In Europe, half a million people still die prematurely each year because of air pollution, despite many regulatory measures in place to lower pollution levels. Globally, WHO estimates that more than 2 million premature deaths each year can be attributed to the effects of urban outdoor air pollution and indoor air pollution. More than half of this disease burden is borne by the populations of developing countries ([http://www.who.int/topics/environmental\\_health/en/](http://www.who.int/topics/environmental_health/en/)).

There is an urgent need to integrate the activities on tackling and preventing chronic diseases into the Rio+20 process.

Adding co-benefits: Huge health benefits of sustainable development and greening the economy

Making health central to Rio+20 would also serve as a major driver for a renewed and stronger commitment for sustainable development measures, through highlighting the huge health benefits that could be gained from taking ambitious action now. Primary prevention through strong environmental policies and enforcement has shown to be not only cost effective but also provide significant gains in providing a healthier environment for all. Reducing our consumption and moving to a low-carbon economy will also create health gains in many cases.

Regarding climate change, the work of WHO and many others have shown the health co-benefits of stronger climate change mitigation action and the move to a low-carbon economy.

For Europe, HEAL and HCWH Europe recently published figures that showed that the EU would gain up to 30.5 billion EUR by moving to a more ambitious GHG reduction goal of 30% (<http://www.env-health.org/spip.php?rubrique97>). This would be as a result of cleaner air, but additional health benefits would be gained from encouraging more walking and cycling and also less meat consumption.

As the leading medical journal Lancet has shown, huge health benefits would also be reaped at a global level. For example, through a programme to introduce 150 million low-emission cookstoves in India the national burden of disease of respiratory and other diseases would be lowered by about a sixth (<http://download.thelancet.com/flatcontentassets/series/health-and-climate-change.pdf>).

Renewed international commitment to reducing the public's exposure to harmful chemicals

From an environmental health perspective, another central issue is to increase international efforts to reduce people's exposure to harmful chemicals. We very much welcome the proposal to strengthen the international framework for chemicals management and make it legally binding. Such a framework should also clearly establish concrete actions to meet the 2020 deadline for producing and using chemicals in such a way that they do not lead to harmful effects on health and the environment.

Support for specialised UN agency for the environment

HEAL supports discussions to strengthen environmental governance through the creation of a specialized UN agency for the environment on equal footing with other specialized UN agencies. This is necessary to fundamentally improve governance, accountability and liability.

HEAL believes that a key criteria for the success of the UN conference will be to make the health dimension central to the process, and consequently involve all actors - UN member states, different intergovernmental organisations and UN bodies, and stakeholders in the process. Given the increasing toll on people's health of unsustainable development, special efforts should be given to increasing the participation of the health sector in this new RIO+20 agenda, as well as increasing the public health framing around discussions.

We hope to continue to contribute to these discussions in the coming months, bringing together various expertise and perspectives from our broad based environment and health alliance.

Best regards,

Genon K. Jensen

Executive Director, Health and Environment Alliance (HEAL)

The Health and Environment Alliance (HEAL) is the leading European not-for-profit organisation addressing how the environment affects health in the European Union. We demonstrate how policy changes can help protect health and enhance people's quality of life. HEAL has over 70 member organisations, representing health professionals, patients, citizens, women, youth and environmental experts, help to bring independent expertise and evidence from the health community to different decision-making processes. Members include international and Europe-wide organisations, as well as national and local groups. [www.env-health.org](http://www.env-health.org)

---

## Heinrich Boell Foundation and the Ford Foundation

Submission to the 2012 Earth Summit Outcome Document 'Zero Draft' Joint Submission: Heinrich Boell Foundation, Ford Foundation

Recommendation regarding policy coherence among governance institutions: To direct the United Nations system – particularly the UN Environment Program, the UN Development Program, the UNFCCC and UN WOMEN -- to work with other global governance bodies – specifically the Group of 20 – to promote an agenda that integrates the three indispensable elements of sustainable development relating to the natural environment, the economy, and poverty reduction.

The G20 describes itself as the world's “premier forum for our international economic development,” yet its growth frameworks lack an integration of these elements. This has significant implications because the G20 stipulates that its growth frameworks should be implemented and financed by the United Nations and international trade, finance and development institutions.

---The G20's “Seoul Development Consensus” (November 2010) and its growth framework, the “Development Action Plan” (DAP) would promote public-private partnerships in infrastructure and agriculture, but without core concerns for the environmental, poverty or equity dimension of this approach.

---In the context of its “Strong, Sustainable and Balanced Growth Framework,” the G20 reversed course – from a coordinated global stimulus in 2008-2009 to a synchronized fiscal consolidation in the advanced countries in 2010-2011. The G20 has been unable to find a less drastic, middle ground that would create desperately needed job and

social protection programs in fiscally responsible ways. Nor has it moved ahead on its pledges to remove fossil fuel subsidies.

If its orientation and growth frameworks are not revamped, the G20 could work at cross-purposes with the 2012 Earth Summit by increasing, rather than help close, the wide gap between the aspirations and commitments to sustainable development and the implementation performance of nations and institutions.

However, such re-orientation can only occur if the G20 becomes an open, transparent and accountable body. At present, in contravention of Rio Principles (e.g., Principle 10 on Public Participation; Principle 20 on the role of women in sustainable development), the G20 operates behind closed doors, excluding 173 UN member countries and civil society.

The 2012 G20 Summit in Mexico will occur in the same month as the Earth Summit 2012. The lack of integration between these two global processes is highly problematic for crafting coordinated responses to the urgent development challenges we face at this time.

In order to integrate the three indispensable elements of sustainable development relating to the natural environment, the economy, and poverty reduction in the G20 agenda, we recommend that the UN work with the G20 to achieve the following outcomes:

#### G20 Accountability and Transparency

- G20 as an advisory body on development. Rather than issuing policy mandates and research work for international trade, finance and development institutions, as is its practice currently, the G20 should issue recommendations for consideration by the governance bodies of these institutions.
- Participation and Consultation. The G20 excludes 173 UN member countries. Therefore, it should:
  - a) establish consultative mechanisms to enhance its accountability to the United Nations;
  - b) appoint the UN Secretary-General as a full member (rather than observer) of the G20;
  - c) allow for rotating participation of country representatives from Africa, LDCs and SIDS as participants in G20 fora and summits, and allow for the participation of several more countries from these groups as observers;
  - d) create mechanisms that enable it to relate to civil society in ways that are analogous to the G20's outreach mechanisms for consulting with transnational corporations;
  - e) engage the UN in all aspects, or "pillars," of its agenda.
- Transparency. With regard to Summits, Ministerials, working and expert groups, the G20 should disclose the meeting members, their agendas, papers commissioned, and minutes of meetings in a timely and proactive manner, including on publicly accessible websites.
- Principle 10 of the Rio Declaration. This Principle, signed at the first Earth Summit in 1992, asserts that access to information, public participation and access to justice (referred to as "environmental access rights") are critical for sustainable development. The G20 must recognize the access rights of information and the right to consultation regarding development decisions. This should be reflected in the G20's processes and in both of its growth frameworks.
- Principle 20 of the Rio Declaration. The G20 has not evinced a particular concern for equality and human rights. It should acknowledge that the full and effective participation of women, indigenous peoples and marginalized groups in all aspects of sustainable development is essential for inclusive economic growth and for broad political empowerment.

Role of the G20, particularly in development finance. The United Nations should ensure that:

- To the extent that new sources of finance are generated at the international level, their disposition should be determined by development finance institutions, and their shareholders in line with country-led and designed programs and priorities developed in a fully participatory process involving all relevant stakeholders, particularly citizens groups. Analogously, at the local and national level, the disposition of resources should also be determined by elected bodies with the participation and involvement of all relevant stakeholders, particularly citizens groups, wherever pluralistic and open processes exist. Process implicates product: the closed nature of the G20 has circumvented any consideration of sustainable development in its Development Action Plan.
- The G20 should support a significant expansion of public finance to support sustainable development, including climate finance, as called for in the United Nations Framework Convention on Climate Change and the UNFCCC Cancun Agreement. The United Nations and its UNFCCC should work with other institutions, including the G20, to identify particularly innovative public sources of finance for mitigation and adaptation purposes and to design transparent, participatory and accountable mechanisms through which to deliver the financing in ways that further environmental, social and gender co-benefits and respect and uphold environmental, social, and gender safeguards.

Retooling the G20 Development Action Plan to Focus on Sustainable Development. The United Nations should work with the G20 and its member states to ensure that:

- Infrastructure.
    - a) infrastructure and industrial priorities dovetail in ways that promote sustainable development;
    - b) trade agreements do not handicap the role of the state in national and regional development;
    - c) means by which risk is allocated between public and private sectors are set forth in Public-Private Partnership (PPP) contracts which are disclosed to the public and which honor public obligations under existing international human and environmental rights conventions. These contracts should support sustainable management of natural resources and serve community interests over the course of generations;
    - d) low-income consumers receive protections against price increases arising from the removal of subsidies for fossil fuels, or end-products such as food that depend upon such fuels.
  - Access to electricity.
- To help meet the Millennium Development Goals and end energy poverty by 2030, the UN and the G20 should work with African partners to facilitate investments in energy technologies that prioritize energy access for the poor by focusing on affordable and reliable electricity (with a particular focus on off-grid solutions) and cooking energy.
- Agriculture.
    - a) small-scale, agro-ecological forms of food production are expanded;

- b) recognizing the role that women in many developing countries play in securing local food production, while regulating and supporting the transformation of industrial and other forms of unsustainable agriculture;
- c) land tenure laws and economic incentives for production should support the roles of women and men equally, and give preference to the role of smallholders;
- d) mandates and subsidies for industrial biofuels production should be withdrawn.

· Expansion of Social Protection Models.

- a) governments maintain a strong role in the provision of such services;
  - b) social protection “floors” not be considered “ceilings”;
  - c) models aim for universal rather than piecemeal coverage of needs;
  - d) models of social protection be designed in a participatory way by the countries and beneficiaries for whom they are intended, taking into account the particular role women play currently in the delivery of unpaid social services;
  - e) models should rely on existing standard-setting institutions for social protection, such as those of the International Labor Organization (ILO), rather than dilute the authority and mandate of such institutions.
- National and local community initiatives.

In retooling the DAP, with the support of UNEP, UNDP, and other UN agencies concerned with sustainable and equitable development, the G20 should emphasize the creation of national and local ownership of sustainable development plans, including national and local climate-change mitigation and adaptation plans.

‘Hard’ and ‘Soft’ Commitments to a Sustainable World. At the 1992 Earth Summit, three global conventions were launched (relating to climate, biodiversity, and forests) to set forth binding commitments by nation-states to sustainable development goals.

Currently, many nations want to reject such ‘hard’ commitments. As an example, in 2010, in negotiating the Copenhagen Accord, nations replaced binding emission reduction requirements with a “pledge and review” process. ‘Soft’ legal norms in the fields of environment and human rights are creating a worrying lack of true accountability. In setting out his hopes for the 2012 Earth Summit, the UN Secretary-General stated,

There is a need to reinforce the institutions and processes involved in delivering on normative commitments made at the global level. Presently, there is an apparent disconnect between the bodies making normative decisions and the bodies responsible for implementation...

The United Nations should participate in all “pledge and review” standard-setting processes of the G20 (e.g., responsible investment in value chains; environmental and social safeguards applying to infrastructure; responsible investment in agriculture) and ensure full civil society participation, particularly the involvement of affected communities, women and vulnerable groups, as well.

Relying on an approach that respects the ‘common but differentiated responsibilities’ of nations, civil society must work with global, regional, and national governance bodies to not only pressing for ‘hard’ commitments, but also create “Measure, Report, and Verify” (MRV) systems. These system would allow citizens to hold states and firms accountable for delivering emissions reductions, providing adequate aid for adaptation to climate change – as well as for protecting community and individual rights to assets, including water, food and land. These ‘MRV’ systems should be backed by strong independent grievance mechanisms and other adjudicatory processes with enforcement teeth that ensure that there are consequences for violations.

While also working to strengthen legal frameworks for securing private and public-sector obligations, the UN and the G20 should: a) prepare an inventory of voluntary normative systems and b) launch a joint work plan (among the UN, the MDBs, civil society and the private sector) to assess the strengths and weaknesses of such systems in terms of conducting social, gender and environmental due diligence; guiding and disciplining the conduct of public and private actors; and ensuring access to justice by affected peoples. The work plan should seek full implementation of Rio Principles 10 and 20. Both the inventory and the work plan should be announced in the Earth Summit 2012 Outcome Document and the 2012 G20 Summit Communiqué.

## HELIO International

[\[In English\]](#)

### Résumé

Les politiques énergétiques actuelles des pays industrialisés sont essentiellement déterminées par la nécessité de réduire les émissions de gaz à effet de serre. Toutefois, les mesures adoptées dans le cadre du Protocole de Kyoto en vue de modérer les effets de la production d'énergie sur le climat n'ont pas réussi à prendre en compte les conséquences pleines et entières d'une variabilité climatique de plus en plus importante : mentionnons notamment les inondations, les sécheresses saisonnières, la multiplication des tempêtes, les glissements de terrain, les vents de vitesses extrêmes, les conditions glaciaires et les vagues de chaleur. Il est donc nécessaire et urgent de mettre en oeuvre des efforts d'adaptation, et ce, non seulement dans des régions géographiquement déjà vulnérables comme le Bangladesh, l'Afrique centrale ou les îles basses comme Tuvalu, mais également, compte tenu de la nature planétaire du changement climatique, partout dans le monde.

En comparaison avec les mesures d'atténuation, il n'existe pas aujourd'hui de paramètres et d'indicateurs communément acceptés permettant de comparer les besoins d'adaptation et l'efficacité des mesures d'adaptation. Compte tenu de l'importance de l'énergie pour l'économie et les efforts de développement de tous les pays, il est vital de parvenir à réduire de façon substantielle les vulnérabilités du secteur énergétique lui-même. Les mesures d'adaptation suggérées doivent également favoriser les objectifs de l'écodéveloppement si l'on souhaite pouvoir les réaliser conjointement avec les Objectifs de développement du millénaire (ODM), c'est pourquoi il convient d'élaborer et de tester des critères et des indicateurs pour les systèmes énergétiques—c'est-à-dire d'utiliser une métrique—en vue d'évaluer l'adéquation des mesures proposées.

### Le changement climatique et les systèmes énergétiques

Le changement climatique est en cours, quels que soient les efforts de réduction des émissions que consentiront les États à l'avenir. Il est le résultat de nombreux facteurs convergents qui interagissent de différentes façons, créant ainsi pour l'humanité un nouveau défi sans précédent en termes de complexité et de gravité. Dans ce contexte, le concept d'approche « anti-risque climatique » doit évoluer d'une démarche de protection des activités humaines des conditions climatiques extrêmes, vers une démarche de réduction de l'exposition aux incidences du changement climatique. Il faudra donc s'adapter à ce changement, notamment aux modifications du régime des pluies et aux épisodes météorologiques extrêmes. Compte tenu de l'importance de l'énergie dans l'économie et dans la poursuite de l'écodéveloppement<sup>1</sup>, il est vital de réduire les

vulnérabilités du secteur énergétique. Les systèmes énergétiques se doivent d'être adaptés pour résister au changement climatique attendu et à ses effets. Cet objectif peut être atteint en augmentant la résilience d'un système énergétique, par exemple en renforçant la robustesse de ses équipements techniques, en diversifiant ses sources d'approvisionnement en énergie, en localisant de façon plus appropriée ses équipements énergétiques, en développant ses relations avec d'autres régions, en planifiant la préparation aux catastrophes, en gérant la demande et en investissant dans l'évolution technologique—énergies renouvelables, amélioration du rendement énergétique, gestion énergétique—en vue de développer plus avant le portefeuille des options disponibles.

Étant donné la faible rotation du capital dans le secteur de l'énergie et la durée de vie importante des équipements, il est fondamental que les fournisseurs d'énergie, les décideurs et les citoyens soient bien informés des incidences possibles du changement climatique sur le secteur de l'énergie afin que les mesures d'atténuation et d'adaptation requises puissent être prises en temps voulu.

Malheureusement, lors des discussions au niveau national sur l'avenir énergétique, le sujet est traditionnellement abordé essentiellement sous l'angle de la sécurité d'approvisionnement énergétique en termes de quantité et des moyens de l'améliorer. Les politiques formulées autour du contexte plus large de la réduction de la vulnérabilité des systèmes énergétiques au moyen de stratégies d'écodéveloppement intégrées, c'est-à-dire traitant simultanément des problèmes environnementaux, sociaux, économiques, techniques et civiques, sont plus sophistiquées et encore peu nombreuses.

#### Évaluer la vulnérabilité et la résilience des systèmes énergétiques

En vue de mieux appréhender le meilleur moyen de susciter et de pérenniser des synergies positives, HELIO a développé une méthodologie simple et transparente ainsi qu'un ensemble d'indicateurs visant à évaluer la vulnérabilité et la résilience des systèmes énergétiques nationaux au changement climatique. En appliquant les indicateurs aux systèmes énergétiques, HELIO cherche à favoriser l'identification de politiques et de mesures (P&M) les mieux à même de faciliter et de soutenir les activités d'adaptation.

Les indicateurs Vulnérabilité – Adaptation – Résilience Énergétique (VAR) mesurent:

1. La vulnérabilité des systèmes énergétiques ;
2. L'efficacité des efforts d'adaptation dans le secteur énergétique.

Ces indicateurs ont été mis au point en cohérence avec le principe selon lequel la métrique sous-jacente, c'est-à-dire la mesure ou la statistique effectivement utilisée, devait en général être disponible pour la majorité, si ce n'est pour l'ensemble, des pays. Si des calculs sont nécessaires pour obtenir un indicateur, il convient qu'ils soient aussi simples que possible.

#### Impacts sur les systèmes énergétiques induits par le climat et vulnérabilités associées

Le changement climatique est susceptible d'avoir des impacts diversifiés. La moyenne des différents paramètres climatiques ainsi que la fréquence des événements météorologiques extrêmes sont par exemple susceptibles d'évoluer. De plus, ces impacts peuvent s'appliquer à d'autres paramètres climatiques comme les précipitations, la vitesse du vent et l'ensoleillement.

Les effets peuvent être directs ou indirects, ces derniers étant fréquemment plus marqués. Un accroissement des températures a, par exemple, peu de chances de détruire une infrastructure énergétique. Par contre, la fonte des glaciers entraînée par la croissance des températures peut avoir des répercussions dramatiques sur les systèmes de production hydroélectrique en termes de dommages aux infrastructures, sous la forme d'inondations et d'envasement, de glissements de terrain, et donc sur les capacités de production.

Les modifications des variables météorologiques auront un impact sur la transmission et l'utilisation de l'énergie, indépendamment de la façon dont elle est produite. Des événements extrêmes pourraient accroître le risque de destruction des lignes de transmission et, en conséquence, réduire la demande en raison de l'élimination physique des entités consommatrices, c'est-à-dire les industries, les entreprises et les ménages.

#### Vulnérabilité au niveau des pays

Lors des discussions au niveau national sur l'avenir énergétique, le sujet est traditionnellement abordé essentiellement sous l'angle de la sécurité d'approvisionnement énergétique et des moyens de l'améliorer. Les politiques formulées autour du contexte plus large de la réduction de la vulnérabilité des systèmes énergétiques au moyen de stratégies d'écodéveloppement intégrées, c'est-à-dire traitant simultanément des problèmes environnementaux, sociaux, économiques, techniques et civiques, sont assez peu nombreuses.

Si l'on souhaite que les politiques et les mesures proposées soient efficaces, il est indispensable de quantifier l'état de vulnérabilité globale du pays, c'est pourquoi le premier ensemble d'indicateurs HELIO mesure la vulnérabilité globale d'un pays.

#### Vulnérabilités des systèmes énergétiques

Le changement climatique aura des impacts directs sur la demande comme sur l'offre énergétiques. La façon dont cette dernière sera touchée est toutefois moins évidente. En vu du rôle central que joue l'énergie il est crucial d'être en mesure d'évaluer les vulnérabilités principales de chacun des systèmes énergétiques. Une fois les vulnérabilités identifiées, il devient possible de concevoir et de mettre en oeuvre des mesures d'adaptation appropriées. Ce processus doit être appliqué aux infrastructures existantes et à leurs évolutions prévues.

Indicateurs de capacités d'adaptation mesurant les interventions ayant permis d'accroître la résilience.

Le niveau de résilience d'un système s'appuie sur ses capacités d'adaptation. Les mesures d'adaptation peuvent être réparties entre mesures techniques, concernant les infrastructures, et réponses sociales en termes de comportements.

- Les adaptations techniques s'efforcent de rendre les infrastructures invulnérables aux évolutions à long terme des variables météorologiques et aux événements extrêmes.
- Les adaptations comportementales visent à adapter le mode d'exploitation des infrastructures, qu'elles soient nouvelles ou anciennes, et l'emplacement des nouvelles infrastructures, en vue de minimiser les dommages potentiels. Dans le contexte des pays en développement, ces capacités ont besoin d'un soutien externe, par exemple en provenance des mécanismes financiers existant dans le cadre du régime des politiques internationales sur le changement climatique. En vue d'éviter de dépenser des fonds, déjà peu nombreux, de façon inefficace, un ensemble de critères ont été développés pour mesurer l'efficacité des efforts d'adaptation.

#### Recommandations et conclusions

Même si la première application des indicateurs VAR est loin d'être parfaite, une première application en d'Afrique subsaharienne<sup>2</sup> a permis de produire un certain nombre d'informations capitales. Le processus d'évaluation a généré un certain nombre de recommandations :

- Évaluation et suivi systématiques des systèmes énergétiques en vue de garantir qu'ils sont suffisamment robustes et évolutifs pour s'adapter aux incidences climatiques attendues.
- Introduction de nouveaux critères d'évaluation des systèmes énergétiques.
- Élaboration d'une stratégie de moyen à long terme en vue d'assurer un système d'offre énergétique plus sûr, décentralisé et à faibles émissions de carbone.
- Utilisation de la gestion de la demande énergétique comme une mesure d'adaptation.
- Développement des capacités locales à évaluer et à répondre aux besoins énergétiques dans une perspective climatique.
- Mise en place de procédures de transfert technologique et de financement transparentes.
- Développement d'une gouvernance énergétique participative en vue d'obtenir des informations de première main concernant les besoins énergétiques réels et afin de mobiliser le soutien nécessaire de la part des bénéficiaires.

Le niveau de résilience d'un système dépend de la robustesse de son emplacement. Il n'est donc pas suffisant de simplement évaluer l'impact d'une installation sur l'environnement ; il convient également de déterminer les répercussions de l'évolution de l'environnement sur l'installation (Paskal 2009). Par ailleurs, un secteur énergétique résilient constitue le fondement d'une meilleure résilience de la collectivité. L'énergie permet la fourniture de services essentiels comme l'alimentation, la santé et l'éducation. Grâce à son utilisation dans le commerce et les entreprises, elle favorise également la création d'emplois et l'amélioration du niveau de vie des populations. C'est pourquoi, pour évaluer correctement la meilleure façon d'accroître la résilience d'un système énergétique, il convient de l'étudier dans le contexte plus large de l'écodéveloppement.

---

## Hong Kong Automobile Association (HKAA)

Road Safety Issue to be discussed in the Rio+20 U.N. Conference on Sustainable Development

An analysis of Hong Kong's traffic accident statistics for 2010 reveals 14,943 traffic accidents involved injuries and 19,124 resulted in casualties. On average, 41 traffic accidents with injuries occurred every day during the year and that about two persons were killed every week. Compared to the previous year, the number of accidents and the number of casualties increased by 4.38% and 5.44% respectively.

Clearly, pedestrians consistently suffer the highest number of fatalities while private cars are the largest group involved in accidents. Of the 22,602 vehicles involved in traffic accidents in 2010, private cars accounted for 6,255, compared with 4,053 taxis, 2,726 light goods vehicles, 2,442 public buses, 2,428 motorcycles, 2,027 bicycles and 2,671 other vehicle types.

With the joint effort of various stakeholders, road traffic fatalities are declining. In 2010, with a population of about 7 million, Hong Kong's traffic fatalities dropped to 117, the lowest on record since 1955. Yet we should not be complacent and must continue to collaborate with the community to promote road safety.

It is encouraging that the number of traffic accidents involving drink driving has continued to drop. In 2010, a total of 214 drivers were arrested in traffic accidents involving drink driving. This represents a significant drop of 69% when compared with 701 drivers in 2008, before random breath testing was introduced. These promising figures evidence the effectiveness of strict traffic enforcement as well as high profile publicity and education campaigns in promoting road safety in Hong Kong. The launch of HKAA's Chauffeur-Drive-Home Service since February 2009 has also been a helpful concrete campaign in this area.

Over the years, the Hong Kong Automobile Association (HKAA), has been providing valuable commentary to help both the Road Safety Council and the Government in developing new legislation, improving road quality, devising new road safety measures and handling various other aspects related to the general protection of road users. The Association is represented in the Council, the Road Safety Research Committee, the Road Safety Campaign Committee and the Speed Limit Review Working Group with contribution of road safety expertise from time to time to the authority.

The Association continues today its heritage of almost a century of promoting road safety and more efficient traffic management in Hong Kong. It also promotes safe and legal motor sports as a member of the Fédération Internationale de l'Automobile (FIA, or the 'International Automobile Federation').

In conclusion, improving road safety can help to achieve environmental objectives, including action on climate change, particularly through providing a safer road system for users of non-motorised transport, such as pedestrians and cyclists, the most vulnerable road users. Providing safe facilities for non-motorised transport, and encouraging affordable and safe public transport, can reduce demand for modal shift to the car. According to the UN Environment Programme, such policies can make 'a large, lasting impact...on fuel use, congestion, air quality and CO2 emissions... It is also one of the most cost-effective actions for saving hundreds of thousands of lives'; The priorities agreed at Rio+20 will set the global agenda. It is vital that action to improve road safety and promote sustainable transport is included in the agenda and outcomes of the Rio+20 Conference. The lives and health of millions of people is at stake.

## Human Impacts Institute

November 1, 2011

Re: Input for Compilation Document for Rio+20 Zero Draft .

To the Secretariat of the UN Conference on Sustainable Development:

We call for Rio+20 to be unprecedented in terms of participation, cooperation, and leadership. Leadership must include representatives of government, business, and civil society. Participants must be included from across the globe and from all walks of life. The Rio+20 process must encourage communication and cooperation within these groups. Any renewal of political commitment to sustainable development cannot take place but within such a conference. Further, such principles will enhance progress in the institutional framework for sustainable development.

We ask that the conference implement new web-based and social media facilities, which carry the potential to reinvigorate the UN and its work in the eyes of a new and crucial generation of global citizens. The conference must result in a document simplified in its language, and incorporate processes that are transparent and accessible.

We demand that Rio+20 abide by its stated objectives, and thus result in new and ambitious agreements, goals, and pathways toward realizing them. The conference must honestly review and respond to the successes and failures of the current paradigm of global sustainable development work.

We request that conference outcomes also address the full scope of sustainable development, including its ecological, social, and cultural aspects, finance, the law, science and technology, economics, and natural resources. It can only be within such a comprehensive view that our goals can be achieved.

We recognize that the green economy can be a means to achieving sustainability, progress, and environmental, economic, social well-being. Any development of such an economy must, however, keep those ends in mind, and not replace them with growth or development for its own sake.

We suggest the development of global, open-source, accessible registry of sustainable actions. With such a tool, businesses, individuals, communities, and governments around the world can learn from each other and from the past, examine obstacles, and craft solutions to the pressing challenges of developing a sustainable human civilization.

Rio+20 can refresh our outlook and our energy for working toward a sustainable global future, and rise to face the critical challenges of our time. We hope it realizes this potential, as it surely will by meeting these above expectations.

Signed,

MobilizeUS!

The Human Impacts Institute

## Human Rights Clinic

The Foreclosure Crisis in the United States Poses a Threat to Sustainable Development and Poverty Eradication

### I. Introduction

The foreclosure crisis in the United States is currently posing a serious threat to sustainable development and poverty eradication. Homes are being abandoned more and more by owners in foreclosure and they are left to fall apart. Similarly, tenants who live in foreclosed properties are left living in homes that are dilapidated, unhealthy, and unsafe because landlords are neglecting their duties during the foreclosure process. As a result, human rights violations are occurring in neighborhoods all across the United States. The Human Rights Clinic at the University of Miami School of Law is currently working to bring attention to these violations of human rights. The UN Conference on Sustainable Development is an important opportunity to bring these issues into the international spotlight. We formally submit this document for input in the compilation document for the Rio+20 UN Conference on Sustainable Development.

### II. Statement of Interest

The Human Rights Clinic at the University of Miami School of Law exposes students to the practice of law in the transnational and cross-cultural context of human rights litigation and advocacy at the local, national, and international levels. In the classroom, students critically engage with human rights law and contemporary social problems while honing their lawyering and advocacy skills. To bridge theory and practice, students also gain hands-on experience working directly with practitioners and affected individuals on active human rights cases and projects. The Clinic pursues litigation, legislative advocacy, community organizing, documentation, public policy analysis, media advocacy, and public education. The Clinic seeks to affect change and promote social and economic justice both locally and globally by relying upon the core principles articulated in human rights treaties, consensus documents, and related instruments.

### III. The Foreclosure Crisis in the United States and "Project No One Leaves - Miami"

As part of an effort to address human rights violations in the United States, the University of Miami School of Law's Human Rights Clinic partners with the University of Miami School of Law's Community Lawyering Clinic and Florida Legal Services to address the foreclosure crisis locally. Project No One Leaves - Miami (PNOL) focuses on the plight of tenants of properties in foreclosure. Tenants who rent these properties do not know what rights they have as a tenant. They often receive notices about the foreclosure, are named as parties in the foreclosure, or hear about the landlord's financial troubles from other tenants. As a result, many of them are scared and leave the property because they believe they have no other choice. Others take cash from their new landlords in exchange for their keys, even if it is not beneficial for them, because they think it's their only chance at compensation.

Tenants who chose to stay in homes going through the foreclosure process are often at an even greater disadvantage. The landlord who is in foreclosure, especially those who own multi-family units, often disappears and neglects their lawful duty as a landlord. The landlord no longer pays bills or makes needed repairs or renovations, leaving the tenants in bad conditions that continue to worsen. For example, some landlords of multi-family units have buildings that run on a single-read meter for utilities such as water. The landlord neglects to pay their water bills leaving the tenants without access to water, a basic necessity for living. Limited access to running water is just one example of the egregious human rights violations that tenants of foreclosed properties must endure.

While working in the community on the issue of the foreclosure crisis, we met a group of three male Nicaraguan migrant workers who had been living together as tenants in a duplex in Miami, Florida. The property had been in foreclosure for several months. Despite the fact that these tenants continued to pay rent, the landlord had turned off the water and electricity since the foreclosure process began. The property had fallen into disrepair resulting in dangerous cracks in the ceiling, non-working doors, and pest infestations. This is just one of the many examples that we have come across while doing fieldwork.

On May 20, 2009, the US Congress passed the Protecting Tenants of Foreclosure Act (PTFA) in order to address some of the issues faced by tenants whose landlords are facing foreclosure. The PTFA gives tenants some protections, but many are unaware that these protections exist. In part, the Community Lawyering Clinic and Florida Legal Services aim to address this problem through door-to-door canvassing and community meetings where tenants learn about their rights.

The large number of foreclosures throughout the United States has a profound effect on the human rights of tenants and the sustainability and development of their communities. As of September 2011, one in every 605 housing units in the US received a foreclosure filing. In addition, fifty-one percent of the foreclosure filings in 2008 were in the states of California, Arizona, Nevada and Florida. According to a report by the Alameda County Public Health Department that services Oakland, California, "foreclosures create devastating health impacts--not only for those individuals and families undergoing the process, but also whole communities that are reeling from its ripple effects and aftershocks."

The situation is no better in the state of Florida where one in every 368 housing units received a foreclosure filing in September 2011. In Miami-Dade County, where our clinics have done fieldwork, one in every 286 housing units received a foreclosure filing in September 2011. Of the 191 units visited, between forty-three and seventy were vacant. There were also numerous other houses that were clearly not occupied. The abandoned homes were often in complete and utter disrepair. Some conditions we observed were: broken or boarded-up windows, lawns overgrown and littered with garbage, and dilapidated walls. Many of the buildings were falling apart and smelled of rot.

These conditions were not limited to the vacant houses. We visited some houses that were occupied by tenants whose landlords had stopped maintaining the property and/or paying the utility bills. This results in tenants living in deplorable conditions that include structural issues (i.e. ceiling, floor, or wall disrepair). For example, one family we met lived with roaches, broken air conditioning, a broken stove, and several plumbing problems. The landlord allowed the sewage to drain onto their yard and placed a lock on their water hose, which restricted their ability to wash anything, including their garbage cans.

Again, these conditions are not atypical. These are the sort of human rights violations that are occurring nationwide across the United States. In Oakland, California one tenant and her seven children "experienced water shut-offs, mold and persistent vector issues." The Alameda County Public Health Department found that twenty-nine percent of the tenants in Oakland are experiencing utility shut-offs or threats of utility shut-offs and thirty-one percent are living in unhealthy living conditions (such as mold and pests).

#### IV. "Project No One Leaves - Miami" and Rio + 20

The 1992 Rio Declaration on Environment and Development (1992 Rio Declaration) laid out integral principles to guide states in implementing sustainable development "with the goal of establishing a new and equitable global partnership through the creation of new levels of cooperation among States, key sectors of societies and people." One of these principles in particular, is especially important to this topic of foreclosures. Principle 8 states that:

To achieve sustainable development and a higher quality of life for all people, States should reduce and eliminate unsustainable patterns of production and consumption and promote appropriate demographic policies.

As mentioned previously, the foreclosure crisis is affecting the quality of life for many people across the United States. In addition, the abandoned houses are an "unsustainable pattern of production and consumption" that must be addressed. The UN Conference on Sustainable Development (UNCSD) is an important opportunity to address this issue in the context of the 1992 Rio Declaration and create new guiding principles for states faced with housing crises of this magnitude.

The goals of UN Conference on Sustainable Development (UNCSD) and Project No One Leaves-Miami mesh well and complement each other. One of the main focuses of the UNCSD is "a green economy in the context of sustainable development and poverty eradication." Addressing the foreclosure crisis is critical to poverty eradication, as evidenced by the information provided above. Additionally, utilizing or perhaps updating the abandoned homes for affordable housing with greener materials is a critical step toward sustainable development.

If the crisis is not addressed, many people will face homelessness. Communities are facing "mass displacement and homelessness" in the wake of the foreclosure crisis. Further, abandoned houses are in severe disrepair and are decaying. When these homes are finally purchased, some are knocked down and large amounts of raw resources are used to build new homes. In addition, it also takes a lot of resources to restore a home from these dilapidated conditions back to livable conditions. Landlords and owners should maintain these properties regularly to avoid excess use of limited resources to make the homes habitable. Conversely, leaving these houses abandoned and in ruin is a waste of already-used resources that could be utilized. Governments could slow the development of new homes and incentivize developers to focus on the homes that are currently sitting on the market. In an effort to promote sustainability and poverty eradication, governments could set some of these homes aside for affordable housing. The houses could be updated using greener, more affordable technology to transform these homes into more energy-efficient and affordable low-income housing. Taking these steps will help alleviate poverty and will also be an effective way for governments to introduce green technology and sustainable development into fully developed areas.

#### V. International Human Rights Standards

International human rights standards have been recognized in various forms such as treaties, general principles and even as customary international law. International human rights laws outline the obligations of Governments to promote and protect human rights, which are universal and inalienable, interdependent and indivisible, as well as equal and non-discriminatory.

Economic and social rights in particular are a newer concept within human rights, although no less important, that have been gaining more and more recognition. In particular, the focuses of PNOL and this conference, lead us to look at three main rights within the economic and social sphere. It is hoped that the delegates to this conference raise this issue as it is directly connected to the topics of the Rio+20 conferences well as state obligations under international human rights standards. Below is a brief explanation on the right to adequate housing as the principle right, as well as the connected rights to health and water.

##### Human Right to Adequate Housing:

The right to adequate housing is protected in various international and regional treaties. This human right can be traced back to the Universal Declaration on Human Rights (UDHR). Article 25(1) of the UDHR states that:

Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.

Among many other international instruments, the International Covenant on Economic, Social and Cultural Rights (ICESCR) has pronounced the right to adequate housing as an essential human right. More specifically, the Committee on Economic, Social and Cultural Rights, which is responsible for implementing and monitoring the ICESCR, defined the concept of adequacy in its General Comment No. 4. This General Comment listed seven specific components of the right to adequate housing as being the legal security of tenure; availability of services, materials, facilities, and infrastructure; affordability; habitability; accessibility; location; and cultural adequacy. More specifically, the legal security of tenure "guarantees legal protection against forced eviction, harassment and other threats." Many of the other components directly address the correlations between the rights to housing, health, and water.

##### Human Right to Health:

The human right to health guarantees the right to the highest attainable standard of physical and mental health. The right to health should not be thought of as the right to be healthy necessarily, but it is more properly conceptualized as the right to enjoy facilities, goods, services and conditions necessary for the realization of health. At a minimum, there must be sufficient public services that include safe drinking water and sanitation. The right to health is directly associated with the right to adequate house, as housing availability and conditions will affect the health of an individual and communities.

The UN Committee on Economic Social and Cultural Rights' General Comment No. 4 on adequate housing, articulates state obligations connected to the right to the highest attainable standard of health, in that homes must contain "adequate space and protecting them from cold, damp, heat, rain, wind or other threats to health, structural hazards, and disease vectors."

##### Human Right to Water:

In 2002, the Committee on Economic, Social and Cultural Rights, adopted the General Comment on the right to water. It explains that "the human right to water is

indispensable for leading a life in human dignity. It is a prerequisite for the realization of other human rights." It also defined the right to water as the right to "sufficient, safe, acceptable and physically accessible and affordable water for personal and domestic uses."

Furthermore, in a 2010 resolution adopted by the General Assembly of the UN, the right to water and sanitation was explicitly recognized as essential human rights. The right to water is applicable in various forms in connection with the right to adequate housing. For example, all beneficiaries of adequate housing should have sustainable access to safe drinking water, sanitation and washing facilities, and site drainage.

#### VI. Recommendations for Input in the Compilation Document for Rio+20 UN Conference for Sustainable Development

We recommend that the delegates to the Rio+20 Conference address this most pressing issue, which has severe impact on sustainability and poverty eradication. Specifically we recommend that:

1. States recognize their affirmative obligations to tenants and ensure that landlords are complying with the international human rights standards set forth in the Covenant on Economic, Social, and Cultural Rights.
2. States facing foreclosure crises should afford more protections to tenants of foreclosed properties. Legislation like the Protecting Tenants in Foreclosure Act (PTFA) in the US, address this need for protection, but need to go further to ensure that these tenants are not forced out of their homes and are not living in deplorable, unhealthy, and unsafe conditions.
3. Urge governments to provide incentives to public and private actors to maintain properties, thereby avoiding unnecessary renovations, and when necessary to renovate and regularly maintain these properties with greener and more affordable materials so that they can be utilized for affordable housing for low-income families.

IANA - IVLP Alumni Network of the Americas – Committee 4: Environment

Our inputs for Rio + 20

This document aims at making a contribution to the Compilation Document for Rio + 20 on the following key issues:

- Managing natural resources at their carrying capacity
- Non-renewable energy and land management
- Waste reduction
- Governance

#### 1. Managing natural resources at their carrying capacity

We propose to create an International Carrying Capacity Index (ICCI) by country as an indicator of true sustainable development of nations and the life quality of its people. Currently GDP is the most important economic indicator to measure the success of a country, as a measure of material well-being of society. Gross refers to the variation not accounted for inventory and depreciation or appreciation of capital; Domestic means that the production is within the boundaries of an economy; and Product refers to added value terms.

As is known, a country can increase its GDP by an intensive use of natural resources, which may decrease well-being of the population due to causes not measured by domestic product (pollution, disease, etc.) And at a long term, can result in a decrease of the GDP due to the unavailability of non-renewable resources. Moreover, GDP ignores the income distribution. Considering the environmental deterioration that we actually live and the collapse risk of the human species by the development system and success that we considered so far is that the initiative was born in the America's IVP community, to propose Rio + 20, the importance of the creation of the International Carrying Capacity Index, as an indicator of an essential balance that each nation needs to maintain quality of life for its people and their long-term business.

Using the example of Costa Rica, in the global happiness index, was appointed in 2010 as the happiest country in the world, according to the fourth State of Central America report, each Costa Rican person have a green "need" of approximately three global hectares, while Costa Rica's biocapacity - defined as the potential for a place to meet the demand for natural resources - it is just two hectares. That is, Costa Rica needs an hectare more for each citizen in order to satisfy their water, energy, housing and transportation needs, among others (La Nación, October 12, 2011).

According to this reality, in Costa Rica, a country that has been a model in environmental issues, there is currently a mismatch between economic growth and the environment, which undoubtedly will deteriorate the country if nothing is done about it. Different scientists also mention that are overusing the planet in 30% of its natural ability to regenerate. In other words, we are not living with the "interest" as if we are "eating the capital." On the other hand, as this wise proverb, directed to family life, says: "Have the children that you can make happy," each country should say: "Have the people and businesses that can sustain without impairing the resources to ensure quality of life and sustainable development in the nation."

To this purpose, the ICCI could be a very important tool, which allows each nation to have a clear diagnosis of their integral development and allow you taking course to protect it from collapse by an unbalanced management.

The ICCI should be built by a multidisciplinary and international team, that can measure its governmental management ability to invest resources and create policies that reflect the capacity of its territory, mainly considering the area to support the consumption of resources, waste disposal, the ideal number of residents, amount and type of industries that can be maintained in balance with the environment that sustains them.

