Finance;” Co-founder Ricardo Terán has been selected as a finalist for the John P. McNulty Prize, which awards young leaders making lasting change in their communities.

## AIIESEC International

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The Rio+20 Outcome Document should include special paragraph related to “Education for Sustainable Development”. Especially, it should be focused on Higher Professional Education - University’s mission and activity.

The Outcome Document should highlight the necessity of substantial institutional transformation of university’s business toward sustainable development imperative.

It should present the conception of “The University of the Future” as the university of new type - a model and a laboratory for drawing up educational guidelines for future generations in terms of sustainable development paradigm.

The Outcome Document should highlight the road map for further development and implementation of “The University of the Future”.

---

#### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

The importance of education and universities is already highlighted in the United Nations Decade of Education for Sustainable Development and it became a part of proposals of several groups (for example, German National Committee for the United Nations Decade of Education for Sustainable Development report and Draft Opinion of the Committee of the Regions of European Commission, etc).

The proposal of Committee of the Regions states: “There is a substantial demand for the exchange of experience and a transfer of knowledge... education, training and information are all areas in which there is a significant need for the exchange of experience and transfer of knowledge between cities and regions on a global scale.”

But we call attention to the necessity of deep reformation of the university’s curriculum on the base of sustainable development paradigm and new types of knowledge. As we stress the “deep education in frames of certain domain of knowledge, without proper understanding of how a specific field of study can mutually benefit from cooperation with

other domains of knowledge results in “blind spots” and causes “collisions” with human life, society and biosphere.”

In order to fully engage potential of education in overcoming global sustainable development problems we need to build a new type of knowledge infrastructure. This can be achieved by creation of the university of new type – “The University of the Future”.

The functioning of “The University of the Future”, its’ new type of interdisciplinary curriculum and new forms of activity, will not only facilitate the dissemination of sustainable development paradigm through tertiary education of university level, but also create cumulative effect and significantly support the integration of all other activities and pillars of global sustainable development agenda.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

All kinds of “implementation gaps” are first of all caused by knowledge gap, intellectual division of labor and vision deficit.

In order to promote global educational sustainable development agenda it is necessary to improve its’ institutional framework and first of all the status of education.

Universities mission should be reassessed and raised up.

All possible sectoral priorities (e.g., energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) should be rightly reintroduced into university practices in integrated globally concerted way.

As soon as key players will get the deep understanding of sustainable development issues, as soon as they will be equipped by relevant knowledge and action tools – all plans and activities will be realized more easily and successfully. The new type of education will implicate collaboration of efforts of relevant actors and establishment partnerships focused on global sustainable development, etc.

Among other implementation tools, the activity under framework of “The University of the Future” will be the most important and serve to close the “implementation gaps”.

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

The promotion and implementation of the conception of “The University of the Future” (as the university of a new type and model - a laboratory for drawing up guidelines aimed to educate future generations in the sustainable development paradigm) comprise the following basic steps:

1. The conception of “The University of the Future” and the idea to build it should be highlighted in the Outcome Document (June, 2012);
2. The Basic Laboratory for the further exploration and development of conception of “The University of the Future” and its institutional design should be established (November, 2012);
3. The consortia of knowledge communities and university’s communities under framework of “The University of the Future” should be created. It will develop pilot projects, regional and global implementation plans, etc. (January, 2013);
4. Scholars from leading universities of the USA, Ukraine, Russia, and Canada will network and create a core group for “The University of the Future” activity development and further promotion. (May, 2013).

---

**Specific Elements**

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: “The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development”.**

AIIESEC International

The University of the Future - as Education for Sustainable Development Hub

Initiated by

Denys Oleksandrovych Shpotia

e-mail: denis.shpotya@gmail.com

Rio+20 Preparation Events Coordinator

AIIESEC Ukraine

Juiz de Fora, Brazil – October 31, 2011

Summary

This report is related to the third pillar “The institutional framework for sustainable development”. Its’ task is to show how the creation of such an institutional framework as “The University of the Future” can strengthen individual pillars of sustainable development, as well as facilitate the integration of the three pillars, at multiple levels – local, national, regional and international.

AIIESEC prepares leaders to make a positive impact in societies all around the globe. Even though it is the world’s largest student-run organization the impact it does on world’s scale is very little.

AIIESEC leaders make positive changes in societies due to knowledge and experience they receive. Unfortunately, AIIESEC can not educate enough people and overcome

social, economical and environmental crises, because its' institutional framework was not supposed to work in the institutional framework of a real university and to deal with substantial issues such as university's curriculum.

This project and report is based on the assumption that True Sustainable Development of the Planet can be achieved only by educating future generations in a new – Sustainable Development Paradigm and in terms of collaboration of globally interconnected universities.

AIIESEC International, the main instance in the management hierarchy of our organization, gives sustainable directions for our organization worldwide and acting sustainable we achieve tremendous synergetic effect that ensure success of our development.

This practical experience may suggest how to built new institutional framework activities worldwide - "Sustainable Universities".

The idea of such an institutional framework was found in Ukraine. The conception of "The University of the Future" was developed from idea of Noösphere of great Ukrainian/Russian Academician Vladimir Vernadsky.

AIIESEC International assigned one of its' leaders, Denys Shpotia, to report this concept in order to be considered as a key part of final Rio+20 resolution.

#### Rationale

Nowadays, the deep education in frames of certain domain of knowledge, without proper understanding of how it can interact with other domains results in "blind spots" and causes "collisions" with human life, society and biosphere. Improvements in certain institutional frameworks that deal with specific sectoral priorities are no longer appropriate for societies in order to be developed in a sustainable way.

Universities are complex and multi-modal institutions. Only they posses all tools and characteristics to work out a new (sustainable) world view, knowledge-base and implement successfully these components into a new sustainable development paradigm.

We need to look not in depth but in width in order to find the ways for sustainable development of every area of human life.

Dealing with global problems in the "end-of pipe" way, instead of working in a preventive way, we face countless problems. Countries throw out resources in expense of potential social, economic and environmental development. This also proves that existing paradigms of education can't prepare professionals capable to deal with existing world's challenges.

Exactly 10 years passed since The Lüneburg Declaration on Higher Education for Sustainable Development was adopted. The educational paradigm has not being changed. That is why we need to conduct an assessment on declaration's results and keep on moving forward.

As it was emphasized in the Framework for the International Implementation Scheme: "Universities must function as places of research and learning for sustainable development, and as initiators and poles of activity in their communities and nationally. ... Sustainable development needs to become a central preoccupation in determining areas of educational research and development". The efforts of Global Higher Education for Sustainability Partnership "to change strategies for reorienting higher education toward sustainable development" should be strengthened by innovative initiatives on further university's mission and education paradigm.

The world needs to reevaluate its' "higher education standing order" and to develop new type of university – which will be more relevant to global sustainable development challenges – "The University of the Future".

#### The University of the Future

The real implementation of sustainable development approaches depends on how future generations will think and act.

"The University of the Future" concept is aimed to ensure the renovation of higher education that will prepare new generations of humanity according to the sustainable development paradigm.

To become a basic and globally followed paradigm - sustainable development approach should become a core of higher education that will train new specialists - "sustainable developers".

"The University of the Future" should be developed as a global network movement that involves collaboration of Think Tanks, university's research centers, universities, NGOs, media organizations and other related structures. It should be built on the following principles:

- All subjects (of curriculum) must be formed in support of sustainable development world view and paradigm;
- Curriculum should be built on interdisciplinary approach and be constructed around Research & Development (R&D) projects related to common global sustainable development issues;
- R&D agenda (its topic and issues) should be framed by sustainable development paradigm;
- Should be used all new types of educational advanced approaches and technologies (including Web-based and Web 2.0 opportunities, etc.);
- Project-based approach and collaborative Research & Learning. The collaborative teamwork with sustainable development objectives within "The University of the Future" is aimed to solve common global problems.

Acting as a vehicle – "The University of the Future" will build up new theoretical and methodological frameworks and implement interdisciplinary approaches to all kinds of sustainable development issues. This mission assumes that:

- Research & Learning agenda should be orientated on creation of new knowledge and technologies according to the sustainable development paradigm;
- It should work as a center of excellence and as the main source of new approaches on how to educate new generations according to the sustainable development world view and its' paradigm of actions;
- "The University of the Future" should produce new active life styles focused on sustainable development paradigm of actions;
- "The University of the Future" must implicate new socio-cultural functions for successful establishment of sustainable development ideology;
- "The University of the Future" must lead a start for a creation of interactive web-based expertise platform that will analyze, accumulate, structure and integrate knowledge required for sustainable development of the whole world.

a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

The Rio+20 Outcome Document should include special paragraph related to "Education for Sustainable Development". Especially, it should be focused on Higher Professional Education - University's mission and activity.

The Outcome Document should highlight the necessity of substantial institutional transformation of university's business toward sustainable development imperative.

It should present the conception of "The University of the Future" as the university of new type - a model and a laboratory for drawing up educational guidelines for future generations in terms of sustainable development paradigm. The Outcome Document should highlight the road map for further development and implementation of "The University of the Future".

b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

The importance of education and universities is already highlighted in the United Nations Decade of Education for Sustainable Development and it became a part of proposals of several groups (for example, German National Committee for the United Nations Decade of Education for Sustainable Development report and Draft Opinion of the Committee of the Regions of European Commission, etc).

The proposal of Committee of the Regions states: "There is a substantial demand for the exchange of experience and a transfer of knowledge... education, training and information are all areas in which there is a significant need for the exchange of experience and transfer of knowledge between cities and regions on a global scale."

But we call attention to the necessity of deep reformation of the university's curriculum on the base of sustainable development paradigm and new types of knowledge. As we stress the "deep education in frames of certain domain of knowledge, without proper understanding of how a specific field of study can mutually benefit from cooperation with other domains of knowledge results in "blind spots" and causes "collisions" with human life, society and biosphere."

In order to fully engage potential of education in overcoming global sustainable development problems we need to build a new type of knowledge infrastructure. This can be achieved by creation of the university of new type – "The University of the Future".

The functioning of "The University of the Future", its' new type of interdisciplinary curriculum and new forms of activity, will not only facilitate the dissemination of sustainable development paradigm through tertiary education of university level, but also create cumulative effect and significantly support the integration of all other activities and pillars of global sustainable development agenda.

c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

All kinds of "implementation gaps" are first of all caused by knowledge gap, intellectual division of labor and vision deficit.

In order to promote global educational sustainable development agenda it is necessary to improve its' institutional framework and first of all the status of education. Universities mission should be reassessed and raised up.

All possible sectoral priorities (e.g., energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) should be rightly reintroduced into university practices in integrated globally concerted way.

As soon as key players will get the deep understanding of sustainable development issues, as soon as they will be equipped by relevant knowledge and action tools – all plans and activities will be realized more easily and successfully. The new type of education will implicate collaboration of efforts of relevant actors and establishment partnerships focused on global sustainable development, etc.

Among other implementation tools, the activity under framework of "The University of the Future" will be the most important and serve to close the "implementation gaps".

d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

The promotion and implementation of the conception of "The University of the Future" (as the university of a new type and model - a laboratory for drawing up guidelines aimed to educate future generations in the sustainable development paradigm) comprise the following basic steps:

1. The conception of "The University of the Future" and the idea to build it should be highlighted in the Outcome Document (June, 2012);
2. The Basic Laboratory for the further exploration and development of conception of "The University of the Future" and its institutional design should be established (November, 2012);
3. The consortia of knowledge communities and university's communities under framework of "The University of the Future" should be created. It will develop pilot projects, regional and global implementation plans, etc. (January, 2013);
4. Scholars from leading universities of the USA, Ukraine, Russia, and Canada will network and create a core group for "The University of the Future" activity development and further promotion. (May, 2013).

**Albanian Center for Population and Development, CHOICE for Youth and Sexuality, Realizing Sexual and Reproductive Justice (RESURJ), Star Star Macedonia, Y-PEER, YouAct, Youth Action Nepal, Youth Coalition for Sexual and Reproductive Rights**

THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT (UNCSD) 2012 INPUTS OF THE UNDERSIGNED ORGANIZATIONS TO THE COMPILATION DOCUMENT

Population dynamics and sustainable development are linked. The linkages between population dynamics and sustainable development has been recognized by many internationally agreed goals and principles, including the Rio Declaration 1992, Agenda 21, International Conference on Population and Development (ICPD) Programme of Action (PoA), the Beijing Declaration and Platform for Action and the Millennium Declaration. In the context of the UN Conference on Sustainable Development (UNCSD)

2012, it is important to reaffirm role of sexual and reproductive health and rights and gender equality in achieving sustainable development. This means ensuring that policies and programmes that aim to achieve sustainable development should also promote the human rights of all people to the highest attainable standard of sexual and reproductive health and wellbeing, particularly for women, young people and those living in poverty.

Young people are the present and the future. There are over 1.8 billion people aged 10-24 years in the world today, the majority of whom live in developing countries. In most developing countries, this generation of young people comprises more than a third of their country's population. In 67 developing countries, young people aged 10-24 constitute more than 40% of the adult population above 10 years of age. Young people are the most significant demographic group today and will remain so for the coming decades.

Policies should take into account the drivers of population growth. As the world reaches 7 billion, it is projected to grow to 9.3 billion by 2050. Most of the growth will take place in the developing world, as a result of the combined effects from the large number of women of childbearing age due to the high fertility of the past (so-called population momentum), declining mortality and remaining high fertility in some parts of the world (due to high desired fertility and high unmet need for contraceptives). In the least developed countries, which are marked by the highest fertility rates, the population is expected to nearly double by 2050, increasing the working age population by about 15 million per year. In the context of a green economy, there is an urgent need for countries to incorporate policies and programmes that take these dynamics into account and effectively respond to the shifting sources of population growth.

Access to sexual and reproductive health and rights addresses high fertility. Addressing high fertility where it prevails continues to be a viable strategy, provided that programme interventions are human-rights based and give people the opportunity to influence the number of children and the spacing between births that they desire. High fertility is partly due to high rates of unwanted pregnancies, especially in adolescents. Young women and couples of reproductive age are increasingly choosing to have fewer children than the previous generation, but they will be unable to fulfill these desires if they lack access to comprehensive sexual and reproductive health services and contraceptives. Globally, an estimated 215 million women want to use family planning methods and services, but do not have access to them. Family planning services are essential for the prevention of unintended and unwanted pregnancies and enable women and couples to choose the number and spacing of pregnancies. There is a need to ensure that national development plans support age-appropriate sexuality education, including information with gender equality perspective, in and out of school as well as young people's access to contraceptives. Special efforts are required to ensure that health systems respond to the needs of young people, and that adolescent sexual and reproductive health programmes are able to reach those who are most in need.

Gender equality and access to health will slow down population momentum. Where population growth is already due almost exclusively due to population momentum, i.e. the large number of women of childbearing age due to the high fertility of the past, putting in place approaches to increase the age at marriage, to empower girls and young women with information for acquiring accurate contraceptive methods, and enhancing adolescents' sexual and reproductive health, educational levels, and income-generating potential can have significant effects on population growth rates. Where girls are able to stay in school until secondary school and are empowered to decide on matters related to their sexuality and reproduction, there is a significant observed effect in delaying child birth and increasing spacing.

Promoting sexual and reproductive health services advances environmental sustainability. Many experts agree that slowing down population growth including through ensuring access to sexual and reproductive health including family planning would reduce pressure on scarce natural resource within communities, including fuel for cooking and warmth, drinking water, and land for subsistence farming. Universal access to sexual and reproductive health including family planning should be one the key interventions needed to achieve sustainable, low-carbon development. The United Nations Population Fund (UNFPA) estimates that demand for family planning will increase by about 50 to 75 per cent from 2005-2020 in many developing countries. If governments and other donors fund sexual and reproductive health services and supplies, we can advance environmental sustainability while also promoting social justice, development and human rights.

HIV prevention amongst young people ensures a sustainable workforce. Governments must recognize that the response to HIV is both a human rights issue and also an economic necessity crucial to eradicating poverty. On one hand, disproportionately high levels of poverty and unemployment make young people more vulnerable to HIV infection. On the other, with close to four out of ten new HIV infections occurring amongst young people, this has serious implications for productivity today and the workforce of tomorrow, particularly in countries in Sub-Saharan Africa where HIV prevalence is as high as 25% of the population.

Access to sexual and reproductive health services promotes adaptation. Young women's health and well-being, their ability to choose if or when to have children and their risk or early pregnancy is affected by their lack of access to safe and stigma free sexual and reproductive health services, contraception and comprehensive sexuality education. Such access helps build resistance among individuals and communities and should be incorporated as a part of policies to promote sustainable development and adaptation strategies for climate change.

#### RECOMMENDATIONS:

In the context of the Green Economy, member states should:

- Recognize that sustainable development entails empowering young people, particularly the most marginalized, by investing in their education, health including sexual and reproductive health, employment and leadership.
- Reaffirm commitments to the ICPD Programme of Action, the Beijing Platform for Action and the World Programme of Action for Youth
- Prioritize their full and effective implementation of these commitments through multisectoral programmes that link social justice, access to health, gender equality and environmental sustainability.
- Take into account population dynamics in policies and expand rights-based programmes that effectively respond to the shifting sources of population growth through promotion of sexual and reproductive health and rights.
- Commit to build the capacities of young people and women in the production and marketing of green technologies should be prioritized in the transition to a green economy.
- Promote gender equality and the empowerment of young women and support programmes as a cross-cutting issue and a priority for sustainable development including through addressing the gendered impacts of climate change as a part of strategies to promote adaptation.
- Support gender-sensitive, age-appropriate, life-skills-based comprehensive sexuality education for young people both in and out of school based on international standards as a way to empower young people, promote gender equality, human rights, prevent HIV and increase use of sexual and reproductive health services.
- Expand and support young people's choices and opportunities by ensuring and investing in access to youth friendly sexual and reproductive health services including family planning, particularly for marginalized adolescent girls and young women, those living with disabilities and in humanitarian situations.
- Reaffirm the goal of universal access to HIV prevention, treatment, care and support, in line with the Declaration of Commitment on HIV (2001) and the Political Declaration on HIV/AIDS (2006).

- Embrace the vision of Zero New Infections, Zero AIDS Related Death and Zero Discrimination and support efforts to achieve the three Bold Results on HIV and Young People under the UNAIDS Strategy 2011-2015, namely, (1) Raising comprehensive knowledge to 80%, (2) Doubling condom use amongst young people and (3) Doubling HIV testing among young people - in order to reduce new HIV infections among young people by 30% by 2015.

- Support integrated approaches to sustainable development that build on people's expressed needs, and strengthen community-based strategies, including through the meaningful participation of young people.

In the context of the Institutional Framework, member states should:

- Ensure the meaningful participation of young people in decision making processes, by putting in place enabling structures and supportive policies and through building the capacities of youth-led organizations.

- National development plans, poverty reduction strategies, sustainable development strategies, policies and programmes should be planned, implemented, monitored and evaluated in equal partnership with young people through a participatory approach.

- Young people and youth-led organizations should be empowered to hold their governments accountable for their commitments including through monitoring budgets and participation in appropriate institutional mechanisms.

SIGNATORY ORGANIZATIONS:

1. Albanian Center for Population and Development
2. CHOICE for Youth and Sexuality
3. Realizing Sexual and Reproductive Justice (RESURJ)
4. Star Star Macedonia
5. Y-PEER
6. YouAct
7. Youth Action Nepal
8. Youth Coalition for Sexual and Reproductive Rights

## ALCALA and ECO GLOBAL S.A.

PROPUESTA PARA QUE LOS ESTADOS APLIQUEN INSTRUMENTOS HACIA UNA GESTION INTEGRAL EN EL SECTOR PRIORITARIO DE LA INFRAESTRUCTURA

La "industria de la construcción" es considerada como una de las que genera mayor impacto al ambiente, especialmente en cuanto a consumo de recursos y en relación con las emisiones de Carbono (CO2). Se estima que únicamente para construcción de "edificios", el consumo de los recursos abarca un rango del orden de un 20 hasta un 50% del consumo total mundial, dependiendo de si se trata de consumo de agua dulce, tala de árboles, uso de combustibles para aclimatación por ejemplo. En relación con las emisiones de CO2, al "sector transporte", directamente ligado también al uso de la "construcción de infraestructura vial" se le atribuye aproximadamente un 13% del total de Gases Efecto Invernadero. Por otra parte, se estima que al llegar el año 2030 cerca del 60% de la población mundial vivirá en zonas urbanas, las mega ciudades no son ya solamente tema de ciencia ficción. Para el 2015, según Naciones Unidas, se identifican 22 mega ciudades y se espera que 12 de éstas alberguen poblaciones de más de 15 millones de personas. No todos los retos asociados con esta vida urbana masificada, de la que los países en vías de desarrollo no se escapan, han logrado ser atendidos oportuna y acertadamente. Por otra parte, esta industria también es asociada con altos índices de corrupción en la gestión de obras de gran escala, con consecuencias directas en el desarrollo de las comunidades a nivel mundial por las implicaciones económicas y sociales que se suman a los aspectos ambientales mencionados. Los Estados, incluyendo en forma amplia Gobiernos Centrales y Locales así como también la Empresa privada (incluyendo el sector de construcción a lo largo de toda su cadena de valor), la Academia y otras Organizaciones de la sociedad, están llamados a proponer y gestionar alternativas innovadoras inspiradas en políticas integrales que apoyen el desarrollo sostenible.

Se entiende en el contexto de este documento el término "infraestructura" según lo manifiesta en su libro Hayes (2005), a saber grandes conjuntos de obras que van desde: carreteras, ferrocarriles, puentes y túneles, hasta aquellas hidráulicas y las correspondientes a los sectores de alimentos agricultura, petróleo y gas -plantas de energía, redes energéticas etc.; aviación, marítimas, comunicaciones, residuos y reciclaje. Muchas de estas infraestructuras son emprendidas y gestionadas por la empresa privada, otras por los gobiernos y algunas mediante mecanismos de Participación Público Privada (PPP). Hay un movimiento desde el concepto de obra pública hacia el de infraestructura permitiendo este último concepto que se integren elementos intangibles como servicios y el contenido finalista o teleológico de dar sustento a toda una organización, con lo que se conserva, pero ampliado, el viejo concepto de "obra pública".

El Proceso de Marruecos, resultado de Rio +10, orienta a considerar que el gobierno de un país generalmente es un comprador mayor y que por tanto, tiene gran capacidad para estimular por medio de las compras públicas sustentables (CPS) un cambio con efecto cascada hacia la producción y consumo de bienes y productos sustentables. Las compras de los Estados pueden considerarse, en forma general, del orden del 20% del PIB y también en forma general, uno de los rubros más importantes en cuanto a inversión monetaria de las adquisiciones de la Administración de Gobiernos Centrales y Locales, corresponde a "infraestructura" en el sentido amplio arriba descrito, especialmente para países en vías de desarrollo. Al respecto, la metodología desarrollada por y en proceso de evaluación de parte del Grupo de Trabajo de Marrakech GTM a través de Proyectos Piloto en varios países a nivel mundial provee insumos para orientar sobre la relevancia de la infraestructura en las compras públicas de los gobiernos.

Adicionalmente, el otro Grupo de Trabajo del Proceso de Marruecos, específicamente el de Construcción Sostenible ofrece también oportunidad para impulsar los instrumentos en los ejes estratégicos que a continuación se proponen para un desarrollo más sostenible de nuestras sociedades.

Se propone que los Estados apliquen instrumentos hacia una gestión integral, más transparente, con enfoque de Ciclo de vida y de Prevención de la Corrupción en áreas prioritarias de la inversión en infraestructura. En este sentido, se considera la necesidad de incorporar instrumentos normados en relación con aspectos:

- Técnicos: Distintos instrumentos propios del diseño (técnicas empleadas en las ingenierías y la arquitectura), junto con los de sostenibilidad llevarán a un enfoque integrado. El apoyo de laboratorios con pruebas acreditadas de conformidad con normas internacionales homologadas localmente es indispensable para el sustento técnico. La ingeniería y la arquitectura, deben hacer uso de su instrumental técnico, en evolución, para pasar de pensamiento a cosa construida esta vez para satisfacer además, los

nuevos retos de las compras públicas sostenibles CPS. La capacidad de diseño y procesos constructivos innovadores requerirán creatividad renovada.

- Económicos: El marco de referencia son las CPS por lo que los aspectos económicos de la construcción sostenible (CS) desbordan los conceptos tradicionales, incorporando nuevos aspectos con impacto en la forma en que se estiman, contabilizan y evalúan los ingresos así como los costos y gastos. Las preferencias temporales son modificadas con nuevos criterios, que afectan decisiones acerca de las compras públicas.
- Jurídicos: Para poner en operación los principios de las CPS, son necesarios cambios normativos tanto en el ámbito legal como reglamentario. Igualmente, los agentes, tanto jurisdiccionales como administrativos tendrán que modificar, en consecuencia, las conductas típicas, los contenidos y las motivaciones de sus actos.
- Éticos: Las intersecciones entre lo público y lo privado plantean aspectos éticos de gran importancia. El advenimiento de las CPS, hace necesario replantearse viejos problemas aún no resueltos y otros nuevos. La respuesta a la corrupción de funcionarios públicos, a la negligencia en el cumplimiento de deberes, a la desviación y el abuso de poder debe venir signada con nueva fuerza ahora también por la inserción de las CPS. En este sentido varias entidades a nivel internacional, regional y nacional han realizado esfuerzos que pueden ser recogidos para un avance más armonizado y de mayor impacto..
- Académicos y Educativos: La formación de profesionales es un proceso dinámico que demanda continuamente remozamiento, ahora además, con modificaciones más profundas, de índole estructural hacia lo integral y trans-disciplinario. Cada vez es más necesario contar con profesionales que sean líderes y con líderes que entiendan el camino del desarrollo sostenible.

El papel de los profesionales de la ingeniería y la arquitectura se destaca con relevancia por cuanto la labor que realizan es esencialmente un servicio intermedio que aporta valor agregado a la sociedad y que nunca puede estar separado del resto de la vida social. La ingeniería civil tiene que ver con la calidad de vida de los usuarios o beneficiarios de las obras que produce, desde la más pequeña a la más grande y está inserta en la vida civil que ha venido incorporando los criterios de sostenibilidad.

Agradecemos la consideración a esta propuesta y quedamos atentos para ampliar o aclarar sobre el contenido de la nota, no sin omitir que ALCALA junto con ECO GLOBAL ha venido tratando el tema de infraestructura, construcción sostenible, compras públicas sustentables con enfoque integral, incluyendo ciclo de vida y prevención de la corrupción, con la participación, aportes y colaboración de individuos y organizaciones que comparten nuestra visión, a nivel nacional e internacional.

Por ALCALA y ECO GLOBAL

## Alianza Nicaragüense ante el Cambio Climático (ANACC)

Valoraciones y aportes de la Alianza Nicaragüense ante el Cambio Climático (ANACC) a la propuesta del Informe de Nicaragua 0 Previo a la Conferencia de Naciones Unidas sobre Desarrollo Sostenible, Rio +20,

Del 04 al 06 de junio de 2012, Río Janeiro, Brasil.

La Alianza Nicaragüense ante el Cambio Climático (ANACC), es un espacio de diálogo intersectorial permanente entre organizaciones de la sociedad civil. Trabaja en la búsqueda de alternativas concertadas que mejoren la capacidad del país para enfrentar el cambio climático. Así mismo dedica esfuerzos para incidir constructivamente en la elaboración de políticas públicas, estrategias y planes nacionales de desarrollo.

La ANACC es un espacio abierto, auto convocado, con fines propositivos y constructivos para discutir, analizar, incidir y construir colectivamente propuestas de los diferentes actores de sociedad civil. Se propone incidir en las políticas públicas que coadyuven a la reducción de los efectos adversos del cambio climático. Trabaja a favor del reconocimiento oficial de Centroamérica como región altamente vulnerable.

En el marco de este esfuerzo la ANACC ha organizado una sesión para el intercambio de ideas sobre el proceso previo a la Conferencia de Naciones Unidas sobre Desarrollo Sostenible y los compromisos de país derivados del mismo. En este contexto se ha preparado un conjunto de ideas con relación al compromiso del Informe 0 de Nicaragua. Las valoraciones y aportes son los siguientes:

### CO-CHAIRS' GUIDANCE NOTE INPUTS FOR COMPILATION DOCUMENT

### CO-PRESIDENTES NOTA DE ORIENTACIÓN ENTRADAS PARA LA ELABORACIÓN DEL DOCUMENTO

3. General Content: Contributions should endeavour to address the following questions:

3. Contenido General: Las contribuciones deben tratar de responder las siguientes preguntas:

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

a. ¿Cuáles son las expectativas para el resultado de Rio +20, y cuáles son las propuestas concretas en este sentido, incluyendo puntos de vista sobre una posible estructura del documento final?

1. El informe final debe reconocer que el modelo económico sigue en crisis, los sectores mas empobrecido siguen pagando en gran medida los costos y en consecuencia el sector social sigue en franco deterioro y la crisis medioambiental se profundiza y particularmente las condiciones climáticas.

2. Incremento de los compromisos de los diferentes actores sociales.

3. Establecer metas claras para el desarrollo sostenible y diseñar e implementar un mecanismo de monitoreo, seguimiento y evaluación periódica de los compromisos asumidos.

4. Este debe reflejar las lecciones aprendidas y no aprendidas, con relación a lograr el desarrollo sostenible.

5. En la Cumbre debe revisarse, valorar y retomar compromisos adquiridos, tales como los establecidos en la Convención sobre la Diversidad Biológica y Convenio sobre la Lucha contra la Desertificación y la Sequía.
  6. En materia de la Convención Marco de Naciones Unidas sobre Cambio Climático, debe pronunciarse a favor de un segundo periodo de compromisos del Protocolo de Kyoto, debe fijar las fuentes de financiamiento seguras y sostenibles para hacer frente a los efectos adversos del cambio climático, deben haber metas cuantificables y en la fuente sobre la emisión de gases de efecto invernadero y para los países menos desarrollados deben haber fondos para los Planes de Acción Nacionales de Adaptación (PANA).
  7. Debe lograrse mayor nivel de convergencia y asignación de recursos presupuestarios destinados a los pilares social, ambiental y económico; medidas y acciones concretas en esos tres pilares. El pilar ambiental debe buscar convergencia de las tres convenciones.
  8. Establecimiento de compromisos legalmente vinculantes a corto plazo, que impacten positivamente en el desarrollo sostenible de los pueblos.
  9. Debe trabajarse una reclasificación de los países mas vulnerables ante los efectos adversos del cambio climático.
- b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?
- b. ¿Cuáles son las observaciones, si las hubiere, acerca de las propuestas existentes: por ejemplo, una economía verde hoja de ruta, marco de acción, objetivos de desarrollo sostenible, la revitalización asociación mundial para el desarrollo sostenible, o para otros?
1. Se esta sustituyendo el pilar económico de la conceptualización de desarrollo sostenible por economía verde (agrocombustibles, OGM, patentes, uso de biomasa), favoreciendo a ciertos sectores de actividad económica que no necesariamente se enfocan en el mejoramiento de la calidad de vida de las poblaciones de los países menos desarrollados y en desarrollo.
  2. La economía verde debe flexibilizar los mecanismos de mercados, para los países menos desarrollados y en desarrollo, por ejemplo en materia de derecho de propiedad intelectual, privilegiar la soberanía y seguridad alimentaria y nutricional y la preservación de la diversidad biológica.
  3. Tal como esta planteado el concepto de economía verde, no propicia un cambio significativo en el actual modelo, que beneficie a los países menos desarrollados y en desarrollo.
  4. El modelo actual no ha sido capaz de conjugar adecuadamente los pilares (económico, social y ambiental) para lograr el desarrollo sostenible, en detrimento de la calidad de vida de las poblaciones de los países menos desarrollados y en desarrollo.
  5. La economía verde debe favorecer los intereses de los países menos desarrollados y en desarrollo, dada la urgencia que impone la crisis, debe establecerse un mapa de ruta al mas breve plazo posible.
- c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);
- c. ¿Cuáles son los puntos de vista sobre la aplicación y sobre la manera de cerrar la brecha de implementación, que los actores relevantes se han previsto como involucrados
- (Gobiernos, las específicas de los Grupos Principales, el sistema de las Naciones Unidas, las instituciones financieras internacionales, etc);
1. Los países desarrollados deben asumir su responsabilidad histórica, compensando los perjuicios causados y actuando en lo sucesivo de manera consecuente con la actual crisis económica, social y ambiental; frenando el deterioro causado por la extracción de recursos naturales y contribuyendo a evitar la profundización de la crisis ambiental global y la disminución de las desigualdades sociales.
  2. Las poblaciones locales de los países menos desarrollados, y en desarrollo, deben avanzar y fortalecer los mecanismos de fiscalización y de auditorías sociales, que vigilen el cumplimiento de los compromisos internacionales y nacionales concebidos para la construcción del desarrollo sostenible.
  3. Se debe trabajar en una nueva arquitectura financiera que establezca mecanismos que garanticen una forma equitativa en la distribución de los recursos financieros, dirigida a los países y sectores con menor nivel de desarrollo relativo.
- d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?
- d. ¿Qué mecanismos específicos de cooperación, acuerdos de asociación o de otro tipo instrumentos de ejecución se prevé y lo que es el marco de tiempo relevante para el las decisiones que se propone alcanzar y las acciones que deben realizarse?
1. Deben cumplirse los acuerdos de la cooperación para el desarrollo (Consenso de Monterrey), que establece que la Ayuda Oficial al Desarrollo debe ser del 0.7% del PIB de los países desarrollados.
  2. Deben destinarse fondos adicionales (suficientes, predecibles) para enfrentar la crisis climática global.
  3. Debe realizarse una revisión, valoración y ajuste de los acuerdos comerciales, de tal manera que se identifiquen los puntos que perjudican a los países menos desarrollados y en desarrollo, a fin de disminuir esas inequidades.
  4. No aceptamos que se busquen salidas a las crisis desde la lógica militar.

Alianza Nicaragüense ante el Cambio Climático (ANACC).

01 noviembre 2011.

## Allgemeiner Deutscher Automobil-Club (ADAC)

Safer Roads at Rio +20

## A Submission to the UN Conference on Sustainable Development by ADAC

Road safety is a key driver for sustainability. To date an estimated 1.3 million people per year are killed due to road traffic accidents. 20 to 50 million more are injured. For these reasons the United Nations have launched the 'Decade of Action for Road Safety 2011-2020', describing road injury as "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals". It is of high relevance not only for road safety associations but for the broad public to position "road safety" on the agenda of international meetings such as Rio +20. Issues that are absent from these agendas are subsequently neglected and under-funded. This is why it is essential that actions to improve road safety and promote sustainable modes of transport are included in the agenda and outcomes of the Rio +20 Conference.

1. ADAC (Allgemeiner Deutscher Automobil-Club e.V.) is Europe's largest automobile club, with more than 17 million members to date. The club represents the interests of its members regarding transport and mobility aspects in the political arena – on national and international level. Furthermore ADAC operates a large fleet of mobile mechanics that assist motorists in trouble (Yellow Angels) and provides 44 helicopters for urgent medical rescue services in Germany. ADAC publishes a members' magazine with the largest distribution in Germany, the "ADAC Motorwelt".

2. ADAC fully supports Rio +20 as an essential opportunity to define the major sustainability challenges facing the world and to contribute to the design of a post-Millennium Development Goals framework that will meet the needs of developing nations in the next decades. The club strongly believes that global road traffic death and injury as well as the wider but related issues of safe and sustainable transportation policy, must be recognised as challenges for sustainability at the Rio +20 conference.

3. For some, road safety is perhaps not the first issue that crosses the mind thinking about sustainable development. Yet, it is a key factor and the growing number of death and disability on the world's roads is a consequence of the continuous disregard of this issue, e.g. at the 2002 World Summit on Sustainable Development in Johannesburg. Pursuant to the Global Status Report on Road Safety (WHO, 2009), road crashes kill an estimated 1,300,000 people each year and injure between 20 to 50 million more. Actually, this means, that road crashes kill more people than malaria. More than ninety per cent of these casualties occur in middle- and low-income countries where road safety awareness and the capacity to tackle the problem is low, and where both - traffic levels and road casualties - are rising. Road deaths and injuries place immense burdens on hospitals and health systems. These tragic deaths and the misery and grief they cause are not inevitable. They can be prevented, if measures are taken by governments, police and all road users to improve safety.

4. The UN Decade of Action for Road Safety 2011-2020 is based on the General Assembly Resolution A/RES/64/255. It aims at reducing global road traffic injuries. According to expert groups, achieving this ambitious goal can save up to 5 million lives over the course of the decade. 50 million serious injuries could be prevented within the same timeframe ('Make Roads Safe: A Decade of Action for Road Safety', Commission for Global Road Safety, 2009). This would mean a fundamental reduction of economic cost to developing countries.

5. In its resolution proclaiming the Decade of Action for Road Safety, the United Nations General Assembly defines road traffic injuries as: A "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals". According to leading development experts and international agencies, the impacts of failure to address road safety can go beyond the immediate toll of death and disability, undermine policies on poverty alleviation, child survival and development as well as endanger defined goals regarding climate change.

6. Until road safety will be integrated into the mainstream of sustainability policy, millions of people will be condemned to unnecessary and preventable deaths, or lives blighted by severe disability. This is why it is so important that action to improve road safety and the promotion of sustainable modes of transport are included in the agenda and outcomes of the Rio +20 conference.

7. Therefore, ADAC encourages the secretariat to include a reference to safe and sustainable road mobility in the 'Outcomes Document' of the conference. This would mean a huge step to make our roads safer – worldwide.

---

## Alliance for Future Generations

The Alliance for Future Generations

Rio+20 working group  
Rio+20: Open Challenge Paper

The Alliance for Future Generations

The Alliance for Future Generations is a group of individuals and organisations who have agreed to work to ensure that long-termism and the needs of future generations are brought into the heart of UK democracy and policy processes, in order to safeguard the earth and secure intergenerational justice.

This Open Challenge Paper has been developed by members of the Alliance's Rio +20 working group for further discussion within the Alliance and as a basis for the possible development of an overall Alliance position on the process leading to the 2012 UN Conference on Sustainable Development (UNCSD; also referred to as „Rio + 20“) in Rio de Janeiro. Signatories are also pleased to submit this paper to the official preparatory process for the UNCSD.

### Overview

Sustainable development, as defined by the Brundtland Commission (1987) is "development that meets the needs of the present without compromising the ability of future generations to meet their own needs."<sup>1</sup> This Open Challenge Paper suggests that the needs of future generations have been, in recent years, greatly overlooked. These needs must be brought into the heart of the UNCSD, also known as Rio+20, in order to safeguard the earth and secure intergenerational justice. We propose the establishment of a UN High Commissioner for Future Generations as a mechanism to safeguard long-termism and the needs of future generations at the global level. We also support the urgent appointment of an Assistant Secretary General (ASG) on Youth and Future Generations within the UN as an interim measure until the position of the UN High Commissioner for Future Generations and an associated Commission for Future Generations are established, building on the work of the ASG. At the regional, national and subnational levels, we consider that sustainable development itself demands that every individual nation as well as regional groupings (e.g. the European Union) commit themselves to setting up strategies, mechanisms and institutions to promote long-termism and give due consideration to the needs of future generations.

## Context

Since the 1992 Conference on Environment and Development in Rio, the concept of sustainable development has been incorporated into many UN instruments and its implementation has been taken up by the international community. However, current assessments signal the increasing vulnerability and precariousness of the Earth's ecosystems now and into the future and consequently the lives of both people alive today and those who have yet to be born. We have already breached the safe operating space (or boundaries) for three of nine key planetary systems (climate change, biodiversity loss and excess nitrogen and phosphorus production).<sup>2</sup> Operating within planetary boundaries is a necessary precondition for sustainability.

Our actions as human beings impact not just other people and our local environment, but the planet and the conditions of life for centuries to come. We have raised global temperatures, destroyed habitats and made countless species extinct. Our consumption patterns underscore a view of ecosystems and the planet's natural environment as little more than unlimited and disposable resources. Worse, predicted accelerated consumption will lead inexorably to a series of „resource peaks" as we use "natural capitals" beyond sustainable levels and further degradation of the ecosystems on which all life depends. It is commonly agreed that the impacts humans have on the planet are not only growing in magnitude, but they are also growing in consequence. For all their positive achievements, human beings may now have become a negative force on a par with Earth-rending volcanic eruptions.

Spikes in food and energy prices, together with accelerating anthropogenic climate change and rapid global population growth are among the evolving risks that threaten to bring sustainable development to a crisis point. Our current activities: that is our consumption of fossil fuels and water, our uses of chemicals, and the uses to which we put land, are reducing the planet's ability to sustain life. We stand to leave future generations with an impoverished common inheritance. Humanity faces a situation of gross intergenerational injustice. Future generations will question hardships they face and the sacrifices they are forced to make due to their ancestors' careless, short-termist lifestyles. Likewise, the world's poor people will also question their privations when they observe a widening disparity between their lifestyles and the lifestyles of the rich; generation upon generation. Inequality, over-consumption, loneliness, isolation and greed threaten our current collective well-being and threaten greater intergenerational injustice in the future.

## Our Challenge to Rio+20

Our challenge to participants in the Rio+20 process is to view the 2012 Conference as a milestone in a global effort to deliver higher regard for the longer-term and the needs of future generations through the way in which they conduct the business of politics and the governance of our nations.

There are already some examples of good practice in national governance approaches. Since 2008, the Parliamentary Commissioner for Future Generations has been one of four ombudsmen elected by the unicameral Hungarian Parliament. Around the world, nineteen constitutions refer explicitly to future generations, including those of South Africa, Argentina, Germany, Bolivia and Iran.<sup>3</sup> The constitution of the Confederation of the Six Nations of the Iroquois requires leaders to make decisions with the „Seventh Generation to come" in mind.

These examples of institutional and constitutional trailblazing offer inspiration; building on this there is much more to be done from the local to the global level. A commitment to bring long-termism and future generations into policy processes needs institutional, political and cultural foundations. Any innovation at the national and subnational levels needs support from global institutions and internationally agreed commitments. Rio+20 is the time to demonstrate and craft that support. People and their representatives must drive the process of transformation that is now so urgently needed to set the world on course for sustainable development. Renewed commitments to public participation and to public right of access to information must therefore be a prominent part of the Rio+20 process and outcomes.

We need international laws, policies and agreements to support long-termism and the needs of future generations. We need highest-level representatives to make decisions with a focus on the long-term, the interests of our children, and the needs of generations yet to be born – wherever in the world they might be.

In so much as we take inspiration from the achievements of past generations and the key decisions that shape our lives, our aspiration is to create the conditions in which future generations may come to see Rio+20 as a significant turning point towards sustainable development.

## Rio+20 - A turning point

Three objectives and two themes have been agreed for the UN Conference on Sustainable Development. We comment on each in turn below.

### 1. Objectives

1.1. Securing Renewed Commitment to Sustainable Development - Putting long-termism and future generations at the heart of Rio+20 is a key element in securing renewed political commitment for sustainable development as defined by the report of the World Commission on Environment and Development (the Brundtland report).

- The nature and content of the renewed political commitment to sustainable development must be clear and unequivocal. It must incorporate a clear recognition that intergenerational justice is an essential component of sustainable development. And it must recognise the biophysical reality of the imperative to remain within overall planetary boundaries. Environment, economy and society must be recognised as the pillars of sustainable development, but against a non-negotiable backdrop of the limits of our planet.

1.2. Assessing Progress and Exploring Gaps - Taking a long-term view can support the framing of our assessment of the progress to date and the gaps in the implementation of the outcomes of the major summits on sustainable development so far. Many visions for the Earth already exist. A commitment to taking a longer view can underpin efforts to develop a successor framework to the Millennium Development Goals (MDGs); to bring the needs of future generations into the Universal Declaration of Human Rights, and thereby to act on an understanding of longer-term trends, instead of simply taking snapshots of the current situation. We concur with the many critics, including the Sarkozy Commission on the Measurement of Economic Performance and Social Progress,<sup>5</sup> which pointed out that GDP is an inadequate metric through which to gauge well-being over time. There is an important distinction between assessing current well-being and assessing sustainability. Well-being measures generally portray a snapshot in time, while sustainability shows the trend over time.

- Preparations for Rio+20 must assess progress on sustainable development to date in terms of a broad set of indicators of well-being and underlying trends over time. Goals and indicators must be developed that give a richer picture of both the current situation and what the future might hold. Only then can appropriate decisions be made on what needs to be done to improve the lives of people in the future as well as the lives of people now.

1.3. Address New and Emerging Challenges – Intergenerational justice is very much about building foresight through futures-awareness analysis.<sup>6</sup> An appropriate focus on the needs of future generations would give us a lens through which we can identify and address new and emerging challenges to sustainability. The risks of past failure to take account of the needs of future generations are arguably illustrated by recent events in the Middle East and North Africa (MENA) region, urban unrest in England and rising uneasiness about youth unemployment across the globe.

- Rio+20 should provide political recognition that short-termism and lack of regard for the needs of future generations in political processes and decision-making are

themselves emerging challenges that need to be addressed at political, institutional and cultural levels. In addition, both short-termism and lack of regard for the needs of future generations undermine efforts to effectively address other new and emerging challenges, such as those highlighted by Rio+20 Secretary General Mr Sha Zukang which include sound water management, improved resilience and disaster preparedness and food security.

## 2. Themes

### 2.1. Green Economy and Poverty Eradication

Decisions regarding our global economic system should not prioritise current well-being over future well-being. The imperative of eradicating poverty world-wide as soon as possible should not be achieved at the expense of future generations who – left with an impoverished common inheritance – may simply fall back into a poverty trap not of their own making. Furthermore, it is possible to have a "green", low-carbon economy that allows a minority of the population to live highly affluent but eco-resilient lives, whilst forcing the majority of the population to live on the margins. Such a model would not capture an essential element of sustainability; that of fairness, now and into the future.

Rio+20 must provide a milestone in the development of an ecologically-friendly economy that respects planetary boundaries and actively helps to secure both intergenerational and intragenerational justice.

In support of such a transformed economy, the legal and constitutional frameworks within which businesses operate must not incentivise a focus on short-term financial returns. Instead, they should actively support the adoption of long-term perspectives on business contributions to sustainable development; on long-term benefits of action to achieve sustainability, not only short-term costs.

Assumptions about the future in policy tools applied by governments and others to support economic decision-making should be transparent and publicly accessible. Economic policy tools should never discount future costs and values in such a way as to undermine the potential for future generations to meet their needs.

- Rio+20 must recast the 'Green Economy' as the 'Green and Fair Economy'. For these purposes, fairness must be considered both spatially and temporally.
- Rio+20 is an opportunity to formally recognise key environmental limits - such as planetary boundaries - within which we must remain, and the thresholds that we must respect in order to maintain the sustainability of our planet. The signing at Rio + 20 of a 'Declaration on Planetary Boundaries' outlining key principles would show political commitment by attendees to this concept.
- International financial and economic institutions must be equipped to take a long-term perspective and play their part in meeting the needs of future generations in ways that maximise their contribution to overall indicators of well-being and sustainability over time.
- Governments and businesses participating in Rio+20 must commit to work to remove legal and other obstacles that prevent business managers and workers from acting on long-term perspectives or hamper efforts to develop and implement sustainable development policies.
- Governments must commit at Rio+20 to a) transparency about assumptions on future prices and rates of return that are applied in economic evaluations and other economic policy tools, and b) not discounting the future in ways that undermine the potential for future generations to meet their needs in line with sustainability principles.

### 2.2. The Institutional Framework for Sustainable Development

Frameworks for the delivery of sustainable development from the international through to the national and down to the local level call for strategies, governance, performance management frameworks and appropriate monitoring and reporting. More qualitatively, but equally important, strong leadership and meaningful accountability from top to bottom are also essential. Due regard for the needs and well-being of future generations needs to be hard-wired into this architecture to ensure that long-termism becomes a matter of course and that appropriate checks and balances are in place.

Regional, national and subnational governments and institutions should use Rio+20 as an opportunity to share ideas on how best to incorporate long-termism and the needs of future generations into regional and domestic policy decisions, including the policy tools and institutional settings that could help to achieve this in ways that respect principles of sustainable development. Examples could include exploring the idea of guardians for future generations; applying sustainable development-oriented foresight or futures methodologies to public policy decisions; and development of futures impact assessment tools that adopt longer time-horizons than those associated with existing impact assessment approaches. The adoption of Sustainable Development Goals at the global level would also provide an underpinning for long-term decision-making and regard for future generations.

- Rio+20 should mark the beginning of discussions to develop a successor to the Millennium Development Goals (MDGs); a broader framework of Sustainable Development Goals (SDGs). These SDGs should reflect emerging evidence of planetary boundaries and other key long-term trends and projections.
- As part of the Declaration on Planetary Boundaries, a Planetary Boundaries Institution should be given the job of promoting and developing the principles of the Declaration.
- The political outcomes of Rio+20 need to incorporate a commitment on the part of UN members to develop mechanisms to incorporate long-term thinking and regard for the needs of future generations into decision-making processes. This will not necessarily be achieved through current proposals for strengthening of UNEP, or even the creation of a World Environment Organisation, and must be considered separately.
- UN members should commit at Rio+20 to improve governance in order to ensure long-termism and regard for the needs of future generations. For example, a UN High Commissioner for Future Generations would provide a mechanism to safeguard long-termism and the needs of future generations at global level. However given the urgency of related issues, an Assistant Secretary General (ASG) on Youth and Future Generations should immediately be appointed. This ASG should lead a review of the achievements and shortcomings of UN programmes designed to support youth and future generations, and champion recommendations on how to more effectively address the challenges hindering the development and participation of youth. The creation of such roles would be an enabling and positive step towards providing assurance that long-term care for the earth and its people is at the core of global governance. The UN High Commissioner for Future Generations and an associated Commission on Future Generations would build on this work of the ASG for Youth and Future Generations.

This Open Challenge Paper has been endorsed as a basis for further discussion by the following individuals and organizations. Save where indicated, all are members of the Alliance for Future Generations.

1st November 2011

## ALSTOM SUBMISSION TO THE UN ZERO-DRAFT FOR THE RIO+20 SUMMIT

## USING INTERNATIONAL CLIMATE CHANGE FUNDS TO LEVERAGE PRIVATE

## INVESTMENT IN CLEAN TECHNOLOGY

## Key messages box:

- IEA estimates that over \$300 trillion of investment in clean technologies will be needed by 2050
- COP16 in Cancun agreed to establish a Transitional Committee to set up a Green Climate Fund to raise \$100bn per year by 2020 for mitigation and adaptation projects in non-Annex 1 countries
- • The private sector will be critical to achieving these levels of investment but leveraging private finance will require:
  - o The right policy frameworks, including markets that enable development of competitive tariffs;
  - o Carbon pricing;
  - o Capacity building in developing countries; and
  - o Use of a combination of Public Private Partnerships (PPPs), capital markets and infrastructure funds

Alstom invests in many different kinds of projects around the world. We have invested significant sums in building manufacturing facilities, export hubs and R&D centres in key locations. This investment in our own facilities typically offers benefits (direct and indirect) to the host community such as jobs, development of local industrial capacity and technology transfer. We are also involved in arranging project finance for some of the major infrastructure (e.g. power plants, grid systems, rail) projects that we deliver to our customers. This note focuses mainly on leverage of project finance, though some of the issues it raises (especially capacity building) will also be applicable to investment in corporate facilities.

## ‘Crowding-in’ private finance at scale

Investment will be attracted to projects with the best balance of risk and reward, so governments need to focus on both in order to scale up finance with the speed and volume required.

## Risk

Investors will assess projects on the basis of whether the level of risk offered is commensurate with the reward. But they find political and capacity risk difficult to manage because it is hard to forecast and price. These risks may include: policy or regulatory change, inconsistency of regulation or enforcement, nationalization, confiscation or expropriation of assets. These risks are especially problematic because of the mismatch between the long-term nature of investment (typically over decades) and the shorter-term lifetime of policy and regulation. Before investing, the private sector will look to the public sector to offset the worst downside risks.

Governments can reduce **political risk** to low carbon projects by:

- Committing to long-term, predictable policy frameworks – e.g. market mechanisms to price carbon; Feed-in Tariffs or Power Purchase Agreements; tax incentives to encourage entrepreneurialism and investment (including FDI)
- Planning and implementing major public infrastructure projects as transparently as possible – e.g. competitive tendering, payment by results
- Setting regulation and standards to support competition and commercial activity – e.g. setting performance standards, supporting transparent reporting and liability regimes, fair public procurement and protection for intellectual property rights.

Multilateral Development Banks, Export Credit Agencies and other International Financial Institutions can help address the **capacity risks** of operating in developing countries by:

- Assisting governments in planning for major infrastructure and helping them assess the potential of newer or transformational technologies
- Support policy development
- Supporting industrial capacity building by funding projects with potential to enhance local construction, manufacturing, supply chains, especially those that may also have R&D elements
- Support capacity building in local and regional financial services in developing countries to enhance finance flows, improve the availability of local finance (reducing currency risk) and supporting local industrial development (e.g. improving access to finance for supply chain partners)

## Reward

Incentivising private investment can be based on either lowering the costs of the project or enhancing its profitability.

## Lowering the cost of capital

Cost is directly linked to risk, so measures listed above that reduce risk will also help to lower cost, and especially those that target the cost of debt, through delayed payment of principals or lower interest rates. Now is an exceptionally difficult time to be raising finance, in the wake of the financial and sovereign debt crises in developed countries and the rising cost of commodities fuelling inflation in emerging economies. For sheer scale and for its long term maturities, the international bond market offers a potential source of funding but market participants will be highly sensitive to commercial returns and unwilling to finance loss-making or non viable projects unless there is a tariff or subsidy mechanism to compensate them. Institutional investors, another potential source of long-term investment, will primarily be seeking operational assets that generate reliable cash flow over their lifetime.

For these reasons, additional support may be necessary to lower the cost of financing projects by lowering the risk profile, such as:

- Subordinated debt – by which a public funder would offer finance but with a lower priority than other creditors for repayment

- Guarantees from IFIs for project bonds (another form of subordinated debt) along the lines of the EU's proposal for a Europe 2020 Project Bond Initiative
- Concessional long-term debt financing that deferred interest payments for the first few years to support highly capital-intensive projects
- Government loan guarantees to provide confidence to private sector investors
- Export credit guarantees, as already offered by many national governments to support exports, their use could be expanded regionally, e.g. offered on a European basis by the EIB.

#### Supporting profitability

Many low carbon projects involve high up-front capital costs. Investors in major infrastructure projects are highly sensitive to CAPEX and will require the assurance of a viable retail market for their investment. Financial backers similarly will require assurances that projects will move into a required level of profit within a specific timeframe to generate enough cash flow to pay debt and equity investors. This may also require some targeted OPEX support to improve the Net Present Value of newer technologies. Policies that can help enhance the profitability of low carbon projects include:

- Pricing carbon, to create a long term incentive for low carbon investment and generate value from the sale of credits and offsets or from their use as collateral to raise finance
- Building power markets across regions based on transparent, harmonized regulation and standards, to develop a broad consumer retail market
- Advance market commitments to guarantee a viable market for products requiring high capital investment
- Feed-in tariffs (where grid-connected power is supplied through a market) to accelerate investment in low carbon technologies and offer preferential access to the grid.

#### Public-private risk sharing

Public-Private Partnerships (PPPs) will be essential to attracting private investment in major public infrastructure projects. The PPP structure offers:

- flexibility of securing diverse sources of up-front finance and funding
- risk mitigation (by sharing it between public and private partners) where levels of risk may erode the Net Present Value of low carbon projects.

Specifically, PPP can help where projects are hard to finance on purely commercial terms, such as where:

- o technology is deployed for the first time in a country (even if successfully demonstrated elsewhere)
- o a government faces the challenge of simultaneously developing infrastructure, policy frameworks and supply chains.
- o pilot or demonstration projects for newer technologies could support capacity building

Where PPP is used, it will be important for governments to be active participants, cofunding projects and ensuring that they are aligned with national development priorities and implementation plans. Early dialogue between governments and potential private sector partners is essential to ensure alignment and adequacy of funding levels. This underlines the importance of engaging business in the process of Technology Needs Assessments, Nationally Appropriate Mitigation Activities and other strategic planning of national infrastructure.

#### Basic model of a PPP

## Alternatives Locales de Développement (CAALD)

Titre du texte : Observatoires communautaires de changement Climatique

NZOA Gervais,

Centre d'Accompagnement des Alternatives Locales de Développement (CAALD), basé à Messamena, Est Cameroun

BP 2441 Yaoundé, Cameroun

Tel : (237) 99 88 58 06

Email : nzoager@yahoo.fr

### 1- Introduction

Les changements climatiques constituent l'un des défis majeurs du vingt-et-unième siècle, tant pour les pays développés que pour ceux en développement. Bien que les pays en développement portent rarement la responsabilité des phénomènes à l'origine des changements climatiques, ils sont appelés à en souffrir davantage en raison de leur vulnérabilité aux événements climatiques extrêmes.

Les communautés locales qui travaillent dans les secteurs les plus dépendants du temps, comme l'agriculture sont les plus touchées aux conséquences de la dégradation de l'environnement, notamment la consommation d'eau, la déforestation, la pollution, la désertification et la biodiversité. Pourtant, à long terme, personne (femmes ou hommes, riches ou pauvres) n'est à l'abri des défis et dangers qu'engendrent les changements climatiques. Les conséquences des changements climatiques varient selon les régions, les générations, l'âge, les classes, les tranches de revenus, les professions et le sexe.

Manquer de répondre aux défis posés par les changements climatiques pourrait avoir de graves conséquences sur le niveau de vie des communautés locales. Les changements climatiques mettent en danger les efforts déployés pour atteindre les Objectifs du millénaire pour le développement convenus au niveau international. Les crises économique et financière mondiales que nous traversons aujourd'hui représentent également des risques, notamment de voir les engagements antérieurs de limiter les émissions de gaz à effet de serre ou de démanteler les usines polluantes.

A Messamena, il manque une expertise locale autochtone qualifiée ; des observatoires communautaires en matière de changement climatique. Dans la zone, le changement climatique influence sur de nombreuses ressources, notamment l'agriculture, la pénurie d'eau, la forêt, la faune, les infrastructures de base et de communication, la

recrudescence des maladies ( paludisme, VIH/Sida, ...).

Toute réponse aux changements climatiques devrait être intégrée aux stratégies nationales , sectorielles et locales de développement . Une adaptation planifiée aux changements climatiques améliore la résilience des communautés et des citoyens qui sont dépendants des ressources naturelles pour leurs besoins quotidiens ainsi que leur savoir – faire spécifique en vue de renforcer les moyens d'existence et de sécurité.

Parmi les mesures pour promouvoir l'adaptation aux changements climatiques et leur atténuation, le CAALD envisage de :

 Puiser dans les vastes connaissances et capacités de gestion des ressources naturelles des communautés locales lors de l'élaboration de politiques et d'initiatives d'adaptation et d'atténuation du changement climatique ;

 Intégrer les perspectives spécifiques aux communautés dans les politiques internationales, nationales et locales ;

 Veiller à faire participer les communautés locales aux processus de prise de décision et d'élaboration des politiques ;

 Promouvoir les approches participatives dans les activités de planification locales et communautaires ;

 Créer des opportunités aux niveaux national et local pour éduquer et former les communautés dans le domaine des changements climatiques, stimuler le renforcement de capacités et le transfert de technologie et engager des ressources spécifiques afin de garantir la participation des communautés locales sur un pied d'égalité aux bénéfices et opportunités offertes par les mesures d'atténuation et d'adaptation ;

 Collecter de nouvelles données différenciées pour les communautés locales et analyser ces chiffres dans les secteurs clés, comme l'agriculture, le tourisme, la foresterie, la pêche, l'énergie et la consommation d'eau, afin de mieux comprendre comment le changement climatique influence la vie des communautés locales de Messamena. La mise en oeuvre de cette action sera développée dans le cadre d'un programme de création d'observatoires communautaires et de renforcement des capacités des hommes et des femmes des communautés locales de Messamena en vue de faciliter leur capacité d'adaptation et de savoir –faire aux changements climatiques.

Cette action permettra aux communautés locales d'être des agents importants de changement et de contribuer à l'atténuation des effets des changements climatiques et aux programmes d'adaptation aux niveaux local, national, et international

## 2. Objectif de développement

Objectif global

Le projet vise à faciliter l'engagement civique des populations de la localité de Messamena dans la résolution des problèmes de lutte contre le changement climatique et de développement des capacités des communautés en météorologie.

Objectifs spécifiques :

 Renforcer les capacités de 60 jeunes des organisations locales en matière de changement climatique ;

 Créer quatre observatoires communautaires de lutte contre le changement climatique dans la localité de Messamena ;

 Equiper les quatre observatoires communautaires de matériels de fonctionnement (système d'information géographique, système de positionnement global, pluviomètre, thermomètre, anémomètre, girouette,...) ;

 Collecter des données concernant le climat, la biodiversité, la socio-économie de la zone ainsi que gérer la base de données des observatoires ;

 Créer la base de données du projet en étroite collaboration avec les partenaires ;

 Concevoir et mettre en oeuvre un système d'information géographique avec le matériel informatique, les logiciels et leur paramétrage ;

 Produire des cartes actualisées des données sur le climat, la biodiversité, la socioéconomie, les infrastructures de base et de communication, les ressources énergétiques, l'eau, le transport,....

 Former les utilisateurs du projet à l'usage de la base des données et renforcer les capacités au niveau local en gestion des bases de données et système d'information géographique ;

 Créer des supports de sensibilisation concernant le climat, la socio-économie, les infrastructures de base et de communication, les ressources énergétiques, l'eau,.... (publications, dépliants, brochures, matériels écrits, sites internet,...) ;

 Echanger des données avec des partenaires d'assistance technique au développement ;

 Fournir des données et cartes aux partenaires de développement ;

 Rédiger et faire valider un canevas standard pour la collecte des données géo référencées ;

 Elaborer une stratégie cohérente et harmonisée en matière de collecte des données dans les observatoires de changement climatique dans les villages ;

 Veiller à la supervision, au reporting et à la capitalisation des activités du projet ;

 Assurer la gestion administrative et financière des observatoires de lutte contre le changement climatique.

## 3. APPROCHE PARTICIPATIVE DE GESTION DU PROJET

### A – METHODOLOGIE

Le projet utilisera une méthode essentiellement participative et interactive comprenant :

-des réunions de sensibilisation et de mobilisation des partenaires autour des objectifs poursuivis par le projet ;

-des ateliers de réflexion sur les activités du projet ;

-des ateliers de planification des activités prioritaires du projet ;

- des séminaires de formation des organisations et communautés locales pour faciliter l'appropriation du projet par les bénéficiaires ;
- des plans de communication avec des partenaires d'assistance technique et financière au développement ;
- des discussions en plénière avec la participation de tous les acteurs et des travaux en groupes ;
- des recueils de données et recherches sur les informations nécessaires (climat, économie, biodiversité,...) ;
- des plans de communication des activités au partenaires

## B – ACTIVITES

Cette méthode participative et interactive sera soutenue par les activités suivantes :

- le développement des capacités des communautés et des utilisateurs locaux du projet à l'usage et gestion des outils de changement climatique ;
- la création des observatoires communautaires de changement climatique ;
- l'équipement et la dotation des observatoires en matériels de fonctionnement ;
- la mise en place d'une base de données de changement climatique ;
- la production des documents de sensibilisation et de communication pour la lutte contre le changement climatique : cartes actualisées, publications, dépliants, brochures, matériels écrits, sites Internet,...
- la collecte des données sur les ressources naturelles, la biodiversité, la santé, le climat, les infrastructures de base et de communication, les ressources énergétiques, l'eau,....
- la supervision, le reporting et la capitalisation des activités du projet ;
- la production des émissions télévisées et radiophoniques ;
- la formulation des propositions de projets de lois au gouvernement camerounais

## C- MISE EN OEUVRE DU PROJET

[Rio+20 Secretariat: Please refer to full submission document for graph]

Tableau 2 : diagramme de gant't du projet

[Rio+20 Secretariat: Please refer to full submission document for graph]

## 4 - Résultats escomptes du projet

-  60 jeunes formés dans la lutte contre le changement climatique ;
-  21 jeunes formés engagés dans les activités de lutte contre le changement climatique ;
-  800. 000 pygmées engagées dans les activités de lutte contre le changement climatique ;
-  2.500.000 habitants des communautés villageoises impliquées dans les activités du projet ;
-  12 agents du CAALD enrôlés dans les activités de changement climatique ;
-  04 observatoires communautaires de lutte contre le changement climatique créés dans la zone de Messamena ;
-  04 observatoires communautaires dotés d'équipements de fonctionnement du projet ;
-  Données climatiques collectées par les populations, les jeunes et déposées dans les observatoires ;
-  Base de données climatiques créée par le projet ;
-  Système d'information géographique conçu et mis en place par le projet ;
-  Cartes actualisées des données climatiques produites par le projet ;
-  06 députés de l'Assemblée Nationale impliqués et engagés dans les activités de lutte contre le changement climatique
-  Supports pédagogiques de sensibilisation produits par le projet pour les activités de lutte contre le changement climatique ;
-  Données climatiques et cartes fournies aux partenaires de développement ;
-  Canevas standard validé pour la collecte et la saisie des données géo référencées ;
-  Stratégie cohérente des données climatiques dans les observatoires.

## 4. ASPECTS NOUVEAUX

- Présence d'une expertise locale qualifiée en matière de lutte contre le changement climatique ;
- Effectivité du fonctionnement des observatoires communautaires de changement climatique ;
- Présence réseau d'acteurs de lutte contre le changement climatique ;
- Engagement civique des communautés locales dans la lutte contre le changement climatique : collecte des données, recherche, information, sensibilisation, formation, usage des outils techniques et des équipements,...

- Elaboration des programmes politiques et de développement d'adaptation et de savoir-faire aux changements climatiques aux niveaux local, national, et international ;
- Intégration des perspectives spécifiques aux communautés dans les politiques internationales, nationales, locales et de création des opportunités aux niveaux national et local pour éduquer et former les communautés dans le domaine de la lutte contre le changement climatique ;
- Etablissement de plan de communication (sensibilisation, information, communication) dans les communautés, les organisations locales dans le domaine de la lutte contre le changement climatique ;
- Connexion des observatoires communautaires aux réseaux national, régional, international de lutte contre le changement climatique.

## 5 - PLAN D'APPRENTISSAGE ET ECHANGE DE CONNAISSANCES

### MODALITES PEDAGOGIQUES

Pendant l'exécution du projet, les activités seront articulées par l'animation des modules de formation dans les sites permettant aux jeunes participants d'acquérir des aptitudes dans la lutte contre le changement climatique ( des supports seront remis aux participants pour soutenir les activités de terrain et garantir la pérennité des services fournis par le projet) ainsi que la séance pratique permettant aux participants à ces séminaires de maîtriser l'usage des outils et équipements techniques pour la collecte des données climatiques dans les observatoires (des équipements techniques seront remis à chaque observatoire de la zone).

### CONTENU DE LA FORMATION

Le contenu de la formation prend en compte l'intérêt de connaître les changements climatiques. La formation comporte sept ( 07 ) parties :

-  Fundamentals of climate change ;
-  Observed and projected change of climate parameters;
-  Responses to climate change adaptation;
-  Responses to climate change mitigation;
-  Responses to climate changes;
-  Climate change and active citizenship;
-  Use tools of collecting data.

### ORGANISATION DU PROJET

Le projet se déroule durant trois (03) semestre dans l'arrondissement de Messamena au Cameroun. Il est exécuté de manière concertée et participative par les partenaires réunis au sein d'un comité de pilotage. Le projet fait l'objet d'un plan d'évaluation périodique ( hebdomadaire, mensuelle, trimestrielle, semestrielle) des activités

## 7 – Conclusion

ensemble construisons des observatoires de lutte contre le changement climatique en vue de protéger la vie des hommes, des plantes, des animaux, des écosystèmes maritimes et forestiers.

---

## Alzheimer's Disease International

64 Great Suffolk Street

London SE1 0BL

United Kingdom

Tel: +44 (0)20 7981 0880

Fax: +44 (0)20 7928 2357

Email: [info@alz.co.uk](mailto:info@alz.co.uk)

Web: [www.alz.co.uk](http://www.alz.co.uk)

Submission for Rio +20 Conference

The global number of people with Alzheimer's disease and other dementias was 36 million in the year 2010 and it is estimated to rise up to 66 million by the year 2030 and 115 million by 2050, as a result of global ageing. The cost of the disease was \$604 billion in 2010 (Source: World Alzheimer Report 2010, <http://www.alz.co.uk/worldreport>). These diseases will hurt the sustainability of health and finance systems in the future if we don't act.

What are the solutions?

1. Reduce risk factors for dementia, many of them are in line with other major non-communicable diseases: reduce smoking, obesity, and hypertension and increase physical exercise; prevent diabetes and cardiovascular diseases.
2. Improve disease management: earlier diagnosis and intervention improves the quality of life of people with dementia and their carers and it saves money to health care systems. Governments should work on national dementia plans to make this happen.
3. Stimulate innovation and research to find a cure. This means an increase is needed of the currently little research efforts and resources into the working of the brain, prevention and treatments for Alzheimer's disease and other dementias.

Alzheimer's Disease International

Marc Wortmann

Executive Director

m.wortmann@alz.co.uk

## Amend

Rio+20: Improving Urban Development in Africa, for Environment, Safety and Accessibility

A submission to the UN Conference on Sustainable Development by the UNEP 'Share the Road' Initiative and Amend

Rob de Jong, Head of Transport, UNEP and Tom Bishop, Africa Director of Amend

November 2011

### Introduction

UNEP's Share the Road initiative and Amend recognise the natural confluence of safe roads and sustainable transport. We are both working in Sub-Saharan Africa to improve nonmotorised transport, to make cities safer, to reduce pollution and to increase accessibility.

Share the Road is an initiative led by the United Nations Environment Programme (UNEP) to promote policies in government and donor agencies for systematic investments in walking and cycling road infrastructure, integrated with mass transit systems.

Amend is an NGO operating in Sub-Saharan Africa, with the objective of reducing the number of children killed and injured on the roads.

We welcome Rio+20 as an important opportunity to highlight a cost-effective solution to many of the most urgent problems associated with road development in urban Africa – increased investments in walking and cycling infrastructure.

This submission details our contribution to the Compilation Document, which will serve as basis for the preparation of the Rio+20 Outcome Document. It focuses on the sectoral priority of sustainable urbanisation, through the development of non-motorised transport infrastructure, which will also contribute to a green economy and poverty reduction.

### A Cost-Effective Solution to Some Major Global Problems

According to the World Health Organization (WHO), globally more than 1.3 million people are killed every year due to urban outdoor air pollution. Up to 90% of this air pollution comes from the emissions of motor vehicles, and road transport is the fastest-growing sector for greenhouse gas emissions. WHO statistics also show that more than 1.2 million fatalities and 50 million serious injuries are caused each year by road crashes. 90% of these fatalities occur in low- and middle-income countries where pedestrians and cyclists make up the majority of people killed or injured.

Investing in road infrastructure for walking and cycling leads to massive benefits in environment, safety and accessibility. It reduces emissions of air pollutants and greenhouse gases, protects vulnerable road users and income earning adults from high-speed motor traffic, and increases affordable access to vital services and employment.

### Roads for Some versus Roads for All

Sub-Saharan Africa has the most dangerous roads in the world, with a road fatality rate of 28.3 per 100,000 people. Despite the fact that millions of lives could be saved and pollution and poverty could be reduced, urban development in Africa continues to benefit the carowning minority, at the cost of the majority who walk, cycle and use public transport. The majority have lost their place on the roads. Pedestrians and cyclists - users of the most healthy, clean and resource-efficient forms of transport - have been pushed out to make way for bigger roads and bigger vehicles. They are now the group of road users most at risk of death and injury through crashes and health problems related to pollution.

Saving lives will help to reduce poverty, as so often those who are killed and injured are young adults and children. The death or disability of a breadwinner can push a family deeper into poverty, and a sick or injured child will suffer through absence from school while at the same time costing the family in medical fees. In addition, the healthcare costs from urban air pollution are estimated to cost up to 5% of GDP in developing countries.

### The Cost of Inaction

Sub-Saharan Africa has an average GDP growth rate of 5.1%, which should mean ample domestic and foreign investments in sustainable road infrastructure. Without such investments, road fatalities in 2020 will be 80% higher than now. The problem in urban areas will be amplified due to the fact that more than 300 million residents will be added to Africa's cities in the next 25 years. The majority of these rural to urban migrants will rely on the most affordable and accessible modes of transport – walking and cycling – for which minuscule investments are currently made.

In addition to the exponential rates of urbanization, the population of Africa will grow by more than a billion people by 2050. Africa's rate of motorization is one of the fastest in the world, with thousands of cars added to the roads every day. Globally, the number of private motor vehicles is forecast to triple by 2050. Two-thirds of this explosive growth will take place in non-OECD countries such as those in Sub-Saharan Africa.

### Change is Possible

There are ways to drastically reduce the forecast congestion, pollution, and deaths and injuries, while at the same time bridging the gap between the rich and poor. This solution is to build cities that thrive on integrated, multi-modal transport systems. In modern, green and efficient systems, non-motorised transport will be at the core of mobility planning and implementation.

The critical change needed at the level of decision-makers in government and donor agencies is to systematically allocate funds for walking and cycling infrastructure in all urban transport investments. Even a small proportion of funds would go a long way in making investments more accountable and beneficial to the majority of the population, instead of only benefiting the car-using minority. In turn, such investments will support governments in meeting the overarching goal of poverty reduction, as envisaged in the Millennium Development Goals.

There have been successes in Africa, through both the Share the Road initiative and the work of Amend. For example, the Kenyan government has enacted a policy change whereby walking and cycling facilities are incorporated into its urban road designs. There are also positive developments in Uganda and Rwanda, and in Tanzania where Amend is working to improve the walk to school for tens of thousands of school children. But more needs to be done in these countries as well as the whole of Africa.

The focus of Rio+20 is green economy in the context of poverty eradication and sustainable development. The international community would be hard-pressed to ignore the rationale and feasibility of increasing investments in walking and cycling on Africa's roads. The hundreds of millions of people moving around our cities by foot or bicycle, going to school and work, going to meet friends and family, at great undue risk to their lives. They deserve a strong call for action on this occasion of Rio+20.

## American Cancer Society (ACS)

### Placing Non-Communicable Diseases (NCDs) on the Agenda for Rio+20:

American Cancer Society Input for the United Nations Conference on Sustainable Development in Rio de Janeiro, 4-6 June 2012

#### Introduction

As world leaders and experts meet to secure renewed political commitment for sustainable development, to assess progress to date, and to address new and emerging challenges it is imperative that attention is drawn to the topic of non-communicable diseases (NCDs) and their links to economic development and the environment. NCDs—cancer, cardiovascular diseases, respiratory diseases, and diabetes—have been increasingly acknowledged as a major health and economic development issue, and one of the most significant emerging challenges to poverty eradication.

The magnitude of this threat has been recently acknowledged in the UN High Level Meeting on the Prevention and Control of NCDs and its resulting political declaration (September 2011). The importance of the NCD burden and its links to sustainable development and equity concerns were also highlighted by many member states, experts, and civil society representatives at the recent WHO Meeting on the Social Determinants of Health in Rio de Janeiro (October 2011).

#### The Global NCD Burden

NCDs are the leading causes of death in the world, accounting for 63% of global deaths<sup>1</sup>. The burden of NCDs is greatest in the developing world, with nearly 80% of NCD deaths occurring in low and middle income countries<sup>2</sup>. In addition, vulnerable and socially disadvantaged people in developing countries get sick and die sooner as a result of NCDs than people of higher socio-economic status<sup>3</sup>. Approximately half of all female deaths in low and middle countries are attributable to NCDs<sup>4</sup>. Among women ages 15-59 in low and middle income countries, NCDs account for 37% of total deaths and 18.5% of the overall DALY burden (disability-adjusted life years)<sup>5</sup>. Even in low income countries the percentage of female deaths attributable to NCDs (32.6%) far exceeds those attributed to maternal conditions (3.6%) and HIV/AIDS (6.3%)<sup>6</sup>.

Projected increases in NCD incidence and mortality are expected to be greatest in developing countries. Between 2010 and 2020, global NCD deaths are projected to increase by 15%. NCD growth is projected to be highest in the regions of Africa, South-East Asia and the Eastern Mediterranean, where between 2010 and 2020 NCD deaths are projected to increase by over 20%<sup>7</sup>. The growth in cancer incidence by 2030 is projected to be over twice as high in low income countries (82% growth) compared to high income countries (40% growth)<sup>8</sup>.

The increase in NCDs is shifting the global disease burden and placing what has been referred to as “a triple disease burden”—infectious, non-communicable and pregnancy related conditions—on people and health systems in developing countries, thereby complicating our ability to ensure the right to health. In combination, these place a tremendous and escalating strain on resource-poor health systems.<sup>9</sup> NCDs thus represent a major and growing socio-economic burden in the developing world, which places undue strain on communities and health systems and is a major contributor to poverty. In the Political Declaration of the recent UN High Level Meeting on the Prevention and Control of NCDs, which has been unanimously adopted by Member States, the link between NCDs and poverty is underscored, noting “with grave concern the vicious cycle whereby NCDs and their risk factors worsen poverty, while poverty contributes to rising rates of NCDs, posing a threat to public health and economic and social development.”<sup>10</sup>

The NCD burden in the developing world is on the rise due to demographic factors and development-related changes in lifestyle, nutrition, and behavior. Chief factors contributing to the NCD burden, its growth worldwide, and its increasing impact in developing countries include:

- Demographic changes (i.e., and aging population) due to the combination of increasing life expectancy with decreasing fertility rates<sup>11</sup>.
- Changes in diet, working patterns, and activity patterns<sup>12</sup> as a result of economic development, urbanization, and globalization, that have increased exposure to major NCD risk factors (the most significant of which are tobacco, obesity, physical inactivity, and excessive alcohol consumption)

Some of the main common NCD risk factors are increasing as a result of environmentally problematic economic development policies and practices. For example, increases in obesity, physical inactivity, and air pollution have been fostered by planning and transportation patterns in urban centers that have also promoted environmental degradation. Poor diet (i.e., “overnutrition”) and obesity have also been fostered by environmentally unsound rural development practices that diminish the availability of fruits and vegetables and undermine food security.

A major impact on the NCD burden can be made by through preventative measures to address the main common NCD risk factors and strengthen access to NCD treatment and management. For example the, global community has the knowledge and tools to prevent more than half of all new cancer cases and cancer deaths worldwide<sup>13</sup>. The WHO estimates that approximately 40% of worldwide cancer deaths can be prevented by improving eating habits and physical activity, reducing tobacco use and alcohol consumption, and immunizing against viruses.

#### Health, NCDs, and Sustainable Development

The critical importance of health as a foundation of sustainable development has been widely acknowledged. Health and development are intimately interconnected, and environmentally problematic forms of economic development can result in severe environmental health and nutritional problems. The important links between health, the environment, socioeconomic disparities, and poverty are acknowledged in both Agenda 21 and the Rio Declaration on Environment and Development. Within Agenda 21's section on “social and economic dimensions” (section I), health figures as a chief focus. Agenda 21 underscores the “primary health needs of the world's population” as “integral to the achievement of the goals of sustainable development and primary environmental care.

In particular, Agenda 21 emphasizes “preventive and curative health facilities, especially primary health care and maternal health care systems accessible to all” as a critical component of sustainable development<sup>14</sup>. Furthermore, Agenda 21 affirms that efforts to address health, environmental and socio-economic concerns require intersectoral actions—with a particular emphasis on preventative health measures—and that there is a need to “to coordinate the involvement of citizens, the health sector, the health-

related sectors and relevant non-health sectors (business, social, educational and religious institutions) in solutions to health problems<sup>15</sup>.

The Johannesburg Declaration on Sustainable Development (from the 2002 Earth Summit in Johannesburg, South Africa) reaffirms the central importance of health in sustainable development, stating in paragraph 19 that: 'We reaffirm our pledge to place particular focus on, and give priority attention to, the fight against the worldwide conditions that pose severe threats to the sustainable development of our people, which include...endemic, communicable and chronic diseases, in particular HIV/AIDS, malaria and tuberculosis...' <sup>16</sup>

Despite the widespread acknowledgement of health as a critical foundation of sustainable development, attention to NCDs in particular has been minimal, overlooking the important links between NCD prevention and control and global sustainable economic development. Given that environmental degradation and NCDs share similar causes and solutions, inclusion of the NCD challenge as part of broader debates about sustainable development and green economies and in the outcome document adopted at Rio in 2012 is essential to ensure more sustainable approaches to economic development.

### Summary Recommendations for Rio+20

The American Cancer society urges that the Rio+20 meeting and its outcomes document reinforce the central importance of health concerns in global sustainable development policies, strategies, and actions, and that the conception of health within sustainable development be broadened in a manner that holistically integrates NCDs and established health priorities (e.g., maternal and child health and communicable diseases) and encompasses health issues throughout the lifecycle, with a particular emphasis on the most vulnerable populations.

NCDs are a major component of future demographic, economic development, and environmental trends globally and it is critical that they part of the dialog, metrics, and policies of sustainable development. It is imperative that the potential synergies between NCD control and environmental concerns be incorporated within the agenda of the Rio+20 meeting. In particular, we urge attention to the importance of NCD prevention and control for:

- Promoting, health, wellness, and poverty alleviation.
- Monitoring the impacts of development and providing evidence-based support for sustainable development.
- Strengthening strategies for multisectoral policy development and planning, thereby maximizing their potential for the effective promotion of health, the environment, and sustainable development.
- Developing rural development and agricultural policies that support food security, nutritional health, and environmental sustainability.
- Developing urban planning and transportation policies and plans that promote health, environmental, and economic goals.
- Developing policies and strategies for tobacco control that promote health and sustainable development.

### Potential Synergies between NCD Control and Sustainable Development

Policies and actions for NCD control and environmental issues have the potential for important synergies. Some environmental policies may also pose health risks or tradeoffs (e.g., economic and agricultural policies to promote biofuel production can undermine food security and nutrition if not properly designed) that need to be considered in formulating sustainable development policies<sup>17</sup>. Inclusion of NCDs in sustainable development discussions is important to better understand the links between health and the environment and to maximize potential synergies between environmental, health, and economic development policies.

NCD control can contribute to a variety of elements encompassed within the vision of sustainable development as articulated in Agenda 21, including: promoting food security as a component of sustainable agriculture, protecting and empowering vulnerable communities and groups (e.g., women) in decision making processes, giving attention to rapid urbanization, reducing health risks from environmental pollution and hazards, strengthening basic health care services for women and children, and promoting of health education and provision of essential drugs, and the development and monitoring of health indicators for sustainable development.

More broadly, interventions for NCDs can contribute towards progress on the Millennium Development Goals (MDGs). For example, controlling NCDs will make progress towards ending poverty (MDG1) and it will promote gender equity (MDG3) and child health (MDG4). Similarly, reducing adult death rates and disability promotes economic growth and poverty reduction (MDG1); and, given that NCDs are the leading cause of death for women in most countries, preventing NCDs promotes women's health and empowerment (MDG3). NCD prevention efforts can also complement interventions to ensure environmental sustainability (MDG7) through promoting biodiversity-friendly, sustainable food production, limiting production of and exposure to air and water pollution, and limiting occupational exposure to toxic compounds, among other measures.

Below is a survey of some specific examples of potential synergies between NCDs and environmental concerns that can contribute to the pursuit of the broader global objective of promoting sustainable development.

### NCDs, Health, and Poverty Alleviation

- Improved prevention and control of NCDs diminishes the health and economic burden on vulnerable populations, thereby contributing to poverty alleviation and the promotion of sustainable development. Actions targeting NCDs also support other global health priorities (e.g., maternal and child health, communicable diseases) and are essential to health system strengthening. Improved NCD control will strengthen healthcare systems in ways that will bolster interventions for all diseases and health conditions, including improving and strengthening: public health literacy, human resources, technical capacity, primary care capacity and delivery, diagnostic capacity, infrastructure for secondary and tertiary care, and procurement strategies for essential medications. Priority interventions for NCDs – such as tobacco control and improved nutrition – would actually benefit maternal and child health<sup>18</sup>. For example, reducing smoking and indoor air pollution decreases childhood illness. Improvements in health status and in the quality and accessibility of health care as a result of attention to NCDs are essential for addressing poverty alleviation and promoting sustainable development.

### NCD Prevention and Sustainable Development

- Prevention of some of the major NCD risk factors (e.g., poor diet, nutrition, and lack of physical activity) can and should be addressed through sustainable development policies (e.g., policies aimed at food security, sustainable agriculture, sustainable transportation, and urban air pollution). Attention to NCDs within the framework of sustainable development provides important synergies between health and environmental concerns, helping to provide evidence-based support for negative impacts of environmental policies as well as strengthening the potential outcomes of environmental policy and governance structures.
- Because of overlapping causes between health and environmental concerns, there are potential synergies between educational efforts for NCD prevention/awareness and environmental sustainability.
- The development and implementation of preventative health and wellness initiatives within government policies and the private sector contribute to a greener economy and avert placing unnecessary burdens on economic and health systems.

- Attention to NCDs can help improvement monitoring of impacts of sustainable development initiatives and the development of evidence-based policies and strategies for sustainable development. Agenda 21<sup>19</sup> calls for taking into account demographic trends and factors as essential to formulating integrated national policies for environment and development. Attention to the causes and implications of the NCD burden is an indispensable component of the future demographic trends that needs to inform sustainable development policies and plans.

#### **NCDs, the Environment, and Multisectoral Approaches to Sustainable Development**

- Cross cutting measures are essential for promoting sustainable livelihoods and environmental protection. As is the case for environmental issues, addressing NCDs requires a multi-sectoral, whole-government approach. Addressing both of these issues, necessitates engaging ministries of health, environment, transportation, agriculture, finance, foreign affairs, and education—among others—and, therefore, integrated approaches to addressing both issues can be supportive of strengthened models for effective multisectoral actions and institutional frameworks for sustainable development. Agenda 21 acknowledges the virtue of intersectoral approaches that integrate health and environmental concerns, asserting that the “linkage of health, environmental and socio-economic improvements requires intersectoral efforts.... Particularly relevant is the inclusion of prevention programmes rather than relying solely on remediation and treatment.” The Political Declaration of the recent UN High Level Meeting on the Prevention and Control of NCDs includes a commitment to “promote, establish or support and strengthen, by 2013, as appropriate multi-sectoral national policies and plans for the prevention and control of non-communicable diseases<sup>20</sup>.” Inclusion of environmental considerations as part of the process of developing these multisectoral policies and plans is fundamental to the promotion of health and sustainable development.

#### **NCD Control and Rural Sustainable Development**

- Integration of health and environmental concerns is critical in formulating rural development and agricultural policies aiming to promote food security, improved nutrition, and more environmentally sound land and resource use practices. Attention to the NCD issue can help strengthen support for such policies and potentially improve their impacts on health, wellbeing, and the economy. A recent report (Bringing Agriculture to the Table How Agriculture and Food Can Play a Role in Preventing Chronic Disease) asserts that “in the decades to come, the agriculture and food system will need to change to meet the related challenges of rising demand, accessibility and affordability, and improved nutrition and health”, necessitating an “integrated look at agriculture, food, nutrition, and the growing threat of diet-related chronic diseases.” The threat of “dual malnutrition” brought on by the rise of NCDs needs to be acknowledged and integrated within agricultural and resource utilization policies in order to make “healthy foods more available and affordable to consumers at all income levels”, thereby fostering more sustainable economic development. The persistence of “current trends in agriculture would mean maintaining inequitable food distribution, unhealthy diets, unsustainable environmental threats, and unknown risks from climate change”<sup>21</sup>. Addressing NCDs requires a multisectoral response that engages agricultural and food production sectors (among others) in support of health objectives<sup>22</sup>. In order to promote sustainable development there is a need for integrated approaches to enhancing agricultural production, increasing food access, supporting healthy populations, and protecting the environment. A combined focus on health and the environment is important for developing fiscal policies and subsidies that more fully account for environmental and health externalities and maximize their potential for promoting sustainable development. For example, policy and market instruments to support small scale food producers and farming communities in order to promote food security and improved availability and access to nutritious foods need to be mindful of both under and over nutrition in order to effectively promote sustainable development<sup>23</sup>. Conversely, policies targeting the price, availability, and marketing of unhealthy foods need to be cognizant of environmental concerns, ensuring that they do not foster unsustainable resource use practices and maximizing their potential to be leveraged for the promotion of more environmentally sound resource use practices.

#### **NCD Control, Urbanization, and Urban Green Development**

- Agenda 21 underscores the importance of attention to rapid urbanization and calls for the need for “greater attention should be given to preparing for the needs, in particular of women and children, for improved municipal management and local government.” It also highlights the links between urban development, poverty, inadequate diets, and environmental hazards and the importance of attention to urban health as an integral component of sustainable development. Furthermore, it underscores the fact that in urban contexts “many factors that affect human health are outside the health sector”, thus requiring coordinated actions to address urban health. Given the important links between urbanization and decreases in physical activity, impoverishment of diet, and air pollution, attention to NCD control is a critically important component of urban sustainable development policies and programs. For example, WHO’s Health in the Green Economy brief<sup>24</sup>—which highlights some potential synergies and tradeoffs between health and climate change policies and interventions—asserts that “cycling, walking and using rapid transit/public transport can greatly enhance levels of physical activity, helping prevent a range of chronic diseases including cancer, heart disease and diabetes.” Green transportation initiatives provide an excellent example of synergies between health and environmental issues. Green urban planning and transportation policies (e.g., investment in and provision of transport network space for pedestrian and bicycle infrastructure, and land use planning that increases density and diversity of uses) can diminish risk factors for respiratory disease, cardiovascular diseases, cancer, diabetes, and obesity, through promoting physical activity and addressing air pollution<sup>25</sup>.

#### **Tobacco Control and Sustainable Development**

- Tobacco exposure is a risk factor for cancer, cardiovascular disease, respiratory diseases, diabetes, and other diseases, and tobacco-related deaths are the single most preventable cause of death in the world, making it one of the most pressing global health priorities.
- The WHO FCTC (Framework Convention on Tobacco Control)—an international treaty which currently includes 174 parties—emphasizes the importance of “protection of the environment” (Article 18) as part of tobacco control efforts, calling for “Combined health and environmental efforts to promote nutrition and food security to promote government policies promote corporate initiatives that are environmentally sound and promote health, including social responsibility initiatives, workplace initiatives, and business practices (e.g., food and beverage industry)”. The FCTC contains a mixture of demand and supply side interventions for tobacco control. Among the three supply side interventions is “Provision of support for economically viable alternative activities”, including for tobacco workers and growers (Article 17). Supply side measures targeting tobacco cultivation can provide environmental benefits (and health benefits to rural workers) and need to incorporate a sustainable development framework in promoting alternative agricultural and land use programs.
- Increasing taxes on tobacco products is seen as one of the most effective ways to diminish demand and promote tobacco control<sup>26</sup>. Resources raised through these taxes can potentially be applied to supporting economically and environmentally sustainable alternative agricultural activities.
- Implementing comprehensive national tobacco control strategies also brings additional potential economic benefits, thereby supporting sustainable development efforts. Smoke-free workplaces create a healthier workforce that benefits businesses by reducing absenteeism, improving productivity, and lowering healthcare costs and insurance premiums<sup>27</sup>. Secondhand smoke imposes a heavy financial burden on businesses in the form of increased medical costs for employees, lost productivity due to illness, higher insurance premiums, and other costs.<sup>28</sup>

## American Planning Association

American Planning Association (APA) and the Energy and Climate Partnership of the Americas (ECPA)

Objective: To secure renewed political commitment for sustainable development in the Western Hemisphere by assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development, as well as addressing new and emerging challenges.

The American Planning Association (APA) has partnered with the U.S. Department of State, U.S. Department of Housing and Urban Development, and a variety of educational and nongovernmental organizations in the U.S. and abroad to address the issue of sustainable development through improved urban and regional planning. Under President Obama's leadership, APA was awarded two grants under the umbrella of the Energy and Climate Partnership of the Americas (ECPA), an intergovernmental agreement among over a dozen Western Hemisphere nations to cooperatively address the issues of climate change and energy consumption. We suggest that the framework established through our first ECPA grant, aimed at improving planning capacity in Latin America and the Caribbean, combined with the goals of our second ECPA grant, where we will identify and initiate pilot projects in housing and sustainable community development, will provide lessons for the attendees and their governments as they seek to reaffirm and commit to reducing remaining barriers in sustainable development.

Themes: (1) A green economy in the context of sustainable development and poverty eradication; and (2) The institutional framework for sustainable development.

ECPA provides a thoughtful approach to engaging a wide range of interests and stakeholders— government, NGOs, educational institutions, and private sector companies—to collaborate across levels of jurisdiction and disciplines, thus placing more expertise at the hands of all parties directly responsible for community building. Primarily through a variety of networks, APA has already seen progress in changing the way people and communities view the role of planning in the overall effort to achieve more sustainable, economically prosperous, and equitable places. In our ECPA work, we have specifically targeted solutions that will simultaneously improve the living standards for the poor and those historically marginalized from the discussions related to infrastructure and economic investment, while also assisting communities to reduce energy poverty, build resilience to climate change, and promote community and national NGO bodies that will carry on this work after our initial technical assistance work ends.

A primary example of our success thus far is reflected by progress in the Caribbean to create a professional network of city and regional planners who will be able to provide more technical assistance, advocacy, and knowledge to local citizens and government leaders about energy and climate change issues. This effort transcends borders and languages, representing one of APA's early achievements in the ECPA effort. In addition, we have advised a joint U.S.-Brazilian graduate level urban and regional planning studio on a petrochemical facility outside of Rio de Janeiro and hosted two international conferences on sustainable urban planning and sustainable economic development that drew participants and case studies from across the Americas.

APA's overall institutional framework combines training, targeted technical assistance, and the creation and enhancement of nonprofit organizations. As such, it is a framework that we feel should be of interest to the participants in Rio + 20. As a result of our ECPA program, APA feels that our work resonates well with both themes and that our successful outcomes will greatly assist in meeting the summit's overall objectives

## American Youth Understanding Diabetes Abroad, Inc. (AYUDA)

Youth and NCDS: Their Role in Sustainable Development

As young people involved within the field of development as it pertains to health, we welcome the opportunity to comment on the Rio +20 Meeting on Sustainable Development.

Here, in light of this meeting and others that touch on similar social, economic and environmental determinants such as UN GA High Level Meeting on NCDs, the Rio World Conference on Social Determinants of Health are our comments regarding the importance of youth involvement, which we find critical as it relates to health and its impact on development sustainability.

Non-Communicable Diseases or NCDs, including but not limited to diabetes types 1 and 2, cancer, chronic heart disease and asthma, account for 60% of deaths worldwide. The World Economic Forum's 2010 Global Risks Report identifies NCDs as the second most severe threat to the global economy and a global risk equal in cost to the current global financial crisis. NCDs can be especially crippling in low and middle-income countries where they can contribute directly to poverty and other development issues.

Chronic diseases in young people include asthma, diabetes, congenital adrenal hyperplasia, cystic fibrosis, chronic lung disease and some cancers. It has been well documented that the incidence of type 1 and type 2 diabetes is increasing not just in adults, but also children, particularly in developing countries that previously experienced very low prevalence of the diseases. The challenges of managing these diseases on a day-to-day basis are exacerbated in developing countries where a lack of education at the primary health care level is coupled with poor access to medical supplies (due to poor access to health services, inequities within the health system, insufficient or non-existent drug supply system and inability to pay). These issues can create a heavy negative impact on economic development and sustainability.

Although NCDs affect many young people, most prevention measures are not targeted towards youth. It is young people who will bear the brunt of the economic, social and emotional burden of NCDs throughout their lives. This is why we see it as critically important to encourage meaningful youth participation within all global development policy discussions.

To reinforce these points, we include the following goals:

Young people are meaningfully involved in the global policy debate. From global to national settings, world leaders must acknowledge the significant contributions of young people and meaningfully involved them in the policy-making that addresses NCDs. We seek to ensure that youth are meaningfully included in high-level negotiations and processes. This includes investments in youth leadership for global, regional and national processes and the inclusion of specific time-bound outcomes related to young people and NCDs in global health policy. Youth inclusion ensures not only representation from a key population, but sustainability as the youth leaders of today will be the adult leaders of tomorrow.

Include Youth in NCD Prevention design and delivery. The four WHO-identified NCD risk factors - tobacco use, unhealthy diets, physical activity, and harmful use of alcohol, as well as mental health conditions, have their roots in adolescence. In order to target this key population in NCD prevention, youth must be meaningfully involved in the design and delivery of interventions - with a strong focus on peer-to-peer learning and "for youth, by youth" approaches.

Current literature raises awareness of many of the challenges facing people living with chronic disease in developing countries and acknowledges that many factors impact health outcomes. However, many of the recommendations fail to focus on practical interventions or solutions that are replicable in resource-poor settings. There is limited evidence comparing the relative effectiveness of locally-appropriate interventions for managing chronic disease in developing countries, particularly in regards to managing chronic disease in children, a particularly vulnerable group. Abegunde et al. argue in the Lancet Series on chronic disease that there is considerable opportunity for low-cost interventions that could help to curb the growing epidemic of non-communicable disease in developing countries.

AYUDA, (American Youth Understanding Diabetes Abroad, Inc) has been implementing sustainable low cost programs for children with type 1 diabetes in developing countries in conjunction with local partner organizations for over a decade. By empowering young people living with diabetes to work with and educate other youth with the same disease, AYUDA has found improved health outcomes for children when compared to alternative interventions in resource poor settings, in particular with regard to psychosocial outcomes. Cohort data demonstrates improvements in short-term and long-term glycemic control (HbA1c values).

Make NCDs a Human Rights Issue for Youth. From poverty to stigma and discrimination to access of health services, violations of human rights can make young people more vulnerable to NCDs. Young people will, where possible, link NCDs with the issues of human rights to ensure people understand that NCDs are not just about health, but are also an issue of social justice.

Connect communities, countries, conditions and sectors. Young people will make an effort to build a coalition on NCDs that connects young leaders, particularly those most affected, with leaders from all other areas of civil society. The youth movement will be linked to issues within global, regional and national context. The coalition will be linked to the greater youth and development movement.

---

## An Taisce The National Trust for Ireland

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

- A commitment to fully implement those principles of the Earth Summit 1992 which have not yet been completed, both nationally and internationally.
- To prioritize those principles that have become even more critical, namely biodiversity and habitat loss, measures to counteract Climate Change, eradication of poverty, greater emphasis on Local Agenda 21 and 'bottom up' sustainability measures.
- A firm principle on strong governance and oversight to ensure audit and implementation of the measures agreed.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

### 1.2 Irish Constitutional and legislative provision for sustainable development.

The provision of Constitutional amendment to incorporate the revised and updated sustainable development declaration which will emerge from Rio +20 process.

Legislative provision for sustainable development as an overarching objective, parallel to national climate change legislation with mandatory greenhouse gas emission reduction targets. Revision of remit of Government departments state and Statutory boards and Government share-hold controlled companies, including Bord Na Mona and Coillte with sustainable development as overriding objective.

### 1.3 Reducing Irelands global resource consumption and emission footprint.

A range of global emission and resource consumption measurements now exist which all establish the unsustainability of continuing consumptions and emission levels. The 2006 National Footprint Network table (Appendix 1) is particularly striking in illustrating the disparity between the developed and the poorest countries. Global footprint calculation is based on a range of measurements including arable land use area, water use, fossil fuel and mineral resource use, calculating point of origin and transboundary impacts.

The October 2010 Living Planet report identified Ireland as having the tenth highest global footprint

The Living Planet report looks at the changing state of ecosystems, consumption of natural resources and the implications for the future of the world. Overall, the report concludes natural resources are being consumed faster than the Earth is replenishing them. People are now living lifestyles which would require one and a half planets to sustain, though there are significant differences between rich and poor nations. The report, carried out by the World Wildlife Fund, examines the number of 'global hectares' — the amount of biologically productive land and water available per person on the planet — that countries need.

Irish people on average use just over six global hectares per person, more than double the demand of some EU countries, such as Hungary and Romania. The worst offender is the United Arab Emirates.

Irish per capita resource consumption levels and global foot impacts are at a comparable level to the US and Australia. Post boom Ireland retains in high per capita levels of energy consumption, consumer and household goods and clothing, meat and processed food.

### 2.2 Sustainable use of the components of biodiversity,

All human activities, including all our economic activities, take place inside, and cannot exceed, the carrying capacity of our environment. The carrying capacity of our environment is dependent on the healthy functioning of our biodiversity and ecosystems. From an economic perspective, numerous attempts have been made to understand the value of biodiversity to humanity in terms of ecological goods and services for instance insect pollination, water regulation and purification, carbon storage.

The Millennium Ecosystem Assessment (MA) assessed the condition of 24 of the earth's natural systems that it considers humanity's "life support systems". It concluded that over the previous 50 years, four of these systems have shown some improvement, fifteen are in serious decline, and five are in a stable state on a worldwide basis, but threatened in some parts of the world. The establishment of the TEEB (The Economics of Ecosystems and Biodiversity) study (<http://www.teebweb.org/>) is another initiative to highlight economic benefits of biodiversity, cost of biodiversity loss and ecosystem degradation, and make practical management recommendations.

Yet other reasons to conserve biodiversity are equally valid and must not be lost in the rush to weigh up its economic value to humans. There is also our ethical responsibility to conserve biodiversity and facilitate a shift toward societal respect for nature. In the words of Richard Frankham "The ethical justifications for conserving biodiversity are simply that one species on Earth does not have the right to drive others to extinction, analogous to abhorrence of genocide among human population".

#### Pollination

The value of crop pollination in Ireland by all pollinating insects has been estimated as €53million per year in Ireland . Unfortunately, the current status of Irish pollinators appears to be in decline, with 30% of the wild bees and 18% of butterfly species in Ireland considered threatened according to the International Union for Conservation (IUCN).

#### Soil Protection

To achieve food security in face of an ever growing population, Ireland and the world, will require large areas of fertile land. However increasing pressures such as urbanisation, afforestation, industry, erosion and overgrazing are putting soil quality at risk. As yet there is no program to monitor and protect this essential resource in Ireland. In the European Union it has been estimated that soil deterioration costs 38 billion a year, however to date; no such figure appears available for Ireland.

---

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

An Taisce – The National Trust for Ireland

Tailor's Hall,

Back Lane,

Dublin 8

31st October 2011

RE: UN Submission re Rio +20

An Taisce, The National Trust for Ireland, welcomes this opportunity for public consultation on Ireland's progress since the 1992 Earth Summit in Rio de Janeiro (Rio 1992). An Taisce was established in 1948 and is Ireland's oldest voluntary environmental organisation. It is national organisation and a key consultation prescribed body under a

number of environmental and planning, acts and regulations in Ireland. As such An Taisce has been uniquely positioned to observe the ongoing developments in Ireland's natural environment since Rio and during the economic and construction boom of the 'Celtic Tiger'.

There is an urgent need to ensure that environmental issues are embedded in all relevant legislation both on a national and international level. Measures should be introduced to assess practices carried out throughout the system e.g. agriculture, forestry, planning etc. Procedures for appropriate monitoring of impacts along with relevant regulations and should be introduced plus provisions for strict enforcement to ensure compliance when found necessary together. The establishment of a Court for Environmental Justice would be an appropriate development as would the strengthening of UNEP. A constitutional right to a healthy environment should be enshrined in law.

Since the adoption of the 1992 Rio Declaration, Ireland had the fastest population increase in the EU. The unprecedented physical and infrastructural investment which occurred between the mid 1990's and 2007 failed to address the principles of the Rio Declaration. Development was instead underpinned by a flawed economic growth based model disregarding resource consumption, climate emissions and debt accumulation. There was significant lack of initiative in protecting Ireland's most internationally significant Habitats and accordingly breaking the biodiversity convention. This particularly applies to the introduction of a ten year derogation to accommodate continued mechanised peat cutting in Special Area of Conservation designated raised bogs.

Transport investment was focused on over-scaled airport terminal capacity and a motorway programme which has accelerated car based urban sprawl and made rail travel slower than inter regional road travel times.

The late implementation of EU building energy performance rating standards and lack of any significant retrofit investment has left a highly energy inefficient building stock.

Investment in a new generation of 3 peat burning power stations created an additional carbon burden on top of an already per capita emission level. Ireland's per capita emissions at over 16 tonnes are twice that of Sweden.

Much of the focus of Tourism investment during the boom years was for visitor accommodation and golf resort development in sensitive landscape locations or country house parklands. This can undermine the key asset base which makes Ireland attractive in the first place.

Government Departments and State Agencies and companies failed to incorporate sustainability into their core remit, policy and decision making.

In many cases policies or actions promoted by the former Department of the Environment, Heritage and Local Government were disregarded. Department of the Environment, Heritage and Local Government funded a television advertising campaign recommending lower driving speeds to reduce greenhouse gas emissions, while the Department of Transport increased motorway speed limits from 100kph to 120kph, thereby increasing greenhouse gas emissions and further undermining viability and use of public transport.

In 2008 the Department of Enterprise Trade and Employment promoted the export of Irish Peat to Africa without addressing legal status of extraction under the Environmental Impact Assessment and IPPC Directives, let alone sustainability.

In 2010 the Department of Agriculture and Food published a ten year strategy 'Food Harvest 2020'. This includes an objective to increase milk production by 50%. No evaluation was carried out on the impact of this on climate emissions, biodiversity or fertilizer and energy use was not addressed.

Ireland's failure to adopt an integrated sustainable development model over the last 20 years has created unquantifiable, social, environmental and economic costs for the future.

The cost of the EU/IMF bailout is only now being recognised.

Parallel to this we face the social cost of poorly integrated socially divided communities, car dependence and obesity, poor planning in climate adaptation and flood risk.

Our high dependence level on imported fossil fuel creates unquantifiable cost exposure in transport and energy.

Poor biodiversity protection and water management will need significant remedy to meet EU standards and Directives.

The failures of the last two decades cannot be reported. Sustainability needs legal and practical effect in all future planning and decision making.

The key recommendation of this submission is the need to give sustainably legal effect in the Constitution and legislative remit of Government departments and State agencies and companies.

United Nations Conference on Sustainable Development

An Taisce Submission to the UN

October 2011

1 SUSTAINABLE DEVELOPMENT

1.1 Introduction

Much of the current national political and media focus is on promoting economic development and employment. While all mainstream commentators and politicians extol the virtues of a return to economic growth (GDP/GNP) as the conventional solution to our current economic, unemployment and fiscal difficulties it should be borne in mind that there is an inherent contradiction between the current model of economic growth and environmental and resource sustainability. Our society is currently locked into an economic system that has a GDP growth imperative and, as a consequence, increased energy demand, increased greenhouse gas emissions and increased resource throughput and depletion. Our ecological debts are as unstable as our financial debts. Neither is properly accounted for in the relentless pursuit of consumption growth. This contradiction is placing further pressure on the carrying capacity of the environment to support society and the economy.

Furthermore, GDP economic growth is a highly imperfect and counter-productive measure of human progress as it only measures income and does not account for the

consumption of natural capital (resources) or the significant costs of anthropogenic pollution. The Stern Report noted that Climate change is the greatest and widest-ranging market failure ever seen. As can be seen from the very high prices in Brent Crude Oil, the return of economic growth to the world economy has triggered an energy price spike, reducing consumption demand and further recession. Continued GDP economic growth in the Irish economy is unsustainable in the long-term and it is prudent to plan now for a different economic future including 'low growth' or 'no growth' scenarios.

For example, a 2 per cent per annum growth in GDP would mean the carbon occasioned by each unit of economic output would have to be 130 times lower in 2050 than it is today otherwise we cross a threshold in terms of carbon emissions that future generations are unable to recover from. Economic growth is therefore inconsistent with the requirement to abate greenhouse gas emissions. In any event, 2% GDP growth would mean the total size of the Irish economy with double every 35 years. This is not physically possible in finite world and we should therefore not be planning for it.

Current Government policy is to promote the Smart Economy and a return to an export-led economy. While this strategy has many virtues it is based on the premise that Ireland cannot compete with manufacturing industries in low-cost developing nations in a globalised economy. As a consequence, the structure of modern developed economies such as Ireland have typically tended to move progressively away from domestic manufacturing resulting in more and more finished and semi-finished goods need to be imported from abroad and expanding the financial and services sector to pay for it. Of course, this strategy is extremely vulnerable to oil price inflation (for transport) and outsources environmental degradation to less regulated countries. We submit that a strong local manufacturing base that is based on the sustainable use of local indigenous resources and local markets will make Ireland more resilient in long run.

Current national economic development policies demonstrate a long-term blindness to the limitations of the material world. Responses to the crisis which aim to restore the status quo are misguided and doomed to failure. Prosperity today means nothing if it undermines the conditions upon which the prosperity of tomorrow depends.

## 1.2 Constitutional and legislative provision for sustainable development.

The provision of Constitutional amendment to incorporate the revised and updated sustainable development declaration which will emerge from Rio +20 process.

Legislative provision for sustainable development as an overarching objective, parallel to national climate change legislation with mandatory greenhouse gas emission reduction targets. Revision of remit of Government departments state and Statutory boards and Government share-hold controlled companies, including Bord Na Mona and Coillte with sustainable development as overriding objective.

## 1.3 Reducing Irelands global resource consumption and emission footprint.

A range of global emission and resource consumption measurements now exist which all establish the unsustainability of continuing consumptions and emission levels. The 2006 National Footprint Network table (Appendix 1) is particularly striking in illustrating the disparity between the developed and the poorest countries. Global footprint calculation is based on a range of measurements including arable land use area, water use, fossil fuel and mineral resource use, calculating point of origin and transboundary impacts.

The October 2010 Living Planet report identified Ireland as having the tenth highest global footprint

The Living Planet report looks at the changing state of ecosystems, consumption of natural resources and the implications for the future of the world.

Overall, the report concludes natural resources are being consumed faster than the Earth is replenishing them. People are now living lifestyles which would require one and a half planets to sustain, though there are significant differences between rich and poor nations. The report, carried out by the World Wildlife Fund, examines the number of 'global hectares' — the amount of biologically productive land and water available per person on the planet — that countries need.

Irish people on average use just over six global hectares per person, more than double the demand of some EU countries, such as Hungary and Romania. The worst offender is the United Arab Emirates.

Irish per capita resource consumption levels and global foot impacts are at a comparable level to the US and Australia. Post boom Ireland retains in high per capita levels of energy consumption, consumer and household goods and clothing, meat and processed food.

## 1.4 Transport

### 1.4.1 Shipping

Greenhouse gas emissions from international shipping activity currently account for at least around 3% of total global emissions, and comparable to aviation. The global shipping and aviation sectors were not included in the failed Kyoto protocol, and left to be addressed in future agreements.

The most recent study into medium to long-term traffic volumes at Irish ports is provided in the Dublin Port National Development Plan Study, published in 2009. This study took account of the economic downturn and the uncertainty over when the economy would return to growth. The Study concluded that the sector would face renewed capacity constraints from approximately 2025 onwards. This study did not factor the emission and resource consumption reductions that will be required by 2020 or the impact of oil production peak.

### 1.4.2 Low carbon sea-rail link from Dublin to London

Ireland is unsustainably dependant on international air travel for connectivity. This creates high per capita levels of greenhouse gas emissions, and disproportionate risk exposure to future fluctuation in fossil fuel costs or natural events such as a major Icelandic volcanic eruption.

A joint initiative will be negotiated with the UK Government and Welsh Assemblies for a low carbon Dublin-London link extending electrification of rail link from Crewe to Holyhead and procurement of the most emission efficient passenger ferry vessels.

The impact of the spring 2010 Icelandic volcanic eruption highlighted the strategic importance of foot passenger services from Ireland to Britain and France. This was reinforced by the minor May 2011 eruption which curtailed the Barak Obama visit to Ireland.

Based on the nearly 1,000 year historic data on Icelandic volcanic eruptions and older ice core data, there are future unpredictable risks, in duration and time interval for much larger scale eruptions such as occurred in the 1780s, which would be capable of curtailing jet aviation in Europe and the North Atlantic for unquantifiable time periods. It is unclear what future risk factor should be calculated for such an event, whether 1 in 100 years, 1 in 200 years or a larger margin.

There are factors apart from volcanic ash risk, requiring that low carbon sea passenger connectivity should be the single most important marine transport priority for Ireland in order to:

1. Ensure that aviation greenhouse gas emissions are reduced in tandem with all other categories of national and transnational emissions

2. Avoid future exposure of aviation fuel to unpredicted price rise, which would create an unplanned flip to sea passenger demand.

Existing passenger ferry services to Britain and France, are primarily car and roll on and roll off freight services. Ferries are poor in emission standards. There is a need for a new generation of low carbon efficient specifically passenger ferries, with the most efficient achievable land connection to London and other centres. This provides a major co operation opportunity to use the Cross Border and Ireland UK institutions under the Belfast agreement, to a real practical benefit.

#### 1.4.3 National transport investment

A time-tabled implementation of the targets set out in Department of Transport's Smarter Travel Policy 2009 is required.

Smarter Travel: A New Transport Policy for Ireland 2009 – 2020 sets out a series of overriding policy objectives in Chapter 3, summarised as follows:

- 1 Future population employment growths will predominantly take place in sustainable compact forms which reduces the need to travel for employment and services;
- 2 500,000 more people will take alternative means to commute to work to the extent that the total share of car commuting will drop from 65% to 45%;
- 3 Alternatives such as walking, cycling and public transport will be supported and provided to the extent that these will rise to 55% of total commuter journeys to work;
- 4 The total kilometres travelled by the car fleet in 2020 will not increase significantly from current levels;
- 5 A reduction will be achieved on the 2005 figure for Greenhouse gas emissions from the transport sector.

Local initiatives to reduce short car journeys in favour of walking or cycling.

Regional and national initiatives to increase modal share of public transport through investment and traffic management using revenue from carbon tax and parking fees.

National implementation of car parking levy in all commercial and other locations. This would in particular remove the unfair advantage of out of town urban fringe retail in comparison to town centre retail. Limiting of further world investment to minimal bypassing of towns and villages causing bottleneck/congestion. Abandonment further investment inter regional road inter regional motorway/dual carriageway schemes and cross border Dublin-Derry dual carriageway focusing of investment in Greater Dublin Area and other major urban centres on bus priority measures, bus rapid transport and investment in best technology, lower emission buses.

#### 1.4.4 Rail freight and Smarter Travel Policy

Successive transport ministries and CIE Iarnrod Eireann have pursued a deliberate policy of running down rail freight over the last 20 years, reflected in the closure of the Navan Kingscourt freight line in the early 1990s

The Lisheen and Galmoy lead and zinc mines were ill advisedly permitted without requirement for a rail spur. The closure of the Navan Kingscourt freight line in the early 1990s

Iarnrod Eireann failed to exploit the potential of Rosslare Port as a rail based freight hub and has now closed the vital strategic Waterford to Rosslare railway line representing a major strategic failure.

In the overall exercise of its remit CIE Iarnrod Eireann has failed systemically to take leadership as a public transport provider

The objectives on rail freight stated in Department of transport "Smarter Travel" policy are vague and ineffective.

Specific targets in increased of annual tonnage in rail freight is required.

#### 1.5 Electricity generation and heating

##### 1.5.1 Greenhouse Gas Power Generation

Phased reduction of peat and coal for power generation at Moneypoint and 3 peat burning power stations which cessation achieved by 2020.

##### 1.5.2 Domestic and other heating

Ireland faces a particular challenge in reducing levels of greenhouse gas emissions in the domestic heating sector because of poor insulation quality of national housing stock, the higher levels of energy consumed in one-off houses or free standing houses and limited capacity in retrofitting district housing schemes.

Up scaling of national energy refit/insulation programme using government bonds with householder loan scheme for ten year repayment period demonstrating net energy saving over payment of borrowings during this period.

The priority is phasing out of domestic peat combustion from mechanised extraction sources by 2020 with incentivisation of energy insulation alternatives biomass or other renewable sources where appropriate.

##### 1.5.3 40% Renewable energy target by 2020

Ireland faces major challenges in meeting the 2020 40% renewable energy target.

This requires a strategic approach to grid enforcement and wind energy distribution while at the same time minimising impact on biodiversity peatlands and sensitive landscapes.

#### 1.6 Tourism and outdoor recreation

Strategies for promotion of tourism need to minimise aviation dependence because of risk to future cost of fossil fuel and exposure to natural events such as a significant Icelandic volcanic eruption (see section 3.2 under transport).

Investment should focus on encouraging home tourism and recreational activity and maximising visitor numbers to Ireland by sea from Britain and continental Europe.

Tourism investment should be linked with the protection and enhancement of the existing natural and cultural endowment. There are particular opportunities to develop Ireland as a focus for outdoor recreation and in particular walking/hiking, cycling/mountain biking, surfing, canoeing/kayaking.

A number of significant initiatives have been taken such as the cycling/mountain bike trails developed by Coillte in Ballyhoura, County Limerick and the Dublin Mountains, the

development of the Clew Bay cycle way between Westport and Mulranny and the major initiative in the promotion of canoeing/kayaking on the Northern Ireland Waterways.

A key focus is the integration of a tourism investment with local communities and stake holders with parallel benefit in maximising local employment and dispersal of economic input from visitors across a wide spectrum of the community.

## 2 BIODIVERSITY

One of the major agreements at Rio 1992 was the Convention on Biological Diversity. The Convention established three main goals; (1) the conservation of biological diversity, (2) the sustainable use of its components, and (3) the fair and equitable sharing of the benefits from the use of genetic resources. Ireland along with other signatories submits reports on their achievements under these headings. However, An Taisce has a number of concerns about Ireland's efforts to attain these goals and has illustrated some examples under each of the three headings.

### 2.1 The Conservation of Biological Diversity.

#### 2.1.1 Protected areas.

Special protection Areas for Birds (SPAs) and Special Areas of Conservation (SAC's).

Ireland's SPAs and SAC's are designated and protected by the European Birds Directive and the European Habitats Directive respectively as part of the Natura 2000 network established by the European Union in response to the Convention on Biological Diversity. As such, full implementation of EU legislation is seen as integral to Ireland fulfilling its obligations under the Convention of Biological Diversity.

Ireland has the lowest percentage of land protected by SPA's of all EU states bar Malta, though additional areas are being proposed and this is welcomed. However many difficulties exist, with rulings found against Ireland by the European Court of Justice (ECJ) in areas such as, correct designations, failure to correctly transpose important provisions of the Birds Directive and the Habitats Directive, protection of designated sites from pollution and deterioration, etc. All of these failures are in the context of continuing declines in the conservation status of important protected habitats and species. Just over 93% of Ireland's Annex 1 habitats under the Habitats Directive have either a poor or bad conservation status. Many habitat types are classified as being in overall "unfavourable –bad" status. Favourable reference values are the minimum values required for the long term survival of the habitat or species.

#### NPWS and Funding

The National Parks and Wildlife Service (NPWS) is currently preparing Site Management plans for SAC's and Species Action Plans (SAPs) for species of highest conservation concern. A number are already published, which is welcomed. However, the further compiling of management plans and implementation of existing management plans depends largely on the resources available to the NPWS (as well as the extent to which other government departments take on their responsibilities in relation to Natura 2000 site management and protection and their own areas of responsibility, such as planning, forest licensing, and agri-environment support measures).

The 2011 budget cuts for the Department of the Environment Heritage and Local Government were entirely disproportionate in comparison to those for Tourism, Arts and Sport. Particularly significant was the 57% cut in the 'project' funding of the NPWS and 47% cut in the budget of the Heritage Council. This trend of underfunding nature conservation in Ireland needs to be reversed if Ireland is to conserve its biological diversity in line with the EU 2020 biodiversity strategy. This strategy in turn responds to the global Strategic Plan for biodiversity 2011-20207 agreed at the Conference of the Parties (CoP10) to the Convention on Biological Diversity.

Following the last governmental election the NPWS were transferred from the former Department of the Environment Heritage and Local Government to the Department of Arts, Heritage and Gaeltacht. This switching around of Heritage between Departments is something which has happened on a frequent basis following General elections. It swallows valuable resources the reorganisation of Human Resources, Accounting and Communications systems, the design of new websites and new stationery and the disruption of working relationships cost a lot in terms of money and time resources.

#### Cumulative impacts and transparency

An Taisce conducted an investigation into two randomly selected SAC's to attempt to assess the procedure from site selection designation right through to ongoing site protection. One example which illustrates the lack of assessment for cumulative impacts was highlighted in connection with the Forestry Service. All forestry files, for the period of January 2007 to June 2010 in relation to the two SAC's were requested. The Forest Service stated the request was too 'voluminous', they also stated that 'we do not have data stored on an SAC basis' and requested a fee of €3,854.80 in order search and retrieve the files requested. After An Taisce requested an internal review of this decision it was upheld by the Forest Service. Currently the request is being appealed to the Commissioner for Environmental Information.

This indicates that currently afforestation licences in SAC's are being assessed on an individual basis. That the information is not accessible for Forest Service staff in going about their duties seriously compromises their ability to assess potential impacts including cumulative impacts upon designated areas. This deficiency needs to be rectified as it is vital that all sites protected under EU and Irish Environmental Legislation are easily identified by Forest Service staff and easily accessible to the general public, stakeholders and NGO's.

In reality SAC management falls under many different organisations. It is not just the NPWS that is responsible for the conservation interests of a site. The roles of organisations outside the control of the NPWS can influence the conservation status of an SAC. Therefore, responsibility also falls to the Department of Environment, Community and Local Government (DoECLG), DAFF, the Forest Service, Planning authorities (county councils), Inland Fisheries Ireland, etc. A mechanism is needed for developments such as windfarms, strategic infrastructure, forestry, aquaculture, etc to be assessed by different agencies and authorities in a specific area.

#### Salmonoid rivers

In 2005 SAC Rivers throughout Ireland had changes made to the boundaries of the buffer zone required between SAC Rivers and areas outside the SAC from previous levels of 50 – 20m down to 2.5m including all salmonoid rivers. Revising the boundary to a 2.5m buffer zone increases the danger of run-off from agricultural fields getting into the river system. An Taisce considers this change in the law was a retrogressive act which may reduce the conservation status of Ireland's rivers. The possible ramifications for water quality are many fold, one example being the status of protected species such as salmon *Salmo salar*, lamprey *Lampetra planeri*, crayfish *Austropotamobius pallipes* etc

#### Natural Heritage Areas (NHA's) and proposed Natural Heritage Areas (pNHA's)

NHA's are areas that contain flora and fauna, habitats, or geological or geomorphological features which are of interest for their diversity of natural attributes, and which are thus worthy of conservation. These areas are protected under the Wildlife (Amendment) Act of 2000. Currently, only bog NHAs have been granted statutory protection. There are a further 617 pNHAs which still do not have the full legal protection they require although have been proposed since 1995. Many conservation professionals are alarmed by the unchecked destruction of pNHAs across the country.

Protecting NHAs with statutorily awarded NHA Orders is crucial to strengthen the coherence and benefits of Ireland's network of ecosystems and 'Green Infrastructure'; to

protect the functional values and ecosystem services of Ireland's Environment; to buffer against the impacts of Climate Change; to deliver commitments under European Nature Directives; and a worthy task toward achieving Ireland's objectives under Sustainable Development objectives and the EU 2020 biodiversity strategy.

#### Actions required for protected areas

- Complete the designation and protection of Natura 2000 sites in immediate future.
- Set site specific conservation objectives for all Natura 2000 sites by 2012. This obligation is long overdue and needs to be allocated necessary resources and prioritised without further delay. The creation of site specific management plans for all Natura 2000 site would also be welcomed.
- Address the serious problems that exist around planning policy and the effective management of protected areas in Ireland. An Taisce recommend that binding statutory guidelines are produced (with associated training) for Local Authorities and other planning bodies on the protection of species and habitats listed in the Annexes of the Habitats and Birds Directives in order to ensure compliance with the Directives and maintain Favourable Conservation Status of all protected species and habitats.
- Proceed with the designation of pNHA's starting with those which do not need further surveys as identified by An Taisce report NHAs The Case for Conservation.

#### 2.1.2 Wider countryside

##### Biodiversity Forum

Comhar (the Sustainable Development Council) has been abolished and its remit taken over by the National Economic and Social Council (NESC). The Biodiversity Forum as it existed under Comhar was essential to ensure stakeholder involvement in drawing up and implementing the National Biodiversity Plan as required by each country under the Convention for Biological Diversity. No mention has been made to the continuation of the Biodiversity Forum. An Taisce sees this as a step backwards in fulfilling our obligations under the Convention for Biological Diversity.

#### Actions required for the wider countryside

- The Biodiversity Forum should be reestablished as a matter of urgency.
- Urgent action is required as regards habitat mapping for Ireland.
- A National Hedgerow Conservation Plan for Ireland should be realized.
- It is imperative that each Local Authority has a designated biodiversity officer to undertake natural heritage conservation responsibilities.
- More specific actions for forestry are needed.

#### 2.1.3 Transposing EU Directives

The introduction of primary legislation is required to ensure effective transposition of EU Directives on Waste, Water, Air, EIA, IPPC, Birds and Habitats. Excessive use of S.I.'s and regulatory amendments undermines the implementation of effective transposition (see example on EIA assessment below). Where functions are delegates to local authorities the EPA or other statutory body's adequate national oversight is required on implementations.

##### Environmental Impact Assessment (EIA) assessment - Split authorities

A European Court of Justice (ECJ) judgment found that Ireland did not take enough account of sensitive countryside features. The judgment found that the thresholds for undertaking an EIA for certain types of projects, including the restructuring of rural landholdings and water management projects land drainage, were based on high size thresholds alone. Ireland has recently sought to address this with two pieces of recent legislation.

However, in seeking to address this judgment on EIA Directive, compliance in another case should have been addressed. This case related to the lack of proper provision for consent authorities in Ireland to perform EIA, and the issue of lack of integrated assessment in the case of split jurisdictions for consent on different elements of a project. While the case cited the split between planning legislation and EPA functions for EIA, the judgment is applicable to all split consents.

These proposed Department of Agriculture, Forestry and Fisheries (DAFF) Regulations follow SI No 456 of 2011 which creates a new EIA threshold, screening and assessment and consent regime under DAFF. This establishes a new EIA consent function at a time when another case has highlighted the lack of integration between existing EIA consent functions in Ireland. Giving this decision making power to the Minister for Agriculture, Fisheries and Food is contrary to current practice which is to vest such decision-making power in independent decision making bodies. For example, the Minister for the Environment, Community and Local Government's power to grant foreshore licenses is to be transferred to planning authorities and An Bord Pleanála.

#### Actions required for the EU Directives

- Primary legislation should be used to ensure effective transposition of EU Directives.
- All decision-making powers in relation to Environmental Impact Assessment should be given to independent decision making bodies.
- All plans and strategies should be proofed against existing legislation to insure they do not contravene them.

#### 2.2 Sustainable use of the components of biodiversity,

All human activities, including all our economic activities, take place inside, and cannot exceed, the carrying capacity of our environment. The carrying capacity of our environment is dependent on the healthy functioning of our biodiversity and ecosystems. From an economic perspective, numerous attempts have been made to understand the value of biodiversity to humanity in terms of ecological goods and services for instance insect pollination, water regulation and purification, carbon storage.

The Millennium Ecosystem Assessment (MA) assessed the condition of 24 of the earth's natural systems that it considers humanity's "life support systems". It concluded that over the previous 50 years, four of these systems have shown some improvement, fifteen are in serious decline, and five are in a stable state on a worldwide basis, but threatened in some parts of the world. The establishment of the TEEB (The Economics of Ecosystems and Biodiversity) study (<http://www.teebweb.org/>) is another initiative to highlight economic benefits of biodiversity, cost of biodiversity loss and ecosystem degradation, and make practical management recommendations.

Yet other reasons to conserve biodiversity are equally valid and must not be lost in the rush to weigh up its economic value to humans. There is also our ethical responsibility to conserve biodiversity and facilitate a shift toward societal respect for nature. In the words of Richard Frankham "The ethical justifications for conserving biodiversity are simply that one species on Earth does not have the right to drive others to extinction", analogous to abhorrence of genocide among human population".

## Pollination

The value of crop pollination in Ireland by all pollinating insects has been estimated as €53million per year in Ireland. Unfortunately, the current status of Irish pollinators appears to be in decline, with 30% of the wild bees and 18% of butterfly species in Ireland considered threatened according to the International Union for Conservation (IUCN).

## Soil Protection

To achieve food security in face of an ever growing population, Ireland and the world, will require large areas of fertile land. However increasing pressures such as urbanisation, afforestation, industry, erosion and overgrazing are putting soil quality at risk. As yet there is no program to monitor and protect this essential resource in Ireland. In the European Union it has been estimated that soil deterioration costs 38 billion a year, however to date; no such figure appears available for Ireland.

## Flooding

With a predicted rainfall increases of 17% in western areas of Ireland and possibly as much as 25% in places, the importance of adequate flood management is immediate. An Taisce commissioned a report "The Use of Wetlands for Flood Attenuation" which highlights amongst other issues the draining of many small wetlands. "Small isolated wetlands, or 'kettle holes' within a landscape probably have limited storage capacity and flood attenuation potential on an individual basis, but studies show that when many small wetlands occur within a catchment, the aggregate storage capacity may give rise to considerable flood attenuation potential."

## Actions required to protect Ecosystem Services.

- Stricter protection of the wider countryside utilising the natural buffer zones provided by biodiversity in relation to pollination, flooding mitigation etc.
- Future strategies for Flood Risk Management should refer to increasing research into the services of wetlands in flood attenuation and the incorporation of wetland protection and management into flood risk management plans.
- A National Hedgerow Conservation Plan for Ireland should be realised.
- Prioritisation of a national action plan on Green Public Procurement (the importation of illegally felled timber being a particularly significant issue); and detailed actions for ensuring legal protection of Irelands Natural Heritage Areas.

## 2.3 Sharing the benefits arising from the commercial and other utilization of genetic resources in a fair and equitable way

Ireland has not yet signed the Nagoya protocol to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization (ABS) to the Convention on Biological Diversity which is a supplementary agreement to the Convention on Biological Diversity.

## Action to be taken

This treaty should be signed without delay.

## Other issues.

## Aarhus

Ireland has not ratified Aarhus.

## Action to be taken

This treaty should be ratified without delay.

## Summary

An Taisce believes that the principle outcomes of Rio+20 should include:

- A recommitment to fully implement those principles of the Earth Summit 1992 which have not yet been completed, both nationally and internationally.
- To prioritize those principles that have become even more critical, namely biodiversity and habitat loss, measures to counteract Climate Change, eradication of poverty, greater emphasis on Local Agenda 21 and 'bottom up' sustainability measures.
- A firm principle on strong governance and oversight to ensure audit and implementation of the measures agreed.

## APPENDIX I

This document is written in an Irish context but with universal analysis.

## PRICING CARBON AND RESOURCE CONSUMPTION IN GLOBAL TRADE.

The 2007 Stern report identifies the climate change as the greatest ever market failure.

Global trade is operating to a short term economic model which disregards the immediate and longer term impact of climate emissions. The worlds' poorest in Sub Saharan Africa are already victims.

Rich high resource consuming countries have externalised their real emission impact on other countries. One third of total Chinese emissions or half the increase over the last decade is for the manufacture of goods for the developed world, in factory conditions that would not be remotely tolerated in the West. China is becoming a progressively larger extractor of global resources including mineral smelting and extraction in Africa (2009 Carnegie Mellon University).

The up scaling of shipping to develop container vessels the size of oil tankers has made long distance transport such a small element in the cost of global consumer goods and has enabled this mass production of goods from the energy of coal burning power stations of China. Port expansion and the accommodation of larger tonnages of container ships and throughputs directly increases global Greenhouse gas generation in shipping and the manufacture of consumer goods, many of them throw away with a short performance life, leading to unsustainable waste streams.

Future global and national trade models require the full internalisation of the cost of carbon emission generation and resource consumption. This requires that cost must be borne by the end use consumer, and be at a level that a per capita emission level which climate science requires cannot be exceeded.

The imperative of containing nuclear radiation levels within accepted safe levels, must be applied equally to climate emissions.

It is no coincidence that the emergence of this recent enlightenment on the importance of issues associated with sustainable development has coincided with the national economic collapse and the inter-related major challenges of peak oil, climate change, resource scarcity and the persistent degradation of our natural environment and its ecosystem services. There is now a general overwhelming international and national consensus amongst policy makers at all levels of the policy making hierarchy that business as usual is no longer an option, we can no longer afford to continue the pursuit of the failed short-sighted policy approaches of the past and that our collective future must be different.

The international and national economic recession has provided a narrow window of opportunity to take action to concentrate investment and focus policy on the transition to a post-oil low-carbon locally resilient society. This is the major challenge of our time and will require urgent understanding of the nature of the challenges; no shortage of decisive political leadership, a radical change of direction together with robust and, in some instances, policy implementation which will be politically unpopular in the short-term. Through the regulation of port capacity, Dublin Port Company, has the most critical role to play in facilitating this transition.

#### ENERGY DESCENT & CLIMATE CHANGE – THE CHALLENGE

Peak oil and climate change are the interrelated biggest challenges of our time. We are currently experiencing an environmental and resource crisis that places human development at a crossroads. The implications of climate change, peak oil and resource scarcity are becoming increasingly visible and are being exacerbated by economic recession. The effects of these challenges are, and will continue to be, multi-faceted and systemic. Effects include energy price inflation, increased flooding; increases in the cost of resource dependent production; food shortages and other scarcities. These challenges, and the necessary development of policies to address them, are becoming a reality with which society has to learn to live by becoming more localised and resilient.

It is likely that energy price inflation and climate change will also have additional crippling effects on our economy. The 2007 Stern Report, for example, strongly suggests that climate change will result in an average 5-10% loss in global GDP. In addition, protection against flooding and the clean-up costs after extreme weather incidents will place significant burdens on our national finances. The total cost of the major 2009 floods in Ireland was estimated to be €244m (Irish Insurance Federation, 2010). The rising cost of insurance due to the increased risks posed by climate change will also have major implications especially for those on low incomes. In 2010, the Irish Brokers Association stated that Irish homeowners will face insurance premium increases of up to 20% due to flooding (Irish Times, 26/2/2010).

#### Greenhouse Gas Emission Reduction Targets

As discussed above the Planning & Development (Amendment) Act 2010 includes a new mandatory objective as follows:

“The promotion of sustainable settlement and transportation strategies in urban and rural areas including the promotion of measures to

- (i) reduce energy demand in response to the likelihood of increases in energy and other costs due to long-term decline in non-renewable resources,
- (ii) reduce anthropogenic greenhouse gas emissions, and
- (iii) address the necessity of adaptation to climate change

in particular, having regard to location, layout and design of new development.”

Circular (PSSP-4-2010) issued to all Planning Authorities and has determined that the following national policy documents relate to proper planning and sustainable development under section 9(6):

- a) Smarter Travel – A Sustainable Transport Future: A New Transport Policy for Ireland 2009 – 2012 (Department of Transport)
- b) National Climate Change Strategy 2007 – 2012 (Department of the Environment, Heritage and Local Government).

The Government has signed up to the 20:20:20 EU agreement whereby we have a legally binding pledge to reduce greenhouse gas emissions by 20% below 1990 levels and increase energy efficiency by 20% by 2020. The scale of change needed to meet Ireland's commitments is enormous. Ireland's national Green House Gas (GHG) emissions reduction target equates to c.2.5% per year until 2020. Greenhouse gas emissions from the transport sector have risen 170% over 1990 levels primarily due to spatial sprawl.

#### Oil Dependency

Peak oil is a monumental challenge, the impact of which is widely and significantly underestimated, misunderstood and eschewed by official policy makers. Ireland is the seventh most oil dependent economy in the world (O'Neill, 2003). Ireland's primary energy usage increased by 67% between 1990 and 2006 (SEAI, 2008). Further, demand for fossil fuels is increasing, not decreasing.

Ireland is 99% dependent on oil for transport and is amongst the most private car dependent countries in the world. Ireland is also highly dependent on road haulage for freight with only an extremely marginal rail freight infrastructure. The amount of oil used for transportation in Ireland tripled between 1972 and 2002, leaving Ireland consuming at least 50 per cent more per capita than the average of the EU-25 by the end of the period.

There is growing international consensus, as expressed by Macquarie Bank, Goldman Sachs, McKinsey Consultants, the UK Industry Task Force on Peak Oil and Energy Security, the UK Energy Research Council, IHS Herold, OFGEM, ASPO, Global Witness, the International Energy Agency and the Saudi Oil Ministry together with, most recently, Lloyds Bank that the 'era of cheap oil is over' and that serious supply constraints and an oil supply crunch is likely in the short-to-medium term. The Hirsch Report commissioned by the US Department of Energy in 2005 highlights very clearly that the era of plentiful, low-cost petroleum is approaching an end. World demand for oil is predicted to increase by 50% over the period up to 2025 at a time when the world oil reserves are diminishing rapidly and will lead to rapid price inflation and scarcity.

The key issue with peak oil is that it is not an energy crisis so much as a 'liquid fuels' crisis, which will have immediate consequences for the main categories of oil usage, in particular transportation. As Ireland is particularly and increasingly dependent on oil for transportation, we are particularly vulnerable to oil price inflation it is important to start preparing and contingency planning for such an event. The Hirsch Report states: “The peaking of world oil production presents the U.S. and the world with an unprecedented risk management problem. As peaking is approached, liquid fuel prices and price volatility will increase dramatically, and, without timely mitigation, the economic, social, and political costs will be unprecedented. Viable mitigation options exist on both the supply and demand sides, but to have substantial impact, they must be initiated more than a decade in advance of peaking.”

More recently, the International Energy Agency - World Energy Outlook published in November 2009 and again in November 2010 confirmed that oil prices are likely to inflate significantly through to 2030 and the continuation of current energy use trends would have dire consequences for climate change together with huge systemic implications for the economy, society and environment. They would also exacerbate ambient air quality concerns, thus causing serious public health and environmental effects, particularly in

developing countries. The current economic recession is likely to further exacerbate oil price inflation due to lack of current investment in boosting capacity.

We would respectfully refer to the following critical reports, which should be foremost in the consideration in the preparation of the Development Plans:

 A Baseline Assessment of Irelands Oil Dependence - Key Policy Considerations, Forfas, 2006

 Tipping Point: Near Term Systemic Implications of a Peak in Global Oil Production: An Outline Review; Feasta, 2010

 Sustainable Energy Security – Strategic Risks and Opportunities for Business (White Paper), Lloyds/Chatham House, 2010

 Growth Isn't Possible – Why We Need A New Economic Direction, New Economics Foundation/Schumacker College, 2010

As confirmed in the Hirsch Report there is no ready alternative to oil for private vehicle use. In this context, debates over substituting oil with renewables are irrelevant. The widespread replacement of the current vehicle stock with electric powered vehicles is economically and environmentally impractical. The mass production of battery or hydrogen technology capable of the propulsion of electric vehicles, particularly HGVs, is at the very least several decades off and it is most probable that there is no technological solution to this problem. The preferred raw material for the production of batteries, Lithium, is itself severely resource constrained and found largely in highly politically unstable regions of the world. In any event, the mass production of electric vehicles is wholly resource inefficient and the use of increasingly scarce energy for unproductive uses, such as electric vehicles, would be imprudent. Bio-fuels are not a solution as it competes with food for land and drives up food prices. For example, the grain required to fill the tank of a modern car could feed one person for a year.

Accordingly, any rational analysis of future available oil resources and energy resources would result in an inevitable conclusion that further public investment in new air transport infrastructure or road transport infrastructure for use primarily by private vehicles is short-sighted, ill-conceived and an inefficient use of public funds. While we recognise that there remains a considerable straightforward connection in the minds of policy makers and elected members as to the economic benefits of road infrastructure, the overwhelming international evidence clearly indicates that past trends must not be used as a guide to likely future outcomes. Further investment in Ireland in road infrastructure (outside of road infrastructure maintenance) and the shaping of our society and economy around oil based transport (i.e dispersed settlement patterns) will inevitably increase and 'lock-in' our exposure to oil price inflation and undermine the resilience of our economy and society in an era of peak oil and our international greenhouse gas reduction commitments.

-3 w Route Selection Study for a City By-Pass for Oil Vulnerability & Carbon Price Impact Assessment

As compared to other northern European countries Ireland is considered to have significant infrastructural deficits that undermine our national competitiveness particularly in transport and waste infrastructure. The former is largely a result of our laissez faire and malleable land-use regulation and permissive approach to market-driven car dependent dispersed development patterns that were not aligned with appropriate infrastructure investment. The latter is as a consequence of a complete absence of any understanding of environmental carrying capacity and the short-term prioritisation of new development over other public health and environmental interests.

The Capital Investment Programme 2010 - 2016, Transport 21 – much of it dependant on PPP's has collapsed leaving major public transport deficiency.

The Water Services Investment Programme is designed for a now departed era of energy abundance with no consideration given to the future price of oil or carbon. For example, the current energy bill for a large modern waste water treatment plan can be in the order of €2.5 million per annum. No assessment is being undertaken to ascertain whether this huge Exchequer investment is entrenching deep structural vulnerabilities in our society and storing up major problems for the future.

Peak Oil and its impacts is a phenomenon which is we cannot avoid but we should urgently prepare a risk management strategy for its effects. A permanent oil shock is coming and is the biggest threat to Ireland's economy and society. A national "Oil Vulnerability & Carbon Price Impact Assessment" is required to assess the threats to our future from inflated and volatile oil prices together with the future (shadow) price of carbon. This should be undertaken for both capital and operational municipal functions (e.g. sewage treatment, water supply, road developments, road repair, flood defences etc) and of vulnerabilities to the general economy (e.g. increased distribution costs, decline in tourism, retail etc.).

1. BUILDING IRELAND'S SMART ECONOMY 2008

2. The 2008 developing Ireland's Smart economy does not identify high tonnage or bulky exports as a part of the future smart economy.

3. INDUSTRIAL DEVELOPMENT AUTHORITY INWARD INVESTMENT STRATEGY

4. The main industries targeted by the IDA for future development are not dependent on high tonnage capacity. The high exports values generated by Ireland's inward investment boom by multi nationals is in medical devices pharmaceuticals and IT services with a high value to tonnage ratio.

5. DEPARTMENT OF AGRICULTURE, FISHERIES AND FOOD POLICY 2020 FOOD HARVEST

6. The 2010 Department of Agriculture, Fisheries and Food 2020 Food Harvest policy was published without Strategic Environmental Assessment (SEA). The application of SEA and other sustainability considerations means that significant additional export tonnage capacity will not be achievable. Future food security planning will require a significant reduction in current Irish import levels and dependence on fertiliser, grain, animal feed, fruit vegetables and processed foods.

All parts of Irish trade need to be subject to sustainability evaluation. A prime example is the continued government promotion of peat compost export to UK, Europe and Africa, which is coming from illegal extracting sites in Ireland, and failure to screen sources of tropical hardwood import and wood products.

An Taisce submits there is no requirement for additional oil or coal import capacity, since current levels need to be substantially reduced to meet climate emission reduction levels required and reduce unsustainable energy import dependency. The requirement to explore the percentage contribution of truly renewable gas as an important element of our energy solution also needs to be addressed.

The London-based New Economic Foundation (NEF) has carried out considerable work in this area on the UK and accordingly, there is useful guidance in carrying out similar analysis in Ireland. This includes perverse trade for example in foodstuffs where goods of virtually identical type or quality e.g. are exported and imported in similar quantities eg plastic bottled water.

In 2007 the NEF published Chinadependence, which remains equally applicable to the sustainability of Ireland's trade relationship with the world at large (appendix 1)

An Taisce submits that fully transparent information is needed on the nature origin and destination of all goods passing through Irish ports. The suggestion on pages 13 and 14 of the Departments consultation document that "commercial confidentiality" applies is not tenable. The provision of the EU Access to Information on the Environment Directive 2003/4/EC and Aarhus Convention for which Irish ratification is overdue, require this.

## APRODEV and Act Alliance

APRODEV is the network of European development agencies related to the World Council of Churches. This paper expresses the views of the APRODEV Working Group on Climate Change Advocacy. Over the last five years this group has worked with ecumenical organizations like the World Council of Churches and partners in the South to advocate an ambitious, equitable and legally binding climate regime. Being a European network our focus is first and foremost to influence the European Union and Norway

The ACT Alliance is an alliance of more than 125 churches and church-related organisations that work together in development, humanitarian and advocacy, operating in 140 countries around the world. Eighty per cent of members are from the global south. The alliance has over 33,000 people working globally and mobilises US\$1.6 billion annually to enable and empower poor and vulnerable women and men to have sustainable livelihoods, attain economic development and enjoy their human rights. As part of its global climate advocacy strategy, the alliance urges States to take action since climate change is threatening development and affects poor and vulnerable people the most

### Overview

This submission covers issues of:

- A fair green economy: a justice perspective
- Alignment of international agencies and finance
- Political will for raised action on climate change
- Political will for raised action on biodiversity
- Post-MDG framework
- Development finance and tax
- Finance, technology and capacity building to implement Rio+20 outcomes
- Trade and Investment regime
- Changes of consumption patterns and life styles
- Access to sustainable energy
- Supporting sustainable agriculture and food systems

### Rio +20

As ecumenical development and humanitarian organisations we have a broad network of partners throughout the world. We appreciate the opportunity to provide input to the important process leading up to Rio +20 in June next year.

In this submission we will highlight a number of concerns on green economy and global governance in relation to sustainable development, as these are the two themes of the conference. However, we will also address the broader debate about sustainable development by providing inputs to the debate about a possible continuation of the current Millennium Development Goals.

#### A fair green economy: a justice perspective

Global environmental, social and economic crises are forcing us to recognise that we must become better at generating economic activity from resources that are limited. As population and consumption grow, and pressure on limited resources increases, it is necessary to move towards a low carbon and resource efficient green economy that limits consumption to the bio-capacity of the planet.

In meeting the challenges, a pillar of greening the economy must be to eradicate poverty. However, achieving this aim will depend on how the vision of 'green economy' is understood and pursued. There is a wide variation in interpretations of the term, from a focus on green growth: perceived by many southern civil society organisations (CSOs) to risk neglecting poverty and equity; by some private sector actors to be a business model to expand the green market potential; and by many as a vision that puts social equity at the heart of the definition. This diversity of views risks undermining progress towards achieving desired outcomes.

A green economy needs to deliver three main outcomes to win international buy-in: ensuring mankind's ecological footprint is sustainable; maintaining and enhancing natural capital, biodiversity and ecosystem services; poverty reduction and improving human well-being and social equity.

The UNEP definition of a green economy as one that "results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities" is a vision we support. However, it is essential that, in the implementation and monitoring of the green economy model, the objectives of social equity are central, not sidelined as a secondary aspiration.

The current dominant economic model will increase extremes of poverty and disparity between rich and poor if it is allowed to continue unchecked: attempts to shift our economies to a more sustainable and fairer footing are of fundamental importance if efforts tackle poverty, now and in the future, are to have any chance of success.

Our fear now is that developed countries, faced by the current economic crisis and fiscal constraints, will be tempted to 'go for the low hanging fruit' and develop systems that favour middle income countries as a green economy might be well received in these countries. Many of the least developed countries need an economy, green or otherwise, and it would be in the long-term interest of governments, donors, and the world as a whole to develop green economies in those countries.

#### Recommendations:

At Rio+20 governments need to agree to practical steps at the local, national and global level that:

- Ensure that fairness and equity – based on the original 1992 Rio Earth Summit declaration of 'common but differentiated responsibilities' (CBDR) principles – are central to sustainable development.
- Move beyond GDP as the main means to define and measure progress in development to indicators that focus on well-being, human rights and equality, on building social, human and economic wealth, and preserving natural resources.

- Make a fundamental change in economic policies, (i.e. financial markets, trade and investment) from liberalisation to a regulations based policy aiming not just at economic growth but at social equity and respecting the ecological limits.
- Make changes in decision-making structures – recognising that a minority of powerful actors benefits from the status quo while our current economic models don't adequately benefit the vast majority.
- Back a vision of green economy, that makes poverty-eradication, equity and resilience central - not supplementary. This should lay a foundation for the development of a post-MDGs framework.
- Commitment of all States to set up low carbon action plans (for industrialised countries zero carbon action plans) until 2050 (milestones for 2020 2030 2040) as a key tool.
- Commitment of all States to reach the biodiversity targets agreed upon at CBD COP-10 in Nagoya, Japan, in October 2010

Make sustainable agriculture and food core issues in Rio. Give the UN Committee on World Food Security (CFS) a mandate to develop a work plan to implement the IAASTD findings and call for all countries to establish their own structures for following up.

#### Alignment of international agencies and finance

International governance for sustainable development needs to be reformed if we are to make progress on international targets for biodiversity, climate change, poverty eradication and social equity. It is beyond the capacity of agencies charged with achieving development and environment objectives, acting alone, to address these challenges effectively. The impact of trade agreements and instruments; the exercise of power and rights at local and national levels; access to and use of natural resources and land; the functioning of markets; and many other factors must also be recognised and addressed. Reforming institutions, rules and processes is vital, since 'unsustainability' is largely a result of weak or inconsistent governance at all levels (global, regional, national and local).

Governance and economic policies regarding finance, trade and investment are inseparable - we need improved governance of the World Bank and other finance bodies in order for these institutions to be in a position to contribute to a transition to a fair green economy and to sustainable development. The multilateral financing mechanisms should be obliged to contribute to social equity by respecting human rights and the biocapacity of the planet. Investment policies and bilateral investment treaties should be reshaped in a way that investors have clear duties regarding human rights, social equity, protection of natural resources, climate protection and biodiversity conservation. International trade rules, as agreed in the WTO and numerous bilateral trade agreements, have to be reshaped in order to give policy space to national governments to make trade work for sustainable development.

#### Recommendations:

At Rio+20 governments should:

- Work towards enacting a step-change in global institutional co-ordination and coherence – in particular to mitigate, and respond to, resource-related crises and risks, such as the food crisis and climate shocks.
- Press for strong operational principles for sustainable development in the work of multilateral financial institutions including the World Bank and IMF, of the World Trade Organisation and bilateral treaties and agreements.

#### Political will for raised action on climate change

With political leaders in Rio, this is a key opportunity to raise the overall political will for greater action on climate change, to be fed into the current climate talks under the UNFCCC.

As a first step, developed countries need to acknowledge promptly their responsibility for and capability to deal with the climate crisis and urgently commit to providing the required support for climate action in developing countries.

At Rio+20, governments must raise their ambition regarding increased emissions reduction targets and financial commitments, equitable effort sharing, and robust implementation. All countries should acknowledge and commit to the climate talks under UNFCCC, and agree on an intensified cooperation within this framework to fight for climate justice.

#### Recommendations:

At Rio+20 governments should be prepared to:

- Assess 20 years of process since Rio '92 and take stock of existing greenhouse gas reduction commitments and adaptation efforts and raise their ambition respecting CBDR.
- Elaborate national and sub national action plans that substantially improve governance – overseeing progress and supporting implementation – of sustainable development objectives.

#### Political will for raised action on biodiversity

The presence of political leaders in Rio will be a key opportunity to raise the overall political will for greater action on the protection of biodiversity.

As a first step, Governments - especially those of developed countries - need to acknowledge their responsibility for and ability to deal with the crisis of biodiversity and urgently commit to providing the required support for biodiversity protection in developing countries.

At Rio, governments must raise their ambition regarding biodiversity protection and financial commitments, sustainable use and benefit sharing, including robust implementation.

#### Recommendations:

At Rio+20 governments should be prepared to:

- Assess 20 years of process since Rio '92 and take stock of the efforts and results regarding the protection of biological diversity, its sustainable use and the fair and equitable sharing of benefits arising from the use of genetic resources and related traditional knowledge. They should raise their ambition regarding these targets of the Convention on Biological Diversity by respecting the principles of CBDR and the precautionary principle.

- Recommit the obligations agreed to in the Strategic Plan approved at the 10th COP to the Convention on Biological Diversity in Nagoya, Japan, in October 2010.
- Take concrete actions regarding the sustainable use of biodiversity.
- Recommit their respect for the rights of Indigenous Peoples as proclaimed in the UN Declaration on the Rights of Indigenous Peoples.
- Sign and ratify the Nagoya Protocol.

#### Post-MDG framework

It is essential that the new Post-Millennium Development Goals (post-MDGs) poverty reduction framework, to be developed over the coming years, builds on the sustainable development objectives as a fundamental aspect of long term poverty reduction, environment protection and human rights. But history shows that governments may fail to meet the internationally agreed goals. In order to provide an incentive for every government to meet its goals, sustainable development goals (SDGs) should not only refer to the global level, but at the same time be complemented and mirrored by national sustainable development goals for all countries, so that the political will and the real contribution of every country to make sustainability a reality becomes transparent and measurable. This will require the new post-MDGs framework to include indicators of sustainable development, and to recognise the impact which consumption pattern of the wealthy can have on access to and exploitation of natural resources and increased poverty.

#### Recommendations:

At Rio+20 governments should:

- Support the establishment of sustainable development goals reflecting the key areas of sustainable development on a global level.
- Support the establishment of national sustainable goals with a clear contribution to global sustainable development.
- Ensure social and transparent monitoring mechanisms so that governments can be held accountable by their citizens.
- The post-MDG goals need to reflect the responsibility of developed countries regarding the impacts of their actions on the rights to natural resources for poor people.
- Recognise that to achieve the goals in a sustainable manner means that States must address natural hazard risk and vulnerability into development plans.

#### Development finance and tax

G8 countries should keep to their Gleneagles commitments of giving 0.7% of GNI to development. However, even if this were to be achieved, the financing gap is still significant. The Monterrey Consensus committed to mobilising domestic resources for development. By raising the tax to GDP ratio to 15%, developing countries could raise an additional \$198bn. Governments have a responsibility to raise domestic revenue in a progressive and equitable manner, implementing tax policies which reflect environmental externalities and encourage investment in sustainable development.

Illicit capital flows including tax evasion undermine development efforts. Financial secrecy provided by offshore financial centres not only undermines efforts to mobilise domestic revenues, but facilitates corruption. By challenging tax abuse by multinational companies, an additional \$160bn could become available for development.

#### Recommendations:

At Rio+20 governments should reaffirm commitments made in the Monterrey Consensus, the Doha review summit and the UN MDG review summit to:

- "Enhancing and strengthening domestic resource mobilization and fiscal space, including, where appropriate, through modernized tax systems, more efficient tax collection, broadening the tax base and effectively combating tax evasion and capital flight."
- "Implementing measures to curtail illicit financial flows at all levels, enhancing disclosure practices and promoting transparency in financial information. In this regard, strengthening national and multinational efforts to address this issue is crucial, including support to developing countries and technical assistance to enhance their capacities."

In addition governments at Rio+20 should

- Recommend a strengthening of the institutional arrangements supporting the UN committee of experts on international tax cooperation.
- Promote automatic information exchange between tax jurisdictions in an effort to curtail illicit financial flows (particularly offshore financial centres).
- Recommend Country by Country reporting disclosure of financial information by Multinational Enterprises to increase accountability and curb tax abuse.

#### Finance, technology and capacity building to implement Rio+20 outcomes

An agreement from Rio +20 will only be implemented if there is sufficient financial and technological support, as well as related capacity building. For some countries these resources will be found within domestic budgets, but for the vast majority of developing countries support from other countries will be needed. Finance and technological support should be given in light of the principle of common but differentiated responsibilities, and capabilities, acknowledging the historic responsibility related to the current ecological, climate and environmental situation.

Finance for sustainable development is addressed in various fora. Rio +20 should acknowledge that climate finance is addressed within UNFCCC, as an additional source to official development assistance. However, while acknowledging existing sources Rio +20 should also address the additional need for support in relation to the agreements made during the conference. It will therefore be important to also address new and innovative sources of finance such a Financial Transition Tax as well as the role of taxation (stated above).

We have noted that the pre Rio+20 debates in several countries focus on private finance. While we acknowledge that private sector may have an important role to play, we also think it is vital to note existing experiences related to private investments and sustainable development. A good investment will lead to positive spill over effects in the local community, encourage new companies and support capacity building and transfer of skills and knowledge. However, investments may also lead to the opposite, i.e. crowding out of local companies, violations of human, labour and land rights and creating emissions and other negative environmental effects.

#### Recommendations:

At Rio+20 governments should:

- Agree on an ambitious work program to operationalise supplementary and innovative sources of long-term finance and reach agreement on a further set of public sources needed to meet the financing requirements for sustainable development.
- Champion a financial transactions tax for this purpose.
- Confirm the formation of a dedicated funding window for poor countries to access finance for clean energy and low carbon development (a 'leapfrog' fund – see below).
- To create a framework for private finance, hindering negative effects of investments and supporting the positive effects, including local stakeholder dialogues. Trade and investment regime The global trade and investment regime is still focussed on a fossil, growth oriented and unsustainable development path. It needs to be re-oriented in order to make it a facilitator rather than a barrier to sustainable development.

Recommendations:

At Rio+20 governments should:

- Affirm that human rights, the protection of natural resources and nature conservation may never be undermined by trade and investment rules. At the same time safeguards that such a system cannot be used by developed countries for justifying protectionist measures against developing countries shall be introduced.
- Affirm that investors have an obligation to meet human rights and contribute to the protection of resources regardless of investors' rights as now agreed in numerous bilateral investment treaties. In this respect, the participation of the local population on an investment and the conditions for an investment have to be respected and supported by governments and investors.
- Acknowledge that national policy space is essential for meeting sustainable development goals.
- Establish an international mechanism within the UN system to survey and monitor the contribution of international trade and investment to sustainable development and to suggest the necessary amendment of rules that exist inside and outside the UN system.

Changes of consumption patterns and life styles

The global consumption class, which is still predominantly located in developed countries and mid-classes of middle income countries, is largely responsible for the overall unsustainable state of the world. Changing consumption patterns and life styles is less an individual responsibility than governments' obligation to provide a framework that sets incentives to make sustainable life styles attractive. In particular, At Rio+20 governments should:

- Agree to open policy space to discriminate between sustainable and non sustainable products while establishing safeguards that this could not be misused as a tool for economic protection against products vital for the economies and livelihoods of people in developing countries.
- Agree to establish and implement national action plans to strengthen sustainable consumption patterns, including to monitor the impacts and to adapt necessary measures for improvement.
- Agree to initiate an accelerated transition from an economy dependent on growth to a sustainable economy aiming at human well-being, sound use of environmental resources and nature protection.
- Support policies that promote healthy consumption, and reduce its environmental foot print. In most OECD countries this means reducing meat and dairy consumption.
- Pioneer new approaches and technologies to reduce waste in the food system, increase recycling and efficiency of energy and water use.

Access to sustainable energy

About 1.4 billion people globally live without access to electricity and 2.7 billion people cook on open wood, dung or charcoal fires. It is widely recognised that without access to modern energy services, such as electricity and modern fuels, it is highly unlikely that any of the MDG objectives will be achieved. Many developing countries have an abundance of renewable energy sources and have huge scope for improving energy efficiency. In short, they can be supported to leapfrog fossil fuel based economies towards low-carbon sustainable energy.

Access to energy for the poorest parts of the poorest countries will require large amounts of financial transfers in form of grants. Providing rural areas with decentralized grid systems powered by energy from solar, biomass or small scale hydro might not attract private investments as the return is highly questionable. Nevertheless, such projects must be core business of a partnership aiming at energy access for all. Hence, while supporting joint public-private investments to a certain degree and for certain countries, this financial model will have to be supplemented with a grant based system if not the poorest people are to be left behind again.

Recommendations:

- As 2012 is the UN year of access to sustainable energy, agreeing new energy goals to expand energy access to the poorest, shift to renewable, and increase energy efficiency must be a priority for Rio +20.
- The target should be the one set by the United Nations of having universal access to modern energy services by 2030: clean, reliable and affordable energy services for cooking and heating, lighting, communications and productive uses.
- Commit to a 'leapfrog fund' to finance access to sustainable energy initiatives.