#### 2. Non-renewable energy and land management

Introduction

Between 1959 and 1999 the population of the world doubled from approximately 3 billion to 6 billion. According to current projections this is expected to expand to about 9 billion. As the population of the world continues to grow, so would the average standard of living, thus increasing the demand for food, water and energy. Over population is expected to exacerbate other environmental problems such as climate change, loss of wildlife habitat, deforestation and pollution. Currently the total world proven reserves for oil is 1,342.207 billion barrels (Oil and Gas Journal), while for natural gas its 6,254.364 trillion cubic feet (Oil and Gas Journal). Supplies of oil, gas, coal and uranium are forecasted to peak between the years 2010 and 2020 after which reserves will deplete. Recent calculations confirm that the world's oil and natural gas supplies are running out too fast leading to critical situation in which the world's supply of oil and gas falling below the level required to meet international demand.

At present oil accounts for between 34% and 37% of the world's primary energy. In the Caribbean region 90% of the energy utilized is derived from oil. In addition the components of crude oil are feedstock to the chemicals, plastics and fertilizer industries. Today and for the next 50 years the world's dependence on oil and gas a means to obtain energy for transportation electricity and heating will continue, generating CO<sub>2</sub>, VOCs, NO<sub>x</sub> and SO<sub>x</sub> emissions, thus affecting the health of the human beings mainly through breathing problems and cancer, also increasing the need for adaptation for natural disasters.

What we are not doing

The oil consumption on a yearly basis exceeds 25 billion barrels and this is increasing. Soon with the expected depletion of the commodity the demand for it will negatively affect all aspects of our existence. Energy intensive societies, such as those found in the Western World, are not sustainable without a stable and relatively low-cost supply of energy, as is currently provided by oil and gas. Yet even with this knowledge we seem not to be pressured enough to seek viable alternative sources of energy nor to decrease the dependency on these non-renewable resources.

In addition, the processes of extraction of the hydrocarbons over the years may change the physical and chemical characteristics of the land. In the case of surface extraction of oil (tar sands), the remaining soil tailings produced are infertile and usually in great abundance. After oil extraction and refining, the land may lay waste. Today with the rising of new technologies to recover even more oil or by the fact that technology offers the possibilities to extract oil from a shale in tight formation which brings about more environmental threats to the area because large quantities of water are needed to extract oil.

Where do we want to be

- Reduced dependency on non-renewable energy.
- To treat with the problem of an early Peak Oil we need to work feverishly on the development of effectively harnessing the renewable energy.
- Renewable energy such as solar cannot presently be used to run large scale plants and refineries. It is therefore suggested that a hybrid approach be considered i.e. use both hydrocarbon and renewable energy. With a hybrid approach you include energy security.
- Replenish the forest and flora.
- Utilize wasted land for an alternative use as parking lots where it is available or to reforest or re-grass the area with local species.
- Incentivate local solution provided by the ancient cultures to solve the basic needs of the people on the base of the pyramid or out of the system. In this way a solution can be possible that will provide access to food, housing and electricity.

How do we get there

- Give every nation a deadline date to choose, develop and implement a suitable alternative energy source for their country. Also make the nations create and respect energy planning forecast to the future with legally binding actions.
- All oil and gas companies MUST have a land management plan while in operation as well as for after care.
- Each country should propose an appropriate crop mixes or a solution with a local grassing or planting local tree species, etc. (e.g. maize or sugar cane or legumes to plant on abandon oil fields). Where possible reforestation should be carried out.
- Use renewable energies like mini hydro, wind or solar to provide access to electricity to the people that are located in remote areas that are off grid, thus creating a sustainable solution to improve the living standards of the poor people.

### 3. Waste reduction

We all have responsibility in waste reduction

A list of global environmental issues would overwhelm even the most well-intentioned optimist. However, the mutual basis of all these issues (and their solutions) is human relationships with each other, and with the natural world. How relationships are conducted can be classified as occurring in communities or in markets.

The citizens of a community tend to be governed by public institutions and because communities are rooted in history, culture and geography these institutions tend to seek protection of exclusive interests but are slow to respond to influences from outside the community.

On the other hand, modern communities tend not to be self supporting in terms of desired resources and seek relationships outside the boundaries of the community, in markets. Contrary to communities, markets are directed by corporations that are nimble and able to respond quickly to consumers' interests, indiscriminately of communal interests, and over large geographies.

Finding ways to reconcile market interests with community interests is a key to solving environmental issues.

Product Stewardship

One common result of market/community disharmony is the over-generation and mismanagement of solid waste. For example, where costs for waste management costs are borne by communities, through taxation, there is little incentive for producers and consumers to waste less and innovate more. One proposed conciliatory solution for consideration is to have costs of environmental damages considered in the accounts of those that exploit environmental resources. In the case of solid waste this would result in more product stewardship such as Extended Producer Responsibility (EPR) where corporations and consumers bear the responsibility for the end-of-life management of products and/or packaging rather than taxpayers.

Innovative Construction & Demolition

Another proposed action is to take advantage of the increased rate of housing development occurring in cities around the world, by finding innovative ways to lessen waste materials generated at construction sites and foster innovation in the reduction, recycling and reuse of demolition debris.

Compost!

Finally, another proposed action is to broadly promote composting of organic residuals, especially organic residuals coming from urban centres. Compostable organic materials comprise a significant portion of the mass sent to landfills. This: represents lost nutrients and other resources used in the production of food; is a major source of greenhouse gas emissions; and demonstrates a disconnected link in the relationship between people and the natural world. Establishing efficient and effective systems for the separation, collection, and composting of residual organic materials will create local jobs; clean up and extend the life of existing landfills; act as a sink for carbon rather than generate greenhouse gas emissions; and create a material that will improve horticulture and/or agriculture soils by retaining moisture and adding nutrients.

#### 4. Governance

Governance is an issue of key strategic relevance in order to foster sustainable use of natural resources. We identify three main areas requiring urgent measures if the promises of Rio '92 are to be realized:

- Global environmental governance
- Water governance
- Forest governance

##### Global environmental governance

At present, there are many similar on-going processes and overlapping international organizations dealing with different aspects of natural resources management, poverty reduction, sustainable livelihoods, food security, health, energy and sustainable development in general. This is true both within and outside the United Nations System.

The consequences of this situation are increased complexity in the organizational structure, rising operating costs, an expanding international bureaucracy and poor coordination among the different mechanisms, commissions, agencies, bodies, secretariats and other structures related to sustainable development.

An ever increasing number of multilateral meetings poses a heavy burden on developing countries in order to have a say in the international decision making process. This leads to either a poor representation of their interest at the meetings or a heavy burden on their budgets. In practical terms, the result is a weak participation in high-level decisions which are likely to have an impact on these countries.

We suggest that Rio + 20 takes this problems into account in order to promote a revision of the current governance arrangements. An enhanced global governance mechanism would free funds that could then be channeled into more field work and concrete actions to achieve the MDGs and other worthy goals.

##### Water governance

The increasing pressure on water resources plus the implementation of the MDGs and the 'new' human right to water makes this issue most urgent. River basins often involve more than one jurisdiction and, often, more than one country. Although some improvements have been made, there is still a lack of coherent governance arrangements in many river basins. In particular, stakeholder involvement in decision making processes is still weak in most of the world. Besides, there is still a sub-optimal use of freshwater in many countries due to lack of adequate technology or poor water management practices.

It is therefore necessary to advance institutional arrangements that provide for an optimized water resources development. Participation —particularly that of marginalized groups— is an issue in which little progress has been made in spite of some small-scale success stories. Incentives for rational use of freshwater must also be implemented, with a special focus in financial and economical mechanisms.

##### Forest governance

Forest degradation and deforestation are still much alive in developing countries. In spite of the efforts, there is little —or no— progress in the implementation of effective forest governance models. Illegal logging is still a primary cause for deforestation and national governments are lacking effectiveness in controlling it. There are massive incentives for land-use changes, especially with commodities prices rising.

There is a need to review the incentives for sustainable forest management plus sustainable livelihoods for rural communities living in forest landscapes. It is also necessary to improve law enforcement, including appropriate measures in order to fight illegal timber trade. Participatory governance models at landscape level should be implemented when possible.

## Ibero-American Network of Life Cycle Assesment

Establishing basic Product Category Rules (PCR) in order to ensure achieving the Green Economy in emerging regions: disacoupling PCR from the economic and commercial interests of big companies and consortiums

### INTRODUCTION

During the last decade, corporate social responsibility (CSR) required companies to adopt measures and tools for cleaner production and sustainable development. This become an important driver for sustainability in the production sector, and was also an effective vehicle to introduce these new concepts to several countries. This also helped to raise awareness in society of the relevance of taking care of the environment as well as the value of the biological richness of the planet for future generations. At the same time, new relationships and collaboration between industry and society started to be developed; under a novel approach for economic-social growth and the improvement of the standard of living, through a framework of respect to the environment.

## What is the Problem?

In the present phase of world development, i.e. towards life cycle thinking and a green economy society has already been deeply instilled with the concept of sustainability. As part of public agenda of developing countries, the initiatives of the private sector have an important influence on general society and also on governmental agencies. These initiatives have the potential to fulfil the expectations of society regarding these areas and can also indirectly help governmental agencies to accomplish their own goals in social and environmental areas. Nevertheless, when these initiatives are promoted by large companies, powerful consortiums or transnational companies, their focus could be more related to economic and commercial purposes, becoming instead a good "business and marketing opportunity" for companies. Nevertheless, to consolidate this process, companies need to be somehow recognized locally as conceptual and practitioner referees in subjects related to sustainable consumption and production. Their huge financial resources, allow them to have significant capacity of implementation of projects, which usually include several levels of development and diffusion of their activities and ideas, and therefore has the potential to be denoted as corporations in a kind of "environmental crusade for the benefit of us all", acquiring consequently public connotation and social and political influence. The practice that is becoming common in many countries of the region, may result in serious damage for the economy and sustainable development of the emerging countries, since it could turn out to be a factor that distorts the implementation of methodological standards for the sustainable consumption and production, like the Life Cycle Assessment (LCA), by establishing models and patterns of reference that entail in their own intrinsic definition the skew provided by the economic interests of the companies, which are promoting them.

## CONSEQUENCES

Not taking suitable measures means that big-size companies with economic and commercial interests beyond the regional, environmental and social ones could determine the standards for sustainable development, and then: establishing what is fine and what is not, what worth more and what worth less in sustainable consumption and production, and consequently what impacts or impact categories are the more relevant, what emissions to consider and which are their relation to particular sitespecific conditions, what is more significant for certain sectors in terms of environmental, social and economic impacts, and therefore what bears the greatest burden and therefore the allocation scheme to be used for a LCSA, etc.

In this context, consortium and big companies could become judge and part of these processes. Their economic and technical resources provide them with the ability and effectiveness: their headquarters provided them of knowhow, the necessary resources for expert development on LCA and other tools, making them prepared with solid arguments and scientific and technical discussion capacity to convince and promote themselves at different levels of society. But, in the other hand, as counterpart there are the social and governmental organisms, most of them with not enough monetary resources, and lack of the necessary knowledge and experience to discuss or to appropriately lead the development and application of these methodologies.

We also understand that out of this situation there is also latent risk for regional SMEs: being most SMEs suppliers of the big companies and transnational that demand to fulfil their environmental standards, conducting the SMEs to compete in technical disadvantage with foreigner suppliers coming from the developed world. Additionally as has already occurred, those SMEs that are able to accomplish the required standards, can be led to a sort of perverse system, in which the SMEs after improving their standards of environmental performance and thus diminishing their energy and material consumptions and their production costs, they were then demanded by the big companies to lower as well the prices of their products in the same proportion as they lower their production costs.

In the implementation of this type of initiatives, a common practice carried out by companies consists in getting the social organizations and governmental organisms involved from the start, and hence ensuring their acceptance and social validation, and simultaneously conform a politic-social action network that consolidates them and makes very difficult to influence these projects from outside, or publicly to criticize their results.

## PROPOSAL

What could be a feasible solution?

Therefore it seems essential and necessary to adopt oriented measures to direct these processes toward the objectives of economic, environmental and social sustainability of the emergent and developing countries, disacoupling them of the economic and commercial interests of big companies and consortiums.

Therefore, we highlight the necessity of developing mechanisms for auditing and controlling those initiatives, projects and programs oriented to establish models of LCA or implementing as well other life cycle thinking tools.

We think that a direct way for this, based on standardized tools that already exist, is the promotion of the use of the product category rules (PCR), according to the ISO14025. Each country in agreement with a global standard frame will be able to establish for products a basic profile that must be fulfilled. This product profile can be settled together with all the producers of the sector and the import products will have to fulfil at least these basic profiles.

In the following phase countries would have to reach inter-sectoral agreements to make these profiles consistent for the country. These processes would agree between countries with commercial agreements. At the same time international basis regarding environmental and social terms would be established for avoiding that products out of specification could be deviated to other countries without regulations.

It is not either necessary to invent nothing. It just would be enough to organize an EPD/PCR scheme under public control of the countries and not to leave these regulatory processes to be defined exclusively by private initiative.

Finally, we propose that these mechanisms are impelled and coordinated by pertinent governmental organisms, such as the economic and environment ministries, national centers for cleaner production, but which scientific and technical support must be based on the scientific communities and technical experts in these areas. In Latin America and other regions in the world, these communities have been grouped themselves in local and regional networks of life cycle assessment, such as the Ibero- American LCA Network, the African LCA Network, and many very active LCA networks at country level too.

In the cases that local networks do not exist, the PCR and EPD development could be coordinated with the regional network, which are able to identify local and regional experts and give technical support if necessary, and/or to act as guarantors for Estate organisms, NGO and for other natural organizations of the civil society.

Promoción de mecanismos para el desarrollo de bases de datos abiertas: plataforma necesaria para dar impulso al desarrollo sustentable y la economía verde en regiones emergentes

## INTRODUCCIÓN

Atendiendo a la globalización de la economía y especialmente a las implicaciones económicas y ambientales de impactos a nivel planetario, se hace necesario disponer de un fondo documental transversal, de forma que sea posible conocer las variables que permitan determinar los impactos que afectan a toda la humanidad, especialmente en los productos transnacionales. Actualmente el consumidor no puede saber el impacto de un producto importado o de un producto elaborado con materias primas o energía procedente de otros países o continentes.

Este fondo documental comœen se concretaria en una base de datos de formato compatible, en la que todos los fabricantes de productos o servicios deber'a volcar una serie minima de datos. Esta base de datos comœen deber'a poder determinar aspectos globales como la vulneraci—n de derechos humanos basicos, como proteccion de la infancia, derecho a educacion, derechos individuales y determinar variables que afecten a la preservacion de recursos no renovables fundamentales, materias primas, fuentes de energ'a y a la prevencion y proteccion contra impactos globales como agotamiento de capa de ozono, cambio climatico. La metodologia de analisis de sustentabilidad de ciclo de vida (life cycle sustainability assessment LCSA), permite la incorporacion de varios de estos temas en el analisis integral, que impulsa la comunidad de expertos en LCA, haciendo desde hace a-os una labor importante a nivel mundial en la recoleccion y seleccion de datos y desarrollo de modelos de impacto tanto genŽricos como sitio especificos y sector especificos. Pero sus esfuerzos se ven tambiŽn limitados a causa de la disponibilidad de datos y acceso a la informacion y falta de medios formales para superar este problema.

Asimismo, el acceso amplio a informaci—n relevante y confiable, es fundamental para la implementacion de programas y pol'ticas de desarrollo sustentable y programas de mejora ambiental continua de procesos, servicios y productos, en paises emergentes. Los principios de Responsabilidad Social Empresarial en primer tŽrmino, asi como las normas en todos los niveles, deben orientarse a promover el acceso a la informacion ambiental, social y economica, a gobiernos y a ciudadanos, a fin de compensar las asimetr'as existentes entre Žstos y las grandes corporaciones.

#### ANTECEDENTES

Mucha informacion referente a consumo y emisiones genŽricas e impactos ambientales y sociales de sistemas productivos y de desempe-o ambiental de productos, se encuentra dispersa en la academia, sectores pœblicos y privados y aun siendo de acceso pœblico, muchas veces se desconoce su existencia y termina encerrada en cajones y archivos hasta finalmente perderles toda pista.

La Guia Global de Principios para Bases de Datos de Analisis de Ciclo de Vida, conocida tambiŽn como la Guia de Shonan, recientemente lanzada por UNEP-SETAC Life Cycle Initiative, identifica como crucial para el desarrollo de inventarios de ciclo de vida y por tanto para el analisis de ciclo de vida, que los tenedores y generadores de informacion desarrollen f—rmulas para incrementar la cooperacion y asi mejorar el acceso a informacion fiable. Capitulo 6 de la Guia Global de Principios:

- Governments are requested to launch national life cycle assessment (LCA) training and awareness activities in their respective countries.

- Global coordination among life cycle inventory (LCI) dataset developers and LCA database managers has been identified as a priority, together with capacity building and data mining, to move toward a world with interlinked databases and overall accessibility to credible data.

- Huge amounts of relevant raw data, and even developed LCI datasets, currently are not easily accessible for LCA studies. LCA database managers and LCA practitioners for particular studies should do data mining by working with actors who routinely collect data

. All stakeholders, including governments, industry associations, and commercial parties that manage and supply databases, should strongly increase their cooperation and coordination."

La Guia de Shonan tambiŽn discute en forma detallada, el como los gobiernos y otras partes tenedoras de datos basicos que pueden usarse en generar inventarios de ciclo de vida, pueden tomar acciones para que sus grupos de datos pedan ser mas facilmente usados en esa direccion.

Existe evidencia de funcionalidad de las bases de datos abiertas: las nuevas generaciones de cientificos y profesionales ocupan fuerte y crecientementemente sitios de generaci—n y desarrollo de temas en internet y las bases de datos que alli se generan, como es el caso de wikipedia, exhibe la condicion de autorregulacion en el tiempo, generando informacion de alta calidad y grupos de trabajo y discusion entorno a temas relevantes. Conociendo este fenomeno, expertos en el mundo han empezado a desarrollar herramientas abiertas para centralizar y compartir informacion, que permiten la mejora de procesos, al compartir informacion sobre indicadores de desempleo de redes de proveedores y consumidores.

Por tanto hay ya una base metodologica y empirica, que en todo caso es necesario aun estructurar y orientar hacia los objetivos del establecimiento de mecanismos a nivel de gobiernos que permitan el desarrollo de bases de datos abiertas de informacion relevante y fiable, como plataforma para el desarrollo sustentable.

#### PROPUESTA

De manera concomitante, los Gobiernos y la sociedad civil, a travŽs de acuerdos pœblico privados deberan desarrollar y compartir estrategia tecnologicas para re-construir la informacion ambiental a partir de los registros existentes en cualesquiera formatos y sujetos que puedan aportarlos, a fin de generar progresivamente una aproximacion a lineas de base globales para los ecosistemas en todos sus niveles.

Desarrollar protocolo de acuerdos internacionales, que permitan que la informaci—n generada por las empresas para su propio desempeo operacional, pueda quedar disponibles para el uso de la comunidad y del Estado, a travŽs de mecanismos que generen valor para las empresas como retribucion a compartir la informacion, los cuales no han sido del todo desarrollados.

Cabe destacar que la forma de creacion y mantenimiento de grupos de datos (datasets) y bases de datos se puede realizar de formas muy variadas, dado el actual nivel de desarrollo tecnologico, pero es fundamental un compromiso tanto a nivel gubernamental de los paises como tambiŽn a nivel internacional, que lleve a que cada pa's garantice la disponibilidad de estos datos en un formato compatible. Por tanto que sea posible verificar, por ejemplo, que en los casos de productos para los cuales la cadena de suministro sea transnacional o en temas de comercializacion, se pueda garantizar que los impactos sociales, econ—micos y ambientales de Žstos, estŽn enmarcados al menos en un minimo internacionalmente acordado.

Consideramos que Rio + 20 es la instancia en la cual se puede asumir un compromiso de este tipo en un plazo razonable, de manera que se pueda seguir un procedimiento similar a las agendas 21, en las que cada pais en forma voluntaria se va suscribiendo al compromiso y mientras tanto se desarrolla un protocolo que permita ir agregando bases de datos.

Los principios de Responsabilidad Social Empresarial en primer tŽrmino, asi como las normas en todos los niveles, deben orientarse a promover el acceso a la informacion relativa al desarrollo sustentable a gobiernos y a ciudadanos, a fin de compensar las asimetrías existentes entre Žstos y las grandes corporaciones.

De manera concomitante, los Gobiernos y la sociedad civil, a travŽs de acuerdos pœblico privados deberan desarrollar y compartir estrategia tecnologicas para re-construir la informacion ambiental a partir de los registros existentes en cualesquiera formatos y sujetos que puedan aportarlos, a fin de generar progresivamente una aproximacion a lineas de base globales para los ecosistemas en todos sus niveles.

Profundizacion de la gestion administrativa en materia de evaluacion de impacto ambiental

La mayor'a de los paises cuenta con legislacion que exige la evaluacion de impacto ambiental previa a la ejecucion de proyectos que involucren ocupacion o transformacion del entorno, generacion de desechos y sustancias toxicas y alteracion o impactos significativos al medio ambiente natural y/o tecnoestructura. Sin embargo, la gestion

ambiental gubernamental asociada a dichas normas resulta deficiente en varios aspectos que es necesario fortalecer desde el punto de vista institucional:

- a) Adecuada estandarizaci—n de los procesos de revisi—n de los Estudios Ambientales, y que involucren los otros aspectos de la sustentabilidad (desarrollo social y economico, respeto a los derechos humanos basicos).
- b) Ampliacion de la integracion de informacion disponible para la revision: tanto las normas como las tecnolog'as deberian converger para permitir integrar progresivamente dichas informaci—n no digitalizadas, dispersas, o en lenguajes incompatibles, de tal manera de permitir superar la vision atomizada.
- c) Potenciacon del acceso a las tecnologias TIC
- d) Revision critica de la Evaluaciones Ambientales y de informacion disponible: las comunidades ACV/LCA agrupadas en redes nacionales y regionales conformadas por expertos en las diversas areas que comprende el LCSA, constituyen una base para que los paises emergentes establezcan procedimientos (gu'a de calidad) de recoleccion, eleccion y revision critica de datos. Se debe proover las alianzas entre los gobiernos locales con las redes nacionales y regionales, las cuales tambiŽn pueden ser la base para el desarrollo de estđndares b'sicos de grupos de datos.

## Ibon International

Contribution of Ibon International to the Zero Draft of the Outcome Document for Rio+20  
1 November 2011

Today the world finds itself far off track in realizing the vision of the Rio Declaration on Environment and Development. Global economic expansion continues to severely strain the environment. Humanity's ecological footprint now exceeds the planet's biocapacity by over 50%, and three of nine planetary boundaries that define the safe operating space for human life on Earth have been breached.

The costs and benefits generated by that economic expansion are shared very unequally. In 1990, the ratio of per capita income in the richest 20 countries to that in the poorest 20 was \$42 to one dollar; in 2005, it was \$59 to one dollar. One out of three persons today or about 1.75 billion people live in acute deprivation in terms of health, education and material standard of living. There are 80 million more people living in income poverty in 2005 compared to 1981 if the handful of BRICS (Brazil, Russia, India, China, South Africa) economies are excluded. And close to a billion people do not even have the very basic condition for human existence, that is adequate food.

The gravity of the multiple crises confronting the world today—not the least of which is the climate crisis—is forcing people to re-examine fundamentals. People's values and lifestyles, their conceptions of the good life, social relations as well as the relationship of man with nature—all these are being reconsidered and reimagined. To put it bluntly, no real development is possible unless it transcends the present economic and social system that engenders these crises.

### Significance of Rio+20

Rio+20 in 2012 thus comes at an opportune time, when the world's states and peoples are obliged to rethink alternatives to the current development model with its ever-increasing failures. It presents opportunities to push urgently and comprehensively the agenda for sustainable development.

The 2012 UNCSD must deliver and not backtrack on the promises and commitments made in Rio twenty years ago. Rio+20 must reaffirm and operationalize the principles expressed in the 1992 Rio Declaration, including the polluter pays principle; the precautionary principle; the principle of common but differentiated responsibility and capability; and Principle 10 on people's participation and access to information and justice. Rio+20 should come out with an honest appraisal of weaknesses in the implementation of Agenda 21, aim for ambitious, timebound and concrete goals, and establish mechanisms for a just transition to genuine sustainable development.

The best way to re-affirm the Rio principles is to promote a rights-based approach to sustainable development in response to the grave economic, social and environmental crises confronting the world today. A rights-based approach to sustainable development is founded on the notion that improving the well-being of present and future generations is a matter of empowerment, equity and justice. It lays down a clear mandate for public officials to take action and provides conditions for rights claimants to hold duty bearers accountable, including governments, intergovernmental organizations, donors, international financial institutions, transnational corporations, international NGOs and so on.

The duty of states and the international community to respect, protect and fulfill legally-binding human rights obligations enshrined in the Universal Declaration of Human Rights, human rights treaties and covenants including the Right to Development, should be the basis of discussions in Rio+20 alongside commitments previously made in Rio in 1992 and the UNCSD process since then. Only on the basis of these can outcomes in Rio+20 be expected to rectify and strengthen the social, economic and ecological dimensions of sustainable development in a holistic and integrative manner.

### On the Green Economy

Many civil society groups are concerned that the Green Economy theme chosen for the Rio+20 does not fully or holistically address the social, economic and ecological challenges of sustainable development today. Many civil society organizations are dismayed that the leading advocates of the green economy confuse economic growth with the full range of development. Moreover, many CSOs fear that the green economy agenda will consist primarily of market-based, private-sector led initiatives or technological fixes that may, inadvertently or otherwise, reinforce corporate control over natural resources and environmental services, not to mention traditional sectors such as agriculture and new technologies, at the expense of the people who are most dependent on these resources.

There is also the fear that market-based mitigation schemes such as carbon trading and carbon offsets allow cop-outs for large polluters and therefore continue to lock-in the same unsustainable patterns of production and consumption.

Instead, we call on governments to support alternative knowledge and practices on sustainable development that are in the hands of the people – biodiverse ecological agriculture, community-based renewable energy systems, community-driven stewardship of ecosystems – and the values of *buenviviri* or living well as opposed to unbridled consumerism. These make the building blocks of genuine people-centered sustainable development that enhances people's well-being, equity and justice for all. But they need to be supported and promoted by an enabling environment.

Crucial to such an environment is the democratization of ownership, control, and decision-making over productive resources and assets in society. We should move towards

more democratic modes such as cooperative, community-based, commons or public forms of ownership to ensure that economic activity provides sustainable livelihoods for all and meets the developmental goals of the community and society. This means implementing thoroughgoing agrarian, aquatic and forestry reforms for the benefit of smallholders, women and indigenous peoples in particular, and to strengthen community-based stewardship of natural resources and ecosystems.

There is a need to promote sufficiency-based economies, i.e., catering primarily towards meeting local needs and demands, developing local capacities, based on available resources, appropriate technologies and resource sharing.

Countries should have the right to determine their patterns of food production and consumption, and farmers should be able to prioritize food production for domestic consumption. Local and national food systems should provide food that is healthy, of good quality, and culturally appropriate. Food production and consumption should be localized as much as possible while food reserves should be established at the local, national and even regional level to raise the resilience of food systems.

There must be an end to perverse subsidies and support for the fossil fuel industry, for agrofuel plantations, for large scale mining, big dams, industrial farming and fishing, and other activities that destroy lives and livelihoods of present and future generations. Instead, there must be a rapid transition away from fossil fuels as energy sources and towards a mix of new, renewable energy sources, some particularly amenable to decentralized and local use such as wind, solar, and micro-hydro power.

Manufacturing should promote closed-loop production where products are produced with minimum use of energy and materials, longer lifespans and with maximum reuse and recycling of parts and components. There must be greater support for mass public transportation but walking and biking should also be promoted as modes of transport for short distances.

On the basis of public, cooperative and community-based forms of ownership, participatory and inclusive modes of decision-making and planning can ensure that economic activity contributes to meeting the goals of the community such as employment, health, education, and so on. The principle of subsidiarity—devolving decision-making to as local a level as appropriate—should be promoted. This should reignite local political reengagement.

Policies should respect cultural diversity, and modern science should be combined with traditional knowledge in bottom-up approaches of research and development to develop technologies that are appropriate and democratic.

International trade, investment, finance and development cooperation should be reoriented around rules that value, respect, protect and fulfill people's rights; economic, social, gender ecological and climate justice; self-determination and self-sufficiency.

A sustainability transition will involve adjustment costs. The highest costs will fall on global corporations, polluting industries and elites who will need to adjust to an economic redistribution. But the poor will also be affected, such as workers in fossil fuel industries when the shift to renewables take place. Workers will need to be reskilled for green jobs. Also, Southern countries that depend on energy and manufactured exports to the North will feel the pain when a transition to lower consumption begins in the North. A coordinated transition within and between countries is necessary to cushion the impacts to the poor. Assistance from the North in the form of financing, technology cooperation, and capacity building are of utmost importance to support developing countries make the transition.

On IFSD

To deliver on the promises of the first Earth Summit, there is also a need for an effective, democratic institutional framework that can and will ensure economic progress, social equity and environmental protection in an integrated and holistic manner.

Building a strong apex body for sustainable development that works on a global level and can integrate or coordinate the work of disparate multilateral bodies working on one of the three pillars of sustainable development may be desirable. Some of the options on offer are promoting the Commission on Sustainable Development into a Council on Sustainable Development, or establishing a UN Organization on Sustainable Development. Any option should uphold and operationalize the principle of common but differentiated responsibilities and respective capabilities, and acknowledge that poor countries constitute the majority. Second, it must be participatory and democratic.

A rights-based approach to the IFSD means that duty-bearers should have explicit mandates expressed in clear, preferably legally binding, human rights standards. There must also be judicial or quasi-judicial mechanisms that are effective at delivering entitlements, responding to complaints, and ensuring accountability. These mechanisms of redress must also be readily accessible, especially to vulnerable and marginalized groups.

A rights-based approach to sustainable development underscores the democratic right of people to determine the goals and means of achieving sustainable development. Along this line, the development and adoption of a global or regional convention on Principle 10 of Rio based on the Aarhus Conventionii should be supported. This will help ensure access to information and meaningful participation of people in sustainable development, and access to effective judicial and administrative proceedings, including redress and remedy.

Rio+20 should work for the immediate establishment of a broad inclusive multi-stakeholder consultative body or network tasked with supporting the promotion and implementation of Agenda 21 and Rio+20 resolutions. Such body should be participatory, democratic, and have an integral multi-stakeholder character that accords civil society with equal rights and equal voice as governments.

The UN Human Rights Council should also establish Special Procedures for the Right to Sustainable Development, including the appointment of a Special Rapporteur on Human Rights and Sustainable Development. Such an expert or experts will be tasked with reviewing international, national and regional case law and practice with a view to clarifying the linkages between social, economic and environmental issues from a rights perspective; elaborating on applicable human rights standards and indicators.

The OHCHR should also collaborate closely with UNEP, the proposed Council on Sustainable Development or World Environment Organization, if and when they are established, in order to develop guidelines and propose actions to be taken by governments, intergovernmental bodies and other actors consistent with human rights obligations.

Ultimately, the effectiveness of a global body on sustainable development rests on the effective functioning of similar institutions at the local and national levels and its relevance to people's lives.

Commitments from the North in the form of adequate financing (according to common but differentiated responsibility), appropriate technology cooperation, and needs-based capacity building are of utmost importance to support developing countries make a just transition to sustainable development pathways.

## On SDGs

The proposed Sustainable Development Goals should not be confined to merely addressing the symptoms of poverty, exclusion and ecological degradation like the millennium development goals. Instead, SDGs must address the roots of these problems including the question of rectifying unequal power relations within and between countries, and the dominant development model based on neoliberal doctrine.

The SDGs should also affirm the Rio principles, including the CBDRRRC. They should not be donor-driven targets or technocratic exercises in formulating indicators and monitoring progress. They should be based on Agenda 21, but also be consistent with human rights obligations, including the Right to Development.

Today, even more so than twenty years ago, peoples of the world are aware that the challenge of genuine sustainable development requires no less than the profound transformation of societies and of international relations. We must all rise up to the challenge.#

## ICEF-International Court of the Environment Foundation

Rio+20 Conference CALL FOR ACTION BY THE PARTICIPATING STATES OF THE RIO+20 CONFERENCE (4-6 JUNE 2012)

To Adopt the Project for the International Court of the Environment presented firstly by ICEF at the UNCED Conference in Rio de Janeiro in June 1992 and Re-proposed at UNCED Conference in Rio de Janeiro in June 2012

Considering the Universal Declaration of Human Rights proclaimed by the United Nations General Assembly on 10 December 1948;

Considering that this Declaration aims at guaranteeing the universal and effective recognition and application of the rights provided for in it;

Considering that the environment is one of the fundamental human rights and that life is the very basis of fundamental freedoms;

Considering that environmental protection is, at the same time, a fundamental duty of all mankind, particularly with regard to future generations, including the utilisation of resources compatible with the needs of life in general on the planet;

Considering that the principles of the Convention on Human Rights and Fundamental Freedoms, signed in Rome on 4 November 1950 and the Protocol to the Convention signed in Paris on 20 March 1952 must be extended to the entire world because they constitute a common universal heritage and the basis for democratic, just and peaceful governments in a new international order;

Considering that Art. 13 of the United Nations Declaration on Social Progress and Development (1969), declares that "the protection and improvement of the human environment" is one of the aims in attaining social development and progress;

Considering that, under Art. 22 of the Declaration of United Nations Conference on the Human Environment (1972) held in Stockholm, States are under a duty to "co-operate" in further developing international environmental law and, under Art. 21, have "the responsibility to ensure that activities within their jurisdiction or control do not produce damage to the environment of other States or of areas beyond the limits of national jurisdiction";

Considering that Art. 30 of the 1974 Resolution of the General Assembly, known as the Charter of Economic Rights and Duties of States declares that all States are responsible for the protection, preservation and improvement of the environment for present and future generations;

Considering that Art. 19 of the Report on State Responsibility, approved by the International Law Commission in 1976, considers the concept of the international crime of a State as an offence against the entire International Community to be applicable to serious acts of pollution and degradation of the planet (serious violations of the fundamentally important international obligation to protect and pre-serve the human environment - "environmental crimes");

Considering that the Third United Nations Conference on the Law of the Sea recognises the sea bed as "a common heritage of mankind" and set up a special International Sea-Bed Authority;

Considering that Principle 10 of the Rio Declaration states that States shall make "effective access to judicial and administrative proceedings, including redress and remedy" available; information widely available;

Considering the various environmental disasters that have occurred without adequate reparation for the environmental damage done: the Torrey Canyon in 1967; the Amoco Cadiz in 1978; the collision of the Atlantic Express with the Aegean Captain outside Tobago in 1979; Exxon Valdez in 1989; Seveso in 1976; Bhopal in 1984; Chernobyl in 1986; Sandoz in 1988; Haven in 1991, Sea Empress off the Welsh coast in 1996, Erika off Brittany in 1999 and the burning oil wells in the Gulf in 1991, the Gulf of Mexico oil spill in 2010;

Considering that an answer must be found for objectively supranational problems (the oceans, space, the Antarctica, the Amazon, the ozone layer, the greenhouse effect, transfrontier pollution, genetic manipulation, toxic products, etc.) on the same level in terms of regulations, sanctions and organs for prevention, management and control and that the entire International Community must assume responsibility for saving life on the earth by creating new more effective regulations and permanently structured administrative and judicial bodies;

Considering the positive role that religions can serve in encouraging stewardship of life on Earth, as for instance in the Encyclical of Pope Benedict XVI Caritas in Veritate 2009 which concerns the need for a "world political authority" capable of assisting States to protect the environment as an integral part of sustainable development, and capable of providing international solidarity for attaining the ethical objectives of preventing and remedying environmental damage.

Considering that the European Parliament in its Motion for a Resolution in view of developing a common EU position ahead of the United Nations Conference on Sustainable Development (Rio+20) (B7-0000/2011 of 12.9.2011) reiterates its proposal for an international environmental court, so that global environmental legislation becomes more

binding and enforceable, or at least an international authority, such as an ombudsman with mediation powers;

Considering that, for this purpose, the role of existing state and international institutions must be strengthened and new organs be created for the environment on a global level:

- an International Environmental Agency within the United Nations
- an International Court of the Environment within the United Nations

Based on the principles that:

- 1) Everyone has a fundamental right to the environment and an absolute duty to preserve life on earth for the benefit of present and future generations
- 2) Everyone has the right of access to environmental information and the duty to provide any environmental information in his/her possession
- 3) Everyone has the right to participate in procedures that may involve the environment, subject to the fact that the public authorities are deemed to have final responsibility with regard to the environmental decision-making processes
- 4) Everyone, whether an individual or an association, has the right to take legal action to prevent activities that are harmful to the environment and to seek compensation for any environmental damage
- 5) Everyone is under a duty to utilise natural resources with equity and care, by ensuring the maximum saving of energy, the minimum consumption of resources and by actively and efficiently co-operating in reducing the amount and kinds of waste produced and in its recycling and re-utilisation.
- 6) The States shall recognise and guarantee the human right to the environment, and foster conditions that make this right effective
- 7) The States are legally responsible to the entire International Community for acts that cause substantial damage to the environment in their own territory, in that of other States or in areas beyond the limits of national jurisdiction and shall adopt all measures to prevent such damage
- 8) The States, in particular, shall:
  - a) adopt all policies in accordance with the global principle of complete compatibility with the equilibrium of the earth's ecosystem
  - b) adopt all policies in accordance with an equitable principle for the utilisation of the earth's common resources by all peoples
  - c) adopt all policies in accordance with a principle respecting the right to the environment of future generations
  - d) prohibit all activities that may cause irreversible damage to the basic natural processes of the biosphere and, as a precautionary measure, suspend those activities whose effects cannot be determined until all such uncertainty has been removed
  - e) take action to restore degraded ecosystems
  - f) prevent the transfer of environmental harm and risks to other parts of the world
  - g) prevent military action that procures irreversible environmental damage
  - h) adopt environmental standards that have been recommended at an international level and, in their absence, other standards aimed at preventing or significantly reducing the various kinds of pollution and at guaranteeing the equitable utilisation of resources
  - i) adopt procedures for environmental impact assessment with regard to legislation, planning and programming and for public and private works of great impact on the environment
  - j) urgently implement control and monitoring systems that are global, continuous, transparent, well publicized and comprehensible to everyone
  - k) prohibit forms of propaganda for the manufacturing and production and for the utilisation of resources considered to be incompatible with the requirements of education and the right to correct and complete environmental information
  - l) conserve terrestrial, coastal and marine habitats together with the species of flora and fauna subject to special protection
  - m) conserve the quality of agricultural land and related products against the excessive use of pesticides
  - n) adopt the principle of ecological compatibility for rivers and lakes whereby they are given the capacity to resist and regenerate by requiring that productive and agricultural activities be authorised
  - o) make the scientific and technical information necessary for protecting the environment available
  - p) co-operate in research and monitoring and assist in cases of environmental disasters
  - q) subject economical initiatives with other States and especially with the South of the planet to environmental impact assessment
  - r) encourage the conservation of large ecosystems through the creation of international parks and reserves, acknowledging that all of nature is a legal and economic resource and a common heritage and that national sovereignty is a obligation at the service of human values

ICEF calls on World Leaders to establish an:

INTERNATIONAL ENVIRONMENTAL AGENCY

An International Environmental Agency shall be established as a permanent organ.

Composition

The Agency shall consist of 15 members, appointed by the United Nations General Assembly from among persons of high moral character and qualifications, from a list of 100 candidates submitted to the Secretary General of the United Nations

## Functions

The functions of the Agency shall be:

- a) to control and monitor the state of the environment on the planet;
- b) to promote and carry out research, also with the assistance of independent experts, research centres and universities, on the actual state of the environment on the planet and on the evolution of large terrestrial, marine and atmospheric ecosystems;
- c) to plan global initiatives for environmental protection and restoration;
- d) to manage the World Environmental Fund;
- e) to establish acceptable standards regarding polluting activities, which the single States may only make stricter;
- f) to promote any other useful initiative for environmental protection, including a vast world-wide educational campaign on the environment;
- g) to publish an Official Report once every three years on the ecological evolution of the planet.

## Term of Office.

The members shall be in office for a period of 7 years and are not eligible for re-appointment. They shall elect a Director with the role of representing and co-ordinating the activities of the Agency. The Director may only be re-elected once;

and an:

## INTERNATIONAL COURT OF THE ENVIRONMENT

An International Court of the Environment shall be established as a permanent organ.

## Organization of the Court

The Court shall be composed of 15 independent judges, elected by the United Nations General Assembly from a list submitted by the Secretary General.

The judges shall be in office for a period of 7 years and shall be eligible for re-election.

The President of the Court shall be directly elected by the United Nations Secretary General and shall be eligible for re-election.

The judges shall enjoy the prerogative of absolute independence with regard to their States of origin and shall receive a salary which will be paid out of the budget of the United Nations.

## Functions

The functions of the Court shall be:

- a) to protect the environment as a fundamental human right in the name of the International Community;
- b) to decide any international environmental disputes involving the responsibility of States to the International Community which has not been settled through conciliation or arbitration within a period of 18 months;
- c) to decide any disputes concerning environmental damage, caused by private or public parties, including the State, where it is presumed that, due to its size, characteristics and kind, this damage affects interests that are fundamental for safeguarding and protecting the human environment on earth;
- d) to adopt urgent and precautionary measures when any environmental disaster concerning the International Community is involved;
- e) to provide, at the request of the organs of the United Nations and other members of the International Community, advisory opinions on important questions regarding the environment on a global level;
- f) to arbitrate, upon request, without prejudice to its judicial role;
- g) to carry out, upon request, investigations and inspections with the assistance of independent technical and scientific bodies when there is environmental risk or damage and, ex officio, when considered necessary and urgent.

## Preliminary Rulings

A national court may request the Court to give a preliminary ruling on the international or national nature of the question brought before it.