Agriculture and the global food system

Agriculture and the global food system are presently causing dramatic environmental problems while failing to feed almost one seventh of humankind. However, this can, and must be turned from a major problem into a part of the solution, contributing to sustainable development. The transition to sustainable agriculture and food systems therefore need to be a core issue at Rio.

Transition from an unsustainable to a sustainable food system

Our current food system is both ecologically and socially unsustainable. It is failing, both in ensuring rights to food and to preserve the ecosystems on which future food production depends. This situation is exacerbated by climate change and other forms of environmental degradation which threaten food production and expose people to new shocks and stresses that deepen poverty.

At Rio+20 governments should commit to

- Implement policies that address the externalities of agriculture and implement the polluter pays principle.
- Implement competition policies to decrease the current concentration of power in food and input markets which is marginalising smallholders and accelerating the loss of biodiversity as well as diversity of agricultural practices.
- Reform agricultural policies so that they promote sustainable agricultural practices and do not undermine food security in developing countries. In the European context this would imply for example a decreased dependency on soy import, which is today putting a heavy ecological footprint on exporting countries while at the same time fuelling unsustainable meat production within the EU.

#### Supporting sustainable agriculture and food systems

Policies must be adopted that give strong and increasing support to small scale farmers and agro ecological and other sustainable and resilient forms of food production that promote poverty reduction and climate change adaptation while preserving ecosystem services for future generations.

At Rio+20 governments should commit to:

- Support the organisation of small scale food producers.
- Secure rights to land and resources of those who depend on them for their livelihood, in particular advance the rights of women food producers.
- Prioritise participatory and farmer-led research, extension and dissemination of agro ecological innovations including locally adapted ('in situ') agricultural technologies and conservation strategies, and the breeding and production of underutilised crops.
- Adopt policies that reduce soil degradation to protect long term food security.
- Strengthen urban and peri-urban food systems.

#### Institutional frameworks

The International Assessment of Agricultural Science and Technology for Development (IAASTD) was initiated Rio+10 in Johannesburg. The findings of IAASTD need to be affirmed at Rio+20, and actions to implement them need to be decided:

- Give the UN Committee on World Food Security (CFS) a mandate to develop a work plan specifying benchmarks/indicators for progress towards the objectives to implement the IAASTD findings and call for all countries to establish their own structures with active inclusion of civil society and mechanism for following up.
- Encourage the establishment of a participatory regular multi-stakeholder panel on agriculture with the mandate to consider the impact of agricultural knowledge, science and technology and IPR on sustainable development.
- Examine and monitor impact of different ways to tackle the climate change challenge (biofuel production, REDD+, CDM, soil carbon sequestration) on local community, food security, and sustainable development and seek out possible remedies.

The principle of common but differentiated responsibilities (CBDR) must be respected, which means that OECD countries have the responsibility to take a lead in the transition to sustainable food systems:

#### Conclusions

APRODEV and ACT Alliance call on the United Nations and the Brazilian government to conduct the negotiations at Rio+20 in an open and transparent way and allow for full participation from civil society.

---

## AquaFed

### Executive summary - Key messages

AquaFed represents private companies of all sizes that operate water and sanitation services under the mandate of public authorities in accordance with a wide variety of business models. Its aim is to contribute to solving water issues through participating to the work of the international community.

Good management of water and sanitation services to the population and the economy is a precondition for sustainable development. It contributes to a green economy; it underpins the three pillars of sustainable development and is also essential to poverty eradication. These are compelling reasons to address water and sanitation challenges in UNCSD 2012.

As practitioners of water supply and sanitation services Private Water Operators believe that the global community should use the opportunity of the UNCSD to make progress on water and sanitation management through making decisions on at least three major water and sanitation challenges: (i) access to sanitation & drinking water, (ii) wastewater management and (iii) sustainable economics. This contribution to the UNCSD zero draft focuses on these three pressing issues which, to a greater or lesser extent, impact countries in both the developing and in the developed world. To a large degree they are interrelated so that progress in one will have a significant impact on the others.

Accelerating access to safe drinking water and sanitation. UNCSD should acknowledge the need for accelerating programmes that aim at improving access to drinking water and sanitation both in rural and urban settlements through: i) recognising the needs of the billions of people without satisfactory access to drinking water (using the criteria of the human right to safe drinking water and sanitation more than half of mankind needs to be targeted); ii) recognising the urgency to reverse the deterioration of water and sanitation services in urban settings where these programmes are outpaced by urban growth; iii) deciding to monitor, both globally and nationally, the quality of water used by people to better identify the current water safety gap.

Sharing a common vision and adopting an action plan for wastewater management. Controlling manmade pollution of water and organising successive uses of water are becoming more and more necessary to protect health of individuals against contamination by others and by economic activities, to support economic development, to protect ecosystems from harmful pollution and to mitigate increasing water scarcity. UNCSD should decide to include the management of man-made water pollution in its global agenda. It should target collection and de-pollution of water after use as well as the organisation of successive uses of water. It should propose to country governments to take appropriate steps to adopt a shared vision of urban, industrial and agricultural wastewater management.

Ensuring sustainable water economics to provide services sustainably. UNCSD should promote the adoption of water/sanitation policies that are grounded on the principles of

sustainable economics. These include predictable public subsidies and affordable tariffs to ensure the Sustainable Cost- Recovery that is necessary for services to be provided sustainably to all users, thus supporting the long term social, environmental, and economic dimensions of green economy and poverty alleviation.

## Introduction

This submission to the zero draft of UNCSD 2012 is made by AquaFed, the International Federation of Private Water Operators. AquaFed is a business-oriented NGO accredited to the UN ECOSOC with consultative status. The Federation represents private companies of all sizes that operate water and sanitation services under the mandate of public authorities in accordance with a wide variety of business models. AquaFed is a membership organisation open to companies from all countries and of all sizes. It currently represents over 300 different companies that provide services to more than 50% of the world's population that is served by private sector operators.

Our aim with this submission is to bring to the attention of the Rio+20 conference some pressing issues concerning the contribution of water and sanitation services to the green economy, a contribution that is essential to Sustainable Development and Poverty Alleviation.

This submission complements the one that we have contributed to Business Action for Sustainable Development (BASD), in which AquaFed is a contributing partner. In that submission, we argue for significant points that affect all sectors of business and industry.

In this submission we focus particularly on the role of water and sanitation services. We have selected three key areas on which we believe the Rio 2012 conference should focus and have not attempted to raise a wide range of subsidiary subjects. In our view all three subjects raised are of pressing importance, irrespective of whether water supply and sanitation services are provided by the public sector, the private sector or informal and philanthropic providers.

The three subjects that we have selected are of pressing importance and, to a greater or lesser extent, impact countries in both the developing and in the developed world. To a large degree they are interrelated so that progress in one will have a significant impact on the others in the context of both Green Growth and Poverty Alleviation. These three areas are:

1. the urgent need to recognise the scale of the challenge posed by the deficiency in the provision of water and sanitation to a large part of the world population and to accelerate significantly efforts to overcome it,

2. the importance of collecting and treating water after use so that it can be used as a resource to meet successive needs and to ensure the protection of the environment and biodiversity,

3. the necessity to ensure that policies for water and sanitation are grounded on the principles of sustainable economics to ensure that services can be provided to support the long term social, environmental, and economic dimensions of Green Growth and Poverty Alleviation.

## 1. Accelerating access to safe drinking water and sanitation

### The challenge

Access to safe drinking water and sanitation is an essential component of sustainable development. The UN have decided to improve this access through the MDG programme. Much is being done in the field with hundreds of millions of people having gained access to safe drinking water or sanitation in the past decade. However, the needs are still very large and the MDG programme is far from addressing all of them. Worse, since the first Rio Summit in 1992, the global landscape has evolved with the emergence of dominating issues such as urbanization, climate change, financial crises or natural disasters that make the challenge of ensuring universal access to safe drinking water and sanitation even more difficult.

Although the safety of the water used by individuals is not yet monitored at the global level, available data show that billions of people need a better access to water supply or to basic sanitation. The situation is critical in the urban half of the world where the programmes that aim at improving access to drinking water and sanitation are being outpaced by the urban growth.

Billions of people are using unsafe water. The current MDG indicator monitors the type of physical access to water sources. According to this indicator significant progress is being made to help people avoid sharing their water sources with animals. The number of individuals having not access to "improved water sources" is now less than 900 million. However, the safety of the water used by people is not yet monitored globally. There are indications that at least 2 billion people use water that is unsafe. It is estimated that more than 3 billion people use water of unknown therefore dubious quality

Even more people have a right to a better access to water. The Human right to safe drinking water requires more than the safety of water. Individuals need water that is also accessible, acceptable, available, and affordable without discrimination. There are no statistics available. However, it is clear that the number of people that should be targeted by the global community exceeds the number of people using unsafe water. Around half of mankind is probably concerned.

Progress of access to sanitation is slow. The global community has a specific MDG goal on basic sanitation, understood as access to private and hygienic toilets. Despite many efforts progress is slow and the 2015 MDG will not be achieved. 2.6 billion people are deprived from private hygienic toilets. In the field of sanitation people need more than toilets. They need their wastewater to be collected and transported safely. They need to be protected from contamination caused by others, etc. The UN General Assembly has called for a 5-drive on sanitation<sup>3</sup> to stimulate acceleration of public policies.

The urgency to stop the deterioration of water/sanitation services in the urban half of the world. In the urban half of the world, despite having provided access to water or sanitation services to hundreds of millions of additional people, the current policies have been unable to prevent the situation worsening.

Comparing the latest figures (2008) with 2000, the initial year of the Millennium Development Goals programme, a clear deterioration is observed. The proportion of the urban population that benefits from satisfactory access to drinking water or sanitation is decreasing<sup>1</sup>. In cities, and towns of all sizes, over those 8 years there has been an increase of: i) 114 million more people without access to tapwater at home or in the immediate vicinity; ii) 134 million more people without access to private sanitary toilets (basic sanitation). In both cases, this means an increase of 20% in the number of individuals living in cities who lack these accesses<sup>2</sup>.

In the meantime, in urban areas, the number of people without access to "improved water sources" (i.e. more or less the sources that are protected from direct contamination) and the number of people without any other option than open defecation has not decreased.

So, in cities, despite all the efforts, overall the world is not making progress in these domains that are essential to life and to social and economic development. There the world is in regression. A surge is necessary to reverse these trends. Obviously, current efforts in rural areas should continue while efforts in urban and peri-urban areas should be stepped up to prevent worsening the situation further.

### More ambitious policies are needed

Access to safe drinking water and sanitation is a challenge that concerns the needs of more than half of mankind. Through their MDG programme, the UN have focused their

efforts on part of this challenge. However, the important efforts being made are not sufficient. People need more than what is monitored by the MDG indicators, progress on basic sanitation is too slow, the situation is deteriorating in the urban half of the world and existing monitoring tools are not sufficient to monitor progress. An acceleration of public policies is needed and the UN should revise their common goals to adopt more ambitious targets on access to safe drinking water and sanitation.

Key action message – Acknowledging the needs for more ambitious policies

UNCSD should acknowledge the need to accelerate programmes that aim to improve access to drinking water and sanitation both in rural and urban settlements through: i) recognising the needs of the billions of people without satisfactory access to drinking water (using the criteria of the human right to safe drinking water and sanitation more than half of mankind need to be targeted); ii) recognising the urgency to reverse the trend towards deterioration of water and sanitation services in urban settings where these programmes are outpaced by urban growth; iii) deciding to monitor, both globally and nationally the quality of water used by people to better identify the current water safety gap.

## 2. Sharing a common vision and adopting an action plan for wastewater management

The challenge

Sanitation includes several components: basic sanitation, wastewater management through individual or collective facilities, stormwater management and solid waste management.

Controlling man-made pollution of water and organising successive uses of water are becoming more and more necessary to protect health of individuals against contamination by others and by economic activities, to support economic development, to protect ecosystems from harmful pollution and to mitigate increasing water scarcity.

Management of water after use is an essential sanitation activity that contributes to social and economic development as well as to environmental protection. It contributes to sustainable development, to the green economy and to poverty alleviation.

However, for more than half of mankind, wastewater is not collected safely and 80% of wastewater is not de-polluted before re-use or discharge into nature which leads to an increasing pollution of rivers, lakes, aquifers and seas. Countries have very different wastewater policies.

An initiative on waterborne pollution and water reuse would fit perfectly with the Rio+20 objectives on the green economy in the context of sustainable development and poverty eradication

Management of water after use is an essential sanitation activity that contributes to social and economic development as well as to environmental protection, all three components of sustainable development. This is why it deserves consideration in every global summit on sustainable development.

The Rio+20 Conference will focus on the green economy in the context of sustainable development and poverty eradication. Wastewater management fits perfectly with this goal from the perspective of water uses since controlling man-made pollution of water facilitates economic development by making water reusable, contributes to protecting ecosystems. It prevents individuals from being contaminated by others or by economic activities and thus facilitates their integration into the national economy.

Furthermore, there are many linkages with other green growth activities since wastewater management creates opportunities for using water as:

- a source of energy through burning sludge extracted from wastewater, using calories transported by the wastewater or using wastewater flows to produce hydroelectricity,
- a source of water and also a source nutrients for agriculture that both contribute to solving the food crisis,
- a source of water that contributes to mitigating increasing water scarcity,
- a source of health for individuals and ecosystems,
- a way to control the emission of gases by the biological pollution included in water,
- a way to enhance property values and encourage the development of tourism because polluted water bodies impair these activities. Recent publications by WHO and OECD have confirmed the high economic rate of return to a national community of investing in wastewater management.

The global strategy on sanitation is incomplete

Up to 2002, sanitation challenges were largely ignored by the international community. In 2002, the Rio+10 Summit in Johannesburg sparked a revolution on sanitation. Governments decided to add a Millennium Development Goal on sanitation. At the time the perceived priority was basic sanitation, i.e. access for individuals to decent toilets and to evacuation of water after use from households. However, for many years sanitation has remained a word added to water in global declarations. Only in 2008 did sanitation gain full respect thanks to the International Year on Sanitation. Although progress on basic sanitation is too slow, the 2002 decision has permitted a complete change in the status of sanitation in the international community. On the 21st of June 2011, the day of his reelection, the UN Secretary General launched a 5-year drive on sustainable sanitation, and in his address to journalists mentioned that eliminating open defecation is part of his job.

The 2000 resolution only did part of the job on sanitation. Sanitation, in all its components, is needed by human beings and the planet. They need more than basic sanitation. They also need man-made pollution of water to be controlled to protect health of individuals against contamination by others and by economic activities, to sustain economic development, to protect ecosystems against excessive pollution and to mitigate increasing water scarcity.

Year after year it has become clearer and clearer that Governments need to harmonise their views and adopt coherent policies on wastewater management. This area is so underestimated that global knowledge of wastewater management is very scarce if not completely absent. There are no global statistics on wastewater collection and reuse. The absence of any global monitoring tool is a good indicator of the absence of shared thinking on the matter.

However, some moves have begun. On 22 March 2009, governments that participated in the Istanbul 5th World Water Forum declared their will to "strengthen the prevention of pollution from all sectors in surface and groundwater, appropriately applying the polluter pays principle, while further developing and implementing wastewater collection, treatment and reuse". On 20 December 2010, the UN General Assembly made a resolution on the follow-up of the International Year of Sanitation, 2008. That resolution "encouraged all States, as well as the United Nations system and international organizations and other stakeholders, to approach the sanitation issue in a much broader context and encompass all its aspects, including hygiene promotion, provision of basic sanitation services, sewerage, and wastewater treatment and reuse in the context of integrated management of water resources."3

The Rio+20 summit could usefully complete the partial resolution on sanitation made in the Johannesburg Rio+10 summit that was limited to basic sanitation. The Rio+20 summit should develop a common vision and adopting an action plan for wastewater management to ensure satisfactory control of man-made pollution of water and successive uses of water.

## Key action message – Sharing a common vision and adopting a common action plan for wastewater management

Controlling man-made pollution of water and organising successive uses of water are becoming more and more necessary to protect the health of individuals against contamination by others and by economic activities, to support economic development, to protect ecosystems from harmful pollution and to mitigate increasing water scarcity. UNCSO should decide to include the management of manmade water pollution in its global agenda, targeting collection and de-pollution of water after use as well as the organisation of successive uses of water. It should propose to country governments to take appropriate steps to adopt a shared vision and action plans for urban, industrial and agricultural wastewater management.

### 3. Ensuring sustainable water economics to provide services sustainably

#### The challenge

The social, environmental and economic benefits of providing water supply and sanitation to people and businesses and of collecting and treating water after use are far more significant than is normally recognised. Water, sanitation and pollution alleviation are often seen as matters that are expensive and politically unattractive. In the case of both Green Growth and Poverty Alleviation this needs to be understood differently. These activities provide very significant direct and indirect benefits, to individuals, economies, and environment. They contribute significantly to national wealth, societal wellbeing and protection of natural capital. They also eliminate broad areas of avoidable direct and indirect costs, which hold back Green Growth and Poverty Alleviation.

Reliable and efficient water and wastewater services and pollution control systems are a clear indication of a stable and well governed society. These services enable people to enjoy productive and healthy lifestyles, to benefit from education and employment and to live in environments that are attractive and rich in biodiversity.

In order to deliver these benefits, these services have to be established and operated on a sound economic basis. They need sufficient and predictable revenue to ensure that capital investment, operating costs and renewal and maintenance expenditure are covered adequately over the longterm.

Sustainable economics of these public services can only be achieved through the communities that benefit contributing to the costs. This can be done through cash flows based on tariffs charged to users, taxes levied on the community, or some combination of the two. Additional financing from transfers from national or international budgets can be useful to provide temporary injection of funds, but it is not sustainable over the long term. These three mechanisms, tariffs, taxes and transfers (the 3Ts) are the fundamental elements of sustainable cost recovery. When stable and predictable cash flows are established using these tools, additional repayable finance in the form of loans from international financial institutions or commercial banks can be mobilised. These processes combined are often referred to as "sustainable cost recovery (SCR)", which is to be distinguished from "full cost recovery", which may be socially or politically unattainable.

Some of the economic justifications for ensuring adequate financing for the provision of water, and sanitation and de-pollution are as follows:

- o Reliable access to satisfactory water and sanitation services eliminates the "coping costs" that are necessary when the services are inadequate or unavailable. Studies show that coping costs can reach 20% of household incomes. Poor households are usually the most seriously affected and burdened by coping costs.
- o Water, sanitation and pollution prevention are powerful and effective tools for public hygiene and preventive health. Water-borne diseases are among the most common causes of death and disability and are almost entirely preventable. The WHO estimates that about half the hospital beds in the developing world are taken up by people suffering from water related diseases. The cost of providing and maintaining a hospital per bed is many times that of delivering a water and sanitation service. Water and sanitation investments are therefore very cost effective solutions for public health.
- o The loss of educational opportunity related to lack of adequate water and sanitation services is serious handicap in many cases. The costs of this are considerable to both individuals and the economy of a country as a whole.
- o Poor education and poor health that result from lack of adequate water, sanitation and pollution removal have serious implications for employment, productivity and purchasing power and therefore directly affect societal wellbeing and economic performance.
- o Access to water and sanitation services has a positive impact on property values, while polluted water bodies reduce values.
- o Clean water bodies and clean environments are more attractive and have richer biodiversity, which give rise to better human wellbeing and to economic activities, notably leisure and tourism industries.
- o The positive benefits of water, sanitation and de-pollution on the economy improve the tax revenue base for the government. The net benefits outweigh the costs by a considerable margin.

#### Key economic principles resulting from our experience in the field

<sup>[4]</sup> The sustainability of all water and sanitation services is dependent on sound economics. This means having sufficient and predictable flows of cash to enable the costs of operation and maintenance to be covered, investments to be planned and their costs to be repaid.

<sup>[4]</sup> Assuring the sustainable financing of water and sanitation infrastructure and operations is essential to ensure that all the other benefits and policy objectives delivered by these services can be realised. Sustainable financing must therefore be considered a pre-condition to other policy objectives.

<sup>[4]</sup> In the vast majority of cases it is a political responsibility to set the prices or cost recovery mechanisms for water, sanitation and de-pollution services. These cost recovery systems need to be set with a realistic relationship to the real costs incurred in delivering the services, irrespective of the nature of the service supplier (public, private or other).

<sup>[4]</sup> Failure to ensure sustainable financing of water, sanitation and de-pollution leads directly to a vicious downward spiral of failing services and increasing costs to consumers, society, the economy and the environment.

<sup>[4]</sup> Affordability must be tackled in a structured way identifying, both affordability for individual users, and for the community as a whole (macro-affordability versus micro-affordability). The structured decision making of SCR enables decision-makers to see the risks and benefits of alternative subsidy policies and minimise adverse consequences of subsidy payments.

<sup>[4]</sup> Setting water service prices for a whole community on the basis of "ability or willingness to pay" of the least affluent is a trap to be avoided. Prices should be set on the basis of covering the costs to provide services to the average consumer, with special provisions to support those who are truly unable to pay that price.

<sup>[4]</sup> Without SCR the newly recognised right to water and sanitation is an empty promise. The misconception that the poor cannot pay leads to their exclusion by default and creates even greater costs for them. Failing to provide them a proper service for which they will pay less is unfair. There is no disconnect between SCR and extension of

access to the poor.

National and local policies to drive more sustainable water economics

The UNCSD is an opportunity to take steps towards more sustainable economics of water and sanitation services. Key elements of national and local policies include the following ones:

- a) Water services should be prioritised in public budgets, recognising the extensive benefits they provide to the objectives of Green Growth and Poverty Alleviation.
- b) Water services should be paid for on a sustainable basis by the communities that benefit from them. Decision makers should determine how this is done by applying the principles of Sustainable Cost Recovery (SCR) which combines predictable subsidies and affordable payments by users.
- c) The policies and processes for setting and regulating cost recovery and charging mechanisms for water services should be applied on the same basis for all forms of service operator within the jurisdiction.
- d) Specific provisions for assessment and targeting of support to people who have difficulty to pay should be set up in ways that do not undermine the overall economic viability of the service provision to the whole community.
- e) Specific policies are required to show to all stakeholders the objectives and processes used in deciding on a particular SCR scheme. These should be reviewed and adjusted periodically as conditions evolve.

We believe that these elements are present fully or partly in many national policies. UNCSD should promote their use in all countries to ensure that water economics are sustainable everywhere.

Key action message - Ensuring sustainable water economics to provide services sustainably. UNCSD should promote the adoption of water/sanitation policies that are grounded on the principles of sustainable economics. These include predictable public subsidies and affordable tariffs to ensure the Sustainable Cost-Recovery that is necessary for services to be provided sustainably to all users, thus supporting the long term social, environmental, and economic dimensions of green economy and poverty alleviation.

## Arab Forum for Environment and Development (AFED)

### ARAB ENVIRONMENT.4

#### GREEN ECONOMY: SUSTAINABLE TRANSITION IN A CHANGING ARAB WORLD EXECUTIVE SUMMARY

Arab economies have underperformed over the past four decades. Arab countries have adopted aggressive economic growth models, but in doing so have gravely undermined progress on social and environmental issues. The ensuing forms of poverty, unemployment, food and water security threats, and environmental degradation continue to plague Arab economies. These shortfalls are not necessarily borne out of natural limitations. Rather, they are the outcomes of policy choices. The shortcomings in the performance of Arab economies have also significantly contributed to deteriorating social conditions. The persistent poverty and unemployment have led to social marginalization, which is further compounded by income disparities. The aggregate impacts of these shortfalls have caused social and political instability. Demands for change across Arab countries reveal that the mounting economic, social, and environmental strains and the resultant implications on livelihood security have become unsustainable.

This report of the Arab Forum for Environment and Development (AFED) advocates a development model rooted in a green economy. A fundamental tenet of a green economy is giving equal weight to economic development, social equity, and environmental sustainability. This report argues that meeting these three goals provides a sound foundation for addressing the shortcomings of Arab economies, from curbing poverty and unemployment, to attaining food, water, and energy security, to achieving more equitable forms of income distribution. Moreover, a green economy places great emphasis on the efficient use and deployment of natural assets to diversify the economy, which in turn provides immunity against the volatilities and recessionary pressures of the global economy.

The systemic strains caused by Arab development models can be appreciated by examining indicators across a range of dimensions. Poverty continues to afflict 65 million people in Arab countries. Economic insecurity is further aggravated by disturbingly high unemployment rates of 14.8% for the general population, reaching 27.3% among the youth. Collectively, these economies have scored less than a 0.5% rise in real gross domestic product (GDP) per capita from 1980 to 2004. These figures cast doubt on the ability of Arab economies, as currently structured, to create 51 million new jobs projected to be required by 2020, just to accommodate new entrants into the work labor force, while keeping current unemployment rates the same.

Arab development strategies continue to be dominated by investments in extractive commodity products earmarked for export markets. These industries require high initial investments but generate low levels of employment. Despite generating high GDP growth, this model leaves Arab economies more vulnerable to global market volatilities, while failing to significantly create jobs. The lack of income diversification is a primary cause of the structural weakness of Arab economies.

#### SHORTFALLS OF ARAB DEVELOPMENT MODELS

The state of water resources is nearing a crisis in most Arab countries, driven mostly by policies that encourage over-consumption and tolerate over-exploitation of the scarce water resources available, leaving future generations to pay the price of current policies. In Arab countries today, more than 45 million people accounting for 10% of the population lack access to clean water and safe sanitation.

Food security poses another major threat to Arab countries, driven primarily by negligence and underdevelopment of the agricultural sector, resulting in poor agricultural productivity, low irrigation efficiency rates, and weak extension services to farmers. The net import bill for the main food commodities was \$30 billion in 2008, including \$18.3 billion for cereals. The escalating food import bills cause large trade deficits, strain the public budgets of Arab countries, and make them vulnerable to export bans by other countries.

Arab economies continue to unsustainably deplete renewable natural resources, motivated by short-term profits, causing environmental impoverishment of scarce land and water resources while discounting the value of these resources to future generations. The average annual cost of environmental degradation in Arab countries has been estimated to be \$95 billion, equivalent to 5% of their combined GDP in 2010.

Nearly 60 million people in Arab countries lack access to affordable energy services, limiting their opportunities for improved living standards. Energy security is becoming a serious concern for oil-importing countries because of high oil prices. A number of Arab economies are among the least energy efficient in the world, measured by their annual CO2 emissions per capita and per unit of GDP. With the demand for electricity escalating in these countries, the policy of building more power plants and providing energy

subsidies will no longer be economically sustainable.

Transportation policies in Arab countries have focused primarily on highway and road construction rather than on mass public transit. The lack of effective intervention policies in the transportation sector has resulted in serious traffic congestion in urban centers, poor air quality in many cities, and land degradation.

Cities in the Arab region suffer from chaotic land-use patterns and excessive urban sprawl, leaving infrastructure systems incapable of adequately supporting their populations. Rural-to-urban migration and high housing costs in many Arab cities have contributed to the spread of slum areas, characterized by inadequate - if not entirely absent - basic services.

Energy and water use in the existing building stock across the region, and in particular in commercial and public buildings, is alarmingly inefficient. The internationalized approach to architecture and construction in the region is insufficiently attuned to the local climatic conditions, resulting in wasteful use of energy.

The waste management sector in Arab countries is characterized by underdevelopment, underinvestment, and high-risk waste dumping practices. The sector is plagued by insufficient regulations and weak waste disposal standards. In many Arab countries, over 50% of all waste generated remains uncollected. Open-air burning is often used at dumpsites, allowing decomposing waste products to pollute the air, soil, and ground and surface water.

#### CHANGING COURSE: TRANSITIONING TO A GREEN ECONOMY

Making the transition to a green economy will require a fundamental review and redesign of public policies to stimulate shifts in production, consumption, purchasing, and investment patterns. The chapters of this report present proposed enabling policies and conditions that will be needed to transition to a green economy across eight priority sectors. The report calls upon Arab governments to prioritize agricultural rural development as a strategic policy objective to alleviate rural poverty and reverse years of neglect. Such a policy shift would enable farmers, aided by well-designed extension services, to improve seeds, irrigation efficiency, soil conservation, agricultural yields, and sustainable practices. Revitalizing the agricultural sector will increase its share in the productive labor force, improve living standards, and limit rural to urban migration. A shift to a 40% share in the labor force by agricultural workers in the Arab region would generate more than 10 million jobs in the sector. In addition, shifting to sustainable agricultural practices is expected to result in savings to Arab countries of between 5-6% of GDP, amounting to about \$100 billion annually, as a result of increased water productivity, improved public health, and better-protected environmental resources. Policy shifts in the water sector must begin with the introduction of institutional and legal reforms that affect water use, regulation, and governance. Arab states need to concentrate on policies that control and regulate water access, promote irrigation and water use efficiency, prevent water pollution, and establish protected areas vital to water resources. Volume of wastewater treated should increase from below 60% today to a 90-100%. The portion of treated wastewater which is reused should increase from 20% today to 100%. Innovative technologies for water desalination should be developed locally, incorporating the use of solar energy.

For the energy sector, the report proposes sustained investments in energy efficiency and in renewable energy sources through a mix of regulatory standards and economic incentives. A reduction in the average annual per capita consumption of electricity in Arab countries to the world average through energy efficiency measures would generate electricity consumption savings that are estimated in monetary terms to reach \$73 billion annually. A 25% reduction in energy subsidies would free up over \$100 billion over a three-year period, an amount that can be shifted to finance the conversion to green energy sources.

Arab countries should develop low-carbon industrial development strategies motivated by the opportunity to become energy-efficient economies. This would enhance local industrial competitiveness, income diversification, and job creation. The viable reduction in energy requirements per ton of product is estimated to be in the order of 30%. For example, energy efficiency enhancements in cement manufacturing can reduce energy consumption per ton of cement by 20% to 40%, leading to a cost advantage to the producer through lower energy costs.

One of the most important measures to reduce emissions is deploying the most efficient production technologies in new plants and retrofitting energy efficiency equipment in existing plants where it is economically viable. A 30% reduction in energy requirements due to more efficient industrial processes is estimated to result in annual savings of 150,000 billion kWh or \$12.3 billion.

For the transportation sector, the report argues for policies in favor of mass public transit systems and vehicle fuel efficiency standards. These policy interventions have been demonstrated to have a relatively low cost while yielding high economic, social, and environmental dividends within a short period of time. The benefits would include the provision of dependable, affordable, and safe transportation services that are energy efficient, while minimizing pollution, congestion, and unmanaged urban sprawl. A projected target of 50% greening of the transport sector, resulting from higher energy efficiency and increased use of public transport and hybrid vehicles, should generate savings of \$23 billion annually. To create healthy and economically competitive urban communities that offer a high quality of living for their inhabitants, the report advocates for the adoption of zoning regulations and mixed-use development. Moreover, traditional design approaches in Arab architecture, which are in many cases more responsive to environmental considerations, should be adapted and applied where relevant and appropriate, thus contributing to environmental, social, and cultural sustainability. For buildings, a holistic design approach that incorporates environmental principles in building form, materials, orientation, equipment installations, and other aspects is proposed to yield the highest energy efficiency gains. Building efficiency codes and standards are seen as the most effective institutional levers for influencing construction practices. Integrating energy efficient considerations in the design of buildings is expected to result in a reduction of about 29% of projected CO<sub>2</sub> emissions by 2020, which would cut consumption by 217 billion kWh and generate savings of \$17.5 billion annually. In addition, spending \$100 billion in greening 20% of the existing building stock in Arab countries over the next 10 years, by investing an average of \$10,000 per building for retrofitting, is expected to create four million jobs.

The report argues that there is an urgent need for a fundamental shift in the approach to municipal solid waste from waste dumping, burning, and/or land filling to a resource management approach that seeks to capture value from waste materials through reduction, reuse, recycling, and recovery. It is estimated that greening the waste management sector would save Arab countries \$5.7 billion annually. Green waste management contributes to job creation because it is labor-intensive and stimulates the demand for products, systems, and services in other industries. Moreover, it offers unique investment opportunities in recycling, composting, and energy production. Organic food waste, which accounts for 40-80% of municipal waste in Arab countries, can be used as a raw material to produce compost for agricultural use and biogas to replace fossil fuels. Agricultural waste can also be used as a potential raw material for biofuels production. In Arab countries today, mainstream economic planning is still anchored in short-term GDP growth and quick fixes, while disregarding the underlying causes of poverty, inequity, unemployment, and environmental degradation. It is clear that to date, the policy response to these shortfalls and associated disparities in income and power has been extremely inadequate.

This report advocates a response anchored in a transition to a green economy. It argues forcefully that the region does not have to choose between economic development, social equality or healthy ecosystems. By design, the green economy seeks to achieve economic, social, and environmental policy goals. The transformative changes called for in this report will require shifts in economic policies and systems.

Making the transition to green development is not a one-time event that can be achieved by a single high level decision. Rather, it must be viewed as a long and arduous process guided both by top-down policy prescription as well as bottom-up public participation. This approach gives transition the political and social legitimacy needed to ensure wide-scale mobilization of efforts to make it a reality.

## Recommendations – Draft 28/10/2011

The Arab Forum for Environment and Development (AFED) held its fourth annual conference in Beirut on 27-28 October 2011, dedicated to discussing the transition to a green economy in the Arab world. The conference, held under the patronage of His Excellency the President of the Republic of Lebanon General Michel Sleiman, has brought together 500 delegates from 46 countries, representing corporations, nongovernmental organizations, academia, research institutions, and media organizations. Ministers and representatives of governments and international institutions have participated as observers. At the conference, delegates deliberated the findings and recommendations of the AFED report, *Green Economy in a Changing Arab World*, which advocates development patterns that achieve balanced progress across the economic, social, and environmental dimensions, while sustaining natural capital. The report communicates a set of enabling policies for making a transition to a green economy across eight key economic sectors in a manner that achieves economic growth, social equity, and environmental sustainability.

The conference endorsed the following conclusions and recommendations:

- 1) The conference agrees with the AFED report that forward-looking Arab economic development models need to meet people's aspirations in economic security, social equity, resource efficiency, and environmental protection. The findings of the report indicate that deterioration in economic, social, and environmental conditions has generated systemic strain on livelihoods, health, and human wellbeing, and may even lead to more social and political turmoil. The conference also agrees that the strategy of pursuing fast growth in gross domestic product (GDP) while neglecting or undermining sociopolitical and environmental conditions, needs to be fundamentally reconsidered.
- 2) To achieve the transformation to a green economy, public and private investments should be directed at maximizing resource efficiency and productivity of energy and water, reducing waste and pollution, securing new growth engines through research and development of green technology, and the sustainable management of local, natural, and cultural assets that boost the local economy and the capacity to create jobs and support the poor. 3) The conference calls upon Arab governments to:
  - a) Allocate a higher priority to agricultural rural development as a strategic policy objective to achieve food security, alleviate rural poverty, and reverse years of neglect. Agricultural strategies should be focused on maintaining the sustainability of surface and ground water, improving irrigation efficiency, raising the productivity of rain-fed crops, facilitating trade in agricultural commodities and virtual water, supporting eco-agricultural methods protective of soils, land, and water, and increasing agricultural investments for development, rehabilitation, and research.
  - b) Introduce a policy shift towards water demand management that would regulate water access, improve water use efficiency, and prevent water pollution. Governments are urged to introduce fair water tariffs that rationalize water use, achieve cost recovery in a gradual manner, and promote equity through targeted subsidies. Wastewater treatment rates should be increased from the current figure below 50% to over 90% and water reuse from the current 20% to almost 100%. Local development of innovative desalination methods that utilize primarily solar energy should be actively promoted.
  - c) Adopt national and regional strategies for energy efficiency, demand-side management, cleaner energy, and renewable energy. To manage energy demand growth cost-effectively, governments should mandate and enforce energy efficiency standards and labels in residential and commercial buildings, industrial facilities, modes of transportation, and for electrical appliances and lighting. Governments should also reconsider broad electricity, petrol, and natural gas subsidies to take into account economic incentives that spur investments in energy efficiency, clean energy, and renewable energy technologies. Targeted subsidies should be used to assist low-income households.
  - d) Introduce municipal zoning regulations that promote mixed-use development, high-density land use patterns, open green spaces, and accessible public transportation networks.
  - e) Develop a national industrial policy that provides appropriate and favorable institutional and regulatory framework for low-carbon industries and research and development (R&D) capabilities.
  - f) Make sustained investments in mass public transportation in Arab cities and in regional rail lines to transport freight and people within busy corridors, locally, nationally, and regionally. Government agencies should ensure that transportation and urban planning are well integrated. Governments should adopt national fuel efficiency standards for vehicles and reduce in a gradual manner vehicle fuel subsidies, while introducing incentives for the replacement of ageing, polluting vehicles with new higher fuel efficiency vehicles, and applying a taxation system proportionate to emissions and fuel consumption.
  - g) Adopt a resource management approach to municipal solid waste that seeks to capture value from waste materials through reduction, reuse, recycling, and recovery. Governments should promote investments in converting organic food waste into compost and biogas, as well as waste-to-energy strategies.
  - h) Develop a package of policy instruments, including regulations, incentives, and capacity building to implement sustainable tourism practices in travel, hospitality, and recreational services. Government should give particular attention to ecotourism as well as community-based cultural tourism to help in nature conservation and to support local economies.
  - i) Promote, through a mix of economic incentives and publicly sponsored research programs, opportunities for the private sector to assist in developing locally-based competitive green technology as an economic engine for growth.
  - j) Commit to re-education of the workforce to develop the knowledge base for implementing green initiatives and to build innovative capacity within the local supply chains to meet the demand for green materials, technologies, and services.
  - k) Strengthen the institutional capacity of national government agencies, municipal councils, and local governments to mandate and enforce efficiency codes, standards, labels, and regulations, and to develop effective economic public incentives that enable green transformation in all sectors.
  - l) Launch sustained public awareness campaigns to cultivate understanding of the green economy and motivate behavioral changes in consuming, purchasing, and investment patterns. Civil society, including non-governmental organizations, academia, and private sector groups should be included in green economy planning and transformation.
- 4) The conference calls upon regional organizations and governments to activate the Arab Environment Facility and establish regional green economy initiatives, covering:

Research and Development, Renewable Energy Solutions, Sustainable Communities, Cleaner Production, Sustainable Agriculture, Regional Transport Networks.

5) The conference recommends that AFED provide technical assistance to various sectors in Arab countries to transition to a green economy upon request. This may be in the form of seminars, training, policy design, and implementation of pilot projects on the ground.

6) The conference calls upon private industrial enterprises to deploy the most efficient production technologies in new plants and retrofitting energy efficiency equipment in existing plants where it is economically viable, in order to maximize the resource productivity of energy, water, and materials and minimize pollution. Industrial companies are also urged to invest in distributed solar and wind power generation on-site when appropriate.

7) The conference calls upon private developers and regionally based professionals in architecture, construction, building materials, and engineering to increasingly accord energy and water efficiency a high priority and make use of green solutions in buildings. Additionally, they are urged to apply traditional design approaches in Arab architecture that are known to be more responsive to local environmental elements and to indigenous cultural and aesthetic values.

8) The conference calls upon real estate developers, commercial building owners, and large resort enterprises to accord energy and water efficiency a high priority in the design and operation of buildings and hotels and to take advantage of the economic viability of solar water heating.

9) The conference calls upon non-governmental organizations, academia, and the private sector to cooperate fully in the implementation of these recommendations.

The conference wishes to thank the Arab Forum for Environment and Development (AFED) for its constructive initiative of promoting an Arab green economy, and requests it to present the recommendations to all Arab governments and other stakeholders, and to the United Nations Conference on Sustainable Development Rio+20. The conference invites the AFED Board of Trustees to consider means of following up the implementation of the annual conferences' recommendations, and to present the outcome at AFED's fifth annual conference. The conference expresses its gratitude to the Lebanese government for hosting the event. It offers its appreciation to all sponsors for lending their support for the convening of this conference.

## Area Cultura Sostenible

APORTACIONES DEL CENTRO CULTURAL RECTOR RICARDO ROJAS, SECRETARÍA DE EXTENSIÓN UNIVERSITARIA Y BIENESTAR ESTUDIANTIL DE LA UNIVERSIDAD DE BUENOS AIRES, ARGENTINA, PARA EL DOCUMENTO DE COMPILACIÓN BASE PARA LA PREPARACIÓN DE UN BORRADOR PRELIMINAR DEL DOCUMENTO FINAL RIO+201.

### CONTENIDO GENERAL

El presente documento se centra en el tema "El marco institucional para el desarrollo sostenible" como contribución del sector cultural universitario, y aborda aspectos sobre mecanismos institucionales específicos de cooperación e implementación.

### ANTECEDENTES:

CULTURA SOTENIBLE DESDE LA UNIVERSIDAD A LA COMUNIDAD Dentro del marco institucional universitario y en línea con la política cultural de la Universidad de Buenos Aires, Argentina, a través de la Secretaría de Extensión Universitaria y Bienestar Estudiantil, el Centro Cultural Rector Ricardo Rojas creó durante 2011 el área de Cultura Sostenible.

Las profundas desigualdades sociales de nuestra comunidad nos sumergen e insertan abruptamente en las diferencias culturales, educativas, artísticas y creativas generadas a partir de la limitada o nula posibilidad de acceso a los bienes culturales. La brecha generacional se profundiza a medida que la comunidad excluida se recluye en su hábitat. Entendiendo a la cultura como la suma de los diversos saberes y costumbres de los distintos sectores de la sociedad, desde el Área de Cultura Sostenible proponemos mirarnos hacia adentro para evaluar nuestras acciones, implicancias y responsabilidades y hacia fuera, con el fin detectar las distintas costumbres y diferentes saberes, de nuestra Autores: Lic. Cecilia Vázquez, Coordinadora General de Cultura de la UBA; Arq. María Antonia Kaul y Mariana Ron, Directoras del Área de Cultura Sostenible del Centro Cultural Rector Ricardo Rojas de la UBA.

comunidad y nuestra región potenciándolos e incentivando el respeto y la existencia de los mismos, como aporte a la construcción cultural global en pos de una sociedad sostenible.

Consideramos que hoy están dadas las circunstancias para proponer a través del Área Cultura Sostenible disminuir esta brecha, promover y generar el crecimiento y desarrollo a través de las industrias creativas, la educación y las artes en búsqueda de una cultura inclusiva, sin discriminación. Sabemos que es necesario un cambio profundo, una @evolución en la forma de enfocar la relación con el medio, los seres humanos, y su cultura. Sabemos que debemos incorporar los costos ambientales en las decisiones que tomamos como productores y consumidores culturales. Sabemos también, que es demasiado costoso para todos considerar los recursos culturales y naturales como bienes carentes de valor y traspasar esa desvalorización al resto de la sociedad.

Desde el área de Cultura Sostenible se abre un espacio colaborativo y de aprendizaje continuo como plataforma de diálogo e intercambio entre los diversos saberes del mundo académico de las Facultades de la Universidad de Buenos Aires y de los Programas ya existentes, junto a las organizaciones gubernamentales, del tercer sector y la comunidad.

Hablar de Educación Cultural Sostenible en la Ciudad Autónoma de Buenos Aires, Argentina, requiere considerar la urgente necesidad de incorporar la variable ambiental a nuestra cultura y nuestra cotidianeidad. Nuestra historia así como el presente, la conciencia sobre la finitud de los recursos naturales y las variables ambientales son temas presentes que involucran cada uno de los aspectos de nuestra vida y de nuestra cultura.

Asimismo la vida democrática requiere la formación y ejercicio de la ciudadanía responsable, comprometida, informada y consciente tanto en relación a los temas de urgente definición como sobre los desafíos y la búsqueda de las propuestas superadoras que cada cultura y cada sociedad establezca como propios. Es pues, en la organización social a partir de los consensos culturales, donde encontraremos como sociedad la solución a los problemas globales. La temática referida a la cultura sostenible se constituye en un valioso y necesario proceso de formación cultural sostenido a partir del ejercicio y compromiso cotidiano de ciudadanos con rol activo en la construcción de una sociedad democrática y solidaria. Es, pues en esta construcción que la reflexión pública sobre el estado de situación de nuestras comunidades locales, se potencia a través de la creatividad relevante de sus miembros, en pos de la construcción colectiva y global.

EL CENTRO CULTURAL RECTOR RICARDO ROJAS DE LA UNIVERSIDAD DE BUENOS AIRES (CCRRRojas UBA) COMO USINA CULTURAL DEL CAMBIO EN POS DE UNA SOCIEDAD SOSTENIBLE.

Para hacer de la reflexión pública sobre la cultura sostenible y el desarrollo humano un instrumento de desarrollo social y político, que integre al concepto de ambiente como totalidad que resguarde permanentemente los equilibrios ecológicos, el desarrollo pleno del hombre y sus instituciones sociales; potenciando la perspectiva sustentable en respeto de las características que la población quiera mantener como fundamento y sentido de sus vidas individuales y colectivas, el Centro CCRRRojas UBA ha desarrollado la plataforma de diálogo para la Cultura Sostenible:

- Porque esta propuesta se realiza en cumplimiento con el artículo 5 de la Declaración Universal de la UNESCO sobre la Diversidad Cultural: "Los derechos culturales, marco propicio para la diversidad cultural, Los derechos culturales son parte integrante de los derechos humanos, que son universales, indisociables e interdependientes. El desarrollo de una diversidad creativa exige la plena realización de los derechos culturales, tal como los definen el Artículo 27 de la Declaración Universal de Derechos Humanos y los Artículos 13 y 15 del Pacto Internacional de Derechos Económicos, Sociales y Culturales. Toda persona debe tener la posibilidad de expresarse, crear y difundir sus obras en la lengua que desee y en particular en su lengua materna; toda persona tiene derecho a una educación y una formación de calidad que respeten plenamente su identidad cultural; toda persona debe tener la posibilidad de participar en la vida cultural que elija y conformarse a las prácticas de su propia cultura, dentro de los límites que impone el respeto de los derechos humanos y de las libertades fundamentales",
- Porque cuidar el ambiente, más que una preocupación, es una forma de vivir y de pensar. Es cultura.
- Porque sabemos que nuestras prácticas cotidianas, nuestras "costumbres", son culturales, se transmiten mediante educación formal y no formal.
- Porque crear y difundir el conocimiento y la cultura en todas sus formas; y extender la acción y el servicios a la comunidad, con el fin de contribuir a su desarrollo y transformación, estudiando en particular los problemas nacionales y regionales y prestando asistencia científica y técnica al Estado y a la comunidad es nuestra misión como Centro Cultural de la Universidad de Buenos Aires a través de la Secretaría de Extensión Universitaria. (Artículo 28 de la Ley de Educación Superior N° 24.521).

#### DESARROLLO:

El Centro Cultural Rector Ricardo Rojas de la Universidad de Buenos Aires propicia a través de esta propuesta la institucionalización de un nuevo espacio abierto y dinámico como mecanismo de participación ciudadana, conducente de manera transparente y horizontal a la sinergia de los actores implicados, articulando mecanismos de participación que permitan hacer permeable, garanticen eficiencia en los procesos de construcción de pensamiento crítico, colaborando en la eficacia de los actos del Estado, objetivando mecanismos y ámbitos que fomenten el tratamiento de los temas de cara a la sociedad.

#### PROPUESTA:

Se promueve la Conformación de la Comisión Universitaria de Cultura Sostenible (CuCS) La conformación de la Comisión tiene por objeto elaborar conjuntamente con las universidades nacionales de la República Argentina un documento de Propuesta de Políticas Culturales para el desarrollo de una Cultura Sostenible a fin de ser elevado como documento preliminar al Secretario de Cultura de la Nación para ser tenido en cuenta en el desarrollo de las políticas nacionales que den un marco adecuado a la gestión de los recursos culturales a través del desarrollo sostenible consagrado en el artículo 41 de la Constitución Nacional.

La mencionada comisión permitirá establecer los mecanismos que posibiliten la participación adecuada de las universidades nacionales. Del mismo modo, se espera que la CuCS contribuya a la elaboración de la correspondiente estrategia, como así también a los planes y programas nacionales para la gestión integral de cultura sostenible.

#### OBJETIVOS:

- Proponer Proyecto de Ley de Presupuestos mínimos para la Gestión Integral Cultural Sostenible.
- Elaborar e implementar junto con los correspondientes organismos nacionales y provinciales una Estrategia Nacional para la Gestión Integral Cultural Sostenible.
- Realizar charlas/debates/jornadas/ciclos/simposios de capacitación en distintas instituciones correspondientes al sector científico, académico, cultural y organismos de aplicación provincial, sobre la propuesta e implementación de la normativa.
- Promover Proyectos de capacitación y reflexión en todo el territorio nacional sobre Cultura Sostenible.
- Promover la comunicación del modelo de Cultura Sostenible a diferentes públicos a través de la formulación de un plan de difusión.
- Colaborar en la definición de presupuestos programáticos para equilibrar las distintas temáticas.
- Trabajar conjuntamente con el programa de Educación Ambiental, Participación e Información Ambiental (EA) en la definición de indicadores y metas conjunta incluyendo indicadores de sostenibilidad cultural.
- Examinar los más relevantes asuntos de gestión cultural desde el punto de vista local, regional, nacional, internacional y global discerniendo los distintos ámbitos de responsabilidad y sus soluciones.
- Propiciar un proceso continuo y permanente consolidando la experiencia educativa formal y no formal así como la vida social en su conjunto, de forma transversal, aportando a la formación de individuos o colectividades coadyuvando a comprender y tomar decisiones en relación con la sociedad en que se vive.
- Relacionar el análisis, estudio formal y no formal y comprensión de los problemas con acciones concretas para afrontarlos en las diversas manifestaciones y modalidades de su abordaje.
- Establecer un Sistema de Indicadores de Desarrollo Cultural Sostenible:

Habida cuenta que desde el año 2004, la Secretaría de Ambiente y Desarrollo Sostenible comenzó el trabajo en pos de la generación de indicadores de Desarrollo Sostenible, y, conscientes de que el desarrollo sostenible no puede ser abordado por un organismo en particular dado el carácter multidimensional que posee, y teniendo en

cuenta que el Sistema de Indicadores de Desarrollo Sostenible para Argentina (SIDSA) considera las dimensiones sociales, ambientales, económicas e institucionales, donde tienen competencias distintos organismos del Estado Nacional, el Centro Cultural Rector Ricardo Rojas de la Universidad de Buenos Aires propone a las universidades nacionales a través de sus institutos, organismos, cátedras y equipos interdisciplinarios, conformar una Red Interinstitucional para el relevamiento, promoción y generación de indicadores de Cultura Sostenible, como aporte para el proceso de construcción de este sistema que se ha desarrollado desde sus comienzos en forma interinstitucional.

## LA PARTICIPACIÓN

De los mecanismos de participación ciudadana en la democracia deriva la inclusión de temas propuestos por la sociedad civil tanto en la agenda política como en la agenda de los gobiernos locales.

Este proceso mejorará la intervención de la ciudadanía en relación a la toma de decisiones así como en la realización de acciones concretas relacionadas con sus propios intereses.

Específicamente, las problemáticas ambientales son de las áreas con mayor participación ciudadana. Como elementos claves en un buen desarrollo de procesos de participación ciudadana se encuentran:

- la disponibilidad de información para todos los ciudadanos
- la presencia de actores vinculados al conocimiento que le dan certidumbre y fidelidad a los argumentos
- La creación, estímulo y desarrollo de espacios abiertos al ciudadano
- Los mecanismos que afiancen el sentido de pertenencia

## INFORMACIÓN CULTURAL:

Del interés de la sociedad, de los sectores gubernamentales y no gubernamentales por atender y solucionar los temas de relevancia cultural se desprende como necesario proveer información veraz, oportuna y pertinente que posibilite realizar evaluaciones objetivas y representativas de las demandas de la sociedad.

El Programa Agenda Local 21, surgido a partir de la Conferencia de las Naciones Unidas sobre el Medio Ambiente y el Desarrollo, celebrada en Río de Janeiro en 1992, destaca la necesidad de contar información y mejorar el acceso a la misma, para la toma de decisiones, a todos los niveles. En el mismo se expresó (Principio 3) "(...) En el plano nacional, toda persona deberá tener acceso adecuado a la información sobre el medio ambiente de que dispongan las autoridades públicas, incluida la información sobre los materiales y las actividades que encierran peligro en sus comunidades, así como la oportunidad de participar en los procesos de adopción de decisiones. Los Estados deberán facilitar y fomentar la sensibilización y la participación de la población poniendo la información a disposición de todos (...)" (Principio 10).

Serán entonces, los procesos de construcción de las soluciones colectivas demandadas por la sociedad, aquellos garantidos y expresados por los actores comunitarios como elemento central que adquiere relevancia en la mejora de las políticas públicas.

Autores: Lic. Cecilia Vázquez, Coordinadora General de Cultura de la UBA y Directora del Centro Cultural Rector Ricardo Rojas de la UBA y Arq. María Antonia Kaul y Mariana Ron, Directoras del Área de Cultura Sostenible del Centro Cultural Rector Ricardo Rojas de la UBA.

## Article 19

Submission of ARTICLE 19, Global Campaign for Free Expression, on Incorporating Principle 10 and the Right to Information in the Rio 2012 Outcomes

### Summary

The rights of access to information, public participation, and access to justice are essential to sustainable development. The 1992 Rio Declaration fostered these rights in Principle 10. Now renewed commitment is needed for the full recognition of the rights in all countries. The Rio 2012 Summit provides an opportunity for governments to transform Principle 10 from aspirational goals into actionable rights. In particular, the Outcome Document should include strong commitments from all nations to improve their legal structures on national environmental governance based on Principle 10 and the Bali Guidelines, agree to the development of an international instrument giving legal force to Principle 10 based on the Aarhus Convention, and ensure that the principles are incorporated into all UN bodies decision-making processes.

### The Interest of ARTICLE 19

ARTICLE 19 is an independent human rights organisation that works around the world to protect and promote the right to freedom of expression and information. It takes its name from Article 19 of the Universal Declaration of Human Rights, which guarantees freedom of expression and freedom of information.

ARTICLE 19 has worked on numerous environment and development-related human rights projects around the world, managed through our offices in London, Mexico, Brazil, Senegal, Kenya, and Bangladesh. In 2010, ARTICLE 19 brought together civil society groups, government officials and experts to develop the London Declaration for Transparency, Free Flow of Information and Development, which sets a clear agenda for transparency in the promotion of development (see appendix 1). In 2011, ARTICLE 19 worked with groups across Africa to set a development-focused agenda on access for African states and assisted in the development of the African Platform on Access to Information (see appendix 2). For the upcoming Rio 2012 Summit, ARTICLE 19 is working closely with other civil society groups around the world, including development and environmental groups, and has recently released a report with The Access Initiative (TAI) on the progress since Rio 1992 and needed outcomes to make Rio 2012 meaningful (see appendix 3). The Importance of Access to Information and Rio 1992

We believe that one of the largest problems standing in the way of sustainable development and a clean environment is the lack at both the national and international level of operational and effective rights of access to information, public participation and access to justice. These access rights facilitate more transparent, inclusive, and accountable decision-making in matters affecting environment and development. Access to information empowers and motivates people to participate in an informed and meaningful manner. Participatory decision-making enhances the ability of governments to respond to public concerns and demands, to build consensus, and to improve acceptance of and compliance with environmental decisions because citizens feel ownership over these decisions. Access to justice encourages the public's ability to enforce their right to participate, to be informed, and to hold regulators and polluters accountable for environmental harm.

Principle 10 of the 1992 Rio Declaration recognised the crucial importance of these rights and proposed that access to information, public participation and access to justice be adopted into law in all nations. We believe that the outcome of the Rio 2012 Summit must include an affirmation of these fundamental access rights and that substantial efforts must be made to establish them and make them enforceable in all countries.

## Need for Full implementation of Principle 10

These demands are necessary because Principle 10 has not yet been fully embraced in many nations. There has been substantial improvements in many national legal frameworks, particularly in areas of access to information and environmental impact assessments. A substantial number of countries have adopted new legal frameworks on access rights, especially relating to access to information. However, the adoption of laws has not been uniform. There remains much needed to be done to ensure that these rights are truly available to empower societies and citizens.

This is particularly noticeable in the area of access to information. Over 90 countries have now adopted framework laws or regulations for access to information, including in the past few years China, Indonesia, Nigeria, Liberia, Mongolia and Brazil. Many countries have also adopted specific environmental information access statutes or included access provisions in general environmental protection laws. Many nations have also created Pollutant Release and Transfer Registers (PRTRs), which require governments to collect information on pollution releases and make that information publicly available through databases. These PRTRs have been shown to be one of the most effective means of making pollutant related information available to the public while simultaneously reducing pollution. The 1992 Rio Declaration and Agenda 21 were instrumental in promoting the adoption of these laws.

However, there are many countries who have not adopted these laws and there are significant disparities between regions. While most of the nations of Europe, the Americas and a significant portion of Asia have the laws in place, most Middle Eastern, African, Pacific and Caribbean countries do not yet have the right incorporated into national law. Thus, much work remains to ensure that the citizens of the other 100 nations without adequate legal rights are empowered to ensure that they are informed so they may participate and ensure development and a clean environment is enjoyed by all in an equitable and fair manner.

Furthermore, practice lags behind laws in many countries. Research by ARTICLE 19 and other human rights and environmental organisations across the world demonstrates that many people are still being denied access to essential information about climate change and the environment 20 years after Principle 10 was signed by the world's leaders. Some of the problems include a lack of detailed administrative rules and operational policies, inadequate public capacity to use the laws, and insufficient official capacity to implement laws. There are also problems with governments failing to proactively release environmental information, including basic information on air quality and drinking water quality. Emergencies also raise problems. As the recent disasters in Japan and Burma revealed, the public is often not informed of serious hazards.

International institutions have also not fully adopted Principle 10 into their practices. The international bodies of the UN, including UNEP and UNDP, do not have adequate mechanisms for access to information that obligate them to provide information and have working mechanisms for appeals of denials for access. Important discussions are held and decisions are made at the World Trade Organisation and other bodies without adequate public participation.

There has been somewhat more progress with the global financial institutions. The World Bank's recent revision of their Policy on Access to Information is a significant improvement but it remains to be seen if it fully provide information that communities need. The other regional development banks are also revising their public information policies but so far, the revisions have been mostly unsatisfactory. The newly revised Public Information Policy of the European Bank of Reconstruction and Development mentions confidentiality more than transparency. Thus any discussion of institutional reform should firmly establish that the international bodies are accountable and transparent also.

The role of the international bodies in promoting Principle 10 has also been mixed. The UNECE Convention on Access to Information, Public Participation and Access to Justice (The Aarhus Convention) has been a notable success as the first legally binding international treaty on access rights. The Convention places ratifying nations under a series of important obligations including the collection of information held by private bodies and requiring public bodies to affirmatively make information available to the public, respond to requests, and provide strong rights of appeal. It also established rules for public participation, appeals, and access to justice measures. It has now been ratified by 44 countries from Iceland to Turkmenistan. The 2003 EU Directive which firmly implements the Convention into EU law should also be noted. We believe that this is a model that should be widely followed. Unfortunately, this model has not been widely adopted elsewhere. No other UN regional body has adopted or even begin negotiations on a similar instrument and non-UNECE countries have joined the Convention.

The UNEP Guidelines for the Development of National Legislation on Access to Information, Public Participation and Access to Justice in Environmental Matters ("the Bali Guidelines") on how governments should develop national laws in relation to Principle 10 are also a welcome development, even if it was nearly 20 years after Rio 2012. Unfortunately, the Guidelines are only voluntary, are largely unknown, and while there are commitments by UNEP and other bodies to provide assistance and training, the efforts appear currently to be on a very small scale.

## Growing Consensus on Principle 10

There is a growing agreement both in civil society and in governments that enhancing Principle 10 rights is an essential element in making further progress on sustainable development and environmental protection. The Declaration of the 64th Annual UN DPI/NGO Conference, representing the consensus of over 1,400 civil society representatives included numerous references and demands relating to Principle 10 and many individual and joint CSO submissions make similar demands. There is also significant government support. The Economic Commission for Latin America and the Caribbean (ECLAC) submission states that "Rio+20 could produce a mandate to negotiate international agreements (at the global or regional level) to promote the enactment of legislation pertaining to Principle 10 of the Rio Declaration and its implementation, to be possibly, but not necessarily, based on the Aarhus Convention." The European Committee of the Regions is calling for "promotion of environmental democracy globally" through extension of Aarhus, regional conventions or starting negotiations on a new global convention. Similarly, the European Parliament resolution of 29 September 2011 on developing a common EU position on Rio+20 calls for "ensuring the effective global implementation of Rio Principle 10" and creating a new global convention or extension of the Aarhus Convention. Based on our discussions with other officials, we expect many government submissions to mirror these recommendations.

## Recommendations

We believe that there needs to be a significant effort to ensure that Principle 10 is reaffirmed and extended in the Rio 2012 progress. We urge governments and negotiators to include these three major areas in the Outcome Document.

- All nations should make tangible and identifiable commitments for adopting Principle 10 into national law based on the Bali Guidelines by 2017. This includes laws on access to information, public participation, and mechanisms to ensure that access to justice to enforce these rights are implemented. These should be included in Sustainable Development Goals. Additional assistance should be provided by UNEP and other parties to assist nations into fully implementing the UNEP guidelines into national law.
- All parties should commit to begin negotiations on a new international convention on Access to Information, Public Participation and Access to Justice to be completed by 2017 based on the Bali Principles and the Aarhus Convention model. The other UN regional bodies should be encouraged to adopt in the meanwhile regional mechanisms for access to information following the model of the Aarhus Convention. The members of the Aarhus Convention should also be encouraged to open up the Convention to members outside of the UNECE.
- Any reform of the institutional framework of governance for sustainable development should including the creation of a Council on Sustainable Development, and a World Environmental Organisation or UN Environmental Organisation should also ensure that the Principle 10 rights are incorporated into their structures. This includes all other UN and regional bodies.

# Appendix 1. The London Declaration for Transparency, the Free Flow of Information and Development

We, as members of the global human rights, development and transparency communities and participants in the ARTICLE 19 conference on “Transparency, Free Flow of Information and the Millennium Development Goals” held in London on 24-25 August 2010, adopt the following Declaration.

In September 2000, leaders from 150 countries adopted the Millennium Declaration and agreed eight Millennium Development Goals (MDGs) each with targets to meet by 2015.

Since 2000, a number of countries have succeeded in achieving some targets, for instance in combating hunger, and improving school enrolment and child health.

However, progress has been uneven and several MDGs are likely to be missed in many countries. Large differences remain between regions, across countries in the same region, and even within countries.

It has been repeatedly acknowledged that progress is off track, not because the MDGs are unreachable or because time is short, but rather because of unmet commitments, inadequate resources, and lack of focus and accountability. Development efforts are hampered by corruption, mismanagement, improper allocation of resources and their inefficient and ineffective use.

There is mounting evidence that transparency of financial flows, including of budgets, aid assistance and revenues from natural and other resources, is insufficient and ineffective. The environment and space for civic engagement and civil society organisations are increasingly restricted, preventing active participation and monitoring, and weakening demands for accountability. Both the free flow of information and transparency, including through a free and independent media, have largely been sidelined in the debate on the MDGs and the fight against poverty.

Yet, as is broadly recognised, transparency and the free flow of information reduce corruption and play a vital role in ensuring accountability at all levels. The availability and accessibility of information empowers people to demand their rights and public services. Free, independent and professional media and civil society organisations are essential to the global fight against poverty, and facilitate citizen participation in development programs.

We are convinced that all efforts towards achieving the MDGs by 2015 must be considerably and urgently stepped up and should encompass the following interconnected principles:

First, the free flow of information, transparency and civic engagement are fundamental to the achievement of the MDGs, and the global fight against poverty

Second, the free flow of information includes protecting and strengthening the right of all to seek, receive and impart information and ideas related to the MDGs and development, and the existence of a free, diverse and professional media

Third, transparency requires collecting, producing, and disclosing accessible, credible and disaggregated data on MDG indicators and targets, as well as on budgets, aid assistance and revenues from natural and other resources

Fourth, civic engagement requires establishing and protecting an enabling environment for civil society organisations (CSOs) and the media, and active participation by all, in particular people living in poverty and those discriminated against, or marginalised. We urge all States to take immediate action on the following priorities:

To promote the free flow of information and civic engagement:

1. Respect, protect and fulfil the right to freedom of expression, including the right to information, as well as the right to freedom of association, in accordance with international human rights law
2. Adopt and effectively implement national laws, regulations and policies on access to information. This includes promoting access to, and proactive disclosure of, information related to development and the MDGs
3. Establish an enabling legal, regulatory and public policy framework for the media, including new media, which promotes their independence, diversity and pluralism, and thus allows for independent investigation and reporting on MDG implementation and poverty alleviation
4. Establish an enabling legal and regulatory environment for CSOs which recognises their independence and right to carry out their peaceful work without fear of harassment, reprisal, intimidation and discrimination
5. Take all necessary measures to ensure that all sectors of society (including women and vulnerable groups) are able to exercise their right to impart and access information without discrimination, including through the media and information and communication technologies (ICTs)
6. Remove all obstacles preventing people living in poverty from accessing information on development policies and take proactive measures to promote their effective participation in the design and execution of development strategies
7. Ensure that national, sub-national and local bodies make available and accessible all development- related information, including information on development assistance received and expended, strategies for development, MDG targets and indicators.

To promote transparency:

8. Ratify and fully implement the UN Convention against Corruption
9. Implement the Paris Declaration and the Accra Agenda for Action; recognise that national development strategies require ownership by governments as well as parliaments, citizens, civil society organisations, and communities
10. Implement the International Aid Transparency Initiative (IATI) and ensure that IATI delivers an international standard that aligns with the information needs of governments and their citizens
11. Publish accessible and comprehensive information on budgets, expenditures and revenues in relation to development and the MDGs, such as on development assistance, social, economic and financial activities, and natural resources, including the extractive industries, forestry, fisheries and land
12. Fully comply with the International Monetary Fund’s Code of Good Practices on Fiscal Transparency
13. Join or support relevant multi-stakeholder initiatives, such as the Extractive Industries Transparency Initiative (EITI), the Construction Sector Transparency Initiative (CoST) and the Medicines Transparency Alliance (MeTA). Donor governments should also support developing countries’ transparency measures in planning, licensing and

contracting for natural resource management and establish benchmarks for all development assistance programming in resource-rich countries

14. Implement the UN Environment Programme's (UNEP) Guidelines for the Development of National Legislation on Access to Information, Public Participation and Access to Justice in Environmental Matters
15. Adopt legal rules to require that all publicly-traded companies in natural resources and other relevant sectors publish all information on contracts with and payments to governments.
16. Ensure that all intergovernmental organisations adopt comprehensive, effective access to information policies, such as those developed by the Global Transparency Initiative (GTI) for international financial institutions (IFIs)
17. Establish participatory and transparent local government institutions to ensure equitable and quality service delivery.

We also call on all other partners in the development and MDGs process to take the following actions:

18. Intergovernmental organisations should adopt and effectively implement comprehensive access to information policies based on the principles of voluntary, maximum and proactive disclosure, such as those developed for IFIs by the Global Transparency Initiative
19. Non-governmental donors should support governments in adopting laws, regulations and policies that will ensure the free flow of information and transparency, including on MDGs and development strategies, and the receipt and expenditure of development assistance
20. Private sector bodies should adopt corporate social responsibility standards which recognise the importance of transparency and the free flow of information. They should join multi-stakeholder initiatives, such as the Extractive Industries Transparency Initiative (EITI), the Construction Sector Transparency Initiative (CoST) and the Medicines Transparency Alliance (MeTA) and publish all information on contracts with and payments to governments, particularly in relation to the extractive industries and other natural resources
21. Civil society organisations, including international and national non-governmental organisations, should join and support international and national self-regulatory initiatives to strengthen their reporting, transparency and accountability, including accountability to the people they serve. They should publish detailed information on their funding and expenditure as well as on the impact of their development activities.
22. Media organisations should provide a platform for an inclusive public debate about development and achievement of the MDGs with the participation of people living in poverty by, among other things, reporting on issues that are of particular concern to them. They should also actively and fairly investigate and report on the implementation of strategies on the MDGs and the delivery and use of development assistance, including by governments, CSOs and IFIs
23. All MDG partners should champion efforts at national and international levels, to enable citizens to access information and hold authorities to account, including by supporting and strengthening CSOs and civic engagement. They should support and make use of relevant accountability mechanisms at the national, regional and international levels, including parliaments, courts, ombudspersons, UN Charter and treaty bodies and regional bodies to scrutinise MDG implementation and strengthen accountability.

London 25 August, 2010

African Platform on Access to Information

19 September 2011

Preamble

We, participants at the Pan African Conference on Access to Information, organised by the Windhoek+20 Campaign on Access to Information in Africa in partnership with the United Nations Educational, Scientific and Cultural Organisation (UNESCO), the African Union Commission (AUC) and the Special Rapporteur on Freedom of Expression and Access to Information of the African Commission on Human and Peoples' Rights in Cape Town, South Africa, September 17-19, 2011:

Reaffirming the 1991 Windhoek Declaration on Promoting an Independent and Pluralistic African Press and viewing the significant progress that has been made in the past 20 years on freedom of expression, access to information and the free flow of information;

Stating that access to information (ATI) is the right of all natural and legal persons, which consists of the right to seek, access and receive information from public bodies and private bodies performing a public function and the duty of the state to provide such information;

Emphasising that access to information is an integral part of the fundamental human right of freedom of expression, essential for the recognition and achievement of every person's civil, political and socio-economic rights, and as a mechanism to promote democratic accountability, good governance;

Acknowledging that access to information is instrumental to fostering access to education and health care, gender equality, children's rights, a clean environment, sustainable development and the fight against corruption;

Recalling Article 19 of the Universal Declaration of Human Rights of 10 December 1948, which guarantees that: "Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers", Article 19 of the International Covenant on Civil and Political Rights and the UN Human Rights Committee General Comment No. 34 adopted in 2011 which states that Article 19(2) of the ICCPR includes the right of access to information held by public bodies, and Article 1.2 of the UNESCO Constitution;

Underlining Article 9 of the African Charter on Human and Peoples' Rights adopted by the Organisation of African Unity (OAU) on 27 June 1981, which provides that, "Every individual shall have the right to receive information";

Reaffirming Article IV(1) of the Declaration of Principles on Freedom of Expression in Africa, adopted by the African Commission on Human and Peoples' Rights at its 32 Ordinary Session held in October 2002, which provides that "Public bodies hold information not for themselves but as custodians of the public good and everyone has a right to access this information, subject only to clearly defined rules established by law";

Cognisant of the African Union Convention on Preventing and Combating Corruption, the African Charter on Values and Principles of Public Service and Administration, the African Charter on Democracy, Elections and Governance, the African Youth Charter and the African Statistics Charter, all of which promote transparency in public life.

Welcoming the efforts of the African Commission on Human and Peoples' Rights Special Rapporteur on Freedom of Expression and Access to Information in developing a Model Law for AU Member States on Access to Information, aimed at assisting Member States in formulating, adopting or reviewing access to information legislation and its

implementation;

Mindful of the efforts of international organisations and others to develop principles and declarations on the right of access to information and freedom of expression including the 2010 Brisbane Declaration Freedom of Information: The Right to Know, the Atlanta Declaration and African Regional Findings, the Accra Agenda for Action, the Lagos Declaration on the Right of Access to Information, the Johannesburg Principles on National Security, Freedom of Expression and Access to Information, and the Declaration of Table Mountain;

Aware that the World Summit on the Information Society (WSIS) brought to the forefront the importance of access to information in the modern world through the Geneva Declaration of Principles and Tunis Commitment and that the Internet Governance Forum (IGF) plays a crucial role in bringing together all of the stakeholders to facilitate an international internet governance debate that includes issues of access and openness;

Recognising the work of the African Union Commission to give practical expression to the various instruments of the African Union on freedom of expression and access to information, through such initiatives as the Pan African Media Network and portal, the new AU website, social networks, the media center, training programmes, ensuring media access to the AUC leadership, and publication of other information materials among others; as well as its efforts in promoting Information and Communications Technology (ICTs) in Africa;

Encouraged that over 90 countries around the world have adopted comprehensive national access to information laws or regulations including ten in Africa; that many countries in Africa have joined the Extractive Industries Transparency Initiative, the International Aid Transparency Initiative and the Open Government Partnership; and that the Economic Community of West African States is moving towards adoption of a binding Supplementary Act for a Uniform Legal Framework on Freedom of Expression and Right to Information;

Concerned that most African nations have not yet adopted comprehensive ATI laws or regulations and that significant problems remain with both the substantive provisions of many of those that have adopted laws and the full implementation of the laws;

Acknowledging that civil society organisations and government bodies around the world have adopted 28 September as International Right to Know Day;

Convinced that it is of critical importance that clear and comprehensive principles are established to guide the promotion and protection of the right of access to information in Africa through the adoption and effective implementation of appropriate national laws and regulations;

Resolve to adopt the following Principles on The Right of Access to Information:

#### Key Principles

1. **Fundamental Right Accessible to Everyone.** Access to information is a fundamental human right, in accordance with Article 9 of the African Charter on Human and Peoples' Rights. It is open to everyone, and no one should be privileged or prejudiced in the exercise of this right on account of belonging to a class or group howsoever defined, and whether in terms of gender, class, race, political association, occupation, sexual orientation, age, nationality, HIV status, and other bases as cited in many African constitutions. It is not required that anyone must demonstrate a specific legal or personal interest in the information requested or sought or otherwise required to provide justification for seeking access to the information.
2. **Maximum Disclosure.** The presumption is that all information held by public bodies is public and as such should be subject to disclosure. Only in limited circumstances set out in these principles below may disclosure be denied.
3. **Established in Law.** The right of access to information shall be established by law in each African country. Such law shall be binding and enforceable and based on the principle of maximum disclosure. The law shall take precedence over other conflicting laws that limit access to information.
4. **Applies to Public Bodies and Private Bodies.** The obligations of ATI shall apply to all public bodies, as well as to private bodies that are owned or controlled by the government, utilise public funds, perform functions or provide services on behalf of public institutions, or have exclusive contracts to exploit natural resources (with regards to said funds, functions, services or resources), or which are in possession of information which is of significant public interest due to its relation to the protection of human rights, the environment or public health and safety, or to the exposure of corruption or illegal actions or where the release of the information may assist in exercising or protecting any right.
5. **Clear and Unambiguous Process.** The law shall include procedures for the exercise of the right. The process to obtain information should be simple and fast and take advantage of new information and communication technologies where possible. Bodies falling under the scope of the ATI law should provide assistance to requesters in order to ensure that they receive the information they need. The information provided should be provided in a form understandable to the requestor. Information should be disclosed within a clear and reasonable deadline provided for by law. It should be available at low or no cost.
6. **Obligation to Publish Information.** Public and relevant private bodies shall be obliged to proactively release information in a timely manner about their functions, powers, structures, officials, decisions, expenditures, budgets, and other information relating to their activities that is of public interest. The dissemination should use all reasonable means of communications, including ICTs, to maximise access to all communities and sectors of society.
7. **Language and Accessibility.** To the greatest extent possible, information should be available in the language of the person seeking it, in an accessible location, in a format that is as accessible as possible, and, in particular, ensures that it is accessible to those who may be particularly affected by the subject matter of the information.
8. **Limited Exemptions.** The right of access to information shall only be limited by provisions expressly provided for in the law. Those exemptions should be strictly defined and the withholding of information should only be allowed if the body can demonstrate that there would be a significant harm if the information is released and that the public interest in withholding the information is clearly shown to be greater than the public interest in disclosure. Information can only be withheld for the period that the harm would occur. No information relating to human rights abuses or imminent dangers to public health, environment, or safety may be withheld.
9. **Oversight Bodies.** Independent bodies such as an ombudsperson or information commissioner should be established to monitor and hold government bodies and relevant private entities to account on their access to information disclosure practices, to receive and decide upon complaints, and generally oversee the implementation of the access to information legislation. The oversight body should be adequately funded.
10. **Right to Personal Data.** All persons have a right to access and correct their personal data held by third parties.
11. **Whistleblower Protection.** To ensure the free flow of information in the public interest, adequate protections against legal, administrative and employment-related sanctions should be provided for those who disclose information on wrong-doing and other information in the public interest.
12. **Right of Appeal.** Everyone has a right to appeal administratively any action that hinders or denies access to information or any failure to proactively disclose information. They have a right to further appeal to an independent body and to finally seek judicial review of all limits of their right of access to information.

13. Duty to Collect and Manage Information. Public and relevant private bodies have a duty to collect information on their operations and activities on behalf of their citizens. They also have a duty to respect minimum standards in relation to the management of this information to ensure that it may easily be made accessible to citizens.

14. Duty to Fully Implement. Public and relevant private bodies have an obligation to ensure the law is fully implemented. This includes internal procedures and processes and the designation of responsible officials.

#### Application of Principles

These principles are essential to development, democracy, equality, and the provision of public service, and are applicable to, amongst others, the following:

1. Enabling Environment. Governments should ensure that the legal frameworks create an enabling environment allowing individuals, civil society organisations including trade unions, media organisations, and private businesses to fully enjoy access to information, thus fostering active participation in socio-economic life by all, in particular people living in poverty and those discriminated against or marginalised.
2. Elections and Electoral Processes: Governments and election management bodies have a positive obligation to provide the public with information before, during and after elections, not to interfere with media coverage, to encourage public participation and proactively publish campaign spending and contributions.
3. Disadvantaged Communities: Governments have a particular obligation to facilitate access to information by disadvantaged minority groups and minority language speakers, as well as marginalised groups including women, children, rural people, the poor and persons with disabilities. Information should be available at no costs to these groups. This especially applies to information that contributes to the long-term empowerment of the groups. Governments also have an obligation to ensure equitable and affordable access to ICTs for those with special needs and for other disadvantaged persons and groups.
4. Women: Governments, civil society and the media have an obligation to facilitate women's equal access to information, so that they can defend their rights and participate in public life. Civil society organisations should be encouraged to make the best use of access to information mechanisms to monitor governments' fulfilment of commitments to further gender equality, to demand the enhanced delivery of services targeted at women and to ensure that the public funds they are entitled to actually reach them. The collection, management and release of information should be gender disaggregated.
5. Children and Youth: Governments have an obligation to encourage the mass media to disseminate information and material of social and cultural benefit to children and the youth. Governments are further encouraged to facilitate the exchange and dissemination of such information and material from a diversity of cultural, national and international sources as well as the production and dissemination of information specifically for children and youth and wherever reasonably possible facilitate and encourage access to such information by children and youth.
6. Environmental Information: Governments and inter-governmental organisations should increase their efforts in implementing Principle 10 of the 1992 Rio Declaration on the Environment and Development on the right of access to information, public participation and access to justice on environmental issues. Governments should adopt appropriate legislation and regulations to promote access and proactive release of environmental information, guarantee openness, fight secrecy in institutional practices, and repeal that which hinders public availability of environmental information. Governments' capacity to supply environmental information and civil society organisations' demand for such information, as well as engagement in decision-making processes and the ability to hold governments and other actors accountable for actions affecting the environment should be strengthened.
7. Education: Taking into account the close connection between the right of access to information and the right to education, governments have the duty to make publicly available information about educational policies and assessments of their impacts, school performance data, and budgets for education at all government levels. Governments also have a positive obligation to provide information for each school, in particular, schools' admission policies and admission lists, information on management practices, school governance, and other relevant aspects.
8. Health: Governments have a duty to provide access to information with a view to ensuring and improving access to health care services and enhancing accountability regarding their provision. Civil society actors should be encouraged to implement actions to expand the reach of this type of information to all sectors in society, promote the exercise of the right to information to advance the right to health and counter its violations, undertake advocacy and monitoring actions and directly involve individuals in them. Enhanced access to health-related information shall not preclude the protection of individuals' right to privacy.
9. The Fight Against Corruption: By contributing to openness and accountability, access to information can be a useful tool in anti-corruption efforts. Besides ensuring that access to information legislation is effectively implemented, governments have a duty to guarantee a broader legal and institutional framework conducive to preventing and combatting corruption. Civil society organisations and plural media independent of powerful political and commercial interests are critical actors in unveiling and fighting corrupt practices, and their use of access to information laws and other mechanisms enhancing transparency should be encouraged.
10. Aid Transparency. Governments, donors and recipients have a duty to make all information relating to development assistance including grants, loans and transfers to public and private bodies, and assessments on the use and effects of such assistance fully public in a proactive manner based on the principles of the International Aid Transparency Initiative.
11. Natural Resources Transparency. Governments should proactively publish all information including policies, impact assessments, agreements, subsidies, licenses, permits and revenues relating to the exploitation of natural resources including the extractive industries, water, fisheries, and forests. Private bodies which are exploiting natural resources should be required to publicly disclose the terms of such agreements and payments made to governments based on the principles developed by the Extractive Industries Transparency Initiative (EITI).
12. Media and Information Literacy. Governments, civil society, education institutions, and the media have an obligation to promote media and information literacy, to assist individuals and communities to ensure that all members of society can understand and take advantage of new technologies, and to be able to participate intelligently and actively in public matters, and enforce their right of access to information. Citizens should be empowered to be able to consume information critically and express their views on such information, as well as be enabled to seek corrections where applicable.
13. Access to Information and Communications Technologies. Governments have an obligation to (i) use ICTs and other media to ensure maximum disclosure and dissemination of information; (ii) promote and facilitate unhindered public access to such technologies for all citizens and especially for disadvantaged minority groups and minority language speakers, as well as marginalised people such as women, children, rural people, the poor and persons with disabilities.
14. Apply in Other Spheres. The principles stated above on the right of access to information also apply to various spheres that have not been listed.

#### Call to Action

In light of the above, the Conference calls on:

UNESCO to:

- Endorse, through its General Conference, the African Platform on Access to Information and the proclamation of 28 September as International Right to Information Day, also recommending the endorsement of this International Day by the United Nations General Assembly, as a date to raise awareness about the importance of the right of access to information throughout the world;
- Develop and implement internal policies facilitating access to information held by UNESCO in line with this Declaration, and to encourage the adoption of similar policies by other UN agencies.

UN Economic Commission for Africa:

- Develop as part of the RIO +20 Earth Summit a regional convention on access to environmental information, public participation and access to justice based on Principle 10 of the 1992 Rio Declaration and the UNEP Bali Guidelines.

The African Union, its Organs and Institutions:

- The African Commission on Human and Peoples' Rights to promote 28 September as African Right to Information Day;
- The African Commission on Human and Peoples' Rights to adopt use this Declaration for a resolution authorising the Special Rapporteur on Freedom of Expression and Access to Information to expand Article IV of the Declaration of Principles on Freedom of Expression in Africa to incorporate the principles of this Declaration.
- The African Commission on Human and Peoples' Rights to complete and approve the proposed Africa Model Law for AU Member States on Access to Information;
- The African Union Commission to take forward this Declaration by (1) proposing to the next AU summit in January 2012 to adopt 28 September as African Right to Information Day; and (2) initiate an Experts Group to develop further instruments on access to information;
- The Pan-African Parliament (PAP) to endorse this Declaration;
- All African Union bodies to promote the respect of the principles in this Declaration by national governments and provide assistance in implementing them;
- The New Partnership for African Development (NEPAD) to adopt the revised African Peer Review Mechanism (APRM), which includes transparency and access to information;
- The African Union should develop and implement internal policies on access to information held by AU bodies based on this Declaration.

Other African Regional Organizations and Institutions:

- All Regional Economic Communities (RECs) should develop internal policies on access to information held by those bodies based on this Declaration;
- ECOWAS to review and adopt the Supplementary Act for a Uniform Legal Framework on Freedom of Expression and Right to Information in West Africa;
- The Southern African Development Community (SADC) to revise the Protocol on Culture, Information and Sport to include principles on access to information;
- Inter-governmental Agency on Development (IGAD) to develop and adopt a Protocol on access to information based on this Declaration;
- The East African Community (EAC) to develop and adopt a Protocol on access to information based on this Declaration;
- The African Development Bank (ADB) to adopt a revised public access policy based on the Transparency Charter for International Financial Institutions.

National Governments of AU member states to:

- Adopt or revise existing comprehensive laws on access to information in line with the principles in this Declaration and the proposed AU Model Law, and fully implement them;
- Harmonise legal frameworks to ensure access to information including repealing or revising antiquated laws which restrict access and ensuring that new laws are compatible with the ATI principles;
- Engage with civil society and other stakeholders to ensure widespread information demand and effective implementation of laws and policies to advance access to information by all persons, especially marginalised groups.
- Join and implement multi-stakeholder efforts including the Extractive Industries Transparency Initiative (EITI), the Construction Sector Transparency Initiative (CoST) and the Medicines Transparency Alliance (MeTA) to further transparency;
- Promote availability of public domain information through ICTs and public access to ICTs;
- Support AU efforts to adopt an instrument on access to information;
- Officially recognise 28 September as International and African Right to Information Day;
- Adopt and effectively implement legislation and policies ensuring whistleblower-protection.

Civil Society to:

- Engage with governments in developing, enhancing and implementing ATI laws;
- Monitor progress on the implementation of ATI laws including sectoral laws;
- Create awareness on ATI and provide assistance to facilitate information access by the general public as well as by specific audiences (including women, minority groups and minority language speakers, children, rural communities, individuals with disabilities or living in poverty);
- Ensure transparency in their own activities;
- Promote September 28 as African and International Right to Information Day and, in particular, carry out activities on that date every year to advance the recognition, awareness and enjoyment of the right of access to information by all sectors of society.

Media to:

- Respect editorial independence, professional ethics and journalism standards in their provision of information;
- Recognise the need for transparency and accountability with regard to their own output and institutions, while safeguarding the principal of protecting sources;
- Respect and promote equality, and provide equitable representation within their information output;
- Promote the widest possible access to their information output;
- Enhance mechanisms for audience participation and response;
- Recognise and be responsive to gender differences in regard to audience and market research;
- Popularise the importance of, and issues around, access to information.
- Make optimum use of ATI laws to access information for the public interest.

Business Sector Companies and Corporations to:

- Join multi-stakeholder initiatives promoting transparency including EITI, CoST and MeTA;
- Adopt corporate and social responsibility (CSR) policies that promote transparency and accountability, including access to information and protection of whistleblowers;
- Proactively disclose information of public interest including on pollution releases and other environmental issues;
- Support government and CSO efforts to improve access to information in society.

Public and Private Donors to:

- Ensure that all information relating to the use of development assistance and its effects are made public;
- Ensure that all information relating to development assistance is made available in conformity with the International Aid Transparency Initiative (IATI) standards;
- Encourage and support governments in the adoption and full implementation of access to information laws and policies;
- Support civil society and governments efforts to promote access to information.

Moving from Principles to Rights

Rio 2012 and Ensuring Access to Information, Public Participation, and Access to Justice for Everyone

Article 19 and The Access Initiative

July 2011

Synopsis

The rights of access to information, public participation, and access to justice are essential to sustainable development. The 1992 Rio Declaration provided for these rights in Principle 10 and Agenda 21 moved them into reality in many countries. Now renewed commitment is needed for the full implementation of the rights in all countries. The Rio 2012 Summit provides an opportunity for governments to transform Principle 10 from aspirational goals into actionable rights. Governments and civil society should use the opportunity to commit together in adopting, implementing, and exercising these rights in support of sustainable development. The 2012 Summit's focus on the theme of improving institutional frameworks should galvanize nations to improve their national environmental governance, develop international instruments giving legal force to Principle 10, and implement these principles into international bodies' decision-making processes. This paper reflects insights from the research, on the ground experiences, and core beliefs of over 250 non-governmental organisations (NGOs) working in 50 countries within The Access Initiative Network together with ARTICLE 19 - a human rights organisation that promotes freedom of expression and freedom of information all over the world.

Principle 10 of the 1992 Rio Declaration

Environmental issues are best handled with participation of all concerned citizens, at the relevant level. At the national level, each individual shall have appropriate access to information held by public authorities concerning the environment, including information on hazardous materials and activities in their communities and the opportunity to participate in decision-making processes. States shall facilitate and encourage public awareness and participation by making information widely available. Effective access to judicial and administrative proceedings, including redress and remedy, shall be provided.

This paper was written by David Banisar and Sejal Parmar from ARTICLE 19, and Lalanath de Silva and Carole Excell from the Access Initiative, World Resources Institute. This paper reflects the views of ARTICLE 19, The Access Initiative, and the authors.

Introduction

In the 1992 Rio Declaration on Environment and Development, the international community recognised that sustainable development depends upon good governance. Principle 10 of the Declaration sets out the fundamental elements for good environmental governance in three "access rights": access to information, public participation, and access to justice. These are based on the experience that governmental decision-making failing to include these essential tenets of access will produce outcomes more likely to be environmentally damaging, developmentally unsustainable, and socially unjust.

Access rights facilitate more transparent, inclusive, and accountable decision-making in matters affecting the environment and development. Access to information empowers and motivates people to participate in an informed and meaningful manner. Participatory decision-making enhances the ability of governments to respond to public concerns and demands, to build consensus, and to improve acceptance of compliance with environmental decisions because citizens feel ownership over these decisions. Access to justice facilitates the public's ability to enforce their right to participate, to be informed, and to hold regulators and polluters accountable for environmental harm.

The access rights in the Rio Declaration have been widely recognized around the world. However, there is much work remaining to ensure that these rights are truly available to empower societies. Commitments made by governments to the principles of good governance under the Rio Declaration Agenda 21, and the Johannesburg Plan of Implementation need to be strengthened, monitored, and reported upon. Governments that have not already done so must establish legal rights to access to information, public participation, and justice. Finally, all governments must demonstrate their support for protection of these rights. Once access rights are established, governments and

civil society need to focus on developing the capacity to operationalize these rights and make them meaningful for the communities they are intended to support.

The Access Initiative (TAI) aims to bridge the gap between international commitment to P10 and national-level implementation of the policies and systems that support these access rights. Over the 10 years since its formation, partner NGOs have carried out evidence-based indicator assessments of their governments' implementation of Principle 10. Article 19 has worked on supporting the development and implementation of laws guaranteeing and implementing rights to freedom of expression for over 20 years in over one hundred countries around the world. TAI and ARTICLE 19's work supports the belief that sustainable development cannot succeed when citizens are sidelined and decisions are made in secret behind closed doors.

We believe that the outcome of the Rio 2012 Summit must include an affirmation of these fundamental access rights and that substantial efforts must be made to establish them and make them enforceable in all countries. At a minimum national governments must commit to the full implementation of access rights into national law, ensure intergovernmental organisations and institutions incorporate these rights into their own regulation and practices, and develop international and regional mechanisms to ensure support across regions for tracking and monitoring of implementation. We believe that the new international instruments are necessary to ensure that these access rights are truly available to everyone.

## 2 The Rio 2012 Process and Principle 10

The United Nations Conference on Sustainable Development, the Rio 2012 Summit, follows up on the 1992 Earth Summit. Its stated purpose is to "secure renewed political commitment for sustainable development, assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges." Within that context, there are two specific themes emphasised: (1) A green economy in the context of sustainable development and poverty eradication; and (2) The institutional framework for sustainable development.

Overall, these themes have been discussed in isolation from each other and there has been insufficient discussion on what reforms are needed to achieve these objectives, who needs to be involved in decision-making, and how the objectives will be achieved. Both agenda items need to be discussed in light of the principles of transparency, public participation, and accountability. A fruitful approach would be for the two themes to be considered together in conjunction with the larger objective of securing political commitments for sustainable development that could have a greater impact on the Summit.

As UN Secretary General Ban Ki-moon notes, the goals represented by these themes are interdependent, as "improved institutions are crucial to favourable social outcomes of green economy policies." He calls upon governments to do more to "build on progress made to promote transparency and accountability through access to information and stakeholder involvement in decision-making." Without these basic changes the current economic paradigm will prevail, supported by institutions and interest groups that have benefited from restricting citizen access.

### 2.1 The Green Economy

There has been an extensive debate on creating a definition for a "green economy" and determining its scope. There is some agreement that at the national level, greening the economy will include improving fiscal policy reform, reducing environmentally harmful subsidies, employing new market-based instruments, and targeting public investments to "green" key sectors. There has been almost no discussion on the role of citizens and on access to rights as an important facet of creating this new economic model.

We should no longer ignore the role citizens must play in determining the success or failure of a global green economy. Ensuring that policies designed as green meet their intended aims of economic and environmental sustainability and social equity requires broad based public participation and support from empowered civil society actors, well-informed and engaged voters, consumers, stakeholders, and shareholders. Disseminating information about what specifically a green economy entails for society is essential to motivating social actors' involvement in the decision-making process of policies intended for developing and protecting sustainability. Governments must establish infrastructure for access to this type of information and ensure public participation. The media must act as a neutral messenger.

Without a fundamental shift in the power of interest groups, greening the economy will remain a game of catch up as innovation and industry move ahead without regard to the social and environmental costs.

### 2.2 Reforming Institutions at the International and National Levels

Meanwhile, discussions on the sustainable development governance theme have focused on International Environmental Governance (IEG). The Nairobi-Helsinki Outcome Document proposes a reform agenda for institutions, the UN Environmental Programme (UNEP), the UN Commission on Sustainable Development (UNCSD), and the Economic and Social Council. A second tier of concerns addresses the fragmentation of Multilateral Environmental Agreements (MEAs), funding mechanisms, and Secretariats.

The current deliberations before the UNCSD have failed to deliver a visionary approach to the creation of a new international environmental governance system that includes mechanisms for accountability.

Within the IEG discussions there has been sufficient emphasis on the need to make these international institutions and governments themselves more transparent and accountable to the citizens they are intended to serve. Currently, there are limited and inadequate mechanisms for access to information held by UN bodies, especially relating to trade. There has been more significant process with the World Bank and International Financial Institutions (IFIs).

At the same time, there has been little effort toward reviewing and reforming national institutions. While international institutions have critical roles in formulating and coordinating policy on international environmental governance, their reform will have little impact on those national level institutions where citizens are still struggling to participate in decisions affecting their environment.

The Nairobi-Helsinki Outcome Document, for example, does not make any mention of compliance mechanism to ensure implementation and monitoring of Multilateral Environmental Agreements and environment obligations by citizens. This is a glaring omission. Without mechanisms to ensure a means of government accountability, governments will continue to fail to fulfill their obligations under international environmental law. Some possible mechanisms which may be put forward for consideration include:

- Peer review - The OECD Group on Environmental Performance (GEP) has developed a process to conduct reviews of the environmental performance of OECD member countries with respect to both domestic policy objectives and international commitments. It has been in place since 1992.

- Independent evaluation and compliance mechanisms - The North American Commission for Environmental Cooperation takes a multi-pronged approach to promoting environmental enforcement and compliance. Central to the agreement is a commitment by the parties to effective enforcement of their respective environmental laws, reinforced by two formal procedures: (1) A procedure for citizen submissions asserting ineffective enforcement by a party, to which the secretariat may respond by requesting a response from the party and developing a factual record; and (2) A procedure for claims by a party that another party exhibits a persistent pattern of failure to effectively enforce its environmental law.

-Dispute resolution process: Under the Kyoto Protocol, states are considered a procedure that would allow private investors a right to appeal decisions by the Clean Development Mechanism that go against their interest while under the World Bank Inspection Panel affected citizens can trigger inspections of alleged failures of the Bank to follow its own policies. Finally, under the WTO dispute settlement process, and under several bilateral investment agreements, civil society organisations have been allowed to submit amicus curiae briefs to influence the outcome of decisions.

In his background paper for Ministerial consultations at the 26th session of the Global Ministerial Environmental Forum, the Executive Director of UNEP noted that to deal with the accountability challenge, it would be necessary to make review a key function of the Global Ministerial Environment Forum, to implement independent third-party reviews and performance monitoring, to create incentives for performance and early action, and to establish a global version of the Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters. The IEG discussions clearly need to move away from the current negotiations and refocus in areas that can engender greater transparency and accountability, acknowledging achievements and compliance with international commitments but also acknowledging where capacity and political will have been lacking.

### 3 Progress to Date on Principle 10 and What is Missing?

The 1992 Rio Declaration was signed by 178 States. There has been notable progress both internationally and nationally since its adoption. However, many gaps remain.

#### 3.1 International Progress

In the area of access rights, the 1992 Rio Declaration has seen mixed success on the global level. Unlike many other areas in the Declaration, no global legal instrument - such as a treaty or convention - on access rights in the environment has been developed. It is only recently, mostly in the context of the Rio 2012 process, that this has even been discussed.

UN bodies have also been slow in addressing the issue. In 2012, after nearly 20 years, the UNEP Governing Council finally adopted guidelines ("the Bali Guidelines") on how governments should develop national laws in relation to Principle 10. The guidelines are intended to assist national governments by "promoting the effective implementation of their commitments to Principle 10 of the 1992 Rio Declaration on Environment and Development within the framework of their national legislation and processes." However, the guidelines are largely unknown and while there are commitments by the UNEP and other bodies to provide assistance and training, the efforts appear currently to be on a very small scale.

More successful has been the efforts of the UN Economic Commission for Europe (UNECE). The UNECE has adopted two groundbreaking treaties based on the Declaration. Of primary interest to this paper, the Declaration was the starting point for development of the first legally binding international treaty on access rights - the 1998 Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters, commonly known as the Aarhus Convention. The Convention places ratifying nations under a series of important obligations including collecting information held by private bodies and requiring public bodies to affirmatively make information available to the public, respond to requests, and provide strong rights of appeal. It also established rules for public participation, appeals, and access to justice measures.

The Convention also requires that signatories "promote the application of the principles of this Convention in international environmental decision-making processes and within the framework of international organisations in matters relating to the environment." UN Secretary General Kofi Annan described it as "the most ambitious venture in the area of environmental democracy so far undertaken under the auspices of the United Nations."

As of June 2011, the Aarhus Convention has been ratified in 44 countries from Western Europe to Central Asia and has been incorporated into EU law through a directive. The Compliance Committee has now heard over 50 cases, nearly all filed by the public or civil society organisations. In 2003, a follow-up instrument to the Aarhus Convention, the Kiev Protocol on Pollutant Release and Transfer Registers, was adopted. This Protocol holds corporations accountable for disclosing information on the toxics they release to the environment. It has now been ratified by 26 countries.

In addition to the Aarhus Convention, Principles 17 and 19 of the Rio Declaration also resulted in the creation of the 1991 UNECE Convention on Environmental Impact Assessment in a Transboundary Context (the Espoo EIA Convention). It creates requirements for state parties to assess the environmental impact of major projects early on and to notify other countries when the project will have a transborder effect. It has been signed by 45 countries and ratified by thirty.

#### The Access Initiative Assessment Toolkit

The Access Initiative (TAI) has developed a comprehensive tracking indicator toolkit on Principle 10. It uses a 148 indicator web-based toolkit to assess the performance of governments on Principle 10 of the Rio Declaration. Working in their respective countries, TAI partners form national coalitions to assess the performance of their governments in providing the public with (a) access to information about government decision, (b) public participation in decision-making, and (c) access to justice when their rights to information, participation, and a clean environment are violated. TAI currently has CSO partners in 50 countries and assessments for over three dozen countries are available on the web. It is available at <http://www.accessinitiative.org/resource/the-access-initiative-assessment-toolkit>.

To date, no other regions have moved forward on developing binding legal instruments similar to the Aarhus and Espoo Conventions. As we discuss later in the paper, there is an opportunity for them to do so.

#### 3.2 National Progress

There have also been substantial changes in legal frameworks at the national level since 1992, particularly in areas of access to information and environmental impact assessments. A substantial number of countries have adopted new legal frameworks on access rights, especially relating to access to information.

However, the adoption of laws has not been uniform. Few African countries have adopted legal frameworks and significant gaps remain in the Asia Pacific region and in Latin America and the Caribbean.

Implementation has been difficult. Profound institutional and societal transformations are necessary to achieve a level of openness in which governments and civil society share a commitment to environmental democracy. Even countries that have made progress in adopting and implementing Principle 10 are often limited by internal structural and political fights. In many countries, efforts have been led by the Ministries of Environment and other agencies dealing with environmental conservation. Simultaneously, in other areas of decision-making that impact the environment, secretive and closed door routines continue to remain the norm. For example, access to information and public participation in decision-making in Ministries relating to macroeconomic policies or energy planning is minimal. Rio 2012's broader sustainable development framing and its emphasis on the green economy present an opportunity for governments to commit to a synchronization of policymaking with opening up a wider range of processes to public scrutiny.

There is considerable evidence that many governments now recognise the need for addressing good governance in achieving sustainable development and fulfilling the Rio commitments. The UN Development Programme, for example, found that the vast majority of 119 countries recently identified capacity development in governance related to issues as their top priority for sustainable development improvements. There is a real need for Rio 2012 to be the impetus for addressing these challenges.

### 3.2.1 Access to Information

Sustainable development relies upon accurate information on a range of environmental matters, including those related to the green economy and climate change. Disclosure of information is therefore clearly in the public interest and serves to enhance the effectiveness of sustainable development programmes.

Since Rio 1992, there has been a dramatic increase in recognition of the right to access information by nations. Over 90 countries have adopted framework laws or regulations for access to information, including in the past few years China, Indonesia, Nigeria, Chile and Mongolia. Over 100 countries have the right to information enshrined in their constitutions. Many others including Brazil have adopted specific environmental information access statutes or provisions in general environmental protection laws. The Rio Declaration and Agenda 21 played an important role in the adoption of these laws.

As the map above shows [UN-DESA: Please see Full Submission for Map], there are significant disparities between regions. While most of the nations of Europe, the Americas and a significant portion of Asia have the laws in place, individuals in most Middle Eastern, African, Pacific and Caribbean countries do not yet have this right to incorporate into national law. Furthermore, practice lags behind laws in the majority of these countries. Causes for this gap vary, including lack of detailed administrative rules and operational policies, inadequate public capacity to use the laws, and insufficient official capacity to implement laws.

Another positive trend with respect to access to information is the increased adoption of Pollutant Release and Transfer Registers (PRTs), which require governments to collect information on pollution releases and make that information publicly available through databases. PRTs have been shown to be one of the most effective means of getting pollutant related information out to the public while simultaneously reducing pollution. There has been a steady increase of countries providing registers and it is estimated that the number of national registers is likely to double over the next 10 years. There are now single register covering all of North America and Western Europe. [UN-DESA: Please see Full Submission for Map]

Outside of these successes, there are many gaps remaining for access to information. These include:

- Research by ARTICLE 19 and other human rights and environmental organisations across the world demonstrates that populations are still being denied access to essential information about climate change and the environment. Denial of access to information stems largely from the absence of freedom of information legislation and the institutional secrecy of numerous state authorities, coupled with legislation in place preventing access to information, including state secret laws, national security laws, and anti-terrorism legislation.
- Around the world, few laws exist that require the government to proactively release environmental information, including basic information on air quality and drinking water quality. Meaningful access to environmental information requires governments to proactively gather, analyse, and disseminate this information. Where databases exist at the international level, there are no requirements that this information is disclosed to the public.
- Many countries performed poorly in providing environmental information during and after emergencies. Most countries fail to release relevant environmental information on emergencies at all. Mandates to produce and disseminate such information are generally weak despite recent international disasters.
- Most countries produced state of the environment reports of generally good quality, but publicity is particularly weak; few countries make attempts to publicize the results through the mass media or in a usable format.

### 3.2.2 Public Participation

Progress on public participation is more complex to assess at the policy, planning, and project levels. In many countries, planning processes are now designed to ensure that the public have procedural rights to intervene and to ensure that public bodies have a duty to take this into account when making their decisions. One key aspect of this area is Environmental Impact Assessments (EIAs), which require the assessing of the environmental and social impact of projects prior to their approval. There has also been a substantial up-take of laws requiring Environmental Impact Assessments in recent years. Over 120 countries have adopted legal provisions on EIAs.

However, in practice, there are many gaps remaining in public participation. These include:

- Public participation has not been fully incorporated at the project level through EIA procedures in many countries. Often there are hurdles to meaningful participation, including insufficient lead time or unavailable project documents even where there are open participatory processes in place. Consultation is often held too late in the project development cycle to make a significant difference in project design or selecting outcomes.
- Framework public participation laws are still new to many governments despite progress in their adoption in a number of countries, e.g. Thailand and Indonesia.
- Implementation of EIA processes has also been criticized as weak. Often sequencing of EIA and permitting processes excludes participation in the scoping and screening exercise, as well as in the determination of permit conditions. In some countries, copies of EIAs are only provided to citizens at a substantial cost, while restrictions to access based on claims of commercial confidentiality are evident in other countries.
- Conflicts of interest in the public hearing process, the technical nature of the EIAs, access to non-technical summaries in local languages, and claims of lack of independence of systems to develop and review EIAs are also evident.

At a higher level, Strategic Environmental Assessments (SEAs) are a mechanism for incorporating environmental considerations into policies, plans, and programmes. The World Bank describes SEAs as "including mechanisms for evaluating the environmental consequences of policy, planning, or program initiatives in order to ensure that they are appropriately addressed in decision making on par with economic and social considerations." SEA strengths include a general availability of documents relating to proposed policies. There is an EU directive requiring that all EU member states incorporate SEAs into national law. SEAs have also been incorporated within national legislation in a number of countries in Latin America and the Southeast Asia region. Some development assistance from international financial institutions and donor agencies is increasingly tied to the conduct of SEAs. However, to date public participation in SEA processes is still rudimentary and needs improvement.

### 3.2.3 Access to Justice

The access to justice pillar is arguably one of the most difficult areas in which to see improvement. Increasingly, countries have created or enhanced environmental courts and tribunals with specialized functions. The belief that these institutions enhance access to justice and provide more efficient means of resolving environmental disputes has been a primary reason for these interventions. In 2010, there were over 300 environmental courts and tribunals in 41 countries [UN-DESA: Please see Full Submission for Map]. Recently, India established a Green Tribunal and Malawi created an Environmental Tribunal.

However, there remain many gaps in the road to improving access to justice. Issues of timeliness (time taken to obtain a remedy), intimidation, and costs (litigation, loser pays principles, payment into court and costs to hire attorneys) should be highlighted, including in countries party to the Aarhus Convention.

The risk of seeking injunctive relief is also significant. There are improvements in many countries relaxing rules for legal standing; however, there are still concerns about

legal standing in sectoral legislative processes such as planning. Meanwhile, public interest cases taken by civil society organisations against corporations and governments for causing environmental harm are almost exclusively supported by donors and foundations.

### 3.3 Capacity Building

Legal mandates are insufficient to ensure the implementation of access rights. Governments need the infrastructure and capacity to supply access and the public and civil society organisations must have the ability to demand access and participate. Government officials need knowledge of the legal framework and officials must possess practical skills and financial resources for access across all relevant ministries. Often, only the national ministry of environment has sufficient training in implementing access while other parallel and sectoral ministries and agencies do not. To address the needs of indigenous peoples, vulnerable communities, and the poor, government must be innovative in how it provides and disseminates access to information. These communities in particular continue to be excluded from decision-making, and specific entitlements are needed to facilitate their participation and achieve inclusiveness.

In addition, a free and independent media plays a key role in increasing awareness of environmental protection and sustainable development to those most likely to be affected by these policies. Article 19 of the Universal Declaration of Human Rights declares everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive, and impart information and ideas through any media regardless of frontiers. Information access reflects how and what media covers. With legal protections, a free and independent media can monitor and strengthen the transparent and accountable delivery of funds for environmental goals on a diverse range of issues including climate change, protected areas, species endangerment, and protection of coastal resources. An effective, free, and independent media translates complex information into a meaningful, understandable, and actionable format for public consumption. Media facilitates discussion and debate between citizens and officials about sustainable development and green policies. The media has the ability to relay back key messages from affected communities to officials.

Furthermore, media plays a key role in an effective advanced warning system, particularly in relation to the dissemination of warnings, developments, and disaster mitigation. Indeed, in many areas affected by natural or other disasters, the mass media are the only means by which crucial information is quickly and widely disseminated. In order to be able to perform this role, the media must be able to access accurate and timely information from credible sources. Local media outlets, including community radios, newspapers, and even television services, have a central role to play not only in disseminating information from official sources but also in ensuring an effective two-way flow of information underpinning effective participation.

### 4 From Principle to Enforceable Rights: How Rio 2012 Could Strengthen Principle 10

There is a compelling need to ensure that Principle 10 is fully implemented in all countries. While UNEP made some progress in 2010 with the adoption of Bali Guidelines on national legislation discussed above, this development is not sufficient by itself. Voluntary implementation of guidelines, coupled with resource and budgetary support, country-by-country, decreases the usefulness and potential impact of these guidelines.

Bolder action at the global level, involving the development of new and revised international instruments to promote Principle 10, is needed. There are a number of approaches at the international level that should be considered including the drafting and adoption of a new legally binding global instrument, adoption of legally binding instruments at the regional level, and new sustained efforts to bring additional parties into the Aarhus Convention. Such proposals are not exclusive but rather complementary and should be considered as part of a package which can be advanced simultaneously.

#### 4.1 Options for international instruments

Possible options for international instruments:

##### 1. A new global convention on Principle 10

The most far-reaching option is the drafting and adoption of a new global legally binding instrument adopting the access rights in Principle 10. This would be based on a commitment by the national leaders at Rio 2012 to adopt such an instrument. This approach would create a global platform to engage worldwide discussion on the subject, as has been done for other areas on environment. It could ensure that P10 is uniformly adopted worldwide. However, there are a number of challenges associated with the development of a global legally binding instrument, such as a convention on access rights. The proposal of such an instrument may encounter resistance from some states and there is real risk that such an initiative would lead to the adoption of minimal standards. It would also likely take a considerable time to develop. Finally, there are possible difficulties on how this would affect parties to the Aarhus Convention.

##### 2. Promoting regional Principle 10 conventions.

A more scaled down approach would focus on the development of new regional legally binding instruments similar to the UNECE Aarhus Convention. A significant positive aspect to this approach is the potential greater involvement of all countries in each region in developing and shaping the text of the regional instrument from the start, rather than the discussion being limited to major countries at the international level. This would provide the opportunity to take account of regional specificities and create a sense of regional ownership. In addition, countries within a region often share common political, cultural and linguistic ties, potentially simplifying the negotiations and making it easier to reach consensus. It would also likely be a quicker process than a global debate. Finally, regional conventions would likely strengthen existing regional institutions and processes to reduce resource constraints. However, this approach is not without risks, set out below.

##### 3. Opening up the UNECE Convention to all states

The last option is to encourage accession to the Aarhus Convention by states outside the UNECE region. The treaty is well respected and has a functioning oversight system. It has already been ratified by 44 countries. However, no state outside the UNECE region have acceded to it to date. There are political and practical obstacles to accession including the procedure for accession itself and reticence from many governments towards adopting a treaty viewed as "European-centric".

#### 4.2 Developing a Regional Convention Approach

We believe that the best approach is to begin the process of negotiating regional and sub-regional legally binding instruments on Principle 10 using the UNECE Aarhus Convention as a model. This approach is guided by a pragmatic belief that a new global convention would be too slow to develop and is likely to be substantially watered down in the process. The Aarhus Convention has been recognised as a model that should be considered for other regions. However, since its adoption in 1998 no other nation outside the UNECE region has signed it. This suggests it is not likely to significantly expand in terms of accession without substantive incentives, which have not yet been forthcoming.

There are some risks to this approach - some regions may be unlikely to adopt legally binding instruments at the regional level in the foreseeable future. But there remains the possibility for progress toward agreements on their merits, drafting, and adoption at the sub-regional level. Moreover, the development of regional treaties could further strengthen future efforts to create a global instrument in the future as has happened in the field of anti-corruption.

##### 4.2.1 Opportunities in Latin America

We are particularly hopeful that this approach will be successful in the Latin America and Caribbean region as a first mover region, where there is a normative convergence around Principle 10. Some developments include:

- Regional Support. The Declaration of Santa Cruz+10 reaffirmed the commitment of the members of the Organisation of American States (OAS) to Principle 10 and the importance of public participation in sustainable development decision making. The Inter American Court of Human Rights recognises the right of citizens in the region to have access to information and participate in decisions that affect their rights, while the OAS Secretariat recently released a Model Law on Access to Information.

- Free trade agreements between several North and South American states recognise the importance of environmental assessments and the need to harmonize environmental regulations and standards. The Central American Commission on Environment and Development (CACED) along with the UN Institute for Training and Research developed tools for a national strategy to guarantee access rights to Nicaragua, Honduras, and the Dominican Republic. ECLAC proposed activities in its 2011 programme of work to help states implement Principle 10.

- National Developments. A number of countries in the region have already adopted laws improving access rights including Chile, Jamaica, Peru, and Mexico while Brazil is currently about to adopt one. Jamaica has just undergone an extensive review of its Access to Information Law to improve implementation, proactive disclosure, and development of a mandated public interest test. Mexico has one of the most advanced access to information regulatory systems, with one of the most effective oversight and enforcement agencies in the world, and has developed its own pollutant release and transfer register. Some countries have increased their efforts to promote public participation. For example, Chile is in the process of revising environmental impact regulations that will take public participation to the next level - to proactively include the poor and marginalized groups in decision-making by requiring both the project proponent and the government to adapt their strategies of information dissemination and adopt methods of citizen participation that take into account the social, economic, cultural, and geographic characteristics of the population in question. The draft regulations require the authority to make special efforts to adapt these procedures, taking into account vulnerable and geographically/territorially isolated communities, indigenous communities or those with ethnic minorities, and communities with a low educational level. What is particularly exciting about this new draft regulation is that it is the first time a Latin American country has brought the notion of environmental justice in public participation into standard practice within the framework of a law. Brazil leads the way with innovative strengthening of the justice system to provide relief for environmental harms through public prosecutors and environmental courts.

## 5 Conclusion and Recommendations

Experience and research have demonstrated that freedom of expression, access rights (including access to information, public participation, and access to justice), transparency, and civic engagement are fundamental to sustainable development and the achievement of the Rio Principles. While there has been significant progress over the past 20 years, billions of people around the world still do not have these rights.

If Rio 2012 is to be successful and bring the world closer to building a green economy and ensuring sustainable development, these fundamental principles must be at the heart of the Outcome Document and consecutive commitments by governments to advance Principle 10 at the international, regional, and national levels.

ARTICLE 19 and The Access Initiative have the following specific four recommendations:

Recommendation One: That all states that have not yet done so, codify Principle 10 of the Rio Declaration in national laws, and for all states to make measurable and time bound commitments to improve laws, institutions, and practices for implementing Principle 10.

In particular, states should provide for:

A legal and regulatory framework:

1. To establish a legal and regulatory framework to protect the right to freedom of expression and the right to freedom of information, including freedom of the media, as well as the right to freedom of association, freedom of assembly, the right of all to access administrative and judicial remedies, and the right to effective political participation. This legal framework should recognise and insist upon the principle of non-discrimination.
2. To enshrine and implement in domestic law the principles of maximum and proactive disclosure on environmental and green economy information.
3. To enshrine the right of the public, communities, and stakeholders to participate in decision-making that affects the environment and natural resources.
4. To ensure that the media, civil society groups, scientists, and members of the general public are not hindered in their efforts to gain access to information on development and environmental issues and to report and express their opinions.
5. To protect the right of whistleblowers, especially related to environmental hazards, and take necessary measures to ensure that whistleblowers should benefit from legal protection.
6. To remove all obstacles preventing people living in poverty, vulnerable groups (such as women and minorities), and indigenous peoples from accessing information on development and environmental policies, and to take proactive measures to promote their effective participation in the design and execution of development strategies.

Recommendation Two: The Rio 2012 Outcome Document should call for new international instruments to provide global and regional standards for, and oversight of, the implementation of Principle 10 into national law. This would include a resolution by all member states mandating UN regional bodies in Asia, Africa and Latin America and the Caribbean, as well as UNEP regional offices and other regional bodies, such as SAARC, SACEP, ECOWAS, ASEAN, OAU, and OAS to take steps to negotiate and conclude legally binding regional or sub-regional conventions modeled on the UNEP Principle 10 Guidelines. The Aarhus Convention Secretariat should intensify its efforts to convince governments in other regions of the world to either adopt the Convention or take it as a model for regional or sub-regional efforts.

Recommendation Three: The Rio 2012 Outcome Document should include a commitment by all international organisations and agencies working on sustainable development to codify Principle 10 of the Rio Declaration in their rules and procedures, including by proactively disclosing information, providing for the participation of civil society in their decision-making processes, and establishing redress mechanisms for individuals affected by their policies and activities. International financial institutions should adopt comprehensive standards as proposed by the Global Transparency Initiative.

Recommendation Four: The Rio 2012 Outcome Document should include specific and time measured information regarding the implementation of the Bali Guidelines recently adopted by the UNEP Governing Council. This programme should identify target countries and specify long term funding sources as well as a timetable for UNEP to provide assistance to developing countries to bring their laws, institutions, and practices in line with the Guidelines. The programme should include capacity building programmes, opportunities for mentoring of public officials, and mechanisms for civil society organisations to share experiences on the development of new legal instruments to create and implement access rights. About The Access Initiative and ARTICLE 19

The Access Initiative is the world's largest network of civil society organisations working to ensure that people have the right and ability to influence decisions about the natural resources that sustain their communities. ([www.accessinitiative.org](http://www.accessinitiative.org)).

ARTICLE 19, the Global Campaign for Free Expression, is an international human rights organisation focused on protecting and promoting the right to freedom of expression and right to information. ARTICLE 19 is a registered UK charity (No. 32741) with headquarters in London and field offices in Kenya, Senegal, Bangladesh, Mexico and Brazil ([www.article19.org](http://www.article19.org)).

## Asia Injury Prevention Foundation (AIP Foundation)

Making Roads Safe at Rio+ 20

A submission to the UN Conference on Sustainable Development by Asia Injury Prevention Foundation (AIP Foundation)

Summary:

- Road traffic crashes are the leading cause of child injury globally, and led to around 262 000 child deaths in 2004- almost 30% of injury caused deaths among children (WHO World Report on Child Injury Prevention, 2008);
  - By the year 2030, road traffic injuries are predicted to be the leading cause of death worldwide for all age groups;
  - The economic cost of road traffic crashes in developing countries is at least \$100 billion a year. In Thailand alone, damage caused by road traffic crashes led to an economic loss of almost 6 billion USD, or about three percent of the country's GNP (Prince of Songkla University, 2009)
  - South-East Asia and the Western Pacific Regions of WHO together accounted for two thirds of all road traffic deaths, and South-East Asia is one of the three regions expected to see the most significant increases in road traffic injuries (WHO World Report on Child Injury Prevention, 2008);
  - In May 2011, the United Nations launched the 'Decade of Action for Road Safety 2011-2020', with a goal to "stabilize and then reduce the forecast level of road traffic fatalities around the world by increasing activities conducted at the national, regional and global levels." (UN Road Safety);
  - There is a strong relationship between road safety and the MDGs. A study conducted in Cambodia entitled How traffic injuries affect household welfare: An assessment using the MDG benchmarks reveals that households in which one member has been injured by a road traffic accident perform worse than average in a number of MDG indicators.
  - Addressing road safety will also help to achieve environmental objectives. According to the UN Environment Programme, such policies can make "a large, lasting impact...on fuel use, congestion, air quality and CO2 emissions... It is also one of the most cost-effective actions for saving hundreds of thousands of lives". In Cambodia, the use of fuel wood (which is linked to forest depletion) increased among surveyed households even though the national average is decreasing;
  - While organizations such as the World Bank have recently become aware of the pressing issue that is global road safety, the gap between an institution acknowledging the issue and achieving sustained action must be bridged. We believe the solution to this lies in the inclusion of road safety in the framework of a major international sustainability conference; (Commission for Global Road Safety)
  - The priorities agreed at international fora like Rio+20 set the global agenda and issues that are absent from the agenda are subsequently neglected and under-funded. This is why it is so important that action to improve road safety and promote sustainable modes of transport is included in the agenda and outcomes of the Rio+20 Conference. (Commission for Global Road Safety) Safer Roads at Rio + 20 1. Asia Injury Prevention Foundation is a U.S. registered 501 (c)(3) non-profit organization whose mission is to provide life-saving traffic safety knowledge and skills to the developing world with the goal of preventing road traffic crash fatalities and injuries. Founded in 1999 in Vietnam, AIP Foundation has offices in Vietnam, Thailand, and Cambodia. AIP Foundation's approach focuses on public-private partnerships, mass media awareness campaigns, and school-based helmet use and traffic safety education programs. AIP Foundation's efforts also include advocacy and the provision of technical expertise. In 2001, AIP Foundation built a non-profit helmet assembly plant that manufactures Protec "Tropical" Helmets, making affordable high quality helmets widely available. Disabled workers make up 30% of the factory's workforce.
2. In Vietnam, 30 people die each day from road traffic crashes (National Traffic Safety Committee, 2010). Approximately 36,000 people suffer from serious brain injuries annually as a result of these accidents. In Cambodia, 18,287 casualties caused by road traffic accidents in 2010 represent a 41% increase since 2006. With males representing over 86% of motorcycle related fatalities, thousands of families are being stripped of their sole bread winner. And in Thailand, 34 people die on the road every day (WHO, 2007).
3. AIP Foundation's 2007 public awareness campaign was credited with influencing the Vietnamese government's decision to bring forward the new nationwide mandatory helmet legislation and also played a role in ensuring an astonishing 98% compliance rate when the law was introduced. Within one year following the passage of the mandatory helmet law, injuries dropped by 24% and fatalities by 12%. By the end of 2010, this law resulted in 780 million USD saved (AIP Foundation calculations based on National Traffic Safety Committee data, 2007 and 2008).
4. This success can be reproduced in countries throughout the developing world. In 2009, AIP Foundation, in collaboration with the FIA Foundation and the World Bank, launched the Global Helmet Vaccine Initiative (GHVI), an international movement with the objective of "putting a helmet on every head in the 'Decade of Action for Road Safety.'" The Initiative brings AIP Foundation programs to developing countries in Africa, Asia and Latin America. Obtaining governmental cooperation and securing adequate funding are the most challenging components of these projects.
5. AIP Foundation strongly believes that global road safety must be addressed at the Rio+20 Conference, as it is one of the most important sustainability challenges facing the world today. The improvement of safe roads and road users can significantly contribute to the success of the MDG's and to tackling environmental issues. In turn, the international visibility that the issue will gain from its inclusion in the conference's 'Outcomes Document' will help institutionalise road safety programmes within middle and low-income governments and organisations like the World Bank.
6. We additionally believe that the absence of road safety from the agenda of the 2002 World Summit on Sustainable Development in Johannesburg, and the subsequent disregard for the issue in the following international fora, has contributed to the growing number of fatalities and injuries on South-East Asian roads.
7. In May 2011, the United Nations launched the 'Decade of Action for Road Safety 2011-2020', with a goal to "stabilize and then reduce the forecast level of road traffic fatalities around the world by increasing activities conducted at the levels" 1 . national, regional and global UN General Assembly Resolution A/RES/64/255 could save 5

million lives and 50 million serious injuries if its goals are attained ('Make Roads Safe: A Decade of Action for Road Safety', Commission for Global Road Safety, 2009).

8. In its Resolution proclaiming the Decade of Action for Road Safety, the United Nations General Assembly described road traffic injuries as a "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals". According to leading development experts and international agencies, the impacts of failure to address road safety can go beyond the immediate toll of death and disability to undermine policies on poverty alleviation, child survival and development, and climate change. (Commission for Global Road Safety)

9. In a study entitled How traffic injuries affect household welfare: An assessment using the MDG benchmarks (Erickson, M. and Kim, P., 2009), road traffic injuries' impact on Cambodia's progress toward the MDGs was measured through a survey of households in which one resident suffered a road traffic injury. In terms of poverty (MDG1), injuries resulted in a 21% loss of income for the household. Those mostly severely affected were those with a seriously injured resident as well as the poorest households. Primary education (MDG2) dropout rates were 8 times the province average. The gender (MDG3) income gap widened by 28% and women bore 88% of the burden of care for the injured. The infant mortality (MDG4) rate was more than double the province's average rate, and the maternal mortality rate (MDG5) was 15 times the national average. The households also recorded rates of priority diseases (MDG6) at twice the national average. There was no indication of an organized partnership (MDG8) for road transport programs which make provision for traffic injuries.

10. Of particular relevance to the Rio+20 Conference are the negative environmental outcomes (MDG7) for households in which one resident had suffered a road traffic injury. While the national Cambodian population's access to improved water sources between 2000 and 2007 increased from 38% to 65% (World Bank, 2009), the surveyed households' access stagnated rather than increased.

11. A serious environmental concern is Cambodia's high incidence of fuel wood dependency, which is a notable factor in its forest depletion (MoP, 2007b). Wood fuel also causes respiratory diseases, burns, and other negative health effects (Mishra, Retherford and Smith, 1999). While the national trend is one of reduced household use of wood fuel (MoP2007b), 26 out of 100 surveyed households reported using an increased amount of wood fuel.

12. The UN Environment Programme is currently urging a transformation of the way transportation is organized and planned in developing nations, to improve the safety of pedestrians and bicyclists. UNEP argues that "designating road space for pedestrians and cyclists in proportion to the demand for non-motorised transport is crucial. It is also one of the most cost-effective actions for saving hundreds of thousands of lives." ('Share the Road: Invest in Walking & Cycling', UN Environment Programme and FIA Foundation, 2011).

13. WHO reports that in Thailand, no formal audits are required for the construction of new road construction projects, and no regular audits take place of existing road infrastructure (2009).

14. A pedestrian research study conducted in Dong Nai Province, Vietnam, revealed that in only six months, approximately 5,824 primary school students were hit by a vehicle while walking around, to, or from school (Pedestrian Research Report, AIP Foundation, 2011). Almost 1000 accidents per month in just one province out of 64 is a clear display of the immediate need for improved road infrastructure to protect these children on their daily routes to school.

15. While many regulations exist and are in place to ensure that cars and their passengers are as safe as possible on the road, many low and middle income country residents do not own a car. According to the WHO, up to 80% of road traffic deaths are among vulnerable road users (pedestrians, cyclists, or users of motorized two-wheelers) in low and middle-income countries. In Vietnam, 95% of registered vehicles are two-wheelers (National Traffic Safety Committee, 2008). In Thailand, 70% of fatal road crashes involved motorcycles (WHO, 2007). According to the CDC, the number of autos in use in rapidly emerging economies is expected to expand six-fold by 2018, potentially without corresponding improvements in road infrastructure or traffic safety. Middle and low income country transportation methods must be taken into account in reviewing global road safety advances.

16. CDC recently recognized increased awareness and response for improving global road safety as one of the 10 great public health achievements of the decade worldwide. CDC Director Dr. Thomas Frieden said, "There are still far too many people who die from conditions that are easily preventable. Continued investments will help millions more live healthy and productive lives while helping to protect our own country from health threats." This report highlighted the Decade of Action for Road Safety goals that, if achieved, could save 5 million lives and \$3 trillion, and prevent 50 million serious injuries.

17. The Rio+20 Conference can play a critical role in encouraging such action. As we have shown above, there is growing recognition that road traffic injuries are a public health and sustainable development challenge that needs to be addressed, and that doing so will benefit the wider agendas of tackling climate change and working towards the Millennium Development Goals. Yet, despite this growing consensus, road safety and wider issues of sustainable mobility remain on the margins of public policy, lacking vocal advocates within government aid agencies and major institutions and consequently denied the resources needed to assist developing nations to improve their institutional capacity, skills and policies. (Commission for Global Road Safety)

18. It is our view that this gap between the growing acknowledgement of the issue and achieving sustained action can be bridged if, for the first time, road safety is included within the framework of a major international sustainability conference. Identifying road traffic injury as a new challenge at the Rio+20 Conference will be invaluable in raising the profile of the issue and helping to institutionalise road safety programmes within middle-income and low-income governments and organisations like the World Bank. As we have seen in the powerful response to climate change and environmental protection following the first Rio summit in 1992, and in the united focus on achieving the Millennium Development Goals that was the major outcome of the Johannesburg Summit in 2002, the priorities agreed at these international fora do set the global agenda and issues that are absent from the agenda are subsequently neglected and under-funded. (Commission for Global Road Safety)

19. Until road safety can be integrated into the mainstream of sustainability policy, millions of people will be condemned to unnecessary and preventable violent, painful deaths, and lives blighted by severe disability or loss of their primary income generator. This is why it is so important that action to improve road safety and promote sustainable modes of transport is included in the agenda and outcomes of the Rio+20 Conference. (Commission for Global Road Safety)

20. We urge and encourage the secretariat, member nations and participants to include reference to safe and sustainable road mobility in the 'Outcomes Document' of the Conference. (Commission for Global Road Safety)

## Asia Pacific Research Network (APRN)

### TOWARDS A PEOPLE CENTERED SUSTAINABLE DEVELOPMENT

#### ASIA PACIFIC RESEARCH NETWORK'S INPUT TO THE ZERO DRAFT OF RIO+20

The Asia Pacific Research Network recommends the following inputs to be fully incorporated into the Zero Draft of the Secretary General's Compilation Document for Rio 2012. The inputs in this contribution are derived mostly from the People's Statement on Rio+20 and Sustainable Development,, which is the outcome document of the "Promoting a Transformative Agenda for Sustainable Development: A Strategy Workshop on Rio+20" in Bangkok, Thailand, where men and women from fifty two organizations in eighteen countries - Bangladesh, Burma, Cambodia, China and Hongkong SAR, India, Indonesia, Kyrgyzstan, Lebanon, Mexico, Pakistan, Philippines, Sri Lanka, South Korea, Spain, Thailand, Timor Leste, USA, and Vietnam - representing peasants, agricultural workers, fisherfolk, indigenous peoples, workers, women, youth and students, refugees and stateless persons, academia, environmental and support NGOs and networks attended. The statement was circulated in various networks and list serves and gained more signatories, in addition to the original fifty two that have signed.

Twenty years after the UN Conference on the Environment and Development in Rio de Janeiro, popularly known as the Earth Summit, the world is farther than ever from reaching the goals of genuine people centered sustainable development. The multi faceted, yet interconnected crises encompassing the economic, political and ecological spheres are causing unparalleled suffering all over the world. Worst afflicted are people from poor countries, most especially women and indigenous peoples.

This crisis of global capitalism further propels profit driven and unsustainable development that causes irreversible damage to the world's environment. This crisis results in the global climate meltdown, the appropriation of natural resources and the destruction of lives and livelihoods, especially of ecologically sensitive indigenous and traditional livelihood systems.

Rio+20 in 2012 thus comes at an opportune time, when the world's governments and peoples are obliged to think of alternatives to the current development model with its ever increasing failures. It presents opportunities to push urgently and comprehensively the agenda for genuine people centered sustainable development.

Indeed, solutions exist. And they are in the hands of the people, who in our communities, workplaces, farms and forests, make the building blocks of genuine people centered sustainable development. As we strengthen and consolidate our movements to achieve genuine economic, political, social, gender, ecological and climate justice, we call on the leaders of governments, multilateral institutions and other stakeholders to heed the people's calls for genuine sustainable development. We urge governments and the UN system to deliver and not backtrack on the promises and commitments made in Rio twenty years ago.

#### On the Green Economy

We are alarmed at the corporatized nature of the Green Economy agenda. We believe that technological fixes and market based incentives are false solutions to the ecological and climate crises and will not advance sustainable development.

For sustainable economies to develop, it is crucial to democratize ownership, control and decision making over productive resources and assets. We should move from a capital investment model towards an appropriate mix of more democratic modes such as cooperative, community based and driven, commons or public forms of ownership to ensure that economic activity provides sustainable livelihoods and meets the developmental goals of the community and society. It is also necessary to rethink the nexus between society and the environment - that is, fostering greater concern and sensitivity to the ecological consequences of human activities rather than regarding nature as an inexhaustible source of materials for human consumption and a bottomless sink of waste. Also crucial are cultural diversity and interculturalism - for when there is greater biodiversity, there is greater resilience, adaptability to changes and new challenges in the environment. Interculturalism, on the other hand, enriches the various systems of knowledge of modern, traditional, advanced industrialized countries, indigenous communities, and so on. To this end, we call for:

- a reversal of privatization and keeping of public enterprises in public control;
- the promotion of sufficiency based economies (i.e. catering primarily towards meeting local needs and demands, developing local capacities, based on available resources, appropriate technologies and resource sharing);
- manufacturing that promotes closed loop production where products are designed with minimum use of energy and materials, longer life spans and with maximum reuse and recycling of parts and components;
- the promotion of mass public transportation systems;
- implementation of genuine agrarian, aquatic, pastureland and forestry reforms; and promotion of biodiverse ecological agriculture that benefits small producers, especially women and indigenous people.
- stoppage of profit oriented exploitation and destruction of natural resources that destroy lives and livelihoods.
- a halt to industrial corporate agriculture and fisheries;
- renewable energy that is not dependent on monoculture and biomass extraction;
- respect for and promotion of community based and farmer driven efforts in organic agriculture, seed banking and on farm improvement of crop varieties and animal breeds; and
- people centered sustainable economies that promote the rights of indigenous peoples and local communities in accordance with UNDRIP including rights to land and resources, and free, prior and informed consent (FPIC).

#### On the Institutional Framework for Sustainable Development

To deliver on the promises of the first Earth Summit, there is a need for an effective and democratic institutional framework that can and will ensure economic progress, social equity and environmental protection - the three dimensions of sustainable development in an integrated and holistic manner. This governance architecture must operationalize and implement the Rio principles including the Right to Development, common but differentiated responsibility, the polluter pays principle and the precautionary principle.

Building a strong apex body on sustainable development that works on a global level and can integrate the disparate United Nations bodies working on one of the three pillars of sustainable development is necessary and urgent. Options that should be explored include transforming the Commission on Sustainable Development into a Council on Sustainable Development, or establishing a UN Organization on Sustainable Development.

A rights based approach to the IFSD means that duty bearers should have explicit mandates expressed in clear, preferably legally binding, human rights standards. There must also be judicial or quasi judicial mechanisms that are effective at delivering entitlements, responding to complaints, and ensuring accountability. These mechanisms of redress must also be readily accessible, especially to vulnerable and marginalized groups.

A rights based approach to sustainable development underscores the democratic right of people to determine the goals and means of achieving sustainable development. Along this line, the development and adoption of a global or regional convention on Principle 10 of Rio based on the Aarhus Convention should be supported. This will help ensure access to information and meaningful participation of people in sustainable development, and access to effective judicial and administrative proceedings, including redress and remedy.

Rio+20 should work for the immediate establishment of a broad inclusive multi stakeholder consultative body tasked with supporting the promotion and implementation of Agenda 21 and Rio+20 resolutions. Such body should be fully inclusive, participatory, democratic, giving equal voice and opportunities for participation to non state actors and have an integral multi stakeholder character that accords civil society with equal rights and equal voice as governments.

The UN Human Rights Council should also establish Special Procedures for the Right to Sustainable Development, including the appointment of a Special Rapporteur on Human Rights and Sustainable Development. Such an expert or experts will be tasked with reviewing international, national and regional case law and practice with a view to clarifying the linkages between social, economic and environmental issues from a rights perspective; elaborating on applicable human rights standards and indicators.

The OHCHR should also collaborate closely with UNEP, the proposed Council on Sustainable Development or World Environment Organization, if and when they are established, in order to develop guidelines and propose actions to be taken by governments, intergovernmental bodies and other actors consistent with human rights obligations.

Ultimately, the effectiveness of a global body on sustainable development rests on the effective functioning of similar institutions at the local and national levels and its relevance to people's lives.

Commitments from the North in the form of adequate financing (according to common but differentiated responsibility), appropriate technology cooperation, and needs based capacity building are of utmost importance to support developing countries make a just transition to sustainable development pathways.

#### On New and Emerging Issues

Addressing new and emerging challenges is crucial in securing renewed political commitment for sustainable development. Therefore, we urge that the Rio+20 Conference go beyond and not be confined to the two identified themes of green economy and institutional framework for sustainable development, and address/include other new and emerging issues in its Conference agenda/objectives and outcome document:

- The UNCSDD 2012 must affirm and strengthen internationally agreed principles and objectives for sustainable development at all levels of government. All actors should be held accountable to well established international standards and conventions - e.g. Right to Development, Human Rights conventions, Extractive Industry Accountability, Transparency Accountability Initiative, etc.
- Reorganize international trade, investment, finance and development cooperation relations around rules that value, respect, protect and fulfill people's rights; economic, social, gender ecological and climate justice; economic sovereignty and self sufficiency.
- Enhance development cooperation in support of sustainable development.
- Commitments from the North in the form of adequate financing (according to common but differentiated responsibility), appropriate technology cooperation, and needs based capacity building are of utmost importance to support developing countries make a just transition to sustainable development pathways.
- Developing countries and their development partners should evaluate the coherence of their policies in trade and investments and rectify those that are incoherent with sustainable development. Repudiate unequal trade and investment agreements.
- Restructure foreign direct investments in the context of South South Cooperation (not North South or South South competition) to include regulatory controls and a transition period.
- Uphold food sovereignty to address the food crisis. Communities should have the right to determine their patterns of food production and consumption, and farmers should be able to prioritize food production for domestic consumption. Government should give incentives to sustainable food production practices.
- Reject the intellectual property rights regime and other monopolistic enclosures that impede people's access to commons and productive resources.
- There should be a global mechanism to assess the impacts of new technologies. Such mechanism should provide resources towards building capacity of countries and communities to assess and monitor the health, biodiversity and environmental impacts of new technologies. We support the adoption of an International Convention for the Evaluation of New Technologies (ICENT) and an outright ban on technologies that put the planet at grave risks such as geo engineering.
- Governments should invest in research and development on people centered sustainable development.
- Policies should respect cultural diversity, and modern science should be combined with indigenous knowledge in bottom up approaches of research and development to develop technologies that are appropriate and democratic.

#### On the Sustainable Development Goals

The proposed Sustainable Development Goals should not be confined to merely addressing the symptoms of poverty, exclusion and ecological degradation like the millennium development goals. Instead, SDGs must address the roots of these problems including the question of rectifying unequal power relations within and between countries, and the dominant development model based on neoliberal doctrine.

The SDGs should also affirm the Rio principles, including the CBDRRRC. They should not be donor driven targets or technocratic exercises in formulating indicators and monitoring progress. They should be based on Agenda 21, but also be consistent with human rights obligations, including the Right to Development.

Communities have shown extreme resilience and creativity in confronting the spiraling multiple crises, utilizing various mechanisms not just to survive, but also to assert their economic, social, cultural and political rights. In the midst of this protracted crisis of the global capitalist system, people dare to imagine and build a new world where development means promoting the well being and dignity of all; where prosperity is created through shared resources and efforts; where nature's limits are respected; and where nations, peoples and communities cooperate to ensure democracy, justice, equity, peace and prosperity for all.

Today, even more so than twenty years ago, people of the world are aware that the challenge of genuine sustainable development requires no less than the profound transformation of societies and of international relations. We must all rise up to the challenge. #

## PEOPLE'S STATEMENT ON SUSTAINABLE DEVELOPMENT AND RIO+20

August 17, 2011

Bangkok, Thailand

We, 52 women and men from 18 countries - Bangladesh, Burma, Cambodia, China and Hongkong SAR, India, Indonesia, Kyrgyzstan, Lebanon, Mexico, Pakistan, Philippines, Sri Lanka, South Korea, Spain, Thailand, Timor Leste, USA, and Vietnam (and some more additional signatories)- and representing peasants, agricultural workers, fisherfolk, indigenous peoples, workers, women, youth and students, refugees and stateless persons, academia, environmental and support NGOs and networks met for the ["Promoting a Transformative Agenda for Sustainable Development: A Strategy Workshop on Rio+20"](#) on August 15-17, 2011 in Bangkok, Thailand.

We have come to this meeting fully aware that twenty years after the UN Conference on the Environment and Development in Rio de Janeiro, popularly known as the Earth Summit, the world is farther than ever from reaching the goals of genuine people-centered sustainable development. The multi-faceted, yet interconnected crises encompassing the economic, political and ecological spheres are causing unparalleled suffering all over the world. Worst afflicted are people from poor countries, most especially women and indigenous peoples.

This crisis of global capitalism further propels profit-driven and unsustainable development that causes irreversible damage to the world's environment. This crisis results in the global climate meltdown, the appropriation of natural resources and the destruction of lives and livelihoods, especially of ecologically-sensitive indigenous and traditional livelihood systems.

Rio+20 in 2012 thus comes at an opportune time, when the world's governments and peoples are obliged to think of alternatives to the current development model with its ever-increasing failures. It presents opportunities to push urgently and comprehensively the agenda for genuine people-centered sustainable development.

Indeed, solutions exist. And they are in our hands, the people, who in our communities, workplaces, farms and forests, make the building blocks of genuine people-centered sustainable development. As we strengthen and consolidate our movements to achieve genuine economic, political, social, gender, ecological and climate justice,

we call on the leaders of governments, multilateral institutions and other stakeholders to heed the people's calls for genuine sustainable development. We urge governments and the UN system to deliver and not backtrack on the promises and commitments made in Rio twenty years ago.

In particular, we put forward these messages:

### On the Green Economy

We are alarmed at the corporatization of the Green Economy agenda. We believe that technological fixes and market-based incentives are false solutions to the ecological and climate crises and will not advance sustainable development.

For sustainable economies to develop, it is crucial to democratize ownership, control and decision-making over productive resources and assets. We should move from a capital investment model towards an appropriate mix of more democratic modes such as cooperative, community-based and driven, commons or public forms of ownership to ensure that economic activity provides sustainable livelihoods and meets the developmental goals of the community and society.

- Public enterprises should remain in public control and privatization should be reversed.
- Promote sufficiency-based economies (i.e. catering primarily towards meeting local needs and demands, developing local capacities, based on available resources, appropriate technologies and resource sharing).
- Manufacturing should promote closed-loop production where products are designed with minimum use of energy and materials, longer life-spans and with maximum reuse and recycling of parts and components.
- Promote mass public transportation systems.
- Implement genuine agrarian, aquatic, pastureland and forestry reforms; and promote biodiverse ecological agriculture that benefit small producers, especially women and indigenous people.
- Stop profit-oriented exploitation and destruction of natural resources that destroy lives and livelihoods.
- Stop industrial corporate agriculture and fisheries.
- No to renewable energy that depends on monoculture and biomass extraction.
- Respect and promote community-based and farmer-driven efforts in organic agriculture, seedbanking and on-farm improvement of crop varieties and animal breeds.
- People-centred sustainable economies should promote the rights of indigenous peoples and local communities in accordance with UNDRIP including rights to land and resources, and free, prior and informed consent (FPIC).

### On the Institutional Framework for Sustainable Development

To deliver on the promises of the first Earth Summit, there is a need for an effective and democratic institutional framework that can and will ensure economic progress, social equity and environmental protection -- the three pillars of sustainable development -- in an integrated and holistic manner. This governance architecture must operationalize and implement the Rio principles including the Right to Development, common but differentiated responsibility, the polluter pays principle and the precautionary principle.

- Building a strong apex body on sustainable development that works on a global level and can integrate the disparate United Nations bodies working on one of the three pillars of sustainable development is desirable. Options that should be explored include transforming the Commission on Sustainable Development into a Council on Sustainable Development, or establishing a UN Organization on Sustainable Development.
- Rio+20 should work for the immediate establishment of a broad inclusive multi-stakeholder consultative body or network tasked with supporting the promotion and implementation of Agenda 21 and Rio+20 resolutions. Such body should be participatory, democratic, and have an integral multi-stakeholder character that accords civil society with equal rights and equal voice as governments.
- Ultimately, the effectiveness of a global body on sustainable development rests on the effective functioning of similar institutions at the local and national levels and its relevance to people's lives. On New and Emerging Issues
- The UNCSD 2012 must affirm and strengthen internationally-agreed principles and objectives for sustainable development at all levels of government. All actors should be held accountable to well- established international standards and conventions – e.g. Right to Development, Human Rights conventions, Extractive Industry Accountability, Transparency Accountability Initiative, etc.
- Reorganize international trade, investment, finance and development cooperation relations around rules that value, respect, protect and fulfill people's rights; economic, social, gender ecological and climate justice; economic sovereignty and self-sufficiency.
- Enhance development cooperation in support of sustainable development.
- Commitments from the North in the form of adequate financing (according to common but differentiated responsibility), appropriate technology cooperation, and needs-based capacity building are of utmost importance to support developing countries make a just transition to sustainable development pathways.
- Developing countries and their development partners should evaluate the coherence of their policies in trade and investments and rectify those that are incoherent with sustainable development. Repudiate unequal trade and investment agreements.
- Restructure foreign direct investments in the context of South-South Cooperation (not North-South or South-South competition) to include regulatory controls and a transition period.
- Uphold food sovereignty to address the food crisis. Communities should have the right to determine their patterns of food production and consumption, and farmers should be able to prioritize food production for domestic consumption. Government should give incentives to sustainable food production practices.
- Reject the intellectual property rights regime and other monopolistic enclosures that impede people's access to commons and productive resources.
- There should be a global mechanism to assess the impacts of new technologies. Such mechanism should provide resources towards building capacity of countries and communities to assess and monitor the health, biodiversity and environmental impacts of new technologies. We support the adoption of an International Convention for the Evaluation of New Technologies (ICENT) and an outright ban on technologies that put the planet at grave risks such as geo-engineering.
- Governments should invest in research and development on people-centered sustainable development.
- Policies should respect cultural diversity, and modern science should be combined with indigenous knowledge in bottom-up approaches of research and development to develop technologies that are appropriate and democratic.

Communities have shown extreme resilience and creativity in confronting the spiraling multiple crises, utilizing various mechanisms not just to survive, but also to assert their economic, social, cultural and political rights. In the midst of this protracted crisis of the global capitalist system, people dare to imagine and build a new world where development means promoting the well-being and dignity of all; where prosperity is created through shared resources and efforts; where nature's limits are respected; and where nations, peoples and communities cooperate to ensure democracy, justice, equity, peace and prosperity for all.

Today, even more so than twenty years ago, people of the world are aware that the challenge of genuine sustainable development requires no less than the profound transformation of societies and of international relations. We must all rise up to the challenge. #

## Asia Pacific Youth

### ASIA PACIFIC YOUTH POSITION PAPER TOWARDS RIO +20

Kathmandu

Nepal

12 August 2011

#### Preamble

1. In recent years, the Asia-Pacific region has experienced robust economic growth with emerging economies. However, key challenges remain in ensuring that negative environmental and social consequences are vigorously tackled and that economic opportunities benefit all.
2. Severe and pressing issues which have arisen as consequences include climate change, melting of glaciers, rising sea level, biodiversity loss, energy crisis, food insecurity and health problems, depleting natural resource base, natural disasters, migration and deforestation. Vicious circle of poverty is on the top of all. The transition to a green economy, revision of institutional frameworks on sustainable development and enabling of low-carbon solutions to energy issues are therefore at central to address these interconnected challenges.
3. It is our firm belief as Asia Pacific youth [representing over 50% of the world's population], that Rio+20 marks an important milestone for the global community to critically reassess our collective commitment towards sustainable development and to implement the reforms that are necessary to transform our societies and economies. The decisions made at Rio+20 will have potentially widespread implications for the Asia-Pacific region. It is us, the youth, who will be affected in future with the decisions made today, and we have to take lead in the coming era in effecting and establishing better economic structures and mechanisms for conservation of our environment.
4. Therefore, it is crucial that we effectively and strongly participate in decision making processes through the provision of important perspectives, thereby taking ownership of the trajectory of the Asia-Pacific's development path leading to a more sustainable future.
5. Keeping in view the diversity of the Asia-Pacific region, this paper sheds light on the most pragmatic recommendations made by youth, as vital change makers, to address our regional issues.

#### Green Economy to Eradicate Poverty

##### Background

The Asia Pacific region is more vulnerable towards the impact of climate change; therefore, urgent adaptations and actions to protect the environment have become an utmost priority. Youth of today should own the responsibility and promote the concept of green economy to tackle the issues of the region. Poverty eradication and environment conservation are the ingredients of Green Economy. According to the United Nations Environment Programme (UNEP), "Greening the economy refers to the process of reconfiguring businesses and infrastructure to deliver better returns on natural, human and economic capital investments, while at the same time reducing greenhouse gas emissions, extracting and using less natural resources, creating less waste and reducing social disparities."

A question always arises who has the ownership right of ecosystem services? Neither the government nor the rich has complete right, the major possession of natural resources lies with the local communities including the vulnerable and marginalised inhabiting in the mountains and remote areas, actually deserve to benefit from the ecosystem services, both tangible and non-tangible benefits. As per the Polluter Pays Principle "Polluter has to pay for the damages caused by him/her to the environment and not the ignorant," Mankind enjoying the luxury of nature in several forms of services has been posing great threat to the environment and never realised the extinction of species, disappearance of resources and is presently responsible for climate change. Green economy is the best solution to food crisis and so to alleviate poverty. Green economy is the stair-case to achieve sustainable development.

According to the User Pays Principle "One has to pay for deriving benefits from the ecosystem, it may be the government, private sector, public or any other stakeholder," Earth is not the premise to dump all the waste and extract all the resources, this way we are ruining our own future leading to low GDP resulting into low economy growth.

Green economy aims to profit the people and the planet. It acts as a fulcrum to maintain a balance between the sustainable development of mankind and GDP growth. Due to expanse of urbanization the demand and supply curve of availability of resources has shown an abnormal growth, with more demand of resources (natural and manmade) and less availability with increasing span of time. Green economy is the best option to bridge the gap between scarcity of resources and growth and thus eliminating social inequity.

#### Challenges

6. Poverty: Barring a few outliers, the Asia Pacific region has seen a significant amount of economic growth in the recent past. However, there still exists a wide divide between poor and rich and social inequity which hampers the overall development of the nations.
7. Climate change and natural disasters: Changing climate is exacerbating the pressure on natural resources and the region is witnessing its impact in the form of glacier melting, floods, droughts, sea-level rise, loss of biodiversity etc.
8. Over exploitation of natural resources: To accelerate the development, people are exploiting the natural resources in an unsustainable manner, which is having multiple impacts like environmental pollution, degradation of ecosystems setting.
9. Unsustainable production and poor waste management: Production of non- biodegradable products, usage of unsustainable processes and poor handling of waste poses threat to the environment.
10. Lack of access to clean and renewable energy technologies: Access to a reliable and adequate source of energy is inextricably linked to sustained progress and growth. However, the most common source of energy production in the region is biomass, fossil fuel burning which poses considerable risks to the environment in the short and long-term. Despite of availability of renewable resources, lack of technology has compelled people to use the resources in unsustainable ways. There needs to be strong mechanism to promote renewable energy like hydropower and other alternative energy resources.
11. Unsustainable urban development: More Asia Pacific cities have become the focal points as major producers, consumers and distributors of goods and services. However, many cities tend to lack sustainable services such as water, air and transport systems. Migrations levels are high in cities, creating more slums, increasing pressure on limited resources and increasing pollution.
12. Inefficient governance and political instability: There is lack of good institutional framework in the Asia Pacific. The current governance system is a centralized system with top-down approach. Voice of community and other vibrant groups including youth is generally not audible to decision makers to make strategic policies as per the need of the community.
13. Lack of priority given to research and development: Asia Pacific region is more vulnerable to climate change impacts, but the development activities have been practicing without basic findings of research. For example, the Himalayan region was presented as data lacking are (white spot) by 4th Assessment Report of the IPCC.
14. Quality of Life: Currently, happiness, mindfulness and wellbeing of society that reflects the true quality of life is not taken into account.
15. Lack of evaluation of ecosystem services: Ecosystem provides number of services with tangible and intangible benefits. Mountain ecosystems are sources of exhaustive number of services, which are not valued by consumers and providers.
16. Low literacy level: Marginalised communities do not have access to the basic education and those getting are generally ignorant of the environmental issues because of the curriculum. Brain drain is another issue which is hampering the development in the region.
17. Unemployment and lack of opportunities: People are not getting enough opportunities to get jobs and vocational trainings or skill development opportunities.
18. Food security in the HKH region: Majority of the HKH communities are highly dependent on livestock and rain-fed agriculture for their livelihoods and due to changing hydrological regimes they are highly vulnerable.
19. Gender issues: Women are worst hit as men have to migrate out for work due to scarcity of resources in the mountain region.
20. Melting of glaciers in the HKH range: Melting of glaciers has contributed faster to sea- level rise in the last 350 years. It also contributes to catastrophic floods known as glacial lake outburst (GLOFs) causing heavy loss of life and property.
21. Health issues: Due to less accessibility to resources, infrastructure and other health facilities the mountain communities are likely to be vulnerable to various diseases.

#### Recommendations

22. Government, industries and people are the stakeholders of any system that has to work in a team to promote green economy.
23. Existing policies and programmes should be properly implemented with continuous monitoring and evaluation mechanism. Government should further carry out SWOT Analysis to assess the gaps and missing links of the present policy reforms. Sustainable Development strategies need to be prioritized and mainstreamed in the government policy framework to strengthen existing environmental laws and policies such as Air Act, Water Act, Forest Conservation Act, CBD, Waste management act, Act to safeguard the rights of local communities, Coastal Zone Regulation Act and implement new acts to ensure green growth of the economy.
24. Government should provide several carbon market mechanisms such as Payment for Ecosystem Services, REDD, REDD+, etc to create green jobs for the unemployed and marginalised communities inhabiting the mountain regions.
25. Further assessments such as Environmental Impact Assessment (EIA), Mountain Risk Engineering, Tourism Impact Assessment is recommended to restore and increase the resilience of the mountainous regions in the HKH region and to reduce the vulnerability of the communities therein.
26. There is need for a monitoring, and verification system to indicate and measure sustainability with respect to the GDP of the economy.
27. Industries need to use clean and green technologies to increase their carbon credits and decrease their emissions to provide increasing employment opportunities through green jobs.
28. Life-cycle analysis should be mandatory for every industrial product. Implementation of 5Rs (reduce, reuse, recycle, recover, residual management) is another tool for waste management. Cradle to grave approach should be adopted.
29. Techniques like organic farming should be used to ensure healthy and productive agriculture to address issues of food security and also micro financing should be

introduced for the welfare of local people.

30. Trainings and workshops to be conducted for local people, tourists and corporate is further recommended to aware them of the guidelines as well as their individual responsibilities to protect the environment.

31. Youth involvement needs to be initiated in the policy formulation processes to get better policy reforms what impacts the youth in future.

32. There is a need to establish a youth network to share the problems and good practices.

33. Regional and global cooperation is needed for knowledge and technology transfer taking into consideration the intellectual property rights.

34. Establishing indicators to check country development need to be incorporated such as Genuine Progress Index and Gross National Happiness (GNH).

35. Entrepreneurship and skill development of the local community should be promoted to build the capacity of local communities.

36. Seed funding should be made available to carry out R&D activities for developing low carbon technologies and in turn generating more green jobs.

#### Energy for Low Carbon Future

##### Introduction

37. This section of the position paper presents the collective vision of the Asia Pacific youth on measures to be adopted to drive a low carbon future.

38. The Asia Pacific youth envisions a low carbon future as one in which

38 i) sustainable energy management is practiced;

38 iii) access and affordability of energy are enhanced thus ensuring the well-being of all; and

38 iii) emissions of greenhouse gases and other air pollutants are minimized to combat adverse effects of climate change.

##### Key Issues

39. The use of fossil fuels and other conventional sources of energy is contributing to global warming.

40. In recent years the Asia Pacific region has gradually increased energy consumption and production due to several factors such as economic growth and/or population growth.

41. Due to lack of affordable and accessible green energy, people are more and more dependent on the unsustainable traditional sources to fulfill their increasing demand of energy.

42. The Asia Pacific countries are dependent on certain other nations for energy sources. This leaves the region highly vulnerable to volatile oil prices which can be dictated by strong industry players in the energy market.

43. Emissions from fossil fuel and some of traditional energy sources such as firewood combustion lead to many diseases. Such health impacts have tremendously increased the medical cost burden to the people and contributed to a reduction in labour productivity.

##### Key Barriers

44. There is a lack of definitive policies and strong legislation promoting the development of low carbon energy. The existing policies and regulations are not implemented effectively due to weak and ineffective institutional mechanisms. In particular, there are significant lacking in the aspects below:

##### Ineffective collaboration & partnership

45. There is a lack of effective collaboration between: public and private sectors, governmental bodies and the community, national and regional-level. In addition, there is low concern of government for youth activities. Without effective collaboration, it is impossible to coordinate a concerted effort towards achieving a low carbon future between institutions.

##### Financial Barriers

46. There is a lack of financial aid (support) system to support the production of low carbon energy. While it requires high start-up and operational costs, long payback periods associated with investment in low carbon technologies, this posed a financial barrier to potential investors.

47. In addition, there is a lack of seed funding for youth driven entrepreneurial initiatives in the area of low carbon energy for instance, innovations in energy efficient appliances.

##### Barriers to social change

48. People are lacking awareness and knowledge of fossil fuel and greenhouse effect and there is a big gap in climate education for community.

49. In addition, people seem unwilling to change due to the difficulties in both accessing renewable energy resources and changing their own daily lifestyle.

##### Technological Barriers

50. In most Asia Pacific countries, research and development (R&D) is quite insufficient due to limited attention and funding. In addition, we are lacking with skilled human resources. Due to these reasons, low carbon energies have shortages and limitations that hinder them from large-scale adoption.

##### Unsustainable Urban Development

51. While lacking of institutional and policy frameworks, the rate of urbanization in Asia Pacific cities are growing fast. As a result, cities in the Asia Pacific region have to deal with rising motorization and energy consumption.

##### Recommendations

52. The legislative framework needs to be strengthened in a way that would promote a low carbon future, enhance compliance monitoring and accountability and establish an index for the measurement of energy sustain.

53. To address Ineffective collaboration & partnership

For national and regional level:

„h National-level governmental bodies should communicate with regional-level governmental bodies in a timely manner and transparent way for community to see.

„h Enhancing civil society's role, especially the youth's role and having an open channel of communication with the government, allowing civil society to have a say in the policy making process.

„h Provide platform for communication and collaboration between the government and different stakeholders.

For international level:

54. Governments should actively participate in international frameworks and intergovernmental Collaborations. Such collaborative processes should be transparent, fair, and inclusive and demand driven. Further, it is important to ensure that these commitments are sustained and the words are translated into effective action.

To address Financial Barriers

55. In order to lower the high financial costs associated with alternative energy setups, there is necessity of:

„h Fund raising for alternative energy research and project implementation and from international organizations and different financial mechanism (in a transparent manner).

„h It is imperative for governments to provide greater funding (and) incentives to encourage the production of alternative energy by the private sector.

„h Potential measures include tax concessions or exemptions, feed-in tariffs, subsidies (i\$Subsidiesj~ should change to i\$incentivej~), grants, and easy credit availability for improving green energy production.

To Address Barriers to social change

56. We need to improve education on low carbon technologies, sustainability, sufficiency and efficiency in using energy. This can be implemented via:

„h Capacity building program, advocacy via social networking platforms, environmental oriented competitions.

„h Innovative and interactive educational initiatives on environment and energy should be encouraged and institutionalized as well.

„h Implementation of carbon footprint labeling.

„h Implementation of policies that encourage reduction in consumption of energy and accept embodied energy in formulating policy.

57. There should be integration among education and sustainable development and green job. Youth can encourage a higher willingness to pay for green products.

To Address Technological Barriers

58. There needs to be enhanced diffusion of low carbon technologies from technologically advanced nations to other nations. It is proposed that efforts be made to establish an attractive investment climate for foreign clean energy companies and thus make technology transfer mutually beneficial to both the donor and recipient parties. Knowledge transfer through educational scholarships and student exchange programs should go hand-in-hand with technology transfer. There needs to be more research & development into alternative energy technologies to enhance their viability.