## Procedure

The procedure of the Court shall provide that:

- a) a Court hearing shall be public;
- b) all parties shall have the right to a defence;
- c) a judgment shall state the reasons on which it is based and shall be final;
- d) civil remedies shall include an interlocutory or perpetual injunction, or an order directing the party against whom judgment is made to pay the costs of restoring the damaged environment, where this is possible, and, failing that, to compensation for damages, with an order to pay the relative sum into the World Environmental Fund;
- e) the enforcement of judgments shall be entrusted to the United Nations Security Council.

The Court shall sit with 5 judges.

The Presiding Judge and the Judge-rapporteur shall be nominated by the President of the Court.

#### Procedural Rules

The Court shall draw up its own rules and determine its own procedure.

#### Locus Standi

The following parties may appear before the Court:

- a) individuals;
- b) non-governmental organizations and environmental associations;
- c) States;
- d) supranational organizations, such as the European Union;
- e) international organizations under the United Nations and the individual organs of the United Nations.

Legal action by an individual or non-governmental organization or environmental association shall be subject to two conditions:

- a) that a claim has been made before the national courts and has been held to be inadmissible because there is no judicial remedy under national law or has been dismissed on the merits;
- b) that the claim, having been filtered in terms of its admissibility, not as a matter of whether there is a cause of action, which is admitted as a general principle, but with regard to the international importance of the question raised (the same principle of inadmissibility shall be applied by the International Court of the Environment in camera and cannot be appealed against).

Individuals or associations may bring an action for the violation of the human right to the environment on the grounds that they have been prevented from gaining access to information, from participating in environmental decision-making processes or from taking legal action or for serious environmental risk, harm or damage of international importance caused by any party whatsoever in violation of international law.

#### Sanctions

Whenever the Court finds in favour of an individual or association, it shall adopt any measures considered necessary for remedying the violated right, by ordering, in accordance with the circumstances, whatever the party, or even the State, guilty of the alleged violation is or is not required to do.

If the claim by an individual or association is related to environmental damage, the judgment which orders the offender to pay the costs of restoring the damaged environment shall redress the claims of the claimant and of the International Community.

If the claim for compensation for general environmental damage by an individual or association is upheld, an order shall be made in favour of the World Environmental Fund, while any claim for residual individual damage may only be made before the national courts and the claimant shall only have the right to costs before the International Court.

---

## Iceland Nature Conservation Association

Iceland Nature Conservation Association

---

The United Nations Conference on Sustainable Development at Rio de Janeiro, 4-6 June 2012

- Comments by Iceland Nature Conservation Association

Almost twenty years after the Earth Summit in Rio de Janeiro mankind still faces enormous threats to the ocean environment, excessive even illegal unreported and unregulated fisheries, ocean acidification as a consequence of global warming, pollution of the marine environment and decline in biological diversity.

Despite the Rio Conventions and numerous other multilateral agreements on sustainable development, climate change is a growing menace to development, to resources, to food security <sup>1</sup> to the oceans. At the United Nations Conference on Sustainable Development in Rio de Janeiro, 4-6 June, governments must agree to measure to halt further destruction of the environment. In particular the focus must be set on the ocean environment.

Since UNCED in Rio 20 years ago, governments have failed. Furthermore, too many corporations have actively fought against sustainable development. Governments must put an end to energy production with coal and nuclear power. Oil consumption must peak very soon (2015) and toxic chemicals can never be made green. .

#### A Green Agenda for 2012

At Rio in 2012, world leaders need not rewrite the Rio Declaration or Agenda 21. Rather, they must live up to those agreements already made; make a real assessment of progress and honestly account for where the global community has failed. Such an assessment must address the excessive increase in corporate power the world has witnessed since Rio 1992. Sustainable Development Goals should be launched on the basis of development within planetary limits. The time-horizon for the goals should be no longer than two election periods at the most, to ensure immediate implementation and avoid gaps in the political commitment.

#### Improved governance

Governments must improve governance, accountability and liability of international environmental institutions and agreements. The UN Environmental Programme should be upgraded to a UN specialized agency status. In order to achieve sustainable development, the world needs a global authority on the environment as well as stronger implementation and enforcement mechanisms.

The world needs corporate accountability and liability. Globalization has created a gap in governance, providing an environment allowing companies to act as they please. In 2002, at the Johannesburg Earth Summit, governments acknowledged the need for global rules for global corporations. At Rio +20, they should agree to develop a legally binding instrument that ensures full liability for any social or environmental damage global corporations cause. Corporations themselves must take full responsibility for their supply chains;

Should agree on a phase-out of environmentally and socially harmful subsidies within this decade, including subsidies to fossil fuels, forest destruction, nuclear power, agrochemicals and other toxics, the meat industry and destructive fishing practises through socially just transition plans;

Should agree to bring the absolute consumption of renewable and non-renewable resources and the impacts of their extraction within planetary limits in a fair and equitable manner.

Clean and safe energy for all

At Rio +20, governments should commit themselves to a 100% renewable future by endorsing a long-term goal of powering the world economy with 100% sustainable renewable energy. More specifically, governments should pursue the most ambitious pathway outlined by the IPCC Special Report on Renewable Energy enabling 80 % of the world's energy needs to be met by renewable energy by 2050. By 2030, the world needs to get 40% of its energy needs from sustainable renewables sources and improve energy efficiency by 50%.

Bridging the Gaps in Oceans Governance and Stopping Overfishing

Gaps in oceans governance are hampering progress on marine protection. This gap must be bridged by a new agreement under the UNNCLoS) for the conservation of marine biodiversity and sustainable management of human activities in areas beyond national jurisdiction. Such an agreement should be based on the precautionary principle and the ecosystem approach and provide for the establishment and management of marine reserves in areas outside national jurisdiction

Governments should agree to take immediate actions to cut the overcapacity of the world's fishing fleets. At present, the world fishing fleet is able to catch up to 2.5 times the maximum sustainable yield. Yet the cumulative power of the global fleet is still increasing at a rapid rate. Bringing fishing yields to a sustainable level calls for decisive measures to eliminate the excess capacity. Reduction efforts should focus on large-scale vessels and be flanked by ensuring priority access to the resources for small-scale fisheries.

Industrial large-scale fleets using unsustainable fishing techniques using access agreements to exploit the Exclusive Economic Zones of third coastal states should be outlawed because it leaves these coastal states little or no economic and social benefits, but environmental destruction instead.

Implement a global network of Marine Reserves, which is essential to conserve and restore the health and productivity of the oceans and to maintain vital ecosystem services and food security for hundreds of millions of people. At the Johannesburg Earth Summit in 2002, governments agreed to establish networks of Marine Protected Areas (MPAs) by 2012. Yet today MPAs cover less than 6 % of territorial seas and only 0.5 % of areas beyond national jurisdiction. At a time when ocean ecosystems all over the world including coral reefs, seamounts and other sensitive habitats may be reaching tipping points, establishing networks of large-scale marine reserves becomes an indispensable tool to building resilience in ocean ecosystems. Conserving 20-30 % of global oceans through a network of MPAs could create a million jobs and sustain a marine fish catch worth US\$70-80 billion/year. Eventually, the global network of marine reserves needs to cover 40% of the oceans

Eliminate Hazardous Chemical Use

Governments should supplement and strengthen the existing commitments by agreeing to a goal of zero discharge of all hazardous substances within one generation, based on the precautionary principle and a preventative approach to chemicals management with the substitution principle at its core and producer responsibility to drive innovation in Green Chemistry and Toxics Use Elimination. This is crucial to rescue and heal our precious waterways and other fresh water sources;

Should agree on a related implementation plan to (a) establish a dynamic priority hazardous substance list for immediate action for the establishment and management of marine reserves in areas the EU, (b) establish intermediate targets, (c) establish a publicly available register of data about discharge emissions and losses of hazardous substances

Commit to providing adequate resources and frameworks for implementation, including: (a) identify priority substance restrictions, (b) introduce requirements of mandatory audits and planning (c) provisions of technical help and appropriate financial incentives (d) research and support for innovation in green chemistry.

Rio+20 must deliver tangible results for the people and our planet. The transition to a green economy must be fair and equitable, lift people out of poverty, respect planetary limits and secure decent jobs to people. As global climate-damaging emissions need to peak within a few short years, we cannot afford to make insufficient progress for yet another two decades. The time for action is now!

## Icelandic Cyclists' Federation

Contribution by the Icelandic Cyclists' Federation to the zero draft of the Outcome document to the UN conference for Sustainable Development in Rio 2012

The Icelandic Cyclists' Federation (LHM) understands itself as an environmental NGO in Iceland, as well as an organisation working for public health and rights issues. It is an umbrella organization of three bicycling clubs with altogether 2000 members. LHM is a member of the European Cyclists' Federation, ECF. LHM stands up for improved transportation equality in Iceland, aiming to improve the conditions for people who choose to bike. LHM sees advocacy for bicycling as an integral part of the bigger picture. Another important aspect of LHM's work is to promote improved access to other major environmentally acceptable modes of transport: walking and public transport.

On the event of the UNCSD 2012, LHM wants to make the following comments, roughly replying to the questions posed in conjunction with the preparation of the zero draft of the outcome document.

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

The Outcome document shall make reference to sustainable transportation with emphasis on non- motorized transportation as an essential part of the green economy, including clear and measurable targets.

Non-motorized transportation is the principal mode of transport of the poor and cycling is an important element in poverty alleviation and improved access to services.

LHM wants the conference to encourage mayors and ministers of transportation all over the world to adapt policies like the charter of Brussels and the Charter of Seville promoted by the European Cyclists' Federation (2011).

The charter of Brussels calls upon policy-makers to promote cycling and to set clear, measurable targets for cycling in terms of both modal share (the percentage of trips made by bicycle out of the total number of trips) and road safety.

The Charter of Seville underlines the benefits of cycling as a daily mode of transport, citing improved health, reduced traffic congestion, significantly cheaper infrastructure, and lowered transport emissions among many other advantages.

The benefits in terms of improved health on the municipal level are readily measured using the online resource HEAT (health economic assessment tool) for cycling, developed by the World Health Organization (2008). Similarly, the benefits of human-powered transportation in terms of mitigating greenhouse gas emissions have been assessed by an Icelandic study: increased walking and cycling comes as a net benefit of 38000 ISK (200 € as per 2011) per ton, even when the triple health benefits of increased physical activity and reduced air pollution and noise, are not counted (Davidsdóttir et al, 2009).

b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

LHM is pleased to see the recommendations from UNEP both generally and specifically in what they say on cycling:

In the report of the UNEP initiative Share the Road it is called for systematic investments in walking and cycling road infrastructure in the developing world, especially in Africa. The initiative recognises that roads so far have not been built for people on foot or on bicycles, and claims designation of road space for pedestrians and cyclists in proportion to the demand for non-motorized transport. The lack of facilities for non-motorized transport has been identified as one of the top reasons why pedestrians and cyclists make up a disproportionate amount of the 1.2 million who die in road crashes each year (2011a). While the content of this report marks a change of tide in the support for cycling and walking in The South, and makes many important observation and recommendations, it is worrisome that stakeholder organisations, like the European Cyclists' Federation, apparently have not been consulted, while the ties to the car organisation FIA are very evident.

Another important report issued by UNEP is Towards a Green Economy: Pathways to Sustainable Development and Poverty Eradication. In Part 2, Transport and Cities of this Green Economy Report, UNEP proposes a three tiered approach to sustainable transportation, namely trip avoidance, a shift to environmentally more efficient modes and only third to improve vehicles and fuel efficiency. On the modal shift they say:

Shifting to more environmentally efficient modes such as public and non-motorised transport (for passenger transport) and to rail and water transport (for freight) is recommended. Investment in public transport and infrastructure that promotes walking and cycling generates jobs, improves wellbeing and can add considerable value to regional and national economies (UNEP, 2011b).

Since already half of the global population lives in urban areas, sustainable development needs also to focus on cities. An emphasis on public transport, cycling, and 'walkability', for example, not only contributes to road safety and community cohesion but also works in favour of the urban low income class who rely on these transport modes much more than other segments of society. (UNEP, 2011c). LHM strongly agrees with these statements.

For this reason we comment on the question of the institutional framework for sustainable development that we would like to see the organisational strength and influence of UNEP substantially enhanced.

c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

The methods needed for implementation are the classical ones: More attention, more communication, the creation of specific programs and co-ordinator positions and cooperation with grass roots movements and academic experts. In the case of cycling promotion two special challenges arise:

(A) The multi-sectoral nature of the benefits promotion of bicycling sometimes means that in one instance bicycling promotion is viewed as a public health effort. In the next instance it is viewed as a solution to problems of congestion or local air pollution. Thirdly, bicycling appears in the toolbox for mitigating climate change. Next, bicycling is touted to improve resilience or as a generally positive symbol. Cycling and improved access is one of the most economically advantageous ways to meet those challenges, but if more of the benefits or co-benefits were considered, cycling would be seen as a much more desirable solution in each sector or problem area. In fact, we believe in the potential of the win-win situations particularly inherent in replacing car trips by bike trips. The inspiring example of the viability of the sustainable development endeavour achieved by increased bicycling modal share in cities, can induce change in other sectors, for instance more sustainable production and consumption, energy conservation, reforestation.

(B) There are barriers to bicycling promotion that on the surface seem to stem from work for public health, and the protection of life and limb. But in the greater scheme of things traditional road safety work is very often car-centric, and lead to severe restrictions on pedestrians and cyclists, while maintaining or increasing comfort and access for cars. This apparent dilemma or even paradox between improving access for healthy, green modes and improving road safety is being recognized as a falsity by a growing number of experts and NGOs (Wittink, 2001 and European Federation of Road Traffic Victims, 2011). Sadly, UN agencies like the World Health Organisation, UNICEF and the Decade for Road Safety seem to a large extent stuck in the trap of road safety thinking from the 1960's, by promoting restrictive safety measures directed towards cyclists and pedestrians, in the tradition of "blame the victim, protect the rapist". Examples of different and sounder approaches are traffic calming, the establishment of stricter liability in the event of crashes between cars and pedestrian/cyclists, street reclaiming for pedestrians and cycling, road diets/traffic evaporation etc.

Concerning which institutions we propose should be involved, it is a well established practice for national governments in Europe, and for major cities worldwide, to develop and implement policies and strategies to promote cycling. Improved access in a broad sense for green and healthy modes (i.e. walking and cycling) and even restrictions on the speed and ubiquity of private cars is a central tenet of these programs. Other countries and cities would do well to emulate them.

Engineering and Planning education needs reforming, although reforms are well underway at many universities. Those professionals already in top positions need adult education to take in the new insights that the soft, green modes provide realistic (arguably more realistic) and very economical solutions to the challenges faced in cities today and in the future.

The World Bank appears to be active already in cycling promotion. As an example a World Bank representative participated the international cycling conference Velo-City 2007, conveying experiences from World Bank dealings with Chinese authorities in the area of cycling promotion. The IFIs should look into the evidence base and best practices, and step it up.

Road safety work needs to take into account the bigger picture, and adopt insights from the Road Danger Reduction approach. Traditionally, the emphasis has chiefly been on the number of casualties and the cost of measures. Instead, the broader public health, environmental and resource issues of road traffic need to be integrated, taking into account the systemic effects of motorisation that leads to sprawl, alienation, intimidation. Very often vulnerable groups such as the poor are even more affected. There is a need for competence building in this field and the close co-operation of environmental and health agencies on the one hand and development and road infrastructure programmes on the other to reverse or adjust the traditional car-centric approaches.

d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

LHM proposes that the Rio+20 conference encourages national and local governments to incorporate public transport, walking, and especially biking into their agendas for a green economy and make sure that by 2020 at least 10 % of the expenditures for transportation infrastructure are spent on a mix of bicycle facilities: bicycle paths, bicycle lanes, medium to high quality bicycle parking etc. The cooperation mechanism often used is network building. In the field of bicycling, the European Cyclists' Federation (ECF) is one of the better hubs for such networking. ECF has increased its global scope during recent years.

People at UNEP, World Bank, national agencies, national and local governments, NGOs etc should attend, present papers and network at the yearly Velo-city bicycling conferences. The conference series is managed by the European Cyclists' Federation. The ECF has also established the networks Scientists for Cycling and Cities for Cyclists, amongst other initiatives.

The goal for the modal share of bicycle trips should be at least 15% by 2020. Where the proportion of bicycle trips (modal share) is already that high by now, as it is the case in many Asian and European cities and towns, further-reaching targets should be set. Copenhagen is at about 35% and wants to head for 50%. Again, the ECF, together with Interface for Cycling Expertise and others are competent partners or hubs.

Finally, advertisements for cars should ideally carry a health warning comparable to how tobacco packaging or advertisements are labelled in many countries. Some countries ban advertisements for tobacco and alcohol. In the future severe restrictions on advertising for private cars will probably be considered. Instead, social marketing and positive campaigns for healthy transport is needed.

Harmful grey (counter-green) subsidies need to be reversed (Bruvoll, Skjelvik, and Vennemo, 2011). Further, re-education of politicians, bureaucrats, planners and engineers should be considered. It can be expected that those measures will pay for themselves.

Written by Ursula Zuehlke and Morten Lange for the Icelandic Cyclists' Federation ( [www.lhm.is](http://www.lhm.is) ), October 2011.

## ICLEI - Local Governments for Sustainability

Contribution to the Zero Draft of the Rio+20 outcome document

31 October 2011

We all know we currently live beyond the carrying capacity of the planet. In 2050, about 9 billion people will live on this planet – how can we ensure at least basic, decent livelihoods for all with more equity and social justice while climatic changes will have taken effect, scarcity will have led to significant price increases in water, food mineral oil, natural gas, and many materials? ICLEI's vision is not to merely look at the status quo and make incremental improvements to it, but rather to consider the systemic changes we need to make now in order to ensure sustained human life on earth. That is the crucial context of ICLEI's input towards, at and beyond Rio+20.

In ICLEI's view, the world does not need another declaration. If Rio+20 is to be a worthwhile multilateral conference justifying the enormous financial and human resources invested in it, Heads of States and Governments have to be personally involved in jointly deciding upon and presenting concrete actions.

### 1. Context: cities and urbanization

#### 1.1 The challenge and potential of urbanization

The increasing speed and scale of Urbanization have turned this trend into an emerging global issue. While in 1950 less than one-third of the world's population lived in cities, by 2050 over two-thirds of the world population will be living in urban areas. In the next 40 years we have to build the same urban capacity which we have built in the past 4000 years. Building quality urban fabrics that provide livelihoods and opportunities for people of all economic backgrounds, so rapidly and at such enormous scale, is the defining challenge humanity faces. The standards along which these urban structures will be designed will decide whether their future inhabitants will be locked into the current life-styles of resource-intensity and dependency on fossil fuels, or if they will become the models for future urban fabrics based on carbon neutrality, minimal use of natural resources, closed economic cycles and social inclusion.

ICLEI calls for a UN Decade of Sustainable Urbanization to raise awareness, create synergies and to share solutions and good practices.

ICLEI helps its 1200 members in 73 countries to work towards eight goals: to implement integrated sustainability policies, to increase resource-efficiency, to become bio-diverse cities, to move towards climate neutrality, to create a resilient community, to green the infrastructure, to transition to a green urban economy and to establish a healthy and happy community. If the cities of the world reached these aims, most global environmental targets would be reached.

ICLEI submission for Rio+20 Compilation Document for Zero Draft – 31 October 2011 2

#### 1.2 Resource productive cities –a vision for green urban economies

Yet in the long term, we have to go even further. Considering the widening gap between the resource demands of growing populations and economies, on the one hand, and declining natural resource base and carrying capacity, on the other hand, there would appear to be only one real solution. Our cities need to themselves be designed and managed to produce more and more of their own resource inputs.

We need to redesign existing urban areas and systems, we need to build new ones that generate substantial amounts of their own resources within the urban region, in particular their energy, food, and even water. Put in economic terms, cities need to be even more productive engines of economic growth by 'growing' a substantial part of their own resource base.

This investment in the resource productivity of cities and urban systems, which until now have been extractive, resource consuming systems, is the central opportunity and challenge of the green urban economy.

#### 1.3 Cities: hubs of green growth

Economic growth in both developed and developing countries has been and will be concentrated in their cities. It is estimated that between 2005 and 2025 some 200 trillion dollars will be spent globally on fixed urban assets. Most of this expenditure will occur in developing countries, but often involving the engineering, infrastructure, architectural,

technology, and construction companies of developed nations. McKinsey & Co estimates that 46 trillion dollars will be spent on fixed urban assets in China alone during the 2005 to 2025 period.

ICLEI sees in the channeling of this expenditure towards more sustainable urban designs, systems and materials a tremendous 'green growth' opportunity. Incentives should direct growth towards resource-productive, resilient, low-carbon and low-risk urban infrastructure. Local Governments need the powers as well as supportive national and global regulatory frameworks to channel this expenditure towards creating sustainable urban systems – to set the standards for all human settlements.

ICLEI's white paper "Financing the Resilient City" of June 2011 argues that finance for resilience and adaptation need to be demand-driven, rather than having conventional top-down global financing mechanisms determining in a top-down fashion which local actions are eligible for funding. This demand-driven model of urban adaptation financing may be a pilot case of demand-driven finance in other areas.

The concentration of economic growth in cities and the relevance of the performance of urban systems to global sustainability may be regarded as common ground between developing and developed countries.

## 2. Green economy in the context of sustainable development and poverty eradication

### 2.1 Beyond the '3 pillars': economy must serve the people and the planet

The common conceptualization of sustainable development as having three pillars – social, economic and environmental – is misleading. While there is an interconnection between the three spheres, ICLEI doubts that they can be seen as equal and the concept of "harmony" between them is solid. Why should humans and their societies, and why should the environment be brought in harmony with the economy?

ICLEI sees the economy as a servicing system, not as an end in itself. The economy is dependent upon productive and functioning natural resources and ecosystem services, which it processes into products and services for people. It is thus the mechanism between nature and humans. It must ideally use as little natural resources as possible to enable as many people as possible to live well. With an increasing global population and finite natural resources, this is essential in order to secure decent livelihoods for all human beings now and in future. The way the economy works – whether wasteful or efficient, whether polluting or clean, whether exploitative or just – determines the extent of sustainability of our civilization.

### 2.2 The need for Sustainable Development Goals

ICLEI supports that one central outcome of Rio+20 should be Sustainable Development Goals (SDGs), the framework and goal set for action until 2050:

- SDGs must ensure that in 2050 all 9 billion people will be able to live within the planetary boundaries with decent living conditions. Continuing with a business-as-usual approach will lead to a dearth of natural resources and the possibility of conflict over scarce remaining natural resources. This threat must be addressed decisively and immediately.
- SDGs should be based on scientific evidence and expertise, particularly regarding current assessments and projections for 2050 under business-as-usual and other models, as well as analyzing which actions now would lead to which revision of trends.
- SDGs should be quantifiable, measurable, reportable and verifiable.
- SDGs must address urbanization and its impacts on sustainable development of all societies on this planet. Urbanization trends are interlinked with most of current key challenges such as poverty and resource scarcity exacerbated by climate change, biodiversity loss and globalization.
- SDGs must include clear targets for global sustainable development standards to be met jointly by all actors. It should also set up a centralized registry of commitments that keeps track of which country or institution has agreed to do what, and the extent to which that commitment has been fulfilled.
- Local Governments and Local Government Organizations (LGOs) such as ICLEI will be crucial for successful implementation of SDGs and should be included in relevant global decisions on the definition of SDGs. Discussions on SDGs and governance should be ICLEI submission for Rio+20 Compilation Document for Zero Draft – 31 October 2011 4 interlinked, since good sustainable development governance at global, national and local level will be crucial for the successful implementation of the SDGs.
- SDGs should be clearly linked to and seen in conjunction with the Millennium Development Goals (MDGs).

### 2.3 Towards a green and sustainable economy: beyond GDP

When considering the green economy in the context of sustainable development and poverty eradication, it is not a question of environmental protection or economic growth, but rather a structurally and qualitatively different type of economic growth which values the finite natural resources the economy relies upon. This is the idea behind green economy in the context of sustainable development and poverty eradication. After the financial and economic crises the world has undergone in the past years, we must once more realize that the current global economic model is unsustainable.

Gross Domestic Product (GDP) is the most widely used metric of the economic performance of a country. However, it is now widely recognized that GDP is an inadequate measure of social progress: measuring efforts and not results, focusing only on quantity of expenditure and not quality, masking inequalities, and disregarding the value of natural capital.

Developing a more comprehensive indicator would allow for more nuanced performance measurement. The Human Development Index (HDI) and other alternatives have existed for a long time. More recently Bhutan's Gross National Happiness Index and the OECD's Better Life Index among others have also gained some recognition. ICLEI welcomes and supports the recent efforts made to seek more nuanced measurement of performance and considers it possible to move to a better indicator of national well-being than GDP.

ICLEI expects the Rio+20 Conference to take a decision to generally introduce a new performance measurement framework for countries and their economies.

ICLEI demands that such improved indicator(s) should allow for being translated into locally used indicators as part of a coherent global monitoring and evaluation framework for globally and nationally agreed targets.

As part of the transition to a green economy, ICLEI requests that existing ideas such as the internalization of costs and the 'polluter pays' principle must finally be fully implemented. In addition, ICLEI proposes the introduction of a new principle, the 'beneficiary pays' principle, for the sake of inter-generational justice: those actors of the current generation who use and benefit from the use of resources or natural capital have to bear the full costs. In the energy sector, for example, energy prices from diverse sources would be extremely different under the 'beneficiary pays' principle. Since the current use of fossil fuel both depletes finite resources and pollutes the planet for future generations, a fairer price for the long-term effects of that which benefits us today should be levied.

## 2.4 Green urban economies for a global green economy

The largest 100 urban areas alone are estimated to have contributed about 30% to the global GDP in 2005. Due to the geographical concentration of people, infrastructure, knowledge, economic activity and resources, cities are able to achieve 'more with less' - or, in other words, to turn density and urban systems into eco-efficiency. Local governments are already working in multiple areas which form part of the green urban economy, such as sustainable procurement, green buildings and infrastructure, improving waste management, access to sanitation et cetera.

ICLEI sees greening the "urban" economies as an essential part of the global transition to a green economy.

LGOs such as ICLEI can draw upon the vast implementation capacity of cities around the world, thus tapping into a large potential for green economy transitions. A green urban economy realizes opportunities to enhance human well-being and local natural resources, while reducing future costs, ecological scarcities and environmental risks. Developing green urban economies will have direct positive local effects such as an enhanced well-being of the local population, keeping more resources in a local economic cycle, a prevention of future scarcities in natural resources and energy, and reduced future costs for maintaining urban infrastructure and social services, and reduced consequential costs to future generations for dealing with impacts of today's economy. ICLEI as the largest global network of local governments working towards sustainability commits to a focus in its work with its local government members around the world to green their urban economies, piloting best practices that may be followed by others.

## 2.5 A Green Economy Roadmap is one option

A Green Economy Roadmap has been proposed by the European Commission. It seeks to map out the "what, how and who" of a transition to a green economy, proposing specific actions that could be implemented at the international, national and regional levels. More precisely, it envisions (1) investing in key resources and natural capital ("what"), (2) combining market and regulatory instruments ("how") and (3) improving governance and encouraging private sector involvement ("who").

Such a Roadmap is one of the options that may support a global transition to a green economy. It should explicitly include and support greening urban economies. It would have to be supported by countries of different economic development and take account of their different circumstances. ICLEI fully agrees with the need to invest in key resources and natural capital as a basis for future economic activity and human well-being. ICLEI realizes that economic and financial mechanisms must be used to address these challenges.

ICLEI demands the full inclusion of relevant actors such as local and regional government, business and civil society in such a roadmap.

## 3. Institutional Framework for Sustainable Development

Over the past decades the world has realized that social, environmental and economic issues transcend political borders. Since the UN Conference on the Human Environment in Stockholm in 1972, a huge number of global bodies have been created dealing with issues that form part of sustainable development. Despite these efforts, the world recently experienced major financial crises and is witnessing a continuing loss of biodiversity, escalating climate change, widespread resource depletion, and other challenges, which the current institutional framework seems unable to adequately address.

Numerous trends and indicators show that the planet and its human beings are facing severe threats to their livelihoods and survival in the present or near future.

At the beginning of the 21st century, we must realize that our current global institutional set-up has failed to set the world and global society on a sustainable path. The time has come for significant revision of the global institutional framework for sustainable development.

### 3.1 Involving all relevant actors in decision-shaping and implementation

ICLEI submission for Rio+20 Compilation Document for Zero Draft – 31 October 2011 6 Based on Agenda 21, relevant UN bodies such as the UN Department of Economic and Social Affairs (DESA), the UN Framework Convention on Climate Change (UNFCCC), the UN Convention on

Biological Diversity (UN CBD), the UN Convention to Combat Desertification (UNCCD) and the UN Environment Programme (UNEP) recognize the so-called "Nine Major Groups": Business and Industry, Children and Youth, Farmers, Indigenous Peoples, Local Authorities, NGOs, Scientific and Technological Community, Women as well as Workers and Trade Unions. Since Agenda 21 was adopted in 1992, the involvement of Major Groups has enriched the debates at the UN and brought relevant voices to the table. Yet the current structure has clear limitations. The current nine groups are very different in their identity, roles and powers, yet they are equal in the UN system.

ICLEI believes that Rio+20 provides an exceptional opportunity to enhance the current Major Group structure. Criteria such as the stakeholders' mandate and capacity to contribute to the implementation of multilateral agreements, to organize commitments to action by their constituencies, to establish performance monitoring systems and to provide regular global reports, i.e. their ability to submit themselves to a accountability framework, need to be taken into consideration.

Possible new Stakeholder Groups could be "Governmental Stakeholders", "Business and Trade Unions", and "Civil Society" including indigenous people, women, science, farmers, youth and NGOs.

ICLEI as a Local Government Organization and as such part of the proposed Governmental Stakeholder Group focuses on that group.

ICLEI proposes that local and regional governments as recognized "governmental stakeholders" in the UNFCCC process should be given responsibility and be involved in decision-shaping that concerns in particular sustainable development and greening our economies. Local governments and

LGOs play a crucial role in the implementation of multilateral environmental agreements (MEAs). ICLEI is currently developing precise suggestions for models of enhanced governmental stakeholders' participation in policy-shaping and implementation, to be publicly proposed ahead of Rio+20.

At a time when there appears to be general consensus that the ability of the United Nations as an international organization of the sovereign states of the world to bring about binding frameworks to safeguard global environmental assets such as climate stability within the necessary timeframe, an institutional framework should be created that involves "relevant actors" besides nation states and integrates them into a system of commitments, actions, performance monitoring and reporting.

ICLEI believes that if the UN wants to fully live up to the spirit of its Charter, not only to "maintain international peace and security" (Article 1.1), but also to "achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character" (Article 1.3), it needs to move – in its functionality – beyond the definition of "United Nations" and to becoming the "United Actors".

### 3.2 A need for integration and coherence – Sustainable Development Council?

As outlined above, we need to move beyond thinking in terms of three pillars of sustainable development. This has clear implications for the institutional framework for sustainable development (IFSD). The economic, social and environmental spheres cannot be separated into pillars which stand on their own. There is a clear need for a coherent, integrated IFSD which recognizes the economy's absolute dependency on ecosystem services, and society's primary role in using, crafting and shaping the global economy to create meaningful and low-impact quality of life for all.

ICLEI believes that the creation of a UN Council on Sustainable Development is a worthwhile option to be considered. Such a Council could serve to increase coherence and coordination among the different global organizations working on sustainable development and it could be the forum for dialogue among countries, governmental stakeholders, business and civil society regarding sustainable development. ICLEI will remain engaged in the process of designing such Council.

### 3.3 The need for a UN or World Environment Organization

ICLEI supports the need for a single organization which works on all environmental issues in a comprehensive and coherent manner, which could be a UN Environment Organization (UNEO) or a World Environment Organization (WEO).

Integration and coherence in the environmental sphere will be one step towards integration and coherence in sustainable development governance. ICLEI believes that UNEO/WEO as the one organization dealing with all aspects of environment and taking care of the finite natural resource base at the global level will be better placed to relate to and discuss important issues with those organizations regulating the global economy and aiming to ensure social well-being. This organization should have universal membership to ensure the highest possible legitimacy and authority. Such an organization would also be helpful for Local Governments and global LGOs in order to link global and local environmental policy and implementation. ICLEI supports the idea to upgrade UNEP into a UNEO or WEO.

### 3.4 New Intergovernmental Panel on Sustainable Development

The United Nations, UN Member States and all other relevant actors need to be clear about where key global developments (such as global warming, water availability, soil degradation, desertification, food production, etc.) must stand in the years 2020, 2030, 2040 and 2050 in order for human civilization on the planet to be on a sustainable path. This is the function of the Sustainable Development Goals (section 2.2 above), which need to be quantitative, measurable, reportable and verifiable. The definition of these goals must be based on scientific evidence and expertise as postulated in section 2.2.

The Intergovernmental Panel on Climate Change (IPCC) has been in operation since 1988 and the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) was recently created. Each Panel forms the interface between science and policy for their area of focus. Sound political decisions on sustainable development issues require a solid scientific base, making these two Panels highly important and useful. Yet ICLEI believes that one has to be careful to avoid fragmentation in the institutional framework.

To this end, ICLEI proposes to create an Intergovernmental Panel on Sustainable Development (IPSD). This Panel would inform the most important global political decisions for the long-term future.

This Panel would be the overarching body for IPCC, IPBES and any other relevant science/policy bodies. Details of the IPSD would have to be worked out after Rio+20.

### 3.5 Sustainable development governance and the local level

While the above-mentioned changes in the institutional framework for sustainable development have been proposed in order to improve the horizontal integration, vertical integration within a multi-level governance system needs to be improved as well.

Local governments are considered the closest and most responsive level of government to the needs of their citizens, electorate and local interest groups. How sustainable development governance works at the local level varies widely. An analysis of the progress and variety of sustainable development governance and action at the local level is currently being carried out for the Local Sustainability 2012 global study. The study will critically evaluate 20 years of Local Agenda 21 and other sustainable development initiatives. The results of the study will be published in early 2012 and will be fed into the Rio+20 process.

Regardless of how the administrative structure for sustainable development is set up, local governments are crucially important to steer sustainable urban development. They provide urban services (water, waste, sanitation, public transport, fire and police, administration, education et cetera), regulate building codes and land-use, respond to public pressures, and leverage, align and allocate large amounts of investments. Their influence is immense: to direct sustainable urban development by utilizing renewable energy, adapting to climate change and building resilience, reducing greenhouse gas emissions and local pollution, reducing consumption and using resources more efficiently, amongst others.

The past two decades have seen a strong decentralization of public tasks from the national level to the local level, mostly without equipping local governments with sufficient power and resources needed to implement these tasks. ICLEI demands that in order for local governments to take on the responsibilities and tasks outlined above, adequate financial resources have to be provided and supportive fiscal and legal national framework conditions have to be established.

Endowed with appropriate capacity, local governments will be the strongest allies of national governments and the United Nations in creating conditions for a sustainable human civilization on Earth.

---

## Iguassu Iterei Centro de Referência do Movimento da Cidadania pelas Águas Florestas e Montanhas (ITEREI)

### Rio+20 Proposal

1. PES incentives for preservation for all natural mountain areas
2. Alert with dependence and addiction with compensation mechanisms
3. Support Sustainability based upon ecotourism, research, art, crafts, no pollutant industries, agroecology and traditional mountain knowledge
4. Increase dialogue between government sectors, and government levels
5. Support a Stronger Civil Society
6. Increase inter-institutional dialogue
7. Further institutionalization of participation instruments
8. Raise awareness of mountain issues on political agendas
9. Consolidate or create specific mountain initiatives where appropriate
10. Improve sustainable mobility and sustainable technology for infrastructure

11. Improve knowledge and information systems
12. Improve data on natural mountain disaster
13. Increase availability of academic and traditional knowledge for specific SMD purposes and decision makin
14. Coordinate research priorities for implementing SMD
15. Consolidate or create specific national or regional mountain initiatives
16. Research and monitoring of climate change adaptation mechanisms, especially with regard to water availability

## Independent Accountability Mechanisms (IAM)

Citizen-driven Accountability for Sustainable Development:

Giving Affected People a Greater Voice—20 Years After

A Contribution by the Independent Accountability Mechanisms to UNCSD 2012

In the twenty years since the 1992 Earth Summit in Rio de Janeiro, a new set of Independent Accountability Mechanisms (IAMs) has been established as part of the governance structures of International Financial Institutions (IFIs), in response to increased public demand for greater accountability and transparency. The IAMs were founded with similar mandates—to provide recourse for citizens adversely affected by projects funded by the IFIs when relevant social and environmental safeguards are perceived to have failed – and have formed an IAM network that regularly interacts to exchange knowledge and experience. This contribution was prepared on behalf of the IAM network by a sub-group of members tasked with helping prepare for UNCSD 2012, and which included the World Bank Inspection Panel; Compliance Advisor/Ombudsman (CAO) for the International Finance Corporation (IFC) and Multilateral Investment Guarantee Agency (MIGA); the Inter-American Development Bank (IDB) Independent Consultation and Investigation Mechanism; and the European Investment Bank -- Complaints Mechanism.

Core Messages for the Outcome Document

Twenty years of experience of independent accountability mechanisms at International Financial Institutions have shown that “citizen-driven accountability” works, and is critical for an effective institutional framework for sustainable development. These accountability mechanisms have pioneered a new means to give greater voice to citizens affected by IFI-financed projects, in support of better outcomes for people, for the environment, for development and for the institutions involved. The work of these accountability mechanisms provides an important example of ways to strengthen the effective implementation of sustainable development going forward.

### EXECUTIVE SUMMARY

The first major step in the development of the independent accountability mechanisms occurred in 1993, in the wake of the Earth Summit in Rio de Janeiro and in response to widespread concerns voiced by civil society about the social and environmental impacts of projects financed by the World Bank. As a result, the World Bank’s Board of Executive Directors established an independent mechanism, the Inspection Panel, with a mandate to receive and investigate complaints from people about social and environmental harm linked to Bank-financed operations. This pioneering approach of “citizen-driven accountability” provides a direct channel for citizens affected by projects to voice their concerns at the highest levels of decision making. Since then, all the major IFIs around the world have established their own independent accountability mechanisms (IAM), each based on a simple premise: giving affected citizens a greater voice in international development decisions that affect their lives.

Twenty years on, these mechanisms constitute an effective architecture to promote accountability, participation, and sustainability in the work of International Financial Institutions (IFIs). Through their work to address concerns of affected communities in diverse regions, sectors and environments, the IAMs have developed a solid body of findings related to IFI-financed projects. This collective experience provides a unique contribution to the discussion about the challenges of sustainable development and poverty reduction at UNCSD 2012, as well as lessons on how to strengthen accountability for sustainable development going forward, which the IAM network proposes to share with the international community.

### Brief History

In June 1992, the international community gathered at the United Nations conference on Environment and Development in Rio de Janeiro to chart a new cooperative approach addressing interrelated issues of socio-economic development and environmental protection. Among other things, the Rio Summit contained strong calls for expanded participation of civil society and the public, in particular for strengthening the role of major groups such as indigenous peoples, nongovernmental organisations (NGOs), workers, farmers, trade unions, women, and youth in development. These and other actions reflected an evolution in the international community towards a more inclusive approach, whereby affected citizens were given the opportunity to participate as actors and decision makers in their own development.

One of the flashpoints leading up to the Summit involved the activities of international financial institutions (IFIs), in particular, the World Bank. In those years, there was growing international concern about negative social and environmental impacts of World Bank-financed projects. A core concern was that the Bank was not respecting its own policies, designed precisely to avoid such impacts and thereby promote sustainable development and outcomes. There was also widespread concern about lack of transparency in the decision-making processes. Some projects were seen as “development disasters”, and affected communities felt voiceless in response.

It was within this context, and the new paradigm set by the Summit, that civil society, donors and some governments began to call for greater accountability, participation, and transparency in the operations of IFIs, initially, at the World Bank. As a result of remarkable efforts by civil society, governments and members of the Bank’s Board of Executive Directors, the Board established the independent Inspection Panel in 1993. It was given the authority by the Board to respond directly to the complaints of affected people and investigate whether operations supported by the International Bank for Reconstruction and Development (IBRD) and the International Development Association (IDA) (two institutions of the World Bank Group) were in compliance with World Bank policies and procedures, and related issues of harm.

This new bottom-up, citizen-driven accountability at the World Bank was a pioneering step not only among IFIs, but in international law generally. The Panel was the first such mechanism established by an IFI providing a direct channel for citizens affected by projects to voice their concerns at the highest levels of decision making. This innovation was followed in 1999 with the Board of Executive Directors’ creation of the Office of the Compliance Advisor/Ombudsman (CAO), an independent mechanism providing dispute resolution and compliance oversight to citizens affected by the Bank’s private sector operations financed by two other institutions of the World Bank Group, the International Finance Corporation (IFC) and Multilateral Investment Guarantee Agency (MIGA).

In the intervening years, the IFIs, as well as some bilateral agencies, have followed this lead by establishing their own accountability mechanisms to address citizens’

concerns about social and environmental project impacts—including the African Development Bank, the Asian Development Bank, the European Bank for Reconstruction and Development, the European Investment Bank, and the Inter-American Development Bank.

Over the years, these independent mechanisms have already gone through a round of reforms, as well as consultation procedures with civil society, and have become a central part of the governance structures and the institutional frameworks of the IFIs. In this sense, these IAMs are “children” of Rio, and reflect some 20 years of operational experience in giving life to its core principles of participation and sustainability. Their objective is to promote greater accountability and sustainability in IFI operations and thus better outcomes for people and the environment.

#### The Architecture for Citizen-driven Accountability

While the structure and functions of the accountability mechanisms vary from one institution to another, they operate on the basis of several core principles which together form a common platform. These shared principles include independence, impartiality, transparency, and integrity, in addition to ensuring maximum accessibility and responsiveness to people affected by IFI-financed operations.