To Address Unsustainable Urban Development

59. Cities should focus more on an integrated view of urban development including environment protection, setting low carbon footprint as one of its strategic objectives. Consider the local context as the critical point for determining the policies and programs, cities; government have to:

59 a) Encourage the development and use of public transport systems and the decrease in the use of personal vehicles; promote the use of non-motorized transport i.e. walking and cycling;

59 b) Promote integrated and collaborative energy demand management initiatives;

59 c) Promote the development of energy efficient and energy conserving buildings, industries and districts.

59 d) Increase and connecting green spaces and wildlife corridors

Lack of enforcement

60. The legislative framework needs to be strengthened in a way that would promote a low carbon future, enhance compliance monitoring and accountability and establish an index for the measurement of energy sustainability.

Institutional Framework for Sustainable Development

Background:

61. The Asia Pacific youth recognize the following key ideas would strongly encompass the concept of sustainable development.

62. Public awareness & engagement allows the community to identify the problems, while capacity building ensures a good and effective deliverance of policy implementation for sustainable governance. In addition, as policies are the tools towards better governance, the use of the right policies is mandatory to ensure authoritative and operative governance in setting the values towards sustainability. Finally, good governance is necessary for effective implementation, monitoring and evaluation of the policies.

Issues & Challenges in:

Governance

63. Although most Asia Pacific countries have introduced a number of globally accepted principles on natural resources and sustainable environmental management in their legislative systems- ineffective implementation, lack of monitoring and evaluation systems, and corruption hinders sustainable development so that it results in a lack of accountability weakening the implementation and rationalization of environmental policies. Absence of evaluation also means the youth fail to learn from past initiatives. Therefore their capacity is compromised.

64. Corruption, vested political and business interests across countries in the Asia Pacific contribute to massive exploitation of natural resources that impacts sustainable development stifles innovations and obstructs the access to information and justice and en-curtaiment of the freedom of speech. Voice of youth is nullified.

65. There are a number of issues during the design and implementation of equitable policies such as the chain of corruption, poor compliance, and poor due process, lack of accountability, transparency and ineffective monitoring processes within the communities. These issues exacerbate environmental degradation.

#### Policy

66. The existence of several Multilateral Environmental Agreements (MEAs), conventions, and organizations with no proper coordination, lack of effective implementation and authority hinders progress regarding solving environment and sustainable development issues.

67. There is a lack of youth participation in policy making processes which in turn neglects the voice, opinions, and ideas of the future generation that could be vital in the formulation of comprehensive environmental policies.

68. Lack of incorporation of environmental issues into socio-economic development policies and plans make it difficult to address sustainable development goal. Also, weak implementation of existing laws, rules, and regulations regarding environmental conservation is a major issue in most Asian countries.

69. There is a lack of awareness of potential revenue and economic growth from other resources that do not damage the environment, such as REDD (Reduces Emissions from Deforestation and Forest Degradation) projects, if necessary safeguards are taken.

70. The lack of advanced scientific expertise along with inconsistencies in research methodologies creates a barrier to the formulation of effective environmental policies.

#### Capacity Building

71. There is an absence of by-laws, a lack of full understanding of technical regulations, and also unclear regulations and mechanisms for enforcement, which have left government and voluntary authorities relatively free to interpret them. They are also limited by their own knowledge and capacities, leading to difficulties with proper implementation of policies.

72. Low technical capacity, knowledge, experience and the high cost of training hamper their ability to incorporate environmental issues with the civil society and local community to have their sustainable works for their areas done effectively. In addition, they lack awareness of available funding for environmentally friendly projects.

#### Public Awareness and Engagement

73. There is a lack of public awareness and sense of individual responsibility and civic engagement in the change of national and international environmental laws. The basic definitions and the importance of environmental laws, conservation and sustainable development are not understood. Due to this lack of awareness, the public becomes less open to positive environmental change.

74. The access to the information and the political will and accountability regarding the issue of Climate Change is still limited. The public, especially youth, does not receive adequate impactful education on the participatory processes that enable effective engagement with the government or government agencies on sustainable development. Though youth are willing to engage to the process of environmental protection, the sufficient effective platforms for the youth to convey their messages, initiatives and innovation are hardly found. On the government side, there is a lack of political will to engage different stakeholders and the public in these participatory processes.

#### Recommendations

##### Governance

75. Comprehensive environmental governance must be a top priority and all sectors must cooperate towards it.

76. A general regulatory framework for the development and enforcement of environmental rules and regulations should be strengthened

77. The chain of corruption can be broken by increased accountability, transparency and responsiveness on a local, district level or a federal system through the involvement of community governance.

78. There should be an international environmental assessment tool to annually measure how well countries are moving towards their commitments to sustainable development under practical Local Agenda 21 and it has to be binding upon signatories. In this regard, youth organisations can produce a shadow report to complement the official government report.

##### Policy

79. An effective development policy strategy should involve innovative and creative thinking with non-price based policy instruments supported by the youth while taking into account each country's unique situation. This will be important in ensuring sustainable economic growth without compromising the environment and standard of living.

80. International, national, and local governments and key stakeholders need to recognize the importance of environment services equitably under the existing development plans and the legal concepts of sustainable development carried out by communities. This could be carried out by using mechanisms that facilitate payment for environmental services. Furthermore, countries could raise awareness and facilitate the implementation of mechanism among the youth and public.

81. More funds should be allocated towards environmental conservation such as research and development for environmental initiatives. More importance should be given to other policies than it is being given right now so as to increase the facilitation of sustainable development.

82. Minimum environmental standards for areas such as energy consumption can be set to encourage use of green technologies. In addition, the "value-added" system should be revised to include direct and indirect environmental benefits encouraging businesses to implement green practices.

83. The design and formulation of environmental policies need to accommodate environmental, social and political aspects. To promote environmental policy innovations, it is recommended that environmental innovation policy centers and pilot projects be established. The innovation policy centre can be set up based on a partnership approach, spearheaded by a governmental interagency committee with collaboration with academic institutions, private associations (environment friendly traders), CBOs, NGOs and youth groups.

## Capacity Building

84. Government officials involved in the policy making process must be selected through a stringent selection process based on merits, experiences, academic achievement and technical knowledge. A review on the countries' environmental regulations must be carried out and timelines must be set and kept through proper monitoring and evaluation and the youth should be an integral part of this process.

85. Governments should address low capacity of their officers to handle partnership collaborations with all stakeholders especially the youth through training and building up skills in community development.

86. Governments should form collaborations with international organizations so that knowledge, expertise and external help are available to the country to actively tackle environmental issues. Governments must maintain an open channel of communication with the grassroots so that feedback from the public can be worked out between the youth, other communities and the government, and partnership practices, for example participatory dialogues set in place. This builds a cohesive relationship between the people and the government.

87. Environmental studies can be introduced as a compulsory subject in pre-tertiary education institutions. Civil society and private sectors should establish an active collaboration with local communities, especially the youth, to educate the community and act as an avenue where members of the community can turn to for environmental advice and help. Annual events that promote awareness such as 'Earth Day' can be adopted and actively participated in across Asia Pacific. These actions will enable better understanding and keep the people updated on environmental know-how. Capacity-building should be carried out by all stakeholders to enable the youth to take the lead in organising such events.

88. Civil society, academia, and the government should exchange ideas, information, and scientific expertise regarding environmental research and development through dialogue sessions and public seminars. Governments should also take steps to collaborate with the youth in environmental projects which could lead to better understanding of environmental issues.

## Public Awareness and Engagement

89. Impactful environmental initiatives from the youth, Civil Society Organisations (CSO), nongovernmental organisations (NGO), academia and the private sector should be encouraged to create a focused and targeted approach in order to raise public awareness and engagement in environmental issues. The government and relevant stakeholders should cooperate and coordinate in order to support these initiatives.

90. The youth should have access to official and professional platforms to voice out their concerns at every level of the decision making process, in regards to issues such as environmental policies. There should be structural mechanisms in place to facilitate their voice, such as setting up youth councils, giving proper consideration to their recommendations, and implementing them at the local, national, and international level. Therefore, assistance must be provided to help youth to build awareness and capacity to take on such a role and be able to impact sustainable development in their respective countries and the world. And the participation must be made compulsory in legal documents.

91. Governments should also prioritize and allocate proper funding for mechanisms which are designed to increase public awareness and engagement regarding environmental policies and issues through education.

## Note:

Asia-Pacific Youth Forum on Climate Actions and Mountain Issues, 8-12 August, which was attended by 43 youth from 17 countries in the Asia Pacific region (Afghanistan, Bangladesh, Bhutan, Cambodia, China, India, Indonesia, Japan, Kazakhstan, Korea, Myanmar, Nepal, Pakistan, Philippines, Singapore, Thailand and Vietnam) representing diverse geography, rich cultural background and variety of issues, concluded with the launch of two important documents prepared in the context of ongoing debates on 'Climate Change Adaption' and 'Rio +20' preparation. The 'Asia Pacific Youth Declaration on Climate Change and Sustainable Development' and the 'Asia Pacific Youth Position paper on Rio +20' both were launched on 12 August in a special function organised to mark the International Youth Day (IYD), conclusion of the International Year of Youth (IYY 2010/2011) and 'key message communication' session of the Youth Forum.

Organised by the International Centre for Integrated Mountain Development (ICIMOD) through its Asia Pacific Mountain Network (APMN), the event was technically supported by more than a dozen global and Asia Pacific regional initiatives promoting climate and sustainability actions including Rio+Twenties, Road to Rio +20, UN CSD Youth Caucus, 350.org, Activating Talent in Sustainability (ACTIS), Adaptation Knowledge Platform (AKP), Asia and the Pacific Adaptation Network (APAN), Eco-Singapore, Peace Child International, Schumacher College UK, Sustainability Asia and UNEP TUNZA.

For more information, write to Mr. Tek Jung Mahat at [apmn@mntnforum.org](mailto:apmn@mntnforum.org).

## Asia-Europe Foundation (ASEF)

An Asia-Europe Environment Forum Submission for the —Rio+20 Outcome Document Zero Draft

### I. INTRODUCTION

The Asia-Europe Environment Forum (ENVforum) convened the Asia-Europe Strategies for Earth Summit 2012: 1st and 2nd Scenario Planning Workshops in Yogyakarta, Indonesia, on 16th to 18th July and Uppsala, Sweden, on 10th to 12th October respectively.

The Asia-Europe Strategies for Earth Summit 2012 is a series of three informal consultation workshops to be held among stakeholders of the Asia-Europe Meeting (ASEM) process in the lead up to the 2012 United Nations Conference on Sustainable Development (UNCSD) or 'Rio+20' in Rio de Janeiro, Brazil, on 4th to 6th June 2012.

The series is an initiative of the Asia-Europe Environment Forum (ENVforum), a partnership among the Asia-Europe Foundation, the Hanns Seidel Foundation, the Institute of Global Environmental Strategies, the Swedish Environmental Secretariat for Asia, in cooperation with the United Nations Environment Programme.

Please note that this document reflects the views and opinions emerging from group discussions and does not necessarily represent the views of the institutions involved. The group of over 55 international experts represents different sectors such as policy makers, academics, civil society activists—all being involved extensively in sustainable development and environmental governance.

## II. PROPOSALS

### A. Recommendations for Asia-Europe Meeting governments

The initiative focuses on one of the two Rio+20 themes: Institutional Framework for Sustainable Development (IFSD) and the need for strengthening environmental pillar as a part of IFSD framework. As such, based on the outcomes of the two workshops, participating governments of the Asia-Europe Meeting (ASEM) are encouraged to:

- participate in Rio+20 at the highest levels by the heads of state or government;
- pledge to produce a politically-binding outcome document that secures a renewed political commitment for sustainable development, assess the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development, and address new and emerging challenges that include the themes of IFSD and green economy in the context of poverty eradication and sustainable development;
- agree on measures for strengthening IFSD through fundamental and incremental changes including those that go beyond the current IEG structure.
- ensure greater participation and accountability from civil society in the entire policy process for sustainable development, from agenda setting to decision making.

The failure to come to decisive action in Rio 2012 will be a missed opportunity and the lack of commitment might result in the perpetuation of an undesirable status quo or at best, progress at incremental—but inadequate—steps.

ASEM governments and civil society are furthermore exhorted to forge closer co-operation at bilateral, regional and inter-regional levels.

### B. Rio+20: Conference Objectives

The following recommendations are made with regard to the Rio+20 conference objectives.

#### - Securing political commitment for Sustainable Development

To secure political commitment for Sustainable Development, the creation of a Sustainable Development Council (SDC) is necessary at all levels: international, regional and national that will integrate three pillars of sustainable development: economic, political and environmental.

The SDC should work to achieve broad goals of sustainable development, subject to assessment in terms of transparent indicators through monitoring mechanisms to further allow and facilitate global reporting on sustainable development.

- Acknowledging the need of addressing gaps in already agreed commitments as well as to ensure the overall coordination of sustainable development within UN system and Bretton Woods institutions

To effectively address gaps in existing commitments and ensure the over-all coordination of sustainable development in the international system, the SDC should map and address any overlapping areas and use available funding in an efficient and transparent way.

#### - Addressing new and emerging challenges

To address new and emerging challenges, scientific and technological innovations should be integrated as an integral part of the decision-making process. This should include the use of a future-oriented, foresight approach and long-term planning to ensure flexibility and preparedness for the uncertain challenges that the SDC will need to address in the years to come.

### C. Horizontal integration

Human activity has seriously affected planet boundaries that directly endanger ecosystem stability and all countries, especially developing countries, need access to the resources required to achieve sustainable development. The 2011 Solo Message resulting from the High Level Dialogue on IFSD2 called for an international body to promote the integration of the economic, social and environmental pillars of sustainable development. The SDC should therefore be established by building upon the precedents and useful lessons to be drawn from relevant institutional reforms, including recent experience in establishing the UN Human Rights Council.

The SDC should:

- ensure horizontal integration and become a central body for sustainable development coordination and coherence;
- be spearheaded by the high level UN representative such as the UN High Commissioner for Sustainable Development or the UN Ombudsman for Sustainable Development;
- address sustainable challenges to be environmentally, socially and economically most effective, based on regular scientific and technical assessment;
- monitor how States adjust policies, reform institutions and enact legislation to meet the achievement of sustainable development targets, adjusting the requirements to their economic and social situation;
- accommodate the need for meaningful public participation and contributions at all levels;
- enhance human security to mitigate the risks of a food, energy, water and climate change nexus, especially for developing countries;
- safeguard the earth's ecosystems for present and future generations.

### D. Vertical Integration

The horizontal integration of the economic, environmental and social pillars should be replicated vertically, according to the principle of subsidiarity throughout the international, regional, national and sub-national levels in the implementation of sustainable development goals.

A multi-level SDC should facilitate the creation of sustainable development bodies, where they do not exist, and complement, where they do, the existing structures at the international, regional and national levels to provide a strengthened mechanism for sustainable development. The legacies of the 1992 Earth Summit and the 2002 World

Summit on Sustainable Development—in terms of institutions, mechanisms and good practices—should be mapped and built upon. Fully accounting for National and Local Councils for Sustainable Development that have continued to thrive, for example, could be a first step in this process.

In line with Principle 10 of the 1992 Rio Declaration, these structures and mechanisms should furthermore be constituted as multi-stakeholder platforms. These platforms can furthermore provide support to (1) synergy among scientists, policy-makers and field researchers; (2) innovative actions for policy development, technology application, social mobilization and partnership building; (3) strategic research; and, (4) higher education, training and capacity development.

With the perspective of a vertically-integrated sustainable development institutional framework, further emphasis is given here to regional-level SDCs and International Environmental Governance:

#### 1. Regional-level SDCs

The regional SDCs should:

- review existing mechanisms for Sustainable Development pillars and map best practices;
- promote complementarity between the UN system (including the regional commissions and offices) and the regional organisations;
- produce a regional report on the achievement of sustainable development goals based on a clearly-defined set of indicators;
- monitor the performance and implementation of national and regional goals based on long-term sustainable development strategies;
- initiate actions and distributing resources for programmes at the different levels, in order to meet the targets set; initiate mitigating measures if targets are not met; and,
-  propagate a model(s) for regional bodies that work under similar principles and functions albeit tailored to regional needs, realities and institutions; and,
-  propagate a model for national bodies to best organise existing institutions for sustainable development or mandate appropriate agencies as needed, tailored to the needs, realities and institutions at the national and sub- national levels;
- support the peer review of national policy performance;
- allow the individual petition/communication and administer a mechanism for complaints and redress. The national mechanism for SDSs should be integrated within the SDC and regional SDCs system. The structure is to be decided by national governments based on the best practices models, possibly in the consultation with the appropriate regional SDC.

#### 2. International Environmental Governance

Additionally, there is a strong need for strengthening the environmental pillar within UN system for better balance. It is therefore vital to strengthen IEG through the measures that will enhance overall coherence, effectiveness and efficiency. To do so requires the reform of the UNEP within the UN structure. It is recommended to upgrade UNEP to an agency that:

- has full and universal membership of member states and other stakeholders;
- has a mandate to oversight environmental strategies and programmes and to cluster similar issues;
- is legitimate to partner with Bretton Woods institution and can:
  -  ensure the contribution of financial bodies to environment enhancement;
  -  facilitate high-level dialogue between Bretton Woods decision makers and stakeholders;
  -  ensure the involvement of the market in environment protection through market-based incentives (eg. subsidies and taxes);
- plans programmes that deliver tangible outcomes in order to receive increased funding;
- has a mandate to require environmental assessment of the projects, especially in case the project will have a
- transboundary effect;
- works with a panel of inter-disciplinary experts representing relevant stakeholders groups such as governments,
- international organisations, major groups and academia to enable knowledge sharing as well as technology transfer;
- includes stakeholders input via organizing meetings and conducting research that enables the agency to act as an
- interface between policy and science, developing practical actions for the environmental pillar;
- provides indicators and general framework for measurement of sustainable development that is unified and allows to
- build up capacity to report at the regional and national level and compare regions progress;
- operationalizes planetary boundaries<sup>3</sup> in terms of regional limits and biosphere carrying capacity;
- conducts regular assessments on carrying capacity using the available scientific knowledge and communicate results to public;
- enables mechanisms to share good practices and knowledge;
- safeguards finances for environmental aid, guided by a bottom-up approach based on local expertise and local needs;
- supervises mechanisms for project assessment which include guidelines on Environmental Impact Assessment at down to the local level for international projects and local consultations;

- has a reinforced role in addressing the securities Nexus, with a mandate to synergistically address energy, water and food issues.

A strengthened IEG could include the creation of a Court for Environmental Justice that:

- takes into account existing environmental law;

- can evaluate the efficiency of development aid and technology used across the needs of local communities seeking assistance.

#### E. Access to information

Access to information, public participation and environmental justice is needed in order to promote compliance that ensures transparency, accountability, efficiency and effectiveness at all levels. Based on Principle 10 of the 1992 Rio Declaration on the Environment and Development, the Aarhus Convention could be enlarged into a global convention.

Governments must ensure the effective implementation and adequate compliance with the national freedom of information acts or relevant legislative measures on the public access to environmental information.

Transboundary environmental management programmes and bodies should reinforce and institutionalize measures for ensuring the public access to environmental information and public participation in environmental decision-making. To foster and ensure compliance with Principle 10, it is vital that the bilateral and multilateral aid agencies and organizations incorporate Principle 10 objectives; particularly the public access to environmental information, environmental information disclosure and public consultation on the projects funded by the aid and/or investment programmes.

Failing a global convention, other regional instruments—such as for the Asia-Pacific region—could be considered. An Asia–

Pacific regional convention on Principle 10 should include the following features:

- compliance mechanisms through the peer review of national level convention implementation;

- individual/non-state actor's communication on non-compliance issues.

The proposed regional convention should also include the provision that will ensure the effective implementation of impact assessment at the project level (EIA: environmental impact assessment) and at the planning level (SEA: strategic impact assessment) taking into account the UNECE Espoo Convention on SEA. Such assessment must include social and environmental impact assessments and follow the public consultation procedures.

#### F. Civil society accountability framework

Civil society participation in the IFSD, particularly the SDC at all levels, must be assured. Conversely, civil society representatives need to be accountable to their constituents through a democratic, self-managed mechanism that ensures transparency, efficiency and effectiveness in CSO participation in the Council's deliberations. Developing an accountability framework for civil society should, as a first step, review the major group participation system to assess its representativeness and accountability.

The principle of subsidiarity concerning representation (from local to national, regional, and international levels) may be relevant but the aggregation of representation must be complemented by direct access to the international level. Guidelines could be developed along these lines.

#### G. Legal framework

In order to pave the way for the establishment of the SDC that would integrate the three sustainable development pillars – social, economic and environmental – and promote sustainable development governance at the global, regional, national and local levels, it is recommended to consider the following options:

- UN Charter change;

- an international convention for sustainable development; or

- decisions and resolutions at the UN and other relevant bodies.

## Asia-Pacific Major Groups & Stakeholders Workshop

Major Groups and Stakeholders Asia Pacific Meeting 2011

Asia – Pacific Regional Preparatory Meeting for the UN Conference on Sustainable Development 2012

"The Road to Rio 2012: Charting Our Path"

Context and Objectives

1. The Major Groups and Stakeholders Asia Pacific Meeting 2011 was held from 17–18 October 2011, immediately prior to the Asia–Pacific Regional Preparatory Committee Meeting for the Earth Summit 2012 on 19-20 October. Discussions in the meeting were organized under four themes, namely: (1) Regional and Sub-regional priorities and emerging challenges, (2) Green economy in the context of sustainable development and poverty eradication, (3) Institutional framework for sustainable development, and (4) Access to information, public participation and environmental justice (Principle 10 of the Rio Declaration 1992).
2. The UN Conference on Sustainable Development in 2012 (Rio+20) provides a critical and timely platform for governments at the highest level to secure renewed political commitment for sustainable development. Since 1992 the ecological crisis has worsened and the world has experienced a series of financial shocks and crises. Income and social inequalities have escalated even as high economic growth took place in several countries. There was a commitment to a paradigm shift towards sustainable development, but this has remained elusive.
3. While the environmental dimension of sustainable development has remained weak, the economic dimension characterised by excessive market liberalisation, privatisation and deregulation has resulted in instabilities in the global financial system and a continuing unfair trade system. As we head towards Rio 2012, employment and livelihoods are under threat, while the rights of women, indigenous peoples, youth and other vulnerable groups continue to be marginalised.
4. The Rio+20 Conference should therefore honestly appraise the implementation of the sustainable development commitments and action plans, and identify the gaps and obstacles, to ensure the transformation of the economic, social and ecological dimensions and their effective integration. This needs to take place at the local, national, regional and international levels.
5. In moving forward towards sustainability that also incorporates the inter-generational dimension, the best of knowledge systems and innovations need to be galvanised. Recognising that changes in social values and practices are necessary in addition to technical solutions, there should be increased, integrated involvement of natural scientists, social scientists, and technologists in helping governments and society to achieve sustainable development. Furthermore, there must be recognition and promotion of indigenous and local knowledge systems and their interface with more formalised knowledge systems.
6. The agreed principles of Rio 1992 should accordingly be strongly reaffirmed and implemented at all levels, in particular common but differentiated responsibilities, the precautionary principle, the polluter pays principle and Principle 10 on Access to Information, Public Participation and Environmental Justice.
7. Twenty years after the first Rio Earth Summit, positive achievements have been primarily manifested at local and community levels. At the national, regional and global levels, many commitments made in Rio remain unfulfilled, and major challenges and gaps persist, even as new issues and challenges have emerged. Thus, it is felt that Rio+20 must result in strong recommitment to the promises made in 1992. The following issues are among those that have yet to be satisfactorily addressed:

- Promoting sustainable societies that ensure gender equality, democracy, and human rights.
  - Recognising that currently prevailing economic models promote unsustainable consumption and production patterns, facilitate grossly inequitable economic systems that fail to eradicate poverty, assist exploitation of natural resources towards the verge of extinction, and have induced multiple crises on Earth, and need to be replaced by sustainable economies in the community, local, national, regional and international spheres.
  - Providing appropriate regulatory frameworks and mechanisms that will prevent unrestrained financial markets from compromising national sovereignty of member states and that will protect them from the adverse impacts of current and potential future global financial crisis on the three dimensions of sustainable development.
  - Addressing the restriction or loss of policy space in developing countries resulting from multilateral agreements and donor impositions that constrain national development strategies from being comprehensively nationally owned.
  - Upholding primary responsibilities of states to promote, guide and deliver sustainable development policies, provide for essential social services, and provide an enabling environment and financing while recognizing the key role of local governance in implementation.
  - Recognizing the importance of peoples' participation, particularly of youth, women and indigenous peoples, providing for their empowerment and relevant, functional education to support inclusive sustainable development.
  - Addressing challenges and vulnerabilities of the least developed countries and small island states in the face of manifold threats from globalization and climate change. 8.
- Below are summarized the key issues, challenges and courses of action that have been identified and affirmed in the Major Groups and Stakeholders' meeting.

#### Issues, Challenges and Ways Forward

##### On Regional Priorities and Emerging Challenges

9. As a diverse region that comprises developing countries, including small island developing states, land-locked nations and least developed countries, as well as developed countries, the Asia Pacific region has many common but also particular sub-regional priorities and challenges.
10. As a region that is home to the largest part of humanity, the right to a life of dignity free from conflict and war is integral to sustainable development.
11. Some regional and sub-regional priorities include:
  - Eradication of poverty – while many have been lifted from poverty, the region still has the most number of people living in poverty.
  - Capacity to respond to natural disasters and impacts of climate change, including monitoring, surveillance and alert systems; emergency responses; disaster risk reduction and adaptation to climate change.
  - Conservation and sustainable use of depleting natural resources and biodiversity, including by indigenous peoples and local communities in managing forest, land and water resources, and in the practice of sustainable agriculture.
  - Specific circumstances of small island developing states in the Pacific highlighting the crucial importance of marine resources management and governance, within and beyond national jurisdictions, (including EEZs) necessary for the survival of the people in these islands.
  - More equitable distribution of income and natural resources, particularly land.
  - Stronger national policies that protect and promote food sovereignty in the face of competing resource use (e.g., land for biofuels).
  - Need for food self-sufficiency policies and regulation that would reduce reliance on imports, as well as support and incentives for sustainable food production practices.
  - Regulation at the international, regional and national levels with effective enforcement mechanisms to ensure corporate social responsibility, accountability and transparency.

- Stronger regulation on foreign investments related to natural resources to protect the rights of indigenous peoples, impoverished and marginalized peoples, and the environment.
- Compliance with trans-boundary agreements to ensure equitable sharing of resources, particularly water.
- Protection and promotion of community access and control of all natural resources, which are vital for impoverished and disadvantaged communities.
- Honoring the UN Declaration on the Rights of Indigenous Peoples in national policies and laws.
- Safeguarding natural resources (including agriculture, forests, ancestral lands, waters, oceans) against commodification and privatization.
- Extended Producer Responsibility (EPR) for environmentally-sound disposal of toxic substances and wastes, and enforcement of international regulations on toxic substances and wastes, in particular hazardous substances is required to avoid the adverse impacts on communities and the environment.
- Creation of local employment and recognition of labor rights to address population mobility and increasing urbanization.
- Global, regional and sub-regional systems based on science to engage communities and CSOs in community-based monitoring and sharing of data related to impacts on the three dimensions of sustainability, including inter alia chemicals and nuclear emissions.
- Involvement of communities and CSOs in the development, implementation and monitoring of new technologies or techniques.
- Compliance, accountability and transparency of corporations to redress displacements and other violations of rights against communities and the environment.

#### 12. Some emerging challenges include:

- Worsening income and social inequalities in several developing countries that have experienced rapid economic growth, and a trend of social inequity in some developed countries.
- Massive infrastructure projects targeted for the next 10 years, with ecological and social sustainability as well as economic viability requiring thorough assessment. Several current large-scale infrastructure projects are already at the centre of controversy.
- Spread of unsustainable consumption patterns that with growing income disparities result in the wealthy consuming beyond their needs while the poor lack basic needs. Unsustainable consumption patterns put additional pressures on natural resources and the environment as well as lead to new health problems.
- Demographic changes and increased urbanization that result in declining rural workforce with resultant stresses on food production and security.
- Critical importance to the region of active promotion and support of sustainable fishing particularly involving small-scale fishers, in view of the dangerous level of depletion of fisheries resources across the region's seas and oceans.
- Need to ensure faithful and consistent enforcement of the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal; ban dumping of wastes and toxic chemicals into the marine environment; and ensure proper management of electronic waste, including efforts towards their reduction and eventual elimination.

#### On Green Economy in the Context of Poverty Eradication and Sustainable Development

13. In view of the need for clearer understanding on the concept of "green economy," participants reaffirmed sustainable development as the overarching paradigm and centered discussions on key attributes of sustainable "economies", viz:

- Built on sustainable production and consumption patterns and ensuring all people's wellbeing;
- Democratizes access to, ownership and control over productive resources and assets, particularly for women, and promotes equitable access to opportunities for advancement and improvement of human and family welfare;
- Provides decent work and right livelihoods and ensures that social benefits are distributed equitably among all peoples;
- Fosters citizen participation;
- Upholds social justice, human rights, equity, and gender equality;
- Achieves economic sufficiency;
- Safeguards animal welfare and protects ecosystems;
- Ensures agriculture systems and supply chains are sustainable and humane; and
- Regulates financial markets and holds firms accountable for the social and environmental impacts of their operations.

14. Governments in Rio 1992 agreed to reform existing patterns of consumption and production in pursuit of sustainable development objectives, recognising the link between poverty and unsustainable production and consumption patterns. However, more attention has been given to environmentally friendly production than on consumption patterns. High economic growth in the region has been accompanied by unsustainable consumption patterns. A more rational pattern of consumption is needed to ensure a more rational pattern of production. Consumption patterns are in turn highly influenced by the distribution of incomes across and within countries.

15. Due to the unequal distribution of world incomes, an inordinately large share of goods and services produced are targeted for those with purchasing power. On the other hand, the poor who have great unmet needs but limited capacity to pay lack basic goods and services such as housing, clean water, sanitation, health services, basic education and food. Solutions cannot be found in the market mechanisms, but must be provided in public policy and government actions. Governments must ensure universal access to basic health, education, sanitation, and other essential services, removing all social and cultural barriers that discriminate against minorities including on the basis of age, sexuality, ethnicity, caste, disability and gender.

16. Economy and economic life must be defined not in the narrow sense of efficiently allocating scarce resources, but as the range of processes, activities, relations and structures involved in and affecting the provisioning for human life in all its fullness, integrity and dignity. These include not only those involved in "production" as commonly understood, but also activities, processes, relations and structures in what is termed "social reproduction," rendered primarily through the unrecognized and un(der)valued

labor of women.

17. Technological fixes alone will not solve environmental problems that are consequences of social and economic factors. Fundamental issues such as access, intellectual property rights (IPR), and assessment of the potential impacts of new and untested technologies (e.g., geo-engineering, ocean fertilization, etc.) before they are released in the environment and deployed commercially must be addressed in the development and transfer of technologies.

18. Opposition was expressed against nuclear energy, mega-dams and agrofuel plantations; instead, governments are called upon to scale up public financing to provide wide access to renewable energy.

19. Opposition was similarly raised against the privatisation and commodification of nature and ecosystem functions that lead to further marginalization of communities.

20. There is need to uphold food sovereignty to address the global food crisis. Communities should have the right to determine their patterns of food production and consumption, and farmers should be able to prioritise food production for domestic consumption. Governments must support small-scale farmers, including women, as they form the heart of sustainable food production systems and along with their families, are the primary objects of rural development.

21. The pursuit of sustainable development in the rural areas must aim at the optimum balance between rural and urban development, with the view towards avoiding problems attendant to excessive rural-urban migration. Efforts to promote sustainable cities via green infrastructure, improved waste management, access to sustainable sanitation and urban food sufficiency are likewise important, but need to be mindful of this rural-urban balance that is determined, among other things, by environmental carrying capacities.

22. Financing sustainable development and a just transition to sustainable economies requires significant public financing, financial and technology transfer from more endowed to less-endowed countries, private sector investments that are productive and non-speculative in nature, and fair and innovative modes of taxation, including a financial transaction tax.

23. Market-based mechanisms that permit developed countries to avoid the delivery of commitments to deep cuts in their greenhouse gas emissions and pass on such obligations through the markets must be reconsidered.

24. Governments must provide enabling policies for promoting sustainable economies as an important impetus to eradicate poverty reduction and achieve sustainable development. Governments must also examine fiscal policies and economic instruments to promote measures conducive to promoting sustainable development, and remove measures detrimental to such objectives including those that subsidize fossil fuel use and support inefficient resource use and economic activities.

25. Governments need to establish regional and inter-regional programmes for supporting capacity development in support of sustainable development. These must inherently involve mechanisms that promote the active participation of stakeholder groups and organisations to exchange good practices and expertise and to support pilot projects, research work, human resource development including training and education, and network activities within and across countries.

26. Stronger partnerships among governments, civil society organisations, private businesses and stakeholder groups must be established for promoting sustainable economies. Such partnerships need to be within frameworks of accountability and transparency including regulation. In line with this, research institutes, educational institutions and other stakeholder groups are enjoined to support good practice case studies and promote dissemination of information on such good practices for promoting sustainable economies in the context of poverty eradication and sustainable development.

27. As young people make up more than 40 per cent of the world's unemployed, governments must provide children, adolescents and youth with education, training and opportunities for the active participation in economic, political, social and cultural life; promote youth employment rights, and security to prevent their marginalisation and social exclusion; and child labour by addressing the conditions that lead to it.

28. Finally, disaggregated indicators to monitor and assess sustainable economies need to be developed, not based on GDP, but on people's wellbeing, inclusiveness, social equity, human rights, gender equality, decent work, biodiversity and ecological footprint.

On the Institutional Framework for Sustainable Development (IFSD)

29. The IFSD should implement the agreed sustainable development commitments and actions at the international, regional, sub-regional levels and national levels with broad public participation in the various bodies and in decision-making. The three dimensions of sustainable development must be strengthened (or transformed where necessary) and closely integrated. The framework must:

- Promote accountability and legitimacy
- Improve coordination and synergies among sectors, actors and levels
- Ensure coherence, complementarity, effectiveness and efficiency
- Guarantee meaningful public participation.

30. There is need to transform the Commission on Sustainable Development into a Council on Sustainable Development under the General Assembly to integrate the work of disparate multilateral bodies working on each of the three dimensions of sustainable development, including the International Monetary Fund, the World Bank and the World Trade Organisation. The body must have strong technical support, an independent secretariat and dedicated budget.

31. In support of the IFSD, and in recognition of the continuing weakness of the environmental pillar in the existing IFSD structure, significant strengthening of international environmental governance is needed to deal with the evolving scale and scope of environmental issues and challenges. As the entity with the primary responsibility for the global environment, UNEP should be upgraded and provided with adequate resources for its work. The institutions and work of the numerous multilateral environmental agreements need to be further coordinated within the context of integrating the 3 dimensions of sustainable development.

32. Strengthening of the environmental dimension must come alongside transformation of the economic dimension to make it supportive of the two other dimensions, rather than overwhelm them. In particular, this transformation needs to be geared toward prevention of the occurrence of more financial and economic debacles, which cause much social dislocation and environmental degradation. The UN must also take a direct hand in economic and financial policy-making and act as an effective counterbalance to the traditional dominant global economic and financial bodies.

33. At the regional level, corresponding sustainable development bodies could be established. Sub-regional analogs could also be created where size and diversity of the region warrant it, such as in the Asia-Pacific.

34. At the national level, governments must establish multistakeholder councils for sustainable development (NCSDs) where absent, and strengthen them where already existing. NCSDs must coordinate planning, policy making, issues resolution, and reporting to the corresponding sub-regional/regional and global sustainable development

bodies to ensure vertical coherence from implementation levels to the global level.

35. Local authorities are closest to the ground and directly serve the people. They must be given a responsibility and be involved in decision-shaping that concerns in particular sustainable development.

36. To be effective, the national sustainable development councils should be (a) organized at highest possible level, i.e., chaired by the Head of State/Government; (b) lodged with an appropriate coordinating body such Office of the Prime Minister or Planning Ministry; (c) composed of relevant ministries and major groups/stakeholders including local authorities; and (d) institutionally stable by virtue of a strong legal mandate and endowed with a dedicated budget.

37. The above proposals are initial steps to start fundamental changes that are necessary to meet the challenges of the 21st century. In the long term this may include updating the Charter of the UN.

#### On Access to Information, Public Participation and Environmental Justice

38. As stipulated in Principle 10 of the 1992 Rio Declaration on Environment and Development, access to environmental information, participation in decision-making and judicial proceedings over environmental matters are a critical part of the policy and institutional framework for achieving sustainable development. Thus the policies on access to environmental information, participation in decision-making and judicial proceedings over environmental matters must be fully implemented at the multiple levels. The Aarhus Convention and UNEP Guideline on Principle 10 provide useful frameworks for developing and implementing policy measures to achieve Principle 10 objectives.

39. The general public is often denied access to information, participation and justice. In the implementation of P-10 policies, due consideration should be given to respect of human rights, gender equality and the realities and needs of the marginalized groups such as women, youth and indigenous peoples

40. A number of countries in Asia and the Pacific have adopted freedom of information acts and promote the public access to environmental information. However, the level of implementation and compliance with Principle 10 varies considerably, and there are cases where the poor and socially marginalized groups such as women, youth, and indigenous peoples are denied or unable to benefit from the access to environmental information.

41. Governments must provide mechanisms and avenues that support the empowerment of the stakeholders, particularly the socially marginalized groups, to recognize their key roles and to enable their active participation in decision making. Government must also involve major groups and stakeholders in policy dialogues and decision making processes over the environment and sustainability policy issues.

42. Governments must promote the application of P-10 in dealing with the new and emerging issues such as the potential impacts of the emerging technology on the human and environment, by ensuring access to information, public participation in technology assessment, access to liability and redress in cases of damages.

43. Governments must extend the application of the P-10 for promoting and ensuring accountability and transparency of the government, corporations and organizations through effective feedback from the citizens.

44. Governments must recognize and allow alternative peoples' initiatives such as citizen juries, peoples' tribunals, and technology observation platforms.

45. Governments need to exercise the authority to obtain information from the private sector and make available such information to the stakeholders when private sector activities are to cause the impacts on the environment or public concerns. Exceptions to the public access to environmental information and other Principle 10 policy measures should be restricted and should not be abused.

46. To facilitate effective implementation of the Principle 10 policy measures, education, awareness raising, training and capacity development activities must be strengthened.

47. Inadequacy of the forums and institutions at different levels has to be recognized and addressed through such measures as strengthening of the existing mechanism, "Green Bench", establishment of environmental courts, and consideration of creating an international environment court.

48. Governments are called upon to mandate and enable UNEP to develop a robust programme on UNEP Bali 2010 guidelines. In additions, governments must adopt and implement UNEP guidelines on P-10 at national level through adopting necessary legal framework and appropriate policies

49. Governments in Asia and the Pacific must develop the regional/sub-regional conventions on P-10. At the same time, interested governments in the region are enjoined to accede to the Aarhus convention, and/or to adopt its features such as the peer policy review, and complaint/individual petition procedures without precluding the adoption of the Asia Pacific convention. The negotiation for establishment of an international convention on Access to Information, Public Participation and Environmental Justice must be launched at the soonest possible time.

50. To ensure the compliance of countries to Principle 10 policy measures at the national level, it is suggested to define the legal rights, obligations and enforcement procedures, and incorporate penalty clauses in such measures in order to pose penalty on the individuals or corporations that fail to provide information despite their legal obligations.

51. Finally, the useful benchmarks and indicators to assess performance on Principle 10 policy measures must be adopted and widely applied.

---

## Asia-Pacific NGOs

We are occupying Seoul:

Position of Asia-Pacific NGOs Major Group on Rio+20

A month ago, civil society started to occupy Wall Street. This week, we are occupying Seoul. In June, we will occupy Rio ...

Recognising the right to sustainable development is a fundamental right of people.

Emphasising that sustainable development must promote equity and enhance the wellbeing of all.

Further emphasising that sustainable development must be based on the protection and conservation of the natural resource base, on which life depends, not on unbridled consumption.

We call for strengthening of the holistic integration of the environment, economic and social dimensions of sustainable development.

Recognising that communities together with NGOs around the world have developed numerous innovative solutions to development challenges that need to be supported with enabling environments to link, upscale and mainstream these efforts.

Recognising that NGOs are independent and equal development actors that are integral in decision-making processes at different levels.

Stressing the importance of effective engagement of NGOs in sustainable development.

We recognise and commend the commitment and efforts of a number of governments in the Asia-Pacific Region to implement Agenda 21 since 1992 through the creation of national councils for sustainable development strategies with the active engagement of NGOs.

We call upon these mechanisms to be recognized as an integral part of the national development agenda.

We further call upon countries where these mechanisms exist but have lagged, to revive and strengthen them and in countries where these mechanisms do not exist, for them to be created.

Sadly recognizing that governments have committed themselves to shift to the sustainable development paradigm 20 years ago, but have done little to deliver this promise.

We urge that new labels such as green economy must not confuse, distract from or obscure commitments to sustainable development and that governments and the international community must instead reaffirm their commitment to sustainable development.

We call for renewed political commitment to sustainable development principles adopted at Rio in 1992, namely, the precautionary principle, common but differentiated responsibilities, polluter-pays principle, the access principle (access to information, public participation, and access to justice in environmental matters), and the recognition of the indispensable role of major groups in sustainable development.

We strongly call upon governments to recognize that the current convergence of crisis should not be used as an excuse to avoid or delay the delivery of these commitments.

#### On Green Economy

Recognising that the current economic model, which promotes unsustainable consumption and production patterns, facilitates a grossly inequitable trading system, fails to eradicate poverty, assists exploitation of natural resources towards the verge of extinction, and has induced multiple crises on Earth, needs to be replaced by sustainable economies in community, local, national, regional, and international spheres.

Acknowledging that green economies within sustainable societies should also ensure gender equality, democracy, improve human wellbeing, reduce environmental risks, respect the fundamental human rights of people, enhance opportunities for green, decent work and right livelihoods, and ensure that jobs and social benefits are distributed equitably among all peoples;

We are convinced that green economies in the context of sustainable development and poverty eradication should be economic systems that foster citizen participation; require social justice and equity and gender equality, protection of ecosystems; creation of economic sufficiency, and that aims for the core idea that green economies enhance sustainable development and prosperity of all nations; ensure the wellbeing of all people; respect the rights, cultures, languages, and wisdom of indigenous peoples and local communities; safeguard animal welfare and conserve biodiversity for future generations, while stressing that green economy does not replace sustainable development.

We believe that partnerships to promote green economies should promote sustainable development and should not be exploitative and opportunistic.

We oppose the privatisation and commodification of nature and ecosystem functions that lead to further marginalization of communities.

We reject market-based mechanisms that serve as means for developed countries to avoid the delivery of commitments to deep cuts in their greenhouse gas emissions and to pass such obligations to markets.

We believe that technological fixes alone will not solve environmental problems that are consequences of social and economic factors. Fundamental issues such as access, intellectual property rights (IPR), and assessment of the potential impacts of new and untested technologies before they are released in the environment and deployed commercially must be addressed in the development and transfer of technologies.

#### On Sustainable Development and Governance

Stressing that governments must recognize the existing efforts of communities and NGOs in promoting sustainable development at the national and local levels, and should support and provide platforms to mainstream and link these efforts to have more sustained impacts on development.

We call for renewed commitment of governments to implement Agenda 21 by establishing, strengthening or reviving national and local mechanisms such as multi-stakeholder councils for sustainable development, and ensuring synergy and coherence among the different agencies involved in sustainable development.

We call for the global institutional framework for sustainable development to ensure equitable rights and opportunities for all to enjoy sustainable development and promote wellbeing for all.

We also call upon the Rio+20 process to address sustainable development governance, and not just focus on international environmental governance that should go beyond reforming UNEP but should also involve all institutions in the environmental governance architecture.

We strongly call for the building of a strong apex body on sustainable development that works at the global level and can integrate the work of disparate multilateral bodies working on each of the three pillars of sustainable development, including the International Monetary Fund, The World Bank and the World Trade Organisation. Options that should be explored include transforming the Commission on Sustainable Development into a Council on Sustainable Development, or establishing a UN Organization on Sustainable Development. The unifying mandate of this body should be the promotion of sustainable development as a fundamental right to all.

We also call upon Rio+20 to work for the immediate establishment of a broad inclusive multi-stakeholder consultative body or network tasked with supporting the promotion and monitoring the implementation of sustainable development commitments and actions since 1992 as well as the Rio+20 resolutions. Such a body should be participatory, democratic, and have an integral multi-stakeholder character that accords civil society with equal rights and equal voice as governments.

We further stress the need for a systematic monitoring of the implementation and strict enforcement of existing agreements related to sustainable development at the global and their enabling laws at the national level.

#### New and Emerging Issues

Being alarmed by the trends in Asia-Pacific in the systematic acquisition of land in least-developed and developing countries by public and private entities from food-insecure

but financially-endowed states.

We call for an end to this massive land grab.

We call upon the specific circumstances of small island developing states in the Pacific to be recognized and fully addressed with regards to the crucial importance of marine resources management and governance necessary for the survival of the people in these islands.

We further call for a ban to the dumping of wastes and toxic chemicals into the marine environment.

We call for the rights and responsibilities of consumers to be recognised and promoted.

We further call for the active promotion and support of sustainable fishing, particularly involving small-scale fishers in view of the dangerous level depletion of fisheries resources across the region.

Recognising the critical importance of food sovereignty to address the food crisis.

We call for communities to have the right to determine their patterns of food production and consumption, and farmers should be able to prioritize food production for domestic consumption, where Government provides incentives to sustainable food production practices.

We call for global and regional mechanisms, such as a Regional Technology Observation Platforms, in evaluating the impacts of new and untested technologies must be adopted. Such mechanisms must involve communities, civil society and other actors, and provide resources towards providing adequate information and building capacity of countries and communities to assess and monitor the health, biodiversity and environmental impacts of new technologies.

On Principle 10

We call on the Rio+20 conference to launch negotiations for the establishment of an international convention on Principle 10 of the Rio Declaration that deals with access to information, public participation and environmental justice.

We further call on the Rio+20 conference to encourage the development of a regional convention on Principle 10, to invite interested states to accede to the Aarhus Convention and to mandate UNEP to develop a robust program to implement the 2010 Bali Guidelines on Principle 10.

Our occupation of Seoul is built on the sincerity of our efforts to live the spirit and operationalize the principles of sustainable development. Our decades of experiences in working with communities and offering concrete solutions in our engagements with governments are living proof that we walk the talk ...

---

## Asian Centre for Organisation Research and Development

### Contribution to the Zero Draft Document RIO + 20

- Terms like “green economy” and “sustainable development” are very pretty, but in terms of hard reality they mean one thing on the ground : lowering the rate of consumption. This however is unacceptable to the people at large, and is a problem of “mass- psychology” which economists, politicians, and technologists are neither willing nor able to even take on. Who wants to be unpopular and get to the root of the problem?
- “The limits to growth published by the Club of Rome in the early 60’s is still the most relevant analytical document, but it has been given a quick burial – every one runs for office on the promise of more growth, more consumption, more welfare, whether sustainable or not.
- The Pareto principle is still an iron law of economics, and it has proven its validity even in biology. The top 20% of the 7 billion people control the consumption and exploitation of 70-75% of the world’s resources, while the bottom 20% consumes less than 2% of global resources.
- The top 50% of the world’s population needs to reduce 10% of its consumption in the first instance, and thereafter 10% every 5 years – the world’s best politicians, philosophers, psychologists, mass-communicators need to form a coalition to help nations work within the global limits, whether natural or man-made limits. The addition to “endless growth without limits” needs to be treated as a mass neurosis which has no sustainable base in reality.

## Asociación Ancash

La hermosa región Ancash cuenta con una amplia porción de su territorio de montañas alto andinas, que son parte de su patrimonio natural y cultural. Es en esta zona donde la operación minera Antamina viene operando su yacimiento desde hace 10 años, generando una oportunidad para promover un cambio en la vida de sus poblaciones en este espacio de vida y desarrollo. Antamina, para atender el desarrollo de las comunidades en su ámbito de influencia, ha creado a la Asociación Ancash en el año 2002, año internacional de las montañas, como una asociación civil sin fines de lucro, encargada de promover el desarrollo sostenible en su región. Nuestra institución es miembro de la Alianza para las Montañas desde su creación.

Parte importante de nuestra labor es la estrecha coordinación con las entidades públicas y privadas que se suman como socios estratégicos para la consecución de dicho objetivo, focalizados en tres aspectos que son el respeto y revaloración de la cultura local y la conservación de los recursos naturales, siendo el turismo el eje transversal de todas nuestras iniciativas, pues estamos convencidos que es el mejor medio para sacar de la marginalidad y fomentar el desarrollo de los pueblos largamente olvidados de

nuestras zonas de montaña. Este modelo de apoyo se convierte en un modelo innovador de trabajo en ámbito de montañas desde la inversión privada, en especial con el apoyo a la gestión del Parque Nacional Huascarán, Patrimonio Natural de la Humanidad.

La oportunidad de aportar al desarrollo de las montañas, desde la iniciativa empresarial privada, está en marcha y estamos convencidos que puede ser ampliamente provechosa si se logra enmarcar el desarrollo e integración real de las montañas en el desarrollo nacional mediante la intervención del Estado.

Por esta razón el desarrollo sostenible de las montañas, especialmente a través de políticas integradas y socialmente incluyentes, así como tecnologías de baja emisión de carbono, debe ocupar un lugar prominente en la agenda de Río 2012 y debe estar claramente establecido en su declaración final.

Mirko Chang Olivas Director General Asociación Ancash

[www.aancash.org.pe](http://www.aancash.org.pe)

A large portion of the beautiful Ancash region is located in the high Andes Mountains, which are part of their natural and cultural heritage. It is in this area where the Antamina mining project has operated for 10 years, creating an opportunity to promote a change in the lives of the surrounding populations in this lively and developing area. In order to address the development of communities within its area of influence, Antamina created the Ancash Association in 2002 –the international year of the mountains– as a civil non-profit entity, tasked with promoting sustainable development in the region. Since the very beginning our institution has been a member of the Mountain Partnership.

An important part of our work is the close coordination with public and private entities that add up as strategic partners to achieve this objective, focusing on three areas; namely, revaluation of local culture, conservation of natural resources and tourism. The latter being the transverse axis of all our efforts, because we are convinced that tourism is the best way to promote the development of our long-forgotten mountain people and to take them out of marginalization. For the private investment, this model becomes an innovative way of working in mountainous areas, especially because of the support given to the Huascaran National Park, World Natural Heritage.

The opportunity for private companies to contribute to the development of the mountains is underway and we believe that it can be widely useful if we can get to include the development and actual integration of the mountains in national development through state intervention.

For this reason, mountain sustainable development, especially through integrated and socially inclusive policies as well as low-carbon-emission technologies, should occupy a prominent place in the agenda for Río 2012 and must be clearly stated in its final declaration.

Mirko Chang Olivas Director General Ancash Association

## Asociación Ecuatoriana de Motociclistas (AEMoto)

Rio de Janeiro for the Rio+20 UN Conference on Sustainable Development  
Rio de Janeiro, Brasil, junio 4 – 6, 2012

What percentage of the world population rides motorcycles?  
Motorcycle Safety Citizens Plan

Project by:  
AEMoto, Asociación Ecuatoriana de Motociclistas  
Ecuadorian Motorcyclists Association  
Adscrit at:

Ecuadorian Motorcycling Federation F.E.M.  
F.I.M. Latin America, International Motorcycle Federation

Rio de Janeiro for the Rio+20 UN Conference on Sustainable Development

IT'S TIME TO ACT; F.I.M. Latin America, International Motorcycling Federation,  
F.E.M. Ecuadorian Motorcycling Federation and  
AEMoto, Ecuadorian Motorcyclists Association

will present a project of a 10 year Strategic Plan for Rider Road Safety inspired in the initiatives being taken by FIM in support of the Decade of Action for Global Road Safety [www.un.org/en/roadsafety](http://www.un.org/en/roadsafety) decreed by the United Nations and the World Health Organization.

IT'S TIME TO ACT; F.I.M. Latin America, F.E.M. and AEMoto will present a project of a 10 year Strategic Plan for Motorcycle Rider Road Safety. This ten-year strategic plan to spread motorcycle road safety throughout the region follows the spirit of the Decade of Action for Global Road Safety.

Many other organizations worldwide, are implementing actions to tackle and reduce traffic accidents, and are following the lead of the F.I.M. International Motorcycling Federation.

In Latin America, we have an extensive motorcycling community, that will be united by this Plan for Motorcycle Safety, and as world citizens, will include Green economy philosophy, always following the Ride Green motto.

At the beginning of 10 years of action to save thousands of lives that are lost due to traffic accidents, F.E.M. and AEMoto and are working to get the essential support of official and civil organizations in order to spread road safety actions in Ecuador. Hundreds of letter have been sent and will be, to Institutions and Companies in Ecuador and other countries, to present this Motorcycle Safety Plan called PLAN NACIONAL CIUDADANO POR LA SEGURIDAD MOTOCICLISTA to the community.

The first step was taken with the distribution of a flyer with the 10 key recommendations for safe motorcycle operation sponsored by insurance company Seguros del Pichincha. This has been done in social events and the press. The second step will be taken in November 2011, with the publication of a Motorcycle Rider Education Supplement with one of the major editorial groups in Ecuador, the Vistazo magazine, with the circulation of 70.000 copies that will circulate with the national magazines Vistazo, Estadio and Generación XXI.

This is the start of a 10 year campaign, with a pilot programme in Ecuador for 2011 and 2012. After an evaluation, the Motorcycle Safety Citizens Plan will be spread throughout the region, with the support of Latin America's Motorcycling community and FIM latin America.

We support the 'Safer Roads @ Rio+20', an initiative led by the Make Roads Safe campaign, building on the momentum of the UN Decade of Action for Road Safety to broaden the coalition supporting action to prevent 5 million road deaths by 2020. We are seeking recognition that tackling the global road injury epidemic must be a key element of any post-2015 sustainable development framework. Road Safety is an environmental issue that has to be part of the Millennium Development objective since decrease of traffic accidents is a vital part of improvement of environment and quality of life.

We request that the Rio +20 conference on sustainable development would also include Motorcycle Road Safety plans as part of agenda so that the decisions taken would give a impulse to the movement for Road Safety.

Now, in Rio de Janeiro Brazil, June 2012, we request that the Rio +20 conference on sustainable development would also include this Motorcycle Road Safety plan as part of the agenda so that the decisions taken would give funding directed to global Motorcycle Road Safety, specifically to edit study of motorcycling in Latin America, invaluable tool to best develop this Plan.

Together we can save millions of lives.

Yours Ricardo Rocco Paz  
Executive Secretary  
AEMoto, Asociacion Ecuatoriana de Motociclistas  
Ecuadorian Motorcyclists Association  
Adscrit at:  
Ecuadorian Motorcycling Federation F.E.M.

2. Referential elements of the contribution
3. The issue of the "Institutional Framework for sustainable development IFSD" within the context of the objectives of the conference
4. Institutional Framework for Sustainable Development, IFSD, and Global or International Environmental Governance, GEG-IEG: Important misunderstandings and conceptual and political contradictions
5. Reform proposals of the ECOSOC in order to walk towards the real conformation of an IFSD at a global normative level of the sustainable development governance
- 4.1. About the current possibility of the creation of a "Special Group of experts on global financial and economical crisis and its effects on the development"; about the role of the United Nations in the global economical governance and the development, and our proposal of the creation of an economical subcommittee within the sustainability context
6. Proposals of transformation of the UNEP directed to the establishment of an operational global structure on the IEG field
- 5.1. About the characteristics of the "Agreement of the relations between the UN and the new specialized agency"
6. Proposals of extraordinary political actions of Rio+20 in relation to the UNFCCC (United Nations Framework Convention on Climate Change)

1. Contribution from the apGDM-WDGpa: about the general content and, specifically about the Institutional Framework for Sustainable Development IFSD

Our young and small Catalan association, in which despite that, are working together persons with long and diverse traditions and aptitudes linked with the field of World Democratic Governance, cannot do anything else than applause the invitation of the Second Preparatory committee of the Rio+20 Conference and, of course reflect, conform and transmit to the UN, with humility but at the same time with great conviction, its contributions to the political preparatory process of the Conference.

As an association that, according to its own denomination, has as fundamental objective, to face the big current challenges, to work towards building a real Global Democratic Governance System; we will contribute fundamentally, within this context towards Rio+20, working on one of the basic topics on which the conference bases in order to achieve its objectives: the "Institutional Framework for Sustainable Development, IFSD".

Understanding that the objectives and general contents of the Conference face with this topic the fundamental challenge in order to clarify the situation, and draw truly a framework and define the way for its construction. In order to walk, with decision and effectiveness, towards a real sustainable development, that includes unavoidably the poverty eradication within a globalized world, it is need that the Democratic Governance at global level serves as a response to the current circumstances. Which gives the frame for the specification and orientation of our reflections and contributions.

If we frame this paragraph –which can be considered as a kind of proposal 0 from us– it is just to stress that each time that we consider that we are defining a proposal it will be frame in this way

1. Referential elements of the contribution

We have chosen to carry out our reflections and contributions neither on a virginal white either on an unapproachable black, due to the interesting and countless contributions that, fortunately are currently being build and carried out. We have chosen as a referential element for our work the previous official report of more significance on the current state of the art towards the Conference: the United Nations Secretary General Report for, concretely, the meeting of the Second Preparatory Committee for the Conference carried out on March of 2011. Report which was presented together with and to complement the first synthesis document based on the responses from the member states, the main groups and the organisms belonging to the United Nations themselves, as an answer to the first invitation received with the aim to participate actively in the preparation of the Conference in the moment of its announcement by the General Assembly(GA) of the UN.

2. The issue of the "Institutional Framework for Sustainable Development IFSD" within the context of the objectives of the conference

In the summary of the report previously mentioned, we can read, literally (the bolds and underlines in cites will always be made by us in order to stress a part of the text): This

report examines the two themes of the United Nations Conference on Sustainable Development — green economy in the context of sustainable development and poverty eradication (GESDPE), and the institutional framework for sustainable development (IFSD) — in relation to the objective of renewed political commitment to sustainable development, reviewing progress and implementation gaps and addressing new and emerging challenges. The starting point is the recognition that sustainable development, with each of its three pillars reinforced and mutually reinforcing, has been the overarching goal of the international community since Rio 1992. Thus, the question posed here is how a focus on GESDPE and IFSD can help accelerate progress on the sustainable development agenda.

And already in the text of the report of the SG, part III, section A, it says, always literally,

#### A. Approaches to strengthening the institutional framework for sustainable development

91. The institutional framework for sustainable development covers a spectrum of formal and less formal bodies, organizations, networks and arrangements that are involved in policymaking or implementation activities. The institutional framework must be considered at local, national, regional and international levels. Globally, the institutional framework has witnessed a dramatic growth in the number of institutions and agreements, with more than 500 multilateral environmental agreements currently in existence. Thus the reach of sustainable development governance has greatly expanded. Yet the continuing deterioration in the natural resource base, threats to ecosystems, global climate change and persistent poverty call into question whether the grasp of the institutional framework matches its reach. The international institutional landscape has been characterized as fragmented, with a silo-like arrangement of regimes and institutions and a related lack of coherence and coordination.

An article, from our point of view, more important than what can be considered in first instance.

Probably when the Secretary General talks about “a spectrum of formal and less formal bodies, organizations, networks and arrangements that are involved in policymaking or implementation activities” we could link it with a possible definition of how would be a global governance system for sustainable development. However, as it happens a lot of times, afterwards the Secretary General will cite as an example of it the “500 multilateral environmental agreements currently in existence”, coming to the conclusion that “the reach of sustainable development governance has greatly expanded”, performing with it the first and important internal contradiction in the text (what is more, so usual during already so many years and so many texts and references coming from the UN) that is the fact of identifying “environmental” with “sustainable”. Fortunately, in this case the SG himself has taken care, within the summary written at the beginning of this section, to point out his own conceptual contradictions in reference to the topic saying: “The starting point is the recognition that sustainable development, with each of its three pillars reinforced and mutually reinforcing, has been the overarching goal of the international community”.

We also consider that SG establishes another important contradiction when he affirms that the “500 multilateral environmental agreements currently in existence” “the reach of sustainable development governance has greatly expanded”. There is no doubt, currently, we have a wide normative level on environmental topics, and it should allow us the implementation of a good and necessary environmental governance. However it does not mean that it has been like this and is like this, or even the opposite, as we think, and many other relevant actors on this issues do. The governance of these agreements, in which refers to their implementation, can be qualified as extremely precarious –and even in some cases inexistent– and, actually, with a lack of a truly Institutional Framework for Sustainable Development, IFSD, that, among other things, allows to move forward on the governance, due to and unavoidably coordinated, in most of the cases, by the cited agreements.

Returning to the first and fundamental identify contradiction: exactly, more since Johannesburg than since Rio, the verification that the social, environmental and economical pillars are indivisible and constitute the essence itself of the way towards sustainable development, it is at least an unquestionable and unquestioned reference, although, there is no need of more than a line in order to contradict it, in almost all the contexts, as we verified again in the SG text.

It can be that because of this we should rewrite, and propose for the process of the conference, consider sustainable development as the sustainable development socially desirable (society has to decide how wants, and can, live in each historical moment within the planet), environmentally compatible (the planet earth, at least until now, is the only home that humanity has and cannot destroy it (without return) in case they do not want to mortgage irremediably the future of humanity life in the planet) and economically performable (it has to be like this because it will always be necessary to keep managing and assigning resources -always scarce- in order to satisfy the needs -impossible to be unlimited- that allows the development socially desirable and, of course, cannot coexist with the curse of the current big poverties). And avoid, acting on hurry, to consider only the environmental pillar when we refer to sustainable development.

The stress on this point could seem excessive, but as will be seen further on it is not. Part III of the SG report presents the following index:

### III. Institutional Framework for Sustainable Development

#### A. Approaches to strengthening the institutional framework for sustainable development

##### B. The broader framework

##### C. Governance of the environmental pillar

##### D. Governance of the economic and social pillars

Although it could seem we suffer a trend to exaggeration; the truth is that the section is almost irrelevant, both in terms of extension (less than one page of the report) and most of all in terms of analysis, and proposals, while most of the focus at section B and of course all section C, refers in fact only to the environmental pillar, and therefore to the corresponding problem: as old as the first of the so named environmental conferences of the UN -Stockholm 1972- in which among other things, the UNEP would be created and the topic of the GEG-IEG would start to be discussed.

In this sense, although it does not appear in the objective, neither in the topics of the basic premises of what Rio+20 would like to be, there is an enormous risk on the fact that most of the preparatory process of the conference and the conference itself ends up talking only about (from our point of view quite mistakenly) IEG and almost no talking about IFSD! For this reason we have to propose to avoid this situation at all costs.

#### 3. Institutional framework for Sustainable Development, IFSD, and Global or International Environmental Governance IEG-GEG: Important misunderstandings and conceptual and political contradictions

In the line with our previous alert our main contribution and/or proposal at this level is to state explicitly the fact that the second topic of the conference are actually two big subtopics: a) the Institutional Framework for sustainable development IFSD, in the direction of the construction of a truly Global Sustainable Governance; b) the International or Global Environmental Governance itself, as a reform and reconstruction of that kind of governance, but to be precise, as a part of the Global Sustainable Governance that we mentioned before, together with the social and economical governance as a whole that defines bidirectionally the IFSD.

Rio+20 cannot be prepared neither carried out without dismissing the eternal misunderstanding and contradiction -or even better expressed reduction- between environmental and sustainable. The environmental part will not be sustainable or unsustainable by itself, but depending of how socially and economically we interact with the environment.

From our point of view, and accepting as a logical fact that the IEG does not have yet, time and spaces (normative and operative realities) such as the ECOSOC, as evident as in reference to the social and economical topics; we consider logical and appropriate that the IEG has a privileged space within the frame of Rio+20 but without misunderstanding -and almost identifying it only- with the whole of the Global Sustainable Governance, or isolating it from social and economical governances.

Following this line, we propose an index that could avoid misunderstanding, contradictions and simplifications; and tries to clarify the previously explained conceptual structure:

. Institutional framework for Sustainable Development IFSD, or Global Sustainable Governance

Global Social Governance, in the sustainability context

Global Environmental Governance, IEG-GEG, in the sustainability context

Global Economical Governance, in the sustainability context

4. Reform proposals of the ECOSOC in order to walk towards the real conformation of an IFSD at a global normative level of the sustainable development governance

Within the UN the fundamental normative authority remains in the General Assembly (GA), but it is shared, specialized or get ready, on thematic and procedure level in the councils. Apart from the security council, it is evident that the experience that we are living with the new -and still provisional- Human Rights Council is one of the most successful and encouraging ones at the level of the UN, as an instrument of World governance. Almost everybody assumes the fact that peace and security and human rights among other topics are included in the jurisdiction of the UN. By contrast the origin on the ECOSOC is closely related to, exactly, the question of, for example, where the Global Economical Governance remains. But it is also true that partially and also in a contradictory way, as the environmental topics have appear historically some of them have end up on the hands of the ECOSOC.

While the UN Charter defines the ECOSOC always in conditional terms (It could: carry out studies, make recommendations, coordinate the agencies work, etc.) and the agreements achieved concerning to the relation between the UN and the institutions of Breton Woods (BWI), defined the last ones as specialized independent agencies of the UN, what we could define as Global economical Governance, was established and keeps still in the IMF and the WB (the two main BWI). And the following G5, G7 and G8 (Maybe in the future the G20 although we do not think so), as the main stockholders of the BWI institutions, have being through the BWI the Worldwide economical governments.

From the very beginning of the UN, the most cited and claimed reform -and less truly tackled- is the reform of the ECOSOC, on one hand, and the relation that it has with the BWI institutions on the other hand.

For the moment, specially since the Rio summit and enforcing it after the Johannesburg summit, some of the environmental issues, -as we have already mentioned- from a normative point of view, have been transferred to the ECOSOC, due to the creation of the Commission for Sustainable Development (CSD) within the Rio summit, as an specific commission of the ECOSOC. As long as, although, Rio will bet for the way of the specific environmental treaties and multilateral environmental agreements about the key environmental issues (climate change, biodiversity, desertification,...) with governmental organs, in most of the occasions, ad hoc, the CSD has not given the expected results. It has never been able to get out of the environmental pillar of the sustainability, it did not have until now any capacity not even to coordinate the MEAs topics and in reference to the economical fundings, the WB eclipsed it almost completely with the creation of the Global environmental facility (GEF). Therefore it happens the same with the CSD than with the ECOSOC, everybody agree on the fact that it has to be reformed, empowered, etc.

And in fact we also consider that is the way: a way that however, it has not been, it is not, and it will not be easy, although not for this reason is not the way. Without a reform and real empowerment of the ECOSOC and its commissions and, with them the CSD, talking about IFSD or Global Sustainable Governance, is one more, talking about a chimera.

We are conscious that the topic is not new, and it has been longly debated and proposed, but still we consider the reform of the ECOSOC as a necessary step forward that has to be done and it will be done sooner or later. In relation to these topics the report that we are taking as a reference of the SG of the UN, says literally in the part III:

B. The broader framework

105. The General Assembly serves as the apex body for legislative outcomes on sustainable development. It also provides the forum for integrated consideration of issues related to the oceans, e.g. through the Regular Process for global reporting and assessment of the state of the marine environment, including socio-economic aspects, as recommended in the JPOI. The Economic and Social Council (ECOSOC) has the overall mandate to integrate the three pillars of sustainable development. ECOSOC, through its Annual Ministerial Review and linkages to the IFIs, has strengthened its integrative role.

106. The United Nations Commission on Sustainable Development (CSD) was established as the high-level body for the review and follow-up to the implementation of Agenda 21. While the central role of the Commission is widely acknowledged, concern has been expressed about lack of implementation of its policy decisions and its perceived weakness in driving the sustainable development agenda. However, the Commission has been a leading institution in the United Nations system with respect to the involvement of major groups, who engage actively and substantively in its work programme.

From our point of view the article 105 Play to the crowd that nobody that works on the institution and the topic can believe rather the reflection of the article 106 (stressed in bold) has to be extended also to the ECOSOC. From all this, our contribution within this context would be to propose:

In relation to the IFSD:

. Deep reform and real empowerment of the ECOSOC in relation to the social, environmental and economical governances and its umbrella role in relation to the financial and economical organizations (BWI), the other specialized agencies of the UN family and the main programmes and funds related to the ECOSOC topics. In this sense, and although it is a minor topic, the ECOSOC should change its name and switch to be named: Economical, Social and Environmental Council of the UN. With this simple denomination change the three sustainability pillars are, at least in conceptual terms, institutionally interrelated.

This proposal includes the ending up of the specific governing body paper that paradoxically the GA plays with some environmental issues (of course of great importance) like the oceans, that should also be included, coherently to our proposal, in the normative competences of the ECOSOC. Afterwards, as always in the UN, the GA exercises the final maximum normative power in all the topics that, either directly faces or are presented by the Councils of the organization themselves.

. Reform and empowerment of the CSD in relation, concretely, to the idea of becoming, within the ECOSOC, in the axis of the IFSD and the interrelation between the three pillars of sustainability.

In order to do so it is necessary a new conception and organization of the competences and the work of this commission. In conceptual terms and at the competences level it has to be the commission who faces (by its own initiative or as a result of the analysis and coordination of the other initiatives that emanate from the UN system) the

normative proposals of the topics related to the sustainable development in its triple dimension.

In order to avoid, from the beginning, that it is identify only with the environmental pillar of the sustainability, it is necessary that it has three subcommittees of organic style work:

- The social Subcommittee social in the sustainability context (that from our point of view it would also include the topics and attributions that already currently has the existent Commission for Social Development of the ECOSOC)
- The Environmental Subcommittee in the sustainability context (that essentially would assume, also among others, the topics and attributions that the CSD currently has)
- The Economical Subcommittee in the sustainability context

It is not even necessary to say that in this reform it is needed to conceive, organize and implement the flow and the coherence inter-bidirectional between the normative commissions (starting obviously from themselves) and the different operative instances of the UN system on these topics.

4.1.About the current possibility of the creation of a Special Group of experts on global financial and economical crisis and its effects on the development; about the role of the United Nations in the Global Economical Governance and the development, and our proposal of the creation of an economical subcommittee within the sustainability context.

In the same way that we understand the Social subcommittee within the sustainability context, as in fact, the adaptation of an already existing commission of the ECOSOC, taking now in consideration that the 66th period of sessions of the GA of the UN -that started in September of 2011- is the one that will be open during both, the preparation process and the execution process of Rio+20, it can be used to do something similar for the implementation of our proposal (quite critical, in fact) of the creation of the Economic Subcommittee in the sustainability context. Indeed, as a result of the financial and economical crisis that we are submerge since 2007, in the UN conference about this crisis that took place in June of 2009, among many other things there where doubts about the role of the UN itself about the world economical governance (a possible confrontation between G20-G192 or UN was discussed) and from all the proposal that came out from that conference (not many caused by the declared disagreement of the G20 countries), just one was left: the creation of a Panel of experts on financial and economical issues that would act as it in relation to the GA and the ECOSOC, with a similar conception to the paper that the Intergovernmental Panel on Climate Change IPCC, roles in relation with the governmental bodies of the United Nations Framework Convention on Climate Change, and that so good results brought So, in the last high level meeting of the ECOSOC (celebrated, as usual, during the last July) The E/2011/L.41 project of resolution was approved that, as it becomes preceptive it will have to be considered and, if proceeds, accepted within the 66th session of the GA of the UN, most probably during its period of maximum normative work: from September to December of the present 2011.

In the resolution process that will arrive to the GA, the ECOSOC says literally:

1. Affirms the need to examine the most efficient modalities to provide independent technical expertise and analysis on issues relating to the world financial and economic crisis and its impact on development, to be made available to the Economic and Social Council and the General Assembly, which could contribute to informing international action and political decision-making and to fostering constructive dialogue and exchanges among policymakers, academics, institutions and civil society;
2. Recommends, in that regard, that the possible establishment of an ad hoc panel of experts on the world economic and financial crisis and its impact on development should be further considered by the General Assembly, taking into account the outcomes of the various related processes, including the Ad Hoc Openended Working Group of the General Assembly to follow up on the issues contained in the Outcome of the Conference on the World Financial and Economic Crisis and Its Impact on Development, as well as the forthcoming deliberations in the Assembly on the role of the United Nations in global economic governance and development, and on the modalities of the financing for development follow-up process;
3. Requests the Secretary-General to explore options in that respect, taking into account the need to make full use of existing United Nations bodies, including the regional commissions, and to report to the General Assembly through existing reporting mechanisms.

Without going into details (since it is not the topic that we are discussing about) but trying to take advantage, once more, our support to the creation of this Panel (although all the weakening that the proposal is suffering in its legislative way within the UN), having observed that in the point 3 the ECOSOC asks to take in consideration its regional commissions that, are actually commissions in the economical sphere, we propose that this new body acts, at least at the beginning, as economical subcommittee in the context of sustainability, within the ECOSOC. Indeed we have been insisting in the interrelation of the three pillars of sustainability, and indeed, also the financial and economical crisis have reinforced again our vision when, in relation to it, strong energetic, alimentary and poverty crisis among others have manifest.

5. Proposals of transformation of the UNEP directed to the establishment of and operational global structure on the IEG field.

In the SG report that we have been using as reference, always referring to the part III, we can read literally (we added the under numbering):

#### C. Governance of the environmental pillar

111. A number of initiatives have explored options for strengthening international environmental governance (IEG), with a focus on UNEP. The consultative process launched by the UNEP Governing Council identified a number of system-wide responses to the shortcomings in the current system of IEG and also considered a number of institutional options for strengthening the environment pillar in the context of sustainable development.

Institutional options:

##### Enhancing UNEP (111.1)

Universal membership in the UNEP Governing Council (GC) universal (from current 58 members). No change to mandate and minimal financial implications. Some analysts conclude that broad and active participation in GC and Global Ministerial Environmental Forum (GMEF) of observer countries amounts to de facto universal membership.

Establishing a new umbrella organization for sustainable development (111.2) New institution exercising executive functions, possibly founded on existing intergovernmental and secretariat entities. It would enhance integration of sustainable development in the work of institutions covering economic, social and environmental pillars. Established by GA resolution or legal instrument.

Establishing a specialized agency such as a world environment Organization (111.3) Specialized agency based on the model of UN agencies such as WHO and FAO, which are hybrid normative and operational entities. It would be the global authority on the environment, providing policy guidance to other UN entities working on the environment and MEAs.

##### Reforming the United Nations Economic and Social Council and the United Nations Commission on Sustainable Development (111.4)

In relation to ECOSOC, possibilities that have been raised include strengthening the coordination of role of ECOSOC in relation to sustainable development, e.g. by establishing a sustainable development segment to engage more closely with the reports of the various functional commissions and entities such as UNEP. Another possibility

involves merging ECOSOC with CSD into a council on sustainable development. Mention has also been made of upgrading the CSD to a Sustainable Development Council, which could be achieved through a GA resolution.

Enhancing institutional reforms and streamlining existing structures (111.5) A consortium arrangement for environmental sustainability, headed by a high-level governing body. An instrument or set of instruments would structure relationship with existing institutions.

From our point of view, it is fully visible, once more, the usual and constant contradictions, already mentioned about the SG report and, so, keeps mixing IFSD and IEG issues, and normative and operative topics. On the other hand, in theory we are now on IEG issues and much more on operative than normative topics, as long as, at least until now, the UNEP is mainly an operative programme that works on the field. In reference to this, the 111.4. proposal would be linked, from our point of view, with the part 4 of our contributions document. We would like to precise here that when it is considered that the ECOSOC does not work properly (which is manifestly like this) it is good to remember that its main meetings during the July month each year, are organized through thematic segments. We do not think that adding another segment would be useful at all; maybe even to get worst. Switching from the ECOSOC to a Sustainable Development Council would need a high degree of maturity and audacity by the institution, in this case, maybe being ourselves a bit conservatives we would prefer the answer already expressed in the part 4 of the present document, which summarizes with the change of the denomination of the current council that would be named further on Economic, Social and Environmental Council.

We would take a similar position facing the 111.2. y 111.5 proposals, that would clearly fit better in the IFSD related proposals. We find them vague and specially hardly to be approved within the context of the organization and with a lot of probabilities, too many from our point of view, of making more complicated and make less efficient and effective the already existing instruments.

In summary, again, in relation to what it is, exactly, the IFSD we refer to our proposals defined in the point 4 of the present document.

We think that, finally, within the IEG the debate turns around the ways to enforce the UNEP as an instrument of this governance (it would be the proposal 111.1) or to carry out, truly, a deep reform of the UNEP that turns it, definitely, to the real instrument, with coordination attributions both normative -in the frame, in this case, of what outcomes from the ECOSOC and the GA and, also and mainly, from the MEAs in reference to the treaties and normative international agreements<sup>[9]</sup> and operational, becoming, in this case, the only and real axis of the IEG in all its operative elements.

We could say that we are proposing to opt for the proposal 111.3. of the creation of a new specialized agency of the UN family, that we would prefer to name: World Organization of environmental sustainability WESO. However, we cannot, neither want to stop here. This option, that we consider as correct, it always seems to us so, and only if, the proposals related to the reforms of the ECOSOC of the point 4 of our document are also carried out, and within the normative collaboration agreements between the GE, the ECOSOC, the MEAs, etc. and the new agency <sup>[10]</sup>WESO<sup>[11]</sup>. The UN is able to radically get out of the inefficiency and inefficacy frame of most of the existing agencies and, in contrast, incorporate those singular aspects that some of them have that, actually explain, from our point of view, their running, sometimes and very pertinent and positive, in other occasions.

Then for example, on one hand, we cannot create a new FAO that, actually, has ended up needing to be duplicate, specially in operational terms, through the UN World Food Programme. On the other hand, and specially in a theme in which the participation of stakeholders, through the main groups structure, is one of the engines that keeps more alive the most interesting dynamics of the environmental governance, we have to base then in the ILO model, in the moment to decide the conception of a new type agency, in which the participation of the stakeholders, both in its governance and operative, becomes one of its fundamental pillars. The new agency should be also engaged with the indispensable coordination of the environmental sustainable operatives at different territorial levels ((global, regional, national, subnational and local), what requires innovative approaches in terms of organization, structuring and implementation .

Our proposal that, we insist, can only be considered complementing the proposals of point 4, assumes, for example, that the new agency becomes the unitarian secretariat (not territorially concentrated) of all the current MEAs; only in this way it can be expected to really walk towards a coherent and effective management of them.

#### 5.1. Ab out the characteristics of the Agreement of the relations between the UN and the new specialized agency

The level of complexity (by itself, but adding the repetitions and overlapping, etc.) of the topics discussed in this contribution is so high, that the presented proposals will keep running bad in a very evident way if a key piece of the working order of the UN system it is not conceived and elaborated, in this case, with a special and singular gentleness.

If created a new specialized agency of the system, according to the UN Charter, it will have to proceed to elaborate and approve, by both parts, the agreement of relations between both.

The agreements that, according to the UN Charter, have to be signed by this one and the specialized agencies, is a figure and legal form, that for example and to stress its importance, can even be elaborated as it was made in the case of the Bretton Woods institutions transferring an almost total level of independence. This paragraph pretends to serve to reinforce and support all the mentions and petitions of revision and deep reform of this agreement between the UN and the Bretton Woods institutions. Then, the group of proposals presented in this contribution, are forecasting and assuming, without any doubt, a relation agreement that, from the most political point of view, have to state explicitly, very clearly, their own and relative competences ranges, and their levels of real coordination; among other aspects and just to enumerate specifically some of the ones that we consider more important, this agreement should clearly establish:

- a) What are the limits of the normative competences of the new ECOSOC with some of its new commissions and where do the normative competences of the new agency start.
- b) The coordination mechanisms and shared work, specially, referring to the border limits of the normative capacities and overlapping between different bodies.
- c) In the same way, there will have to be defined, in a very transparent process, the relations between the normative capacities of the new agency itself, with the current MEAs structure, as long as the new agency have been propose to exercise the coordination, at least, of their secretariats
- . d) Both at the level of the normative developments within the MEAs, and in order to stress the role of coordinator that we propose the new agency performs in relation to them -at least with regard to the secretariats of the MEAs-, it is fundamental that the agreement between the UN and the new agency defines, concretely and clearly, the levels of coordination in reference to the implementation on field.

#### 6. Proposals of extraordinary political actions of Rio+20 in relation to the UNFCCC (United Nations Framework Convention on Climate Change)

Getting out, for first time, of the SG report that we have used as reference in order to present out our contributions and proposals, we believe the world lives a situation of extraordinary importance that, sue to origin and topic, Rio+20 cannot obviate. We are talking, of course, about the climate crisis. The Earth Conference of Rio 1992, among many and important results, approved the UN Framework Convention of Climate Change UNFCCC. The convention, as an international agreement that is, entered into force two years after and nowadays it has been ratified almost all the UN member states (we cannot say the same, about the Kyoto protocol that arises from this convention).

The consideration of this topic as an international agreement brings as consequence that its governing body is performed through its own regulate bodies that, although are

approved or ratified by the GA of the UN, have singularities and specificities that, as another MEA, is are bringing humanity to deadlocks.

It is well known that after the report of the Intergovernmental Panel on Climate Change IPCC of 2007, the Plan of action of Bali, approved in the island the same year, by the maximum governing body of the conference (the conference of the Parts COP -Signing parts of the agreement-, in its 13th annual session), pretended that in its 15th annual session, that would take place in Copenhagen in 2009, the bases of Global fight action against the climate change that, currently, threatens by causing an increase of the average surface earth temperature of between 2 and 6°, depending of the level of mitigation achieved, or not, in CO2 emissions.

It is absolutely known the big failure of Copenhagen and, the most important fact is that neither in Cancun in 2010 or in Durban 2011, there have been the necessary political conditions in order to draw the necessary action plan. The pessimism facing Durban is based in a lot of facts, one of the most fundamental and evident: the North American presidential elections in 2012.

Well then, from our point of view, the deadlock situation of the international climatic negotiations it is so obstruct and serious, that the Conference of Rio+20, 20 years after Rio 92 where the climate change topic was firstly approached and took action on it, the conference has to take again the initiative and has to get ready to approach a new special topic within the conference of Rio+20 that, essentially, has to pretend and achieve decisions about the following key aspects:

a) The governance and the decision making system of the COPs of the UNFCCC; being conscious that one of the reasons for being in a deadlock in the negotiations, lies in the fact that the COP has been unable, until the present date, to approve, within its regulations, a decision making system -in other words, a voting system<sup>[1]</sup> of the conference: our proposal is that Rio+20 makes the necessary modifications in the regulations of the COP of the UNFCCC; on one hand, expanding its composition to members of the IPCC and main groups, and on the other hand and essential, deciding the needed ample majorities in order to make possible decision making, that due to the risk for human life and planet as we know it, would have to be binding for all the parts.

b) Rio+20 has to establish also, already, which are the main objectives that the Convention has to face immediately; the concrete unavoidable goals that have to be achieved both in 2025 as in 2050; and sanction, for the last deadline, in which the emissions reduction in reference to 2050, has to be of the 50% (90% in the case of developed countries) as the IPCC proposals.

Aportaciones para el documento de compilación (que servirá de base para la preparación de un borrador provisional del documento final), como respuesta a la invitación del Segundo Comité Preparatorio de la CNUDS 2012/Rio+20

0. Aportación de la apGDM WDGpa: sobre el contenido general y, específicamente, acerca del Marco Institucional para el Desarrollo Sostenible, MIFS IFSD

1. Elementos referenciales de la aportación

2. El tema del "Marco Institucional para el Desarrollo Sostenible, MIDS IFSD" en el contexto de los objetivos de la conferencia

3. Marco Institucional para el Desarrollo Sostenible, IFSD, y Gobernanza Ambiental Global o Internacional, GAI IEG: importantes confusiones y contradicciones conceptuales y políticas

4. Propuestas de Reformas del ECOSOC encaminadas a la verdadera conformación de un IFSD al nivel normativo global de la gobernanza del desarrollo sostenible

4.1. Sobre la posibilidad actual de creación de un "Grupo especial de expertos en la crisis financiera y económica mundial y sus efectos sobre el desarrollo"; sobre la función de las Naciones Unidas en la gobernanza económica mundial y el desarrollo, y nuestra propuesta de subcomisión económica en el contexto de la sostenibilidad

5. Propuestas de transformaciones del PNUMA UNEP encaminadas a establecer una estructura operacional global en el ámbito de la IEG

5.1. Sobre las características del "Convenio de relaciones entre las NNUU y la nueva agencia especializada"

6. Propuestas de actuaciones políticas extraordinarias de Rio+20 en relación a CMNUCC UNFCCC (Convención Marco de NNUU sobre el Cambio Climático)

0. Aportación de la apGDM WDGpa: sobre el contenido general y, específicamente, acerca del marco institucional para el desarrollo sostenible, MIDS IFSD

Nuestra joven y pequeña asociación catalana, en la que sin embargo trabajan conjuntamente personas con largas y diversas tradiciones y aptitudes vinculadas al campo de la gobernanza democrática mundial, no puede más que aplaudir la invitación del Segundo Comité Preparatorio de la Conferencia Rio+20 y, por supuesto, reflexionar, conformar y transmitir a NNUU, con humildad pero también con gran convencimiento, sus aportaciones al proceso preparatorio político de la Conferencia. Como asociación que, de acuerdo con su propia denominación, tiene como objetivo fundamental, ante los grandes desafíos actuales, trabajar en la dirección de construir un verdadero sistema de Gobernanza Democrática Mundial, contribuiremos fundamentalmente, en este contexto hacia a Rio+20, sobre uno de los temas básicos sobre los que se asienta la conferencia para alcanzar sus objetivos: el del "Marco Institucional para el Desarrollo Sostenible, IFSD".

Entendiendo justamente que los objetivos y contenidos generales de la Conferencia tienen en este tema el reto fundamental ante el cual clarificar la situación, dibujar realmente un marco y definir el camino para su construcción.

Para caminar, decidida y efectivamente, hacia un desarrollo verdaderamente sostenible, que incluya ineludiblemente la erradicación de la pobreza en un mundo globalizado, es preciso que la Gobernanza Democrática al nivel global sea la primera en estar a la altura de las circunstancias. De ahí la especificación y orientación de nuestras reflexiones y aportaciones.

Si encuadramos este párrafo -que puede ser considerado como una especie de propuesta 0 por nuestra parte- es precisamente para hacer notar que siempre que consideremos que estamos realizando propiamente una propuesta la dejaremos encuadrada de esta forma.

1. Elementos referenciales de la aportación

Hemos optado por realizar nuestras reflexiones y aportaciones no sobre un blanco virginal ni sobre un negro inabarcable debido a las interesantes e innumerables aportaciones que, afortunadamente, se están construyendo y realizando ya. Hemos elegido como elemento referencial de nuestro trabajo el informe previo oficial de más significación en el estado actual del camino hacia la conferencia: el Informe del Secretario General de las Naciones Unidas para, precisamente, la reunión del Segundo Comité Preparatorio de la Conferencia realizado el pasado mes de marzo de 2011. Informe que se presentó conjunta y complementariamente con el primer documento de síntesis basado en las respuestas de los estados miembros, los grupos principales y los organismos de las propias Naciones Unidas a la primera invitación recibida a participar activamente en la preparación de la Conferencia en el momento de su convocatoria por parte de la AG de las NNUU.

## 2. El tema del "Marco Institucional para el Desarrollo Sostenible, IFSD" en el contexto de los objetivos de la conferencia

En el sumario del informe mencionado podemos leer, textualmente, lo siguiente (los subrayados y las negritas de citas textuales serán siempre nuestros): En el presente informe se examinan los dos temas de la Conferencia de las Naciones Unidas sobre el Desarrollo Sostenible —la economía ecológica en el contexto del desarrollo sostenible y la erradicación de la pobreza, y el marco institucional para el desarrollo sostenible— en relación con el objetivo del compromiso político renovado en favor del desarrollo sostenible, evaluando los avances logrados y las lagunas en la aplicación y haciendo frente a las nuevas dificultades que están surgiendo. El punto de partida es el reconocimiento de que el desarrollo sostenible, con sus tres pilares reforzados y que se refuerzan mutuamente, ha sido el objetivo general de la comunidad internacional desde la Conferencia de las Naciones Unidas sobre el Medio Ambiente y el Desarrollo celebrada en Río de Janeiro en 1992. Así, la cuestión que se plantea es de qué manera la atención prestada a esos dos temas puede contribuir a acelerar los avances en el programa de desarrollo sostenible.

Y ya en el texto del informe del SG en la parte III, en el apartado A, se dice, siempre textualmente,

### A. Enfoques dirigidos a reforzar el marco institucional para el desarrollo sostenible

91. El marco institucional para el desarrollo sostenible abarca un conjunto de organismos, organizaciones, redes y arreglos con distinto grado de oficialidad que participan en actividades de formulación o ejecución de políticas. Dicho marco debe considerarse en los planos local, nacional, regional e internacional. A escala mundial, dentro del marco institucional ha habido un crecimiento espectacular en el número de instituciones y acuerdos, existiendo actualmente más de 500 acuerdos medioambientales multilaterales. Por lo tanto, se ha ampliado sustancialmente el alcance de la gobernanza en materia de desarrollo sostenible. Sin embargo, el continuo deterioro de los recursos naturales, las amenazas a los ecosistemas, los efectos del cambio climático a nivel mundial y la pobreza persistente plantean dudas sobre su eficacia. Se considera que el panorama institucional internacional está fragmentado y presenta una configuración de regímenes e instituciones compartimentada, con la consiguiente falta de coherencia y coordinación.

Un artículo, a nuestro parecer, más importante de lo que quizás pueda considerarse inicialmente.

Probablemente cuando el secretario general habla de "un conjunto de organismos, organizaciones, redes y arreglos... que participan en actividades de formulación o ejecución de políticas", nosotros podríamos relacionarlo con una posible definición de lo que sería el sistema de gobernanza mundial para el desarrollo sostenible. Sin embargo, como sucede tantas veces, después el secretario general pondrá como gran ejemplo de ello los "500 acuerdos medioambientales multilaterales, AMM MEAs", llegando a la conclusión que ello "ha ampliado sustancialmente el alcance de la gobernanza en materia de desarrollo sostenible", cometiendo así una primera e importante contradicción interna en el texto (por otra parte tan habitual durante ya tantos años y en tantos textos y referencias de NNUU) que es la de identificar "medioambiental" con "sostenible". Afortunadamente, en este caso el propio SG se habría cuidado, en el resumen recogido al principio de este apartado, de poner en evidencia las que serán también sus propias contradicciones conceptuales al respecto cuando dice: "El punto de partida es el reconocimiento de que el desarrollo sostenible, con sus tres pilares reforzados y que se refuerzan mutuamente, ha sido el objetivo general de la comunidad internacional".

También creemos que entra en otra importante contradicción cuando afirma que con los "500 acuerdos medioambientales multilaterales" "se ha ampliado sustancialmente el alcance de la gobernanza". No hay duda de que, actualmente, tenemos un nivel normativo, en lo medioambiental, muy amplio y que debería permitirnos implementar una buena y muy necesaria gobernanza medioambiental. Pero otra cosa es que haya sido y sea así, o más bien al contrario, como opinamos nosotros y muchos actores relevantes en estos temas. La gobernanza de estos acuerdos, por lo que se refiere a su implementación, puede calificarse como de extremadamente precaria y a veces inexistente- y, precisamente, faltada sobretodo de un verdadero Marco Institucional para el Desarrollo Sostenible, IFSD, que, entre otras cosas, permita avanzar realmente en la gobernanza, debida e imprescindiblemente coordinada en la mayoría de los casos, de dichos acuerdos.

Volviendo a la primera y fundamental contradicción identificada: efectivamente, más desde Johannesburgo que de Río, la constatación de que los pilares sociales, ambientales y económicos son inseparables y constituyen la esencia misma del camino hacia el desarrollo sostenible, es como mínimo una referencia incuestionable e incuestionada, aunque nunca se tarde más de alguna línea en contradecirlo, en prácticamente todos los contextos, como acabamos de constatar otra vez en el texto del SG.

Tal vez por ello debamos volver a escribir, y proponer para el proceso de la conferencia y para la conferencia misma, que siempre se considere, explícitamente, el desarrollo sostenible como aquel desarrollo socialmente deseable (la sociedad debe decidir cómo quiere, y puede, vivir en cada momento histórico en el planeta), ambientalmente compatible (el planeta tierra, como mínimo por el momento, es la única casa que tiene la humanidad y no puede destruirla irreversiblemente sino quiere hipotecar irremediamente el futuro de la vida de la humanidad en el planeta) y económicamente factible (porque siempre será necesario continuar distribuyendo y asignando recursos -siempre escasos- para satisfacer las necesidades -que no pueden ser ilimitadas- que permitan el desarrollo socialmente deseable que, por supuesto, no puede convivir con las lacras de las grandes pobreza actuales). Y que nunca, apresuradamente, se contemple solo y de forma aislada el tema medioambiental cuando nos refiramos al desarrollo sostenible. Nuestra insistencia en este punto podría parecer excesiva; pero como se comprobará a continuación no lo es en absoluto. La parte III del informe del SG de las NNUU tiene el siguiente índice:

### III. Marco institucional para el desarrollo sostenible, MIDS IFSD

#### A. Enfoques dirigidos a reforzar el marco institucional para el desarrollo sostenible

#### B. El marco más amplio

#### C. Gobernanza del pilar medioambiental

#### D. Gobernanza de los pilares económicos y sociales

A primera vista podría parecer que padecemos de un defecto de exageración maniquea; pero lo cierto es que el apartado D es prácticamente irrelevante tanto a nivel de "extensión" (menos de una página del informe) como sobretodo de análisis y ya no digamos de propuestas, mientras que, gran parte del enfoque del apartado B y, por supuesto, todo el apartado C hacen referencia de hecho, y únicamente, al que hemos identificado como el pilar medioambiental y, por la tanto, a la problemática correspondiente: tan "vieja" como la primera de las denominadas conferencias ambientales de las NNUU -la de Estocolmo en el 1972- en la que, entre otras cosas se creará el PNUMA UNEP y se empezará a hablar, por lo tanto, de la Gobernanza Ambiental Internacional o Global, GAI IEG.

De tal manera que a pesar de que no figura ni en el objetivo, ni en los temas ni en las premisas básicas de lo que se pretende que sea Río+20, hay un enorme peligro de que gran parte del proceso preparatorio de la conferencia y de la propia conferencia acabe hablando solo (y a nuestro parecer muy equivocadamente) de IEG y prácticamente ni aborde el IFSD! Por ello, debemos proponer que esto se evite a toda costa.

### 3. Marco Institucional para el Desarrollo Sostenible, MIDS IFSD, y Gobernanza Ambiental Global o Internacional, GAI IEG: importantes confusiones y contradicciones conceptuales y políticas

En sintonía con nuestra alerta anterior nuestra principal aportación y/o propuesta a este nivel es la de que se explicita especialmente que el segundo gran tema de la conferencia son -deben ser-, en realidad, dos grandes subtemas: a) el del Marco Institucional para el Desarrollo Sostenible, IFSD, en la dirección de construcción de una

verdadera y efectiva Gobernanza Sostenible Global; b) el de, concretamente, la Gobernanza Ambiental internacional o Global, IEG, como reforma y reconstrucción de esta gobernanza pero, precisamente, como parte incluida dentro de la Gobernanza Sostenible Global anterior, parejamente a las Gobernanzas Sociales y Económicas que, como conjunto tripartito define bidireccionalmente el IFSD.

Rio+20 no puede prepararse ni realizarse sin desterrar la eterna confusión y contradicción -o mejor dicho, reducción a- entre lo ambiental y lo sostenible. Lo ambiental no será sostenible o insostenible en sí mismo, sino en función de lo que social y/o económicamente interactuemos con el medioambiente.

Desde nuestro punto de vista, y admitiendo como lógico que la IEG no tiene aún, como lo pueden tener los temas sociales y económicos en, por ejemplo, el ECOSOC, unos espacios y tiempos (unas realidades normativas y otras aplicativas/operativas), tan explicitadas como en los temas sociales y económicos, nos parece lógico y oportuno que tenga un espacio privilegiado en el marco de Rio+20, pero sin confundirlo -y casi identificarlo únicamente- con el conjunto de la Gobernanza Sostenible Global ni aislándolo, de ninguna manera, de las Gobernanzas de los temas sociales y económicos.

En este sentido, un índice que evitase confusiones, contradicciones y simplificaciones fuera de todo sentido proponemos que, por lo que se refiere a este segundo tema de la conferencia, tuviese una estructura conceptualmente ineludible del siguiente tipo:

. Marco Institucional para el Desarrollo Sostenible, IFSD, y/o Gobernanza Sostenible Global

Gobernanza Social Global en el contexto de la sostenibilidad

Gobernanza Ambiental Global, IEG, en el contexto de la sostenibilidad

Gobernanza Económica Global en el contexto de la sostenibilidad

4. Propuestas de Reformas del ECOSOC encaminadas a la verdadera conformación de un IFSD al nivel normativo global de la gobernanza del desarrollo sostenible

En NNUU, la autoridad normativa fundamental reside en la AG pero se comparte o se especializa o se prepara, a nivel temático y de procedimiento, en los Consejos. Dejando aparte el Consejo de Seguridad, está claro que la experiencia que se está viviendo con el nuevo -y de hecho todavía provisional- Consejo de DDHHes una de las más exitosas y esperanzadoras a nivel de lo que supone NNUU como instrumento de Gobernanza Mundial. Poco se cuestiona que Paz y Seguridad y Derechos Humanos, entre otros, sean temas de NNUU. En cambio, el origen del otro Consejo, el ECOSOC (Consejo Económico y Social), está íntimamente relacionado con, precisamente, el cuestionamiento generalizado de dónde reside, por ejemplo, la gobernanza económica mundial. Pero también es cierto que de forma parcial, y también contradictoria, a medida que los temas ambientales han ido saliendo históricamente a la palestra, algunos de ellos han ido a parar a las manos del ECOSOC.

En la medida en que la Carta de NNUU define el ECOSOC en términos siempre condicionales (podrá: realizar estudios, hacer recomendaciones, coordinar el trabajo de agencias, etc.) y que los convenios a los que se llegó en lo que concierne a la relación entre las NNUU y, particularmente, las Instituciones de Bretton Woods (IBW- BWI), definieron a estas últimas como agencias especializadas independientes de NNUU, aquello que podríamos entender como gobernanza económica global se asentó, y así sigue, en el FMI y el BM (las dos principales BWI). Y los subsiguientes G5, G7 y G8 (tal vez en un futuro el G20, aunque no lo creemos así), como accionistas principales de estas instituciones, han venido siendo, a través de dichas BWI, los gobernantes económicos mundiales.

Desde el origen de las propias NNUU, no hay una reforma más citada y reclamada -y menos realmente abordada- que la reforma del ECOSOC, por un lado, y de su relación con las BWI, por el otro.

De momento y, sobretodo en este caso, desde la Cumbre de Rio, y reforzándose después en la Cumbre de Johannesburgo, algunos temas ambientales -como ya hemos dicho-, desde un punto de vista normativo, se han trasladado al contexto del ECOSOC con la creación en Rio de la Comisión de Desarrollo Sostenible (CDS CSD), como comisión específica del ECOSOC. En la medida, sin embargo, que Rio apostara también por la vía de los tratados y los acuerdos multilaterales específicos alrededor de temas ambientales clave (cambio climático, biodiversidad, desertificación, etc.; los AMMs- MEAs) con órganos de gobierno, en la mayoría de ocasiones, ad hoc, la CSD tampoco ha dado los frutos deseados. Nunca ha sido capaz de salirse del pilar ambiental de la sostenibilidad, no ha tenido ninguna capacidad de siquiera coordinar el tema de los MEAs y, por lo que se refiere a los fondos económicos, el Banco Mundial (BM WB) la ha apantallado casi totalmente con la creación en su día y en su seno del Fondo Ambiental Global (FAG GEF). Por lo tanto, pasa con la CSD como con el ECOSOC: todo el mundo está de acuerdo en que hay que reformarla, empoderarla, etc.

Y de hecho también nosotros consideramos que este es el camino; un camino que, sin embargo, no ha sido, no es, ni será fácil pero que no por ello dejará de ser el camino.

Sin una reforma en profundidad y un empoderamiento real del ECOSOC y de sus comisiones y, entre ellas, de la CSD, hablar de IFSD o de Gobernanza Sostenible Global será hablar, una vez más, de una quimera. Apostemos por aquel refrán español que dice "tanto va el cántaro a la fuente que al final se rompe", e interpretándolo a nuestro favor en sentido contrario, asumamos que de tanto hablar de la reforma del ECOSOC y de la CSD, etc. al final la conseguiremos.

Con relación a estos temas el informe que estamos siguiendo como referencia del SG de las NNUU, en su parte III, dice textualmente:

B. El marco más amplio

105. La Asamblea General es el órgano principal en materia de resultados legislativos relativos al desarrollo sostenible. También sirve de foro para el examen integrado de las cuestiones relativas a los océanos, por ejemplo mediante el proceso ordinario de presentación de informes y evaluación del estado del medio marino a escala mundial, incluidos los aspectos socioeconómicos, tal como se recomienda en el Plan de Aplicación de las Decisiones de Johannesburgo. El Consejo Económico y Social tiene encomendado el mandato general de integrar los tres pilares del desarrollo sostenible. El Consejo, gracias a su examen ministerial anual y sus vínculos con las instituciones financieras internacionales, ha reforzado su papel integrador (véase A/61/583).

106. La Comisión sobre el Desarrollo Sostenible es la máxima instancia para la revisión y seguimiento de la ejecución del Programa 21. Si bien se reconoce ampliamente el papel fundamental que cumple la Comisión, se ha expresado preocupación por la escasa aplicación de sus decisiones normativas y sus presuntas deficiencias a la hora de impulsar el programa de desarrollo sostenible. Sin embargo, la Comisión ha asumido un papel de liderazgo dentro del sistema de las Naciones Unidas en lo que respecta a la participación de los grupos principales, que colaboran de manera activa y sustantiva en su programa de trabajo.

A nuestro entender el artículo 105 es un brindis al sol que nadie que conozca la institución y el tema puede creerse en absoluto. Más bien debe extenderse la reflexión crítica (destacada en negritas) del artículo 106 también al ECOSOC. A partir de todo ello, nuestra aportación en este contexto sería proponer: En relación al IFSD:

. Reforma en profundidad y empoderamiento real del ECOSOC en relación a las gobernanzas sociales, ambientales y económicas y a su papel de paraguas en relación a las organizaciones financieras y económicas (las BWI), las demás agencias especializadas de la familia de las NNUU y los programas y fondos principales de NNUU relacionados con los temas propios del ECOSOC. En este sentido, y aunque sea un tema menor, el ECOSOC debería cambiar de nombre y pasar a denominarse: Consejo Económico, Social y Ambiental de las NNUU. Con este simple cambio de denominación los tres pilares de la sostenibilidad ya están, como mínimo de forma conceptual, interrelacionados institucionalmente.

Esta propuesta incluye acabar con el papel de órgano de gobierno específico que, a nuestro entender, paradójica y especialmente juega la Asamblea General, AG, ante algunos temas ambientales (cierto que de especial importancia) como el de los océanos que también debería entrar, coherentemente con nuestra propuesta, en el ámbito de competencias normativas del ECOSOC. Después, y como siempre en NNUU, la AG tiene el máximo poder normativo final en todos los temas que, o bien afronte directamente, o bien le vengan presentados por los propios Consejos de la organización.

. Reforma y empoderamiento de la CSD en relación, específicamente, a convertirse, dentro del ECOSOC, en el centro de gravedad del IFSD y de la interrelación entre los tres pilares de la sostenibilidad.

Para ello es necesaria una nueva concepción y organización de las competencias y del trabajo de esta comisión. Conceptualmente y a nivel de las competencias debe ser la comisión que aborde (por iniciativa propia o/y como resultado del análisis y la coordinación de los otras iniciativas que emanen del sistema de NNUU) las propuestas normativas de los temas relacionados con el desarrollo sostenible en su triple dimensión.

Para evitar, de entrada, que se identifique solamente con el pilar medioambiental de la sostenibilidad, es necesario que tenga tres subcomisiones de trabajo orgánico: la subcomisión social en el contexto de la sostenibilidad (que a nuestro entender comprendería también los temas y atribuciones que tiene actualmente la ya existente Comisión de Desarrollo Social del ECOSOC) la subcomisión ambiental en el contexto de la sostenibilidad (que esencialmente asumiría también, entre otros, los temas y atribuciones que ya tiene actualmente la actual CSD) la subcomisión económica en el contexto de la sostenibilidad

No habría ni que decir que dentro de esta reforma hay que concebir, organizar e implementar el flujo y la coherencia inter-bidireccional entre estas comisiones normativas (empezando por supuesto por ellas mismas) y las distintas instancias operativas del sistema de NNUU en estos temas.

4.1. Sobre la actual posibilidad de creación de un "Grupo especial de expertos en la crisis financiera y económica mundial y sus efectos sobre el desarrollo"; sobre la función de las Naciones Unidas en la gobernanza económica mundial y el desarrollo, y nuestra propuesta de subcomisión económica en el contexto de la sostenibilidad

Del mismo modo que entendemos la subcomisión social en el contexto de la sostenibilidad como, de hecho, la adaptación-principalmente por ampliación de competencias- de una comisión ya existente en el ECOSOC, teniendo en cuenta ahora que el 66 período de sesiones de la AG de NNUU -que acaba de empezaren setiembre de 2011- es el que estará abierto en todo el proceso tanto de preparación como de realización de Rio+20, puede aprovecharse para hacer algo similar para implementar nuestra propuesta (bien importante, por cierto) de creación de la subcomisión económica en el contexto de la sostenibilidad.

Efectivamente, a raíz de la crisis financiera y económica en la que estamos inmersos desde el año 2007, en una Conferencia de NNUU sobre esta crisis, celebrada en junio del 2009, entre muchas otras cosas se cuestionó el propio papel de las NNUU en la gobernanza económica mundial (se habló de una posible confrontación política G20 G192 o NNUU) y, de entre las propuestas que salieron de aquella conferencia (pocas por el desacuerdo manifiesto de los países del G20), quedó una: la de la creación de un Panel de Expertos en temas Financieros y Económicos que actuaría como tal en relación a la AG y al ECOSOC, en una concepción más o menos simétrica a la del papel que juega el Panel Intergubernamental sobre el Cambio Climático en relación a los órganos de la Convención Marco de las Naciones sobre el Cambio Climático y que tan buenos resultados ha dado en aquel contexto. Pues bien, en la última reunión de alto nivel del ECOSOC (celebrada como es habitual durante el pasado mes de julio) se aprobó el Proyecto de Resolución E/2011/L.41 que, como es preceptivo deberá considerarse y, si procede, aprobarse en la 66 sesión de la AG de las NNUU, muy probablemente en su período de máximo trabajo normativo: de setiembre a diciembre de este 2011.

En el proyecto de resolución que llegará a la AG, el ECOSOC dice textualmente:

1. Afirma la necesidad de examinar las modalidades más eficientes de aportar un análisis y conocimientos técnicos independientes sobre las cuestiones relacionadas con la crisis financiera y económica mundial y sus efectos en el desarrollo, que se facilitarían al Consejo Económico y Social y la Asamblea General, lo que podría contribuir a informar la acción internacional y la adopción de decisiones políticas y a fomentar un diálogo e intercambios constructivos entre los encargados de formular las políticas, los círculos académicos, las instituciones y la sociedad civil;

2. Recomendando, a ese respecto, que la Asamblea General siga considerando la posibilidad de establecer un grupo especial de expertos en la crisis económica y financiera mundial y sus efectos en el desarrollo, teniendo en cuenta los resultados de los diversos procesos conexos, incluido el Grupo de Trabajo Especial de composición abierta de la Asamblea General para el seguimiento de las cuestiones que figuran en el documento final de la Conferencia de las Naciones Unidas sobre la crisis financiera y económica mundial y sus efectos en el desarrollo, así como las próximas deliberaciones que se efectuarán en la Asamblea sobre la función de las Naciones Unidas en la gobernanza económica mundial y el desarrollo, y las modalidades del proceso de seguimiento de la financiación para el desarrollo;

3. Solicita al Secretario General que estudie opciones al respecto, teniendo en cuenta la necesidad de aprovechar plenamente los órganos de las Naciones Unidas existentes, incluidas las comisiones regionales, y que informe de ello a la Asamblea General a través de los mecanismos vigentes de presentación de informes.

Sin entrar en más detalles (puesto que no es el tema que nos ocupa) pero sin dejar de aprovechar, una vez más, nuestro apoyo a la creación de este Panel (muy a pesar de las debilitaciones que está sufriendo la propuesta en su paso legislativo dentro de NNUU), habiendo observado, por ejemplo, que en el punto 3 el ECOSOC pide que se tengan en cuenta sus comisiones regionales que, precisamente, lo son en el ámbito económico, nosotros proponemos que este nuevo ente pase a actuar también, como mínimo inicialmente, como subcomisión económica en el contexto de la sostenibilidad, dentro del ECOSOC. No en vano hemos venido insistiendo en la interrelación de los tres pilares de la sostenibilidad y no en vano, tampoco, la crisis financiera y económica nos ha reforzado otra vez esta visión cuando, en relación a ella, se han manifestado fuertes crisis energéticas, alimentarias, de pobreza, etc.

5. Propuestas de transformaciones del PNUMA UNEP encaminadas a establecer una estructura operacional global en el ámbito de la IEG

En el informe del SG que venimos siguiendo como referencia, siempre dentro de su parte III, podemos leer textualmente (la subnumeración de las opciones es nuestra):

#### C. Gobernanza del pilar medioambiental

111. En el marco de algunas iniciativas se han considerado opciones para reforzar la gobernanza medioambiental internacional, prestando especial atención al PNUMA. En el proceso de consultas puesto en marcha por el Consejo de Administración del PNUMA se identificó una serie de respuestas a nivel de todo el sistema para subsanar las deficiencias del sistema actual de gobernanza medioambiental internacional y se sopesó también una serie de opciones institucionales para reforzar el pilar medioambiental en el contexto del desarrollo sostenible.

#### Opciones institucionales

Fortalecimiento del PNUMA (111.1) Composición universal del Consejo de Administración del PNUMA (actualmente cuenta con 58 miembros). Sin modificaciones al mandato y con mínimas consecuencias financieras. Algunos analistas consideran que la participación amplia y activa de países observadores en el Consejo de Administración y en el Foro Ministerial Mundial sobre el Medio Ambiente equivale a una composición universal de facto.

Establecimiento de una nueva organización coordinadora para el desarrollo sostenible (111.2 Nueva institución con funciones ejecutivas, posiblemente basada en entidades

intergubernamentales y de secretaría existentes. Esta institución fomentaría la incorporación del desarrollo sostenible en la labor de las instituciones encargadas de los pilares económicos, sociales y medioambientales, y sería establecida por resolución de la Asamblea General o por instrumento jurídico.

Creación de un organismo especializado, como, por ejemplo, una organización medioambiental mundial (111.3) Organismo especializado basado en el modelo de organismos de las Naciones Unidas como la Organización Mundial de la Salud (OMS) y la FAO, entidades híbridas de carácter normativo y operacional. Se trataría de la autoridad mundial en materia de medio ambiente y proporcionaría orientación normativa a otras entidades de las Naciones Unidas que trabajan en ese ámbito y a los acuerdos medioambientales multilaterales.

Reforma del Consejo Económico y Social y de la Comisión sobre el Desarrollo Sostenible (111.4.)

En relación con el Consejo Económico y Social, entre las posibilidades planteadas cabe mencionar el fortalecimiento de la función de coordinación del Consejo en relación con el desarrollo sostenible, por ejemplo estableciendo un "segmento de desarrollo sostenible" para examinar con mayor detenimiento los informes de las diversas comisiones y entidades orgánicas, como el PNUMA. También se podría fusionar el Consejo Económico y Social con la Comisión sobre el Desarrollo Sostenible, creando así un consejo de desarrollo sostenible. Se mencionó asimismo la posibilidad de dotar de mayor categoría a la Comisión, que pasaría a denominarse consejo de desarrollo sostenible, pudiendo esto lograrse por medio de una resolución de la Asamblea General.

Afianzamiento de las reformas institucionales y racionalización de las estructuras existentes (111.5.)

Modalidad de consorcio para la sostenibilidad medioambiental, dirigido por un órgano rector de alto nivel. Un instrumento o conjunto de instrumentos articularía la relación con las instituciones existentes.

Desde nuestro punto de vista, es del todo observable a priori que se repiten, una vez más, las contradicciones habituales y constantes ya comentadas del informe del SG y, así, se va de un lado a otro "intercambiando mezclando" temas de IFSD con temas de IEG y temas normativos con temas operativos. En cambio, teóricamente estaríamos ahora en temas de IEG y mucho más operativos que normativos en la medida que, como mínimo de momento, el PNUMA UNEP es un programa de NNUU de carácter principalmente operativo sobre el terreno.

En este sentido la propuesta 111.4. estaría relacionada para nosotros con el apartado 4 de este nuestro documento de aportaciones. Precisar aquí solamente que cuando se considera que el ECOSOC funciona mal (lo cual es manifestamente así) es bueno recordar que sus reuniones principales de los meses de julio de cada año funcionan a través de "segmentos temáticos". No creemos que añadirle otro segmento sirva prácticamente para nada; tal vez para empeorarlo. Pasar del ECOSOC a un Consejo de Desarrollo Sostenible supone tal grado de madurez y osadía por parte de la institución que, en este caso, pecaremos nosotros de conservadores y preferiremos la propuesta que ya hemos planteado en el apartado 4 de este documento que, recordemos, se resumiría aquí, para no repetiros, en el cambio de denominación del consejo que pasaría a llamarse y a actuar de Consejo Económico, Social y Ambiental.

Nos situaríamos en una posición parecida ante las propuestas 111.2. y 111.5, que claramente se inscribirían más en lo que serían propuestas relativas al IFSD. Las encontramos vagas y sobretodo muy difícilmente aprobables en el seno de la organización y con muchísimas, demasiadas para nosotros, probabilidades de que aún complicaran e hicieran menos eficientes y eficaces los instrumentos existentes.

En definitiva, otra vez, en relación a lo que es, propiamente, el IFSD nos remitimos a nuestras propuestas presentadas en el apartado 4 de este nuestro documento.

Creemos que, finalmente, en el contexto de la IEG el debate gira en torno a las maneras de fortalecer el PNUMA-UNEP como instrumento de esta gobernanza (sería la propuesta 111.1) o a realizar, verdaderamente, una reforma profunda del mismo que lo convierta realmente en el instrumento, con atribuciones de coordinación tanto normativas -en el marco, en este caso, de lo que emane del ECOSOC y de la AG y, también y muy principalmente, de los MEAs cuanto a tratados y acuerdos internacionales normativos se refiere- como operativas, transformándose, en este caso, en el centro de gravedad real y único de la IEG en todos sus elementos operativos.

Podríamos decir que estamos proponiendo optar por la propuesta 111.3. de creación de una nueva agencia especializada de la familia de las NNUU, que nosotros preferiríamos llamar: Organización Mundial de la Sostenibilidad Medioambiente, OMSM-WESO. Sin embargo, no queremos ni podemos pararnos aquí. Esta opción, que nos parece la correcta, solo nos lo parece si, y solo si, las propuestas relativas a las reformas del ECOSOC del apartado 4 de nuestro documento también se llevan a cabo, y en los convenios de colaboración normativos entre la AG, el ECOSOC, los MEAs, etc. y la nueva agencia -WESO-, NNUU es capaz de salirse radicalmente del marco ineficiente e ineficaz de la mayoría de las agencias existentes y, en cambio, incorporar aquellos aspectos muy singulares de algunas de ellas que, precisamente, explican, a nuestro entender, su funcionamiento, a veces y en otros casos, muy pertinente y positivo.

Así por ejemplo, por un lado, no podemos crear una "nueva FAO" que, justamente, ha necesitado acabar siendo "duplicada", sobre todo operativamente, mediante el Programa Mundial de la Alimentación de NNUU. En cambio, y sobre todo en una temática en la cual la participación de los stakeholders, a través de la estructura de los grupos principales, es uno de los motores que más vivas mantienen las dinámicas más interesantes existentes de la gobernanza medioambiental, debemos basarnos entonces en el modelo OIT-ILO, en el momento de concebir una agencia de nuevo tipo en la que la participación de los stakeholders, tanto en su gobernanza como en su operativa, sea uno de sus pilares fundamentales. La nueva agencia debería ser también la responsable de la imprescindible coordinación de las operativas ambientalmente sostenibles a los distintos niveles territoriales (global, regional, nacional, subnacional y local), lo cual requiere concepciones novedosas tanto en su organización, como en su estructuración e implementación.

Nuestra propuesta que, insistimos, solo podemos entrever complementariamente a las del apartado 4, presupone, por ejemplo también, que la nueva agencia pase a ser el Secretariado Unitario (no concentrado territorialmente) de todos los MEAs; solo de esta manera se puede esperar avanzar realmente hacia una gestión coherente y eficaz de los mismos.

#### 5.1. Sobre las características del "Convenio de relaciones entre las NNUU y la nueva "agencia especializada"

El nivel de complejidad (de por sí, pero al que se añaden repeticiones, solapamientos, etc.) de los temas de los que trata esta aportación es tan elevado, que las propuestas presentadas seguirían "funcionando mal" de una forma muy evidente si una pieza clave del funcionamiento del sistema de NNUU no es concebida y elaborada, en este caso, con una especial y singular delicadeza. Creada una nueva agencia especializada del sistema, de acuerdo con la propia Carta de las NNUU, deberá procederse a elaborar y aprobar, por ambas partes, el convenio de relaciones entre las mismas. Los convenios que, de acuerdo con la Carta de las NNUU, deben firmarse entre esta y las agencias especializadas, es una figura y forma legal que, por ejemplo y para subrayar su importancia, tanto daño hizo y hace al multilateralismo cuando puede llegar a elaborarse como se hizo para las Instituciones de Bretton Woods, otorgándoles un nivel de independencia real total. Sirva este párrafo para apoyar todas las menciones y peticiones de revisión y reforma profunda de este convenio entre las NNUU y las Instituciones de Bretton Woods.

Pues bien, el conjunto de propuestas presentadas en esta aportación, están previendo y/o presuponiendo, sin lugar a dudas, un convenio de relaciones en el que, desde el punto de vista más político, deben explicitarse, muy claramente, los ámbitos de competencias propios y relativos, y sus imprescindibles niveles de coordinación real; entre otros aspectos y por explicitar solamente algunos de los que consideramos más importantes, este convenio deberá establecer claramente:

a) Hasta dónde llegan las competencias normativas del "nuevo" ECOSOC -con algunas de sus nuevas comisiones- y dónde empiezan las competencias normativas de la

nueva agencia.

b) Los mecanismos de coordinación y trabajo conjunto, sobretodo, en los estadios frontera de estas capacidades normativas.

c) De la misma manera, deberán establecerse, muy diáfananamente, las relaciones entre las capacidades normativas propias de la nueva agencia, con la de la estructura actual de MEAs, en la medida que hemos propuesta para la nueva agencia una atribución de "coordinación" de, como mínimo, sus secretariados.

d) Tanto a nivel de los desarrollos normativos en el seno de los MEAs, como sobre todo para subrayar el papel de coordinador que proponemos juegue la nueva agencia en relación a ellos -como mínimo respecto a los secretariados de estos MEAs-, es fundamental que el convenio entre la nueva agencia y las NNUU, hilvane, muy específicamente y claramente, los niveles de coordinación en lo que concierne a su implementación sobre el terreno.

6. Propuestas de actuaciones políticas extraordinarias de Rio+20 en relación a CMNUCC UNFCCC (Convención Marco de NNUU sobre el Cambio Climático)

Saliéndonos, por primera vez, del informe del SG que hemos utilizado como referencia para presentar nuestras aportaciones y propuestas, creemos que el mundo vive una situación de extraordinaria importancia que, por origen y tema, Rio+20 no puede ni debe obviar.

Se trata, por supuesto, de la crisis climática. La Conferencia de la Tierra en Rio 1992, entre sus muchos e importantes resultados, aprobó también la Convención Marco de NNUU sobre el Cambio Climático, CMNUCC UNFCCC. La Convención, como tratado internacional que es, entró en vigor dos años después y actualmente lo han ratificado prácticamente todos los estados miembros de las NNUU (no se puede decir lo mismo, como es sabido, del Protocolo de Kyoto que deriva de esta Convención).

El tratamiento de este tema como tratado internacional comporta que su gobierno se realice a través de órganos y reglamentos propios que, aunque aprobados o ratificados finalmente por la AG de las NNUU, tienen especificidades y singularidades que, como un MEAs más, están llevando a la humanidad a algunos callejones sin salida.

Es sabido que después del informe del Panel Intergubernamental sobre el Cambio Climático, PCCC IPCC, de 2007, el Plan de Acción de Bali, aprobado en esta isla y este mismo año, por el máximo órgano de la Convención (la Conferencia de las Partes, COP -partes firmantes del tratado-, en su sesión anual número 13), pretendía que en su sesión anual número 15, que se celebraría en Copenhague el año 2009, se aprobasen las bases de actuación mundiales de lucha contra el cambio climático que, actualmente, amenaza con provocar aumentos de la temperatura media en la superficie de la tierra de entre 2 y 6C, dependiendo de cuál sea el nivel de mitigación conseguido, o no, en emisiones de CO2.

Es absolutamente conocido el gran fracaso de Copenhague y, quizás no tanto pero igual o más importante, que ni en Cancún en 2010, ni este 2011 en Durban, se dieron ni van a darse las condiciones políticas para dotarse del plan de acción necesario. El pesimismo ante Durban tiene muchas bases; una de ellas fundamental y evidente: las elecciones presidenciales norteamericanas en el 2012.

Pues bien, desde nuestro punto de vista, el bloqueo de las negociaciones climáticas internacionales están enquistado y es tan grave, que la Conferencia Rio+20, 20 años después de que en la Conferencia Rio+92 se tomase la iniciativa en este tema, debe retomar esta iniciativa y debe prepararse para tratar un nuevo tema especial dentro de la misma Conferencia Rio+20 que, esencialmente, debe pretender y conseguir tomar decisiones sobre los siguientes aspectos clave:

a) La gobernanza y el sistema de decisiones de la COP de la UNFCCC; sabiendo que uno de los motivos del enquistamiento de las negociaciones, radica en el hecho de que esta COP ha sido incapaz, hasta el momento, de aprobar, dentro de su reglamento, el sistema de toma decisiones -de votaciones, en definitiva- de la Convención: nuestra propuesta es que Rio+20 haga las modificaciones pertinentes en el reglamento de la COP de la UNFCCC; por un lado, ampliando su composición a miembros del IPCC y de los grupos principales y, por otro lado e imprescindible, decidiendo las mayorías holgadas necesarias para que se puedan tomar decisiones que, habida cuenta de que lo que está en juego es el futuro y la calidad en este futuro- de la vida humana en el planeta tal como la conocemos, sean de obligatorio cumplimiento por todas las partes, es decir sean vinculantes.

b) Rio+20 debe establecer también, ya, cuáles son los objetivos principales que debe afrontar de forma inmediata la Convención; las metas concretas ineludibles que deben alcanzarse tanto a nivel del 2025 como del 2050; y sancionar, para este último plazo, que la reducción de emisiones mundiales, respecto al año 2050, debe ser del 50% (del 90% en el caso de los países desarrollados), tal como propone el IPCC.

## Association des Populations des Montagnes du Monde (APMM/WMPA)

Paris, le 28 octobre 2011

### CONTRIBUTION DE L'APMM

#### POUR LA CONFÉRENCE DE RIO 2012

Partout dans le monde et en dépit des différences de milieux et cultures, les populations des montagnes se reconnaissent une **identité commune** par les savoir-faire, les savoir-être et les pratiques spécifiques qui leur permettent de vivre dans leurs territoires, lieux de richesses spirituelles comme matérielles. Elles sont **fières** d'y avoir créé des civilisations et des cultures encore trop souvent méconnues ou méprisées, et qui sont pourtant une richesse de notre monde. Elles sont **fières** d'avoir diversifié les milieux et d'avoir ainsi **contribué à l'augmentation de la biodiversité** qu'on les accuse trop souvent et contre toute évidence de mettre en danger.

En vue de la Conférence de RIO 2012, l'Association des Populations des Montagnes du Monde présente la synthèse des travaux et propositions issus de rencontres réalisées entre les communautés et acteurs de territoires de montagne de plus de 40 pays ainsi que des rencontres régionales réalisées sur trois continents (Andes, Himalaya, Afrique du Nord, Afrique centrale, Afrique de l'Est, Afrique australe). Elles sont nourries des études des scientifiques, des expériences et expertises des ONG de développement et des institutions impliquées dans les territoires de montagne. L'APMM et ses représentants font les propositions suivantes

#### I- DES COMMUNAUTÉS ET DES TERRITOIRES : DES INSTITUTIONS POUR LA GESTION DES ÉCOSYSTÈMES DE MONTAGNE

##### 1-L'institution communautaire

Les montagnes sont des réservoirs de grande richesse biologique accrue par l'étagement en montagne sur des faibles distances. L'homme en a tiré profit par la domestication de nombreuses plantes cultivées et la diversité biologique naturelle a été constamment enrichie par les savoir-faire de l'homme et savoir-être de l'homme dans son milieu. Du fait des caractéristiques et contraintes du milieu et de la singularité de leurs Histoires, les populations de montagne se sont organisées en collectivités gérant des territoires selon des formes culturelles très diverses.

Construites par des cultures voire des civilisations millénaires, les institutions communautaires ont fait la preuve dans la longue durée, de leur capacité à gérer des écosystèmes complexes, en inventant des formes de gouvernance souvent fondées sur des règles de démocratie participative capables d'évolution ; elles ont su créer des

systèmes de normes dans l'usage des ressources et des organisations territoriales fonctionnant à diverses échelles et dans le temps long.

Elles ont su mettre à profit les complémentarités qu'offrent les systèmes de production agro-sylvo- pastoraux, ont aménagé fortement le milieu pour en vivre par des investissements collectifs lourds en

travail qui ont créé les paysages notamment de terrasses, pour contrôler l'eau, sa répartition et son usage et ainsi augmenter les productions et la diversité.

Les territoires de montagnes sont ainsi les lieux et le produit de l'intégration de l'ensemble des activités qui lient les communautés à leur milieu et leur permettent d'innover et de s'adapter aux évolutions constantes des sociétés. Pour le bénéfice des populations de la planète, elles doivent continuer à porter ces valeurs et biens. Car, dans le contexte actuel de la mondialisation homogénéisatrice et des défis écologiques à venir, ces communautés constituent un atout pour le futur de la planète, en tant qu'important potentiel de diversité humaine et culturelle.

En effet, la montagne a été nourricière en léguant au monde beaucoup de ce que la plaine et la science et la technologie moderne se sont approprié en matière de productions agricoles et recèle aujourd'hui encore un potentiel trop souvent ignoré de produits de qualité, de services et de formes de vie équilibrées, d'une grande diversité, toujours issus de la culture des hommes et du milieu. En ce sens, il reste important de réarticuler les espaces de plaine et des grandes villes de montagne à leurs territoires dans un rapport de proximité et d'échange.

### **1. Les territoires de montagne : au-delà de l'économie verte un projet politique pour une transition écologique et sociale des territoires**

La Conférence de Rio 2012 met en avant un nouvel objectif pour la planète, l'économie verte et sa gouvernance.

Nous sommes bien convaincus que le mode de développement du Nord n'est plus tenable et que les pays en développement les plus pauvres devront réaliser leur développement selon une autre voie, inédite, essentiellement à partir des énergies renouvelables. Mais cela ne saurait exonérer les pays du Nord, qui, rappelons-le, représentent 20% de la population mondiale mais consomment 80% de l'énergie produite, d'un changement significatif de leurs consommations et activités et de leurs bases énergétiques.

Nous reconnaissons donc l'intérêt de ce concept à condition qu'ils permettent d'aborder des questions encore insuffisamment explorées qui lient les activités productives en synergie avec la qualité de leur environnement et de mesurer le **déficit écologique des plaines et des pays du Nord**. L'intérêt et les préoccupations de la société globale pour les espaces et écosystèmes de montagne s'en trouvent renouvelés et se mettent en place des politiques qui correspondent à ces intérêts, qui sont nouveaux pour elle mais, en réalité, le fondement millénaire des économies montagnardes. Cette vision répond ainsi à ce que sont les atouts de la montagne, la valorisation de ses ressources en reconnaissant la spécificité des produits de montagne liées aux qualités de leurs territoires et aux cultures et savoir faire de leur population.

L'autre dimension de « l'économie verte » concerne la rémunération pour la production des biens et services écologiques rendus à la société. Justifiés par les grands défis écologiques que doit affronter la planète du fait des difficultés et crises du mode de développement actuel, se mettent en place les mécanismes de monétarisation des « services écologiques » et les accords internationaux privilégient les mécanismes de marché pour traiter des questions écologiques notamment avec la mise en place du marché du carbone, de la biodiversité et des mécanismes de compensation entre pays du Nord et du Sud. Apparaissent ainsi au gré des accords internationaux, de nouveaux secteurs d'activités et une nouvelle offre lancée depuis l'international et déclinée jusqu'au local selon des mécanismes complexes entre Nord et Sud.

Dans des contextes économiques souvent difficiles, les personnes saisissent ces nouvelles opportunités au gré de l'offre et de la demande relatives à un secteur de gestion : l'eau, la forêt, la biodiversité

notamment... Ces mécanismes sectoriels de marché agissent en dehors des politiques de territoires, de développement durable des pays et sans concertation avec l'ensemble des communautés concernées au premier chef du fait de leurs fonctions et apports à la gestion de l'écosystème de montagne et celui de la planète.

L'APMM considère que l'économie verte organisant la rémunération des biens et services écologiques ne peut devenir le mode de rétribution de la montagne. Le changement du modèle technologique dans un sens plus écologique ne peut se faire par la monétarisation croissante du vivant et des écosystèmes.

Cette notion est plus restrictive que celle de développement durable, puisqu'elle ne mentionne pas explicitement des objectifs sociaux, renvoyant seulement à un changement de modèle technologique pour certains acteurs. Mais le changement de civilisation ne peut être limité à une transformation technologique, aussi nécessaire soit-elle. Cette notion ne peut être considérée comme un objectif en soi. Au regard des enjeux de sortie de crises, c'est la transition écologique et sociale pour aborder conjointement environnement et développement, proposée par le Collectif Rio+20 des ONGs françaises, qui doit prévaloir.

L'APMM souhaite utiliser les mécanismes et outils comptables de l'économie verte pour permettre de réévaluer l'importance et l'intérêt de la gestion collective des territoires dans une nouvelle pensée de l'activité économique liée à leur environnement dans le milieu qu'elles façonnent. Il s'agit de montrer que les communautés de montagne ont toujours été créatrices de « services écologiques », que, par leurs savoir-faire et savoirs, ces communautés de montagne ont su gérer leurs biens communs aux différentes échelles de territoire et que la société mondiale a besoin qu'elles restent sur leurs territoires et y vivent dignement.

Mais ensuite, dans la nouvelle vision du développement dont la planète a besoin, ce n'est pas à la compensation sectorielle qu'il faut recourir, notamment entre Nord et Sud : il faut reconnaître le rôle des communautés de montagne par des politiques intégrées de développement territorial véritablement équitables, aux échelles des massifs, des bassins versants, des communautés. Et non pas introduire de nouveaux déséquilibres en attribuant une valeur extrinsèque à tel ou tel élément, forêt ou rivières, des systèmes de production montagnards. En effet, par exemple, payer des populations en fonction de la superficie en forêts de leur territoire c'est, d'une part, dans le court terme, désavantager celles qui n'ont pas de forêts et qui contribuent d'une autre manière positivement au bilan carbone par une agriculture de proximité minimisant les transports, d'autre part, déstabiliser les systèmes de production agro-pastoraux en induisant une extension des forêts qui entraînera une diminution des espaces cultivés, plus de migrations et plus de saturation et pollutions urbaines, dans un contexte d'insuffisance alimentaire mondiale.

**Dans la perspective de Rio, l'économie verte a pour intérêt l'expérimentation qui peut être menée avec les communautés sur leurs territoires à la condition que les mécanismes de compensation respectent les conditions suivantes :**

- ils doivent financer équitablement le développement intégré des territoires de montagne à toutes les échelles
- selon des modalités définies avec/par les communautés concernées de ces territoires
- ils ne doivent pas devenir l'unique instrument financier car ils sont largement insuffisants pour répondre aux besoins de politiques intégrées de développement de ces territoires

L'objectif de Rio 2012 sera de tracer la voie d'une transition écologique, culturelle et sociale pour affronter les crises de toute nature qui se présentent en repensant développement et environnement. Pour cela, le monde a besoin de montagnes vivantes et il doit reconnaître le rôle qu'elles ont joué, jouent et veulent encore jouer dans le développement puisqu'elles sont souvent à la pointe aujourd'hui du développement soutenable malgré leurs difficiles conditions d'existence.

## 2. Territoires de montagne, biens communs et patrimoine

Au concept de service écologique, l'APMM préfère se référer à celui des « biens communs » créé à partir notamment de la forme de gouvernance par les communautés de montagne des ressources de leurs territoires. Elles sont organisées en communautés d'usagers de ces biens, objets d'une appropriation collective

Les biens communs sont des dons de la nature, mais surtout des biens produits, entretenus, partagés entre des usagers regroupés dans une « communauté », dont la taille et la nature peuvent varier. Ils supposent l'engagement des citoyens et la définition de règles d'usage en fonction notamment de savoir-faire traditionnels. A l'échelle globale, les biens communs tels que l'eau, la terre, la forêt, la mer et les océans, mais aussi la santé ou l'éducation, le vivant, sont aujourd'hui l'objet d'un accaparement sans précédent qui, au lieu de les préserver, met en péril les équilibres écologiques et la vie des populations qui en dépendent.

L'expérience montre qu'un territoire est le plus souvent mieux géré par la collectivité qui en fait usage que par la sanctuarisation au nom de la protection de la nature que peuvent imposer les États contre leurs propres gestionnaires et usagers.

Enfin, alors que l'utilisation de la notion de "biens communs" offre une alternative au terme de

« ressources naturelles » qui est marquée par l'extériorisation et l'instrumentalisation de la nature, par un anthropocentrisme caractéristique de la civilisation occidentale, parler de « biens communs » permet de trouver un langage commun entre des cultures différentes. Le terme « bien commun », en insistant sur le rôle des communautés humaines et sociales, peut permettre un dialogue des civilisations.

**La gouvernance qui devrait être proposée à Rio, notamment la mise en place d'une Organisation Mondiale de l'Environnement (OME), devrait être organisée avec les communautés et territoires contribuant de façon décentralisée à la constitution des biens communs globaux et constituer un appui pour toutes les expériences qui, de manière décentralisée, sont fondées sur la réappropriation collective des biens communs de toute nature par les communautés d'usagers. Ces communautés d'usage des communs, tout en étant autonomes, ne seront ainsi plus indépendantes de la société globale.**

**Dans ce sens, nous proposons, de promouvoir des politiques intégrées de la montagne avec les institutions nécessaires à la bonne gouvernance en biens communs à toutes les échelles de territoires, tout en poursuivant l'objectif de rétablir l'équité du développement économique et social, condition de la durabilité. La poursuite des OMD doit rester une priorité à condition qu'elle s'appuie sur des politiques spécifiques mettant au centre la vie des territoires et des communautés et les compétences de gestion territoriale que ces sociétés ont su acquérir et organiser.**

## 3. L'innovation, l'expérimentation sociale et politique

Cela demande dans chaque contexte culturel et socio politique des innovations en matière de gouvernance fondées sur la reconnaissance des communautés, leur diversité culturelle, leur autonomie, leurs savoir-faire en matière de gestion de leurs ressources territoriales.

L'APMM veut faire connaître, faire partager, fédérer les expériences politiques et sociales concernant les thèmes suivants, portés actuellement par des pays de montagne et des organisations d'acteurs de la montagne :

- le concept du « bien vivre » apporté par les pays andins ;
- le « Bonheur National Brut » du Bhoutan ;
- les politiques de cohésion et diversité territoriale mises en avant par les organisations de la montagne en Europe (AEM) ;
- beaucoup d'expériences nationales, dont celle de la Fédération des Groupements d'utilisateurs de la forêt au Népal, et locales dont celle de la démarche patrimoniale de l'Institut Patrimonial du Haut Béarn en Pyrénées françaises.

Les sociétés montagnardes ont toujours mis à profit les complémentarités des territoires soit par l'exploitation directe de ces territoires soit en pratiquant l'échange. Ces pratiques diversifiées et ces échanges ont toujours exigé et favorisé l'innovation, inscrite dans la gouvernance des territoires. Ces sociétés sont donc sont un réservoir inégalé de savoir-faire et de ressources potentielles à la condition qu'elles soient des acteurs légitimés et reconnus dans les processus de décision politique.

**Les régulations et la gouvernance mondiale doivent être reconstruites dans cette interdépendance construite selon ces principes, par subsidiarité ascendante, par la redistribution des richesses générales et par la péréquation indispensables au développement équitable (services de base, infrastructures, activités économiques non territorialisées...). À ces conditions, les communautés pourront vivre en montagne et de la montagne. Elles pourront affronter les nouveaux défis qui se présentent en particulier les évolutions démographiques, les migrations et mobilités entre villes et campagnes, les adaptations liées au réchauffement climatique.**

La mise en œuvre de ces politiques intégrées de la montagne à toutes les échelles est d'autant plus urgente que les évolutions démographiques locales et les aléas climatiques ont augmenté les pressions sur les milieux à un rythme parfois supérieur à celui des innovations techniques qui auraient permis l'adaptation nécessaire et le fonctionnement équilibré des capacités gestionnaires de ces populations. L'évolution actuelle et prévue des climats ne fera qu'augmenter les déséquilibres.

## 4. Le Changement Climatique et les mécanismes du marché du carbone

**Dans de nombreux massifs, les prévisions climatiques laissent présager un véritable choc climatique lorsque l'on sait que la limitation prônée par le GIEC à 2° ne pourra être tenue et qu'en montagne les augmentations sont le double de la moyenne. Même si certains territoires seront gagnants, on sait que les catastrophes climatiques vont se multiplier demandant alors des adaptations technologiques et des investissements en infrastructures qui vont dépasser les capacités locales de gestion des communautés, en particulier dans le domaine de l'eau.**

**La disparition des glaciers à brève échéance va affecter considérablement les disponibilités des ressources en eau, comme on peut déjà l'observer. Les enjeux pour l'accès à l'eau vont**

s'accentuer entre les différents acteurs : les grandes métropoles, l'agriculture productive d'exportation des grands périmètres irrigués et les industries minières. Il est probable que les priorités et les investissements souvent colossaux à prévoir iront à ces acteurs incontournables. Il est donc encore plus important que les populations des territoires de montagne, particulièrement vulnérables du fait de leurs faibles ressources, soient associées aux décisions et programmes.

L'Alliance du Mountain Partnership mise en place pour RIO devrait aussi être active et très présente dans les grandes négociations en particulier dans la Conférence sur le Changement Climatique.

### **I. DES OUTILS ET PROGRAMMES D'ACTION POUR LA MONTAGNE**

Pour répondre à ces enjeux qui concernent l'ensemble de l'humanité tant aux niveaux économique, démographique, culturel qu'environnemental, l'APMM en tant qu'acteur regroupant les populations, considère que la Montagne doit être l'objet d'un document de référence relatif à toutes ses dimensions. Elle fait la proposition d'actualiser avec les partenaires le Chapitre 13 de l'Agenda 21 de Rio 92 qui reste une étape fondamentale vers la reconnaissance des territoires de montagne et de la nécessité d'une approche systémique et multiscale des problèmes de l'écosystème mondial.

Ce nouveau document présentera les politiques, les outils, les actions que nécessite la spécificité des territoires de montagne du local au global.

Les organisations de montagne sont particulièrement concernées par la mise en œuvre de certaines thématiques, que l'APMM soutient :

1. La mise en œuvre de la Déclaration des Nations Unies sur le Droit des Peuples Autochtones, qui sont nombreux en région de montagne. Cette déclaration est fondée sur des principes qui relèvent du Droit des personnes et des Droits de l'Homme (DDHH), des droits collectifs, du droit des communautés.
2. La reconnaissance constitutionnelle par les États et les Régions concernés de la spécificité des territoires de montagne et l'adoption, en concertation avec les populations locales, de  
« lois montagne » adaptées aux différentes situations des massifs.
3. Les droits et règlements économiques et sociaux spécifiques appropriés à ces territoires partagés avec la société nationale et globale et visant à réduire de manière volontariste l'iniquité de traitement qui les touche et tenant compte des caractéristiques naturelles.
4. La reconnaissance culturelle et juridique des formes de gouvernance de leurs territoires selon le mode dont elles sont les héritières ou qu'elles choisissent.
5. Les droits relatifs à cette pleine reconnaissance des cultures comme moteur de la gouvernance.
6. Le droit de consultation sur l'exploitation des ressources naturelles et les politiques de partage des bénéfices entre les différents niveaux territoriaux sont une exigence partagée par toutes les communautés de montagne, souvent victimes de spoliations. En effet, l'un des thèmes les plus critiques actuellement, est celui du rapport entre les populations de montagne et les acteurs de la société globale intéressés par l'exploitation des ressources naturelles largement concentrées sur les territoires de montagne et qui constituent les richesses territoriales des communautés (industrie extractive, grands projets hydro-électriques, etc.).

### **II. MOYENS ET FINANCEMENTS**

1. L'affectation par les Etats dans les **budgets nationaux et régionaux** de moyens adaptés à la mise en œuvre de ces politiques et investissements spécifiques pour les territoires de montagne par une **juste péréquation nationale** et en utilisant notamment la richesse issue de l'exploitation des ressources naturelles dans les montagnes
2. la création de taxes sur les ressources exploitées dans les montagnes par les acteurs de l'économie globalisée (multinationales qui exploitent eau, énergie, hydrocarbures, minerais, forêt) pour financer, en complément les budgets nationaux, les coopérations internationales et programme international ainsi défini.
3. la définition d'un **Programme international d'action pour la montagne** sur le long terme en faveur des populations des montagnes afin d'atteindre les Objectifs du Millénaire pour le Développement (OMD) dans ces zones spécifiques alimenté notamment grâce aux mécanismes de compensation concernant le carbone, selon des modalités territoriales plutôt que sectorielles et pas seulement monétarisées, comme il a été dit plus haut.

### **III. ADAP T A T I O N DES ORGANISATIONS INTERNA TIONALES AU FAIT MONTAGNE**

Le rôle de l'APMM est de porter la voix des territoires des Montagnes dans les instances internationales et auprès des acteurs globalisés et des autres secteurs des sociétés.

- Le Mountain Partnership
- Les Forum Sociaux
- L'OME et RIO (pour que le projet d'OME comme nouvelle agence de l'ONU répondant aux objectifs qui vont être définis dans la Conférence de Rio, soit acceptable par les communautés de montagne, l'APMM entend qu'elle ne soit pas seulement inter-gouvernementale, mais constituée de façon participative à partir d'acteurs territorialisés à côté de ceux apportant la connaissance générale sur les phénomènes environnementaux. Elle devra être aussi transversale aux autres agences, notamment la FAO, etc.)

Afin de faire reconnaître et respecter la légitimité des propositions des populations des Montagnes qui sont

1. La participation des organisations de la montagne à la Conférence Intergouvernementale sur le Changement Climatique est nécessaire compte tenu de l'impact très fort du CC en montagne.
2. La reconnaissance par l'Organisation Mondiale du Commerce de la spécificité des économies et produits des territoires de montagne et des politiques nationales et régionales spécifiques mises en œuvre et à mettre en œuvre en leur faveur.
3. La création au sein de la FAO d'un département « Montagne » chargé de coordonner l'action internationale en faveur des populations des montagnes en relation avec les Centres régionaux, la recherche, les ONG et l'Observatoire International.
4. La reconnaissance comme thématique de montagne de l'importante question de la production de cultures déclarées illicites pour leur usage sous forme de drogue. Les populations de ces territoires principalement de montagne, sont souvent criminalisées sans que soient prises en compte les situations de

pauvreté, les déséquilibres dans le développement territorial, l'absence de gouvernance à l'origine de ces cultures.

5. En ce sens, l'APMM poursuivra l'action menée avec les organisations de producteurs de ces cultures qui ont lancé, avec d'autres partenaires, le premier Forum Mondial des Producteurs de Cultures Illicites avant d'être présents à l'Assemblée Générale des

6. LN'aAtiPoMnsMUNAieccsoem n pSaesgsnioenlaSpdéeemialendsuerdlesddérpoégnuaelsis(aUtINoGn AdSe Sla20c0u9lt)u. re du chanvre et de la

feuille de coca pour leurs usages traditionnels (mastication), artisanaux, culturels et pharmaceutiques ainsi que des usages industriels potentiels, la lutte contre le trafic des drogues qui en sont issues, la décriminalisation des producteurs et la redéfinition des politiques dites alternatives de l'UNODC.

## Association européenne des élus de montagne (AEM)

### AEM's position paper on RIO +20 conference – The crucial role of mountains in the achievement of Rio +20 objectives

The European association of elected representatives from mountain regions (AEM) welcomes the RIO + 20 conference and especially the consultation of the stakeholders in preparing this event that can be a milestone similar to the Earth summit in 1992. In the outcomes of this previous conference, mountain territories' issues have been acknowledged, thanks to Chapter 13 of Agenda 21. This highlight has permitted the creation of numerous organization dedicated to the preservation and the valorization of mountain territories and people.

Europe's mountain ranges have similar issues to other mountain ranges on the rest of the planet. Ecosystems are in danger, as well as the quality of life of mountain people. In spite of Chapter 13, mountains are still in critical condition, because of the climate challenge but also because of the economic conditions (crisis, lack of access to services). Moreover, "one size fits all" policies do not take into account mountains added costs and specificities. To sum up, mountains deserve a specific attention but they are still too often considered as only rural or strictly marginal.

AEM has been contributing to the European debate for more than 20 years. Our association has called for a better acknowledgment of mountain specificities within EU's policy making.

For a long time, policies related to mountain territories have mainly focused on tourism and agriculture (e.g. natural disadvantage compensations from the CAP). However, AEM's lobbying has contributed to a shift. Indeed, the Lisbon Treaty (adopted in 2009) now grants a specific attention to regions with a permanent natural or demographic disadvantage, such as mountain regions (art.174). Mountains are also naturally considered as a key element of the EU official objective of territorial cohesion (art.3). As a consequence, it is now established in the Treaty that European mountain territories should benefit from a particular attention from all of EU sectoral policies (art. 175).

### Green Growth and mountain regions

In 2010, the European Union has launched a new global strategy. Europe 2020 defines EU's priorities for the next 10 years which are gathered in three broad objectives: smart, inclusive and green growth.

e-mail : [info@promonte-aem.net](mailto:info@promonte-aem.net)

[www.promonte-aem.net](http://www.promonte-aem.net)

Green economy is also the main theme on RIO +20 agenda. AEM fully agrees on the fact that a new model of sustainable development must be set up in order to tackle the climate change challenge.

AEM has lead numerous works that prove that mountain territories have a lot of assets regarding this objective and, hence, will have a role to play at the EU but also at the global level. Besides agriculture and tourism, mountain assets are obvious: they include most of the water resources (which implies most of the hydroelectric production), a large part of the wood industry, many specialized and precision industries, flexicurity as a result of pluriactivity and seasonality, local development through formation and a great biodiversity. The economic profile of mountain regions is deeply linked to environment, biodiversity and landscape, while at the same time ecological innovation and green growth are becoming a major dynamic at the European and international level (as RIO +20 proves it).

AEM argues that mountain ranges have to renew and promote their economic potential considering their environmental assets and their traditional know how. Of all territories, mountain regions are aware of the importance of the mitigation and the adaptation to climate change. This issue has to trigger new model of endogenous development. Such sustainable development must be based on mountain assets, be well balanced between preservation of ecosystems, as it will be a key element to green growth and the production of carbon free energy.

Because of its specificities and its wealth in natural asset, mountain territories can become pilots for new initiative based on green growth and social inclusion.

However, the environmental challenge is far from being abstract. It implies that every territory, every ecosystem, must be taken into account and must be the target of tailor

made policies. As a result, mountain people and stakeholders have to be associated to the policy making in a broad multilevel governance based system.

#### **Multilevel governance, cooperation and territorial cohesion**

AEM calls for the setting up of a multilevel governance that associate every level of government and stakeholders to the policy making. In Europe, "one size fits all" policies that do not take into account the territory have proved to be misadapted, with the failure of the Lisbon Strategy. This type of governance could also be implemented at the global level for environmental issues. New academic works lead by the University of Geneva on Regional Environmental Governance show that cooperation between regions with the same ecosystem is mandatory to tackle climate change and shape adapted policies. Mountain ranges have the particularity to be often transboundary. They request a special type of governance that could then be implemented at a global scale. Once again, mountain ranges request cooperation, which will be a key element for the success of RIO +20 and the following initiatives. However, such a model is not "mountain exclusive" and should be applied at a global scale.

With the Lisbon Treaty, the European Union has adopted a new objective: territorial cohesion. This aim goes hand in hand with the need of multilevel governance and cooperation. Territorial cohesion stipulates has assets and should then contribute to EU strategies. No region should be left behind as every territory has potentials.

To achieve this, a key element is the concept of functional area. Each area should be defined according to its territorial cohesion. The actual EU debate on macroregional strategies is another sign of this tendency. Macro regions aim at creating more synergies between the various strands of the cohesion policy, in a more efficient and relevant way than with segmented sectorial policies. There is a clear interregional added-value regarding the European territorial challenges "transform diversity into strength" and development of macro-regional strategic approaches that clearly fits to mountain ranges. The integration of policies, the acknowledgment of territorial cohesion both go beyond traditional administrative border would also be great inputs to RIO +20.

#### **Conclusion**

AEM understands that RIO +20 will not include mountain orientated initiatives, as the earth summit did. However, in order to reach a model of endogenous development, mountain ranges need reinforcement and development of regional, national and international (multilevel) governance that articulate mountains and lowlands, facilitate transboundary coordination and support capacity building and the exchange of good practices for innovation and sustainable development. Mountain territories are different. They need a specific attention granted by the Earth Summit even if it has not been sufficient, as mountain ranges are still treated as marginal environments.

Green economy and the new focus on environment is positive news for mountain ranges. They have a lot of assets to valorize. But environmental issues imply a new model of governance and a focus on each territory specificity.

*Since 1991, AEM brings together elected representatives, from mayors to members of the European Parliament, local and regional authorities from mountain areas, as well as various similar networks. AEM gathers, directly and indirectly, members from 12 000 municipalities, 100 provinces, 50 regions from 11 European Member States. The composition of the Executive Board is based on a political and geographical balance.*

## Association for Defense of Nature (Prodena) and Ecosophy Foundation (EF)

### **INPUTS FOR COMPILATION DOCUMENT**

**UNCSD Secretariat, Division for Sustainable**

**Development, UN-DESA.**

**Submission by**

**Association for Defense of Nature (PRODENA) Ecosophy Foundation (EF)**

*PRODENA and EF are Bolivian independent environmental organizations. PRODENA is the second oldest environmental organization in Bolivia, founded in 1979; it has been working for the nature for more than 3 decades. Prodena has been promoting environmental laws and policies, as well as sustainable development in Bolivia since*

*1990. We made proposals for the new Bolivian constitution, many of which were included in the text. Currently the focus of our work in Bolivia is demanding access to information, participation, justice, accountability, transparency, law enforcement and compliance on environmental issues. We are also working in climate change adaptation.*

*The Ecosophy Foundation is a new think tank that is working in the intersections between mind, culture and the environment. It deals with philosophical, religious and ethical issues related to the environment, and it is trying to rescue and revitalize the environmental knowledge of indigenous peoples, particularly the ethno-ecological knowledge of Bolivian indigenous peoples.*

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

The expectations couldn't be greater since the planet cannot wait for another 10 years of constant deterioration, species extinction and disruptions of natural processes and cycles. We need a transformational change in the way we are managing the planet. Climate change is not the just the result of increasing greenhouse emissions but of the way we have been managing (rather mismanaging) the Earth, therefore we need a very bold approach to not let the earth systems collapse.

In this sense we have the following proposals:

1. Create a **Global Environmental Organization** that upgrades the UNEP and that hosts the Multilateral Environmental Agreements (MEA), and other UN bodies that deal with environmental issues.
2. Approve an updated Rio Declaration or an **Environmental Governance Charter that** among others includes transparency, accountability, efficiency and the rights access to information, participation and justice.
3. Create Global **Center of Environmental Information** to collect all the environmental and climate information from the governments on a regular bases (currently this information is collected by the WB, UNEP, UNDP, among others) but is incomplete and not always updated by the governments. It should be a duty of the states to provide updated information.

The other purpose of this Center will be to connect diverse environmental data bases, and to deliver information to the public for free.

5. To establish an **International Court for the Environment**, where all the citizens have access.

6. A **Declaration of Environmental Rights and Duties**

7. The creation of a **Global Ombudsman for the Environment**.

Whenever violations of environmental rights and environmental destruction occurs out in developing countries, we don't have any instance to complain, therefore we need to have the possibility to be heard at the global level.

Possible structure of the Outcome document

1. Current state of the environment (includes climate change).
2. The consequences and prospects of environmental destruction and climate change for future societies and for the world's peace,
3. Institutional architecture and governance framework for more effective enforcement and compliance of environmental laws and regulations.
4. Sectoral issues: oceans, biodiversity, climate change, energy, population, etc.
5. Funding

b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

Green economy maybe a great new paradigm to overcome environmental ills, however it is not understood nor digested in developing countries, which are suspicious of the ideas behind green economy. Many of them tend to see green economy as a Trojan horse to introduce market barriers, and impose conditionalities in developing countries. In

addition many don't agree with the payment for environmental services. Therefore, if the discussions for Rio+20 are focused on the green economy a lot of time is going to be consumed without concrete outcomes, and no much progress is going to be achieved towards the improvement of global environmental governance. We believe that first

developed countries should show the viability of green economy, and then try to spread to the world.

Regarding the "revitalized global partnership for sustainable development" we should bear in mind that most of the Partnerships emerged of the Johannesburg Summit were not very successful, therefore it may remain in another good declaration.

Regarding IFSD, the CSD has failed in advancing SD goals. Therefore the UNEP should be upgraded in a Global Environmental Organization (GEO), because we need a powerful organization that can lead the process of transformational change. The GEO should also include the many UN bodies and Conventions (more that 700) that deal in a separate, disperse and non-effective manner with environmental issues.

The core issue should be providing world's citizens enough tools to change the state of affairs. Despite that in developing countries the legal environmental framework has improved, the laws are often broken even by the governments when economic interests are involved, thus the environmental impacts and constraints are disregarded. According to our experience governments don't care for the environment if don't have enough social pressure.

c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

The implementation of the Rio outcomes has been very week and as a result environmental conditions have been deeply deteriorated as can be seen with global green house emissions. Therefore it is necessary to reinforce the participation of civil society organizations because the governments always tend to stand for economic gains in detriment to the environment. As a result we have seen the rising of environmental conflicts worldwide, and that the most vulnerable and poor people are the more affected.

We should move from Principles to Rights, and the Principles should become Rights to be enforceable. For instance, some of the principles of the Rio Declaration should become Rights.

d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

In our view, the most important implementation tools are: a Global Environmental Organization for the improvement of environmental governance, an International Environmental Court for the implementation and enforcement of environmental agreements, a Center for Environmental Information and an Ombudsman for the Environment.

## 2. Specific Elements:

a. **Objective of the Conference:** To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.

Contributions could include possible sectoral priorities (e.g., (e.g., energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) and sectoral initiatives that contribute to integrate the three pillars of sustainable development could be launched and endorsed at Rio+20.

To secure renewed political commitment we need a powerful environmental organization, otherwise not changes in the ground are going to be made. We don't need more programs of action that not implemented, but rather tools for citizens to defend nature and their right to a clean environment.

On regard to climate change we cannot deal with greenhouse gasses in a separate manner since the carbon cycle works in interaction with other cycles and processes, the wiser is to not intervene the last remaining natural areas of the world. Mitigation should be included in all the natural resources management plans.

We need to realize that in a warming world it is going to be more difficult to satisfy the needs of the present and future generations, therefore what we need now is a resilient development that helps people in the developing world to overcome or not being much affected by the impacts of climate change. In the incoming years we should work

resiliency as the most important tool to overcome climate change impacts

b. *Green economy* in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication.

Poverty eradication is a delusion in a warming world because many people in developing countries are becoming poorer due to the losses of extreme weather events. Hunger and poverty are increasing in many developing countries, and developed countries are less rich. Therefore there are fewer resources to support poor countries.

That is why we believe that the most important is to assure that people have enough tools to defend their rights, to not let the governments implement plans and projects that are harmful for the environment and people. Governments tend to respond to economic interests, but if people have more power of influence in decisions, things may change.

c. *Institutional framework* for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels – local, national, regional and international.

It should be recognized that the environment is not a pillar, but the support base of our societies and economies, and therefore should be prioritized over the other pillars.

d. *Any proposals* for refinement of the two themes. Recall that Resolution

64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".

We believe that the conference should focus on institutions, rights and rules for the improvement of environmental governance to deal with the deteriorating state of the planet and global warming that already compromised the satisfaction of the needs of future generations.

La Paz, Bolivia, October 31 2011

## Association for Protection of Environment and Culture (APEC-Nepal) and Atlantic States Legal Foundation (ASLF), Inc. (NGO), USA

### Inputs for Rio+20 Compilation Document

#### The conceptual problems of Green Economy and Sustainable Development

On behalf of the

Association for Protection of Environment and Culture (APEC-Nepal) and

Atlantic States Legal Foundation (ASLF), Inc. (NGO), USA

Input submitted by Medani P. Bhandari ([medani.bhandari@gmail.com](mailto:medani.bhandari@gmail.com)) co-founder and former chair of APEC-Nepal; Scientist of at the ASLF-USA and Research Associate at Syracuse University, NY, USA

**APEC-Nepal:** General objectives of the organization are to extend help in the protection of biological diversity such as wildlife, wetland species, forest resources and development of the nation by organizing individuals and experts in the conservation of natural resources and sustainable use. Founded in 1985, APEC-Nepal is a member of IUCN; accredited with the UNEP; member of Global Environment Facility-NGO Networks and associated with UN-DPI. [http://www.geocities.ws/ngo\\_apec/](http://www.geocities.ws/ngo_apec/)

**ASLF-USA:** Atlantic States Legal Foundation (ASLF) was established in 1982 to provide affordable legal, technical and organizational assistance to individuals, community groups, and other Non-Governmental Organizations (NGOs), as a way to effectively remediate threats to the natural environment. ASLF is accredited with the UNEP; member of Global Environment Facility-NGO Networks and associated with UN-DPI. <http://aslf.org/>

#### Introduction:

As the Rio+20 has already set the objective to secure renewed political commitment for sustainable development, it should begin to create common ground to build the consensus among

stakeholders as it was able to do in the Rio 1992.

a. *What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?*

The Rio+20 conferences should prioritize for the political commitments through the institutionalization of the Sustainable Development and Green Economy concepts in various binding agreements.

b. *What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?*

The proposed themes of Rio+20 Conference-- a green economy (GE) in the context of sustainable development (SD) and poverty eradication and the institutional framework for sustainable development-- are very vague. There is no clear documentation regarding the history and the theoretical route of green economy initiatives. In separate attached document, I outline the theoretical frame of GE and SD (see attached document).

c. *What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);*

There is an assumption that GE tries to capture the notion of the vulnerability of human welfare, caused by the degradation of global environment, which can be understood

as a result of the widespread application of an unsustainable economic growth. Probably, it captures the concerns of the past four decades to address climate change to frame treaty agreements. The GE initiatives can serve as a tool for the greening as an engine for growth, with valuing the ecosystem services and biodiversity issues by addressing strategic uncertainty such as: the likelihood of adverse effects; the consequences of change; the speed of change; discontinuities; and especially uncertainty over the effectiveness of policy instruments.