Typically, the mechanisms are modelled around two complementary functions in responding to complaints from affected people: a “consultation” or “early problem solving” function; and a “compliance review” function. In addition, each of the mechanisms has a budget and capacity to carry out independent fact-finding to investigate whether the IFI management has complied or not with applicable operational policies and procedures, including policies designed to avoid or minimize harm to people or the environment. In this way, these mechanisms constitute important international fact-finding bodies charged with looking into key issues of compliance, harm and sustainability in the operations of IFIs. On the basis of their fact-finding, the mechanisms develop independent reports to the highest levels of decision making at their institutions, which include their findings in response to the claims from affected communities, and the institutions have a responsibility to take action to address findings of non-compliance and harm.

As the mechanisms have evolved over time, new elements have been included, such as post-investigation monitoring and evaluation of outcomes. The IAMs are currently putting together a comparative analysis of each of the individual mechanisms, which will provide a horizontal view of the IAMs and how they function. It is hoped that this comparative view will be of value in identifying opportunities, challenges and best practices for strengthening systems of accountability at international organizations as part of the forward looking agenda noted below.

#### Outcomes and Trends in the Work of the IAMs Over 20 Years

The IAMs have made substantial contributions to the evolution of the IFI's social and environmental performance by pursuing issues of compliance and responsible application of standards. Their work has also created opportunities for the design of development projects to be improved by giving affected communities a voice, and ensuring their concerns are heard and acted upon by IFI management, local and national decision makers, and public and private sector operators. Twenty years of experience among the IAMs has produced a solid body of independent findings spanning multiple regions, development activities, cultures, and environments around the world. This provides a unique glimpse into the practical challenges of sustainable development and poverty reduction from a grassroots perspective.

As a contribution to Rio+20, the IAMs are gathering data from their work to highlight the types of systemic risks, issues, and trends evidenced in complaints from affected communities over the past 20 years. As global development increases so it comes with increased risk, and the work of the IAMs reflects the greater pressures that exist on demand for food, water, land, and energy. These data will highlight the types of social and environmental risks that drive complaints to the IAMs, including competition over natural resources, public and private assets, and the socio-economic concerns which underlie many complaints, as people raise questions about access to project benefits, job creation, and impacts to livelihoods. In addition, through the IAMs, affected communities have sent a clear message about consultation and information disclosure, project processing and supervision, which points to the importance of good local participation for development projects to be successful.

#### The Forward Looking Agenda

As the international community looks to the next twenty years, it is likely that governments, donors, and IFIs will still struggle to find the right balance between economic growth, social development, and environmental protection—now being captured under various headings such as “green economy” or “green growth”. Following the Rio Summit, new and innovative financial instruments have been created to fund sustainable development involving not only public but also the private sector. The international aid architecture is also evolving towards a model with greater emphasis on country ownership, balanced with results orientation and mutual accountability. The issue of ensuring accountability becomes even more relevant in this context.

The cumulative experience of the accountability mechanisms is a valuable addition to this debate and could contribute to how development actors achieve that balance and help refine the role they play in underpinning sustainable development outcomes.

---

## Indian Himalaya Mountain Partnership

As Mountain Partnership member from Indian Himalayan region please find below our comments / suggestion for Rio+ conference:

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for natural goods and ecosystem services from mountains have grown considerably. Moreover, the ability of mountain ecosystems to provide such essential goods and services for all of humanity is increasingly under threat due to climate change, in-discriminate development, poor governance and lack of appropriate financing in this region.

As Mountain Partnership members we recognize that despite the progress that has been made in promoting sustainable development of mountain regions, national and international development agendas still treat mountains, if at all, as marginal environments. As a result, poverty rates are higher than in non-mountain areas, therefore, the people are most vulnerable to climatic changes, poor development practices and lesser livelihood opportunities.

In the context of a Green Economy, the region is looking for cautiously chosen opportunities for investments by interested players and they could in renewable energy, sustainable agriculture, agro-forestry, water management technologies and other similar ecosystem goods and services. In this context innovative institutional arrangements are urgently required to trigger best governance models and decision support systems aiming at both the integration of the social, environmental and economic capital at all scales in the mountain regions, as well as the actual mainstreaming of mountains into overall national development and conservation processes.

Also enhancing the global political commitment that translates into increased investments tailored to mountain regions will directly benefit poor mountain communities and indirectly humanity as a whole. Hence, sustainable mountain development, notably through integrated and socially inclusive policies, livelihood opportunities, environment governance models, appropriate green technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

---

## Indigenous Peoples

### INDIGENOUS PEOPLES MAJOR GROUP SUBMISSION FOR THE ZERO DRAFT OF THE OUTCOME DOCUMENT OF THE UNCSD/RIO + 20

Co-organizing Partners for the Indigenous Peoples Major Group: Tebtebba (Indigenous Peoples' International Centre for Policy Research and Education), Indigenous Environmental Network (IEN) and Indigenous Information Network (IIN)

1. Representatives of Indigenous Peoples' communities, organizations and networks from Latin America and the Caribbean, Asia, Africa and North America, gathered together in a Global Preparatory Meeting of Indigenous Peoples on Rio+20 and Kari-Oca 2 last August 22-24, 2011 in Manaus, Amazonia, Brazil. The key objective of this process was to discuss and agree on how Indigenous Peoples will engage and contribute effectively in the preparatory processes and the conference proper of the UN Conference on Sustainable Development/Rio+20. The participants united on the "Manaus Declaration: Indigenous Peoples In Route To The Rio + 20 Conference" and most of the conclusions and recommendations from this are integrated in this submission.

2. At the Earth Summit in Rio de Janeiro in 1992, we, the global Indigenous Peoples' caucus, agreed on the "Karioca Declaration of Indigenous Peoples". The official outcomes of Rio 92 include the Rio Declaration and Agenda 21 which recognized the vital role of Indigenous Peoples in sustainable development and identified Indigenous Peoples as one of the 9 Major Groups. During the World Summit on Sustainable Development (2002) in Johannesburg, South Africa, we gathered again and came up with the Kimberley Declaration and the Indigenous Peoples' Plan of Implementation for Sustainable Development. We used this Plan as the framework in our work around sustainable development up to the present. In Johannesburg, more than 100 Heads of States recognized the "vital role of Indigenous peoples in sustainable development." It was the first time that a High Level UN Summit used the phrase "indigenous peoples" in its Outcome Document. This helped us get the phrase "indigenous peoples" to be used by the UN Declaration on the Rights of Indigenous Peoples (UNDRIP) which was adopted by the UNGA in 2007.

3. Twenty years after Rio 92, the Global Indigenous Peoples' Caucus would like to present these 5 key messages which hopefully will be included in the Zero Draft and the Final Outcome Document of the UN Conference on Sustainable Development.

#### 1st Key Message:

The UN Declaration on the Rights of Indigenous Peoples should be a key international standard and framework for the realization of sustainable development.

4. Almost twenty years have passed since Rio 1992 where the States and Peoples of the world made a firm commitment to the implementation of a new vision for Sustainable Development. However, twenty years later, Indigenous Peoples see that little has changed regarding the fundamental relationship between human societies and the natural world. The ecosystems, biodiversity, as well as Indigenous Peoples who depend on them, are ever more threatened and endangered. Our basic individual and collective human rights, are violated on a daily basis. In the absence of a true implementation of sustainable development and respect for human rights, the world now confronts a multiple crises. These include, the ecological, economic, social, political and cultural crises. These are manifested in climatic change; biodiversity erosion; desertification; deglaciation; food, water and energy shortage; a worsening global economic recession; social instability and unresolved conflicts and a crisis of values.

5. The UN Declaration on the Rights of Indigenous Peoples (UNDRIP) has been adopted by the UN General Assembly after Rio and Johannesburg. Thus, our first key message is for the Outcome Document of Rio Plus 20 to acknowledge that the UNDRIP should be a key international standard and framework for the global, regional and national implementation of sustainable development, biodiversity conservation and sustainable use and climate change mitigation and adaptation. The Declaration provides a framework for the full and effective participation of Indigenous Peoples in all stages of the Rio + 20 process. It contains 6 Articles on free, prior and informed consent (FPIC) including the need to obtain this before any development project is brought to indigenous peoples' territories. FPIC is the standard to be applied in the development process affecting indigenous peoples.

6. The Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits (2010) which was adopted at the 10 COP of the Convention on Biological Diversity and the Cancun Agreements (2010) of the 16 Conference of Parties of the UN Framework Convention on Climate Change have noted the adoption of the UNDRIP. Other UN Treaty Bodies like the Committee on the Rights of the Child (CRC) and the Committee on the Elimination of Racial Discrimination (CERD) referred to the UNDRIP in some of their General Comments. Judgements and decisions of some Supreme Courts (e.g. Belize, Brazil, etc.) and other intergovernmental Bodies (Inter-American Commission on Human Rights) on cases filed by Indigenous Peoples, invoked the UNDRIP to make favourable judgements for the plaintiffs.

7. It is clear that the UNDRIP has evolved to be the minimum international standard which should ensure the dignity and survival of indigenous peoples. The effective implementation of the UNDRIP by UN member-states, by the UN bodies, agencies, programmes and funds, by other multilateral bodies and non-state actors including, us, indigenous peoples; civil society; and business is crucial to make sustainable development a reality. The human-rights based approach to sustainable development should be affirmed and integrated in the outcome document of Rio + 20. nd

#### 2 Key Message:

The cultural pillar should be included as the 4th pillar of sustainable development

8. Indigenous Peoples continue to challenge the development model based on resource extraction, exploitation and market-based models, which fails to recognize that we human beings are an integral part of the natural world, and also fails to respect human rights, including the inherent rights of Indigenous Peoples. We challenge this development model which continues to destroy Mother Earth, putting at risk the survival of the entire human family. We believe that our worldviews and respect for natural law, our spiritualities and cultures and our values of reciprocity, harmony with nature, solidarity, collectivity, and caring and sharing are crucial in bringing about a more just, equitable and sustainable world.

9. Our 2 key message is that Rio + 20 must usher in, with a sense of urgency a 4th pillar of sustainable development, which is the Cultural Pillar - the ethical and moral values needed to nurture and care for the Earth. This cultural pillar encompasses the broad cultural and spiritual traditions of humanity, reborn in 21st century values which are addressing contemporary problems. Culture which includes, spirituality, is the missing 4th pillar of sustainable development. Rio+20 must engender a deep love and moral responsibility towards Mother Earth and her intrinsic life-giving values, transcending instrumental conceptions of ecosystem services for human well-being, towards a reverence for the sacredness of life.

10. Sustainable development is social and cultural as well as economic and environmental. We, Indigenous Peoples, will maintain the right to define and freely pursue our own vision of development based on our needs, priorities, traditional understandings and responsibilities, including the cultural and spiritual relationships with the natural world, our ancestral territories and the ecosystems that have sustained us since time immemorial. We also affirm our sacred responsibility to defend the lives and survival of future generations of our Peoples.

#### 3 Key Message:

Protection and respect for the rights to Indigenous Peoples' to their lands, territories and resources is a precondition for sustainable development.

11. The past twenty years have seen the further entrenchment of deep inequalities and structural imbalances in the macro-economy, including the plunder of indigenous peoples' lands, territories and resources to serve global trade and markets and corporate profit. A prerequisite for promoting diverse local economies, is the security of lands, territories and resources of Indigenous Peoples, which are their basic sources of our wealth, well-being, cultures and identities. Based on government maps and community participatory mapping, there is a stark overlap of key biodiversity hotspots and forests within Indigenous Peoples' territories, which strongly proves that the remaining conserved biodiversity hotspots and forests are the ones traditionally and sustainably managed for hundreds of years by Indigenous Peoples all over the world. Our 3 key message, is that without the protection and respect for the rights of Indigenous Peoples to their lands, territories and resources, sustainable development cannot be realized.

12. Resource extractive industries - oil, gas and mining, as well as, logging and export- oriented forestry and chemical-based industrial agriculture - not only lead to the unjust appropriation of Indigenous Peoples' lands, territories and resources but also the transfer wealth away from Indigenous Peoples, while degrading ecosystems and creating poverty. The violation of our rights to our ancestral lands, territories and resources is one of the main causes of our impoverishment and the non-realization of sustainable development. Beyond income, Indigenous Peoples need secured tenure over our lands, territories and resources, and the enjoyment of all their human rights. Policies and plans on sustainable development must address the underlying causes of poverty and not merely its alleviation.

13. As reiterated in the Manaus Declaration, mining is an activity that produces large amounts of environmental contamination, including greenhouse gasses, and is vastly destructive to natural ecosystems, health and the water and food sources upon which Indigenous Peoples and other communities depend. Therefore, Indigenous Peoples call for a moratorium on mining in fragile and culturally important ecosystems such as forests, deserts, water sources, sacred sites, in fragile Arctic and high mountain ecosystems and in or near the traditional lands or territories of Indigenous Peoples, who have not given their free prior and informed consent.

14. There should be no expansion of extractive industries on Indigenous Peoples lands and territories. There should be no landgrabbing with forced displacement of Indigenous Peoples as a result of industrial agriculture and large-scale production of biofuels and other mitigation measures to combat climate change, such as mega hydro-electric dams. Unsustainable development entrenches global and national inequalities, and leads to further impoverishment of the poor. Mining development creates enclaves of unsustainable production and consumption and this is the glaring example of how gross inequalities and impoverishment among indigenous peoples, who host such wealth in their territories, are created.

15. The legal protection of the rights of Indigenous Peoples to land, territories, resources and traditional knowledge should be a prerequisite for development and planning for any and all types of adaptation and mitigation to climate change, environmental conservation (including the creation of "protected areas"), the sustainable use of biodiversity and measures to combat desertification. In all instances there must be free, prior and informed consent of Indigenous Peoples, and therefore, we encourage States to take steps in this direction.

4 Key Message: Recognition of the distinct and crucial contribution of traditional knowledge and diverse local economies to poverty eradication and sustainable development and as the cornerstones of green economies

16. It is without any doubt that Indigenous Peoples have something to offer in the 21 century solutions for survival, and have an important and even central role to play in addressing the problems of poverty eradication, biodiversity loss and climate change within a context of sustainable development. The traditional knowledge, innovations and practices of Indigenous Peoples has ensured the preservation and protection of several ecosystems. Empirical data will show that the most of the last remaining ecosystems in the world today which are not fully degraded are found in indigenous peoples' territories. These ecosystems include forests and woodlands; wetlands; drylands; marine and coastal; mountain and polar; inland waters; and islands, are found in indigenous peoples territories. Indigenous Peoples' traditional knowledge and values of reciprocity, harmony with nature, etc; their customary sustainable use and management of resources, and their resistance against the wanton exploitation and plunder of their territories are the key factors which ensured this.

"Biodiversity is a clinical, technical term for this intricate inter-weaving of life that sustains us. We, indigenous peoples, say that we are related to this life; thus your "resources" are our relations. It is all in how you look at it."

"Indigenous Peoples have something to offer in this equation for survival. We have the perspective of time. Living in one place for thousands of years has given us an understanding of the complexities of life forces. Our languages are libraries of knowledge that may contain keys to survival, and I use that word advisedly. One of our Elders said a long time ago that there will come a time when we will cease to live and begin to exist. For the sake of life and our grandchildren, we cannot let that happen in our generation. We have common goals and responsibilities, and I say that you, the leaders of this great hope of the world's people, the United Nations, should be working with us and not against us, for peace. We submit to you that as long as you make war against Etenoha (Mother Earth), there can never be peace."

Chief Oren Lyons, Faithkeeper, Onondaga and Seneca Nations, Iroquois Confederacy 17. Diverse local economies and livelihoods such as those found in indigenous peoples' territories, which primarily serve local needs and which are underpinned by traditional knowledge are cornerstones of a green economy. Such local economies are examples of green economies which are integrated within social-ecological production landscapes and systems, promote local livelihoods, ecosystem resilience and community solidarity. For the most part of human history and development, local economies have provided these multiple values, beyond the generation of profit. Indigenous Peoples' diverse local economies, and self-determined development are critical components of resilient economies and ecosystems. Our 4 key message is that Indigenous Peoples' traditional knowledge and values are distinct and special contributions to 21st century global transformation and this knowledge together with their diverse local economies are the cornerstones of green economies.

The Dayak People of West Kalimantan in Indonesia practice a community-based integrated natural resource management called the dahas. This local wisdom of protecting and conserving nature and resources has sustained them long before the state of Indonesia. This concept shows how they settle within the area and conduct agricultural activities that are integrated with other economic activities taking account their spiritual relationship with the forest and resources.

The diverse ways by which the Loitan Maasai describe the forest show a relationship that is linked to livelihoods and important community traditions and practices. They have developed traditional forest management practices that ensure the sustainability of this important resource. These are reflected in community-adhered to guidelines that prevent livestock grazing during the rainy season, the identification by elders of segregated watering points for various purposes (e.g. for domestic harvesting and for livestock), and the selective utilization of types of trees and other plants. Furthermore, the presence of sacred sites inside the forest has served to regulate the utilization of this resource and its other products.

In Nicaragua, the way Miskitu people of Kuakual II community possess a great deal of knowledge about the resources in the forest, and such knowledge is reflected on how they categorize the forest. In Miskitu language, there are three words related to the concept of forest based on its characteristics and use: Unta, Unta Alal, and Dus Aial. These concepts serve to guide the community's management of the forest and the resources found within. The Amerindians in Guyana have mixed livelihoods involving subsistence and cash-earning activities at present. Customary systems of rotational farming coupled with hunting, fishing and gathering support food security and form the core of traditional ways of life among the Arawak, Carib, Wapichan, Makushi, Patamona, Akawaio, Arekuna, Warau and Wai Wai peoples. As well as providing the staple crop, bitter cassava, ground provisions, fruits and other foods, traditional multi-cropping supplies families with cultivated spices, fibres, dyes, medicines and ritual crops like tobacco. In addition to providing vital crops, traditional farming grounds are an important cultural space for transmission of ancestral knowledge and skills. Subsistence farming, hunting, fishing and gathering activities in the hinterland are often underpinned by extensive tenure and customary land use systems along with traditions of sharing, reciprocity and self-help work parties that support indigenous food and livelihood security

18. Sustainable development requires government policies and regulations which recognize and reinforce traditional knowledge and which protect local economies and the prior rights of indigenous peoples and local communities from predatory investments. Public policy must prioritise support for building resilient local economies and ecosystems and the self-development efforts of Indigenous Peoples. Indigenous Peoples population is estimated at 370 million. They constitute around 5 percent of the total world population but it is estimated that they make up 15 percent of the world's poor. The renewed political commitment to sustainable development, must be targetted at the poor. Good governance to meet the needs of the poor, implies inclusive development, and respect for human rights, as the means and outcome of the development process.

#### 5 Key Message:

The Green Economy should support the indigenous peoples' holistic framework to sustainable self-determined development which integrates approaches which are human-rights based, ecosystem or territorial-based knowledge-based , intercultural and gender-sensitive.

19. The proposal of a "green economy" which is a theme for discussion at Rio +20, has not been clearly defined, and Indigenous Peoples are concerned that it will be used by States and corporations to continue the same destructive and exploitative economic growth development model that caused the current global economic, environmental and climate crisis. Indigenous Peoples call on Rio +20 to support their holistic framework and strategy for sustainable development which integrates principles and approaches which are human-rights based, ecosystem or territorial-based, knowledge-based, intercultural and gender-sensitive. This is our 5 key message. This holistic framework should be integrate the indicators of well-being and sustainability which are defined by Indigenous Peoples should promote sufficiency economy principles and approaches.

20. We further recommend that current "Green Economy" proposals be drafted, to emphasize, among others, the following elements: conservation and reduction in resource consumption levels, especially in highly industrialized counties; the importance of decentralized development projects that respect self-determination and traditional knowledge and support and restore local economies and food systems. The green economy should support decentralized locally-controlled renewable energy programmes and projects and a rapid phase-out of all fossil fuels production and use and; respect for and incorporation of Indigenous Peoples' vision of development based on harmony between human societies and nature. Finally, we recommend that all "Green Economy" programs and projects must first and foremost include Indigenous Peoples' full participation in all stages from design, implementation, monitoring and evaluation. Their free, prior and informed consent should be obtained as well.

24. Indigenous peoples call on the UN to ensure the full, formal and effective participation of Indigenous Peoples in all processes and activities of the Rio+20 Conference, and its preparatory and follow-up mechanisms. We recommend that there be further and continuing debate, with the full participation and engagement of Indigenous Peoples, regarding the development of new or the strengthening of existing institutional frameworks on sustainable development. Any further developments of institutional frameworks should include and recognize the important contributions of Indigenous Peoples based on their traditional knowledge and practices, as well as the key role of the UN Permanent Forum, the Expert Mechanism on the Rights of Indigenous Peoples and the Special Rapporteur on the Rights of Indigenous Peoples. We recommend the creation of formal mechanisms that ensure the participation of Indigenous Peoples in general. In addition, there should be adequate resources provided to ensure the full and effective participation of Indigenous Peoples in any the new or enhanced institutional framework.

28. Further, we recommend that the traditional knowledge being used by Indigenous women regarding methods of adaption and mitigation must be respected, promoted and strengthened; and that their roles as leaders and actors in all levels of discussion and decision making regarding sustainable development and well-being for Indigenous Peoples be respected. We further recommend the recognition of the vital contributions and the vision of the future presented by Indigenous youth, as those who will experience the long-term results of the decisions being made at the Rio + 20 World Conference. We stress the importance of including Indigenous and other youth in all stages of the planning and implementation, as well as in designing the final outcomes, of Rio + 20.

29. Finally, the proposal to upgrade the UN Commission on Sustainable Development to a new Council, similar to the Human Rights Council, may elevate discussions on sustainability within the UN system. However, it could also have the potential to reduce the space for Indigenous Peoples and other stakeholders to participate and be part of any negotiation process. The experience with the recent creation of the Human Rights Council, from the former Commission on Human Rights, confirms the potential for reduced opportunities for participation. This is an issue that requires further discussion and analysis particularly in relation to the development of guiding principles, taking into consideration the UN Declaration on the Rights of Indigenous Peoples, current Indigenous-related UN mechanisms, as well as the role of self-governing bodies and autonomies within Indigenous territories.

-end-

## Information Habitat: Where information Lives

Information & Communications Technologies:

Critical Foundation for a Sustainable Common Future

In the twenty-one years since the initial PrepCom for the UN Conference on Environment and Development, no industry has come close to the exponential growth, rapid technological innovation, widespread adoption and affordability than the information & communications technology (ICT) sector; nor has any industry in human history so rapidly transformed the path of development and the global financial, economic and social landscapes.

However, the significance of ICT in relation to sustainable development has gained scant attention, yet its growth and evolution continues to have profound impacts on a wide range of processes critical to the transition to a sustainable common future - including opportunities for access to information and citizen participation in decision-making, technology transfer, access to education and health care, real-time monitoring of industrial processes and of the environment, early warning systems for natural disasters and disaster relief.

The second key concept in the rarely-cited second sentence of the Brundtland Report's definition of sustainable development - i.e. "the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs" - provides a valuable framework for understanding ICT's significance for sustainable development. That ICT has enabled unprecedented new, networked forms of social organization is undeniable, and the very idea of limitations has been transcended in a digital environment in which the constraints of the material world - imposed by the laws of conservation of mass and conservation of energy - no longer apply, for information has zero mass, zero physical size and takes virtually zero time to travel. Free access to knowledge is key to sustainable use of the environment. The combination of the characteristics of information and rapidly increasing computing power, storage capacity, bandwidth, affordability and portability has provided

unprecedented access to knowledge - the key to a sustainable common future.

The recognition in the Brundtland Report of the interlocking nature of the crises relating to sustainable development represented a major breakthrough in understanding; in this regard, advances in ICT have made possible analyses, models and presentations based on massive sets of data from the nature and specifics of relationships between the different sectors in ways that were not previously possible.

#### Green Economy

\*A Networked Information Economy: The key features of an the information economy - virtually zero marginal cost of production, unprecedented opportunities for collaborative peer production free from constraints of time and distance, the emergence of new forms of intellectual property including Open Source software and Creative Commons licenses - have given rise to a new culture of cooperation, a transformation of markets in a platform that is essentially carbon-free, and a rapidly growing and freely accessible global digital commons.

\*Access to Markets: There are countless ways in which ICT has transformed access to markets, from the use of cell-phones and text messaging for agricultural producers in rural areas to current market prices and conditions to online payment systems and the availability of free templates and hosting services that enable individual or community-based enterprises to establish an online "storefront" to sell products and services - including, but not limited to, digital products - in the global marketplace of the World Wide Web.

\*Education and ICT: Access to all levels of education is a central prerequisite for a sustainable common future and ICT is transforming access to education - whether elementary education, education in methods of sustainable agriculture, or graduate level courses from major universities.

\*Technology Transfer: ICT has played a vital role as a medium for the transfer of technology, especially in the free access to the transfer of the information technology itself - in conjunction with Free/Libre Open Source Software (FLOSS) - thus enabling free use of an extensive set of tools for building in a digital economy.

\*Open Source Construction Templates: Among recent development has been the dissemination of freely available templates with detailed designs for the construction of goods and products, especially with locally available resources.

\*Wireless Communications: The exploding use of wireless / wi-fi communications unparalleled and timely access to information, markets, tele- medicine, and much more in areas and conditions where communications were previously minimal or non-existent, this breakthrough in modality of communications offers numerous savings in energy and CO emissions.

\*Information Infrastructure: The development of affordable, broadband information infrastructure - especially wireless infrastructure - deserves much greater recognition as a foundation for sustainable development. Wireless infrastructure - for example, combining satellite access and mesh networking in conjunction with improvised "last-mile" information delivery. In many respects, the establishment of universally accessible information infrastructure can allow developing countries to leapfrog the wired technology of developed countries.

\*Full Cost Accounting: The failure of markets to external costs ICT - applied, inter alia, to monitoring of energy use and waste generation in production and to accounting for external cost throughout a business's value chain is a sine qua non of full cost accounting. The adoption and implementation of full cost accounting policies and procedures needs to be actively supported, through voluntary and/or mandatory guidelines.

\*External Costs of ICT: While there are many positive ways in which the ICT sector can and does support a sustainable development path, the manufacture of computers and mobile phones is not without a substantial ecological and social footprint, including toxic wastes and toxic working conditions to which much greater attention must be provided. There is also a vital need for greatly strengthened provisions and requirements for recycling used electronic equipment to reduce the impact on landfills and to recover valuable minerals for re-use.

#### Institutional Framework for Sustainable Development

\*Access to Information and Participation: During the UNCED preparations, the use of email and "electronic conferences" became established as the default modality for access to information and the participation of NGOs in UN proceedings; since then, ICT has become

\*Common Framework for Multilateral Agreements: The adoption of a common framework for the administration of multilateral agreements can provide greatly increased coherence between the different agreements. The characteristics of a common framework - ideally based on an Open Source software platform - needs to include a common data warehouse, and a common online template for managing and organizing the work and meetings of multilateral agreements.

\*Environmental Monitoring: From high-resolution satellite images through real-time monitoring of air and water quality and weather conditions, systematic monitoring of environmental conditions is essential to intelligent responses to environmental conditions.

\*Open Government & Open Data: Openness and transparency in government play a key role in enabling broad-based an informed participation in decision- making in sustainable development. The growth of ICT has been a principle driving force in a growing movement for open government, including the recently launched Open Government Partnership. A key element of open government is the provision of open access to governmental data, in conjunction with encouragement for provisions that enable the independent development of "Apps" that can provide access to government information in more useful and usable forms than are available on government web sites.

\*Online Meeting Spaces: One area of ICT that has gained greater appreciation concerning sustainable development is the use of videoconferencing and the use of collaborative documents for meetings - by governments, businesses and social organizations - providing substantial savings in travel, time and energy & resource use. The use of online meetings needs to be actively promoted, in conjunction with the development and strengthening of broadband information infrastructure.

\*Natural Disaster Early Warning Systems and Disaster Response: In the context of predictions of increasing frequency and intensity of natural disasters, ICT-based early warning systems can play a vital role, and mobile phones and GPS- enabled smart phones have a crucial role in disaster recovery.

#### Conclusion

This paper barely begins to do justice to the scope of actual and potential relevance of ICT with respect to sustainable development, a green economy and an institutional framework for sustainable development. It is essential that greater attention be given to this issue, for example through the establishment of an Ad Hoc Working Group on ICT and Sustainable Development

## Initiative pour le Développement Durable (I.D.D)

RECOMMANDATIONS POUR LA CONFERENCE DES NATIONS UNIES SUR LE DEVELOPPEMENT DURABLE

DU 04 AU 06 JUIN 2011 RIO+20

RIO DE JANEIRO/BRESIL

Par

INITIATIVE POUR LE DEVELOPPEMENT DURABLE ONG/ASBL

et

Quelques ONG congolaises (Kinshasa) réunies sous le vocable Mouvement Centre Rio+20

Octobre 2011

### I. INTRODUCTION

Les sommets de la Terre sont des rencontres décennales entre dirigeants mondiaux organisées depuis 1972, avec pour but de définir les moyens de stimuler le développement durable au niveau mondial. Partie de Stockholm (Suède) en 1972, le prochain se déroulera à Rio de Janeiro (Brésil) au mois de juin 2012. Preuve du développement d'une culture mondiale de respect de l'environnement, les sommets de la Terre présentent un enjeu symbolique important. Ils visent à démontrer la capacité collective à gérer les problèmes planétaires et affirment la nécessité d'une croissance écologique.

Considérer le développement durable dans son ensemble revient à considérer ses 3 trois aspects qui sont d'ordre social, environnemental et économique. Il serait alors difficile de dissocier lesdits aspects, l'un ne pouvant subsister sans l'autre. Il n'est guère de doute que le sous-développement touche une grande partie des pays africains et qu'il est nécessaire d'intensifier la lutte contre les divers maux qui rongent l'Afrique : la famine, le chômage, la corruption, les violations des droits de l'homme et de la femme, ...

En outre, l'Afrique en général et la République Démocratique du Congo en particulier doit s'atteler à remédier à cette crise en assurant aux générations futures la création d'un environnement sain et durable.

Dans une autre optique, si le sommet de la Terre de 1972 a engendré le Programme des Nations Unies pour l'Environnement (PNUE), celui de 1992 la Convention Cadre des Nations Unies sur les Changements Climatiques (CCNUCC), que vaudra-t-il retenir de la Conférence des Nations Unies sur le Développement Durable (CNUDD), mieux connu sous l'appellation de RIO+20 ?

Quelques Organisations non Gouvernementales de la société civile congolaise (Kinshasa) ont proposé ce document à l'attention des participants à la Conférence de Rio+20. Le Présent document renferme les différents points de vue émis au cours des concertations ; il tente de cerner les 2 thèmes principaux de la Conférence de Rio+20, à savoir :

- L'économie verte dans le cadre du développement durable et de l'élimination de la pauvreté ;
- Le cadre institutionnel du développement durable.

### II. RECOMMANDATIONS

Les principales recommandations émises dans ce document sont réparties dans les axes prioritaires suivants :

1. Eliminer la pauvreté en Afrique sous-entend le renforcement des stratégies de lutte contre les divers différents maux qui gangrènent le social du peuple africain, à savoir : l'analphabétisme, la malnutrition et la famine, les maladies, le chômage, la désertification, ... Ce qui revient à dire que l'Afrique demeure confrontée aux problèmes récurrents liés à l'éducation, à la sécurité alimentaire et à la malnutrition, à la santé, à l'emploi, à la salubrité, à l'eau et à l'assainissement, ...

Schéma I : Incidences de l'élimination de la pauvreté. (UNDESA: Please reference Full Submission)

Il convient de tenir compte d'une étude sur la mise en place d'une économie verte, moins polluante, donc développer la croissance des énergies renouvelables et diminuer la consommation excessive d'énergies non renouvelables.

2. Mise en place de plans nationaux de développement durable et ensuite, à l'échelon international, mise en place d'un cadre de concertation regroupant les acteurs qui interviennent directement dans le secteur du développement durable, c'est-à-dire sous-entendre une gouvernance mondiale ou gouvernance globale.

Schéma II : Gouvernance mondiale.(UNDESA: Please reference Full Submission)

Cela est à dire que les différents acteurs doivent privilégier à tout prix l'intérêt communautaire. Il serait impérieux de favoriser une méthodologie incidente dans chaque secteur afin de mieux établir une évaluation concrète : donc évaluer à chaque étape, établir s'il y a eu avancées ou stagnation touchant au progrès dans chaque secteur du développement humain et s'il échoue, renforcer les capacités d'organisation soit des hommes soit des institutions.

Soulignons que le développement durable pris dans ces 3 composantes : social, environnement et économique, pourra s'articuler autour de ces objectifs :

1. Développer de façon durable et responsable, la vie de la communauté par la mise en place d'une consommation et d'une production durables, répartir de manière équitable les ressources en s'appuyant sur les priorités des communautés impliquées.
2. Gérer de façon durable l'espace de vie, l'environnement. Veiller à la diminution des émissions de carbone, gérer de façon durable les forêts et l'eau, éviter le déboisement et la consommation excessive.
3. Produire les biens et services ainsi que les produits de consommation courante nécessaires à la survie de manière durable.

## Résumé des recommandations.

Au sortir de la Conférence de Rio+20, les délégués auront à examiner les différentes recommandations dont les suivantes :

<sup>[4]</sup> Les autorités gouvernementales s'engagent à multiplier les relations et à restaurer un climat de confiance avec la communauté locale.

<sup>[4]</sup> Elles s'engagent en outre, à concilier les priorités nationales et les initiatives locales et tentent de trouver une nouvelle articulation entre

les politiques menées à différentes échelles. <sup>[4]</sup> Les acteurs impliqués dans le cadre de du développement durable : Etat, collectivité locale, société civile, Organisations non Gouvernementales internationales, organisation du système des Nations Unies tentent de développer au maximum des approches transversales, prenant en compte l'ensemble des interactions entre les différentes politiques, c'est-à-dire établir un pont direct entre les bailleurs de fonds et les acteurs privés : société civile, population locale.

<sup>[4]</sup> Les gouvernements doivent rendre effective la décentralisation par un transfert réel des compétences et du pouvoir de gestion à la base : des dispositifs de participation des habitants aux politiques (démocratie locale participative) doivent être mis en place le plus souvent sous forme des commissions de locales, comité de village, on devra penser au budget participatif, par exemple.

<sup>[4]</sup> Les autorités gouvernementales ainsi que les Organisations Internationales s'engagent à améliorer la sécurité alimentaire des ménages auprès des communautés vulnérables ou locales en lançant des politiques d'agriculture durable, en allouant des crédits aux petits éleveurs et en développant l'approche d'une économie de moins en moins polluante. Elles s'engagent à diminuer la production des émissions de carbone dans l'atmosphère.

<sup>[4]</sup> Les autorités s'engagent à faciliter l'accès à l'eau potable et aux soins de santé de qualité des populations les plus pauvres.

<sup>[4]</sup> Les gouvernements établissent de plans nationaux de distribution de l'eau potable aux populations les plus vulnérables : enfants en bas âge, réfugiés, ménages les plus pauvres, ... Ils établissent en outre, de plans de gestion durable de l'eau, donc ils veilleront à une consommation responsable de l'eau dans de grands centres urbains.

<sup>[4]</sup> Les autorités gouvernementales ainsi que les Organisations Internationales s'engagent à fournir une réponse urgente aux, rapide et appropriée devant des situations dangereuses touchant la population, telles la désertification, la malnutrition et la famine.

<sup>[4]</sup> Les gouvernements s'engagent à renforcer la prévention et les réponses face aux violations des droits de l'Homme et face aux menaces contre l'intégrité physique ainsi que les moyens d'y faire face. Ils s'engagent à lutter activement contre les violences faites à la mère et à l'enfant.

<sup>[4]</sup> Les autorités gouvernementales ainsi que les Organisations Internationales s'engagent à garantir les droits des peuples autochtones à exploiter librement leurs terres. Les droits des peuples des forêts et des populations riveraines sont garantis face au risque d'accaparement des terres par les industries d'exploitation minière ou forestière. Elles priorisent la transparence ainsi que la bonne gouvernance dans ce contexte de gestion durable des ressources minières ou forestières.

<sup>[4]</sup> Les gouvernements s'engagent à faire du droit au développement durable et du droit à vivre dans un environnement sain et protégé, un Droit de l'Homme.

<sup>[4]</sup> Les gouvernements s'engagent à gérer de manière transparente les fonds reçus de différents bailleurs de fonds au profit des projets de développement durable en faveur des collectivités locales.

<sup>[4]</sup> Les gouvernements s'engagent à faciliter la mise en œuvre de la stratégie de réduction de la pauvreté par le renforcement de ses capacités à coordonner l'assistance fournie par les bailleurs de fonds et s'engagent à fournir les services essentiels, tant au niveau central que régional.

<sup>[4]</sup> Les acteurs impliqués dans le cadre de du développement durable : Etat, collectivité locale, société civile, Organisations non Gouvernementales internationales, organisation du système des Nations Unies s'attèlent à atteindre concrètement les Objectifs du Millénaire pour le Développement d'ici 2015. Parmi ces objectifs, le 1er renseigne : De Réduire l'extrême pauvreté et la faim avec comme cible 1.A : Réduire de moitié, entre 1990 et 2015, la proportion de la population dont le revenu est inférieur à un dollar par jour ainsi que Réduire de moitié, entre 1990 et 2015, la proportion de la population qui souffre de la faim.

Nous envisageons que les délégués créent une structure spécialisée des Nations Unies dénommées « Programme des Nations Unies pour le Développement Durable », PNUDD, en sigle, dont les instruments de création seront soumis à la signature et à la ratification.

Tels sont les points de vue émises au cours de nos rencontres à Kinshasa en République Démocratique du Congo.

## Institut de Recherche pour le Developpement (IRD)

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

#### THE DRYLANDS TOWARDS RIO+20: A GLOBAL CHALLENGE

More than 2,300 scientists and policymakers from 80 countries and all continents, including public officials, natural and social scientists, representatives of the private sector and international agencies, and members of non-governmental and other civilsociety organizations, met in Fortaleza – Brazil (ICID+18, 2010), Mendoza – Argentina (ICID+19, 2011) and in Niamey – Niger (ICID+19 Africa, 2011), during the International Conference on Climate, Sustainability and Development in Semi-arid Regions (ICID). They exchanged information and lessons of the past two decades about sustainable development in Drylands around the globe and offered policy recommendations for consideration at the Rio+20 Summit in 2012.

Since the first ICID was held in 1992, human-induced global warming and environmental changes and their consequences for human and ecosystems well-being are now widely accepted as fundamental development issues.

The purpose the set of ICID Conferences was to assess the situation of Drylands regions (arid, semi-arid and dry subhumid lands) in order to foster sustainable development and the fight against poverty, land degradation and desertification in the Drylands. From this analysis, participants have reached conclusions and adopted

action oriented recommendations addressed in particular to the Rio + 20 Summit in 2012. The participants in the ICID conferences suggest that the agenda of the Rio + 20 could devote a special chapter to the discussion of the challenges and potentialities of the Drylands, given their importance in terms of population, poverty, development gap, and environmental assets.

#### EXPECTATIONS

The Drylands worldwide contain the largest concentrations of poverty and suffer the greatest pressures on their natural resources such as water, soils, and biodiversity. Their populations are extremely vulnerable to the adverse consequences of environmental changes related to climate variability and change, and are among the least able to cope effectively with them. Desertification alone, as a symbol of environmental threats in the Drylands, adversely affects the livelihoods of one billion (1,000,000,000) people.

Although significant advances continue to be made in scientific knowledge and public understanding concerning the interactions among climate, environmental sustainability and socio-economic development and despite progress and the best of government intentions, the challenges continue to increase and constrain efforts to effectively reduce poverty, mitigate and adapt to climate change and achieve sustainable development and the Millennium Development Goals (MDGs).

Past errors, poorly conceived policies, and exploitative practices have resulted in environmental and social conditions that are not easily reversed without substantial and sustained development efforts that require increased national and international financial support. Declining productivity in the Drylands of their natural resources, the prevalence of poverty and significant inequities as well as institutional weaknesses are expected to be worsened by climate variability and change.

The world's Drylands possess many important assets, including rich social, cultural and biological diversity. They are responsible for more than 20% of food production around the globe.

The sustainable development of Drylands, through improved governance, enhanced livelihoods and greater voice, empowerment, and political representation of their populations (especially the poor), should be the foremost objective of local to international action.

Climate-sensitive development interventions from local to global must be substantially increased paying special attention to the needs of women, children and the elderly, throughout the Drylands.

"Win-Win" opportunities to cope with global warming must be identified and pursued, especially climate adaptation tactics and strategies that reduce local vulnerability, increase resilience and build assets of the poor. Efforts are needed to develop greater institutional capacity for managing climate variability today in the context of projected climate changes (e.g., greater emphasis on improved climate and environmental monitoring networks, drought preparedness planning based on a risk-based management approach, development of appropriate decision-support tools, and improved information delivery systems to aid decision making). Efforts must promote access to land and to markets, as well as effective civil-society grassroots participation in decision-making, implementation, and evaluation of development activities.

The sustainable development of the drylands and the combat to land degradation and desertification should be fostered, through the incorporation of the environmental, social and economic dimensions in development planning and implementation.

The United Nations should urgently consider the current plight of the Drylands, including the risks to global security associated with the growing impoverishment and food insecurity, increasing vulnerability to natural disasters and climate change, and rising conflicts and violence in Drylands regions.

Previous financial pledges by industrialized countries to support sustainable development efforts must be met. Existing institutional arrangements and financial instruments must not only be strengthened but must become more efficient.

Disbursement of concessionary resources from recently established Climate Investment and Adaptation Funds, for example, should be accelerated, and local and national institutional absorptive capacities strengthened to effectively utilize these resources.

Regular exchange including scientists, decision and policymakers dealing with the drylands should be encouraged.

Short, medium and long term strategies are necessary to better monitor implementation of actions against land degradation and desertification. In this regard, a zero net land degradation target should be set.

Beyond Rio + 20, the MDGs that will be defined for the period following 2015 should pay special attention to the Drylands and consider them as a target with a high-level of priority.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

## COMMENTS

Mechanisms should be strengthened through integrated action to arrest and avoid land degradation, to mitigate the effects of droughts, fires and floods, to conserve soil and water resources and biodiversity, and to resiliently adapt to climate change and its consequences. In addition, mechanisms to financially compensate local communities for the environmental protection services they provide must be identified and implemented. Multilateral and bilateral development agencies can play an important role.

Investment opportunities should exploit the comparative advantages of drylands areas such as solar power generation, as well as other alternative and renewable energy sources (including hydropower, wind, and biomass). They should also support techniques for rainwater capture, improved sanitation, wastewater reuse in irrigation and low carbon, resource saving and environmentally-friendly activities. Such investment would enhance energy and food security by the improved efficient management of demand for water through adequate pricing and other means. The integration of water basins should also be considered.

There is also the need to recover degraded areas, strengthen the management and sustainability of existing and newly protected areas and to prevent environmental deterioration of those that are as yet well preserved. Drylands regions should catalogue and prioritize the various sustainable uses and conservation of biodiversity.

Synergies among global, national, regional and local interventions to mitigate and adapt to climate change, conserve biodiversity, and curb desertification should be maximized. Interactions among and with the three Rio Conventions (UNCCD, UNCBD, UNFCCC) should be integrated with broader domestic and international efforts to foster quality of basic education, combat poverty and promote sustainability.

Enhancing climate-sensitive sustainable development activities will require additional financial resources. Part of these costs should be absorbed by national economies, but, because of the global public goods nature of these issues, a larger share of the needed incremental financing should come from industrialized countries.

Contextualized quality education at all levels should be a priority, cooperatively supported by all agencies involved. In addition to a high-return investment in human capital, this should be viewed as the need to raise the awareness of local populations about the linkages among climate change, poverty and sustainability. This will ensure an effective voice, empowerment and representation in public decision-making regarding the future of Drylands regions. Specific Drylands education policies should be developed. The priority focus should be on the youth of both genders beginning with early childhood development. They have the most at stake and will become the next wave of policy and decision makers.

The path to sustainable development requires a greening of the economy of the drylands, as is the case in other regions. The green economy approach should fully incorporate needs for sustainable land management and not be used as trade barriers against exports coming from developing countries.

Renewable energy (solar, wind, biomass) should be enhanced in the Drylands.

Developing countries are encouraged to take advantage of financial opportunities offered by existing or emerging mechanisms such as the ones derived from the Rio Conventions process (carbon market, GEF enabling funds, etc.). Likewise, activities on agroforestry and water resources, including underground aquifers, should be fostered in the context of cooperation for development policies.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

## IMPLEMENTATION

The concerns of Drylands peoples are often poorly represented in international, national and local policy processes. Good governance of the Drylands will also bring knowledge, cultural values, needs and aspirations of local inhabitants into multi-level policy and decision-making.

An integrated multidisciplinary climate research, observation, modeling and applications program should be implemented to inform resource managers, policy makers, planners, educators and local populations about adaptation to the consequences of a changing climate.

While information technology and knowledge based on the complex causes and effects of climate variability, extremes and change have advanced significantly during the past two decades, significantly greater inputs from the social sciences are needed, especially to focus on the social and political causes of vulnerability and resilience as well as the societal impacts of climate variability and climate change.

The gap caused by a mismatch between scientific and technological investigation related to the Drylands along with knowledge about production systems on the one hand, and the prevailing system of decision-making and environmental and local governance, on the other, should be eliminated. New Science and Technology (S&T) knowledge must be developed in existing and new Drylands institutions. Sustainable development efforts must respect the cultures of indigenous, traditional and other local

populations that have inhabited these regions for centuries.

Drylands knowledge networks should be enhanced with two basic objectives: (i) scientific and applied research: exchange of information, discussion of methodologies, communication of scientific discoveries and joint development of research activities; and (ii) participatory planning and action: create a forum for exchanging experiences among specialists, government authorities and civil society.

Governance of sustainable development in the drylands should be strengthened at different levels, by enforcing the implementation of the multilateral environmental agreements (MEA) and supporting national and local policies, inter alia through: i) taking into account traditional knowledge, cultural values, needs and aspirations of local inhabitants; ii) reinforcement of regional cooperation between States directly or by means of dedicated organizations such as APGMV and river basin organizations; iii) use of different policy means, including the empowering of local populations and facilitating their access to land. These measures must be consistent with cultural values and customary laws as appropriate.

International cooperation should be encouraged since better coordination of development programs improves their efficiency. South-south cooperation and tripartite (South, North, South) cooperation should be especially fostered. South–South cooperation, notably when it implies developing and emerging countries, like Brazil, is powerful because some emerging countries have already experimented with success policies to fight poverty, land degradation and desertification. Tripartite cooperation, which involves developing, emerging and developed countries, should also be encouraged. International donors and lenders – States, Financial Institutions, foundations, corporate philanthropists – should pay special attention to the needs expressed by organizations directly involved in the combat against desertification, bearing in mind the principles of the Paris Declaration.

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

**TOOLS**

Convene a “Drylands Summit on Sustainable Development” to refine policy options for Drylands worldwide. Inputs from ICID+19, Niamey 2011, and those of the proposed Drylands Summit would enhance discussion of the importance of Drylands issues in the Rio+20 Conference agenda. Summits for other eco-regions should also be identified and convened.

A new strategic geo-political Drylands Initiative, if not alliance, can be developed to coordinate efforts to address common climate, development and sustainability related problems, prospects and opportunities.

Generate support for development and implementation of community-level knowledgebased strategies to educate children, adults, policy and decision makers, including parliamentarians, and the media, about the obvious as well as hidden implications of climate and environmental changes in the Drylands.

Efforts to improve scientific cooperation devoted to the drylands should be promoted at all levels.

This could be reached by the development of Science, Technology & Innovation (STI) initiatives located in Drylands countries, by enhancing regional and continental centers of excellence on topics concerning drought and desertification.

This could also be reached in Drylands regions through the activities of existing and new networks and observatories devoted to integrated approaches on climate change, land degradation and desertification, migration, health, sustainable development experiences, e.g.

Exchange and share of information and data related to the drylands should be facilitated among scientists and should be used by policy makers.

We should encourage interdisciplinary research programs (inputs from social sciences are particularly needed). Indeed they are well tailored to take into account all the impacts – social, economic and environmental – of measures and policies fighting desertification and promoting sustainable development in drylands.

Research activities should provide local expertise about drylands management.

Research activities should contribute to training and capacity building in the drylands regions.

Moreover, scientific knowledge and dissemination towards the private sector and civil society – mainly throughout the educational system – should be improved. Information, models and policies related to drought and desertification should be enhanced.

Research activities should lead to usual outputs - such as scientific publications - but also to specific outputs that could be used directly by policy makers and other stakeholders.

Efforts should be done in order to assess the state of the art about research devoted to the drylands, including with the use of impact indicators.

The links between research and innovation should be strengthened as well as publicprivate partnership. The development of biotechnologies and ecological intensification using the diversity of local biological resources should be promoted.

---

## Specific Elements

**a) Objective of the Conference:** To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.

[Download the original document to see the full submission](#)

**b) Green economy in the context of sustainable development and poverty eradication:** views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication

[Download the original document to see the full submission](#)

**c) Institutional framework for sustainable development:** Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.

[Download the original document to see the full submission](#)

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

[Download the original document to see the full submission](#)

## ANNEXE 1

### Déclaration de Niamey

Les terres arides dans l'agenda de Rio +20 : un enjeu mondial et un focus pour l'Afrique  
Conférence Afrique - Brésil - France sur la lutte contre la désertification en Afrique (ICID + 19, Afrique)

Niamey, République du Niger, 24-25 Octobre 2011

en perspective

du 6ème Forum Mondial de l'Eau (Marseille, Mars 2012)

et de la Conférence des Nations Unies sur le Développement Durable (Rio+20, Juin 2012)

### RESUME EXECUTIF

L'Afrique, le Brésil et la France s'associent pour lutter contre la pauvreté, la dégradation des terres, la sécheresse et la désertification en Afrique

· Une dynamique portée par la coopération tripartite Afrique-Brésil-France

L'Agence panafricaine de la grande muraille verte (APGMV), l'Institut de recherche pour le développement (IRD) et le Centre de gestion et d'études stratégiques du Brésil (CGEE) ont organisé, les 24 et 25 octobre 2011, à Niamey et en collaboration avec le gouvernement de la République du Niger, la conférence internationale « Pour un développement durable des zones arides en Afrique » (ICID +19 en Afrique). La centaine de participants (scientifiques, décideurs, institutionnels) a adopté la Déclaration de Niamey en vue notamment de la transmettre au comité préparatoire de la conférence des Nations Unies sur le développement durable, Rio+20, de juin 2012.

· La désertification : un enjeu mondial et vital pour l'Afrique

Phénomène mondial aux causes et conséquences multiples, la désertification affecte particulièrement le continent africain, très vulnérable du fait de l'insécurité alimentaire et de la pression anthropique sur les ressources naturelles. La conférence tripartite organisée à Niamey visait à évaluer la situation des régions arides avec un focus particulier sur l'Afrique, dans la perspective de favoriser la lutte contre la pauvreté, la dégradation des terres, la sécheresse et la désertification.

· 22 recommandations pour le développement durable des Terres Arides

La Déclaration de Niamey invite les dirigeants mondiaux qui participeront à la Conférence de Rio + 20 à porter une attention particulière et à prendre des décisions innovantes afin de promouvoir le développement durable des zones sèches , notamment en Afrique. Pour cela, la déclaration comprend 22 recommandations, visant à :

- Renforcer la gouvernance et le développement durable dans les zones sèches , en mettant en oeuvre des accords environnementaux multilatéraux et en soutenant des politiques régionale, nationales et locales établies selon une logique conforme aux préceptes du développement durable.

- Encourager la coopération internationale, afin d'améliorer l'efficacité des programmes de développement. La coopération Sud-Sud et la coopération tripartite (Sud-Nord-Sud) doivent être particulièrement prises en compte et privilégiées.

- Améliorer la coopération scientifique, le renforcement des capacités et le transfert de technologie, par un soutien aux initiatives et aux programmes de recherche intégrés et interdisciplinaires, la mise en réseaux, l'échange et le partage de données, la formation, l'expertise locale, l'innovation, les partenariats public-privé et la diffusion des connaissances.

### Introduction

Une centaine de participants, chercheurs et décideurs en provenance de pays africains, du Brésil, d'Argentine, de France, et des organisations internationales, se sont réunis à Niamey, au Niger, les 24 et 25 Octobre 2011, dans le cadre d'une conférence intitulée: « Lutte contre la désertification en Afrique » ou « ICID + 19 en Afrique ». Cette initiative tripartite a été prise par les pays africains sous la tutelle de l'Union africaine, l'Agence Panafricaine de la Grande Muraille Verte (APGMV), en étroite collaboration avec l'Institut de Recherche pour le Développement - IRD (France) et le Centro e Estudos de Gestão Estratégicos - CGEE (Brésil). Cette conférence visait à évaluer la situation des régions arides (arides, semi-arides et subhumides sèches), avec un focus particulier sur l'Afrique, dans la perspective de favoriser le développement durable, la lutte contre la dégradation des terres, la sécheresse et la désertification. Les participants ont abouti à des conclusions et adopté des recommandations destinées aux décideurs politiques, en vue notamment de les inscrire dans l'agenda du Sommet de Rio + 20 qui se déroulera en Juin 2012.

## Un défi mondial

Plus de 2 milliards de personnes vivent dans les zones arides du monde et la majorité d'entre elles se situe en dessous du seuil de pauvreté. La désertification et la dégradation des terres résultent des pratiques d'une agriculture non durable, d'un élevage extensif et de la mauvaise gestion des ressources naturelles dont l'eau, les sols et la biodiversité. La forte variabilité du climat et les changements climatiques aggravent cette dégradation.

## Un focus sur l'Afrique

L'Afrique est le continent le plus vulnérable à la désertification, la dégradation des sols et les effets de la sécheresse (DLDD). Selon la Banque mondiale, 40% de la population sahélienne vit sous le seuil de pauvreté. La situation actuelle est déjà très grave en raison de l'insécurité alimentaire, la malnutrition et la pression anthropique sur les ressources naturelles. De plus, la vulnérabilité de l'Afrique à la désertification est exacerbée par la croissance démographique et les effets du changement climatique.

## Le Contexte Institutionnel

La présente déclaration prend en compte les trois conventions de Rio (CCNUCC, CDB et UNCCD). Les participants à la Conférence de Niamey ratifient la Déclaration de Fortaleza, « Un appel pour une action sur les terres arides » adoptée au cours de l'ICID + 18 à Fortaleza, au Brésil, en août 2010, ainsi que la Déclaration de Mendoza, adoptée lors de l'ICID + 19 à Mendoza, en Argentine, en Septembre 2011. Les recommandations contenues dans la troisième partie de la présente déclaration complètent ces déclarations, avec un focus particulier sur Afrique.

## Déroulement de la Conférence

Bien que reconnaissant les améliorations réalisées par des initiatives de développement menées durant la dernière décennie par les gouvernements nationaux, les organisations régionales ou locales, les participants constatent que le développement durable du continent africain est toujours menacé par divers facteurs tels que l'utilisation extensive des terres, le manque de gouvernance environnementale et la faible diffusion des connaissances scientifiques. Les quatre thématiques suivantes ont été discutées lors de la conférence de Niamey au cours de tables rondes : la sécurité alimentaire ; les politiques sociales et le changement climatique ; la gestion des eaux et des sols ; les plantes et les communautés microbiennes des sols et la dimension régionale de la gestion des terres arides. Les Recommandations

## Vers un Développement Durable

1. Le développement durable des zones arides et la lutte contre la dégradation des terres et la désertification devraient être encouragés grâce à l'introduction des dimensions environnementale, sociétale et économique dans la planification du développement et sa mise en oeuvre.
2. Les mesures prioritaires et les politiques à mettre en oeuvre doivent intégrer, entre autres, la disponibilité et la gestion de l'eau, la conservation des sols et l'utilisation durable des terres.
3. La transition vers le développement durable nécessite un passage à une économie plus verte des zones arides, comme c'est le cas dans d'autres régions. L'approche de l'économie verte devrait intégrer pleinement les besoins pour la gestion durable des terres mais ne pas être utilisée comme barrière commerciale à l'encontre des exportations des pays en développement.
4. Les énergies renouvelables (solaire, éolien, biomasse) doivent être renforcées dans les zones arides. Les pays en développement sont encouragés à profiter des opportunités financières offertes par les mécanismes existants ou émergents tels que ceux découlant des conventions de Rio (marché du carbone, Fond Mondial de l'Environnement). De même, les activités en agroforesterie et en gestion des eaux, y compris les eaux souterraines, doivent être mieux prises en compte et figurer dans les politiques de développement.

## Vers une Meilleure Gouvernance

La gouvernance et le développement durable dans les zones arides doivent être renforcés à différents niveaux, en mettant en oeuvre les accords environnementaux multilatéraux et en soutenant des politiques nationales et locales, notamment:

5. en tenant compte des savoirs traditionnels, des pratiques culturelles, des besoins et des aspirations des populations locales,
  6. en renforçant la coopération régionale entre les États, directement ou par l'intermédiaire d'organismes dédiés tels que l'Agence Panafricaine de la Grande Muraille Verte et les agences de bassins fluviaux,
  7. en utilisant des moyens politiques différents, y compris la participation des populations locales et en facilitant leur accès au foncier. Ces mesures doivent être compatibles avec les pratiques culturelles et les lois coutumières. La Coopération Internationale
- La coopération internationale doit être encouragée car une meilleure coordination des programmes de développement améliore leur efficacité. La coopération Sud-Sud et la coopération tripartite (Sud, Nord, Sud) doivent être particulièrement prises en compte et encouragées.
8. La coopération Sud-Sud, notamment lorsqu'elle implique des pays africains et des pays émergents, comme le Brésil, est un puissant levier de développement car certains pays émergents ont déjà expérimenté avec succès des politiques de lutte contre la dégradation des sols et la désertification.
  9. La coopération tripartite, qui associe les pays en développement, émergents et développés doit également être stimulée. Les donateurs et les prêteurs internationaux - les Etats, les institutions financières, les fondations, les entreprises philanthropiques - sont invités à accorder une attention particulière aux besoins exprimés par les organisations régionales directement impliquées dans la lutte contre la désertification, tout en gardant à l'esprit les principes de la Déclaration de Paris.

## La Coopération Scientifique, le Renforcement des Capacités et le Transfert de Technologie

Les efforts pour améliorer la coopération scientifique consacrée aux zones arides devraient être encouragés à tous les niveaux.

10. Par le soutien à des initiatives en Science, Technologie et Innovation dans les pays situés en régions arides et par le renforcement des centres d'excellence régionaux et continentaux sur des sujets concernant la sécheresse et la désertification.
11. Les réseaux nouveaux et existants et les observatoires consacrés à des approches intégrées en matière de changement climatique, de dégradation des sols et de désertification, de migrations, de santé et d'expériences de développement durable doivent être renforcés.
12. L'échange et le partage des informations et des données relatives aux terres arides doivent être facilités entre les scientifiques et rendus utilisables par les décideurs.
13. Les programmes de recherche interdisciplinaire sont préconisés (l'apport des sciences sociales est particulièrement requis). En effet, ceux-ci sont particulièrement

adaptés pour prendre en compte tous les impacts - sociaux, économiques et environnementaux - des mesures et des politiques de lutte contre la désertification et la promotion du développement durable dans les zones arides.

14. Les activités de recherche devraient fournir et améliorer l'expertise locale sur la gestion des terres arides.

15. Les activités de recherche devraient contribuer à la formation et au renforcement des capacités dans les régions arides.

16. Par ailleurs, la connaissance scientifique et sa diffusion vers la société civile - principalement à travers le système éducatif - doivent être améliorées. L'information sur les politiques relatives à la sécheresse et à la désertification en Afrique devrait être renforcée.

17. Les activités de recherche doivent conduire aux productions classiques du savoir - telles que les publications scientifiques - mais aussi à des résultats spécifiques qui pourraient être utilisés directement par les décideurs et les autres acteurs.

18. Des efforts doivent être entrepris afin d'établir l'état de l'art dans les différents domaines scientifiques consacrés aux zones arides, y compris avec le recours à des indicateurs d'impact, pour savoir si les résultats scientifiques ont été appliqués, et dans ce cas, si ces applications ont été couronnées de succès.

19. Les liens entre la recherche et l'innovation doivent être intensifiés de même que le recours aux partenariats public-privé. Des stratégies d'intensification écologique fondées sur la valorisation de la diversité des ressources biologiques locales et sur le développement des biotechnologies sont préconisées.

Prospective, Stratégie et Objectifs

20. Des échanges réguliers entre scientifiques, décideurs et responsables politiques traitant des zones arides doivent être intensifiés.

21. Des stratégies à court, moyen et long terme sont nécessaires pour mieux surveiller la mise en oeuvre des actions contre la dégradation des terres et la désertification. À cet égard, un objectif de « zéro dégradation » des terres devrait être adopté.

22. Au-delà de Rio + 20, les OMD qui seront définis pour la période postérieure à 2015 devraient accorder une attention particulière au développement durable des zones arides et en faire une cible prioritaire.

Les participants au séminaire de Niamey (ICID + 19 en Afrique) invitent les dirigeants mondiaux participant à la Conférence de Rio + 20 à porter une attention particulière et à prendre des décisions innovantes afin d'intensifier les efforts visant au développement durable, à la lutte contre la dégradation des terres et la désertification et à l'atténuation des effets de la sécheresse dans les zones arides. Ils invitent les décideurs politiques des pays et des institutions concernés à utiliser la présente Déclaration et à la diffuser à toutes les parties prenantes.

ANNEXE 2

ANNEXE 3

DECLARATION OF FORTALEZA

Second International Conference on Climate, Sustainability and Development in Semi-arid Regions (ICID 2010)

Fortaleza, Ceará, Brazil

16 - 20 August, 2010

A DRYLANDS CALL FOR ACTION

The Drylands worldwide contain the largest concentrations of poverty and suffer the greatest pressures on their natural resources such as water, soils, and biodiversity. Their populations are extremely vulnerable to the adverse consequences of environmental changes related to climate variability and change, and are among the least able to cope effectively with them. Desertification alone, as a symbol of environmental threats in the Drylands, adversely affects the lively hoods of one billion (1,000,000,000!) people.

A gathering of 2,350 participants from 80 countries, including public officials, natural and social scientists, representatives of the private sector and international agencies, and members of non-governmental and other civil- society organizations, met in Fortaleza, state of Ceará, Brazil, from August 16th to 20th, 2010, in the Second International Conference on Climate, Sustainability and Development in Semi-arid Regions (ICID 2010). They exchanged information and lessons of the past two decades about sustainable development in Drylands around the globe and offered policy recommendations for consideration at the Rio+20 summit in 2012.

Since the first ICID was held in 1992, human-induced global warming and environmental changes and their consequences for human and ecosystems well-being are now widely accepted as fundamental development issues. Although significant advances continue to be made in scientific knowledge and public understanding concerning the interactions among climate, environmental sustainability and socio-economic development and despite progress and the best of government intentions, the challenges continue to increase and constrain efforts to effectively reduce poverty, mitigate and adapt to climate change and achieve sustainable development and the Millennium Development Goals (MDGs).

Political resolve, sustained commitment to action and to provide additional resources are urgently needed to realize these objectives. These challenges are critical but surmountable in 1 the underrepresented arid, semi-arid and dry sub-humid regions, collectively called "Drylands".

Past errors, poorly conceived policies, and exploitative practices have resulted in environmental and social conditions that are not easily reversed without substantial and sustained development efforts that require increased national and international financial support. Declining productivity in the Drylands of their natural resources, the prevalence of poverty and significant inequities as well as institutional weaknesses are expected to be worsened by climate variability and change.

Drylands regions contribute much less to global climate change (ie, as sources of greenhouse gas emissions) than other biomes, but are likely to be much more adversely affected by it.

Extreme weather and climate events around the globe — most recently floods in Pakistan and forest and peat fires in Russia and Indonesia, dust storms in China, erratic monsoon behavior in India, droughts and food shortages in sub-Saharan Africa, severe prolonged droughts and water shortages in northern Mexico and Northeast Brazil among other disastrous events elsewhere — underscore the urgency for governments to prepare for an uncertain climate future.

The economic and social impacts of such high-impact climate, water and weather events include sharply reduced agricultural output and productivity, damages to infrastructure, disruption or loss of basic services, massive dislocation of population, and increasing frequency of conflict, violence, and misery in the poorest parts of the

developing world. Industrialized countries are not immune from adverse climate-related changes and are also increasingly susceptible to the similar high impact phenomena. Yet, the world's Drylands possess many important assets, including rich social, cultural and biological diversity. They are responsible for more than 20% of food production around the globe.

Drylands present many opportunities for sustainable development, especially renewable solar, wind and biomass energy. Many of the actions required to address climate challenges are of benefit now as well for long-term economic growth, sustainable development and poverty alleviation in future decades. They require a high priority consideration from governments, national and regional, from the international community and from the private sector.

Deliberations during the Second International Conference on Climate, Sustainability and Development in Semi-arid Regions (ICID 2010) resulted in a call for the following action:

#### Climate Change and Sustainable Development: Challenges and Opportunities for the Drylands

1. The sustainable development of Drylands, through improved governance, enhanced livelihoods and greater voice, empowerment, and political representation of their populations (especially the poor), should be the foremost objective of local to international action.
2. Climate-sensitive development interventions from local to global must be substantially increased paying special attention to the needs of women, children and the elderly, throughout the Drylands.
3. "Win-Win" opportunities to cope with global warming must be identified and pursued, especially climate adaptation tactics and strategies that reduce local vulnerability, increase resilience and build assets of the poor. Efforts are needed to develop greater institutional capacity for managing climate variability today in the context of projected climate changes (e.g., greater emphasis on improved climate and environmental monitoring networks, drought preparedness planning based on a risk-based management approach, development of appropriate decision-support tools, and improved information delivery systems to aid decision making). Efforts must promote access to land and to markets, as well as effective civil-society grassroots participation in decision-making, implementation, and evaluation of development activities.
4. Mechanisms should be strengthened through integrated action to arrest and avoid land degradation, to mitigate the effects of droughts, fires and floods, to conserve soil and water resources and biodiversity, and to resiliently adapt to climate change and its consequences. In addition, mechanisms to financially compensate local communities for the environmental protection services they provide must be identified and implemented. Multilateral and bilateral development agencies can play an important role.
5. Investment opportunities should exploit the comparative advantages of dryland areas such as solar power generation, as well as other alternative and renewable energy sources (including hydropower, wind, and biomass). They should also support techniques for rainwater capture, improved sanitation, wastewater reuse in irrigation and low carbon, resource saving and environmentally-friendly activities. Such investment would enhance energy and food security by the improved efficient management of demand for water through adequate pricing and other means. The integration of water basins should also be considered.

#### Political Representation from local to international

6. The concerns of Drylands peoples are often poorly represented in international, national and local policy processes. Good governance of the Drylands will also bring knowledge, cultural values, needs and aspirations of local inhabitants into multi-level policy and decision-making.
7. To promote the recognition and well-being of Drylands, second and third-order implications of the climate-poverty-sustainability interface should be widely acknowledged, and Drylands countries should become equal partners in the global environment and development agenda.
8. The United Nations should urgently consider the current plight of the Drylands, including the risks to global security associated with the growing impoverishment and food insecurity, increasing vulnerability to natural disasters and climate change, and rising conflicts and violence in Dryland regions.
9. Convene a "Drylands Summit on Sustainable Development" to refine policy options for Drylands worldwide. Inputs from ICID 2010 and those of the proposed Drylands Summit would enhance discussion of the importance of Drylands issues in the Rio+20 Conference agenda. Summits for other eco- regions should also be identified and convened.
10. A new strategic geo-political Drylands Initiative, if not alliance, can be developed to coordinate efforts to address common climate, development and sustainability related problems, prospects and opportunities.
11. Generate support for development and implementation of community-level knowledge-based strategies to educate children, adults, policy and decision makers, including parliamentarians, and the media, about the obvious as well as hidden implications of climate and environmental changes in the Drylands.

#### Biodiversity Protection

12. There is also the need to recover degraded areas, strengthen the management and sustainability of existing and newly protected areas and to prevent environmental deterioration of those that are as yet well preserved. Dryland regions should catalogue and prioritize the various sustainable uses and conservation of biodiversity.

#### Synergies Among Global Environment and Development Initiatives

13. Synergies among global, national, regional and local interventions to mitigate and adapt to climate change, conserve biodiversity, and curb desertification should be maximized. Interactions among and with the three Rio Conventions (UNCCD, UNCBD, UNFCCC) should be integrated with broader domestic and international efforts to foster quality of basic education, combat poverty and promote sustainability.

#### Financing Climate-Sensitive Sustainable Development

14. Enhancing climate-sensitive sustainable development activities will require additional financial resources. Part of these costs should be absorbed by national economies, but, because of the global public goods nature of these issues, a larger share of the needed incremental financing should come from industrialized countries.
15. Previous financial pledges by industrialized countries to support sustainable development efforts must be met. Existing institutional arrangements and financial instruments must not only be strengthened but must become more efficient. Disbursement of concessionary resources from recently established Climate Investment and Adaptation Funds, for example, should be accelerated, and local and national institutional absorptive capacities strengthened to effectively utilize these resources.
16. Holding emitters of greenhouse gases accountable by applying the "Polluter Pays" principle, and other such measures, should generate additional sources of financial resources to support new investments in adaptation measures. Financial innovations to advance sustainable development under climate change conditions should also include: (i) funds to finance adaptation and associated sustainable development activities in Dryland subregions, such as the proposed Fund for the Caatinga ecosystem in Brazil; (ii) payment for ecological and other 5 environmental services, including establishment of a fund for reduction of emissions from land degradation and desertification, along the lines of existing ones for reduction of emissions from deforestation and forest degradation in tropical forest areas (REDD); and (iii) climate-related damage

compensation and insurance instruments.

#### Education and Food Security for Sustainable Development

17. Contextualized quality education at all levels should be a priority, cooperatively supported by all agencies involved. In addition to a high-return investment in human capital, this should be viewed as the need to raise the awareness of local populations about the linkages among climate change, poverty and sustainability. This will ensure an effective voice, empowerment and representation in public decision-making regarding the future of Dryland regions. Specific Drylands education policies should be developed. The priority focus should be on the youth of both genders beginning with early childhood development. They have the most at stake and will become the next wave of policy and decision makers.

18. Food Security for Sustainable Development must be a key area of concern among civil society, NGOs, international agencies, government institutions and other forms of organization, as food security remains a fundamental need for reducing vulnerability and promoting resilient adaptation.

#### Knowledge and Information Exchange

19. An integrated multidisciplinary climate research, observation, modeling and applications program should be implemented to inform resource managers, policy makers, planners, educators and local populations about adaptation to the consequences of a changing climate.

20. While information technology and knowledge based on the complex causes and effects of climate variability, extremes and change have advanced significantly during the past two decades, significantly greater inputs from the social sciences are needed, especially to focus on the social and political causes of vulnerability and resilience as well as the societal impacts of climate variability and climate change.

21. The gap caused by a mismatch between scientific and technological investigation related to the Drylands along with 6 knowledge about production systems on the one hand, and the prevailing system of decision-making and environmental and local governance, on the other, should be eliminated. New Science and Technology (S&T) knowledge must be developed in existing and new Drylands institutions. Sustainable development efforts must respect the cultures of indigenous, traditional and other local populations that have inhabited these regions for centuries.

22. Drylands knowledge networks should be enhanced with two basic objectives: (i) scientific and applied research: exchange of information, discussion of methodologies, communication of scientific discoveries and joint development of research activities; and (ii) participatory planning and action: create a forum for exchanging experiences among specialists, government authorities and civil society.

#### International Cooperation

23. Strengthen measures to facilitate international cooperation and appropriate technology transfer, including the fostering of south-south and tripartite cooperation and the establishment of local laboratories and observatories.

24. Efforts to improve coordination and reduce the existing compartmentalization of development programs should be promoted at all levels, especially in areas such as education, land, water and forest resource management, the combating of desertification, adapting to climate change, protecting biodiversity, improving food security, and poverty reduction.

#### A Sense of Urgency

25. The urgency to respond to current and emerging climate, development and sustainability challenges and opportunities in drylands must not be understated. The international community has shown its intention to place drylands development on the international agenda by the launching at ICID 2010 of the 'United Nations Decade of Deserts and the Fight Against Desertification 2010-2020'. In light of ICID 2010's findings and in view of global climate change scenarios that intensify the drylands development imperative, the dawn of this new UN Decade is a welcome recognition that decisive action for human and ecosystems well-being in the world's drylands is needed now!

Supporting documents from the preparatory meetings and panels of ICID 2010, including special contributions on Africa and Latin America, are available at URL: [www.icid18.org](http://www.icid18.org).

#### ANNEXE 4

#### Mendoza DECLARATION

Third International Conference on Climate, Sustainability, and Development in Dryland Regions

Mendoza, Argentina

September 25-28, 2011

#### THE DRYLANDS TOWARDS RIO+20: A LATIN AMERICAN AND CARIBBEAN PERSPECTIVE

Three hundred participants from various continents met in Mendoza between September 25 and 28, 2011 to analyze the principal advances and gaps in the management of drylands (arid, semi-arid, and subhumid lands) in the Latin America and the Caribbean Region since the United Nations Conference on Environment and Development (UNCED), held in Rio de Janeiro in 1992, from the perspective of poverty eradication and sustainable development. The objective of the Mendoza meeting was to generate recommendations for the Sustainable Development Conference to be convened in Rio de Janeiro, Brazil in June 2012, also known as "Rio+20."

In the discussions in Mendoza, the conclusions and recommendations contained in the Fortaleza Declaration, A Drylands Call for Action, approved by the 2,500 participants of the Second International Conference on Climate, Sustainability, and Development in Dryland Regions (ICID+18), that took place in Fortaleza, Ceará, Brazil between August 16 and 20, 2010. As in the first ICID, also held in Fortaleza in 1992, the present Conference called attention to the problematic situation confronted by the dryland regions of the planet in the context of environmental degradation and climate change. Among the conclusions and calls to action of ICID+18 are the following:

- The drylands contain a large proportion of the world's poor people and suffer an enormous pressure on their natural resources, including water, air, soils, and biodiversity;
- The people that inhabit these lands are the most vulnerable to the negative effects of climate variation and change, and possess the fewest means to confront them;
- There is a need for better governance of the drylands which ensures adequate representation of their inhabitants in the appropriate political forums and greater food security;
- Emphasis should be given to interventions that are sustainable and climate-sensitive to the characteristics of the drylands;

- It is necessary to create the favorable conditions for sustainable development in the drylands through integrated actions to confront land degradation, mitigate the effects of droughts, combat desertification, conserve biodiversity, and guarantee their adaptation to climate change.
- Important potential synergies exist among the Rio Conventions (on Climate Change, Biodiversity, and Desertification) to reduce vulnerabilities and increase the population's capacity to adapt to climate variability; and,
- It is necessary to take advantage of the investment opportunities generated by the comparative advantages of the drylands, including the production of renewable energy.

In summary, the inhabitants of drylands are highly vulnerable to land degradation and desertification, natural disasters, climate change, water scarcity and food insecurity. However, their economic and socio-cultural potential to confront the challenges of climate change and desertification should also be clearly recognized.

#### Advances and Gaps

In this context, ICID+19 considered the most significant advances and gaps (or unfulfilled elements) with respect to the measures proposed for the management and sustainability of the drylands since the Earth Summit in Rio in 1992. They are as follows:

1. The Conference recognized the multiple advances toward sustainable development in Latin America and the Caribbean since Rio 92. However, it is also necessary to consider the strong social, economic and environmental disequilibria that have occurred during the past two decades. These disequilibria prevail and constitute obstacles to the sustainable progress of the drylands in the developing countries. Therefore, it is urgent to take political decisions and actions that are oriented to overcome these obstacles.
2. Beyond the advances, structural changes have occurred in several contexts since Rio 92, such as continued population growth, the new patterns and requirements of international trade, international financial crises, and other changes in the world economy. Particularly in response to the global financial crises, changes are being produced – or proposed – in the international financial architecture, resulting in greater vulnerability and uncertainty that significantly affect the sustainability of development.
3. During the period under review, there has been a reduction in poverty and improvement in the indices of inequality in some countries and regions in Latin America and the Caribbean. However, persisting high levels of poverty and inequality continue to be worrisome. And these same indices at the local level in dryland areas are even more worrisome.
4. Despite the improvements that have occurred during the past two decades, governance in the drylands (and elsewhere) is still threatened by various factors.
5. Institutional strengthening has advanced substantially, but the following needs persist, among others, in dryland regions: (a) to achieve a greater commitment on the part of all of society and all of the components and levels of the State to the objectives of sustainable development and poverty eradication; (b) to promote the integrated sustainable development of natural resources; (c) to elaborate and implement environmental territorial organization and sustainable urban development policies; (d) to promote food sovereignty as a vehicle for the reduction of the vulnerability of socio-economic and biophysical systems; (e) to strengthen policies to protect environmental assets and services (natural habitats, soils, water resources, biodiversity, etc.); and (f) to incorporate the environmental dimension in national income and wealth accounting and public policies.
6. Greater awareness exists about the importance and dimension of environmental externalities, but the need to fully internalize environmental costs derived from productive activities remains.
7. The Conference took note of the significance advance of scientific and technical knowledge with regard to the drylands. However, it observed that there is an important weakness in the dissemination of scientific knowledge -- as well as traditional, indigenous and local knowledge -- to government authorities, and that weaknesses also exist with regard to the access to, transfer and adoption of primary production technologies. In addition, it is also necessary to: (a) improve drought prediction systems; (b) undertake inventories of wetlands and other strategic environmental resources; (c) recover and conserve biodiversity in dryland regions; (d) improve knowledge about environmental goods and services in order to develop adequate compensation mechanisms; and (e) strengthen the relation between environment-related knowledge generation and decision making by governments, producers, and civil society entities alike.
8. Increasing social empowerment in relation to environmental themes as the result of education and greater public awareness can be observed, but it is still necessary to: (a) promote sustainable land management as a vehicle for climate change adaptation; and (b) promote and disseminate traditional knowledge and wisdom.
9. Social protection networks have improved significantly in some countries – for example, in order to mitigate the negative economic, social, and environmental effects of droughts – but there is still a need to ensure the continuity and strengthen these safety nets and programs.
10. Special programs have been established, such as the carbon and climate investment funds, but: (a) the use of economic instruments for conservation and sustainable management of drylands remains insufficient; (b) it is still necessary to put national and international systems at the service of the development of drylands; and (c) there is a need to create more innovative financing sources and facilitate access to them on the part of traditionally marginalized groups.
11. Response mechanisms to the problem of desertification have improved, but full development and appropriate use of climate, agro-meteorological and hydrological services to help confront droughts and land degradation are still lacking.
12. Other important gaps that were observed are the following:

- Despite the fact that nearly twenty years have passed since the Earth Summit in Rio and the signature of the Conventions on Biodiversity and Climate Change and 17 years since the signature of the Convention on Desertification, the effective implementation of these Conventions cannot be seen in terms of the improvement of the situation of ecosystems in dryland areas. These ecosystems continue to be subject to various degradation processes leading to increased desertification.
- Despite some advances in the design of water resource management systems, the dryland regions are not prepared to confront the effects of climate variability and change. As a result, a significant gap still needs to be resolved through integrated water resource management programs, both at the level of water basins and aquifers and in other territorial realms, and especially in the case of transboundary or shared hydrological systems.
- Even though important advances have been registered in both formal and informal education in dryland areas, weaknesses persist in certain aspects relative to school infrastructure, teacher training, and access, quality, and contextualization in relation to local socio-cultural and environmental factors.

#### Conclusions and Recommendations for Rio+20

Taking into account the conclusions and calls to action of ICID+18, the principal themes of the World Conference on Sustainable Development to be held in Rio de Janeiro in June 2012 (Rio+20), and the advances and gaps with respect to climate, sustainability, and development in dryland regions since 1992 summarized above, the deliberations in Mendoza reached the following conclusions and recommendations. General Recommendations

1. The final document of the Rio+20 Summit should contain a specific chapter about the socio-economic and environmental situation and challenges of the drylands and the policies, programs, investments, and institutional arrangements that countries with dryland areas should adopt for sustainable development and poverty eradication within them.
2. The principle of common, but differentiated, responsibilities among developed and developing countries should be made operational through concrete proposals for implementation and financial mechanisms that put forward the strengthening of the capacities of and opportunities for future generations.
3. In order to be effective, Environmental Governance requires a baseline, targets, indicators, and financing; permanent global, national, regional, and local dialogues concerning drylands and their management are necessary, with priority participation of vulnerable groups of local communities. The empowerment of these local communities with respect to financial aspects, environmental services, and productive and value chains can strengthen said governance.
4. We confirm the need for a systemic and integrated focus for the comprehension and treatment of land degradation and desertification processes.

#### Reaffirmation of the Contributions of the Fortaleza Declaration

5. ICID+19 reaffirms the recommendations that are summarized in the Fortaleza Declaration, highlighting sustainable development, education, governance and financing as the most relevant themes.
6. We recognize the intrinsic value of the earth as the basis for the sustenance of humanity and all other species and we do not assign it merely a commercial value. This is the notion of "mother earth," or as it is expressed in the Andean indigenous language Quechua, "pachamama." In this sense, the relevance of land tenure systems and food security is likewise should also be kept in mind.
7. The Fortaleza Declaration emphasized the importance of the interchange of information and lessons learned during the two decades of the Earth Summit (Rio 92) process. During ICID+19, we have reconfirmed the pertinence of the guiding principles of sustainable development. We have also identified the need to approach these principles in geo-socio-economic-cultural-environmental terms so as to reflect the concerns, challenges, and opportunities of the people of the drylands.
8. ICID+19 represents substantive progress regarding the necessity for a systemic focus in the analysis, debates, and recommendations leading to Rio+20 with respect to the implementation in dryland regions of the three Rio Conventions: Biodiversity, Climate Change, and the Struggle against Desertification and Mitigation of the Effects of Droughts.
9. We recommend that: sustainable development objectives be adopted both globally and at the individual country level for dryland areas expanding the Millennium Development Goals (MDGs); educational policies and programs be strengthened in an interdisciplinary framework to address the situation at hand; targets be set to slow down the degradation and desertification and that they be proposed for inclusion in national, regional, and local agendas; biodiversity conservation be maximized; integrated water resource management systems be implemented and reinforced, including new initiatives at the global, national, regional, and local levels; and, the creation, communication, and transfer of knowledge and technology for the sustainable development of drylands be advanced.

#### Green Economy and Eradication of Poverty in Drylands

10. ICID+19 recognizes that making national, regional, and local economies more socially and environmentally friendly is an opportunity to secure the welfare of the present and future generations.
11. We propose that, through a participatory process, the debate within the region in relation to better development of and consensus around the concept of a green economy be deepened. Among the aspects that should be considered we highlight that green economies are: (a) low in carbon intensity; (b) refer to the internalization of environmental costs and the sustainable management of natural resources; and (c) incorporate all (i.e., social, economic, and environmental) dimensions of sustainability.
12. Thus, we recommend that the definition of the concept of a green economy focuses on social and environmental sustainability with emphasis on the eradication of poverty within the context of national, regional, and local priorities and taking into account the risk that, in the short run, environmental regulations could be converted into non-tariff trade barriers of hidden subsidies.
13. With regard to water than the management of water resources and wetlands in dryland regions, the following measures should be taken: (a) promote the integrated sustainable management of water resources; (b) increase the use of available knowledge and research concerning water resources; (c) guarantee security and equity in the access to water; and (d) encourage policies for conservation of wetlands, including the undertaking of inventories.
14. It is necessary to increase the attention given to droughts and other extreme weather events associated with climate change in dryland areas and improve measures to adapt to and live with them.
15. Territorial organization and development should be prioritized, as should the conservation of ecosystems and valuation of and compensation for environmental goods and services in the drylands.
16. It is necessary to promote in dryland regions: (a) sustainable land management as one of the vehicles for adaptation to climate change; (b) the strengthening and diversification of production of local economies; and (c) food sovereignty as a vehicle for reducing the vulnerability of socio-economic and biophysical systems.
17. The importance of financing mechanisms and associated instruments for the development of drylands areas should be highlighted.
18. Environmental assets and deficits need to be included in national income and wealth accounts, and the relation between the generation of knowledge and decision making by governments, producers, and civil society needs to be strengthened.
19. It is necessary to promote investment projects that consider social recovery and environmental restoration, especially those oriented to micro, small, and mediumsized enterprises, in the drylands.
20. Appropriate financial and technological responses should be sought and incorporated in public policies and governance for dryland regions affected by desertification and poverty.