The issues of institutionalization of political commitments are missing in Rio+20. In order to attain the objectives of the SD, institutional framework has to be developed to coordinate and manage activities of all related stakeholders (i.e. governments, UN agencies, multilateral and bilateral donors; development banks; international nongovernmental and governmental organizations; national nongovernmental organizations etc.). It requires an effective institutional structure, strong policy, and framework for policy implementation and can work effectively, efficiently, equitably and transparently.

*d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?*

To achieve the desired outcomes in such complicated themes, it would be hard to propose the specific timeframe. However, it is also necessary to bind within the time frame; therefore, I proposed three schemes (1) 2 to 3 years policy and program framing phase; 4-6 years program implementation phase; and 7-10 years monitoring and evaluation phase.

To implement the green economy initiatives in the developing world, there is also a need to change or revisit the trade regulations imposed by the World Trade Organization (WTO); especially the social and environmental conditions of specific developments such as the removal of the ability of foreign cooperation to over-ride local social and environmental factors. To foster the ability of the developing world, it is essential to establish a chain of cooperation between North and South. The chain of cooperation can be established through creation of international oversight schemes which can help to bridge the gap between North and South.

## A view paper for Rio+20

### The Theoretical Route of Green Economy Initiatives, Applicability and the

#### Future

#### Abstract

Medani Bhandari<sup>1</sup>

There is no clear documentation regarding the theoretical route of green economy initiatives. Only, from 2008, global conservation movements have taken on a new dimension, with a special focus on Green Economic Initiatives. The United Nations and its agencies, for example, are major stakeholders in global environmental governance, and have been advocating in international forums to integrate conservation and development themes and establish collaborative platforms where all concerned stakeholders could contribute to the health of the planet. The green economy initiative initiated by United Nation Environment Program (UNEP) captures the notion of the vulnerability of human welfare, which can be understood as the result of the widespread application of an unsustainable model of economic development. Green economy initiatives capture the notion and concerns raised repeatedly over the course of the past

40 years, from the Stockholm conference of the first United Nations Conference on the Human Environment held in 1972, to Earth Summit 1992 in Rio; to the World Summit on Sustainable Development (Rio' Earth Summit +10), Johannesburg, South Africa 2002. These concerns likewise have been raised in publications over the course of that period, such as World Conservation Strategy-Living Resources conservation for Sustainable Development (1980), Our Common Future (1987), and Caring for the Earth- A Strategy for Sustainable Living (1991). These conferences and publications have explored global environmental phenomena in transnational political context to minimize environmental impact and maximize public wellbeing. UNEP defines a green economy (GE) as one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities. The UNEP assumes that greening is a new engine for growth, emphasizing sectoral opportunities, addressing hurdles and enabling conditions, demonstrating the value of ecosystems and biodiversity, capturing these values, and reversing the vicious cycle of environmental losses and persistent poverty by reversing the vicious cycle of environmental losses and persistent poverty. The major players fostering the GE include UNDP, UNEP, UNIDO, ILO, CBD, multilateral and bilateral institutions, member countries, regional forums, business and civil society groups, universities and regional commissions and international and national NGOs, among others.

Theoretically, it is possible to interpret environmental problems and recommend environmental reforms with the application of technology-intensive policies to manage the environmental problems both in the developed and the developing world (e.g., through analysis of the existing situation, formulation of policy options, and encouragement to apply environment friendly advance technology for sustainable world). The GE initiative is embedded within the frame of sustainable development, including the globalization processes and global transformations, and providing the know-how to perceive global economic growth in a positive way. It also incorporates the ecological economic factors of social dynamism and responses to basic environmental changes i.e. the Environmental Kuznets Curve (EKC), CO2 emissions per unit of GDP, proportion of natural resource consumption in GNI, an economy's energy and

<sup>1</sup> He is a co-founder and former chair of APEC-Nepal; Scientist of at the ASLF-USA and Research Associate at the Syracuse University, NY, USA, he can be reach at The Atlantic States Legal Foundation, Inc. 658 West Onondaga Street, Syracuse NY 13204-3711 USA email: [medani.bhandari@gmail.com](mailto:medani.bhandari@gmail.com)

resource density, and global heat have been raised in alarming rate. Likewise human population density, energy production, pollution and per capita industrial wastewater biochemical oxygen demand (BOD) have been rising and the per capita forest resources and biodiversity have declined from the 18th to 20th century. At the same time awareness about such changes is also raised from the local to the global level; several international and national treaties, memorandums and acts have been introduced, incorporated and implemented. However, these notions do not apply to the developing world because it encompasses a different set of environmental problems, basically linked with the poverty and inequality. Yet the developing

world, in particular, needs to consider GE principles to overcome its socio-economic (population growth, poverty, epidemics etc.) and environmental crises. It needs a different set of institutional architectures. However, till now there has been no institutional model that encompasses the responsibility to fulfill these assumptions and objectives of the GE. This research will briefly outline the practical problems to realize GE initiatives in developing world. The research argues for the reform of existing structures and to

create a new institutional framework which can coordinate and manage activities by which all related stakeholders may obtain the goals of GE, by creating and implanting environmental policy instruments such as standards; bans; permits and quotas; zoning; liability; legal redress as well as the flexible regulations.

This research proposes the historical overview of GE theoretical route and overseas the linkages between GE (theory) and social theories such as ecological economics and environmental/resource economics, and industrial ecology. Further, this research takes the GE initiative as a platform that still needs to be grounded to be accepted as an application tool or theory in addressing severe global environment problems.

GE highlights long-term impact, and searches for high-tech visions, while environmental sociology examines the world on the practicality of environmentalism based on social dynamism. However, because GE is still a relatively new concept, there is an urgent need to advance knowledge to foster more theoretical grounding for the green economy paradigm. In this paper, I argue that for GE to flourish, it should focus on beliefs about humanity's ability to upset the balance of nature, the existence of limits to growth for human societies, and humanity's right to rule over the rest of nature. GE philosophy should design in ways that provide an equal platform for both South and North to manage the environment by creating an effective institutional structure, strong policy, and framework for policy implementation that can work effectively, efficiently, equitably and transparently within the frame of global governance. The task that lies before us. We, as scholars and practitioners, have to help define this innovative and ambitious architecture.

**Key Words:** global conservation; green economic initiatives; environmental governance; social theories

## 1. Introduction

Since 2008, global conservation movements have taken different paths, with the especial focus towards the Green Economic Initiatives (GEI). The major stakeholder of global environmental governance, the United Nations, has been advocating for the integration of conservation and developmental themes as well as the establishment of a collaborative platform where all concern stakeholders can contribute to the health of the planet.

In fostering this concept, the UNEP called for a Global Green New Deal (GEND) in the wake of unprecedented economic stimulus packages. A UNEP report released in December

2008 called for a GEND and a subsequent policy brief to G20 heads of state urging them to turn the crisis into an opportunity by enabling a global green economy (GE) driven by massive job creation from a more efficient use of resources, energy-efficient building and construction, widespread use of clean and modern public transport, the scaling up of renewable energy, sustainable waste management, and sustainable agriculture that reflects the latest thinking in ecosystem management and biodiversity and water conservation (UNEP-GRID 2009:4).

However the concept of the GE is still maturing within the UN as well as in academia

and global forums for conservation. The UNEP (2010) notes that the GE is an important concept in linking economic growth to the achievement of environmental sustainability. It implies the realization of growth and employment opportunities from less polluting and more resource- efficiency in energy, water, waste, buildings, agriculture and forests. It also demands the management of structural changes such as potentially adverse effects on vulnerable households and traditional economic sectors. The concept of a GE and its policy implications will be

applied differently across the globe, reflecting national circumstances and priorities. However, for developing countries in particular, widespread opportunities exist to strengthen economic development, including poverty reduction as well as food and water security in developing countries, through improved environmental and natural resource management (UNEP 1010:5).

## 2. The green economy

A GE is one whose growth in income and employment is driven by public and private investments that reduce carbon emissions and pollution, enhance energy and resource efficiency, and prevent the loss of biodiversity and ecosystem services. These investments need to be catalyzed and supported by targeted public expenditure, policy reforms and regulation changes. This development path should maintain, enhance and, where necessary, rebuild natural capital as a critical economic asset and source of public benefits, especially

for poor people whose livelihoods and security depend strongly on nature. A green economy

(GE) can be defined as one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities. A GE is characterized by substantially increased investments in economic sectors that build on and enhance the Earth's natural capital or reduce ecological scarcities and environmental risks. These sectors include renewable energy, low-carbon transport, energy-efficient buildings, clean technologies, improved waste management, improved freshwater provision, sustainable agriculture and forest management, and sustainable fisheries. These investments are driven

or supported by national policy reforms and the development of international policy and market infrastructure (UNEP 2010:3).

The GE system is also a complex phenomenon which aims to achieve a low-carbon economy, life cycle analysis, and resource efficiency. The GE theory especially captures the notion of the vulnerability of human welfare, which can be understood as the result of widespread application of an unsustainable model of economic development. With the linkages of the recent year's economic and environmental crises, the UNEP urges cooperative efforts to address bringing economy and environment together, under the notion that the environment is where we live, and the development is what we all do in attempting to improve our lot within that abode. The two are inseparable (UNEP 2007). As the environmental issues have chain effects; these situations also can be seen through the lens of diverse and complex impacts of

climate change, water management, biodiversity conservation, and forest and land management

(UNEP 2010).

## 3. The major component of Green Economy (GE)

The UNEP GE Report outlines the eleven major issues to be addressed while empowering the social well-being of citizens of the developing world. The report addresses important sectors of the GE along with cross-cutting issues, such as finance and other enabling conditions, which include: "Green Industry Segments; Energy Generation; Energy Efficiency; Transportation; Green Building; Energy Storage; Environmental Consulting; Water & Wastewater; Finance/ Investment; Environmental Remediation; Air & Environment; Business Services; Research & Alliances; Agriculture; Recycling & Waste Materials; and Manufacturing/Industrial" (UNEP-GRID 2009:38-39).

It is important to note however that the UNEP is one of the major partners of the IUCN in theorizing and preparing policy directives, and encouraging governments to utilize GE concepts in the UNEP and the IUCN's member-states. Dr. Achim Steiner, the UN Undersecretary- General and UNEP Executive Director, notes that the GE concept is also far from being set in stone. It is, on the other hand, providing for some governments a rationale, blueprint, and a focus for actively realizing many of those unmet sustainability goals, albeit at the current level of each nation (UNEP 2010:2).

As noted above one of the goals of a GE is to help reduce poverty, while increasing resource efficiency and improving social welfare. Importantly, the GE is both a journey and a destination; it has much to do with the MDGs; and it is inextricably intertwined with many of the drivers and factors involved in trying to achieve them (UNEP 2010). There is a strong connection between the environment and the MDGs, since its goals include the eradication of extreme poverty and hunger; the achievement of universal primary education; the promotion of gender equality and empowerment of women; the reduction of child mortality; the improvement

of maternal health; combating major diseases; ensuring environmental sustainability; and the

creation of a global partnership for development (UNEP 2007).

The MGDs are based on principles of the people-first approach and the notion of the human well-being. As the UNEP (2007:13) notes, human well-being is the extent to which individuals have the ability and the opportunity to live the kinds of lives they have reason to value. People's ability to pursue the lives that they value is shaped by a wide range of instrumental freedoms. Human well-being encompasses personal and environmental security, access to materials for a good life, good health, and good social relations, all of which are closely related to each other, and underlie the freedom to make choices and take action. Furthermore, in capturing the impact of environmental change on human well-being as described in the Global Environmental Outlook -4 (GEO 2007) conceptual frameworks, the impacts of environmental change on human well-being are strongly mediated by social and institutional factors. Furthermore, the explicit links between environmental change and certain aspects of human

well-being, such as food availability and water stress, are better understood than, say, those related to education, personal security, good social relations, and overall access to materials for a good life.

#### 4. The Human Wellbeing and the Green Economy

Well-being encompasses more aspects than listed in the following text box; they do not, therefore, fully capture the impacts of environmental change on well-being. However, by

enhancing positive impacts, these concepts can pave the way positive environmental change, and it is likely that the addressing the well-being aspects can help to empower society to minimize its impact on the environment.

The conventional environmental problems are well-known effects of environment degradation; whereas single sources can generally be identified, the potential victims are often close to those sources, and the scale is often local or national. " Conventional problems such as microbial contamination, harmful local algal blooms, emissions of sulphur, nitrogen oxides, and particulate matter, oil spills, local land degradation, localized habitat destruction, fragmentation of land, and overexploitation of freshwater resources" (UNEP 2007:517). The green economy concept establishes causality of environmental damage and proposes a new way to tackle those causes by bringing all concerned stakeholders together in addressing the issues.

#### 5. Theory behind the GE concept

The position document (zero draft) for the Rio+20; clearly sets the desired outcome from the world conference but lacks theoretical background of green economy initiatives. The document also lacks discussion of how views toward the sustainable development are emerged and linked with the green economy. To fill this gap I propose the following conceptual map (modified from Hopwood *et al.* 2005).

The theoretical map of sustainable development and green economy

The map above shows the complex conceptual frame derived basically from the Club of Rome publication "The Limits to Growth" (1972). That report presented five challenging scenarios for global sustainability, (population, food production, industrial production, pollution, and consumption of non-renewable natural resources) which still represent the reality of the conservation problems (Turner 2008). The World Conservation Strategy promulgated by IUCN,

UNEP and WWF (1980) illustrated the importance of biological diversity, setting the objectives of conservation and requirements for their achievement, including priorities for national and international actions. Similarly, Caring for the Earth- A Strategy for Sustainable Living IUCN, UNEP and WWF (1991), also crafted the principles and actions for sustainable living, with a set of objectives for implementation and follow-up. However, the mainstreaming of sustainable development only took place after the United Nations Conference on Environment and Development in Rio de Janeiro in 1992, which also created the Convention on Biological Diversity (CBD).

Since inception, CBD has been playing an institutional role to conserve biological diversity, working collaboratively to achieve the Millennium Development Goals and targets (which came from the Millennium Declaration signed by 189 countries, including 147 Heads of State, in September 2000) with the convention parties (the governments) and other international UN agencies, international non-governmental organizations (IUCN, WWF etc.), and multinational and bilateral international development agencies (as listed in the conceptual map above, which is one of the initiatives of CBD - Biodiversity and Poverty, CBD 2011). Theory has advanced through research, development and academic institutions to provide a theoretical

frame for obtaining the CBD goals. Particularly since 2008, global conservation movements have taken on a new dimension, with a special focus on green economic initiatives.

The United Nations and its agencies, for example, are major stakeholders in global environmental governance, and have been advocating in international forums to integrate conservation and development themes and establish collaborative platforms where all concerned stakeholders could contribute to the health of the planet. The major players fostering the green economy include UNDP, UNEP, UNIDO, ILO, CBD, multilateral and bilateral institutions, member countries, regional forums, business and civil society groups, universities and regional commissions and international and national NGOs, among others. Because "Biodiversity contributes directly to poverty reduction in at least five key areas: food security, health improvements, income generation, reduced vulnerability, and ecosystem services" (Koziell and McNeill. 2002 as in Emerton 2005:1) this new initiative can be helpful to obtain the Rio+20 goals listed in the ZERO-DRAFT, somehow captures the theory of green economy.

Furthermore, GE concept is based on the basic principles of ecological economics and environmental/resource economics. These disciplines are specifically dedicated to the economic analysis of the relationship between humans and the environment; whereas ecological economics considers the economy as a subset of a larger ecological system (Dasgupta 2001; Daly 2005), environmental/resource economics examines the combination of environmental elements with

existing classical (or neo-classical) economic models (Harris, 2006). The following table shows the difference between these two schools of thought (on the basis of Bergh 2000 classification).

Table 1: difference between ecological economics and environmental/resource economics

Ecological Economics	Traditional Environmental and Resource Economics
1. Optimal scale	1. Optimal allocation and externalities
2. Priority to sustainability	2. Priority to efficiency
3. Needs fulfilled and equitable distribution	3. Optimal welfare or Pareto efficiency
4. Sustainable development, globally and North/South	4. Sustainable growth in abstract models

5. Growth pessimism and difficult choices
6. Unpredictable co-evolution

12. Cost-benefit analysis
13. Applied general equilibrium models with external costs
14. Maximization of utility or profit
15. Global market and isolated individuals
16. Utilitarianism and functionalism

Ecological economics takes a broad perspective in framing environmental questions by incorporating laws derived from the natural sciences. Ecological economy theorists emphasize the importance of energy resources, especially fossil fuels, in current economic systems. All ecological systems depend on energy inputs, but natural systems rely almost entirely on solar energy. A fundamental principle of ecological economics is that human economic activity must be limited by the environment's carrying capacity (Harris 2006:5-7).

Resource economics is the study of the how society allocates scarce natural resources. Moreover, the green economy concept is situated on the Neoclassical Welfare Economics theory and provides the alternative avenue with the use of ecological economic alternatives to cope with the changing scenario of the global environmental crisis.

The GE concept accepts the traditional economic model and provides options with the application of ecological economics, resource economics, and industrial ecology for sustainable livelihood. As Randall (1982) noted long ago, the mainstream economists fall into several loose groupings. The middle ground is occupied by those who find the mainstream economic methodology useful and even quite powerful, but who recognize that it has some perplexing limitations, especially when applied to policy analysis. "To one side of the middle, there is a group of free-market zealots, who see the economic system in very simple terms, and who

cannot understand why others fail to see what, to them, is obvious. They divide their time between proselytizing for free-market solutions among known economists and attempting to keep the other group of mainstream economists on the straight-and-narrow. On the other side of the middle, there is an ill-defined group of those who are quite uneasy about limitations, so the mainstream economists and policy analysts are suspicious that the zealots are confusing methodology and ideology, but are unable to develop a coherent alternative to the mainstream methodology" (Randall 1982:37 and also in Terry 1982:928).

Furthermore, the GE concept accepts the key conceptual issues of neoclassical welfare economics and alternatives to the ecological economic model, which largely overlap each other, as seen in Table 2.

Table 2: Key conceptual issues of neoclassical welfare economics and ecological economic model

Conceptual Issue	Neoclassical Welfare Economics	Ecological Economic Alternative
Value Monism	Reduce value to commensurable monetary units; utility function.	Separate value into incommensurable categories; multi-criteria assessment.
The Rational Actor	Individual consumers and firms at the	Analyze humans as social actors, consumers

	center of analysis.	versus citizens.
Marginal Analysis	Comparative statics of marginal changes.	Recognizes discontinuous change and total effects
Evolutionary Change	Evolution as constrained optimization, survival of the fittest view of market outcomes, individual based selection.	Importance of contingency, historical accidents, path dependency. Considers altruism and group selection as well as selfishness.
Uncertainty	Reduce uncertainty to risk. Market outcome focus to decision-making.	Precautionary principle to deal with pure uncertainty. Process-oriented, co-evolutionary focus to decision-making.
Decision Criteria	Efficiency as the sole criterion, usually based on potential Pareto improvements.	Equity, stability, resilience of environmental and social systems.
Production Process	Theory of allocation of fixed resources; production function.	Production as a biophysical process, thermodynamics; extended input-output approach, joint production of goods and polluting wastes.
Discounting	Straight-line discounting of future costs and benefits.	Recognizes the difference between individual and social valuation of the future; hyperbolic discounting.

Adopted from Gowdy and Erickson 2005:213 (Value Monism implies that all objects of utility

have some common characteristic that allows them to be compared. Until the middle of the twentieth century there was a lively debate in economics about varieties of value, including use vs. exchange value, labor and energy theories of value, and so on. Value Monism lies behind standard cost–benefit analysis (CBA) which uses the notion of consumer surplus to judge the desirability of public policy choices (Gowdy and Erickson 2005:212-213).

As seen in the table, the ecological economy examines the inter-relationships of

economic activities that have an impact on the environment. The ecological economy also looks at the functional relationships of ecosystems, social systems, and economic systems, which has a domino effect on social institutions as seen in Table 3.

Table 3: Ecological economic functions

Ecosystem		
Social System

Transactions among Economic Sectors	Transactions from Economic Sectors to Social Institutions	Environmental Impact from Economic Sectors
Transactions from Factor Inputs to Economic Sectors		

Transactions from Social Institutions to Economic Sectors	Transactions between Social Institutions and Value Added	Transactions between Social Institutions	Environmental Impact from Social Institutions
Environmental Inputs to Economic Sectors		Environmental Inputs to Social Institutions	

Drawn on the basis of Gowdy and Erickson 2005:219

Fueled by the ecological economic functional model, one of the major aspects of the GE is the examination of the impact of human economic activities on the biophysical environment and provisions of alternatives to reduce such impacts. Similarly, another discipline which relates closely to the notion of the GE is the industrial ecology, which looks more closely at the relationship between human activity and the environment in the context of an industrialized

society (IUCN 2010:3). The concept of industrial ecology is relatively old and uses a systematic approach to examine the trends of environmental degradation. The concept was first utilized by Jay Forrester at MIT in the early 1960s, to examine the world as a series of interwoven systems. Industrial ecology is the study of the physical, chemical, and biological interactions and interrelationships both within and between industrial and ecological systems (Forrester 1968,

1971 as in Garner and Keoleian 1995:3).

The idea of an industrial ecology is based on an analogy of natural ecological systems. In nature an ecological system operates through a web of connections in which organisms live and consume each other and each other's waste. The system has evolved so that the character of communities of living organisms seems to encompass a notion that that nothing which contains available energy or useful material will be lost. There will evolve some organism that will manage to make its living by using any waste product that provides available energy or material. Ecologists talk of a food web: a mutual connection of organisms to each other's wastes. The structure of a natural ecology and the structure of an industrial system, or an economic system,

are extremely similar (Frosch 1992:800, also in Garner and Keoleian 1995:31).

Broadly speaking, industrial ecology is the study of systems, which applies the multidisciplinary approach with orientation toward the future of analyzing interactions between industrial and ecological systems; material and energy flows and transformations; and changes from linear (open) processes to cyclical (closed) processes (so the waste from one industry is used as an input for another). Furthermore, it looks for ways to reduce the industrial systems' environmental impacts on ecological systems, to emphasize the harmonious integration of industrial activity into ecological systems, to suggest making industrial systems emulate more efficient and sustainable natural systems, and to identify the industrial and natural hierarchies, which indicate areas of potential study and action (Garner and Keoleian 1995). The goal of industrial ecology is to promote sustainable development at the global, regional, and local levels, which largely overlaps with the goals of the green economy principles.

Likewise, GE theory is fueled by the principles of environmental economics, which is a subset of economics concerned with the efficient allocation of environmental resources. The environment provides both a direct value as well as raw material intended for economic activity, thus making the environment and the economy interdependent. For that reason, the way in which the economy is managed has an impact on the environment which, in turn, affects both welfare and the performance of the economy (The Environmental Literacy Council 2007:6). Environmental economics examines human relationships with nature using rational choice models of human behavior. It analyzes the impact of economic activities on the environment, the significance of ecosystem to the economy, and suggests the appropriate ways of regulating economic activity so that balance is achieved in the society. Furthermore, environmental

economics is the understanding of various environmental factors, their influence in the economy, their functions upon the environment, and their impacts upon the life of the people of the present and future. Environmental economics also examines how the individual and society values the overall environmental dynamism and willingness to pay if needed to address the environment.

The ultimate goal of the GE is also embedded with the principles of sustainability. There is a link between social, economic, and environmental sustainability and green economics. The framework of sustainable development provides criteria for the management of human and economic development, while ensuring a proper and optimal function over time (Goodland and Daly 1996; UNEP 2007).

The GE is also based on the people-first approach whereas the concept of sustainability is based on the planet-first or equal-treatment approaches. Furthermore, the GE accepts the environment as the foundation for the furthering of people's well-being by increasing the asset- base and productivity; empowering poor people and marginalized communities; reducing and managing risks; and taking a long-term perspective with regard to intra- and intergenerational equity (UNEP 2007). Environmental health is central to all four of these requirements. Long- term development can only be achieved through sustainable management of various assets such as financial, material, human, social, and natural. Natural assets, including water, soils, plants, and animals, underpin the livelihoods of all people. At the national level, natural assets account for 26 percent of the wealth of low-income countries. Sectors such as agriculture, fishery, forestry, tourism, and minerals provide important economic and social benefits to people. The challenge lies in the proper management of these resources (Bass 2006; World Bank 2006;

UNEP 2007:10). Sustainability and GE stand for quality of life (including and linking social, economic, and environmental aspects); care for the environment; thought for the future and the precautionary principle; fairness and equity; and participation and partnership (Gibbs 2000). The only difference between the two is the procedure of implementation. In addition to these major theoretical roots of the GE, it can also be examined under the various sociological theories such

as governance, stakeholder, institutional, network, and so on.

## 6. The GE and environmental sociological theory

The GE can be evaluated within scholarship of environmental sociology. Environmental sociological scholarship reviews human ecology; environmental attitudes, values, and behaviors; the environmental movement; and technological risks. It conducts the risk assessment and evaluates the political economy of environmental politics. Furthermore, environmental

sociology looks toward bridging the dualisms – structure vs. agency, nominalism vs. realism, materialism vs. idealism, methodological precision vs. substantive importance – that continue to

pervade the discipline as a whole (Buttel 1987:484- 1987). One of the core implications of the

GE is to look at the societal situation in relation to social and environmental justice. In the same line, environmental sociology looks at society as a globalized marketplace with the

understanding that the prevailing forces in our lives undermine the real importance of our human communities and our planet. Green Economics argues that society should be embedded within the ecosystem, and that markets and economies are social structures that should respond to social and environmental priorities (Cato 2008). Environmental sociology acknowledges the role of conservationist, naturalist, holistic approaches, and particularly international media, and looks at the societal influence on the global bio-physical environment. Similarly, it looks at environmental organizations as a loose network structures rather than as dense inter- organizational networks, and finds it difficult to function in corporatist arrangements (Buttel

1987).

In the broader theoretical line, sociologists have not examined the greening of the world, which is present in sociological scholarships. The New Ecological Paradigm (NEP) propounded by Dunlap and Liere (of 1977), is one example of sociologists' concerns about the connection of the environment and society. The NEP focuses on beliefs about humanity's ability to upset the balance of nature, the existence of limits to growth for human societies, and humanity's right to rule over the rest of nature (Goldman and Shurman 2000; Dunlap *et al.* 2000; Dunlap 2008).

Here the subject matter of the GE and the organization sociology largely overlap. In this regard, it is noteworthy to see that how the NEP can contribute to the extension of GE, which is still

largely being discussed in international environment conservation forums by the United Nations agencies (particularly the UNEP) and conservation organizations like the IUCN.

New ecological paradigm

	New Ecological Paradigm (NEP)
Assumptions about the nature of human beings	While humans have exceptional characteristics (culture, technology, etc.), they remain one among many species that are interdependently involved in the global ecosystem.
Assumptions about social causation	Human affairs are influenced not only by social and cultural factors, but also by intricate link- ages of cause, effect, and feed- back in the web of nature; thus purposive human actions have many unintended consequences.
Assumptions about the context of human society	Humans live in and are dependentt upon a finite biophysical environment which imposes potent physical and biological restraints on human affairs.
Assumptions about constraints on human society	Although the inventiveness of humans and the powers derived therefrom may seem for a while to extend carrying capacity limits, ecological laws cannot be repealed

Source: Catton and Dunlap 1980:34; Modified from Buttel 1987:470

It is evident that the subject matters listed in the NEP are subject matters of the GE and

are situated in the same nexus. Both try to understand and search for options to reduce the public pressure on the global ecosystem, with the understanding of the conventional (forest

degradation, water pollution, air pollution, acid rain etc.) and the newly explored (climate change, ozone hole, rise in the global temperature and glacier recession) cause-and-effect environmental problems. The principles of environmental sociology, the NEP, and Green Economics as Kennet and Heinemann (2006) note, are positioned within a very long-term, earth-wide, holistic context of reality as a part of nature. It also incorporates and celebrates difference, diversity, equity, and inclusiveness within its concepts of society and community. Its philosophy is to manage economics for nature as usual, rather than to manage the environment for business as usual. Green Economics can incorporate a much wider, more practical, multidisciplinary range of knowledge than other schools of economics (Kennet and Heinemann 2006:68).

Green Economics highlights forward thinking for long term impact and searches for high- technology based on the practicality of environmentalism on the basis of social dynamism. However, because the concept is so new there is an urgent need to incorporate accepted sociological knowledge to foster more theoretical grounding. Linking the theory into the efforts of the UNEP for greening the world, the Max Weber concept of rationalism and the avenue of the global leadership hold very strong positions. Weber focuses on the trend of rationalization

in organizational governance in both the public and private sectors of modern societies and how society can produce more goods and services to fulfill social needs through formal forms of organizations. It is important to acknowledge that the former and current Secretary General of the United Nations, as well the Director General of the UNEP, have been trying to implement policy directives through UN agencies. Although there are few indications of a positive direction, it is too early to state the effectiveness of the initiatives. The UN has, for example, implemented varieties of environmental policy instruments such as standards; bans; permits and

quotas; zonings; liabilities; legal redress; and flexible regulations (UNEP 2010), as seen in Table

5.

## Environmental policy instruments and focus

Command-and-control regulations	Direct provision by governments	Engaging the public and the private sectors	Using markets	Creating markets
Standards Bans Permits and quotas Zoning Liability Legal redress Flexible regulation	Environmental infrastructure Eco-industrial zones or parks National parks, protected areas and recreation facilities Ecosystem rehabilitation	Public participation Decentralization Information disclosure Eco-labeling Voluntary agreements Public-private partnerships	Removing perverse subsidies Environmental taxes and charges User charges Deposit-refund systems Targeted subsidies Self-monitoring (such as ISO 14000)	Property rights Tradable permits and rights Offset programs Green procurement Environmental investment funds Seed funds and incentives Payment for ecosystem services

UNEP 2007:468

However, by nature, the implementation of the international policy instruments in the complex phenomena and the globalized the concept and follow the complexity procedure and still try to incorporate all most all component of GE.

## 7. Theory of governance, and GE

The UNEP policy directive on governance notes that the term 'governance' has been defined in many different ways, which vary according to the scope and locus of decision-making power (ECOSOC 2010). In recent times, many governance functions that influence individual and collective behavior have been executed beyond the exclusive remit of governments. Accordingly, there has been a shift to a definition under which the governance, at whatever level of social organization it may take place, refers to conducting the public's business by the collection of authoritative rules, institutions, and practices by means of which any collectivity manages its affairs (Ruggie 2004). The most important actors in the process of IEG include national governments; intergovernmental organizations such as the UN and its specialized bodies; civil society groups; private sector associations; and a variety of partnerships between public, private, and civil society actors. The key institutions and mechanisms through which

IEG is carried out include a multitude of intergovernmental, non-state, and public-private processes and initiatives that vary in format, structure, and membership (UNEP 2010: 2).

Governance engenders a number of perspectives and definitions which are closely linked with the concept of a green economy and the IUCN's efforts in mainstreaming the environmental governance principles. This definitional claim of Kahn and Zald (1990) is useful to examine the relationships between the IUCN and its members including INGOs, NGOs, national

governments, and private enterprises. It is an established notion that the global governance includes both nation-state and the non-state actors (INGOs, NGOs, Civil Society Organizations and private sectors (McKormick, 1999; Kauffman 1997; Schreurs 1997). In the social sciences, governance is also sometimes explained in Foucaultian terms (Baldwin 2003; Agrawal 2005), where government means less of the political or administrative structures of the modern state but

rather the people's internalization of the rules that leads to types of self-governance, that is

governance without active external enforcement (Foucault 1991). Foucault's work is notable; it philosophically illustrates the extensive social and political structures, including the state,

bureaucracy, and professions that are utilized in framing the GE. It also describes how knowledge and power are utilized by a hybrid international organization (such as the IUCN) at the state and transnational levels. In the broader sense governance is a matter of resolving conflicts, finding common purpose, and/or overcoming inefficiencies between actors in situations of interdependent choice (Barnett and Duvall 2005:6).

There are various players in global governance that include: multilateral organizations, such as the UN, IMF, World Bank and WTO; international associations, such as the G8, OECD, the Commonwealth and NATO; inter-regional groups, such as SAARC, APEC, and the Trans- Atlantic Partnership; regional bodies like the EU and NAFTA; private governance, such as the IUCN, Greenpeace, WWF, Amnesty International etc.; national governments, of which there are approximately 230 in the world; and finally subnational governments like US states, Canadian provinces, and the German *Länder* etc. (Cable 1999 as in World Humanity Action Trust 2000).

## 8. GE and Global Environmental Governance (GEG)

Global environmental governance (GEG) is the sum of organizations, policy instruments, financing mechanisms, rules, procedures and norms that regulate the processes of global environmental protection. In the contemporary world, there has been increase in the awareness of environmental threats. As a result numerous efforts have emerged to address them globally.

Since environmental issues entered the international agenda in the early 1970s, global environmental politics and policies have been developing rapidly (Najam *et al.* 2006:6). In the development of environmental policies the agencies of the United Nations have played the most important roles. Similarly, from the nongovernmental sector, the IUCN is only the IO who is involved in environmental governance policy formation. The GEG is the complex issue; therefore it is extremely difficult to evaluate success and failure. Najam *et al.* (2006) have tried to outline major efforts of UN in GEG reform, especially in strengthening the role of the UNEP.

The weakness of the GEG, particularly in the case of the UNEP, has been largely discussed in the UN General Assembly. In this line, with the realization of a strong international

environmental conservation organization, the French President, Jacques Chirac, called for the creation of a United Nations Environmental Organization (UNEO) at the UN General Assembly in 2003. In response to President Chirac's presentation, an informal working group was set up to facilitate dialogue among governments on UNEP reform (Najam *et al.* 2006). From 2003, there have been long debates in the UN General Assembly and in international forums about the global authority of environmental governance. Similarly, there have been discussions regarding models of GEG reform such as the Compliance Model, which advocates for the creation of a body that could provide binding decisions; and the New Agency Model, which refers to creating a new organization outside the UNEP with concentrated environmental responsibilities and the ability

to steer UN agencies in relation to environmental issues. This model has been highlighted mostly by the Bierman *et al.* mostly since 2000.

Bierman (2004:17) argues that creating a UNEO would pave the way for the elevation of environmental policies on the agenda of governments, international organizations, and private organizations; it could assist in developing the capacities for environmental policy in African, Asian, and Latin American countries; and it would improve the institutional environment for the negotiation of new conventions and action programs as well as for the implementation and coordination of existing ones.

Similarly the UNEP model focuses to upgrade the UNEP as a departure point for improving environmental governance and suggests upgrading it to a specialized agency to

strengthen its status. Likewise, the Multiple Actors Model argues that the system of governance comprises multiple actors whose actions need to be mutually reinforcing and better coordinated. Without better integration of these multiple actors, organizational rearrangement cannot resolve institutional problems (Najam *et al.* 2006:17-20). The success and failure of the governance depends on the governments' and other stakeholders' commitments and mutual efforts to attain the goals. In the case of environmental management it has a chain of difficulties largely associated with the public well-being. As Bierman (2004:12) notes, the UNGO is a political response to economic, cultural, social, and eco-logical globalization. It is not initiated and developed by some centralized decision-making body, but by an amalgam of centers of authority at various levels.

The efficacy of the current system of global governance has been the subject of intense debate. It is not only a normative discussion as to increased global governance, but likewise a debate on better global governance. By nature the success of GEG depends on political will. As World Humanity Action Trust (2000) notes, the challenge of GEG can also be seen on the basis of the World's Commons, whereas issues of responsibility have always been challenging. Furthermore, the effectiveness of GEG also depends on the capacity of tackling the commons as well as on the formation of coping strategies, and the availability of infrastructures for implementation.

The cause of ineffective GEG is due to the lack of cooperation and coordination among international organizations; the lack of implementation, compliance, enforcement, and effectiveness; inefficient use of resources; and global governance outside the environmental arena. Other causes of GEG's ineffectiveness can be noted similar to the analysis of Najam *et al.* (2006:24), such as the lack of leadership; developing country concerns; institutional fiefdoms; lack of political will; and the balance of national interests versus global environmental problems. They further note that developing countries have legitimate concerns about the state of the international system. They are already distrustful of the international system in general and are especially concerned about the rapid growth of environmental instruments and its possible impacts on their economic growth. Although developing countries are not necessarily beholden to the status quo, they fear that any change will necessarily make things even worse. Likewise, the UN institutions that are the major responsible body to implement the governance principles are often loath to let go of any part of their authority even where overlap and duplication are obvious.

There is also a marked decrease in the importance attached to environmental issues by the international community.

## 9. Conclusion

The economy is often given priority in policies and the environment is viewed as apart from humans. They are interconnected, with the economy dependent on society and the environment while human existence and society are dependent on, and within the environment. The separation of environment, society and economy often leads to a narrow techno-scientific approach, while issues to do with society that are most likely to challenge the present socio-economic structure are often marginalized, in particular the sustainability of communities and the maintenance of cultural diversity (Giddings *et al.* 2002:187).

This paper largely looks only the contemporary scene of macro level theories in which the concept of green economy (GE) is embedded; whereas GE broadly aims to reforest the global economy without hampering the earth ecosystem and boost social justice. However, there has been a long history of utilization of creativity for the human wellbeing without destroying the nature. Though in academia it has been documenting as a means of economic transformation only since 1980s (Hopwood *et al.* 2005; Donald 2010), when scholars began to examine the relationship between humans and the environment. The green economy theory is based on the neoclassical welfare economics; ecological economics and environmental/resource economics; industrial ecology; scholarship of the environmental sociology; ecological modernization theory etc.; however these concepts are in the trajectory to stand as new theory particularly the GE, which is close sibling of sustainable development (SD) and highly in global discussion. There is an assumption that GE tries to utilize the resources in sustainable way; bridge the gap of North and South, has long term focus; and is based on the integrated models with cause-effect relationships; and able to empower local communities and enhance environmental ethics (IIED- GlobeScan 2011).

Theoretically, it is possible to interpret environmental problems and recommend environmental reforms with the application of technology-intensive policies to manage the environment problems both in the developed and the developing world (e.g., through analysis of the existing situation, formulation of policy options, and encouragement to apply environment friendly advance technology for sustainable world). The GE initiative is embedded within the frame of sustainable development, including the globalization processes and global transformations, and providing the know-how to perceive global economic growth in a positive way.

However, till now there has been no institutional model that encompasses the responsibility to fulfill these assumptions and objectives of the GE.

Innovative knowledge institutions and partnerships are needed, and they must be guided by certain principles. Highly varied local situations and the uncertainty of complex social and ecological systems call for flexible, experimental, and adaptive learning-based approaches. The new institutions must also be problem-driven. The alleviation of poverty and environmental sustainability should be explicit goals for which knowledge must be generated. Institutions must transcend traditional disciplinary boundaries to generate new ideas and technologies and link science with policy and governance to frame questions and foster social change (Bawa, *et al.* 2008:126).

There is no global institution which can implement initiatives like GE and can bridge the gap between North and South. The role of international organizations (particularly the United Nations; the World Bank) has not been very healthy particularly in global environmental governance (Najam *et al.* 2006; Bierman 2004), whereas success and failure of the inventiveness GE aims to archive largely depended on how governance mechanism operate in particular niche. The GE concept is based on basket and macro assumption and too broad and too complex. The contemporary world problems can only be solved when micro level, sectoral and people driven approach is created and implemented. There is a need of umbrella institution, with the flexible

mandates, freedom from bureaucratic control, and a focus on specific problems, and able to forge the frameworks to implement work that is relevant to the identified societal needs (Bawa *et al.*

2008), and can work with the principles of mutuality and can create the collaborative platform

from global, continental, regional and national to the local level, with the especial focus to the developing world. Only the hybrid institution (German and Keeler 2010) can create the above mentioned situation; and creating such institutional architecture might be one of the options to enhance the feasibility of GE; however, there no any concept flowing to create such umbrella agency. GE without having the institutional frame assume too much about greening as an engine for growth, sectoral opportunities, hurdles and enabling conditions, the value of ecosystems and biodiversity, and the vicious cycle of environmental losses and persistent poverty.

There is also strategic uncertainty in applying green economy theory especially to the developing world because of the:

Uncertainty about the likelihood of adverse effects global environmental change; Over the consequences of change;

Over the speed of changes; and

About discontinuities and mostly the uncertainty over the effectiveness of policy instruments

To effectively imply the GE it is essential to have a firm commitment and consensus on how concept can be implemented. Several existing Agreements are not legally binding in their current form and lack clarity around a timeline for establishing a legally binding regime, which could help to obtain the goal of green economy.

These concepts are still a relatively new; therefore there is an urgent need to advance knowledge to foster more theoretical grounding for these green paradigms. I believe that for GE to flourish,

it should focus on beliefs about humanity's ability to upset the balance of nature, the existence of limits to growth for human societies, and humanity's right to rule over the rest of nature, which

is one of the major missing point of green economy concept.

Particularly, the GE philosophy should design in ways that provide an equal platform for both South and North to manage the environment by creating an effective institutional structure, strong policy, and framework for policy implementation that can work effectively, efficiently, equitably and transparently within the frame of global governance. The task that lies before us, particularly of the developing world, where environmental problems are more severe

We, as scholars and practitioners, have to help define this innovative and ambitious architecture and need to frame the model which fits for developing world.

## Association for the Advancement of Sustainability in Higher Education

Input for the UNCSD 2012 Compilation Document from Multiple National, Multinational, and International Tertiary Education Sustainability Organizations During the past several months, the following tertiary education focused organizations have been collecting input regarding UNCSD and the position of their members towards Rio + 20 outcomes: The Association for the Advancement of Sustainability in Higher Education (AASHE) (USA/Canada) Australasian Campuses Towards Sustainability (ACTS) (Australia/New Zealand) Global University Network for Innovation (GUNI) (Spain/international) Korean Association for Green Campus Initiative (KAGCI) (South Korea) Environmental Association for Universities and Colleges (EAUC) (United Kingdom) Collectively, these organizations engage more than one-thousand tertiary institutions across the globe. Each organization has gathered input through consultation and developed positions regarding the input for the UNCSD Compilation Document, the Zero Draft Document and the Outcomes Document. The statements from each organization are provided below. Although there are differences representing the different viewpoints and needs there are a number of common, international themes that are embodied in these statements. All organizations noted that it is critical for the role of tertiary education in advancing sustainable development to be explicitly recognized in all documents related to UNCSD 2012. The role of tertiary education in realising sustainable development and the eradication of poverty includes its functions in education and training, knowledge production and dissemination (i.e. research), community engagement, and as serving as exemplars for good practices in sustainable development. In addition, the organizations called for the UNSCD 2012 to insist on support for tertiary education through the provision of appropriate resources and through access to stakeholders so they can assist business, governments and society to advance sustainable development Although the organizations have not reached consensus on how to best create long term institutionalization of sustainable development within the United Nations structure, they do agree that there is a need to create an organization with United Nations support that will last long term and provide a focus for education for sustainable development. Within this structure there needs to be a body for addressing, assessing and encouraging continued education for sustainable development efforts.

As is noted in the following documents, the organizations are prepared to work with each other, to encourage their members to work with one another as well as institutions elsewhere, and to work with the appropriate United Nations agencies to assist tertiary education in advancing sustainable development. Australasian Campuses Towards Sustainability submission for the UN Conference on Sustainable Development 2012 1. Australasian Campuses Towards Sustainability (ACTS) is a non- profit member based organisation representing higher and further education institutions within Australia and New Zealand. ACTS aims to inspire, promote and support change towards best practice sustainability within the operations, curriculum and research of the tertiary education sector. ACTS seeks to build community and business partnerships at the local, regional and international level, in order to bring together a network of people for positive engagement, capacity building and change. 2. As an NGO operating within the Asia Pacific region, ACTS was involved in drafting the statements submitted by Major Groups and Stakeholders Asia Pacific, as well as Asia Pacific NGOs and we therefore strongly endorse and support both. 3. We believe that the UN Conference on Sustainable Development in 2012 (Rio+20) provides a critical and timely platform for governments at the highest level to secure renewed political commitment and action for sustainable development. Since 1992 the ecological crisis has worsened, whilst income and social inequalities have escalated even as high economic growth took place in several countries. Not enough has been done to achieve the paradigm shift required to change current unsustainable trends and we urgently call on governments to act on change towards sustainable development, rather than continue to debate the issue further. 1. The Rio+20 Conference should therefore honestly and openly appraise the implementation of the sustainable development commitments and action plans, and identify the gaps and obstacles, to ensure the transformation and integration of the economic, social and ecological dimensions. This needs to take place at the local, national, regional and international levels. 2. In moving towards sustainable development that also incorporates the inter-generational dimension, the critical role that tertiary education plays in achieving a long-term and sustainable shift needs to be galvanised. Recognising that changes in social values and practices are necessary in addition to technical solutions, there should be a focus on ensuring educational structures provide appropriate and relevant sustainability related skills and knowledge to achieve long term change within society and economy. Furthermore, there must be recognition and promotion of indigenous and local knowledge systems and their interface with more formalised knowledge systems. 3. The role that tertiary education can, should and does play in achieving sustainable development has often gone unrecognized and/or under represented. Since 1992, it has become clear that tertiary education institutions play a number of critical roles, including those summarized below: They provide relevant and critical education to our future government, business, industry, education and community leaders. By integrating sustainable development into curriculum, skills training and student development, tertiary education will equip the future with people who have the knowledge and capacity to positively impact the global economic and educational systems and programs, to eradicate poverty and improve access to education for all; They are critical homes for the research that provides sustainable solutions to the complex problems of development. Indeed, Secretary Ban Ki-moon pointed out in his call for the world's academic community to find solutions to global hunger, water shortages, and energy issues, "the academic community can help us connect the dots"; They serve as the "test beds" for examining the context in which innovative sustainability practices are executed. As these institutions implement a variety of context-specific sustainability practices through education and operations, they demonstrate the viability of these practices and provide models for sustainable development; They facilitate engagement of groups at the community level through building and maintaining strong links to government, business and civil society, as part of the core business of learning and teaching and as part of research; and They provide the opportunity for cross fertilization of knowledge and understanding through hosting students from the international community, who then transfer learnings into their own areas for the benefit of all. 4. These roles of tertiary institutions should be recognised while also acknowledging that: There is need to strengthen the holistic integration of environmental, social and economical dimensions of sustainable development; Through promoting sustainable societies it is essential to ensure gender equality, democracy, and human rights; The importance of peoples' participation, particularly of youth, women and indigenous peoples, and providing for their empowerment and relevant, functional education to support inclusive sustainable development, is most readily done through the tertiary education system; and There have been communities that have developed numerous solutions to sustainable development challenges in spite of a lack of leadership and support from high levels of government. These initiatives need to be fully recognized, supported and celebrated with a view to link, upscale and maintain efforts. 5. It is the fundamental role of tertiary education to innovate and be an open source of new technologies for the benefit and wellbeing of the global community. We therefore propose that tertiary education institutions need to be more open and transparent with regards to the sharing of information with the global community for the common good towards sustainable development. 6. Open sharing of information and innovation cannot be accomplished without the support and backing of business and government. We therefore request business and government to provide more substantial financial and in kind support to see such endeavours come to fruition. 4. Below are summarized the key issues, challenges and courses of action that have been identified and affirmed in the ACTS annual conference. Issues, Challenges and Ways Forward On Tertiary Education sector contributions to the Zero Draft document and subsequent implementation 7. We believe that the language that is used within the Zero Draft document and any subsequent documents must be directive and commitment-oriented to avoid any misunderstanding or 'ways out' from implementing the intention of the document and in order to achieve the paradigm shift required to move beyond rhetoric to action towards sustainable development. 8. We strongly feel that the role of tertiary education should be prominent throughout the Zero Draft document and any subsequent documents in order for the intent of Rio and Rio + 20 to be realised. The role of tertiary education should therefore not be relegated to inclusion as an ad hoc after thought. 9. We further believe that relevant and appropriate education at all levels is essential, as is support from pillars of society such as government and business. The recognition that informal learning processes are just as important as formal learning processes is essential, particularly to empower and encompass the marginalised youth, women and indigenous groups in society. These two approaches to learning can be used in conjunction to ensure the most beneficial outcomes at a variety of levels and learning. Education for all is an important cornerstone of civilisation, whether provided through formal or informal means. 10. Community engagement is part of the core business of higher and further education. We therefore believe that tertiary education institutions are in a strong position to facilitate the partnerships between government, business and civil society (including individuals and community groups) at the community level, as part of the implementation of goals and objectives associated with Rio + 20 outcomes (see Figure 1 below). Figure 1: Implementation for Change Model 11. We submit that tertiary education be recognised as playing a significant role in the Zero Draft document and in its subsequent implementation to achieving the commitments of Rio and Rio + 20 and in particular, as summarised below: Tertiary institutions, business/industry groups and governments alike should provide resources and funding to facilitate the fundamental shift to embed sustainability in the curriculum, research, and operations of tertiary education. The development of tools, resources and appropriate professional development for academics and institutional leaders are required for this fundamental shift in our collective approach to sustainable development to be successful Each tertiary institution within developed countries should partner and work with a tertiary institution from a developing country, for the purpose and mutual benefit of research, knowledge and resource exchange. Each institution should make this partnership explicit through registering on a dedicated page, coordinated by the apex body discussed further below Every tertiary institution should commit to sharing and learning from one another in the spirit of international partnership and long-term global societal benefit. As importantly, institutions should commit to working more closely with local community and business to facilitate dialogue, capacity building and change at the local level. On Green Economy in the Context of Poverty Eradication and Sustainable Development 12. We firmly believe that current prevailing economic models promote unsustainable consumption and production patterns, facilitate grossly inequitable economic systems that fail to eradicate poverty, assist exploitation of natural resources towards the verge of extinction, and need to be replaced by sustainable economies in the community, local, national, regional and international spheres. 13. We have concerns about the term 'green economy', and indeed, striving towards a 'green economy' as it leaves the current economic system open to 'greenwashing' without fundamentally changing a system that is significantly contributing to unsustainable practices. 14. The use of jargonistic titles such as 'green' to describe the economy only confuses the matter and the outcomes that need to be reached in order to realise sustainable development by ignoring the social dimension. We therefore propose that the approach is based on fully integrated sustainable economies, the key attributes of which promote and encapsulate: Cultural change towards sustainable development from the bottom-up, moving towards less unnecessary consumption; Sustainable production and consumption patterns, ensuring social and environmental wellbeing in that process; Decent work and livelihoods, ensuring that social benefits are distributed equitably among all peoples; The upholding of social justice, human rights, equity, and gender equality; Allows and supports the achievement of economic sufficiency; Safeguarding animal welfare and protection of ecosystems; and Regulation of financial markets, holding firms accountable for the social and environmental impacts of their operations. 15. We further question the use of Gross Domestic Product (GDP) as a measurement for growth and instead believe a more appropriate index be used, one which is based on people's wellbeing, inclusiveness, social equity, human rights, gender equality, decent work, biodiversity and ecological footprint. 16. We present that tertiary education institutions can play a significant role in developing the methodologies required to measure progress towards sustainable economies and indeed, sustainable development. Through our core business, we have the capacity to question terminology and measurement of non- economic factors, bearing in mind our reluctance to inappropriately value the environment. 17. We believe that technological

fixes alone will not solve environmental problems that are consequences of social and economic factors. Fundamental issues such as assessment of the potential impacts of new and untested technologies (e.g., geo- engineering, ocean fertilization, etc.) before they are released in the environment and deployed commercially must be addressed in the development and transfer of technologies. 18. We present that tertiary education has a significant role to play in ensuring the issue of assessment of potential impacts is addressed. Through our research we have the capacity to question current technologies, and innovate and appropriately assess future technologies prior to release, and importantly, to continue monitoring and evaluation once technologies are in place. 19. We further present that tertiary education can play a significant role in achieving sustainable economies in an accelerated timeframe through embedding sustainability across curriculum and by enabling it to be delivered through relevant learning and teaching practices that are based on best knowledge, unbiased and distanced commercial conflicts of interest to ensure the current skills and knowledge gap does not exist into the future. 20. We believe that stronger partnerships among governments, civil society organisations, private businesses and stakeholder groups must be established for promoting sustainable economies. Such partnerships need to be within frameworks of accountability and transparency including regulation. In line with this, tertiary education institutions and other stakeholder groups are enjoined to support good practice case studies and promote dissemination of information on such good practices for promoting sustainable economies in the context of poverty eradication and sustainable development. On the Institutional Framework for Sustainable Development (IFSD) 21. We believe it is necessary to build a strong apex body on sustainable development that works at the global level and can integrate the work of disparate multilateral bodies currently working on each of the three dimensions of sustainable development. This apex body needs to include the International Monetary Fund, the World Bank and the World Trade Organisation to ensure ALL dimensions of sustainable development are considered, and those with the ability to influence change are involved in decision-making processes. Options to be explored include transforming the Commission on Sustainable Development into a Council on Sustainable Development, or establishing a UN Organization on Sustainable Development. The unifying mandate of this body should be the promotion of sustainable development as a fundamental right of all. 22. We further believe it is essential to immediately establish a broad inclusive multi-stakeholder consultative body or network which is tasked with supporting the apex body through provision of information to assist in realising outcomes and monitoring the implementation of commitments and actions since 1992. Such a body should be participatory, democratic, and have an integral multi-stakeholder character that accords civil society with equal rights and equal voice as those of governments. 23. At the regional level, corresponding sustainable development bodies should be established. Sub-regional analogues could also be created where size and diversity of the region warrant it, such as in the Asia-Pacific. 24. At the national level, governments must establish multi-stakeholder councils for sustainable development (NCSOs) where absent, and strengthen them where already existing. NCSOs must coordinate planning, policy making, issues resolution, and reporting to the corresponding sub-regional/regional and global sustainable development bodies to ensure vertical coherence from implementation levels to the global level. 25. To be effective, the national sustainable development councils should be (a) organized at highest possible level, i.e., chaired by the Head of State/Government; (b) lodged with an appropriate coordinating body such Office of the Prime Minister or highest level elected represented body; (c) composed of relevant ministries and major groups/stakeholders including local authorities; and (d) institutionally stable by virtue of a strong legal mandate and endowed with a dedicated budget. 26. Local authorities are closest to the ground and directly serve the people. They must be given appropriate responsibility and be involved in decision-making that concerns sustainable development. 27. We strongly assert that it is essential for the apex body and governments to recognize the existing efforts of communities and NGOs such as ACTS in promoting sustainable development at the national and local levels. Recognition needs to be accompanied by support, with the provision of platforms to mainstream and link these efforts to have more sustained impacts on development. 28. The above proposals are initial steps to start fundamental changes that are necessary to meet the challenges of the 21st century and ensure a sustainable global civilisation in the centuries beyond. In the long term this may include updating the Charter of the UN. ACTS would particularly like to thank and acknowledge the contributions of the following people without whom this document would not be possible: Leanne Denby Danielle Rostan-Herbert Carlene Kirvan Corey Peterson Audette Benson Cathy Horan Brett Sharman Jennifer Klippel Stephen Derrick Aaron Magner Geoff Dennis Clem Campbell John Hassall Ed Maher Sam Kashuk Lesley Stone Lania Lynch Delwyn Langdon John Rafferty Jonathan Pheasant Rowena Scott GUNI's INPUT FOR RIO+20 Input on UNCSD Compilation Document 1. Expectations of Outcome: What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document? In the Outcome Document, two key aspects for the construction of sustainable development should appear: the role of knowledge and its use, and the role of education in the construction of a sustainable future for humanity and the planet: - The Role of Knowledge: We are on the verge of a change in the model of civilization, which cannot be constructed from the old paradigms of a system which has already met its limits. Sustainability involves the development of a new culture that attributes a different kind of value to knowledge and that questions the assumptions on which we are sustaining the comprehension of the world and the human dynamics in it. The major contribution of higher education to sustainability is the co-creation of pertinent knowledge for the understanding of reality, and of doing it with anticipation so as to play a proactive and committed role in the transformation and positive change of societies. The role of higher education as agents of social transformation and how its visions and actions could be re-oriented towards a new understanding of knowledge, broadening the scope of the use of knowledge in society to facilitate the emergence of better and positive contributions to global human coexistence. Renew thought for society: break the conformity of thought by proactively criticizing the world of ideas. Transform the paradigms and beliefs established in social, economic and political systems, how we organize our community and how this is reflected in our education systems. Analyze the ethical, social and environmental implications of the advance of knowledge: Increase the resources invested in analyzing the impact of science and technology and augment the capacity to absorb their expansion, in all aspects of human life. - El papel de la educación: Education is the key for change: sustainable development is a learning process, a way how people is prepared to live and to understand the world they live in. Rethink how we prosper, specially how we do it collectively and then we have to reconsider how we are educating and for what purpose. Now is the moment to widen the scope of education and research in society and to move beyond creating socio-economic wellbeing towards the transformation of society as a whole and the creation of a sustainable global community. 2. Comments on Existing Proposals: What are the comments, if any, on existing proposals: e.g. a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others? HEIs can contribute to a green economy and to sustainable development goals by providing the lessons learned by its research, through the training of the professionals of the future, and by introducing technological advances. - Research Experiences and lessons learned: provide solutions through research and through higher education experiences on sustainable development. Democratize access to knowledge and research: provide open access to expert knowledge, making it as useful as it can be for international organizations, UN system, governments, civil associations and citizenry. Move to the idea of socially relevant knowledge as human heritage. Networking and research for local needs and global challenges: Cooperation and co-creation of knowledge and technology. Local needs require local proposals in global frameworks, and global challenges require global solutions that are locally acceptable. However, global solutions can come from local experience and vice versa. Explore how to link scientific research and political decision making related to collective well-being. - Training and development of professionals that can lead the shift towards sustainability Go beyond educating professionals to educating citizens: The mission of higher education is to prepare critical professionals, with ethical awareness and civic commitment. Know how to contribute to the common good through professional practice. Educate for locality, democracy, citizenship, intercultural dialogue and relations, peace building, sustainability, global social justice and a deep understanding of life's dynamics. Make links with previous levels of education. Introduce complexity, uncertainty and transdisciplinarity in the training and in research, towards a holistic vision of reality. Link different areas of knowledge in order to understand complex issues and find solutions to the great problems in the local and global context. - Technology Incorporate sustainability in the creation of technology: shift paradigms from individual competitiveness, economic profitability and a short-term focus to the collective, with social and human benefits and sustainable in the long term. 3. Views on Implementation: What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.) It is necessary to shorten the time in which knowledge reaches society. The democratization of knowledge and education must bring better decisions and actions based on a suitable use of knowledge. The access to education and specially to higher education is an indicator of human development and there is a co-relation between education and the eradication of poverty (source: GUNI Reports on Higher Education in the World). 4. Implementation Tools and Timelines: What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actioned to be implemented? Open up to society: proactive engagement in dialogue with citizens and the rest of social, cultural and economic stakeholders. Create a true knowledge-based society through engagement with society as a whole. Provide a plurality of expert advice in dealing with green economy, poverty and the sustainable development goals. The creation of real partnerships for the co-creation of knowledge and answers to problems and to co-create visions for the future. Partnerships between higher education institutions (at all levels or scales), partnerships with the community stakeholders, and partnerships with governments, NGOs, civil associations, etc. Become cosmopolitan centres of global culture:

build bridges between different cultures and sources of knowledge. Knowledge is no longer produced exclusively by and consumed within universities. Instead, their task should be to connect different kinds of knowledge, forging links between knowledge and citizenship. Input on Role of Tertiary Education 1. Role of Tertiary Education: Please describe why the role of tertiary education institutions' in global sustainable development is central to Rio+20 discussions and Outcomes document. HEIs can play a significant role in building a sustainable paradigm. They may help in facing local and global challenges, facilitating society to answer major global challenges. Their vision and action could be reinforced with a role review towards the creation and distribution of socially relevant knowledge in education and research and in the relationship with communities. They can support, and even anticipate, ways for action to play a proactive and committed role in rebuilt societies. Higher education can prepare people to handle complex realities in a simple way and they should integrate emotional abilities with instrumental and knowledge related abilities. They can train people to learn to learn; to fully understand uncertainty and change; to handle a vast and complex universe of data from many sources and of many different natures; and to discriminate between information, knowledge and wisdom. They can train people to understand what we are, what we are like and how to be, both as individuals and as a group, and to manage their own education and development throughout life. It is an education based on the development of the individual. It is about learning to be, to know, to do, to live together and to transform oneself and society. All this implies personal, family and societal well-being; respecting and searching for knowledge and wisdom; engagement in productive work and recreation; social justice and cohesion; inter-cultural and international co-operation and peace; food security; active citizenship; futures thinking; responsible lifestyles; sharing of resources; and adaptability. 'UN Rio+20 Conference Position Paper' Prepared by KAGCI (Korean Association for Green Campus Initiative) We are living in a transition period of the greatest risk and uncertainty ever experienced in the human history. Earth's climate change, the destruction of natural ecosystem, together with the changing world economic geography and the deepening gap between the rich and the poor are the causes of amplifying anxiety. The most critical problem of these is the intensifying vulnerability of terrestrial ecosystem, which threatens the survival of mankind and their future. At the heart of the problem lies the sustainability crisis – the climate crisis, the environmental crisis, the resource crisis, and the energy crisis, over which mankind has limited control. To save earth and mankind from the present crisis, we need a fundamental change in economic and social lifestyle comparable to the early industrial revolution, which we can call "the sustainability revolution". Sustainability revolution should start at the university, a hall of the leading intellectuals and where future leaders are nurtured. Governments and businesses are tied up with short-term economic recovery and growth, so they are not ready to address the serious global crises in a macroscopic, holistic, and systematic manner. Once we recognize the seriousness of the sustainability crisis, we become sympathetic to the need for change and will start to search for ways to solve the problem. To spread this movement globally as well as locally, we should start a political, economic, social, and cultural reformation movement throughout the world based on the sustainability criteria. The formal education so far was influenced by the early industrial revolution and was framed to fit mass production and mass consumption. The coming age would not allow us to continue the hitherto spending spree lifestyle where consumption was a virtue. New era requires a paradigm shift from the growth-oriented paradigm to the sustainability-oriented paradigm, which cares for the ecological vulnerability of the nature. Concepts such as green economy or green growth are still based on growth-oriented paradigm and are deficient to save the earth and mankind from the crisis at hand. Therefore, following the 1992 Rio Declaration, we need to systemize and sophisticate the sustainability paradigm based on the triple bottom line. In line with this, education contents and methods to link the sustainability paradigm to the real world should be researched and taught at the tertiary education. We hereby declare that sustainability to be the main value for mankind to jointly pursue and tertiary education should play a pioneering role to transmit this value to future leaders and to save the earth from the sustainability crisis. For this, we ask to the UNCSD the following missions: 1. UNCSD evaluates the UNESCO-led DESD (Decade of Education for Sustainable Development) program, and newly starts a research and education program to overcome the upcoming sustainability crisis. 2. To this end, we suggest the UN Secretary General's Office to form a task force to prepare a vision for new value and social, economic systems commensurate with the sustainability crisis era. The Association for the Advancement of Sustainability in Higher Education (AASHE) Input for the Compilation Document of the UN Conference on Sustainable Development 2012 (Rio+20) The Association for the Advancement of Sustainability in Higher Education (AASHE) is an institutional member NGO representing more than 850 colleges and universities (primarily in the United States of America and Canada). During the AASHE 2011 Conference, a meeting was held to gather input for the UNCSD2012 Compilation Document. Also, for more than one month, AASHE provide opportunities for members to provide input via a webform on the AASHE website. From these various inputs, AASHE has compiled the following recommendations for UNCSD. Regarding the "expectations for the outcome of Rio+20: The outcomes document must recognize the critical role that tertiary education plays in sustainable development. During the past two decades it has become clear that tertiary education has been essential in discovering both problems and solutions related to sustainable development. Through tertiary education's research functions we better understand how what we do currently is not sustainable and what we must do to create a global sustainable society. Furthermore, the outcomes document should specifically recognize the role that tertiary education plays in providing learning opportunities for both professionals and for citizens in contributing to sustainable development. In addition, the outcomes document should recognize the role that tertiary education plays in serving as a testing site for new technologies and that tertiary education facilities can and do model what can be done at larger scale throughout society with respect to sustainable development. Indeed, how tertiary education facilities address issues of water and energy can be drivers of change throughout their communities and nations. Finally, the outcomes document should urge support for tertiary education efforts that provide opportunities through research, education, and example to both advance sustainable development and to eradicate poverty. With respect to comments on existing proposals, specifically a green economy: AASHE has witnessed the important role that tertiary education can play in training technicians and professionals to create and work in the green economy. Only with adequate access to tertiary education can the workforce required by a green economy be prepared for facing the uncertainty of the future and develop the creativity needed to solve the many complex and inter-related problems we face in sustainable development. Furthermore, the critical research that is needed to develop the various technologies of a green economy will necessarily be based in tertiary education's research capacity. Tertiary education will need to be engaged in the advancement of sustainable development. Without this engagement (and support) there will be little chance in creating any economy that is capable of eradicating poverty while reducing global environmental impacts. In particular, it will be important that the education of all stakeholder be advanced to the greatest degree possible but especially the education of young women who will be required to play a significant and equal role in solving the problems of our unsustainable development and growth. With regards to implementation and closing the implementation gap: AASHE supports strong language urging nations to charge their tertiary education system with providing society with graduates who are well trained in the skills needed for creating a globally sustainable society and to focus funding on research at those institutions on those areas that will contribute to sustainable development and the eradication of poverty. Furthermore, AASHE supports strong language that recognizes the need for academic programs to work in more integrated ways to make contributions to solving the complex problems of society. It is important that the outcomes document charges the nations to provide regular reports on their progress with respect to education for sustainable development in both education and training and in research and its dissemination. Finally, the tertiary education institutions themselves should be charged with reporting their progress towards creating a sustainable society within their own practices including reporting on their efforts and impacts on the eradication of poverty. Regular accountability by nations and their tertiary education institutions will be needed to ensure progress in ESD. With respect to specific cooperation mechanisms: AASHE exists to facilitate cooperation among tertiary institutions with respect to sustainable development. The United Nations should provide support for similar collaborative efforts in other countries and should assist in the formation of an umbrella organization that respects the individual differences of the various national and multi-national organizations while providing opportunities for international sharing of sustainable development knowledge. Furthermore, nations should be urged to develop specific funding for exchange programs for both students and instructors that are focused on furthering understanding of sustainable development and the eradication of poverty. Finally, support should be provided to tertiary institutions that make efforts to disseminate their findings to the larger public through community demonstration project and other similar activities. Perhaps most important is the position that AASHE takes with respect to the importance of tertiary education in sustainable development. It has been clear that in the past two decades, tertiary education has made great progress in addressing issues related to sustainable development. Only through the efforts of tertiary education do we understand the complexity of global climate change. Because, as Secretary General Ban Ki-moon said, "the academic community can help us connect the dots" it is imperative that the critical role of tertiary education in sustainable development be explicitly and regularly recognized in the outcomes document from UNCSD 2012. Paul Rowland, Executive Director AASHE Environmental Association for Universities and Colleges - UK The Environmental Association for Universities and Colleges - EAUC is the sustainability alliance for the United Kingdom. Established in 1996 the EAUC comprises 312 UK universities and colleges plus another 160 governmental, professional and support organisations and private companies. Our vision is a university, college and learning and skills sector where the principles and values of environmental, economic and social sustainability are embedded. Our Mission is to lead, inspire and equip Members and stakeholders with a shared vision, knowledge and the tools they need to embed sustainability within curriculum and operations. To develop a position to inform the Rio +20

submission, in October 2011 the EAUC conducted a survey of its members. We had a very significant response. In addition a consultation event was held at the University of Exeter. Iain Patton Chief Executive, Environmental Association for Universities and Colleges EAUC National Office Park Campus, Cheltenham, Gloucestershire, GL50 2RH 01242 714321 [www.eauc.org.uk](http://www.eauc.org.uk) Company No: 5183502 Charity No: 1106172 Environmental Association for Universities and Colleges - UK Input for the Compilation Document of the UN Conference on Sustainable Development Rio+20, 2012 The Environmental Association for Universities and Colleges - EAUC is the sustainability alliance for the United Kingdom. Established in 1996 the EAUC comprises 312 UK universities and colleges plus another 160 governmental, professional and support organisations and private companies. Our vision is a university, college and learning and skills sector where the principles and values of environmental, economic and social sustainability are embedded. Our Mission is to lead, inspire and equip Members and stakeholders with a shared vision, knowledge and the tools they need to embed sustainability within curriculum and operations. To develop a position to inform the Rio +20 submission, in October 2011 the EAUC conducted a survey of its members. We had a very significant response reflecting the aspiration (and frustration) from within the TE sector to play a more significant part in leading change. In addition to the survey a consultation event was held at the University of Exeter. I am grateful to EAUC Board Member Harriet Sjerps Jones at the University of Exeter for leading the EAUC response. Why the critical role of Tertiary Education Institutions to Global Sustainable Development must be central to Rio+20 discussions The role that tertiary education can, should and does play in achieving sustainable development has often gone unrecognized and/or under represented. In the past two decades, it has become clear that tertiary education institutions:

- Provide relevant and critical education to our future government, business, industry, education and community leaders. By integrating sustainable development into curriculum, skills training and student development, tertiary education will equip the future with people who have the ethical principles, knowledge and capacity to positively impact the global economic and educational systems, to eradicate poverty and improve access to education for all;
- Are critical homes for the research that provides sustainable solutions to the complex problems of development. Indeed, Secretary Ban Ki-moon pointed out in his call for the world's academic community to find solutions to global hunger, water shortages, and energy issues, "the academic community can help us connect the dots"; and
- Serve as the "test beds" for examining the context in which innovative sustainability practices are executed. As these institutions implement a variety of context-specific sustainability practices through education and operations, they demonstrate the viability of these practices and provide models for sustainable development. However, Education for Sustainable Development (ESD) is still not being supported at the national level. This is the conclusion of the UNESCO first report on the DESD (2009). International frameworks such as the UN DESD and UNFCCC have presented ESD models but these have not been implemented or supported by national agencies particularly in further and higher education. In light of this, it is recommended that:

- Tertiary institutions and governments alike should provide resources and funding to facilitate the fundamental shift to embed sustainability in the curriculum, research, and operations of tertiary education. The development of tools, resources and appropriate professional development for academics and institutional leaders are required for this fundamental shift in our collective approach to sustainable development to be successful;
- Each tertiary institution within developed countries should partner and work with a tertiary institution from a developing country, for the purpose and mutual benefit of research, knowledge and resource exchange. Each institution should make this partnership explicit through registering on a dedicated UNCSD page, though we do have concerns that this could become a meaningless window-dressing exercise.
- Every tertiary institution should commit to sharing and learning from one another in the spirit of international partnership and long-term global societal benefit.
- Tertiary institutions will act as a locus for catalytic research, learning and action for a transition towards a 'Green Economy'. We are divided over the use of the words 'green economy' or 'green growth' as to many of us this still emphasises economy and growth, and could neglect the importance of social value like social capital and community participation.
- The EAUC would like to see Rio Plus 20 provide incentives and governance frameworks to ensure that the role of education and learning for sustainability is understood by national agencies and supported through grants and other incentives particularly within FE and HE.
- Actions and implementation frameworks are being identified for Climate Change, Biodiversity, MDGS and similar thematic areas. ESD should have a similar set of actions and implementation framework which identifies what constitutes progress in ESD in TE (amongst other sectors).

Iain Patton, Chief Executive, Environmental Association for Universities and Colleges

## Associations 21

Input from Associations 21 to zero draft of final document Rio+20 :

Renew our commitment: for a really sustainable world, OKBrussels, October 28, 2011.

Associations 21 for Sustainable Development is a network of associations and organizations of the civil society working in different fields: environment, culture, agriculture, social economy, education, gender, social work, North-South relations, human rights, etc.

Cfr founding charter: <http://www.associations21.be/Charte-fondatrice>

Since 2006, we develop together a critical transverse thinking, so as to allow everyone access, here and there, now and later, to quality of life. As part of the major group "NGOs" defined in the Rio Declaration, we contribute to social dialogue in Belgium, in order to integrate sustainable development principles into all policies and, eventually, into society. Facing huge problems...

On one hand, concerns expressed by the visionary heads of the Rio Summit in 1992 have now become urgent and immediate problems: 1. In 20 years, the production of wealth has exploded but these are less and less spread. There are still many hungry (1 billion) while in 2011, global food production could be enough to feed 6 billion people, provided that provided that the global food system is controlled and modified. . Meanwhile, around the world, inequality is still growing. In Belgium, according to the General Report on Poverty published in 1994, between 6 and 7% of people were then living below the poverty line. Now in 2011, they are 15%. In 2015, most of the objectives of the Millennium Development Goals will not be achieved.

2. The pressure of human activity on resources has also emphasized; particularly, the ecological footprint of industrialized countries is still growing. Consequently, humanity has exceeded the limits of Earth's biocapacity and the most vulnerable populations are the most affected, especially in developing countries. The three major Rio conventions of 1992 (climate change desertification and biodiversity) have failed to contain global warming, desertification and biodiversity loss.

3. Liberalization has facilitated the globalization of trade without internalizing social and environmental costs. The financialization of the economy has pushed these trends and changed the balance of power in favor of financial institutions, so that it has been more and more difficult to take measures towards sustainability.

4. In this context, repeated crises and austerity programmes cause social conflicts and push numerous people in misery.... Seizing countless opportunities On the other hand, the commitments made in 1992 have led many initiatives across associations, companies, local authorities and States, many of whom have proven their relevance and are now credible solutions to get the humanity out of these multiple crises. There are countless examples in the following fields: agro-ecology & farming in the perspective of food sovereignty, renewable energy, social economy, green building, waste reuse, waste reduction ..., complementary currencies, solidarity-based initiatives... Last but not least, the successful experiences of participation of those concerned, particularly the poorest, and of involvement of cultural actors in this dynamic of change. The challenge: proactive and courageous policies, effective regulation It is now time to bring out such initiatives of their niches and to break the "glass ceiling" that prevents them from transforming the world ... and society. To achieve such a goal, proactive policies and effective regulation are crucial, because the market can't regulate itself. It is also possible because for 20 years, the concept of sustainable development made its way into institutions and in minds. Given the crises described above, the biggest part of the world's population is now ready to understand their relevance and emergency. So as in Belgium, it is high time to apply the "durability testing" (impact assessment of decisions on sustainable development), enshrined in law and mandated but not yet implemented. Yet this tool being "oiled" at different power levels, we could make it effectively inspiring for others countries. Renew our commitment yes, if it is for such a goal! The final declaration of the Rio Conference in 2012 has to be an inspiring and motivating document for all stakeholders invited to renew their commitments for the future, while taking into account not only the "emerging challenges" but also all those who waited too long for the decisive stage of regulation. This commitment will be meaningful only if it is based on:

- thorough analysis of the reasons why our development patterns aren't sustainable
- an alternative proposal responding to the wishes of the majority, by insuring social justice in the redistribution of the wealth produced
- a drastic reduction of the footprint of

industrialized countries while preventing runaway in some emerging countries. Renew our commitment: yes, but how? This commitment can be translated into sustainable development Goals (SDG). At first, they should not compromise the continuation of Millennium Development Goals (MDGs). Anyway, for those SDG to be acceptable, relevant, realistic and measurable by all parties, their definition will take some time. It is thus reasonable to agree the SDG to take over the MDGs as from 2015. Managing transition to fair and sustainable ways of life. The first theme of the conference - a green economy - is reductive, even though the following clarification was added: "In the context of sustainable development and poverty eradication." By the way, green economy is presented as the main solution. Decoupling is one of the measures but not the only one to allow a real change of paradigm & civilization. The priority is now to put the social pillar in the heart of the debate. Indeed, allowing more fairness in a world with limited resources, requires not only technical changes but also social and cultural innovations. The economy is not a goal but a tool that must be converted so as to allow transition to a fair and sustainable patterns for all. Furthermore, the aim is to fight against inequality and not against poverty (certainly not against the poor!) Why transform the economy? Because since 1992, overall wealth produced by growth, exploded! But translating these gains in economic welfare is less efficient. Between 1990 and 2001, for every \$ 100 increase in GDP / person, only \$ 0.6 helped reduce extreme poverty (\$ 1 / day / person). So, for every dollar allocated to poverty reduction, \$ 166 come from production and consumption. The poor performance of the current economic model not only does not contribute to reduction of inequalities, it exacerbates also dangerously environmental degradation. How to transform the economy?

1. Ensuring compliance with social and environmental standards

2. Internalizing in costs all social and environment costs.

3. In these perspective, it is necessary to go beyond GDP with a set of indicators, focusing on the ecological footprint (which should be as close as possible to 2 ha / person / year), on employment, inequality (a GINI index as low as possible), well-being and the realization of human rights. According to the Human Development Index (HDI), the minimum level to achieve worldwide minimum = 0.8. Equity, redistribution, participation. Currently, the least developed countries lack the financial means to implement such a policy. However, these countries are in the frontline to face famine and climate change. Meanwhile, in Northern countries, societies are increasingly dual. Therefore, it is urgent to:

1. Ensure, in each State and at the global level, more redistributive policies that reduce inequalities and ensure the realization of basic human rights for all.

2. Protect Social Security where it exists (eg in Belgium) against the austerity policies, and promote it where it remains to be established.

3. Recognize gender differentiated impact of climate change and strengthen the role of women, as agents of change, in the decision-making processes by improving access to resources, land and skills ensuring their right to sexual and reproductive health and education as mentioned in Chapter 24 of Rio Declaration (1992).

4. Consolidate the role of policy as regulators.

5. Control and regulate financial markets, therefore tax havens must be forbidden.

6. Create tax instruments harmonized on global level: financial transactions tax, carbon tax wealth tax, withdrawal from the Agreement of Chicago giving the airline industry an exemption from tax on kerosene.

7. Establish fully participation processes that systematically take into account the views of civil society on different power levels, particularly in the context of international meetings; for example, the new "Committee for Food Security" (CFS) established within the framework of United Nations (FAO). Reduce the environmental footprint. The drain on natural resources should be minimized, while maximizing the positive social and environmental effects of new production and consumption models. Therefore, the following steps need cooperation rather than competition between States, in order to:

1. Set product standards on global level, so as to ban pollutants on global level as well.

2. Subordinate world trade agreements to treaties on labor, environment, agriculture and human rights, so that it really takes into account needs and potentials of people, preservation and restoration of natural resources. So, prices in B to C exchanges should really internalise the costs of different production processes and marketing patterns so that they become sustainable and in order to stop dumping.

3. Reach a binding, ambitious and fair climate agreement, so that EU is committed to reduce GHG emissions by at least 40% within Europe and to finance the climate fund for developing countries.

4. Ensure greater coherence for all SD policies. This requires:

- a "no harm" procedure so as to avoid conflicting policies or measures (eg, a Belgian or European climate policy inducing land grabs and a netto increase of greenhouse gases beyond our borders).
- Reinforced analysis tools: systematic impact assessments – including gender among other criteria – of trade policies, financial, agricultural, climate, cooperation, etc. .... on SD.
- Stated objectives to fight inequalities (not against the poor but with their participation)
- stricter application of the precautionary principle to new technologies. Our "common's" future. The international community must now integrate a hierarchy of rights giving primacy to the commons and public interest. Therefore:

1. Basic rights all over the world must be realized with respect for international human rights and environmental conventions. These, like food security, must be above trade laws in the hierarchy.

2. It is time to shift land, agriculture and trade policies by giving primacy to the right of use for soil and natural resources rather than to exchange laws. So as to stop merchandising of commons, the principles related to the economics of ecosystems and biodiversity (TEEB), should be reviewed. Ultimately, credible alternatives to emissions trading and other "rights to pollute" should be defined because so as they are, they increase inequalities.

Agriculture: a priority solution

During Rio UNCS D Summit, a particular attention should be given to the entire food system. On this point, Association 21 refers to the common declaration of civil society entitled "Rio +20: time to act" [www.time2actrio20.org](http://www.time2actrio20.org). Indeed, agriculture is both a problem and the main solution to feed the world on a sustainable way, while ensuring food sovereignty principles and self-sufficiency. In that perspective, let:

1. relocate production and diversify consumption and food processing by reducing the power of oligopolies..

2. Stop land grabbing.

3. Give priority to the food function in land use including ensuring women's access to land.

4. Support farming and agro-ecology.

5. Replenish food stocks at the regional level to ensure the supply of distressed areas and to avoid speculative outbreaks of prices, while ensuring proper management of stocks in order to avoid waste.
6. Improve the local processing, including by women, to increase the added value and therefore the management and control of income on the spot of production. Institutional Framework for Sustainable Development: providing the means to act multilaterally. Institutional reform considered in the Rio+20 process is an opportunity for adopting within the UN institutions a strategy to integrate the principle of sustainable development into all policies and institutions. To do this:
  1. The coordination of different agencies and programs must be provided by an executive body with the authority and resources needed to monitor and sanction, if needed. In that perspective, the "Commission of Sustainable Development" (CSD) must be transformed and eventually merged with ECOSOC.
  2. Beside this, it is now time for UNEP to become a true World Environment Organisation, like the WTO and the ILO, the WTO being subject to compliance with social and environmental standards in all economic policies.
  3. In order to legitimate taking account of sustainability on all levels, we also advocate the creation of an international panel of experts on sustainability like the IPCC (for climate) and the IAAST (for Agriculture and Food). Such a panel should be balanced regarding to gender and South//North.
  4. The recommendations from the Committee for Food Security (UN / FAO) must be applied in the regions and states with the participation of civil society.
  5. Environmental justice must be ensured and the principle 10 of Rio Declaration must be implemented. Therefore Arrhus Convention should be extended worldwide.
  6. A multilateral protocol should ensure implementation of the precautionary principle before any use of new technologies.
  7. The framework for action should include accountability mechanisms for authorities. They should be accountable to the major groups and create services "ombudsman" for future generations.

## Ateliers Terre

### CONFERENCE DES NATIONS UNIES POUR LE DEVELOPPEMENT DURABLE RIO+20

#### 4-6 JUIN 2012, RIO, BRESIL. CONTRIBUTION DES ATELIERS DE LA TERRE

*Tirée du Livre Blanc de la Global Conference 2011,*

#### **REVOLUTIONNER LE CADRE INSTITUTIONNEL DE LA GOUVERNANCE POUR FAVORISER LE DEVELOPPEMENT DURABLE ET L'ESSOR DE L'ECONOMIE VERTE**

### Préambule

Les Ateliers de la Terre sont un cercle de réflexion indépendant qui analyse les défis contemporains et à venir en matière de développement durable. Leur vocation est d'animer la vie des idées, d'encourager l'innovation intellectuelle et de produire de l'expertise pour alimenter la vision de long terme des décideurs et participer à

l'élaboration d'un nouveau modèle de société, plus respectueux de l'homme et de l'environnement.

Résolument tournés vers l'action, les Ateliers de la Terre se focalisent également sur la valorisation des expériences de terrain réussies et diffusent les bonnes pratiques pour accompagner le changement vers des modèles de développement et de société plus soutenables.

Les 26, 27 et 28 septembre 2011 a eu lieu à Evian, France, la VIème édition de la Global Conference des

Ateliers de la Terre.

Plus de 900 décideurs, leaders d'opinion, responsables gouvernementaux, chefs d'entreprises, d'ONG et d'associations, représentants de la société civile, chercheurs, académiques et medias, originaires de 65 pays,

se sont réunis pendant trois jours pour échanger et imaginer les solutions permettant de faire face aux défis économiques, sociétaux et environnementaux qui caractérisent notre monde actuel.

Dans le cadre de cette VIème édition, la thématique retenue était la suivante : « **Quelles révolutions pour gouverner ensemble un monde vulnérable ?** ».

En choisissant ce thème comme cadre de réflexion commun de ces trois jours d'échanges, les Ateliers de la Terre ont voulu souligner le fait que de véritables révolutions (des modes de pensée, des modes de vie, des modes de consommation et de déplacement, et surtout des modèles de gouvernance) sont nécessaires pour

faire face aux enjeux de notre temps et pour parvenir à une gouvernance efficace et partagée à l'échelle pl a-

nétaire.

**Cette 6ème édition de la Global Conference a donc été pensée en cohérence avec le Sommet de Rio, puisque l'une des deux priorités de Rio+20 est la définition d'un cadre institutionnel de gouvernance du développement durable.**

Déclinée en plusieurs sous-thèmes pendant ces trois jours, cette question a permis de mettre en avant les innovations et solutions existantes, mais aussi d'imaginer des révolutions qui nous permettront de faire face, tous ensemble, aux défis posés par la multitude des crises (politique, économique, sociale et environnemen- tale) que nous traversons.

Trois *Commissions de Travail* ont également présenté leurs travaux à Evian dans le cadre de cette VIème édition de la Global Conference :

-*Internationaliser le modèle de l'entrepreneuriat social*, en partenariat avec le Groupe SOS.

*-Responsabilité Sociale et Environnementale : faire évoluer la gouvernance des entreprises, en partenariat avec Terra Nova.*

*-La médiation comme solution de règlement des conflits environnementaux, en partenariat avec l'ESSEC-*

IRENE.

La contribution des Ateliers de la Terre pour la Conférence des Nations Unies pour le Développement Durable est tirée du Livre Blanc de la Global Conference 2011 et s'attache à mettre en avant les idées et propositions évoquées pendant ces trois jours de réflexion.

**Cette contribution est donc constituée de la synthèse des échanges de la Global Conference 2011. Elle comprend également les recommandations proposées par les experts des trois commissions de travail mises en place cette année.**

#### **« Face aux bouleversements du monde, quelle gouvernance construire ? »**

*Concilier vulnérabilité et développement économique nécessite un changement radical de modèles. Plusieurs alternatives sont envisagées: remettre en cause le système actuel de la gouvernance mondiale ; renforcer les institutions existantes ou mettre en place une instance plus fonctionnelle. Un modèle unique est-il souhaitable ? Comment allier attentes des acteurs économiques et équilibres géopolitiques mondiaux ?*

« Nous avons trop parlé, et insuffisamment agi ». Cette phrase de Karl Falkenberg résume un constat largement partagé par les acteurs et experts du développement durable.

Les décideurs d'aujourd'hui sont nés dans un monde qui comptait entre trois et quatre milliards d'habitants. Aujourd'hui, la population mondiale atteint quasiment sept milliards d'habitants, et les prévisions pour les décennies à venir envisagent neuf milliards d'habitants.

La gouvernance à l'échelle mondiale est souvent perçue comme le produit de l'action des grandes institutions internationales, comme les Nations unies. Or, ces institutions, nées dans un contexte historique et social bien précis – celui de l'après-Seconde Guerre mondiale – doivent faire face à une remise en cause profonde de

leur mode de fonctionnement. Leur pertinence dans le traitement des défis du développement durable est questionnée.

L'efficacité des modes de gouvernance doit s'évaluer à l'aune de leur capacité à traiter les défis du

développement durable dans leur multiplicité, même si les objectifs peuvent à l'occasion apparaître

contradictoires. Les réponses proposées doivent tenir compte cette complexité et, en premier lieu, elles ne doivent pas négliger l'humain. Par exemple, sauvegarde de la biodiversité ne peut se faire au détriment de la réduction de la pauvreté et de l'élimination de la fin, qui sont des objectifs du millénaire.

Le maintien en l'état pour les prochaines décennies des structures de production et des contraintes extrêmes qu'elles placent sur les écosystèmes ne peut être accepté. Il est nécessaire de mettre en place sans tarder

des solutions durables, qui réduisent les émissions et la pollution, utilisables par toutes les nations.

Le constat de l'insuffisance de la gouvernance actuelle face aux évolutions du monde et aux défis du développement durable étant établi, quelles solutions s'offrent aux acteurs économiques, politiques et sociaux ?

#### **Gouvernance publique des acteurs privés ?**

*Les acteurs privés sur la sellette*

Certains regrettent qu'avec l'accélération de la mondialisation qui a marqué les vingt dernières années le code de conduite de ces entreprises soit devenu évanescent, que leurs comportements ne soient pas étudiés

ni surveillés, et qu'aucune instance ne permette de les sanctionner efficacement le cas échéant.

Les conventions et traités concernant des sujets spécifiques, comme la pollution, ne sont pas des outils adaptés pour condamner des actions néfastes de la part d'entreprises.

Certaines organisations internationales manquent de pouvoir, comme l'OIT ; d'autres sont perçues comme des instruments de la mondialisation libérale et de l'économie financière qui assure la prospérité des multinationales, comme le FMI, la Banque Mondiale ou l'Organisation mondiale du commerce.

Les entreprises multinationales se sont développées jusqu'à atteindre une puissance considérable. La mise en perspective des montants en jeu avec les chiffres correspondant à l'économie des États donne le vertige.

À titre d'exemple, le chiffre d'affaires d'un géant de l'informatique, dont les effectifs sont d'environ 50 000 employés dépasse le produit intérieur brut de plus de 120 pays ; et la capitalisation boursière de cette même

entreprise correspond au produit intérieur brut de l'Autriche – un pays avancé et industrialisé de plus de 8 millions d'habitants.

Cette puissance peut légitimement soulever des inquiétudes, car le déséquilibre induit met un grand nombre

de pays dans une situation d'inégalité, voire de sujétion, face aux multinationales.

En réalité, toutes les entreprises ne s'exonèrent pas de leur responsabilité sociale et environnementale. Dans les pays en voie de développement, si certaines entreprises se conduisent en prédateur, d'autres adoptent un comportement responsable. Celles-ci sont encore plus sensibles à cette responsabilité lorsqu'elles évoluent dans un environnement fragile où les effets de leurs interventions peuvent être considérables.

Il convient d'éviter l'amalgame et de ne pas blâmer l'ensemble des entreprises pour ces comportements.

Toutes les entreprises présentes dans des pays émergents ont la capacité, en agissant sur les salaires,

conditions de travail et modes d'opération, de participer à une gouvernance incluant les besoins de la population et permettant de répondre, même à petite échelle, aux nécessités du développement durable.

*Soft power : quels résultats ?*

Ce type d'action est considéré comme faisant partie du « *soft power* », par opposition aux lois et règlements

(« *hard power* »).

Cette gouvernance locale peut être définie dans des codes et chartes de conduite des entreprises, dans des engagements vis-à-vis des parties prenantes et de la société civile. Mais il convient surtout qu'elle associe les

pouvoirs publics et les autorités locales, qui sont souvent défaillants dans les pays les moins avancés.

Par ailleurs, les citoyens ont une responsabilité individuelle sur leurs modes de vie, qui permet de favoriser des comportements bénéfiques pour le développement durable. Cette responsabilité peut s'étendre aux organisations des modes de gouvernance collectifs : dans l'entreprise, dans les associations, dans les collectivités territoriales – jusqu'aux gouvernements.

L'idée maîtresse est d'éviter la dilution bureaucratique et de conférer à tous les acteurs la responsabilité

partagée des décisions ?

### **Dépasser les blocages nationaux**

S'agissant des États et des organisations internationales, leur action est souvent marquée par la défense d'intérêts catégoriels. Les défis du développement durable se heurtent aux structures économiques, sociales et industrielles complexes des pays qui défendent – ou croient défendre – le bien-être de leur population et

leur prospérité économique. Les vicissitudes du Protocole de Kyoto montrent que les pays riches ont toujours tendance à pratiquer un protectionnisme économique qui nuit au développement durable.

Certains pays émergents ont connu des succès remarquables dans leur trajectoire de développement au cours des dernières années. Ainsi, sous la présidence de Luiz Inácio Lula da Silva, près de 40 millions de Brésiliens sont sortis de la pauvreté.

Toutefois, ce succès a été réalisé au détriment de la protection de l'environnement et en particulier de la forêt

amazonienne.

L'intérêt du développement brésilien entre en conflit avec la préservation du patrimoine mondial qu'est la forêt amazonienne. Cette situation est symptomatique de la difficulté de la coordination internationale dans la gouvernance du développement durable : les écosystèmes et les défis environnementaux associés ne reconnaissent pas les frontières internationales.

Il a été proposé de bâtir une Organisation internationale de l'environnement, qui pourrait fédérer des compétences issues d'autres organisations internationales (Santé, Travail, Agriculture, Commerce, etc.) et offrir un cadre de débat et de décision plus efficace afin de dépasser les critiques énoncées à l'encontre des

grandes institutions de la communauté internationale. Dans la perspective de la préparation du sommet Rio

+20 de 2012, cette proposition est d'une grande actualité.

Dans l'Union européenne, la règle de l'unanimité, très stricte dans son application, apparaît comme un frein à une action déterminée en faveur du développement durable. De manière générale, l'unanimité ne saurait être

un mode de gouvernance adapté aux défis à relever.

Toutefois, dans le cadre européen, l'effet d'entraînement d'une décision soutenue par la Commission et le Conseil est particulièrement bénéfique. L'adoption d'une gouvernance reposant sur la majorité qualifiée ou sur des pôles de pays volontaires peut être un moyen d'action efficace en ce sens.

### **La gouvernance : une médiation**

Le succès d'une gouvernance nouvelle doit être apprécié au travers des réponses et des résultats obtenus. À

ce titre, l'évaluation doit être intégrée à la gouvernance. Des acteurs externes sont en mesure de porter un

regard sur les projets en amont, lors de leur conception, et en aval lors de leur implémentation. Une évaluation sincère, objective et efficace favorise les bonnes pratiques.

De tels exemples existent au sein d'initiatives de conservation ou de démarches volontaires d'entreprises, comme celle de la Table ronde sur l'huile de palme responsable. De manière similaire, certaines entreprises

comme Puma répondent aux questionnements soulevés par des ONG sur la dangerosité des produits.

La gouvernance est un moyen et non une fin en soi. C'est un ensemble de pratiques qui a pour but d'orienter les acteurs – publics, privés et individuels, de favoriser les comportements responsables et de définir et implémenter des réponses aux défis du développement durable. C'est une médiation entre les besoins immenses du développement durable et les réponses nécessairement nouvelles qu'il convient d'apporter.

#### « Acteurs nouveaux, pouvoirs différents, modèles balbutiants »

*De nouveaux acteurs ont émergé sur la scène internationale. La « société civile » est devenue incontournable. L'émergence de ces nouveaux acteurs nécessite une redistribution de l'équilibre des pouvoirs à l'échelle globale. Faut-il une révolution des institutions démocratiques pour les associer aux décisions ? Sommes-nous déjà rentrés dans la République des réseaux ?*

Les mots « gouvernance » et « nouveaux modèles » ont probablement été ceux qui furent le plus prononcés au cours de cette 6ème Edition de la Global Conference des Ateliers de la Terre. En effet, la conscience d'une nécessaire recherche de nouveaux types de gouvernance et d'approches économiques est de plus en plus forte et partagée. L'émergence de la société civile dans les différents débats politiques et économiques laissent à penser que de nouveaux acteurs prennent ou partagent une partie du pouvoir et que s'instaure un

nouveau bilatéralisme « société civile » face à « pouvoir économique ». Peut-on réellement parler de nouveaux acteurs ou n'assistons nous pas plutôt à un rééquilibrage des pouvoirs ? Au delà de ces questions, le sujet d'un nouveau mode de gouvernance mondial reste la clé pour s'engager vers un vrai développement durable.

La question consistant à comprendre si on faisait face à de nouveaux acteurs ou à un rééquilibrage des pouvoirs entre acteurs a été centrale au cours des différents débats.

Depuis la chute du Mur de Berlin, le poids du pouvoir politique ne cesse de reculer dans les pays démocratiques et ce sont des acteurs présents depuis toujours qui ont soit conforté leur pouvoir soit qui sont

arrivés sur le devant de la scène. Il s'agit essentiellement de la société civile et de ses relais dont l'expression

n'est plus sans conséquence aujourd'hui pour les sphères économiques et politiques. Il s'agit aussi bien sur

de la mise en lumière d'une évidence existant depuis les balbutiements du commerce qui est le poids

croissant et affirmé de la sphère privée économique. C'est elle qui aujourd'hui exerce une part non

significative du pouvoir et qui s'oppose de plus en plus régulièrement aux représentants de la société civile.

Les débats de cette conférence ont clairement mis en avant plus une réallocation des pouvoirs entre acteurs

que l'apparition de nouveaux acteurs.

Les taux de participations aux élections des différents pays démocratiques ces dernières années traduisent de leur côté la baisse de crédibilité et de confiance des politiques. Cette dégradation est renforcée par de multiples exemples de leur incapacité à réguler les problématiques sociales, économiques et environnementales mondiales. Les exemples du changement climatique et de la crise financière sont les plus récentes illustrations.

Dans le même temps et sur ces mêmes sujets les ONG ont démontré leur capacité à faire entendre les voix

de cette société civile qui hors crise ou révolution ne s'exprimait que peu lors des siècles passés. Les

conséquences des alertes portées par ces organisations au cours de ces dernières décennies ont souvent été à l'origine d'évolutions importantes du fonctionnement de notre société. Cependant, les récents bouleversements politiques dans le Monde Arabe démontrent aussi que la société civile n'a pas toujours besoin de relais structurés (type ONG) pour s'exprimer y compris pour engager ces changements de gouvernance radicaux. Et c'est ainsi qu'on arrive aujourd'hui à une nouvelle réallocation des pouvoirs ou la sphère économique concentre l'essentiel du pouvoir face à une société civile et à ses relais se faisant de plus en plus entendre et à un pouvoir politique à la recherche d'une nouvelle gouvernance et d'une nouvelle

légitimité.

L'internationalisation relayée par l'efficacité des moyens de communication et de transport est une des

explications de ce rééquilibrage des pouvoirs. En effet, très vite, l'activité économique humaine s'est fondée sur les échanges internationaux. Dès l'antiquité, les « hommes d'affaires grecques » agissaient sur un territoire méditerranéen bien au delà de leurs frontières. Ceci n'a fait que se renforcer, au cours du temps et aujourd'hui, l'activité économique et mondiale totalement globalisée et s'appuie sur des outils et moyens adaptés. Cette question de la territorialité n'est pas neutre dans les débats. En effet, l'expression politique est encore très ancrée sur des zones locales et assez peu globales. Elle agit au plus au niveau d'un pays. Les premières recherches d'une gouvernance mondiale politique au travers de La Société Des Nations puis via

l'ONU n'ont pas été grandement couronnées de succès jusqu'à la fin des années 90. La multiplication des

crises politiques sanitaires, alimentaires et politiques a démontré le manque d'efficacité de ces organismes

supranationaux.

Dans le même temps, ces mêmes crises ont fait apparaître une série d'acteurs issus de la société civile qui

se sont élevés d'une part contre l'inefficacité politique et d'autre part contre l'ignorance volontaire par la

sphère économique des enjeux sociaux, sociétaux et environnementaux.

C'est ainsi qu'on arrive à la situation d'aujourd'hui où une puissance économique mondialisée fait face à une

société civile locale et globale en l'absence d'une gouvernance politique et démocratique internationale.

Il serait illusoire de croire que la recherche d'un développement durable pourra se passer de l'action politique.

C'est cette action, dans une logique démocratique, qui est la seule à même de proposer des modèles de

société compatibles avec la démographie et les ressources de la planète.

Face à ce constat la question de savoir comment travailler à un rééquilibrage des pouvoirs, qui est le seul garant

d'un exercice efficace de la démocratie.

L'enjeu qui est devant nous n'est pas de donner la prééminence à un acteur mais bien d'envisager, comme cela a pu être proposé lors des débats de cette conférence, un fonctionnement multilatéral accompagné d'une réelle gouvernance. Il n'est pas envisageable que la société civile et la sphère économique ne soit pas régulées et le seul à le pouvoir ne peut être que l'acteur politique. Ce dernier doit donc faire sa révolution et chercher un modèle démocratique supranational capable de s'adapter à la nouvelle territorialité des enjeux et

de leurs acteurs.

Le fonctionnement des Nations Unies depuis Rio illustre ce que pourrait être un fonctionnement politique international : sur les sujets environnementaux et sociétaux l'ONU tente d'organiser un multilatéralisme connectant l'ensemble des acteurs vers un seul et même objectif. L'efficacité n'est pas encore démontrée, mais c'est probablement sur ces bases et sur ces modèles où sphères politique, économique et sociétal

peuvent se rencontrer et travailler ensemble.

Dans un plan similaire, la construction de l'Europe essentiellement sur des réalités politique et économique est une réelle opportunité de tester le fonctionnement d'une gouvernance supranationale.

L'enjeu est majeur pour les politiques du monde entier car ce n'est ni aux acteurs économiques ni à la société

civile de proposer un modèle de développement et une gouvernance. Ils doivent y contribuer mais dans le respect d'un cadre défini au plan politique. Face à des enjeux globalisés la réponse des décideurs politiques ne peut se faire que dans un contexte lui aussi globalisé. Le vrai modèle à inventer reste donc aujourd'hui un

modèle politique ancré sur son territoire mais en même temps capable de faire face aux grands enjeux qui se

jouent à l'échelle de la planète. L'économie et la société civile agissent déjà dans ces deux champs et le plus

souvent sans réelle gouvernance, et sur ces points les débats de la Global Conference 2011 ont été particulièrement riches.

À 7 milliards de personnes aujourd'hui sur la planète et à 9 milliards demain le mot clé de cette conférence reste plus que jamais « Gouvernance ». Mais l'enjeu est de savoir de quelle gouvernance parlons-nous. Elle

ne peut être que démocratique et construite par le pouvoir politique. Il faut donc sans briser la nécessaire territorialité locale imaginer un mode de fonctionnement international dans le sens de l'intérêt général. Cette approche impliquera parfois des renoncements pour certains et des changements pour d'autres, mais elle est probablement la seule option soutenable dans le long terme. Il ne s'agit pas de réinventer la démocratie mais bien de la faire comprendre et accepter à 7 milliards de citoyens d'un même territoire.

#### **« Le développement durable, esquivé ou réalité ? »**

*Le concept de développement durable est aujourd'hui questionné. Tel qu'il a été conçu, il ne semble plus répondre aux enjeux actuels. Devant l'accélération des crises, faut-il plus mettre l'accent sur la responsabilité des acteurs ou imaginer des stratégies de rupture? Le temps n'est-il pas venu de mettre en œuvre des modèles révolutionnaires ?*

Le « développement durable », bien que né il y a environ 25 ans, reste un concept encore jeune qui n'a pas atteint la pleine maturité. Ses principes fondateurs sont bien connus : éclairer les décisions de toute organisation à la lumière des enjeux sociaux, environnementaux et économiques et placer ces mêmes décisions dans une optique de long terme en prenant en compte les transferts générationnels. En reliant les

pilliers économique, social et environnemental, le développement durable place la notion d'équilibre au cœur

des décisions des acteurs économiques. La justesse du message porté par ce concept est aujourd'hui

confirmée par les événements se déroulant au niveau mondial. En effet, le système économique actuel néglige les dommages causés à l'environnement et aux populations. Lors d'une récente conférence de l'ambassade de Chine à Paris, il était fait état des dommages causés par les désordres sociaux et

environnementaux dans ce pays : 70% des cours d'eau et des bassins sont pollués; 40% en ont perdu l'exploitabilité, 90% des cours d'eau sont gravement pollués dans les zones urbaines, 16 des 20 villes les plus polluées du monde sont chinoises, 33% du territoire reçoit des pluies acides, etc. Dans cette situation, la perte économique causée par la pollution est estimée entre 8 et 13 % du PIB. Avec une vision de développement durable, la croissance chinoise peut-elle être vraiment considérée comme une croissance à

deux chiffres ? Nous n'entrerons pas ici dans la question des indicateurs de mesure de la croissance (ou du

bien-être) mais ceci nous amène à penser que le constat posé par le concept de développement durable est

plus que jamais d'actualité et que c'est probablement la validité de ce constat qui s'est radicalisée au cours

des dernières années.

Certains acteurs continuent encore à esquiver leurs responsabilités en contestant (parfois partiellement) la réalité du constat de la détérioration de l'état de la planète et en utilisant le concept de développement durable dans une version édulcorée sans s'attaquer à la racine des problèmes. Et pourtant, près de 25 ans après la naissance de ce concept, la situation s'est aggravée. Nous citerons ici les éléments collectés par le

WWF et publiés dans le Rapport Planète vivante 2010. Il est notamment fait état du déclin de la biodiversité, en particulier dans les zones tropicales et les habitats d'eau

douce. L'index planète vivante montre en effet une baisse de 30 % depuis 1970, dont les aires tropicales apparaissent comme les plus touchées avec une baisse de 60 % en moins de 40 ans. Par ailleurs, les pays à haut revenus ont une Empreinte Ecologique environ trois fois plus importante que les pays à revenus moyens et à peu près cinq fois plus importante que les pays à faible revenus. Enfin, sur la base des données de 2007 analysées dans le rapport 2010,

l'Empreinte Ecologique de la Terre a dépassé sa biocapacité de 50 %. D'après le WWF, « nous sommes en

capacité de dépasser cette biocapacité uniquement dans la mesure où l'atmosphère fonctionne comme soupape de sécurité, ceci malheureusement sans éviter des conséquences climatiques. »

Le concept de développement durable s'appuie sur un constat et porte une ambition. Depuis quelques années, le constat de la gravité de la crise environnementale et sociale s'est confirmé, et l'ambition de réconciliation intra et inter générationnelle est plus que jamais d'actualité. Il ne faut donc pas se méprendre

sur le concept de développement durable car il ne porte pas en lui les solutions concrètes et pratiques du quotidien, c'est à l'ensemble des acteurs de les inventer à la lumière des principes posés. Ce concept est en fait à même de provoquer les nécessaires ruptures d'intérêt général. Et aujourd'hui, en effet, la pensée

théorique et les expérimentations de terrain progressent rapidement se portant, pour certains, vers des innovations de rupture. Ainsi, la radicalité du constat ne peut plus nous faire esquiver le problème posé par la

relative lenteur et pauvreté des solutions apportées jusqu'à présent.

A cet égard, les entreprises sont parfois aujourd'hui des vecteurs privilégiés de la mise en place de solutions

concrètes plus radicales. De quelle nature sont-elles ?

On distingue des actions liées à différents types de stratégies : s'adapter / innover sans rupture pour les uns

et innovation de rupture pour les autres en remettant en cause le modèle existant. Dans les stratégies d'adaptation, on retrouve par exemple la réduction des impacts sociaux et environnementaux des produits ou le développement d'une offre éco conçue ou socialement responsable permettant respectivement de baisser les coûts et de développer l'attractivité d'une marque. Quant aux stratégies de rupture, on peut donner l'exemple de l'économie de fonctionnalité dans laquelle l'entreprise revoit de façon fondamentale sa stratégie

commerciale en passant de la vente de produits ou de biens à la vente de services ou bien encore des stratégies BOP (Bottom of the Pyramid) qui consiste à développer une offre spécifique pour les populations à bas revenus.

Ces innovations de rupture sont aujourd'hui possibles dans nombre de secteurs d'activités. Les participants à la table ronde lors de la 5ème Edition des Ateliers de la Terre ont d'ailleurs appelé à ne pas se cacher derrière certains arguments qui ont jusque là entretenus « l'esquive ». Des éléments tels que le besoin de

gouvernance mondiale, les bienfaits du progrès technologique nous placent dans un horizon de temps bien souvent trop lointain, alors que des actions en rupture peuvent être engagées dès maintenant par les acteurs économiques.

Pour conclure, il nous apparaît que le concept de développement durable est toujours pertinent et en phase avec les enjeux actuels. Il définit une ambition de changement qui s'appuie notamment sur le constat d'une détérioration accrue de l'état de la planète. Néanmoins, malgré ses 25 ans, il s'agit d'un concept jeune qui laisse place à l'inventivité des acteurs dans sa mise en œuvre opérationnelle. Aujourd'hui, l'urgence face à la

montée des enjeux environnementaux et sociaux et la relative faiblesse des acteurs publics en terme de

régulation mondiale ont poussé certains acteurs privés à engager des stratégies de rupture, n'est ce pas là la

plus belle preuve de vie de ce concept de développement durable ?

#### « Rio+20 : souvenirs ou avenir ? »

*L'ambition commune proclamée il y a 20 ans et fondée sur une approche globale s'est traduite par des résultats en demi-teinte. Peut-on toujours construire nos espoirs sur cette démarche ou faut-il favoriser les espaces de négociations sectoriels et régionaux ? La croissance verte est-elle réellement un concept fédérateur ?*

La conférence Rio+20 aura lieu à Rio de Janeiro (Brésil) du 4 au 6 juin 2012. Elle porte sur deux thèmes : la croissance verte dans un contexte de développement durable et d'éradication de la pauvreté et le cadre institutionnel du développement durable. Elle aura lieu 20 ans après la conférence Rio de Janeiro en 1992 qui

avait notamment donné lieu à la création de l'agenda 21 ainsi qu'à l'adoption de trois grandes conventions :

sur la diversité biologique (CDB), sur les changements climatiques (CCNUCC) et sur la lutte contre la désertification. Ces 20 ans écoulés appellent à dresser un bilan des avancées.

Concernant l'évolution de l'environnement mondial, le résumé pour les décideurs du programme des Nations

Unies pour l'environnement rappelle que le monde a connu de nombreux bouleversements depuis 20 ans : la

population mondiale a augmenté de 5 à presque 7 Mds, le PIB de presque 2% par personne. Les innovations technologiques ont amélioré les moyens d'existence et la santé.

Le rapport juge ensuite qu'il : « il est évident qu'il y a des changements environnementaux sans précédent au niveau régional et mondial » « ces changements sans précédent sont causés par des activités humaines dans une société mondialisée, industrialisée et interconnectée, provoquée par des flux croissants de biens, de services, de capitaux, de populations, de technologies, d'informations, d'idées et de travail et affectent même des populations isolées ». Le « développement humain » est ainsi mis en péril. Les populations pauvres restent les plus vulnérables. « Les systèmes sociaux et biophysiques peuvent atteindre des points de basculement au delà desquels les changements sont graves, plus rapides et potentiellement irréversibles ».

Les acteurs ont également profondément évolué : en 1992, les ONG agissaient comme aiguillon des négociations mais pas comme parties prenantes. Les collectivités

locales n'étaient pas organisées sur le développement durable, certains maires étaient néanmoins présents comme personnalités. Aujourd'hui, une « diplomatie scientifique » qui s'appuie notamment sur le GIEC est mise en œuvre. La société civile est reconnue

comme un acteur à part entière. Elle est pleinement associée aux négociations. Les entreprises ont également désormais largement intégré le développement durable à leur processus de prise de décision et de gestion.

Interrogés sur les avancées qu'il y a eu depuis la première conférence en 1992, les membres du panel ont tous estimé que Rio avait permis l'émergence de nouvelles initiatives, de penser différemment. En particulier, pour [Mohameed SHAREEF](#), le sommet de Rio fut « l'un des sommets des Nations Unies les plus ambitieux ».

Concernant ensuite les actions concrètes qui ont été mises en place à l'issue de ce sommet, Marie Hélène Aubert rappelle que des agendas 21 locaux ont été réalisés dans de nombreuses collectivités locales avec des mesures sur les trois piliers du développement durable et une large participation des citoyens. Elle estime

cependant qu'il n'y a pas eu de transformation en profondeur des modèles de développement ni un changement

de vision qui auraient permis d'identifier des leviers d'action pour faire émerger un nouveau modèle.

Dressant lui aussi un bilan de la conférence, [Nick ROBINS](#) juge pour sa part que le sommet de Rio a permis la création d'un cadre légal nécessaire et efficace mais que Rio + 20 devrait mener à des avancées sur le sujet des forêts, de la comptabilité nationale ... sans se cantonner à une adaptation de l'existant.

La seconde question de Christine Oberdorff concernait les obstacles politiques ou économiques qui pourraient bloquer le projet. Les panelistes ont estimé que le sommet de 2012 interviendra dans un contexte de crise économique et sociale qui pourrait avoir des effets contradictoires. Les dirigeants politiques essaient

« d'éteindre l'incendie » sans prendre les mesures qui s'imposent. Plus qu'un simple « ajustage », le modèle

semble arriver à sa fin et imposer l'invention de nouveaux modèles de gestion de territoires avec des principes

communs.

Pour [Nick ROBINS](#), il faut donc intégrer d'avantage une vision à long terme et des critères économiques et sociaux. Selon les données publiées en mars 2009 par l'IFC (International Finance Corporation), l'intégration ESG concerne près de 300 milliards de dollars d'encours dans les pays émergents et les fonds ISR représentent près de 52 milliards de dollars en 2008 (contre près de 30 milliards en 2006).

[Gonzalo RAMIREZ GUIER](#) juge quant à lui que la pression dominante des populations concerne l'emploi et qu'il faut identifier un point à partir duquel une population accepte de réduire ses impacts sur l'environnement

et de ralentir sa croissance économique pour mieux le préserver.

La troisième question concernait les moyens à donner aux pays forestiers pour avoir des alternatives à la déforestation. Marie-Hélène AUBERT estime que c'est une obligation : « *si on ne s'assure pas que les forêts sont gérées durablement, on creuse notre tombe* ». Il faut d'une part être conscient de la situation, des enjeux et d'autre part user des outils en étant sûr de leur efficacité. La directrice adjointe de Futur Facteur 4 rappelle qu'il n'y a pas que la certification, « *il faut arrêter de parler et user des outils qui existent* ». Cela permettra aux pays forestiers d'être producteurs de croissance verte avant d'être consommateurs.

La dernière question concernait les mécanismes financiers. Les panelistes ont estimé qu'il y avait pour les investissements deux secteurs particulièrement importants : les nouvelles énergies et l'efficacité énergétique. Mais ils se sont aussi demandé si l'économie verte était forcément plus vertueuse et si elle devait se traduire par un verdissement de l'économie ou un changement de paradigme. Certains ont néanmoins rappelé que le fait de se focaliser sur la dimension économique du développement durable est problématique et qu'elle ne doit pas faire oublier la dimension sociale et l'enjeu de la réduction des inégalités. Certaines avancées peuvent être obtenues au niveau local et dès aujourd'hui.

La prise de conscience et les moyens techniques peuvent donc permettre de faire de Rio+20, selon Véronique Smée, « *un sommet de transition vers un monde plus soutenable... à condition que les décisions politiques suivent* ». La croissance verte dans un contexte de développement durable et d'éradication de la pauvreté et le cadre institutionnel du développement durable seront les deux thèmes principaux.

Concernant le premier thème, la Commission européenne estime que nous avons besoin d'une économie qui puisse assurer croissance et développement, tout en permettant d'améliorer le bien-être humain, d'offrir des emplois décents, de réduire les inégalités, de lutter contre la pauvreté et de préserver le capital naturel dont nous dépendons tous. « *Ce type d'économie, une économie verte, constitue un moyen efficace de promouvoir le développement durable, d'éradiquer la pauvreté ainsi que de répondre aux nouveaux défis et de remédier aux lacunes existant dans la mise en œuvre* ».1

Ce concept rassemble mais il n'est pas précisément défini. Lors du 2nd comité préparatoire de Rio +20, les pays ont notamment échangé leurs points de vue sur cette notion. Bien qu'une définition consensuelle n'ait pu être dégagée, les différents blocs de négociation ont pu être précisés. Les délégués de l'OASIS (alliance of small Island states) ont introduit la notion « d'économie bleue » qui met l'accent sur le développement durable des océans. Ensuite, le G77 estime d'une part que l'intégration sociale et la nécessité d'éviter tout protectionnisme vert doivent figurer dans le document final portant sur l'économie verte et d'autre part que l'économie

1 Communication de la commission européenne, « Rio+20: vers une économie verte et une meilleure gouvernance », 20 juin 2011.

verte doit être conforme aux Principes de Rio et à l'Agenda 21, prioriser l'éradication de la pauvreté ainsi que

réaffirmer le droit souverain des pays à disposer de leurs ressources.2

La gouvernance mondiale du développement mondial est rendue difficile par le fait que pour assurer la gestion commune des ressources terrestres, des mécanismes de régulation doivent être mis en place par les

Etats. Or, chacun est tenté d'adopter la stratégie du « passager clandestin » ou de gérer les autres crises qui

s'imposent : économiques, sociales qui donnent la fausse illusion que les enjeux environnementaux ne ré-

clament pas de solutions immédiates.

Pour Jean Pierre Thébault également, il faut trouver un nouvel équilibre entre le global et le local ainsi que renforcer le statut des Etats comme socle inattaquable de l'ordre mondial. Si le concept de développement

durable est partagé, il faut désormais lui donner un sens plus concret et cela passe pour lui par la réforme des institutions. Il juge que la gouvernance internationale du développement durable est en plein débat au-

jourd'hui entre les tentatives avortées de favoriser l'émergence de solutions rapides dans le système onusien

et la possible création d'une organisation mondiale de l'environnement.<sup>3</sup>

Plusieurs options de réformes existent en effet, rappelées par la Commission européenne : d'abord « *renforcer le rôle du Conseil économique et social des Nations unies (ECOSOC) en matière de développement durable, en accordant une importance égale à ses trois piliers* ». Ensuite, « *transformer la Commission du développement durable (CDD) des Nations unies en un organe plus permanent doté de fonctions élargies [de façon à garantir que] tous les organes des Nations unies concernés fassent une place beaucoup plus grande au développement durable.* »

Est enfin possible un renforcement du PNUÉ, soit en améliorant « son fonctionnement dans le cadre de son mandat actuel », soit en le renforçant et en le dotant de nouvelles tâches et responsabilités ou enfin « en créant une organisation environnementale multilatérale mondiale, par exemple en transformant le PNUÉ en

une agence spécialisée des Nations-Unies (telle que l'OIT).

« La conférence de Rio+20 débouchera sur des objectifs concrets, qui mèneront à des plans d'action », assure Brice Lalonde, co-coordonnateur exécutif de la conférence des Nations unies sur le développement durable appelée « Rio+20 ». Selon Brice Lalonde, la conférence devrait permettre de « *joindre des objectifs liés au développement durable aux objectifs sociaux des Objectifs du millénaire pour le développement* », dont l'échéance est 2015.

Aline Brachet relate qu'il « *il place en tête de ces objectifs la question de l'énergie, qu'il décline en trois mesures : l'accès universel à l'énergie d'ici 2030, le doublement de l'efficacité énergétique et le doublement de la part des énergies renouvelables dans le mix énergétique d'ici 2030. D'autres objectifs concrets devraient être formulés à Rio, liés à la sécurité alimentaire - comment produire mieux sans toucher aux terres, aux res-*

*sources en eau et en énergie* » - aux océans, et à la biodiversité. »<sup>4</sup>

Paris, jeudi 13 octobre 2011

#### « Les Afriques en marche vers Rio+20 »

*A l'approche du grand rendez-vous de Rio +20, le continent africain est amené à jouer un rôle pivot dans les négociations. Ainsi, les différents pays cherchent à s'accorder sur une vision commune. Quel consensus doivent-ils trouver pour être un acteur moteur dans ces négociations ?*

Vingt ans ont passé depuis le Sommet de la Terre de 1992. Il est utile de s'interroger sur les accomplissements, en particulier au regard des Objectifs du millénaire. Quelles ont été les concrétisations de ces objectifs nobles et généreux ? Sans minimiser les avancées réalisées, il apparaît que la tâche à accomplir

pour l'Afrique est encore immense.

Le regard porté sur l'Afrique et le constat qui en résulte est souvent sombre. L'Afrique représente moins de

2 % des échanges mondiaux ; et l'accumulation des calamités qui frappent le continent – sécheresses,

famines, guerres civiles, épidémies – peuvent faire le jeu d'un fatalisme parfois appelé « Afro-pessimisme ».

Mais la crise dans laquelle s'enlise l'économie des pays développés et l'urgence du développement durable permettent d'appréhender ce constat différemment. Le retard de développement se transforme en une page à écrire : l'Afrique peut être le continent de demain, à condition qu'elle prenne sa part du risque. Les révolutions arabes du printemps 2011 ont d'ailleurs commencé sur le sol africain

Aujourd'hui, la question du développement durable et du développement de l'Afrique est portée au plus haut

niveau dans de nombreux pays du continent. Le renouvellement des élites politiques et économiques insufflé

de nouvelles perspectives. La diversité de l'Afrique est la source d'émergence de formes d'engagement qui

feront la différence et permettront la réalisation de la « promesse africaine ».

#### Constat : la nécessité de nouvelles perspectives de développement

S'agissant des défis du développement durable considérés dans le contexte africains, trois constats sont

particulièrement significatifs :

- Les phénomènes d'épuisement des ressources et de destruction des milieux naturels et des éco-

systèmes sont irréversibles. Ce qui est perdu aujourd'hui en Afrique – forêt équatoriale primaire et

biodiversité associée, milieux aquatiques des Grands Lacs, savane reculant devant la désertification – ne pourra jamais être retrouvé à l'identique. Il n'existe pas de réserves de droits de tirage spéciaux pour la planète, dont la finitude s'impose à nous de manière de plus en plus nette.

- La forêt primaire « poumon de l'Humanité », les océans et les autres ressources environnementales sont des biens publics mondiaux. Leur caractère exceptionnel doit être préservé et leur jouissance

– contrôlée – doit être non-exclusive. À ce titre, l'échelle de l'État-Nation n'est pas pertinente pour

les appréhender, d'autant plus que la gouvernance des États africains est encore trop souvent d'échec.

- Un conflit de temporalité est perceptible dans les pays les moins avancés, et particulièrement en Afrique, dans la progression des trois objectifs du développement durable. L'ampleur des phénomènes, par exemple l'insécurité alimentaire ou l'épidémie du SIDA, est telle qu'il est difficile de prioriser les axes de développement. Le corollaire, malheureusement, est souvent le délaissement d'un

des piliers du développement durable : le pilier économique et le bien-être social des populations ne sont pas considérés dans un projet environnemental de conservation de la nature, par exemple.

Par ailleurs, les politiques de développement menées à partir de 1980 sous les auspices du Consensus de

Washington ont montré leur incapacité à répondre aux problèmes du développement durable. L'ajustement structurel est désormais structurellement dépassé.

La confiance de l'Afrique et des Africains en leurs capacités est essentielle. Il est nécessaire d'abandonner l'attentisme vis-à-vis des autres continents – l'Europe, l'Asie – des pays développés et des organisations internationales.

### ***Porter les voix africaines***

L'Union africaine œuvre pour rassembler les diversités du continent et rapprocher les États qui le composent. Dans la perspective du sommet de Rio +20 et de la présidence du G77, l'Union africaine doit parler d'une seule voix : c'est une responsabilité importante. L'Union africaine rassemble les multiplicités géographiques, politiques et culturelles de l'Afrique.

Dans le cadre des négociations internationales, l'Afrique a l'ambition d'être un moteur. L'Afrique, continent qui a vu naître l'Humanité, ne se délie pas de la solidarité globale, au contraire : elle souhaite prendre sa part de

responsabilité et contribuer positivement aux nouveaux fondements de notre civilisation.

Il est une valeur que les Africains souhaitent faire partager au reste du monde : c'est la solidarité. Le message

africain du sommet de Rio +20 vaut aussi pour l'Afrique elle-même : il est indispensable d'écouter sa propre

voix. Il importe que les dirigeants africains écoutent et prennent nettement conscience des demandes de leurs peuples.

Enfin, l'Afrique peut initier des programmes de coopération internationale pour la préservation et la gestion durable d'écosystèmes vitaux comme la forêt primaire et les bassins des grands fleuves (Congo, Niger, etc).

Les poumons et vaisseaux du monde doivent être gérés au mieux ; les pays concernés doivent être aidés. La déclaration de Brazzaville va en ce sens.

### ***L'Afrique : terre des possibles***

Au cours des vingt années qui se sont écoulées depuis le sommet de Rio, les enjeux du développement durable ont été culturellement intégrés en Afrique, comme ils l'ont été dans le monde occidental. C'est d'ailleurs l'absence de développement économique et la pauvreté qui permettent de définir des structures et

de mettre en place des projets qui appréhendent les trois piliers du développement durable : la création de richesses et l'augmentation du bien-être humain sont absolument cruciales en Afrique, ainsi que l'est la sauvegarde de l'environnement.

À ce sujet, la Première dame du Niger a souligné que « *toute politique de sauvegarde des biens environnementaux communs et de bonne gouvernance économique et sociale participe à la réduction de la pauvreté.* »

Alors que sa population a franchi le cap du milliard d'habitants en 2009, l'Afrique compte pour moins de 2 % des émissions totales de CO2. L'écart entre ces deux chiffres – un sixième de la population mondiale mais un cinquième seulement des émissions de gaz à effet de serre – est certes un reflet significatif de la différence de développement entre le continent africain et le monde occidental, mais c'est aussi un élément qui montre l'ampleur des potentialités africaines.

Sur ces territoires où tant reste à faire, il est possible et souhaitable de réaliser des projets innovants, durables, et adaptés aux besoins des populations – accès à l'eau, à l'énergie, sauvegarde de l'agriculture

vivrière, etc. Au cours des dernières années, le comportement quotidien des Africains a été modifié ; les

projets de production locale d'énergie propre ont foisonné.

Ainsi, la Commission de l'Union économique et monétaire ouest-africaine a financé 8 000 forages avec pompes à motricité humaine. Elle propose également un programme d'un milliard de dollars, en partenariat avec la BCEAO et la BOAD afin de financer des investissements locaux dans l'énergie durable : éolien,

biomasse, petites installations hydroélectriques. Ces équipements sont particulièrement bien adaptés aux

nécessités africaines, notamment à l'état souvent délabré des infrastructures existantes.

Certains élèves et étudiants africains formés en Europe voient désormais leur continent natal, l'Afrique, comme la terre où ils souhaitent développer leurs talents. Les

politiques d'immigration restrictives et la crise des pays du Nord sont des éléments importants dans ce « retour des cerveaux » qui apporte à l'Afrique des

élites motivées et compétentes, des ferments de société civile et de bonne gouvernance. La jeunesse a d'ailleurs un rôle considérable à jouer en Afrique, plus que dans tout autre continent. En effet, un Africain sur deux a aujourd'hui moins de 25 ans.

Enfin, le secteur privé – notamment les PME – et la société civile, qui se structure dans plusieurs pays africains, sont des richesses à mobiliser. De même, la voix des artistes et créateurs africains doit être prise en compte : il convient de la soutenir, sur la scène internationale comme en Afrique même.

### **Le continent des solutions**

L'Afrique a un rôle considérable à jouer dans le développement durable et l'atteinte des objectifs du millénaire. L'Afrique est un réservoir de ressources naturelles et d'inventivité. C'est un continent jeune, qui progresse malgré les défis immenses qu'il doit relever. Dans le cadre du sommet Rio +20, l'Afrique qui prend

conscience de son potentiel et des moyens de le réaliser est le continent des solutions.

### **« Les révolutions en marche »**

*Sur un plan financier, technologique et social, des solutions existent déjà pour mettre en œuvre les transformations nécessaires. Elles impliquent des bouleversements profonds des mentalités et représentent de véritables révolutions.*

Le terme « révolution » est souvent associé au renversement inattendu et précipité d'un régime politique pour

le remplacer par une autre de forme de gouvernement avec de nouvelles personnalités à sa tête. Les révolutions abordées dans le cadre de cette conférence des Ateliers de la Terre sont toutefois d'une toute autre nature. Il s'agit de révolutions au niveau social, technologique ou financier qui ont pour point commun de ne pas être à l'initiative de la sphère politique mais d'être le fruit de réflexions exercées à l'échelle des

entreprises et de la société civile. Ces réalisations ou ces projets bouleversent tous à leur manière les cadres de référence qui les ont vus émerger et certains cherchent explicitement à combler un espace laissé vacant par le politique.

Le terme de « révolution » n'est il toutefois pas excessif pour désigner ces initiatives ? En quoi contribuent-elles à un changement de paradigme en lien avec le développement durable ? Sont-elles réalistes et répliquables à grande échelle ?

Robert Bell dresse un constat d'échec de l'action des gouvernements et du marché pour lutter contre le changement climatique afin d'en appeler à une mobilisation de la société civile dans le cadre de « Fonds de rédemption verts ». L'économiste soutient ainsi que les Etats ne sont pas prêts à investir les montants jugés

nécessaires par l'Agence Internationale de l'Energie pour opérer la transition de notre modèle énergétique

(400 à 500 milliards USD par an d'ici à 2020 et 1000 milliards USD par an après cette date). L'apport financier

ne pourra pas non plus selon lui venir du marché dont l'horizon est trop axé sur le court terme. 70 % des

actions sont en effet vendues plusieurs fois par seconde sur les marchés. La solution consisterait donc à constituer des fonds d'investissements verts bloqués sur du long terme, quatre-vingt-dix-neuf ans par

exemple, pour fonctionner à une échelle de temps comparable à l'ampleur de la crise climatique. Ces fonds seraient soutenus dans l'esprit de Robert Bell par des États, des institutions publiques, des associations écologistes, des organisations caritatives, des Églises, voire des particuliers. Si l'idée est séduisante et ne manque pas de crédits elle n'est soutenue par aucune réalisation concrète à ce jour. On peut toutefois faire preuve d'optimisme en partant du principe que les premiers pas sont toujours les plus difficiles et que les premiers fonds constitués auront un effet d'entraînement pour structurer tout le système.

Une autre solution, fondée sur le recours à la technologie, a été proposée pour diminuer de façon significative les émissions mondiales de gaz à effet de serre : la fabrication de pétrole à travers la conversion accélérée de

CO2 en pétrole artificiel via l'utilisation de phytoplancton dans des concentrations très élevées. Ce procédé

innovant permet la production d'un pétrole au bilan carbone négatif directement utilisable comme carburant.

Après les révolutions financières et technologiques, deux entreprises privées, Orange et Suez Environnement, ont apporté leurs contributions aux débats lors de cette conférence en expliquant comment elles repensent leurs activités dans les pays en développement pour concilier rentabilité économique et progrès social. A travers le soutien apporté à une étude<sup>5</sup> sur le lien entre TIC6 et développement de projets

pour les populations les plus défavorisées dans les domaines de l'agriculture, de l'éducation, de la santé et

des services financiers, Orange a eu l'opportunité de présenter quelques facteurs de réussites et d'échecs de

ce types d'initiatives :

- Les services dans les domaines de l'éducation et de la santé ont beaucoup plus de difficultés à at-

teindre un stade d'indépendance financière que ceux dans les domaines de l'agriculture et des ser-

vices financiers.

- Dans le cadre de la conception du service il est fondamental de faire la distinction, étroite au premier abord, entre les besoins des populations ciblées et leurs demandes. La notion de demande permet

notamment d'identifier les services pour lesquels un individu est prêt à dépenser une somme d'argent

ce qui n'est pas toujours le cas pour un besoin.

- L'identification de relais au niveau local est indispensable pour implanter le service et le faire perdurer.

· La rentabilité du projet dépendra en grande partie de sa capacité à mobiliser le plus grand nombre

de secteurs d'activités et à s'exporter hors des frontières.

Les programmes d'ingénierie sociétale menés par Suez Environnement dans le domaine de l'accès à l'eau

reposent également sur une définition claire de la demande et une implication directe des populations locales,

allant parfois jusqu'au bénévolat.

Les initiatives de ces deux entreprises pour développer un business model en direction de la « base de la pyramide » témoignent d'une réelle volonté d'engagement et ont pour mérite de dépasser le cadre du mécénat. Toutefois, nous sommes toujours loin d'une remise en cause des fondements de leur modèle

5 Cf Etude Hystra, Leveraging information and communication technology for the base of the pyramid, juin 2011.

6 Technologies de l'Information et de la Communication

économique.

La révolution sociale passe également dans de nombreux pays par l'accès à la propriété privée. Les

questions foncières sont à l'origine de plus de 50 % des conflits devant les tribunaux dans de nombreux pays

africains. Le concept de « micro propriété », inventé par Abdoulaye HARISSOU, constitue une réponse adaptée à cet enjeu en descendant au plus près des populations pour décerner des titres officiels de propriété qui ne pourront plus être remis en cause.

Quel bilan tirer de ces initiatives de nature très différentes mais ayant pour dénominateur commun de ne pas entrer dans les cadres de pensée traditionnels ? Aucune d'entre elles ne peut réellement s'attribuer le label

révolutionnaire étant donné que les actions susceptibles de créer les plus grands changements en sont encore au stade de la théorie ou du projet pilote. Toutefois, plusieurs initiatives comportent incontestablement une dimension révolutionnaire en gestation tant elles bouleversent les référentiels traditionnels des

entreprises ou des investisseurs ou les modes de production pétroliers. Ces projets sont tous porteurs d'un

vent d'optimisme à l'heure des discours sur l'incapacité de la communauté internationale à définir une ligne

de conduite claire pour lutter contre le changement climatique. Une extraordinaire créativité existe au niveau des universités, des entreprises de toute taille ou de la société civile en général. Cependant, s'il ne faut pas attendre les bras croisés que toutes les solutions viennent du haut, l'implication du politique apparaît comme toujours indispensable pour permettre l'éclosion de ces révolutions et leur conférer une dimension de plus

grande envergure.

**« Eau potable : quelles échelles, quels modèles ? »**

*Des réformes sont à mettre en place pour assurer une gestion équitable et durable de l'eau. A quelle échelle cette ressource doit-elle être gérée ? Quel modèle de gouvernance mettre en œuvre pour en assurer un accès et une gestion efficace ?*

**Pour une gestion équitable et durable de l'eau**

L'eau va constituer un des grands défis contemporains de notre siècle. La démographie et l'activité humaine ont fait passer l'eau au cours des dernières décennies d'une situation d'abondance dans de nombreuses régions

du monde à un statut de ressource rare.

Or, la notion de rareté fait immédiatement référence à la science économique dont l'objet principal est de pouvoir gérer de manière optimale les ressources rares. En effet, l'époque de l'eau potable gratuite en quantité illimitée est révolue. Mais l'eau ne peut bien entendu se limiter à un bien économique tant elle est synonyme de vie aussi bien pour l'espèce humaine que pour la faune et la flore qui peuplent notre planète. Il s'agit par conséquent tout autant d'un bien social et d'un bien environnemental. Si depuis des millions d'années, la quantité d'eau est stable sur la terre, sa qualité s'est en revanche considérablement détériorée. Les possibles

évolutions climatiques, temporaires ou durables, viennent également perturber la donne avec des risques accrus d'inondation par moment et par endroit tandis que simultanément des risques de grande sécheresse peuvent apparaître dans d'autres régions du monde.

Dans ce contexte, la gestion de l'eau est devenue un exercice difficile et complexe. Difficile, car il faut désormais offrir un accès à l'eau potable à 7 milliards d'habitants alors que la planète ne comptait que 1,5 milliard d'habitants au début du XX<sup>ème</sup> siècle. Complexe, car l'eau, ce sont des enjeux techniques, institutionnels et

organisationnels, de nouvelles technologies, des aspects juridiques et réglementaires, des normes, de la régulation, des investissements, des coûts, des financements, des prix, de la gouvernance et de la soutenabilité économique, financière, sociale et environnementale. Même si la révolution numérique a eu un impact sur le

secteur, il demeure limité car depuis l'Antiquité on fait graviter l'eau, on construit toujours et encore des réseaux

et des aqueducs, simplement parce qu'à la différence des technologies de l'information, il n'est pas possible de transférer des millions de m<sup>3</sup> d'eau d'un territoire à un autre en un clic.

**La gestion des ressources en eau**

La quantité d'eau disponible à la surface de la terre ne s'est pas modifiée au cours de ces derniers millénaires. Si sa quantité est stable en revanche sa qualité s'est considérablement altérée. Par conséquent le premier enjeu se trouve au départ du cycle de l'eau avec la nécessité de préserver la ressource en amont.

Mais à quelle échelle territoriale ?

L'eau a vocation à être gérée à une échelle locale. Mais quelle que soit l'organisation institutionnelle, chaque Etat doit se préoccuper d'avoir la maîtrise de ses ressources en eau au niveau national. Toutefois, on voit très rapidement que cette échelle ne peut être satisfaisante quand on sait qu'il existe de nombreux fleuves et cours d'eau transfrontaliers ou des nappes phréatiques communes. Il existe en effet 215 fleuves transfrontaliers.

liens dans le monde dont les bassins couvrent une superficie d'environ 50 % des terres émergées. Si on ajoute à cela que 32% des frontières des Etats de la planète reposent sur des supports hydrographiques, on accroît substantiellement le risque de conflit à cause de la mitoyenneté de la ressource. Cela signifie que la coopération transfrontalière doit être une préoccupation partagée par les Etats.

Au-delà, c'est au niveau planétaire que la gestion de l'eau douce doit être prise en compte, notamment à

cause des phénomènes climatiques qui peuvent avoir des impacts sur la variabilité des ressources.

### **La gestion hydrographique par bassin**

Depuis une vingtaine d'années, et notamment depuis la conférence de Dublin de 1992, l'approche de la ges-

tion par bassin hydrographique s'est développée avec la création de la gestion intégrée des ressources en

eau (GIRE) par bassin. En effet, les ressources exploitables et renouvelables en eau douce se situent dans

les lacs, les marais, les fleuves et les aquifères. Ainsi le bassin fluvial correspond à la zone réceptrice des précipitations qui alimentent un système de rivières et de fleuves s'écoulant vers la même embouchure. Il faut rappeler à cet égard que l'on appelle souvent « l'école française de l'eau » l'ensemble des dispositions législatives qui ont permis en France la création des agences de bassin, devenues depuis agences de l'eau, qui, dès 1964, ont permis d'organiser les premières expériences de gestion de l'eau par bassin.

Il y a en effet une grande cohérence à gérer l'eau par bassin hydrographique, même si cette approche vient

bousculer l'organisation institutionnelle et administrative des Etats, puisque le bassin hydrographique ne cor-

respond généralement pas à une province, une région et encore moins à un Etat, mais souvent à plusieurs

fractions d'Etat (Nil, Congo, Niger, Tigre, Euphrate, Amazone, Rio de la Plata, Danube, Rhin pour n'en citer

que quelques uns).

Quels sont les bénéfices d'une GIRE ? D'abord, elle contribue à la gestion et à l'aménagement durables et

adaptés des ressources en eau, en prenant en compte les divers intérêts sociaux, économiques et environnementaux. L'approche intégrée par bassin permet ensuite de coordonner la gestion des ressources en eau pour l'ensemble des secteurs (usages agricole, industriel et domestique) et groupes d'intérêt, que ce soit au niveau local, régional et international. De plus, la gestion par bassin met l'accent sur la participation des acteurs à tous les stades dans l'élaboration des textes juridiques et privilégie la bonne gouvernance et les dis-

positions institutionnelles et réglementaires efficaces de façon à promouvoir des décisions plus équitables et viables.

### **L'organisation institutionnelle de la gestion de la ressource**

La fragmentation et les prises de décision non coordonnées ont été et sont encore dans une certaine mesure des problèmes cruciaux qui ont affecté l'efficacité de la gestion des ressources en eau. Dans ces conditions, le développement systématique de la création d'Agences de Bassin ne peut être qu'encouragée avec des

Comités de Bassin où autorités nationales, locales, usagers et citoyens peuvent s'exprimer en vue de satis-

faire au mieux la fourniture d'eau destinée à ses différents usages.

Sur le plan international, le Réseau International des Organismes de Bassin (RIOB) joue un rôle important de coordination. Mais il s'agit davantage d'une structure où l'on échange les expériences et les bonnes pratiques que d'une Autorité en tant que telle. Même si les Nations Unies jouent un rôle éminent dans le secteur de l'eau (reconnaissance du droit à l'eau en tant que droit humain universel en juillet 2010) avec la fédération des compétences au sein de l'agence UN-Water, il n'existe pas à proprement parler, aujourd'hui, une Autorité au niveau de la planète. Or, l'eau est un bien public mondial qui mérite qu'existe une gouvernance mise en œuvre par une Agence ou une Commission à l'échelle mondiale. S'agit-il de créer une nouvelle organisation

ou de fédérer des structures existantes en leur donnant des pouvoirs accrus, le débat est ouvert. Mais il est clair que si des progrès ont été accomplis au cours des dernières années, il est nécessaire d'avoir une gou-

vernance globale de la gestion des ressources en eau permettant de soutenir les bonnes pratiques et de sanctionner des décisions ou des actions unilatérales mettant en péril la ressource ou ne prenant pas en compte les intérêts de pays appartenant aux mêmes bassins hydrographiques.

### **L'accès à l'eau potable**

Une gestion durable et cohérente des ressources en eau est la première étape permettre un accès satisfaisant à l'eau potable. Cette condition est nécessaire, mais non suffisante. Il faut ensuite mettre en œuvre l'organisation permettant de capter, transporter, stocker, de traiter et de distribuer l'eau. Cette problématique se décline différemment suivant que l'on se trouve en milieu rural ou urbain voire au sein de grandes mégalo-

poles qui se sont développées au cours de ces dernières décennies avec les migrations de population des campagnes vers les villes.

### **L'organisation institutionnelle pour l'accès à l'eau potable**

Une fois réglées les questions relatives à la gestion des ressources en amont, l'accès à l'eau potable devient un enjeu local. Depuis un demi-siècle, on observe un transfert de compétences des Etats vers les collectivités territoriales (ce fut notamment le cas ces dernières années au sein des anciens pays à économie administrée

qu'étaient les pays d'Europe centrale et orientale où l'on a observé un transfert du patrimoine en direction des

régions et des municipalités). Ces structures sont en quelque sorte les autorités organisatrices qui ont le pouvoir de décider de l'organisation et des modalités d'accès à l'eau potable. En fonction des territoires, que ce soit en milieu rural ou en milieu urbain, l'intercommunalité ou l'organisation régionale doit être soutenue pour mettre en commun les moyens et mutualiser les besoins pour favoriser les économies d'échelle.

### Les modes de gestion

Les autorités organisatrices ont ainsi la compétence pour décider du mode de la gestion à adopter au niveau des différents maillons du cycle de l'eau, notamment de la production à la distribution. Les options sont essentiellement publiques ou privées, en particulier au travers des Partenariats Publics Privés qu'il ne faut pas confondre avec la privatisation, qui reste exceptionnelle et dont l'exemple le plus couramment cité est celui de l'Angleterre et du Pays de Galles où les actifs privés de production et de distribution d'eau ont été vendus par l'Etat au secteur privé.

Ces dernières années, de nombreux débats ont eu lieu sur l'opposition entre mode de gestion entièrement public et partenariat avec le secteur privé. Or, dans ce domaine, l'affrontement est trop souvent polémique et idéologique, ce qui n'a pas servi la cause d'un meilleur accès à l'eau potable. En effet, s'il est possible de trouver de nombreux exemples de bonne gestion publique comme de bonne gestion privée, l'inverse est également vrai. Il ne s'agit donc pas ici de privilégier un mode de gestion plutôt qu'un autre. D'ailleurs les choses n'ont que peu changé depuis 2000, et le secteur public reste très largement dominant dans le monde avec environ 95% de la gestion des services d'eau et d'assainissement. Mais si l'on veut qu'une véritable synergie se crée entre public et privé pour servir la cause de l'eau, il est nécessaire que les passions s'apaisent.

En effet, au milieu des années 90, les programmes d'investissement ambitieux pour améliorer l'accès à l'eau potable, financé par le secteur privé exclusivement, se sont retrouvés très vite dans les factures d'eau, avec

une impossibilité, pour beaucoup de consommateurs, de supporter des hausses tarifaires importantes et trop rapides. Or, ce problème relève du mode de financement et non du mode de gestion. Par ailleurs, s'agissant d'un service essentiel, la marge des opérateurs privés doit être adaptée et s'appliquer en toute transparence. Ces principes étant posés, c'est au regard de l'analyse coût/efficacité/qualité de service que la décision doit être prise, dans l'intérêt du consommateur. Dès lors, la coopération publique/privée peut s'avérer très utile pour accélérer l'accès à l'eau et à l'assainissement, si elle est fondée à la fois sur la gouvernance et la démocratie: Car c'est évidemment aux citoyens de s'exprimer par leur vote et aux élus d'appliquer des

décisions dans le cadre du mandat qui leur a été confié.

### Les financements pour favoriser l'accès à l'eau potable

La logique des 3T « Tarif, Taxes, Transfers » souvent exposée ces dernières années n'est rien d'autres que

celle du prix, des financements publics et de l'aide publique au développement. Pour autant, il est toujours

aussi difficile de se faire une idée précise de la situation mondiale au niveau des financements globaux consacrés à l'eau. Il s'agit encore une fois d'un problème de mise en place d'indicateurs communs avec la capacité d'agréger à un niveau national les ressources provenant du prix de l'eau, des financements publics

et de la solidarité internationale.

Bien que l'aide publique au développement ait doublé conformément aux préconisations du rapport

Camdessus entre 2002 et 2007, nous sommes encore loin de disposer des ressources financières nécessaires à la demande. Face à cette situation, la variable d'ajustement a été trop souvent l'investissement ou plus exactement l'insuffisance ou l'absence d'investissement. Or, on voit bien que pour progresser, il n'est

pas possible de rester dans une logique purement financière, car elle ne suffit pas à avancer sur le terrain. La logique du développement durable est, quant à elle, différente : elle consiste à intégrer l'ensemble des gains économiques, sociaux et environnementaux. Un accès à l'eau potable et des rejets d'eau assainie dans le

milieu naturel offrent des bénéfices globaux considérables. Non seulement, ils apportent des perspectives

d'activités économiques classiques, eux-mêmes induits par les investissements propres à l'eau, mais plus

généralement des gains pour la société dans son ensemble, en particulier dans le domaine de la santé

publique et de la préservation de l'environnement. Or les coûts, qui résultent de l'absence d'investissement,

ne sont que trop rarement pris en compte.

Pour faciliter le développement des financements, nous avons suggéré de mettre en place des mécanismes de solidarité financière où les consommateurs d'eau des pays riches viendraient en aide aux consommateurs d'eau des pays pauvres. Il s'agirait en réalité de majorer faiblement la facture d'eau par un prélèvement proportionnel à la consommation d'eau des premiers pour qu'il soit reversé aux seconds, au travers d'une aide directe ou d'une participation à certains projets. En effet, l'aide publique au développement ne pourra suffire. D'autres mécanismes doivent être inventés. L'enjeu est par conséquent à la fois de renforcer ce mécanisme et de l'étendre. Il consiste à faire en sorte que le concept de « l'eau finance l'eau » soit élargi territorialement entre les pays riches et les pays pauvres. Cela veut dire, en substance, qu'il doit devenir une cause de solidarité sectorielle, simplement parce que l'eau de la planète est à la fois un bien universel partagé et qu'il est indispensable à la vie. Développer une telle mesure, signifierait par exemple appliquer un prélèvement d'un pour cent sur le montant de la facture, ce qui demeurerait une contribution marginale mais avec un effet de levier fort, qui permettrait à des projets non réalisables aujourd'hui, pour des raisons d'équilibre financier, de le devenir. Etendre le dispositif au plus grand nombre de pays riches, et notamment à ceux de l'OCDE serait nécessaire. Cette approche doit constituer un objectif prioritaire pour que de tels mécanismes de solidarité contribuent utilement au financement des projets d'accès à l'eau potable dans les

zones les plus pauvres de la planète.

### « La ville est-elle devenue le laboratoire du long terme ? »

*L'urbanisation galopante impose une réflexion profonde sur nos modes de vie et conduit à la mise en œuvre de projets innovants et cohérents. La ville est-elle l'échelle de*

*gouvernance la plus adaptée pour impulser le changement? N'est-elle pas devenue le laboratoire grandeur nature d'un développement durable ?*

Les villes sont aujourd'hui un acteur incontournable des phénomènes environnementaux et sociaux en cours. Pour preuve, « dans le domaine climatique, les villes, qui ne représentent que 2 % de la surface de la Terre regroupent plus de 50 % des humains, et sont responsables de plus de 80 % des émissions de GES. »

La ville est donc assurément un espace crucial d'action pour faire avancer les grands combats du développement durable : lutte contre le changement climatique, réduction de la fracture sociale, bien être et mieux vivre ensemble, etc.

Pour autant, la ville est elle déjà ce laboratoire qui va permettre à l'humanité de mieux contrôler et réduire son empreinte environnementale ? Le projet de la ville durable de demain est il déjà en route ? L'urgence est là puisque sur 9 milliards d'habitants à l'horizon 2050, 7 milliards seront des urbains, quasiment le double d'aujourd'hui, comment penser cette ville du futur qui devra accueillir toujours plus de population ?

La ville « laboratoire » du futur doit se traduire par un nouveau projet urbain, ce qui n'implique pas

nécessairement de faire un saut technologique. Les innovations technologiques nécessaires pour construire

une ville « zéro émissions » existent déjà bien souvent. Par contre, les enjeux se situent aujourd'hui

notamment dans la recherche de nouveaux moyens financiers, de synergies entre les installations pour optimiser la consommation de ressources, la nécessité de penser l'organisation de la ville en amont et à une

échelle globale et de favoriser les coopérations entre le citoyen et le politique.

Ainsi, au-delà des avancées technologiques ou d'innovations en terme de mobilité qui sont déjà en place

dans certaines villes, il nous semble que la ville est d'abord le laboratoire d'une nouvelle forme de

gouvernance entre les acteurs de la cité. Ainsi, par exemple, dans la ville de Porto Alegre, un système innovant de formulation et d'accompagnement du budget municipal, appelé budget participatif, a été mis en

place à la fin des années 80. Il permet aux citoyens de décider comment allouer une partie du budget réservé aux projets de développement urbain (10 % du budget global de la ville). La démocratie participative de Porto

Alegre est en constante évolution depuis sa création et s'améliore d'année en année. Elle montre que la

gestion démocratique et transparente des ressources est le meilleur moyen d'éviter la corruption et de créer

une cohésion sociale autour du projet urbain.

Cet exemple nous montre également que l'écoute des populations et la coopération entre les différents acteurs (architectes, urbanistes, techniciens) de la conception de la ville nouvelle et/ou rénovation doit intervenir en amont de la réalisation des projets urbains. Cette approche est fondamentale pour le succès des

projets urbains. Le corollaire est bien souvent la nécessité d'une gouvernance forte de l'autorité publique

locale en place, cette dernière ne devant pas parfois hésiter à imposer ses idées même si elles vont contre

l'avis de l'opinion publique.

Au delà du socle de la gouvernance, il nous semble que les villes jouent également un rôle de laboratoire sur des sujets aussi diverses que la mobilité, le retour du lien avec la terre, le développement de nouveaux

modèles d'usage et de propriété, les innovations liées à l'utilisation de l'énergie, etc.

Sur le sujet de la mobilité, la période actuelle s'avère idéale pour la dématérialisation du transport de véhicules en ville notamment; les jeunes générations attachant moins d'importance au statut social que

confère le bien automobile. Une proportion grandissante de la population est ainsi disposée à passer de la

possession à l'usage. Les services d'auto-partage, de covoiturage ou le recours grandissant à la location de

voitures se mettent en place et permettent de diminuer significativement les transports urbains. Néanmoins

leur succès est étroitement lié aux conditions tarifaires d'accès, à l'efficacité globale de ces solutions en terme

de temps de déplacement notamment. Le lancement du système Autolib à Paris en décembre 2011 sera à

cet égard un test intéressant car il s'agit de la première initiative mondiale de cette envergure en matière de

mise à disposition de voitures électriques.

Pour rendre ces solutions plus opérationnelles il est primordial de travailler sur l'idée de chaîne de mobilité qui doit assurer la praticité et l'efficacité du système, seules conditions permettant de concurrencer véritablement le règne de l'automobile individuelle. Dans ce cadre, l'enjeu de l'information jouera un rôle primordial pour informer les usagers d'une offre combinée et intégrée de modes de transports : vélo / train / location de

véhicules/ transports collectifs, etc.

La ville doit ainsi être aujourd'hui un laboratoire qui accompagne les citoyens vers des modèles (de mobilité notamment) qui privilégient l'utilisation plutôt que la propriété.

Cette mutualisation des biens publics devra d'ailleurs à terme être testée dans d'autres domaines que celui de la mobilité. On peut par exemple penser que les logements étudiants pourraient être utilisés comme logements touristiques l'été et bien d'autres

exemples existent.

Concernant le retour à la terre, il constitue à la fois un enjeu de lien social mais aussi de diminution de l'empreinte environnementale avec le retour d'un approvisionnement local. La « verticalisation » de la production agricole est ainsi envisagée au cœur des villes. Les tours agricoles permettraient d'obtenir une

capacité de production six fois plus importante qu'en agriculture classique du fait notamment de l'absence de parasites et de contraintes extérieures. Il s'agit encore à ce stade de projets futuristes dont la ville constituera bien un premier laboratoire d'expérimentation. Le retour à l'utilisation de techniques parfois très anciennes fait

également partie de cette tendance du retour à la terre. Ainsi, les toits végétalisés sont utilisés dans certaines

villes aujourd'hui, et ont des effets bénéfiques notamment sur la lutte contre le réchauffement climatique, l'eau

ou la biodiversité.

Un autre champ d'expérimentation est plus directement lié à des innovations technologiques facilitant la réduction de la consommation d'énergie notamment. Depuis quelques années, certaines villes expérimentent des procédés de récupération d'énergie liés à la marche. Le principe est relativement simple et peut être appliqué à l'alimentation des éclairages publics ou installer dans des lieux de passage type le métro par

exemple pour être ensuite réinjecter dans le réseau. Des dalles, équipées de micro-capteurs sont installées. Le va-et-vient des piétons, à savoir de l'énergie cinétique, est alors transformé en énergie électrique qui

alimente une batterie. La mobilité électrique est en marche... Si aujourd'hui, les habitants équipés de

panneaux solaires peuvent revendre l'énergie produite sur le réseau, demain ils pourront également profiter

de l'énergie produite par la batterie de leur voiture électrique pour alimenter leurs habitations. Tous les

moyens sont bons pour transporter cette énergie « verte » à pied, à vélo et même en voiture.

Des exemples concrets à travers le monde montrent donc que la ville est déjà aujourd'hui ce laboratoire cherchant à trouver les modes de gouvernance adaptés, à tester des nouvelles formes de mobilité ou bien encore inventer une façon de réconcilier rural et urbain. Néanmoins, si dans les villes du Nord les innovations

technologiques existent pour faire face aux défis environnementaux et sociaux, c'est bien dans les pays du

Sud que vont se poser le plus de problèmes dans les villes de demain du fait de l'urbanisation croissante.

Quel laboratoire pour les pays du Sud ? Comment réaliser les transferts technologiques nécessaires vers ces pays et avec quels moyens financiers ? Beaucoup reste encore à inventer pour que l'exode rural massif en cours dans les pays en développement n'entraîne pas l'humanité vers des conflits urbains violents liés à ressource en eau, la gestion des déchets ou l'accès à l'énergie.

#### **« Bien au-delà des progrès technologiques, une nouvelle culture de la mobilité ? »**

*Des avancées notables sont réalisées dans le domaine des transports pour rendre notre mobilité plus sûre, plus propre, plus interconnectée. Mais cela ne deviendra durable qu'à travers une évolution forte de nos habitudes en matière de déplacement. Comment favoriser des comportements optimodaux ? Comment rendre la mobilité responsable accessible au plus grand nombre ? Comment accompagner la mise en œuvre d'un écosystème durable en matière de mobilité ?*

La mobilité, c'est-à-dire la capacité de déplacement des êtres humains et des marchandises, est essentielle pour notre société. Il est devenu normal de parcourir quotidiennement entre son domicile, son université, son

travail et ses lieux de loisir une distance significativement supérieure à la cinquantaine de kilomètres qu'un

homme peut raisonnablement marcher en une journée. Le caractère essentiel de la mobilité est d'ailleurs

spécialement saillant quand les réseaux et installations défilent et que nous parvenons des images de

foules échouées sur des quais de gare sans trains ou d'étendues immenses de voitures bloquées par la

neige.

#### *Transformation des territoires, évolutions de la mobilité*

Le transport a longtemps été un élément de fluidité permettant de déplacer hommes et marchandises entre des emplacements fixes à la fonction déterminée : la ville, la ferme, le château, le port, la mine, etc.

Aujourd'hui, la mobilité est un élément sous contrainte : elle assure un lien entre des emplacements dont les fonctions et les caractéristiques de population sont sans cesse en transformation. D'anciennes zones industrielles, parfois en friche, sont devenues des quartiers d'affaires, des zones rurales s'urbanisent et accueillent aujourd'hui les actifs.

Ainsi, la Plaine de France au Nord de Paris regroupe de nombreuses entreprises tertiaires qui ont pris la place des gazogènes, dépôts et ateliers ; et le plateau briard a vu ses surfaces horticoles être remplacées par des lotissements. Les réseaux de transport ont accompagné, parfois subi, ces évolutions. Offrent-ils

aujourd'hui aux utilisateurs la mobilité dont ils ont besoin ? L'expérience montre que les encombrements des

routes et la saturation des réseaux ne peuvent se résoudre par la simple augmentation de l'offre. En effet,

celle-ci entraîne rapidement une demande correspondante.

#### *La mobilité : une affaire de comportements*

Aujourd'hui, mettre en place de nouvelles formes de mobilité et assurer le succès du transport public et des

modes doux, il est indispensable de mener au préalable une réflexion sur les comportements des voyageurs

et sur l'accompagnement qui permettra de répondre à leurs besoins de transport.

Le défi du changement climatique impose de réaliser rapidement cette mise en place de solutions de transport public ou de modes de déplacement doux, non émetteurs de CO<sub>2</sub>, et ce de manière globale – car les progrès enregistrés dans certaines villes ou certains pays seront inopérants à l'échelle mondiale si la

consommation et les émissions continuent à croître dans les pays émergents.

Cependant, dans les pays en développement, la population des mégapoles et de leurs abords ne cesse de croître ; et malgré leur taille, leurs réseaux routiers sont saturés de voitures individuelles, le transport public y étant *laissé pour compte*.

Par ailleurs, l'augmentation du prix des carburants – ceux-ci ayant culminé à l'été 2008 – et la perception

grandissante par le corps social du caractère non renouvelable des ressources fossiles font prendre conscience de l'urgence de changer les comportements vis-à-vis de la mobilité. D'une étude récente pour le loueur ING Car Lease (septembre 2011), il ressort que les Français considéreraient d'abandonner les déplacements quotidiens en voiture si le prix des carburants dépasse 1,80 € par litre.

Le signal prix est un aiguillon très efficace pour la modification des comportements : même si les citoyens se déclarent préoccupés par des défis environnementaux et particulièrement par le changement climatique, ils

privilégient la dimension du coût. D'après le baromètre de Mobivia Groupe, pour 85 % des Français, il est

indispensable de réduire le coût des transports en commun et de proposer une aide financière à l'achat de

véhicules propres, comme des vélos électriques.

Cette dimension de coût porte encore trop souvent sur le coût d'usage immédiatement perçu. Les externalités engendrées par la voiture individuelle – évaluées par la Commission Européenne jusqu'à 2 € par kilomètre en milieu urbain, où l'influence des encombrements est considérable – ne sont pas toujours prises en compte par les automobilistes.

Toutefois, le baromètre d'opinion montre que les Français ont globalement conscience des dégâts à l'environnement par l'utilisation massive de la voiture et qu'ils reconnaissent que les solutions ne se trouvent

pas nécessairement à titre individuel.

Pour aider les citoyens à analyser leurs besoins de mobilité et à adopter les modes de transport et les véhicules les plus pertinents pour leurs déplacements, les opérateurs et acteurs du transport proposent désormais des offres de conseil.