#### Governance Institutions for Development of the Drylands

21. Environmental Governance in a broader sense than technical and institutional concerns should be understood as a new relation between the State and Society, which considers the participation of the stakeholders involved and constitutes a space of alliances and cooperation that can be influenced by conflicts that arise from the impact of social asymmetries and their effects on the environment.

22. It is necessary to strengthen the existing United Nations organisms related to the drylands, considering other existing institutions and coordination mechanisms.
23. Global, national, regional, provincial, and local integration, negotiation, coordination, interchange and horizontal cooperation mechanisms need to be strengthened, including, for example, existing institutional frameworks such as UNASUR, MERCOSUR and CARICOM.
24. Actions to promote improved governance in dryland areas should consider the strengthening not only of national and provincial institutions, but also of municipal and local ones, and support the establishment of interchange mechanisms among countries, regions, provinces, and municipalities, in the same continent or across continents, as for example the cooperation agreement between the Brazilian state of Ceará and the Argentina province of Mendoza.
25. The pertinent authorities should be influenced such that public policies, laws, norms, and other legal and institutional mechanisms regarding environmental themes in dryland regions are complied with and implemented out of conviction and not as a result of social pressures, with knowledge of these mechanisms from the outset and their validation together with their adequate dissemination being primordial for this purpose.
26. As one of the pillars of governance, it is necessary to strengthen participation and control over the pertinent financial mechanisms in order to guarantee sustainable development.
27. For the design of policy options for the drylands, the following should occur: (a) define, develop, and utilize the scientific and technical actions that meet the national demands and positions regarding the Rio Conventions and reinforce the synergies among them; and (b) promote the implementation of the priorities contained in national action plans.
28. As inappropriate technologies are among the causes of environmental degradation, it is necessary to promote: (a) sustainable land management; (b) the application of good practices, which are locally appropriate; and (c) adapt production technologies to local conditions and for organic agriculture.
29. It is necessary to guarantee the participation of the local population, technical specialists, researchers and other professionals from various disciplines, those responsible for the management of natural resources, and representatives of local governments and non-governmental organizations (NGOs) with the objective of contributing to decision making and the generation and implementation of legislation for the fight against desertification.
30. In relation to the participation, organization, and empowerment of vulnerable groups and populations, it is government's responsibility to promote the existence and strengthening of mechanisms of participation, social inclusion, prior informed consultation, and community empowerment based on the principles of equality, equity, transparency, access to information, and a gender focus. A case in point is the Integrated Management of Water Resources, taking the water basin as the functional, planning and management unit through Basin Councils or Committees.
31. All levels of society should be informed, educated, and trained, with emphasis on children and youth, on the basis of scientific and technical knowledge in order to influence decision making regarding natural resource management and global environmental processes such as climate change, land degradation and desertification, droughts, water stress, and other disasters in dryland regions.
32. Scientific and technical information should be disseminated in such a way that it can be understood and utilized by decision makers at the national, regional, and local levels and by the community in general. Taking up the urgent call to action of the Fortaleza Declaration, we reaffirm the rights of all citizens of the drylands to water, the land, the sun, the air, and healthy ecosystems in order to achieve a dignified individual, family, and community life.

Advancing the Oceans agenda at Rio+20: where we must go

Raphaël Billé , Elisabeth Druel , Julien Rochette ,

IDDRI, Institute for Sustainable Development and International Relations

27, rue Saint Guillaume, 75337 Paris Cedex 07 – France, [www.iddri.org](http://www.iddri.org)

### 1. Introduction

The 1992 Earth Summit in Rio de Janeiro gave birth most noticeably to the three "Rio Conventions" (on desertification, climate change and biodiversity) as well as to Agenda 21. Twenty years later, the "Rio+20" conference has much lower ambitions: in a best-case scenario, it will end up with a strong political declaration, visionary enough to blow a new wind of change and specific enough to open concrete avenues for progress. Officially , "the objective of the Conference is to secure renewed political commitment for sustainable development, assess the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development, and address new and emerging challenges. The Conference will focus on two themes: (a) a green economy in the context of sustainable development and poverty eradication; and (b) the institutional framework for sustainable development" .

This paper aims at contributing to three of these four objectives with regard to oceans by (i) demanding renewed political commitment for sustainable ocean management; (ii) proposing options to fill the remaining gaps in ocean governance; and (iii) addressing some new and emerging challenges. We do not elaborate on the assessment of progress to date, which is clear from UNEP's Global Environmental Outlook: in a nutshell the state of the oceans has continuously and seriously worsened since 1992, despite some local or sectoral successes which remain very scattered. Degradation trends are even often still accelerating.

The choice here is therefore to try and contribute directly to the conference objectives, without however developing our views in the framework of the two separate conference themes. The reason is two-fold:

- Oceans have had their share of empty concepts, buzzwords and so-called tools that are actually "Lichtenberg knives" . We strongly oppose the supposed need to reframe the problem under a new umbrella, like the "blue-green economy". The ocean community is now strong enough, its science robust enough, its concepts and principles established enough, not to let new fashions impose more chewing-gum concepts which bring neither tools, communication, political momentum nor helpful reframing.
- The institutional framework is of course important, but we believe that environmental governance in general, and ocean governance in particular, is bound to remain complex

. Efforts at rationalizing the institutional and organizational framework may achieve minor improvements – and let's take these! – but the system will remain essentially multi-layer, heterogeneous, contradictory and seemingly irrational. That is because it was never conceived as a “system”. Its complexity is the context in which we shall work and make progress, not a temporary disfunctioning which should be remediated.

We argue that significant progress has been made on science – not a limiting factor at this stage, on the diagnosis of threats and governance gaps, and on legal and policy proposals. It is time to be specific, and the Rio+20 outcome, although a mere political declaration, can help a lot provided it addresses at least five key issues which can perfectly be dealt with outside the green economy “conceptual” framework. Without any pretention to be exhaustive, we call for progress on (1) setting the stage for the establishment and management of MPAs in Areas Beyond National Jurisdiction; (2) paving the way for an international regulation of offshore oil exploitation; (3) giving the regional approach a new lease on life; (4) giving a new impetus to a drastic reduction of land-based pollution; and (5) strengthening the tools to fight Illegal, Unreported and Unregulated fishing.

## 2. Setting the stage for the establishment and management of MPAs in ABNJ

Areas beyond national jurisdiction (ABNJ) cover around half of the planet's surface and 64% of the surface of oceans and seas. They are also the least known and least protected areas on Earth. In recent years, the exponential use of ABNJ and their resources and a growing human pressure have subjected them to a multiplicity of threats: overexploitation of fish stocks, alteration of deep water habitats due to destructive fishing practices, oil pollution, introduction of alien invasive species, acidification of the oceans as well as emerging threats linked to bio-prospecting and deep-sea mining...

In this context, marine protected areas (MPAs) are seen as an efficient tool to protect this fragile biodiversity, but a certain number of legal issues are raised when it comes to the question of their establishment and management in ABNJ .

The United Nations Convention on the Law of the Sea (UNCLOS) is the overarching framework for the governance of the oceans. Its Part VII deals with the legal regime of the high seas and defines its freedoms (freedom of navigation, fishing, marine scientific research...) but seems rather incomplete on the protection of marine biodiversity in this zone. In particular, nothing is said about the establishment of MPAs.

For that reason, regional seas conventions have recently taken the lead on this issue, and created the first MPAs in high seas . But this regional approach has intrinsic limits. First, MPAs designated by a regional sea convention only bind contracting parties to that convention, and not third States, which can nevertheless be active in the region. Moreover, regional seas conventions do not have the mandate to regulate some activities which occur in the ABNJ, such as fishing, deep-sea mining or navigation. Other organisations are competent for these issues, and there is therefore a need of cooperation and collaboration between all these authorities which yields high transaction costs. Last, most parts of the high seas are actually not regulated by a regional convention.

At the same time, the Convention on Biological Diversity (CBD) has adopted scientific criteria for identifying ecologically or biologically significant marine areas in need of protection in open ocean waters and deep-sea habitats (EBSAs). The identification of EBSAs is ongoing, and will probably serve as a scientific basis for the designation of MPAs should the legal framework permit. In 2010, contracting parties to the CBD also agreed in Nagoya to establish a network of MPAs covering 10% of the oceans, including ABNJ, by 2020.

October 31st, 2011 Advancing the Oceans agenda at Rio+20: where we must go Raphaël Billé , Elisabeth Druel , Julien Rochette ,

These three spheres of action (regional, UNCLOS and CBD) are interrelated and need to be strengthened in order to establish an efficient governance system for MPAs in ABNJ. At the regional level, agreements involving inter alia regional seas conventions and regional fisheries management organisations need to be concluded, and complementary models must also be established for parts of the world where no such agreements may exist. Given the growing importance of the CBD due to its prominent position in the identification of EBSAs, its role must also be enhanced. Additional protection could be granted to EBSAs through, for example, a resolution of the United Nations General Assembly (UNGA). However, there is growing evidence and consensus that all these efforts will fall short of delivering adequate protection if a global legal framework does not provide for the establishment and management of MPAs in ABNJ. A clear political mandate must therefore be given at Rio + 20 to the UNGA to open the negotiations on an implementing agreement to UNCLOS on the conservation of marine biodiversity in ABNJ, including through the creation of MPAs. This needs to include other issues such as the status of marine genetic resources in ABNJ or the need of environmental impact assessments, as a package deal.

## 3. Paving the way for an international regulation of offshore oil exploitation

A recent series of accidents on offshore oil platforms (Montara platform, August 2009; Deepwater Horizon, April 2010; Penglai 19-3 platform, June 2011...) have raised public awareness on the extent to which offshore oil exploitation is moving into increasingly deep waters. Whereas just after the Second World War industries were only drilling in around 10 metres of water, it is now increasingly common for rigs to drill at a depth of over 2 km. Almost a third of the oil consumed in the world now comes from underwater areas. However, human domination of the world's oceans does not look set to abate. The sea has so far revealed only a tiny fraction of its energy potential and new ultra-deepwater drilling technologies are currently being developed. Consequently, it is assured that despite its environmental, economic and social impact, these recent accidents are unlikely to halt the rush towards offshore drilling, especially given that the technical cost of deepwater oil drilling has been significantly reduced in recent years and that offshore oil fields are continually discovered. Thus, despite several official declarations advocating for the adoption of a moratorium on deepwater drilling, the economic weight of this sector and the fact that it is currently vital to the equilibrium of the oil market, nobody is seriously considering halting its development. What does this mean in practice? Such strong standpoints against deepwater drilling remain useful and should still be supported and strengthened globally. However, it should be done in parallel with attempts to rethink the regulation of the activity itself. Because of the multiplication of accidents, their dramatic consequences both for marine environment and coastal populations and the “four Ds, which, from now on, are destined to characterize the offshore oil industry in its search for black gold: Deep, Distant, Dangerous and Difficult 10”, it is no more possible to plead for a legal status quo. Agenda 21 argued in 1992 that “the nature and extent of environmental impacts from offshore oil exploration and production activities generally account[ed] for a very small proportion of marine pollution”. The Rio +20 process must invite the international community to question the suitability of the current framework for the regulation of offshore oil drilling.

Indeed, although UNCLOS imposes a general obligation to protect the marine environment, no international convention specifically sets international standards determining the conditions under which States should issue drilling permits. Moreover, in terms of liability and compensation, oil platforms, floating or otherwise are not covered by international agreements such as the Convention on civil liability for oil pollution damage (1992) or the Convention on the establishment of an international fund for compensation for oil pollution damage (1992). Last, the current governance of offshore oil drilling is in fact largely characterised by self-regulation by operators. It is therefore clear that there are two main gaps in global international law: the first is located upstream – the absence of an international framework on the conditions under which oil exploration/exploitation is authorised and monitored – while the second is downstream – the absence of a global instrument relating to responsibilities and the distribution of damage liability.

At the regional level, there is only one real legal instrument aimed at specifically monitoring offshore drilling: the Madrid Protocol for the protection of the Mediterranean sea against pollution resulting from exploration and exploitation of the continental shelf and the seabed and its subsoil, adopted in 1994 within the framework of the Mediterranean

Action Plan and entered into force in March 2011. In the North-East Atlantic, the OSPAR Commission has adopted a number of regulations on the matter, but in a more fragmented manner. While hoping that these regulations will be applied by all States and that a common regime will be implemented in these two regions where offshore drilling is rapidly developing, international regulation should not be developed only at the regional level. Indeed, in many regions impacted by the oil industry, such as West Africa, there are major governance problems which impede States to ensure an effective control on offshore platforms and to deal with pollution accidents. Such circumstances can only plead for a comprehensive approach that aims to (i) establish a common set of obligations for States (and operators) to cover the entire process of approval, monitoring, intervention, sanctions and liability regime; (ii) and counterbalance the power of oil companies and their professional organizations with an international legal framework that creates obligations, including reporting, and allows the creation of an international convention secretariat. The current initiatives led by Russia within the G20 framework and Indonesia at IMO push in the right direction. Nevertheless, the Rio +20 process constitutes the opportunity to address this issue in a global and non-fragmented framework: the whole international community must now recognize that Agenda 21 is outdated on this particular topic and therefore pave the way for an international regulation of off shore oil exploitation.

#### 4. Giving the regional approach a new lease on life

The 1972 United Nations Conference on the Human Environment led to the creation of the United Nations Environment Programme (UNEP) "to serve as a focal point for environmental action and coordination within the United Nations system". In its first session, UNEP made the oceans a priority action area and the UNEP Regional Seas Programme was then initiated in 1974 "as an action-oriented programme having concern not only for the consequences but also for the causes of environmental degradation and encompassing a comprehensive approach to combating environmental problems through the management of marine and coastal areas". Since it was launched, the Regional Seas Programme has proven attractive, as evidenced by the more than 140 States participating in regional seas framework. Because "not every international environmental problem needs to be dealt with on a global level", such regional arrangements have often given States the opportunity to go "closer, further and faster" than at the global level. However, regional frameworks must now overcome some challenges to retain their value and gain effectiveness within the international oceans governance architecture.

First, new frontiers must be conquered. For a long time indeed, regional seas frameworks have remained within the confines of territorial waters and exclusive economic zones. Recently, regional cooperation has extended to the high seas (Mediterranean Sea, North East Atlantic) and coastal zones (Mediterranean Sea, Western Indian Ocean), in a still limited way however. Under the impetus of UNEP Regional Seas Programme, regional seas frameworks must therefore study the political and legal feasibility as well as the scientific and geographic relevance of such extension of the regional cooperation. Indeed, the regional approach can compensate some of the current shortcomings of the global level with regard to conservation of biodiversity in ABNJ. It can also help homogenizing – to a high common denominator – the way coastal areas are managed at the national level.

Besides, since Rio, many initiatives have been conducted within regional frameworks to update and develop legal instruments of cooperation. Nevertheless, one cannot deny that too many conventions and protocols have been and remain dormant or weakly implemented. It is therefore time to reactivate these instruments, by providing regional frameworks the means of their ambition. More efforts, in terms of funding in particular, must therefore be dedicated to strengthening regional systems, so that they be able to keep the cooperation alive and provide States with technical assistance and support for the implementation of the regional instruments. In this regard, the creation of Regional Activity Centres, such as the ones existing in the Mediterranean and Caribbean Seas, must be promoted. It should be underlined that financial constraints to do so may actually often be more easily removed than usually assumed. For instance, reallocating into trust funds an even small proportion of development cooperation funding that is today dedicated to marine biodiversity conservation through projects, would basically allow to sustain at least one RAC in each regional sea.

Special attention should also be given to the cooperation between the regional seas conventions and other sectoral organisations interested in marine conservation. The North-East Atlantic looks like the most advanced region in this respect. Indeed, the OSPAR commission is currently working on a draft collective arrangement between competent authorities on the management of the six MPAs in ABNJ established in 2010. This process, also referred to as the "Madeira process", aims to coordinate the adoption of sectoral management measures and to strengthen cooperation on this issue with organisations such as the North East Atlantic Fisheries Commission, the IMO, the International Seabed Authority (ISA) or the International Commission for the Conservation of Atlantic Tunas (ICCAT). Such cooperation between regional and international organisations is also crucial in parts of the world where no regional seas convention and/or no RFMO (regional fisheries management organisation) exist. In the Sargasso Sea for instance, there is no regional sea convention and the only competent RFMO, ICCAT, is only competent for tuna. Regional cooperation can nevertheless be enhanced by a combination of protective measures adopted by sectoral organisations, such as the designation of a particularly sensitive sea area by IMO, of fisheries closures by ICCAT, of areas closed to seabed mining by ISA. In the future, an agreed management plan could be signed by these organisations, and could also enlist the support of coastal States to this initiative. The Sargasso Sea Alliance is currently promoting this approach. These two models show the need of a better cooperation at the regional level but also highlight that there are already instruments existing for this cooperation to be enhanced. At the regional level, States have the power to act without necessarily going through an important institutional reform.

Rio +20 is therefore the appropriate moment, not only to recall the strategic importance of the regional approach in addressing marine issues, but to help regional organisations enter the 21st century: the Rio+20 outcomes must urge the international community, including donors and NGOs, to strengthen the regional frameworks so that they be able to make a real difference in tackling marine challenges. As far as high seas conservation is concerned, a mandate given to the UNGA to start a negotiation process towards an UNCLOS implementing agreement should necessarily assert the importance of the regional level, and encourage negotiating parties to strengthen the coordination and cooperation between regional organisations.

#### 5. Giving a new impetus to a drastic reduction of land-based pollution

Land-based activities have been recognised as a major source of marine environmental pollution for decades. During the 1992 Earth Summit, States considered that these activities contributed to "70 per cent of marine pollution". Even if the Johannesburg Plan of implementation called States to "make every effort to achieve substantial progress (...) to protect the marine environment from land-based activities", the situation has further deteriorated. It is now estimated that up to 80 per cent of marine pollution comes from land-based sources, which also poses huge threats to human health. Despite the various legal instruments and policies adopted at global, regional and national levels, the situation is therefore getting worse as illustrated by the two related "emerging issues" identified by the 2011 Report of the UN Secretary-General on oceans and law of the sea.

The first issue relates to the discovering of high levels of accumulation of plastics and other marine debris in seas convergence zones, known as "gyres". In the North Pacific for example, studies show a "literal blanket of trash" while recent expeditions highlighted the presence of 250 billion particles of micro-plastic in the Mediterranean. The ocean is therefore sick from land-based activities, as also illustrates the second issue identified by the UN Secretary General's report, namely nutrient over-enrichment of marine waters, which causes oxygen depletion, eutrophication and lead to the development of "dead zones". In this regard, dead zones in coastal areas have doubled in extent every decade since the 1960's. A recent study conducted by UNEP has identified 415 eutrophic and hypoxic coastal systems, including 169 identified hypoxic areas, 233 areas of concern and 13 systems in recovery. These two phenomena can obviously be seen as "emerging issues" but they are, above all, the symptoms of a continuously deteriorating situation.

However, policy and legal responses to address land-based pollutions have been widely adopted in recent years, through the elaboration of the Global Programme of Action for the Protection of the Marine Environment from Land-based Activities, the adoption of the European Union Water Framework Directive and the EU Marine Strategy

Framework Directive, and specific protocols within regional seas frameworks, as well as the related development of national policies and laws. But one cannot fail to notice that these political and legal instruments have not curbed the general trend.

Rio+20 process and outcomes must therefore not miss this issue but recall the extent of the problem. In particular, considerable progress could be made in the future on at least three dimensions. First, there is unquestionably a need to ensure the effective implementation of legal instruments, especially at the regional level, which presupposes the strengthening of the regional systems themselves (see section 4). Second, investments should be reinforced to develop sewage treatment plants, which are dramatically lacking in many coastal zones, and the associated water management systems; donors should thus reinforce this area of action. Last, economic instruments should be used to promote environmentally friendly behaviours and activities: taxes, non-compliance fees and, more than anything and following the Nagoya Strategic Plan, elimination of harmful subsidies which are supporting models of agriculture, industry, mining or tourism that have been polluting our oceans for too many decades. No major step forward can be expected from Rio+20 in that regard. However simply placing the fight against land-based pollution back among the highest priorities for action and funding would be useful for future reference.

#### 6. Strengthening the tools to fight Illegal, Unreported and Unregulated (IUU) fishing

Chapter 17 of the Agenda 21 promoted the sustainable use and conservation of marine living resources and described a wide range of tools available to States in order to achieve this aim. In 2002, at the WSSD, States agreed to "maintain or restore stocks to levels that can produce the maximum sustainable yield with the aim of achieving these goals for depleted stocks on an urgent basis and where possible not later than 2015". Today, in 2011, it seems clear that these objectives, formulated with wisdom in very vague terms ("and where possible not later than 2015"), will not be met – whatever this should mean. The 2010 report of the FAO on the state of the world's fisheries and aquaculture indeed estimates that about 32 percent of world fish stocks are overexploited, depleted or recovering and that 53 percent of the remaining stocks are fully exploited. The report moreover states that "the increasing trend in the percentage of overexploited, depleted and recovering stocks and the decreasing trend in underexploited and moderately exploited stocks give cause for concern". At the same time, market demand for fish has never been so high and is not likely to decrease in the upcoming years.

Illegal, Unreported and Unregulated (IUU) fishing is a widespread phenomenon which largely contributes to the depletion of fish stocks. A report to be adopted soon by the European Parliament estimates that its share is equivalent to at least 15% of worldwide catches, between 11 and 26 million tonnes a year. In 2001, the international community decided to tackle the issue with the adoption of an International Plan of Action to prevent, deter and eliminate IUU fishing (the FAO IPOA IUU), an instrument which provides States with a range of tools and principles which could help to fight IUU fishing. The following year, the Johannesburg Plan of Implementation (JPOI) called upon States to "urgently develop and implement national and where appropriate, regional plans of action to put into effect [...] the International Plan of Action to prevent, deter and eliminate illegal, unreported and unregulated fishing by 2004". But, since then, only very little progress has been made. The biggest flaw of the FAO IPOA IUU is that it is a voluntary instrument and to date only a small number of States have adopted their own national plan of action. This proves that it might not be the appropriate tool.

On the whole, efforts are far from sufficient and, as of today, it is clear that the fight against IUU fishing is a triple failure:

- It is the failure of international organisations (RFMOs but also the UN, with UNCLOS and the other agreements linked to it as well as the FAO) to impose an effective control over States on this matter. RFMOs have established IUU lists of fishing vessels, which are all out of date, empty or never contain the names of vessels flagged in one of their Contracting Parties. A reform of the RFMOs is urgently needed in order to strengthen their capacity to ensure compliance with the measures they are adopting and to impose sanctions on States which are not respecting them.

- It is the failure of States to exercise an effective control over their own vessels and/or nationals because of a lack of means, but also and primarily because of a lack of political will. The lack of political will is here not only a vague reluctance but in some cases a clear and active political choice, with the existence of "States of non-compliance". The international community should adopt means such as a flag State compliance instrument with stringent sanctions associated in case of non-respect to make sure that these States can no longer escape their international obligations. In addition, and according to the requirements of the JPOI and Nagoya plan of action, States should also eliminate subsidies which contribute to IUU fishing.

- It is the failure of the markets to regulate fish exchanges so as not to accept in the production chain products stemming from illegal catches. IUU fishing is a very profitable business and it is relatively easy for operators to take advantage of the system. Trade market related measures have been advocated for a long time, and the EU is pushing for the introduction of a global catch certification scheme. In order to be efficient and to avoid fraud, this scheme should not be paper based, but fully electronic, based for example on the TRACES system used by the EU for health and sanitary certification requirements.

More broadly, a particular emphasis must be put on the fight against flags of convenience and in particular against countries which are granting their flags and international fishing licenses (the owner of the vessel is not allowed to fish in the EEZ of the flag State but only in the high seas) to beneficial owners who are hiding their identity under the status of an International Business Company or Corporation, as is currently the case in Belize for example. Parallel registration of fishing vessels should also be carefully monitored. To this end, the establishment of a mandatory record of fishing vessels under the auspices of the FAO would be an efficient instrument. Additional efforts have also to be put on the definition of the link between a flag State and its vessels. Article 92 of UNCLOS simply states that "there must exist a genuine link between the State and the ship". An agreed international definition of this link must be adopted, which should underline the necessity of States to effectively exercise their jurisdiction on their vessels.

Rio+20 should be the occasion for States to renew their commitment to fight IUU fishing but also to take into account the shortcomings of this fight in the last 20 years. A call is needed for the adoption of stringent international instruments (a global record of fishing vessels, a flag state compliance instrument) and for the ratification of the FAO Port State Agreement. Discussions must be launched on the review of the RFMOs and on the adoption of an international, electronic-based, catch certification scheme.

#### 7. Conclusion

We reviewed five key areas where we think steps forward could and should be taken at Rio+20. Readers may be stricken by two observations:

1. These all sound like old stories: none of these issues – except to a certain extent offshore energy – is new, and most of the policy responses are well-known.
2. The range of progress that may be achieved in Rio in June 2012 seems ridiculously bureaucratic: launching processes, reasserting the importance of ..., etc.

We believe both are realistic and legitimate concerns.

First (1), most issues have indeed been around for at least 20 years, often many more, and the international community – or part of it – has been trying to take action for almost as long. Rio+20 is also Stockholm+40, and a lot was already going on long before 1972, both in terms of problems and action. Pretending things have been moving in the right direction, although too slowly, would not only be misleading: it would be a strategic dead-end. The only way forward is to recognize the overall failure with regard to ocean governance, to study the few successes at hand, and to develop strategies that seriously take both into account. This means also acknowledging the conflictual dimension of ocean governance and the widespread reluctance – if not active resistance – to make it more sustainable as soon as it comes at a cost.

The green economy concept, however blue we may manage to make it, does not contain any silver-bullet to overcome such oppositions. We are left with good old advocacy, communication, education, demonstration, to hopefully build the necessary constituency – hence the political will – that will reverse the balance of powers.

Besides intensification of well-known threats, what may be considered new – in the sense that we are only starting to understand it – is the additional pressure climate change and ocean acidification place on marine ecosystems. Impact science is in its infancy, and effects of e.g. acidification are difficult to isolate from that of other stressors. There are however three points we can make:

- Climate change and ocean acidification may well turn out to be the greatest threats to marine ecosystems along the 21st century, but this will largely depend on the way we manage other stressors.

- As global issues (i.e. issues which need to be addressed globally), they will however impact marine ecosystems and dependent societies very unevenly and at different time scales. This will challenge the willingness to and attempts at addressing these threats globally.

- Most importantly, oceans are faced for the first time with global threats rising after most levers and policy options to tackle them have already been identified and tested: reducing CO2 emissions, building ecosystem resilience through networks of MPAs, the reduction of land-based pollutions or reducing the pressure from fishing, etc. Although some minor progress has been made along these lines, efforts have remained vastly insufficient and unsuccessful.

This means that there is not much choice but to eventually succeed where we failed to a large extent so far. Hence the old stories and familiar policy responses reviewed in this paper.

Second (2), having too high expectations about Rio+20 would not help. The above indeed shows the nature of what may be achieved there: at best the international community may decide to renew and strengthen the political momentum inherited from Rio 1992, and to launch new processes which in turn may lead to important decisions. But crucial decisions – in the sense of decisions directly driving changes in pressures on oceans – will not be taken in Rio. It is all the more important to demand that Rio+20 be a political and bureaucratic success. This will condition to a significant extent the next decade of the international sustainable development agenda.

Powerful International Science – Policy Interfaces for Sustainable Development:

organise their proliferation, accept and clarify their political role

Sébastien Treyer, Raphaël Billé, Lucien Chabason, Alexandre Magnan IDDRI, Institute for Sustainable Development and International Relations 27, rue Saint Guillaume, 75337 Paris Cedex 07 – France, [www.iddri.org](http://www.iddri.org)

This contribution for UNCSD 2012 concerning the Institutional Framework for Sustainable Development builds upon IDDRI's experience in supporting negotiations about the establishment of international science-policy interfaces like IPBES, and on recent publications and workshops intending to take stock of the variety of science-policy interfaces having emerged for the international governance of the environment or other sustainable development objectives like food security.

#### 1. Organising the proliferation

International Science-Policy Interfaces (ISPIs) are proliferating in the various regimes of international governance of sustainable development (scientific advisory bodies of various environmental conventions, IPCC, IPBES, World Water Assessment Programme, High level panel of experts for Food security and nutrition, Assessment of Assessments [AoA] for the marine environment, foreseen panels on soils at FAO or for the UNCCD ...).

Their multiplication is for the moment often based on the replication of successful mechanisms or experiences, that are used as references: the IPCC has obviously been one of them, but also the Millennium Ecosystem Assessment as far as the IPBES is concerned; other main references are the role played by science in addressing long range transboundary air pollution (LRTAP / Acid rains), tropospheric ozone depletion (Montreal protocol), or environmental issues in the Mediterranean (Barcelona Convention).

Integrated modeling exercises and integrated assessment methods (scenario and simulation, for instance) have been co-evolving with these different exercises, playing a central role in the mechanisms that are acknowledged as successful. Influential personalities and key research institutions have also played a central role in transferring experiences from one field to another. There is therefore some genealogy underpinning the multiplication of ISPIs. But recent experiences and publications put the stress on the specific political context and specific structure of academic and epistemic communities in each field, showing that the role of science has to be analysed specifically in each case.

#### Recommendations

1a. It is useful to seek for synergies and coordination, in order to avoid duplication among ISPIs.

1b. The role of science in each field has to be identified specifically, and an existing ISPI should not be directly substituted to the expected function in another field, neither can the model of an existing ISPI be directly replicated in another field.

1c. Having identified a specific function for scientific expertise in an international policy process should not necessarily lead to the institutionalisation and the design of a new ISPI. Empowering existing academic arenas and coordinating partial, scattered existing mechanisms should also be considered valid options.

1d. Drawing lessons from experiences of ISPIs in other fields is useful and should be organised, without leading to direct replication.

#### 2. Accepting and clarifying the power of ISPIs comes first, before ensuring their efficiency

Current discussions about ISPIs are overwhelmed by questions concerning the improvement of their efficiency, and the corresponding optimal institutional design. As stated before, questions of institutional design should only come after the identification of the function that is expected from scientific expertise in the specific area under consideration.

The reference models of successful ISPIs that are generally used to define efficiency improvements have to be put into perspective, as they often refer to situations where the key role played by science was to influence the policy agenda by making the case for a specific environmental problem, for which technological solutions were apparently already at hand, which was the case for LRTAP or the Montreal protocol.

It is in the same perspective that the IPCC, and in particular its Working Group I on climate science, have been seen as a reference, because of their very efficient process for clarifying the characteristics of climate change, giving evidence of its anthropogenic cause, and making a clear statement of the minimum expected level of climate change during the next century. In such a perspective, it is generally considered as the ideal model that scientists should reach consensus and clarify residual uncertainties in order to have an impact on decision makers. Efficiency is then a question of:

- ensuring good quality standards for the production of "sound science";
- improving communication channels and mechanisms to reach policy makers.

But this perspective is only relevant:

- for experimental sciences and biophysical phenomena;
- and if the objective is to put an environmental issue on the agenda.

For many other scientific fields and policy contexts, controversies are inevitable (whenever it comes to social changes, development pathways, and to social sciences or economics), and they can not and should not be reduced to consensus. And for many decisions, the role of science is not anymore in agenda setting, but rather on comparing policy options.

Working group III of IPCC provides an interesting example of producing scientific expertise on possible socio-economic trajectories to 2100 in order to inform a negotiation process where burden sharing has been at the heart of the discussions. Solutions found to deal with divergences among researchers in WG III are nevertheless much less analysed and discussed than WG I processes, although they might represent very useful experiences.

Food security is also an interesting domain, for which the critical function of science might well be much more in the evaluation of the performance of public policies and regulations than in putting food security on the international agenda. The role of science for the evaluation of policies will be all the more critical when the focus comes down from international regulations (what options do we have to regulate the volatility of international prices ?) to assessing the performance of national domestic policies, that are essential drivers of food security. Such an evaluation however raises sovereignty issues and will therefore necessarily question the legitimacy of the ISPI to work on this core question.

#### Recommendations

2a. The political function of science should be acknowledged, particularly as it should not be reduced to producing biophysical scientific evidences for the only purpose of agenda setting.

2b. The role of science, and the function of ISPIs if the institutionalisation is seen as necessary, has to be considered as strategic, in so far as knowledge production ensured in these arenas has a key role to play in advocating for changes in current policies, by, inter alia:

- assessing the current state of a problem;
- evaluating the performance of existing or possible policy options;
- evaluating the costs (not only economic costs, but also social, environmental, political costs) of the different options, and the distribution of these costs among the different negotiating parties or non negotiating stakeholders;
- closing controversies when possible;
- re-opening the range of possible options;
- re-framing the formulation of a problem to include dimensions that are not enough taken into account...

This first list of possible functions of scientific expertise in international negotiation processes should illustrate that there are a diversity of possible strategic roles of science. They have to be identified carefully, in order to clarify how to ensure the legitimacy of science, or the corresponding ISPI if considered necessary, for such a strategic role.

2c. The role of science is therefore of a political nature, but it will never be to impose any decision calculated as optimal, which would substitute expertise to the negotiation process. Science should not be expected to take over the responsibility of political decision-makers and negotiators. Improving the legitimacy of ISPIs is important, and can necessitate pluralism, or even the participation of a variety of stakeholders because they hold a key component of relevant knowledge, as is the case in IPBES. However such a "democratisation" process in the field of knowledge production should never result in its substitution to political decision making.

2d. Common criteria used to assess the efficiency of ISPIs (credibility, legitimacy, relevance) are very useful tools to improve the capacity of science or of the corresponding ISPI, but only once the strategic role of science has been clarified.

Depending on the context and the expected function, credibility should not directly be reduced only to quality processes to ensure "sound science". It can be linked to the organisation of a pluralistic academic debate among different worldviews (for instance, in economics, about the impacts of trade liberalisation on socio-economic development), showing both convergences and divergences in the existing scientific production, that the decision maker has to bear in mind when making a political choice. It would not be science's role to substitute for the political choice by a false consensus. Independence from any mandatory body, be it national or international, can be a very important criterion to ensure some of the strategic functions science could play (the capacity to re-open the range of possible options, for instance, necessitates that the mandate of an ISPI is not too narrowly defined by its mandatory body), and it would increase its credibility and also its legitimacy. But in some intergovernmental negotiation processes, legitimacy might need to be ensured through some kind of intergovernmental designation of experts, and relevance might necessitate some definition of the mandate by an intergovernmental process.

In every specific context, it is thus necessary first to analyse and specify the strategic function that is expected from science, or from an ISPI if considered necessary, in order to clarify its political role, and to address specifically how to ensure or improve credibility, legitimacy and relevance, with respect to the specific expected strategic function.

It is not just efficient but really powerful science-policy interfaces that are needed for the international governance of sustainable development: ensuring they can have power, in a legitimate and efficient way, is more than a question of institutional design. UNCSD Rio+20 should be the opportunity that the international community endorses the necessity to empower each ISPI with a strategic and political role, although this role differs depending on the issue at stake. A process should be launched to enable to specify this strategic role in each case and at the same time draw relevant lessons from other experiences without replicating one-size-fits-all models.

#### Introduction for Rio+20

"Reconciling Poverty eradication and quality of the environment: what are the innovative solutions?"

- The Poverty-Climate Nexus: A Review of the Debate since The Stern Review
- Biodiversity and poverty: old debates, recent evidence and emerging controversies
- Poverty Eradication and Quality of the Environment in Urban and Peri-urban Areas
- What is the role of the private sector in combating poverty and caring for the environment?

In June 2011, the Institut Veolia Environnement and the Agence Française de Développement organized an international Conference in Paris to address the interactions between poverty and the environment. The programme was structured around four main themes:

- poverty eradication and climate change ;
- poverty eradication and biodiversity ;
- poverty eradication and quality of the environment in urban areas ;
- poverty eradication and quality of the environment: what is the role of the private sector?

The objective of exploring the subject in such a comprehensive manner was to identify and share the current state of knowledge and practices, in anticipation that this may eventually be of interest for the preparation of the UN Conference Rio+20.

For each of the principal themes, a background article was solicited from leading scholars in their field of expertise. These background articles present a global perspective on the themes, addressing the questions:

- what is the current situation?
- what are the unresolved questions?
- what we should focus on to imagine a better future?

A number of priority objectives stand out. They are:

- to make the poor less vulnerable to climate-related risks;
- to improve the livelihoods of the poor through the preservation of biodiversity, the sustainable development of natural assets and an improved access to energy;
- to contribute to improving the quality of life of the poorest, particularly in cities;
- to promote innovations in business models, in modes of funding, and in forms of cooperation between key parties.

We believe that these objectives are in line with the expectations and themes (particularly that of addressing "new and emerging challenges") of the upcoming United Nations Conference on Sustainable Development.

#### The global context

Poverty and environmental damage increasingly go hand in hand throughout the world. Each of these problems can cause the other. Since global population could reach 10 billion by 2050 - including some 2 billion in Africa - demand and requirements could also rise, forcing societies to adapt and devise new development and growth models. For

example, they will have to resort increasingly to a rational use of resources and develop a carbon- neutral economy. Considering the complexity and interdependency of both these major issues - combating poverty and preserving the quality of the environment - analysing their interactions opens up the prospect of new innovative solutions and creates real opportunities.

Poverty assumes different forms, depending on whether you live in France, Mali or India. If the ultimate objective for women and men is to be respected as fully-fledged human beings, with dignity, moving out of poverty also means having access to food, education, housing, medical care, and essential goods: water, energy, electricity. For people to benefit from these essential services, crucial economic transformations are needed to create more wealth and eventually improve their living conditions. The various forms of development that the people of the earth engage in have led to an infinite number of forms of poverty, to which are added other parameters, such as environmental factors, that may potentially worsen the situation. It is useful to explore relevant and adapted solutions that take into account the environmental dimension.

Today, preserving the environment is a major component of sustainable development. Humans, because they interact with the natural environment, must evolve in order to face up to new constraints at international level. These include limited and vulnerable natural resources, loss of biodiversity, finite land that is sought for competing uses, need for new energy sources, demographic pressures - particularly in urban areas - and climate change. So, for people and the planet to survive, wouldn't it be necessary to reflect on such an integrated approach and on the economic resources that would allow an efficient transition towards meeting the dual objective of reconciling poverty eradication and quality of the environment?

Most of the world's population will grow up in cities in developing countries. The challenges facing these people will be immense (housing, food, health, education, etc.). Mobilising all actors, governments, international organisations, NGOs, businesses, charitable foundations and scientific communities, is necessary to develop and implement new policies, as well as effective and sustainable poverty reduction instruments in a context of environmental deterioration.

Although the challenge is global, answers need to be found at the level of local communities. Cooperation between all of the actors, lasting innovative economic activities, preserving existing funding sources, developing local projects and ensuring feedback, all need to be at the heart of reflections and decisions for the future.

Such a situation calls for reflection on the solutions to be formulated to meet these challenges. Existing economic models are now being questioned. There are calls for greater valuation and integration of social and environmental returns, as well as long term benefits. To this should be added changes in the aid systems applied up to now, whether in terms of their amount, their allocation, or their evaluation. It seems essential, therefore, to rethink both the mechanisms and the measure of the efficacy of economic instruments.

Furthermore, new forms of cooperation and partnerships between actors are emerging, motivated by better risk-sharing and improved awareness, and a greater sense of responsibility. In view of the present economic crisis, financial resources will have to be redirected towards development projects that include economic, social and environmental dimensions. This improved allocation of available funds must go hand in hand with new funding sources from other actors who can provide leverage by proposing additional resources.

After the New York Summit on progress in the Millennium Development Goals that was deemed insufficient (September 2010), the Cancun Climate Summit (December 2010) approached with cautious optimism following the results of Copenhagen (December 2009), the "Poverty-Environment" Conference has provided an additional opportunity for dialogue on development and environmental issues one year ahead of the Rio+20 Earth Summit.

#### The Poverty-Climate-Vulnerability Nexus

##### A Review of the Debate since The Stern Review

Prepared by Laurence Tubiana (IDDRI), Noura Bakkour (IDDRI), with contributions from Lord Nicholas Stern

Two of the greatest challenges facing our interdependent world - overcoming poverty in the developing world and combating climate change - are inextricably linked. The channels linking climate change to development are numerous: droughts, floods, storm surges and changes in rainfall patterns all affect the natural environment as well as the livelihoods of poor people, their nutrition, their security, their future opportunities and probably those of their children. The social impacts of climate change are numerous and difficult to assess as interactions are complex and poorly understood. Nevertheless, evidence is presented in a growing number of studies demonstrating that climate change is an exacerbating factor of poverty that confines people in so-called poverty traps. The Stern Review has conducted a comprehensive assessment of the links between poverty and climate change. The results have been confirmed by additional studies providing new information and insight. This paper aims reviews the conclusions of some recent literature, against the major findings of the Stern Review and the IPCC Fourth Assessment Report, clarifying the underlying assumptions and questioning some of the conventional wisdom. There is wide scientific consensus relating to the scope of climate change impacts. Rise in temperature level is one major aspect but the impacts of climate change often translate into water problems, such as floods, extreme precipitation, sea level rise or conversely lack of water and ensuing droughts. These impacts have varying effects on countries, regions and people. These differentiated impacts are at the heart of the poverty and climate change nexus. The current debate addresses two underlying questions: Does climate change deepen existing poverty and if so, how? And how does poverty increase vulnerability and affect capacity to cope with extreme weather events and slow onset changes in climate?