#### **La nécessité d'une offre nouvelle**

*Le transport automobile individuel : un besoin ?*

L'automobile est associée à une grande liberté et facilité de déplacement. La sacralisation de l'automobile a

culminé au cours des Trente glorieuses<sup>7</sup> : la voiture symbolisait alors, en plus de la liberté et de la facilité de déplacement, une réussite sociale et financière. Aujourd'hui, les études d'opinion montrent que les Français ont une relation bien plus utilitariste à l'automobile. Toutefois, subsiste toujours la transformation de la *possibilité* d'utiliser une voiture individuelle en un *besoin* pour une proportion significative de la population.

L'infrastructure routière a été la principale bénéficiaire des investissements publics des dernières décennies.

Le réseau ferré français a connu sa plus grande extension dans l'entre-deux guerres. Les investissements

dans le réseau à grande vitesse ont certes été très importants, mais ils représentent en moyenne une cinquantaine de kilomètres de ligne à grande vitesse par an depuis le milieu des années 1970. Par

comparaison, le réseau autoroutier est aujourd'hui cinq fois plus étendu.

Dans les grandes villes du Sud, les réseaux de transport public n'ont généralement pas suivi le développement et l'urbanisation massive. Cette caractéristique est particulièrement prégnante en Amérique latine. Ainsi, les 11 millions d'habitants de Sao Paulo ne peuvent emprunter que 74 km de métro, même si le réseau fonctionne de manière très satisfaisante et qu'il est en extension. À Mexico, le transport public – particulièrement l'autobus – est frappé d'un stigmate social : c'est un transport « pour les pauvres », perçu

comme bondé, peu efficace et dangereux par rapport à la voiture particulière.

<sup>7</sup> En 1971, Georges Pompidou tenait ces propos : « *La voiture existe, il faut s'en accommoder et il s'agit d'adapter Paris à la fois à la vie des Parisiens et aux nécessités de l'automobile* ». (Discours prononcé au District de la Région parisienne le 18 novembre 1971)

#### *La mobilité quotidienne : le défi*

Le TGV a engendré une carte de France anamorphosée, où les temps de parcours se jouent de la réalité géographique. La réussite technique de la grande vitesse ferroviaire et son développement en France, en

Europe et au Japon a montré l'efficacité du mode ferroviaire pour des transports de moyenne et longue

distance.

Mais les préoccupations les plus contemporaines de la mobilité portent sur les trajets quotidiens qui sont

indispensables à l'activité économique. Les vingt kilomètres qui séparent Noisy-le-Grand de la Défense sont

ici plus importants que les 409 kilomètres de la ligne à grande vitesse Paris-Lyon. Sur les réseaux urbains, l'augmentation de l'offre n'amène pas de remède durable à la saturation. Elles portent également sur les déplacements quotidiens entre le domicile, l'école, les lieux de travail de loisir et la possibilité de réaliser ceux-ci par des modes doux, comme la marche à pied et le vélo. Ceux-ci sont d'autant plus pertinents que plus de 10 % des déplacements en Europe se font sur moins d'un kilomètre.

*Des offres qualitatives...*

Le transport public a besoin de réseaux maillés et interconnectés qui lui assurent une robustesse

d'exploitation appréciable. Depuis les expériences pionnières de Grenoble et Nantes à la fin des années

1980, les tramways ont connu en France un développement spectaculaire – alors même que les grands

réseaux de tramways d'avant la guerre avaient été supprimés dans leur immense majorité et remplacés par

des autobus. Ces nouveaux réseaux de tramways se caractérisent par une séparation des réseaux routiers et par des véhicules neufs et confortables. Les succès rencontrés montrent que la *qualité* de l'offre

est absolument primordiale.

La perception par le voyageur de son environnement au cours du trajet est fondamentale. Le confort est déterminé en particulier par la proximité avec les autres voyageurs, la qualité des aménagements intérieurs des véhicules et la fiabilité des informations reçues. Des progrès sensibles ont été effectués ces dernières années.

Jusqu'à la fin du XXe siècle, la conception du matériel roulant pour les services de banlieue répondait principalement à l'objectif de transporter le plus grand nombre de voyageurs possible. Bien sûr, la capacité est très importante, mais la réponse au besoin d'être transporté de manière confortable dans un véhicule de transport en commun attrayant l'est tout autant. Les dernières générations de matériel, comme celles

commandées pour les services au TER en France et aux *Regio* en Allemagne ou en Suisse, se rapprochent

de cet objectif. Grâce à ces efforts, la fréquentation des TER a augmenté de 40 % en un peu plus d'une

décennie.

Cet enseignement est particulièrement pertinent pour l'Amérique Latine. La déconsidération qu'y subit le

transport public urbain est souvent forte ; la voiture ayant l'apanage de la sécurité et de la commodité. Les

évolutions et adaptations portent essentiellement sur les réseaux : ainsi, Bogota dispose de nombreuses lignes de bus à haut niveau de service en site propre. Mais les conditions de transport ne sont pas améliorées à proportion des progrès des réseaux.

S'agissant du transport individuel et des modes doux, la qualité de l'aménagement est également un facteur déterminant dans le succès de l'utilisation. Les réalisations à l'économie n'attirent pas les usagers et se

dégradent, alors que les infrastructures bien conçues emportent le succès. La voie reliant Bristol à Bath au

Royaume-Uni, bâtie sur une ancienne infrastructure ferroviaire, attire aujourd'hui 2,8 millions d'usagers par

an.

La réutilisation de voies ferrées abandonnées (en pondérant la possibilité d'une reprise du trafic ferroviaire)

ou de chemins de halage permet de construire une infrastructure sécurisée et dédiée aux déplacements doux

(marche, vélos, rollers). Par leur maillage et par la qualité et la sécurité qu'elles proposent, les *voies vertes*

sont une offre de qualité pour ces modes de transport. Le développement de ces infrastructures sera accéléré par une pression citoyenne.

À Séville en Espagne, un investissement de trente millions d'euros pour bâtir 140 km de pistes cyclables a

profondément changé la répartition des modes de transport : la part de la bicyclette est ainsi passée de 0,2 à

7 % de la mobilité quotidienne.

Des villes nordiques comme Copenhague ou Stockholm connaissent des taux d'utilisation du vélo très élevés, notwithstanding la rigueur du climat hivernal. Ainsi, plus d'un million de voyageurs-kilomètres sont réalisés chaque

jour à Copenhague en vélo. Grâce à une infrastructure de pistes cyclables très développée et à un facteur culturel favorable, la bicyclette y atteignant la part modale de 32 %.

*Et simples d'emploi*

La première desserte voyageurs en France – de l'embarcadere de l'Europe, qui n'était pas encore la Gare Saint-Lazare au Pecq puis à Saint-Germain en Laye – offrait déjà 1837 des départs réguliers à raison d'un train toutes les 90 minutes. Dans les années 1920, le réseau de l'État sur la banlieue Saint-Lazare offrait une

desserte cohérente et régulière par groupes de destinations.

Le cadencement étend cette régularité à l'ensemble du réseau et simplifie l'utilisation. Il consiste à

systématiser les dessertes et les horaires afin de construire, autour de nœuds de correspondances, une

trame aisée à mémoriser et qui permet une exploitation robuste. Si les Pays-Bas ont débuté le cadencement dès les années 1930, ce sont les chemins de fer fédéraux suisses qui ont mis en place un cadencement généralisé, étendu à tous les réseaux du pays. Ce plan Rail2000, adopté par référendum et initié dans les

années 1980, est considéré comme une référence d'organisation d'un réseau maillé et aisé à utiliser. En

France, les dessertes ferroviaires seront cadencées pour le service 2012 (débutant le 12 décembre 2011). Cette évolution majeure renforcera l'attractivité du transport ferroviaire et grâce à la coordination entre réseaux, ouvre de nouvelles perspectives d'intermodalité.

### Un regard nouveau sur la mobilité

La crise que nous traversons actuellement est une opportunité de repenser les besoins de déplacement,

d'agir sur les habitudes et d'adapter les infrastructures pour préparer la mobilité nouvelle.

L'éco-mobilité, l'intermodalité et la complémentarité des moyens de transport permettent de réduire les

consommations énergétiques, les coûts associés et les émissions de gaz à effet de serre. La diminution de

l'usage de l'automobile et des coûts sociaux correspondants est une nécessité – qui ne se limite pas aux pays

développés.

Au-delà des améliorations de l'offre, qui doit correspondre aux attentes de confort et de qualité des usagers, un déplacement du regard doit s'opérer – du transport individuel automobile vers des modes doux et des transports publics efficaces. C'est en gagnant les consciences que l'éco-mobilité réussira.

### « Sécurité Énergétique, sécurité humaine ? »

*La catastrophe de Fukushima incarne la contradiction entre sécurité énergétique et humaine. Pourtant, l'homme ne peut négliger l'un au profit de l'autre. Comment concilier ces deux impératifs ? La sécurité énergétique peut-elle être un atout pour la sécurité des hommes ?*

Lors de la 5ème Edition des Ateliers de la Terre, les débats se sont centrés sur les enseignements à tirer de

l'accident de Fukushima qui nous rappelle le besoin impérieux de concilier sécurité énergétique et humaine.

Toutefois, au delà du débat sur l'énergie nucléaire, il nous paraît important de rappeler le rôle joué par la sécurité énergétique pour le développement des populations.

L'accès à l'énergie est assurément un facteur

essentiel pour le développement économique et donc un levier indéniable pour sortir nombre de populations de la pauvreté. Dans cette optique, la sécurité humaine ne doit-elle pas être envisagée aussi au regard de la

sécurité d'approvisionnement ?

Il est rappelé que : « l'accès aux services énergétiques est une condition indispensable au développement social et économique et à l'éradication de la pauvreté. Cependant, dans les pays en voie de développement, plus de 1,4 Md de personnes n'ont pas accès à l'électricité et 2,7 Mds dépendent de l'utilisation traditionnelle

de la biomasse pour la cuisine. » Ainsi, en janvier 2011, lors du Sommet mondial sur les énergies du futur qui a eu lieu à Abu Dhabi, Ban Ki Moon (secrétaire général de l'ONU) déclarait : « notre défi réside dans la transformation, nous avons besoin d'une révolution mondiale des énergies propres, une révolution qui rendra l'énergie disponible et abordable pour tous ».

Le défi de l'obtention d'une énergie « disponible et abordable pour tous » est immense car, au delà de l'obtention d'une énergie bon marché, il est nécessaire de s'appuyer sur une énergie sûre et propre (permettant de contribuer à l'objectif global des Etats de lutte contre le réchauffement climatique) dans un contexte d'épuisement progressif des réserves d'énergies fossiles.

Pour obtenir une énergie propre, différentes voies sont possibles. Selon Nobui Tanaka, directeur exécutif de

l'Agence Internationale de l'Energie, pour diviser par deux les émissions mondiales de CO2, « toutes les

technologies et toutes les énergies sont nécessaires ». Les deux priorités pour y parvenir sont les améliorations en termes d'efficacité énergétique « souvent peu coûteuses » et la « décarbonisation du secteur de l'électricité » qui pourrait passer par le développement des énergies renouvelables et du nucléaire ainsi que par l'équipement des centrales électriques de technologies de capture et stockage de carbone.

Ainsi, la voie qui devrait être privilégiée est d'abord celle de l'efficacité énergétique. Il reste en effet des gisements d'économies d'énergie à réaliser dans tous les pays. Sur ce point, les Etats membres de l'Union Européenne ont par exemple pris l'engagement de réduire d'ici à 2020 la consommation d'énergie primaire de

20%. En Europe, la consommation d'énergie dans les bâtiments résidentiels et commerciaux représente environ 40% de la consommation totale d'énergie finale. Elle est responsable de 36% des émissions totales de CO2 de l'Union européenne. Le secteur du bâtiment constitue donc un levier primordial pour des actions en matière d'efficacité énergétique.

Par la suite, l'ensemble des pays doit tendre vers un mix énergétique laissant plus de place aux énergies renouvelables. Ces dernières présentent incontestablement des avantages en matière de lutte contre le changement climatique, et constituent également des énergies moins exposées aux accidents et moins dangereuses pour la santé humaine. Toutefois, des inconvénients existent notamment en matière

d'accessibilité économique et de continuité de l'approvisionnement (aspect fondamental pour le

développement économique de nos sociétés). Par exemple, pour le solaire thermique ou électrique, l'obstacle

majeur est l'intermittence de l'ensoleillement. L'éolien est également freiné par l'intermittence du vent, les

tempêtes, la corrosion, ou bien encore l'emprise au sol. Dans ce contexte, la question du stockage de

l'énergie produite par ces sources renouvelables est fondamentale pour les années à venir. La question du

financement à l'accès à ces énergies renouvelables plus coûteuses que les sources d'énergie

conventionnelles reste également posée.

La nécessaire sécurité des approvisionnements en énergie impose par conséquent de rechercher des gains en matière d'efficacité énergétique et un mix énergétique mieux équilibré en vue de réduire progressivement la part des énergies fossiles. Toutefois, au-delà de l'enjeu en matière de sécurité d'approvisionnement, l'impératif de sécurité des hommes doit-il aller jusqu'à exclure du mix énergétique certains types d'énergies

notamment nucléaire ?

La filière nucléaire n'est pas aujourd'hui uniforme à travers le monde en termes de pratiques. En France, Areva rappelle que la sûreté, la sécurité et la transparence sont des éléments essentiels à l'intérieur de l'entreprise pour orienter les décisions. Toutefois, quelques soient les acteurs considérés, le risque zéro n'existe pas en matière nucléaire. En parallèle, il faut également prendre en compte qu'il s'agit d'une énergie produite sans émission de gaz à effet de serre et qui revendique le fait d'être bon marché. Dans ces conditions, on comprend que l'énergie nucléaire suscite des débats passionnés sur lesquels le pouvoir politique a bien du mal à trancher. La réponse de l'avenir du nucléaire dans les mix énergétiques au niveau mondial renvoie donc à l'acceptation sociétale d'une telle source d'énergie. Et aujourd'hui, les réponses sont diverses au niveau mondial car les sensibilités des hommes s'expriment différemment à travers le monde, la réponse ne sera donc assurément pas uniforme. Néanmoins, il apparaît que le développement de l'énergie

nucléaire pourrait globalement être fortement ralenti voire freiné suite à la catastrophe de Fukushima.

Par ailleurs, le débat sur l'énergie nucléaire ne doit pas éclipser le risque associé aux autres sources d'énergies. Pour mémoire, l'exploitation des énergies fossiles n'est pas exempte de risques que ce soit dans

les mines de charbon, champs de gaz ou plateformes pétrolières. Le 20 avril 2010, la plate-forme pétrolière

Deepwater Horizon louée par la compagnie pétrolière britannique BP pour forer dans le golfe du Mexique (dans les eaux territoriales américaines) explosait. Il s'agissait du puits le plus profond jamais creusé en offshore. 11 personnes sont mortes dans l'accident et 17 ont été blessées, une marée noire de grande envergure s'en est suivie.

En conclusion, la question de la sécurité humaine dans une situation incertaine de disponibilité de l'énergie au niveau mondial pose à la fois la question de la sécurité d'approvisionnement qui permet le développement

économique et celle de la sûreté des installations qui produisent puis distribuent ces énergies. Ce sont les citoyens qui seront progressivement amenés à opérer un choix en tenant compte de ces paramètres, le modèle énergétique est en effet devenu un enjeu sociétal primordial malgré la dimension technique de cette

question. Espérons dans ce contexte que les populations opèrent des choix éclairés...

#### « **Financements innovants, clé d'une croissance durable ?** »

*Malgré la mise en place de nouveaux modes de financements, les pratiques traditionnelles perdurent et les paradigmes évoluent peu. Ces solutions innovantes suffisent-elles à changer les modèles économiques et à assurer un développement responsable ? Sont-elles réellement efficaces ?*

L'enjeu majeur pour assurer un développement durable localement ou globalement c'est de financer ce développement. Quelque soit l'état du pays ou de la région, le financement est un sujet clé :

- Dans les pays développés, l'endettement des états fait que le recours au financement public sera de

plus en plus complexe et qu'il faudra donc dans certains cas réunir intérêt public et privé. C'est le cas

des Partenariats Public Privé (PPP). Il faudra également que la partie privée du financement se

préoccupe des enjeux de développement durable pour que les mécaniques économiques traditionnelles agissent comme un effet de levier

- Dans les zones les plus pauvres la question du financement est tout aussi cruciale et voire beaucoup plus, puisqu'il s'agit de donner accès à des richesses à des gens qui n'ont à priori pas les moyens de rembourser leur endettement qu'ils soient personne morale ou physique.

Les débats de la Global Conférence sur ces thématiques ont évoqué trois grands types d'exemples innovants

: la prise en compte croissante du développement durable dans le financement du tissu économique des PME des pays développés, en particulier dans les opérations de LBO, la recherche par les grandes entreprises de business model innovants adaptés aux pays pauvres et la question de la micro-assurance, tout aussi essentielle que la micro-finance très largement évoquée en général.

La prise en compte du développement durable dans les mécanismes financiers de création de valeur, en particulier dans le domaine du capital investissement, est récente mais croissante au plan international. Sur

ce sujet, certains fonds d'investissement français sont en pointe et ont clairement illustré leurs positions lors

des débats.

En effet, un des acteurs clés de l'économie est aujourd'hui constitué de fonds d'investissement réalisant

essentiellement des opérations de LBO. Ces fonds sont des investisseurs plutôt de long terme tournés vers le développement des entreprises de tailles moyennes qui sont au cœur de l'activité économique de la plupart des pays développés. Ce type d'investissement en capital n'est pas à proprement parlé innovant puisqu'il existait depuis plusieurs dizaines d'années. Par contre, depuis deux ans le secteur est en pleine

évolution autour des questions de développement durable. Compte tenu des effets de levier potentiels de ce

secteur cela constitue une bonne nouvelle d'autant plus que les principales motivations de ces acteurs

reposent sur la conviction que développement durable et croissance économique sont conciliables.

Au sein de ce secteur, la prise en compte du concept de Développement Durable se traduit par l'intégration des critères extra financiers Environnementaux, Sociaux et de Gouvernance (ESG) dans la conduite des affaires. Cette prise en compte consiste principalement en :

- Exercer leur responsabilité d'actionnaire actif et non dormant ;
- Capitaliser sur les principes de gouvernance existants puisque la profession du Capital Investissement s'est

construite autour de la gouvernance ;

- Déployer une stratégie ESG équilibrée à chaque étape du « cycle de vie » des participations, de la prise de participation à la cession permettant d'optimiser la gestion des risques et des opportunités, d'améliorer la

compétitivité et la valorisation financière.

L'importance de ces enjeux s'illustre par le rôle croissant des parties prenantes aspirant à un modèle

économique plus durable :

- L'Etat qui incite les entreprises cotées à intégrer les critères ESG dans leur gestion quotidienne, à travers l'adoption et l'application de réglementations telles que la loi NRE de 2001 et en 2013 la mise en œuvre de l'article 225 de la loi Grenelle II.

- La société civile qui recherche désormais une vision de long terme et des investissements durables pour

satisfaire ses besoins réels.

- Les entreprises qui évoluent en conséquence et modifient peu à peu leur business-model. Elles adaptent leur offre (produits et services) afin de répondre à la demande croissante de leurs parties prenantes : investisseurs, consommateurs, clients, société civile, ONG, fournisseurs.

Au-delà de ces attentes, un certain nombre de facteurs contribuent très significativement à la prise en compte progressive des critères ESG au sein du Capital Investissement :

- Des investisseurs institutionnels de plus en plus exigeants. Cette exigence émane des parties prenantes (souscripteurs, régulateurs, opinion publique) qui leur demandent de ne plus prendre en compte la seule performance financière de leurs investissements mais également la performance économique globale intégrant les enjeux sociaux et environnementaux. Ils prônent ainsi un devoir de transparence qui se formalise

progressivement sous la forme de questionnaires à l'attention des sociétés de gestion. Dans quelques

années, la prise en compte de critères ESG constituera très probablement un avantage concurrentiel pour lever des fonds.

- Une réglementation elle aussi de plus en plus rigoureuse, qui vise à renforcer le reporting sociétal des entreprises.

Néanmoins, la prise en compte des critères ESG ne doit pas seulement être considérée comme une contrainte, fruit de pressions émanant des parties prenantes, mais comme un véritable levier de création de valeur permettant de :

- Pérenniser la performance des participations et notamment sur la gestion des risques, la gestion des ressources humaines, la capacité à répondre aux appels d'offre et à l'émergence de nouveaux marchés et enfin à la réduction de certains coûts.

- Valoriser la performance des participations par le résultat des actions menées sur la politique sociale et environnementale, qui lui permettront de faire progresser son CA ou son EBITDA. La mise en place d'un reporting ESG au sein de chaque participation sera nécessaire pour suivre des indicateurs de performance ESG pendant la période de détention.

- Renforcer les relations entre la société de gestion et les sociétés constitutives de son portefeuille.

De même que pour les entreprises qui ont le Pacte Mondial les acteurs du capital investissement ont élaboré sous l'égide des Nations Unis les *Principles for Responsible Investment* (PRI) qui consistent à formaliser l'engagement des sociétés de gestion et à le rendre transparent via un reporting annuel. La prise en compte

de ces questions ESG devient une réalité forte sur le marché du Private Equity français puisque sur les 920

signataires des PRI, 73 sont français à ce jour. Et c'est bien ce qu'ont montré les discussions des différents

intervenants de cet atelier.

Si la question de la prise en compte du développement durable dans les financement privés des pays développés semble pouvoir se résoudre de façon traditionnelle, il faudra faire appel à de réels leviers

d'innovation pour régler les grands paradoxes auxquels nous sommes confronté dans les pays en voie de

développement tels que : des problématiques massives de malnutrition dans des pays où l'essentielle de la population est constituée d'agriculteurs, ou la pauvreté extrême (moins d'1 dollar par jour) dans des pays riche de ressources énergétique comme le pétrole.

Une partie des réponses semblent pouvoir venir de l'adaptation du business modèle de certaines entreprises

aux réalités économique et sociale des pays pauvres. Au delà de la commercialisation dans les pays développés des produits issus du commerce équitable c'est le développement de marché intérieur réel pour ces entreprises qui peut donner un espoir. L'exemple de Danone au Bangladesh est frappant à ce sujet. Pour

développer et pérenniser son activité localement et donc se créer une clientèle susceptible de pouvoir acheter ses produits sur place l'entreprise a dû revoir complètement son modèle économique et accepter une marge inférieure, au prix d'une promesse de volume important à long terme.

Ce type d'approche extrêmement innovante devrait avoir tendance à se développer dans les prochaines années, nombre de grandes entreprises étudiant de façon de plus en plus intéressées les marchés potentiels des économies à fort développement mais faible revenus.

Le microcrédit, mode de financement qui existe depuis plus de 10 ans, est particulièrement adapté aux pays en voie de développement, cependant les questions tournant autour des garanties des personnes ne sont abordées que depuis peu et sont par exemple le fait de grandes compagnies comme Allianz et sa division Allianz Africa.

La micro-assurance est un mécanisme de protection des personnes à faibles revenus contre les risques

(accident, maladie, décès familiaux, catastrophe naturelle) en échange du paiement d'une prime d'assurance

calculée en fonction de leurs besoins, de leurs revenus et du niveau du risque concerné. Selon une étude réalisée en 2009 par le [Fonds pour l'innovation en micro-assurance de l'Organisation internationale du travail \(OIT\)](#), 14,7 millions d'africains vivants avec moins de 2 dollars par jour sont actuellement couverts par des

produits de micro-assurance, soit seulement 2,6% de la population africaine entrant dans cette tranche de revenus. Les auteurs de l'étude révèlent aussi que l'Afrique du Sud couvre à elle seule 56% du total, que le continent est dominé par les produits d'assurance vie et que les produits de santé - souvent cités comme les plus demandés - ne couvrent en réalité que 0,3% de la population à faibles revenus. Quant à l'assurance des biens et l'assurance agricole, elles couvrent une population encore moins nombreuse, avec respectivement

0,2% et 0,1% de leurs marchés potentiels.

Les personnes les plus pauvres auraient tendance, selon les auteurs de l'étude, à croire que l'assurance n'est faite que pour les riches. Ils auraient aussi du mal à comprendre comment fonctionne l'assurance ou comment la comparer à d'autres outils de gestion des risques tels que l'épargne et le crédit. Un des

principaux objectifs de la prochaine décennie sera donc de rendre la micro-assurance plus accessible aux

personnes les plus démunies en instillant progressivement une culture de l'assurance par des programmes

de formation et de sensibilisation.

En effet, es produits doivent être conçus pour répondre aux besoins spécifiques des clients pauvres, ils doivent être disponibles (même dans les régions reculées) et abordables, le paiement des primes doit être

structuré de façon à convenir au budget des familles pauvres. Enfin, l'accès est aussi intellectuel. Les

assureurs en Afrique constatent, sur le plan de la demande, que l'expansion de la micro-assurance est

entravée par le manque de compréhension des concepts de l'assurance et les confusions qui existent par

exemple avec les mécanismes d'épargne (les clients s'attendent à récupérer leurs primes si aucun sinistre n'a

eu lieu) et mettent en avant la nécessité de l'éducation des consommateurs afin de faciliter les ventes. Ce

n'est que lorsque les populations à faibles revenus verront la micro-assurance comme une valeur ajoutée dans leur manière de gérer les risques que la croissance de l'industrie connaîtra un véritable essor. Sur le plan de l'offre, les assureurs notent que leurs difficultés sont essentiellement liées à l'efficacité des systèmes

existants qui ne répondent pas aux besoins du secteur. Les coûts administratifs sont élevés, les systèmes de

gestion des informations encore mal organisés et le personnel des compagnies d'assurance n'est pas

toujours formé de manière suffisante pour ce type de marché.

La micro-assurance ne se réfère pas à la taille de l'assureur, même si certains prestataires en Afrique sont en effet de taille modeste et ont même une structure informelle. Il existe des exemples de très grandes entreprises qui offrent des produits de micro-assurance, y compris des multinationales comme Allianz. Sous

diverses formes, la micro-assurance est disponible en Afrique depuis un certain nombre d'années. Les

coopératives d'assurance ont servi différents segments de population depuis les années 1970. Dans les

années 1980, de nombreux régimes d'assurance maladie communautaires, en particulier en Afrique de

l'Ouest, ont été créés. Au milieu des années 1990, les assureurs privés ont commencé à investir le marché de

la micro-assurance, offrant des produits spécifiques pour les populations démunies. Quant à la micro-

assurance informelle, elle est disponible depuis des décennies sous des formes variées allant des « tontines

» en Afrique de l'Ouest ou des groupes « Friends in need », en Afrique de l'Est, en passant par les sociétés

funéraires en Afrique du Sud.

Le fait que les divisions locales de grandes compagnies d'assurances internationales travaillent sur le sujet est un facteur encourageant pour ces pays et leurs populations.

La question du financement reste clairement au centre des enjeux de développement durable qu'ils s'agissent d'économies développées ou en voie de développement. Les débats relatifs aux financements innovants dans cette 5ème Edition des Ateliers de la Terre l'ont clairement illustré via deux approches essentielles. L'une centrée sur le développement économique dans les pays développés et s'appuyant sur les mécanismes mis en place par les fonds d'investissement intégrant de plus en plus le développement durable comme PAI, Eurazeo PME ou Pragma Capital. Et l'autre tournée sur le monde en développement et démontrant que des solutions économiques viables sont possibles pour traiter un certain nombre d'enjeux, comme la nutrition et l'assurance. Le fait que des grands groupes d'assurance, au-delà des raisons morales, s'intéressent à des territoires comme l'Afrique donne de l'espoir pour ce continent. Il est clair que de le percevoir comme un marché potentiel est la principale opportunité de développement pour l'Afrique. Une des plus grandes

innovations en termes de financement reste encore à venir. Elle est le fait des états et relève des choix

qu'elles feront en matière de gouvernance mondiale et de démocratie planétaire. Il s'agit de toutes les

récentes discussions issues de réflexions de James Tobin à propos de la taxation des transactions financières. C'est probablement une des options les plus crédibles aujourd'hui pour faire face aux besoins en développement de l'humanité.

#### « Crise alimentaire : quelles révolutions vertes ? »

*La sécurité alimentaire reste un défi majeur. Les mécanismes actuels ne répondent pas à cette crise profonde. Comment mettre en œuvre un autre système de production agricole permettant de nourrir 9 milliards de personnes? Faut-il révolutionner la révolution verte ?*

Un milliard d'êtres humains souffrant de malnutrition, la recrudescence des émeutes de la faim en Asie, en

Afrique et en Amérique centrale, une situation d'urgence humanitaire en Somalie du Sud ... les crises

alimentaires constituent un sujet brûlant d'actualité arrivé au cœur des agendas politiques nationaux et internationaux. Le modèle agricole actuel ne semble pas adapté pour répondre aux besoins d'une population mondiale de 9 milliards d'habitants en 2050 tout en faisant la promotion de conditions de production plus respectueuses de l'environnement. Si de multiples facteurs sont à considérer pour expliquer cette situation, mêlant des questions d'investissements et de spéculations à des problématiques climatiques et de comportements alimentaires, les réponses à ce défi majeur sont également plurielles. La réalisation d'un bond

technologique comparable à celui de la « révolution verte » des années 1960-1990 semble peu probable. Les

nouvelles révolutions vertes devront s'appuyer également sur des politiques publiques volontaristes ainsi que

sur des initiatives privées et citoyennes.

L'agriculture souffre depuis le début des années 80 d'un déficit chronique d'investissement aussi bien de la

part des pouvoirs publics que du secteur privé. Cette situation, conjuguée au développement des exportations

de produits alimentaires sous l'impulsion du FMI, a conduit à une diminution de la productivité agricole dans

plusieurs pays africains et à une situation de dépendance alimentaire de nombreux Etats du Sud, autosuffisants auparavant. Le niveau de vie des pays développés nécessite dans le même temps des besoins en terres dépassant leurs propres frontières. Une étude du Sustainable Europe Research Institute a ainsi mis en évidence que l'Europe des 27 mobilisait 640 millions d'hectares en 2004 pour sa consommation, soit 1,5 fois sa propre superficie. La consommation moyenne de terres de l'Union européenne est de 1,3 hectare par personne, contre 0,4 hectares pour la Chine ou l'Inde. La spéculation sur les matières premières alimentaires

et l'augmentation des cultures pour les biocarburants contribuent pour leur part à fragiliser encore davantage

la sécurité alimentaire des populations les plus vulnérables.

Le bilan environnemental d'une agriculture axée essentiellement sur l'amélioration des rendements conduit par ailleurs à s'interroger sur la pérennité d'un tel système : absorption de 70 % de la consommation d'eau mondiale par l'agriculture, pollution des sols et de l'eau par l'utilisation intensive d'intrants chimiques, atteintes

graves et parfois irréversibles à la biodiversité, etc. Le changement climatique se manifestant par des

événements météorologiques extrêmes risque enfin d'exposer d'ici 2080, 600 millions de personnes

supplémentaires à la faim<sup>8</sup>.

Face à l'ampleur et à la diversité des enjeux, les réponses apportées ne peuvent être que multiples et dans la mesure du possible complémentaires.

Une politique d'investissement de grande ampleur doit tout d'abord être mise en place pour préparer les

hommes et les territoires aux conséquences du changement climatique et œuvrer à la transition vers des

modes de production plus durables tout en atteignant des niveaux de rendement élevés. Cette approche, parfois désignée sous le terme « d'agroécologie<sup>9</sup> » se fonde sur le maintien ou l'introduction de la biodiversité

agricole (diversité des cultures, agroforesterie, pollinisateurs, etc.) et compte déjà à son actif des résultats prometteurs en Tanzanie<sup>10</sup>, au Malawi, au Mozambique ou en Zambie. Si les investissements publics doivent rester prépondérants pour assurer une vision à long terme aux programmes de recherche et aux opérations

de reconversion agricole, l'apport du secteur privé est également essentiel. Il convient ainsi de ne pas adopter

de position dogmatique à ce sujet : l'achat de terres agricoles par des entreprises étrangères peut être

profitable aux populations locales si les termes de l'accord sont suffisamment transparents et cadrés en amont ; le développement des agro carburants peut attirer des capitaux étrangers et contribuer à l'introduction

8 PNUD, Rapport mondial sur le développement humain 2007/2008

9 Nations Unies, Rapport du Rapporteur spécial sur le droit à l'alimentation (Olivier de Schutter), décembre 2010

10 Cf intervention de Christopher K. CHIZA, Ministre Délégué en charge de l'Agriculture, de la Sécurité Alimentaire et des Coopératives (Tanzanie)

de nouvelles techniques pour améliorer les rendements agricoles<sup>11</sup>.

Depuis l'envolée des prix alimentaires en 2008 et le sommet de l'Aquila en 2009, de plus en plus de voix se font entendre pour dénoncer la spéculation sur les produits agricoles et prôner une régulation des marchés. Cette sanctuarisation des produits agricoles qui concernerait notamment les prix des 4 céréales à la base de

l'alimentation mondiale (maïs, blé, riz, soja) s'inscrit dans un cadre plus global de régulation des marchés financiers et ne pourra être instituée que par l'entremise d'un accord au niveau du G20. Si cette perspective semble encore éloignée, cette voie doit rester ouverte et être explorée au cours des prochaines années.

La lutte contre le gaspillage constitue un autre axe de travail pour lutter contre les crises alimentaires. Dans un récent rapport, les experts de la FAO estiment à 1,3 milliard de tonnes le montant des produits alimentaires perdus ou gaspillés chaque année sur la planète. Soit un tiers de la production mondiale. Ces pertes de nourriture sont directement imputables à une surconsommation de nourriture dans les pays

développés et à des infrastructures défectueuses dans les pays en développement. L'agence de l'ONU conclut

ainsi qu'il est aujourd'hui plus rentable de réduire le gaspillage de nourriture que d'accroître la production

agricole pour nourrir une population mondiale en croissance.

S'il convient d'agir pour améliorer l'acheminement des produits alimentaires vers les populations qui en ont

besoin et intégrer la notion de mesure dans nos actes d'achats en lien avec le développement de stratégies

marketing plus responsables, la nature même de notre alimentation fait débat. Près de 50% de la production mondiale de céréales est en effet destinée à la fabrication de nourriture pour animaux. La diminution de la part des protéines animales dans le régime alimentaire des pays du Nord permettrait de dégager des excédents de céréales tout en répondant à un enjeu majeur de santé publique.

Le développement de l'agriculture en milieu urbain, illustré par l'initiative des fermes Lufa à Montréal présentée lors de la Global Conference, constitue enfin un élément de réponse intéressant pour concilier augmentation de la population urbaine, raréfaction des terres arables et promotion de circuits de distribution courts.

La science ne suffira pas à répondre au défi alimentaire auquel l'humanité aura à faire face au cours des 50 prochaines années. Plusieurs leviers d'actions sont entre les mains des gouvernements, des entreprises et des individus. Tout au long de l'Histoire, la faim a joué un rôle déterminant dans le déclenchement des révolutions et les renversements de régime. Si les décideurs politiques ont montré les premiers signes d'une prise de conscience en 2009 en s'engageant à mobiliser plus de 20 milliards USD en 3 ans, cet effort doit s'inscrire dans la durée et ne pourra pas faire l'économie d'une véritable stratégie agricole à l'échelle mondiale.

Cependant les nouvelles révolutions vertes passeront également par une « révolution des mentalités » se manifestant par une revalorisation des métiers agricoles aussi bien dans les pays du Nord que du Sud.

## PRESENTATION DES RESULTATS DES COMMISSIONS DE TRAVAIL

### GLOBAL CONFERENCE 2011

#### INTERNATIONAL LEADERS OF THE ENTREPRENEURIAL SOCIETY

#### NOTE DE SYNTHÈSE

*Les entreprises sociales disposent d'un formidable potentiel de croissance, de création d'emplois durables et d'utilité sociale. Cette commission de travail mise en place par les Ateliers de la Terre en partenariat avec le Groupe SOS a pour but de réfléchir aux réformes nécessaires pour démocratiser le modèle de l'entrepreneuriat social et favoriser son émergence à l'échelle européenne et internationale.*

#### PREMIÈRE PARTIE : Et adresses de l'entrepreneuriat social

##### Qu'est-ce que l'entrepreneuriat social aujourd'hui ?

La notion d'entrepreneuriat social regroupe un panel relativement large d'activités dont on peut néanmoins

relever plusieurs **traits fondamentaux et pratiques communes** :

1) Tous les projets d'entrepreneuriat social constituent des **démarches privées**, ancrées dans le marché, favorisant la création d'emplois, recherchant un modèle économique viable, et visant à la production de biens et services.

Il s'agit donc d'une **démarche d'entreprise** (privée), au sens européen du terme. « *Est considérée comme entreprise toute entité, indépendamment de sa forme juridique, exerçant une activité économique. Sont notamment considérées comme telles (...) les sociétés de personnes ou les associations qui exercent régulièrement une activité économique* » (annexe I au règlement (CE) n° 800 / 2008).

2) Néanmoins, ces initiatives privées sont **au service de l'intérêt général**, avec pour objectif de répondre à des besoins de la société peu ou mal satisfaits : lutter contre les exclusions, maintenir des emplois sur des territoires fragiles, garantir un juste revenu aux producteurs, aider les personnes

âgées à mieux vivre, protéger l'environnement, répondre à de nouveaux besoins sociaux...

La finalité sociale de ces initiatives privées peut prendre différentes formes :

- **Sociale par les bénéficiaires de l'activité** (clients, usagers) : personnes fragiles ou fragilisées sur le plan du revenu, de l'emploi, de la santé, de l'éducation.

- **Sociale par les salariés de l'entreprise** : personnes fragiles ou fragilisées bénéficiant (ou pas) d'un accompagnement des pouvoirs publics (insertion, handicap...).

- **Sociale par l'offre de l'entreprise** : conception, production et/ou distribution d'une offre à caractère social, attestés par un label ou une certification reconnue (ex.: Max Havelaar).

La démarche est **doublement inclusive**. D'une part, les personnes vulnérables ciblées (pauvres, handicapés, etc.) sont incluses soit du côté de la demande (clients ou usagers), soit de l'offre (employés, producteurs, chefs d'entreprise).

3) Les projets d'entrepreneuriat social ont une **lucrativité limitée** : le profit n'est pas une fin mais un moyen, les excédents dégagés étant majoritairement réinvestis dans le projet ou dans d'autres initiatives sociales, notamment grâce à la stricte limitation de la rémunération du capital :

- Encadrement de la rémunération des apports en fonds propres (définition d'un seuil absolu ou relatif, limitation de la part des excédents redistribuables en dividendes...)

- Encadrement de l'échelle des salaires (1 à 10, à corrélérer en fonction du nombre de salariés).

- Excédents majoritairement réinvestis dans le projet (investissements, fonds propres, réserves...).

- En cas de dissolution, dévolution majoritaire des actifs à d'autres entreprises sociales.

4) Enfin, ces projets **encouragent l'innovation** et le dépassement des pratiques traditionnelles. Inventant de nouvelles réponses aux problèmes sociaux, de nouvelles manières de mobiliser des res-

sources : les entrepreneurs sociaux sont des « agents du changement social ». L'entreprise sociale privilégie des formes de gouvernance participative, où le processus de décision n'est pas fondé uniquement sur la propriété du capital mais aussi sur l'intérêt d'autres parties prenantes (salariés, collectivités, bénéficiaires, ONG...).

## II) Des opportunités de marché social existent :

Les entreprises sociales sont déjà des **dizaines de milliers** en Europe à montrer que l'on peut **concilier efficacité économique et utilité sociale**, pour lutter contre les exclusions, maintenir des emplois sur des territoires fragiles, garantir un juste revenu aux producteurs, aider les personnes âgées à mieux vivre, protéger l'environnement ou encore répondre à de nouveaux besoins sociaux.

Sont notamment concernées des entreprises d'insertion, des entreprises adaptées aux personnes handicapées, des coopératives sociales, des entreprises du commerce équitable, des entreprises associatives de la santé, des joint-ventures du type Grameen Danone, etc.

Rappelons qu'un certain nombre de **dynamiques ont favorisé l'essor de l'entrepreneuriat social** :

1) La prise en considération croissante des 3 piliers du développement durable.

· Domaine **environnemental** : la nécessité de gestion raisonnée des ressources qui s'est progressivement imposée (gestion locale des ressources en eau, projets de reforestation...) ou encore la dynamique de lutte contre le changement climatique, avec des projets visant à développer des solutions alternatives, notamment dans le secteur énergétique.

· Domaine **social** : le vieillissement de la population, ou encore la lutte contre l'accroissement des inégalités.

· Domaine **économique** : défi du commerce équitable ou du développement économique des territoires, politiques RSE, consommation responsable.

2) Les **financements** de l'entrepreneuriat social se sont multipliés, grâce notamment à de nouveaux fonds liés à la « venture philanthropy », à des financements issus du grand emprunt (100M€), à de nouvelles fondations, etc. Les « jeunes pousses » de l'entrepreneuriat social trouvent plus facilement

des capitaux pour amorcer leur projet.

3) L'**accompagnement** est progressivement renforcé, avec par exemple la mobilisation du réseau

« Entreprendre », le développement des dispositifs d'incubation, etc. Cet accompagnement reste

néanmoins loin de celui que l'on peut trouver dans le secteur classique.

4) L'**environnement juridique progresse**, grâce notamment au rapport Vercamer, à la Commission

Label, au Conseil Supérieur de l'ESS, etc.

5) Les **compétences augmentent** : de plus en plus de jeunes ou expérimentés issus du privé veulent

aujourd'hui mettre leurs compétences au service de l'entrepreneuriat social, même à des salaires in-

férieurs.

Ainsi, la dynamique des entreprises sociales est **porteuse d'avenir** :

1) Leur efficience économique est un levier de **réduction des déficits publics**.

2) Leur qualité de service est un facteur de **compétitivité économique et sociale**.

3) Leur modèle économique original attire de nombreux entrepreneurs en **quête de sens**.

4) Leur **potentiel de croissance, de création d'emplois durables et d'utilité sociale** est avéré, notamment sur :

· les marchés éthiques : bio, commerce équitable, écoproduits, circuits courts, recyclage...

· les activités d'intérêt général : santé, social, petite enfance, dépendance, environnement, éducation,

culture, transports...

5) Leur **potentiel de duplication entre pays**, encore peu exploité, reste important. De plus en plus de gouvernements, de collectivités locales, de fondations de pays européens s'engagent sur le soutien à la duplication d'entreprises sociales sur leur territoire.

*Ex : C'est par exemple le cas de la Catalogne qui vient de mettre en place un Programme pour développer l'entrepreneuriat social, notamment via la duplication d'entreprises sociales d'autres pays européens.*

Néanmoins, le développement de l'entrepreneuriat social butte sur des obstacles qu'il convient d'identifier.

### III) Limites au développement de l'entrepreneuriat social :

1) Un manque d'entrepreneurs sociaux : même s'ils sont déjà des milliers - voire des dizaines de milliers

- **les entrepreneurs** deviennent finalement la « **ressource rare** » dans l'économie sociale et solidaire

(ESS).

2) **Un manque d'accompagnement** des structures, notamment par rapport au secteur classique.

3) **Des outils de financements inadaptés**, en particulier pour les entreprises sociales matures à la recherche de capital-développement.

4) **Des obstacles à l'internationalisation** des structures de l'ESS, notamment en raison d'un manque

de référentiel commun.

Le frein principal au développement, ce n'est donc ni les compétences, ni les marchés. Bien sûr, ils restent insuffisants et il faut continuer à les développer et les mobiliser.

Mais il faut également s'attacher à démocratiser le modèle de l'entrepreneuriat social et lui apporter une reconnaissance au niveau européen et

international.

*Quelles réformes pourrait-on alors mettre en place pour favoriser l'émergence du modèle de l'entrepreneuriat social au sein de l'économie européenne et mondiale ? Comment faire pour changer d'échelle et propulser le modèle de l'entrepreneuriat social à l'échelle internationale ?*

La seconde partie de ce document s'efforce de mettre en avant plusieurs recommandations, dans quatre

domaines dont l'importance nous est apparue primordiale : formation, financement, identification et

internationalisation de l'entrepreneuriat social.

## DEUXIEME PARTIE : Recommandations pour l'émergence du modèle de l'entrepreneuriat

**social à l'échelle internationale.**

Au travers des contributions partagées par les experts de la commission de travail, il apparaît qu'en vue de favoriser l'émergence du modèle de l'entrepreneuriat social à l'échelle internationale, quatre dimensions sont essentielles et doivent faire l'objet de réformes aussi bien au niveau national, qu'eupéen et international : la formation, le financement, les statuts et la démocratisation à l'échelle internationale de l'entrepreneuriat social.

#### I) Formation à l'entrepreneuriat social :

*L'un des freins au développement de l'entrepreneuriat social en Europe et dans le monde vient du manque de l'offre de formation mise à disposition des étudiants et entrepreneurs souhaitant se diriger vers ce secteur en plein essor. Ce dernier ne pourra en effet changer d'échelle que si une offre de formation adéquate et de qualité est disponible. Cet enjeu est d'autant plus important que de nombreux postes sont amenés à se libérer dans le secteur dans les prochaines années, avec 480 000 postes concernés en France.*

Il convient donc de :

##### - Favoriser la mise en place d'une offre de formation en entrepreneuriat social qui soit plus structurée

**et plus massive dans les universités et les grandes écoles**, afin de proposer aux étudiants qui s'intéressent à ce secteur une formation solide, spécialisée et reconnue. En effet, aujourd'hui, la demande d'accès aux formations existantes est largement supérieure aux capacités d'accueil.

Ces nouvelles offres de formation pourraient notamment s'inspirer d'initiatives encourageantes, comme la création par l'ESSEC de la Chaire Entrepreneuriat Social au sein de l'Institut de l'Innovation et de l'Entrepreneuriat Social.

**- Développer les offres de formation continue à destination des dirigeants, salariés et bénévoles** de différentes structures. Ces offres pourraient s'inspirer de l'approche et des programmes proposés par l'Ecole de l'Entrepreneuriat en Economie Sociale de Montpellier.

##### - Mettre en place des modules de formations et sensibilisation à l'attention des organisations

**intermédiaires et des ONG**, en développant un réseau d'échanges des connaissances, pour favoriser les

dialogues entre les parties prenantes du secteur.

**- Rendre plus lisible l'offre de formation déjà existante** dans le domaine, en allant à la rencontre des étudiants, notamment par le biais de campagnes d'information et de sensibilisation par la preuve, pour donner envie aux jeunes d'entreprendre autrement.

**- Développer un socle théorique commun** dans le domaine de l'entrepreneuriat social, en favorisant la création d'un véritable corps doctrinal spécialisé, qui pourrait améliorer à la fois la qualité des formations

dispensées, mais aussi la lisibilité des enjeux propres au secteur. Dans cette optique, il serait intéressant de **répertorier les institutions les plus actives dans le domaine**, ainsi que les **ressources académiques disponibles**. Cette **base de données recensant tous les acteurs de l'économie sociale** faciliterait leur

mise en relation, la création de synergies et la construction de projets communs, en s'inspirant par exemple

des travaux réalisés dans le cadre de la **Growing Inclusive Market Initiative**, une initiative menée par le

PNUD pour favoriser la recherche multi-acteurs.

- Dans une logique d'internationalisation des compétences, **développer le volet « Entreprises Sociales »**

**du programme « Erasmus for Young Entrepreneurs »**. Lancé par la Commission européenne en février

2009, sous l'égide du « Small Business Act », ce programme a pour but d'aider des créateurs d'entreprise à

acquérir des compétences en management en passant une période de 1 à 6 mois dans un autre pays

eupéen, auprès d'un entrepreneur expérimenté.

#### II) Financement de l'entrepreneuriat social

*Le secteur de l'entrepreneuriat social est confronté à une même problématique dans la plupart des pays d'Europe: la baisse des financements publics nécessite de trouver de nouveaux financements privés afin de faire perdurer leurs activités. Le secteur de l'entrepreneuriat social ne pourra en effet changer d'échelle s'il n'existe pas d'outils financiers spécifiques et adaptés permettant de couvrir leurs besoins.*

##### 1) Encourager un nouveau mode de financement pour les entreprises sociales :

Déjà répandu en Angleterre et aux Etats Unis, l'**impact investing** correspond aux investissements à « impact

social », c'est-à-dire qui allient à la fois **un retour financier et un retour social sur investissement**. L'**impact investing diffère donc de l'ISR** (Investissement Socialement Responsable), qui s'adresse aux entreprises engagés dans une démarche RSE (Responsabilité Sociale de l'Entreprise). L'**impact investing**

correspond donc au marché des entreprises sociales : entreprises dont la finalité sociale, sociétale et/ou environnementale est atteinte grâce à un modèle économique viable.

Le rapport « *Impact Investments, An emerging asset class* », publié en novembre 2010 par J.P.Morgan,

reconnait le marché de l'**impact investing** comme une **nouvelle classe d'actifs à très fort potentiel de**

**croissance**.

Ce rapport démontre que le marché de l'**impact investing** ne peut être classé parmi les classes d'actifs

traditionnels, car il répond à des logiques différentes, à savoir :

- un couple rentabilité/risque nouveau ;
- des compétences en gestion et organisation spécifiques ;
- des structures avec un modèle juridique et économique particulier
- le besoin de nouvelles mesures d'impact standardisées. Le rapport prévoit d'importantes opportunités pour les dix prochaines années, dans les secteurs du logement, de l'accès à l'eau potable, de la santé, de l'éducation, et de la microfinance. L'opportunité d'investissement est estimée au plus bas à 400 milliards de dollars.

Il convient donc d'**informer** et de **sensibiliser les investisseurs institutionnels classiques à ce nouveau mode d'investissement.**

Si les investisseurs traditionnels (banques, assurances, fonds d'investissement) sont concernés, d'autres fonds peuvent être sollicités.

#### **Les « *unclaimed assets* »**

Les « *unclaimed assets* » sont les fonds des banques restés inactifs pendant plus de 15 ans et non réclamés

à ce jour. En Grande Bretagne, leur montant s'élèverait à 400 millions de livres (selon la *British Banking*

*Association*). La « *Commission on Unclaimed Assets* », lancée par Tony Blair, a recommandé la création, à partir de ces actifs non réclamés, d'une « Social Investment Bank » d'au moins 250 millions de livres. Cette nouvelle structure jouerait le rôle d'un « grossiste » : opérateur de second niveau qui ciblerait les

investisseurs solidaires « détaillants » qui financent en direct les entreprises sociales et le tiers -secteur. David

Cameron a repris l'idée à son compte et annoncé le 19 juillet dernier la création à l'horizon d'avril 2012 d'une

« **Big Society Bank** », financée par les « *unclaimed assets* », et qui devrait débloquer « des centaines de millions de livres » à destination des entreprises sociales, et plus largement du tiers-secteur.

#### **L'épargne (salariale, retraite, assurance vie)**

En France, l'épargne salariale et solidaire a augmenté de 111% entre 2009 et 2010. Cette impressionnante

croissance est le fruit de plusieurs mesures. Tout d'abord, une obligation légale a été instituée par la loi de

Modernisation de l'économie du 4 août 2008 (loi Madelin). Celle-ci a instauré l'obligation de proposer dans

tout Plan Epargne Entreprise un Fond Commun de Placement Solidaire, investissant entre 5 et 10 % de leur actif dans des entreprises agréées solidaires. De plus, l'épargne salariale et solidaire est encouragée par des mesures fiscales. La même loi Madelin prévoit en effet une exonération d'impôt sur le revenu des capitaux

placés dans ces fonds. La possibilité de capter la part solidaire (5 à 10%) des FCP, FCPE et Sicav solidaires représente une réelle opportunité de part l'importance des volumes en question. Une modification des réglementations nationales pourrait encourager l'orientation de ces fonds vers les entreprises sociales.

#### **2/L' impact investing a besoin d'outils institutionnels pour fonctionner**

*Mesurer l'impact social des entreprises sociales*

**Mesurer l'impact social est nécessaire, aussi bien pour les investisseurs** qui font ou veulent faire de l'impact investing **que pour les entreprises sociales elles-mêmes**. Certains outils de mesure d'impact existent déjà, mais il n'y a pas de méthode commune. Les principales méthodes connues sont le SROI, le GIIRS et IRIS. Si toutes ces méthodes ont le mérite d'évaluer la performance sociale des entreprises, elles se

révèlent, pour les entrepreneurs comme pour les investisseurs, complexes, chères et chronophages.

Afin d'accélérer et faire converger le développement de cette **ingénierie** (boîte à outils, méthodologies, guides...) encore émergente mais essentielle pour un développement à grande échelle du *social business*, et son appropriation par les acteurs économiques classiques, il faut se mettre d'accord sur une **méthode**

#### **d'évaluation des performances financière et extra financière des entreprises sociales commune.**

Disposer d'un outil de mesure d'impact commun favoriserait la réalisation d'un **reporting systématique**. Evaluer les entreprises financièrement et extra-financièrement permettra de **valoriser ces dernières en prouvant l'efficacité de leur modèle**, attirant ainsi à la fois de nouveaux entrepreneurs et des investisseurs

vers l'entrepreneuriat social.

*Créer une agence de notation financière et extra financière européenne*

La mise en place d'une méthode d'évaluation des performances des entreprises sociales amène à

s'interroger sur les acteurs responsables de la notation. La mise en place d'une agence de notation

indépendante apporterait non seulement un cadre réglementaire et une transparence dans l'évaluation

financière et extra-financière des entreprises européennes.

Fournissant de l'information financière aux banques et aux fonds d'investissement, elle pourrait favoriser la normalisation de l'analyse financière des entreprises sociales. En développant les procédures d'analyse du

risque propre à ces **entreprises, elle faciliterait leur accès au financement.**

*Favoriser la mise en place d'un « social stock exchange européen »*

L'idée consiste à créer **une plateforme web qui mettrait en contact direct et de manière qualifiée les entreprises sociales et les investisseurs**, en vue d'une transaction. Cela permettrait de fluidifier et de **structurer le marché du financement solidaire**. Cette plateforme comporterait des **compartiments** par type de besoins de financement (fonds propres, prêts, dons...), de structures, d'investisseurs... Les entreprises sociales seraient systématiquement qualifiées par des tiers-experts.

Ainsi, cette plateforme contribuerait également à développer et **diffuser de nouveaux « standards »** pour l'entrepreneuriat social, notamment en matière de reporting social. Elle favoriserait donc une convergence vers des référentiels communs, élément essentiel à toute internationalisation.

*En France, la chaire entrepreneuriat social de l'ESSEC, le cabinet d'avocats Bird&Bird et Le Comptoir de l'Innovation (Groupe SOS) mènent un projet de recherche destiné à lancer une telle plateforme d'intermédiation.*

*Créer un fonds de liquidité européen*

Ce fonds jouerait le rôle de *market maker* sur le marché intérieur pour les entreprises sociales. Il fonctionnerait en garantissant aux investisseurs le rachat de leurs titres d'entreprises labellisées sociales au bout d'une certaine période de temps, par exemple 5 ans, et sous certaines conditions de performances de la structure émettrice.

Il ne s'agit évidemment pas de créer un fonds poubelle pour les titres sociaux, les conditions de rachat étant à la fois conditionnées à la viabilité économique et à la performance sociale de l'entreprise émettrice. Ce fonds agirait alors comme un **vecteur d'orientation en termes de performances sociales et économiques minimales pour l'entrepreneuriat social**. La question de la mesure de la performance sociale se pose encore ici, d'où la **nécessité de coupler la création de cet outil avec celle d'une agence de notation**

*Création d'un OPCVM européen des titres aux entreprises sociales*

Création d'une autorité européenne compétente pour agréer les OPCVM et les sociétés de gestion simplifiant ainsi les montages impliquant plusieurs Etats membres. La Création de cet OPCVM serait accompagnée par la **Création d'un agrément solidaire pour les OPCVM** gérant des fonds provenant de l'épargne solidaire.

*Encourager la recherche dans le secteur de la finance solidaire*

Il s'agit d'inventer de nouveaux produits financiers adaptés aux spécificités des entreprises sociales. Par exemple, on pourrait imaginer la mise en place de titres de fonds propres pour les entreprises sociales européennes ou le développement de « *Social Impact Bonds européens* » (SIB). Ce **concept innovant permet d'attirer de nouveaux investissements privés dans le secteur public** afin d'attaquer les problèmes sociaux, tout en encourageant l'innovation et en passant outre les contraintes budgétaires que rencontre le gouvernement. Le gouvernement établit un contrat avec un **investisseur intermédiaire privé à motivation sociale**, qui, à terme, **va réaliser certaines prestations sociales** auparavant assumées par le secteur public, en ayant préalablement fixé des **objectifs de réussite** précis avec le gouvernement. En ce sens, le gouvernement économise de l'argent, et **récompense l'investisseur privé avec l'argent économisé au pro rata des objectifs atteints**. Dès lors, plus l'investisseur atteint ses objectifs, plus le gouvernement économise, et plus l'investisseur est bien rémunéré. A l'inverse, ce dernier prend le risque de ne pas l'être s'il n'atteint pas les objectifs fixés. Faire de la recherche dans ce secteur permettrait de répondre aux problèmes induits par les *Social Impact Bonds*, à savoir en premier lieu la difficulté à définir et mesurer des objectifs.

*A titre d'exemple, l'organisation Social Finance développe les social impact bonds aux Etats-Unis grâce à un financement de la Rockefeller Foundation. En France, le Comptoir de l'Innovation développe des outils financiers spécifiquement adaptés aux entreprises sociales (produits, durée, rentabilité...).*

### III) Statuts de l'entrepreneuriat social

*Une autre problématique majeure du développement de l'entrepreneuriat social en Europe et à l'international provient du manque de lisibilité des entreprises sociales. Il convient donc de travailler sur les statuts des acteurs concernés.*

**1) Favoriser l'émergence de statistiques lisibles, mais pas nécessairement d'un statut unique**

**Il faudrait favoriser une implication sociale à « granularité » variable**, selon les organismes, et selon les cultures, en ne s'opposant pas à la **diversité des statuts et des niveaux d'engagement à travers le monde**.

- Rendre **les divers statuts plus précis et plus lisibles**, afin de mieux distinguer les différents niveaux d'engagement dans l'entrepreneuriat social, mais aussi de permettre une meilleure reconnaissance des

entreprises du secteur par les bailleurs de fonds.

- Dans ce cadre, **le statut de société anonyme à but social** tel qu'il est expérimenté en Californie pourrait être pris comme exemple. Ce statut a prouvé qu'il permettait aux entités de lever des fonds dans un but

différent de celui de la maximisation de profits pour les actionnaires.

- **Un statut optionnel de Société d'intérêt social (SIS)** au niveau européen pourrait également être adopté par toutes les sociétés (SA, SARL, SAS, SCS, SCA, corporations etc.), les coopératives et les associations. Ce statut implique une partition des fonds propres entre fonds verrouillés (non lucratifs) et fonds non verrouillés (en partie lucratifs). Les dividendes et plus-values sont nuls sur les fonds verrouillés (tout bénéfice

distribuable est mis en réserve verrouillée) et sont limités sur les fonds non verrouillés (l'excédent de bénéfice

distribuable est mis en réserve verrouillée). En cas d'abandon du statut optionnel de SIS, la société conserve

la partition entre fonds verrouillés et non verrouillés, mais la lucrativité des fonds non verrouillés n'est plus

limitée. Les fonds verrouillés sont composés de subventions publiques, de donations de particuliers et d'entreprises, ainsi que des bénéfices distribuables encadrés. Les associations qui choisissent ce statut ne peuvent avoir qu'une minorité de fonds propres lucratifs ; ces derniers ne donnent alors pas de droit de vote.

**2/ Favoriser la mise en place d'un label, notamment à l'échelle européenne, plutôt qu'une unique**

Accordé **par une autorité publique** aux entreprises efficaces sur le plan social, ce label permettrait de

**valoriser les bonnes pratiques** et serait un moyen d'**identifier les entités socialement prometteuses**. Il

permettrait de **systématiser les fondamentaux communs** et de les rendre visibles et lisibles par les

investisseurs, publics et privés, mais aussi, le cas échéant, par les consommateurs.

Dans ce cadre, un label européen « Social Enterprise » pourrait être créé. Ce dernier garantirait que les entreprises réunissent les conditions de définition de l'entreprise sociale et clarifierait les relations entre les collectivités publiques et les entreprises sociales : l'impact social doit être défini en concertation avec les collectivités, tout en assurant la liberté d'entreprendre du secteur privé. Il donne en contrepartie, aux entreprises sociales, des avantages publics. Le fait de posséder le label d'entreprise sociale devrait être obligatoire pour avoir le droit de répondre à certains appels d'offre spécifiques.

Fondé sur des pratiques (en distinguant des critères indispensables et recommandés), ce label européen permettrait de **donner un cadre clair à la « nébuleuse » des entreprises sociales**. Pour qu'il soit largement adopté, des **contreparties incitatives** devront néanmoins lui être associées. La piste de la création d'un label est actuellement à l'étude au sein de la DG MARKT. Sa mise en place constitue un **objectif à l'horizon 2013**, qui pourrait être désignée, par la même occasion « Année européenne de l'entrepreneuriat social ».

**3/ Poursuivre un processus de fertilisation croisée entre entrepreneuriat classique et entrepreneuriat social**

- **Encourager l'entrepreneuriat classique à s'inspirer des méthodes propres à l'entrepreneuriat social** pour les encourager à aborder les questions d'acceptabilité (le développement durable est autant question d'acceptabilité sociale que d'innovation).

- **Encourager les entreprises « classiques » à traiter la question de l'acceptabilité sociale de manière inductive** (partir d'un projet social pour construire un modèle économique viable) et non plus déductive (partir du business plan d'un projet pour y greffer une justification sociale).

- **Renforcer la culture entrepreneuriale de l'entrepreneuriat social**.

- **Inclure progressivement les problématiques de l'entrepreneuriat social et les compétences de l'entrepreneuriat « classique »**, afin de tendre vers la fusion de ces « secteurs », dont les projets porteraient tous une granularité sociale variable.

**IV) Changement d'échelle et internationalisation de l'entrepreneuriat social**

*La mise en place de formations, de nouvelles modalités de financement et de nouveaux statuts contribue largement au changement d'échelle et à l'internationalisation de l'entrepreneuriat social. D'autres pistes sont néanmoins à explorer pour concourir à cet objectif.*

**1/ Favoriser la convergence des critères et pratiques à l'échelle européenne**

- **Intégrer des critères sociaux dans les nouvelles directives européennes sur l'économie verte** : inclure des critères sociaux ou des incitations à privilégier les entreprises sociales sur les principaux marchés «

écologiques » (tri des déchets, éco-construction...).

- Créer des « Social Enterprises Unit » au sein des « DG » liées à l'intérêt général pour favoriser le

développement de social business sectoriels.

- **Intégrer les enjeux de l'entrepreneuriat social dans le prochain PCRD** (cadre de développement de la réflexion, et de la coopération en Europe) : cela facilitera entre autres les réseaux entre entreprises sociales des différents pays européens.

- **Créer une Fondation « Social Business Act » européenne**, abondée par les Fonds Structurels et des grandes entreprises européennes, focalisée sur l'aide au démarrage, et les dispositifs d'appui à la création.

**2/ Favoriser des dynamiques à l'échelon international**

- **Mettre en place un cadre juridique uniformisant les fondamentaux communs, à l'échelle européenne, puis internationale**, qui serait alors reconnu par les Nations-Unies.

- **Créer une charte et un statut global de l'entrepreneuriat social par les Nations-Unies**, pour lui donner une reconnaissance mondiale, tout en s'attachant à reconnaître la diversité des formes d'entrepreneuriat social existantes.

- Favoriser **des synergies à l'échelle internationale** dans le secteur de l'entrepreneuriat social

Ex : Le **Social Innovation Park dans la région de Bilbao** (Pays Basque, Espagne) s'est donné pour but de devenir **la première « Silicon Valley » sociale du monde**. Ce projet vise à regrouper de nombreuses entreprises sociales ayant déjà fait leurs preuves, ainsi que des jeunes projets innovants, afin de stimuler les coopérations et l'apprentissage mutuel.

Cette **fertilisation croisée** ayant pour vocation de largement dépasser les frontières administratives, elle concourt largement à l'internationalisation du modèle de l'entrepreneuriat social.

#### ANNEXE 1 : LISTE DES MEMBRES DE LA COMMISSION

Président de la Commission

• **Jean-Marc BORELLO**, Délégué Général, Groupe SOS.

Experts ayant participé aux travaux de la commission

• **Farid BADDACHE**, Directeur Europe, Business for Social Responsibility.

• **Geneviève FERONE**, Directrice du Développement Durable, Véolia Environnement.

• **José-Maria LARRAMENDI**, Ancien Directeur, Coopérative Mandragon.

• **Cécile MOLINIER**, Directrice, Bureau du Programme des Nations Unies pour le Développement à Genève.

• **Bernard SAINCY**, Directeur Responsabilité Sociétale, Direction Stratégie et Développement Durable, GDF-SUEZ.

• **Francis VERCAMER**, Député du Nord, Rapporteur à l'Assemblée Nationale du Rapport sur l'entrepreneuriat social.

Animateurs de la commission et rédacteurs de la Note de Synthèse:

• **Jérôme BEILIN**, Directeur du développement en charge des programmes et contenus, Les Ateliers de la Terre.

• **Adrien DE CASABIANCA**, Responsable relations extérieures et Communication, Groupe SOS

#### RESPONSABILITE SOCIALE ET ENVIRONNEMENTALE : FAIRE EVOLUER LA GOUVERNANCE DES ENTREPRISES

##### NOTE DE SYNTHESE

*Cette commission de travail mise en place par les Ateliers de la Terre en partenariat avec Terra Nova a pour but de réfléchir aux évolutions de la gouvernance des entreprises vers plus de transparence et vers une prise en compte à long terme des impacts économiques, sociaux et environnementaux de leurs activités.*

Concurrence accrue dans la mondialisation, augmentation du prix des matières premières, marges de

manoeuvre financières réduites, les entreprises sont soumises à un faisceau de contraintes nouvelles. Elles

font face à ce nouveau contexte alors même que la perception de leur rôle et de leur responsabilité dans la société a changé : principaux lieux de vie pour les salariés et les entrepreneurs, acteurs clés de l'économie et

du quotidien, elles sont au centre des attentes de la population. À ce titre, elles sont amenées de manière croissante à prendre en compte des demandes extérieures qui dépassent leurs simples obligations

réglementaires, et à intégrer à leurs objectifs des préoccupations d'intérêt général.

De fait, le modèle de l'entreprise dont « la seule responsabilité est d'être profitable pour ses actionnaires », selon la formule de Milton Friedman, a fait son temps. De plus en plus, les entreprises intègrent dans leur

fonctionnement leurs environnements économique, social et écologique, qui dépendent d'elle et dont elles

dépendent. Dans une lecture plus complexe de l'organisation de la société, ne se réduisant pas au binôme

Etat / marché, l'entreprise apparaît comme co-productrice de l'intérêt général. Certes, sa mission demeure de

faire fructifier le mieux possible les capitaux qui lui sont confiés, mais en respectant un certain nombre de normes de comportements, vis-à-vis de ses salariés, de ses clients, de ses fournisseurs, de son environnement écologique, territorial, humain.

Dans le cadre de la Global Conference qui s'est tenue les 26, 27 et 28 septembre à Evian, Terra Nova et les Ateliers de la Terre ont mis en place une commission de travail ayant pour but de réfléchir aux évolutions de la gouvernance des entreprises vers plus de transparence et vers une prise en compte à long terme des impacts économiques, sociaux et environnementaux de leurs activités. Cette commission a formulé des recommandations pour :

- accroître la transparence au sein des entreprises, notamment en matière de reporting extra-financier, de

- rémunérations et d'échelle des salaires, de montages fiscaux et juridiques ;

- mieux prendre en compte les différentes parties prenantes de l'entreprise dans sa gouvernance, à travers des recommandations en matière de diversité, démocratie dans l'entreprise, participation des salariés aux organes sociaux de l'entreprise, prise en compte des sous-traitants, responsabilité des dirigeants ;

- intégrer la vision de long terme dans la gestion de l'entreprise, en liant les rémunérations à la performance à moyen terme, en liant l'entreprise à son territoire.

## **PREMIERE PARTIE : Transparence et gouvernance des entreprises : une nécessaire transformation**

Pour l'essentiel de nos concitoyens, salariés et entrepreneurs, les entreprises sont d'abord des lieux de vie

dans lesquels on passe souvent plus de temps qu'à son domicile. Ce sont aussi des lieux d'innovation et de

production de richesses où s'inventent les réponses à nombre de besoins sociaux.

Soumises à la pression sociale, les entreprises sont amenées de manière croissante à prendre en compte des demandes extérieures qui dépassent leurs simples obligations réglementaires. Certaines développent

également des solutions à des besoins non pris en charge par les pouvoirs publics, c'est le cas du secteur de

l'insertion par l'activité économique ou de projets menés par exemple par Danone ou Essilor pour favoriser

l'accès de familles démunies aux aliments pour bébés ou à une correction visuelle. La lutte contre les

inégalités, la précarité et l'exclusion sociale passent davantage qu'auparavant par une régulation interne des

comportements managériaux et une évolution du droit de l'entreprise.

Par ailleurs, la crise financière, dont les conséquences sociales n'ont pas fini de se faire sentir, a mis dramatiquement en lumière la nécessité d'un rééquilibrage entre sphère financière et sphère productive,

rééquilibrage qui implique de nombreux changements dans les modes de gestion et de gouvernance des entreprises.

Face à ces enjeux, le discours ambiant s'est souvent contenté de renvoyer de l'entreprise une image caricaturale. Il est grand temps d'aborder l'entreprise autrement, sous l'angle du changement et pas

seulement de dénonciation.

### **Prendre en compte la diversité du monde de l'entreprise**

Lorsqu'on pense « entreprise » en France, on pense d'abord entreprise cotée, voire entreprises du CAC 40. Or, l'écrasante majorité des entreprises comptent moins de 10 salariés. On pense aussi actionnaires et fonds d'investissement alors que le capitalisme familial reste une réalité très prégnante. On pense surtout objectif de profit et de rentabilité alors que tout un panel d'entreprises appartenant au champ de l'économie sociale et solidaire développe des actions dont la rentabilité n'est pas l'objectif premier. Et de plus en plus nombreuses

sont les entreprises qui panachent activités lucratives et non lucratives.

En réalité, le paysage entrepreneurial est très complexe. Par exemple il ne faut pas ignorer que beaucoup de

PME sont des sous-traitantes de groupes et se situent dans une relation de dépendance vis-à-vis de leurs

donneurs d'ordres.

Lorsqu'on réfléchit sur l'entreprise, il importe d'avoir cette diversité à l'esprit pour éviter de plaquer

artificiellement un modèle qui n'aurait de pertinence que sur un champ restreint de l'économie.

### **Des entreprises co-productrices de l'intérêt général**

L'État n'a pas directement la main sur les modes d'organisation internes des entreprises et il est très bien qu'il en soit ainsi. Cela ne signifie pas qu'il doive être neutre vis-à-vis des pratiques qui peuvent être développées par telle ou telle entreprise. En tant que garant de l'intérêt général, l'État est dans son rôle en valorisant et en encourageant les entreprises dont la démarche s'inscrit en cohérence avec la recherche de bénéfices sociaux et environnementaux. En démocratie, la définition de l'intérêt général relève du politique issu de la légitimité des urnes. Toutefois, cela n'implique pas que l'État détienne le monopole de la « production » de l'intérêt général. D'autres –

citoyens, associations, entreprises – peuvent y contribuer en participant à une diversité de réponses aux besoins sociaux. En effet, l'État n'est pas toujours le mieux placé, ni pour identifier les besoins

sociaux ou environnementaux, ni pour mobiliser les moyens nécessaires pour y répondre en tenant compte des situations particulières.

Il convient donc de changer le regard posé classiquement sur l'organisation de la société, et qui tend à ne considérer que deux acteurs : l'État et le marché. Une autre approche est nécessaire : « Au côté du marché et de l'État il est temps d'affirmer le rôle et l'importance de l'individu, sujet libre et responsable et fondement de la démocratie politique et économique »<sup>12</sup>. Ce faisant il faudra, évidemment, affirmer le rôle et l'importance dans la construction sociale, des différentes formes d'organisations dans lesquelles l'individu s'engage : entreprise capitaliste, sociétés de personnes, associations...

On peut légitimement avoir l'intuition que les échanges existants entre sphère publique et sphère privée iront en se renforçant : la sphère privée contribuera de plus en plus largement à la réponse aux besoins sociétaux alors que, dans le même temps, les pouvoirs publics se soucieront toujours plus de la compétitivité des

entreprises, source d'emplois et de croissance des richesses. De fait, les entreprises se trouvent au cœur de

nombre de débats essentiels dont elles ne peuvent se désintéresser : développement durable, emploi, risques psychosociaux, etc.

De plus en plus, la société fait irruption dans l'entreprise. Les demandes, les remises en causes, les

pressions ne se situent plus seulement au niveau de la confrontation entre directions et organisations syndicales mais proviennent aussi de l'extérieur, des attentes des clients en termes de services (par exemple,

faire circuler les transports en commun la nuit) et en termes éthiques (bannissement du travail des enfants notamment). Ainsi, le concept de responsabilité sociale de l'entreprise (RSE, devenue responsabilité sociale et environnementale) s'est imposé à l'entreprise, qui l'a plus ou moins largement récupéré. Si cette notion ne

peut être considérée comme un aboutissement dans la mesure où elle a essentiellement prospéré dans de grandes entreprises en servant parfois de couverture à de pures opérations de marketing, elle constitue

néanmoins une clé d'entrée qui a contribué à un travail de sensibilisation et d'évolution des pratiques sur

lequel il est important de chercher à capitaliser.

#### **Valoriser les entreprises qui se situent dans une démarche de changement**

Dans le cadre de cette réflexion, nous ne remettons pas en cause l'économie de marché en tant que système de production et d'allocation des ressources. Nous condamnons en revanche l'ultralibéralisme qui impose l'instauration d'une « société du marché » et préconisons de remettre l'économie de marché « au service » de la société.

Nous critiquons toutefois le fonctionnement actuel de certaines entreprises et cherchons à promouvoir :

D'une part, la diversité des démarches entrepreneuriales, considérant qu'il n'y a pas un modèle, par nature meilleur qu'un autre, et qu'il est plutôt préférable de rechercher la coopération entre des modèles complémentaires d'organisations – société de personnes, entrepreneuriat social, associations de producteurs,

etc. ;

D'autre part, l'instauration de nécessaires régulations et innovations permettant d'éviter les dérives de l'entreprise capitaliste qui tend à considérer l'humain et l'environnement, non comme des capitaux à préserver et développer, mais comme des ressources à exploiter et des variables d'ajustement sur lesquelles il faut

jouer pour préserver la rentabilité du seul capital financier.

On considère ici que la finalité purement pécuniaire ne relève pas d'une démarche progressiste. Gagner de l'argent devrait être un moyen pour l'entreprise 1. de survivre, 2. de développer ses activités, 3. d'adopter des

<sup>12</sup> Hugues Sibille, Tarik Ghezali, *Démocratiser l'économie*, Mondes vécus, 2010.

comportements plus responsables et plus favorables à son environnement.

Les logiques financières ne sont pas nuisibles en elles-mêmes mais elles le deviennent lorsqu'elles sont

exclusives : il importe de les réinscrire dans des finalités plus larges. En effet, leur prédominance conduit

également à altérer l'efficacité du management, qui ne s'intéresse qu'aux résultats et plus à la manière dont le travail est mené.

En outre, l'entreprise a besoin du profit... et du réinvestissement du profit. L'investissement fait les frais de

taux de rendement absurdes, ce qui aura des conséquences négatives à moyen / long terme.

L'investissement pourrait aujourd'hui être un moteur bien plus puissant de l'économie française, aux côtés de

la consommation des ménages.

On considère ici des entreprises dont la réalité va au-delà du seul pacte entre actionnaires, fondement principal aujourd'hui de la définition de la société en droit français, même si celui-ci reconnaît (ce qui n'est pas le cas dans beaucoup d'autres pays) l'existence d'un « intérêt social » (au sens d'intérêt propre de la société)

qui ne se réduit pas à celui des actionnaires.

Une telle logique est critiquable en ce qu'elle ignore les autres parties prenantes de l'entreprise que sont, au premier chef, les salariés apporteurs du capital humain, mais aussi les sous-traitants, fournisseurs, riverains, etc.

On l'a vu, il existe désormais une pluralité de modèles d'entreprises : la grande majorité, en nombre, en poids

dans l'emploi, dans la production, les échanges, relèvent du modèle classique de la société anonyme, dans

lequel des investisseurs apportent des capitaux à une entreprise pour que celle-ci les fasse fructifier ; mais le poids du secteur coopératif, mutualiste, des différentes formes que prennent l'économie solidaire ou à but non lucratif a cessé d'être marginal pour devenir très significatif.

À la logique de primauté du rendement financier des capitaux investis s'ajoute désormais celle de

performance globale qui prend en compte, non seulement les aspects économiques de la performance mais aussi les aspects, sociaux, sociétaux et environnementaux. Dans les entreprises de l'économie solidaire, associative, coopérative, mutualiste, ces objectifs sont d'emblée reconnus comme faisant pleinement partie de la vocation de l'entreprise, et le rendement des capitaux investis apparaît comme la clef de la pérennité et

du développement plutôt que comme un objectif en soi.

Qu'en est-il dans les sociétés anonymes « classiques », à but lucratif ? Leur mission demeure de faire fructifier le mieux possible les capitaux qui leur sont confiés. Elles ne sauraient se muer en agents des

politiques publiques. Mais il apparaît de plus en plus clairement qu'elles ne peuvent remplir cette mission

dans des conditions acceptables par la société tout entière que si elles prennent en compte pleinement leur responsabilité sociale et environnementale. Il ne s'agit pas de substituer cette responsabilité à leur mission originelle, mais de l'accomplir dans le respect d'un certain nombre de normes de comportements, vis-à-vis de

leurs salariés, de leurs clients, de leurs fournisseurs, de leur environnement écologique, territorial, humain.

Nous sortons de plusieurs décennies durant lesquelles les évolutions technologiques ont profondément

transformé les emplois et le contenu du travail. Ces évolutions ont réduit l'efficacité des garanties collectives

et affaibli les solidarités entre les différentes catégories de salariés. Leur cumul avec les politiques managériales centrées exclusivement sur une culture du résultat (technique, économique ou commercial) a progressivement retiré aux salariés des plus bas niveaux, mais aussi parfois aux cadres, la dimension de

sujet, déshumanisant l'entreprise et faisant perdre au travail tout son sens. Ce défi est central car l'humain

devient au contraire un facteur stratégique dans le développement de l'innovation, de la performance, du

capital social et immatériel de l'entreprise. Ce dernier devient d'ailleurs prépondérant face au capital matériel.

Nous proposons de répondre à ce second défi par des politiques de développement humain.

La prise en compte de la diversité, la lutte contre les discriminations, les solidarités intergénérationnelles

contribuent à la compétitivité de l'entreprise, à sa capacité d'innover, d'entreprendre et de transmettre ses

savoirs faire.

Quelles sont les réformes nécessaires pour faire de cette vision une réalité de l'entreprise ?

La seconde partie de cette note s'efforce de mettre en avant plusieurs recommandations afin de faire évoluer la gouvernance de l'entreprise vers plus de responsabilité et de transparence.

## **DEUXIEME PARTIE : Recommandations pour faire évoluer la gouvernance des entreprises**

À l'exception notable des sociétés coopératives, les entreprises se caractérisent de manière générale par le

pouvoir des actionnaires dans la fixation des orientations de l'activité. Ce pouvoir, légitime, tend toutefois à

laisser peu de places aux autres parties prenantes (salariés au premier chef, mais aussi collectivités locales, sous-traitants, associations, etc.) qui sont susceptibles de porter une vision complémentaire de l'entreprise.

Plusieurs biais peuvent être critiqués dans le gouvernement des actionnaires lorsqu'il se fait sans prendre en compte la responsabilité sociale et environnementale de l'entreprise, en particulier le manque de transparence des décisions prises, l'absence de concertation et la prédominance des intérêts de court terme.

### **2. 1 - Accroître la transparence au sein des entreprises**

#### **Information dans l'entreprise :**

- Mise en œuvre de l'article 225 de la loi du Grenelle 2 obligeant les grandes entreprises à publier dans leurs rapports de gestion un reporting extra-financier : aucun décret d'application n'a encore été publié à ce jour.

- Ce reporting extra-financier pourrait être complété par une analyse d'impact sommaire de l'entreprise sur :

- son empreinte environnementale (carbone, énergie, eau, matière) ;

- son empreinte sociale et sociétale.

#### **Rémunérations et échelle des salaires :**

- Inclure dans les rapports sociaux des éléments synthétiques de suivi des inégalités de rémunération (indices, tableaux). On peut ainsi imaginer un indice, le même pour toutes les entreprises, assurant la comparabilité, par exemple, des dix plus hautes rémunérations ramenées sur le salaire médian. Un tel indice

permettrait de comparer les entreprises d'un même secteur, et également de prendre la mesure des inégalités

salariales inter-sectorielles : ainsi, les différences de rémunérations entre le secteur industriel et le secteur financier, où celles-ci ont explosé, expliquent la « fuite des cerveaux » vers la finance.

- Etendre l'obligation de déclaration des rémunérations aux revenus annexes (facturations de prestations par bénéficiaire)

- Organiser un débat au sein du comité d'entreprise sur les éléments concernant les inégalités de rémunération figurant dans le rapport social. Les éléments clés du rapport social, notamment s'agissant des inégalités de rémunérations, seraient présentés en assemblée générale des actionnaires. L'obligation d'information des assemblées générales d'actionnaires sur les rémunérations des dirigeants et les

rémunérations les plus élevées serait renforcée. Pour les entreprises distribuant des bonus, des éléments

d'information sur les types de critères d'attribution de ces derniers devraient être présentés au comité

d'entreprise, avec des éléments plus détaillés pour les dix plus hautes rémunérations.

- Améliorer la composition (majorité d'administrateurs indépendants, absence de conflits d'intérêts) et la professionnalisation (recours à des experts externes, étude des meilleures pratiques, examen détaillé des éléments rendus publics) des comités de rémunérations qui fixent le salaire des dirigeants.

- Assurer la transparence des rémunérations du ou des mandataires sociaux dans toutes les grandes entreprises. Progresser dans la transparence des rémunérations des dirigeants en étendant aux sociétés non

cotées qui ont un chiffre d'affaires supérieur à 100M€ (seuil à préciser) l'obligation de publier la moyenne des

trois plus hautes rémunérations tout compris (code AFEP – MEDEF).

### Montages fiscaux et juridiques

- Supprimer le régime du bénéfice mondial consolidé

- Déterminer une règle par défaut de fixation du prix de cession avec obligation de validation (opposable) par le commissaire aux comptes en cas de dérogation.

Note: le remplacement de la fiscalité actuelle focalisée sur le travail par une fiscalité énergie / climat facilite la transparence fiscale, en enregistrant la fiscalité au point de consommation et / ou d'émission et en limitant l'intérêt même des effets d'aubaine (ex. : holding luxembourgeoise, importation de hifi & hi-tech via Monaco, groupe de droit néerlandais...)

- Imposer aux entreprises transnationales de publier des éléments de reporting (chiffre d'affaires, emploi) pays par pays. Des initiatives sectorielles existent déjà, dont le processus EITI (Initiative de transparence des industries extractives), mais elles ne reposent que sur une démarche volontaire des entreprises.

- Lutter contre l'évasion fiscale en donnant accès aux administrations fiscales de l'Union européenne à l'identité des ayants droits économiques des structures de type trust, fondation, etc. établies dans l'Union Européenne ; pour les structures hors Union européenne, lorsque la levée de l'anonymat s'avère impraticable, rechercher des accords permettant d'en taxer les ayants droits économiques conformément au

droit de leur pays de résidence.

## 2. 2 - Prise de décision et rôle des différents stakeholders dans la gouvernance de l'entreprise

### Diversité

- La France a le plus grand mal à faire entrer la diversité au sein de toutes ses structures d'activité, et demeure rétive à la mise en œuvre de quotas. Elle gagnerait néanmoins à s'inspirer de la loi canadienne pour l'équité en emploi, plus efficacement et rapidement applicable dans le cadre français. Cette loi, qui a obtenu

de bons résultats au Canada, et a été bien acceptée socialement, impose non pas une obligation de résultats,

mais une obligation de moyens à l'entreprise. À partir d'une certaine taille, celle-ci a l'obligation d'évaluer si la

diversité en son sein correspond à la diversité du territoire dans lequel elle se trouve. Si la comparaison révèle un niveau de diversité insuffisant, l'entreprise a l'obligation d'élaborer un plan d'action et de le mettre en œuvre de bonne foi. Elle s'expose à d'importantes sanctions financières si elle ne remplit pas cet objectif

à moyen terme.

### Démocratie dans l'entreprise

- Créer une obligation pour le comité des rémunérations de prendre connaissance de l'avis du comité d'entreprise sur les éléments du rapport social concernant les inégalités de rémunération, sur les types de critères retenus pour l'attribution des bonus, et en particulier sur les critères d'évolution des 10 plus hautes

rémunérations.

- Donner aux femmes et aux hommes dans l'entreprise un droit d'initiative et de participation à la

transformation de leurs situations professionnelles quotidiennes et à la définition de la qualité du travail, au

sein de groupes d'échanges homogènes.

Dans la mesure où de nombreuses méthodes de changement participatives, fondées sur des groupes

d'échanges homogènes, ont été expérimentées et développées avec succès par de grands groupes et des

PME, une négociation nationale interprofessionnelle est envisageable immédiatement. Elle pourrait être organisée en deux temps :

Une période de construction d'un diagnostic partagé sur l'intérêt d'une participation des travailleurs aux changements permanents et sur les modalités d'organisation de telles pratiques dans les différentes tailles d'entreprises et secteurs d'activité.

Une négociation entre partenaires sociaux à proprement parler sur les modalités de mise en œuvre d'un tel objectif. Y seraient incluses les modalités de l'évaluation dans le temps d'une telle réforme.

Une loi serait ensuite présentée au Parlement. Un cadre déontologique des modalités de travail des intervenants extérieurs serait conçu à cette occasion (son usage pourrait être élargi à l'ensemble des experts intervenants déjà auprès des comités d'entreprise).

### **Gouvernance et financement**

- Assurer la participation des salariés dans les organes sociaux de l'entreprise, avec un seuil minimal d'un tiers. Il s'agit d'affirmer une logique : l'intérêt social de l'entreprise ne se résume pas à celui de ses seuls

actionnaires, même dans le cadre des sociétés anonymes à but lucratif. Organiser une consultation régulière

et un dialogue de l'entreprise avec ses parties prenantes, à l'échelon de ses organes sociaux.

- Définir un statut de l'entreprise économiquement dépendante responsabilisant les donneurs d'ordre vis-à-vis de leurs sous-traitants : lorsqu'une entreprise représente plus de 50 % du chiffre d'affaires d'un de ses

fournisseurs, elle aurait une responsabilité spécifique vis-à-vis de celui-ci ; lancer une négociation entre organisations syndicales et patronat pour en déterminer les modalités avec un délai raisonnable pour aboutir (dix-huit mois, par exemple), faute de quoi, recours à des mesures législatives.

### **La responsabilité des dirigeants**

- Mettre en place un régime de sanctions lié au non-respect par les entreprises de leur obligation de reporting social et environnemental. Les entreprises seraient tenues ainsi à une double obligation : mettre en œuvre l'obligation de reporting pesant sur la société mère à l'échelle du groupe ; s'assurer que la société mère a

déployé tous les moyens adéquats, internes et externes, pour garantir un reporting reflétant fidèlement les

impacts sociaux et environnementaux de l'entreprise

- Imposer que les rapports de développement durable intègrent une attestation émanant d'une agence de notation sociale et environnementale reconnue sur les méthodes d'élaboration et le contenu de ces rapports ;

encourager la publication d'une « note de commentaires », rédigée de manière indépendante par un panel de parties prenantes associant des associations de défense des droits, des groupes de consommateurs, des

organisations écologistes, des représentations syndicales...

- Etablir un label de reconnaissance des agences de notation sociale et environnementale, inspiré des démarches applicables aux commissaires aux comptes et aux agences de notation financière.

## **2. 3 - Prise en compte de la vision de long terme dans les entreprises**

### **Lier les rémunérations avec la performance à moyen terme**

- Lier la rétribution des dirigeants à la performance globale à moyen terme : au-dessus d'un certain multiple du salaire le plus bas, les rémunérations devraient comprendre une part bloquée dont le versement serait étalé dans le temps, et serait conditionné au respect de critères de performance économique, et également, lorsque ce serait pertinent, sociale et environnementale.

- Proposer des règles fiscales incitatives au réinvestissement (notamment dans une logique de filière et territoriale). Cela permet à la fois une meilleure efficacité pour l'entreprise et pour la collectivité, et ne donne pas une image « punitive » mais collaborative.

### **Lier l'entreprise à son territoire**

- Encourager les contrats de territoires et accords inter-entreprise.

- « Dépoussiérer » l'arsenal législatif pour faciliter la collaboration inter-entreprises (sur le modèle des plans de déplacements d'entreprises coordonnés), notamment de mise en commun de moyens (outillage, logistique et livraison, approvisionnement, retraitement des déchets, transferts de co-produits, approvisionnement énergétique et en eau).

- Mettre en place des zones franches écologiques où des entrepreneurs partageant les mêmes valeurs écologiques et sociales essaient de nouveaux modèles économiques, écologiques et sociaux, dans le strict respect des principes de prévention et de précaution, mais avec un cadre législatif et administratif assoupli (notamment DDASS / DREAL / DRIRE...) contre démonstration sous 3 ans de la viabilité du concept et de l'intérêt de généraliser.

- Favoriser l'intervention des autres parties prenantes (notamment consommateurs et territoires) dans

l'appréciation des actions de RSE, en particulier en conditionnant les aides locales aux performances sociales

et environnementales des entreprises.

- On peut imaginer que dans le cadre d'une nouvelle étape de décentralisation (acte III attendu notamment par l'ARF), les Régions qui gèrent déjà les Schémas régionaux de développement économique se voient

dotées de compétences élargies et reçoivent en gestion déléguée certaines aides gouvernementales pour soutenir les entreprises. Dans ce cadre, il serait souhaitable de promouvoir des « contrats de développement

économique et territoriaux » dont les objectifs seraient de promouvoir des synergies entre entreprises d'un

territoire donné et entre ces entreprises et le territoire. Ce type de contrat serait incontournable pour permettre aux entreprises de bénéficier des aides régionales (et nationales) et les conduirait, en compensation de ces aides, à participer activement au développement économique local (contribution à la formation des salariés, à la recherche locale, à l'investissement dans des équipements publics...).

## ANNEXE 1 : LISTE DES MEMBRES DE LA COMMISSION

Président de la Commission

• **Oliver FERRAND**, Fondateur et Président, Terra Nova

Experts ayant participé aux travaux de la commission

• **Gilles de MARGERIE**, Directeur du Capital Investissement et de l'Immobilier, Groupe Crédit Agricole

• **Sandra DESMETTRE**, Rapporteur du groupe de travail de Terra Nova « Entreprises au service du pro- grès ».

• **Nicolas IMBERT**, Directeur, Green Cross France et Territoires

• **Yann QUEINNEC**, Juriste, Association Sherpa

• **Bruno REBELLE**, Directeur, Transitions

• **Hélène VALADE**, Directrice du Développement Durable, Lyonnaise des Eaux ; Présidente, Collège des

Directeurs du Développement Durable (C3D)

Animateurs de la commission et rédacteurs de la Note de Synthèse

• **Jérôme BEILIN**, Directeur du Développement en charge des programmes et contenus, Les Ateliers de

la Terre

• **Anne LAROCHE**, Directrice des Publications, Terra Nova

## LA MEDIATION COMME SOLUTION DE RESOLUTION DES CONFLITS ENVIRONNEMENTAUX

### NOTE DE SYNTHESE

*Cette commission de travail mise en place par les Ateliers de la Terre en partenariat avec l'ESSEC-IRENE a pour but de favoriser le recours à la médiation comme solution à la résolution des conflits environnementaux. Cette réflexion s'inscrit dans le cadre de la Global Conference 2011, dont le thème est le suivant : « Quelles révolutions pour gouverner ensemble un monde vulnérable ? ».*

*A ce titre, le mot "ensemble" prend une connotation particulière, en opposition à la culture de conflit, du tous contre tous. La médiation est l'un des aspects de la gouvernance, et même une technique de gouvernance bien comprise, en ce qu'elle est la meilleure résolution des conflits à chaque fois qu'elle est possible.*

*Elle n'est pas un modèle unique car tous les conflits environnementaux ne sont pas du ressort de la médiation. Le recours aux justices étatiques ne doit évidemment pas être écarté, pour les conduites criminelles notamment. La médiation constitue néanmoins une solution efficace qu'il serait utile de favoriser dans le cas des conflits environnementaux qui sont amenés à se multiplier. Ainsi, les experts de cette commission se sont réunis pour formuler plusieurs recommandations permettant de faciliter le recours à la médiation.*

### I-PREMIERE PARTIE : Définition, avantages, cadre et état des lieux de la Médiation comme solution aux conflits environnementaux :

*La première partie de cette note de synthèse s'attache à revenir sur la définition et le processus de la médiation, puis à en souligner les avantages comme méthode de résolution des conflits. Les experts de la commission*

#### I Q u 'est -ce que la médiation ?

##### 1- Nature et définition de la médiation

La médiation est un procédé amiable, volontaire et confidentiel de résolution amiable des conflits dans lequel un tiers neutre et indépendant - le médiateur - facilite, structure et coordonne les négociations des parties en litige, à leur demande, en vue d'aboutir à une solution amiable optimale au vu du contexte et des intérêts des parties.

A la différence du juge, le médiateur n'impose pas de décision. Il n'a donc pas vocation à trancher le litige ; le Médiateur ne propose pas, il doit susciter les propositions des Parties elles-mêmes, qu'il entend et dont il confronte les positions.

-Selon Maurice-Antoine Lafortune<sup>13</sup>, la médiation est « une méthode douce qui permet à des personnes, avec

l'aide d'un tiers impartial et sans pouvoir d'instruction, de consultation ou décision, de créer ou d'améliorer

leur liens, de prévenir et résoudre leurs désaccords, différends ou conflits ».

-Selon le professeur Michèle-Guillaume Hofnung, la médiation est définie comme « un processus de

<sup>13</sup> Maurice-Antoine Lafortune est avocat général honoraire à la Cour de Cassation, consultant arbitre, membre de

l'Institut d'expertise, d'arbitrage et de médiation.

communication éthique reposant sur la responsabilité et l'autonomie des participants, dans lequel un tiers impartial, indépendant et neutre (sans pouvoir décisionnel ou consultatif), avec la seule autorité que lui reconnaissent les médiateurs, favorise par des entretiens confidentiels l'établissement, le rétablissement du lien social, la prévention ou le règlement de la situation en cause ».

-la Directive 2008/52/CE du Parlement Européen et du Conseil du 21 mai 2008 définit la médiation comme étant « un processus structuré, quelle que soit la manière dont il est nommé ou visé, dans lequel deux ou plusieurs parties en litige tentent par elles-mêmes, volontairement, de parvenir à un accord sur la résolution

de leur litige avec l'aide d'un médiateur. Ce processus peut-être engagé par les parties, suggéré ou ordonné par une juridiction ou prescrit par le droit d'un Etat membre ». Selon cette directive, le médiateur est « tout tiers sollicité pour mener une médiation avec efficacité, impartialité et compétence, quelle que soit l'appellation ou la profession de ce tiers et quelle que soit la façon dont il a été nommé pour mener ladite médiation ou dont il a été chargé de la mener.

Il en résulte que l'accès à la médiation comme mode alternatif de règlement amiable des différends peut résulter de la mise en œuvre :

-d'une clause de médiation conventionnelle conclue par les parties

-d'une médiation judiciaire dont la proposition, faite par un organe judiciaire est acceptée par les parties concernées.

Quel cadre pour la médiation ?

Du point de vue du médiateur, La médiation professionnelle consiste en l'intégration d'un modèle culturel différenciant qui comprend :

-un processus d'aide à la décision, visant la responsabilisation et l'autonomie des personnes, qu'il s'agisse ou non d'une situation de nature conflictuelle.

-un cadre où des parties en conflits recherchent un accord négocié de manière contributive, c'est-à-dire un accord qui puisse être pérenne, respectueux des personnes et de leurs intérêts ;

-une technique qui favorise la conclusion du litige et anticipe au mieux les conséquences du choix qui peut être fait par chaque client partie.

## 2- L'accord de médiation

L'accord de médiation lorsqu'il est écrit, relève du droit des contrats, ce qui ne veut pas dire qu'un médiateur doit être nécessairement formé au droit, mais toujours en tous cas formé aux techniques de médiation.

Lorsqu'il s'agit d'une médiation conventionnelle (ou privée) - hors procédure judiciaire - les parties peuvent établir un accord qui relève naturellement du droit des contrats. C'est alors une transaction, terme qu'il est prudent de noter dans la clause de médiation du contrat, en droit français il est possible de demander au juge étatique dans la forme des référés de lui donner force exécutoire.

Lorsque la médiation intervient en cours de procédure judiciaire, (médiation judiciaire), il appartient aux parties de faire constater par le juge pour qu'il homologue l'accord. Dans ce cas l'accord a valeur de jugement et est exécutoire comme un jugement.

Des parties, qui ont choisi la médiation pour régler un différend, peuvent prévoir, dans leur accord, le retour devant le médiateur en cas de difficulté d'exécution, avant d'engager toute procédure judiciaire, ce qui aura

pour effet de suspendre la prescription de l'action civile.

Art. 9 Règlement de médiation de l'OMPI : " La procédure de médiation se déroule de la manière décidée par les parties. Si, et dans la mesure où, les parties n'ont pas pris de décision à ce sujet, le médiateur, conformément au présent règlement, décide de la manière dont se déroulera la procédure de médiation."

Principales étapes d'une médiation :

-Introduction de la procédure : demande de médiation

-Nomination du médiateur

-Première prise de contact entre le médiateur et les parties ; entente sur l'organisation de la première réunion, entente sur un premier échange éventuel de documents.

-premières réunions et réunions suivantes : entente sur les règles de base de la procédure, information et délimitation des questions en litige, examen des intérêts des parties, Elaboration des possibilités de règlement, évaluation des solutions possibles

-Conclusion

## 3- Le processus de médiation

Ce processus, pour avoir le maximum de chance d'aboutir, doit comporter des règles de fonctionnement et de communication dont le médiateur est choisi comme garant.

La médiation nécessite :

- l'adhésion des parties en litige
- leur capacité de s'engager et de décider

Il est possible d'identifier des étapes dans ce processus :

- Accueil
- Contextualisation
- Identification des positionnements, revendications, demandes, attentes, besoins, désirs...
- Résolution : identification des solutions énoncées et recherche d'autres hypothèses. Solution : selon les situations, définitive, intermédiaire, temporaire - et anticipation des conséquences .

Le médiateur: le médiateur professionnel est tenu au secret. Il conserve confidentiellement tous les échanges qui ont lieu lors des entretiens et des réunions qu'il est amené à conduire ou réguler. Il est indépendant de toute autorité hiérarchique, de tutelle ou économique. Il est tenu à l'impartialité. Il est neutre quant aux décisions prises par les parties pour résoudre leurs différends. Le médiateur doit :

- informer des coûts de son intervention ;
- informer les parties de la possibilité de consulter le Code d'Ethique et de Déontologie des Médiateurs ;
- orienter vers un autre médiateur s'il ne peut assurer le suivi d'une situation qu'il aurait commencé à accompagner ;
- restituer toutes les pièces qui lui auraient été présentées

La médiation est une procédure informelle et flexible dont les parties et le médiateur gardent le contrôle

A noter que lorsque les Parties refusent totalement de coopérer et/ou ne parviennent pas à un accord, l'Arbitrage apparaît comme la voie de suite naturelle.

Proposer les deux activités peut être un moyen de suivre la clientèle quel que soit son cheminement.

#### 4- Quelle ouverture à la médiation ?

Il existe certains moyens afin de stimuler l'intérêt et développer la mise en pratique de cette compétence :

- En informant, en participant à des manifestations, à des formations ;
- En communiquant auprès des entreprises signataires de la Charte de Médiation interentreprises ;
- En incluant de façon systématique des Clauses spécifiques au niveau des articles « Règlement des litiges »

dans tous les contrats rédigés.

#### 5- Spécificités et avantages

Les avantages de la médiation sont nombreux. En se renforçant les uns les autres, ils forment un système.

Le premier avantage de la médiation – c'est d'ailleurs un élément constitutif de sa définition – est qu'**elle laisse le pouvoir de décision aux parties elles-mêmes**, évidemment dans le respect de l'ordre public. Elle

offre aux parties **un processus libre, volontaire, de caractère consensuel**, dans lequel chacune des parties conserve jusqu'au bout un droit de retrait et un droit veto qui la protègent. Le corollaire important de cette liberté est que chaque partie n'acceptera la solution que si elle lui convient. Cette absence de contrainte,

propre de la médiation, pourrait-elle freiner son efficacité ? Au contraire : dans trois cas sur quatre, les parties acceptent une solution commune à l'issue de la médiation – celle-ci est donc un processus efficient. Ce

caractère volontaire explique que **l'exécution de la solution se trouve considérablement facilitée**. Cela

est à comparer avec les difficultés d'exécution que la solution judiciaire rencontre bien souvent. La médiation

forme **des solutions d'autant plus durables et robustes qu'elles sont générées par les parties elles-mêmes**, et acceptées sans contrainte.

Cette durabilité est en partie liée à d'autres avantages de la médiation. La médiation entretient notamment un rapport très particulier avec le temps. **Elle peut être déclenchée et aboutir dans un laps de temps beaucoup plus rapide** que des procédures judiciaires. Cette rapidité a comme corollaire **un avantage en terme de coût**. Il est moins coûteux pour les deux parties de rémunérer un médiateur que de rémunérer chacune leur avocat, qui plus est pour un laps de temps beaucoup plus long. Si la médiation consomme peu de temps, en revanche elle le met intensément à *profit, les parties peuvent voir leurs affaires traitées en autant de temps que leur complexité l'exige*. Or, en médiation, au contraire, les parties peuvent voir leurs

affaires traitées en autant de temps que leur complexité l'exige. Cette durée a des conséquences positives : il

y a là pour les parties, d'abord, **une marque de reconnaissance et d'apaisement** qui n'est pas à minorer.

Cette durée disponible facilite **une compréhension approfondie du problème**. Le médiateur a la possibilité d'organiser des entretiens séparés avec chacune des parties, entretiens qui optimiseront l'échange d'informations. Cette compréhension approfondie permet de remonter aux racines du problème, à ses causes réelles. Or, les racines d'un conflit sont souvent composites. Là où le juge se trouve vite embarrassé, car il ne

peut traiter autre chose que le litige pour lequel il est saisi, le médiateur a toute liberté de révéler, de mettre en lumière, d'embrasser l'ensemble des composantes du problème afin d'aider les parties à le traiter. La **robustesse et la durabilité des solutions** s'en trouvent renforcées.

Ce temps disponible et cette capacité à remonter aux racines du problème mettent en lumière un autre avantage de la médiation : il s'agit d'un **processus profondément inclusif** ; c'est particulièrement précieux pour la résolution des conflits environnementaux, lesquels intéressent une pluralité d'acteurs. À mesure que l'on comprend les racines du problème, on peut se rendre compte qu'au-delà des parties qui se trouvent réunies autour de la table, se trouvent dans le paysage d'autres parties prenantes, qui ont compté dans l'émergence du conflit et qui peuvent aussi, désormais, contribuer aux solutions. En associant ces parties

prenantes, **la médiation permet d'étendre de manière très opportune le périmètre à la fois de compréhension et de solution du conflit**. Cela permet la recherche de solutions innovantes, créatives et satisfaisantes pour tous. La médiation offre en outre la possibilité, si cela est nécessaire, de travailler à la

**restauration de la relation entre les parties**. Dans de nombreux conflits, la relation s'avère aussi importante

que le problème : celui-ci n'est qu'un symptôme d'une relation dégradée. En matière aussi bien civile que

commerciale, le maintien ou la restauration de la relation sont des enjeux cruciaux. Les parties ont certes un passif dans le passé, mais elles ont aussi un futur partagé ; c'est vrai aussi pour les acteurs partageant une destinée commune sur un même territoire. Cette dimension, qui fait de la médiation bien plus qu'une simple

transaction sur le fond, est fondamentale. Cela fait écho à la **fonction pacificatrice** généralement associée à la médiation.

Un avantage supplémentaire de la médiation réside, si besoin est, dans **sa discrétion et sa confidentialité**. En effet, des parties en conflit peuvent avoir un intérêt commun à préserver la confidentialité sur leur différend. Là où la procédure judiciaire est par nature publique, sauf exception, la médiation permet de créer une bulle de discrétion particulièrement précieuse pour les parties. Mais cette discrétion ne saurait servir à

masquer des problèmes environnementaux au détriment d'autres parties prenantes.

**D'autres avantages encore sont attachés à la figure du tiers** : le médiateur peut fournir un espace neutre et pallier l'absence de communication entre parties qui ne veulent pas forcément se rencontrer. Il peut également servir d'écran pour protéger chacune des parties contre l'émotion parfois agressive des uns envers les autres. La méfiance des parties l'une contre l'autre est équilibrée par la confiance qu'elle porte chacune au

médiateur. Dans une négociation non facilitée par un tiers, les parties doivent tout gérer par elles-mêmes :

structurer le processus de négociation, traiter du fond, tout en gérant leur relation personnelle, parfois tendue. Or, **la médiation organise une sorte de partage des tâches facilitant l'identification de solutions** : c'est en effet sur le médiateur que repose l'organisation d'un processus efficace. Il fait office de modérateur pour ce

qui concerne la gestion des relations, permettant ainsi aux parties de se consacrer plus efficacement aux questions de fond.

**Ces multiples avantages de la médiation ont cependant pour condition le respect d'un certain nombre de principes** : en particulier l'indépendance du médiateur vis-à-vis des parties, sa capacité à organiser et à garantir l'impartialité des processus, et donc sa compétence. On ne s'improvise pas médiateur. Être médiateur n'est pas une posture, n'est pas qu'une attitude. La médiation s'adosse à des méthodes, des techniques et des outils qui vont faire la différence dans l'aptitude du médiateur à éviter des risques et à gérer

un certain nombre de dilemmes (par exemple, comment réagir lorsque des parties acceptent volontairement

un accord qui est manifestement inéquitable ?). Il faut lutter contre l'utilisation du titre de médiateur par des personnes ne présentant pas forcément ces garanties d'impartialité ni de compétence.

**La médiation évite de recourir aux procédures judiciaires et aussi à l'arbitrage** : La médiation évite la saisine des tribunaux étatiques et un affrontement conflictuel tranché par un jugement. Il est sûr aussi que la

voie pénale dans le domaine de l'environnement ferme quasi automatiquement la porte à la médiation. C'est

pourtant la voie choisie dans bien des pays comme la France.

**Bien des conflits environnementaux trouvent cependant leur solution dans une réparation rapide et**

**intégrale, par la remise en état d'un espace naturel**.

Cela pose la question classique de la culpabilité. En Europe aujourd'hui règne une conception pénale dominante. C'est un outil qui ne sert que très peu dans la mesure où il n'est pas assez flexible, nécessite beaucoup de temps et ne tend pas naturellement à la réparation des dommages. Il n'est pas assez flexible en cas d'accident environnemental. **La voie pénale exclut pratiquement la médiation**.

La vision de la réparation à apporter doit être modifiée : si on sort de la conception pénale, on va vers plus de responsabilisation, vers la prise de conscience et la garantie de la réparation.

-La médiation est synonyme de prévention, réparation, responsabilisation : c'est un processus volontaire rapide et efficace. Dans le domaine de l'environnement, il faut souvent agir dans l'urgence pour rétablir au plus vite le milieu naturel à la suite d'un accident. Il faut apporter une réponse rapide à une dégradation

environnementale.

Les techniques de médiation peuvent être déjà utilisées de manière préventive pour désamorcer les conflits latents avant qu'ils soient formalisés, prendre en compte toutes les observations utiles, informer, négocier les acceptations. La médiation peut donc être un facteur de prévention des conflits. Par exemple, certaines

grandes entreprises, dans le cadre de leur activité de traitement des déchets à l'étranger, ont mis au point des

techniques de médiation, ayant permis de désamorcer les conflits avec la population locale ou entre les différentes parties prenantes de la population locale.

**Il n'est pas envisageable d'exploiter la médiation comme moyen de résolution des conflits environnementaux, une solution sous exploitée devant être renforcée et favorisée.**

Soucieux de mettre en avant la médiation comme solution plausible, innovante et efficace aux conflits environnementaux, les experts de la commission de travail partagent plusieurs constats. Notamment le fait

que, même si on parle beaucoup de médiation, en réalité c'est un système très peu utilisé dans certains pays comme la France.

La médiation judiciaire familiale est assez fréquente de même que la médiation sociale, soit conventionnelle, soit judiciaire surtout au niveau des cours d'appel. La médiation commerciale commence aussi à se répandre.

**Mais en ce qui concerne la médiation environnementale, malgré les avancées du Grenelle 2 et la Directive Européenne de 2008, nous en sommes toujours aux balbutiements.** Il faut pousser les grandes entreprises pour qu'elles mettent en place des solutions de médiation.

**Il n'y a pas aujourd'hui de structure de médiation nationale ou internationale spécialisée sur les conflits environnementaux.** En effet à l'heure actuelle il n'existe aucune structure spécifiquement dédiée à la médiation comme solution possible aux conflits environnementaux.

**-Plus largement, au niveau européen, la médiation et les autres mécanismes de résolutions des conflits ne sont pas assez fréquemment utilisés :**

**-Tout d'abord, les parties aux conflits environnementaux donnent toujours leur préférence aux procédures classiques** de règlement et sont assez sceptiques quant à l'idée d'utiliser d'autres outils, même si les pratiques de médiation sont répandues dans des pays comme l'Autriche, l'Allemagne ou les Pays-Bas.

**-Il ya un manque général de ressources, de connaissances, d'informations et de compétences autour de la médiation comme solution de résolution des conflits environnementaux.** Il n'y a que peu d'organisations et d'institutions spécialisées dans la médiation environnementale. Dans certains pays d'Europe, comme c'est le cas en Hongrie, un certain nombre d'instituts et d'universités s'intéressent à certains aspects de la médiation environnementale, mais pas une seule institution n'est complètement

spécialisée dans le domaine

**-Un faible nombre d'instruments juridiques ont été mis en place autour de la médiation environnementale. A l'exception des Etats-Unis, du Canada et de l'Autriche, où le recours à la médiation environnementale est plus fréquent, la médiation environnementale n'a que très rarement un cadre juridique bien défini.** Un tribunal ne peut pas imposer une médiation environnementale au préalable.

La médiation en matière d'environnement apparaît donc aux membres de notre commission comme une solution sous exploitée mais émergente, présentant de nombreux avantages et pouvant s'avérer adaptée à la résolution des conflits environnementaux.

**II-SECONDE PARTIE : Recommandations pour favoriser l'usage de la médiation comme technique de résolution des conflits environnementaux.**

Même s'il existe encore peu d'expérience de médiation environnementale en Europe, le Consensus Building

Institute a des partenaires avec qui il travaille en Grande Bretagne, Irlande, France, Portugal, Italie, Norvège, Allemagne et Autriche qui ont autant **d'expérience que certains des médiateurs environnementaux les**

**plus expérimentés aux Etats-Unis.** Le dernier rapport de l'OCDE sur le sujet suggère que la **médiation**

**« institutionnalisée » est de mieux en mieux acceptée en Europe.**

Il est donc temps **d'encourager et de soutenir la médiation environnementale en Europe**, en s'appuyant sur les succès marquants déjà obtenus dans d'autres pays. Dans cette optique, les points suivants ont particulièrement attiré l'attention des experts de la commission et devront faire l'objet de réformes :

- 1-Institutionnaliser la médiation comme solution de règlement des conflits environnementaux
- 2-Faire émerger le médiateur comme figure institutionnelle de la résolution des conflits environnementaux
- 3-Favoriser la médiation environnementale par la rédaction de clauses contractuelles
- 4- Financer le processus de médiation environnementale
- 5-Renforcer l'offre de formation en matière de médiation environnementale
- 6-Créer une plateforme spécialisée dans la médiation environnementale
- 7-Informer et sensibiliser la population et les parties prenantes aux avantages de la médiation comme moyen de règlement des conflits environnementaux.

**1-Institutionnaliser la médiation comme solution de règlement des conflits environnementaux :**

**-Renforcer la crédibilité et l'efficacité de la médiation comme solution de résolution des conflits**

**environnementaux :** dans la phase de préparation du processus de médiation, le soutien politique et juridique de la procédure doit être assuré. Il existe quelques options

pour renforcer la médiation dans la sphère des conflits environnementaux.

**-Donner une base légale à la médiation environnementale.** Comme aux Etats-Unis et au Canada, il serait intéressant de rédiger des dispositions de médiations dans certaines lois et réglementations afin de donner toute crédibilité à la procédure de médiation. Une telle réforme inciterait les parties à utiliser la médiation au lieu des procédures judiciaires et administratives classiques. Les rédacteurs de ces clauses devront prendre en compte les intérêts de toutes les parties prenantes en donnant une base légale à la médiation environnementale.

**-Permettre au juge d'ordonner une médiation pour une réparation immédiate du dommage en matière environnementale.**

**-Evaluer les conflits et bien identifier les bons représentants des parties prenantes :** Le médiateur doit débiter la préparation de l'évaluation d'un conflit afin de définir qui sont les interlocuteurs appropriés. La préparation de l'évaluation du conflit implique d'interviewer les parties prenantes évidentes (premier cercle) de manière privée et confidentielle. Cette série d'interviews met généralement en évidence un deuxième cercle

de parties prenantes à intégrer à la discussion. Une fois les interviews réalisés ; le médiateur doit écrire une note de synthèse cartographiant les grandes catégories de parties prenantes.

**-Procéder à des enquêtes conjointes :** Les parties devraient s'engager à procéder à une enquête conjointe dans le cadre du processus de médiation afin que les considérations scientifiques et techniques soient correctement intégrées au processus de médiation. De nombreux conflits environnementaux impliquent des décisions qui s'appuient sur des jugements scientifiques ou techniques. Quand des considérations

scientifiques ou techniques entrent en jeu, toutes les parties doivent avoir un accès égal à l'information. Aussi,

il est opportun d'éviter les batailles d'experts, choisis par chaque partie pour renforcer leur interprétation

techniques et contredire les arguments techniques des autres.

**-Donner un rôle consultatif aux ONG, qui pourrait aller jusqu'à l'amicus curiae dans le processus de médiation et faire évoluer le modèle classique de médiation** pour représenter la pluralité des intervenants impliqués.

**-Ne pas tout miser sur les mécanismes formels de médiation mais aussi s'attacher à mettre en œuvre**

**un cadre plus large de dialogue** favorisant la **résolution des conflits environnementaux** par des échanges réguliers et facilités entre les différentes parties prenantes. C'est par exemple ce qui a été mis en place au sein de l'ALENA avec la création de la Commission de Coopération Environnementale, qui est une plateforme d'information et de dialogue sur les risques environnementaux. Si ce système n'est pas parfait et

ne suffit pas à résoudre tous les problèmes à lui seul, la mise en place de ces réseaux est essentielle pour faire progresser le dialogue et parvenir la résolution de certains conflits.

-Concernant les **dispositifs visant à renforcer et à garantir la qualité de la médiation et la déontologie des médiateurs**, on se heurte à une limite. Certes, **un code de déontologie du médiateur**, faisant référence au code de conduite européen, est **important, de même que l'adhésion à des associations agréées semble nécessaire**. Mais fondamentalement, la médiation **est un processus libre, volontaire, souple, pluriel, multiple, adaptable et par conséquent adapté. Elle doit le rester.**

Le défi consiste donc à favoriser une **nécessaire professionnalisation, mais sans pour autant instituer une profession réglementée, contrainte et contraignante, tant pour le médiateur que pour les parties.**

## 2-Faire émerger le médiateur comme figure de la résolution des conflits environnementaux :

**-Faire émerger un nouvel acteur, le médiateur** comme un intervenant efficace des conflits environnementaux, **une force rapide d'intervention tant pour la réparation des dommages** en accord avec les organismes publics et les collectifs privés gestionnaires que **pour l'indemnisation des victimes**. Et ce sans qu'il soit besoin de longues procédures pour établir éventuellement responsabilités et culpabilités.

**C'est aussi replacer l'humain au cœur de la gouvernance environnementale, tout en sachant que le modèle classique de la médiation qui réunit deux parties autour du médiateur** (divorce, contrat de travail, petite délinquance...) **doit évoluer en raison de la pluralité fréquente d'intervenants**, pouvoirs publics, organisations associatives, co-auteurs du dommage, victimes....

**Mettre en place une liste de médiateurs à disposition**, eux-mêmes extérieurs aux agences impliquées dans le processus de médiation. L'Environmental Protection Agency aux Etats-Unis a choisi toute une liste de médiateurs neutres au sein de certaines agences fédérales et d'institutions nationales de résolution des conflits. L'Agence Européenne de l'Environnement pourrait développer une liste similaire avec l'IRENE et d'autres centres de résolutions des conflits. Cela pourrait aider à rationaliser le processus de sélection des

médiateurs.

**-Disposer de médiateurs de qualité.** Le médiateur motive les parties et les acteurs concernés, met au point le processus en coopération avec les parties et construit une atmosphère de confiance pour un tel procédé

par des discussions préparatoires avec les acteurs concernés. Afin d'assurer le succès de la médiation, un

médiateur doit répondre à certains critères : carrière professionnelles, familiarité avec les spécificités locales,

régionales et techniques, neutralité („Faciliter la Concertation", Eyrolle, 2009)

## 3-Favoriser la médiation environnementale par la rédaction de clauses contractuelles :

**-Favoriser la rédaction dans les contrats de clauses de médiation conventionnelle :** en l'absence de ces

clauses, une médiation ad hoc naissant après un litige ouvert risque fort d'aller au conf lit. Si la clause de

médiation est prévue en amont, elle constitue la loi des parties. Cela peut aussi inciter une entreprise ou une organisation à élaborer une véritable politique **de prévention**

des risques. Il faudrait donc promouvoir dans les contrats les clauses obligatoires et préalables de médiation, éventuellement précédée d'une phase de négociation ou de conciliation.

**-Promouvoir dans les contrats inter-entreprises (notamment de sous-traitance) mais aussi dans les conventions avec les particuliers, voire dans les statuts des associations environnementales des clauses de médiation obligatoires et préalables**, à l'image des clauses de conciliation obligatoire comme préalable par exemple aux clauses compromissoires, pour que soit systématiquement recherché un accord avant toute décision éventuelle de recours judiciaire.

#### 4- Financer le processus de médiation environnementale :

**Des ressources financières sont nécessaires pour garantir le fonctionnement du processus de médiation.** La répartition et le paiement des couts par plusieurs institutions ont montré leurs avantages. Cela

permet d'éviter l'impression que la voix de celui qui paie pèse plus que celle des autres, et donc que l'argent

peut déterminer l'issue. Ainsi, un **soutien financier est nécessaire pour aider les organisations à but non**

**lucratif, les communautés à participer dans les efforts de médiation.** Les expériences allemande et autrichienne montrent que les ressources financières pour les processus de résolution des différents conflits

viennent de différentes sources de financement et de programmes d'organisations internationales et étaient

gérées par des ONG qui menaient la médiation. On pourrait aussi imaginer que l'**Agence Européenne de l'Environnement et la Commission Européenne puissent développer des programmes de financement**

pour les communautés et les organisations à but non lucratif afin qu'elles participent au processus de

médiation comme méthode de résolution des conflits.

-Il serait très opportun pour l'Union Européenne de **créer un « fonds incitatif » pour soutenir les**

**expériences de médiation environnementale** ainsi qu'une **documentation approfondie** et transparente de leurs résultats.

#### 5-Renforcement de l'offre de formation en matière de médiation environnementale :

**-Favoriser la recherche est une pré-condition au développement de la médiation comme outil constructif de résolution des conflits environnementaux.** Il faudrait donc recenser, répertorier puis

étudier les pratiques de médiation environnementale déjà en place dans les pays de l'Union Européenne. Il

existe des exemples et des études intéressantes en Autriche et en Allemagne, mais il faudrait mettre au point un comparatif structuré des expériences passées dans le domaine de la médiation environnementale en Europe et ailleurs. Ce projet devra être considéré comme un point de départ de coopération vers une résolution collaborative des conflits environnementaux

-Il faut évidemment **former les médiateurs, les avocats, qui peuvent être soit conseils de parties en médiation**, soit médiateurs eux-mêmes. Former et recruter un corps de médiateurs spécialisés et brevetés en

matière environnementale avec des moyens d'actions et des procédures reconnues. Dans le cas précis de la

médiation environnementale, il sera important de former et recruter des experts spécialistes de la question de l'intégration des modèles culturels (historiens des idées, sociologues) pour aider à la sensibilisation des parties prenantes, dans le cas d'un préjudice environnemental ou d'une décision d'implantation d'une

entreprise à impact environnemental, afin que la médiation ne soit pas biaisée par une incompréhension culturelle.

-Il faut également **former des cadres et futurs cadres d'entreprise à ce qu'est la médiation** : par exemple, c'est le cas des formations de l'ESSEC : le jour où les étudiants se trouvent en situation de responsabilité au sein d'entreprises et face à des conflits, ils sont amenés à considérer la médiation comme un mode sérieux et

efficace de résolution des différends.

-Les **responsables associatifs et les élus politiques gagnent aussi à se former à la médiation, son esprit et ses méthodes.** La médiation figure ainsi dans les **modules de formation permanente** que

l'ESSEC propose à des cadres en fonction.

-Mettre à disposition de la société civile des formations intelligentes et responsables aux avantages de la médiation lors d'un conflit entre deux parties. Par exemple à destination des collectivités territoriales, des organisations de la société civile, environnementales notamment. Démocratiser et favoriser l'accès à la

médiation pour les populations locales

**-Renforcer les compétences autour de la médiation par un effort dans le domaine de l'éducation.** Les études empiriques sur l'utilisation de la médiation suggèrent que les instruments de médiation dans l'Union Européenne sont peu utilisés. C'est assez clairement du au fait que l'étendue des connaissances dans le

domaine de la médiation et de la résolution des conflits est limité. Les conflits dans le domaine environnemental ont une longue histoire de règlements administratifs et judiciaires avant même qu'un effort

de résolution informel soit amorcé. Il semble que la confiance soit bien plus grande envers ce type de processus de résolution des conflits qu'envers un processus de médiation mené par une personne indépendante et impartiale dont les décisions n'ont pas force exécutoire. Il est sans doute possible qu'il ne

s'agisse pas uniquement d'une question de confiance, mais aussi **d'un manque de connaissance des solutions alternatives de résolutions des conflits et de leurs outils ou procédures.** Il faut alors **renforcer activement les compétences autour de la médiation comme solution de résolution des conflits environnementaux.**

**Cela nécessite :**

- un accès facilité à l'information au sujet du processus de médiation et des autres outils et instruments de résolution des conflits/
- l'analyse de cas de médiations réussies dans d'autres pays.
- des échanges d'expériences et des entraînements communs
- des programmes de formation spécifiques pour les différentes parties (professionnels du monde judiciaire, organisations de la société civile et autorités publiques comme l'Agence Européenne de l'Environnement).

Dans cette optique, il serait utile que la Commission Européenne **offre des formations à la médiation environnementale de qualité pour des professionnels de l'environnement**, afin d'assurer une offre de médiateurs environnementaux "enregistrés".

-Il est **essentiel de pouvoir maintenir une "offre" de médiateurs environnementaux relativement proche de la "demande" pour de tels professionnels**. Pour ce faire, il faudrait **mettre l'accent sur la formation d'un petit nombre de professionnels issus du monde de l'environnement accompagné d'un engagement d'expérimenter la médiation de la part de l'Agence Européenne de l'Environnement**.

**6-Créer une plateforme spécialisée dans la médiation environnementale :**

-Création d'une **plateforme spécialisée dans la médiation environnementale**, constituée de médiateurs

spécialisés en environnement (exemple pour le gaz de schiste, il faut de vrais techniciens). Ouvrir un centre spécialisé de Médiation environnementale **avec des médiateurs spécialisés (et brevetés) en matière environnementale, domaine qui ne manque pas d'experts, avec des lieux propres, voire des instances ou espaces de négociations, eux mêmes spécialisés, sectoriels, régionaux, nationaux et**

**internationaux**. Cette solution serait préférable à la création d'une nouvelle juridiction internationale (une de

plus), qui ne ferait qu'ajouter des juges à des juges dans une culture procédurière et vindicative à l'opposé du modèle de la médiation.

Cette plateforme spécialisée dans la médiation devra intégrer en tant qu'élément central des mécanismes

d'engagement, de dialogue et d'échange entre les différentes parties.

**-Dans le même esprit, promouvoir une plateforme Européenne en matière de médiation.**

On pourrait **utiliser l'Agence Européenne de l'Environnement comme une plateforme pour la résolution des conflits environnementaux**. Les bénéfices potentiels d'une harmonisation européenne des procédures de médiation devrait être soulignés, en particulier le rôle de l'Agence Européenne de l'Environnement et des agences nationales de l'environnement devra être mis en valeur. **L'Agence Européenne de**

**l'Environnement et d'autres agences de l'environnement locales devrait être utilisées pour promouvoir l'utilisation de la médiation dans les conflits environnementaux et la levée de fonds pour**

mettre en place une troisième partie neutre incarnée par le médiateur. On pourrait s'inspirer des 30 années

d'expérience de la Environmental Protection Agency (EPA) aux Etats-Unis, pionnière dans l'application des

processus de médiation comme méthode de résolution des conflits.

**7-Informer et sensibiliser la population et les parties prenantes aux avantages de la médiation comme**

**moyen de règlement des conflits environnementaux.**

-Promouvoir un **Cadre commun de référence** pour définir et expliquer le processus de médiation. Un cadre reconnu et référençant les principes, les étapes et les acteurs engagés dans la procédure.

**-Sensibiliser les grandes entreprises aux avantages de la médiation (médiation conventionnelle notamment), mais aussi les organisations collectives, associations spécialisées et ONG.**

-Il faut **sensibiliser plus encore l'autorité judiciaire à la médiation**. Dans bien des instances, le recours à la médiation est très attaché et très corrélé à une personnalité : le jour où cette personnalité quitte son poste, le recours à la médiation chute. Il faut **systématiser l'insertion de clauses de médiation dans des contrats**.

-En premier lieu, il y a un intense besoin, en particulier en France, **d'informer les parties et le public des avantages réels de la médiation**.

- Il est important de **réunir une documentation et une évaluation précises des expériences existantes de médiation environnementale**, ce qui permettrait de **faciliter le recours à la médiation environnementale en Europe**.

**ANNEXE 1 : LISTE DES MEMBRES DE LA COMMISSION :**

Président de la Commission

• **Aurélien COLSON**, Directeur de l'ESSEC-IRENE

Experts ayant participé aux travaux de la commission

• **Francis CASORLA**, Avocat général honoraire à la Cour de cassation, chargé d'enseignements à la

Faculté de droit de l'Université de Nice, Conseiller d'Etat de la Principauté de Monaco.

• **Andrew CROSBY**, Directeur Exécutif Opérations et Stratégies, International Center for Trade and

Sustainable Development (ICTSD).

• **Samuel DAHAN**, Professeur associé, ESSEC-IRENE ; chargé d'enseignements, Université de

Cambridge.

• **Dominique DE COURCELLES**, Directeur de recherche au CNRS ; Membre du Collège International de Philosophie ; Enseignante à l'Ecole Polytechnique et à l'Université Paris-Dauphine.

• **Charles JARROSSON**, Professeur de Droit International et de Droit International de l'Arbitrage, Université Paris Panthéon-Assas.

• **Marianella Prizio Biroli SCLAVI, Sociologue**, Professeur d'Ethnographie Urbaine et de Gestion

Créative des Conflits, Institut Polytechnique de Milan.

• **Blaise TCHIKAYA**, Juriste et Professeur, Université Paris XIII, Membre de la Commission de l'Union

Africaine pour le Droit International.

Animateurs de la commission et rédacteurs de la Note de Synthèse

• **Jérôme BEILIN**, Directeur du Développement en charge des programmes et contenus, Les Ateliers

de la Terre

• **Eduard BELTRAN**, Avocat aux Barreaux de Paris et Barcelone, membre associé de l'ESSEC- IRENE.

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The Rio+20 conferences should prioritize for the political commitments through the institutionalization of the Sustainable Development and Green Economy concepts in various binding agreements.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

The proposed themes of Rio+20 Conference-- a green economy (GE) in the context of sustainable development (SD) and poverty eradication and the institutional framework for sustainable development-- are very vague. There is no clear documentation regarding the history and the theoretical route of green economy initiatives. In separate attached document, I outline the theoretical frame of GE and SD (see attached document).

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

There is an assumption that GE tries to capture the notion of the vulnerability of human welfare, caused by the degradation of global environment, which can be understood as a result of the widespread application of an unsustainable economic growth. Probably, it captures the concerns of the past four decades to address climate change to frame treaty agreements. The GE initiatives can serve as a tool for the greening as an engine for growth, with valuing the ecosystem services and biodiversity issues by addressing strategic uncertainty such as: the likelihood of adverse effects; the consequences of change; the speed of change; discontinuities; and especially uncertainty over the effectiveness of policy instruments.

The issues of institutionalization of political commitments are missing in Rio+20. In order to attain the objectives of the SD, institutional framework has to be developed to coordinate and manage activities of all related stakeholders (i.e. governments, UN agencies, multilateral and bilateral donors; development banks; international nongovernmental and governmental organizations; national nongovernmental organizations etc.). It requires an effective institutional structure, strong policy, and framework for policy implementation and can work effectively, efficiently, equitably and transparently.

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

To achieve the desired outcomes in such complicated themes, it would be hard to propose the specific timeframe. However, it is also necessary to bind within the time frame; therefore, I proposed three schemes (1) 2 to 3 years policy and program framing phase; 4-6 years program implementation phase; and 7-10 years monitoring and evaluation phase.

To implement the green economy initiatives in the developing world, there is also a need to change or revisit the trade regulations imposed by the World Trade Organization (WTO); especially the social and environmental conditions of specific developments such as the removal of the ability of foreign cooperation to over-ride local social and environmental factors. To foster the ability of the developing world, it is essential to establish a chain of cooperation between North and South. The chain of cooperation can be established through creation of international oversight schemes which can help to bridge the gap between North and South.

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

---

**b) Green economy in the context of sustainable development and poverty eradication:** views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication

**c) Institutional framework for sustainable development:** Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.

**d) Any proposals for refinement of the two themes.** Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".

#### Inputs for Rio+20 Compilation Document

##### The conceptual problems of Green Economy and Sustainable Development

On behalf of the

Association for Protection of Environment and Culture (APEC-Nepal) and

Atlantic States Legal Foundation (ASLF), Inc. (NGO), USA

Input submitted by Medani P. Bhandari ([medani.bhandari@gmail.com](mailto:medani.bhandari@gmail.com)) co-founder and former chair of APEC-Nepal; Scientist of at the ASLF-USA and Research Associate at Syracuse University, NY, USA

**APEC-Nepal:** General objectives of the organization are to extend help in the protection of biological diversity such as wildlife, wetland species, forest resources and development of the nation by organizing individuals and experts in the conservation of natural resources and sustainable use. Founded in 1985, APEC-Nepal is a member of IUCN; accredited with the UNEP; member if Global Environment Facility-NGO Networks and associated with UN-DPI. [http://www.geocities.ws/ngo\\_apecl](http://www.geocities.ws/ngo_apecl)

**ASLF-USA:** Atlantic States Legal Foundation (ASLF) was established in 1982 to provide affordable legal, technical and organizational assistance to individuals, community groups, and other Non-Governmental Organizations (NGOs), as a way to effectively remediate threats to the natural environment. ASLF is accredited with the UNEP; member if Global Environment Facility-NGO Networks and associated with UN-DPI. <http://aslf.org/>

#### Introduction:

As the Rio+20 has already set the objective to secure renewed political commitment for sustainable development, it should begin to create common ground to build the consensus among stakeholders as it was able to do in the Rio 1992.

*a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?*

The Rio+20 conferences should prioritize for the political commitments through the institutionalization of the Sustainable Development and Green Economy concepts in various binding agreements.

*b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?*

The proposed themes of Rio+20 Conference-- a green economy (GE) in the context of sustainable development (SD) and poverty eradication and the institutional framework for sustainable development-- are very vague. There is no clear documentation regarding the history and the theoretical route of green economy initiatives. In separate attached document, I outline the theoretical frame of GE and SD (see attached document).

*c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);*

There is an assumption that GE tries to capture the notion of the vulnerability of human welfare, caused by the degradation of global environment, which can be understood as a result of the widespread application of an unsustainable economic growth. Probably, it captures the concerns of the past four decades to address climate change to frame treaty agreements. The GE initiatives can serve as a tool for the greening as an engine for growth, with valuing the ecosystem services and biodiversity issues by addressing strategic uncertainty such as: the likelihood of adverse effects; the consequences of change; the speed of change; discontinuities; and especially uncertainty over the effectiveness of policy instruments.

The issues of institutionalization of political commitments are missing in Rio+20. In order to attain the objectives of the SD, institutional framework has to be developed to coordinate and manage activities of all related stakeholders (i.e. governments, UN agencies, multilateral and bilateral donors; development banks; international nongovernmental and governmental organizations; national nongovernmental organizations etc.). It requires an effective institutional structure, strong policy, and framework for policy implementation and can work effectively, efficiently, equitably and transparently.

*d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?*

To achieve the desired outcomes in such complicated themes, it would be hard to propose the specific timeframe. However, it is also necessary to bind within the time frame; therefore, I proposed three schemes (1) 2 to 3 years policy and program framing phase; 4-6 years program implementation phase; and 7-10 years monitoring and evaluation phase.

To implement the green economy initiatives in the developing world, there is also a need to change or revisit the trade regulations imposed by the World Trade Organization (WTO); especially the social and environmental conditions of specific developments such as the removal of the ability of foreign cooperation to over-ride local social and environmental factors. To foster the ability of the developing world, it is essential to establish a chain of cooperation between North and South. The chain of cooperation can be established through creation of international oversight schemes which can help to bridge the gap between North and South.

## Australasian Campuses Towards Sustainability (ACTS)

### Australasian Campuses Towards Sustainability submission for the UN Conference on Sustainable Development 2012

1. Australasian Campuses Towards Sustainability (ACTS) is a non--profit member based organisation representing higher and further education institutions within Australia and New Zealand. ACTS aims to inspire, promote and support change towards best practice sustainability within the operations, curriculum and research of the tertiary education sector. ACTS seeks to build community and business partnerships at the local, regional and international level, in order to bring together a network of people for positive engagement, capacity building and change.

2. The annual ACTS conference was held in Adelaide from 28--30 September

2011. One of the sessions at the conference was devoted to discussions pertaining to Rio + 20 and organized under three themes, namely: (1) Tertiary education sector contributions to the Zero Draft document and subsequent implementation, (2) Green economy in the context of sustainable development and poverty eradication, and (3) Institutional framework for sustainable development.

3. As an NGO operating within the Asia Pacific region, ACTS was involved in drafting the statements submitted by *Major Groups and Stakeholders Asia Pacific*, as well as *Asia Pacific NGOs* and we therefore strongly endorse and support both.

4. We believe that the UN Conference on Sustainable Development in 2012

(Rio+20) provides a critical and timely platform for governments at the highest level to secure renewed political commitment and action for sustainable development. Since 1992 the ecological crisis has worsened, whilst income and social inequalities have escalated even as high economic growth took place in several countries. Not enough has been done to achieve the paradigm shift required to change current unsustainable trends and we urgently call on governments to act on change towards sustainable development, rather than continue to debate the issue further.

5. The Rio+20 Conference should therefore honestly and openly appraise the

implementation of the sustainable development commitments and action plans, and identify the gaps and obstacles, to ensure the transformation and integration of the economic, social and ecological dimensions. This needs to take place at the local, national, regional and international levels.

6. In moving towards sustainable development that also incorporates the inter--

generational dimension, the critical role that tertiary education plays in

achieving a long--term and sustainable shift needs to be galvanised. Recognising that changes in social values and practices are necessary in addition to technical solutions, there should be a focus on ensuring educational structures provide appropriate and relevant sustainability related skills and knowledge to achieve long term change within society and economy. Furthermore, there must be recognition and promotion of indigenous and local knowledge systems and their interface with more formalised knowledge systems.

7. The role that tertiary education can, should and does play in achieving sustainable development has often gone unrecognized and/or under represented. Since 1992, it has become clear that tertiary education institutions play a number of critical roles, including those summarized below:

- They provide relevant and critical education to our future government, business, industry, education and community leaders. By integrating sustainable development into curriculum, skills training and student development, tertiary education will equip the future with people who have the knowledge and capacity to positively impact the global economic and educational systems and programs, to eradicate poverty and improve access to education for all;
- They are critical homes for the research that provides sustainable solutions to the complex problems of development. Indeed, Secretary Ban Ki--moon pointed out in his call for the world's academic community to find solutions to global hunger, water shortages, and energy issues, "the academic community can help us connect the dots";
- They serve as the "test beds" for examining the context in which innovative sustainability practices are executed. As these institutions implement a variety of context--specific sustainability practices through education and operations, they demonstrate the viability of these practices and provide models for sustainable development;
- They facilitate engagement of groups at the community level through building and maintaining strong links to government, business and civil society, as part of the core business of learning and teaching and as part of research; and
- They provide the opportunity for cross fertilization of knowledge and understanding through hosting students from the international community, who then transfer learnings

into their own areas for the benefit of all.

8. These roles of tertiary institutions should be recognised while also

acknowledging that:

- There is need to strengthen the holistic integration of environmental, social and economical dimensions of sustainable development;

- Through promoting sustainable societies it is essential to ensure gender equality, democracy, and human rights;

- The importance of peoples' participation, particularly of youth, women and indigenous peoples, and providing for their empowerment and relevant, functional education to support inclusive sustainable development, is most readily done through the tertiary education system; and

- There have been communities that have developed numerous solutions to sustainable development challenges in spite of a lack of leadership and support from high levels of government. These initiatives need to be fully recognized, supported and celebrated with a view to link, upscale and maintain efforts.

9. It is the fundamental role of tertiary education to innovate and be an open source of new technologies for the benefit and wellbeing of the global community. We therefore propose that tertiary education institutions need to be more open and transparent with regards to the sharing of information with the global community for the common good towards sustainable development.

10. Open sharing of information and innovation cannot be accomplished without the support and backing of business and government. We therefore request business and government to provide more substantial financial and in kind support to see such endeavours come to fruition.

11. Below are summarized the key issues, challenges and courses of action that

have been identified and affirmed in the ACTS annual conference.

#### **Issues, Challenges and Ways Forward**

##### ***On Tertiary Education sector contributions to the Zero Draft document and***

##### ***subsequent implementation***

12. We believe that the language that is used within the Zero Draft document and

any subsequent documents must be directive and commitment--oriented to avoid any misunderstanding or 'ways out' from implementing the intention of the document and in order to achieve the paradigm shift required to move beyond rhetoric to action towards sustainable development.

13. We strongly feel that the role of tertiary education should be prominent

throughout the Zero Draft document and any subsequent documents in order for the intent of Rio and Rio + 20 to be realised. The role of tertiary education should therefore not be relegated to inclusion as an ad hoc after thought.

14. We further believe that relevant and appropriate education at all levels is

essential, as is support from pillars of society such as government and business. The recognition that informal learning processes are just as important as formal learning processes is essential, particularly to empower and encompass the marginalised youth, women and indigenous groups in

society. These two approaches to learning can be used in conjunction to ensure the most beneficial outcomes at a variety of levels and learning. Education for all is an important cornerstone of civilisation, whether provided through formal or informal means.

15. Community engagement is part of the core business of higher and further education. We therefore believe that tertiary education institutions are in a strong position to facilitate the partnerships between government, business and civil society (including individuals and community groups) at the community level, as part of the implementation of goals and objectives associated with Rio + 20 outcomes (see Figure 1 below).

#### **Figure 1: Implementation for Change Model**

Dissemination

of knowledge

Business

Civil Society

16. We submit that tertiary education be recognised as playing a significant role in the Zero Draft document and in its subsequent implementation to achieving the commitments of Rio and Rio + 20 and in particular, as summarised below:

- Tertiary institutions, business/industry groups and governments alike should provide resources and funding to facilitate the fundamental shift to embed sustainability in the curriculum, research, and

operations of tertiary education. The development of tools, resources and appropriate professional development for academics and institutional leaders are required for this fundamental shift in our collective approach to sustainable development to be successful

- Each tertiary institution within developed countries should partner and work with a tertiary institution from a developing country, for the purpose and mutual benefit of research, knowledge and resource exchange. Each institution should make this partnership explicit through registering on a dedicated page, coordinated by the apex body discussed further below

- Every tertiary institution should commit to sharing and learning from one another in the spirit of international partnership and long-term global societal benefit. As importantly, institutions should commit to working more closely with local community and business to facilitate dialogue, capacity building and change at the local level.

***On Green Economy in the Context of Poverty Eradication and Sustainable Development***

17. We firmly believe that current prevailing economic models promote

unsustainable consumption and production patterns, facilitate grossly inequitable economic systems that fail to eradicate poverty, assist exploitation of natural resources towards the verge of extinction, and need to be replaced by sustainable economies in the community, local, national, regional and international spheres.

18. We have concerns about the term 'green economy', and indeed, striving towards a 'green economy' as it leaves the current economic system open to 'greenwashing' without fundamentally changing a system that is significantly contributing to unsustainable practices.

19. The use of jargonistic titles such as 'green' to describe the economy only confuses the matter and the outcomes that need to be reached in order to realise sustainable development. We therefore propose that the approach is based on sustainable economies, the key attributes of which promote and encapsulate:

- Cultural change towards sustainable development from the bottom-up, moving towards less unnecessary consumption;
- Sustainable production and consumption patterns, ensuring social and environmental wellbeing in that process;
- Decent work and livelihoods, ensuring that social benefits are distributed equitably among all peoples;
- The upholding of social justice, human rights, equity, and gender equality;
- Allows and supports the achievement of economic sufficiency;
- Safeguarding animal welfare and protection of ecosystems; and

- Regulation of financial markets, holding firms accountable for the

social and environmental impacts of their operations.

20. We further question the use of Gross Domestic Product (GDP) as a measurement for growth and instead believe a more appropriate index be used, one which is based on people's wellbeing, inclusiveness, social equity, human rights, gender equality, decent work, biodiversity and ecological footprint.

21. We present that tertiary education institutions can play a significant role in

developing the methodologies required to measure progress towards sustainable economies and indeed, sustainable development. Through our core business, we have the capacity to question terminology and measurement of non-economic factors, bearing in mind our reluctance to inappropriately value the environment.

22. We believe that technological fixes alone will not solve environmental problems that are consequences of social and economic factors. Fundamental issues such as assessment of the potential impacts of new and untested technologies (e.g., geo-engineering, ocean fertilization, etc.) before they are released in the environment and deployed commercially must be addressed in the development and transfer of technologies.

23. We present that tertiary education has a significant role to play in ensuring the issue of assessment of potential impacts is addressed. Through our research we have the capacity to question current technologies, and innovate and appropriately assess future technologies prior to release, and importantly, to continue monitoring and evaluation once technologies are in place.

24. We further present that tertiary education can play a significant role in

achieving sustainable economies in an accelerated timeframe through embedding sustainability across curriculum and by enabling it to be delivered through relevant learning and teaching practices that are based on best knowledge, unbiased and distanced commercial conflicts of interest to ensure the current skills and knowledge gap does not exist into the future.

25. We believe that stronger partnerships among governments, civil society organisations, private businesses and stakeholder groups must be established for promoting sustainable economies. Such partnerships need to be within frameworks of accountability and transparency including regulation. In line with this, tertiary education institutions and other stakeholder groups are enjoined to support good practice case studies and promote dissemination of information on such good practices for promoting sustainable economies in the context of poverty eradication and sustainable development.

#### ***On the Institutional Framework for Sustainable Development (IFSD)***

26. We believe it is necessary to build a strong apex body on sustainable development that works at the global level and can integrate the work of disparate multilateral bodies currently working on each of the three dimensions of sustainable development. This apex body needs to include the International Monetary Fund, the World Bank and the World Trade Organisation to ensure ALL dimensions of sustainable development are considered, and those with the ability to influence change are involved in decision-making processes. Options to be explored include transforming the Commission on Sustainable Development into a Council on Sustainable Development, or establishing a UN Organization on Sustainable Development. The unifying mandate of this body should be the promotion of sustainable development as a fundamental right of all.

27. We further believe it is essential to immediately establish a broad inclusive multi-stakeholder consultative body or network which is tasked with supporting the apex body through provision of information to assist in realising outcomes and monitoring the implementation of commitments and actions since 1992. Such a body should be participatory, democratic, and have an integral multi-stakeholder character that accords civil society with equal rights and equal voice as those of governments.

28. At the regional level, corresponding sustainable development bodies should be established. Sub-regional analogues could also be created where size and diversity of the region warrant it, such as in the Asia-Pacific.

29. At the national level, governments must establish multi-stakeholder councils

for sustainable development (NCSDs) where absent, and strengthen them where already existing. NCSDs must coordinate planning, policy making, issues resolution, and reporting to the corresponding sub-regional/regional and global sustainable development bodies to ensure vertical coherence from implementation levels to the global level.

30. To be effective, the national sustainable development councils should be (a) organized at highest possible level, i.e., chaired by the Head of State/Government; (b) lodged with an appropriate coordinating body such Office of the Prime Minister or highest level elected represented body; (c) composed of relevant ministries and major groups/stakeholders including local authorities; and (d) institutionally stable by virtue of a strong legal mandate and endowed with a dedicated budget.

31. Local authorities are closest to the ground and directly serve the people. They must be given appropriate responsibility and be involved in decision-making that concerns sustainable development.

32. We strongly assert that it is essential for the apex body and governments to

recognize the existing efforts of communities and NGOs such as ACTS in promoting sustainable development at the national and local levels. Recognition needs to be accompanied by support, with the provision of

platforms to mainstream and link these efforts to have more sustained

impacts on development.

33. The above proposals are initial steps to start fundamental changes that are necessary to meet the challenges of the 21st century and ensure a sustainable global civilisation in the centuries beyond. In the long term this may include updating the Charter of the UN.

## Automobile Association of Southern India

Safe Roads at Rio +20

A Submission to the U.N. Conference on Sustainable Development by the commission for Global Road Safety.

- Road Traffic Accidents take a toll of more than a lakh and twenty five thousand in India and added to that more than 5 lakhs people get injured.
- Inspite of having a target of reducing by 20% reduction the number of deaths and injuries is increasing alarmingly.
- Though the Government is committed to Road Safety, effective implementation in a coordinated manner is lacking due to various agencies being involved.
- The WHO and the U.N. General Assembly had rightly recognised the problem of Road safety as an Health Issue and even earmarked a day for Road Safety.
- The U.N. Decade of Action for Road Safety 2011-2020 with the goal to reduce road deaths by 2020 is also being implemented by the Government. But still it has not gained the momentum needed for effective reduction.
- Road Safety is also an environmental issue and has to be a part of the Millennium Development goal since reduction of accidents forms an essential part of improvement of environment and quality of life.
- The impact of injuries affects the rate of economic growth. The development of public Transport and creating safe environment for those who walk or cycle is necessary for reducing road accidents and improving the air quality safety has to be an integral part of design and management of road Transport system as envisaged by the World Bank.
- It is our request that the Rio +20 conference on sustainable development should also include Road Safety issues as part of agenda so that the decisions taken would give a fillip to the movement for Road Safety.

---

## Automobile Club of Moldova

General content

World and country statistics in road crashes domain is an alarming fact that urges everyone to act in order to prevent them. It is alarming the fact, that in recent years, road accidents have become an epidemic, which destroys the lives of more than 1.3 million people worldwide, and other of some 50 million are severely traumatized. The road crashes are predicted to become the fifth leading global cause of death by 2030, unless immediate action is taken.

Most passenger and goods traffic uses roads (for example, close to 80 percent and 50 percent, respectively, in the European Union). Rising incomes in many developing countries have led to more motor vehicles and greater traffic volumes, but road safety management capacity, road infrastructure and enforcement of traffic safety regulations have not kept pace. As a result, road traffic injuries have become a major public health challenge in many low- and middle-income countries including in ECA. About 90 percent of the 1.3 million deaths and 50 million injuries from road traffic crashes worldwide each year occur in LMICs, although these countries have only 48 percent of the world's registered vehicles (WHO 2009). Increasing motorization and urbanization in these countries could double this toll by 2030. The difference between low- or middle-income countries and high-income countries - where many road deaths still occur - is stunning.

The main risk factors for road crashes are:

- Road design features, including those that expose vulnerable road users when mixing with traffic (for example, due to lack of crossings or walkways).
- Lack of effective regulation and enforcement of required vehicle condition, driver's education and training, and risky behaviors.
- Driver behavior: speeding; recklessness; drinking and driving; not using seatbelts, helmets, and other protective equipment; and using mobile phones, especially texting.

The Commission for Global Road Safety is an independent body under the Chairmanship of Lord Robertson of Port Ellen and patronage of HRH Prince Michael of Kent. It was established in 2006 by the FIA Foundation (a UK registered charity) to promote action to reverse the rising tide of road traffic injury and fatality in developing countries. Its "Make Roads Safe" reports published in 2006 and 2009 called for the first ever global Ministerial Conference, which was subsequently held in Moscow in November 2009, and proposed that the UN mandate a Decade of Action for Road Safety, a proposal which was subsequently approved by the UN General Assembly in March 2010. Amongst the recommendations in the Commission's third "Make Roads Safe" report, published in 2011, we call on the international community to recognize road traffic injuries as a

sustainability challenge in the context of the Rio+20 Conference and discussions on a post-Millennium Development Goals framework.

Dr. Watkins' analysis is echoed in the 2011 'State of the World's Children' report from the UN Children's Fund. In the report, which focuses on adolescence, UNICEF argues that older children have been neglected as a health priority. "Lasting change in the lives of children and young people...can only be achieved and sustained by complementing investment in the first decade of life with greater attention and resources applied in the second", the report concludes. Injury, and in particular road injury, is identified as an area that needs to be addressed. "Injuries are a growing concern in public health in relation to younger children and adolescents alike. They are the leading cause of death among adolescents aged 10-19...many of these deaths are related to road traffic accidents", the authors acknowledge. "Fatalities from injuries among adolescents are highest among the poor...Because the rate of urbanization is most rapid in the poorest regions."

We welcome Rio+20 as an important opportunity to identify the major sustainability challenges facing the world and to contribute to the design of a post-MDG framework that will meet the needs of developing nations in the second and third decades of the 21st Century. We strongly believe that global road traffic death and injury, and the wider but related issue of safe and sustainable transportation policy, must be recognized as sustainability challenges at the Rio+20 Conference. We urge and encourage the Secretariat, member nations and participants to include reference to safe and sustainable road mobility in the 'Outcomes Document' of the Conference.

#### Specific elements

According to WHO Report on road traffic injury prevention: "Road traffic injuries are a growing public health issue, disproportionately affecting vulnerable groups of road users, including the poor. More than half the people killed in traffic crashes are young adults aged between 15 and 44 years. Furthermore, road traffic injuries cost low-income and middle-income countries between 1% and 2% of their gross national product – more than the total development aid received by these countries."

The Republic of Moldova is one of the countries mentioned above, where the issue of road traffic accidents is a major public health problem. Over 3000 Moldovans are seriously injured and about 500 are killed on our national roads annually, more than 10% - children.

A deep study of the statistics demonstrated that the most vulnerable road users are young people and men - often the breadwinners in a family. This fact has a strong impact on the general situation of social public health. By the World Bank ranking, Moldova is considered to be a country with a "senescent" society, which is another important reason for us to prevent the fatalities involving young generation. These losses are not caused just by the number of crashes at the scene, but also by the tardy render of the first aid by the paramedics and the lack of an established system of post crash rehabilitation.

It is important to underline the link between the road casualties and development. In 2009 the World Bank and other leading development banks published a joint strategy paper identifying road casualties as "one of the most significant public health development priorities of the early 21st century." Real progress will require concerted action of the part of many actors. Within countries, effective casualty reduction requires cooperation across many public agencies. Achieving a good outcome will in turn require the development of new coalitions bringing together health professionals, teachers, parents and local community groups. At an international level, development agencies and civil society organizations need to start a treating road traffic injury as a core element in their activities.

In such a way, road safety issue is recognized as a huge burden, harming not only the social sphere of the community, but also the sustainable development of the whole state. A World Bank report in 2009, "Death on Wheels", pointed to the increasingly unbearable burden of road deaths and injuries on economic and social development in Eastern Europe and Central Asia, costing up to 3% of GDP in many countries.

Melanie Marlett, Head of the World Bank in Moldova, has estimated that every life lost on Moldova's roads costs the equivalent of US\$ 511,000 to the Moldovan economy, not to mention the human cost of each life lost and each injured person. The cost of road deaths and injuries to Moldova in 2009 was already in excess of \$300 million a year – around 3% of GDP. This demonstrates that safe roads are crucial to Moldova's economic development – underpinning trade and tourism, connecting people to offices, schools and hospitals, and building a business environment attractive for foreign investors. Effective enforcement is therefore an important tool for Moldova's economic and social development.

In regard to this, the Republic of Moldova has sponsored a UN Resolution agreed in March 2010 calling for the Decade of Action for road safety 2011-2020. In such a way, on 11th of May 2011, in Moldova, like in many other countries was launched the Decade of Action for Road Safety, making the commitment to raise the level of road safety and improve the safety measures for all road users.

The United Nations has launched the 'Decade of Action for Road Safety 2011-2020', describing road injury as "major public health problem with a broad range of social and economic consequences which, if unaddressed, may affect the sustainable development of countries and hinder progress towards the Millennium Development Goals". It worth to mention that Moldovan Secretary General of the Government, Victor Bodiu, participated at the UN Millennium Development Goals (MDGs) Summit in New York, which took place in September 2010. Thus, the General Secretary of State met with senior United Nations officials and leaders from multilateral development institutions to highlight the 'missing link' between road safety and the MDGs.

There is growing recognition that improving road safety can also contribute to achieving the MDGs, particularly in relation to child mortality, access to healthcare (on safe roads), and universal access to education (a million children are killed or seriously injured each year in road crashes, the majority as pedestrians). UNICEF has urged that action to prevent injuries in the second decade of a child's life should become "a major international health objective".

Addressing road safety will also help to achieve environmental objectives, including action on climate change, particularly through providing a safer road system for users of non-motorized transport, such as pedestrians and cyclists, the most vulnerable road users. Providing safe facilities for non-motorized transport, and encouraging affordable and safe public transport, can reduce demand for modal shift to the car. According to the UN Environment Programme, such policies can make "a large, lasting impact...on fuel use, congestion, air quality and CO2 emissions... It is also one of the most cost-effective actions for saving hundreds of thousands of lives".

The UN Environment Programme is also urging a change in emphasis in transport planning in developing nations to support and protect non-motorized mobility and to encourage safe and affordable public transport (low income families in developing countries can currently spend up to 25% of their income on public transport), citing the benefits for a range of environmental objectives. UNEP points out that "cities with a better modal mix between cars, public transport, walking and cycling have lower energy use per capita. By incorporating non-motorized transport facilities in the transport grid, a large, lasting impact can be made on fuel use, congestion, air quality and CO2 emissions". Furthermore, UNEP argues that "designating road space for pedestrians and cyclists in proportion to the demand for non-motorized transport is crucial. It is also one of the most cost-effective actions for saving hundreds of thousands of lives. For example, the top two countermeasures for improving safety in Nairobi, Kenya, recommended by the International Road Assessment Programme (iRAP) are pedestrian crossings and sidewalks", ('Share the Road: Invest in Walking & Cycling', UN Environment Programme and FIA Foundation, 2011).

As Moldova is a developing country, the situation is made worse by the urbanization process, in the result of which the number of transport grows and the presence of old soviet cars pollute the environment and bring harm to a big number of population, particularly town inhabitants.

Another disappointing fact is that in our country there are no facilities for bicyclists and in many places even for pedestrians. On July 2, 2010, in Moldova was launched the iRAP Programme (International Road Assessment Programme) that inspected over 3000 km of Moldavian road network. At the end of the inspections there was elaborated a

final report, in which was specified that: "Overall, road markings were found to be poor on more than 90% of the road inspected. Less than 20% of roads were rated as in 'good' condition. Some 80% of the network had unpaved shoulders. Two-thirds of the network has aggressive objects less than 5 meters from the road edge."

According to World's Bank report entitled "Death on wheels": "An effective road safety strategy requires a multi-sectoral, "safe system" approach. It needs a lead agency to coordinate contributions by the many government departments across which road safety responsibilities tend to be diffused: transport, interior, police, health, and education, among others. The goal is to prevent the occurrence of injury, minimize the severity of injury when traffic injuries occur, and reduce the severity of injury in the aftermath. Road safety must be integrated into the design of transport plans and programs and considered in broader public policy discussions that influence people's transport options and decisions. When road safety becomes an integral part of transport policy, the benefits of reducing noise and air pollutants, controlling alcohol abuse, and promoting walking and cycling become apparent. For example, maintaining lower speeds reduces the costs of injuries and also the costs from air pollution, greenhouse gas emissions, noise, and fear-based barriers among would-be pedestrians and cyclists."

It should be mentioned that in the Republic of Moldova a Strategy for Road Safety was elaborated, that highlights the main road safety problems and the main key steps to improve it, and namely to reduce with 50% the number of crash fatalities till 2020. In this strategy it is specified also about the so called Progressive Vision Zero, which goal is to have zero victims on roads, stating that even one victim is too much.

#### Institutional framework for sustainable development

It is our view that this gap between the growing acknowledgement of the issue and achieving sustained action can be bridged if, for the first time, road safety is included within the framework of a major international sustainability conference. Identifying road traffic injury as a new challenge at the Rio+20 Conference will be invaluable in raising the profile of the issue and helping to institutionalize road safety programmes within middle-income and low-income governments and organizations. As we have seen in the powerful response to climate change and environmental protection following the first Rio summit in 1992, and in the united focus on achieving the Millennium Development Goals that was the major outcome of the Johannesburg Summit in 2002, the priorities agreed at these international fora do set the global agenda and issues that are absent from the agenda are subsequently neglected and under-funded.

The priorities agreed at international fore like Rio+20 set the global agenda and issues that are absent from the agenda, subsequently neglected and under-funded. This is why it is so important to undertake action to improve road safety and promote sustainable modes of transport to be included in the agenda and outcomes of the Rio+20 Conference. The absence of road safety from the agenda of the 2002 World Summit on Sustainable Development in Johannesburg, and the consequent neglect of this issue in international development fore, has arguably contributed to the growing toll of death and disability on the world's roads. The vast majority – more than ninety per cent - of these casualties are occurring in middle-income and low-income countries where road safety awareness and the capacity to tackle the problem is low, and where both traffic levels and road casualties are rising rapidly (Global Status Report on Road Safety, WHO, 2009).

Many developing country governments and large institutions are beginning to recognize the need to prioritize road safety in the context of a sustainable transport system. But progress is slow. The gap between an institution acknowledging the issue and achieving sustained action can be bridged if road safety is included within the framework of a major international sustainability conference.

Despite the absence of road safety from the mainstream sustainable development agenda there is now a global mandate for action to reduce global road traffic injuries. UN General Assembly Resolution A/RES/64/255 has established the UN Decade of Action for Road Safety 2011-2020 with a goal to 'stabilize and reduce' road deaths by 2020. Our Commission estimates that if this ambitious goal can be achieved up to 5 million lives and 50 million serious injuries could be prevented over the course of the Decade ('Make Roads Safe: A Decade of Action for Road Safety', Commission for Global Road Safety, 2009).