#### 1. POVERTY AND VULNERABILITY

Poverty encompasses various dimensions: the poverty of a nation - measured by GDP, per capita GDP or a broader definition of their level of development such as the Human Development Index; household poverty as measured by income (monetary measure); or poverty as a lack of capabilities and assets (individuals).

Defining and measuring poverty are essential to any discussion on development and poverty alleviation. Definitions of poverty have traditionally focused only on material - specifically monetary - measures of well- being but have expanded to include the social and psychological burdens of daily survival on lower level society. This broader concept is described by Amartya Sen as a lack of the capabilities that enable a person to live a life he or she values, encompassing such areas as health, education, empowerment, and human rights in addition to income.

A better understanding of these complexities has led to the use of participatory assessments that allow the poor to speak for themselves and identify their own priorities. Such studies make it clear that, in addition to being without financial resources, being poor often means suffering sickness, chronic pain, or exhaustion. It means enduring difficult social relations, sometimes facing exclusion from the community or family. Poverty also translates into insecurity and powerlessness, a lack of access to information and institutions, and often a lack of self-confidence and voice. These varying aspects of poverty tend to be self-reinforcing, making it all the more difficult to move out of poverty and construct a stable life. It is hard to plan ahead or to seize new opportunities when you are exhausted, stressed, or hungry. In addition, the poor often live in dangerous and degraded environments, since that is all they can afford nor do they have the capacity or right to migrate to a more suitable living environment. In this context, it is important that the poverty impacts of climate change be analyzed taking into account these various dimensions.

Vulnerability adds another dimension to the climate-poverty nexus. Vulnerability to climate change is determined by both physical and social assets. It refers to the quality of the physical asset base as well as the likely responses of the sectors and resources on which societies and individuals depend, the availability of resources and, crucially, the entitlement and choice of individuals or groups to call on these resources (access to assets).

Vulnerability to climate change is not strictly synonymous with poverty. While climate change impacts fall more heavily on the poor, it is important to remember that the levels of warming that we risk would be profoundly damaging for all countries, rich and poor. Nearly all human societies and activities are sensitive to climate in one way or another. Where people live and how they generate livelihoods and wealth are influenced by the ambient climate. All nations will need to adapt to increased climate risk.

The conventional wisdom is that poverty in the narrow sense (monetary) is the main factor of vulnerability, since low-income households have less capacity to adapt. This however is rather simplistic, since it measures ability to adapt (and thus reduce vulnerability) solely on the basis of economic and technological means. Yet there are many other factors in responding (or not) to natural disruptions. A more comprehensive view of vulnerability includes several factors other than income: the layout of the land, the sensitivity of ecosystems, social cohesion, diversity of activities (economic and subsistence), political and institutional organization, and living conditions. Only the last factor (living conditions) is tied directly to development level, which proves that low income is not the only measure of vulnerability, and at times only has minor influence.

### 1.1 Poverty of Nations and the Geographic Factor

As the Stern Review and IPCC reports established, the adverse impacts of climate change will be most striking in the developing nations because of their geographic and climatic conditions, their high dependence on natural resources, and their limited capacity to adapt to a changing climate.

Geographic location is a key factor in the vulnerability of poor people and poor nations. Many of these countries lie in the regions most at risk from climate change. Most of the 48 nations included in the Least Developed Countries (LDC) group will be those most severely impacted by climate change. These countries are already warmer on average and most of them suffer from higher rainfall variability, and are highly dependent on agriculture, the sector most sensitive to climate. Crop yields are expected to decline in most tropical and sub-tropical regions as rainfall and temperature patterns change with a changing climate. There is also some evidence that disease vectors such as malaria-bearing mosquitoes will spread more widely and that health risks related to heat and air pollution will increase. Projected changes in the incidence, frequency, intensity, and duration of climate extremes as well as more gradual changes in the average climate will threaten the livelihoods, further increasing inequity between developing and developed countries.

The effects of climate change on economies and societies will vary greatly around the world. The circumstances of each country - its initial climate, socio-economic conditions, and growth prospects - will shape the scale of the social, economic and environmental effects of climate change. IPCC defines vulnerability to climate change as exposure to changes in climate sensitivity - the degree to which a system is affected by or responsive to climate. Geographical exposure plays an important role in determining a country's growth and development prospects. Many developing countries are located in tropical areas. As a result, they already suffer from climate extremes (such as those that accompany the monsoon as well as El Niño and La Niña cycles), intra and inter annual variability in rainfall, and very high temperatures. Geographical conditions have been identified as important contributors to lower levels of growth in developing countries (e.g. dependence on monsoon for India or Bangladesh). William Nordhaus and Jeffrey Sachs have confirmed the negative effect of "tropical geography on output per capita compared to temperate regions", including on agricultural performance. Climate change is expected to make these conditions even more challenging. Even slight variations in the climate can have very large costs in developing countries as many places are close to the upper temperature tolerance of activities such as crop production.

### 1.2 The Poverty Lock-In: Dependence on Climate Sensitive Activities

For developing economies, heavy reliance on climate-sensitive sectors such as agriculture and ecosystem services, along with rapid population growth and high concentrations of people in slum and squatter settlements highly exacerbate the impacts of climate change leading to poverty lock-in.

#### - Climate Change Threatens Food Security

Agriculture and related activities are crucial to many developing countries, in particular for low income or semi-subsistence economies. The rural sector contributes 21% of GDP in India, for example, rising to 39% in a country like Malawi, whilst 61% and 64% of people in Asia and sub-Saharan Africa are employed in the rural sector. This concentration of economic activities in the rural sector - and in some cases based on just a few commodities - is associated with low income levels and this creates critical sensitivity to climate. In a number of African countries like Morocco or Burkina Faso, GDP is highly correlated with precipitation. Of course there are mediations between the evolution of agricultural output and poverty. Models explore how changes in agricultural productivity as a result of climate change will affect poverty in poor countries, concluding that there are various pathways by which climate change might affect agricultural income and food prices. Rising world prices for staple commodities may result in a substantial reduction in real income - and an ensuing increase in poverty - for households spending a large share of their income on staple grains. However, the well-being of households depends not only on changes in the cost of living, but also on changes in earnings.

While climate change has a fairly consistent impact on the real cost of living at the poverty line, the impact on household earnings is quite varied. In regions where the bulk of the poor are self-employed in agriculture, higher global agricultural prices can boost factor returns in the sector, thereby reducing overall poverty. On the other hand, when poverty is dominated by wage earners and urban poverty, the opposite applies. Countries combining subsistence agriculture and urban poverty will see an increase in aggregate poverty.

#### - Climate Change Increases Water Constraints

Developing countries are highly dependent on water, the most climate-sensitive economic resource, for their growth and development. Water is a key input for agriculture, industry, energy and transport and it is essential for domestic purposes. Irrigation and effective water management will be very important in helping to reduce and manage the effects of climate change on agriculture. But many developing countries invest little in irrigation systems, dams, and ground water. Ethiopia for example has less than 1% of the per capita artificial water storage capacity of North America, despite having to manage far greater hydrological variability. Many developing countries do not have enough water storage to manage annual water demand based on the current average seasonal rainfall cycle. This will become an even greater bind with future, less predictable cycles. In addition, inappropriate water pricing and subsidised electricity rates that encourage the excessive use of groundwater pumping (for agricultural use, for example) also increase vulnerability to changing climatic conditions. For example, 104 of Mexico's 653 aquifers (that provide half the water consumed in the country) drain faster than they can replenish themselves, with 60% of the withdrawals being for irrigation. Similarly, water tables are falling in some drought-affected districts of Pakistan by up to three meters per year, with water now available only at depths of 200-300 meters. The consequences of inadequate investment in water-related infrastructure and poor management are important given that most climate change impacts are mediated through water.

Access to water - in particular to clean water - is central in the millennium goals to fight poverty. Climate change will have a major impact on availability of water and will foster conflicts for this increasingly scarce resource.

- Climate Change Impacts Energy Poverty Debate about climate change and vulnerability has been slow to highlight the energy-poverty-climate nexus. Traditionally, energy poverty has been considered and addressed as a sub-problem of general poverty, mainly due to low income. But solving the energy poverty problem via household income, through subsidies for energy costs or fuel payments for example, can be problematic since households may not feel that covering energy service needs is the priority in assigning extra income.

Another level through which energy poverty has been traditionally addressed is energy prices. Many countries have attempted to address energy poverty and spur development through subsidized energy prices or pricing policies. However, subsidized energy prices need to be very carefully used in addressing energy poverty since they

can be counterproductive in the long-run, potentially locking households in energy poverty.

Conversely, energy prices, if properly managed, are a powerful tool for demand-side climate policies. They are expected to increase in real terms as we progress towards a carbon-constrained economy and may be an important driver of energy poverty rates in the future, leading to trade-offs between climate change mitigation and energy poverty alleviation. If the chief tool for tackling climate change is carbon pricing, energy poverty levels will rise. Conversely, if energy poverty is tackled through energy subsidies, energy consumption levels will rise as a result of inefficient capital stocks, increasing emissions. In order to avoid conflict between the welfare of future versus present generations which would arise, it is crucial to address energy poverty through its other levers.

Another pillar of energy poverty is the efficiency of energy-using capital stock. For this lever to make a marked difference in energy poverty levels, the efficiency levels of state-of-the-art and prevailing equipment or stock in use need to be substantial. This is the case for many buildings and heating equipment in countries where heating dominates the energy landscape.

Finally, access to modern energy carriers like natural gas or electricity is also an important determinant of energy poverty. Without such access, households are forced to spend a disproportionately large portion of their resources on meeting basic energy service needs, which may constitute a significant part of household resource expenditure.

## 2. DIFFERENTIATED IMPACTS OF CLIMATE CHANGE

Climate Change will impact poverty through extreme weather events and through slow onset changes. It will also have serious impacts on health and migration patterns.

### 2.1 Extreme Weather Events and the Poverty/ Vulnerability Nexus

Variability of climate impacts countries and people. Climate change and variability cut revenue and increase national expenditure, adversely affecting a balanced budget. Dealing with climate change and extreme variability places a strain on government budgets, as illustrated by the case of Zimbabwe following the drought of 1991-92. The severity of the effect on government revenue will in part depend on the structure of the economy. For example, the drought in southern Africa in 1991-92 resulted in a drop in income of over 8% in Malawi where agriculture accounted for 45% of GDP at that time, but in South Africa, income was down by only 2% since agriculture at that time accounted for just 5% of GDP. Morocco's GDP is highly correlated with precipitation levels. Climate change will also necessitate an increase in spending at the national level to deal with the aftermath of extreme weather events and the consequences of a gradual reduction in food and water supplies. In some cases, the government may not be able to allot the level of expenditure required. This was the case following Hurricane Mitch in 1998, when the government of Honduras (with a GNP of \$850 per capita) faced reconstruction costs equivalent to \$1250 per capita.

Extreme climate events are a source of mounting concern throughout the world. In recent decades, the number of people affected by climate disasters such as drought, flooding and storms has been rising. As climate science develops it will provide clearer insights into the relationship between global warming and weather system outcomes. However, current evidence points very clearly in one direction: climate change will increase the risk of exposure to climate disaster.

Reported climate disasters are on an upward trend. Between 2000 and 2004, an average of 326 climate disasters was reported each year. Some 262 million people were affected annually over this same time frame, more than double the level in the first half of the 1980s. For the period 2000-2004, on an average annual basis, one in 19 people living in the developing world was affected by a climate disaster. The comparable figure for OECD countries was one in 1,500 affected, a risk differential of 79:10.

Flooding affected the lives of some 68 million people in East Asia and 40 million in South Asia. In sub-Saharan Africa 10 million were affected by drought and 2 million by flooding. When disasters strike, they hurt whole communities—but women and children pay the highest cost. Disaster risks are skewed. Extreme events cost lives and create huge losses but they also undermine future development. They destroy assets that cannot be replaced easily and if repeated entail economic and social capacity to develop. But not all of the human development costs of climate shocks occur after the event. For people with precarious livelihoods in areas of climate variability, uninsured risk is a powerful impediment to increased productivity. With less capacity to manage risk, the poor face barriers to engage in higher-return but higher-risk investment. In effect, they are excluded from opportunities to produce their way out of poverty.

As households move closer to extreme poverty they become risk averse for a very good reason: adverse outcomes can affect life opportunities at many levels. Operating without formal insurance in areas of high risk exposure - such as floodplains, drought-prone regions or fragile hillsides - poor households quite understandably choose to forego potentially higher return on investment in the interests of household security. Farmers may be forced to make production decisions that are less sensitive to rainfall variation, but also less profitable.

As stated in The Stern Review, the survival strategies adopted by poor people to cope with a changing climate may damage their long-term prospects. If there is a risk of more frequent extreme weather events, then households may also have shorter periods in which to recover, thus increasing the possibility of being pushed into a poverty-trap.

Poor households may also be forced to sell their only assets (such as cattle during the 1991-92 drought in Zimbabwe). This can then compromise their long-term prospects as they are unable to educate their children, or to increase the level of income over time. Alternatively, to try and avoid permanent destitution, households may decide to reduce consumption levels, a strategy that can have long-term effects on health and human capital. Reductions in consumption levels during a drought in Mali, for example, led to permanent and irreversible loss of growth in children.

Vulnerability is different from risk. People living in the Ganges Delta and lower Manhattan share the same flood risks associated with rising sea levels. They do not share the same vulnerabilities. The Ganges Delta is marked by high levels of poverty and low levels of protective infrastructure. When tropical cyclones and floods strike Manila, they expose the entire city to risk. However, vulnerability is concentrated in the over-crowded, makeshift homes in slums along the banks of the Pasig River, not in Manila's wealthier areas. In many developing countries the capacity of poor people to withstand extreme weather events such as a drought is constrained both by low income levels and by limited access to credit, loans or insurance (in terms of access and affordability). These constraints are likely to become worse as wet and dry seasons become increasingly difficult to predict with climate change.

Even in developed countries, vulnerability to extreme events has been far greater among poor households. In 2003, Europe was hit by its most intense heat wave in more than 50 years—an event that caused thousands of deaths among the elderly and other vulnerable segments of the population. In 2005, Hurricane Katrina, one event in the worst Atlantic hurricane season on record, provided a devastating reminder that even the world's richest nations are not immune to climate disaster. "Hurricane Katrina selected its victims overwhelmingly from the most disadvantaged areas of the city. Poorer districts dominated by black communities bore the brunt.

Flood damage interacted with deep racial inequalities". An estimated 75 percent of the population living in flooded neighbourhoods was black. Two of the poorest and most vulnerable districts of the city, were both totally devastated by Katrina. As stated in the HDR, two lessons can be drawn from Katrina. The first is that high levels of poverty, marginalization and inequality create a predisposition for risk that converts to mass vulnerability. The second is that public policy matters since policies that provide people with entitlements to health and housing can facilitate early recovery, while weak entitlements can have the opposite effect.

Vulnerability is exacerbated by weak social safety nets. At the national level, many low-income countries have limited financial reserves to cushion the economy against natural disasters, coupled with underdeveloped financial markets and weak links to world financial markets that limit their ability to diversify risk or obtain or reallocate financial resources. Less than 1% of overall losses from natural disasters, for example, were insured in low-income countries for the period 1985 to 1999.

## 2.2 Climate, Poverty and Health

Poverty and vulnerability increase when malnutrition make people more sensitive to the impact of climate change on health. Climate shocks such as drought and floods can cause grave setbacks in nutritional status as food availability declines, prices rise and employment opportunities shrink. Deteriorating nutrition provides the most telling evidence that coping strategies are failing. The drought that swept across large areas of eastern Africa in 2005 illustrates this point. In Kenya, it put the lives of an estimated 3.3 million people in 26 districts were at risk of starvation. In Kajiado, the most affected district, the cumulative effect of two poor rainy seasons in 2003 and the total failure of rains in 2004 almost completely wiped out production. The decline in production of rain-fed crops such as maize and beans harmed both people's diet and their purchasing power. Health centres in the district reported an increase in malnutrition, with 30 percent of children seeking medical assistance found to be underweight compared to 6 percent in normal years.

Climate change affects human health both directly and indirectly. Direct effects are a consequence of extreme weather events such as heat waves, cold spells, drought, fires, flooding and storms. Such events have direct health impacts through injury, post disaster mental stress, and excess mortality and morbidity. Indirect health effects occur via ecosystem changes (such as desertification or air pollution) and include changes in seasonal and spatial patterns of infectious diseases. In particular, food-borne diseases that increase in summer and diseases transmitted by ticks, mosquitoes and other vectors are projected to increase in a warmer climate, but this also applies to allergies and respiratory diseases. Longer-term consequences of climate change may include adverse effects on food production and micronutrients in food, the availability of safe water and secure dwellings. In combination with other recent emerging processes of global environmental change (such as urbanization, biodiversity loss, land degradation, depletion of freshwater supplies), the direct and indirect effects of climate change are expected to have negative impacts on human health and well-being worldwide in the future.

### - Health Impact of Extreme Temperature and Air Pollution

Every summer, high temperatures and heat waves are associated with increased mortality, especially among the most susceptible individuals living in urban areas. Large multi-city studies from Europe and the United States have documented a geographic heterogeneity in both the temperature threshold and the effect of high temperatures. Thresholds at higher temperatures were found in the warmest cities, suggesting that these populations are probably better acclimatized to high temperatures. The extent of heat-related effects depends on the size of the susceptible population, the intensity and duration of heat stress conditions and the adaptation measures in place at both individual and population levels. The public health significance of heat-related effects on human health is expected to increase as a consequence of the projected trend in climate-change-related exposure and some areas in the world, such as the Mediterranean, will be particularly at risk. This demonstrates the need to develop better coping strategies by exploring the factors that shape the social impacts of heat waves and by drawing up a research program to address the considerable gaps in knowledge in this area.

The main factors of vulnerability are being elderly, living alone, having a pre-existing disease, being immobile or suffering from mental illness, and being economically disadvantaged. The synergistic effects of such factors will prove fatal for some.

### - Climate-Sensitive Infectious Diseases

Infectious diseases are still one of the greatest challenges for public health, in terms of lives lost as well as diminished health and quality of life. Climate, as one of the main modulators of the environment, influences various aspects of epidemiological dynamics as well as the interaction between bacteria, viruses, vectors and humans. This is why there is reason for concern about the emergence or re-emergence of certain infectious diseases as a consequence of a changing environment.

Climate can influence infectious diseases by three principal gateways: human behaviour, disease pathogen and the disease vector. At different temporal scales (seasonal, inter-annual, longer-term climate trends) factors like temperature, rainfall, parasitic life cycle and vector activity, population movement, water availability after storms and floods can drive outbreaks of various climate sensitive infectious diseases. According to the type of transmission, infectious diseases can be divided into water- and food-borne diseases, vector-borne diseases and those transmitted from human to human.

The impacts of climate change will exacerbate poverty, in particular through its effects on health, income and future growth prospects. Equally, poverty makes developing countries more vulnerable to the impacts of climate change. This chapter raises some of the specific risks faced by developing countries. But it is the sum of the parts that creates perhaps the greatest concern. Poor households and governments may, for example, have to face falling food and water supplies that will directly increase poverty directly, while also having to face greater health risks, for example, malaria or fallout from extreme weather events. These impacts may be compounded if governments have limited, or reduced, financial resources.

## 2.3 Poverty and Environmental Migration

Understanding how climate change can influence migration requires an understanding of the relationship between environmental change and migration, of how climate change exposes people to risks, and of existing estimates of the number and distribution of likely climate migrants. Migration caused by environmental degradation or change remains difficult to define, mainly due to the fact that it is linked to the difficulty of isolating environmental factors from other drivers of migration. Another major hindrance when discussing displacement linked to environmental disruption lies in the confusion of forced versus voluntary migration.

Both gradual environmental change and extreme environmental events influence population movements, but in different ways. While the latter may force affected populations to leave their homes, often suddenly and in large numbers, the prospect of returning in such cases is said to be 'feasible' in the long run. Migration caused by a gradual deterioration of the environment however, is more often irreversible.

Most research agrees that environmental change is an important proximate factor in decisions to migrate. Thus, while recognizing the complexity and spatial and temporal contingency of the relationship between climate change and migration, and recognizing that social drivers are more important than environmental changes per se, climate change is nevertheless a factor that influences migration. Given the magnitude of environmental changes expected because of climate change, there are grounds to think that climate change may contribute to increased numbers of new migrants. And it is not just resource-dependent low-income rural people at risk. Many people whose incomes depend on primary resource industries may also be affected. Also at risk are the urban poor, who might experience increased health problems and rising prices of basic goods such as food and water. Migration can represent a real adaptation strategy but not all people will have access to that option. The poorest of the poor may not be able to bear the cost of migration.

It will be a challenge in the future to decide what status (notably legal) is to be granted to people thus affected. International legal norms provide little if any protection for environmental migrants, and all too often there is no recognition at all that this migration phenomenon exists.

Since the responsibility for climate change rests primarily with the western industrial nations, they are accountable for helping those forced into environmental migration. But the countries from which environmental migrants originate also have major responsibility for their citizens and they too must do their best to protect their lives. This effort includes taking preventive measures to adapt to the consequences of climate change and lessening their impact thereof over both the short and long term.

## 3. HOW CAN WE ADAPT?

Adapting to the consequences of climate change requires anticipation, investment (in information, equipment and infrastructure) and organisation. It will in many cases involve radical changes in patterns of economic activity and ways of living. There are many actions which will be justified under a broad range of possible outcomes. These may be called 'win-win' strategies.

The design and quality of infrastructure and buildings should be a crucial part of any adaptation strategy. If appropriate care is taken at the design stage, infrastructure can be made much more resilient to climate change. Irrigation systems clearly have to be designed appropriately if rainfall patterns and the behaviour of water systems are to change. Roads, bridges, tunnels, transmission of electricity and railways should be designed to cope with an increase in storms, floods and droughts. Communities in the Indian Himalayas are faced with erratic rainfall in the spring and summer, which means a short growing season of just two to five months. Farmers have developed a number of water harvesting practices to ensure food security and additional income, including small ponds (with spring water collected in small reservoirs that is then used at appropriate intervals to irrigate higher ground); roof-water harvesting (roof water collected in dugout structures near homes); harvesting of rainwater (excess water stored directly in farm ponds and depressions, or stream flow diverted to safer points where it is stored then used for irrigation from dugout structures).

For agriculture, a particularly important challenge is to develop climate resilient crop varieties and techniques. Along with significant investment, progress will depend on international agricultural research systems and stations making this a top priority.

Cultivation techniques which use water more economically (such as in rice cultivation) are also likely to release fewer greenhouse gases like methane. Low-till agriculture may preserve the water content of soils, helping with adaptation while simultaneously releasing less carbon thanks to less disturbance of the soil. In agriculture as in other activities that generate emissions, adaptation can be combined with mitigation.

Adapting buildings so that they cope more easily with higher temperatures is another response that bridges adaptation and mitigation. After all, many traditional buildings in low latitudes are designed to cope with high temperatures without energy-intensive cooling systems.

A substantial part of any strategy must also be to facilitate recovery from damage after the fact. The insurance sector is already re-evaluating the probabilities of extreme weather events and natural disasters. As the likelihood of severe damage goes up, it will be important to develop ways to share risk and reduce exposure of those most vulnerable, who are often the poorest. Programs developed in the UK between government and insurance companies allow small businesses and households at risk to gain access to flood insurance.

Extensive programs of crop insurance can be developed to help cover farmers. These can be difficult to administer but could, in principle, be handled at a district level. Administration can be simplified and the problem of false claims reduced if payments are triggered by measurable events occurring in that district. In India, Lombard General Insurance in association with Weather Risk Management Services has launched an insurance product to cover risk incurred by wheat farmers. The idea is to link climate to an index of weather data rather than actual crop losses, which significantly reduces moral hazard as well as the time it takes to settle claims.

A final important feature of adaptation is disaster management, both before and after the event. The way in which the logistics of early warning and relief efforts are handled can have a major impact on the scale of the disaster. (The tsunami of December 2004, for example, would have caused much less loss of life if information had been transmitted earlier). Disaster response is sorely needed. Comparing the Chinese reaction to the earthquake in Sichuan in May 2008 with that of the Myanmar government to Cyclone Nargis that same month (146,000 deaths), we can see the difference that organisational logistics and social organisation can make. Bangladesh six months earlier suffered a similar cyclone but with only 3400 victims. The need for extra transport, equipment, food and medical services was denied for a long period, with the consequence of substantial and unnecessary loss of life.

Preparation for many of these kinds of disasters is best handled at an international level where equipment and vehicles can be shared and made available quickly and relevant experience successfully exploited. For an individual country, particularly a small, poor country, it can be very costly to store the necessary hardware. Ethiopia, for example, faced a series of huge forest fires in early 2000, the severity of which could have been eased by helicopters, but the government simply did not have many.

Extra funding for disaster preparedness and management can give high returns. In China, expenditure of \$3 billion for flood control was estimated to have returns of \$12 billion. In India, disaster programmes in Andhra Pradesh have shown benefit/cost ratios of 13 or more. And in Vietnam, planting mangroves to protect coastal populations from typhoons and storms has yielded benefit-cost ratios of 50 or more.

The cost of disasters and extreme events related to climate change will of course still be very high, but it makes good sense to prepare and protect as best we can. This should be a top priority for national policy and international assistance.

The financing involved is not high in comparison to Overseas Development Assistance (ODA). The sum of \$86 billion compares with around \$100 billion for ODA, although recent ODA figures are swollen by the falling value of the dollar and debt relief to Iraq, which is accounted for, rather misleadingly, as aid. Annual foreign direct investment to low and middle-income countries is close to \$3000 billion, although more than 90% of this goes to the latter and not the former. Currently, the member countries of the Organisation for Economic Cooperation and Development (OECD) allot some 0.3% of their GDP to ODA. If this figure were increased to 0.7%, as many of these countries have promised to do by 2015, there would be an extra \$150-200 billion a year.

If the costs of managing climate change in the developing world are indeed in the ballpark of HDR estimates of \$86 billion per annum (a conservative figure), they would eat up most of the increase that has been pledged by 2015. On the basis of current trends, many rich countries are likely to fall short of the target of 0.7% by 2015, while others have not even made such a promise.

Current total allocations to adaptation funds in 2007 were \$279 million. This is miniscule in relation to needs. The scale of the tasks involved in adapting to climate change and the intricate links between adaptation and development are such that a serious international contribution to taking on the problems of development in a more hostile climate must include a substantial increase in development aid.

#### - Towards Low-Carbon Growth

The two great challenges of the 21st century are the battle against poverty and the management of climate change. On both we must act strongly now and plan to continue to do so in the decades ahead. Our response to climate change and poverty reduction will define our generation. If we fail on one, we will fail on the other. But whilst recognising that we must respond, and respond strongly, to both challenges, we should also recognise the opportunities, since a well-constructed response to one can provide great direct advantages and opportunities for the other. So what do we need to do to combat the threat of climate change whilst boosting efforts to reduce poverty and tackling the global economic downturn? Developing countries should ultimately want to go low-carbon. Not only is it the future, but it brings huge benefits beyond climate change. Renewable energy sources can free countries from dependency on imported fossil fuels. Cleaner transport and cooling mean less pollution and better health. Halting deforestation protects water supplies, controls flooding and provides bio-diversity. The transition to a low-carbon future can bring major economic gains in the short term. Energy efficiency can help boost incomes. Low-carbon technologies can open up new sources of growth and jobs. They can help even the poorest countries leap-frog old approaches, avoiding some of the cost of large grids in the way cell phones helped cut the need for telephone wires. And smarter grids can both enhance energy efficiency and enable new technologies whilst cutting transmission costs. New sources of low-carbon energy - hydro, solar - could help create a comparative advantage for some of the

poorest countries.

But the fact remains that no matter how successful we are with mitigation, we will in the next few decades be faced with a degree of climate change due to GHG levels already in the atmosphere along with emissions in the coming years. That means all countries will have to adapt. The challenge is particularly urgent for developing countries as they are the first and hardest hit.

Many of the poorest people in the world will be those most exposed and vulnerable to the impacts of climate change that will occur over the next few decades. These are also the people who are least able to afford the cost of adaptation, which is even more unfair since they have contributed much less than those in the rich world to the current levels of greenhouse gases in the atmosphere. This fundamental inequity should be a strong incentive for the rich countries to provide more funds to developing countries, in addition to current development commitments to fund the extra costs created by climate change.

Biodiversity and poverty: old debates, recent evidence and emerging controversies

Pavan Sukhdev (GIST Advisory), Raphael Bille (IDDRI), Romain Pirard (IDDRI), Kaavya Varma (GIST)

Achieving the goal of liberating half of the world's poor from their poverty by 2015 will either mark the true beginning of sustainability or the end of biodiversity at the hands of the best-intentioned policies. Sanderson & Redford, 2003.

## 1. OLD DEBATES, EMERGING CONSENSUS

### 1.1. Why does biodiversity matter for poor people?

Because three quarters of the more than one billion people living on less than one dollar a day live in rural areas, the poor often depend on a wide range of natural resources and ecosystem services for their well-being, and are therefore potentially affected by their degradation. For example, over one billion people worldwide draw their living from forest-based assets. For poor people, biodiversity loss is often equivalent to the loss of biological insurance (MA, 2005). Richer groups of people are usually less affected because of their ability to purchase substitutes or to offset local losses of ecosystem services by shifting production and harvest to other regions. According to the Organization for Economic Cooperation and Development (OECD), in low-income countries, environment-based wealth accounts for around 25% of the total wealth (compared to less than 4% in OECD countries).

More precisely, biodiversity matters to poor people directly in four principal ways (Timmer & Juma, 2005):

- Food security and health: Many poor people have limited access to land ownership and water and so are especially dependent on wild plants and animals for their food security. In many forest countries, bushmeat is an important source of protein. In Ghana for example, 75% of the population eat bushmeat regularly and wild animals constitute the main source of animal protein for rural households. However, in many countries, the availability of bushmeat and wildlife is declining and this is having negative impacts on nutrition (DFID, 2002). Declining ecosystems can also have negative impacts on health, particularly on that of poor women, as they increase the burden of searching for and carrying heavy loads of water, wood or fodder.

- Income generation and livelihoods: For the majority of poor people living in rural areas, dependence on agriculture is high. The agricultural labour force, most of it in the developing world, includes over 20% of the world's population and accounts for almost half of its total labour force (MA, 2005). This means that their livelihoods rely on several ecosystem services that are crucial to agriculture, and on the diversity of food crops available. In many climatically vulnerable regions, poor households prefer traditional varieties or so called land races of rice and other crops due to their greater resilience to climate fluctuations. For example, in Jeypore, India, cyclonic conditions, long spells of drought and very high temperatures within a crop season can result in yield stress: land races of rice have proved genetically resilient and withstand the harsh weather while so called "high yielding varieties" in nearby areas suffer irretrievably (Steele, Oviedo & McCauley, 2006).

- Reduced vulnerability to shocks: Poor people are often highly vulnerable to shocks and stresses associated with climatic events. These shocks can be amplified by ecosystem degradation, while better ecosystem management can reduce the impact of such events. There is growing evidence of the role of coastal vegetation (like mangroves) and natural protection (like coral reefs) in mitigating coastal storms and cyclones. Where these ecosystems are declining, poor coastal populations often become more vulnerable. In Bangladesh, the disappearing swamp forests of the haor, which have served as a natural barrier in the past against the monsoon waves, has led to much more severe erosion. As a result, poor households have been compelled to increase spending to protect their tiny homesteads every year (Steele, Oviedo & McCauley, 2006).

- Cultural and spiritual values: For many poor people, biodiversity is inextricably linked with identity, culture and spirituality. It is therefore an integral part of their very existence. In India for example, there are over 50,000 sacred groves that play an important role in the religious and socio-cultural lives of local people (Gohkale et al., 2001). Located within wilderness areas, protection is provided to patches of forests dedicated to deities and ancestral spirits. A number of religious celebrations take place in these groves, which are an integral part of the spiritual beliefs of the communities.

### 1.2. A complex relationship: the biodiversity-poverty nexus

In many ways linking conservation with poverty reduction is more of an art than a science Fisher et al., 2005.

#### 1.2.1. An unresolved debate at the general level

Biodiversity matters to the poor, but the linkages between biodiversity and poverty are much more complex and dynamic (Billé, 2006a). The intense debate on this nexus demonstrates that there are no simple causal relationships between biodiversity and poverty, although they do coincide in many ways according to an increasing body of evidence (see Hernandez-Morcillo et al., 2010). Widespread concepts such as "pro-poor conservation", often utilized in an incantatory manner, tend to overlook such complexity (Billé & Chabason, 2007). Nevertheless, conservationists and development practitioners and policy makers often have different opinions on how—and whether—to link biodiversity conservation with poverty reduction. The growing volume of literature on the subject highlights how complex and context-specific poverty-conservation linkages are, and how subjective is their interpretation (Roe & Elliott, 2005).

In this context, attempts to find common ground often result in platitudes that fail to confront real problems faced by development projects, plans and policies (Brockington et al., 2006). This is why endeavours to address real issues—rather than pretending they do not exist— as well as efforts to be more specific about definitions, contexts and activities when undertaking assessments, are so badly needed. As a matter of illustration: (i) natural resources broadly speaking (e.g. timber) are sometimes mistaken for biodiversity (Bainford et al., 2008 show that biomass may provide greater benefits to poor people than diversity of species), (ii) poverty indicators will never comprehensively encapsulate the thinking on poverty complexity, and (iii) conservation of biodiversity differs substantially from the sole presence of biodiversity because the former depends closely on how conservation is performed (e.g. does ecotourism lead to equitable distribution of the revenues? Does conservation mean promotion of agroforestry or exclusion of people from protected areas?).

For instance, the International Institute for Environment and Development's (IIED) Poverty and Conservation Learning Group typically aims at addressing the real issues

beyond platitudes. Among others, it has provided useful insights on a number of key hypotheses (see Box 1), all of which would deserve a whole section of this paper. However, here we shall only briefly discuss two questions that we think are particularly critical (Billé & Pirard, 2007):

- Is biodiversity conservation a route to poverty alleviation? And/or
- Is poverty alleviation a route to better biodiversity management?

Some have argued that biodiversity conservation is incompatible with lifting poor people out of poverty; others that the most effective intervention for biodiversity conservation is poverty reduction. Such questions are quite sensitive and may have very concrete consequences for the way development policies and projects are designed. We shall mainly introduce the debate here and underline simplifications that should be avoided—not necessarily answer these questions, which remain partly open.

Box 1. What do we know about conservation-poverty linkages? Accepted and contested relationships

Hypothesis 1: There is a geographical overlap between biodiversity and poverty

Conclusion: At the global level there is a geographical overlap between biodiversity and poor people but it becomes less pronounced the more 'the South' is disaggregated. At the national and sub-national levels the two occasionally coincide, but governance factors are generally more significant than geography in determining where biodiversity prevails, where poor people live and how the two interact.

Hypothesis 2: Poor people depend on biodiversity

Conclusion: All of humanity is dependent on biodiversity for the goods and services it provides, but the poor appear to be particularly dependent (although this is hard to quantify). In a large part this dependency is related to the role that biodiversity plays in poor people's farming systems and the degree of resilience and adaptability to environmental change that poor people have developed.

Hypothesis 3: Poor people are responsible for biodiversity loss

Conclusion: Poverty may contribute to biodiversity loss, but it is only one of a number of factors. Whether poor people conserve or over exploit biodiversity is dependent on specific circumstances and contexts—and particularly on the influence of external governance factors—and not a question to which a generalized answer can be given.

Hypothesis 4: Conservation activities hurt poor people

Conclusion: The impacts of conservation activities are not evenly spread. Some forms of conservation activity may have negative consequences for poor people. Others may benefit poor people or even be initiated by poor people. Governance factors appear to be critical once again.

Hypothesis 5: Poor people can undermine conservation

Conclusion: Unless different priorities for biodiversity and incentives for conservation are recognised, local people are often bound to be perceived as 'undermining' conservation, and indeed may proceed to do so. Local people need to be engaged to conserve aspects of biodiversity that are critically important to their livelihoods, if broader-based, long-term public support for protection of globally threatened biodiversity is also to be achieved.

Hypothesis 6: Biodiversity is irrelevant to poverty reduction

Conclusion: A lack of quantitative data—particularly at national levels—makes it difficult to challenge the assumption that biodiversity is irrelevant for poverty reduction. In general, poverty reduction policies tend to rely on agriculture—both at the household level through supporting smallholder farmers for their subsistence and income-earning potentials, and at the national level through agriculture's potential to drive economic growth. Making a better case for biodiversity in poverty reduction therefore means clearer articulation of the links between biodiversity and agriculture and between biodiversity and ecosystem services (those that support agriculture and those that generate other benefits).

Hypothesis 7: Poverty reduction activities can cause biodiversity loss

Conclusion: Historical patterns of rural development—based on primary commodity production—have not performed well for biodiversity—nor in many cases have they performed well for poor people either. Innovative approaches to poverty reduction that are founded on local knowledge, institutions and processes are critical—both to achieving the Millennium Development Goals (MDGs) and tackling biodiversity loss.

Source: Roe & Elliott, 2005.

#### 1.2.2. Is biodiversity conservation a route to poverty alleviation?

Conserving biodiversity is not always favourable to the poor. Many examples have been documented worldwide where conservation activities have negatively affected poor people living nearby (Brockington, 2003; McLean & Straede, 2003). This seems to be especially true of the establishment and management of protected areas, and of related donor-funded projects. Nevertheless, the risk of further marginalizing and impoverishing poor people is clearly not specific to conservation (beside the fact that conservation takes various forms with various impacts as mentioned above). It is part of the vicious circles deeply embedded in most societies that tend to make poor people poorer and rich people richer. The development of any economic activity—including conservation but also forest exploitation, handicraft, trade, tourism, infrastructure, etc.—has a tendency to reinforce these circles ("poverty traps") unless appropriate attention is paid to the issue. To take this one step further, in a given country, with funding from a given donor, conservation activities are usually just as democratic, participatory and pro-poor as the rest of a government and donor's policy (Billé, 2006b). When the political context does not take into account the needs and desires of marginalized groups of stakeholders, especially the poorest, when their access to natural resources, their right to participate in the decisions that directly affect their lives, are denied, projects and policies whose primary objective is biodiversity conservation cannot be expected to be transparent and equitable. Good governance at the national and local levels is obviously necessary for biodiversity conservation to bring expected benefits.

However, that biodiversity conservation can contribute to poverty alleviation is supported by a broad consensus—many even argue that the potential of biodiversity conservation to contribute to poverty reduction is still largely unrecognised by developing country governments and international development agencies (DFID, 2002; Koziell & McNeill, 2002). Much depends on the how: how conservation projects are designed and carried out, how poor and marginalized people are consulted, involved in and associated with the conservation objectives and activities, how poverty alleviation is mainstreamed in biodiversity projects and policies, etc. Much also depends on the alternative without conservation: does conservation take place instead of local development by local people (e.g. agriculture), or does it take place instead of biodiversity degradation as a consequence of activities undertaken by (and for the benefit of) companies unsustainably extracting natural resources (e.g. forest conversion for export-oriented oil palm production)? That said, there are many examples where biodiversity conservation has benefited poor people in developing countries. More precisely, this happens in two main ways (Steele, 2004), at the local and national levels:

- A route out of poverty for poor people: biodiversity can, particularly in areas with few other economic opportunities, provide a way for poor households to generate a surplus

and eventually invest in other economic activities and escape poverty.

- A route out of poverty for poor countries: at a macro-level, biodiversity and ecosystem services can, under certain conditions, generate growth at an economy-wide level that may in turn, under certain conditions, benefit poor people. Biodiversity-related natural resources often provide a key export, foreign exchange earner and source of government revenues, as illustrated by the importance of seafood exports from Africa and Asia.

Both ways, however, demand that biodiversity not be exploited beyond sustainable levels, and that the growth generated be reinvested to shift away from biodiversity-dependence. Moreover, the highly speculative character of the convergence between conservation and poverty alleviation is reinforced by the various, contrasted meanings of "poverty" (Billé & Pirard, 2007). For example, depending if material wealth or flexibility is favoured, the conversion of a primary forest into a mono species industrial plantation may be seen as a driver of enrichment (with increased cash incomes in the short term) or on the contrary of impoverishment (reduced choices in the long run, vulnerability to commodity markets fluctuations...). This was summarized by Wunder (2001) when opposing the roles of "poverty trap" and "safety nets" played by biodiversity-rich areas, of which tropical forests are an emblematic example.

The biodiversity-poverty relationship clearly has to be addressed in dynamic terms. We need to be cautious about statements on the dependence of the poor on biodiversity - this dependence being demonstrated in many studies reviewed by Roe (2010). To say that poor people depend on biodiversity does not say much about their fate in case of biodiversity loss, which may be better (alternative sources of income) or worse (disappearance of livelihoods). In other words biodiversity conservation may be an obstacle to economic improvement of people's lives, or on the contrary it may be extremely important because of positive impacts on vulnerability and an absence of alternatives. All in all, Roe (2010) mentions that "at least six conservation mechanisms have been a route out of poverty for some people in some places: community timber enterprises, nature-based tourism, fish spillover, protected area jobs, agroforestry and agrobiodiversity conservation".

### 1.2.3. Is poverty alleviation a route to better biodiversity management?

This hypothesis is supported by the well-known Environmental Kuznets Curve, which suggests that environmental quality declines as income rises until income reaches a certain level, at which point environmental quality improves. However, this curve is strongly disputed, be it by pessimists or optimists (Dasgupta et al., 2006), and even for its advocates the extent to which it applies to biodiversity is questionable: once a species is lost, it is gone forever.

A majority of analysts actually seem to believe that poverty alleviation will not in itself achieve conservation goals. For example, experience from Africa and Asia shows that as wealth increases, so too does the demand for wildlife (Robinson & Bennett, 2002) and even more impactful is the availability of capital for more destructive and large-scale activities. More pertinent questions may therefore be: can reducing poverty actually contribute to halting biodiversity loss? If yes, how?