Until road safety can be integrated into the mainstream of sustainability policy, millions of people will be condemned to unnecessary and preventable violent, painful deaths, or lives blighted by severe disability. This is why it is so important that action to improve road safety and promote sustainable modes of transport is included in the agenda and outcomes of the Rio+20 Conference.

The time to act has arrived and it should not be missed any chance to prevent road fatalities and their cruel consequences!

## Automóvil Club del Ecuador ANETA

### Safer Roads at Rio+ 20 / Carreteras más Seguras en Rio+ 20

Los accidentes de tránsito están matando cada año más de 1.3 millones de personas y causando lesiones de 20 a 50 millones, cifras superiores a las causadas por la malaria.

El 90% de la víctimas por accidentes de tránsito provienen de países de ingresos medios y bajos. Cada año 260.000 niños mueren en las calles y carreteras y 1.000.000 sufren lesiones serias quedando con frecuencia discapacitados para el resto de sus vidas.

El Ecuador no escapa de esta tragedia y en el cuadro siguiente se puede comprobar la gravedad de esta verdadera endemia, a lo cual había que agregar el elevado porcentaje de discapacitados por accidentes de tránsito y las pérdidas económicas anuales.

Del total del número de muertos en el Ecuador, los accidentes de tránsito representan un gran porcentaje los mimos que detallamos en la siguiente tabla:

Año	% de Muertes por Accidentes Tránsito	Causalidad
2007	19,50%	<b>Segunda Causa de Muerte en el Ecuador</b>
2008	19,50%	
2009	22,70%	
2010	23,30%	

En la siguiente tabla podemos ver como severamente aumentan las cifras de muertos

## **AÑO ACCIDENTES HERIDOS MUERTOS REFERENCIA Total Niños**

2007 19.347 10.530 1.780 Del total de muertos 17 son niños, uno de cada 106

2008 19.667 12.749 1.529 Del total de muertos 80 son niños, uno de cada 19

2009 21.528 14.869 2.088 Del total de muertos 174 son niños, uno de cada 12

2010 25.588 2.313 2.172 Del total de muertos 145 son niños, uno de cada 15

por Accidentes de Tránsito en el Ecuador, incluyendo la muerte de niños.

• Fuente: Inec

ANETA conjuntamente con la Vicepresidencia de la República el 20 de agosto de 2009 decidieron concentrar sus esfuerzos para cumplir el eje **N.- 2 del Plan de Acción de Naciones Unidas**: "Crear una responsabilidad de todos los usuarios viales a través de la educación escolar y no escolarizada, mediante la suscripción de un documento por parte de organismos públicos y privados de adhesión a la "Década de Acción para la Seguridad Vial 2010-2020".

A continuación detallamos los PROGRAMAS DE EDUCACION VIAL, AUTOMOVIL CLUB DEL ECUADOR ANETA.

### **1) PROGRAMA NACIONAL ITINERANTE DE PREVENCIÓN DE ACCIDENTES DE TRANSITO**

#### **Objetivos: GENERAL:**

• Contribuir a reducir la alta siniestralidad en la población

Ecuatoriana, a consecuencia de accidentes de tránsito.

• Fomentar la Educación Vial como estrategia preventiva ante los accidentes de tránsito.

#### **ESPECIFICOS:**

• Dictar cursos de Educación y Seguridad Vial a niños y jóvenes mediante el desplazamiento de la Unidad Móvil a las diferentes ciudades del país, con el propósito de formar una Cultura Vial y una responsabilidad ciudadana como usuarios viales.

• Mejorar la calidad de vida de los ecuatorianos.

• Disminuir los costos y gastos en la atención a víctimas de accidentes de tránsito.

#### **Mecanismo de Operatividad**

ANETA puso en marcha a partir de julio del año 2005 una Unidad Móvil que recorre varias ciudades del Ecuador.

Su misión es recorrer el país capacitando en teoría y práctica, y sin costo alguno, a niños en edades comprendidas entre 6 a 12 años, y jóvenes de

13 a 17 años, en temas de educación y seguridad vial. Esta formación se realiza en horario continuo de mañana y tarde, de lunes a domingo.

El número total de personas que se capacitan es de 30.000 al año, aproximadamente.

#### **Aula de Conferencias**

La Unidad está adecuada con la mejor tecnología: pantallas, baños, aire acondicionado, escalera eléctrica para personas discapacitadas, oficinas administrativas, bar y un aula donde se dictan clases y se proyectan videos.

#### **Parque de Educación Vial**

• La Unidad está provista de un Parque de Educación Vial de aproximadamente 400 m2.

• Los niños, dirigidos por tutores, practican lo aprendido con el uso de carros de pedal, bicicletas y realizando caminatas, a fin de familiarizarse con las normas horizontales y verticales de tránsito que todo usuario vial debe aplicar.

#### **Metodología y Ubicación**

Las instalaciones se ubican en un lugar de máxima representación en las ciudades elegidas entre Aneta y los municipios, con una permanencia de una a dos semanas, por ejemplo:

• Quito: Plaza de San Francisco

• Guayaquil: Malecón 2000

#### **Actividades:**

• Presentación del Programa a los medios de comunicación: rueda de prensa.

• Desarrollo de Cursos.

#### **Inauguración**

- La inauguración de la Escuela Itinerante de Educación Vial ANETA se llevó a cabo en las ciudades de Quito y Guayaquil, a través de una rueda de prensa con los medios de comunicación locales: Prensa, Radio y Televisión.

- Los asistentes a la rueda de prensa fueron:

- Alcaldes

- Representantes de ANETA

- Representantes de los patrocinadores

- Invitados especiales

#### **Contenido del Programa**

##### ***Alumnos de Primaria***

#### **1. El peatón y la Ciudad**

1.1 Peatón de carretera

1.2 Peatón de Ciudad

#### **2. La seguridad en el transporte**

2.1 Escolar

2.2 Privado

#### **3. La seguridad como conductor**

3.1 Uso del casco

3.2 Revisión de las bicicletas

#### **4. El Policía local y las señales de tránsito**

4.1 Funciones de la autoridad de tránsito

4.2 Señales verticales y horizontales

#### **Contenido del Programa**

##### ***Jóvenes y Adultos***

1. Uso del Cinturón de Seguridad

2. Importancia de los elementos de visibilidad

3. Neumáticos, puntos vitales del automóvil

4. Conducción ecológica y responsable

5. Importancia de los sistemas de seguridad

5.1 Air- Bag

5.2 ABS

5.3 Sillas de retención infantil

6. Alcohol y drogas en la conducción

7. Fatiga y conducción

8. Preguntas y respuestas

#### **2) CAMPAÑA DE EDUCACION VIAL “PILAS AL VOLANTE” Antecedentes**

En el transcurso de Enero a Julio del presente año, en el Ecuador se han producido 9.187 accidentes de tránsito que ocasionaron 7.719

heridos y 1.136 muertos en el país; cifras por demás alarmantes e impactantes.

#### **Objetivos**

##### **Generales.-**

Contribuir a disminuir los accidentes de tránsito y orientar a las personas a conducir con responsabilidad.

##### **Específicos.-**

- Entregar un mensaje positivo y educativo a los conductores con el objetivo de prevenir accidentes de tránsito.
- Concientizar a las personas sobre 3 ejes (impericia e imprudencia, exceso de velocidad y consumo de alcohol) que constituyen las principales causas de accidentalidad en nuestro país.
- Informar las sanciones y riesgos que los conductores se exponen al cometer infracciones de tránsito.

#### **Mecanismo de Operatividad**

La campaña se iniciará con una actividad de BTL utilizando Mimos en las principales intersecciones de las principales ciudades del país.

#### **Descripción:**

Cada Mimo realizará una interpretación de las 3 causas principales de accidentes de tránsito en el Ecuador, enfatizando lo que no se debe hacer al momento de conducir. Además, presentará un cartel con el logo de la campaña y el mensaje de Educación Vial.

Adicionalmente, para reforzar la campaña se utilizará cuñas radiales que comunicarán los conceptos y mensajes de la misma, en varias radios con alcance a nivel nacional.

#### **ARTES DE LA CAMPAÑA**

Gracias por su atención.

---

## **Aviva**

### **Convention on Corporate Sustainability Reporting**

A policy proposal for corporate sustainability reporting to be mandated for the advancement of a Green Economy for The UN Conference on Sustainable Development (Rio+20)

- Aviva is the world's sixth largest insurance group. We provide 44.5 million customers with insurance, savings and investment products with total worldwide sales in 2010 of £47.1 billion. We are the UK's largest insurer with over 14 million customers. Our combination of life, health and general insurance is unique in its scale and breadth in the UK market. Aviva plc are in the top 10% of socially responsible companies globally in the Dow Jones Sustainability World Index.
- Aviva Investors is the global asset management business of Aviva plc. The business delivers investment management solutions, services and client-driven performance to clients worldwide. Aviva Investors operates in 14 countries in Asia Pacific, Europe, North America and the United Kingdom with assets under management of £269 billion at 30 June 2011.
- We are calling on all United Nations member states to commit to develop a Convention that mandates company boards to consider sustainability issues, and to integrate those issues that they consider to be material within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not. We are also looking for effective mechanisms for investors to hold companies to account on the quality of their disclosures, including for instance, an advisory vote at the AGM.

#### **EXECUTIVE SUMMARY:**

- Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992.
- A large number of companies now report on their environmental, social and governance (ESG) performance and it has been demonstrated that there is a direct correlation between sustainable business practices and the longer-term financial success of that company.
- At present however, there is no globally accepted rule requiring reporting of ESG performance. Despite the large number of companies publishing such reports, the vast majority of companies fail to do so.
- We proffer that a requirement for a company to consider and report on a sustainability issues will create the right kind of discussions within boardrooms, throughout firms and encourage investors to think about the sustainability of the firm. This will help capital to be allocated to more sustainable, responsible companies and strengthen the long term sustainability of the financial system.
- If a Sustainable Green Economy is to be reached, the time has now come for sustainability reporting to become standard practice. This can be achieved by the UN Conference on Sustainable Development (Rio+20) conference committing to develop a Convention on Corporate Sustainability reporting.
- It is now almost twenty years since the first Earth Summit, as such we believe next year offers a momentous opportunity to move this agenda forward at a global level.

#### **Progress**

Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992. In Agenda 21 of the Conference, governments agreed that business and industry should be 'encouraged to adopt and report on their environmental records, as well as on the use of energy and natural resources'.

We recognise and support the considerable progress that has been made since then.

There have been a number of initiatives under the UN umbrella promoting sustainability reporting. Such initiatives include UN Global Compact, United Nations Environment Programme Finance Initiative (UNEP FI) and the United Nations Principles for Responsible Investment (UN PRI).

There has been progress in company policy, for example, since its launch in 2000, over 8,700 companies have signed up to The United Nations Global Compact, which covers the areas of human rights, labour, environment, and anti-corruption.

There has also been progress in guidance for companies from Governments – such as through the recent further strengthening of the OECD guidelines for multinational

enterprises.

And progress by investors – more than 900 institutional investors from 48 countries with over \$30 trillion in assets signed up to the United Nations-backed Principles for Responsible Investment. They were launched just five years ago. All of these investors recognise that that environmental, social, and corporate governance (ESG) issues can affect the performance of investment portfolios.

However, despite this progress, we are still a very long way indeed from the ultimate aim of transparency, comparability and relevance of corporate sustainability reporting.

In other words, these progressive voluntary initiatives have not been enough - for example so far less than two per cent of listed companies have opted into the Global Compact.

#### The Transparency and Accountability Gap

Sustainable Stock Exchanges, an initiative by UNPRI, UNCTAD and Global Compact has been urging all stock market listing authorities to make it a listing requirement that companies consider how responsible and sustainable their business model is and put a forward-looking sustainability strategy to the vote at their AGM.

Aside from a few notable examples such as the Singapore, Johannesburg and Istanbul Exchanges, there has yet to see a serious commitment from stock exchanges to make changes to their listing rules. This is reflected by analysis which indicates that at present more than 75% of the companies covered by Bloomberg do not currently disclose their sustainability performance.

It is our belief that stock markets require the support from governments and regulators. This is why we believe this is a relevant issue for the global forum of the Earth Summit.

#### The business case for sustainability reporting

According to a recent McKinsey survey, more than 50 percent of executives consider sustainability “very” or “extremely” important in a wide range of areas, including overall corporate strategy.

The internal and external value that companies have found in sustainability management and reporting is widely documented. Sustainability reporting increases innovation and competition and at the same time makes organisations more accountable for their impacts. The evidence for the business case is building as uptake of reporting increases. To cite two examples:

Goldman Sachs is one of the firms to have carried out analysis of the relationship between how companies address ESG issues and the returns they generate. It contends that in a number of sectors there is a direct correlation between sustainable business practices and the longer-term financial success of that company.

WestLB also published a study of the materiality of extra-financial factors based on a sample of 540 European firms. It found evidence of a link between extra-financial risk, cost of capital to a firm and shareholder value. The report suggested that compiling a sustainability report was among the most important catalysts for change – contributing to accumulation of knowledge, questioning of processes and the establishment of suitable structures and practices.

Some organizations are now producing integrated reports, a form of corporate report that brings together financial performance data with material information about an organization's strategy, governance, performance and prospects in a way that reflects the economic, political, social and environmental context within which it operates. An integrated report provides a clear and concise representation of how an organization creates value, now and in the future. In August 2010, the International Integrated Reporting Committee (IIRC) was established to create a globally accepted framework for integrated reporting. The objective is that through integrated reporting many more companies and their stakeholders will become aware of sustainability performance measurement and disclosure and start acting on this information.

#### The market case for sustainability reporting

Markets are driven by information. If the information they receive is short term and thin then these characteristics will define our markets. If companies do not provide an assessment of the broader Environmental, Social and Governance risks and opportunities to which their business model is exposed, then how can the market assess the sustainability of that company's growth?

Recent years have seen an increasing interest from markets in sustainability performance data disclosed in reports. There is considerable evidence that investors require this information and there has also been seen some major investment such as Thompson Reuters and Bloomberg adding to the data set that they provide investors, while rating agencies such as Standard & Poors have created ESG indices for India, Egypt and the MENA region.

Within 60 days after the launch of the product on Bloomberg terminals 11.5m hits on the ESG data points were recorded. At the time of writing, Bloomberg estimates that about one thousand users now use Bloomberg just for ESG analysis. They also report that the number of users is increasing with more conventional asset managers approaching Bloomberg regarding the product.

While the number of reporters is growing, including in emerging economies such as Brazil, China and India, and the quality of reporting improves, sustainability reporting far from achieving its full potential.

At the current rate it would take decades before sustainability reporting is common practice across global markets. This means that regulators, investors and stakeholders know little or nothing of the sustainability practices and impacts of the vast majority of the world's large companies.

Markets will not routinely use sustainability information as long as only a minority of companies report. A critical mass of sustainability information is needed to inform markets and enable performance benchmarking and analysis. Companies that do not report withhold from the markets information that is important for the assessment of medium to long term risk and value. By leaving information gaps and creating asymmetries of information, non-reporting companies impose a cost on the markets and undermine its effective functioning.

The world needs to move from the innovative and pioneering approach of a minority of companies to a true global mainstream practice for all companies.

#### A CONVENTION ON CORPORATE SUSTAINABILITY REPORTING

We are calling for the member states at the United Nations 2012 Earth Summit to:

- Acknowledge the growing practice of sustainability reporting and its current and potential contribution to the transition towards a Green Economy.
- Note that the increased quantity and quality of data available through sustainability reporting can be a powerful tool to help markets work more efficiently.
- Commit to develop a global policy framework requiring of all listed and large private companies to consider sustainability issues and to integrate material sustainability information within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not.

The global policy framework (which can take the form of a Convention) should adhere to three key principles:

- Report or Explain – establish a report or explain approach to sustainability reporting policy
- Transparency – enhance transparency by requiring national measures which would mandate the integration of material sustainability issues within the company reporting cycle, in their Annual Report and Accounts;
- Accountability – provide effective mechanisms for investors and all stakeholders to hold companies to account on the quality of their disclosures, including for instance an advisory vote at the Annual General Meeting (AGM).

Corporate boards should be required to consider the future sustainability of the firm that they govern. The sustainability strategy should include performance targets; recent trend data and some level of external assurance. We would expect it to consider factors such as: use of natural resources; levels of workforce training; impact on local communities; the business model and the regulatory context. Companies will also have the option of publishing the explanation as to why the board considers such a strategy to be unnecessary.

Importantly, this initiative is a market based mechanism that promotes enhanced self regulation within the market. individual nations would be free to choose whether to implement this in primary legislation, in their regional Company Law, or via the listing authorities.

#### APPENDIX A - POLICY FREQUENTLY ASKED QUESTIONS

##### 1. Are you setting out a standard that all companies must adopt?

No. We merely ask for the support of governments to make corporate sustainability reporting a "report or explain" requirement and for this report or explanation, in whatever form it takes, to be put to shareholder approval at the AGM. However, we are not dictating the form it should take. This will provide corporations with the freedom to define their own reporting and where they determine that it is not necessary, outline why. This will also ensure that the report is based on the board's best thinking.

Those companies yet to explore reporting in this area may review the excellent work already done in this area by the Global Reporting Initiative, the Global Compact, UNCTAD, and the International Integrated Reporting Committee - all of whom have produced useful guidance on reporting on ESG issues.

##### 2. Why have you focused on asking boards to publish their thinking rather than for example proposing a sustainability reporting regulation?

We do not think it possible to craft a regulation that specifies a sufficiently detailed reporting template on the rich diversity of corporations around the world. Consequently, we have decided against proposing heavy handed regulation that tries to enforce one reporting template. This is also because regulation is often slow moving, lags the market, and encourages a minimum compliance mentality within the company. We are seeking to stimulate a substantive board discussion on the risks and opportunities to a company arising from sustainable development, as well as the creation of their strategic response. We are also anticipating that some companies will seek to compete on the quality of their disclosure in this area (as, indeed, is already the case).

Equally, however, we do not have blind faith that markets will self regulate toward sustainability. The evidence for spontaneous progress on a purely voluntary basis is that it will be slow.

##### 3. What needs to change within the system if it were to adopt your recommendation?

This will vary for different jurisdictions. For example, where the regional code of Corporate Governance is embedded within the listing rules then this document could be updated, requiring the support of all the bodies that govern this code. Where it is guided by the exchange itself, then the exchange can update the code itself. Where guided by primary legislation, then this will need to be changed.

Could a principle-based international reference framework for reporting on Sustainability improve the comparability and relevance of CSR reporting?

Yes. We believe in four principles:

1. Transparency - that all companies should be required to integrate a sustainability strategy into their report and accounts – or to explain to the market why they can not do this
2. Accountability - This report or the explanation should be put to an investor vote. This vote should encourage investors to read the information, form an opinion, and provide feedback to the company.
3. Responsibility - Board duties should explicitly include setting the company's values and standards and ensuring that its obligations to its shareholders and other stakeholders are understood and met.
4. Incentives - Companies should state in remuneration reports whether the remuneration committee consider ESG factors which are of material relevance to the sustainability and long term interests of the company when setting remuneration of executive directors; aligning remuneration with the interests of shareholders and other key stakeholders, including customers and employees.

---

## Baha'I International Community

Expectations for the quality of the process:

To secure renewed political commitment for sustainable development, the intergovernmental preparatory and follow-up processes associated with the United Nations Conference on Sustainable Development must be ethically-oriented, forward-looking and focused on finding unified yet locally- and regionally-appropriate approaches toward achieving equitable and effective solutions.

#### PROPOSED ACTION:

- The principles that guide the participatory and consultative processes leading up to and during the United Nations Conference on Sustainable Development, as well as the principles that will underlie the mandate of any resulting institutional and governing instruments and agencies, should include trustworthiness, integrity, transparency, solidarity and inclusiveness, and should prioritize the concerns of the most vulnerable communities.

Poverty

A transition to a green economy requires the elimination of extremes of wealth and poverty. The persistent rise of inequality and poverty is fuelled by inequitable access to resources, to knowledge, and to meaningful participation in society.

PROPOSED ACTION:

- Secure a global commitment to multifaceted and lifelong education that recognizes the inherent potential in every human being, promotes the equality of women and men, supports universal access to science and technology, and upholds the right of every individual to participate in generating and applying knowledge—including local and traditional knowledge—for the betterment of the world.

Education:

Women, men, girls, and boys must be given the access to knowledge and opportunity to contribute to the social and economic transformation process that leads to a green economy, empowering them to fulfill their rightful roles.

PROPOSED ACTIONS:

- Formal curricula in schools as well as informal learning processes should address the material, social and spiritual dimensions of human development. By building human capacity to address contemporary problems in a manner that harmonizes all dimensions of human development, schools can become engaged in processes of positive social transformation.

- In their fullest sense, educational processes must provide the space for lifelong, values-based learning aimed at achieving global sustainability, peace and prosperity. Furthermore, education should foster ethical conduct and sustainable lifestyles. - Both formal and informal education should employ a framework of learning that encourages the generation of knowledge through a cycle of action, reflection on insights gained, and consultation to determine next steps.

Gender Equality:

Achieving the full equality and participation of women and girls is a prerequisite for the transition to a green economy.

PROPOSED ACTION:

- Any plan of action for the transition to a green economy must challenge behaviors and attitudes which perpetuate discrimination against women and girls. Such plans must foster a fundamental change of belief about the roles of women and men and lead to the advancement of women in areas such as governance, politics, science, and commerce.

Governance

The reform of institutional frameworks must consider more explicitly how to create a multilevel system of governance, where local and national governments, intergovernmental organizations, civil society, entities from social and economic sectors, and other stakeholders each play their part in achieving a common goal.

PROPOSED ACTIONS:

- Prioritize the establishment of a common vision and purpose among all stakeholders, as the basis for achieving agreements and determining a plan of action.

- Monitoring mechanisms must be established such that the moral, ethical and spiritual principles outlined in the UN Charter, the Universal Declaration of Human Rights, the Rio Declaration, and other instruments and covenants, are fully respected and acted upon.

---

## Banque Agricole Gabonaise (BAG)

Subject : Inputs for Computation Document

Resume

The present energy policies in industrialized countries are primarily determined by the need to reduce greenhouse gas emissions. However, the measures adopted under Japan to mitigate the effects of energy production on climate change failed to take into account the full consequences of climate variability more important: These include floods, seasonal droughts, increased storms, landslides, extreme wind speed, ice conditions and heat waves. It is therefore an urgent need to implement adaptation efforts, and this not only in geographically already vulnerable such as Somalia, Central Africa or the low-lying islands like Tuvalu, but, given the nature global climate change around the world.

In comparison with the mitigation measures, there are no parameters and now widely accepted indicators for comparing adaptation needs and the effectiveness of adaptation measures. Given the importance of energy for the economy and development efforts of all countries, it is vital to achieve substantially reduce vulnerabilities in the energy sector itself. Adaptation measures are also suggested to promote the objectives of the eco-development if we want to achieve in conjunction with the Millennium Development Goals (MDGs), which is why it is necessary to develop and test criteria and indicators for energy systems—that is to say, to use a metric to assess the adequacy of proposed measures.

Climate change and energy systems

Climate change is underway, regardless of efforts to reduce emissions that consent states in the future. It is the result of many converging factors that interact in different ways, creating a new humanity to unprecedented challenge in terms of complexity and severity. In this context, the concept approach "anti-climatic risk" needs to evolve an approach for the protection of human extreme weather conditions, an approach to reducing exposure to impacts of climate change. We must therefore adapt to this change, including changes in rainfall patterns and extreme weather events. Given the importance of energy in the economy and the continued eco-development it is vital to reduce vulnerabilities in the energy sector.

Energy systems are adapted to withstand the expected climate change and its effects. This can be achieved by increasing the resilience of an energy system, for example by increasing the strength of its technical equipment, diversifying its sources of energy supply, by locating more appropriately its energy equipment, developing relationships with other regions, by planning disaster preparedness, managing demand and investing in technological change, renewable energy, energy efficiency, energy management, to further develop the portfolio of options.

Given the low capital turnover in the energy sector and the long life of equipment, it is essential that energy providers, policy makers and citizens are well informed about the

potential impacts of climate change on the sector energy so that mitigation and adaptation required to be taken in due course.

Unfortunately, in discussions at national level on energy future, the subject has traditionally been addressed mainly in terms of security of energy supply in terms of quantity and ways to improve it. Policies formulated around the broader context of reducing the vulnerability of energy systems through integrated eco-development strategies, that is to say dealing simultaneously environmental, social, economic, technical and civic, are more sophisticated and still scarce.

Assess the vulnerability and resilience of energy systems .

In order to better understand the best way to create and sustain positive synergies, GABONESE AGRICULTURAL BANK has developed a methodology and a simple and transparent set of indicators to assess the vulnerability and resilience of national energy systems to climate change. Applying the indicators for energy systems, GABONESE AGRICULTURAL BANK seeks to promote the identification of policies and measures (P & M) best able to facilitate and support adaptation activities.

Vulnerability indicators - Adaptation - Energy Resilience (VAR) measure:

1. The vulnerability of energy systems;
2. The effectiveness of adjustment efforts in the energy sector.

These indicators were developed in line with the principle that the underlying metric, that is to say, so far as the statistics actually used, would generally be available for the majority, if not for the whole country. If calculations are required to obtain an indicator, they should be as simple as possible.

Impacts on energy systems and climate-induced vulnerabilities associated.

Climate change is likely to have diverse impacts. The average climatic parameters and the frequency of extreme weather events are likely to change for example. Moreover, these impacts can be applied to other climate parameters such as precipitation, wind speed and sunshine. The effects may be direct or indirect, the latter being frequently more marked. An increase in temperature, for example, is unlikely to destroy an energy infrastructure. For cons, the melting of glaciers caused by the growth temperature can have dramatic impact on hydroelectric systems in terms of damage to infrastructure in the form of flooding and siltation, landslides, and thus production capacity. Changes in weather variables will affect the transmission and use of energy irrespective of how it is produced. Extreme events may increase the risk of destruction of transmission lines and, consequently, reduce the demand due to the physical elimination of consuming entities, that is to say, industries, businesses and households.

Vulnerability at the country level

During discussions at national level on energy future, the subject has traditionally been addressed mainly in terms of security of energy supply and ways to improve it. Policies formulated around the broader context of reducing the vulnerability of energy systems through integrated eco-development strategies, that is to say dealing simultaneously environmental, social, economic, technical and civic, are not very many.

If it is desired that the policies and measures proposed to be effective, it is essential to quantify the state of overall vulnerability of the country, so the first set of indicators measuring GABONESE AGRICULTURAL BANK overall vulnerability of a country.

Vulnerability Energy Systems

Climate change will have a direct impact on demand as the supply of energy. How it will be affected is less obvious. In view of the central role of energy is crucial to be able to assess the vulnerabilities of each of the major energy systems. Once vulnerabilities are identified, it becomes Possible to design and implement appropriate adaptation measures. This process must be applied to existing facilities and their planned evolutions.

Indicators measuring the ability to adapt interventions resulted in increased resilience.

The level of resilience of a system based on its ability to adapt. Adaptation measures can be divided into technical measures, such as infrastructure, and social responses in terms of behavior.

- Technical changes to try to make infrastructure invulnerable to long-term changes in meteorological variables and extreme events.
- The behavioral adaptations intended to adapt the mode of operation of the infrastructure, whether new or old, and location of new infrastructure, to minimize potential damage. In the context of developing countries, these capabilities need external support, for example from the financial mechanisms available under the regime of international policies on climate change. In order to avoid spending money, already small, inefficiently, a set of criteria were developed to measure the effectiveness of adaptation efforts.

Recommendations and conclusions

Even if the first application of indicators VAR is far from perfect, a first application in sub-Saharan Africa has produced a number of vital information. The evaluation process has generated a number of recommendations:

- Evaluation and systematic monitoring of energy systems to ensure they are sufficiently robust and scalable to adapt to climate impacts expected.
- Introduction of new evaluation criteria for energy systems.
- Development of a strategy for medium to long term to ensure a system of energy supply more secure, decentralized, low carbon emissions.
- Use of energy demand management as an accommodation.
- Development of local capacity to assess and meet the energy needs in a climate perspective.
- Establishment of procedures for technology transfer and financing transparent.
- Development of participatory governance energy to get first hand information about the actual energy needs and to mobilize support from the beneficiaries.

The level of resilience of a system depends on the strength of its location. It is therefore not enough to simply assess the impact of a plant on the environment should also determine the impacts of the changing environment of the installation. In addition, a resilient energy sector is the foundation for better community resilience. The energy allows the provision of essential services such as food, health and education. Thanks to its use in trade and business, it also promotes job creation and improved standards of living. Therefore, to properly assess the best way to increase the resilience of an energy system, it is necessary to study in the broader context of eco-development

Naulin MOMBO

PRESIDENT

## Batool Welfare Trust (BWT)

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

As we all know that Rio+20 is a continuation of the Earth summit held in 1992. It is largely assumed that the objectives of the earth summit have not been achieved in its true spirit. And in past 20 years environment has become the top list issue of the world. So there are huge expectations from Rio+20 conferences.

Proposals:

- ☐ To make developed world understand that they are the major source of Global environmental issues, hence they should be compel to take major responsibility as well.
- ☐ More proactive role of UN and its all entities in addressing Global environmental issues.

Possible structure of the outcome document

- ☐ Preservation of natural resources (forest, fresh water, wet lands, Biological Biodiversity, ecosystem, marine life etc)
- ☐ Environmental legislation and its implementation.
- ☐ Strong liaison between developed and developing (including LDCs) world in order to cope with alarming environmental situation.
- ☐ Effective coordination between UN and the stake holders across the globe.

#### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

Of course Green economy is the future of the globe which includes Green production, Green consumption, Green jobs etc.

Framework for action: the first and foremost action needs to be imitated is to convert conventional industry to Green industry. Massive awareness campaigns across the globe especially in LDCs regarding environmental issues.

Sustainable development goals: To preserve natural resources for future generations, utilization of renewable energy. Implementation of industrial laws to keep industrial pollution under check.

Revitalized global partnership for sustainable development: There is a visible amount of tension between developed and developing (including LDCs) world on the responsibility/cause of environmental issues. In order to overcome this issue there has to be an effective and immediate coordination between both.

At the same time at regional level, coordination between UN and local stakeholders should be reinforced.

#### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

Role of Government

- ☐ Governments should be compelled to enforce environmental laws.
- ☐ Governments of the member states should be directed to develop a strong mechanism among Government line departments, ministries, decision/policy makers, NGOs/civil society, social sector and other stakeholders.

☐ There has to be an effective liaison among the Specific Major Groups to disseminate information and ideas to tackle environmental issues and ensure sustainable development.

UN system:

- ☐ More proactive role by UN system regarding mobilization and empowerment of local stakeholders.
- ☐ Comprehensive coordination among UN regional system and specific major groups and stakeholders in order to ensure sustainable development.

IFIs:

- ☐ They should ensure equal distribution of wealth.
- ☐ IFIs should encourage Green industry by providing funding.
- ☐ To provide technical assistance in order to ensure sustainable development.

#### **d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

Cooperation Mechanism:

- ☐ Effective cooperation among developed, developing and LDCs in order to achieve sustainable development.
- ☐ Cooperation among UN System and Major Groups and regional/local stakeholders.

Partnership arrangements:

- ☐ Developed countries among member states should be directed to facilitate developing and LDCs in order to cope with environmental issues.
- ☐ UN system and NGOs/Civil Society and other major groups and stakeholder should coordinate closely with each others.

Implementation tools:

- ☐ UN System should work as a watch dog on member states regarding the implementation of charter of RIO+20 regarding Sustainable Development.

Proposed Time Frame:

- <sup>[6]</sup> As RIO+20 is taking place after 20 years of the Earth Summit which is too long to address such globally emerging challenges and issues.
- <sup>[6]</sup> Rio+20 should come up with initial five years implementation plan and make sure its timely accomplishment for real sustainable development.

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

No comment

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

Green economy and three dimensions of sustainable development mainly Economic, Social and Environmental can be a great source of poverty eradication through Economic aspect:

- <sup>[6]</sup> The cost effective (renewable) energy and less raw material.

Social aspect

- <sup>[6]</sup> Green economy is worker friendly as compare to conventional industry.

Environmental aspect

- <sup>[6]</sup> Less harmful for living beings, renewable raw material and reduction of toxic substances.

Added value:

The biggest added value or advantage of green economy is its being environment friendly.

Experience to date:

China being the largest population of the world has shown keen interest towards sustainable development and to green economy in its recent five year national economic and social development plan, which is evident of the emerging trends towards green economy and sustainable development.

Challenges:

- <sup>[6]</sup> One of the major challenges is that renewable energy is expensive and its generation is limited.
- <sup>[6]</sup> Green growth results in less agricultural productivity as compared to conventional agricultural mechanism.
- <sup>[6]</sup> Reluctancy of developed world towards adoption of green economy.

Opportunities:

- <sup>[6]</sup> Green economy provides far better living standards through green jobs.
- <sup>[6]</sup> Green economy safeguards the fundamental human right of pollution free environment.
- <sup>[6]</sup> Green economy ensures sustainable development.

Possible elements of outcome document:

- <sup>[6]</sup> Time frame to convert conventional economy to green economy.
- <sup>[6]</sup> Strong legislation and implementation of environmental laws among member states.
- <sup>[6]</sup> Creation of green jobs across the globe.
- <sup>[6]</sup> Initiatives to make renewable energy cost effective.
- <sup>[6]</sup> Global partnership and coordination among member states and global major groups.
- <sup>[6]</sup> Effective monitoring and evaluation of the proposed action plan.

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

- <sup>[6]</sup> TO strengthen the three pillars of sustainable development, Economic, Social and Environment following measures shall be incorporated.

Economic

- <sup>[6]</sup> In order to provide better and sustained living standards to people across the globe, Green growth/production etc shall be adopted.

Social

- <sup>[6]</sup> More regional and global cooperation will be required to combat current environmental issues, which will ultimately result in global harmony and cultural diversity and over all socially better world.

Environment

- <sup>[6]</sup> Emergence of green economy, e.g. green growth, green consumption etc is the only way forward towards a clean, green pollution free and sustainable environment.
- <sup>[6]</sup> Priorities and Proposal for strengthening integration of three pillars

Local Level:

- <sup>[6]</sup> Integration of government line departments with NGOs, civil society and other stakeholders for effective dissemination of information and knowledge.

National Level:

- <sup>[6]</sup> In the context of Pakistan, after the 18th amendment in constitution most of the federal ministries have been shifted to provinces including environment as per devolution plan. So it was the need of the hour to have an effective executive body at federal level to coordinate and integrate among all environmental entities at national level. Although a new ministry, "National disaster management" has been established recently, but it is required to play a proactive role to ensure sustainability of environment and sustainable development.

Regional Level:

<sup>84</sup> UN system at regional level shall form a strong liaison among the regional countries and present their environmental issues at global level.

International Level:

<sup>85</sup> Member states shall be given some certain responsibilities and they shall be accountable after a given time frame.

<sup>86</sup> Global major groups shall have an effective liaison and mechanism to share expertise, knowledge and information with each other to ensure sustainable development.

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Proposal for refinement:

As per Batool Welfare Trust the core objective and theme of Rio+20 shall be focused on, "Refinement of Environment/Pollution free World/reversal of Environment", rather than split emphasis on

- 1) Green Economy
- 2) Sustainable Development
- 3) Poverty Eradication.

We do not disagree with this chain that, "Green Economy will result in Sustainable development and it will result in Poverty Eradication".

Our prospective is that Poverty Eradication is purely associated with humans whereas; "Refinement of Environment/Pollution free World/Reversal of Environment" will ensure the sustainable future of all living beings including biological biodiversity, Ecological system, Sea and Marine life etc.

## **Batool Welfare Trust**

### **Inputs on Rio+20**

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

As we all know that Rio+20 is a continuation of the Earth summit held in 1992. It is largely assumed that the objectives of the earth summit have not been achieved in its true spirit. And in past 20 years environment has become the top list issue of the world. So there are huge expectations from Rio+20 conferences.

**Proposals:**

Ø To make developed world understand that they are the major source of Global environmental issues, hence they should be compel to take major responsibility as well.

Ø More proactive role of UN and its all entities in addressing Global environmental issues.

### **Possible structure of the outcome document**

Ø Preservation of natural resources (forest, fresh water, wet lands, Biological

Biodiversity, ecosystem, marine life etc)

Ø Environmental legislation and its implementation.

Ø Strong liaison between developed and developing (including LDCs) world in order to cope with alarming environmental situation.

Ø Effective coordination between UN and the stake holders across the globe.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

Of course Green economy is the future of the globe which includes Green production, Green consumption, Green jobs etc.

**Framework for action:** the first and foremost action needs to be imitated is to convert conventional industry to Green industry. Massive awareness campaigns across the globe especially in LDCs regarding environmental issues.

**Sustainable development goals:** To preserve natural resources for future generations, utilization of renewable energy. Implementation of industrial laws to keep industrial pollution under check.

**Revitalized global partnership for sustainable development:** There is a visible amount of tension between developed and developing (including LDCs) world on the

responsibility/cause of environmental issues. In order to overcome this issue there has to be an effective and immediate coordination between both.

At the same time at regional level, coordination between UN and local stakeholders should be reinforced.

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

### **Role of Government**

Ø Governments should be compelled to enforce environmental laws.

Ø Governments of the member states should be directed to develop a strong mechanism among Government line departments, ministries, decision/policy makers, NGOs/civil society, social sector and other stakeholders.

Ø There has to be an effective liaison among the Specific Major Groups to disseminate information and ideas to tackle environmental issues and ensure sustainable development.

**UN system:**

- Ø More proactive role by UN system regarding mobilization and empowerment of local stakeholders.
- Ø Comprehensive coordination among UN regional system and specific major groups and stakeholders in order to ensure sustainable development.

**IFIs:**

- Ø They should ensure equal distribution of wealth.
- Ø IFIs should encourage Green industry by providing funding.
- Ø To provide technical assistance in order to ensure sustainable development.

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

**Cooperation Mechanism:**

- Ø Effective cooperation among developed, developing and LDCs in order to achieve sustainable development.
- Ø Cooperation among UN System and Major Groups and regional/local stakeholders.

**Partnership arrangements:**

- Ø Developed countries among member states should be directed to facilitate developing and LDCs in order to cope with environmental issues.
- Ø UN system and NGOs/Civil Society and other major groups and stakeholder should coordinate closely with each others.

**Implementation tools:**

- Ø UN System should work as a watch dog on member states regarding the implementation of charter of RIO+20 regarding Sustainable Development.

**Proposed Time Frame:**

- Ø As RIO+20 is taking place after 20 years of the Earth Summit which is too long to address such globally emerging challenges and issues.
- Ø Rio+20 should come up with initial five years implementation plan and make sure its timely accomplishment for real sustainable development.

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

Green economy and three dimensions of sustainable development mainly Economic, Social and Environmental can be a great source of poverty eradication through

**Economic aspect:**

- Ø The cost effective (renewable) energy and less raw material.

**Social aspect**

- Ø Green economy is worker friendly as compare to conventional industry.

- 3) Poverty Eradication.

We do not disagree with this chain that, "Green Economy will result in Sustainable development and it will result in Poverty Eradication".

Our prospective is that Poverty Eradication is purely associated with humans whereas; "Refinement of Environment/Pollution free World/Reversal of Environment" will ensure the sustainable future of all living beings including biological biodiversity, Ecological system, Sea and Marine life etc.

#### Batool Welfare Trust's Profile:

**Batool Welfare Trust®** (BWT Acronym) is an established organization since 2002 and has been registered on 21st, May, 2007 as a non-profitable organization

Working for the sustainability, promotion of green economy, sustainable development. Batool Welfare Trust is enjoying UN (ECOSOC) "Special Consultative Status".

We have Participated in, "12th Major Groups and Stakeholders Conference" at UNEP headquarter Nairobi, Kenya as a member organization of UNEP Global Major Groups and Stakeholder Forum (GMGSF).

Batool Welfare Trust has also participated GC-26/GMEF at UNEP headquarter, Nairobi, Kenya.

Batool Welfare Trust has also organized side event in UNEP Greenroom on, "Environmental Conservation".

UNEP has also awarded certifications to Batool Welfare Trust on Billion Tree Campaign

& PLANT FOR THE PLANET.

Batool Welfare Trust is leading organization of Pakistan contributed and promoted the mandate and chartered of UNEP, UNCSD, ECOSOC and its subsidiaries bodies.

## Beyond 2015

Text not available.

---

## Biofuelwatch

A Green Economy Cannot Run on Biofuels or Bioenergy Submission to Rio Plus 20 Zero Draft, from: Biofuelwatch, Global Forest Coalition, Global Justice Ecology Project, EcoNexus, Biomass Accountability Project, Partnership for Policy Integrity, PT AirWatchers (Port Townsend, Washington), Ozark Riverkeepers Network.

Bioenergy including liquid biofuels for transportation as well as the combustion or gasification of biomass, wastes etc. for heat and electricity, (and various other biomass substitutions for fossil energy) feature prominently in many visions of a green economy. They are a crosscutting issue because of their relevance to energy, transportation, agriculture, food and water, soils, and forests and jobs and income. In sum, decisions about bioenergy are key on many fronts relevant to the mission of the UN Commission on Sustainable Development (UNCSD) and the goals of RioPlus20.

There is no question that fossil fuels are a leading cause of biosphere degradation, and weaning off of these fuels is critical. However, attempts to develop alternatives based on plant (or waste) substitutes worsen rather than resolves the problems. Abundant and irrefutable evidence demonstrate that commercial and industrial scale biofuels are failing to reduce emissions, while simultaneously contributing to a host of ills increasing hunger, land grabs, ecosystem degradation, air and water pollution and more.

The UNCSD must reject commercial and industrial scale bioenergy and the subsidies and targets for it, and commit to a focus first and foremost on dramatically decreasing energy consumption in developed countries, while supporting the scale-up of truly clean and renewable energy sources: those which put minimum pressures on lands, water and soil resources, and do not involve polluting combustion.

1) Various studies have shown that, once direct and indirect land use-related changes in carbon stocks, including the time-lag between biomass combustion and sequestration of CO<sub>2</sub> by new trees planted are taken into account, combustion of wood and other biomass for electricity and heat can result in substantial carbon and overall greenhouse gas emissions and translate into a carbon debt of decades or centuries, compared to equivalent amounts of energy generation from fossil fuels. Land use change related to large-scale production of crops and trees for bioenergy is associated with a wide range of very significant negative impacts (iiiiiiiv) on ecosystems and biodiversity.

2) Estimates of biomass availability are grossly overestimated. References to large areas of available marginal lands is fictional and based on devaluation of the many uses of lands by indigenous peoples, peasant farmers, pastoralists, and for biodiversity, water (v) and soil protection. In their submission to the Rio Plus 20 zero draft, North American Indigenous Peoples point out: A world-wide bio-economy is proposed as the solution to climate change and sustainable development. Again, as in proposals for market based solutions to climate change, the Earth's biological resources are the target for this new green economy and the markets that it will create. The very basis of life, genetic material, both plant and animal, become potential markets in this formula. The experience of Indigenous Peoples, particularly those that inhabit bio-rich environments, is that their lands, territories, waters and total environments are targets for the new technologies, industrialized agriculture and the concentration of productive lands, their lands, in the hands of the private few, for the production of so-called renewable resources.

3) Attempts to gain access to lands to grow large quantities of biomass, as well as for food, are resulting in market speculation and investment in land - land grabs around the world. Recent research from International Land Coalition indicates about 44% of (vi) land grabs have been for the purpose of growing bioenergy crops. There is growing evidence that the increasing global demand for and trade in woodchips and wood pellets will lead to similar land- (viiiixxi) grabs as is the case with biofuels today. 4) Different sectors transportation, electricity, aviation, the military, chemicals production, plastics, pharmaceuticals, manufacturing and processing - are all seeking biofuel and biomass derived alternatives. When viewed in sum, this bioeconomy is massive in scope, and the full magnitude of demands for land (soils, water, forests) have not been adequately evaluated and (xii) recognized.

5) Demand for biomass is driving expansion of industrial monocultures, deforestation, replacement of natural forest with (xiii) industrial tree plantations, biodiversity loss, draining of water resources and soil degradation, and resulting in increased use of (xiv) agrichemicals and fertilizers. The lack of distinction between natural forest and tree plantations, (for example in the FAO formal definition of forest), results in incentives to replace natural forest with fast growing tree plantations, including exotic species, for pulp and biomass.

6) Escalating demand for biomass is contributing to rising food (xv) prices and worsening hunger.

7) Failure to accurately account for emissions from combustion and from direct and indirect land use change associated with (xvi) bioenergy is resulting in subsidies and supports intended for clean renewable energy being misused to fund dirty practices that worsen climate change, (in many cases emitting more CO<sub>2</sub> per (xvii) unit of energy generated than coal or natural gas) as well as (xviii) hazardous air pollutants and also soot.

8) Fast paced development of risky new technologies including synthetic biology (to develop microbes for production of cellulosic fuels, for example), nanotechnology and genetic engineering of trees are too risky, cannot be adequately regulated and should be (xx) halted.

8) Attempts to geo-engineer the climate by burying charcoal (biochar) would create massive additional demand for plant biomass. Claims made about the efficacy of biochar for carbon sequestration and improving soil fertility are not supported by (xxi) science. Bioenergy with Carbon Capture and Sequestration (BECCS), proposed as a carbon negative technology, faces the same problems inherent to all other proposals requiring large quantities of biomass, (as well as problems associated with costs, energy requirements and reliability of CCS).

#### RECOMMENDATIONS:

>End subsidies and targets that are artificially supporting development of biofuels and bioenergy (including waste to energy).

>Focus policies and supports on significantly reducing energy use and fulfill remaining demand from energy sources that minimize requirements for land, water, and soils and do not entail ongoing emissions of carbon or other pollutants, and respect the rights and basic needs of communities.

>Make protection and restoration of lands, ecosystems, soils and waterways a top priority, not compromised by increased additional demands for biomass for energy generation.

>Amend the formal definition of forest used by FAO and others to ensure that tree plantations are not considered (hence supported, subsidized etc.) as forests, as requested in an open letter from (xxii) scientists around the world.

>Support recycling and zero waste strategies that eliminate waste rather than combusting it for energy generation.

>Ban release the of genetically engineered microbes and trees

i

Unintended Environmental Consequences of a Global Biofuels Program, Jerry M. Melillo et al, MIT Joint Program on the Science and Policy of Global Change, Report No. 168, January 2009, [www.calepa.ca.gov/cepc/2010/AsltonBird/AppAEx13.pdf](http://www.calepa.ca.gov/cepc/2010/AsltonBird/AppAEx13.pdf) ) used a computable general equilibrium model of the world economy, the MIT Emissions Predictions and Policy Analysis Model and the Terrestrial Ecosystems Model to explore environmental consequences of an aggressive global cellulosic biofuels program up to 2050. A large-scale cellulosic biofuel programme would require similar or the same types of solid biomass feedstock as would be used for a large-scale biomass combustion with CCS programme. The study looked at two scenarios: One in which there were no restrictions on deforestation and in which any land would be available for biofuel production as long as it was economically viable ('deforestation scenario') and the other in which the conversion of natural forests and other 'unmanaged land' was limited to recent regional land conversion rates ('intensification scenario'). The study concluded that the total (direct and indirect) carbon debt from the first scenario would be up to 103 billion tonnes by 2050 and that from the second scenario up to 34 billion tonnes. The study also concluded that the more optimistic 'intensification scenario' would see the loss of 3.4 2 million km of grasslands currently used for grazing, 38% of the natural forest cover and 38% of wooded savannah in sub-Saharan Africa based on 2000 figures. In Latin America, the same scenario would be associated with the loss of 20% of natural forests and savannah in Latin America. According to the authors: These losses [in both scenarios] have the potential to put thousands of endemic plant and animal species at risk across the globe, especially in the sub-tropical and tropical regions... The increases in co-opted NPP coupled with the loss of biodiversity have the potential to diminish the capacity of terrestrial ecosystems to deliver many of the support services that humans rely on, such as the cleansing of air and water. We currently do not understand the relationships between ecosystem structure and function well enough to predict when such disturbances in a region will move it beyond a critical threshold for delivering one or more essential ecosystem service (Carpenter, 2003; Walker and Meyers, 2004; Millennium Ecosystem Assessment, 2005).

ii

The upfront carbon debt of bioenergy, Joanneum Research, May 2010, [www.birdlife.org/eu/pdfs/Bioenergy\\_Joanneum\\_Research.pdf](http://www.birdlife.org/eu/pdfs/Bioenergy_Joanneum_Research.pdf) T his study looks at the greenhouse gas balance of bioenergy from wood sourced from "sustainably managed" European Forests. It finds When the raw material is wood, the time needed to re-absorb the CO<sub>2</sub> emitted in the atmosphere can be long, depending very much on the source of wood. This delay can create an upfront carbon debt that would substantially reduce the capability of bioenergy to reduce the greenhouse gas emissions (GHG) in the atmosphere in the short to medium term...Additional fellings for bioenergy can produce a decrease of the overall carbon stock in the forest that significantly affects the GHG balance of the bioenergy material. In the short-medium term (20-50 years), additional fellings could produce more emissions in the atmosphere than a fossil fuel system (CN<0). In such a case, the use of additional fellings would produce only very long term benefits, in the order of magnitude of 2-3 centuries.

iii

Fixing a critical climate accounting error, Timothy D. Searchinger et al, Science, Vol. 326, October 23, 2009, [www.princeton.edu/~tsearchi/writings/Fixing%20a%20Critical%20Climate%20Accounting%20ErrorEDITED-tim.pdf](http://www.princeton.edu/~tsearchi/writings/Fixing%20a%20Critical%20Climate%20Accounting%20ErrorEDITED-tim.pdf)

T his article provides a critique of the assumption that bioenergy can be routinely classed as 'carbon neutral', one which lies at the heart of the concept of 'carbon negative' bioenergy. The authors point out that The accounting now used for assessing compliance with carbon limits in the Kyoto Protocol and in climate legislation contains a far-reaching but fixable flaw that will severely undermine greenhouse gas reduction goals (1). It does not count CO<sub>2</sub> emitted from tailpipes and smokestacks when bioenergy is being used, but it also does not count changes in emissions from land use when biomass for energy is harvested or grown...Several recent studies estimate that this error, applied globally, would create strong incentives to clear land as carbon caps tighten. ...If bioenergy crops displace forest or grassland, the carbon released from soils and vegetation, plus lost future sequestration, generates carbon debt, which counts against the carbon the crops absorb.

iv

Implications of Limiting CO<sub>2</sub> Concentrations for Land Use and Energy, Marshall Wise et al, Science 324, 1183, May 2009

This study models expected impacts of a climate change mitigation policies which put price on fossil fuel carbon only and ignore all emissions linked to bioenergy. The authors find: As the use of bioenergy increases, land uses shift from food and fibre crops, forests, and unmanaged ecosystems to dedicated biomass crops. This in turn increases terrestrial carbon emissions globally—a perverse result of curbing energy and industrial emissions...Placing an increasingly stringent tax on only the fossil fuel and industrial carbon emissions without placing any corresponding tax on terrestrial carbon (i.e., the FFICT [Fossil fuel and Industrial Emissions Carbon Tax] regime) causes land-use change emissions to increase to a peak greater than 10 Pg C per year, as lands are converted to meet the growing demands for purpose-grown bioenergy crops in a growing but decarbonising energy system (Fig. 1)...The result is that in the FFICT regimes virtually all land that is not required for growing food and forest products is used for growing bioenergy (Fig. 2). In other words, a policy to significantly reduce fossil fuel emissions whilst classing all bioenergy as carbon neutral (the presumption behind BECS being 'carbon negative') will result in the destruction of virtually all remaining natural ecosystems, including natural forests and grasslands by the second half of the 21 century.

v

Agrofuels and the Myth of Marginal Lands: Gaia Foundation, African Biodiversity network, Biofuelwatch, Salva La Selva, Watch Indonesia, EcoNexus, 2008 Briefing.

A 2006 study by David Tilman et al estimates a high bioenergy potential from low-input cultivation of biodiverse, native perennial grass. This, the authors suggests, could become a feedstock for "carbon negative" second generation agrofuels. They did no research on how much "marginal land" is available. Instead, they relied on earlier estimates by different authors of how much "abandoned cropland" was available "at least 500 million hectares, they, and other authors, claim. The term marginal land appears to have been merged with the abandoned cropland concept, which lies at the heart of many of the bioenergy feasibility studies that provide the scientific basis for governments' biofuel policies. Many of those, in turn, rely on earlier crude estimates of how much land could be made available, not for biofuels but for carbon sinks, including tree plantations "which is where the 500 million hectare figure originates. They look at abandoned cropland which includes large areas of land where tropical forests were destroyed for plantations and cattle ranching and where soil degradation and water depletion now make agriculture difficult. As Goeren Berndes, who has reviewed 17 bioenergy feasibility studies remarks: Land reported to be degraded is often the base of subsistence for the rural population. One example of how estimates for abandoned cropland useable for bioenergy are derived is a 2008 study by Christopher Field et al who suggest that 386 million hectares of such land exist. Any land believed to have been used as cropland at any time since 1700, and which satellite images don't show as being cropland today is classed as abandoned unless it is currently forested or part of urban settlements. There has been no critical review to assess the extent to which satellite-based mapping ignores small-scale mixed farming by communities, but it is clear that other community uses, including the use of land for pasture, are ignored when abandoned cropland is defined.

xv

Price Volatility and Food Security: FAO: High Level Panel of Experts, Report 1. July 2011: Biofuel support policies in the United States and the European Union have created a demand shock that is widely considered to be one of the major causes of the international food price rise of 2007/08. & Given the major roles played by biofuels in diverting food to energy use, the CFS should demand of governments the abolition of targets on biofuels and the removal of subsidies and tariffs on biofuel production and processing.

xvi

Biomass Electricity: Clean Energy Subsidies for a Dirty Industry. Biomass Accountability Project. June 2011. <http://www.nobiomassburning.org/BAP/Home.html>

Billions of dollars in taxpayer money is going to build dirty biomass incinerators, while health, environmental, community and fiscal watchdog groups fight them at the local, state and national levels. Dozens of communities have rejected proposals for biomass combustion power and many more are actively fighting them. These subsidies are intended for clean energy but biomass is one of the most expensive, inefficient, and polluting forms of electricity generation.

xvii

<http://www.pfpi.net/carbon-emissions>

It's often claimed that biomass is a low carbon or carbon neutral fuel, meaning that carbon emitted by biomass burning won't contribute to climate change. But in fact, biomass burning power plants emit 150% the CO<sub>2</sub> of coal, and 300 % 400% the CO<sub>2</sub> of natural gas, per unit energy produced. These facts are not controversial and are borne out by actual air permit numbers.

xviii

<http://www.pfpi.net/air-pollution-2>

Burning biomass emits large amounts of pollutants, just like burning other solid fuels such as coal. Burning organic material emits particulate matter (PM), nitrogen oxides (NO<sub>x</sub>), carbon monoxide (CO), sulfur dioxide (SO<sub>2</sub>), lead, mercury, and other hazardous air pollutants (HAPs).

xix

The UNECE's Executive Body for the Convention on Long-Range Transboundary Air Pollution has set up a dedicated expert group to tackle Black Carbon [tinyurl.com/6dlwaw](http://tinyurl.com/6dlwaw) In 2009, the Executive Body of the Convention recognized that black carbon poses significant risks to human health and the environment. It has a significant climate forcing impact, leading to increased warming, particularly in areas covered by snow and ice, such as the Arctic. Official greenhouse gas balances used for bio- energy and 'energy from waste' take no account of the warming effect of black carbon and are therefore underestimating the climate damage resulting from biomass, bioliquid combustion (and waste) incineration.

Biochar: A Critical Review of Science and Policy. Biofuelwatch 2011

<http://www.biofuelwatch.org.uk/2011/a-critical-review-of-biochar-science-and-policy/> Provides a review of science from field studies. Data show that biochar additions may not result in any overall increases in soil carbon (Fate of soil-applied black carbon: downward migration, leaching and soil respiration, Julie Major at al, Global Change Biology, Volume 16, Issue 4, April 2010; Long term effects of manure, charcoal and mineral fertilization on crop production and fertility on a highly weathered Central Amazonian upland soil, Christoph Steiner et al, 2007, Plant Soil DOI 10.1007/s11104-007-9193-9 AND Nitrogen Retention and Plant Uptake on a highly weathered central Amazonian Ferralsol amended with Compost and Charcoal, Christoph Steiner et al, J. Plant Nutr. Soil Sci. 2008, 171, 893899) or that soil carbon sequestration from biochar may be no greater than that from common organic fertiliser use (See figures in Stability and stabilisation of biochar and green manure in soil with different organic carbon contents, Joseph M. Kimetu and Johannes Lehmann, Soil Research 48(7) 577585, 29th September 2010). Published field trials show that using different rates of the same type of biochar in the same region can have impacts on crop yields which vary from negative to neutral to positive, even over a short period (See for example: Biochar amendment techniques for upland rice production in Northern Laos, 1. Soil physical properties, leaf SPAD and grain yield, Hidetoshi Asai et al, Field Crops Research 111 (2009) 81:4). Similarly, biochar impacts on mycorrhizal fungi have been shown to vary from positive to neutral to negative and biochar-fungi interactions are not fully understood at present (Mycorrhizal responses to biochar in soil - concepts and mechanisms, Daniel D. Warnock et al, Plant Soil (2007) 300:9-20). Like other biomass based technologies, conversion of large areas of land to provide feedstocks is concerning. A recent assessment of a global biochar potential shows that sequestering 12% of annual anthropogenic greenhouse gas emissions would require conversion of about 556 million hectares to dedicated biomass plantations, as well as the large-scale mobilization of forest and agricultural residues. Sustainable biochar to mitigate global climate change, Dominic th Woolf et al, Nature Communications 1, Article 56, 10 August 2010.

xxii

Open Letter to the FAO from Scientists: World Rainforest Movement, Sept 21 2011.

[http://wrm.org.uy/forests/letter\\_to\\_the\\_FAO.html](http://wrm.org.uy/forests/letter_to_the_FAO.html)

FAO defines forest as land spanning more than 0.5 hectares with trees higher than 5 meters and a canopy cover of more than 10 percent, or trees able to reach these thresholds in situ. (\*) Under this definition, it has been possible to replace primary forests with monoclonal plantations of genetically engineered exotic tree species, without this being considered as deforestation. This definition has also made it possible to use the term forest to refer to the industrial monoculture tree plantations that are expanding at the expense of the destruction of other ecosystems. Matters are made worse by the fact that other UN organizations and initiatives, such as the UN Framework Convention on Climate Change, as well as numerous national governments, implement this definition in negotiations, pro- grammes and policies.

## BioRegional Development Group

One Planet Living - a Proposal for Rio+20 UNCSD 2012 submitted by BioRegional and Partners

This submission is structured in three parts:

1. Introduction and background
2. Executive Summary of the Proposal

### 3. Detail of the Proposal and Signatories

Comments and questions should be addressed to [freya.seath@bioregional.com](mailto:freya.seath@bioregional.com) +44 (020)8404 4884

#### 1. Introduction and background

This practical proposal is submitted by BioRegional Development Group and thirteen other civil society partners who have been working to implement sustainable communities and businesses around the world using the one planet living framework. There is increasing support for this proposal with a further eleven organisations expressing their support as part of this submission.

#### One planet living – a proven framework

One planet living is a simple way to communicate and implement sustainability. It is based on ten guiding principles and can be used cross-sectorally and at different scales. It has been proven to get results and is being used by the partners in this proposal in 11 countries: Australia, Canada, China, France, Greece, Ireland, Mexico, Portugal, South Africa, UK, United Arab Emirates and USA . These organisations employ more than 80,000 people and have annual revenues of \$25 billion. Sustainable communities to a value of £30 billion are in development using the approach. In addition, a free toolkit has been used in 51 countries.

Many people find that one planet living is an easy way to understand and implement sustainability because it encompasses messages and concepts to which they can relate:

- a) Equity and the scale of the problem; we are currently producing pollution and consuming resources at a rate forty per cent higher than the planet can absorb or replenish annually and exceeding planetary boundaries. In addition, resources are not being consumed equitably. If everyone lived the global middle class lifestyle we would need three planets to support us, but millions live on less than a tenth of this and don't have enough.
- b) A positive vision One planet living is a positive, appealing and easy to understand vision of what a green economy should aim to deliver; a world in which we live happy, healthy lives within the natural limits of the planet, wherever we live in the world, and leave sufficient space for wildlife and wilderness.
- c) Sustainable Development Goals, with targets and indicators, which guide action; based on contraction and convergence of ecological and carbon footprint, clean production and zero carbon (in building energy use), zero waste, transport, materials, food, water, land use & wildlife, culture & community, equity, fair trade & the local economy, health & happiness.
- d) A process which engages people and implements sustainability and a green economy. The science based and participatory process highlights major impacts and what should be prioritised. Outputs include Action Plans to implement sustainability with time-bound trajectories and creative solutions e.g. resource efficiency, new products, technologies and business models.
- e) A common language for sustainability which is cross-sectoral and scaleable. Originally designed for planning sustainable communities in 1998, it has been found to be scaleable and adaptable to different sectors and audiences e.g. London 2012 Olympics, home retail store customers, food, products, an individual, a local authority, a city, a country.
- f) Real-life examples of a next generation, resource-efficient lifestyle for 7-9 billion people. The sustainable communities and businesses of the partners submitting this proposal are starting to show how we can achieve one planet living, technically and cost effectively.

At Rio+20 we will showcase the one planet living case studies and launch an open-source toolkit and training. The concept of one planet living and ten principles are freely available for anyone to use.

We propose that at Rio+20 the simple concepts and approaches of one planet living could be adopted or adapted, in conjunction with existing proposals, as an effective way to renew political and civil society commitment to sustainable development and implement a Green Economy in the context of sustainable development and poverty eradication. The paper explains our practical proposals to this end.

#### 2. Executive Summary - One Planet Living, a Practical Proposal for Rio+20

Submitted by BioRegional and Partners and informed by their experiences of implementing sustainable communities and businesses around the world using the well-proven one planet living framework.

##### A. Objective of the Conference

In order to secure renewed political commitment to sustainable development, implement remaining gaps and address new challenges, at Rio+20 the UN and civil society will:

- Make a statement recognising environmental limits and planetary boundaries in a world with a large, growing human population;
- Present a simple ambitious vision of a green economy in the context of sustainable development and poverty eradication that citizens can get behind and feel motivated to achieve. "One planet living" is suggested as that vision. That is, a world in which people can live happy, healthy lives within the natural limits of the planet, wherever we live in the world, and leave sufficient space for wildlife and wilderness" together with a set of Sustainable Development Goals.
- Commit to take action to enable the world to deliver one planet living and a fair and green economy within the timeframe that science and morality tell us is necessary.

##### B. Green Economy in the context of sustainable development and poverty eradication

1. Roadmaps with Action Plans at a global, national and civil society level. We support existing proposals for flexible and simple Roadmaps, Action Plans and Sustainable Development Goals as a main operational outcome of Rio+20. It is proposed that Action Plans or Roadmaps include:

- a) A Vision - in line with the Objective of the Conference - to enable citizens to achieve one planet living and a green economy and live happy, healthy lives within the natural limits of the planet, wherever we live in the world, and leave sufficient space for wildlife and wilderness. b) Principles drawn from existing international agreements, see Principles for a Green Economy.
- c) Sustainable Development Goals (SDGs) and Indicators. Based on Sustainable Consumption and Production, what citizens need and contraction and convergence of resource use to one planet living. SDGs could include: sustainable energy; sustainable transport; zero waste to landfill through circular economies; sustainable materials; food security – sustainable and humane agriculture and fisheries; sustainable water; biodiversity and land use; culture & community; Green Economy – equity, fair trade and the local economy; and health & happiness.
- d) Process to develop them in partnership with civil society.

e) Education and training based on Vision & SDGs. One Planet training will be launched at Rio+20.

f) Support of "Intergovernmental Panel(s) on Resources" to provide scientific evidence of resource availability, resource consumption and safe planetary boundaries and a "Solutions Bank" of peer reviewed solutions for sustainability.

2. Prototyping of Roadmaps by pioneer nations and civil society in 2012 for adoption in 2015.

3. Sectoral proposals necessary if we are to achieve the SDGs:

a) Renewable energy – proposals to encourage uptake include grid connection, diverse ownership, actuarial based carbon price, removal of subsidies for fossil fuels and Feed in Tariffs;

b) Human settlement and urbanisation Planning policies to promote walk-able & cycle-able cities; c) Circular economies – incentives towards circular resource efficient and zero waste economies;

d) Biodiversity and natural capital – agreements and financial and regulatory mechanisms to enable net zero deforestation and protection of peat bogs;

e) Economic and Monetary Policies including an expert UN Economic and Monetary Panel; supranational reporting and enforcement mechanisms under the IMF; treaties to avoid liquidity and capital flow crises and local currencies.

#### C. Institutional Framework for Sustainable Development

We support proposals to strengthen this in particular; a Council on Sustainable Development; the elevation of UNEP as a specialised agency; Framework Conventions on Corporate Social Responsibility and on Access to Information, Participation and Decision-Making Process; and for the Ombudsperson for Future Generations.

#### 3. One Planet Living – Detail of Practical Proposal for Rio+20

##### A. Objective of the Conference

In order to secure renewed political commitment to sustainable development, implement remaining gaps and address new challenges, we propose that at Rio+20 the UN and civil society:

- Make a statement recognising environmental limits and planetary boundaries in a world with a large, growing human population.

- Present a clear, bold, simple, ambitious vision of a green economy in the context of sustainable development and poverty eradication which it is easy to see if it is on track or has succeeded, that politicians and citizens can get behind, feel pride in and feel motivated to achieve. We suggest "one planet living" a world in which people can live happy, healthy lives within the natural limits of the planet, wherever we live in the world, and leave sufficient space for wildlife and wilderness" and a set of simple Sustainable Development Goals.

- Commit to take action to enable the world to deliver one planet living and a fair and green economy within the timeframe that science and morality tell us is necessary.

##### B. Green Economy in the context of sustainable development and poverty eradication

We support existing proposals for Roadmaps, Action Plans and Sustainable Development Goals as a main operational outcome of Rio+20, including those of the European Union<sup>iii</sup> Switzerland<sup>iv</sup> Columbia and Guatemala, and Kazakhstan<sup>v</sup> and the WBCSD's Vision 2050<sup>vi</sup> proposal. We agree that the framework be flexible and simple to enable nations to adapt to their own circumstances and develop their own approaches in line with the proposals of The People's Republic of China.

1. We support Roadmaps with Action Plans and propose that they are taken up at a global, national and civil society level and include the following elements based on our practical experience in the one planet living initiative<sup>viii</sup>:

a) Vision as per the Objective of the Conference; to enable all citizens to achieve one planet living and a green economy where they live happy, healthy lives within their fair share of the world's resources, wherever they live in the world and leave sufficient space for wildlife and wilderness.

b) Guiding Shared Values and Principles drawn from existing international agreements, we suggest the fifteen Principles for a Green Economy published in March 2011<sup>ix</sup>.

c) Sustainable Development Goals (SDGs) and Indicators. We propose that the SDGs and indicators be based on Sustainable Consumption and Production (SCP), on Clean Production<sup>x</sup>, on what citizens need for a good quality of life and contraction and convergence of resource consumption based on ecological and carbon footprint and scientific advice of Intergovernmental Panels (point e). One planet living is the same goal for all, for some it means becoming more resource efficient, for others it means growing in a sustainable way. This also supports the Millennium Consumption Goals proposal. SDGs could include:

1. sustainable energy –including zero carbon emissions from building energy use

2. sustainable transport and reducing the need for transport

3. zero waste to landfill through circular economies

4. sustainable materials

5. food security – sustainable and humane agriculture and fisheries

6. sustainable water

7. biodiversity and land use

8. culture and community

9. Green Economy – equity, fair trade and the local economy

10. health and happiness

d) Process to develop plans in partnership with civil society. National good living, consumption- based roadmaps will provide visibility to individuals and business that Governments are committed to creating a better life for their citizens in a resource-efficient green economy. With national commitments in place, business will respond by working with its suppliers to improve resource efficiency and help consumers to lead one planet lifestyles.

e) Education and training based around the implementation of the Vision and SDGs for decision-makers in the UN, nations and civil society. This could be linked to the adoption of the Ten Year Framework of Programmes on Sustainable Consumption and Production (10YFP on SCP), which we would like the UN to ratify at Rio+20. One Planet Partners will launch training at Rio+20.

f) Be supported by resources which could include:

i. "Intergovernmental Panel(s) on Resources" to provide advice to decision-makers based on scientific evidence of resource availability, resource consumption and safe planetary boundaries. The IPCCxii and the Intergovernmental Platform on Biodiversity and Ecosystem Services IPBES xiii could be expanded to include all Resources such as minerals.

ii. A "Solutions Bank" of peer reviewed solutions for sustainability, measured against the SDGs, with clear explanations of the solution, how to implement it, progress, measured results and impacts. This could begin with case studies showcased at Rio+20.

2. We propose that Roadmaps be prototyped in 2012 for adoption in 2015. Pioneer nations from the developed, emerging and least developed countries can prototype Action Plans or Roadmaps in the coming months and showcase the idea at Rio+20. They could develop the detail during 2012-2015 for other nations to adopt.

3. Sectoral Proposals relevant to achieving the Sustainable Development Goals. There are some sectoral issues at a multilateral level which partners in the one planet living initiative find stops us from implementing the SDGs and one planet living and need to be addressed at a national or multilateral level. This could be informed by science-based Intergovernmental Panels on Resources.

a) Renewable energy – fossil fuels used for energy account for half of our ecological footprint. Our experience is that national regulations make introducing renewable energy difficult in many countries. Suggested measures, based on our experience are:

1. enable new renewable energy to connect to the national electricity grid
2. enable more diverse and local ownership of energy companies
3. introduce an actuarial based carbon price
4. remove subsidies for fossil fuels, if necessary adjust fiscal policies to avoid fuel poverty
5. Feed in Tariffs to incentivise uptake of renewable energy.

b) Human settlement and urbanisation – we propose all nations introduce planning guidance to promote walk-able and cycle-able cities with good public transport and which discourages cars, car-parking and construction of roads for cars.

c) Create circular economies towards resource efficient and zero waste economies: Materials must be dealt with more efficiently by designing products to ensure waste becomes raw material for new products – completing the cycle. We ask governments to embrace the closed loop model and take action by providing the right incentives.

d) Biodiversity and natural capital

1. Net zero deforestation - deforestation rates are not slowing down, with 12-15 million hectares of forest lost each year. Forest loss is not just an environmental issue, as pressure on the availability of timber over the next 5-10 years is one of businesses biggest supply chain challenges. Deforestation and illegal logging distort global markets and timber prices. Despite many excellent initiatives there is little or no firm international agreement. We propose an agreement at Rio+20 to net zero deforestation.

2. Protect peat bogs through financial or regulatory mechanisms to make the sustainable choice the affordable choice. The experience of business is that trying to move away from using peat as a base for compost towards a lower impact alternative is hampered by the economics of an established mining industry against those incurred by a new entrant.

e) Economic and monetary policies - sustainable development and the eradication of poverty is threatened by the failure of markets and restricted flows of capital as in recent and continuing global economic crises. The just management of the finite natural capital of the planet also requires the just regulation of the economic capital of the international financial markets. There is a need for regulatory frameworks and reporting mechanisms to ensure monetary transparency and avoid over-exploitation of both natural and economic capital. We agree with the underlying analysis of the globalised financial systems and the need for their reform outlined in the "Note on financial reform" from the Pontifical Council for Justice and Peace issued 24th October 2011. This identifies that:

<sup>FN</sup> In its annual Report of in 2007, the International Monetary Fund recognized the close connection between an inadequately managed process of globalization on the one hand, and the world's great inequalities on the other.

<sup>FN</sup> Already implicit in the Statutes of the International Monetary Fund is a commitment to create some form of global monetary management.

To this end, we therefore propose:

1. A reinforced commitment to global monetary management and the establishment of its mechanisms.
2. A new expert "UN Economic and Monetary Panel", to monitor and inform international financial and regulatory frameworks, by which transparency can be assured within the mechanisms of international monetary and liquidity transactions.
3. Establish Supranational reporting and enforcement mechanisms under the IMF for regulatory and systemic breaches on monetary management, capital and liquidity ratios and the illegal use of international tax havens and associated special purpose vehicles.
4. UN and IMF encouragement of legally binding international treaties to avoid liquidity and capital flow crises and ensure both developing and developed nations can access opportunities to grow economically within planetary boundaries.
5. Allow regional and local authorities to issue their own local currencies to promote local, sustainable trade and enable greater liquidity in a time of capital constraints.

C. Institutional Framework

With our strong belief in good governance, where accountability, participation, transparency and access are central and important elements, BioRegional do support a number of efforts to strengthen the institutional architecture at the intergovernmental and governmental level. BioRegional would like to lend its support to the many proposals that call for strengthened and reformed structures around environmental, social and economic issues and in that the UN Conference on Sustainable Development in Rio decides to:

1. Establish a Council on Sustainable Development as a subsidiary organ of the UN General Assembly, on par with the newly established Council on Human Rights.
2. Elevate the United Nations Environmental Programme to a specialised agency and give the new specialised agency a strong mandate.
3. Agree on developing a Framework Convention on Corporate Social Responsibility. 4. Agree on developing Principle 10 of the Rio Principles into a Framework Convention on Access to Information, Participation and Decision-Making Process.
5. Agree to develop the intergenerational principle on environmental issues and establish an Ombudsperson for Future Generations.

## Biovision – Foundation for ecological Development

The following statement is signed by more than 100 CIVIL SOCIETY ORGANISATIONS. A full list of supporting organizations is available online at: <http://www.timetoactrio20.org/en/list-of-signatories>

---

### SUMMARY OF JOINT STATEMENT

#### AGRICULTURE AND FOOD SECURITY AT RIO+20

#### WHAT ARE THE OPTIONS WHEN "BUSINESS AS USUAL" IS NOT AN OPTION?

20 years after the Rio Earth Summit, the planet is in a deeper environmental, energy and financial crisis. The United Nations Conference on Sustainable Development 2012 (hereinafter referred to as "Rio+20") needs to strengthen an agricultural system that substantially diminish hunger and poverty, drastically reduces climate change and its impact, and restores biodiversity, soil fertility and water resources. Rio+20 has a historical opportunity to make important decisions and agree on actions that actually do eradicate hunger and poverty, and save the environment. We, the undersigned civil society organizations, agree that IT'S TIME TO ACT!

#### PART I - OBJECTIVE OF THE CONFERENCE

Ensure that agriculture in all its dimensions is a core issue at the UNCSD in Rio and subsequently in global policy and practice;

Give strong and increasing support to small scale, agroecological and other forms of sustainable, ecological and humane food production;

Mandate a UN agency to develop a work plan for implementing the decisions of UNCSD 2012 and the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD).

#### PART II – ELEMENTS FOR AN OUTCOME DOCUMENT IN RIO

We, the undersigned civil society organizations, agree on the following ELEMENTS OF AN AGREEMENT in an outcome document e.g., on a green economy in the context of sustainable development and poverty eradication, and strengthening "institutional frameworks for sustainable development" (More details are provided in the Annex).

1. Ensure that agriculture in all its dimensions is a core issue at the UNCSD in Rio and subsequently in global policy and practice;
2. Give strong and increasing support to small scale, agroecological and other forms of sustainable, ecological and humane food production, research in this area and enabling conditions, to ensure a shift away from environmentally and socially destructive industrial food production in order to produce enough and healthy food for the projected 9 billion people or more; create employment, vibrant communities and fair economies for billions of people; help reduce climate change; maintain and enhance ecosystem functions, landscape, biodiversity and other natural resources;
3. Regulate, encourage and support the transformation of industrial and other forms of unsustainable agriculture towards smallholder based agroecological and other forms of sustainable, ecological, low energy food production;
4. Support food sovereignty as the overall framework for food and agricultural policies;

5. Recognize the central role of women in small scale agriculture and in achieving food security;
6. Emphasize the important role of the organizations of small scale food producers;
7. Welcome the reformed UN Committee on World Food Security (CFS);
8. Give the CFS a mandate to identify current deficiencies and shortcomings impeding the implementation of existing plans and proposals on sustainable agriculture and food;
9. Give the CFS a mandate to develop a work plan for implementing the decisions of UNCSD 2012, the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD);
10. Call for all countries to establish their own structures/mechanisms for following up the implementation of the findings on the IAASTD);
11. Support the adoption of a UN Declaration on Peasant Rights;
12. Support the implementation of the UN Declaration on the Rights of Indigenous Peoples;
13. Ensure that food and water are not used as instruments of intimidation in situation of conflicts;
14. Resist the commodification and commercialization of natural resources and carbon trading such as REDD+, the Clean Development Mechanism (CDM)
15. Condemn multi-genome patent claims and encourage governments to block or rescind such claims;
16. Establish a new, broad, participatory and transparent UN environmental network;
17. Commit the UN - in 2012 to a negotiating process leading to an international technology assessment (bio, nano and geoengineering) and information mechanism;
18. Assert the integrity of the multilateral community over technologies intended to address climate change;
19. Underline that the principle of common but differentiated responsibilities must be respected

### PART III –POLICIES RIO+20 CAN ADOPT IMMEDIATELY

We, the undersigned civil society organizations, agree on the following PRACTICAL POLICY OPTIONS that can be implemented now that will immediately strengthen food sovereignty, reduce environmental damage and support the innovative work of peasants / small scale food producers and providers. The numbers in brackets refer to further information provided in the full document in the Annex.

A. POLICIES TO DEAL WITH THE FOOD CRISIS: Restore public support for agriculture to address the food crisis (1); convert "land-grabs" to peasants' fields (2), and biofuel land to food (3). Adopt policies that reduce soil erosion and combat desertification (5) and that reduce food losses (6) and freshwater waste in food and beverage processing industries (11).

B. POLICIES TO TRANSFORM THE FOOD CHAIN INTO A FOOD WEB: Strengthen the food web and break up the food chain (7); advance the rights of women food producers (8); Diversify food processing and retailing (9); Ban Terminator-type agricultural technologies (10);

C. POLICIES TO SHRINK AGRICULTURE'S ENVIRONMENTAL FOOTPRINT AND IMPROVE HEALTH: Improve health and reduce environmental damage (12); Reduce OECD meat and dairy consumption (13); Eliminate waste and environmental devastation in the fisheries industry (14); Strengthen urban and peri-urban food systems (15).

D. POLICIES TO ENCOURAGE INNOVATION AND DIVERSIFICATION IN THE FOOD WEB: Support in situ peasant conservation strategies (16); Encourage breeding and production of underutilized crops (17); Restructure research priorities to support peasant breeding (18). Promote resilient livestock breeds and species diversity; and re-introduce traditional and local animals on farms (19); conserve and promote marine and freshwater fishing (20).

----- ANNEX I: FULL DOCUMENT

### RIO+20: WHAT ARE THE OPTIONS

#### WHEN "BUSINESS AS USUAL" IS NOT AN OPTION?

In his preface to the World Economic and Social Survey 2011, BAN KI-MOON, Secretary-General of the United Nations argues that humankind's progress has come at the lasting cost of degradation of our natural environment. He further notes that the publication of this 'Survey' capturing this disturbing state of affairs "is especially timely as the world prepares for next year's Rio+20 United Nations Conference on Sustainable Development" Ban Ki-Moon highly recommends it to policy-makers, non-governmental partners, business executives and concerned.

Quote from the report:

'Business as usual' is not an option..

While humankind has made enormous progress in improving material welfare over the past two centuries, this progress has come at the lasting cost of degradation of our natural environment. About half of the forests that covered the earth are gone, groundwater resources are being depleted and contaminated, enormous reductions in biodiversity have already taken place and, through increased burning of fossil fuels, the stability of the planet's climate is being threatened by global warming. In order for populations in developing countries to achieve a decent living standard, especially the billions who currently still live in conditions of abject poverty, and the additional 2 billion people who will have been added to the world's population by mid-century—much greater economic progress will be needed.

Continuation along previously trodden economic growth pathways will further exacerbate the pressures exerted on the world's resources and natural environment, which would approach limits where livelihoods were no longer sustainable. Business as usual is thus not an option".

... and Governance as usual is not an option

We, the undersigned civil society organizations, agree on the now popular mantra in major reports (UNEP, WESS, IAASTD) on the road to Rio, that "Business, as usual, is not an option" - a repetition of the theme made famous by Barack Obama. The pertinent policy point for civil society, however, is the fact that while business as usual is not an option, neither is 'governance, as usual!'

### TIME TO ACT

20 years after the Rio Earth Summit, the planet is in a deeper environmental, energy and financial crisis. The United Nations Conference on Sustainable Development (UNCSD) in Rio de Janeiro in 2012 might be just another high-level conference stating the need to eradicate hunger and poverty, stop climate change, the loss of biodiversity, soil erosion and other serious environmental problems – and then, after the conference, life goes on as before. But it can be different. It has a historical opportunity to make important decisions and agree on actions that actually do eradicate hunger and poverty, and save the environment. It's time to act!

AGRICULTURE – A MAIN PROBLEM ...

Industrial food systems and other unsustainable practices are causing dramatic environmental damage, including reduction of biodiversity and soil fertility, overuse and pollution of water, and are substantially contributing to climate change. These kinds of food systems and food production undermine the possibilities for producing enough and healthy food for actual and future generations. At the same time these industrial food systems impoverish millions of small-scale food producers, are creating increasingly bigger waves of poverty, hunger and migration, and are causing health problems at a large scale. There are one billion people food insecure but at the same time abundant unhealthy foods and diets are affecting at least 2 billion people, causing obesity, heart disease, cancer, type 2 diabetes and other diseases, and serious pandemics are likely to occur in the near future.

... WHILE BEING THE MAIN SOLUTION

Viable food systems do exist. They have evolved and adapted over millennia in traditional forms of agriculture and are now more relevant than ever. They can be combined, if appropriate, with latest knowledge on agro ecology and other forms of sustainable production. Small scale food producers provide the food for about 70 percent of the population today, and small scale agroecological and other forms of sustainable agriculture and food production, developed in the framework of food sovereignty, can

- substantially diminish hunger and poverty,
- drastically reduce climate change and its impact,
- restore biodiversity, soil fertility and water resources,
- improve livelihoods and provide rewarding employment for billions of people,
- produce enough, high quality, diverse and nutritious food for 9 billion people or more.

UNCSD IN RIO 2012 SHOULD

1. Ensure that agriculture in all its dimensions is a core issue at the UNCSD in Rio and subsequently in global policy and practice. Agriculture and food are both a main causes of and potential solutions to the world's environmental, climate and social problems. Industrial food production is a key cause of environmental and social harm and needs urgently to be reduced in size and impact. The solution is in smaller-scale, ecological food production systems, currently practiced by millions food producers, whom if supported can substantially increase availability of food, contribute to the elimination of hunger and poverty, increase equity and reverse environmental degradation. These systems, which currently deliver food for 70% of the world's peoples and could provide more, if supported and protected, are mainly sustainable, resilient, (agro)ecological and bio-diverse. They are essential for the survival of humankind, for the preservation of biodiversity, helping reduce climate change and for socially fair and ecologically sustainable development and poverty eradication. However in order for agriculture to be a viable livelihood practice rural areas need to become attractive and livable spaces with access to education, health and a healthy environment.
2. Give strong and increasing support to small scale, agroecological and other forms of sustainable, ecological and human food production, research in this area and enabling conditions, to ensure a shift away from environmentally and socially destructive industrial food production in order to produce enough and healthy food for the projected 9 billion people or more; create employment, vibrant communities and fair economies for billions of people; help reduce climate change; maintain and enhance ecosystem functions, landscape, biodiversity and other natural resources.
3. Regulate, encourage and support the transformation of industrial and other forms of unsustainable agriculture towards smallholder based agroecological and other forms of sustainable, ecological, low energy food production. Governments should in cooperation with farmers' and peasants' organizations develop policies and concrete actions necessary for such a transformation thus providing small farmers access to land, water, local seeds, local markets, credit, agroecological technologies and participatory education schemes. Governments should regulate and make the industrialized agriculture pay for its negative environmental and health impacts.
4. Support food sovereignty as the overall framework for food and agricultural policies and encourage communities, peoples, states and international institutions to recognize and realize food sovereignty. Food sovereignty puts the right to sufficient, healthy and culturally appropriate food for all individuals, peoples and communities at the center of food, agriculture, livestock and fisheries policies, rather than the demands of markets and corporations that prioritize internationally tradable commodities. It localizes food systems and values the knowledge and skills of small-scale food providers, and works in harmony with nature through using smaller-scale, ecological forms of food provision.
5. Recognize the central role of women in small scale agriculture and in achieving food security Women play major roles in food production, processing and preparation, and yet a majority of the one billion food insecure are women. The future of agricultural and food systems has to be built on the firm foundation of women's empowerment for it to be sustainable and equitable.
6. Emphasize the important role of the organizations of small scale food producers.

Strong social movements are vital for making the changes in policies and practices which are needed, as well as for democratic and sustainable development of societies. It is therefore of utmost importance to support and help strengthen the organizations of peasants / small scale food producers and food providers, and especially to strengthen the participation and role of women. It is also important to pay special attention to and support active participation of youth and women in these organizations. The organizations of peasants / small scale food producers and providers must be consulted on all relevant issues and given a leading role in defining policies and actions for food and agriculture.

7. Welcome the reformed UN Committee on World Food Security (CFS) as the governing body for food, agriculture and rural development policy and related financial issues, and as the interlocutor on these issues within the proposed new UN environmental network (see no 12);
8. Give the UN Committee on World Food Security (CFS) a mandate to identify current deficiencies and shortcomings impeding the implementation of existing plans and proposals on sustainable agriculture and food.
9. Give the UN Committee a mandate to develop a work plan for implementing the decisions of UNCSD 2012, the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IASTD, ) and the recommendations on agroecology by the United Nations' Special Rapporteur on the right to food in his annual report 2010 submitted to the Human Rights, as well as a relevant part of Chapter 14 of Agenda 21 and UNCSD 16/17, making sure that the views and concerns of small scale food providers are taken into account and responding to their mandate to increase food security
10. Call for all countries to establish their own structures/mechanisms for following up the implementation of the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IASTD) with full participation of women and men, small-scale farmers, peasants, pastoralists, fishers, indigenous people and other relevant stakeholders
11. Support the adoption of a UN Declaration on Peasant Rights Across the world, peasants and small farmers, agricultural workers and landless people are victims of violent oppressions, criminalization, discrimination, expulsion from their lands and alienation from their livelihoods. In order to address these unique patterns of violations, there is a need for specific provisions and mechanisms to fully protect the rights of peasants. An international instrument to respect, protect, fulfill, and uphold peasants' rights should

therefore be created within the UN.

12. Support the implementation of UN Declaration on the Rights of Indigenous Peoples Across the world, Indigenous communities and pastoralists are victims of discrimination, oppression and most importantly expulsion from their home lands and alienation from their livelihoods. . Rio plus 20 should recognize that sustainable development is only if the right to food and right to water obligations to these communities are met through the realization of Rights of Indigenous Peoples

13. Ensure that food and water are not used as instruments of intimidation in situation of conflicts....

14. Resist the commodification and commercialization of natural resources and carbon trading, such as REDD+, the Clean Development Mechanism (CDM). Such mechanisms do not address the root causes of greenhouse gas emissions from agriculture but tend to provide perverse incentives to polluters and benefit the emitters;

15. Condemn multi-genome patent claims and encourage governments to block or rescind such claims. Governments must also develop a clear intergovernmental process for examining the impact of intellectual-property regimes on living materials and processes;

16. Establish a new, broad, participatory and transparent UN environmental network. Within this network, Southern governments, backed by civil society, can coherently address the full range of climate, environmental and social issues currently covered by a variety of treaty bodies, funds and offices;

17. Commit the UN - in 2012 to a negotiating process leading to an international technology assessment (bio, nano and geoengineering) and information mechanism that strengthens national sovereignty and choice and respects the Precautionary Principle and builds the capacity of developing countries and communities to assess the health, environmental, economic and social impacts of new and emerging technologies;

18. Assert the integrity of the multilateral community over technologies intended to address climate change. This requires the establishment of a legally-binding prohibition on all forms of geo-engineering;

19. Underline that the principle of common but differentiated responsibilities must be respected. Industrialized countries should pay their ecological and climate debt to developing countries, including payment for the damages caused by their historical greenhouse gas emissions.

## 20 POLICIES RIO+20 CAN ADOPT IMMEDIATELY

Below are practical policy initiatives that can be implemented now that will immediately strengthen food sovereignty, reduce environmental damage and support the innovative work of peasants / small scale food producers and providers.

### POLICIES TO DEAL WITH THE FOOD CRISIS:

1. Restore public support for agriculture to address the food crisis. Corporate concentration in the food chain has, since at least the 1970s, severely reduced public-sector support for both research and rural development. Agricultural assistance declined from \$8 billion in 1984 to \$3.4 billion in 2004 . Governments should cooperate to place an annual \$5 billion surtax on the food oligopolies over at least the next 25 years to recoup a portion of these losses. The recovered funds should go directly to peasants' organizations to support their initiatives.

2. Convert "land-grabs" to peasants' fields. There is growing international recognition that public or private internal or cross-boundary land grabs are destructive of the environment and food security. The at least 80 million hectares of land involved in these transactions should be made available to peasants and converted into 26.7 million farms of roughly 3 hectares each.

3. Convert biofuel land to food. In 2007, both the US and EU devoted \$11 billion to state subsidies and tariffs in support of biofuel production. As of 2006, 14 million hectares (1%) of all arable land was being used for biofuel production (providing only one half of 1% of global primary energy use.) New policies should transfer biofuel land to landless or land-poor peasants (4.6 million families could get 3 hectares each) – potentially doubling farm production (average farm size in Africa and Asia is currently 1.6 ha.) The \$11 billion annual subsidy should support agro-ecological developments on the farms.

4. Secure sufficient, nutritious and appropriate food for at least 9 billion people by 2050. Today, the cereals used for animal feed could meet the annual caloric needs of more than 3.5 billion people. The current world population is just under 7 billion. There is no technological barrier to meeting our future food needs.

5. Adopt policies that reduce soil erosion and combat desertification Today, the industrial food chain leads to an annual loss of topsoil amounting to 75 billion tonnes and costs the world \$400 billion. An oligarchy of ten global fertilizer companies discourages good soil management. Peasant soil conservation systems utilizing naturally occurring soil microorganisms are responsible for fixing 140-170 million tonnes of nitrogen – equivalent to \$90 billion in chemical fertilizers. Policies must support these conservation strategies. Improved land management, especially using peasant techniques, could increase agricultural GDP between 3% and 7%.

6. Reduce crop losses: Today, annual food losses equal more than half of the world's cereals crop (2.3 billion tonnes), meaning unnecessary production of roughly 500 million tonnes of GHG. Food losses in industrialized countries range between 90 and 111 kg per person per year. New policies should immediately lower OECD crop losses by 90% – at least to sub-Saharan African and South Asian levels of 9–11 kg per person per year.

### POLICIES TO TRANSFORM THE FOOD CHAIN INTO A FOOD WEB:

7. Strengthen the food web and break up the food chain. Oligopoly in agricultural inputs reduces efficiency and discourages the resiliency necessary to respond to new health and environmental challenges. Today, six corporations (Monsanto, DuPont, Syngenta, Dow, Bayer, and BASF) control 71% of crop chemicals, 58% of commercial seed sales; and (with their biotech partners) control 77% of the world's so-called "climate-ready" crop patent claims. The 6-company oligopoly stifles innovation, encourages energy waste and promotes polluting chemicals. Competition policies must break up the food chain. New policies must encourage market diversity and research support for agro-ecological systems. Market diversification, for seeds alone, could reduce prices by at least 30% saving the world's peasants more than \$9 billion per annum.

8. Advance the rights of women food producers: Women account for 60 to 80% of peasant growers and produce 90% of food in Africa and about half of all food worldwide. Yet in sub-Saharan Africa, only 15% of landholders are women and they receive less than 10% of credit and 7% of extension services. Policies that address gender inequalities could, conservatively, increase yields on women's farms by 2.5% to 4%.

9. Diversify food processing and retailing. Today, the largest supermarket oligopolies control 40-50% of the food market in Latin America, 10% in China, 30% in South Africa and 50% in Indonesia. The leading 100 processors control 77% of global packaged foods and 10-11% of world retail food sales. Peasant systems feed 70% of the world – including the most vulnerable. Competition policies should eliminate oligopolistic practices. New policies must diversify consumer options, including fair-trade and reduce the need for processing and support local food storage and distribution. .

10. Ban Terminator-type agricultural technologies. Although there is a global moratorium on Terminator technologies, there are moves by some governments to overturn this moratorium in 2012. Rio+20 must establish a global ban. In Ethiopia, approximately 90% of the total wheat area is planted in farm-saved seed. If Terminator seeds were

commercialized and Ethiopian wheat growers were forced to buy new seed every time they planted, it would cost an estimated \$66 million per year. Brazilian soybean growers who now save and re-use soybean seeds would be forced to spend an estimated \$407 million per year if the Brazilian ban on Terminator seeds were lifted. In the Philippines, an estimated 59% of the rice crop is planted with peasant-saved seeds. If these rice growers were forced to buy new seed every time they planted - they would spend an estimated \$172 million per annum. If Canadian wheat growers (who now grow wheat on 8.36 million hectares with peasant-saved seed) were forced to buy Terminator wheat seed, the total cost per annum would be \$85 million.

11. Reduce freshwater waste in food and beverage processing industries. Five global food and beverage corporations – Nestle, Danone, Unilever, AnheuserBusch, and Coca-Cola-consume enough water to meet the daily domestic needs of every person on the planet. Today, it takes, for example, 12,000 L of water to produce and process a half kilo of chocolate. The water required to produce 65 million kgs of ground beef – the amount recalled and destroyed due to food safety violations in the US in 2008 – was equivalent to the water required to irrigate 100,000 hectares of dry land for a year. Peasant production models that privilege local consumption waste little or no water. Policies must prioritize local consumption and heavily tax wasteful processing companies.

#### POLICIES TO SHRINK AGRICULTURE'S ENVIRONMENTAL FOOTPRINT AND IMPROVE HEALTH: 12. Im

prove health and reduce environmental damage. Today, the average adult in an OECD country eats an unnecessary and unhealthy extra meal each day (roughly an extra 750 Cal). About 25% of the energy and water – and the associated greenhouse gas produced used in OECD countries goes to “waste food.” At least 50% of OECD adults are overweight or obese. Obesity costs the OECD states almost \$300 billion per year – an amount that is more than enough to meet all of the Millennium Development Goals by 2015, with around \$100 billion leftover.

13. Reduce OECD meat and dairy consumption. According to UN estimates, demand for meat and dairy products will double by 2050. Per capita OECD meat consumption is 10 times that of the global South. A 25% reduction in livestock product consumption worldwide would reduce our GHG emissions by 12.5%.

14. Eliminate waste and environmental devastation in the fisheries industry. Today, industrial fish farming takes 6 tonnes of wild fish to produce 1 tonne of fishmeal and between 1.5 and 3 tonnes of meal to harvest 1 tonne of farmed salmon. Peasant fishers and family fishponds recycle nutrients and have almost no waste. Policies must incorporate this waste into industrial fish farm taxes.

15. Strengthen urban and peri-urban food systems. Today, British consumers throw away 243 L of water per person per day in wasted food. This amounts to 6% of total UK water usage and one and a half times more than personal daily fresh water needs. Today, 25 to 30% of fresh water – about 45 billion litres – in urban areas is lost through leaky pipes costing municipalities \$14 billion a year. The urban water wasted through leaky pipes could provide the water needs of 200 million people or 4.5 million urban micro-gardens. If the 243 L of water lost each day from food thrown away were available to urban gardeners it could produce 18,000 tomatoes per annum, 3,240 lettuces every 60 days, 900 cabbages every 90 days or 9,000 onions every 120 days. Policies should promote urban agriculture (including its access to safe water) that will improve water efficiency, recycle wastes, and support local nutrition.

#### POLICIES TO ENCOURAGE INNOVATION AND DIVERSIFICATION IN THE FOOD WEB:

16. Support in situ peasant conservation strategies. There is general agreement that the adaptation of agriculture to climate change will depend upon the conservation and introduction of crop wild relatives. Current efforts, however, are only collecting 700 species. Peasants conserve 50-60,000 species of wild relatives. Their in situ conservation and community breeding must be supported.

17. Encourage breeding and production of underutilized crops. Today, the industrial food chain concentrates on 150 species with almost all research going into 12 species. The peasant food web breeds and nurtures 7,000 food crops, offering enormous potential to respond to climate change. Policies must strengthen their efforts to diversify the food web.

18. Restructure research priorities to support peasant breeding. Over the last half-century, industrial breeders have produced about 80,000 plant varieties (including 7,000 from international research centres). Almost 60% of private commercial breeding has been ornamental. Over the same time, peasants have contributed close to 2.1 million food and feed varieties. Policies must surrender breeding direction to peasant organizations, duplicate gene bank accessions for peasant breeding and inter-farm exchange, and eliminate monopolistic regulations that inhibit innovation. Public spending on research on agriculture must increase and the bulk of research should be refocused to agroecological solutions for the challenges ahead by promoting biodiverse and resilient farming systems.

19. Promote resilient livestock breeds and species diversity; and re-introduce traditional and local animals on farms. Today, 3-4 multinationals control breeding stock for each of the four key livestock animals (cattle, pigs, broiler chickens, laying hens and turkeys). In total, about 100 breeds account for almost all commercial meat and dairy production. Furthermore, three agribusinesses account for 43% of veterinary medicines and three others control 25% of industrial feeds world-wide. While the industrial food chain continues to narrow the range of species and breeds available to meet climate changes, peasants maintain 40 livestock species and 7,616 breeds that may otherwise become extinct. Policies must support peasant conservation and breeding of these animals and the rights of traditional livestock keepers. Grass-fed meat and dairy and animal feed production on farm or locally should be promoted. All not therapeutic use of antibiotics in animal production should be eliminated.

20. Conserve and promote marine and freshwater fishing. Today, industrial fisheries commercialize 363 species and the industrial system has wiped out 20% of all freshwater species while overfishing virtually all popular marine species. Peasant fishers protect and harvest more than 22,000 freshwater species alone. Policies must strengthen support for peasant fishers.

#### COMMENTS AND SUPPORT

If you have comments and suggestions for changes in this document, and if your organization wants to support the document, please send a mail to [rio2012agcso@gmail.com](mailto:rio2012agcso@gmail.com). A new version of the document will be produced in October 2011 based on inputs and discussions.

The document in French, Spanish and German; and a version of it with references is available on [www.eradicatehunger.org/Rio+20](http://www.eradicatehunger.org/Rio+20)

## Blue Marine Foundation

Blue Marine Foundation Submission for the preparation of zero draft for an outcome document for Rio + 20

## A Blue/Green initiative for the Oceans

Some of the most important threats to sustainable development to emerge in the decade since WSSD in Johannesburg have been in the oceans. So there will be a strong public expectation that Rio+20 will address and improve man's stewardship of the watery commons that cover 70 per cent of the Earth's surface.

In the past decade we discovered that catches of wild fish peaked in the late 1980s and have since been in decline; that on our present trajectory there will be few sustainable fish stocks left by 2050; and that there are major new threats to the oceans which include acidification and mining of the deep sea. It was the decade of the Census of Marine Life, which showed that areas thought to be barren because they were too cold or too dark actually teemed with life - raising concern about how to protect it from exploitation.

The Blue Marine Foundation (Blue) is a charity which was formed as a result of public concern in that period of discovery. It is the culmination of first a book, *The End of the Line*, and then a film of the same name (shown at the UN General Assembly in Feb 2010) – which in October 2011 won the inaugural Puma award for a documentary that had the most impact on society. Blue was formed to address the concerns raised in the book and film. Its major achievement to date has been to pay the British government to create the largest marine reserve in the world in the Indian Ocean.

Blue believes the explosion of public interest and concern about the oceans needs to be met with action at Rio + 20, not only in the Blue Economy section of the existing proposals but as part of a revitalised partnership for sustainable development that includes new, stronger governance structures for areas outside national jurisdictions.

Another compelling reason for action is that the crisis in the oceans, at least in terms of our exploitation of the species within it, is one of the most solvable of all environmental problems.

## Proposals

- Recognise that food security and biodiversity conservation fit together as never before. A World Bank report showed that \$50 billion a year is being wasted through the illegal or unreported over-exploitation of fisheries. The linkages between food security in a world of greater human population and marine resources need to be made explicit and waste eliminated.
- Accelerate the creation of the network of marine protected areas called for by WCSD, ensure that they are large enough to protect biological productivity, and tackle the international governance problems raised by their creation. Protecting such areas as the Sargasso is limited by the powers granted to Regional Fisheries Management Organisations. These need reform. The EU and G77 have called for a new treaty for high seas biodiversity conservation as part of UNCLOS.
- Establish improved spatial management of the oceans, for example by zoning areas where deep sea mining is acceptable and where it is not by using the precautionary principle.
- Improve enforcement of fisheries covered by UN resolutions 61/105 and 64/72 on deep sea bottom trawling.
- Improve the coverage and scope of RFMOs so they become responsible for conservation as well as fishing. Establish common practice in the ending of discards, and the promoting of more selective gears, and greater efficiency in the harvesting of fish and fish proteins.
- Establish global standards for open-ocean aquaculture.
- Address IUU fishing by improving global fisheries transparency through a Global Record of fishing vessels and binding international standards for Flag State performance.
- Establish a process, through UNEP or its successor body, to monitor and report on the process of ocean acidification.

---

## BOND-Development and Environment Group (BOND-DEG)

### BOND-DEG - UK NGOs Joint Rio Narrative

"You never change things by fighting the existing reality. To change something, build a new model that makes the existing model obsolete." -R. Buckminster Fuller

#### 1. Introduction

Our vision is of a Green and Fair Economy.

This must be achieved through a just transition. It must deliver a better quality of life for all within environmental limits, now and into the future.

Humanity faces critical decisions. The scale of our current economic crisis will soon be overshadowed by the impending environmental crisis in both impacts and costs. Over the past 50 years our current global economic model has failed to deliver the sustainable society that we need.

The concept of sustainable development that was elaborated at the first Earth Summit in Rio in 1992 still provides a compelling vision of the transformation that needs to be made. But implementation of that vision has fallen far short.

Operating within planetary boundaries is a necessary precondition for sustainability. But at present the world is pressing harder against ecological limits and we have already breached the safe operating or boundaries for three of nine key planetary systems (climate change, biodiversity loss and excess nitrogen and phosphorus production).<sup>2</sup>

At the same time inequality and unfairness is growing between and within countries. Poverty has increased in absolute terms, and the gap between rich and poor is growing. Furthermore, the world's population is increasing rapidly (a projected 9 billion by 2050 from 7 billion now) increasing the demand for resources and adverse impacts such as pollution and waste.

The UN Conference on Sustainable Development (UNCSD) to be held in Rio in June 2012 (Rio + 20) presents world leaders with a unique opportunity for change. We need to revive the original Rio momentum and launch the transformation towards a truly sustainable global economy that promotes true prosperity for all in a socially just and equitable way now and into the future, while acknowledging and respecting environmental limits; that is the Green and Fair Economy. This will require bold political leadership and engagement of all parts of society to bring about the necessary transformation of the global economy. It will require fundamental reforms in political systems and institutions and a shift in values and behaviours.

Minor modifications of present policies within an essentially business as usual model of the economy cannot bring about the scale of transformation needed. Developed countries such as the UK need both to transform their own economies by creating more sustainable pathways for the future; and help developing countries find a greener and more equitable pathway for their own future development.

All parts of society need to be engaged in the transition, and will be affected by the changes. So the transition must be managed in an open and co-operative way that ensures a just and fair transition to the sustainable green economy. We need common value and language and new politics to shape and guide the transition in a harmonious and equitable way. Only then will we create the trust required to build socio-environmental security and resilience, now and into the future.

## 2. The Green and Fair Economy

The Green Economy needs to be a fair one, with all that this implies. To this end, the social dimension of sustainable development needs to be given greater emphasis. The basic preconditions for this are: social cohesion, fairness, including inter-generational fairness, fair redistribution and solutions for social problems such as growing inequality, lack of access to a whole range of resources, poverty and unemployment.

The Green and Fair Economy should not be used as a euphemism for green growth to promote the business as usual agenda of growth at all costs. Rather we must acknowledge key environmental limits/planetary boundaries, and this does require us to rethink our growth pattern and help define pathways for sustainable development.

The transition to a Green and Fair Economy and a sustainable future is fundamental to the process of change, in developed and developing nations. Seeing it as a just transition is about recognising and planning fairly and sustainably for the huge changes that climate change policies will have for the whole economy. There are key conditions to ensuring a just transition to a green and fair economy, these include:

- Access to Information and Stakeholder Engagement - In line with Rio Principle 10 and the Aarhus Convention, all individuals should have access to environmental information, be able to participate in decision-making processes and have effective access to judicial and administrative proceedings. This includes inclusive and effective consultation processes between all stakeholders (government, business, trade unions, voluntary, development and environmental organisations) on the changes required in transitioning to a green and fair economy.
- Investing in People - The transition must also ensure the creation of quality jobs and decent work, investments in communities, investments in relevant education/training and skills programmes and strong and efficient social protection systems in the transition to a sustainable economy. General Education for Sustainable Development (ESD) programmes must be given higher priority and support.
- Respect for Labour and Human Rights - Democratic decision-making and respect for human and labour rights are essential in order to ensure the fair representation of workers and communities' interests.
- Improving Financing and Investment for Sustainable Development - Financial decisions and investments must begin to flow towards restoring our environment and generating a better quality of life for all. This means reforming subsidies, taxation and public sector financing to meet environmental and societal needs rather than just GDP growth; driving investment towards new private sector markets; and putting an end to short-term market speculation.
- An Earth-centred Governance Approach - For development to be truly sustainable it needs to be founded on Earth-centred principles which promote the long-term health and integrity of the Earth, recognising that Earth has limits within which humans must live, and respecting the inherent rights of all life on Earth of present and future generations.

The Green Economy means many different things to different people. The broad spectrum can create confusion. However, a singular definition will be next to impossible to agree with such a large, diverse group of stakeholders. Furthermore, the economic, political, cultural and environmental context of each country needs to be taken into account, and there is no one prescriptive model. Instead, principles for a Green and Fair Economy should be agreed, and which will act as a decision-making framework in practice. Underpinning measures/mandates for greening the global economy should also be discussed and agreed at Rio+20. These should include:

- Measuring progress in the just transition;
- Educating for the green and fair economy;
- Fiscal measures for the green and fair economy;
- Investing for the green and fair economy;
- Regulating for the green and fair economy;
- Targets and goals for sustainable development in different sectors of the economy that can feed into the Millennium Development Goals (MDG) review in 2015, and any new Sustainable Development Goals (SDGs - see Section 2 below for further details). Specific initiatives to be put forward at Rio+20 on the Green and Fair Economy include:
  - Beyond GDP - The current reliance on economic growth and GDP as an indicator of success has led to perverse outcomes. It has not delivered fair levels of well-being for society or individuals. GDP is an inadequate metric through which to gauge well-being over time. Instead we need to reassess our common values, making decisions that lead to a green and fair economy around what we really value. There is an important distinction between assessing current well-being and assessing sustainability.
  - Sustainable Management of Natural Resources and Capitals - The poor management and regulation of natural assets and ecosystems leads to increasingly frequent and severe regional and global crises, and is a major factor behind food, water and energy insecurity (see Section 3 below for further details on these securities). Outcomes from Rio+20 must ensure that national development strategies take full account of the state of natural assets and ecosystems and their role in sustaining human and animal well-being and economic activity; actively investing in their conservation and enhancement to avoid a devastating and irreversible global crisis.
  - Fiscal Reform - True environmental costs of production and consumption must be internalised into accounting models in order to address the causes rather than simply the symptoms of environmental degradation. The polluter pays principle should be adopted in practice in standard accounting and reporting practices for both business and governments, so that these costs can be reflected in market valuations and environmental impact assessments. Furthermore, green taxes should be used to incentivise positive behaviours and discourage harmful ones. For example, an internationally agreed mechanism to raise finance from international transport. A global Financial Transaction Tax (FTT) should be implemented, with a significant proportion of the revenue raised used to support long-term efforts to fight climate change in developing countries and implementing sustainability programmes. Lastly, all subsidies that undermine sustainable development should be eliminated, particularly those underpinning fossil fuel use and unsustainable agricultural and fishery practices.
  - Sustainable Public Procurement - Governments must use public procurement as a leadership and leveraging tool to promote the green and fair economy. All public procurement contracts should include specifications for labour and environmental sustainability standards.
  - A Declaration on Planetary Boundaries - Rio+20 is an opportunity to formally recognise key environmental limits - such as planetary boundaries - within which we must remain, and the thresholds that we must respect in order to maintain the sustainability of our planet. Rio+20 should begin the process of creating a Declaration on Planetary Boundaries which outlines key principles and shows political commitment by attendees to this concept.

- A Convention on Corporate Sustainability - All corporations must be mandated to report on their environmental impacts and contribution to wellbeing, or explain why they are not doing so. There should be a commitment at Rio+20 in the form of a Convention on Corporate Sustainability to develop national regulations which mandate the integration of material sustainability issues in the Annual Report & Accounts; and therefore providing effective mechanisms for investors to hold companies to account on the quality of their disclosures.

- Global Convention on Rio Declaration Principle 10 iV Access to environmental information, participation in transparent decision-making processes, and access to judicial and administrative proceedings should be basic rights for all, at all levels of decision-making, including local, national and international processes. Rio+20 should support a proposal for a Global Convention on Access to Information based on Principle 10 of the 1992 Rio Declaration. There could also be regional replications of the Aarhus Convention in other parts of the world.

### 3. Institutional Framework for Sustainable Development

It is vital that form must follow function for any reform of the institutional framework for sustainable development. It is important that Rio+20 should seek to improve the integration of the different elements on sustainable development; social, environment and economic. Furthermore, a renewed emphasis must also be place on Principle 10 of the 1992 Rio Declaration. Transparency, access to information, public participation in decision-making, accountability and access to justice are fundamental and necessary elements for effective and legitimate governance.

Integration of the different sustainability pillars could be effectively achieved through the creation of a Sustainable Development Council (SDC) at the top of the UN system. It would report directly to the General Assembly (on the same level with Security Council), and integrate and strengthen the work currently done separately in the UN's Economic and Social Council (ECOSOC) and Commission on Sustainable Development (CSD). It should be charged with driving forward global action on all aspects of sustainable development, promoting the transition to a green and fair economy, and initiating action on new and emerging issues such as food and energy security. Below this, a Sustainable Development Board (SDB), answering through ECOSOC to the new SDC, would merge the boards of UNDP/the United Nations Population Fund (UNFPA), the United Nations Children's Fund (UNICEF) and the World Food programme (WFP), bringing those agencies together in engaging individuals, allocating funding, delivering programmes and most importantly scrutinising outcomes against the criteria of both sustainable development and wellbeing. Horizontally linking nations, the SDB would facilitate an exchange of information from North to South, engendering co-operation, while also de-linking the concepts of well-being and material wealth.

In addition to the horizontal integration of sustainable development across the UN (and national) structures, there is also a need to strengthen the environmental pillar of sustainability giving it equal political weight to social and economic pillars within the UN system. Rio+20 must consider either strengthening the UN Environment Programme (UNEP), or upgrading it to either a UN Environment Organisation (UNEO) or World Environment Organisation (WEO). Either way, this reformed/upgraded UNEP must have universal membership with civil society represented on the governing body. It must also be given greater powers and an additional mandate to improve its efficiency and effectiveness. Its portfolio and funding must also be expanded to support sustainable development activities and partnerships at the regional levels.

Specific initiatives to be put forward at Rio+20 on the Institutional Framework for Sustainable Development include:

- Sustainable Development Goals iV In August 2011, Colombia submitted a proposal to the UN to introduce Sustainable Development Goals (SDGs). It sees these as a possible foundation for building international political commitment at Rio, providing measurable tangible goals for the sustainable development debate. The SDGs would address the Agenda 21 aims produced at Rio 20 years ago. The SDGs would apply in all countries, and therefore act as a complementary, successor framework to the Millennium Development Goals (MDGs), which end in 2015 and focuses mainly on the Global South. Furthermore, SDGs would also shift the centre of gravity away from the economic (poverty reduction) pillar of the MDGs and more towards the environmental and social pillars of sustainable development. For example, by providing measurements against metrics of planetary boundaries, and a strong focus on consumption patterns in the Global North. However, the SDGs should not detract from the urgent need for a post-2015 framework that focuses on poverty or from funding for that agenda.

- National, Local and Regional Governance iV National Sustainable Development Strategies need to be revived and refreshed with full engagement and support from business and all parts of civil society. These strategies should be underpinned with route maps outlining national actions towards a green and fair economy. Advisory bodies such as Councils for Sustainable Development need to be adequately resourced to play their full part in bringing forward new thinking and maintaining pressure for progress.

- Reform of International Financial Institutions iV There must be better incorporation of sustainable development parameters in the existing International Financial Institutions, particularly in terms of funding, operations, strategic plans, objectives and implementation. Additionally, Rio+20 should pursue further reforms to strengthen the efficiency of the Global Environment Facility (GEF).

- Planetary Boundaries Institution iV As part of the Declaration on Planetary Boundaries, a Planetary Boundaries Institution (PBI) should be given the role of promoting and developing the principles of the Declaration.

- High Commissioner/Ombudsperson for Future Generations - The needs of future generations are a crucial element of sustainable development, but are not represented in the relevant decision-making processes. In order to remedy this situation and ensure that long-term interests are heeded, it is proposed that a High Commissioner/Ombudsperson for Future Generations be created at UN and national levels.

- International Court for the Environment iV Environmental problems extend across international boundaries, but there are few effective international institutions to deal with them properly. Strengthening international environmental law mechanisms are essential to securing sustainable development. The Rio+20 outcome document should accordingly recommend the establishment of an International Court for the Environment (ICE). This would build trust, harmonise and complement existing legal regimes and provide clarity and access to justice as well as redress.

### 4. Sectoral Issues

There are also specific sectoral and thematic issues that must be discussed at Rio+20. These issues have reached a point of urgency and require immediate attention. The issues include, but are not limited to:

- The water, energy and food securities nexus iV Global trends such as population growth and rising economic prosperity are expected to increase demand for energy, food and water, which will further compromise the sustainable use of natural resources and equitable access. This pressure on resources could ultimately result in shortages which may put water, energy and food security for the people at further risk, hamper economic development and poverty reduction, lead to social and geopolitical tensions and cause lasting irreparable environmental damage.

Ensuring the resilience of basic ecosystems services through the integration of common challenges and solutions of these securities is vital; which should be coupled with principles of fair and secure access to water, energy and food for all people.

- The Blue Economy - Healthy oceans provide tremendous economic, social, and environmental benefits that directly support livelihoods around the globe, and further support life-sustaining processes for the planet. Consideration and inclusion of these services at Rio+20 is imperative to ensure the global community can continue to rely on the marine environment on which it so essentially depends.

- Sustainable Agriculture and Food - Rio provides a key opportunity to set us on a new global course for food and agriculture. There is a need for urgent, radical reform of the global food system. As climate change is predicted to be a major driver of future food poverty, it is the duty of the planet's decision makers to take steps to avoid this coming catastrophe. This requires an understanding of the complexities of our planet's ecosystem services, the way in which they interact with one another and our impacts on them.

While these issues are seemingly environmental, they are, at heart, issues of fairness. Our current activities (e.g. fossil fuel and water consumption, use of chemicals and forest clearance) are reducing the planet's ability to sustain life. Our current food system is broken in that it allows widespread hunger, obesity, obscene waste, animal cruelty and appalling environmental degradation. It is a system that was set up with the primary purpose to deliver profit for an elite few. Through increased efficiency, reducing wastage and sharing best practice we have the ability to feed everyone on the planet without devoting any more land to food growing. Yet, at the moment estimates state that one in seven people on the planet go hungry everyday. So not only are we destroying our own only life support system, we are doing so in a highly inequitable manner.

UN policies and programmes and Rio+20 provide an opportunity for global leaders to agree on humane and sustainable agriculture policy and practice, with a focus on agro ecological approaches and recognising the fundamental role of small scale farmers in providing food for those most in need, the majority of which are women. In addition to improving the efficiency of food systems and reducing waste, a focus should be on improving production. These goals can be achieved in part through sharing of knowledge, best practice and technology.

Animals are important to biodiversity and they have an important role in maintaining the healthy balance of life on earth. Rio+20 outcomes must acknowledge the role of animals and their welfare within greener agriculture systems and wider society.

- Renewable Energy - Our current models of energy production are driving dangerous climate change. Addressing energy access through locally appropriate renewable technologies therefore enables development and catalyses a global shift away from fossil fuels. By installing enough renewable energy, the cost of investment will continue to fall until it becomes competitive with fossil fuels, thereby making renewables the default choice. The necessary levels of investment will not be delivered by market forces alone, especially around the decentralised systems the International Energy Agency predicts will dominate future spending, meaning public policies and investment will play a pivotal role.

UN initiatives and Rio+20 are both opportunities that should not be missed, and policies should be based on the extensive research that exists on the most effective way to catalyse the uptake of renewable technology. Meanwhile, outcomes must ensure that the necessary energy transformation respects the principles of a green and fair economy. Communities and civil society must be central to all policies at each stage and on all levels (global, national and local level). This provides legitimacy and longevity through local ownership, as well as protection from environmentally and socially harmful technologies and practices which would not deliver sustainable development.

The installation, operation and maintenance of renewable energy is far more labour intensive than our large-scale, centralised fossil fuel-powered energy systems. Therefore pursuing a policy of renewable energy access that respects labour and human rights can create the quality of jobs and training programmes that are necessary for a sustainable economy in both the Global North and South.

„h Population dynamics and lack of access to sexual and reproductive health and rights ;V Population dynamics, including growth, urbanisation and migration, interact with the environment to influence availability of natural resources, biodiversity, climate change and other key Rio+20 priorities. Ensuring universal access to sexual and reproductive health programmes that respect and protect human rights would enable all women and couples to plan and space their children as they wish, offering scope to achieve population stabilisation and contribute to poverty alleviation, gender equality, environmental sustainability and other important aspects for sustainable development.

- Urbanisation and Planning ;V Taking population dynamics into account, including population growth, urbanisation, migration and ageing, will help focus the sustainable development agenda. Between 1995 and 2005, the urban population of developing countries grew by an average of 1.2 million people per week, or around 165,000 people every day. By the middle of the 21st century, it is estimated that the urban population of these countries will more than double, increasing from 2.5 billion in 2009 to almost 5.2 billion in 2050.<sup>3</sup> In 2008, developed nations were about 74 percent urban, developing nations were 44 percent urban and for the first time the world's population was evenly split between urban and rural areas. The urban areas of the world are expected to absorb almost all the population growth expected over the next four decades while at the same time drawing in some of the rural population.<sup>4</sup> While the overall proportion of the world's population living in slums has fallen in the last decade from one quarter to one third,<sup>5</sup> the population of slum dwellers in absolute numbers has continued to rise to 1 billion today.<sup>6</sup> Efficient and inclusive urban mobility is essential for economic and social development since it enables citizens to access goods, services, jobs, markets, education opportunities and social contacts. Yet, urban planning and management has been unable to either cope with the growth thus far or address urban challenges. So without improved capability for urban planning and greater political vision and support, this future increase is likely to cause significant socio-environmental problems for our cities and towns. The rapid urbanisation and growth of cities must be addressed so that there is fair access to resources as well as sustainable resource use. This means green and low impact development in cities, growing urban food networks, increasing urban biodiversity, reducing pollution, recycling resources, and managing land-use through robust and inclusive planning systems focussed on the delivery of sustainable development, operating within environmental limits and enabling social justice.

---

## Boston University, Pardee Center

Rio+20: Accountability and Implementation as Key Goals

Adil Najam and Miquel Muñoz

About the authors Prof. Adil Najam was recently appointed Vice Chancellor of the Lahore University of Management Sciences (LUMS) in Pakistan and was until recently the Director of the Frederick S. Pardee Center for the Study of the Longer-Range Future. He works on issues of international diplomacy, sustainable development, and human well-being, with a focus on developing countries.

Dr. Miquel Muñoz, a Post- Doctoral Fellow at the Frederick S. Pardee Center for the Study of the Longer- Range Future, specializes in renewable energy, sustainable development and climate change. He has participated in numerous international environmental negotiations.

Sustainable Development Insights is a series of short policy essays supporting the Sustainable Development Knowledge Partnership (SDKP) and edited by Boston University's Frederick S. Pardee Center for the Study of the Longer-Range Future. The series seeks to promote a broad interdisciplinary dialogue on how to accelerate sustainable development at all levels.

For more than two decades the Global Environmental Governance (GEG) system has been a story of growth, and there is much progress to celebrate: scores of new international institutions; a proliferation of legal instruments, declarations, and financial mechanisms; growing public interest; multiple layers of national structures; an impressive knowledge economy serviced by multitudes of experts in governments, academia and in civil society. Most importantly, perhaps, the idea of sustainable development is now firmly ensconced as the very central goal of all environmental governance. Arguably, environmental governance can now only be understood within the

context of the sustainable development imperative.

Despite the fact that there is much to be justifiably proud of in this growth in the infrastructure of governance, the global challenges have in fact multiplied in both number and intensity. This is partly because our understanding of the extent and nature of many of the challenges has itself grown, and many of the problems have proven to be far more complex and difficult to deal with than we had once assumed. But it is also evident that while much of the global effort has focused on negotiating agreements, there has been little focus on implementing the agreements or holding international actors accountable for their global commitments. One does not wish to be harsh in this assessment, since we are still in the relatively early days of this global enterprise. However, as we prepare for the forthcoming 2012 United Nations Conference on Sustainable Development (known as "Rio+20"), an accountability and implementation deficit now stares us squarely in the face. And Rio+20 would be a very good moment to start seriously addressing this deficit.

Stakeholders at all levels are aware of the urgency for the GEG system to deliver on its promise of implementation. However, there are obstacles to achieving this goal, none more important than a widely prevalent 'culture of unaccountability.' For years, talk of accountability was feared by many who considered it a threat and resisted by others who saw it as a distraction from 'real issues.' We believe that this is no longer the case. There is a growing realization of the costs of unaccountability, an evolution of norms in related governance areas, and a recognition that accountability is a key lever for implementation. Importantly, Rio+20 and its focus on the institutional challenges to sustainable development provide an opportunity to bring the issues of accountability and implementation to the forefront.

This paper seeks to develop a practical agenda for institutional reform to improve implementation by identifying a set of incremental and plausible steps in two areas: (a) strengthening the mechanics that cultivate accountability, and (b) putting into place the institutional arrangements that nurture these mechanics. A first and important step, however, is to recognize the aforementioned 'culture of unaccountability.'

#### The Culture of Unaccountability

A 'culture of unaccountability' is perhaps the most significant enabler of unaccountability and, thus, lack of implementation in GEG. It is important to understand why the culture of unaccountability has become such a pervasive feature of the GEG system. Our previous work (Najam and Halle 2010) identified several reasons.

Global environmental governance is declaratory in nature, relying on values-based and knowledge-based persuasion, in contrast to other 'rules-based' areas of international governance. The dominant culture is one of moral persuasion — GEG efforts are generally based on the premise that if all countries do the 'right thing,' this is good not only for them, but for everyone else. This approach, however, leads to the classic free-rider problem. Rulesbased GEG exists — e.g. ozone and CITES — but, as best exemplified by the Kyoto Protocol, rules-based GEG has severe accountability and compliance deficits.

The GEG system has evolved within a negotiation paradigm, rather than an implementation mindset. The accelerated growth in the number and intensity of GEG negotiations during the last two decades has resulted in an over-heated, neverending negotiation system that can sometimes see negotiation as its primary function and goal.

Environmental institutions have morphed into — and see themselves as — negotiation support services. As a result, GEG efforts are measured by negotiation metrics rather than by actual environmental improvements.

Often, implementation stakeholders have little ownership of the treaties that they inherit from the negotiators. Developing countries' few resources are siphoned off to servicing the appetites of international negotiation, at the expense of domestic implementation.

Global realities are being shaped by forces beyond the nation-state, yet key actors remain unrepresented in the GEG system. Despite wellmeaning yet token participation, most non-state actors — whether civil society groups, business interests, or local communities — have no real tools to hold the international system accountable for its actions (or inaction); nor does the international system have any real tools with which to engage with civil society.

Beyond shaming, there is no disincentive for failing to implement.

Shaming itself becomes less effective as repeated failure leads to an increased culture of unaccountability, where the norm seems to be that implementation of commitments is optional, rather than mandatory. In addition, there is a short institutional memory of who committed or failed to implement what, which leads to further impunity for failing to implement, even for the soft standards of naming and shaming.

#### Towards More Accountability: A Pragmatic Agenda

It is impossible to undo the culture of unaccountability with the stroke of a pen. As any large organization knows, institutional cultures cannot be changed overnight, and changes require long-term dedicated toplevel commitment. What is needed is a set of 'radically incremental' steps to begin creating an alternative culture of accountability that refines, reinforces and rewards the habits of accountability within the international system, while discouraging unaccountability.

This can be done by identifying those elements within the GEG system that are doable today and will begin developing a culture of accountability, steering the system in the right direction. These steps include enabling accountability mechanics and enabling institutional arrangements, both of which are discussed in greater detail below.

#### Enabling Accountability Mechanics

We define accountability mechanics as those measures that cultivate and facilitate accountability. These include metrics and reporting, transparency, compliance, and capacity building.

##### 1. Improved Metrics and Reporting Mechanics

Effective mandated reporting requirements must be defined to gauge progress against obligations and commitments, using agreed upon sets of performance indicators. Improved metrics are required, especially metrics that measure actual progress in environmental matters, rather than effort. In physics, moving a single brick represents more work than pushing a wall for days. In a fitting analogy, for the GEG system we want to know how many environmental bricks have been moved, not how many years governments spent pushing against walls. Particularly relevant are metrics reflecting bottom-up and local approaches. After all, action and implementation are ultimately local affairs.

It is important to emphasize that good indicators and reporting cost money, both for monitoring and data collection, and for the actual preparation and submission of reports. For instance, the cost of preparing a single national report on implementation for the UN Convention to Combat Desertification has been estimated at approximately US\$56,000. Even such modest estimations, if spread across the spectrum of multi-lateral environmental agreements (MEAs) and the GEG system, quickly escalate to significant amounts. Thus, improved metrics and reporting requirements cannot be slapped into an agreement as an afterthought, but need to be conceived and endowed with appropriate resources.

Importantly, there are synergies and economies to be had if reporting metrics for different MEAs are coordinated and cross-learning is encouraged.

In addition to being appropriately funded, reporting needs to be more effective in conveying meaningful information. Volume after volume after volume of reports may keep their authors busy, but mostly go unread and join their predecessors in the ever-growing pile feeding the global data overload. We need better reporting, not more reports. Effective reporting places asymmetrical requirements on different countries.

Developing countries will require assistance for capacity-building and other enabling measures, while developed countries need to take the lead with clear and accurate reporting, including on fulfillment of existing commitments. Reporting, particularly self-reporting, also has asymmetrical consequences, where weaker parties can be penalized (for example by donors) for reporting failure, while more powerful countries face no repercussions. This needs to be recognized and addressed if effective reporting is to be achieved.

#### Accountability in the GEG System

There are at least three different types of accountability in the GEG system that need to be addressed separately: Accountability to mandate. Is an international organization accomplishing what it was created to accomplish? Businesses are most clear on this type of accountability, which is measured by their bottom lines. International organizations are surprisingly silent on this. For example, a treaty secretariat or national representative is more likely to tell you how many meetings were held and how many decisions were made than to say whether, how, and to what extent the purpose of the treaty was advanced because of these meetings and decisions.

Institutional accountability. Is an organization well- managed? Managerial processes, such as hiring, staff performance and reward, budgetary controls, etc., have occasionally become the subject of public discussion, but usually only when they become 'scandals,' raised by those who wish to discredit the GEG system. Supporters of the GEG system often choose to wink, nod, and ignore blatant managerial abuse in international organizations, thus being complicit in a conspiracy of silence, just because they do not wish to strengthen the hands of those out to 'cut the system down to size.'

Accountability to constituency. Whom are international organizations accountable to? This gets straight to the power politics of institutions, including inter-state, intra-state and non-state actor politics. It can be argued that global citizenry is the constituency of global environmental institutions, with Member States acting as custodians. While global citizenry interacts with global institutions through the state apparatus, in doing so it does not cede its right to hold these institutions and their actions accountable.

#### 2. Improved Transparency Mechanics

Transparency is a key element of accountability, especially with regard to review and monitoring programs. There are different review models, each with their advantages and drawbacks. The essential element is that the monitoring of GEG performance becomes independently verifiable and allows the involvement of third parties. Existing review mechanisms include those based on self-reviews, third-party reviews, and peer-reviews. An example of third-party review is the OECD's Environmental Performance Review (EPR) Programme, while a review based on voluntary national presentations is exemplified by the MDG Annual Ministerial Review.

Peer-reviews are a growing area of interest, with examples found in OECD DAC peer reviews, NEPAD's African Peer Review Mechanism (APRM), or nationally-initiated peerreviews, such as France's peer-review of National Sustainable Development Strategies. Other review approaches are being explored, including UNEP's work on MEA review methodology, or bottom-up approaches based on local review mechanisms. Review mechanisms have to be conceived and understood as collaborative efforts in the context of eradication of the culture of unaccountability, rather than as an impingement on sovereignty or stepping into some other agency's mandate.

Environmental leaders need to set this culture in motion by voluntarily initiating such performance reviews to establish themselves as the purveyors of best practice. Once enough of them take the lead in this, it will become more and more difficult for other actors not to follow suit.

Monitoring is a task where NGOs and whistle blowers have traditionally been active, either in a collaborative way, such as the civil society-led wildlife trade monitoring network, TRAFFIC, or through a more aggressive approach, such as the Environmental Intelligence Agency.

The internet and information technologies open a new range of possibilities for monitoring and transparency. From a top-down or centralized perspective, the possibility of transmitting and revealing large quantities of information at the click of a mouse allows for centralized transparency or 'raw' accountability.

Wikileaks has already had an impact on climate change and other MEA negotiations. While the jury is out on whether such data dumps are good or bad for the overall health of the system, the number of similar episodes is likely to grow. Given the predictable recurrence, it would be wise to conceptualize ways in which the impact of such 'leaks' can be positively channeled towards accountability and implementation.

#### 3. Improved Compliance Mechanics

An effective set of compliance incentives entails a delicate balance of 'sticks' and 'carrots.' The problem of accountability is not only that the system does not punish bad behavior, but also that it does not reward good behavior. A system of incentives for better performance with rewards for good behavior and early action is needed to complement monitoring and penalty-based approaches.

Rewards for countries who live up to their commitments, for example, could include trade preferences, or preferential access to international credit or to global support funds such as the Global Environmental Facility (GEF). There is ample precedent of needs-based preferential treatment, so perhaps it is also time for performance-based preferential treatment. It must be stressed that a country's performance should not only be compared to that of similar countries, but, most importantly, against itself. Is a country doing better over time?

The transparency mechanisms discussed above should be linked directly to compliance. The key element is for the information to clearly show whether agreements are being complied with or not. Such information, when available across countries, will itself become a source of real pressure on countries to improve their image — i.e., be seen to be compliant to, rather than deviant from, their global responsibilities.

#### 4. Capacity Building

The need for more and better capacity building in developing countries is a permanent demand in the GEG system. The lack of capacity in developing countries is a real and urgent problem that, among its many consequences, perpetuates the lack of accountability (for both developed and developing countries) and makes implementation more difficult, and sometimes impossible. The role of capacity building in improving accountability and implementation cannot be underestimated. However, the key question — as in so many capacity building issues — is capacity for whom and capacity for what? To begin with, capacity enhancement for improved reporting, transparency, and compliance is needed. Moreover, it is needed at the national (and sometimes local) levels. In essence, we are talking about the capacity to implement and the capacity to be able to account for implementation.

The creation of structural and permanent capacity in developing countries to monitor, report, and analyze information related to implementation is an urgent need.

Importantly, such capacity is needed in governmental as well as nongovernmental institutions so that effective networks for accountability can be created and sustained.

#### Enabling Institutional Arrangements

Institutional arrangements are needed to nurture accountability mechanics and foster a culture of accountability, including by strengthening the habits of accountability and reinforcing these habits in a positive fashion. Institutions are important, but they will only succeed to the extent that they manage to change the culture of unaccountability, thus ensuring accountability and implementation in the longer-term.

#### High-Level Brainstorming Session:

“Accountability and Implementation:

The Keys to Sustainable Development”

The Frederick S. Pardee Center for the Study of the Longer-Range Future at Boston University co-hosted a side event on “Accountability and Implementation: The Keys to Sustainable Development” at the Second Preparatory Committee for the United Nations Conference on Sustainable Development (Rio+20) on March 8, 2011. The event, supported by the Nordic UN Missions of Denmark, Finland, Iceland, Norway, and Sweden to the United Nations in New York, was attended by senior diplomats, nongovernmental experts, and scholars, and served as a high-level brainstorming session to identify key steps towards accountability and implementation in the global environmental governance system. The session was chaired by Amb. Carsten Staur (Denmark), facilitated by Prof. Adil Najam (BU Pardee Center), and included presentations by Sen. Elizabeth Thompson (Barbados), Dr. André Aranha Corrêa do Lago (Brazil), Dr. Asad Khan (Pakistan), Amb. Irene Freudenschuss-Reichl (Austria), and Dr. Bradnee Chambers (UNEP).

The brainstorming session with senior practitioners provided valuable input into the ideas presented in this paper. The session highlighted the fact that accountability is now clearly seen as a key challenge for all global governance, including for governance in pursuit of sustainable development, and especially in the context of Rio+20 discussions. While there is wide support in both North and South for addressing accountability concerns, the preferred approaches of various actors range from largely voluntary initiatives to more mandatory measures. The urgency for a meaningful response, however, seems shared by all.

#### 1. Compendium of Best Practices

One component of encouraging a cultural shift away from unaccountability is to establish a compendium of best practices in accountability. Despite the prevailing culture of unaccountability in GEG, throughout the system there are cases and examples of good practice. These cases need to be documented and understood, both to avoid reinventing the wheel and to increase the levels of expectation. Recognizing and rewarding (even if just by acknowledging) good practice will likely foster replication and nudge the system towards a culture of accountability.

The compendium should not be conceived as one more publication. After all, as mentioned above, what is needed is better information, not more reports. The compendium of best practices, then, should be conceived as a dynamic learning process, where best practices are not only compiled, but also dissected and analyzed, providing the added value of highlighting what worked where, when, and why. Within this framework, a publication providing a yearly snapshot could be presented at the annual meeting of the Commission on Sustainable Development (CSD) with the main goal of celebrating and acknowledging good practice, thus reinforcing a system of positive rewards. Different from other reports, such a compendium could ‘live’ on the internet — in a manner that allows it to be dynamically accessed as well as updated. Any such compendium would be greatly strengthened if it also included information on ‘bad practice,’ if only as exemplars of what is to be avoided. Knowing best practice helps us to avoid reinventing the wheel; knowing bad practice prevents us from stumbling twice against the same stone. The idea should not be to shame, but to outline a clear sense of what is not desirable and why.

#### 2. Registry of Commitments

With very few exceptions, every conference of the parties (CoP), subsidiary body, and any other GEG meeting results in decisions, conclusions, declarations, plans of action/implementation and a myriad of other agreements that ultimately boil down to commitments. How many commitments, by whom, and on what? Which ones have been fulfilled? No one really knows, as many commitments are already forgotten by the time the next meeting is held and most remain unimplemented.

There is an urgent need for a centralized registry of commitments that keeps track of which country or institution has agreed to do what, and the extent to which that commitment has been fulfilled.

Having an open, transparent, and easily accessible record of all commitments will have a healthy effect on the system and keep negotiators from re-inventing the wheel over and over again. With the register of commitments, negotiators will have a handy reference to existing agreements and an incentive to make only those commitments that countries have the intention or capacity to fulfill. Most importantly, such a register will move the focus away from the need to be seen to reaching agreement on ‘new’ commitments (even when they are not new at all) and towards a discussion of how well we are doing — or not — in fulfilling ‘old’ commitments.

The proposed registry could quickly evolve from a mere compilation of commitments to a system of commitment tracking and reporting.

Similar mechanisms are being developed in an ad hoc basis for specific issue-areas, such as climate finance, but no GEG-wide registry system is in place. Examples include OECD’s tracking of development financing, or the proposal for GEG finance tracking (Najam and Muñoz 2008). Institutionally, UNEP would perhaps be best placed to host this register since it has the institutionwide mandate for information gathering and knowledge creation.

Indeed, placing such a system within UNEP would also serve to strengthen UNEP in other significant ways. For example, it would provide a renewed reason for better inter-institution coordination, especially between MEA secretariats and UN agencies and programmes.

#### 3. (Re)New(ed) Focus for CSD

Recent events at the Commission on Sustainable Development (CSD) have again highlighted the fact that it is an institution with a forever uncertain future. Constrained by the straight jacket of a rather inflexible 14 year Programme of Work, its negotiation role severely weakened by an inability to deliver, the CSD clearly needs to rediscover itself again. Born from the Rio Earth Summit 20 years ago, CSD has the perfect opportunity at Rio+20 to reach back to its roots and renew itself as the agency it was originally designed to be.

Revisiting the original mandate of CSD provides useful inspiration, particularly in terms of how important the accountability and implementation role was in the original design of this platform. For example, the original architects of the CSD had envisaged its role as including:

“monitor progress in [...] activities related to the integration of environmental and developmental goals throughout the United Nations system through analysis and evaluation of reports from all relevant organs, organizations, programmes and institutions of the United Nations system dealing with various issues of environment and development;” and “consider [...] information regarding the progress made in the implementation of environmental conventions.” Thus, we propose that the CSD returns to its original purpose, and becomes a reporting and assessment hub, the place where the world meets once a year to assess and to report on progress towards sustainable development, including on environmental issues. It would thus cease to act as a negotiating forum and embrace its original design more wholeheartedly than it has in its first two decades. Accountability of GEG (as well as the other dimensions of Global Governance for Sustainable Development) would become the key function of the CSD.

We envision a reporting process where secretariats would be tasked (and given the necessary tools and mandate) to assess progress towards the respective goals of their organizations, and to develop their reports based but not dependent on national reporting. The focus would be measuring actual progress, rather than effort, as illustrated earlier with the 'pushing the wall' analogy. Importantly, the idea is not that agencies report 'to' the CSD, but that they report 'at' the CSD. This is a key distinction. The idea here is for the CSD to return to its conception as a forum that brings together the key actors in GEG to take stock of where we are in our global commitment to sustainable development, what have we achieved, and what still remains to be done. The idea is not to give the CSD a punitive or regulatory role, but rather to turn it into a venue for an ongoing assessment of the global progress towards sustainable development.

#### 4. Towards a Global Instrument ('A Global Aarhus')

Ultimately we are ready to move towards the next step of creating a global legal instrument to enhance greater accountability in environmental governance. The Economic Commission for Europe's Aarhus Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters is a working model that has been widely cited as a success.

The Aarhus convention, however, is regionally limited in scope. It may be time for a global instrument, a global version of the Aarhus Convention, to improve the GEG system and move it towards a new culture of accountability. As we begin preparations for the 2012 Rio+20 conference, negotiation of such a global instrument might be a goal that Rio+20 sets for itself. If the great achievement of the Rio conference in 1992 was that it triggered a surge of global environmental negotiations and environmental instruments, it would be a fitting goal for Rio+20 to put together a robust system of accountability around these negotiations and instruments. Such an instrument clearly would be Aarhus-plus. Not only because it would be global, but more importantly because it could incorporate the type of steps and recommendations outlined in this paper: an umbrella agreement which brings together a system of better accountability for better implementation in GEG.

#### Sustainable Development Knowledge Partnership (SDKP)

brings together governments, individuals, institutions, and networks engaged in the production and dissemination of knowledge on sustainable development, including research institutions and sustainable development expert networks. Its aim is to organize knowledge on sustainable development and make it available to policy makers and practitioners. The Partnership is supported by the Division for Sustainable Development of the United Nations. Sustainable Development Insights is a contribution of The Frederick S. Pardee Center for the Study of the Longer-Range Future at Boston University to the SDKP. The Frederick S. Pardee Center for the Study of the Longer-Range Future at Boston University convenes and conducts interdisciplinary, policy-relevant, and future-oriented research that can contribute to long-term improvements in the human condition. Through its programs of research, publications and events, the Center seeks to identify, anticipate, and enhance the long-term potential for human progress, in all its various dimensions.

## Brazilian Chemical Industry Association - Abiquim

### BRAZILIAN CHEMICAL INDUSTRY ASSOCIATION (ABIQUIM) INPUT FOR UNCSD 2012 COMPILATION DOCUMENT

01/11/2011

#### Introduction

1. Sustainable Development is the foundation upon which all human activities should be based. The Brazilian Chemical Industry Association (Abiquim) participated at the 1992 UN Conference on Environment and Development and the 2002 World Summit on Sustainable Development, and has played an active and significant role in subsequent intergovernmental initiatives to promote safer chemicals management at national, regional and international levels, on its own right or as part of the chemical industry community lead by the International Council of Chemical Associations (ICCA). Abiquim develops its Responsible Care® initiative, called Atuação Responsável®, since 1992, and is fully committed to promoting sustainability and the safe management of chemicals throughout their lifecycle, both inside and outside the Country.

2. As an ICCA member, Abiquim participated in the development of ICCA's input for UNCSD 2012 Compilation Document and fully supports its contents. Abiquim's document reinforces ICCA's positions and provides some specific views from a chemical industry located in a developing country.

#### Objectives for UNCSD 2012

3. Likewise the ICCA, Abiquim sees UNCSD 2012 as a valuable opportunity to take stock of progress made since the 1992 Earth Summit, and to develop policies and responses which address new and existing challenges, particularly in developing countries, the ones where sustainable development can make the greatest change and positive impact. UNCSD should focus on outcomes that recognize all three pillars of sustainable development as essential components of recommended policies and solutions, whose implementation should be carried out in a balanced manner, taking into account the capacities and priorities of all parties involved.

4. To the chemical sector, the UN Conferences on Sustainable Development have been particularly important to advancing sustainable management of chemicals. Abiquim

believes that, while many challenges remain, significant advances have been made since 1992. Internationally, this includes legally binding instruments focused on the key global elements of chemicals management (e.g. the Stockholm, Rotterdam and Basel Conventions, and the new instrument under negotiation on mercury); innovative multi-stakeholder voluntary based partnerships such as the Strategic Approach to International Chemicals Management (SAICM); and industry-led initiatives such as the Global Product Strategy and the Responsible Care Global Charter. Additionally, at regional and national levels, regulations and voluntary industry initiatives (e.g. the Brazilian Responsible Care Program – Atuação Responsável) have been introduced (or improved) aiming at securing adequate levels of chemical safety management.

5. In 2002, at the WSSD, the Johannesburg Plan of Implementation (JPOI), in its paragraph 23, called on stakeholders to renew the commitment advanced in Agenda 21 to sound management of chemicals and to achieve, “by 2020, that chemicals are produced and used in ways that lead to the minimization of all significant adverse effects on human health and the environment” . The JPOI launched the SAICM, whose development was concluded in 2006 and approved at the first International Conference on Chemicals Management (ICCM 1). Since then, the global community has used the ICCM process, with very good results, to find the best alternatives to meet the WSSD’s “2020 target” for sound chemicals management.

6. Abiquim has been actively engaged with the SAICM at national, regional and international levels (here as part of ICCA). As an ICCA member, Abiquim fully supports the strengthening of SAICM as an outcome from UNCSD and does not support calls for the development of a new international regime on chemicals and hazardous substances. In particular, Abiquim does not view a “framework convention” on chemicals as being appropriate at this time: it would increase the administrative and bureaucratic overhead of international efforts to promote sound chemicals management, and, by excluding non-governmental stakeholders from direct participation in decision making, undermine the innovative and constructive example set by SAICM. The mandate to promote sound chemicals management set at WSSD runs through to 2020, and UNCSD should focus on assessing progress towards the 2020 goal and providing recommendations to help facilitate further progress, in particular with regards to the provision of adequate resourcing for SAICM activities and the functioning of its Secretariat, thus enabling the ICCM to achieve its mandate.

#### Green Economy in the Context of Sustainable Development and Poverty Eradication

7. A green economy, regardless of the absence of a precise and internationally agreed definition of the term, presupposes the existence of greener products and services, produced and consumed sustainably. Abiquim understands that the chemical sector is enabled to provide key contributions to a green economy, and reinforces that the Brazilian chemical industry is publicly committed to developing, producing and delivering greener products and services, in partnership with other sectors and parties.

8. Sustainable Consumption and Production (SCP), built around life-cycle thinking, sound economics and scientific understanding, should guide the market to achieve sustainable development. Discussion should consider that production will follow consumption and, though the private sector must take sustainable production seriously, exploring paths to a different, not less, consumption regime is expected to generate better results.

9. The chemical sector considers that green, sustainable chemistry is an indispensable contributor to accomplish sustainable production. Sustainable chemistry is key to ensuring the best use of scarce natural resources as the world’s societal demands increase. This improved chemistry is based on sound and inclusive science, applied in new or improved technologies which lead to innovation and the deployment and diffusion of greener products. To strive, it depends on the application of policy frameworks which enhance sustainable outcomes (for example, incentives for research and development).

10. Since its early days, the chemical industry has been closely related to the energy sector, in particular to the coal and oil industries. This relationship results from the need to use fuels for heating purposes in many chemical processes and from the fact that some of the same fuels and other materials generated by the energy sector have been used as feedstocks for chemicals production. As demands for biofuels increase, new renewable feedstocks have become available as alternative feedstocks for the chemical industry. In Brazil, for example, the opportunity to use biomass as feedstock, in a sustainable chemistry approach, has boosted scientific and technological development both in agriculture and industry, and has already resulted in commercial production of chemicals from biomass. More is in the pipeline, since there is a clear demand for such chemicals for their environmental and social positive impacts. Abiquim understands that UNCSD should promote discussions on incentives to renewable chemicals in order to promote sustainable production within a green economy.

11. Because of its unique position, the chemical industry operating in developing countries has a critical role to play in advancing sustainable chemistry while it supports local sustainable development strategies. Abiquim defends that poverty eradication in developing countries can be accomplished faster and more efficiently by promoting responsible industrialization strategies for their national economies, aiming at achieving sustainable patterns of production and consumption, in line with green economy principles. Properly conducted, industrial sustainable development strategies provide many direct benefits such as good and well paid jobs, improved infrastructure and better education for workers; as well as indirect benefits such as higher social incomes and improved urban conditions. The chemical industry is globally recognized as a good employer and through its investments and high value products, a great contributor to poverty eradication in the countries where it operates. Every job in the chemical industry generates five others in the value chains it participates, not including the ones in universities and research centers, making this industry a catalyst for social and economic development, in a green economy context.

12. Investments in responsible industrialization in developing countries should be a priority in a green economy. The capital applied in industry raises the living standards of all segments in any society, heavily contributing to free millions from illness, hunger, lack of decent housing and violence – well known consequences of poverty. Investors should be stimulated to use their financial resources in supporting sustainable production, particularly in developing countries, as a way to earn fair returns and to contribute to reduce the risks of global financial crises. Policy frameworks to stimulate investments need to be clear, stable and predictable to give investors and financiers the confidence to foster innovation-led green development which address all three pillars (economic, social and environmental) of sustainable development.

13. Open trade, functioning under international accepted rules, is indispensable for growing a green economy. Efforts to advance the green economy, including public-private partnerships, should work within market systems and not distort markets or limit market access, with an appropriate balance between public and private sector roles. Government policies should promote greener products and technologies without establishing tariffs or other trade barriers that could hinder their application to greening economies worldwide. Of particular importance is secure and cost-effective access to key renewable raw materials for chemical production. The global development and diffusion of simple and viable technologies on one hand, and state of the art technologies on the other, which will be crucial to progress towards a green economy (e.g. on issues such as climate change), depends heavily on free and open trade.

14. A global culture which fosters sustainable values and life-styles is the foundation of a green economy. Public at large should know more about the science which supports sustainable development, and governmental authorities and officers, industry professionals and other decision makers should be educated through capacity building initiatives related to sustainability, particularly in developing countries. A global culture based on sustainable values cannot tolerate social disruptors such as the traffic of drugs, corruption, terrorism and wars. A rigorous fight against them is vital to allow green economy and sustainable development to flourish.

#### Institutional Framework for Sustainable Development

15. Abiquim subscribes ICCA’s positions regarding the need to enhance the current institutional framework for sustainable development, which has a number of shortcomings. The failure of CSD-19 to agree on an outcome is an important illustration, highlighting the way that negotiated text has taken priority over the identification of practical mechanisms for advancing sustainable development. ICCA and Abiquim strongly believe that the focus of discussions on the institutional framework at UNCSD must be on pragmatic reform to ensure a more integrated approach to sustainable development at the inter-governmental level.

16. Institutional frameworks should foster sustainable development rather than constrain it, and form must follow function. Relevant activities should be grouped together in clusters, without establishing additional layers of bureaucracy. Efficiencies should be pursued in all instances where they can help to promote sustainable outcomes. The private sector has technical and implementation-related expertise that can help inform policy decisions and improve the effectiveness of implementation.

17. As part of the ICCA, Abiquim supports the strengthening of UNEP to enable it to more effectively coordinate and address environmental issues within the overall context of sustainable development. Reform must, however, extend beyond that to include key global institutions covering all three pillars of sustainable development. These institutions should be integrated into the priority-setting process, and concentrate on their specific added value. Two concrete steps should be implemented to assist in setting priorities and ensuring that resources are appropriately deployed:

(a) Strengthening the science-policy interface within international institutions, with the full and meaningful participation of developing countries. This must also include channels for incorporating credible and robust science from stakeholders, including business and industry;

(b) Links between policy frameworks and the financing for relevant institutions also need to be strengthened. Government resourcing for international institutions should be more strategic, and the institutional framework should provide for vigilant oversight of resources contributed.

18. The institutional framework for sustainable development should also help build capacity and develop institutions that support implementation at the national level. National and regional differences mean that imposing a top-down global model for sustainable development is unlikely to effectively address underlying problems and challenges. Taking ownership of sustainable development through national institutions (with appropriate international support) is the most likely means of securing real impact at the national level.

19. Finally, sustainability challenges cannot be adequately addressed by governments alone. The challenges of globalization require active collaboration between governments and other stakeholders. In this regard, private-public partnerships can supplement inter-governmental activities and act as a catalyst for improved implementation. SAICM provides an innovative model of how multi-stakeholder frameworks can help advance sustainable development objectives. Any reforms to the institutional framework for sustainable development emerging from UNCSD must recognize the contribution of non-governmental stakeholders, including business and industry, and ensure an appropriate role for these groups in the pursuit of sustainable outcomes.

## Brazilian Society of Ecological Economics (ECOECO)

The Brazilian Society of Ecological Economics-ECOECO, founded in 1994, is a regional society affiliated with the International Society for Ecological Economics – ISEE. ECOECO is a nonprofit scientific society, whose aims are to build ecological economics as a field of study and transdisciplinary understanding on the interactions between society and nature, motivating academic debate and interaction with public policies. ECOECO held its 9th Biennial Conference in Brasília from Oct. 4-7, 2011, having as one of its principal lines of discussion, the potential for transition to a “Green Economy”. This synthesis reflects on the discussion and makes recommendations for consideration during UNCSD (“Rio+20”).

### 1. Definitional issues: the “Green Economy” and Decoupling in focus

1.1 In our view, Green Economy is not exactly a new concept, but rather a toolkit for sustainable development: it should be understood as a pragmatic effort to change the real economy so as to be in alignment (with) and serve as a promoter (for) sustainable development.

1.2 From the Ecological Economics perspective, the Green Economy is based on the “Environmental Kuznets Curve (EKC)”. As a reiteration of “old” ideas in new clothing; it is a proposal to put in practice the technological effects and (sectoral) composition that it is supposed may be able to compensate for the “scale” effect of economic growth in a finite world. An important difference from the EKC, is that it proposes political activism to accelerate the transition, to induce the construction of a “tunnel” under the EKC, so as to improve human wellbeing and social equality and at the same time as it would significantly reduce the risks of environmental damage and limitations (UNEP, 2011).

1.3 Preoccupation with “sustainable scale” is included in the green economy “toolkit” in a very limited form, through the valuation of ecosystem services, internalization of environmental externalities and revision of the system of national accounts to signal tendencies of depletion of natural resources and loss of environmental quality. It would thus act as an “Early Warning System” of potential collapse.

1.4 The transition to a Green Economy is not spontaneous: it is clear that “business as usual” will be incapable of conducting the transition toward a green economy. On the contrary, such a transition will require substantial effort and engagement of all segments of society, in particular governments and private sector agents. It would demand, on the part of governments, that they level the playing field for “greener” products through removal of perverse incentives, revision of policies and incentives, introducing new market and regulatory mechanisms, redirecting public investments and public acquisitions. On the private sector side, it is necessary to respond to these policy reforms through increased financing and investment, as well as capacity building and the ability to innovate to take advantage of the opportunities opened up by the green economy.

1.5 Decoupling: implies a significant separation of rates of economic growth and welfare improvement from rates of resource consumption and associated negative environmental impacts – combined with resource productivity enhancement and increased eco-efficiency. These are resultant processes from the application of instruments proposed for the “Green Economy Initiative”; that is, decoupling will arise from a profound change in the structure of economic incentives present in a given country.

### 2. Policy dimension: potential North-South, South-South and domestic conflicts

2.1 The context of systemic crisis as an opportunity: as a consequence of a series of simultaneous crises (financial, economic, climatic, food security, energetic, ethical...), that configure a systemic crisis, debates and reflections have arisen throughout the world about the need for a new economy. This is an opportune moment to finally introduce into the economy.

2.2 Recognition that the transition for a green economy will not be neutral, since there will be losers: despite the multiple synergies and focus on measures that can generate win-win outcomes, it should be recognized that the green economy also implies losses for some actors. It is necessary to undertake measures that protect workers and smooth the way toward green jobs.

2.3 North-South conflicts that can be stimulated by the Green Economy: since currently green technologies are the domain of only a few developed countries, it is important to be attentive that the green economy not be a source of increased international disparities. Some developed countries possess a series of advantages, such as human resource capacity, technological infrastructure, high R&D investment, consolidated and long-term finance mechanisms and existing economic incentives, etc. International cooperation and new and additional financing should be considered as mechanisms to impede that the green economy serve to introduce new sources of disparities. The transition to a green economy must become a strategy of endogenous development in less developed countries.

2.4 The impact of green technologies along the social dimension: our concern here is with the complementarity or conflict between technological market solutions (protected by intellectual property rights) and “environmental social technologies” (adaptive, less sophisticated solutions in the public domain). It is necessary to evaluate carefully the

impact of new green technologies on employment, both nationally and internationally so as not to exacerbate preexistent inequalities.

2.5 South-South conflicts that the Green Economy can generate: Southern nations are more and more heterogeneous. Brazil has moved closer to the BRICS and further from Latin America. It is necessary to create a means to favor the transition globally and minimize consequent losses.

2.6 Domestic conflicts that can be generated by the Green Economy: changes in the incentive structure of a country can benefit some and harm others. Losses must be minimized. How can Decoupling be conciliated with a commodity boom? How to internalize environmental costs without losing competitiveness?

The "Green Economy Initiative" involves economic interests through the market for environmental technologies, but should not be confused with a proposal for economic liberalism; on the contrary, it should be clearly recognized the need for regulation, governmental interventions that allow a break with given existing technological trajectories to give space to new ecological technological trajectories.

The green economy has different meanings for developing and emergent economies. For the emergent, it means not only to continue growing with low impact, but also as an opportunity for endogenous development. In this sense, the obligations of Northern countries with those in the South in the name of the common good should contemplate technology transfer not as a return to neocolonialism, but involving an awareness of responsibility for environmental service payments as an ecological debt.

The operational dimension: how to promote transition for a green economy in Brazil

Transition policies should have as a goal the creation of instruments with the objective to change the structure of incentives, but also, disincentives, so as to induce agents to consider environmental effects in their production and consumption decisions (internalize the externalities).

Education has to be a highest priority, principally basic education (fundamental and high school levels), including technical training. With regard to environmental education, its principal focus should be to influence demand, that is, to educate the consumer.

Economic policy should orient investment in pro-transition sectors in which Brazil has competitive advantages, and to define special public policies that for micro and small businesses, since large enterprises react to investor pressures and regulatory rules. For this, it is necessary to create incentive and eco-innovation mechanisms, which would have as a basis the conception of innovation mobilized by profits. Some strategies in this sense include: investment in win-win-win (social, economic and environmental) strategies; investment in social technologies – already available, at low cost, with great local potential; promotion of policies of endogenous technological innovation and reverse logistics; and creation of a robust system of indicators that consider the environmental dimension.

Contribution of the scientific community (ECOECO)

The integration between scientific knowledge and development of new products, the articulation of scientific knowledge with theoretical-methodological qualification in the involved concepts are mechanisms that contribute to generate academic products consistent with reality and the needs of the economy as a whole. Examples of this are the TEEB and Green Economy studies conducted by UNEP; and studies on the costs and benefits of different market instruments and public policies that enable a transition to a green economy. Such engagement of ecological economics practitioners should be stimulated.

---

## Building Sustainable Cities

A Rio+20 e a construção de cidades sustentáveis

Contexto

O mundo está se urbanizando rapidamente. Hoje mais da metade da população mundial vive em cidades. No caso latino-americano, 80% da população vive em cidades. Em países como Argentina, Brasil, Chile e Uruguai trata-se de porcentagens maiores de 85% da população. Esta transformação demográfica altera profundamente o modo como o mundo se governa. Já não somos populações rurais dispersas com capacidade de decisão política, econômica e social apenas nas capitais. O próprio mundo rural, hoje em dia, encontra-se articulado com as cidades regionais e locais. As cidades, com o seu entorno rural, tornaram-se as unidades básicas de gestão do território e da sociedade.

A Rio+20 não será mais uma conferência de proclamação de metas planetárias. Estas estão suficientemente definidas na Agenda XXI cujos aportes devem ser aproveitados, mas também na Carta da Terra, nas Metas do Milênio, e tantos outros documentos. Os avanços impressionantes dos últimos anos na nossa capacidade de organizar e disponibilizar as estatísticas do planeta tornam dispensáveis a reapresentação das ameaças que se avolumam. O desafio da Rio+20, não está mais no buscar os objetivos, mas na definição dos processos decisórios da sua implementação.

O fato maior no que tange à implementação das políticas é a virtual inexistência de mecanismos multilaterais de gestão. Siglas como FMI, BM, OMC continuam sem dúvida significativas, mas simplesmente não estão à altura. A própria ONU, parceira indispensável das mudanças, encontra-se profundamente fragilizada. A impotência planetária frente à crise financeira apenas reforça esta compreensão. Os problemas são planetários, mas a gestão que temos, gostemos ou não, está fragmentada nos 193 governos de estados realmente existentes. É a governança que temos, e portanto as grandes políticas deverão se traduzir em planos nacionais de desenvolvimento sustentável. Com isto, a Conferência que se prepara, mais do que reafirmar ou atualizar compromissos globais, deverá traçar o roteiro para que os governos apresentem as suas formas diferenciadas de resposta aos desafios.

As políticas nacionais, por sua vez, terão de se apoiar nas cidades. Ao evoluirmos do "o quê fazer" para o "como fazer", as cidades passam a desempenhar um papel especial. Basicamente, é neste nível que as populações podem participar de maneira organizada da resolução dos seus problemas, da construção da qualidade de vida, segundo os desafios concretos que enfrentam. Os desafios podem ser planetários, e as políticas precisam ser nacionais, mas as realizações devem ao fim e ao cabo mudar os equilíbrios ambientais e a qualidade de vida nos locais onde as populações podem se organizar em torno aos seus objetivos. O tradicional tripé da sociedade economicamente viável, socialmente justa e ambientalmente sustentável precisa claramente ser complementado pela dimensão democrática e participativa da implementação.

A dimensão democrática e participativa tanto faz parte do direito das pessoas de construírem socialmente o seu destino, como é condição da implementação eficiente. A cidade, com seu entorno rural, constitui o espaço por excelência do processo democrático de decisão. É o nível em que as pessoas enfrentam desafios comuns, podem conhecer-se umas às outras, reunir-se, assegurar a eficiência dos programas nacionais. É onde as pessoas conhecem melhor a situação, e podem organizar as indispensáveis parcerias entre iniciativas públicas, empresas, sindicatos, organizações da sociedade civil. Décadas de projetos mal sucedidos nos ensinaram que a apropriação das políticas pelas populações interessadas constitui o principal fator do seu sucesso. Para existirem de verdade, as transformações que o planeta exige precisam se enraizar nas condições concretas de vida das pessoas.

Demasiada atenção tem sido dada à dimensão global dos desafios, e insuficiente ao nível onde são efetivamente implementadas. Em cada cidade encontramos situações de

pobreza crítica, e os programas sociais correspondentes precisam identificar cada família, com endereço concreto, e análise das situações diferenciadas e das medidas necessárias. As políticas de saneamento básico, de destino final de resíduos sólidos, de recuperação de solos, de democratização de acesso às políticas sociais, de articulação da cidade com o seu cinturão verde, de construção sustentável, de arborização, de segurança, de comunicação local, de mobilidade, de educação ambiental, de esporte e tantas outras passam, inevitavelmente, por políticas locais integradas. As pessoas querem viver melhor. Mobilizar o anseio das comunidades por uma vida melhor é essencial para que as políticas de sustentabilidade tenham lastro e profundidade.

Vivemos em um mundo conectado, onde quase todas as cidades estão ligadas pela internet, ou estarão no decorrer desta década. Isto significa que a gestão da sustentabilidade já não se limita a pirâmides verticais de autoridade. Cidades em rede estão aprendendo umas com as outras, consórcios intermunicipais, comitês de bacias hidrográficas, redes de municípios com vocações semelhantes ou complementares estão se organizando nos países e no plano internacional. Com a conectividade atual, já não se discute sobre municípios mais ou menos viáveis, pois a viabilidade econômica depende diretamente das articulações que se formam. A multiplicidade dos poderes locais no planeta não constitui um problema, e sim uma oportunidade de gerar um processo colaborativo planetário de territórios articulados.

As cidades constituem a unidade básica de gestão social e o elo chave da articulação política. Em inúmeros países, os prefeitos estão organizados em redes, federações, entidades regionais, nacionais e internacionais. Constituem um interlocutor essencial para a definição das políticas concretas a serem implementadas. A participação efetiva das cidades na Conferência Rio + 20, através de formas concretas de representação – governamental e não-governamental - é essencial para que os desafios que se manifestam no nível final de implementação das políticas afluam nas discussões e nas decisões finais.

#### Propostas para a ONU

- A ONU e os governos nacionais devem promover políticas de financiamento descentralizado e direto aos poderes locais para projetos de sustentabilidade;
- A ONU e os governos nacionais devem fortalecer a representação das autoridades locais no conjunto do sistema multilateral de decisão;
- Reforçar, no quadro das Nações Unidas e numa visão ampliada da função de Habitat, a organização de um sistema facilitador de intercâmbio científico e tecnológico visando a aprendizagem das cidades, umas com as outras, na construção de políticas de sustentabilidade;
- A ONU deve orientar a dinamização de políticas nacionais e regionais de formação de quadros em desenvolvimento local integrado e sustentável
- A ONU deve adotar (e apoiar a sua implantação em escala mundial) sistemas locais de indicadores sociais, ambientais, políticos, econômicos e culturais que mensurem a qualidade de vida nas cidades, permitindo às populações locais participar e avaliar as políticas de sustentabilidade implementadas;
- A ONU deve disponibilizar informações por meio de plataformas abertas, visando facilitar o acesso democrático a estas, promovendo e apoiando sistemas locais de informação e comunicação. Deve-se ainda, engajar os sistemas nacionais e internacionais de produção de informações, sejam do setor público, organizações não governamentais e setor privado. Uma cidadania informada é essencial para a construção de um processo sustentável de desenvolvimento e, para tanto, todos os atores devem ser envolvidos.

#### Propostas para os governos

I – Realizar gestão estratégica da ocupação do território com vistas ao uso sustentável dos recursos naturais e garantia de qualidade de vida para todos os seres humanos.

II - Reconhecer diferentes modos de vida existentes no território e criar políticas para valorizar essa diversidade.

III – Atuar fortemente na adaptação às mudanças climáticas com foco na diminuição de vulnerabilidade e danos e na geração de impactos positivos, priorizando as medidas que têm co-benefícios imediatos na saúde pública.

IV – Políticas de direito à cidade sustentável e democrática

• Evoluir de políticas setoriais de direito à moradia para políticas de direito à cidade (“construir bairros e cidades, e não apenas casas”), aliada com a eliminação da pobreza, promoção da inclusão social, diminuição das desigualdades, promoção à saúde através de práticas de atividades físicas e esportivas e incentivo à inovação (tecnológica, de gestão e de governança participativa nas cidades).

V - Construir Cidades sustentáveis e democráticas:

- Induzir a formulação de políticas de desenvolvimento urbano que tenham o direito à cidade, a sustentabilidade e a democracia como valores centrais.
- Incentivo à formação de sistemas integrados de cidades, nas escalas nacional, regional e municipal;
- Implantar sistema de indicadores sociais, ambientais, econômicos, políticos e culturais para mensurar a qualidade de vida, garantir a transparência das informações públicas e proporcionar o monitoramento da sociedade sobre as políticas públicas;
- Instituir legislação que estabeleça Planos de Metas para cada gestão, baseados em indicadores e articulados aos Planos Diretores, em todos os municípios;
- Criar e implantar políticas para os diferentes tipos de cidades, particularidades e formas de ocupação existentes no território.
- Fomentar a instalação de estruturas participativas de governança metropolitanas e de revitalização de centros urbanos.
- Garantir amplo acesso à educação, ao esporte e à cultura para crianças, adolescentes e jovens, promovendo a formação profissional, o desenvolvimento pessoal e a capacidade de reflexão sobre os valores que orientam a vida em sociedade com preservação e recuperação da natureza;
- Promover a integração e articulação de políticas de habitação, saneamento, mobilidade, adaptação às mudanças climáticas, proteção de mananciais, promoção do desenvolvimento e do bem-estar humano.
- Articular o acesso ao saneamento básico às ações de superação do déficit habitacional e de promoção da saúde.
- Implementar políticas nacionais de regularização urbanística e fundiária e urbanização de favelas e outras formas de ocupações.
- Aprimorar mecanismos de financiamento, subsídios e arranjos institucionais para suprir déficits e garantir inclusão e acesso a cidades saudáveis.
- Criar políticas de acesso à água potável e proteção aos mananciais de abastecimento de água, incorporando a saúde humana, a qualidade da água e uso sustentável como valores centrais na cadeia de produção da água para abastecimento.
- Ampliar o tratamento, disposição e reutilização de resíduos industriais e inertes, foco especial nas cidades com processos acelerados de crescimento e expansão e

resíduos provenientes da construção civil

- Implantar programas estruturados de coleta seletiva e reciclagem, visando o desenvolvimento de sua cadeia de produção com a inclusão dos catadores e cooperativas.
- Orientar e estruturar o crescimento e mobilidade nas cidades, visando sistemas adequados aos diferentes tamanhos e tipos de cidades existentes no território.
- Incentivar a bicicleta como meio de transporte e criar condições para seu uso seguro (ciclofaixas, ciclovias, ligações intermodais).
- Descentralizar a gestão energética e promover o estabelecimento de diretrizes e legislação local que incentive a utilização de energias renováveis e os ganhos progressivos de eficiência energética.
- Desenvolver políticas para a substituição da matriz energética baseada no petróleo, incentivar a adoção dos combustíveis mais limpos, priorizar o transporte público no sistema viário das cidades e estabelecer limites de emissões de poluentes segundo a Organização Mundial da Saúde.
- Dar ampla visibilidade às boas práticas de sustentabilidade urbana já implantadas nas mais diversas áreas em muitas cidades do mundo, promovendo a socialização das experiências, tecnologias e processos para todas as cidades do planeta.
- Promover a educação para a cidadania, engajando escolas públicas e privadas em programas sobre políticas públicas e democracia;
- Viabilizar políticas públicas em defesa da fauna e flora urbanas.

Esta proposta foi desenvolvida pelo GT "Construindo Cidades Sustentáveis" e contou com a colaboração de vários parceiros.

## Bund für Umwelt und Naturschutz Deutschland

A commitment to sustainability beyond Green Economy

BUND/Friends of the Earth Germany's contribution to the United Nations Conference on Sustainable Development, Rio de Janeiro, June 04-06, 2012

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts:

1. The concept of "needs", in particular the essential needs of the world's poor, to which overriding priority should be given, and
2. The idea of limitations imposed by the state of technology and social organisation on the environment's ability to meet present and future needs."

(WCED 1987, p. 43)

Twenty years after the UN conference on environment and development in 1992 - and thus one summit various avowals and action plans later - we are still far away from the guiding principle of sustainable development. The environmental crises and increasing social inequalities have not been mastered, but rather aggravated. While our understanding of ecological interrelations between the climate and biodiversity crisis - and of the limits of our knowledge - has increased since the first Rio conference, the political answers do not reflect the acknowledged need to act. Nevertheless, almost no time is spent on critical accounting of what has been promised since 1992 and (not) achieved in the preparatory process up till now.

Rio 2012 is supposed to renew the political commitment to sustainable development. Whether it will work or not essentially depends on the commitment of all countries.

Our core aims for sustainable development

are based on the Brundtland Commission's definition: We want a human development - not solely orientated towards poverty reduction but also towards an intra- and inter-generational justice - with economic means within the ecological limits of our planet, achieved by all actors within the scope of regulations set by the states (primacy of politics, creative power of communities as well as of individuals). Every proposal to the UNCDS is to be measured by these basic principles of sustainability.

### 1 Green Economy in the context of sustainable development and poverty reduction

Green Economy will be one of the two defining topics of the conference. It is asserted that Green Economy creates markets for the solution to the environment crises, security of resources, new jobs and more economic growth. Green Economy is not supposed to replace the guiding principles of sustainable development, as the governments continue to emphasise, but to refer to the importance of economy as the main instrument for their realisation and especially to help developing countries to make the leap into green industrial development. There is no mention of an orientation of the economic activity towards human needs, especially of the poorest. The orientation towards maximum profit without public service obligations remains untouched; poverty reduction is one of the objectives, but the respective contribution of Green Economy is hardly designated and thus only appears as a welcomed side effect.

Without question, many of the components of a green economy are important and have been long since demanded by the environmental and development NGOs - for instance, the improvement of energy and resource efficiency by means of ecological tax reforms and the abolishment of environmentally harmful and socially unnecessary subsidies, more recycling, a transition to renewable energy in industry as well as in so-called developing countries, and more. But the decoupling of resource use and economic growth, the transition to green technologies, and ecological modernisation have been propagated for more than 30 years and their economic potential has been underlined: Efficiency pays off for companies. If the universal win-win-potentials are that high, then the previous failure in their realisation is none of the most considerable market failures ever. So why do we keep believing that even more would solve the problems? Will the structural difficulties and resistance of lobbies which have hindered this transition up till now, be resolved if we call it Green Economy?

Green Economy has a great deal of potential to contribute to more sustainable economic but it clearly has its limits:

Green Economy in everyone's sole discretion

What is Green Economy - and what is it not? A universally valid definition of how a sustainable economy could look in different countries is not possible. But the positive nimbus of the Green Economy must not contribute to the legitimisation of highly precarious technologies like CCS, nuclear power, and genetic engineering. The reasoning that such technologies would be necessary to achieve a low-carbon energy supply and food security conceals the fact that there are other less risky solutions.

A consensus must be developed, independent from economic interests, in respect to which technologies should not be funded as "green technologies" or counted as contribution to a green economy - as nuclear power, genetic engineering and carbon capture and storage, deepwater oil drilling and shale gas production.

## Mercantilisation of nature and ecosystem services

UNEP sees the current crisis as an expression of a fundamental error of our economic management and the misallocation of capital. The corresponding political answer is to perform the change towards a Green Economy mainly by means of economic instruments. Some of these, e.g. an ecological tax reform and the abolishment of environmentally harmful subsidies are urgently necessary. However artificial markets for public goods, as we currently experience, offer no effective protection but rather create new risks for humankind, nature and the environment, as seen in emissions trading and the REDD mechanism. If the relevance of ecosystems and biodiversity is accepted in the community of states, as assured by UNEP, then it can also be guaranteed that they are effectively protected.

1. The community of states should look at economic instruments in environmental and resource protection in a more differentiated way. Providing economic incentives is theoretically a sensible approach, but in practice it may have opposite consequences and bring with it insurmountable difficulties. Of paramount importance for the large-scale implementation of economic instruments, aside from their ecological effectiveness, is their impact on poverty and social justice. Economic instruments are not in general superior in all three criteria to others, such as regulatory instruments.

## Blindness to planetary limits

Green Economy relies on efficiency yet disregards sufficiency aspects. The idea of limits, which is still contained in the Brundtland definition, takes a backseat. A complete decoupling of resource use and economic growth, and complete reuse of raw materials are unrealistic. And since efficiency accelerates growth, savings in a single product are often overcompensated by increasing production. Under these circumstances, achieving a reduction CO<sub>2</sub> emissions in the industrial countries without streamlining the economy seems unrealistic. Furthermore, the raw materials on which the green economy technologies are based are limited. How should the "planetary limits" - which are indeed acknowledged - be observed if the concept of green economy is unconditionally based on economic growth?

2. Besides the global funding of efficient and green technologies, the change towards a steady state economy must also be accomplished, in which the economy needs 89-90% fewer resources and no longer depends on growth. This requires new models of work production, and service, but first and foremost a remodeling of social systems. There are still no answers to many questions, and little experience to build upon. Here, research and pilot experiments must be pushed. Introducing new indicators beyond the GDP would be an important first milestone, which is not able to express sustainable development.

## Blindness to social justice

Which social and developmental model does Green Economy comprise? Aside from environmental and resource protection, poverty reduction and intra- and inter-generational justice are also part of sustainable development. Today, jobs in the green sector are often paid below the negotiated wages. This is why ecological modernisation must be linked to the vision of a participatory welfare state, as correctly done by UNEP; with humane work with proper payment, renunciation of child labour, health and occupational safety standards, social security, and freedom of assembly as well as promotion of social and economic participation in society for all population groups. Poverty reduction is stated as the goal of a Green Economy, but not which specific measures are to contribute to poverty reduction. In the same way, questions concerning distributive justice remain neglected.

3. If Green Economy is also to be accepted in the population, it must contribute to closing the ever growing gap between poor and rich, to create jobs under proper conditions, to provide social security, and to bring more fairness in value chains between and within societies. A Green Economy must explicitly be an Equitable Green Economy.

Many actors, especially in the global south, criticise the focus on Green Economy as a one-sided concentration on environmental issues at the expense of the efforts undertaken for economic and social development. They see it as an attempt of the industrial countries to establish green protectionism and to hinder the southern countries' economic development with their environmental agenda. This criticism must be taken seriously and common solutions must be found.

The concept of Green Economy can contribute to boosting the advancement of green technologies and production patterns more systematically than it has been done so far. Therefore, especially the industrial and emerging countries have to approach the modification of their economy more consistently - the funding of the green sectors is desirable but also the "brown" industries must be phased out. The reduction of environmentally harmful subsidies must be pushed forward and national capital spending, research, and education policy as well as public procurement must be aligned in an ecologically sustainable and socially just way. To demand and fund "Leap-frogging" in developing and emerging countries, nor on the principle of common but differentiated responsibility.

That environmental protection is by now also seen as having economic potential represents a turning point in debate, and that definitely is a success. Many of the planned individual measures are welcomed as ecological progress, but the fixation on technology and the neoclassical growth orientation as the Janus faces of Green Economy. If the currently dominant interpretation of sustainability, especially the three-pillar model of so-called weak sustainability, is already intellectually incorrect and politically misleading, the Green Economy threatens to further curtail this definition.

The transition to a green, socially (intra- and inter-generationally) just economy in the development of sustainability and social justice requires an agreement on specific guiding principles and rules for individual economic sectors from the community of states and from the member states:

### 1.1 Agriculture and Soil Conservation

- The focus of all relevant policies on sustainable agriculture, serving the threefold goal of food security/the fight against hunger, agricultural biodiversity, and climate protection.
- The express support of small-scale farming with plant varieties and animal breeds adapted to particular environments to promote food sovereignty (see the 2008 International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD))
- The focus on agricultural methods powered by energy from the sun, as opposed to industrialised fossil fuel-dependent methods.
- The adaptation of agriculture to climate change through a combination of traditional and ecological, science-based agricultural methods, especially in the countries in which climate change has the largest impact.
- The cultivation of biomass, agro-fuels and feedstuff should neither threaten food security nor lead to transformation of valuable ecosystems into cropland, be it directly or indirectly.
- Restriction of crop speculation, in that limitations on the amount of raw agricultural products traded in exchanges are reinstated.
- Limitation of the growing global demand for farmland due to so-called "land grabbing" or foreign direct investment in farmland, through the previously mentioned support of small-scale farming. In addition, internationally recognised socio-ecological guidelines or a code of conduct must be proposed; this can then expand upon the process begun by the FAO.

- The limitations of the power of agribusiness, especially in regards to the patenting of seeds and other agricultural inputs.
- Liberalisation within the framework of world trade agreements has not lead to an increase in food security. Countries must be able to decide for themselves whether to use tariffs to protect domestic food markets. In addition, direct and indirect export subsidies must be fundamentally discontinued.
- The introduction of social, environmental, and animal protection criteria based on the Eco-Fair-Trade guidelines.
- The award of a mandate for a legally binding world soil convention for the global protection of soil.
- The reduction of meat production in the EU: cultivation of native food crops instead of large-scale feedstock imports from southern countries, an end to industrial livestock farming.

## 1.2 Water

- The explicit commitment of the international community to implement the human right to water and sanitation, and to ensure universal access to safe fresh water and sanitation, especially through the support of communal water utilities, rather than multinational corporations.
- Consideration of the water demands of ecosystems, the use of surface and ground waters only in quantities not harmful to the environment and at a rate less than or equal to the natural rate of replenishment. Protection of watersheds, and of wetlands in particular.
- Development and distribution of water efficiency technology in agriculture, industry, and in households.
- Allocation of existing water resources to achieve the greatest possible social utility and the guarantee of ecological sustainability.
- The limitation of construction of large dams, and commitment to the guidelines of the World Commission on Dams (see also "Energy"). Although often socially and ecologically devastating, plans for large dams continue to advance, oftentimes with the support of multilateral development banks and development aid funds.

## 1.3 Energy

- The voluntary agreement of the international community to the following goals by 2030: 30% of total energy from renewables (excluding large hydropower), 40% reduction of energy use, and universal access to sustainable energy service.
- More consistent development of renewable energies, with wind and solar power taking precedence over hydropower. Large dams may only be constructed in accordance with the guidelines set forth by the World Commission on Dams. Biomass and agro-fuel production should not compete with food production for land.
- The end of the age of fossil fuels as soon as possible, no new construction of oil and coal power plants. Natural gas combined heat and power plants may be constructed as a transnational solution for power production.
- No construction of new or replacement of nuclear power plants and the quickest possible phase-out of nuclear power; due to the unmanageable risks associated with it, nuclear power does not present a "green", climate-friendly energy solution.
- Development of binding national timetables for the dismantling of environmentally harmful direct and indirect energy subsidies, especially those for nuclear power and fossil fuels; the funds freed in this transition should be used to help launch renewable energies and energy efficiency in the market.

## 1.4 Biodiversity and Ecosystems

- The implementation of the Aichi Targets of the CBD's new strategic plan during the UN Decade on Biodiversity, including the dismantling of harmful subsidies, reduction of the global carbon footprint, and the end of overfishing in the world's oceans.
- Mobilisation of sufficient capital for the protection of biodiversity, including funds freed from dismantled subsidies. When dealing with the preservation of our livelihood, market-based approaches are not a substitute for good legislation and secure, direct financial support that must be oriented towards the common good.
- Swift ratification and implementation of the Nagoya Protocol (ABS Protocol) on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from Their Utilisation.
- Implementation of REDDplus solely as a funds-based mechanism with effective safeguards. Forests are more than carbon sinks; they are a living space for humans, complex systems of great biodiversity and an indispensable element in water cycles. At the same time, forests as the 'green lungs' of our earth, are one of the fundamental factors in climate protection. Hence, all instruments of forest conservation policy need to take into account the protection of human rights, of biological diversity and of the climate. Market-based mechanisms do not achieve this.
- Protection of the last old-growth forest from development of any kind, including certified logging. Promotion of stricter international standards for wood products, especially in regards to proof of origin.

## 1.5 Marine Conservation

- Development of a comprehensive international network of Marine Protected Areas (MPAs) in international waters, outside of national borders of 200 nautical miles, in which all economic activity, such as fishing and the utilisation of resources, is prohibited (no take zones). The MPAs must cover at least 30% of the ocean, since the oceans will only have a chance to recover if one third of the worldwide marine biodiversity is comprehensively protected.
- Development of a system of environmental impact assessment for all types of intervention in international waters. The assessment of ecological consequences for marine environments should follow the precautionary principle and the ecosystem approach as basic principles and should be carried out by an independent authority.
- Implementation of global sustainable fisheries, most importantly the reduction of fishing capacities of large trawlers.
- Effective reduction of rubbish pollution in the oceans. In order to achieve this, the amount of rubbish collected on beaches - an indicator of marine pollution levels - must be reduced by 50% before 2020. Rubbish in the ocean kills 1 million birds and 100,000 marine mammals die each year, and pollutes the food chain with toxic materials.
- Clear and ambitious movement towards a green economy that favours and incentivises long life, biodegradable and sustainably sourced goods and packaging in order to protect our oceans against the rising amount of disposable and single use goods that are ending up in the marine environment. Actions to encourage such an economy will have multiple economic and social benefits due to the reduction in costs associated with the damage caused to coast tourism and other marine industries.

## 1.6 Green Technology

- Technologies with a high societal risk such as CCS, nuclear energy and genetic engineering cannot be promoted as "green technologies" or be counted towards of sustainable development.

- The community of states should make technologies that support sustainability public goods by buying up the patents and sharing the technologies throughout the world free of charge. If companies refuse to sell the patents, the worldwide availability of technologies could be enforced by legal means, as in the case of AIDS medication.

## 2 Institutional Framework for Sustainable Development

There is an obvious implementation deficit of the Rio resolutions, just as the coordination problems within the UN have not yet been solved after the UN reform, especially in the environmental but also in the development sector. There are numerous suggestions to improve the international environment and sustainability architecture, in governments as well as from actors in civil society. It remains to be seen whether those, who are ultimately capable of consensus, will be sufficiently ambitious.

The main demands of the BUND/Friends of the Earth Germany are:

1. Both the UN Environmental Programme (UNEP) and the Commission for Sustainable Development (UN CSD) must be substantially upgraded regarding budgeting and mandate.
2. The basic principles of sustainable development must become guidelines and objectives for other political fields and institutions as well. Especially international financial institutions (IFIs) and the world trade regime must be obligated to pursue ecological goals, or to bindingly take the regulations of environmental agreements into consideration through other UN institutions and processes, and above all international institutions and processes outside the UN. (end of 7)
3. Governments have to commit to more transparency, accountability, and liability in international contracts and agreements, including by means of a monitoring mechanism in the UN-system.
4. In addition to the Millennium Development Goals, a mandate for sustainable development goals should be issued. These goals need to embrace concepts of basic needs and social justice as well as planetary boundaries, and should apply for all countries.
5. Since sustainable development ultimately takes place on the local level, the interests of sustainability must also be reinforced on the local and national level
6. The participation of the Major Groups within the scope of the CSD as well as within the rest of the UN environment and development architecture and down to the national level must be reinforced.
7. New indicators for the measurement of social prosperity must be found - the GDP is not suitable to measure progress on sustainable development.

### 2.1 Upgrading the UNEP

The United Nations Environment Programme (UNEP) is currently financed solely through voluntary payments of single countries and other UN organisations and is thus permanently underfunded. Moreover, further coordination is required between the UN institutions that are responsible for environmental tasks and the international agreements with their offices beyond the existing Environmental Management Group under the aegis of UNEP. In the end, the specific implementation of programmes and agreements in the member states are hindered due to the lack of human resources on the side of UN institutions and national administrations and to the high requirements of coordination on national level. An upgrade of the UNEP should reach for the following goals: 1) creating more coherence in the environment architecture of the UN system, 2) strengthening the environment pillar in comparison to other areas by means of bundling.

. The UN environmental programme should be transformed to a specialised agency of the UN, with a proper and binding budget and an extended mandate. As specialised agency, a UNEO, would have the universal membership of all UN member states together. If that is not possible, the attempt should be undertaken to achieve a universal membership and better budgeting within the existing UNEP.

. As the central UN authority for the environment, a UNEO must also stand for the contribution of the environment to social development. It is often the poorest who are most dependent on nature and the immediate right to use natural resources for their livelihoods.

. Furthermore, it must stand for the conservation of value of the natural livelihoods, also beyond economic rationales and profitable interests.

. In its new role such a UNEO should undertake the coordination between the different environmental agreements (MEAs) without constraining the ability of the offices to act. It can thereby monitor the execution as a central authority and help to work more effectively on points of intersection.

. As a Clearing House Mechanism, a UNEO should bundle the information and data from monitoring programmes and organisations in respect to environmental trends and make these accessible to politics, research and the public.

. A UNEO should coordinate the environmental work of the UN, especially on the level of the member states, in order to redress an unraveling into many small interventions and to not unnecessarily burden the national administrations.

### 2.2 Upgrading the CSD

Since 1992, the UN Commission for Sustainable Development (UN CSD), being a permanent member of the UN Economic and Social Council (ECOSOC), has been in charge of supervising the implementation of Agenda 21 and the Johannesburg Plan of Action as well as the continuation of the Rio process.

. The UN Commission for Sustainable Development (UN CSD) should be upgraded either through a merger with the ECOSOC or by establishing a council for sustainable development modeled on the Human Rights Council which is directly subordinated to the UN General Assembly.

. In any case, stronger involvement of the Major Groups should be provided through the right to speak and the power of initiative.

. Its members should include high-ranking or elected government officials so that ambitious, binding decisions can be made.

. The Major Groups should gain the right to speak and the power of initiative in a reformed sustainability council; similarly, involvement within environmental organisations should be arranged.

. The Major Groups should also be formally involved regarding formulation, realisation, and monitoring of sustainability strategies and goals on the national level. To consider the impacts on people and the environment in third world countries, a consultation with third country delegates could take place prior to the passage of sustainability strategies, as already implemented in France.

### 2.3 Integration of Sustainability into other Policy Areas and Institutions

Considering sustainable development as an international goal, decision making may not be limited to specific conferences and institutions. The underlying principles of sustainable development must also become the guidelines for other policy areas and institutions. International financial institutions and the global trade regime in particular must be obligated to pursue social and ecological goals.

. These basic principles must be anchored in the catalogue of targets of the international financial institutions, and have to be further considered in the allocation of financial resources and consulting services.

. Terms of the national and international environmental law have to be given more weight in comparison with other legally protected goods within the multilateral WTO negotiations as well as in bilateral peace and investment agreements.

. In order to create the necessary framework for social welfare and ecological sustainability, financial markets in particular have to be more strongly regulated and the speculation with foodstuff and natural resources on the international market have to be contained.

### 2.4 UN Parliament

State parliaments have little to say during the negotiations of international treaties and conventions. In order to give international treaties broad social support this should be changed and an advisory parliamentary assembly should be established within the UN. This would not replace the Security Council, the UN General Assembly, the Bretton-Woods financial institutions or other UN bodies. It would be an additional institution to integrate parliamentarians more effectively into global governance.

### 2.5 Reinforcement of Sustainability on the national and local Level

While important decisions concerning cooperation and determination of goals are made on a global level, the realisation of sustainable development occurs on the national and local level. The international conference on sustainable development should therefore also give an impulse for the enhancement of sustainability interests on the national and local level.

This could be achieved amongst others by extending the mandates of national sustainability councils and formally involving Major Groups in the formulation, realization and monitoring of sustainability strategies. To consider the impacts on people and the environment in third world countries, a consultation with third country delegates could take place prior to the passage of sustainability strategies, as already implemented in France.

### 2.6 Participation, Access to Information, and legal Protection

During the Rio Convention of 1992 the nations already recognised the importance of different groups of society in contributing to a sustainable development. The contribution of these nine Major Groups to the political organisation of sustainability has to be fostered on a national as well as international level.

. Municipal administrations in particular should be involved in high-level decision-making in areas on which cities can have a great impact, such as energy, water, traffic, and construction. Coalitions like the ICLEI and the Covenant of Mayors highlight the potential for action on the municipal level.

. Meaningful participation requires access to information. In Europe this principle of the Rio Declaration has already been codified in European law through the Aarhus Convention. The right to access to information concerning the environment from government agencies should be anchored on a global level, and complemented by the right to access to information related to the environmental impacts of corporations.

. In addition, the right to access to jurisdiction of environmental relevance which has been acknowledged by the Aarhus Convention should be extended to the global level so that governments as well as corporations can be held responsible when breaking national and international environmental law.

. Multinational corporations have massive influences on humans and the environment. During the financial crisis the social answer was to socialise the damages –against the polluter pays principle –and to save the enterprises believed to be “too big to fail”. Thus a mandate for a convention should be issued to hold businesses responsible, which –beyond the definition of corporate liability to protect environment and society (like environmental impact assessments) –will also hold them responsible to full liability and the right to indemnity for affected people according to the causative principle.

### 2.7 Measurable Goals of Sustainability

The lack of concrete, time-bound goals at the 1992 summit in Rio has contributed to the non-compliance of various claims of the Rio and Johannesburg summits. BUND /Friends of the Earth Germany therefore welcomes Columbia's proposal following the Millennium Development Goals to adopt international Sustainable Development Goals.

. The goals have to be time-bound and measurable, and further supplemented by an effective framework to ensure monitoring and accountability.

. They must take into consideration the challenges for sustainable development in all countries –developing countries, emerging nations, and industrial countries. This includes in particular ecological thresholds, comparable to the goal to halt global warming at maximum 2°C, framework conditions for life in dignity, inter- and intra-generational justice and sustainable lifestyle.

. They must tie in with the definition of sustainability from the early 90s (Brundtlandt) or the WBGU of recent years.

. SDGs should neither water down existing environmental goals and responsibilities nor undermine existing actions (UN FCCC, CBD etc.).

. An independent and effective authority must be established that is responsible for monitoring and compliance.

### 2.8 Indicators

As long as we measure social prosperity with the GDP, we will hardly be able to measure whether we approach our goal of sustainable development. It is equally important to capture consumption and regeneration of our natural resources and of social factors, and to consider them equally in politics. The Human Development Index is a useful measure for social development, however it is more useful to regard its elements one by one. The consumption of nature by society should be captured in real numbers through the resource use indicator. Here, the enviro-economic total account or the UN-Stats System of Integrated Environmental and Economic Accounting could serve as starting points.

In Rio, the member states should agree on a collective plan for the establishment of such comprehensive indicators.

Contribution for Rio+20 Compilation Document

1 November 2011

Note: this BASD 2012 submission consists of a main chapeau text on the two main themes of the Rio+20 Conference, complemented and supported by submissions from BASD partners and convenors highlighting their specific contribution to Rio+20. These wide range of private sector expert inputs illustrate the collaborative effort of BASD 2012 partners, conveners, and their respective memberships.

The private sector has a key role to play in helping achieve the goals of sustainable development, in particular poverty eradication. This fact has been noted in Agenda 21 and at many United Nations conferences including the United Nations Commission for Sustainable Development (UNCSD). In addition, many around the world are part of the "private sector", whether as self-employed, entrepreneurs, farmers, or small and medium sized as well as large multi-national enterprises. The private sector generates most of the goods and services that are utilized every day and must actively be engaged to address the implementation gaps that have limited achievements of the sustainable development goals.

### Introduction

1. In June 2012, world leaders will meet in Rio for the twentieth anniversary of the United Nations Conference on Environment and Development (Rio+20). The objective of the Conference is to secure renewed political commitment for sustainable development, assess the progress to date, as well as the remaining gaps in the implementation of the outcomes of the major summits on sustainable development, and address new and emerging challenges.
2. Since 1992, business has been deeply and constructively engaged in the many United Nations and other international conferences that have identified the crucial components of a global partnership for sustainable development. Together the outcomes of these conferences reflect a global consensus on the challenges facing humanity and set out a roadmap for cooperative action required by all actors in society – governments, business, civil society and consumers.
3. A growing number of companies around the world have already put sustainability at the forefront of their agenda, recognizing the growing relevance and urgency of global environmental, social and economic challenges. Engagement by the private sector can help ensure that the Rio+20 Conference is a launching ground for widespread global action in support of sustainability, green growth and poverty eradication.
4. Regardless of company size or location, corporate leaders understand how sustainability issues affect the bottom-line and, thus, are looking beyond traditional business and financial factors. For example, market disturbances, civil unrest or ecological strains which are happening nearby or far away can have wide-ranging and material impacts through the value chain, capital flows, public opinion or employee productivity.
5. Companies view sustainability issues from both, a risk management perspective, and the increasingly evident and appealing benefits and opportunities – particularly associated with green growth and poverty alleviation. In short, the business case for sustainability has strengthened as a response to the deep interdependencies in today's globalized world.
6. Business has already made significant contributions and developed a wide range of tools and applications to measure environmental, social, and governance impacts and help assess response measures, such as:
  - Voluntary sustainability principles based on frameworks and conventions supported by all governments, such as those of the United Nations Global Compact;
  - The International Chamber of Commerce (ICC) Business Charter for Sustainable Development – which provides companies (large and small) with the basis for sound environmental management, as well as its systems conditions for a transition towards a green economy;
  - Long-term visions such as the World Business Council for Sustainable Development (WBCSD) Vision 2050;
  - Capacity-building activities for small and medium-sized enterprises via the ICC World Chambers Federation (WCF) network;
  - Sectoral approaches, e.g. the chemical industry's "Responsible Care", the WBCSD's Cement Sustainability Initiative (CSI), the International Council on Mining and Metals "Sustainable Development Framework", the Global Gas Flaring Reduction partnership (GGFR), the Partnership for Clean Fuels and Vehicles (PCFV), WBCSD's Tire Industry Project, or the aviation industry's sector-wide climate change targets.
7. Business is willing to step up its efforts to raise more awareness about its existing commitments and achievements already made. We will also continue to broaden and deepen our thinking towards Rio+20 on key themes of the conference. BASD 2012 via the member companies and associations stand ready to support, build, scale up, and accelerate cooperative initiatives in Rio+20 and beyond to achieve the objectives of sustainable development.
8. It is in this context that the temporary coalition of the Business Action for Sustainable Development (BASD) has been re-established to coordinate the participation of the private sector to the Rio+20 Conference and enhance its contribution to sustainable and inclusive markets.
9. BASD 2012 thus welcomes this opportunity to submit input to the compilation document for Rio+20 and establish leading priorities for governments to maximise the contribution of business, not only at Rio+20 but beyond. While this document will focus on the two themes of Rio+20 - a) green economy in the context of sustainable development and poverty eradication, and b) institutional framework for sustainable development - BASD 2012 has and will continue to bring forward a wide range of private sector experiences and expertise on specific topics which can be found in the appendix such as:

a) Access to Energy

- b) Agriculture and Food Security
- c) Ecosystems and Biodiversity
- d) Food - Water - Energy Nexus
- e) Science, Technology, and Innovation
- f) Social Development, Human Rights, and the Role of Business
- g) Resource and Materials Management
- h) Transformational Partnerships
- i) Urbanization
- j) Water for Green Economy and Poverty Alleviation

Green economy in the context of sustainable development and poverty eradication

10. Business expects the Rio+20 outcome to focus on the following key deliverables to catalyse private sector action towards a green economy:

- Take stock of progress since the 1992 Earth Summit, and develop policies and approaches that address new and existing challenges, recognizing the economic, social, and environment pillars of sustainable development as essential components of recommended policies and solutions.
- Encourage widespread adoption and uptake of sustainability principles by businesses of all sizes, sectors and regions.
- Provide the enabling environment necessary to accelerate and intensify the practice of corporate sustainability so that business can fully contribute to sustainable development. Combating corruption and ensuring peace and security will be critical to diffuse corporate sustainability practices. The private sector is committed to work collaboratively with the public sector and civil society to create incentives and remove barriers to achieve green economies.
- Embed the "green economy" concept in the broader sustainable development concept. The business community believes that the term "green economy" is embedded in the broader sustainable development concept. While business would rather speak about "greener economies" to acknowledge the many opportunities and risks for its sectors, value chains, and different national contexts, for the purpose of the Rio+20 Conference, we acknowledge the term "green economy" and view it as a unifying theme to articulate the "sustainable development direction" in which all global economies need to move albeit the existing tensions and global economic turmoil.
- Recognize that in order to move forward, it is crucial to green all sectors in all countries and advance resource efficiency and life cycle approaches. We consider improvements of existing processes (manufacturing technologies, jobs, logistics, research, etc.) to be as important as launching new products and technologies. Both approaches should be pursued simultaneously for a step change. It should be noted that business operates across global supply and value chains and greening all stages along the life cycle of its products and services is becoming a guiding principle for many leading companies and sectors. The actions needed to transition towards a green economy vary from sector to sector, value chain, and from country-to-country, depending on national circumstances, for example near term priorities may differ significantly especially for least developed countries.
- Recognize that collaboration and collective action is needed to operationalize and mainstream the concept of a green economy. The transition towards a green economy is a shared responsibility by all actors in the value chain. No one stakeholder group, whether business and industry, governments or society, can do this on their own. Collaboration and collective action on innovation and technology development and their appropriate deployment via sustainable production and consumption (SCP) concepts are at the heart of greening economies. It should also be noted that education is the cornerstone of any strong and competitive 'green economy' and a skilled workforce is a prerequisite. Stepping up education efforts will foster the mindsets and behavioural changes needed to drive the required innovations into the direction of a 'green economy'. Public private partnerships can hereby play a major role in building the essential knowledge and skills required for the transition to a green economy.

11. The "green economy" is described as an economy in which economic growth and environmental responsibility work together in a mutually reinforcing fashion while supporting progress on social development. Business and Industry thus has a crucial role in delivering economically viable products, processes, services and solutions required for the transition to green economy. A green economy should integrate the three pillars (social, economic, environment) of sustainable development. Efforts by all actors need to look beyond short-term pressures and focus on the development of long term shared value.

Therefore, business and industry believes that the Rio+20 outcome should outline high level system conditions, including the following core items (please see appendix for a detailed description) which seek to describe what is required to transition a green economy, from both business and governments:

Social innovation

- 1. Awareness
- 2. Education and skills
- 3. Employment

Environment innovation

- 4. Resource efficiency and decoupling
- 5. Life cycle approach

Economic innovation

- 6. Open and competitive markets
- 7. Metrics, accounting, and reporting
- 8. Finance and investment

Mutually enforcing cross-cutting elements

9. Integrated environmental, social and economic policy and decision making

10. Governance and partnerships.

Institutional Framework for Sustainable Development

12. Green economy and international institutional framework for sustainable development should become mutually reinforcing, as there is a need for structural change in institutions. Improving these institutions and their ability to enable the right frameworks are critical so that all actors can deliver on their shared responsibility and ensure better coordination and policy implementation.

13. BASD believes that the following key points should be considered in the Rio+20 compilation document:

- A system-wide strategy for sustainability across the United Nations system, including strengthening synergies across the various bodies involving the economic, social and environmental pillars of sustainable development. Sustainability challenges, such as climate change, food, resource scarcity, water, energy, waste management, corruption and social inclusion, poverty eradication, awareness, employment, education, call for an integrated, strategic approach and collective United Nations vision. We encourage the development of synergies between compatible multilateral environmental agreements, while preserving and complementing the independence and tailored nature of multilateral agreements should be a priority.
- Enhancement of the engagement of business and business organizations at global, regional, and national levels; business is a primary contributor to prosperity as recognized in Agenda 21, article 30.1.
- Strengthening the science-policy interface within international institutions, with the full and meaningful participation of developing countries. This must also include channels for credible and robust science from stakeholders, particularly from business and industry.
- Identification of priorities by United Nations institutions and concentration on their specific expertise. In the past two decades, a number of new challenges to sustainable development have surfaced which have required the international community to develop collaborative, global efforts. Climate change, the loss of biodiversity, water management, the spread of desertification and land degradation, damages to marine life, all these issues have been taken by the United Nations in an effort to offer concerted solutions. A clear process leading to a thorough assessment of emerging issues would assist in the allocation of tasks and responsibilities amongst a variety of actors within and outside the United Nations.

Appendix

Contribution for Rio+20 Compilation Document

Draft Ten Systems Conditions for a Transition towards a Green Economy

Author: International Chamber of Commerce (ICC)

The ICC Green Economy Task Force has defined the term "Green Economy" as follows: "The business community believes that the term "Green Economy" is embedded in the broader sustainable development concept. The "Green Economy" is described as an economy in which economic growth and environmental responsibility work together in a mutually reinforcing fashion while supporting progress on social development. Business and industry has a crucial role in delivering the economically viable products, processes, services, and solutions required for the transition to a green economy."

The Task Force undertook extensive analysis and global consultation to determine what is required to further a transition towards a Green Economy, including the development of the following ten high level systems conditions that will form part of a longer term ICC Green Economy Roadmap.

The Ten Green Economy Systems Conditions

Social innovation

1. Awareness

The shift towards a Green Economy requires awareness about the depth of global economic, environmental and social challenges as well as new opportunities. Awareness and understanding are pre-requisites for setting priorities and action and require a shift in the global debate. It is a shared priority and challenge for all actors, whether government, inter-governmental bodies, business or civil society and consumers.

2. Education and Skills

Education is paramount for the operationalization of the Green Economy. Education must be enhanced by policy makers, academia and business in order to build the skills and entrepreneurship needed for implementation. All skill requirements will be affected from continuously evolving environmental and scientific understandings. A Green Economy should seek to develop the necessary skills in STEM and inter-disciplinary disciplines, in human and natural capital, sustainable livelihoods, capacity building.

3. Employment

Employment is a critical element to the economy, the environment and social development. A Green Economy provides decent and meaningful employment and promotes employment throughout the world, especially as a means to overcome poverty. Policies aimed to create so called "green jobs" should not come at the cost of a net reduction of jobs across the overall economy. A distinction between "green" and "brown" jobs must be avoided as all jobs contribute to green all aspects of the economy.

Environmental innovation

4. Resource Efficiency and Decoupling

A Green Economy recognizes that the world's resources are finite and must be managed with scarcity in mind. It enhances the resource efficiency of materials flows through the principle of "more from less". It also seeks to take into account the economic value of natural capital and ecosystem services. Over the long term, Green Economy strives to increase economic, social, and environmental benefits to achieve sustainability while decoupling economic activities and societal developments from negative environmental impacts.

5. Life Cycle Approach

A Green Economy adopts a life cycle approach which involves further minimizing the environmental footprint of all economic activity through applying science and acknowledging emerging knowledge. The life cycle of a product starts at raw material extraction, research on conceptual design and development of products and services, manufacturing, distribution, use and end of life treatment options such as recycling, recovery and re-use or re-manufacturing. At every stage of the life cycle of a product, process, technology or service, critical questions about costs, benefits, environmental responsibility and social impact are being addressed. A life cycle approach also helps identify hidden opportunities and accounts for unintended consequences, spillover implications, and competition for resources.

#### Economic innovation

#### 6. Open and Competitive Markets

A Green Economy emphasizes the importance of sustainable growth and access to open, well-functioning, and efficient markets. It recognizes that relying on markets is indispensable to the evolution of both societies and companies toward greener economic activity and prosperity. In order to become a functional economic system, Green Economy needs to become ingrained in international and global markets and operationalized in the market and business balance sheets. Economy-wide approaches should be adopted that include receptive markets for delivering business value and commercially viable products and services along the value chain.

#### 7. Metrics, Accounting, and Reporting

For a Green Economy to become operational, indicators, metrics, accounting measures and better disclosure and reporting must be developed that make sense in economic terms while ultimately including the cost for externalities. This entails the simultaneous pursuit of developing operational green growth measures at company level (bottom up) and strategic macro-political accounting standards and economic indicators at the system level beyond Gross Domestic Product (GDP; top down). A flexible approach which balances the cost-benefits remains critical for success; flexibility will also be essential to incorporate new knowledge and scientific understanding in coming decades.

#### 8. Finance and Investment

A Green Economy actively drives innovation in private and public finance and investment into the direction of sustainable development. To succeed, it should set supporting policy and regulatory frameworks that promote informed investment decisions for both public and private investors. It stimulates new demand for innovative and responsible businesses and government services through transparency. It also provides appropriate public-private engagement mechanisms that look beyond short-term pressures and focus on the development of long term shared value.

#### Mutually enforcing cross-cutting elements

#### 9. Integrated environmental, social and economic policy and decision making

A Green Economy has a holistic approach to decision making. It integrates and balances policies with respect to environmental, social and economic priorities by considering the intended and unintended consequences of interlinked policies that may result in synergies or barriers and promote or hinder economy-wide, greener growth. Consequently, it will be essential to enhance scientific input and consider perspectives from a variety of stakeholders to assess policy pathways and to improve processes moving forward.

#### 10. Governance and Partnerships

A Green Economy is based on governance structures that allow all actors can meet their shared responsibilities. Governance structures at local, regional, national and global level need to be aligned and mutually reinforce each other for innovation to occur. Elements include but are not limited to multilateral rules-based trade and investment, a stable economic environment governed by the rule of law, including effective intellectual property rights protection, strong contractual arrangements, and safe and stable communities. A key modus operandi of a Green Economy is working through new approaches that facilitate innovative collaborations and partnerships between business, government and civil society. Such collaborations can take many forms including public private partnerships, business value chain engagements and alliances with academia and consumers. No one can do this alone.

\*\*\*

#### Specific topic contributions

As outlined in point 9 above, please find following a wide range of private sector expert inputs provided by BASD conveners and partners. Please note that contributions are regularly posted on the BASD website [www.basd2012.org](http://www.basd2012.org).

#### a) Access to Energy

Lead Authors: International Chamber of Commerce (ICC), UN Global Compact, and World Business Council for Sustainable Development (WBCSD)

Access to reliable, affordable, economically viable, socially acceptable and environmentally sound energy is fundamental to economic growth and sustainable development. Energy poverty induces poor living conditions in many developing countries and global poverty. In this context, providing access to modern energy services and reducing greenhouse gases (GHG), are key challenges for society.

#### Key Messages

- Businesses stand ready to work with the United Nations Secretary-General's initiative on Sustainable Energy for All.
- All energy options will be required to meet the challenges outlined above and must remain open to meet pressing demands for access to and security of energy while reducing greenhouse gas emissions.
- Substantial progress needs to be made on reducing energy poverty if the Millennium Development Goals are to be achieved. Priority should be given to reduce energy poverty by deploying renewable sources of energy, where appropriate, as this can reduce the exposure of poor communities to volatility of energy prices.
- Diversification of energy mix and infrastructure needs to be supported through enhanced technology development and deployment. In order to accelerate the development and deployment of key technologies, new financing approaches will be required. Carbon financing will bridge some of the gap, but multilateral development financing and other policy incentives will help accelerate deployment.
- Also innovative business models demonstrate how the private sector is already succeeding in expanding energy access by providing more affordable and reliable products and services; overcoming key market barriers or failures; and increasing the profitability and scalability of sustainable engagement in low-income energy markets. There is significant scope for these new business models to be scaled and replicated.

- Energy efficiency needs to be significantly increased both on the demand and supply side in order to optimise emissions, reduce resource use and improve affordability particularly for low-income consumers.

#### Narrative

Business is the primary solution provider for expanding access to energy, and will work with key stakeholders to forge ahead and to pursue sustainable and scalable market solutions to help deliver universal energy access. This role includes not just extending the reach of energy services, but also supporting the quality and reliability of the services that are delivered, which significantly increases the benefits that energy access has for low-income consumers and producers. These efforts can be enhanced and accelerated by effective government efforts to support market solutions, provide incentives, and address risk and regulatory issues.

Public and development finance mechanisms should be specifically designed to leverage additional private investment that is needed to achieve universal access. The broader financing architecture must be well-designed with appropriate consideration to the quality of the regulatory and investment climate, which significantly drives the risks and returns associated with these investments.

The International Energy Agency (IEA) estimates that the 17% (USD 46 trillion) increase in energy investment required globally between 2010 and 2050 to deliver low-carbon energy systems would yield cumulative fuel savings equal to USD 112 trillion (IEA, 2010). The private sector has already taken concrete actions in all sectors towards green growth, from reducing environmental impacts across value chains, to increasing energy and resource efficiency, investing in low-carbon and renewable energy, utilizing ICTs to limit energy use, manage scarce resources and reduce waste.

#### Policy Recommendations

- Energy security, economic growth and development are interwoven, so energy and development policies should be addressed in an integrated way. Coordinated international effort is needed to ensure an enabling framework and markets.
- To meet growing demand, all energy options should be kept open. Public policy should establish criteria and guidelines for safe, cleaner energy supply and responsible use of resources. Energy efficiency should be a key focus and needs to be further promoted.
- Business is already succeeding in expanding energy access by providing more affordable and reliable products and services; overcoming key market barriers or failures; and increasing the profitability and scalability of sustainable engagement in low-income energy markets. There is significant scope for these new business models to be scaled and replicated. Thus, policy measures should support market-based innovation to promote energy access through diversification of supply and introduction of more efficient supply and end-use technologies as well as enable new and innovative business models. Strong research, development and deployment policies and programmes must be fostered and maintained.
- Governments should establish stable, long-term energy policy, recognizing the need for open, competitive markets supported by reliable legal, fiscal and regulatory frameworks to encourage energy investment and innovation that responds to and marshals market forces taking into account that sector-wide changes can take decades. The quality of the regulatory and investment climate significantly drives the risks and returns associated with these investments.
- Partnerships and cross-sector collaborative approaches between key stakeholders are essential to make all of these opportunity areas successful. Effective public private partnerships (PPPs) will be particularly important drivers of progress toward universal access to energy. National and international governance infrastructure should enable a global open market trading system in energy, energy feedstocks, and energy intensive goods. A variety of market mechanisms fit for national/local circumstances have to be identified.

#### b) Agriculture and Food Security

Lead Author: CropLife International

As a sector, agriculture plays a key role in supporting the economic development and well-being of societies. With a predicted 9 billion people by 2050, agricultural production will have to increase to meet new demands for food, feed, fuel and fibre. Agriculture must not only meet demand – it must also do so while minimizing its environmental footprint and creating sustainable livelihoods for farmers and others along the supply chain, while helping mitigate and adapt to climate change.

In a time of food insecurity where the poorest people are most vulnerable, the world must proactively leverage the potential of agriculture to positively contribute to the triple goals of a secure food supply, poverty reduction through improved rural livelihoods, and environmental sustainability. Food sufficiency, quality, availability and environmental footprint must be central elements of any political commitment directed toward the green economy and poverty eradication. Rio+20 outcomes should reflect a continued and long term commitment to achieving food security through increased productivity in agriculture and sound natural resources management.

However, agriculture by nature represents a mosaic of solutions and practices, with no silver bullet and no single 'best practice' able to meet the needs of all farmers. In addition, sustainability is a moving target towards which farmers in different geographies and farming systems are already progressing and they will all need support to continuously improve. Whatever type of agriculture a farmer chooses to adopt, they must be supported by availability of tools, appropriate technology and knowledge, which can be employed under 'good agricultural practices' to optimise productivity, while minimising any adverse impact.

#### Key Messages

- Rio+20 outcomes should be focused on the goal of sustainable intensification of food production, and support the role of knowledge, science and technology in achieving this goal. Rio+20 outcomes should endorse the notion that agriculture in a green economy means a broad-based, knowledge-centred approach to development through agriculture.
- Poverty reduction: Make agriculture a driver for poverty reduction by ensuring policies link producers, in particular smallholders, to markets and enable value to be created throughout the supply chain to help create income opportunities and diversify rural activities.
- Focus on enhancing sustainable production and productivity of all farmers: the world will need to produce more with less to meet demand and reduce its environmental footprint. Increasing production and productivity should be a priority to protect natural resources while meeting demand for food, feed, fuel and fiber.
- Invest in agricultural research and development, capacity building, knowledge sharing, to close the uptake gap for existing tools; ensure new solutions are available for today and tomorrow by incentivising and supporting both public and private innovation.

#### Narrative

#### Reducing Poverty

Agriculture can be a potent driver for poverty reduction. The World Bank estimates that GDP growth from agriculture generates at least twice as much poverty reduction than

any other sector. Currently 65 percent of people in developing countries are involved in agriculture, and 1.3 billion are small farmers with limited access to inputs, infrastructure and markets. In countries where agriculture represents one of the primary livelihoods, concerted efforts to improve productivity through sustainable practices as well as access to food through improved markets could change the lives of millions, by raising incomes and addressing food security needs.

A dynamic and productive agriculture sector is also essential for the urban sector. In 2010, for the first time ever, more people lived in urban areas than in rural areas globally. Urban populations are dependent on the agricultural sector for most of their consumption, so improving local production and trade is crucial; but it also means a world of opportunities for farmers who can reach the urban market.

Making agriculture a dynamic sector will require the adoption of supportive frameworks and investment in infrastructure and markets. Farmers need to be able to access markets at the local, regional and global level in order to sustain a livelihood from their activities. In some areas, this means improving access to transport, storage and market facilities. In Tanzania, US\$2.4 billion of investment is being directed towards tripling the area's agricultural output and maximising the trade potential of the Dar-es-Salaam port for Tanzania's neighbouring landlocked countries. Through the Southern Agricultural Growth Corridor of Tanzania project (SAGCOT), both public and private sector organisations are supporting 20,000 smallholders to become commercial farmers to bring in annual revenues of an estimated US\$1.4 billion into the country.

Access to weather and price information and risk management tools also helps farmers grow better crops, improve their production practices and sell at better prices. For example, in Zambia, the Zambia National Farmers Union market information system (ZNFU 455) allows farmers to find out the current prices being offered for a commodity by sending an SMS. They receive a response listing prices and buyer codes and they can then make an offer to the best buyer directly by using SMS. In Kenya, another scheme using cell phones offers banking services to farmers as well as support for a crop and input insurance scheme. Farmers can insure a kilogram of maize seed or of fertilizer against drought with an index insurance product. They buy the insurance at a local agro-dealer and receive confirmation of purchase and of any payout through the M-PESA service on their phones. Going forward, the use of ICTs could be expanded to supporting pest control and other extension services.

Enhancing sustainable productivity Improving the footprint of agriculture while increasing production needs a concerted effort in two areas: first closing the uptake gap of existing best practices and technologies by focusing on capacity building and knowledge sharing and creating supportive public and private extension services networks; and second investing in agricultural research and development and supporting innovation to provide the solutions for tomorrow and ensure a supportive, science based regulatory framework and policies.

Enhancing sustainable productivity must be the centre of efforts to make agriculture both environmentally sound and economically dynamic— we need to achieve more crops per drop of water, per acre of land, per measure of inputs. This is essential to ensure the surface of land under cultivation does not expand, in order to preserve biodiversity and natural carbon sinks. While productivity is a concern for all farmers, specific attention to address the challenges faced by smallholder farmers in raising their productivity is also required.

Climate change is expected to have severe negative impacts on agriculture, both through the intensification of severe weather events (such as droughts and floods) as well as changing weather patterns, increased pest prevalence and generally greater uncertainty. Improving the resilience of farming systems will be crucial to any strategy to address not only long term productivity but also to reduce food price volatility.

The United Nations Convention to Combat Desertification estimates that by the year 2050, half of the current arable land will become unusable. Improved seeds will help to maintain yields under drought conditions and prevent erosion. The 2009 Keystone 'Field to Market' research found that gains in yield per acre in the past 20 years in the USA had also been accompanied by significant improvements in the overall efficiency of resource use. The project looked at key crops such as soybean and maize and found reduced use of irrigated water, reduced soil loss, reduced habitat loss, reduced energy use, and lower carbon emissions. The Field to Market study clearly showed that progress has been made by farmers in the path to increased sustainability while enhancing their productivity. Producers need to be integrated in value chains and new activities need to be developed in processing and other sectors to improve rural incomes and ensure that growth in productivity translates into better livelihoods. In this context, specific attention should be paid to the challenges faced by smallholder farmers in accessing markets and securing adequate value from their participation.

Additionally, efforts should be increased to promote sustainable agri-food systems throughout the lifecycle. In 2010, FAO estimated that poorly developed systems for handling, storage, packaging, transportation, and marketing of agricultural products in developing countries results in post-harvest losses ranging from 15% to a staggering 50%. Investment in food infrastructure and handling could reduce losses and improve food safety as well as help reduce price volatility by improving stocks. Developed countries also face losses due to food waste from harvest, through delivery to food services, and in households. Waste is worst in fresh produce which delivers vital nutrients to humans around the globe.

Finally, improving farmers' access to inputs and supporting technology uptake and diffusion is essential. In some areas, creative strategies that enable access to existing knowledge networks can make real differences to farmers. For instance, in India, a late December harvest of mustard seeds was causing up to 30 percent of crop to be lost to frost, so breeders worked on a seed with a shorter duration period. This enabled farmers to harvest in early December, avoiding the issue of frost. Farmers also benefited from better prices as they were able to bring their seeds to the market before the usual excess occurred in January.

Research, Innovation and Capacity Building Agriculture is a knowledge-intensive sector. Farmers need to have access to training, services, capacity building, and sharing of traditional knowledge that can encourage the production of abundant and nutritious crops and mixed diets. Knowledge helps farmers adopt practices that maximize the efficiency of the inputs they use and help protect the natural resources they depend on. Training programmes should specifically involve women and young farmers in developing countries as essential partners for household nutrition and welfare.

Providing this education to rural communities in a systematic, participatory manner that is maintained, rather than a 'one-off' activity, is essential to improving their production, income and quality of life. Extension services disseminate practical information related to agriculture, including correct use of improved seeds, integrated pest management, including the use of pesticides, fertilizers, farm implements, tillage practices, water management, livestock management and welfare, marketing techniques, and basic business skills to address poverty. Extension is also an essential pillar for rural community progress including support for the capacity building at farm level.

Farmers must constantly adapt, and the challenge of climate change is making that need ever more acute. Investing in research and development, in both public and private sector, is essential to ensure farmers have the tools they need in the future and that the gains obtained in productivity and footprint are not undermined.

Targeted investment in research, combined with supportive frameworks for the roll out, diffusion and uptake of new improved technologies and the products are essential to support continuous improvements in agricultural sustainability. Governments need to support both public and private research by creating supportive regulatory and incentive frameworks that promote not only innovation but collaboration. Global alignment of regulations and these frameworks is vital to support freedom to operate and important trade. Specific efforts to localise and adapt existing scientific knowledge to serve the needs of small farmers in different geographies are also required. In this area, public-private partnerships can play a role but localisation and technology adaptation need to be supported by strong national and regional scientific capacity and active efforts to create markets in order to spur private investment, not only in farming itself but in the agro-food industry that surrounds it.

#### Policy Recommendations

a) The outcomes of UN CSD17 represent agreed negotiated language by the same Parties that are involved in Rio+20 and as such should represent the basis for any

outcome on agriculture for Rio+20.

- b) Reaffirming the importance of agriculture as a key sector for both poverty reduction, food security and environmental sustainability,
- c) Recognizing that agriculture policies must be tailored to local conditions in order to be effective and sustainable,
- d) Emphasizing the need to proactively support the agriculture sector in efforts to adapt to and mitigate climate change as a pre-requisite for sustainability and food security,
- e) Expressing deep concern for the risks posed by ongoing food price volatility for the livelihoods of farmers and consumers around the world,
- f) Recognizing the specific challenges faced by smallholder farmers,
- g) Governments commit themselves to fulfilling the pledges made at CSD17 and through other forum, including the L'Aquila Commitments, in the five following areas:
  - a. Enhancing agriculture production, productivity and sustainability.
  - b. Create a strong enabling environment for sustainable agriculture.
  - c. Manage sustainably competing uses of water and land resources
  - d. Develop sustainable agricultural value chains and improve farmers' and agro-industry enterprises access to and participation in markets.
  - e. Provide secure access to food and social safety nets.

#### c) Ecosystems and Biodiversity

Lead Author: World Business Council for Sustainable Development (WBCSD)

Biodiversity is the variability among living organisms within species, between species, and between ecosystems.

An ecosystem is a dynamic complex of plant, animal and micro-organism communities and their non-living environment, interacting as a functional unit. They make up the environment around us and are effectively habitats for example, coral reefs, forests, grasslands, rivers, farmland and urban parks, that support various species.

#### Key Messages

- Support for the key principle of The Economics of Ecosystems and Biodiversity (TEEB) report for policy makers; namely, that biodiversity and ecosystem values should be integrated more consistently and effectively into policy and regulation
- Businesses have a strong interest in ensuring ecosystems continue to function properly to deliver both business and societal value. To this end, businesses are already helping to deliver improved conservation outcomes through their own actions including through investment in conservation-related research and development, through the creation and strengthening of sustainable supply chains and through programs which build capacity, transfer technology and enhance monitoring and reporting performance.
- Businesses are keen to work more closely with policy makers on the design and implementation of biodiversity and ecosystem related policy and this collaboration can significantly improve the chances of delivering policies that work.

#### Narrative

The current rate of loss of biodiversity, induced through human activity, is at unprecedented levels. Over the next 40 years, ecosystems will be altered faster and more extensively than ever before – posing significant business risks as well as bringing opportunities for new eco-efficient goods, services and technologies. Meeting the vision for the sustainable management of ecosystems in 2050 requires that all stakeholders, including business, recognize the real benefits of ecosystems and the true value of ecosystems services and account for them. A key must-have is thus to integrate the value and sustainable management of ecosystems into economic planning and decision-making. Policy makers also have a key role to play in setting up smart policies that include flexible, innovative, market-oriented approaches. Key Elements:

- Deeper local & environmental understanding
- Incentives for behavior change
- Global, local & corporate leadership
- Infrastructure investment
- New measures of success
- Commitment to true value pricing
- Removal of subsidies
- Freer & fairer trade
- Global carbon price

**Business and ecosystems interdependency:** Business depends and impacts on biodiversity and ecosystem services. Consequently, ecosystem degradation will affect how business operates. Business cannot function if the ecosystem services it relies on are degraded or out of balance.

**Assessing and valuing ecosystems:** There is the need to recognize the full value of ecosystems and their services to ensure their sustainable use. Ecosystem assessment and valuation can help business manage risk and consider new business opportunities, while valuing ecosystem-related impacts and dependencies helps business make better decisions. Ecosystem valuation will increasingly be considered by governments, finance sector and business-to-business customers.

**Policy responses:** Current responses from business and existing policy measures have not been sufficient to halt biodiversity loss and ecosystem degradation. Good policy ideas exist – these need to be recognized and then implemented and enforced more widely: in many cases policy is already adequate but enforcement is poor. Ecosystem and biodiversity policies need to have clearly-defined goals, supported by targets which are Specific, Measurable, Attainable, Relevant and Time-bound (SMART); many businesses are willing to work with policy makers, which can improve policy effectiveness, and some businesses are already positively responding to the UN Convention on Biological Diversity's 2010 Aichi targets.

Business responses: Business has an important role to play in achieving biodiversity conservation and sustainable use and this role goes beyond financial support. The business community should proactively:

- i. Measure, manage and mitigate risks and impacts
- ii. Improve decision-making by undertaking corporate ecosystem valuation to quantify business risks and opportunities
- iii. Innovate and help develop new markets for ecosystem services and eco-efficient goods, services & technologies
- iv. Encourage suppliers & purchasers to adopt best practices
- v. Enter into local partnerships to address on-the-ground issues
- vi. Promote “smart” ecosystem regulation that leverages market forces and business solutions that halt degradation and “levels the playing field” for companies competing in the same markets, or to use the same resources

#### Policy Recommendations

a) Establish guiding principles for policy and regulatory frameworks:

- Set realistic but challenging targets and clearly assign accountability for their delivery.
- Provide clear policy signals into the future (at least 5-10 years and longer where policy will influence long term business decision making).
- Establish a level playing field both for companies competing in the same markets, and for companies competing to use the same resources.
- Respect, protect or assign property rights.
- Be cognizant of and commensurate with relative ecosystem value wherever possible.
- Be aligned with specific and clearly stated policy objectives and create the right incentives for the delivery of those policy objectives.
- Deliver stated policy objectives at the lowest economic and social cost or with the greatest economic and social benefit.
- Provide incentives as directly as possible to resource managers to maintain and enhance the provision of valuable ecosystem services.
- Seek to achieve consistency between nations to assist in the management of trans-boundary issues.
- Internationally relevant proposals should allow sufficient flexibility to reflect cultural differences when they are implemented at a national level.

b) Establish a framework for closer collaboration between business and policy makers on biodiversity conservation is needed. This framework should include a more defined role for business within the Convention on Biological Diversity as well as in other multilateral environmental agreements. The Intergovernmental science-policy Platform on Biodiversity and Ecosystem Services (IPBES) could be another platform for engagement.

c) Much biodiversity and ecosystem policy and regulation relies on the private sector in its implementation, and in any event, it is often the private sector which has the resources and flexibility to develop and implement solutions at scale. For these reasons, as part of increased involvement from business it is essential that overarching objectives and targets are designed to be relevant for business.

d) New biodiversity and ecosystem policy and regulation should draw from successful examples from other policy fields and should seek to build on and scale up successful private sector voluntary initiatives in the field of biodiversity and ecosystem conservation.

e) New biodiversity and ecosystem policy and regulation should also be based on sound principles, and input from business to inform these. Principles should include providing clear signals for business, creating a level playing field, recognizing the importance of property rights, being mindful of potential economic and social impacts and adaptable to cultural differences between nations.

f) It is important to note that in many cases it is not new policy and regulation that is required, but the capacity and resources for more effective implementation and enforcement of existing policy and regulation.

g) Beyond policy and regulatory reform, governments can take a leading role in the implementation of measures to enhance biodiversity and ecosystems by using their direct influence over state owned enterprises to drive the implementation of such measures.

d) Food - Water - Energy Nexus

Lead Authors: Croplife International and World Business Council for Sustainable Development (WBCSD)

Food, Energy and Water security , sustainability of resource use – in particular water - and the availability of energy are key issues that underpin the availability of societies to function and are fundamental to the challenge of sustainable development. Water, food and energy are interlinked and interdependent so understanding the connection between these three areas is essential in order to support integrated approaches to these issues.

The sustainability of food, water, and energy - and the security of these resources - underpins the ability of societies to function. Food, water, and energy also are interlinked and interdependent. Understanding the connections between these three resources is essential to support integrated approaches to addressing sustainable development.

#### Key Messages

- Water, energy and food are increasingly and intrinsically related, and essential component of sustainable development strategies
- Employing an integrated, cross-sectoral approach to planning and managing these resources is critical to sustainable development
- Research, innovation, knowledge sharing, and access to improved technologies are essential to efforts to tackle the challenge of efficient use and equitable distribution

#### Narrative

Meeting the Resource Efficiency Challenge: By 2050, the world's population will have reached an estimated 9 billion people, with global demand for water, energy and food

rising dramatically. By 2030 it is predicted that the world will need 40 percent more available freshwater and 50 percent more food and energy.

Climate change, urbanization and increasing prosperity in certain regions of the world will also impact the availability, affordability, access and use of these resources. These three areas are closely interdependent and policies need to address these challenges in an interlinked and coherent manner.

Managing natural resources such as land, water, and energy need to be at the core of the way in which sustainable development issues are considered because they underpin the ability of all activities to succeed over time. Water and energy are interlinked in many sectors, such as manufacturing, waste management, recycling, and energy production. The primary energy sector is becoming more water intensive. With a significant projected increase in electricity demand, a significant increase in water withdrawal and/or consumption is expected, in both water and energy use is critical and often underestimated.

Agriculture and the broader food value chain are one of the sectors in which water and energy are essential dimensions of sustainability and for which the water-food-energy nexus is the most central. As one of the main user of water, provider of food and potentially both a consumer and producer of energy, agriculture needs to be a focus area for managing this three thematic resource challenges. Each issue goes beyond the production (growing) phase however. The processing, transformation, packaging, distribution and trade of agriculture-based products also involve the use of both water and energy sources. Water and energy use for food production are indeed essential elements in determining the sustainability of agriculture and food production systems.

Biofuels exemplify the connection between food, energy and water in a vivid manner. The sustainability of biofuels depends on the ability to use input resources efficiently, such as water, so as to ensure the footprint of biofuels is acceptable. But it also depends on the ability to not compete with food production to avoid affecting food security.

Going forward, we need to increasing resource efficiency in a way that will also generate benefits and creating new opportunities that go beyond the ability to simply cope, including creating more jobs and stimulating broad economic development.

Water, energy and food are intrinsically inter-related. Producing more food requires more water, and so too do many forms of energy production; we need water to cool power plants, refine crude oil and produce biofuels. Managing water poorly can have a detrimental impact on energy supplies and agricultural production, and vice versa. We also need to be aware that global warming, increasing urbanization and growing consumption of water, energy and food continue to disrupt our already fragile ecosystem. For example, water provides important ecosystem services. It serves as a non-substitutable input for all biomass growth, which in turn supports climate regulation, carbon sequestration and other critical ecosystem services.

Finding new ways to minimize waste both in the production and consumption phases of the value chain is important. In addition, managing uncertainty and risks (such as floods), particularly due climate change-induced weather variations, will require increased planning, advance warning systems and careful coordination.

1. Employing an integrated, cross-sectoral approach to managing these resources is critical. 'Silo' planning is no longer practical given the complex relationship between water, food and energy. There is a need for collaborative planning, as demonstrated by the US Environmental Protection Agency (EPA), which in 2008 announced an inter-agency agreement between the offices of air and water to collaborate on energy and climate efforts at water utilities. Cities, industry, businesses and the public sector all need to act to address shared risks and opportunities.

2. Research, innovation, knowledge sharing and access to improved technologies are essential to tackle the challenge of efficient use and equitable distribution. This ranges from promoting efficient irrigation and farming practices to providing the best available seeds (including drought- and stress-tolerant plants) to training farmers to optimize fertilizer use and employ stress management techniques. For example, when Indonesian farmers sowed pre-germinated rice seeds directly into the wet mud of their rice paddies, they could avoid flooding and shorten growing cycles through this direct seed technology. This has increased yields, and has limited methane gas emissions as well as reducing water use by 20 percent. Second generation biofuels produced from agricultural waste can maximize the efficiency of the use of resources put into growing a crop and minimize competition with food crops.

Risks of Inaction: Inaction in this area will profoundly impair the ability of communities to develop sustainably and risk creating a vicious circle of poverty, resource depletion and food insecurity. Energy poverty is a major obstacle to the ability of communities, in particular rural communities, to improve their livelihoods, access services and pursue economic opportunities. Water scarcity is an issue across the globe but threatens the most vulnerable communities in disproportionate and life threatening manner through drought and desertification. Food security is one of the primary concerns of millions of people around the globe, whose livelihoods are compromised by inadequate access to a secure supply of nutritious food which impairs not only adults lives but also children's with long term consequences for their development. The challenges and threats may be different in other circumstances but fundamentally sustainable development cannot occur on the basis of an unsustainable use of water, insufficient production of food, and lack of access to sustainable energy.

#### Policy Recommendations

- a) Recognizing the interlinked and interdependent nature of water and energy use, and their centrality in several sectors, in particular with regards to achieving food security
- b) Recognizing the importance of coordinated and cross-sectoral approaches to managing natural resources
- c) Emphasizing the central nature of both food, water and energy to the realization of sustainable livelihoods Governments should commit themselves to:
- d) Improving data collection and research into the issue of water management, energy production and availability, agricultural productivity and footprint, and in particular with regards to how the three dimensions are interconnected, to assist in informing policies at all levels
- e) Encouraging collaborative and cross-sectoral approaches, as well as public-private collaborations to improve resource management, risk prevention and reduce the footprint of different activities
- f) Increase funding and support for both public and private research in the areas of energy, water and food production e) Science, Technology, and Innovation

Lead Author: Digital Energy Solutions Campaign

Innovation, and scientific and technological advance in particular, are neither a luxury nor an accessory, nor things to be feared or muted. Rather they constitute an exciting and essential element of our transformative journey to future sustainable development and growth.

Acknowledging that the world population will keep growing in the coming years and decades, particularly in urbanized areas and in developing and emerging countries, and that the earth's resources are finite, and in some cases already reaching a level of scarcity, it becomes obvious that improvements in efficiencies of all types will be keys to addressing sustainability challenges, enabling us to do more with less. This will be accomplished through regular, continuous improvement of existing technologies and through the entry into service of reliable breakthrough technologies.

#### Key Messages

- Science, technology, and innovation are essential enablers to future sustainable development and growth, and especially to the goals to which Rio+20 aspires.
- Sustainability will increasingly depend on the capacity to generate, access and leverage science, technology, and innovation to ensure society makes the best use of scarce resources as the world's population grows.
- Business will play a leading role, but expects to -- and must -- do so in partnership with governments and policy makers, and in a policy and regulatory environment that encourages sustainability innovation and scientific and technological advances.
- This policy and regulatory environment needs to include both public and private investment in research and development, as well as supportive regulatory frameworks (i.e. stable and enabling investments in long-term research), including adequate protections for intellectual property rights and support for small business.
- Governments should seek international cooperation and public-private partnerships that both (i) help ensure innovation and scientific and technological advance, and (ii) strengthen the capacity of developing countries to absorb, adapt, and utilize these advances where appropriate.
- Information and communications technologies will be critical enablers of healthy communities, and increased access to them must be facilitated.

#### Narrative

To achieve sustainable development and growth, we need major technological transformations. These transformations will require infrastructure, education, and enabling policy environments that put a premium on smart creativity and innovation, and that support the rollout and uptake of technology. These will become crucial preconditions for achieving the goals set at Rio+20. The sustainability successes of governments, business, and individuals around the globe will increasingly depend on their capacity to generate and access science, technology, and innovation.

Business plays a leading role in harnessing the enabling potential of innovation and scientific and technological advance. However, business will only be able to do so in partnership with governments and other stakeholders, and in a policy environment that both encourages innovation as well as scientific and technological advance, and that strengthens the capacity of developing countries to absorb, adapt, and utilize these advances to their local settings.

There is no single policy that, by itself, will ensure success, but rather comprehensive policy approaches are required to create regulatory and policy environments that fosters innovation and scientific and technological advances, both in local settings and globally. Governments should avoid policies that could impede innovation and technology adoption, and should instead adopt supportive policies, such as: investment in education and skills; investment in research and development, conducted in partnership with business and the scientific community; investment in infrastructure; investment in mechanisms that support knowledge transfer; protection and enforcement of intellectual property rights; promotion of competition; support for entrepreneurship, small business, and the creation of new firms; open markets; regulatory transparency and long-term thinking; support for voluntary, global, market-driven technology standards; and, promotion of and access to information and communication technologies.

The public at large should know more about the science and technology that supports sustainable development and growth; governmental authorities, industry professionals and other decision makers should be educated through capacity-building initiatives.

While business plays a key role in developing new science and technologies, it is clear that diffusion and adoption remain a challenge in many countries. The private sector, through collaborations with governments and through public-private partnerships can help bring solutions to this issue. However, adequate market and regulatory conditions combined with available local knowledge and capacity remain an essential factor in the success of technology diffusion and adoption. Governments can play a key role in this arena, which also then facilitates local businesses' own learning curve and innovation so that technology development can become localized and appropriate to the needs of local actors. Global efforts of this nature are already taking place through a variety of mechanisms, such as the Asia-Pacific Partnership (APP) on Clean Development and Climate, now continued through the Global Superior Energy Performance Partnership (GSEP) and the Telecommunication Technology Centers as well, as a host of partnerships. At the meta-level, current negotiations on the creation of a 'technology mechanism' under UNFCCC are also a cornerstone for a global effort to improve technology development, diffusion and uptake in areas critical to sustainable development. Rio+20 outcomes should reinforce these efforts and recognize the need for localized solutions based on the participation of public and private sectors.

Organizations around the world continue to cite the importance of information and communications technologies to healthy communities, and stress the desire for greater access to these technologies. Policy Recommendations

- a) Recognize that innovation and scientific and technological advance are essential enablers to achieving the goals for sustainable development and growth that Rio+20 is targeting
- b) Encourage all governments to adopt policies that foster transformational innovation and scientific and technological advance, with special attention to policy frameworks that provide adequate protection for intellectual property rights and increased public support for sustainability-enhancing research and development.
- c) Call on the private sector to both provide sustainability innovation and scientific and technological leadership, and to partner with governments towards these ends.
- d) Agree to seek mechanisms for international cooperation and public-private partnerships that help spur the innovation and scientific and technological advances needed to meet the Rio+20 goals, and that strengthen the capacity of developing countries to absorb, adapt, and utilize these advances to their local settings.
- e) And finally, call for improved access to information and communications technology to facilitate growth towards healthy communities in every sense – civic engagement, health, education, food security, clean and efficient energy, and stability.
- f) Resource and materials management

Lead Authors: Aquafed, International Council on Mining and Metals (ICMM), World Business Council for Sustainable Development (WBCSD)

As populations grow and lifestyles develop, the consumption of materials and natural resources is increasing, in many cases exponentially. This means that there will be increasing stress on the supply of many of the natural resources and substances that are required to sustain societies, the economy and the environment. In some regions and for some substances, the lack of materials or resources is already, or will shortly, constrain Green Growth and Poverty Alleviation efforts. A variety of existing concepts seeks to minimise this problem and extend the "carrying capacity" of the earth sustainably into the future. These include; sustainable consumption and production, sustainable value chains, the circular economy, and sustainable materials management. Each of these approaches has advantages, but individually none provide a unique or complete solution, because each has real and practical limits. A more productive way forward is to address all of these lifecycle approaches together to combine the strengths of each. Promoting Green Growth and establishing Green Economies requires action by all stakeholders throughout the lifecycle of materials and products, including consumers, producers, and governments. A combination of behaviour and regulatory policy changes will be required.

#### Key Messages

1. An "ideal" green economy would be one where there is a complete decoupling of development from the depletion of natural resources, and where all the materials originating from biological sources return to the biosphere after use and all those originating from mineral or non-renewable sources are recycled. This vision of a circular economy is unrealistic, but sets a target for resource and materials management.
2. Existing approaches to products and services need to be reviewed to reduce or eliminate their demand for natural resources. New business models and societal expectations with corresponding products and services need to be defined that decouple growth and material consumption.
3. Recognising this, increased knowledge of the magnitude and effect of the strategy of the 3R's (reduce, reuse, recycle) needs to be incorporated into macro-economic models and indicators, to guide consumer, industrial and government behaviour, decisions and actions.
4. The change from a product-consumption economy to a product-service economy, which replaces the sale of products and services with the marketing of their use, is one way to achieve the decoupling of growth and material consumption.
5. Any approach to decoupling (both absolute and relative) must address the current limitations of recycling efforts and the unsustainable rates of primary resource consumption, with the understanding that a major change to material usage patterns will be required urgently.
6. Integrated materials management policy frameworks are required at all levels to ensure that natural resources are used/reused productively and sustainably throughout their lifecycles. This requires a holistic lifecycle approach to the design, production, use, and recycling of products and services. In addition, different materials will require different management approaches to ensure a sustainable resource base for society.
7. Collaboration between businesses, consumers, policy makers and civil organizations can help create the enabling environment necessary to support a more sustainable consumption and production model. To facilitate this, standards for measuring and assessing the sustainability impacts of material use in value chains are required.
8. Policy makers can accelerate progress toward more sustainable consumption and production models, by focusing on specific areas: market-based mechanisms and economic instruments, regulatory structures, encouraging development of technology and innovation, promoting and supporting efficient use and recycling of materials, collection and sharing of information on materials and material flows, and promoting research into human behaviour to encourage sustainable consumption and production.

#### Narrative

Escalating public and governmental concerns about poverty, climate change and biodiversity loss are linked in many ways to how we use natural resources. Society as a whole uses vast amounts of materials that come from and return to the Earth such as wood, minerals, fuels, chemicals, agricultural plants and animals, soil and rock. The scale of this use is such that associated impacts are beginning to pose serious threats to the health of ecosystems and overdraw Earth's natural capital.

A central objective of Green Growth and establishing Green Economies is the decoupling of development from the depletion of natural capital and resources. Decoupling has two aspects that must be implemented together to be successful. Absolute, decoupling restrains the growth in total consumption of raw materials, while relative decoupling reduces the share of primary (virgin) resources in the total consumption of materials. This objective drives the three 'R' approach, "Reduce" (the amount of natural resources required – Absolute decoupling), "Reuse" (extend the life or the number of times a product or service is used – Relative decoupling), "Recycle" (turn materials that would otherwise become waste into valuable resources – Relative decoupling).

Currently governments and the private sector are tackling these challenges through a number of common but often independent policy and operating frameworks. These include natural resource management policies, product policies and waste management policies. Within each of these areas, decision-makers have a variety of options for exercising economic, physical, or operational influence upon material flow patterns. However to successfully manage and reduce negative impacts and maximize benefits a more integrated, lifecycle-based approach is required. Governments in the developed world are beginning to consider this as seen in the emerging policy discussions on Sustainable Materials Management at the OECD. Emerging economies are also well suited to rapid assimilation of integrated materials management approaches (e.g. China's policy on the circular economy).

The production and use of materials involves energy and water inputs at key stages in the materials lifecycle. This interrelationship is at the root of the ecological footprint associated with industrial economies. However, this also denotes that any changes in material usage may inadvertently trigger changes in the consumption of energy, water, or other critical resources in other parts of a materials lifecycle. It is therefore imperative that an integrated materials management approach is taken at the global level to ensure that natural resources are used/reused productively and sustainably throughout their lifecycles.

Increased competition for raw materials and markets coupled with sustained growth in emerging economies has given rise to two major materials sustainability issues: access to raw materials and resource efficiency. Part of the answer is to progressively move towards a circular economy. This is an economy in which today's primary resource is tomorrow's secondary resource. To achieve this in today's global economy a fuller lifecycle-based understanding of material flows within and between economic domains is vital. This is necessary to manage system-wide impacts effectively and to ensure net-positive outcomes for man and the environment.

Materials are the building blocks of industrial society from which products are manufactured and services derived. Products, including both goods and services are developed and created to serve societal needs. Society obtains the materials it needs from natural resources. The interdependence between resources, materials and products needs more detailed understanding and differentiated yet integrated management approaches. Different materials need different management approaches to build a more sustainable resource base for society. To focus on the "source" of resources without acknowledging the role that society plays in extracting, refining, utilizing and re-utilizing materials from natural resources is short-sighted. It diminishes the opportunity for policy makers, businesses and users to maximize the eco-efficiency of goods and services.

Lifecycle thinking is essential to sustainable development. The main goal of lifecycle thinking is to ensure consideration of socio-economic and environmental impacts associated with goods and services throughout their lifecycles and to improve performance of resources and materials. This requires effective links between the economic, social and environmental dimensions of the entire value chain. To achieve these linkages the principles of sustainable development need to be applied to the conception of products and services and to supply chain management. All business levels need to identify opportunities, manage risks and determine responsibilities throughout the value chain.

#### Policy Recommendations

1. Develop policies to decouple development from resource use, recognising the need to employ both absolute decoupling and relative decoupling.
2. Encourage a shift in society towards norms of sustainable consumption and production.
3. Develop social and economic incentives to reduce the demand for natural resources.
4. Develop regulation to improve the management of supply and demand for natural resources.
5. Build an integrated lifecycle-based approach to materials management at the local, national, regional and global level.

6. Promote lifecycle thinking within supply chains to improve economic, social and environmental performance of resources and materials.
7. Recovering value from and creating markets for the materials and energy produced from used products and waste have to become key policy targets.
8. Develop macro-economic models and indicators that incorporate and advance knowledge on the magnitude and effect of policies aimed at the 3R's (Reduce, Reuse and Recycle).
9. Establish at both global and national level a system of materials/resource accounting to track the sustainability of prime resources against the three measures of: i) total consumption growth rate (recycled and primary materials), ii) rate of growth of net additional stock, iii) recycling rate.
10. Create a fuller lifecycle-based understanding of material flows and seek to develop closed-loop systems.
11. Develop integrated planning for significant levels of recycling of materials and resources
12. Address the need for restoration of ecosystem resources as part of sustainable consumption and production efforts

#### g) Social Development, Human Rights and the Role of Business

Lead Author: International Council of Mining and Minerals (ICMM)

States bear the primary duty for social development, poverty alleviation and ensuring the protection and realization of human rights. They also have responsibility for the effective management of the natural resources on which development often depends. These aspects are closely interlinked and require a vibrant and well-functioning private sector, working together with government and stakeholders, to enable significant progress against the Millennium Development Goals, and the realization of economic, social and cultural rights. At the same time, states also have a duty to ensure that the enjoyment of these rights is supported by progress against civil and political rights.

#### Key Messages

- Recognizing that the primary duty for social development, poverty alleviation and the protection and realization of human rights lies with states, and that states also have responsibility for the effective management of the natural resources on which development depends,
- Acknowledging that the Millennium Development Goals' (MDGs) vision of sustainable environmental, social and economic progress provides a foundation for, or explicitly addresses, many of the human rights set out in the International Bill of Human Rights,
- Recognizing that business has a responsibility to respect human rights – meaning to not infringe on the enjoyment of rights by others and remediating negative impacts with which they are involved,
- Acknowledging that many business organizations have formally established or embraced principles and codes of practice that set an expectation for business to behave in an economically, socially and environmentally responsible manner,
- Emphasizing that business has an extraordinary potential to enable and contribute to social development, poverty alleviation and the realization of rights in a variety of ways,
- Acknowledging that a vibrant private sector – and effective stewardship of the natural resource base – is essential to achieve significant social and economic progress against the MDGs and broader realization of many economic, social and cultural rights,
- Emphasizing that no one development actor can deliver the MDGs in isolation, and that significant progress is dependent on engagement and various forms of collaboration (including partnerships) between states, business and other stakeholders.

#### Narrative

The primary responsibility for social development, poverty alleviation and the protection and realization of human rights lies with individual states. It is states that have ratified a range of international conventions and have adopted UN resolutions relating to human rights, poverty alleviation, development and environmental protection. States are also responsible for developing national legal frameworks in support of social and economic development and the effective management of natural resources, as well as protecting the rights of their citizens. However, business has a responsibility to respect human rights and an important role to play in contributing to social development and poverty alleviation.

In 2000, the then 189 member states of the United Nations established the Millennium Development Goals' (MDGs): eight time-bound objectives to reduce poverty and improve people's lives by 2015. The MDGs vision of sustainable environmental, social and economic progress – in areas such as poverty alleviation, food security, water and sanitation, health, education and environmental protection – address many of the rights set out in the Universal Declaration of Human Rights in 1948, and elaborated on in the International Covenants on Civil and Political Rights and on Economic, Social and Cultural Rights of 1966. They also explicitly recognize that sustainable social and economic progress is critically reliant on protecting the natural resources on which development depends. This includes clean water, productive lands, biodiversity and the many services it provides that benefit mankind.

The basic responsibilities of business are set out in the legal frameworks of the states within which they have activities, and include compliance with laws relating to labor rights and environmental protection at a minimum. At the international level, a number of voluntary guidelines or codes have also been developed (notably the OECD Guidelines for Multinational Enterprises and the UN Global Compact) which set out expectations for responsible business behavior. In addition, many business organizations have formally established or embraced principles and codes of practice that set an expectation for business to behave in an economically, socially and environmentally responsible manner. At the international level, the consensus agreed at the Human Rights Council in 2008, and supported by major industry associations, is that business has a responsibility to respect human rights – to not infringe on the rights of others and to remediate any negative impacts with which they are involved. This responsibility is articulated in the UN's "Protect, Respect and Remedy Framework", and elaborated on in the UN's "Guiding Principles on Business and Human Rights".

Business also has an extraordinary potential to enable and contribute to social development, poverty alleviation and the realization of human rights. For example, business plays a significant role in producing the basic materials and developing and operating essential infrastructure that enables social and economic advances. In many post-conflict situations and fragile states, business has been essential in kick-starting economic and social progress, helping to sustain peace-building efforts as well as encouraging respect for the rule of law. Where governments embrace a market-economy and create the enabling environment for business to flourish, progress against the MDGs can be accelerated. In parallel, opportunities for the realization of many human rights are enhanced.

The reality is that without a thriving competitive private sector, significant social and economic progress against the MDGs is unlikely to be achieved and impossible to sustain. A healthy business environment — where companies make investments, create jobs, deliver services and improve productivity—helps alleviate poverty by contributing to economic growth, increasing employment and enhancing people's incomes and opportunities. However, states effectiveness in enabling development depends

on good governance and on the quality of its institutions – social, political and economic. States need to: create an enabling environment that incentivizes businesses to expand their productive capacity in a responsible manner; provide social protection for the most vulnerable and strengthen their capacity to sustain livelihoods; and encourage collaboration between the state, business and other stakeholders in support of enhanced developmental outcomes.

To create a healthy business environment, states must ensure that markets and entrepreneurial activity are not stifled by excessive regulation and taxation, unfair competition, corruption, or an unstable policy environment. They must establish rules that: clarify property rights; reduce the cost of resolving disputes; increase the predictability of economic interactions; and provide contractual partners and investors with certainty and protection against abuse. This is the conclusion of the World Bank/International Finance Corporation's Doing Business series over the past eight years (<http://www.doingbusiness.org/>). At the same time, states also have an important role to play in ensuring that business behaves responsibly, in a manner that respects human rights, supports rather than undermines the natural resource base, and contributes to sustainable social and economic progress. Part of this is about incentivizing responsible practices and players – and part is about creating strong disincentives for irresponsible behaviors.

If those already living in poverty are to enjoy the benefits of an improved business environment, they must be able to actively participate in the potential opportunities that this brings. To do so, requires investments in social and economic infrastructure – notably health, water and sanitation, and education – but also access to training, energy and credit without discrimination. It also requires specific attention to empowering women through access to education and healthcare. In addition, it involves a sustained focus on governance reforms, particularly those that focus on promoting transparency and eliminating corruption. Corruption exacerbates poverty by impairing service delivery, constraining responsible investment, reducing incomes of the poor and undermining programs designed to address their basic needs, such as sanitation and healthcare.

#### Policy Recommendations

Sustainable social and economic progress critically depends on states taking steps to:

- a) Fulfil all of their human rights obligations in support of sustainable social and economic progress, with particular emphasis on those at risk of being vulnerable and marginalized, and in line with the UN Guiding Principles on Business and Human Rights, set out clearly the expectation that that business respects human rights through the conduct of effective due diligence
- b) Ensure the effective management of land, water, biodiversity and other natural resources on which development depends, through adequate planning, protection and enforcement
- c) Create the conditions necessary to encourage responsible investment (domestic or foreign), job creation, and improved productivity in support of economic growth and poverty alleviation, to ensure that business expands rather than constrains social and economic development progress
- d) Empower poor and potentially vulnerable or marginalized people to participate in economic opportunities, through investments in health, education, and gender equality, while addressing governance issues (particularly corruption) which can have a disproportionate impact on the poor
- e) Effectively use the revenues from natural resource endowments and other economic activities in support of enhancing social capital, the rule of law, the protection of human rights, establishing social and economic infrastructure, and fostering participatory development and economic diversification
- f) Engage with international institutions, business and other stakeholders on the effective delivery of services and products in support of social and economic progress, through partnership approaches or other forms of collaboration where appropriate g) Encourage business to apply ethical principles, practices and effective systems of corporate governance, in support of state-led efforts to address corruption
- h) Encourage business to integrate sustainable development considerations within corporate decision-making processes, and seek continuous improvement in sustainable development performance – social, environmental and economic – and report progress in a systematic and credible manner that engenders the trust of relevant stakeholders
- i) Create incentives for business to expand economic opportunities along their value chains, either through involving the poor within the value chain (as employees, suppliers, customers, etc.) or through developing their human capital j) Create incentives for business to contribute to the social, economic and institutional development of local communities, in addition to mitigating any adverse impacts that business might have

#### h) Transformational Partnerships

Lead Author: UN Global Compact

While businesses can make significant contributions to sustainable development independently, partnerships can often contribute to enhancing impacts. There are many systemic challenges that can only be addressed with the coordinated efforts of a wide variety of actors. The convergence of interests between the public and the private sector has provided an opportunity for exploring innovative models for collaboration that achieve greater impact and scale.

#### Key Messages

- Transformational partnerships are necessary to address systemic challenges. Solving complex global development challenges requires systemic change which is only possible with the coordinated efforts of a wide variety of actors.
- Transformational partnerships can address fundamental market or governance failures in an integrated manner.

#### Narrative

In the past, partnerships with the private sector were often conceived of only as fund-raising activities. Today, however, it is widely recognized that many of the most effective and sustainable partnerships leverage the core competencies of all partners. Both the public and private sectors have come to realize that the real potential in partnering lies in the synergy and scalability of competencies, resources and expertise that drive successful initiatives.

As an outcome of Rio+20, and building on the legacy of Johannesburg in 2002, Governments are asked to continue to encourage partnerships as voluntary and collaborative relationships between various parties, both public and non-public, in which all participants agree to work together to achieve a common purpose or undertake a specific task, and to share risks, responsibilities, resources and benefits. From philanthropic and strategic partnerships to broader issue-based networks and advocacy partnerships, there are a wide range of partnerships that have the capacity to contribute to sustainable development.

Governments are also asked to support the development of more transformational partnerships which have the potential to transform the ways in which we realize development goals. Transformational partnerships have the following characteristics:

- Address a systemic issue: Solving complex global development challenges requires systemic change which is only possible with the coordinated efforts of a wide variety of actors. Transformational partnerships should address fundamental market or governance failures in an integrated manner.

- Involve all stakeholders who play a necessary role and pertain to the relevant geographies, and do not involve any who fail to meet the criteria.
- Leverage the core competencies of all partners – such as convening power, resources, local presence and technical expertise – to address the systemic issue across all relevant value chains.
- Have an in-built capacity to reach scale and leave a lasting impact – which requires long-term efforts towards instituting new policies and rules, correcting market failures and shifting behavioural norms. Incentives and funding are designed to drive scale and sustained impact.

The challenge of sustainable development requires the participation of all sectors and actors in society. Partnerships can play a key role in helping meet some of the more complex sustainable development needs and should be recognised by governments in Rio as a key mechanism to be supported and leveraged.

#### Policy Recommendations

- a) Partnerships can play a key role in helping meet some of the more complex sustainable development challenges and should be recognised by governments as a key mechanism to be supported and further leveraged.
- b) Governments should support the development of transformational partnerships which have the potential to transform the ways in which we realize development goals given they address systemic issues; involve all relevant stakeholders; leverage the core competencies of all partners; and have an in-built capacity to scale.

#### i) Urbanization

Lead Author: World Business Council for Sustainable Development (WBCSD)

By 2050, the global population will reach 9 billion, with more than 6 billion living in cities. A thoughtful and integrated approach to urban challenges is necessary in order to meet the basic needs of this urban population, enable dignified lives, and support meaningful roles for people in their communities.

#### Key Messages

- Sustainable urban development requires an integrated approach, inviting all relevant and concerned stakeholders at all stages and balancing resource efficiency, competitiveness, social equity, environmental impacts, with many other social and economic factors.
- Involving business early in the urban planning process will help create a cross-cutting strategy and provide competitive and effective solutions.
- On our way to sustainable urbanization, a broad understanding of 'green' is necessary, adequately addressing social, economic and ecological dimensions of sustainability. 'Green' is not a final state but a process, and support of 'green' cities, industries, and jobs goes hand-in-hand with efforts toward 'greener' cities, industries, and jobs.
- Education is an important lever to foster understanding of 'greener' urbanization.
- The Rio+20 process should aim at improving ways and structures to strongly promote 'greener growth' in urban areas worldwide. Existing targets can best be reached by prioritizing actions adjusted to local/regional circumstances.

#### Narrative

With the population of cities swelling by three million a week, the case for sustainable urban environments becomes more compelling: it offers citizens better lives by lifting people out of poverty and providing appropriate services. Integrated urban management must become the norm, and be based on good governance, in order to achieve the progress necessary to reach sustainability. Involving business early in the urban planning process will help create a cross-cutting strategy and provide competitive and effective solutions. Urban sustainability requires a system-wide view of the interlinked challenges, and a balanced, integrated approach tailored to local circumstances.

#### Policy Recommendations

- a) Sustainable urban development requires an integrated approach, inviting all relevant and concerned stakeholders at all stages and balancing resource efficiency, competitiveness, social equity, environmental impacts, with many other social and economic factors.
- b) Sustainable urban development requires innovation, improved technology - including access to technology - and competitiveness as prerequisites for sustainable and 'greener' cities. Governance and finance priorities need to be set accordingly with a clear definition of roles and responsibilities of all actors. Involving business early in the urban planning process will help create a cross-cutting strategy and provide competitive and effective solutions.
- c) The Rio+20 process should aim at improving ways and structures to strongly promote 'greener growth' in urban areas worldwide. Existing targets can best be reached by prioritizing actions adjusted to local/regional circumstances.

#### j) Water for Green Economy and Poverty Alleviation

Lead Author: Aquafed

To succeed with the development of a green economy and the eradication of poverty, significantly more attention must be paid to water policy. This is essential to ensure that the economic, social and environmental dimensions of water management can be satisfied and they are integrated with the other essential and interrelated elements of natural and man-made capital. At present, water is under-estimated and consequently under-resourced in green growth policies at all levels. We single out three major policy issues concerning water, green economy and poverty alleviation:

- The serious shortfall in the delivery of water and sanitation to meet the requirements of the Human Right to Safe Drinking Water and Sanitation, which are more precise and demanding than those set out in the MDGs.
- The recognition that it will be very difficult to feed the growing world population unless there are significant improvements in water and energy productivity in agriculture.
- The current lack of treatment of polluted water needs to be overcome to ensure that water can be used multiple times as a means of overcoming forecast water stress and meeting future needs of societies, the environment and economies.

#### Key Messages

- Management of water resources and provision of water services are fundamental elements without which developing a green economy and meeting the poverty alleviation targets of the MDGs are impossible.

- Population growth, economic development and improving lifestyles are all placing heavy pressures on water resources. These pressures are causing demand to increase at least twice as fast as population growth. At the same time the stress on the finite resources of water are increasing as a result of mismanagement, pollution and climate change.
- Current data and monitoring processes are inadequate and grossly understate the scale of the problem of inadequate water and sanitation services. The number of people currently suffering from a lack of water services that satisfy all aspects of the Human Right to safe drinking water and sanitation at their dwelling place exceeds 3 billion. This is significantly more than the numbers reported by the MDG monitoring process. The number of people in urban settlements who do not have access to satisfactory water and sanitation services as defined by the MDG target is increasing instead of diminishing. This situation is morally unacceptable and extremely costly in social, economic and environmental losses and externalities. It is a serious concern to business, which sees the impact in reduced productivity of human resources and diminished purchasing power in marketplaces.
- Today 80% of the used water worldwide is discharged to the environment without treatment. This is seriously degrading the environment, threatening human and environmental health and making water unusable for downstream users. Collecting and treating water after use to make it available for subsequent uses is a realistic option for increasing the amount of water available and protecting resources and the environment to permit economic growth and poverty eradication.
- Currently agriculture is the largest user of water resources, often with low levels of efficiency. To meet the significant increase in the demand for food to feed the growing world population the water use efficiency of agriculture will have to improve substantially. This will require improved agricultural processes and practices where rain-fed agriculture is concerned. It will require a combination of agricultural and water management actions where "blue water" is used for irrigation.
- While agricultural is the largest user of water resources, the provision of energy to support development is becoming increasingly water intensive, creating competition for a scarce resource in some parts of the world. To meet the increasing demand for energy, fresh water productivity in the energy sector will have to improve significantly. This may require the increased use of non freshwater resources like sewage effluent, saline or brackish water.
- Business manufacturing and services also use significant amounts of water, either directly or through their supply chains, and also contribute to water discharge. Improvements by both public and private water users and providers are therefore also important with respect to achieving water sustainability.

#### Narrative

Water is a "fundamental" that underpins all sustainable development and the green economy.

Water, with the environmental, social and economic services that are derived from it, forms part of the platform, on which life of all kinds, all societies and all economies are dependant. Combined in complex ways with the atmosphere, land and energy, water is a fundamental part of the global system on which everything else is built and is dependent. This means that there is vast array of questions that need to be asked and relationships developed between water and the green economy and poverty alleviation.

Since the Earth Summit in Rio in 1992, water has been accorded less importance than climate change. The links between the two are now becoming ever more apparent and the need to give equal importance to water as to the atmosphere is becoming evident. It is now seen by many that including a deep examination of water issues and water policy in the Rio 2012 discussions is an absolute imperative.

However, there are so many dimensions to the water challenge, that it is considered impractical and ineffective to attempt to deal with them all. For that reason, we are proposing that States focus on three particularly important policy areas.

- Water and sanitation
- Water productivity in agriculture
- Treating polluted water as a resource

These are described briefly in this paper and some key messages and policy recommendations are outlined.

Why the three themes have been selected: We have suggested the focus on the three themes because it is believed that these are particularly pressing issues that offer very significant potential to meet the objectives of the Rio 2012 conference and make a significant contribution to the future well being of mankind and the environment.

Other parts of this submission raise other aspects of water as it links with sustainable development, green growth and poverty alleviation. These are notably;

- The Energy - Food - Water Nexus
- Agriculture
- Urbanization
- Oceans

It would be possible to highlight links between water and most if not all elements of sustainable development.

#### Policy Recommendations

a) The scale and cost of the lack of adequate water and sanitation services to about half of the world's population needs to be recognised. In the context of green growth, poverty alleviation, social equity and environmental protection, the international community, national and local governments must take urgent steps to remedy the situation.

- Global Review and Revision of Water and Sanitation targets
- International policy commitments to achieving and sustaining access to water and sanitation to meet the requirements laid out by the UN Human right to safe drinking water and sanitation by a specific date.
- National policy commitments to developing country level targets, plans and resource allocation to enable the above.
- Local action to ensure the investment and operation of sustainable water and sanitation services in an economically and socially sustainable way.
- Particular attention must be paid to establishing a sound and sustainable economic basis for water and sanitation services. This can be achieved by using the tools of Strategic Financial Planning and Sustainable Cost Recovery.

b) To reduce the stress on finite water resources, it is essential that the water productivity of agriculture, which globally uses 70% of available water, is increased substantially.

- International and National policies and incentives to improve water productivity of agriculture to be developed.
- Set up national and international monitoring, analysis and reporting of water use and efficiency in agriculture, and also in business manufacturing and services.
- Review of the economics and pricing of water for irrigation to ensure the optimum investment and operation of public and private irrigation infrastructure.
- Develop public and private investment in the research and development of improved technologies for water use in agriculture and the water productivity of crops.

c) A way to support the growth in demand for water from the finite resources available is to ensure the successive uses of water by different users in the same catchment. This can be done by reducing pollution and by collecting and treating used water to enable its subsequent use by others.

- National policy objective to be devised to support the recovery and recycling of water after use.
- National incentives to encourage municipalities and the economic sectors to develop the recovery and recycling of water after use.
- Policies to enable the reuse of used water after treatment for secondary purposes that are consistent with public and environmental health.
- Investment in, or active encouragement of, research, innovation and development in reuse and recycling technologies.

\*\*\* Business Action for Sustainable Development 2012 (BASD 2012) is the official United Nations coordinator of business and industry at the upcoming Conference on Sustainable Development (Rio+20) to be held in Rio de Janeiro on June 4-6, 2012. A temporary coalition of business organizations, BASD 2012 will ensure the voice of business is heard at the event and during the preparatory process. This initiative is convened by the International Chamber of Commerce (ICC), the World Business Council for Sustainable Development (WBCSD) and the United Nations Global Compact (UNGC) and is being expanded with a number of sectoral international business organizations.

BASD 2012 will:

- Provide constructive policy input to the Rio+20 preparatory processes and coordinated business input to the formal United Nations Rio+20 Conference.
- Demonstrate business' commitment to delivering market-based solutions and showcase its active engagement in initiatives and partnerships to promote sustainable development. Market-based solutions are essential to move toward a more sustainable world.
- Represent business and industry at the UN DESA Major Groups Program aimed at enhancing Major Group participation in the Rio+20 process.
- Emphasize business solutions to sustainable development that deliver results and expand the concept to embrace poverty alleviation, job creation, environmental stewardship and social empowerment.
- Express global business positions on key sustainability issues to assist governments in making decisions that allow for a sustainable global business engagement.

The ultimate objective of BASD 2012 is to strengthen the overall contribution of Rio+20 to sustainable and inclusive markets and promote joint action between stakeholders – business, government, civil society and consumers – toward green growth.

---

## Business School Lausanne

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

50+20: Management Education for the World  
Educating Leader of a Sustainable Future

Our call to service:

We call on all stakeholders (education governments, business and international accreditation agencies, youth and parents) to make the primary focus of business schools to serve society by focusing their research and teaching to enable the development of a business system and corporations which deliver a sustainable world.

The future license to operate any management education organization will depend on its contribution first and foremost to the world achieving environmental sustainability and social justice. This means policy frameworks for management education throughout the world which will transform business education organizations to become custodians of the future of sustainable corporations and a sustainable business system on behalf of society.

Concrete proposal:

We will propose a daring vision and concrete roadmap to implement a radically new management education FOR the world. A fundamental re-thinking of business- and management education in order to create globally responsible leaders equipped with required competences to embrace emerging environmental, societal and economic challenges. Such leaders will be needed in business, in government, NGO and social entrepreneurship ventures.

Who are we:

50+20 is a coalition of three organizations dedicated to ensuring relevant management education: the World Business School Council of Sustainable Business (WBSCSB), the Globally Responsible Leadership Initiative (GRLI), and U.N. backed PRME (Principle of Responsible Management Education). [www.50plus20.org](http://www.50plus20.org)

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

We need to include education of future leaders FOR a sustainable future in the core of any and all action. We need to educate the next generation and to re-educate those in and approaching positions of power.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

Implementation:

We will propose 4 different avenues of action:

- a) Creating a model business school in every major region of the world (supported by major foundations)
- b) Proposing concrete avenues for change to existing business schools (sharing emerging practices and recommendations)
- c) A manifesto for government and international agencies to work on a legislative and regulatory level
- d) Raising awareness in the general public with a book, articles, and a video, targeted for them through various channels.

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

We (GRII, WBSCSB, PRME) have formed the 50+20 coalition in order deliver this vision and concrete roadmap to the RIO+20 conference. It is critical to be able to present this vision to all relevant stakeholder groups (government, business, youth, women, the bottom 4bn) and to ensure that education of leaders for a sustainable future is an integral part of what is a successful and hopefully ground-breaking outcome of RIO+20.

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

A safe and powerful approach to educate leaders that are equipped to act for a sustainable future. Such leaders are required in business, government, NGO, and social entrepreneurship ventures of all scales and in every nation of this world.

We need a large scale political commitment for this based on the understanding that we can only save this planet if we completely re-think how we educate leaders, so that they can build a sustainable future in every function they may occupy anywhere in this world.

We need a resolution that every government and international accreditation agency adapts and agrees on as the required minimum standard and sets of outcomes and criteria at which leaders are educated.

We know the problems of this world – we need to create people, citizens around the world who can work on resolving them by embracing the three pillars of sustainable development.

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

Educating leaders equipped to shape a sustainable future is a critical element of creating a green economy that serves the world and achieves a balanced contribution to social, environmental and economic demands.

Developing course materials and case studies for integration of sustainability concepts, practices and values, into core business school courses in Finance, Accounting, Marketing, Information Systems, Operations management and strategic Management.

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

Fundamentally re-thinking business and management education is a key to success. Global responsibility and sustainability must be built-in and not bolt-on.

Getting business school accreditation agencies (AACSB, ACSP, EFMD, etc..) and government education regulatory bodies to incorporate sustainability performance parameters into their curriculum requirements, faculty appraisal, and over Business School performance.

Business school and management institutes can make a difference at a local, national, regional and international level. Business studies have become the most popular topic of undergraduate studies world-wide: we must ensure that we educate the next generation to have the competences needed to address societal, environmental and economic challenges in a balanced and effective way FOR the world.

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

- Educating the bottom 4 billion of the world to ensure that they have the right frame of mind as well as tools to start and sustain entrepreneurial actions that serve their societies and the world.
- Educating the next generation to embrace and resolve societal, environmental and economic challenges in a balanced and effective way FOR the world.
- Re-educating current and emerging leaders to balance societal, environmental and economic challenges in the best interest of the common good (a societal contract).
- Designing poverty alleviation programs in ways that get active engagement of business schools, their faculty and students.

50+20 - Management Education for the World

About the 50+20 Project

The Challenge

The world is demanding a mindful, sustainable approach to the planet's finite resources. Societies are stressed to the point of fracture by shifting demographics, poverty and the rapidity of change itself. Global-thinking citizens are seeking purpose rather than consumption. Business is being challenged to expand its purpose beyond mere profit-making to value-added contributions to society and the world. Business leaders are being called upon to reconcile this panoply of competing urgencies and to lead responsibly in a time of runaway uncertainty and complexity. But how?

More daunting still are the challenges brought to bear by this new scenario on today's business schools. These towers of expertise and tradition are being compelled to re-think the very nature of management education. They are faced with an imperative to set aside what for decades they have done with near exquisite efficiency in favour of something altogether tentative, unmapped and risk-laden. The new reality is calling for wholly innovative, safe and powerful new learning environments capable of inspiring and equipping a new generation of leaders with the skills and competences they will need to bravely and responsibly "step and stumble" their way forward as they address the challenges of an unknown future. Currently, B-Schools are a long way from being able to do this. But time has run out. The future is here.

#### The Context of 50+20 and Emerging Action beyond

To this day business and management education efforts at large function in line with an agenda that was set during the 1950s when the world was a very different place from the one we know today. It has therefore been 50+ years since the agenda for management education has been reset. The upcoming RIO+20 United Nations Conference on Sustainable Development (June 2012) will mark the 20th anniversary of the 1992 Rio Earth summit. It has therefore been 20 years since Governments have been collectively urged to rethink economic development and find ways to halt the destruction of irreplaceable natural resources. It is at this juncture in history where the 50+20 project takes action to reset the management education agenda.

Management education of the future provides education and research that is relevant & applied, holistic & integrative, responsible & sustainable, inter-disciplinary & multi-level, and, of course, learning-oriented. The 50+20 project seeks to achieve this through:

- The 50+20 report will serve two purposes:

■ A summary agenda that highlights the vision, the challenges and the emerging solutions that will be presented at the RIO+20 United Nations Conference on Sustainable Development in June 2012.

■ A comprehensive book for the inspired managers, business students and general public outlining the future business school in pragmatic and captivating language (publishing the report after June 2012)

- Emerging projects at participating business schools around the globe, showcasing emerging practices and pioneering solutions of a responsible & relevant business education.

- Creation of five new business school initiatives in different geographic areas (Asia, Europe, South America, Africa, North America) as leading pioneers to showcase enlightened new models of b-schools.

#### The Ultimate Goal

To provide ground-breaking work for a new paradigm of business schools that embrace the challenges future leaders face when dealing with the world's emerging big issues. A pragmatic, pioneering effort envisioning what a future business school could and should look like. A new paradigm, a quantum leap without comprises, a stick in the ground marking a new era of possibilities to be explored and discovered together.

This paradigm of a new business school seeks to inspire and trigger:

- Multi-stakeholder discussions about where business schools should be heading in the coming decades

- Fundamental and/or incremental change at existing business schools, both the top accredited schools as well as the 10'000 non-accredited schools out there, all of them contributing to educating leaders.

- Business students to take an active part in their education, becoming co-creators in their learning journey

- Accreditation agencies to review and adapt step-by-step their criteria towards a new paradigm

- Inter-stakeholder collaboration between business schools and other fields (coaching & training organizations, societal actors, environmental activists, social & other sciences, emerging business leaders)

- Interdisciplinary discussions in the field of business education – from finance to marketing to strategy, human resources and back to ensure a fundamental re-thinking of how these silos can be overcome.

#### The Rio+20 Milestone

Presenting our vision at the U.N. Earth Summit RIO+20 in Rio de Janeiro in June 2012 represents a first small step of the business school community to participate in and contribute to the public dialogue on the challenges the world (the earth, society, citizens and business) faces in the coming decades.

The agenda will include both a new paradigm – a vision yet to be realized – as well as relevant examples of existing examples and emerging best practices of how business schools are taking action today already towards the new paradigm.

#### The momentum is building

A leadership team of two dozen deans and professors of business schools around the globe and thought-leaders of key stakeholders have started on this path less travelled, a journey towards a better world.

#### The 50+20 Steering Committee

■ Mark Drewell, Chief Executive, GRI

■ Thomas Dyllick, Delegate for Responsibility & Sustainability, University of St Gallen, Co-founder WBSCSB

■ Derick de Jongh, Director, Albert Luthuli Center for Responsible Leadership at University of Pretoria

■ Katrin Muff, Dean Business School Lausanne, Co-founder WBSCSB

■ John North, Albert Luthuli Center for Responsible Leadership at University of Pretoria

■ Paul Shrivastava, Director, D. O'Brien Center for Sustainable Enterprise, Co-founder WBSCSB

---

## C40 Climate Leadership Group (C40)

### An 'Alternative Approach for Cities'

#### C40 Cities Climate Leadership Group Submission to Rio+20

#### Background

1) Today, over half of the world's population lives in cities, a share that is likely to reach 75 per cent in 2050

2) Cities and urban areas currently account for over two-thirds of the world's energy consumption and account for 70 per cent of global CO2 emissions. The world's 50 largest cities generate about 2.6 billion t CO2e annually, more than all countries, except the United States and China.

3) The urban population is expected to double by 2030 and the global built-up area is expected to triple during the same period. Massive construction of buildings and infrastructure in developing countries will lock in conventional energy efficiency and GHG emissions for many decades to come. Poorly managed cities exacerbate enormous

new demands for energy and infrastructure investment. It is a big challenge for sustainable development to shift buildings and infrastructure to low emission and it should be the first priority in a green economy.

4) In order to establish sustainable societies, and truly mitigate against the impacts of global climate change, it is crucial to shift every aspect of the society to low carbon. This 'Paradigm shift' to a low carbon society creates new investment, new consumption and new jobs. The construction of low carbon cities will form a large portion of the green economy. It will spur investment and entrepreneurialism, foster new technologies and innovations, increase income through reforming the economy and improve the human habitat. Cities and societies are still dependent on energy and natural resources from distant locations. The future indicates an increase of local energy generation and smarter grids to improve efficiency. Cities will be the engine that fuels a green economy and thus are a major stakeholder in sustainable development.

5) Cities have emerged as a leading force for global action on climate change. With global protocols and treaties unable to bring about significant reforms, cities are strongly positioned to generate real change, and in fact are already taking significant action. The facts on the ground bear up: Rio, New York, Sao Paulo, London, Tokyo and Jakarta are just some of the world's megacities that are working to transform their policies and infrastructure to improve energy efficiency and other resource use. While national treaties and global protocols have struggled to generate meaningful change, cities continue to have an impact.

6) A greener economy demands actions to promote economic growth with social inclusion. Informal settlements and disorganised urban sprawling are two of the major challenges from urbanisation with a large impact on the health of the population and the environment. Effective policies to promote sustainable development will come alongside improving the standard of living for all city inhabitants. As such, this is not only a matter of addressing climate change and promoting economic growth. These actions also have a significant impact on the general public health.

#### C40 Cities Climate Leadership Group

7) The C40 Cities Climate Leadership Group (C40) is a network of large and engaged cities from around the world committed to implementing meaningful and sustainable climate policies and actions locally that will help address climate change globally. 40 large cities and 18 other cities are working together to exchange ideas in order to accelerate climate actions. The C40 has developed networks of cities to work together on key areas such as energy efficiency, waste, water, transportation and adaptation and to hold workshops and seminars to exchange best practice. A biennial mayoral summit convenes member cities to discuss the implementation of new initiatives and opportunities for further collaboration. The summit allows cities to work together on implementing meaningful climate change solutions. This cooperative approach leverages the best practices and lessons learned by cities that are taking action.

8) C40 cities are already taking significant climate action. A recent survey showed that C40 cities across the world have taken 4,734 climate related actions to date. Over 80% of these actions were taken initiated after participating cities joined the C40. Additional key findings were;

- \* C40 Mayors and Governors lead by example, retrofitting municipally-owned buildings and vehicles
- \* C40 Mayors and Governors are leveraging powers over buildings to reduce energy demand and encourage distributed renewable energy supply generation
- \* 75% of C40 Mayors and Governors have direct and strong powers over city roads, where on average 35% of emissions occur
- \* In addition to the 4,734 climate related actions already taken 1,465 more were under consideration.

#### Examples

Energy demand in buildings - Energy efficiency retrofit programmes have been implemented for existing buildings in 20 cities. Installing energy efficient light bulbs or other smart lighting mechanisms is the one of the most popular programmes. 12 cities have implemented Building Rating and Reporting programmes for existing buildings to set standards in order to create a market for energy efficient building. A city-wide cap-and-trade program is also being implemented to motivate public and commercial buildings to invest in energy efficiency. 15 cities are introducing Building Standards for energy efficiency for new buildings which is very effective for constructing a low carbon city.

Transportation - 10 Cities have already delivered bus rapid transit systems. Of the 16 mayors with direct power over 1.4 million taxis, 4 mayors are piloting electric taxis and 5 are taking policy measures to introduce hybrid taxis. 22 mayors have taken action to improve the cycling infrastructure starting with over 9,370 km of cycle lanes.,

Waste management - 12 mayors are implementing waste to energy facilities within their cities, harnessing existing resources and utilising powers in creative ways; and 13 have programs to capture methane gas emitted from their landfills.

#### Green Economy

9) Through the actions already being taken by the C40 cities, low carbon investment and consumption are already being promoted, and these will play a key role in stimulating a green economy. These actions will create new jobs, improve the human habitat and contribute to reducing poverty in developing and emerging countries.

10) The leading actions that cities are already taking ahead of nations will demonstrate what a low carbon society is like and how a green economy creates our future. Cities are already demonstrating models that realise emission reductions and economic growth at the same time. The programmes foster understanding among developing and emerging countries and help us to achieve international agreement on a framework for climate change solutions.

11) While international negotiations struggle, global warming proceeds day by day. The endeavour to achieve international agreement for new climate change framework is needed; however, we need an 'alternative approach' to address climate change as well; we should make cities go first.

Therefore, the C40 calls on international society for the following;

- \* International society should recognise the importance of cities' role in combating climate change and adopt a new concept of alternative approach to make cities lead the way. To tackle climate change and mitigate its effects also leads to an increase in the well being of citizens all over the world. The outcome of Rio+20 should include clear statements that emphasise cities' role.
- \* United nations and international financial organisations should develop programmes for low carbon financing designated for cities' low carbon and sustainable projects. Also they should develop programmes to share the advanced efforts of cities with the world and support international cooperation between cities.
- \* Technology transfer should be facilitated, with sufficient funding commitments given to cities in developing countries, so that they can achieve sustainable human development by making progress in developing renewable energy sources and increasing energy efficiency.
- \* National government, financial institutions and business entities should work together to develop finance models that are aimed at financing longer-term sustainable infrastructure projects in cities.
- \* Representatives of cities and local governments should have an official seat in the new international negotiating platform for sustainable development and should participate

in the design process of the Green Economy Roadmap.

\* The new UN organisation to be established for sustainable development should have a division that supports, coordinates and optimises the climate actions of cities.

\* The "toolbox" of the best practices of cities<sup>1</sup>; climate actions should be developed. The C40 can contribute by providing best practices of C40 cities

\* The new UN organisation to be established for sustainable development should have a division that supports, coordinates and optimises the climate change actions of cities.

For more information about the C40, please visit [C40.com](http://C40.com)

## Calvert Investments, Inc.

### CORPORATE SUSTAINABILITY REPORTING COALITION

The Corporate Sustainability Reporting Coalition (CSRC) represents financial institutions, professional bodies, NGOs and investors with assets under management amounting to a Global AUM of US\$2 trillion.

<sup>EN</sup> We believe progressive companies understand that long-term value is enhanced by embedding long-term sustainability considerations into their business strategy and by fully disclosing their progress to investors. This is why the Corporate Sustainability Reporting Coalition was founded.

<sup>EN</sup> The Coalition is collectively calling on all United Nations member states to commit to develop a Convention that mandates company boards to consider sustainability issues, and to integrate those issues that they consider to be material within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not. We are also looking for effective mechanisms for investors to hold companies to account on the quality of their disclosures, including for instance, an advisory vote at the Annual General Meeting.

### EXECUTIVE SUMMARY

<sup>EN</sup> Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992.

<sup>EN</sup> A large number of companies now report on their environmental, social and governance (ESG) performance and it has been demonstrated that there is a direct correlation between sustainable business practices and the longer-term financial success of that company.

<sup>EN</sup> At present however, there is no globally accepted rule requiring reporting on ESG performance. Despite the large number of companies publishing such reports, the vast majority of companies fail to do so.

<sup>EN</sup> We proffer that a requirement for a company to consider and report on a sustainability issues will create the right kind of discussions within boardrooms, throughout firms and encourage investors to think about the sustainability of the firm. This will help capital to be allocated to more sustainable, responsible companies and strengthen the long term sustainability of the financial system.

<sup>EN</sup> If a Sustainable Green Economy is to be reached, the time has now come for sustainability reporting to become standard practice. This can be achieved by the UN Conference on Sustainable Development (Rio+20) conference committing to develop a Convention on Corporate Sustainability reporting.

<sup>EN</sup> It is now almost twenty years since the first Earth Summit, as such we believe next year offers a momentous opportunity to move this agenda forward at a global level.

Progress Governments first referred to environmental reporting at the United Nations Conference on Environment and Development in 1992. In Agenda 21 of the Conference, governments agreed that business and industry should be 'encouraged to adopt and report on their environmental records, as well as on the use of energy and natural resources'.

We recognise and support the considerable progress that has been made since then.

There have been a number of initiatives under the UN umbrella promoting sustainability reporting. Such initiatives include UN Global Compact, United Nations Environment Programme Finance Initiative (UNEP FI) and the United Nations Principles for Responsible Investment (UN PRI).

There has been progress in company policy, for example, since its launch in 2000, over 8,700 companies have signed up to The United Nations Global Compact, which covers the areas of human rights, labour, environment, and anti-corruption.

There has also been progress in guidance for companies from Governments – such as through the recent further strengthening of the OECD guidelines for multinational enterprises.

And progress by investors – more than 900 institutional investors from 48 countries with over \$30 trillion in assets signed up to the United Nations-backed Principles for Responsible Investment. They were launched just five years ago. All of these investors recognise that that environmental, social, and corporate governance (ESG) issues can affect the performance of investment portfolios.

However, despite this progress, we are still a very long way indeed from the ultimate aim of transparency, comparability and relevance of corporate sustainability reporting.

In other words, these progressive voluntary initiatives have not been enough - for example so far less than two per cent of listed companies have opted into the Global Compact.

### The Transparency and Accountability Gap

Sustainable Stock Exchanges, an initiative by UNPRI, UNCTAD and Global Compact has been urging all stock market listing authorities to make it a listing requirement that companies consider how responsible and sustainable their business model is and put a forward-looking sustainability strategy to the vote at their AGM.

Aside from a few notable examples such as the Singapore, Johannesburg and Istanbul Exchanges, there has yet to see a serious commitment from stock exchanges to make changes to their listing rules. This is reflected by analysis which indicates that at present more than 75% of the companies covered by Bloomberg do not currently disclose their sustainability performance.

It is our belief that stock markets require the support from governments and regulators. This is why we believe this is a relevant issue for the global forum of the Earth Summit.

## The business case for sustainability reporting

According to a recent McKinsey survey, more than 50 percent of executives consider sustainability “very” or “extremely” important in a wide range of areas, including overall corporate strategy.

The internal and external value that companies have found in sustainability management and reporting is widely documented. Sustainability reporting increases innovation and competition and at the same time makes organisations more accountable for their impacts. The evidence for the business case is building as uptake of reporting increases. To cite two examples:

Goldman Sachs is one of the firms to have carried out analysis of the relationship between how companies address ESG issues and the returns they generate. It contends that in a number of sectors there is a direct correlation between sustainable business practices and the longer-term financial success of that company.<sup>4</sup>

WestLB also published a study of the materiality of extra-financial factors based on a sample of 540 European firms. It found evidence of a link between extra-financial risk, cost of capital to a firm and shareholder value. The report suggested that compiling a sustainability report was among the most important catalysts for change – contributing to accumulation of knowledge, questioning of processes and the establishment of suitable structures and practices.<sup>5</sup>

Some organizations are now producing integrated reports, a form of corporate report that brings together financial performance data with material information about an organization’s strategy, governance, performance and prospects in a way that reflects the economic, political, social and environmental context within which it operates. An integrated report provides a clear and concise representation of how an organization creates value, now and in the future. In August 2010, the International Integrated Reporting Committee (IIRC) was established to create a globally accepted framework for integrated reporting. The objective is that through integrated reporting many more companies and their stakeholders will become aware of sustainability performance measurement and disclosure and start acting on this information.<sup>6</sup>

## The market case for sustainability reporting

Markets are driven by information. If the information they receive is short term and thin then these characteristics will define our markets. If companies do not provide an assessment of the broader Environmental, Social and Governance risks and opportunities to which their business model is exposed, then how can the market assess the sustainability of that company’s growth?

Recent years have seen an increasing interest from markets in sustainability performance data disclosed in reports. There is considerable evidence that investors require this information and there has also been seen some major investment such as Thompson Reuters and Bloomberg adding to the data set that they provide investors, while rating agencies such as Standard & Poors have created ESG indices for India, Egypt and the MENA region.

Within 60 days after the launch of the product on Bloomberg terminals 11.5m hits on the ESG data points were recorded. At the time of writing, Bloomberg estimates that about one thousand users now use Bloomberg just for ESG analysis. They also report that the number of users is increasing with more conventional asset managers approaching Bloomberg regarding the product.

While the number of reporters is growing, including in emerging economies such as Brazil, China and India, and the quality of reporting improves, sustainability reporting far from achieving its full potential.

At the current rate it would take decades before sustainability reporting is common practice across global markets. This means that regulators, investors and stakeholders know little or nothing of the sustainability practices and impacts of the vast majority of the world’s large companies.

Markets will not routinely use sustainability information as long as only a minority of companies report. A critical mass of sustainability information is needed to inform markets and enable performance benchmarking and analysis. Companies that do not report withhold from the markets information that is important for the assessment of medium to long term risk and value. By leaving information gaps and creating asymmetries of information, non-reporting companies impose a cost on the markets and undermine its effective functioning.

The world needs to move from the innovative and pioneering approach of a minority of companies to a true global mainstream practice for all companies.

## A CONVENTION ON CORPORATE SUSTAINABILITY REPORTING

The Corporate Sustainability Reporting Coalition (CSRC) calls for the member states at the United Nations 2012 Earth Summit to:

<sup>[4]</sup> Acknowledge the growing practice of sustainability reporting and recognize that, improving corporate management and performance, facilitating stakeholder engagement, driving innovation and competitiveness represents an essential contribution to the transition towards a Green Economy.

<sup>[4]</sup> Note that the increased quantity and quality of data available through sustainability reporting can be a powerful tool to help markets work more efficiently.

<sup>[4]</sup> Commit to develop a global policy framework requiring boards of all listed and large private companies to consider sustainability issues and to integrate material sustainability information within the reporting cycle, in their Annual Report and Accounts – or explain why if they do not.

The global policy framework (which can take the form of a Convention) should adhere to three key principles:

- Report or Explain – establish a report or explain approach to sustainability reporting policy
- Transparency – enhance transparency by requiring national measures which would mandate the integration of material sustainability issues within the company reporting cycle, in their Annual Report and Accounts;
- Accountability – provide effective mechanisms for investors and all stakeholders to hold companies to account on the quality of their disclosures, including for instance an advisory vote at the Annual General Meeting (AGM).

This is a modest, market-based proposal that we believe represents the next step towards sustainable capital markets.

## APPENDIX A - POLICY FREQUENTLY ASKED QUESTIONS

1. Are you setting out a standard that all companies must adopt? No. We merely ask for the support of governments to make corporate sustainability reporting a “report or explain” requirement and for this report or explanation, in whatever form it takes, to be put to shareholder approval at the AGM. However, we are not dictating the form it should take.

This will provide corporations with the freedom to define their own reporting and where they determine that it is not necessary, outline why. This will also ensure that the report is based on the board’s best thinking.

Those companies yet to explore reporting in this area may review the excellent work already done in this area by the Global Reporting Initiative (GRI) that produces a comprehensive Sustainability Reporting Framework that is widely used around the world, to enable greater organisational transparency and the current discussions in the International Integrated Reporting Committee. It is important to reference the normative frameworks for sustainability offered by UN Global Compact and OECD Guidelines for Multinational Enterprises, as well as the contribution of ISO, PRI, UNCTAD and UNEP. .

2. Why have you focused on asking boards to publish their thinking rather than for example proposing a sustainability reporting regulation?

We do not think it possible to craft a regulation that specifies a sufficiently detailed reporting template on the rich diversity of corporations around the world. Consequently, we have decided against proposing heavy handed regulation that tries to enforce one reporting template. This is also because regulation is often slow moving, lags the market, and encourages a minimum compliance mentality within the company. We are seeking to stimulate a substantive board discussion on the risks and opportunities to a company arising from sustainable development, as well as the creation of their strategic response. We are also anticipating that some companies will seek to compete on the quality of their disclosure in this area (as, indeed, is already the case).

Equally, however, we do not have blind faith that markets will self regulate toward sustainability. The evidence for spontaneous progress on a purely voluntary basis is that it will be slow.

3. What needs to change within the system if it were to adopt your recommendation?

This will vary for different jurisdictions. For example, where the regional code of Corporate Governance is embedded within the listing rules then this document could be updated, requiring the support of all the bodies that govern this code. Where it is guided by the exchange itself, then the exchange can update the code itself. Where guided by primary legislation, then this will need to be changed. For this reason we adopted a report or explain approach that would set the principle and leave flexibility to national regulators.

---

## Canadian Earth Summit Coalition

Dear UNCSD 2012 Bureau Members,

Re: Input for Zero Draft compilation document

It is with great pleasure that we submit ideas and recommendations for inclusion in the compilation document for your consideration that will serve as basis for the preparation of the Zero Draft. Specifically, we ask you to include the following five issues:

1. Committing nation-states and the United Nations to Principle #10 of the Rio Declaration on access to information, transparency, public participation and access to justice;
2. Reflecting that the overarching goal of a green economy should be defined in the context of sustainable patterns of consumption and production that are built on a fair and socially just economic system that meets the needs of all people and respects animal welfare within the ecological carrying capacity of the planet;
3. Measuring what matters: moving beyond GDP;
4. Getting the prices right: eliminating fossil fuel subsidies and pricing carbon; and
5. Making trade fair: committing to public procurement of fair trade certified products We are making this submission on behalf of the partners of the Canadian Earth Summit Coalition, a self-organized, independent and informal civil society network of non-governmental, non-profit, academic and research organizations created to push for Canadian leadership at the Rio+20 conference, as well as reach out to Canadians on the important question of sustainability through the coalition's bilingual public engagement initiative, "We Canada". The initiative's website, [www.earthsummit.ca](http://www.earthsummit.ca) serves as a venue to share innovative ideas, actions and policy recommendations with a wider audience; to promote Canadian initiatives organized in the context of the conference; and to gather voices and amplify the existing movement around sustainability.

We would like to take this opportunity to express our deep disappointment for not having been consulted by the Federal Government of Canada on the development of its own submission to the Zero Draft on behalf of all Canadians. This lack of consultation goes against a long-standing Canadian tradition dating back to the Rio Earth Summit in 1992 of engaging with civil society on important issues including sustainable development.

In the lead-up to, and during, the UN World Summit on Sustainable Development in 2002, for example, the Canadian Government established an exemplary public participation and engagement process<sup>1</sup>, which contributed to the determination of Canada's areas of focus at the Summit. Since Rio, Canada has been one of the few UN-member states to include civil society representatives as part of its official delegation to the UN Commission on Sustainable Development; we are concerned that Canada will no longer pursue this valuable form of collaboration with Canadian civil society, particularly since we have just learned that the Federal Government of Canada has declined core funding to the Canadian Environmental Network (RCEN) after having provided such critical support for 34 years. The RCEN has been a key stakeholder in ensuring civil society representation on delegations for UN events. We are advocating for the reinstatement of RCEN funding and for a commitment to include a civil society and youth representative on the Canadian delegation to Rio +20.

The attached note details the ideas that the Canadian Earth Summit Coalition is putting forth to the United Nations. In addition to some comments more general in nature that we will be making, such as ensuring that the green economy is defined along the lines of sustainable consumption and production patterns and includes social justice and wellbeing considerations, we emphasize three specific policy areas that we feel require particular attention and that should be featured in a green economy's roadmap or framework for action:

- o "Measuring what matters: Beyond GDP": Complementing the ubiquitous gross domestic product (GDP) with full-cost accounting, measures of capital stock depletion, and well-being indicators.
- o "Getting the prices right: Eliminating fossil fuel subsidies and implementing carbon pricing": Eliminating fossil fuel market-distorting subsidies and putting a price on carbon by implementing an ecological tax reform (taxing the "bads", not the "goods"). Carbon pricing should also be based on eight principles outlined below.
- o "Fair Trade procurement policies": For guidelines pertaining to cotton uniforms, food items, and beverage products which bear the Fairtrade Certified Mark<sup>2</sup> as part of green procurement and sustainable development strategies.

We look forward to working with you in the coming months, and would like to emphasize our commitment to making Rio+20 the success and historical turning point that it deserves to be.

Respectfully yours,

Aleksandra Nasteska, and Marie-Pierre Daigle,

National Co-Director National Co-Director

Expectations for the outcome of Rio+20

The Canadian Earth Summit Coalition expects that the UN Conference on Sustainable Development will lead to:

- o A bold vision of a sustainable future for humanity that will inspire people from around the world – a future we want.
- o A short politically-binding outcome document that includes an appendix of countries' own commitments to sustainable development, including the further implementation of existing documents, including Agenda 21 and the Johannesburg Plan of Implementation, with provisions for monitoring, compliance and reporting.
- o A green economies' roadmap that sets out clear, mutually-agreed upon sustainable development goals and targets (to complement and build on the Millennium Development Goals) accompanied by a timeline to undertake the great global transition to sustainability.

General comments on the green economy in the context of sustainable development and poverty eradication

The Canadian Earth Summit Coalition puts forth the following remarks on the green economy:

- o The concept of the "green economy" should not replace "sustainable development"; although greening economies plays an important role in achieving sustainable development, current definitions of a green economy ignore or gloss over the central questions of fairness, social justice and the rights of both humans and non-humans.
  - o The overarching goal of the green economy should be defined in the context of sustainable patterns of consumption and production that are built on a fair and socially just economic system that meets the needs of all people and respects animal welfare within the ecological carrying capacity of the planet.
  - o A green economy calls us to:
    - Make sustainability a political priority
    - Think in terms of systems, and act on the high leverage points (structures and mindsets)
    - Develop a bold, new economic vision that plans for the long term and provides for future generations
    - Live within safe ecological margins, and redefine our relationship to the natural world and to each other
    - Address unjust disparities of wealth and income
    - Prioritize meeting the needs of the world's poor (in both high- and low-income countries) while simultaneously reducing the unsustainable Ecological Footprint of the world's rich along a global framework of 'contraction and convergence'
    - Redefine prosperity in more than simply economic and consumptive terms, and adopt new measures of progress and wellbeing
    - Recognize that a country cannot "go it alone", and that reciprocity and cooperation is a key pillar of global wellbeing
  - o Examples of specific, high-leverage policies to be implemented for a green economy:
    - Instituting a socially fair carbon tax or equitable cap-and-trade system
    - Phasing out of subsidies and investments for unsustainable, inhumane systems
    - Freeing up the length of the working day, week and year to reflect a work-life balance that promotes well-being
    - Reforming our banking system in support of a larger diversity of communitybased savings, lending and investment
    - Putting a stop to urban sprawl through increased densification in existing urban centres
    - Discouraging car use, especially in urban areas, and investing heavily in efficient and comfortable public transportation options and self-propelled infrastructure (i.e. car-free spaces)
    - Retrofitting existing buildings to a minimum of PassivHaus norms
    - Implementing choice editing to remove unsustainable options from the market place by industry and government
    - Maximizing public purchases through green and fair-trade procurement
    - Reforming the World Trade Organization so that it serves to promote fair trade
- Three overarching policy recommendations around which UN-member States should develop targets and timelines

The Canadian Earth Summit Coalition would like to highlight three overarching and cross-cutting policy areas that it feels need to take centre stage at the UN Conference on Sustainable Development:

1) The adoption of new measures of progress and well-being to measure social and ecological progress towards sustainability:

- o It is time to "measure what matters", which means complementing the ubiquitous gross domestic product (GDP) with full-cost accounting, measures of capital stock depletion, and indicators of well-being.

The development of a green economy that is sustainable and works toward eradicating poverty demands that nations move beyond simply measuring GDP, as called for in Section IV, Chapter 40 in Agenda 21. Science-based indicators of progress and development that account for human and environmental well-being will give policy makers more complete data they need to encourage green and sustainable development. They also allow for a deeper understanding of progress, not just in terms of dollars, but also in terms of the quality of life enjoyed, and the health and resiliency of the natural environment

2) The elimination of market-distorting subsidies to all fossil fuels and putting a price on carbon:

o "Getting the prices right" and making the markets work for sustainable development requires, inter alia, eliminating fossil fuel market-distorting subsidies and putting a price on carbon by implementing an ecological tax reform. Furthermore, no matter the instruments, a carbon-pricing policy should be:

- 1) Comprehensive, without exemptions
- 2) Nation-wide
- 3) Simple and readily implemented
- 4) Transparent and accountable
- 5) Complemented when a price signal alone is insufficient

The carbon price itself should be:

- 6) Environmentally effective
- 7) Ultimately comparable to that in other countries and

8) Predictable but adaptable<sup>3</sup> The elimination of harmful subsidies and reflecting true social and ecological costs in the price of goods and services by putting a price on carbon are the starting point and the condition sine qua non to shifting towards a green economy. One of the objectives of the Rio+20 Conference is to secure renewed international political commitment for sustainable development. Countries must show real commitment to making the markets work for sustainable development by using effective levers such as taxes, subsidies and procurement to discourage ecologically damaging activities and promote healthy and socially progressive alternatives. A system that eliminates harmful, market-distorting fossil fuel subsidies and that partly shifts taxation systems from "goods" (i.e. employment) to "bads" (carbon emissions) would constitute a significant step to making the markets work for sustainable development without unnecessarily jeopardizing the economy.

3) The implementation of national sustainable procurement policies that includes sourcing products bearing the Fairtrade Certified Mark:

o Fair Trade procurement guidelines pertaining to cotton uniforms, food, and beverage products need to be included in the traditional government procurement policies, and complement green procurement at the national and sub-national scale.

The Johannesburg Plan of Implementation calls on relevant authorities at all levels to "promote public procurement policies that encourage development and diffusion of environmentally sound goods and services" (Ch. III, 19 c.). Rio+20 must go beyond promoting simply "green" procurement, and must include social considerations. Fair Trade procurement runs in concert with the objectives of the Rio+20 Conference as large-scale purchasing of Fair Trade products can lift thousands of producers out of poverty and greatly improve living conditions in farming and artisanal communities around the world. Fair Trade addresses environmental concerns such as soil erosion and climate change while tackling emerging challenges in human trafficking by rooting out child labour.

## Caribbean Policy Development Centre

The Caribbean Policy Development Center – a coalition of NGOs of Caribbean SIDS, look forward to a renewed commitment to the intent set out Agenda 21 in which, nations small and large, commit to greater emphasis on the needs of the diverse groups of people who make up their populations, and to the best stewardship of the earth, especially in the context of the intersection between climate change and the global financial crisis. CPDC therefore seeks the inclusion of the following Specific Elements:

1. Link between climate change, more frequent disasters and the livelihoods of small farmers, small fishers, and poor women in the Caribbean Small Island Developing States

Links must be made between climate change and more frequent, more intense and more varied natural disasters on human health, agriculture, food security, and livelihoods in Caribbean SIDS. The negative consequences of global warming and sea level rise on the region's tourism, water quality and quantity, human settlements and real GDP must be addressed from the perspective of a global partnership.

i. Food and Nutrition Security Food Security is at the heart of the wellbeing of households, communities and nations of Caribbean SIDS which were once net exporters of food and have become net importers with the food import bill reaching out of proportion particularly with recent sharp increases in food prices.

CPDC and members propose that Caribbean SIDS adopt the strategy of Sustainable Community Food Systems to guarantee, particularly for persons living in poverty, food and nutrition security and sovereignty. Inherent in this system is women's access to and ownership of arable land and adequate inputs to maximize their roles as producers, processors and distributors of food. CPDC NGOs propose the adoption of state policies that reserve and protect agricultural land for diversified local food production

balanced with production for export. CPDC proposes the end of patenting of plant and animal genetic material which brings about much degradation of the natural environment and robs small farmers who are primary the producers for local consumption of the benefits of the land.

## ii. Sustainable Consumption and Production

Prudent management of ecosystems in Caribbean SIDS is required of because of the fragile and limited nature of natural resources. Caribbean SIDS therefore need to rethink patterns of consumption and production which are influenced by global trends and practices.

## iii. Biodiversity loss

This is affected by inappropriate land, unpredictable weather patterns and invasive species. Caribbean SIDS must plan infrastructural development which is appropriate for its natural ecosystems taking into account issues of mitigative climate change approaches. Caribbean SIDS must ensure protection of its borders from invasive species which are an extreme threat to biodiversity.

---

# Caritas Oceania

Caritas Oceania Contribution to Rio +20 conference on Sustainable Development

Caritas Oceania is a region of the Caritas International Confederation with a coordinating function for the various national Caritas organizations of the region (Aotearoa New Zealand, Australia, New Caledonia, Papua New Guinea, Samoa and Tonga). We also work alongside Catholic and other justice and development agencies in the south Pacific.

Both Caritas Internationalis and Caritas Oceania have put on record our concerns about climate change and sustainable development. We base our view of the world on an understanding of human beings, the earth and the universe as gifts of God. From this point of view every human being has an innate dignity and worth from the beginning to the end of life. Likewise the earth is a gift of God that must be valued and respected in itself before it is an object for human use or exploitation. The members of the Caritas network are committed to eradicating poverty, advocating and organising around issues of poverty and development, promoting stewardship of the earth and its resources in the service of all humanity.

Individual members of the network in the South Pacific work in these areas educating, advocating, and supporting projects to sustain communities and mitigate the effects of extreme poverty and climate change. Caritas Oceania has a particular commitment to the issue of climate change as it is already having a devastating impact on the region, particularly for small, low-lying island states.

As a region Caritas Oceania has also worked together on disaster risk reduction and preparedness programmes. The need to cooperate in addressing such issues has become increasingly important due to the seasonal challenges (eg, typhoons) and because some of these disasters (eg, extreme weather events) are predicted to become more frequent and intense as a result of climate change, increasing the vulnerability of the communities we serve.

All the states of the Pacific face unique challenges not only as a result of climate change (to which most of these states have made little contribution in terms of per capita emissions) but also in terms of sustainable development. For smaller, more isolated states the challenge of employment for their people, especially the young, is great. For larger and more economically developed states the challenge can be models of development which may be unsustainable or environmentally damaging.

We have some brief submissions for the compilation document:

What are our expectations for the outcome of Rio+20?

a) We expect a stronger commitment to the development of a green economy, not just in name but in practice. We expect the major economic powers (states and companies) will resist this because it will challenge profits and power. We expect individuals and social groups to resist it because populations have become addicted to consumption in terms of what are seen as desirable lifestyles (eg, consumer items, imported food, etc).

Specific elements:

a) We support strong sectoral priorities being established, developed and launched at Rio+20. We especially look for these initiatives in the fields of energy, food security, oceans and biodiversity. As our region is predominantly a marine environment, so the care of the oceans as a climate regulator and source of food is essential. Likewise energy imports (eg, oil, petrol) are both costly and unsustainable. The dominant model of development elevates the value of imported products and foods at the expense of local produce.

With many small island nations in our area we ask that the human dignity of those living in these threatened states be prioritized on the international agenda. The peoples of these islands may be few in number relative to the total population of the world, but they have had a history of survival, independence and sustainable living in relatively isolated situations.

In more recent times they have often been drawn into a dependency on imported products and values which have drawn them away from their traditional practices and independence. This is not to say everything new is bad and everything "traditional" is good, however efforts to achieve sustainable development must necessarily attempt to restore some of what has been lost, culturally, economically and socially. Particularly important is developing sustainable employment opportunities which can offer possibilities for young people to stay in their communities and on the land. Projects that bring together care of the earth, indigenous cultural values and employment opportunities for the young are valuable.

c) Institutional framework for sustainable development:

We do not wish to negate the value of the political, economic and social commitments that the conference is working on and which is central to the work of the UN. We applaud that commitment and support it. However, coming as we do from a religious background, we see spiritual and ethical questions which must accompany the other aspects of the debate: What must we do to make the world a better, safer, healthier place? What must I do or not do to ensure that my brothers and sisters do not suffer poverty and exclusion? What can I/we do or not do to ensure that our grandchildren have a livable earth to inhabit?

From that perspective we want to see in the document an acknowledgement that the spiritual and religious traditions of the peoples of our planet are engaged as partners in the dialogue around sustainable development practices. There are strong religious traditions in the Pacific, many of which have dimensions that tie the local people closely into the environment as the world from which they come. These traditions can give insight into better ways of acting and motivation for change.

The Churches too can be influential in people's lives. As an organization dedicated to the eradication of poverty and environmental justice without engaging in proselytism we

see great possibilities in bringing together environmental awareness, sustainable development and the spiritual traditions of local peoples.

## Catto Fellowship of the Aspen Institute

### SECOND NATURE

#### SUBMISSION TO UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT IN ADVANCE OF THE RIO EARTH SUMMIT

#### GLOBAL DECLARATION ON PLASTIC POLLUTION

##### Introduction

##### Summary: Global Declaration on Plastic Pollution

For the past 60 years, society has been using plastics in everyday life with little concern or understanding of how to properly dispose of or recycle this material.

Plastic is a valuable, important, and useful material in applications across the value chain, but society must find a more sustainable way to maintain lifecycle responsibility for this non-renewable material so that it does not degrade our land, oceans, and human health.

Between 60 and 80% of marine debris is derived from plastic products. Enormous quantities of plastic are concentrated in the 5 largest gyres of our oceans, with possible grave consequences for the food chain and the human health and certain consequences for the well being of the animals that live in the oceans or rely on the oceans for habitat and food.

In its 2011 Year Book, UNEP identified oceans plastics pollution as "persistent, bio- accumulating and toxic substances", stating that "Research indicates that tiny pieces of plastic are absorbing and concentrating from the seawater and sediments chemicals, from polychlorinated biphenols, PCBs, to the pesticide DDT. [...] Many of these pollutants, including PCBs, cause chronic health effects such as endocrine disruption, mutagenicity and carcinogenicity."

Research indicates that cleaning up the existing stock is simply impossible; the areas are too large and the plastic too small and pervasive. And even if a way to clean up the plastic currently in the oceans was found, more plastic pollution is accumulating daily.

Therefore, bearing in mind the precautionary principle, immediate action is needed to prevent further plastic pollution in the oceans.

There are effective, immediately available options for reaching this result. The key areas of action are: infrastructure (providing the infrastructure to properly collect and recycle the plastic waste), consumer behavior (engaging consumers to reduce demand, recycle, and reuse, as appropriate), regulatory controls, and creation of markets for post-consumer waste. Experience shows that these solutions are effective and with the proper infrastructure in place, recycling rates can double within one year. Within this framework, Extended Producer Responsibility policies appear to be a promising instrument to accelerate the deployment of each of these solutions, particularly in financing infrastructure and involving producers of plastic products and packaging in end-of-life management.

Governments play a central role in mobilizing these solutions: governments can educate and incentivize consumers, help put in place infrastructure, and create markets.

And Governments have by definition a responsibility for protecting the common goods.

Therefore we propose a Global Declaration on Plastic Pollution.

##### Draft Global Declaration on Plastic Pollution

##### The Challenge

Whereas, plastic is a valuable, important, and useful material in applications across the value chain;

Whereas, for the past 60 years, society has been using single-use plastics in everyday life with little concern or understanding of how to properly handle this material throughout its entire life cycle;

Whereas, society must find a more sustainable way to handle this non-renewable material throughout its life cycle so that it does not degrade our land, oceans, and human health;

Whereas, the costs to manage and clean up single-use plastics are significant, and do not account for the environmental costs of plastic pollution;

Whereas, the impact of plastic pollution has been particularly significant on our oceans;

##### The Opportunity

Whereas, there are economically attractive solutions for mitigating global plastic pollution;

Whereas, key opportunities to make impact include: infrastructure, consumer behavior, creation of markets for post-consumer waste, and regulatory controls, these have yet to be widely adopted;

Whereas, governments can play a central role in mobilizing these solutions: regulate single-use plastics, educate and incentivize consumer behavior, create and maintain appropriate infrastructure, and support the development of market mechanisms;

Therefore we propose a Global Declaration on Plastic Pollution.

##### The Action

We hereby commit to reduce our nation's contribution to the problem of plastic pollution. Specifically, in accordance with precautionary principle we will immediately develop appropriate regulatory controls, market incentives, extended producer responsibility policies for single-use plastics, collection and recycling infrastructure, and other strategies to achieve specific source reduction targets aimed at decreasing the production of plastic materials (especially single-use items) most likely to end up as plastic pollution.

#### About the Supporters

Aspen Institute Catto Fellows is part of the Aspen Global Leadership Network. The Catto Fellowship brings together a diverse and accomplished group of 20 professionals in the environmental field from the NGO, government, and business communities to discuss values based leadership and how we can move from success to significance in our individual and collective work to address global environmental issues. We, as the current class of Catto Fellows, have committed our collective energy to addressing the significant challenge of protecting the oceans from the buildup of plastic pollution.

Natural Resources Defense Council (NRDC), is an environmental advocacy organization that uses law, science and the support of our 1.3 million members and online activists to protect the planet's natural resources and ensure a safe and healthy environment for all living things.

5 Gyres Institute is a non-profit organization dedicated to researching plastic pollution in the world's oceans, and actively promoting solutions. With its scientific research, it engages policymakers, businesses, students, and communities around the world in solutions-based education. 5 Gyre's goal is to utilize first hand knowledge to stop the flow of plastic pollution to the world's oceans.

Californians Against Waste is recognized as one of the nation's leading non-profit environmental research and advocacy organizations focusing on resource conservation and pollution prevention through waste reduction and recycling. The organization's 34- year history and track record of accomplishments has demonstrated it to be principled, practical, creative and effective.

WeTap is a non profit that works toward improving and increasing the use of public drinking fountains and encouraging the protection and appreciating of municipal drinking water.

The California Coastal Coalition (CalCoast), is a non-profit advocacy group comprised of 35 coastal cities; five counties; SANDAG, BEACON and SCAG; private sector partners and NGO's, committed to protecting and restoring California's coastline through beach sand restoration, increasing the flow of natural sediment, wetlands recovery, improved water quality, watershed management and the reduction of marine debris and plastic pollution.

Urban Semillas is a social conscientious, reconnaissance and outreach, community- based watershed-driven organization. We work to educate underserved and monolingual (Spanish-speaking) communities about watershed and social justice issues, provide them with community-building skills and empower them to participate in local, regional and nationwide policies that impact their neighborhoods.

Environment Washington is a state-wide, citizen-based advocacy group. It works on protecting clean air, clean water, and open spaces. Combining independent research, practical ideas and tough-minded advocacy, Environment Washington seeks to overcome the opposition of powerful special interests and win real results for Washington's environment.

Surfrider Foundation is a grassroots, environmental non-profit organization dedicated to the protection and enjoyment of the world's oceans, waves, and beaches through a powerful activist network. Surfrider Foundation's Rise Above Plastics program is aimed at reducing the impacts of plastics on the marine environment by raising awareness about the dangers of plastic pollution and by advocating for a reduction of single-use plastics and the recycling of all plastics.

Orange County Coastkeeper is Orange County's leading water quality organization dedicated to protect and preserve the region's marine habitats and watersheds through education, advocacy, restoration, research and enforcement. Founded in 1999, Orange County Coastkeeper is a member of the international Waterkeeper Alliance and remains dedicated to preserving and protecting water from polluters.

Inland Empire Waterkeeper is a grassroots, non-profit water quality organization dedicated to enhancing and protecting the quality of the waterways within the Upper Santa Ana River Watershed. Inland Empire Waterkeeper guards water quality in San Bernardino and Riverside Counties in southern California and strives to preserve and protect water from polluters.

Seventh Generation Advisors is a nonprofit environmental organization working to make a sustainable world, seven generations into the future. Like many Native American traditions, SGA believes we must consider--in all our actions--the consequences to future world generations. Currently, our programs focus on climate change, and plastic pollution issues.

Clean Water Action is a U.S. based national grassroots environmental organization that has been helping citizens and local communities hold polluters accountable and reduce water pollution at the source since 1972. Clean Water Action is developing cutting edge policies and programs in source reduction and producer responsibility to minimize plastic pollution.

Captain Charles Moore is an oceanographer and captain of the Oceanographic Research Vessel, Alquita. He is the founder of Algalita Marine Research Institute, Long Beach Organic, and the co-author of the new book Plastic Ocean, which details his discovery of the Eastern Garbage Patch in the North Pacific and his efforts to combat the ocean's plastic plague.

The ChicoBag Company's mission is to help humanity eliminate the unnecessary use of single-use paper and plastic bags by designing reusable bags to be unforgettable and fun to use. A reusable bag left at home or in the car does no good. Therefore, all ChicoBag products easily stuff or fold down into compact, pocket-sized stuff-sacks making it easy for people to say no to single-use bags, not just sometimes but every time. The ChicoBag Company also offers school fundraising programs, a custom promotional bag program and the infamous Bag Monster - a costume that represents the average American's annual consumption of single-use plastic bags.  
www.chicobag.com www.bagmonster.com

Sona Kalapura, Environmental Programs Manager, City of Manhattan Beach. Sona leads the development and implementation of the environmental programs for the coastal Southern California city of Manhattan Beach. Being a coastal city, this community has taken marine pollution very seriously, and it was at the request of its residents and youth that the City Council unanimously banned plastic bags in the city. The City was the recent winner in a July California Supreme Court ruling, earning the right to move forward with its plastic bag ordinance in spite of the 3-year legal battle brought by the plastic bag industry.

Manuel Maqueda is co-founder of Plastic Pollution Coalition, an international coalition of organizations working together to stop plastic pollution worldwide; and a participant in Midway Journey, a transmedia art project documenting the effects of plastic pollution on the remote island of Midway.

Environment California is a state-wide, citizen-based advocacy group. It works on protecting clean air, clean water, and open spaces. Combining independent research, practical ideas and tough-minded advocacy, Environment California seeks to overcome the opposition of powerful special interests and win real results for California's environment.

Team Marine is a multi-award winning eco-action group of teens dedicated to advancing environmental sustainability through research, multimedia, service learning, and community outreach. Their work focuses on raising awareness about the problems of and solution to climate change, ocean acidification, overfishing, and plastic pollution.

Heal the Bay is a non-profit environmental organization with over 13,000 members dedicated to making southern California's coastal waters and watersheds, including Santa Monica Bay, safe, healthy and clean.

Green Cities California is a coalition of twelve of California's largest and most environmentally progressive jurisdictions in the State. Our mission is to accelerate the adoption of sustainability policies and practices through collaborative effort. We have worked together as a coalition for the last two years to promote local single use bag bans, and commissioned the development of a Master Environmental Assessment on Single Use and Reusable bags toward that end, which is available here:  
<http://greencitiescalifornia.org/mea>

The City of Santa Monica is a coastal city in Southern California with a population of 90,000 residents. Over the past several decades the city has shown strong leadership for sustainability and the environment, notably with the adoption and implementation of its Sustainable City Plan, which began in 1994, and subsequent actions to significantly reduce greenhouse gas emissions, improve water quality, and improve the quality of life for visitors and residents. As a coastal city Santa Monica has long been concerned with marine plastic pollution and has worked hard to address it. In 2008 the city became one of the first in the country to ban the use of non-recyclable plastic food service packaging and in 2010 it became one of the first cities in California to ban single use plastic bags.

Save Our Shores is the Central Coast leader in caring for the marine environment through ocean awareness, advocacy and citizen action. Over the last 30 years, Save Our Shores helped to establish the Monterey Bay National Marine Sanctuary, prevent offshore oil drilling and cruise ship pollution, and today focuses on educating youth about our local watersheds, tackling pollution on our beaches and rivers, implementing our renowned Dockwalker oil spill prevention program, and providing our community with educated and inspired docents in our Sanctuary Stewards program.

The Center for Oceanic Awareness, Research, and Education seeks to enlighten people, young and old, to the plight of the oceans, to change the way they think and act, and to encourage them to create positive and lasting change. COARE's purpose is to study our oceans and increase public awareness of the earth's marine environment through educational programs and outreach.

San Diego Coastkeeper protects the region's inland and coastal waters for the communities and wildlife that depend on them by blending education, community empowerment and advocacy.

Environment Oregon is a statewide, membership-driven environment advocacy organization dedicated to protecting clean air clean water and open spaces. We combine direct advocacy with grassroots organizing to deliver real results for Oregon's environment.

---

## CEE Himalaya

Please find the submission for UNCSD Rio+20 Summit on behalf of CEE Himalaya:

With the 'Humanity' touching the 7 billion mark, we are now forced to consider the carrying capacity of our planet and how judiciously we are using our resources. Mountains, the water towers of earth and repository of natural resources cover about one fourth of planet's terrestrial landmass accommodating approximately 10 per cent of the world's population. More than half of the world's people depend directly or indirectly on mountains. The demand for goods and services from mountains is growing exponentially while the ability of mountain systems to provide essential goods and services is increasingly under threat from climate change, globalization, a chronic lack of investment and ongoing land degradation.

CEE Himalaya, the Himalayan Initiative of Centre for Environment Education (CEE), India was established in 2002 to coincide with the International Year of Mountains. It promotes environmental awareness on fragile mountain ecosystems and builds capacities towards sustainable development. CEE's primary objective is to develop and implement innovative programmes towards improving the quality of environment and the life. CEE undertakes demonstration projects in education, communication and development that endorse attitudes, strategies and technologies that are environmentally sustainable. CEE works in partnership with local governmental, non-governmental and community based organisations utilizing their complementary strength and avoiding duplication of efforts. Youth, women and students are the important target groups.

As a member of Mountain Partnership CEE recognizes that despite the progress that has been made in promoting sustainable development of mountain regions, national and international development agendas still treat mountains, if at all, as marginal environments. Due to lack of appropriate development mountain communities are still marginalized and poverty rates are higher than in non-mountain areas.

Development of mountain areas is important for mountain people as well as for people downstream. There is lack of knowledge about the mountain systems in developing

countries, which is a bottleneck for making development plans. Current understanding about socio-economics, institutional and biodiversity in mountain areas is still very limited. There are large gaps in knowledge about climate change, deforestation and exploitative agricultural, mining and tourism practices, development of non-agricultural opportunities, pollution, population growth, gender-related issues, armed conflict, the unique aspects of space and micro environmental variations and their implications on development, biodiversity, mountain genetic resources, landslides and soil erosion. Far greater efforts are needed to understand them.

CEE appeals for enhancing the global political commitment that translates into increased investments tailored to mountain regions to provide direct benefits for poor mountain communities and indirectly humanity as a whole. Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

---

## CEEweb for Biodiversity

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably. Moreover, the ability of mountain systems to provide essential goods and services for all of people and ecosystems is increasingly under threat from climate change, globalization, ongoing land degradation, a chronic lack of sustainable investment and unsustainable pattern of resource use.

The CEEweb for Biodiversity, a network of more than 60 NGOs in Central and East Europe, and Mountain Partnership members recognize that despite the progress that has been made in promoting sustainable development of mountain regions, national and international development agendas still treat mountains as marginal environments. As a result, e.g. poverty rates and depopulation are higher than in non-mountain areas. In particular, mountains are increasingly threatened by unsustainable investments, e.g. in tourism infrastructure. After 20 years of declarations, there are only single but no concerted actions in place driven by the United Nations System or Governments responsible for mountain ecosystems.

In the context of a Green Economy, new opportunities for investments by the private sector are emerging in mountain regions, especially in renewable energy, sustainable agriculture, and ecosystem goods and services. However, innovative institutional arrangements are urgently required to trigger governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, as well as the actual mainstreaming of mountains into overall national and regional development and conservation processes, such as in the Carpathians and the Alps with a number of legally binding protocols (e.g. on tourism, biodiversity).

Enhancing the global political commitment that translates into increased sustainable investments tailored to mountain regions will directly benefit poor mountain communities and indirectly humanity as a whole. Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

In the past 20 years the global sustainable development process has become a unique policy making platform under the umbrella of the United Nations. Notwithstanding all the efforts made in its framework, there are several symptoms today, which warn us that we need more significant changes in the way we tackle socio-economic and environmental issues on global levels. We see worsening trends both in social and environmental fields. Since the world's carrying capacity was exceeded<sup>1</sup>, we have been accumulating ecological debt with many- decade-long payback period. This has led to the degradation of 60% of ecosystem services globally<sup>2</sup>, which, however, underpin wellbeing for all. Population boom, expected to result in a population of 9 billion people within four decades further lowers the chance of stepping to the path of sustainability within the current framework and poses far bigger challenges to tackle.

These phenomena prove that we manage our common goods (natural resources and land) in an unsustainable way and we cannot share the benefits arising from these resources equitably at national, as well as global levels. This has serious consequences not only for the global ecosystems, but also for poverty eradication, international relations, security or long term economic viability. Even though these problems have been apparent for many decades, our responses failed to tackle the problems within the current socio-economic framework. As the recent report of the International Resource Panel<sup>3</sup> points out, in order to tackle to resource overuse on global level and not to put further pressure on ecosystems, an absolute and radical reduction is needed. This requires new paradigms and holistic approach, since one cannot solve the problems with the same kind of thinking one used when creating them.

CEEweb's recommendations for the Rio+20 Conference outcome

1. The urgency of the global environmental and social problems shall result in a global deal on development, which can ensure that economic activities stay within the global carrying capacity, the access to resources and land is ensured to all, and the generated benefits are shared equitably. Such a global deal shall be translated into concrete actions underpinned by strong political will, and regularly monitored with an active involvement of the civil society. A green economy roadmap shall provide a framework for these actions.
2. The actions shall bridge implementation gaps through adopting a new paradigm. For this aim the Conference shall provide an assessment why previous efforts have failed to deliver global targets on sustainable development. While it is a common objective of countries to ensure and increase human wellbeing for all on the principle of equitability, we cannot solve this aim as long as we deal with economic, social and environmental issues separately, which was a main reason of past failures. The Conference shall reveal the complex interrelations among the only seemingly independent sectoral challenges. For this aim all aspects of the DPSIR<sup>4</sup> framework (drivers, pressures, state, impacts and responses) have to be considered within the context of these environmental and socio-economic problems. These challenges, such as growing social inequalities and the associated hunger and poverty, the financial and economic crisis and the fragility of the financial system and the economy, the environmental crisis including climate change and biodiversity loss, international disputes over trade, resource use and benefit sharing are all interrelated on the level of the cultural, institutional and structural levels of the drivers. Addressing them requires finding the most effective intervention points of the drivers, such as the regulatory framework of land and resource use, which can greatly contribute to tackling environmental, economic and social problems.
3. The assessment of the complex interrelations among environmental, social and economic issues helps redefining the concept of development globally. Societies, including economies, need to adapt to the environmental conditions and changing circumstances, which shall orient development pathways. Within a green economy current economic growth models need to be changed urgently.
4. The Rio principles and spirit, including the principle of common but differentiated responsibilities, and the precautionary principle should be the basis for the international community to strengthen cooperation and move forward on sustainable development. Actions shall be firmly based on sound science and ethics to fully take into account both environmental and social considerations.
5. Transition to a green economy requires that total environmental pressures (originating from resource use, land use and from pollution and alien genotypes) are absolutely limited and reduced to stay within the carrying capacity of the Earth. If this is not achieved, environmental degradation continues. For this aim changing the boundary conditions of the economy and more specifically reducing the resource use globally is inevitable in line with the recommendations of the International Resource Panel. This

shall be realised together with ensuring equal access to resources and equitable sharing of benefits for all.

6. Reducing resource use addresses the drivers on institutional level, while radically changes production and consumption patterns and the values of people. It also balances human and machine labour and thus increases employment. It results in a structural change in the global economy, and, if properly realised, can reduce social inequalities nationally and globally.

7. Actions to address production and consumption patterns shall include an energy quota scheme. This introduces an incentive system, which can ensure the access to resources, reduce the differences in resource use and help realising resource efficiency investments for all. It can also boost research, innovation and employment in sectors that contribute to the efficient and sustainable use of resources. The four pillars an energy use quota system<sup>5</sup> shall cover all non-renewable energy sources, and they should be applied on national and global levels:

- Resource use quota system introduced for countries on international level and for each individual, public and private consumer on national level. The quota system ensures the yearly reduction of all non-renewable energy resources on global level. Those, who save part of their allocated annual quotas, can sell their remaining quotas through the quota managing organization to those who have consumed more than their allocated quotas. The quota managing organization sells the quota in the national currencies, and buys the remaining quota for quota money.

- The market for environmental goods and services is an open market operating according to environmental and ethical rules including aspects of sustainability and market considerations. The quota money received from selling energy quotas could be exchanged to products in this 'eco-labelled' secondary market.

- The Revolving Fund provides the opportunity for everyone, both energy producers and consumers, to be able to achieve savings through energy efficiency and renewable energy investments. The Revolving Fund provides interest free loan in quota money with a payback period adjusted to the energy savings or income generation realised through the investment.

- The Support Service aims to provide advice on lifestyle, planning, social and environmental issues, as well as information on the functioning of the scheme to consumers.

8. The global quota scheme enables the necessary radical change in developed countries, as well as leapfrogging in developing countries. Applying the quota scheme at international level can generate funds for innovations, technology transfer and capacity building in developing countries from the trade of energy quotas.

9. Sustainable land management shall be another cornerstone of green economy as a basis of food security and agriculture, sound water management and improved resilience and disaster prevention among others. This shall also specifically consider the significant role of ecosystems (e.g. water related ecosystems (such as peatlands, lakes and marine habitats) and all forests) in climate change adaptation and mitigation due to their enormous capacity in carbon storage, and the need to make them part of national and international climate change policies. Actions to realise a green economy shall include effective measures to integrate green infrastructure in development planning.

10. Existing international governance arrangements are not up to the task in their current framework and thus cannot deliver implementation, integration and coherence among the various parts of the system. Within an improved structure increased coherence is needed among Multilateral Environmental Agreements (MEAs), intergovernmental bodies and international organizations to address sustainable resource and land use as the basis of green economy.

11. Current global governance and institutions for sustainable development need to be reformed and improved, including the upgrading of UNEP and the International Resource Panel to support its work and strengthening the Commission on Sustainable Development.

12. Regional cooperation needs to be strengthened for common policy responses, experience exchange, common projects and other means in order to realise international commitments.

13. Arrangements to improve participatory democratic governance at national and sub-national levels are essential to make global commitments work. New arrangements shall ensure that the voice of all stakeholders, including the civil society, NGOs and the private sector are heard. This also requires the active engagement and empowerment of underrepresented groups of the society such as women, youth, the unemployed and vulnerable.

## Center for Environmental and Sustainability Education

CENTER FOR ENVIRONMENTAL AND SUSTAINABILITY EDUCATION

FLORIDA GULF COAST UNIVERSITY

FORT MYERS, FLORIDA

PROPOSED INPUTS FOR COMPILATION DOCUMENT FOR THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT

"The Rio+20 Opportunity: Higher Education's Contribution to Sustainable Development"

Speaking at the United Nations Academic Impact Forum<sup>1</sup> in August 2011, Secretary-General Ban Ki-moon noted the relatively new view that governments and the United Nations alone cannot preserve the world's peace and advance the well-being of its people. He said, "As the challenges we face grow ever more complex and interconnected, the United Nations has opened its doors to a wide range of new, exciting and sometimes unexpected partners.... The academic community is among those key new partners injecting dynamism into our work and making such partnership the wave of the future." Ban emphasized sustainable development and climate change as urgent issues on which the academic community could make a difference. He said sustainable development has been his top priority, and called for a focus on the links among hunger, water, and energy. He asked the academic community to bring its ideas to the UN Conference on Sustainable Development (UNCSD, or Rio+20) in 2012.

Higher education can use the Rio+20 process, including submissions to the Compilation Document, to reengage its commitment to sustainable development. A significant global intergovernmental conference at this level provides us with the opportunity to raise the key questions related to the conference themes and objectives on campuses. The Compilation Document draft should reference the vital role higher education could play in achieving the conference's objective of assessing "the progress to date and the remaining gaps." Assessment should include the implementation of education commitments from previous United Nations declarations such as the Stockholm Declaration (1972), Belgrade Charter (1975), Tbilisi Declaration (1977), Chapter 36 of Agenda 21 (1992), and Johannesburg Declaration on Sustainable Development (2002). This assessment could extend to other important documents, such as Our Common Future: The Report of the World Commission on Environment and Development (Brundtland 1987), The Tailloires Declaration (1992), and the Earth Charter (2000).

The academic community can play a vital role in addressing the conference themes of a green economy within the context of sustainable development and the institutional framework for sustainable development. Higher education can use the Rio+20 process as a way to invigorate and refocus the education community on their commitment to a

sustainable future. We recommend, therefore, that the Rio+20 Declaration urge governments, the United Nations, and major groups to support the role of education for sustainable development in the following ways.

1. Affirm a strong sustainability framework, such as the Earth Charter. Adoption of an Earth Charter is part of the unfinished business of the 1992 Rio Earth Summit. Since 1992, too little progress has been made in implementing various commitments to sustainable development, and the need for a more comprehensive global ethical framework such as the Earth Charter has only increased. Consideration of sustainability ethics is essential to the development of a just and sustainable green economy.
2. Recognize the critical role of education for sustainable development and particularly higher education for sustainable development in advancing sustainable development. This includes reaffirmation of the need for strong outcomes of the Decade of Education for Sustainable Development and to elevate the importance of education, as a major group, in a strengthened UN institutional framework for sustainable development governance.
3. Assess the progress in higher education in supporting a sustainable future, realizing commitments made such as the Stockholm Declaration (1972), Belgrade Charter (1975), Tbilisi Declaration (1977), Chapter 36 of Agenda 21 (1992), and Johannesburg Declaration on Sustainable Development (2002). This assessment could extend to other important documents, such as Our Common Future: The Report of the World Commission on Environment and Development (Brundtland 1987), the Tailloires Declaration (1992), and the Earth Charter (2000).
4. Advance academic input into the two themes of the conference. Higher education is uniquely positioned to contribute practical and theoretical research to the emerging green economy and institutional framework for sustainable development. This includes research and development in technological, engineering, financial, and social science dimensions of the conference themes. Higher education plays a role in the formulation of economic and global governance policies.
5. Expand the capacity for youth to engage in infrastructure for sustainable development and the green economy through education. The participation of young people is a fundamental element of environmental governance for sustainable development, and education plays a vital role in this process. Students are at the forefront of promoting sustainable development values such as human rights and social justice.
6. Secure renewed academic commitment to sustainable development in curriculum, operations, research, service, and outreach. Higher education must move in the direction of strong sustainability. This change must be researched and shared in international, intergenerational, and interdisciplinary ways.
7. Address new and emerging challenges for the higher education sector in the transition to a green economy and a sustainable future.

---

## Center for International Environmental Law (CIEL))

Thank you for the opportunity to submit comments on the compilation document to serve as a zero draft for an outcome at the 2012 Earth Summit in Rio. The Center for International Environmental Law offers the following comments:

### I. Views on implementation and on how to close the implementation gap

With respect to implementation, it is important to include not only the UN system and its associated nation states but also international financial institutions (particularly the Bretton Woods institutions, of which only the World Bank is recognized as a specialized agency of the UN), civil society (including the recognized major groups), and the international trade regime. Within the UN system, it is vital to consider not only the different UN agencies and multilateral environmental agreements but also the overall UN human rights system as an anchor component for sustainable development.

First, with respect to international financial institutions, any Rio+20 outcome should address the relationship between the UN and Bretton Woods institutions, such as the World Bank. Given that the World Bank is a specialized agency of the UN, the outcome should make clear that international instruments (including, but not limited to, multilateral environmental agreements such as the UNFCCC, CBD, and CCD; human rights obligations; and the UN Declaration on the Rights of Indigenous Peoples) must be respected and supported by international financial institutions in the fulfillment of their mandates.

Second, within the UN system, UN agencies need to improve their institutional approaches to addressing and implementing international obligations. Opportunities in this area to address the implementation gap include supporting efforts by UN agencies to create and maintain institutional safeguards grievance mechanisms, consistent with relevant international obligations.

Third, as regards major groups, the 1992 Earth Summit was a landmark moment for the major groups recognized as integral stakeholders to negotiations. The ability of NGOs, women, youth, and others to take the floor alongside countries was formally recognized as a part of the Rio process and has had important implications for public participation generally. Likewise, improved access to information was an important outcome of Agenda 21. Implementation has had mixed success, with some fora increasingly opening participation to major groups while in others participation has been limited. The experiences of civil society should be recognized as relevant and vital contributions in any process. Rio+20 gives us a chance to reaffirm these important principles of transparency, access to information, and participation and support increased opportunities for civil society generally, and potentially impacted communities specifically, to engage in participatory monitoring and assist with reporting information to the global community.

Two themes crucially important to this implementation gap are accountability and finance.

#### a. Accountability

It is crucial that any discussions of institutional governance support enhanced accountability in the sense that institutions must be responsible for their actions (including unintended adverse impacts) and responsive to concerns raised in the implementation of activities. Accountability should cover the full panoply of actors. This includes governments and corresponding international obligations and compliance regimes. It also includes international organizations, including environmental and social safeguard policies, accountability mechanisms, and international dispute settlement mechanisms. Accountability also pertains to non-state actors, particularly corporations (including compliance considerations, corporate policies, and financial institutions) but also labor unions, certification organizations, NGOs, and others. Indeed, the rise of globalization and its associated empowerment of international corporations, means that increasingly non-state actors play a greater role in development with less historical accountability for its associated impacts.

For concrete actions related to accountability, at Rio 2012, Heads of State should: (1) recognize and emphasize the need for increased accountability - domestically and internationally - in order to address the serious problems facing human society and make progress toward sustainable development, in particular by increasing implementation and effectiveness of commitments and obligations, in a world of multiple actors and different types of commitments; and (2) strongly endorse domestic and international actions to achieve this. Additionally, Rio 2012 should provide space for dialogue to improve clarity on the application of extraterritorial obligations.

b. Finance Financial resources for implementation of obligations have fallen far short of what assessments indicate are required. Additional resources must be mobilized. For

example, the Parties to the Stockholm Convention on Persistent Organic Pollutants (POPs) identified an estimated \$4.5 billion USD needed for financial resources and technical assistance. However, the 5th replenishment of the Global Environmental Facility (GEF 5), the only financial mechanism of the Stockholm Convention, allocated merely \$375 million USD for POPs (U.S. \$425 for Chemicals overall). Given historical trends, this will typically leverage about \$700 million USD in co-financing. Recognizing the need for greater information regarding challenges on the implementation of treaty obligations, the funding gap is substantial and unlikely to be closed simply by a reduction of implementation barriers and inefficiencies. This funding gap is not unique to chemicals. For example, while costs for limiting global warming to a two degree target vary widely, annual amounts of \$100 billion USD have been identified as a minimum estimate needed, with delay compounding the cost of both mitigation and adaptation. A portion of the financing has been committed, but the timing, source and hence impact of these funds is still to be determined. Given resource limitations, integrating human rights considerations into the prioritization of resource allocation is essential.

## II. Specific Elements

### a. Objective of the conference

CIEL sees particular opportunities in the following sectors:

#### 1. Human rights

Earth Summit 2012 gives us a chance to consider rights and ecosystems together, both from an institutional governance perspective and in the green economy context. Institutionally, the UN system mandates a rights-based approach and any green economy must also respect human rights. The linkages between a green economy and environment mirror those that exist between governance and human rights. Accordingly, identifying and strengthening the links between the green economy and governance also calls for a deepening of the relationship between human rights and the environment. In this regard, Rio2012 has before it a binary choice: either it makes progress on the linkages between human rights and the environment or it will take a step back. A missed opportunity in Rio 2012 would be most regrettable, not only given the theme of the conference and the progress already made in identifying the human rights and environment linkages, but also because the planet requires the development of new tools to secure global environmental justice. Rio 2012 must take decisive steps toward the recognition of the right to environment.

#### 2. REDD+

Early on in the Rio+20 negotiations, REDD+ was cited as a unique area in which UN institutions and the World Bank are collaborating. Indeed, negotiation of a common approach to REDD+ between the World Bank, UN institutions, and other multilateral development banks, provided a novel opportunity to consider accountability and specific social and environmental protections in the context of institutional governance. Similarly, Rio+20 offers an opportunity to further address how UNFCCC obligations (including REDD+ safeguards), UNDRIP, CBD REDD safeguards, and human rights treaties can be respected throughout the implementation of REDD+. In addition to safeguards being elaborated within the UNFCCC, the CBD is also developing safeguards for REDD. Given that both the CBD and UNFCCC are Rio conventions, it is important to ensure coherence between these two conventions, particularly for REDD+. Biodiversity should not be adversely affected in efforts to address climate change and the safeguards developed by each regime should be mutually respected and supported to ensure sustainable development. Additionally, beyond the particular REDD+ safeguards, Rio+20 provides an opportunity for other institutions (such as the UNFCCC) to learn how the CBD has negotiated and implemented access to benefit sharing and FPIC/7P1C.

Regarding coherence and linkages across institutions related to REDD+ activities, CIEL believes that successful efforts to reduce deforestation require clear and equitable rights. We thus find troubling the statements by some actors within the UNFCCC that it is a climate convention and not a human rights convention. Nor does the World Bank directly respect human rights obligations. Unfortunately, that narrow focus and short-sighted perspective threatens to compromise results. There are very few places where we can have a discussion across these regimes on how rights should be respected. REDD+ efforts will benefit if we can improve the global understanding of-and support for-the rights of forest-dependent local communities. Rio+20 provides an opportunity to affirm the broadly recognized need to respect international obligations in the implementation of REDD+ and other sustainable development activities.

### b. Green Economy

Experience to date indicates that the economic pillar has historically outweighed the social and environmental pillars. Consequently, economic development has often had the effect of exacerbating inequality and creating human health risks by ineffectively addressing environmental risks. One way this has been addressed in the past is through safeguards systems' at international institutions, and particularly at the Bretton Woods institutions. The UN system has an opportunity to build on these lessons learned and to consider what institutional policies for UN agencies can minimize social and environmental harms while maximizing benefits. Specifically, UN agencies can develop institutional safeguards and improve internal accountability in order to enhance sustainable development outcomes. This will be discussed further in the institutional framework section below.

One particular sectoral element of the green economy that Rio+20 could consider is the use of technology to promote innovation in the developed world. The ability for intellectual property to serve as a barrier to the transfer of technologies to the global South on fair and reasonable terms is a highly sensitive issue and well documented in certain contexts. In addition, sensitivities also exist around the patenting of genetic resources and traditional knowledge originating with indigenous peoples, local communities, or the developing world at large. These issues not only risk the delay the transition to a balanced green economy, but also risk undermining the integrity of international conventions, for example if restrictions are used by intellectual property rights-holders to gain market share for higher-priced proprietary technologies. Temporary resolutions have emerged; however, broader reform of innovation policies is necessary to advance a green economy, by both maintaining incentives for innovation without sacrificing access to beneficial technologies. Rio+20 could contribute to the beneficial use of technologies for sustainable development by identifying and supporting options beyond intellectual property rights to spur innovation.

c. Institutional framework for sustainable development Promoting linkages across institutions and enhancing accountability within institutions should be a central theme to strengthening implementation and integration of the three pillars and at multiple levels. It is important to consider how these institutions, as well as the objectives and outcomes of the Rio+20 conference, will feed into the Millennium Development Goals.

We must avoid a "race to the bottom," in which the institutions with the weakest standards are the ones selected to implement sustainable development activities. The GEF, UNFCCC, and some UN agencies are now developing new safeguards and accountability systems (including grievance mechanisms). In this vein, Rio+20 provides an opportunity to consider safeguards as part of institutional governance discussions, and indeed safeguards have already been raised as a part of the 2012 Earth Summit negotiations. Generally speaking, UN institutions lack the detailed safeguards developed by the international financial institutions. Rio+20 has an opportunity to support enhanced safeguards systems at international institutions that respect rights and ecosystems. Notably, where this would apply within the UN itself, this kind of mandate would not require a treaty-level outcome to make it happen, which could facilitate implementation of such a decision.

---

## Central Unitaria de Trabajadores (CUT)

A 20 años de la Cumbre de Naciones Unidas sobre Desarrollo Sostenible en Río de Janeiro: mensaje y propuestas de la Central Unitaria de Trabajadores.

El Mensaje de la CUT desde la perspectiva del desarrollo sostenible y el Trabajo Decente.

Ante la Conferencia de las Naciones Unidas sobre el Desarrollo Sostenible, que se realizará en la ciudad de Río de Janeiro el 2012 en Brasil<sup>1</sup>, La Central Unitaria de Trabajadores de Chile (CUT) junto a otros actores pertenecientes al mundo social hemos debatido y reflexionado acerca de los retos que se imponen con el deterioro permanentemente de los recursos naturales, la crisis energética, la pobreza y la desigualdad para el mundo del trabajo a nivel global, regional y nacional y sobre el papel que hemos desempeñado con todo el Movimiento Sindical Chileno para ayudar a hacer frente a esos retos y encontrar soluciones.

Entendemos que Río + 20, se convierte en la instancia para que el Movimiento Social junto al sindical y en particular la CUT renueve el compromiso de promover de forma activa y propositiva la integración plena de los tres pilares del desarrollo sostenible en las políticas públicas del país y, en las cuales, la Agenda de Trabajo Decente promovida por la OIT, suscrita oportunamente, hace su contribución fundamental en este contexto.

Esto porque se debe recordar que los tres pilares que forman parte de la visión del desarrollo sostenible son: el desarrollo económico, el desarrollo social y la protección del medio ambiente, que si bien son tres dimensiones interdependientes entre sí, se refuerzan mutuamente. De hecho para la CUT la integración entre estas dimensiones y el enfoque del Trabajo Decente, resultaría ser una base para formular nuevas políticas y asumir compromisos globales frente al imperativo energético; la problemática ambiental, incluido el cambio climático; la erradicación de la pobreza y la lucha contra todas las formas de discriminación y exclusión social.

En el marco de estos desafíos, la CUT se compromete a luchar para superar la pobreza y las desigualdades sociales y a contribuir a la reducción y mitigación de los impactos medioambientales de la economía en su conjunto, orientando con información y apoyando técnicamente a los sindicatos, a los trabajadores y sus comunidades, en el proceso de adaptación a las repercusiones del cambio climático en el mundo del trabajo en Chile.

La CUT viene sosteniendo su incorporación permanente en la lucha por un cambio climático más acorde al país que necesitamos. Concretamente previo a la realización de Río + 20, hemos decidido reanudar este compromiso aumentando sus capacidades institucionales mediante la creación, al interior de la Central, de una Secretaría Sindical relativa al Medio Ambiente y Energía, cuya pretensión es contribuir a la elaboración de una propuesta sobre Estrategia de Desarrollo Nacional, que le permita al país lograr transitar hacia un nuevo modelo de desarrollo garantizando el bienestar, la protección y la seguridad social de todos sus habitantes.

Al pensar esta Secretaría, nuestra Central busca reforzar su participación con miras al cumplimiento de los ocho Objetivos del Milenio (ODM)<sup>2</sup>, especialmente aquellos relacionados con la reducción de la pobreza y la sostenibilidad del medio ambiente, cuyas metas debieran ser alcanzadas por Chile en 2015. Además le propone al país aprovechar los retos ambientales, climáticos y energéticos para iniciar una transición hacia una economía sostenible centrada en la generación de empleos verdes con trabajo decente y con menores emisiones de carbono.

Es por eso que el mensaje de la CUT se orienta básicamente a convencer a los responsables de tomar decisiones en Chile, de la necesidad de establecer una política justa y limpia en el país hacia una economía baja en carbono, en el contexto del desarrollo sostenible y la promoción del Trabajo Decente definido por la OIT. En efecto, la CUT afirma que el tripartismo y el diálogo social son mecanismos claves para la cohesión social, ayudan a mirar hacia el futuro evaluando las lecciones extraídas de las experiencias del pasado, a la vez que permiten hacer propuestas para encarar estos desafíos para el mundo del trabajo.

El papel del movimiento sindical y la importancia del diálogo social para responder las consecuencias del cambio climático en el mercado laboral y al desafío energético en Chile

El debate sobre una política nacional energética en Chile esta comenzando, al margen de que los Gobiernos anteriores y el actual lo sitúan marginado de las opiniones de actores sociales. Recientemente, un conjunto de proyectos eléctricos han generado múltiples conflictos y un cuestionamiento público acerca de la necesidad de los mismos y también sobre los procedimientos de aprobación. La ausencia de una política de estado que permita a la vez diversificar la matriz energética, mejorar la sustentabilidad de desarrollo del sector y que respete el medio ambiente y la opinión de la comunidad, es claramente un déficit insoslayable y que no se puede postergar más.

Es en este ámbito donde hemos definido que el papel del movimiento sindical es clave para abordar las consecuencias sociales, económicas y ambientales del cambio climático sobre los medios de vida de los trabajadores y sus comunidades. Para ello, resulta necesario orientar a los sindicatos para que realicen sus aportes a la política ambiental, desde la perspectiva del mundo del trabajo, a fin de poner atención, especialmente, en aquellas políticas que puedan asegurar que los futuros empleos verdes sean también decentes.

Definimos que la voz y la participación de los sindicatos resulta esencial para debatir en torno a las causas que han ocasionado el complejo panorama energético que vive Chile y para proponer la necesidad de una política energética de largo plazo, a fin de cubrir la creciente demanda energética que necesitaría nuestro país para lograr desarrollarse de manera sostenible. Por ejemplo, aunque las emisiones de gases de efecto invernadero (GEI) emitidas a la atmósfera por Chile corresponden solamente al 0,23% del total mundial, ésta emisiones, a diferencia de otros países de la región en los cuales el aumento de emisiones de GEI se encuentra asociado al cambio de uso de suelo, en el caso de chileno éste porcentaje se asocia a proyectos de generación eléctrica, particularmente centrales termoeléctricas (CEPAL, 2010).

Dado que el tema de la energía resulta central para Chile, puesto que no sólo han aumentado las emisiones de GEI del país, sino también presenta problemas severos asociados al transporte, a la seguridad del suministro y a los altos precios del recurso, consideramos fundamental que la acción sindical logre desarrollar e implementar una política energética que aborde este tema de manera global, en concordancia con los desafíos de un desarrollo justo, participativo e inclusivo. Es indispensable modificar las actuales conductas de generación, distribución y transporte de energía eléctrica, y poner el acento en reducir la demanda energética, garantizando el suministro de energía a mediano y largo plazo, y diseñando un plan de acción que promueva la independencia, la seguridad energética y que tienda al autoabastecimiento de insumos energéticos en el país, sin que esto signifique negarse a la búsqueda de acuerdos audaces e imaginativos con nuestros países vecinos para asegurar el crecimiento y cooperación de la región.

Otro ámbito de acción para el movimiento sindical consiste en hacernos cargo de promover la reducción de las emisiones contaminantes tanto de fuentes fijas como del transporte público impulsando planes de descontaminación en las ciudades más afectadas del país, así como, aportando antecedentes y evidencia empírica para generar normas de emisión y tecnologías más exigentes para las termoeléctricas, que permitan reducir los efectos de la contaminación local y la emisión de GEI.

En la transición hacia una economía sostenible, la cooperación entre el Estado, las empresas y los trabajadores es fundamental a fin de aminorar tensiones, captar y asignar recursos financieros, conseguir una distribución equitativa de costos y beneficios, instalar tecnologías limpias y progresar en bienes y servicios ecológicos, entre otras iniciativas. El tema energético está estrechamente asociado al empleo, ya sea en transporte como en los procesos industriales, y por tanto aquí existe un vínculo efectivo con la implementación de empleos verdes.

De hecho la CUT considera pertinente la creación y el fortalecimiento de los espacios de diálogo tripartito en los que los interlocutores sociales pueden proponer y comprometerse con el diseño de políticas, programas y proyectos relacionados con la creación de una economía favorable al medio ambiente, con empleos verdes y un trabajo decente para todos.

Conclusiones y propuestas de la Central Unitaria de Trabajadores para su incorporación en el debate como un actor importante y fundamental.

Los sindicalistas tenemos la obligación, mas que ningún otro actor, de luchar por el trabajo decente, contra la pobreza y por un clima ausente de contaminación ambiental. Tenemos la responsabilidad de incorporar la justicia y la equidad en los procesos de adaptación y de mitigación del cambio climático actuando ante las políticas y desarrollo de la energía. Es muy importante y necesario que cumplan este importante papel en alianza con otros actores sociales. Es así que la CUT considera a la Cumbre de Río + 20 es un espacio de diálogo social oportuno y pertinente que abre múltiples posibilidades para encontrar una base común entre los empleadores y el gobierno con los trabajadores para establecer las políticas públicas necesarias que aseguren una transición justa hacia una economía más sostenible, a nivel global, regional y nacional.

A nuestro juicio, el desafío del movimiento sindical es forjar nuevos acuerdos y encontrar nuevas formas de cooperación, que superen los antagonismos y movilicen a la opinión pública, especialmente entre las generaciones jóvenes de la necesidad de establecer una actitud mas justa hacia una economía más sostenible.

Haremos forjar un papel del movimiento sindical para fortalecer la participación de sus miembros en sus organizaciones en cuestiones de cambio climático y energía.

El Movimiento Sindical en su plataforma de lucha debe incorporar nuevas demandas, además de las tradicionales, relativas al cambio climático y en especial en Chile por el desarrollo energético, como son: Protección de Seguridad Social. Con la realidad del calentamiento global, las generaciones actuales y venideras sufrirán nuevos desajustes ecológico-sociales que hacen preciso el fortalecimiento de los sistemas de protección social existentes en pensiones, desempleo, tercera edad, etc.

Solidaridad: Dar prioridad a los mas vulnerables. Los más pobres son los que sentirán los impactos del cambio climático, debido a razones físicas y socioeconómicas. Ser solidarios con las generaciones venideras es un deber inalienable de los actuales.

Nuevos derechos para los trabajadores: Nuestra lucha contra el cambio climático a través de la participación en los procesos con cuestiones medioambientales redundara mayor apoyo a los esfuerzos de mitigación y mejor implementación de las medidas adoptadas, ejerciendo los derechos a participar en decisiones, a conocer los riesgos en sus lugares de trabajo, a proteger a los denunciantes por informar los riesgos medioambientales, a negarse a realizar un trabajo peligroso y a negarse a realizar un trabajo que dañe el medio ambiente.

Diálogo Social. Los procesos de Dialogo Social también entiéndase como Negociación Colectiva u otro carácter de entendimiento entre partes como un instrumentos para tratar también los derechos y deberes de los trabajadores con el medioambiente y así resolver los problemas económicos y sociales para consolidar la paz y estabilidad social e industrial para el impulso económico, cuando las industrias y la producción de energía sufran procesos por los cambios estructurales del medio ambiente es un adecuado espacio para proponer medidas que pongan freno al cambio climático.

Para conseguir una política medio ambiental mas justa para los trabajadores y sus comunidades y caminar hacia un modelo de desarrollo sustentable, la CUT expresa algunas propuestas de acción que permitirán avanzar en esta dirección:

- Identificar los efectos – positivos y negativos – de las políticas y programas hacia una economía verde sobre el empleo y el trabajo.
- Asegurar medidas de protección social adecuadas que mitigan los efectos negativos de los cambios temporales y estructurales en la transición hacia la economía verde y los efectos en el empleo y los ingresos de los problemas medioambientales, como las sequías, las inundaciones o la elevación del nivel del mar como resultado del cambio climático.
- Asegurar acceso para hombres y mujeres, y los más vulnerables, a las oportunidades productivas y de empleo que presenta la economía verde al nivel local, regional y nacional
- Involucrar a los representantes de trabajadores y empleadores en un diálogo efectivo sobre el diseño y la implementación de políticas de economía verde y medidas para tomar decisiones informadas respaldadas por todos.

Finalmente, debemos decir que en los últimos años han aumentado la visibilidad y el numero de organizaciones sindicales que participan en el debate de los temas trascendentales para hoy y el futuro, ya que el proceso del medioambiente como el desarrollo energético en Chile no es prerrogativa exclusiva de los estamentos políticos y las organizaciones ecologistas, sino de toda la estructura de la sociedad incluyendo a las organizaciones sociales en especial los trabajadores. La matriz energética no es patrimonio del Gobierno ni del Parlamento, debe ser un consenso de la sociedad en su conjunto.

Queremos ser convocados para construir el Chile que queremos con un desarrollo energético sin contaminación ambiental y acercamiento definitivo al Trabajo Decente.

## Centre de Coopération Internationale en Recherche Agronomique pour le Développement (CIRAD)

L'agriculture, au cœur des défis de la planète

Alors que la lutte contre la faim est le premier des objectifs du Millénaire pour le développement, les dernières données de la FAO confirment qu'un milliard de personnes souffrent toujours de ce fléau dans le monde. Les projections démographiques indiquent qu'à l'horizon 2050, la planète pourrait dépasser les 9 milliards d'habitants contre 7 aujourd'hui, avec une majorité dans les régions chaudes ou tropicales. Dans ces conditions, le risque de crises alimentaires, voire de famines majeures, n'est pas à exclure.

En 1992, le sommet de Rio a été le sommet de l'environnement. Trois conventions internationales ont été adoptées : lutte contre le changement climatique ; protection de la diversité biologique ; lutte contre la désertification. Les crises majeures qui ont depuis secoué la planète, en particulier les crises alimentaires révélées par les « émeutes de la faim » en 2008 dans nombre de pays en développement, ont fait resurgir le spectre de la faim. Alors que ce risque semblait mineur ou localisé, les opinions publiques comme les décideurs politiques et les organismes en charge du développement ont découvert à nouveau l'ampleur du défi de la sécurité alimentaire et d'une nutrition équilibrée.

Permettre aux plus pauvres d'accéder à l'alimentation, aujourd'hui et demain, est redevenu une priorité. Nourrir la planète exigera non seulement de produire plus, et aussi de tenir compte des nécessités environnementales : l'agriculture est au cœur des défis de demain !

En effet, le défi est d'autant plus complexe à relever que croissent les pressions sur l'accès aux terres agricoles pour produire de l'énergie et des biens industriels. A cet égard, la frontière entre agriculture et forêt soulève de nombreux débats : en cette année internationale des forêts, on ne saurait passer sous silence les enjeux qui leur sont liés, tant environnementaux (stockage de carbone et protection de la biodiversité) que de développement (emplois, nourriture, produits ligneux et non ligneux).

Les questions du volume des productions agricoles nécessaires, de la productivité et des surfaces à valoriser via l'agriculture restent au centre des enjeux. Produire davantage en utilisant moins de ressources naturelles (sol, eau...), en optimisant les intrants (énergie, engrais, pesticides), tout en dynamisant le fonctionnement biologique des agro-écosystèmes : tel est l'enjeu d'une agriculture « écologiquement intensive ». Une agriculture qui valorise les services écosystémiques des milieux agricoles comme des milieux naturels.

L'agriculture, au sens large, est bien plus qu'un secteur d'activité économique ; elle est le vecteur premier de la gestion des territoires. D'elle dépendent les ressources

biologiques et en eau, la fertilité, les stocks de carbone. D'elle dépend également la capacité à nourrir et faire vivre les hommes. Dans nombre de pays en développement et émergents, c'est en effet en milieu rural que se trouvent les plus grandes zones de pauvreté, que vivent certains des plus démunis. L'agriculture y est la source essentielle et principale d'emploi, de revenu, de richesse. C'est elle qui permet de vivre, de sortir de la pauvreté, de dépasser la survie.

Traiter de lutte contre le changement climatique, de conservation de la diversité biologique, de lutte contre la désertification, agir pour la sécurité alimentaire et la lutte contre la pauvreté, c'est aussi, voire d'abord, parler d'agriculture.

Les analyses et perspectives, comme Agrimonde pilotée par le Cirad et par l'Inra, montrent que l'augmentation de la production agricole est une composante essentielle de la sécurité alimentaire et d'une alimentation équilibrée pour tous, mais qu'elle n'est pas la seule. D'autres facteurs jouent un rôle prépondérant, comme la réduction des pertes et des gaspillages lors de la production, du stockage et de la distribution, comme l'évolution des modes de consommation et l'organisation des échanges locaux et internationaux. Sur ce dernier point, la volatilité des prix agricoles joue un rôle majeur, comme l'a montré le High Level Panel of Experts dans son rapport « Volatilité des prix et sécurité alimentaire », présenté à la FAO en octobre 2011.

La sécurité alimentaire est une équation complexe, à la croisée de l'environnement, de la santé, du développement économique et social et de l'énergie. Elle pointe le besoin d'agricultures à la fois productives, économiquement viables, socialement équitables et respectueuses de l'environnement. L'ouvrage récent des présidents de l'Inra et du Cirad (« 9 milliards d'hommes à nourrir. Un défi pour demain ») se situe dans ce cadre pour proposer des solutions.

Plusieurs organismes, internationaux, intergouvernementaux, nationaux, de la société civile, et des conférences et sommets ont analysé cette situation et les évolutions à envisager. La Prepcom de l'Assemblée générale des Nations unies de mars 2011 présente dans sa note « onf.216/pc/8 » les défis à relever pour un développement durable des Etats de la planète, et en particulier des pays en développement. Elle souligne l'urgence de mettre l'accent sur l'agriculture.

La préparation de Rio + 20, et la priorité que fait le G20 de l'agriculture et de la recherche agronomique, ont généré plusieurs conférences, parmi lesquelles :

- la conférence "Re-energising global agricultural productivity", séminaire du G20 sur l'agriculture organisé à Paris par la France et l'Australie en octobre 2011 ;
- la conférence du G20 sur la recherche agricole pour le développement, tenue à Montpellier en septembre 2011 ;
- la conférence "Greening the economy with agriculture" (GEA), tenue à Paris en septembre 2011 sous l'égide de la FAO ;
- la Global Conference on Climate Smart Agriculture organisée à Wageningen en octobre 2011

L'agriculture, de par sa nature multifonctionnelle, est un des piliers d'une économie verte mise au service du développement durable et de l'élimination de la pauvreté et de la faim. Les modalités d'évolution de l'agriculture auront un fort impact sur la réalisation des objectifs de la conférence des Nations unies pour le développement durable.

La recherche agronomique au service du développement durable

L'agriculture se situe au cœur des enjeux du développement durable. Ses évolutions font l'objet de questions complexes et renouvelées. La recherche doit faire peau neuve pour contribuer à les traiter, à éclairer les enjeux et à les résoudre. Business as usual is not an option!

C'est ainsi qu'est énoncée la principale conclusion de l'Evaluation internationale des connaissances, des sciences et des technologies agricoles pour le développement (EICSTAD, IAASTD). Ce processus de consultation à l'échelle internationale lancé par la Banque mondiale et l'Organisation des Nations unies pour l'alimentation et l'agriculture (FAO) visait à déterminer l'impact des connaissances, des sciences et des technologies agricoles passées, présentes et à venir pour réduire la faim et la pauvreté, améliorer les moyens de subsistance des ruraux et la santé humaine, et promouvoir un développement équitable, socialement, écologiquement et économiquement rationnel.

Approuvé lors d'une plénière intergouvernementale tenue en avril 2008, le rapport de synthèse intègre les résultats de l'évaluation mondiale et des évaluations régionales. Il analyse huit sujets majeurs : bioénergie ; biotechnologies ; changement climatique ; santé humaine ; gestion des ressources naturelles ; connaissances traditionnelles ; commerce et marchés ; rôle et place des femmes. Il fait ressortir en quoi la recherche (et en particulier la recherche agronomique, dans son acception la plus large de recherche pluridisciplinaire et polythématique) est une nécessité pour fonder une vision « viable » du développement durable.

La recherche sur l'agriculture et l'alimentation combine, à l'échelle mondiale, une multitude d'organismes de nature, de statut, mandats et de moyens variés : organismes nationaux publics ou parapublics (centres de recherche agronomique, universités, organismes d'appui au développement, services techniques, administrations...) ; des centres de recherche d'entreprises privées (semencières, phyto-sanitaires, production agricole...) ; des organismes privés et des ONG (WRI, WWF...) ; des organismes privés ou publics régionaux ou internationaux (Consultative Group on International Agricultural Research...). Le financement des recherches est tout aussi diversifié, avec un rôle croissant des entreprises et des grandes fondations (comme la B&M Gates Foundation).

Au cours des deux dernières décennies, la recherche agronomique a profondément évolué, mais de façon différenciée selon les organismes et leur intégration dans les communautés scientifiques internationales. Dans les années 1970, il s'agissait de concevoir des itinéraires techniques, de produire des variétés améliorées et de les diffuser en milieu rural -- le modèle de la révolution verte qui a contribué à nourrir la population mondiale. La recherche agronomique a progressivement intégré dans une vision holistique les aspects biologiques, sociaux, économiques, environnementaux des productions agricoles, de l'alimentation, du développement territorial, en les replaçant dans des contextes de changements rapides et de risques accrus. Elle s'est adossée pour cela sur la révolution du numérique et des moyens de traitement et de diffusion de l'information et sur la mondialisation et l'internationalisation des échanges de toute nature. Petit à petit, emboîtant le pas à la modélisation du fonctionnement du climat, elle intègre la dimension globale des enjeux et ne se résout plus à la simple extension (scaling-up) de solutions techniques éprouvées localement.

La recherche agronomique vise toujours à apporter des informations pertinentes, compréhensibles et scientifiquement validées aux agriculteurs, aux décideurs politiques et aux acteurs économiques du monde agricole. Mais, de plus en plus, elle est à l'écoute et en interaction avec les grands enjeux sociétaux, environnementaux, sanitaires et, de ce fait, avec l'ensemble de la société.

La recherche agronomique est confrontée à quatre défis principaux.

Premièrement, elle doit refonder les bases d'une agronomie qui permette une intensification écologique de l'agriculture.

Deuxièmement, elle est devenue un nouvel espace d'interactions pluridisciplinaires entre chercheurs et au sein des organismes de recherche et de formation. Afin de mieux prendre en compte les questions et les défis d'une agriculture multifonctionnelle (au sens donné par l'OCDE), les thématiques de recherche se sont élargies et les disciplines se sont diversifiées. La recherche agronomique aborde aussi bien l'écologie microbienne, le séquençage du génome du cacao, les flux de carbone en forêt, ou le clonage des bovins, que les politiques tarifaires du commerce des produits agricoles, les stratégies de développement territorial ou la perception par les paysans des paiements pour services environnementaux. Dans un monde scientifique enclin à l'évaluation disciplinaire, le défi d'une recherche pluridisciplinaire ne va pas de soi.

Le troisième défi porte sur la place à accorder aux risques et crises, aux interactions entre local et global et à l'intersectoriel. Il est bien ici question d'une évolution des

concepts, des approches et des méthodes.

Enfin, le quatrième défi porte sur l'utilité sociale et politique de la recherche et de ses résultats. Il est nécessaire de renforcer les interfaces entre science et politique et d'adapter les recherches à une multiplicité d'acteurs et aux attentes de leurs mandataires, voire des populations. Le spectre des besoins sera ainsi mieux couvert. Et seront favorisés la complémentarité et le continuum entre recherche d'amont et recherche finalisée, entre recherche générique et recherche localisée, entre recherche disciplinaire et recherche pluridisciplinaire.

La recherche agronomique, dans sa diversité, est aujourd'hui plus que jamais un outil du développement durable, d'une économie verte et de la lutte contre la pauvreté.

Pour une orchestration mondiale de la recherche agronomique

La recherche agronomique pour le développement (Rad), tournée vers les pays du Sud, dits en développement, a longtemps été distinguée de la recherche agronomique internationale (Rai). Leurs institutions étaient différentes : pour la Rad, le CGIAR, les systèmes nationaux de recherche agricole (Snra) des pays en développement, et les organisations régionales et sous-régionales ; pour la Rai, les instituts de recherche avancée (advanced research institutes, Ari) des pays de l'OCDE ; et, entre les deux, précurseurs des évolutions en cours, quelques instituts des pays du Nord dédiés au développement de l'agriculture du Sud. La distinction entre Rad et Rai allait de soi, même si elle recouvrait d'autres frontières (tropical-tempéré, Nord-Sud, pays riches-pays pauvres, fondamental-finalisé...).

Depuis quelques années, Rad et Rai convergent, ce qui est un atout vu l'ampleur des défis à relever. Plusieurs facteurs expliquent cette convergence : la mondialisation des enjeux liés à la gestion du vivant et aux questions de développement ; la généricité croissante des connaissances scientifiques et technologiques ; les évolutions institutionnelles des organismes de recherche (transformation des dispositifs de recherche spécialisés en Europe, montée en puissance des organismes de recherche des pays émergents, réforme du GCRAI...); sans oublier la difficulté à classer les pays dans des catégories anciennes (en développement, industrialisés...). En effet, les équilibres entre pays se modifient.

Les pays émergents, Chine et Brésil en tête, investissent massivement dans la recherche agronomique. Ils acquièrent une capacité scientifique comparable à celle des institutions de recherche avancée, même si la production scientifique agronomique provient encore majoritairement des pays de l'OCDE. Certains pays intermédiaires parviennent à maintenir à flot un système national de recherche agricole avec un niveau scientifique significatif. Mais les disparités s'accroissent avec les PMA (pays les moins avancés), dont les capacités scientifiques s'effritent.

Alors que les moyens publics restent limités et que les problèmes à résoudre se complexifient et se globalisent, il devient urgent que les acteurs de la recherche agronomique, y compris les institutions à l'interface entre science et politique, coordonnent leurs actions. Il en va de l'utilité et de l'impact de la recherche. Les prémices d'une telle orchestration sont apparues ces dernières années : l'expertise collective de l'IAASTD ; la création du GFAR (Global Forum on Agricultural Research), de ses forums régionaux et des conférences mondiales de la recherche agricole pour le développement (GCARD), afin de faciliter les échanges entre la recherche et ses utilisateurs. Et, plus récemment, la transformation du Comité de la sécurité alimentaire de la FAO en un Comité mondial incluant toutes les parties prenantes et adossant sa réflexion à l'expertise scientifique. Lors du sommet de l'Aquila en 2009, le G20 avait d'ailleurs souligné combien une coordination mondiale de la recherche agronomique était nécessaire.

Estimer qu'une coordination est nécessaire ne signifie pas une programmation globale de la recherche agronomique mondiale ou la fin des compétitions entre équipes scientifiques (qui restent l'un des moteurs de la production). Il s'agit plutôt de concevoir et de mettre en œuvre des mécanismes pour coordonner, et peut-être réguler, les moyens investis dans des systèmes fragmentés de production de connaissances. Il s'agit surtout de réduire les asymétries qui se creusent en renforçant les capacités des PMA, afin que ces pays participent pleinement à la formulation et au traitement des questions de recherche. C'est de dispositifs institutionnels, de règles et d'outils de facilitation dont il est question, pas d'une uniformisation réduisant la diversité, la créativité et l'esprit critique, indispensables à toute recherche.

Tout en soutenant l'ambition d'excellence et de généricité, le Cirad propose comme priorité de renforcer les capacités de production scientifique des pays les moins avancés. Son expérience suggère qu'une production scientifique locale, qui répond à des besoins précis, contextualisés, a davantage d'impact sur le développement pour deux raisons : les questions de recherche sont formulées au plus près des réalités ; et les chercheurs sont plus à même de participer aux réseaux d'innovation. Par la culture scientifique qu'elle génère, la production scientifique locale est un élément déterminant du développement. Les partenariats doivent donc avoir pour objectif de renforcer les dynamiques scientifiques fragiles et de contribuer à la souveraineté scientifique des PMA.

Le débat sur le renforcement des capacités scientifiques comme moteur du développement (l'hypothèse d'un développement par la recherche) en recoupe un autre, portant sur l'utilité et l'impact des productions scientifiques (une recherche pour le développement). Si l'excellence scientifique se mesure à l'aune d'indicateurs de publication ou de brevets, les attentes exprimées et formulées à l'égard de la recherche, en particulier par les bailleurs de fonds, portent sur la capacité des institutions, dispositifs et projets à produire des changements effectifs, des impacts, sur tous les aspects de la société et de l'environnement. Ces exigences génèrent des tensions entre plusieurs conceptions du rôle de la science d'une part, et de la posture de la recherche par rapport à l'innovation et au développement d'autre part. Elles conduisent également à repenser les systèmes d'évaluation de la recherche finalisée et à en tirer des leçons pour la programmation. Des recherches sur les écosystèmes de l'innovation sont donc nécessaires. Elles doivent porter sur les mécanismes et les cheminements permettant les apprentissages, sur l'enrichissement réciproque des savoirs scientifiques et des savoirs locaux, et in fine sur l'émergence des innovations, y compris institutionnelles et sociales.

L'enjeu de l'orchestration mondiale de la recherche agronomique est de dessiner un système ouvert et inclusif, doté d'une gouvernance souple. Trois domaines sont prioritaires.

Renforcer l'intelligence stratégique et la partager en associant tous les acteurs de la recherche, afin d'identifier les enjeux et les priorités de recherche à l'échelle globale. A cette fin, les connaissances disponibles doivent être recensées, confrontées, synthétisées et intégrées dans une démarche finalisée (ingénierie des connaissances); de nouvelles expertises et des perspectives doivent être conduites; la création et la participation aux interfaces entre science et politique sont appelées à s'intensifier. De même, une concertation sur les visions, les stratégies et les priorités de recherche doit être organisée en amont de la programmation afin de prendre en compte la diversité des situations, des perceptions et des priorités sociétales et culturelles, d'éviter les duplications, d'atteindre les masses critiques lorsqu'elles sont indispensables, et de favoriser la circulation et l'utilisation des connaissances.

Élaborer une ingénierie institutionnelle afin de formuler et d'organiser des programmes mondiaux de recherche. Complétant les programmes locaux ou régionaux, des programmes de grande envergure sont nécessaires pour produire les connaissances permettant de relever les défis mondiaux. Ces programmes doivent tenir compte des besoins de connaissances, et répartir les rôles en assumant les asymétries de capacités. Au-delà des regroupements temporaires pour répondre à des appels d'offre, il s'agit de définir des mécanismes et des règles (y compris financières) de programmation et de réalisation de programmes mondiaux.

Faciliter l'accès aux productions de la recherche, en clarifiant le statut de ces productions : règles de propriété intellectuelle, modalités d'accès. Il s'agit d'approfondir le statut juridique de la notion de bien public appliquée aux connaissances scientifiques ou aux matériels biologiques améliorés.

Le Cirad propose de contribuer à cette orchestration mondiale en construction. À la croisée des Nords et des Suds, doté d'une mission explicite de développement des pays du Sud, notamment africains, et d'une longue expérience, le Cirad constitue l'un des nœuds des vastes réseaux de production de connaissances. Il est bien placé pour

participer à la réduction de la fragmentation entre les systèmes nationaux, bilatéraux et multilatéraux d'une part, et entre la RAD et la RAI d'autre part. Il peut ainsi contribuer, dans le cadre d'une diplomatie scientifique émergente et en interaction avec les multiples autres acteurs concernés, à la construction d'une nouvelle coordination mondiale de la recherche agronomique pour le développement.

La conférence des Nations unies sur le développement durable, qui se tiendra en juin 2012 à Rio de Janeiro, est une occasion pour promouvoir cette orchestration mondiale de la recherche agronomique, poser les bases d'une nouvelle diplomatie scientifique, mieux positionner la recherche agronomique au regard des défis de demain et contribuer ainsi à un nouveau cadre institutionnel pour le développement durable.

## Centre for Development and Environment, University of Bern

Mountains Matter for Global Sustainable Development

Submission to the Rio 2012 Secretariat for the 'Compilation Document'

by Dr. Thomas Kohler on behalf of the Centre for Development and Environment CDE (University of Bern, Switzerland)

Water supply, food security and clean energy are likely to become the major challenges of humanity on Earth in the near future. A sustainable development of the world will require efforts to address critical shortcomings of these challenges. This understanding leads the Centre for Development and Environment (CDE) to make the following proposals for the 'Compilation Document' that will lead to the 'Zero Draft' of the Rio 2012 'Outcome Document':

### Expectations

CDE expects that the critical role and stakes of mountain ecosystems and mountain communities are adequately reflected in all documents and future sustainable development (SD) promoting structures emerging from the Rio 2012 Conference thus recognizing that half of the world's population depends on water from mountain regions and that many mountain endemic plant and animal species may become of vital importance for food security on earth.

### Comments on existing proposals

a) Green Economy (GE) Roadmap: Mountains provide through their low-input and environmentally friendly traditional agriculture and their hydro power potential a promising field for GE. This should be reflected in appropriate manner in the forthcoming content and structural proposals of Rio 2012.

b) Framework for Action: In order to give more weight to the role of mountain ecosystems in future SD efforts, the so-far marginalized and neglected mountain areas and mountain inhabitants need to be explicitly addressed as an asset for achieving SD.

c) Sustainable Development Goals: Specific targets addressing mountain regions with their critical ecosystem services and their strong socio-cultural identities need to be defined and included.

d) Partnership for Sustainable Development: New pathways and adequate incentives need to be explored to attract private investment in mountain areas based on fair access and benefit sharing.

### Pathways for closing the implementation gap

To our understanding the active involvement of local actors as custodians of natural resources has failed. We thus propose to establish innovative multi-level stakeholder platforms that can enhance dialogue, help exchange experiences and act as 'market place' where demands, offers and ideas meet.

### Proposal for a specific cooperation mechanism

In the light of the above stated, efforts are under way to launch the 'World Mountain Forum for Sustainable Development' as a permanent platform with a peak event linked to the UN International Mountain Day (11 December). This endeavor shall be undertaken through a novel Public Private Partnership (PPP). CDE expects that through such an initiative the relationship between mountain people and lowland inhabitants can be improved and strengthened to jointly achieve a SD on Earth. The official launch could take place during the Rio 2012 Conference in cooperation with the Mountain Partnership hosted by FAO.

### Objectives of the Conference / sectoral priorities

Given the high vulnerability of mountain ecosystems with regard to the negative impact of Climate Change (glacier melting, hazard impacts, changes in river flow) and their critical role as water towers of the world we strongly recommend to include explicit links to mountain systems for the expected sectoral priorities such as in particular water, energy, food security, agriculture, natural disasters and their prevention, biodiversity as well as possibly conflicts. As such, mountain ecosystems provide an ideal context to integrate sectoral initiatives with the three pillars of SD in a comprehensive approach.

### Green Economy as a pathway for SD

In mountain regions – probably more than anywhere else - it clearly appears that the environment is the biggest market(-ing) failure so far. The appropriate valuation of the environmental goods and services is thus one first step to reduce this failure and create markets where needed and meaningful. Hence we consider that in the context of mountains, GE has the potential to promote 'Sustainable Mountain Development' e.g. by promoting the principle of 'Payment for Ecosystem Goods and Services' that are of 'green nature' in the case of mountain areas. Furthermore most mountainous agricultural production systems are already 'green' and would need a corresponding recognition and support to be kept alive in future given the negative impacts of Global Change and migration.

### Institutional framework for SD

Mountain dwellers are often living under very harsh conditions due to local climate and remoteness. However, while their traditional way of living is considered as 'backward', it has proven to be much more sustainable than most urban livelihoods and lifestyles. . We urge decision makers to adopt a different attitude towards mountain communities and recognize their socio-cultural, spiritual and esthetic values. We thus recommend to include these aspects in the future institutional frameworks and at all levels. Moreover, the traditional institutions - such as e.g. the maintenance work for irrigation systems - that shape the life of mountain people, may well serve as examples or even models for lowland areas to move towards SD.

### Reference

The above input is based on the following reference document: Draft Synthesis Report on Progress and Perspectives in Sustainable Mountain Development: From Rio 1992

to Rio 2012 and beyond. Draft prepared for the 'Lucerne World Mountain Conference' 10-12 October 2011. Prepared by Daniel Maselli, Thomas Kohler, Clara Ariza Niño, and Greg Greenwood based on material provided by the regional reports and other sources. Revised version 1 November 2011

## Centre for Environment Education

Inputs from Centre for Environment Education (CEE), India for Zero Draft - Rio plus 20 Conference

1. The Zero Draft should emphasize on the need for an alternative path to sustainable development that is not imitative but learns from the existing development models anywhere in the world and adapts to the local context and the environment. For developing countries especially, the real challenge is not 'how to get there' but 'how not to follow the same path'. This means an approach that encourages/fosters making choices that are indeed different, appropriate and sustainable. While the rich nations will need to rethink lifestyles and retool themselves, for the developing world there is the opportunity to leapfrog, going straight to a sustainable society rather than following the classical route of becoming a carbon intensive industrial country. In order for societies to make these choices, we need to build capacity and provide appropriate skills and this can be done through education.
2. The draft should highlight the key role education plays in changing mindsets, building capacity and providing skills, and developing abilities for critical thinking. Education should engage people in a discussion on values, ethics and sustainability. The Earth Charter is the clearest articulation of values and ethics required for sustainability which can be a guiding framework. Along with new technologies, environmental legislation, policy reform, international treaties, better monitoring and increased compliance, education is a key tool – a tool that is an essential part of an environment and sustainability strategy.
3. The text of the draft should emphasize that children and youth be involved in taking positive action to move towards sustainability. A measure of positive action called the Handprint was launched by CEE during the International Conference on Environmental Education in 2007 as a part of the series of conferences held during the United Nations Decade of Education of Sustainable Development (UNDESD). The Handprint analyses positive impact on the three aspects of sustainability: environment, society and economy. This is an idea of moving from ecological footprint to that of the Handprint.
4. The Zero Draft should strongly emphasize the need for strengthening of inclusive and participatory decision making through consultative processes as a strategy to move towards sustainability. Education is one of the key drivers to achieve the goals of green economy. UNDESD is a major opportunity to promote role of Education for Sustainable Development in moving towards a green economy and for strengthening institutional frameworks and processes.

## Centre Ressource du Développement Durable (CERDD)

Le Groupement d'Intérêt public Cerdd (Centre Ressource du Développement Durable) Nord-Pas de Calais :

Le GIP CERDD, groupement d'intérêt public réunissant l'Etat Français et le Conseil Régional Nord-Pas-de-Calais ainsi que des entreprises, collectivités locales et associations, a pour mission de promouvoir le développement durable en région Nord Pas-de-Calais. Ce groupement assure des missions de veille et d'analyse, anime des groupes d'acteurs et des réseaux et diffuse des informations et connaissances sur les approches territoriales de développement durable dans un seul but : aider les acteurs locaux mettre en application le développement durable. Le Cerdd existe depuis 10 ans et a ainsi capitalisé une expertise reconnue auprès des opérateurs de terrains et des Institutions. Cette reconnaissance a donné lieu à la création, depuis 1 an au sein du Cerdd, du Pôle Climat Nord Pas-de-Calais en charge de l'animation inter-institutionnelle de lutte contre le changement climatique à l'échelle du Nord-Pas de Calais.

Les « Trajectoires développement durable » d'une région en reconversion :

La Région Nord Pas-de-Calais s'est engagée formellement dès 1992 en faveur du développement durable, et ce, de manière ambitieuse en vue d'apporter une alternative à un mode de développement non durable qui marque encore aujourd'hui profondément les villes et territoires du Nord-Pas de Calais. A mi-parcours de cette histoire le Cerdd a été créé pour faciliter l'appropriation du développement durable par tous et démontrer que des territoires en crise pouvaient y trouver opportunément un second souffle. De nombreuses initiatives, de nouvelles pratiques, de nouvelles stratégies de développement à l'échelle de territoires comme des acteurs, en particulier économiques, ont vu le jour et ont ponctué ainsi les « Trajectoires du Développement Durable » des acteurs du Nord Pas-de-Calais depuis 10 ans.

A l'occasion de ses 10 ans, le CERDD a souhaité initier une réflexion collective en vue d'établir un bilan et des perspectives en matière de développement durable en Nord-Pas de Calais. C'est ainsi qu'au printemps 2011, le projet « Trajectoires et transitions du Développement durable en Nord-Pas de Calais » a été lancé par le Cerdd. Ce projet vise à engager une dynamique collective en faveur d'une nouvelle étape du développement durable dans une logique de saut qualitatif, de changement d'échelle (passer de l'expérimentation à la généralisation) et de changement de cap pour l'ensemble des acteurs de la région Nord-Pas de Calais. Cette réflexion collective a pour objectifs :

- de faire le point sur nos trajectoires collectives en matière de développement 1/3 durable depuis 10 ans après la participation une délégation des acteurs du Nord Pas-de-Calais au Sommet de Johannesburg en 2002.1
- de nourrir les travaux de la Conférence de Rio 2012.
- de relancer une dynamique forte de développement durable en région pour les 10 prochaines années.

Soulignons que les conclusions du projet « Trajectoires » serviront également à alimenter les débats pour la prochaine contractualisation Europe – Etat – Région, ainsi que le nouveau projet du GIP Cerdd 2014 – 2020. D'ores et déjà, à l'automne 2011, la dynamique collective lancée au printemps dernier, se traduit par une remontée de nombreuses contributions écrites, la capitalisation d'analyses issues de temps forts régionaux sur les avancées et les perspective du Développement durable en Nord-Pas de Calais, l'organisation de « Cafés littéraires », de résidences artistiques sur le thème du développement durable.

Nos trajectoires locales à la rencontre des gouvernements et des institutions internationales :

Quelques semaines ont suffi pour faire remonter près d'une centaine de contributions afin de nous permettre de qualifier la trajectoire collective des acteurs du développement durable en Nord Pas de Calais. L'ensemble de ces contributions confirme :

- l'intérêt des entreprises, des associations et des collectivités à la mise en oeuvre d'un développement durable plus « intense », plus intégrée, plus mobilisatrice et féconde, dans notre région et dans le monde.
- l'intérêt des acteurs du Nord-Pas de Calais à faire part humblement de leurs aspirations auprès des institutions nationales et internationales afin d'inspirer des décisions qui puissent changer le destin commun du monde et impacter positivement la trajectoire de notre région en reconversion.

- la complémentarité et la force des propositions à l'échelon local qui constituent un levier réel pour le développement durable à l'échelle mondiale. Le Forum « Trajectoires et transitions » des 1er et 2 février 2012 qui se tiendra à Roubaix constituera un temps de synthèse de ces réflexions afin de réaliser un « porté à connaissance » auprès de certains futurs participants à la Conférence de Rio + 20. Cette synthèse aura été mise en débat via un vote coloré sur le site [www.trajetoiresdd.org](http://www.trajetoiresdd.org) à compter de début janvier 2012 (soulignons que le développement relatif au site Internet [www.trajetoiresdd.org](http://www.trajetoiresdd.org) sera diffusé en « open source » auprès des développeurs et tous ceux intéressés par le web 2.0 afin de faciliter les démarches de démocratie participative utilisant internet). Le Forum « Trajectoires et Transitions » permettra un dialogue entre les acteurs du Nord Pas-de-Calais et les représentants des délégations nationales et européennes (ICLEI, COLLECTIF RIO+20, etc.). Sans attendre les résultats du Forum, où nous attendons 350 personnes sur 2 jours, nous souhaitons soumettre quelques orientations autour du rôle des villes pour accélérer la mise en pratique du développement durable demain à l'échelle mondiale. de vie, le développement des usages des TIC - ville 2.0...

1- A ce titre, une autre conception de la ville doit être mise en oeuvre. Les collectivités locales et les territoires sont en mesure de jouer leur rôle en matière de nouveaux modèles de développement et doivent ainsi tenir une place plus importante en partenariat avec les gouvernements locaux.

2- Faire la ville durable nécessite des innovations non seulement techniques/technologiques ou organisationnelles (performance énergétique dans l'aménagement et la construction, modes de transports et de déplacement plus efficaces et plus sobres...) mais aussi sociales et culturelles (en lien avec l'évolution des comportements, des pratiques, des modes de vie, des usages, etc.). Ainsi la voie de l'économie verte doit prendre en compte ces dimensions autres que purement technologiques.

3- Des défis qui supposent une réponse intégrée et des solutions globales Penser la ville durable, c'est penser l'ensemble de ses fonctionnalités et leurs articulations : habiter, se soigner, se nourrir, travailler, se déplacer, accéder aux services et aux loisirs, etc. Les nouveaux modèles économiques, en particulier l'économie de la fonctionnalité, sont des pistes vers des solutions globales pour des villes durables autour de questions telles que les modes de transports de demain, les nouvelles formes de travail et de production en ville... Vu les défis à relever et leurs incidences stratégiques (en termes d'infrastructures par exemple), plus que jamais les villes sont appelées à expérimenter et à innover pour trouver des réponses adaptées.

4- Répondre aux défis de la ville durable en imaginant des « solutions globales » pour lesquelles la logique de l'usage prime, comme l'exhorte l'économie de la fonctionnalité, questionne le rôle et la place des acteurs qui font la ville, et conduit à renouveler les liens des entreprises aux territoires ainsi que leurs propres modèles économiques. Huit principes d'action doivent pouvoir s'exprimer pour articuler villes durables & modèles économiques dans une perspective de durabilité : Proximité, économie de matières, mutualisation, adaptation-réversibilité, pensée d'ensemble, responsabilité de tous, créativité et co-production.

## Centro de Gestão e Estudos Estratégicos – Brazil (CGEE)

ORGANIZATION: CENTRO DE GESTÃO E ESTUDOS ESTRATÉGICOS – CGEE COUNTRY: BRAZIL

THE DRYLANDS TOWARDS RIO+20: A GLOBAL CHALLENGE

In order to raise awareness in regard to the special conditions of the world Drylands (arid, semi-arid, dry subhumid), a process called ICID was organized by a group of international and national stakeholders (National and Sub-national Governments, non-Governmental institutions and international organizations), with the objective of contributing to the agenda, discussions and decisions of the UNCCD – United Nations Conference on Sustainable Development, also known as Rio + 20.

ICID stands for International Conference on Climate, Sustainability and Development in Drylands. As it is known, the Drylands are the object of the UNCCD – United Nations Convention to Combat Desertification and to Mitigate the Effects of Droughts. The ICID process and the UNCCD itself, which resulted from the Rio 92 Summit, are justified by the fact that the Drylands comprise 40% of the land area of the globe, 30% of the population and the great majority of the poverty of the world. At the same time, they have a great contribution to world food production and a great potentiality to contribute to the world sustainable development. However, these regions lack priority in international and sometimes national decision making.

The first ICID was held in Fortaleza, Brazil, in January 1992, with a participation of 45 countries and international organizations, as a contribution to the Rio 92. The second ICID, called ICID + 18, was also held in Fortaleza, in August 2010, as a contribution to Rio + 20. The third ICID, called ICID + 19 Argentina, was held in Mendoza, Argentina, in September 2011. And the ICID + 19 Africa was held in Niamey, Niger, in October 2011, also as a contribution to the Rio + 20 Conference.

More than 2,300 scientists and policymakers from 80 countries and all continents, including public officials, natural and social scientists, representatives of the private sector and international agencies, including the UNCCD, the World Bank, Bilateral Agencies and others, and members of non-governmental, private sector and other civil-society organizations, met in Fortaleza – Brazil (ICID+18, 2010). In Mendoza, Argentina, the ICID+19, 2011 gathered more than 300 participants from Latin American and European countries and from international organizations. And in Niamey, Niger, the ICID+19 Africa, gathered more than a hundred participants from several African countries (especially from the Sahelian region), from Brazil, Argentina and France. The UNCCD participated in all ICIDs.

All three ICID Conferences exchanged scientific information and policy lessons of the past two decades about sustainable development in Drylands around the globe and offered policy recommendations for consideration at the Rio+20 Summit in 2012. Besides the scientific contribution, each ICID produced a policy oriented Declaration (Declaration of Fortaleza, August 2010; Declaration of Mendoza, September 2011; and Declaration of Niamey, October 2011), with recommendations for international and national policy makers and for society in general, aiming at raising awareness and promoting the sustainable development of, and eradicate poverty in the Drylands regions. The complete text of the three ICID Declarations is attached to this document.

Since the first ICID was held in 1992, human-induced global warming and environmental changes and their consequences for human and ecosystems well-being are now widely accepted as fundamental development issues.

The purpose the set of ICID Conferences was to assess the situation of Drylands regions (arid, semi-arid and dry subhumid lands) in order to foster sustainable development and the fight against poverty, land degradation and desertification in the Drylands. From this analysis, participants have reached conclusions and adopted action oriented recommendations addressed in particular to the Rio + 20 Summit in 2012.

The participants in the ICID conferences suggest that the agenda of the Rio + 20 could devote a special chapter to the discussion of the challenges and potentialities of the Drylands, given their importance in terms of population, poverty, development gap, and environmental assets.

#### EXPECTATIONS

The Drylands worldwide contain the largest concentrations of poverty and suffer the greatest pressures on their natural resources such as water, soils, and biodiversity. Their populations are extremely vulnerable to the adverse consequences of environmental changes related to climate variability and change, and are among the least able to cope effectively with them. Desertification alone, as a symbol of environmental threats in the Drylands, adversely affects the livelihoods of one billion (1,000,000,000) people.

Although significant advances continue to be made in scientific knowledge and public understanding concerning the interactions among climate, environmental sustainability and socio-economic development and despite progress and the best of government intentions, the challenges continue to increase and constrain efforts to effectively reduce poverty, mitigate and adapt to climate change and achieve sustainable development and the Millennium Development Goals (MDGs).

Past errors, poorly conceived policies, and exploitative practices have resulted in environmental and social conditions that are not easily reversed without substantial and sustained development efforts that require increased national and international financial support. Declining productivity in the Drylands of their natural resources, the prevalence of poverty and significant inequities as well as institutional weaknesses are expected to be worsened by climate variability and change.

The world's Drylands possess many important assets, including rich social, cultural and biological diversity. They are responsible for more than 20% of food production around the globe.

The sustainable development of Drylands, through improved governance, enhanced livelihoods and greater voice, empowerment, and political representation of their populations (especially the poor), should be the foremost objective of local to international action.

Climate-sensitive development interventions from local to global must be substantially increased paying special attention to the needs of women, children and the elderly, throughout the Drylands.

"Win-Win" opportunities to cope with global warming must be identified and pursued, especially climate adaptation tactics and strategies that reduce local vulnerability, increase resilience and build assets of the poor. Efforts are needed to develop greater institutional capacity for managing climate variability today in the context of projected climate changes (e.g., greater emphasis on improved climate and environmental monitoring networks, drought preparedness planning based on a risk-based management approach, development of appropriate decision-support tools, and improved information delivery systems to aid decision making). Efforts must promote access to land and to markets, as well as effective civil-society grassroots participation in decision-making, implementation, and evaluation of development activities.

The sustainable development of the drylands and the combat to land degradation and desertification should be fostered, through the incorporation of the environmental, social and economic dimensions in development planning and implementation.

The United Nations should urgently consider the current plight of the Drylands, including the risks to global security associated with the growing impoverishment and food insecurity, increasing vulnerability to natural disasters and climate change, and rising conflicts and violence in Drylands regions.

Previous financial pledges by industrialized countries to support sustainable development efforts must be met. Existing institutional arrangements and financial instruments must not only be strengthened but must become more efficient. Disbursement of concessionary resources from recently established Climate Investment and Adaptation Funds, for example, should be accelerated, and local and national institutional absorptive capacities strengthened to effectively utilize these resources.

Regular exchange including scientists, decision and policymakers dealing with the drylands should be encouraged.

Short, medium and long term strategies are necessary to better monitor implementation of actions against land degradation and desertification. In this regard, a zero net land degradation target should be set.

Beyond Rio + 20, the MDGs that will be defined for the period following 2015 should pay special attention to the Drylands and consider them as a target with a high-level of priority.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

Mechanisms should be strengthened through integrated action to arrest and avoid land degradation, to mitigate the effects of droughts, fires and floods, to conserve soil and water resources and biodiversity, and to resiliently adapt to climate change and its consequences. In addition, mechanisms to financially compensate local communities for the environmental protection services they provide must be identified and implemented. Multilateral and bilateral development agencies can play an important role.

Investment opportunities should exploit the comparative advantages of drylands areas such as solar power generation, as well as other alternative and renewable energy sources (including hydropower, wind, and biomass). They should also support techniques for rainwater capture, improved sanitation, wastewater reuse in irrigation and low carbon, resource saving and environmentally-friendly activities. Such investment would enhance energy and food security by the improved efficient management of demand for water through adequate pricing and other means. The integration of water basins should also be considered.

There is also the need to recover degraded areas, strengthen the management and sustainability of existing and newly protected areas and to prevent environmental deterioration of those that are as yet well preserved. Drylands regions should catalogue and prioritize the various sustainable uses and conservation of biodiversity.

Synergies among global, national, regional and local interventions to mitigate and adapt to climate change, conserve biodiversity, and curb desertification should be maximized. Interactions among and with the three Rio Conventions (UNCCD, UNCBD, UNFCCC) should be integrated with broader domestic and international efforts to foster quality of basic education, combat poverty and promote sustainability.

Enhancing climate-sensitive sustainable development activities will require additional financial resources. Part of these costs should be absorbed by national economies, but, because of the global public goods nature of these issues, a larger share of the needed incremental financing should come from industrialized countries.

Contextualized quality education at all levels should be a priority, cooperatively supported by all agencies involved. In addition to a high-return investment in human capital, this should be viewed as the need to raise the awareness of local populations about the linkages among climate change, poverty and sustainability. This will ensure an effective voice, empowerment and representation in public decision-making regarding the future of Drylands regions. Specific Drylands education policies should be developed. The priority focus should be on the youth of both genders beginning with early childhood development. They have the most at stake and will become the next wave of policy and decision makers.

The path to sustainable development requires a greening of the economy of the drylands, as is the case in other regions. The green economy approach should fully incorporate needs for sustainable land management and not be used as trade barriers against exports coming from developing countries.

Renewable energy (solar, wind, biomass) should be enhanced in the Drylands. Developing countries are encouraged to take advantage of financial opportunities offered by existing or emerging mechanisms such as the ones derived from the Rio Conventions process (carbon market, GEF enabling funds, etc.). Likewise, activities on agroforestry and water resources, including underground aquifers, should be fostered in the context of cooperation for development policies.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

The concerns of Drylands peoples are often poorly represented in international, national and local policy processes. Good governance of the Drylands will also bring knowledge, cultural values, needs and aspirations of local inhabitants into multi-level policy and decision-making.

An integrated multidisciplinary climate research, observation, modeling and applications program should be implemented to inform resource managers, policy makers, planners, educators and local populations about adaptation to the consequences of a changing climate.

While information technology and knowledge based on the complex causes and effects of climate variability, extremes and change have advanced significantly during the past two decades, significantly greater inputs from the social sciences are needed, especially to focus on the social and political causes of vulnerability and resilience as well as the societal impacts of climate variability and climate change.

The gap caused by a mismatch between scientific and technological investigation related to the Drylands along with knowledge about production systems on the one hand, and the prevailing system of decision-making and environmental and local governance, on the other, should be eliminated. New Science and Technology (S&T) knowledge must be developed in existing and new Drylands institutions. Sustainable development efforts must respect the cultures of indigenous, traditional and other local populations that have inhabited these regions for centuries.

Drylands knowledge networks should be enhanced with two basic objectives: (i) scientific and applied research: exchange of information, discussion of methodologies,

communication of scientific discoveries and joint development of research activities; and (ii) participatory planning and action: create a forum for exchanging experiences among specialists, government authorities and civil society.

Governance of sustainable development in the drylands should be strengthened at different levels, by enforcing the implementation of the multilateral environmental agreements (MEA) and supporting national and local policies, inter alia through: i) taking into account traditional knowledge, cultural values, needs and aspirations of local inhabitants; ii) reinforcement of regional cooperation between States directly or by means of dedicated organizations such as APGMV and river basin organizations; iii) use of different policy means, including the empowering of local populations and facilitating their access to land. These measures must be consistent with cultural values and customary laws as appropriate.

International cooperation should be encouraged since better coordination of development programs improves their efficiency. South-south cooperation and tripartite (South, North, South) cooperation should be especially fostered. South–South cooperation, notably when it implies developing and emerging countries, like Brazil, is powerful because some emerging countries have already experimented with success policies to fight poverty, land degradation and desertification. Tripartite cooperation, which involves developing, emerging and developed countries, should also be encouraged. International donors and lenders – States, Financial Institutions, foundations, corporate philanthropists – should pay special attention to the needs expressed by organizations directly involved in the combat against desertification, bearing in mind the principles of the Paris Declaration.

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

Convene a “Drylands Summit on Sustainable Development” to refine policy options for Drylands worldwide. Inputs from ICID+19, Niamey 2011, and those of the proposed Drylands Summit would enhance discussion of the importance of Drylands issues in the Rio+20 Conference agenda. Summits for other eco-regions should also be identified and convened.

A new strategic geo-political Drylands Initiative, if not alliance, can be developed to coordinate efforts to address common climate, development and sustainability related problems, prospects and opportunities.

Generate support for development and implementation of community-level knowledge-based strategies to educate children, adults, policy and decision makers, including parliamentarians, and the media, about the obvious as well as hidden implications of climate and environmental changes in the Drylands.

Efforts to improve scientific cooperation devoted to the drylands should be promoted at all levels.

This could be reached by the development of Science, Technology & Innovation (STI) initiatives located in Drylands countries, by enhancing regional and continental centers of excellence on topics concerning drought and desertification.

This could also be reached in Drylands regions through the activities of existing and new networks and observatories devoted to integrated approaches on climate change, land degradation and desertification, migration, health, sustainable development experiences, e.g.

Exchange and share of information and data related to the drylands should be facilitated among scientists and should be used by policy makers.

We should encourage interdisciplinary research programs (inputs from social sciences are particularly needed). Indeed they are well tailored to take into account all the impacts – social, economic and environmental – of measures and policies fighting desertification and promoting sustainable development in drylands.

Research activities should provide local expertise about drylands management.

Research activities should contribute to training and capacity building in the drylands regions.

Moreover, scientific knowledge and dissemination towards the private sector and civil society – mainly throughout the educational system – should be improved. Information, models and policies related to drought and desertification should be enhanced.

Research activities should lead to usual outputs - such as scientific publications - but also to specific outputs that could be used directly by policy makers and other stakeholders.

Efforts should be done in order to assess the state of the art about research devoted to the drylands, including with the use of impact indicators.

The links between research and innovation should be strengthened as well as public-private partnership. The development of biotechnologies and ecological intensification using the diversity of local biological resources should be promoted.

---

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT RIO+20 INPUTS FOR COMPILATION DOCUMENT

SUBMISSION 1: MAJOR GROUPS – OTHER ORGANIZATIONS

ORGANIZATION: CENTRO DE GESTÃO E ESTUDOS ESTRATÉGICOS – CGGE COUNTRY: BRAZIL

THE DRYLANDS TOWARDS RIO+20: A GLOBAL CHALLENGE

In order to raise awareness in regard to the special conditions of the world Drylands (arid, semi-arid, dry subhumid), a process called ICID was organized by a group of international and national stakeholders (National and Sub-national Governments, non-Governmental institutions and international organizations), with the objective of contributing to the agenda, discussions and decisions of the UNCSD – United Nations Conference on Sustainable Development, also known as Rio + 20.

ICID stands for International Conference on Climate, Sustainability and Development in Drylands. As it is known, the Drylands are the object of the UNCCD – United Nations Convention to Combat Desertification and to Mitigate the Effects of Droughts. The ICID process and the UNCCD itself, which resulted from the Rio 92 Summit, are justified by the fact that the Drylands comprise 40% of the land area of the globe, 30% of the population and the great majority of the poverty of the world. At the same time, they have a great contribution to world food production and a great potentiality to contribute to the world sustainable development. However, these regions lack priority in international and

sometimes national decision making.

The first ICID was held in Fortaleza, Brazil, in January 1992, with a participation of 45 countries and international organizations, as a contribution to the Rio 92. The second ICID, called ICID + 18, was also held in Fortaleza, in August 2010, as a contribution to Rio + 20. The third ICID, called ICID + 19 Argentina, was held in Mendoza, Argentina, in September 2011. And the ICID + 19 Africa was held in Niamey, Niger, in October 2011, also as a contribution to the Rio + 20 Conference.

More than 2,300 scientists and policymakers from 80 countries and all continents, including public officials, natural and social scientists, representatives of the private sector and international agencies, including the UNCCD, the World Bank, Bilateral Agencies and others, and members of non-governmental, private sector and other civil-society organizations, met in Fortaleza – Brazil (ICID+18, 2010). In Mendoza, Argentina, the ICID+19, 2011 gathered more than 300 participants from Latin American and European countries and from international organizations. And in Niamey, Niger, the ICID+19 Africa, gathered more than a hundred participants from several African countries (especially from the Sahelian region), from Brazil, Argentina and France. The UNCCD participated in all ICIDs.

All three ICID Conferences exchanged scientific information and policy lessons of the past two decades about sustainable development in Drylands around the globe and offered policy recommendations for consideration at the Rio+20 Summit in 2012. Besides the scientific contribution, each ICID produced a policy oriented Declaration (Declaration of Fortaleza, August 2010; Declaration of Mendoza, September 2011; and Declaration of Niamey, October 2011), with recommendations for international and national policy makers and for society in general, aiming at raising awareness and promoting the sustainable development of, and eradicate poverty in the Drylands regions. The complete text of the three ICID Declarations is attached to this document.

Since the first ICID was held in 1992, human-induced global warming and environmental changes and their consequences for human and ecosystems well-being are now widely accepted as fundamental development issues.

The purpose the set of ICID Conferences was to assess the situation of Drylands regions (arid, semi-arid and dry subhumid lands) in order to foster sustainable development and the fight against poverty, land degradation and desertification in the Drylands. From this analysis, participants have reached conclusions and adopted action oriented recommendations addressed in particular to the Rio + 20 Summit in 2012.

The participants in the ICID conferences suggest that the agenda of the Rio + 20 could devote a special chapter to the discussion of the challenges and potentialities of the Drylands, given their importance in terms of population, poverty, development gap, and environmental assets.

## EXPECTATIONS

The Drylands worldwide contain the largest concentrations of poverty and suffer the greatest pressures on their natural resources such as water, soils, and biodiversity. Their populations are extremely vulnerable to the adverse consequences of environmental changes related to climate variability and change, and are among the least able to cope effectively with them. Desertification alone, as a symbol of environmental threats in the Drylands, adversely affects the livelihoods of one billion (1,000,000,000!) people. Although significant advances continue to be made in scientific knowledge and public understanding concerning the interactions among climate, environmental sustainability and socio-economic development and despite progress and the best of government intentions, the challenges continue to increase and constrain efforts to effectively reduce poverty, mitigate and adapt to climate change and achieve sustainable development and the Millennium Development Goals (MDGs).

Past errors, poorly conceived policies, and exploitative practices have resulted in environmental and social conditions that are not easily reversed without substantial and sustained development efforts that require increased national and international financial support. Declining productivity in the Drylands of their natural resources, the prevalence of poverty and significant inequities as well as institutional weaknesses are expected to be worsened by climate variability and change.

The world's Drylands possess many important assets, including rich social, cultural and biological diversity. They are responsible for more than 20% of food production around the globe.

The sustainable development of Drylands, through improved governance, enhanced livelihoods and greater voice, empowerment, and political representation of their populations (especially the poor), should be the foremost objective of local to international action.

Climate-sensitive development interventions from local to global must be substantially increased paying special attention to the needs of women, children and the elderly, throughout the Drylands.

"Win-Win" opportunities to cope with global warming must be identified and pursued, especially climate adaptation tactics and strategies that reduce local vulnerability, increase resilience and build assets of the poor. Efforts are needed to develop greater institutional capacity for managing climate variability today in the context of projected climate changes (e.g., greater emphasis on improved climate and environmental monitoring networks, drought preparedness planning based on a risk-based management approach, development of appropriate decision-support tools, and improved information delivery systems to aid decision making). Efforts must promote access to land and to markets, as well as effective civil-society grassroots participation in decision-making, implementation, and evaluation of development activities.

The sustainable development of the drylands and the combat to land degradation and desertification should be fostered, through the incorporation of the environmental, social and economic dimensions in development planning and implementation.

The United Nations should urgently consider the current plight of the Drylands, including the risks to global security associated with the growing impoverishment and food insecurity, increasing vulnerability to natural disasters and climate change, and rising conflicts and violence in Drylands regions.

Previous financial pledges by industrialized countries to support sustainable development efforts must be met. Existing institutional arrangements and financial instruments must not only be strengthened but must become more efficient. Disbursement of concessionary resources from recently established Climate Investment and Adaptation Funds, for example, should be accelerated, and local and national institutional absorptive capacities strengthened to effectively utilize these resources.

Regular exchange including scientists, decision and policymakers dealing with the drylands should be encouraged.

Short, medium and long term strategies are necessary to better monitor implementation of actions against land degradation and desertification. In this regard, a zero net land degradation target should be set.

Beyond Rio + 20, the MDGs that will be defined for the period following 2015 should pay special attention to the Drylands and consider them as a target with a high-level of priority.

## COMMENTS

Mechanisms should be strengthened through integrated action to arrest and avoid land degradation, to mitigate the effects of droughts, fires and floods, to conserve soil and water resources and biodiversity, and to resiliently adapt to climate change and its consequences. In addition, mechanisms to financially compensate local communities for the environmental protection services they provide must be identified and implemented. Multilateral and bilateral development agencies can play an important role.

Investment opportunities should exploit the comparative advantages of drylands areas such as solar power generation, as well as other alternative and renewable energy sources (including hydropower, wind, and biomass). They should also support techniques for rainwater capture, improved sanitation, wastewater reuse in irrigation and low carbon, resource saving and environmentally-friendly activities. Such investment would enhance energy and food security by the improved efficient management of demand for water through adequate pricing and other means. The integration of water basins should also be considered. There is also the need to recover degraded areas, strengthen the management and sustainability of existing and newly protected areas and to prevent environmental deterioration of those that are as yet well preserved. Drylands regions should catalogue and prioritize the various sustainable uses and conservation of biodiversity.

Synergies among global, national, regional and local interventions to mitigate and adapt to climate change, conserve biodiversity, and curb desertification should be maximized. Interactions among and with the three Rio Conventions (UNCCD, UNCBD, UNFCCC) should be integrated with broader domestic and international efforts to foster quality of basic education, combat poverty and promote sustainability.

Enhancing climate-sensitive sustainable development activities will require additional financial resources. Part of these costs should be absorbed by national economies, but, because of the global public goods nature of these issues, a larger share of the needed incremental financing should come from industrialized countries.

Contextualized quality education at all levels should be a priority, cooperatively supported by all agencies involved. In addition to a high-return investment in human capital, this should be viewed as the need to raise the awareness of local populations about the linkages among climate change, poverty and sustainability. This will ensure an effective voice, empowerment and representation in public decision-making regarding the future of Drylands regions. Specific Drylands education policies should be developed. The priority focus should be on the youth of both genders beginning with early childhood development. They have the most at stake and will become the next wave of policy and decision makers.

The path to sustainable development requires a greening of the economy of the drylands, as is the case in other regions. The green economy approach should fully incorporate needs for sustainable land management and not be used as trade barriers against exports coming from developing countries. Renewable energy (solar, wind, biomass) should be enhanced in the Drylands. Developing countries are encouraged to take advantage of financial opportunities offered by existing or emerging mechanisms such as the ones derived from the Rio Conventions process (carbon market, GEF enabling funds, etc.). Likewise, activities on agroforestry and water resources, including underground aquifers, should be fostered in the context of cooperation for development policies.

## IMPLEMENTATION

The concerns of Drylands peoples are often poorly represented in international, national and local policy processes. Good governance of the Drylands will also bring knowledge, cultural values, needs and aspirations of local inhabitants into multi-level policy and decision-making.

An integrated multidisciplinary climate research, observation, modeling and applications program should be implemented to inform resource managers, policy makers, planners, educators and local populations about adaptation to the consequences of a changing climate.

While information technology and knowledge based on the complex causes and effects of climate variability, extremes and change have advanced significantly during the past two decades, significantly greater inputs from the social sciences are needed, especially to focus on the social and political causes of vulnerability and resilience as well as the societal impacts of climate variability and climate change.

The gap caused by a mismatch between scientific and technological investigation related to the Drylands along with knowledge about production systems on the one hand, and the prevailing system of decision-making and environmental and local governance, on the other, should be eliminated. New Science and Technology (S&T) knowledge must be developed in existing and new Drylands institutions. Sustainable development efforts must respect the cultures of indigenous, traditional and other local populations that have inhabited these regions for centuries.

Drylands knowledge networks should be enhanced with two basic objectives: (i) scientific and applied research: exchange of information, discussion of methodologies, communication of scientific discoveries and joint development of research activities; and (ii) participatory planning and action: create a forum for exchanging experiences among specialists, government authorities and civil society.

Governance of sustainable development in the drylands should be strengthened at different levels, by enforcing the implementation of the multilateral environmental agreements (MEA) and supporting national and local policies, inter alia through: i) taking into account traditional knowledge, cultural values, needs and aspirations of local inhabitants; ii) reinforcement of regional cooperation between States directly or by means of dedicated organizations such as APMV and river basin organizations; iii) use of different policy means, including the empowering of local populations and facilitating their access to land. These measures must be consistent with cultural values and customary laws as appropriate.

International cooperation should be encouraged since better coordination of development programs improves their efficiency. South-south cooperation and tripartite (South, North, South) cooperation should be especially fostered. South-South cooperation, notably when it implies developing and emerging countries, like Brazil, is powerful because some emerging countries have already experimented with success policies to fight poverty, land degradation and desertification. Tripartite cooperation, which involves developing, emerging and developed countries, should also be encouraged. International donors and lenders – States, Financial Institutions, foundations, corporate philanthropists – should pay special attention to the needs expressed by organizations directly involved in the combat against desertification, bearing in mind the principles of the Paris Declaration.

## TOOLS

Convene a "Drylands Summit on Sustainable Development" to refine policy options for Drylands worldwide. Inputs from ICID+19, Niamey 2011, and those of the proposed Drylands Summit would enhance discussion of the importance of Drylands issues in the Rio+20 Conference agenda. Summits for other eco-regions should also be identified and convened.

A new strategic geo-political Drylands Initiative, if not alliance, can be developed to coordinate efforts to address common climate, development and sustainability related problems, prospects and opportunities. Generate support for development and implementation of community-level knowledge-based strategies to educate children, adults, policy and decision makers, including parliamentarians, and the media, about the obvious as well as hidden implications of climate and environmental changes in the Drylands.

Efforts to improve scientific cooperation devoted to the drylands should be promoted at all levels.

This could be reached by the development of Science, Technology & Innovation (STI) initiatives located in Drylands countries, by enhancing regional and continental centers of excellence on topics concerning drought and desertification.

This could also be reached in Drylands regions through the activities of existing and new networks and observatories devoted to integrated approaches on climate change,

land degradation and desertification, migration, health, sustainable development experiences, e.g. Exchange and share of information and data related to the drylands should be facilitated among scientists and should be used by policy makers.

We should encourage interdisciplinary research programs (inputs from social sciences are particularly needed). Indeed they are well tailored to take into account all the impacts – social, economic and environmental – of measures and policies fighting desertification and promoting sustainable development in drylands.

Research activities should provide local expertise about drylands management.

Research activities should contribute to training and capacity building in the drylands regions.

Moreover, scientific knowledge and dissemination towards the private sector and civil society – mainly throughout the educational system – should be improved. Information, models and policies related to drought and desertification should be enhanced.

Research activities should lead to usual outputs - such as scientific publications - but also to specific outputs that could be used directly by policy makers and other stakeholders.

Efforts should be done in order to assess the state of the art about research devoted to the drylands, including with the use of impact indicators.

The links between research and innovation should be strengthened as well as public-private partnership. The development of biotechnologies and ecological intensification using the diversity of local biological resources should be promoted.

## Centro para la Autonomia y Desarrollo de los Pueblos Indigenas - CADPI and Foro Internacional de Mujeres Indigenas - FIMI

Indigenous Peoples towards Rio+20  
Latin America and the Caribbean

Centro para la Autonomía y Desarrollo de los Pueblos Indígenas - CADPI  
Foro Internacional de Mujeres Indígenas - FIMI

Preamble:

The situation of indigenous peoples is very different today than what it was at the time of the Earth Summit in 1992, when Latin America was on track to overcome the ravages of the "lost decade". In the same year (1992) celebration took place in Spain and Latin America, the encounter of two worlds: a process of commemoration that placed special attention to the agenda of indigenous peoples: their history, their condition, their struggles and especially the issue of their rights. Indigenous people's organizations, emblematic men and women leaders worked to, on the memory of the event, raise a platform of fighting for the rights of indigenous peoples and for the rights of indigenous women once again. In these 20 years of hard work, endless patience, conviction in rights and reason, mobilized our people's and communities. It has been 20 years with many stories to tell: in 1992 Rigoberta Menchú received the Nobel Peace Prize, in recognition of her fight for the rights of indigenous peoples in Guatemala; in 1989 Convention 169 was signed which opened the decade with the first instrument of recognition of the existence and rights of indigenous peoples; in 1990 the historic march of the Confederation of indigenous Peoples of Bolivia; in 1994 two events coincided, the uprising of the Zapatista Movement for National Liberation in Mexico and the constitution of the Confederation of Indigenous Nationalities of Ecuador (CONAIE).

Parallel to those developments and as a result thereof, in the 90s constitutional reforms are achieved in various Latin America States to be recognized as multinational and multiethnic states: Colombia 1991, Mexico 1992, Peru 1993, Bolivia 1994 and Ecuador 1998. The United Nations declares 1993 the International Year of Indigenous Peoples, in 1995 the first International Decade of Indigenous Peoples (1995 - 2005) is declared and, for the few achievements of the same, the Second Decade (2005 - 2015) is declared.

On September 13, 2007, after two decades of hard work and struggle of indigenous peoples, the United Nations Declaration on the Rights of Indigenous Peoples is signed, in which States finally recognize, among others, the right of indigenous peoples to self-determination. This declaration is a milestone in the construction of the rights of indigenous peoples within the framework of the Rio +20, and strengthens their position within the international community.

At the Earth Summit in Rio de Janeiro in 1992, indigenous peoples made clear the position of our peoples through the Kari-Oca Declaration of Indigenous Peoples. The documents of the Summit, including the Rio Declaration and Agenda 21, recognized the vital role of indigenous peoples in sustainable development and identified us as one of the 9 Major Groups. At the World Summit on Sustainable Development (2002) (WSSD / Rio +10) in Johannesburg, South Africa, attended by more than one hundred Heads of State, the Kimberley Declaration and Plan of Implementation for Indigenous Peoples on Sustainable Development were adopted. In it, for the first time in UN history, the term "indigenous peoples" was used, a concept later adopted in the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP), adopted in 2007. In those conditions is that we demand participation in the process and in the Rio +20 Conference itself. The UNDRIP should serve as a basic framework for support to all national and international policies and programs for sustainable development.

20 years after Rio, Indigenous Peoples see that little has changed in the fundamental relationship between human societies and the natural world; we also observed that ecosystems, biodiversity and, therefore, Indigenous Peoples who depend on them, are increasingly threatened. There are continuing violations of the rights to our lands, territories, resources, and our right to self-determination by governments and corporations. Activists, men and women indigenous leaders that defend their territories continue to be harassed, tortured, vilified as "terrorists" and killed by powerful interests.

In the absence of a real implementation of sustainable development, the world finds itself in a multiple crisis: ecological, economic and climatic, including biodiversity erosion, desertification, deglaciation, food shortages, water and energy, a worsening global economic recession, social instability and crisis of values. In this sense we recognize that much remains in order for the multilateral environmental agreements to adequately address the rights and needs of indigenous peoples, and to recognize present and potential contributions of our peoples for a truly sustainable development that allows us all to live well.

We continue to challenge this development model that promotes the domination of nature, relentless economic growth, resource extraction without limits for profit, unsustainable consumption and production patterns, unregulated products and financial markets. This prevailing system fails to understand that humans are an integral part of the natural world and does not respect the inherent human rights, including the rights of indigenous peoples. We believe that our world view and respect for natural law, our spirituality and culture and our values: reciprocity, harmony with nature, solidarity, community, caring and sharing among each other, are crucial to achieve a more just, equitable and sustainable world.

We call on UN to ensure full, effective and formal participation of indigenous peoples in all processes and activities of the Rio +20 Conference, and its preparation and

monitoring mechanisms, in accordance with the UNDRIP and the principle of Free Prior and Informed Consent. We continue inhabiting and preserving the last sustainable ecosystems and biodiversity hotspots in the world. We can substantially contribute to sustainable development, but we believe that a comprehensive framework for sustainable development should be promoted. This includes the integration of a human rights approach, an ecosystemic approach and a culturally sensitive approach based on the knowledge of our people.

#### PROPOSED INDIGENOUS APPROACHES TO BE ADDRESS IN RIO +20:

The United Nations Declaration on the Rights of Indigenous Peoples, adopted on September 13, 2007, establishes a universal framework of minimum standards for the survival, dignity and welfare of indigenous peoples around the world. States and the United Nations have pledged to promote and guarantee the individual and collective rights included in this Declaration.

The Declaration, constitutes the platform from which indigenous peoples, united in the common ideal of their rights, have developed their approaches and proposals.

We are also aware that we are diverse peoples each with our own national and regional particularities; united in diversity, we are convinced that the Declaration constitutes an strategic breakthrough in the recognition, promotion and protection of the rights and freedoms of individuals and of indigenous peoples, whereupon, we invite and encourage States and all persons and organizations involved in the Rio +20 Conference to consider, both in their approaches and discussions, individual and collective rights that in addition to building our development and our liberties contribute to diversity, wealth of civilizations and cultures that constitute the common heritage of humanity.

United in the pursuit of a sustainable development based on the principles of justice, democracy, respect for human rights and non discrimination, always in good faith, we make the following approaches and proposals:

#### 1. THE CONCEPT OF DEVELOPMENT FROM AN INDIGENOUS PERSPECTIVE

For indigenous peoples, living well does not only refer to the per capita income or economic growth, but is about cultural identity, harmony between human beings and Mother Earth. Living well is based on the values of the culture of life, coexistence and complementarity not only between individuals but in harmony between them and nature, responding to the protection of the common good and benefit of all.

These approaches are shared by indigenous peoples around the world,[1] in the sense that indigenous peoples are in the search of a development model based on the practice of self-determination, on the basis that culture is a important pillar of development. In any case is characterized by having an integrated approach, holistic rather than sectoral, based on individual and collective rights and ensures control and self-government over lands, territories and resources. It is based on tradition and respect for our ancestors, complementarity and equality between men and women, thinking about next generations.

From this perspective, indigenous peoples intend to analyze the following aspects of the concept and especially of the process of sustainable development:

- The importance of establishing as a starting point a consensus on the need to change the concept of development, stagnation and worsening environmental problems we now live across the globe constitute a compelling reason for the search of a new and different paradigm.
- We propose to renew the concept of development and improve the instruments for measurement: measure with statistics that fully include information about indigenous peoples, which identifies the diversity of indigenous people, women, youth, migrating populations, so that the information is not subject to the averages of a homogeneous population that always invisibilize inequalities and negative effects of an uneven and exclusionary development.
- Indigenous peoples propose that a new paradigm of Sustainable Development has to sustain itself in a holistic approach to development where the center and purpose of it are the people, communities and indigenous peoples and populations. We propose that people be considered the center of development.
- We propose that in order to have a holistic approach it's important to review and supplement the pillars of development. These pillars can't be antagonistic but complementary. In this sense our approach is that besides the three pillars: economic, social and environmental, the cultural pillar be incorporated in order to enrich and lead the process towards sustainability.
- Indigenous peoples propose that the analysis of cultural, social, economic and environmental developments, not be exclusive but complementary. For example, economic development policies have to incorporate not only production costs of productive processes, but must also incorporate the environmental, social and cultural costs: one example can be the calculation of environmental and health costs as well as cultural costs of large scale industrial food production (economic valuation ecosystem, destruction with monocrops, contribution to CO2 production by the transportation of food by multinational companies , etc., threatens communities and towns because of the destruction of rural economies).
- The concept of poverty: indigenous peoples are not poor, we own territories, knowledge, rights and have the right to self-determination; indigenous peoples are living in poverty and vulnerable conditions, primarily because States -reduced to a minimum by structural adjustment policies -cannot protect our rights; we also find ourselves in this situation due to the unusual concentration of wealth in a small percentage of Latin Americans. We, the indigenous peoples, propose to review the concepts with which we describe our realities: poverty, vulnerability, sustainable development so that the analysis and proposals aim inequality causes and build feasibility for new development processes that incorporate the principles of individual and collective human rights.
- Finally, in regard to one of the central themes of the conference: green economy, we believe that full cooperation of individuals and institutions that participate in the Conference is needed, to build a green economy concept that can be inserted in concept of sustainable development, meaning that it considers the human rights framework, equality between men and women, the concept of "good life" of indigenous peoples, as well as a framework for the development of fair economy in social , cultural and environmental terms.

#### 2. FOOD SOVEREIGNTY AND THE RIGHT TO FOOD

In Latin America and the Caribbean, the rural population amounts to about 121 million people, of which 60 million are indigenous, at least half are women. Indigenous peoples have a special relationship with their territories and nature and this relationship covers all aspects of life, including social organization, economy, cultural aspects, cosmovision and history. It is important to highlight the role of indigenous women in the transmission and preservation of cultural patterns, such as language, means of production and forms of organization that make them strategic partners for the preservation of cultures, communities, sustainable production and distribution of food.

Food sovereignty and security are crucial aspects of the notion of "good life" of indigenous peoples. Everyone has the right and responsibility to participate in the decision on how to produce and distribute food. The vision of food sovereignty entail a transformation in the current food system to ensure that those who produce food have equitable access to, and control over, land, water, seeds, fishing, agricultural biodiversity and all the technical and financial resources for production.[2]

Considering that respect for indigenous knowledge, cultures and traditional practices of indigenous peoples contribute to food security, sustainable and equitable development and to a proper management of the environment, we make the following statements:

- It is important that States and international organizations recognize and support indigenous peoples traditional practices related to agro-ecology as well as various forms of food production (fishing, hunting, farming, harvesting and silvo-pastoral production ) as a basis for food sovereignty and the protection of biological diversity, traditional knowledge, as alternatives to models of unsustainable industrial food production, based on seeds, genetically modified plants and animals, and the use of toxic pesticides and other agro-chemicals.

- The United Nations Permanent Forum on Indigenous Issues - an ECOSOC subsidiary body and forum for dialogue between states, agencies of the United Nations and indigenous peoples- has made recommendations noting that indigenous women are bearers and intergenerational transmitters of traditional knowledge on the conservation of biodiversity and sustainable environmental management, and in that sense have asked international agencies and governments to ensure their access to resources, including credit, new technologies and technical assistance for agriculture and food production; and that the experience of women is reflected in national and international sustainable development initiatives, ensuring consultation, free, prior and informed consent (FPIC) as well as effective participation in formulation and decision making processes.

- Indigenous people believe is important that States, international organizations and the private sector consider incorporating the Free Prior and Informed Consent (FPIC) for all decisions affecting territories, natural resources and production methods that affect the lives of people in general and indigenous peoples.

- We believe that since mining is an activity that produces large environmental pollution including greenhouse gases, and destroys natural ecosystems, health and food sources from which indigenous peoples and other communities depend upon; we call for a moratorium on mining on fragile and culturally significant ecosystems such as forests, deserts, water sources, sacred sites, subsistence areas, Arctic ecosystems and traditional territories.

- Reports indicate, that in Latin America, despite major advancements in economic growth, there still remain big challenges in the management of toxic chemicals and waste, which threatens human security in both urban and rural areas; the use of fertilizers has doubled since 1990. We Indigenous peoples pronounce ourselves on this fact, there is no way to solve a problem if the solution does not address the right causes. The reason why the use of agro-chemicals has doubled is because patterns of production and consumption of food have not been disputed. The large-scale industrial production and distribution are a structural part of the problems regarding food poverty, disease and pollution.

- We call for food sovereignty, sustainable and organic production, that ensure nutritious food quality, varied and naturally ripened, which also guarantee the recovery of local markets, the introduction of productive work; that expands the opportunities for local investment and economic, social and cultural development on healthy eating, with cultural identity and secure access.

### 3. IMPACT OF THE ECONOMIC MODEL EXTRACTOR OF NATURAL RESOURCES ON THE BASIS OF A GOOD LIFE

The Latin American region, in the framework of the global economic crisis, has made serious efforts to maintain a growing economy, unfortunately this growth has been based mainly on the intensive extraction of natural resources, which creates a great pressure on soils, water resources and all natural resources. Likewise, the manufacturing sectors continue being of low aggregate value and remain a marked heterogeneity in productivity among the various branches of economic activity; this situation is exacerbated by a high degree of ownership and wealth concentration, resulting in deep socioeconomic inequality

20 years ago in Rio, States recognized local and traditional knowledge of indigenous peoples, however, currently stress remains in two issues:

On the one hand, we see a continued loss of our lands, biodiversity and natural resources resulting from occupation by third parties, extractive investment and even green extractive investments, the high rate of deforestation and degradation of soils, forests, marine coastal areas, swamps, sacred sites.

In addition, extractive predation affects not only the integrity of the territory but also violates our rights in political and legal terms. This violation has broken the spiritual balance of our people, as it has affected the natural areas where the spirits or Dawan inhabit, considering them beings with powers that protect resources. As a consequence there has been a rupture of the balance between people that make up the indigenous world, leading to the loss of cultural and spiritual values. The spheres of culture, nature and interrelated policy, determine our survival as individuals and as people. And, the loss of balance between these elements or spaces, constitutes a cause for illness, death and imbalance.

Faced with this reality, indigenous peoples committed to seek a development model based on the practice of self-determination, provide the following approaches:

- Recommend that the proposed "Green Economy" initiative is defined and demonstrates its distance from the development model based on market approach and intensive extraction of resources.

- Express our opposition to the establishment of large tracts of monocrops for biofuel production, especially in our peoples territories-

- Propose that developing countries promote the construction of a new production model that on the one hand promotes local development, considering the territories with their human, economic and environmental capital to develop innovative processes to reduce the destruction, generate greater aggregate value and stimulate local markets.

- Likewise, raise the need for developed countries to emphasize on conservation and reduction of their consumption levels; so that productive projects are geared towards supporting and restoring local economies, markets and local production systems.

- Propose the respect for the implementation of human rights as well as the indigenous peoples rights, respect for our development proposals; we also propose that any discussion on economic models and the green economy, must include full and effective participation of people indigenous as well as the implementation of the free, prior and informed consent, of our peoples in all stages.

- Demand states and international organizations their compromise to harmonize the decision-making processes for economic, social, environmental and cultural development, to constitute a new paradigm of sustainable development based on the principles of justice, fairness and respect of ecosystems, natural resources and territories.

### 4. LEGAL SECURITY AND THE RIGHT TO LAND

Legal protection of the rights of Indigenous Peoples, now known as safeguards, to lands, territories, resources and traditional knowledge should be a prerequisite for the development and planning of any and all types of adaptation and mitigation measures against climate change, conservation of the environment (including the creation of "protected areas"), the sustainable use of biodiversity and measures to combat desertification. In all cases they must have the free, prior and informed consent of indigenous peoples, and therefore, we encourage States to take steps in this direction.

- Recommend that states, guarantors of the rights of indigenous peoples promote and facilitate the restoration of the natural patrimony and indigenous peoples' collective, re-establishing their rights, territorial spaces and integral management of their territories.

- Recommend that States and international organizations promote the strengthening of representations and territorial governments: the development of mechanisms for coordination, negotiation and alliances between communities for the joint protection of territory.

- Recommend as main requirements, legal protection of lands, territories, resources and traditional knowledge. We also recommend that traditional farming methods and practices of our peoples, based on healthy alternatives to pesticides be supported.

- Recommend that the term, food sovereignty, be used in place of food security and be adopted in Rio +20[3], for this term harmoniously links food security and territorial development.

- Propose the development of policy and regulatory frameworks that facilitate the coexistence within the framework of respect for individual and collective rights of indigenous peoples.

## 5. INSTITUTIONAL STRENGTHENING

In recent decades, with recent constitutional reforms through which states recognize themselves as multinational, Multi-ethnic autonomous regions are created, as in the case of Bolivia and Nicaragua and spaces are open for effective governance with the participation of indigenous peoples as development actors and subjects of individual and collective rights.

In the framework of the United Nations Declaration on the Rights of Indigenous Peoples, it is of fundamental importance to build governance with the effective participation of indigenous peoples by strengthening their institutions, cultures and traditions to promote their development based on their aspirations and needs.

For this purpose, we propose indigenous institutional strengthening in four strategic areas:

- . Strengthening indigenous institutions that combine individual and collective characteristics, usually based on ancestral institutions, cosmology, rituals and spirituality, collective history, among others, that base their membership on collective identities as peoples.

- . Strengthening state institutions and civil society to promote the rights of indigenous peoples, rights of women, youth and the environment.

- . Strengthening educational institutions of indigenous peoples, while also strengthening the multicultural approach to higher education institutions and research centers.

- . Strengthening the development of synergies and coordination to enhance the capabilities and dynamics of sustainable development.

In view of the above, indigenous peoples:

- Propose that States and international organizations promote and develop mechanisms for the incorporation of indigenous peoples and their representatives in decision-making, political participation, and at all levels of community representation, local and national. Therefore, it is important to develop positive actions at all levels, promote indigenous participation shares in both political parties and all expressions of governmental and nongovernmental organizations.

- Propose that States and international organizations, promote and protect the rights of indigenous peoples to maintain and strengthen their own institutions in order to demand their rights and participate in decision-making.

- States and international organizations shall consult and cooperate in good faith with indigenous peoples interested through their representative institutions before adopting and implementing legislative or administrative measures that affect them, in order to obtain their free, prior and informed.

- States and international organizations shall boost and assign resources for indigenous peoples to maintain and develop their political, economic, social and cultural institutions that protect their natural resources, human resources, environmental resources and freedoms, this will facilitate capacity building based on traditional and nontraditional knowledge.

- The development of institutions of higher education and vocational training proper of indigenous peoples themselves with institutional development strategies, coordination and articulation of knowledge, likewise educational institutions have a special role for systematization, theorizing and knowledge development of indigenous peoples as universal knowledge that contributes to global development.

- A very important aspect is the strengthening of state institutions that serve the rights of indigenous peoples and those that serve production, economics and sustainable development. Their strengthening must include the management of human rights frameworks and the rights of indigenous peoples.

- The strengthening of state institutions goes through the formation of work teams that, in the framework of the ethical principles of human rights, incorporate within their abilities the framework of rights, gender, generational and multicultural approaches.

- Last but not least, the development of synergies and inter-institutional articulations that allows a holistic view of development. Indigenous peoples propose a work plan for the development of inter-institutionalism and especially the development of synergies, partnerships and interlocutions with indigenous peoples organizations as well as other representatives of social movements united in the principles of justice and equity; youth organizations, women's organizations, peasant organizations and environmentalists.

- Finally, we propose as an important element the articulation and coordination of the actors involved. The joint work of the various national and local government agencies, UN agencies, and civil society organizations and peoples as partners, is critical to the advancement of any development process.

## 6. STRATEGIC RECOMMENDATIONS

- Indigenous peoples request that in Rio +20 formal structures for effective participation of indigenous peoples be promoted, defined and implemented, including women and youth in decision-making process within the Conference.

- Request that, in all areas of discussion in Rio +20, the participation of indigenous peoples be incorporated, considering their views, skills, knowledge and potential and not to prioritize poverty and backwardness, far from defining it discriminates them, excludes them and leaves them at a disadvantage in the development dialogue.

- We indigenous peoples propose that, States, United Nations agencies, international organizations and all persons and institutions involved, consider the United Nations Declaration on the Rights of Indigenous Peoples as a structural part of the human rights framework in which commitments to sustainable development are discussed and agreed.

- We also propose, that all agreements and proposals provide in the discussion as well as in the commitments, financial resources, technical, technological and human resources to ensure their implementation, we especially request States that, specialized agencies, United Nations agencies and other intergovernmental organizations commit to mobilizing the necessary resources to ensure the participation of indigenous peoples on an equal footing, in the processes of building a new model of sustainable development.

Sources consulted to develop the document:

In preparing this document the following documents were taken into account: Declaración de las Naciones Unidas sobre los Derechos de los Pueblos Indígenas, Informes del para las Cuestiones Indígenas UNPFII – ONU, Agenda 21, en especial los capítulos 26, 25 y 24; la Declaración de Kari-oka 1992; la Declaración de Kimberly 2002; el Plan de Aplicación de los pueblos indígenas sobre el desarrollo sostenible 2002; Compromisos y prioridades de los pueblos indígena ante la Cumbre Mundial sobre desarrollo sostenible 2002; Declaración de Manaus 2011; América Latina ante Río +20 2011; The Jokkmokk Agreement; Ronda de Roha. Likewise the Convención contra todas las formas de Discriminación contra las mujeres (CEDAW) was consulted and the documents of La sostenibilidad del desarrollo a 20 años de la Cumbre de la Tierra: Avances, brechas y lineamientos estratégicos para América Latina y el Caribe[4]1, in draft form, developed jointly by agencies, funds and programs of the United Nations operating in Latin America and the Caribbean, coordinated by[5] CEPAL, and the document La hora de la igualdad: Brechas por cerrar, caminos por abrir2, presented by CEPAL in its thirty third session (Brasilia, 2010). Declaraciones.

## Children and Youth

Major Group for Children and Youth Contribution to the Outcome Document of Rio+20

This is the contribution of the Major Group for Children and Youth, incorporating the perspectives of young people from all regions. It specifies our goals and priorities for concrete action and change.

The world faces significant challenges that can only be tackled by global cooperation. Rio+20 offers a unique opportunity to make a new programmes for genuinely sustainable development globally, nationally and locally. Our hope for Rio+20 is that there is significant participation by heads of state in the negotiations to ensure commitments are taken more seriously, and that governments are held accountable for agreements that are not implemented. Finally, we call for the adoption of a UN General Assembly resolution to strengthen the agreements reached at Rio+20.

### 1. OBJECTIVES

#### A. RENEWED POLITICAL COMMITMENT

We call for:

- A holistic commitment to mainstreaming and implementing Agenda 21 and the Rio declaration, while taking it further by including new and emerging issues. All relevant international organisations and national legislatures, with the involvement of civil society, should adopt formal mechanisms to ensure that economic and sustainable development discussions are not held in isolation. These mechanisms should have the authority to act as a check-and-balance on the formulation and implementation of policy.
- Implementation of all agreed upon commitments from the previous CSD cycles by member states, including incorporating them into their National Sustainable Development Strategies. This can be supported by incorporation into the programmes of international financial economic institutions, namely the IMF and the World Bank Group, as well as the WTO. International institutions can take the lead in ensuring that policy recommendations are followed through.
- Securing of resources for development and implementation of Action Plans. There is a need for thorough and transparent evaluation of budgets, governance of the allocation of funds, donor coordination, collaboration between existing initiatives and use of funds. We call for the establishment of a dedicated instrument for financing and implementing Sustainable Development outside of the World Bank Group, which implements decisions in general, and specific decisions on sustainable development as decided by various forums ranging from the UN-CSD, the UNFCCC, the CBD, the CCD, UNEP, etc., or in terms of transitioning to the Green Economy (in the context of Sustainable Development and Poverty Eradication), or within specific sectors (e.g. energy, agriculture). This instrument should be governed with a fair geographic representation, which reflects both funding partners and recipients, next to the full inclusion of non-state actors in its governance.
- Sustainable Development Goals (SDGs) with sufficient ambition to meet environmental and social challenges. As the UN General Assembly office, under the guidance of the UN Secretary General, is currently considering the post-Millennium Development Goals (MDGs) framework, the process leading towards the adoption of the SDGs must be streamlined with this follow-up of the MDGs. In his recent report, the UN Secretary General indeed named Rio+20 as an important international event that could contribute to the post-2015 framework. This new SDGs framework should consider in particular the links between poverty, gender inequality, climate change, biological diversity, human rights, ending violence and inequity. Finally, a strong implementation framework and related institutional elements should be developed in order to guarantee the review of the implementation and the compliance of each state.

#### B. PROGRESS AND IMPLEMENTATION GAPS

We call for:

- Dynamic policies that take into account the diverse economic, environmental and social contexts in which they operate in different member states. This must be captured in the introduction, implementation, monitoring and evaluation stages of the policy design. Adverse impacts of "one-size-fits-all" policies such as structural adjustment must also be addressed.
- The adoption of a 10 Year Framework of Programmes on Sustainable Consumption and Production by 2013 and ensuring its integration into policies and law by 2015.
- Member states should establish evaluation and monitoring mechanisms that will obtain specific feedback and data to determine the effectiveness of policy implementation pertaining to the agreements made at the Sustainable Development Summits, addressing and correcting implementation gaps and providing accountability for both member states and civil society. This should include an integrated regional reporting system between economic, social, environmental and other aspects of Sustainable Development that has clear indicators, and milestones to monitor implementation and to build accountability and ownership of the solutions.
- Addressing the impact of armed conflict on local communities and the environment, with special consideration for related conditions that pose severe threats to children and youth, such as: disruption of basic services, endemic disease, intolerance, terrorism, and environmental hazards and degradation (e.g., landmines and medical waste). Additionally, strengthen international, national, and local partnerships to engage local stakeholders in support of environmental assessments and integrated financial mechanisms; and post-conflict reconstruction, capacity building, victim assistance, and risk education.

## C. NEW AND EMERGING CHALLENGES

Policies designed to tackle short-term economic crises must not reinforce and prolong unsustainable practices of consumption and production. The current economic crisis can be an opportunity to reflect on systemic ecological, economic and social problems, to pre-empt new and emerging challenges and develop long-term strategies to prevent future climate, energy, food and water crises.

It is important that economic, social and human rights institutions are strengthened and that the environment perspective is integrated into their work. In addition, at the UN level, interagency and inter program networks should be established in order to facilitate communication and coordination among different UN actors in order to have an integrated approach and effective international governance on Sustainable Development. Though the goals of economic and social development and environmental sustainability can be in conflict at times, there is a need for them to co-exist to secure a sustainable future. This should lead to:

- Redefined enforcement of sustainable development agreements
- The coordination of multilateral economic, human rights and environmental agreements
- Access to justice
- Donor coordination for efficient and appropriate use of funds
- More effective monitoring and evaluation of implementation gaps, assessment of progress and evaluation of emerging challenges.

Radical changes in the geopolitical world amplify the challenge of providing water, energy and food to a growing population, particularly in developing countries, where children and youth are the most affected by precarious living conditions. Given that the previous Earth Summit successfully elevated the status of sustainable development goals, global leaders must incorporate the water, food and energy security nexus into Rio+20 discussions, so that its importance as a sustainability concept is also validated. This is essential to promote and deliver comprehensive frameworks at a local and regional level that account for the intricacies of an interconnected world.

## 2. GREEN ECONOMY IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT AND POVERTY ERADICATION

We consider a Green Economy to be egalitarian, low-resource economic and social systems that cultivate societal and cultural wellbeing and thriving and resilient natural ecosystems. A Green Economy fully integrates key principles of the Rio Declaration: intergenerational and international equity, and pays special attention to the inclusion of youth and children as the building blocks of a sustainable future. The transition to the Green Economy will require an improved notion of wellbeing, measured with indicators beyond just GDP, that fully take into account the limits of our common planetary and social boundaries.

We call for:

- Youth unemployment to be reduced through the creation of green jobs with a living wage and the stronger consideration of the impact of employment policy on youth. Governments should promote young people's role in the workforce by providing them with the appropriate skills and knowledge to improve their employability. Possible initiatives could include locally appropriate job-training in the context of sustainable development, start-up capital for young entrepreneurs and apprenticeship programmes.
- Education for Sustainable Development (ESD) must equip the next generation of youth with skills, training and capacity to help create the Green Economy. ESD should be structurally integrated into the national sub-national curricula and made accessible to all, taking into account local communities' needs. Priority should be given specifically to drastic improvements in teacher training for ESD and recognition and support for alternative forms of education, non-formal learning, online resources and peer education.
- The creation of a "Global Technology Sharing Facility", which would enhance sharing, enable prior assessments and provide monitoring of technology on the global scale. Alternatives to market-based intellectual property rights have to be developed and new digital information infrastructures could foster the rapid circulation of knowledge and technologies worldwide, based on the notions of fair access and mutual benefit sharing. We must also protect and nurture traditional, local and Indigenous knowledge and recognise their value as alternative technologies. Public and private stakeholders must collaborate internationally and strive to incorporate cradle to cradle design into new and existing technological and product lifecycles.
- An integrated approach to the conservation of species and ecosystems, particularly threatened species and ecosystems. Compliance with international conventions, and agreed international standards for the recording of natural resources and periodic assessment by independent authorities, in collaboration with all stakeholders. These efforts are crucial to ensuring that consumption of natural resources is below regeneration rates. Natural resource impact labelling should be mandatory for every industrial product.
- Strong legislative and executive actions by governments to promote the sustainable development of our Blue Economy, avoid depletion of finite water resources and achieve long term food security for fisheries-dependent communities. Actions should include the establishment of a global network of marine protected areas and "no-take zones", including a moratorium on mineral exploration in the Arctic and proper mechanisms for conflict resolution over aquatic resources, with special emphasis on water. Conflict over future water availability and allocation decisions, under likely global pressures like climate change, must be recognised and addresses as a serious global threat to long-term peace and security.
- A 'low-carbon' future that promotes renewable energy and energy efficiency. Specific, measurable, attainable, results-oriented and time bound (SMART) targets should be devised for the development, accessibility and efficient use of clean energy, and demand reduction and energy conservation. This should involve unprecedented funding and technical support for the development of low carbon, renewable infrastructure.
- An urgent start to the transition towards a green, fair and people-centered agriculture that promotes a sustainable food system producing sufficient, healthy and balanced food for all and maintaining and/or enhancing ecosystems, biodiversity and natural resources. Investments in rural areas should be increased to assure decent incomes and living conditions while creating job opportunities for rural communities, especially including youth. Governments must protect the rights of those working and subsisting off the land and aim towards collective, decentralised ownership for sustainable, resilient and productive ecosystem management. Traditional farming and indigenous knowledge, past and present, offer a wealth of potential solutions and should be recognised as such. It is our hope that an outcome of Rio+20 might be a revitalisation of vital knowledge sharing mechanisms in agriculture.
- Strengthening the capacity of national healthcare systems with an emphasis on universal and comprehensive Primary Health Care. This should include universal access to family planning services for women and girls, because this already proves to be an in-demand, cost effective method of increasing communities' resilience to climate change impacts, whilst meeting the health and development needs of people around the world. Women and girls should receive education and easy access to comprehensive health services and supplies.
- The integration of sustainability into all tourism-policies and management practices through the creation of a 'Green Economy Roadmap' aiming at the active participation of local populations in developing sustainable tourism. Development institutions should work collaboratively with the tourism industry to foster increased potential for local hiring and sourcing and significant opportunities in tourism oriented toward local culture and the natural environment.

- The promotion of holistic and long-term sustainable city planning based on master planning that takes in account population growth, natural resource utilisation, ecosystem preservation, public space accessibility, building design, efficient transport and waste management. Sustainable architecture should strive to improve living conditions, reduce vulnerability and diminish exposure to hazardous materials. This could be made possible through financial incentives and mandatory technical standards for new developments.
  - The removal of harmful subsidies that result in unsustainable practices and threaten development. These include agriculture, fossil fuel and fishery subsidies. If such vast sums of money were being directed toward sustainable development, we would be great strides further on the path to realising the kind of world we want to see. 3.
- INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

#### A. Balanced participation of all stakeholders

- Ombudspersons for Future Generations

Rio+20 should secure collective commitment for the establishment, at the national level, of Ombudspersons for Future Generations. These independent institutions, working from the heart of government, should be mandated to provide an assessment of the long-term impacts of public policies and legislative proposals. They should also respond to citizen petition, investigating claims of environmental crimes and offences and engaging in either conciliation or litigation.

Furthermore, we call for the establishment of an independent Office of the UN High Commissioner for Future Generations. Similar to the national level Ombudspersons, the High Commissioner would seek and analyse system faults on the global level, i.e. situations where even the normal, regular flow of activities results in significant jeopardy of the interests of future generations. This office would have both an agenda-setting and advisory role with regard to the long-term environmental and social coherence and impacts of UN agencies, policies and programmes and other multilateral treaties. It would function in close cooperation with civil society. This office would also support the capacity of developing countries to establish effective mechanisms of intergenerational accountability and provide a forum for the exchange of best practices in relation to the establishment of national Ombudspersons for Future Generations.

- Participation of stakeholders

We call on governments to seize the opportunity offered by the Rio+20 process in order to re-engineer participation within Sustainable Development and to elevate this as a cross-cutting issue in the whole SD-governance.

- Government needs in Rio to either adopt one global or several regional conventions based on principle 10 of the Rio 1992 Declaration and including a compliance mechanism, on the model of the Aarhus Convention.
- At the international level, civil society participation should be evaluated and elevated at all relevant political forums, including financial institutions. Such participation should include the representation of a minimum of 2 non-voting representatives of civil society in the respective bureau.
- All states should urgently implement the Agenda 21 recommendation of establishing national sustainable development councils. Where such Councils already exist, they should be strengthened and provided with adequate resources, political leverage and support by exchanging best-practices. These councils should by default try to mirror all Agenda 21 Major Groups.

#### B. Ensuring progress towards global sustainability

While key legal principles have already been recognised at Stockholm and Rio Conferences, compliance with these principles has been critically lacking, thus requiring the urgent establishment of new accountability mechanisms.

- World Environmental Court

We call for the establishment of a World Environmental Court to take decisions related to the non-respect of national obligations under international environmental law. This court will provide a forum for individuals and communities to hold states party to international environmental agreements legally accountable for their commitments. Procedures for individuals and communities to file a complaint to the Court should be based on those of existing Human Rights courts such as the European Court of Human Rights.

- Creating a new momentum for the implementation of the precautionary principle

Rio+20 presents a unique opportunity to develop institutional arrangements necessary for the full and effective implementation of the precautionary principle. We call for the legal recognition of the fact that industrial production and commercialisation of new substances and technologies should not be authorised in the presence of a reasonable doubt regarding their potential to harm our environment or the natural capital left to our children. In the case of practices and activities creating short-term risks for ecosystems and communities, a proper insurance mechanism should obligate those taking the risks to be in the capacity to fully repair any damages intentionally or accidentally resulting from their actions.

#### C. Ensuring knowledge-based decision making

- Intergovernmental Panel on Sustainable Development (IPSD)

Given the growing fragmentation of knowledge, we call for the establishment of an Intergovernmental Panel on Sustainable Development that functions as an umbrella organization which should design a sustainable development research agenda for the 21st century that reviews relevant scientific knowledge (including not only natural sciences but also social sciences such as economics). Scientific evidence should contribute to knowledge-based policy making and policy monitoring. The Panel should also be mandated to provide an assessment of ecological boundaries.

#### D. Creating a set of global institutions for sustainability

Delivering political coordination and momentum

- UN Council on Sustainable Development

We call for the immediate establishment of a Council on Sustainable Development as a subsidiary to the UN General Assembly, with the authority to adopt legally binding decisions. This Council would seek integration of all composing elements of Sustainable Development, at a higher political level than is currently the case within the existing UN bodies dealing with the matter. It should also be mandated to coordinate the work on Sustainable Development of both the Bretton Woods and UN institutions in a coherent manner. Finally, this institution should enshrine Civil Society participation within its design, upgrading the existing CSD practices amongst others, including representatives of Major Groups within its governance (Bureau).

- Stewardship for Global Commons

We also call for the immediate establishment of a transparent and participatory trusteeship for the transitional governance of the global commons until they are adequately governed by legally binding rules, based on a sense of shared responsibility and the principles of subsidiarity and intergenerational equity. This process should lead by 2015 to the establishment of a permanent, legally-binding Global Commons Trust that cooperatively and responsibly develops, manages, maintains and equitably shares in the usage and benefits coming from resources that are held in common by the community at large. Whilst sympathetic to the vulnerable, there must be a local-global framework and participatory processes to address the issue of free riders.

#### Ensuring implementation

- Upgrade UNEP into a new UN Environmental Organisation with status as a specialised UN agency with the capacity to deliver

We call for an upgrade of both mandate and status of the current UNEP in order to enable this organisation to supervise all environmental sustainability initiatives within the UN. This new, specialised agency will provide an accountability mechanism for policy makers and national ministries and should coordinate all UN programs, agencies and affiliates who are working on initiatives related to or having an impact on environmental sustainability. The international community must ensure that it possesses the adequate means to successfully implement its mission.

The long-term review process for the improvement of Sustainable Development Governance at the UN level should assess the pros and cons of other institutional frameworks, such as the creation of an all-encompassing World Organisation for Sustainable Development.

## China National Working Committee for UNESCO Project on Education for Sustainable Development (CNWCESD)

### Suggestions on Further Promoting ESD in International Society after UN-DESD

#### ----Taking ESD Experience, Challenges and Future Commissions in Ten Countries in Asian-Pacific Region as Examples

In recent decade, in order to deal with severe challenges human beings' society is facing and to fulfill the commitments made by each government, the international society has paid great attentions on educational functions for sustainable development since the World Summit for Sustainable Development in Johannesburg in 2002. Taking implementing the UN Decade of Education for Sustainable Development (2005-2014) (hereinafter for short DESD) as an opportunity, educators in the global society carry out theoretical researches and practice on ESD, and produce abundant and fruitful achievements.

Nowadays, there are still challenges, and commitments made in the World Summit in Johannesburg still are not completely fulfilled. To further fulfill the educational function for promoting sustainable development through ESD, it's extremely necessary to summarize experience on ESD in all countries comprehensively before the World Summit on ESD in Rio de Janeiro in 2012, and to make clear deployments on further promoting ESD after UN-DESD.

Based on the experience obtained by ten countries in Asian-Pacific Region, the review report is made to exhibit the actual situations and to provide suggestions.

#### 1 The Experiences on ESD from Ten Countries in the Asian-Pacific Region

##### 1.1 The first effective driving force to promote ESD is to construct authoritative and professional national organizations.

In the Asia and Pacific region, some countries have already established the national organizations and agents. For example, the Korean National Commission for UNESCO established the Korean National Committee for ESD in 2009; the Ministry of Education in Laos established the National Working Group on ESD; the national working committee on ESD under UNESCO is the main steering organization for ESD in Japan; the Ministry of Environment and the Ministry of Education are two main steering organizations for ESD in Indonesia; China National Commission for UNESCO established the China National Working Committee for UNESCO Project on Education for Sustainable Development (hereinafter for short CNWCESD) which has taken charge for implementing ESD nationwide since 2002. According to the experience in Korea, Laos, Bangladesh, Japan, Indonesia and China, such institutions shall be formed by officials from ministries of education and UNESCO national commissions so as to guarantee the high authority of ESD. Meanwhile, experts on education, environment, culture and other fields should be invited into these organizations in order to make professional and strong plans and guidance.

##### 1.2 The dominant factors to direct and inspire principles and teachers actively to participate in the innovational practice on ESD are to put forward the overall theory and connotations of ESD in light of each country's actual conditions.

In East Asia, ROK, Japan and China are taking the lead in carrying out theoretical researches on ESD. ROK established several research institutes to promote the development of ESD. In 2005, Tongyeong, Incheon and Ulsan three cities established three Regional Institutes on ESD, and organized several seminars with the themes of Green and Creative Human Resources, Curriculum Innovation and Teaching-Learning Process, Educational Competitiveness, the Human being and the Biosphere, etc. Japanese government valued highly theoretical research on ESD, and the Ministry of Environment, the Ministry of Land, Infrastructure, and Transport, the Ministry of Education, Culture and Sports, Science and Technology developed on the Guidelines for the Development of National ESD Indicators in Asian-Pacific. The theoretical researches by CNWCESD in China were represented mainly by the Basic Course in Education for Sustainable Development and several papers nearly 800 million words from 2003 to 2010, and these researches centered on two-level connotations of ESD, teaching model of ESD, cultivation of sustainable learning capacity, the significance of writing ESD in the National Outline, creation of high quality education in ESD, quality education creation through ESD and the indicators for sustainable schools.

##### 1.3 To organize educational experts to implement research and practice of ESD persistently can promote the shift from the research to public policy and incorporate ESD into the national and local outlines.

To incorporate ESD into national development outlines has been a common agreement among countries in Asian-Pacific region. ROK government released its National Vision for Sustainable Development and the National Strategy for Sustainable Development. Besides, ROK legislative body approved the Basic Law on Sustainable Development, the Environmental Education Promotion Act and the Framework Act on Green Growth. The National Socio-Economic Development Plan 2006-2010 (NSED) and National Growth and Poverty Eradication Strategy (NGPES) Lao government issued were two dominant policies for promoting ESD. Based on the Agenda 21, Malaysia released the National Policy on Biodiversity and the National Integrity Plan with focus on building the awareness and capacity for the educatees to respect nature, and preserve environment. In the recent, the 9th Malaysia Plan issued by the government also emphasized the important role of non-governmental organizations (NGO) in ESD and called for further spread ESD to promote environmental awareness and knowledge. The Nepal government launched the Nat-Com Participation Program to promote ESD. The program aims to provide fund for selected schools to implement micro programs on ESD. The Japanese enacted a series of acts to provide legitimate protection for the promotion of ESD. United Nations Framework Convention on Climate Change (UNFCCC) and UN Climate Change Conference these international conventions are the main legitimate guidance in Indonesia. In early 2010, the State Council of China issued the "National Outline for Medium and Long-term Education Reform and Development (2010-2020)" (for short "National Outline for Education"). The "National Outline for Education" lays considerable attention on "focusing on ESD" in its strategic subject and requires education institutes at all levels to implement ESD, and incorporates ESD contents into all courses. It marks that ESD has been shifted from a single research topic and education program to a national public educational policy.

1.4 The main tool to strengthen the capacity of construction of ESD is to organize the training for principles and teachers at national, local and school levels regularly or irregularly.

Most country in Asian-Pacific region has already strengthened the training for principles and teachers. Korea National Commission for UNESCO and Seoul Office of Education established ESD teachers training program for primary and secondary educators, with the aim to train teachers and researchers to implement ESD research. Laos Ministry of Education organized trainings for principals, teachers, researchers and officials. In China, under the leadership of the Chinese National Commission for UNESCO, CNWCESD and Beijing Academy of Educational Sciences have organized 10 national seminars. More than 10,000 principals and teachers from member schools, experimental schools and model schools attended these seminars. At the same time, 100 thematic trainings were organized, and tens of thousands of principals and teachers received the trainings.

1.5 The critical part of implementing ESD in primary and secondary schools is to incorporate the knowledge, capacity and lifestyle on social, economic, environmental, cultural sustainable development into the curricula.

Under the guidance of the idea of ESD, most countries in Asian-Pacific region started to reform their curricula, and incorporated the ESD scientific knowledge, learning capacity and value into the curricula. In regard of curricula development, Laos Ministry of Educational attaches great importance to the use of ESD ideas in curricula reform. In the process of curricula evaluation, ESD is also an important aspect. In Malaysia, in terms of curricula development, ESD is mainly embodied in environmental education, Education for All. Curricula development is an important aspect in Bangladesh's ESD, which absorbed various elements of ESD into basic education curricula including Human Rights, Gender Equality, Health, HIV/AIDS Prevention, Good Governance, Population Education, Cultural Diversity, Natural Resources, Climate Change, Rural Development, Sustainable Urbanization, Disaster Crisis Management, Poverty Reduction, Corporate Social Responsibility, society, culture, environment and economy. ESD curricula development in Nepal has its own characteristics. Teachers, policy makers, students, parents, business, communities are all participants in the process of curricula development. In terms of content, core concepts like environmental protection, pollution control, and sustainability of society, economy and culture are all integrated into the curricula. ESD curricula reform in Tango centered on the value education, and incorporated the cultural diversity, learning capacity and self-identity into curricula. The idea of ESD has already been put into pre-school education, primary education, secondary education, higher education and informal education all educational sectors. Under the leadership of the Chinese National Commission for UNESCO and Ministry of Education, CNWCESD directed schools at all level to form the national curricula, local curricula and school-based curricula 3-level curricula system. The curricula system reflects the basic idea of ESD. At the same time of curricula construction, China also attaches great importance to reform the teaching methods in primary and secondary schools, and achieve good results.

1.6 The effective methods to implement the ESD practice and spread successful experience are to construct ESD experimental schools and districts and to organize workshops on exchanging ESD experience.

Japan, China and Indonesia are the three leading countries in constructing ESD experimental schools and districts. The Ministry of Environment in Japan selected 14 regions nationwide to construct ESD communities. Indonesia paid attention on the construction of Environmental Awareness Schools. Meanwhile, China has already constructed member schools, experimental schools and model schools in 3-level school system. The Chinese National Commission for UNESCO had selected 15 regions in 3 provinces, municipal cities and autonomous regions to create ESD experimental districts.

1.7 To carry out evaluation and assessment on educational quality for ESD

Some countries in Asian-Pacific region have already carried out researches and assessments on educational quality for ESD. China has started to work on evaluating and assessing educational quality for ESD since 2004. CNWCESD had developed and made the educational quality evaluation and assessment criteria for ESD which include five first-level basic indicators on school management, curricula and teaching, teachers' training, energy-saving and emission-reducing campuses construction, students' quality, ten second-level criteria and twenty third-level items. CNWCESD had organized and implemented the national evaluations and assessments on ESD experimental schools for three times since 2008 in accordance with the criteria.

1.8 To create active circumstance for youngsters to receive ESD, it's necessary to cooperate with stakeholders to explore social resources and establish school-society cooperation networks in the process of implementing ESD.

In ROK, government, local administrator, research groups, and schools formed the social ESD network. The Korea Research Institute of Vocational Educational Training (KRIVET), the Korea Foundation for the Advancement of Science & Creativity (KOFAC), the Korea Institute of Curricula and Evaluation (KICE), the Korea Arts & Culture Education Service (KACES), and the Korea National Park (KNP), and National Museum of Korea (NMK) actively participated in ESD. In Laos, Enterprises, communities, non-governmental organizations (NGO) and regional organizations have become active forces in advancing ESD. In China, ESD member schools, experimental schools and model schools carry out thematic activities by exploring social resources, and establish ESD activity bases. At the same time, some ESD experimental schools established friendly relationship with schools abroad.

2. The challenges for Ten Countries in the Asian-Pacific Region in implementing ESD

With the difference on political systems, economic development patterns, cultural traditions and teaching models, countries in Asia Pacific region start to implement ESD at different time. Therefore, there are differences among countries. Meanwhile, different countries are facing different challenges and problems.

2.1 Although some countries have already organized the national ESD organizations, they hardly issued the national policies on ESD. Thus, some countries are implementing ESD by experts and professional organizations, and hardly spreading ESD nationally.

China, Japan and the South Korea have enacted the national policies on ESD. However, other countries just carry out ESD practice by few experts and professional organizations. Therefore, it shows an unbalanced situation in implementing ESD among countries in Asian-Pacific region.

2.2 Some countries in Asia Pacific regions established organizations with certain authorities, but these organizations are under the leadership of few experts, and can not create influential effects. Besides, the ministry of environment, resources management departments, and communities also participate in ESD, but they seldom put ESD into formal educational system.

Some ESD implemented by communities, vocational educational institutes, and NGOs are for the adults. Without inviting educational experts, this kind of ESD can not provide the educational suggestions for routine teachings, and hardly be incorporated into the formal educational system. Thus, the correct ESD should center on students in primary, secondary and higher education, and should cultivate them with knowledge, capacity, value and lifestyle the sustainable development needs.

2.3 Few countries do not carry out ESD theoretical research, especially do not incorporate universal ideas in DESD into each country's practice. Thus, it's necessary to promote all countries to carry out local researches, and to give operational guidance to schools at all levels.

There's a misunderstanding on ESD. Many experts and officials even professional experts think that ESD equals to environment education and has no connect with routine teaching. Therefore, those experts and officials would not like to spend time on carrying out theoretical researches on ESD, and they do not want to direct young researchers and scholars to implement ESD.

Without systematic theoretical researches, some countries replace ESD with Education for International Understanding or Education for all simply and indiscriminately. Even on some international conferences, these countries make the national reports on Education for International Understanding or Education for All, rather than on ESD, which would not urge teachers and students to accept the idea of ESD, and can not incorporate ESD into formal educational systems in these countries. In order to achieve the high

quality educational results, it's necessary to carry professional researches on ESD in the process of implementing DESD.

2.4 A lot of countries in Asian-Pacific region enacted regulations and acts mainly on curricula reform and ignored to create integral and systematic ESD school-running mechanisms which include curricula constructions, teaching reforms, teachers' trainings and constructions of ESD schools.

Some countries in Asia-Pacific region issued the policies on ESD, but most of contents are about guiding principles, working deployments and requirements, and seldom about curricula construction, teaching reforms, trainings for teachers and school-constructions these integral and systematic guidance. These policies documents cannot direct teachers and principles to study, research and obtain the scientific connotations on ESD seriously, and cannot encourage them to promote practice on ESD consciously and persistently.

To achieve the expected results of DESD in 2014, it's urgent to change this situation. To create quality education though ESD can be fully achieved by reforming teaching, curricula and training in accordance with DESD.

2.5 Some countries fail to implement training for principles and teachers with plan and arrangement.

It's difficult for some countries to implement ESD training for principles and teachers when they fail to publish ESD theoretical teaching materials and fail to invite professional ESD experts as instructors.

2.6 It's usual to replace ESD with environment education in informal educational system.

In some countries, some organizations and agents implement environment education with this single theme, and fail to obey the recommendations by DESD to implement integral and systematic ESD with Four-Respect core ideas. Obviously, ESD can not equal to environment education merely.

2.7 Indicators and quality evaluation on ESD fall behind the practice.

A lot of countries in Asia and Pacific region do not make the quality criteria for evaluating ESD in formal and informal education, and they are waiting UNESCO to publish the evaluation criteria and assessment requirements. Without the criteria and requirements, the development of ESD in Asian-Pacific region would be effected. It's quite pity that some countries have been waiting for criteria and assessment requirements for one or two years.

2.8 Most countries failed to launch international exchanging and cooperative activities on ESD.

In recent decade, the Asia-Pacific Offices for UNESCO and the Beijing Office for UNESCO had organized ESD training workshops, seminars, and experience exchanging conferences for many times, which effectively promoted the international co-operations and exchanging activities among countries in this region. Under the guidance of the two offices, and under the leadership of the Chinese National Commission for UNESCO, CNWCESD had successfully upheld the biennial Beijing International Forum on ESD for four times since the year of 2003, which promoted the international cooperative and exchanging activities in Asian-Pacific region. However, the international co-operations and exchanges among countries in the region are not widely organized, which will restrict the further promotion of ESD in these countries.

### 3. Eight Suggestions on Further Promoting ESD in Global Society in Post UN-DESD

The DESD will be completed in the year of 2014. At that time, every country will make its own final national report on ESD. It's proved by the theories and practice in 10 countries in Asian-Pacific region that ESD is and will be an integral and systematic theory and teaching model with time spirit. The ending of DESD will not mean that the value and influence of ESD also will disappear. After 2014, a number of countries, experts, government officials, principles and teachers will continue to implement ESD. Besides, social, economic, environmental and cultural sustainable development in each country needs ESD much more persistently and deeply, because ESD can provide intellectual and human resources support for each country.

Facing these challenges and problems, it's extremely necessary for UN to organize ESD experts and educators to deploy the commissions and to make the researches after UN-DESD in the future four years. Also, it's the indispensable obligation for UN to further promote all government to take actions to implement ESD. In a conclusion, the suggestions are:

#### 3.1 To carry out overall theoretical research on ESD

The correct theoretical knowledge is the precondition to further and persistently implement ESD. ESD is an advanced educational theory with time spirit. Among the Education for all, Inclusive Education, ESD and Education for International Understanding advocated by UN, ESD is the only education concept relating to educational function, policies, educational goals, values, educational contents, teaching methods, educational resources' exploration and development, and stakeholders. Thus, ESD is an integral theoretical system and connotation system to educational reform and development in new century with the aims of promoting the economic, social, environmental and cultural sustainable development.

After years of consideration and practice, CNWCESD made the definition for ESD as follow: ESD is created in the process of sustainable development with the aim of cultivating the educatees with scientific knowledge, values, learning capacity and lifestyle in order to promote the social, economic, environmental and cultural sustainable development. To certain level, ESD is a refreshing element for the traditional educational theoretical system. The research on ESD theory would meet the needs of implementing DESD, and promoting the development and innovation of ESD in each country in the future. Therefore, Asian-Pacific countries should organize educational experts and officials to carry out ESD theoretical research much more comprehensively and deeply.

Given the real condition of Asian-Pacific countries, it's necessary to make the researches on the following aspects: the basic connotation of ESD, value education of ESD, ESD promotes the sustainable development of human society, sustainable teaching and learning, ESD and EFA, ESD and Inclusive Education, ESA and EIU.

#### 3.2 To setup the clear direction of promoting quality education though ESD

It's obvious that ESD is an important method to refresh and innovate the traditional educational theories. To carry out theoretical researches on ESD is to meet the need of further implementing DESD, and to promote all countries to create ESD theories and practice deeply and comprehensively in the future years. In some countries, to promote Quality Education though ESD is gradually regarded as an important content in the field of educational reforms and innovations. Based on this, it's necessary for all governments to organize ESD experts to set the clear direction for ESD, which will shift the core contents of ESD from thematic education, like environment protection, climate change education, to comprehensively Quality Education.

#### 3.3 To speed up the pace of establishing the national ESD organizations.

In Asian-Pacific region, there are three types of organizations established in countries. The first type is national commissions for UNESCO to implement ESD. The second is organizations established by diplomatic ministries. The third type is organizations which are established by the national commissions for UNESCO and ministries of education together. It's proved that the third type organizations are the best ones to carry out ESD practice in formal and informal education systems comprehensively.

Therefore, the suggestion is that it's urgent to promote countries to establish the third type national ESD organizations.

#### 3.4 To continue to carry out systematic and thematic trainings for principles and teachers.

ESD is a new education idea and teaching model, thus there're no existed theories and operational models in traditional training materials. In order to help teachers and principles to implement ESD, it's necessary to carry out systematic and thematic training for them.

According to the experience obtained by some countries, each country needs to organize the national training on ESD theory. The local educational ministries and research

institutes are necessary to implement thematic training and share successful experience. The models of training include national seminars, exhibiting teaching classes, local seminars and experience-sharing meetings.

Besides, owing to the unbalanced ESD situation, UNESCO offices in each country should organize trainings and exchanging among countries, especially cross-country training among different educators, like officials, researchers, ministers, principles, teachers and stakeholders.

3.5 To promote the reform on teaching models and to construct ESD model schools and districts.

The construction of ESD model schools and districts is beneficial for experts to spread the core connotations of ESD, implement the teaching models and achieve the successful experience. Nowadays, Japan, China and Indonesia have already established ESD model schools and districts. Thus, it's advisable for other countries to start to construct their own model schools and districts, which will speed up the development of ESD and spread ESD successful experience to boarder areas.

3.6 To enact the ESD criteria urgently and implement educational assessments regularly

The criteria are the necessary preconditions for monitoring and evaluating ESD situations in each country. It's urgent for countries in Asian-Pacific region to make ESD criteria. At the same time, each country should make national and local criteria for directing schools' work.

Therefore, the UNESCO offices in each country are necessary to organize ESD experts to cooperate with each other to make the monitoring and evaluation criteria.

3.7 To spread and public the ESD successful experience.

In recent year, there're more than 20 media to spread ESD successful experience in provinces, cities and countries. These media make millions of word reports to public the ESD experience, which effectively encourage the educators on ESD. The Chinese experience proved that it's important to spread ESD experience in time.

Therefore, each country should spread its own acquired successful experience in time, which will promote the development of ESD practice and extend its influence.

3.8 To carry out international co-operations and exchanges.

In recent 10 years, UNESCO offices in Bangkok, Beijing and Jakarta made great contributions to promote the international cooperation and exchanges among countries in Asian-Pacific region. What the UNESCO offices in Bangkok, Beijing and Jakarta have done receives highly complement. Countries in Asian-Pacific region can overcome their disadvantages and further perfect ESD though these international exchanges.

Therefore, UNESCO offices in Bangkok, Beijing and Jakarta are supposed to carry out much more international exchanges, and uplift the overall quality of ESD in whole Asian-Pacific region.

The Johannesburg Declaration on Education for Sustainable Development was just published in the year of 2002, and some impassioned, sonorous and powerful words in the declaration are still clear for the public. In the opening ceremony, children from all over the world with their simple and clear words informed us that the future belonged to them. These words inspired each of us to create a beautiful and harmonious world for them through our actions, and poverty, environmental degradation and unsustainable development would not occur in this world, and the dignity of human beings would be respected. "Children represent our common future. So we must have a strong sense of responsibility to create a new bright and promising world, which is the answer to our children".

All governments are supposed to shoulder important responsibilities, all politicians should take the historical missions and educators all around the world should taking actual actions to construct platform for ESD in order to help children acquire scientific knowledge, learning capacity, value and lifestyle the sustainable development needs.

Recalling the past decade, it's necessary to summarize and expand the effective and actual ESD actions by all regions and countries. Facing the actual situation and future challenges, it's urgent to reflect the ESD shortcomings and problems in order to setup the clear direction for ESD to fulfill the new missions and achieve the goals of DESD.

The children around the world, responsible educators for children's growth and future, parents, politicians and other stakeholders are all looking forward to the new international summit on sustainable development held in 2012 sincerely and ardently.

## China Youth Climate Action Network

Position Paper Draft of China Youth Climate Action Network Towards Rio+20

### Introduction

20 years after the Rio Earth Summit, we are still far away from achieving many goals and targets that have been set by world leaders. Rio+20 now is of vital importance to international development cooperation. We, the Chinese youth, recognize the two themes that will be focus of the conference are: (1) Green Economy in the Context of Sustainable Development, (2) Institutional Framework for Sustainable Development. At the same time, we would like to stress our unique position and standpoint. As China Youth, we represent the voice of China and developing countries – we demand all the stakeholders not to overlook the social pillar raised 20 years ago while pursuing the goal of green economy today. For developing countries, green economy can never be achieved before poverty eradication and sustainable development. On the other hand, as China Youth, we represent the voice of youth; it is we, the youth, who will lead the new era in effecting change, establishing economic structures and the preservation of our natural environment.

We, the Chinese youth, propose the following challenges

- Proposing new goals in green economy may undermine the initial goals in sustainable development
- Lacking incentives for public and private sectors to create green jobs
- Lacking competitiveness in green products and green technology among developing countries
- Emerging uncertainty in green jobs elasticity comparing to conventional jobs
- Entailing jobs in certain conventional sectors due to a transition and adjustment to newly-invested green jobs
- Remaining uncertain that green economy would provide enough jobs and incentive to take those jobs
- Failing in deeper environmental decision making when youth continuously participate in global environmental forum
- Lacking technological and financial cooperation within developing countries and between developed countries and developing countries
- Motivating international governments to comply to existed agreements and protocols
- Changing climate poses risks to marginal groups

We, as youth of a developing country, request the global public sector to

- Support scientific researches on sustainable agriculture. This can bring potential social impacts and green economy packages for different groups of countries.
- Promote freer trade, especially in environmentally friendly technologies or services that can benefit developing countries.
- Secure large-scale employment. Put in place social safety nets that support incomes. Limit the long-term negative impacts of unemployment through providing access to education and retraining of workers in developing countries.
- Emphasize private sector and regulatory mechanism. In addition to large corporations, private sector can contribute to green economy through environmentally conscious

investment as well.

- Increase transparency of information disclosure. Corporate Social Responsibility Report (CSR) discloses information of social/environmental impacts caused by investments. Transparency of CSR report remains to be improved.
- Provide financial support for marginal communities, whose basic rights and interests are likely to be affected by economic practices.
- Acknowledge youth's active role in strengthening civil society's participation of national and international decision-making.
- Provide platforms for youth to speak their voice from schools, local communities, and relevant governmental agencies to international conventions, (with special focus on bringing collective voice from youth of developing countries to global communities).
- Educate youth with green concept. The knowledge of green economy, social responsibility and creativity prepares future generation for the global challenge.
- Cooperate internationally of technology development. Sharing talent and technology among countries, and professional exchange is necessary.
- Undertake quantified emission reduction. Support developing countries in countering climate change by transferring to them funds, technologies and personnel with stability and continuity.
- Treat GHGs reduction not as means to confine the growth neither of developing countries, nor as disguises to trade protectionism, but as the common goal of the entire human race.
- Support further solidarity and cooperation within developing countries, including the emerging economies that contribute to a rapid augmentation of carbon but still have low per-capita emission, and the Small Islands countries and the Least Developed Countries (LDCs) that are most vulnerable to climate change despite their extremely minor GHG- accumulation responsibility.
- Encourage fast developing countries to take international responsibility, to devote to their national commitments and to take the leading positions in promoting renewable energy instead of simply waiting for financial or technological transfer, considering the challenges, even opportunities, ahead of green economy trend.
- Call for progressive co-striving for climate justice, which should be one of our priorities associated with the Millennium Development Goals (MDGs) that officially addresses poverty eradication and environmental protection, in the context of the rich-poor gap being widened in different parts of the world.
- Anticipate an amelioration of domestic policy-making in each developing country, including a better environment-related legislative system, an improved monitoring and feedback procedure, a harmonious balance between economic growth and societal progress, and a strengthened public participation.
- Initiate youth NGOs and young representatives among developing countries, educational agencies to gather together during COP negotiations and Rio+20 to launch the Basic Four Youth Press Conference in the standpoint of young generation of these four countries.
- Actively seek assistance from developed countries and cooperate with each other in sharing scientific knowledge, technological equipment and experienced personnel in order to improve the efficiency in GHGs emission reduction

We, as youth of a developing country, request the global private sector to

- Support green employment. This is another form of green investment where a long-term sustainable economic cycle is embedded
- Provide green job training. Advanced education should provide professional training including green technology development and green management
- Pay more attention to the promotion of adaptive capacity in sectors and groups that are more sensitive and more vulnerable to the risks posed by climate change than others, such as agriculture, fisheries and many other components that constitute the livelihood of rural populations

We, as youth of in a global community, request the global youth to

- Encouraging youth participation both in national public policy implementation and inspection at local communities and in issues that are underrepresented by government policies.
- Encourage youth's potential as effective agents to raise awareness and take actions towards eradicating poverty, promoting green technology transfer, innovating solutions to address environment, social, economic challenges.
- Involve youth in the design of and fund learning opportunities in national education system of environmental issues, in relationship to their economic, social, and political implications.
- Facilitate mutual learning of youth populations from different parts of the world, at local, national and international level by Internet and mass media.
- Increase youth responsibility not only as channels but also as missionaries between developing countries and developed countries in the process of technological, social, economical and environmental communication and negotiation.

---

## Chinese Civil Society Organizations

Collective Submission of Chinese CSOs on the Rio+20 Zero Draft

Part 1 Introduction: Context, Objective and Principles

We are a group of Chinese Civil Society Organizations and individuals working day to day on the ground in supporting and implementing sustainable development goals and measures in China, including in the areas of water, forestry, climate change mitigation and adaptation, agriculture, bio-diversity, pollution control, energy, public access and participation, consumption and life style, education, etc.

As the fast-growing civil society from a developing country who benefits from the fast growing economy while facing numerous challenges across the three pillars of sustainable development at home and internationally and as part of global citizenry, we have gathered together to join national, regional and global communities on active, meaningful and effective engagement with the Rio+20, contributing to its success and the delivery processes of its promises from and beyond 2012.

This document is the result of an intensive and collective thinking and writing process, based on learning, discussion and research activities among the Chinese CSOs, with exchange with other CSOs as well as key stakeholders among our society and international community, including CSOs' Bangkok Statement, the 64th UN DPI/NGO Conference (Bonn) Asia Pacific Regional Group Position, Joint Statement of Major Group and Stakeholders Asia Pacific Meeting in Seoul.

Rio+20 provides a critical and timely platform for governments at the highest level, in the eyes of all stakeholders, especially youth whose future is in our hand, to review the past 20 years and pave the way for the coming 20 years and beyond regarding the crucial sustainable development for all countries and peoples.

Since 1992, when the recognition of sustainable development was historically adopted by the world's leaders, and policy and action plans as well as international partnership were bought into national and international agenda, some sustainable development strategies, institutions, measures and programs have taken place in countries (including China), and the world. However, the commitment to a paradigm shift towards sustainable development remains elusive and unsatisfying to a large extent, with the ecological crisis worsened, income and social inequalities escalated and multiple crises hitting us more often and severely including food, finance, energy and climate crises among others.

Thus, we strongly recall the three fold objectives of the Conference: to secure renewed political commitment for sustainable development, assess the progress to date and

the remaining gaps, and address new and emerging challenges. The conference should fully honour such objectives by focused discussion and politically binding outcome document that recommit governments to achieve sustainable development supported by strong political will in a fully inclusive manner, to ensure the transformation of the economic, social and ecological/environmental dimensions and their effective integration at local, national, regional and international levels.

The agreed principles of Rio 1992 should accordingly be strongly reaffirmed and implemented at all levels, in particular common but differentiated responsibilities among countries and within national jurisdiction, the precautionary principle, the polluter pays principle and Principle 10 on Access to Information, Public Participation and Environmental Justice.

Global goals including alleviating and eventually eradicating poverty, reorienting the world' economic system towards a low-carbon, sustainable, and just approach, and securing environmental integrity shall be emphasized.