Swanson, among others, highlights the apparent incompatibility between biodiversity and development: "states with high material wealth have low biodiversity wealth and vice versa" (in Koziell & Saunders, 2001). In the same perspective, the MA scenarios suggest that "future development paths that show relatively good progress toward meeting the poverty, hunger reduction, and health targets also show relatively high rates of habitat loss and associated loss of species over 50 years. This does not imply that biodiversity loss is, in and of itself, good for poverty reduction. Instead, it indicates that many economic development activities aimed at income generation are likely to have negative impacts on biodiversity unless the values of biodiversity and related ecosystem services are factored in".

Consequently, while poverty can be a root cause of biodiversity loss, this is just as true of wealth and economic development: "deforestation, for example, is partly caused by local demand for agricultural land or construction materials, but is even more fundamentally driven by the industrialized world's demand for timber and the growing international trade in forest products" (UN Millennium Project, 2005), as well as by demand for biofuels. Do poor people degrade their environment because they are poor? Do increasing incomes affect the way in which poor people exploit natural resources? IIED's Poverty and Conservation Learning Group came to the conclusion that "issues of governance, security of land tenure and access to resources are likely to have a significantly greater impact on the way in which people over-exploit now or conserve for the future. (...) Poverty is only one factor driving biodiversity loss. Reducing poverty will not necessarily, therefore, lead to biodiversity conservation unless the other drivers are also addressed" (Roe and Elliott, 2005). Poverty alleviation may thus yield better biodiversity conservation only if tied to explicit conservation objectives, strategies, policies and actions, in an appropriate governance context (World Resources Institute, 2005).

### 1.2.4. An intricate problem with no "silver bullet"

The aim of this short discussion is mainly to acknowledge that the linkages between poverty and conservation are dynamic and context specific, reflecting geographical, social and political issues among the groups involved (Kepe, Saruchera & Whande, 2004) more than their actual poverty level. For instance Indonesian hunters- gatherers and slash-and-burn farmers never deeply degraded surrounding biodiversity, contrary to what migrants did through wood harvesting and land clearance for agriculture. In material terms, though, they are equally poor.

In any case, linkages between poverty and conservation are so complex that they rarely authorize simple cause-and-effect analyses. Synergies and positive externalities between sustainably managing biodiversity and alleviating poverty do exist. They are sometimes obvious, but more often win-win solutions to poverty and conservation dilemmas are elusive, and trade-offs tend to be the more realistic outcome (Petersen & Huntley, 2005): trade-offs between biodiversity and economic development on the one hand, between those who benefit and those who bear the costs on the other hand. Unfortunately, there is no "silver bullet" (Robinson & Bennett, 2002) for the twin goals of conserving biodiversity and preventing the people whose lives now depend on biodiversity from being driven further against the wall.

## 2. NEW INSIGHTS FROM THE TEEB STUDY

### 2.1. Conservation as an economic stimulant with equitable returns

Traditional economic measurement indicators like GDP, National Income and Household Consumption fail to reflect the true value of the flows of ecosystem services and biodiversity for society. TEEB for National and International Policy Makers - Chapter 3, states that for developing countries, where the rural poor are dependent on natural resources for employment and subsistence, the exclusion of ecosystem services flows from national accounting systems results in an unsustainable future for generations to come. Additionally, this leads to a tyranny of the average where there is an implicit assumption that a measure of average progress like GDP can reflect progress in the distribution of wellbeing within society at large (TEEB D1 for National and International Policy Makers - Chapter 3 2009). For low-income groups in rural areas, which mainly rely on free services supplied by ecosystems that have little or no market value, the inadequate recognition of environmental resources in national accounts (focusing on productive functions of ecosystems: timber, energy, etc) causes an extraction of valuable commodities from ecosystems at the expense of the free services that the poor depend on (TEEB Climate Issues Update 2009), although admittedly also at their benefit when land development takes place in an appropriate manner (cf section1). Consequently, the degradation of the natural capital substantially reduces the welfare of a significant part of the population that is poor.

A decline in future ecosystem services and biodiversity coupled with the poor getting poorer has serious implications for the continued economic growth and progress of countries. This is because the importance of natural resources to economies is likely to be under-appreciated resulting in sub-optimal use of these assets, economically, environmentally and socially (TEEB Climate Issues Update 2009). Thus, in an assessment by TEEB's Climate Issues Update, if the assets are underperforming and getting eroded, natural capital gets run down and future benefit streams of the country get increasingly smaller. The long-term sustainability and economic performance of a country are then in question.

Haiti for example (left with only 3.8 percent of its forest cover in 2004, see box 2), is facing strong ramifications from severe environmental degradation and deforestation resulting from an inadequate recognition of the significance of natural resources for the country. Due to a loss of natural capital, disposable incomes and critical assets of the poor have disappeared, translating into political turmoil, health concerns and an emergence of environmental refugees that have effects on the stability of Haiti and its relations with neighbouring states (Peduzzi, 2005).

#### Box 2: Environmental degradation and vulnerability: Haiti and the Dominican Republic

The relationship between environmental degradation and impacts on vulnerable populations is evidenced by the differing impact of Hurricane Jeanne in Haiti and the Dominican Republic (DR). Haiti was originally fully forested but from 1950-1990 the amount of arable land almost halved due to soil erosion. Deforestation reduced evaporation back into the atmosphere and total rainfall in many locations has declined by as much as 40 percent, reducing stream flow and irrigation capacity. By 2004 only 3.8 percent of Haiti was under forest cover compared to 28.4 percent of DR.

In Haiti, floods and Hurricane Jeanne killed approximately 5,400 people due to destruction of mangroves and the loss of soil-stabilising vegetation, causing landslides that led to most casualties. In DR, which is much greener and still has 69,600 hectares of mangroves, Jeanne claimed less than 20 lives (Peduzzi 2005).

This stark difference reflects the impacts that deforestation and resource degradation have on the resilience of poor people in the face of environmental hazards. It also highlights the higher risks experienced by vulnerable populations that do not have enough disposable income, insurance or assets to recover from disasters. With an average monthly income of US\$30.5, Haitians are deeply affected by the worsening state of the environment. Source: Peduzzi 2005

A new adapted measure of GDP such as GDP of the Poor is required to reflect the dependence of the poor on natural resources and integrate environmental, economic and social aspects to reflect the vulnerability of poor people if valuable ecosystem services are lost. The resulting 'real income' based on the true cost of biodiversity loss would demonstrate the actual well-being of the poor and have cascading impacts on the longevity of economic prosperity in a country, as it would ensure equitable benefits reaching the poor from evident growth.

#### 2.2. A Tale of Two Tragedies: the measurement gap around the rural poor

Traditional measures of national income like GDP, which measures the flow of goods and services, can be misleading as indicators of societal progress in mixed economies because they do not adequately represent natural resource flows. This misrepresents the state of weaker sections of society, especially in rural areas.

To move beyond paradigms focused on income, human development indices (HDI) have been developed to provide a broader-based measure of development. However, HDI also fails to take account of the contribution of natural resources to livelihoods. The World Bank has published total wealth estimates (Dixon, Hamilton and Kunte, 1997), which seek to account for the contribution of natural capital, but this is a stock concept. There is also a need for a flow variable, which adequately captures the value of natural resource flows, even though these are mainly in the nature of public goods.

Developing "green accounts", with adjustments to GDP to account for natural capital depletion, is a step in this direction but does not show the social dimension. Similarly, the Genuine Savings Indicator (Pearce and Atkinson, 1993) does not indicate the real cost of natural resource degradation at the micro level, even though this is where real and often acute costs are felt by the poorest and most vulnerable sections of society. Particularly for developing countries, where many poor people are dependent on natural resources for employment and subsistence, the result is often a tale of two tragedies. The first is that the exclusion of ecosystem service flows from the accounts of society, including GDP, results in a lack of policy attention and public investment in ecosystem and biodiversity conservation.

The second tragedy, which is intra-generational rather than inter-generational, is because of the "tyranny of the average", or an implicit assumption that an increase in any measure of average progress (such as "GDP Growth", for example) can reflect progress in the distribution of well-being within society at large. This is as much a matter of inappropriate psychological conditioning as it is bad economics, because "GDP growth" as a headline indicator has become so ubiquitous that it is used in everyday conversations as a proxy for all forms of national economic performance which it was never intended to be, not least as a measure of progress.

#### 2.3. Measuring what we manage: GDP of the poor

A "beneficiary focus" helps better recognize the human significance of observed losses of ecosystems and biodiversity. The costs to the welfare of poor and vulnerable sections of society of the depletion or degradation of natural capital (water availability, water quality, forest biomass, soil fertility, topsoil, inclement micro-climates, etc.) are real and can be acute at the micro-level, but are not recorded systematically or brought to the attention of policy makers. Hence the need to move beyond broad measures of income such as GDP, and to focus sharply on the well-being of the poor. For transitional economies where rural and forest-dweller poverty is a significant social problem, we advocate using a measure of GDP, which is sectoral and focused on their livelihoods: TEEB calls this "GDP of the poor".

Like sustainable development frameworks, TEEB argues that what we need is a three dimensional metric, which can integrate the economic, environmental and social aspects together, and which can show the dependence of poor people on natural resources, and the links between ecosystems and poverty, thereby indicating the vulnerability of these sections of the population if valuable natural resources are lost. TEEB proposes a new indicator named "GDP of the poor", as the key beneficiaries of forest biodiversity and ecosystem services are in fact the rural poor and forest-dwellers. The proportion of GDP that can be attributed to the rural and forest-dependent poor directly is termed "GDP of the poor". We measure this for mixed economies (i.e. where rural and urban economies differ, and where the former are more agricultural and the latter more industrial and service-sector) where at the same time there are wide income disparities (such as India, Indonesia and Brazil).

We find that the lower-income, rural and forest-dependent sectors are much more vulnerable to any loss in biodiversity than the country's economy as a whole. Thus the "GDP of the Poor" indicator adjusted for the contribution of ecosystem services can be used along with other income indicators for targeting holistic improvements in livelihood incomes for the poor, accounting not just for their recorded incomes (included in National Accounts / GDP) but also their benefits from ecosystem services.

Sound development would imply growing a holistic measure of income, i.e., an environmentally adjusted "GDP of the Poor". Thus, this indicator could reflect the impact of loss in biodiversity to the "real income" and well-being of the poor. In a society in which the "GDP of the poor" has a high percentage of ecosystem services included, that indicates that a loss in biodiversity would harm the poor more, thereby invoking the vicious circle of poverty and environmental degradation.

Compared to "average" Environmentally Adjusted GDP calculations (i.e. unrecorded ecosystem service values as a percent of national GDP) there are stark differences visible when we estimate ecosystem service values flowing to the poor as a percent of the "GDP of the Poor". We give in Figure 1 the results of these calculations done for three nations (Indonesia, India, Brazil), which have mixed agrarian and industrial economies.

Figure 1. (UNDESA: Please Reference Full Submission for Figure)

It is apparent that the extent of dependence of the rural poor on ecosystem services is very high, and measuring this at a national level must become a matter of priority in order to support an improved development paradigm, in which access of the poor to ecological resources and ecological regulation from natural areas is ensured as part of a holistic development strategy. It is often said that in developing countries, "biodiversity policy is development policy" and TEEB's work on this does appear to evidence the

wisdom of this observation.

For India, the main natural resource-dependent sectors - agriculture, forestry and fisheries - contribute around 16.5 percent to GDP. When the value of ecosystem services provided by forests and the value of products not recorded in GDP statistics are added, this increases the adjusted contribution of agriculture, forestry and fishing to GDP from 16.5 percent to 19.6 percent. For the rural poor, the average per capita value from these combined sectors was US\$138.8. When non-market goods are included as well as the value of ecosystem services, per capita effective income goes up to US\$260. This is a much larger increase than for the average across the economy as a whole. A similar pattern, with even more significant increases, is also observed in the Brazilian and Indonesian case studies.

#### 2.4. Practical steps towards measuring the GDP of the Poor

Tackling poverty and biodiversity loss calls for efficient and sustainable utilization of natural resources. Development paradigms should take into account the nexus between growth, poverty and environment. We should emphasize that degradation of ecosystems and loss of biodiversity has different impacts at the macro and micro level. At the micro level, it leads to the erosion of the resource base and environmental services. Viewed from an "equity" perspective, the poverty of their beneficiaries makes these ecosystem service losses even more acute as a proportion of their incomes and livelihoods.

The first step for economies where rural and forest-dweller poverty is a significant social problem is to use a sectoral GDP measure focused on and adapted to their livelihoods. At a micro-level, including ecosystems and biodiversity as a source of economic value increases the estimate of their effective income and well-being provided that all services are systematically captured. Initially, adding the income from ecosystem services to the formal income registered in the economy will appear to reduce the relative inequality between the rural poor and other groups, as urban populations (rich and poor) are less dependent on free flows from nature. However, once natural capital losses are factored in, the picture of inequality changes as these affect the rural poor much more: it becomes clear that where natural capital is being lost, the rural poor are even less well off. Moving towards this kind of measurement would be useful for policy making.

### 3. TWO INCONVENIENT TRUTHS? (RE)EMERGING ISSUES ON DEVELOPMENT AND BIODIVERSITY

#### 3.1. The "environmentalist paradox"

The MEA (2005) closed on the diagnosis that the degradation of ecosystem services over the last decades had led to significant improvements in human well-being. This finding can be qualified as a paradox if one considers the environmentalist's expectation that degrading biodiversity has adverse consequences in terms of well-being, as abundantly evidenced in specific cases (cf. previous sections). This is indeed a prominent argument in favour of biodiversity conservation for the sake of ecosystem services' continued provision over time. Stimulating hypotheses have been proposed by Raudsepp-Hearne et al. (2010) to explain this apparent paradox: (i) inadequate capture of human well-being by existing indicators; (ii) contrasted importance of the various categories of ecosystem services, with food production outweighing the others; (iii) decoupling between human well-being and ecosystem services due to technological substitution; and (iv) the existence of a time lag between degradations of ecosystems and their impacts on human well-being. Despite their efforts to test these four hypotheses, the authors do not draw clear conclusions as to which one(s) is/are determinant.

We find it useful here to make a link between these hypotheses - a substantial food for thought - and the issue of poverty alleviation. Raudsepp-Hearne et al. point to the possibility that increased in food production overall is a key factor explaining the environmentalist paradox. But one may wonder if this increase in food production has benefited evenly to all categories of the population. It is no mystery that rural populations have often been dominated for a long time by urban ones, both in developed and developing countries, and from a political, social and cultural point of view. Undernourishment is likely to have diminished more in urban areas than in rural areas, and it is important in this respect to remember that among the 840 million undernourished people (Griffon, 2006), about three-thirds live in rural areas and make a living of agriculture. For reasons of socio-political domination by urban elites and the correlation between national prices for agricultural products and international markets, poor rural populations both sell their products at rather low prices and get a small share of the added value. In this context, one could argue that increased food production as a factor explaining the environmentalist paradox does not necessarily support the interest of the poor, at least in rural areas. Regarding the hypothesis that human well-being is poorly captured in the MEA, and according to the previous section highlighting the specific effects of the degradation of ecosystem services on poor people, it can also be argued that this is all the more true for those living nearby preserved ecosystems. Beside productive functions as defined by the MEA (and to which food production belongs), cultural functions play an important role in terms of human well-being. Who would assert that living next to an oil palm plantation is equivalent, *ceteris paribus*, to living near a natural forest where biodiversity plays a key role in terms of games, culture and other social practices (Sheil et al., 2005)? Examples from around the world, including again from sacred groves in India, are many and extremely telling.

Arguably, the possibility that there is a time lag between the degradation of ecosystem services and their consequences on human well-being deserves scrutiny. Would it be a hasty answer to an extremely complex question? In a more dynamic approach, it could for instance be argued that if the degradation of ecosystem services generates development, it allows for the substitution of natural capital by man-made capital. Then the poor who suffer from the erosion of biodiversity are those who remain poor as ecosystem services degrade, whereas those who manage to embark in the development process are not considered "poor" anymore: in that sense the actual benefits that the poor retrieve from biodiversity loss tend to remain invisible. Such a view would tend to support the idea that conservation is not directly linked to poverty alleviation, although it may at least avoid more extreme poverty owing to the "safety net" argument.

#### 3.2. Poverty or inequalities? Re-opening the Millennium consensus

While fighting poverty is undoubtedly a noble cause, setting it as a global sustainable development priority is a choice that may need to be debated, at least when it comes to biodiversity conservation. Indeed, there are conceptual and practical reasons why a hasty consensus on the actual global objective may conflict with the biodiversity agenda. Even if accepting as a postulate that the poor should be provided with the right to choose their future and with the opportunity to escape poverty, some important issues should not be overlooked:

- First, despite numerous and valuable attempts at complexifying the concept of poverty so as to account for its many dimensions, in practice poverty is still widely measured in terms of the money a person lives on. Just like GDP remains the main gauge of development, key institutions around the world, at all levels, still assess poverty against this extremely simplistic if not misleading indicator.

- Therefore, the conceptual frameworks on which policies are grounded, developed and implemented largely fail to account for the complexity and variety of situations. For example, to what extent is someone living with 10 USD a day in the suburb of a huge, polluted, crowded megacity, working 12 hours a day in a stressful industrial environment and commuting for 4 hours every day better off than someone who lives on less than a dollar a day in a remote tropical forest? The answer is not straightforward.

- Challenges are actually such that there is still a worrying - as far as biodiversity is concerned - lack of evidence that poverty alleviation may be decoupled from growth in the consumption of material goods. Hence there is little doubt that current development trends in the South are leading to a somewhat desperate endeavour to catch up with the level of material consumption of the group immediately higher on the social scale.

On the other hand, evidence is mounting on the adverse effects of inequalities in various dimensions of human well-being. For instance, in "the Spirit Level: why more equal societies almost always do better", Wilkinson and Pickett (2009) argue that there are "pernicious effects that inequality has on societies: eroding trust, increasing anxiety and illness, (and) encouraging excessive consumption". They demonstrate that the situation is significantly worse in more unequal rich countries as far as 11 health and social

issues are concerned. Interestingly, some recent publications also demonstrate the negative impact of inequalities (more than poverty) on biodiversity (e.g. Holland et al., 2009; see summary in box 3). Inequalities are likely to be a fundamental missing piece of the biodiversity-poverty puzzle, finally putting coherence in fragmented observations that, for instance, poverty is a cause of biodiversity erosion while clearly wealth is an even greater one. If the poor are to develop and if the natural resources that ecosystems provide are limited, a drastic reduction in the gap between the rich and poor may be a first and foremost requirement.

On the whole, the belief that poverty - not inequality - is the core problem with regard to biodiversity and sustainable development in general, and that the answer lies in increasing the GDP, may turn out to be an example of the blindness that comes with dogma. The poverty/inequality debate is obviously a very political one because it is hardly presented as a win-win scenario in contrast with "poverty alleviation": some believe that reducing inequalities is not a legitimate objective; others do want to reduce inequalities, and believe GDP growth is the best way to achieve it; others believe there is no direct relationship between GDP and inequalities - which does not necessarily mean that GDP growth should be avoided, but that it is not sufficient. Worth noting, little robust literature articulates poverty, inequalities, GDP and biodiversity.

The Millennium consensus at the end of the 1990s set the international agenda on poverty for clear political reasons, although they remained implicit and the choice was usually presented as "neutral". It has seldom been challenged by governments, NGOs or scientists, despite some isolated attempts to at least couple the poverty alleviation agenda with the inequalities issue. It should therefore today become a priority to gather more evidence on the role inequalities play with regard to sustainable development, among others biodiversity erosion. The 2015 Millennium Development Goals horizon, as it is quickly approaching, may be the perfect opportunity to bring new arguments to a debate that definitely needs to be revived, as politically incorrect as it may be.

#### Box3. A Cross-National Analysis of How Economic Inequality Predicts Biodiversity Loss - Summary

We used socioeconomic models that included economic inequality to predict biodiversity loss, measured as the proportion of threatened plant and vertebrate species, across 50 countries. Our main goal was to evaluate whether economic inequality, measured as the Gini index of income distribution, improved the explanatory power of our statistical models. We compared four models that included the following: only population density, economic footprint (i.e., the size of the economy relative to the country area), economic footprint and income inequality (Gini index), and an index of environmental governance. We also tested the environmental Kuznets curve hypothesis, but it was not supported by the data. Statistical comparisons of the models revealed that the model including both economic footprint and inequality was the best predictor of threatened species. It significantly outperformed population density alone and the environmental governance model according to the Akaike information criterion. Inequality was a significant predictor of biodiversity loss and significantly improved the fit of our models. These results confirm that socioeconomic inequality is an important factor to consider when predicting rates of anthropogenic biodiversity loss.

#### Poverty Eradication and Quality of the Environment in Urban and Peri-urban Areas

David Satterthwaite

International Institute for Environment and Development (IIED)

How urban centres and the peri-urban areas that surround them are managed and governed in Africa, Asia and Latin America has very large implications for whether poverty is reduced and whether the Millennium Development Goals are met. Also for whether nations in these regions develop economies and urban and rural settlements that can adapt to climate change. And finally, since almost all the world's population growth and much new investment is taking place in these urban centres, whether these are compatible with low-carbon development.

There are good precedents that show the potential for combining environmental improvements with poverty reduction, especially through supporting upgrading of informal settlements. There are also precedents to show how urban expansion can be managed in ways that protect ecological services and support low carbon development. But these remain the exceptions. For these to become the norm requires national governments, aid agencies and development banks to establish far more effective ways of working with and supporting local governments and civil society organizations in urban areas, including the organizations and federations formed by the urban poor. This paper ends with some suggestions for how this can be achieved.

The global significance of urban issues

Around one in six of the world's population lives in urban settlements in life and health threatening environments. Where their very basic needs for water, for sanitation, for drainage, for health care and emergency services are not met. Even in nations that are democratic, a large part of this population may be unable to get on the voter's register because they live in informal settlements that have no official address. For this or for other reasons, tens of millions cannot get their children into government schools. For these people, urbanization is associated with ill-health, premature death and often hunger. Also with infant and child mortality rates 10-20 times higher than what they should be. These are not problems that only affect a small proportion of the population; for many cities, 30-60% of their population lives in informal settlements lacking provision for infrastructure and services.

Cities with growing populations and economies need to expand spatially. But in low-income and most middle-income nations, rarely is this process and the land-use changes it brings managed adequately. The areas that surround a city's built up area are often termed peri-urban areas. They usually have a mixture of rural and urban characteristics and are where agriculture and urban development interact with natural resource systems. Farmers and agricultural labourers co-exist with growing urban uses - for instance informal settlements, urban enterprises and often private housing developments, although these often compete for land and for access to water. In better-located peri-urban areas, large amounts of land may be vacant, as they have been purchased by real estate agents or developers in anticipation of their rise in value as the city expands. These peri-urban areas generally fall outside the jurisdiction of the city; they often have local governments that are relatively weak and may still be governed as if they are rural areas. Peri-urban areas that are close to successful cities often urbanize rapidly with little or no control on, for instance, polluting industries or protection of water sheds or ecosystems that help protect against floods - and often with disadvantages to the long-time residents and farmers. It is also within particular peri-urban areas that informal settlements often develop rapidly; these often concentrate on land sites that are at high risk from landslides, flooding or other natural hazards because these hazards make the land unattractive for conventional, formal developments.

Yet urbanization is generally driven by a growing economy and it can and should be associated with good health, a high quality of life and real citizen and community engagement in local governance. Well governed cities have among the world's highest life expectancies and the lowest infant and child mortality rates. Of course, successful cities have economies of scale, agglomeration and proximity for enterprises and investors; this is why they are successful and why they attract investors and migrants. But the concentration of enterprises and people also bring many potential economies of scale and proximity for what makes cities healthy - water piped into each person's home and good quality toilets, drainage and regular collections of household waste. There are also economies of scale or proximity for almost all services - kindergartens and schools, health care services, police to provide the rule of law and emergency services (fire, ambulances). Indeed, it was within cities that universal provision for these was first achieved.

It is also within cities that many of innovations in poverty reduction, in participation, in 'good governance' have been pioneered. Over the last 20 years, it is within cities that organizations and federations formed by 'slum' or shack dwellers have demonstrated innovation in addressing their members' needs and offering governments their skills and

capacities.

The need to address urban poverty

In almost all nations, success in poverty reduction requires strong urban components. In the mid 1970s, a case could be made that poverty reduction should focus on rural areas - although even then, the scale and depth of urban poverty should have been recognized. Latin America was already predominantly urban by this time and though much of Asia and Africa were predominantly rural, Asia already had close to 600 million urban dwellers while Africa had more than 100 million. But nearly 40 years later, the ignoring of urban poverty is no longer credible. Between 1970 and 2010, the urban population in low- and middle-income nations grew by 1.9 billion while its rural population grew 1.1 billion. The urban population within these nations is anticipated to grow by 2 billion between 2010 and 2040 while the rural population is projected to decline. Urban and peri-urban areas now concentrate a large proportion of world's population that is hungry, that faces very large (and easily prevented) health burdens, that lacks basic services - see Table 1. Table 1: Estimates for the scale of different aspects of urban poverty in low- and middle-income nations

Type of poverty	Numbers of urban dwellers affected	Notes
Inadequate income in relation to the cost of basic needs	800-1,200 million	No accurate figures are available on this and the total varies, depending on the criteria used to set the poverty line (the 'income-level' required for 'basic needs')
Inadequate or no provision for safe, sufficient water and sanitation	More than 680 million for water and 850 million or more for sanitation	These estimates are for 2000 and are drawn from a detailed global UN review of individual city/urban studies; 45 they have probably increased considerably since then
Hunger	500 million+?	In many Asian and sub-Saharan African nations, 25- 40% of urban children are underweight and/or under height. In many nations, more than half the urban population suffers from food-energy deficiency including India, Pakistan and Bangladesh
Living in housing that is overcrowded, insecure and/or of poor quality	c. 1 billion	Based on a 2003 global UN review of the number and proportion of people living in 'slums' <sup>47</sup> with an allowance for the increase in Africa since then
Homelessness (i.e. living on the street or sleeping in open or public places)	c. 100 million	UN estimate. There are also large numbers of people living on temporary sites (for instance construction workers and often their families living on construction sites) that are close to homeless.

As if this very large and growing scale of urban poverty was not enough justification for getting action from governments and international agencies, there are also the new issues brought by climate change. Africa, Asia and Latin America have most of the cities most at risk from the direct impacts of climate change - especially risks from more frequent and/or more intense extreme weather (storms, floods, heat waves), sea-level rise and constraints on fresh water supplies. For most urban centres in these regions, these come on top of their already evident vulnerability to disasters. It is low-income nations that concentrate most deaths from cyclones, even if many middle and high-income nations have more of their populations exposed to these.

Then there is the role of urban centres in mitigation - the very urgent global need to reduce total greenhouse gas emissions. It could be argued that this is an agenda for high-income nations (and within this for their urban centres). This is supported by the much higher levels greenhouse gas emissions coming from many cities in high-income nations - for instance per capita emissions of 10-30 tonnes of CO<sub>2</sub>e per year when most cities in low and middle-income nations have under 2 tonnes (and many have much lower emissions levels than this).

The case for focusing on mitigation in high-income nations is further strengthened if emissions accounting allocates the greenhouse gas emissions embedded in goods to those that buy and use these goods rather than the nations or cities where the goods were made.

But if greenhouse gas emissions are to be reduced while also not constraining development in low and middle- income nations, development itself - and especially urban development - needs to be low carbon. Most of the world's urban population and most of its large cities are in low and middle-income nations. And as noted above, almost all the growth in the world's population in the next few decades will be in urban centres in low- and middle-income nations. How these urban centres expand to house 2 billion new urbanites has very large implications for poverty reduction, for whether or not these urban centres (and their national economies) are resilient to climate change - and for whether global emissions reduce enough to avoid dangerous climate change. Will the vast expansion of the urban population in the more successful economies in Africa, Asia and Latin America be low density, private car dependent sprawl which implies greenhouse gas emissions per resident of 10-30 tonnes of CO<sub>2</sub>e? Or well-governed, high-density, low-waste, low-carbon residential developments that can combine a high quality of life with greenhouse gas emissions per resident of 1-2 tonnes of CO<sub>2</sub>e? What are the greenhouse gas emission implications of the needed vast expansion in electricity generation and infrastructure provision for these two billion new urbanites (as well as meeting the needs of the billion or so urbanites that also lack such provision now). Whether or not the expanding middle-class in successful economies in Africa, Asia and Latin America (including those that move out of poverty) follow a high- consumption lifestyle will in part depend on whether middle and upper-income groups in high-income nations move quickly to much lower carbon lifestyles. We can demonstrate that a very high quality of life is possible in London, Paris, Toronto, Copenhagen, Amsterdam..... with consumption patterns and individual carbon budgets that contribute to avoiding dangerous climate change. But it does not mean that middle and upper income groups in these and other cities will accept this. If they do not, why should middle and upper income groups in cities in low and middle income nations do so?

Why is so little attention paid to urban poverty and urban climate change policy?

Why have most aid agencies given so little attention to urban poverty for decades? Why do some still insist that almost all poverty is in rural areas? And still claim that good rural development slows urban development when we know that it usually does not. Successful agriculture that includes shifts to higher value crops and that brings rising incomes and opportunities for farmers usually stimulates and supports urban development as local urban centres expand to provide producer and consumer goods and services to the farmers and also provide farming families with off-farm and non-farm employment. More recently, why have most discussions of climate change adaptation ignored urban centres, even as these generate most of the nation's GDP and attract most new investment as well as concentrating a large proportion of the population most at risk from climate-change impacts? And even within discussions of mitigation and the needed 'green economy', why is so little attention paid to urban areas? If a greener economy really is to be built, much of it will need to be rooted in urban centres and supported by urban governments. Aid agencies were not set up to work with local governments and face difficulties doing so, in part because they are under constant pressure from the governments that allocate funds to them to keep down staff costs, in part because national governments do not want them to do so. But how are they to support the meeting of the MDGs, the reduction in poverty and the needed incorporation of climate change adaptation and mitigation into development without a more direct engagement with local governments?

None of the key goals for urban areas - for poverty reduction, for climate change adaptation and for mitigation - is possible without more competent, better resourced city and municipal governments in Africa, Asia and Latin America. And central to this is their capacity to engage with their inhabitants - especially those that currently live in informal settlements. There are examples of good practice that show what is possible. The city of Porto Alegre in Brazil has a high quality of life, a successful economy and relatively

low greenhouse gas emissions per person. The city of Manizales in Colombia has been innovating for more than 20 years in combining good environmental management rooted in community engagement with disaster risk reduction. The nation-wide support in Thailand for community-organized and managed 'slum' up-grading (through the Community Organizations Development Institute) that has transformed the quality of homes and neighbourhoods for hundreds of thousands of people. There are hundreds of initiatives now underway by national federations of slum and shack dwellers as they build or improve their own homes and work with local governments to provide or improve infrastructure and services (this is described in more detail later). It is no coincidence that all the above were underpinned by local governments seeing the value of listening to, working with and supporting grassroots organizations. Perhaps this is a defining feature of what is needed to make poverty reduction work - and to be able to incorporate within this climate change adaptation and low carbon development.

How we define a problem influences how we address it

How we define informal settlements, poverty and environmental degradation has very large implications for the policies developed to address them

We can look at an informal settlement - at Kibera in Nairobi, Dharavi in Mumbai or Korail in Dhaka - and see it as 'a slum,' a huge concentration of dangerous, poor quality housing in unplanned sites that contravenes all official codes and regulations for health and safety. So these need to be replaced. Even to term these settlements as a 'slum' is to imply that they need to be replaced. Even to call them informal settlements may imply that they are not seen to be part of the city economy. Or we can look at these same informal settlements and see their contribution to the city economy and how they house among the lowest-income groups without costing the government anything. (And for those of us living in these cities, how the informal settlements may house our maids, drivers, cooks, gardeners and security guards). Here we do not see 'a slum' but a settlement that needs better provision for water, sanitation, drainage, health care and schools. So we look to ways in which these can be provided (and the examples of good practice given later provide us some guidance as to how this can be done).

Then also consider how others may see these informal settlements. The young migrant who finds accommodation here that is both cheap and within walking distance of their newly found and perhaps precarious employment. (Even if he or she has to share a tiny room with several others or even rent a bed for a set number of hours a day). The entrepreneur that sees the central location, the multiplicity of other producers and the 'demand' there as a great place to start a new business. The funding agency looking for opportunities to finance low carbon development that sees the huge informal 'waste' economy that supports so many livelihoods (tens of thousands of livelihoods in many large cities) and keeps down the city's greenhouse gas emissions - probably much more so than official urban waste projects.

Then there is the issue of how poverty is defined. How we define poverty has a very large influence on how many people are 'poor' and on how we address it. For instance, if poverty is defined as an income that is less than US\$1 per person per day (the definition used in the Millennium Development Goals), then urban poverty disappears for most nations. According to World Bank figures, using this definition, there is virtually no urban poverty in China, the Middle East, North Africa or Central Asia. And urban poverty is a minor issue in Latin America. But this does not accord with the very large numbers of urban dwellers in these regions that are hungry and live in poverty. Set a poverty line too low and almost no-one is poor.

Most definitions of poverty are based only on income level or food consumption. They do not consider the quality of housing or the quality of provision for water and sanitation. Or whether households can get health care services and afford to send their children to school. So the poverty lines based on these definitions make very little allowance for the cost of non-food needs. One of the defining characteristics of a city is that access to almost all needs have a monetary cost - for instance access to housing (or land for housing), infrastructure, services and employment. Large sections of the urban poor have to rent accommodation and even if this is a small room in an informal settlement, it still may take 20-30 percent of their income. As noted earlier, many of those living in informal settlements do not have access to piped water, sewers and health care so they have to pay water vendors, pay-to-use toilets and private health care services. This also takes large chunks of their income. If they live in peri-urban settlements, they may face high expenses going to and from work or services. Keeping children at school is often expensive, even if access to the school is free (for instance through transport costs and the costs of books, uniforms and school meals). The failure of most national poverty lines and the dollar a day poverty line to make sufficient allowance for the cost of non-food needs in urban areas (especially larger and more successful cities) means that they enormously under-estimate the scale and depth of urban poverty. With a dollar a day poverty line, most of the world's poverty seems to be in rural areas. With poverty-lines in each nation adjusted by location so they include an adequate allowance for the cost of non-food needs, the scale and depth of urban poverty greatly increases.

Finally, how the term environmental degradation is understood influences how policies are set to address it. We know that most urban dwellers with low incomes live in poor quality housing lacking provision for water, sanitation, solid waste collection, drainage and health care. So they face very large environmental health burdens. They live in homes and neighbourhoods that can be considered "degraded" environments. These often look degraded, as many of the houses are made of waste or temporary materials and there many waste piles as garbage is not collected. There may be areas where many people defecate in the open because there are no toilets or public toilets are too expensive (or too dirty). So here, urban poverty might be associated with environmental degradation or even said to cause environmental degradation.

But the term "environmental degradation" is usually used to mean the over-use or degradation of scarce natural resources (including fresh water, soils and forests), the generation of ecologically damaging wastes (including greenhouse gas emissions) and damage to ecological services. Used in this sense, there is no association between poverty and environmental degradation because poverty is associated with very low levels of natural resource use and very low levels of waste generation (and greenhouse gas emissions). It is wealth and high consumption levels that are the drivers of environmental degradation, not poverty. This can be seen in differentials between high-income and low-income urban dwellers in consumption and waste generation. For instance, in many cities, there is a 50-fold difference in the volume of fresh water used. Also a 30-fold difference in the land area per person occupied by homes. Also, very large differentials in the land- and energy-intensity of their diets, the fossil fuels consumed in the home and for transport, electricity consumption (and the environmental implications of its generation) and the purchase and use of consumer and capital goods. This can also be seen in the very large differentials between high-income and low-income groups in the greenhouse gas emissions driven by their consumption levels.

Part of this confusion as to whether it is wealth or poverty that causes environmental degradation comes from the distance between where high-income groups live and the environmental impacts of their high-consumption lifestyles. As William Rees pointed out as he developed the concept of ecological footprints, wealthy people (and cities) draw on the resources and eco-system services of 'distant elsewhere's'. So wealthy cities can preserve forests, parks and other open spaces within and around them and protect areas of special scientific interest because this land is not needed to grow food or raw materials for the city's enterprises and inhabitants. Most wealthy cities have little heavy industry. The energy-intensive, land-intensive, water-intensive, pollution-intensive goods their inhabitants purchase are made elsewhere and imported so the environmental costs arising from their fabrication are borne in the places where they were made, not where they are consumed. Part of this transfer is also to the future as it is the world's wealthiest consumers that are the main driver of growing levels of greenhouse gas emissions so their current consumption is driving increasing risk levels in the future.

Can poverty reduction and environmental improvement be combined in urban and peri-urban areas?

The quality of a city environment has very large implications for good health and for poverty reduction. Also for equity. Of course, there are differentials in health in urban centres in high-income nations that are also influenced by the quality of the urban environment. But one key characteristic of urban centres in high-income nations is the universal provision of (for instance) water piped into the home available 24 hours a day, toilets in the home for the exclusive use of each household, regular collection of household waste and house structures (and drainage systems) that are not at risk from extreme weather. There is also almost universal provision for health care and emergency services (for rapid treatment of injuries or serious illnesses, for responses to accidental fires). However bad the living conditions experienced by the lowest-income groups in urban or peri-urban areas in high-income nations, no urban dweller has to walk several hundred yards to queue at a standpipe for water that is not of drinking quality - or to have no access to toilets. Or to have to cook on open fires using waste materials - and not to have electricity. Or if there are examples of these in high-income

nations, they affect a very small proportion of the urban population.

Yet in many urban centres in low- and middle-income nations, a third to two thirds of the entire population faces these kinds of deficiencies in provision for water, sanitation, health care and fuels. It is common for a third to two thirds of the population in these urban centres to live in poor quality, overcrowded housing - either in tenements or cheap boarding houses or in informal settlements. A high proportion have no access to electricity and cook with biomass fuels including waste materials in open fires or stoves that expose them to high levels of indoor air pollution with serious health consequences.

There is also the issue of how urban expansion is managed and governed. The fact that so much urban expansion is uncontrolled and does not conform to any official guidelines or strategic plan was noted already. Most large cities are made up of many different local government units and rapid population growth and urban expansion is often concentrated in the jurisdiction of some of the peripheral local governments that are also among the weakest - as they lack the capacity to manage urban growth and lack the funding to extend infrastructure to residential developments.

Yet for the potential environmental advantages of cities to be realized requires the management of land-use and land-use changes. Such management needs to reconcile different objectives - for poverty reduction, for supporting economic success, for disaster risk reduction, for climate change adaptation and, where possible, climate change mitigation. This is never easily managed, not least because different sectors within city and municipal governments bring different priorities and seek different uses for land within their jurisdictions. We can agree that land-use management needs to ensure sufficient land is available for new housing while ensuring that this is served by trunk infrastructure and encouraging residential developments that avoid private car dependence. But we can also agree that land-use management must ensure sufficient land is available for public use (for schools, health care, recreation/sport/children's play) while also protecting key ecological services (for instance water sheds and mangroves). And building into city expansion the needed resilience to climate-change impacts (and to other natural disasters). There is also the powerful real-estate lobby seeking land for their priorities and often very large numbers of low-income groups seeking land where they can afford to develop housing.

#### Combining environmental improvements with poverty reduction

Governments and international agencies need to act on the potential environmental health advantages of concentrating people, businesses and their wastes because of the economies of scale and proximity for the infrastructure, services and regulations that guarantee good environmental health. One of the most effective ways to reduce urban poverty is to transform the quality of housing and living environments in informal settlements. If we review the experiences of cities in this, there are two different tracks. The first is the more conventional state-directed route for 'slum' and squatter upgrading where it is government agencies that have the primary role - and this has become common in many Latin American nations. The second is upgrading in which the inhabitants of the settlements to be upgraded and their own community organizations have a much more central role, although working in partnerships with local governments. Both these can also build resilience to climate change.

One of the most interesting experiences with upgrading at scale comes from Thailand. Supported by the national government's Community Organizations Development Institute (CODI), this channels government funds in the form of infrastructure subsidies and housing loans direct to community organizations formed by low-income inhabitants in informal settlements who plan and carry out improvements to their housing or develop new housing and work with local governments or utilities to provide or improve infrastructure and services. From 2003 to 2010, within the Baan Mankong (secure housing) programme, CODI approved 745 projects in 1319 communities (some projects cover more than one community) in over 249 urban centres covering 80,201 households and it plans a considerable expansion in the programme within the next few years. Overall, CODI (and the organization out of which it developed, the Urban Community Development Office) has provided loans and grants to community organizations that reached 2.4 million households between 1992 and 2007.

This initiative has particular significance in three aspects: the scale; the extent of community-involvement; and the extent to which it seeks to institutionalize community-driven solutions within local governments so these address needs in all informal settlements in each urban centre. It is also significant in that it draws almost entirely from domestic resources - a combination of national government, local government and household/community-contributions.

Support is also provided to networks of community organizations formed by the urban poor within particular cities, to allow them to work with municipal authorities and other local actors and with national agencies on urban centre-wide upgrading programmes. This initiative also demonstrates how to regularize insecure or illegal land tenure. Those living in illegal settlements can get legal land tenure by a variety of means - for instance by the inhabitants purchasing the land from the landowner (supported by a government loan), negotiating a community lease, agreeing to move to another location provided by the government agency on whose land they are squatting, or agreeing to move to part of the site they are occupying in return for tenure of that site (land sharing). CODI also provides loans to community organizations to on-lend to their members to help build or improve their homes. It also supports city governments in taking the initiative in collaboration with urban poor organizations - for instance providing a site on which those living in various 'mini' squatter settlements in their jurisdiction could relocate, with the land provided on a 30 year lease.

There are also many experiences with upgrading and with the development of new housing that is affordable to low-income groups that are examples of local government-community organization partnerships. In 33 nations, women-led grassroots savings groups have come together to form larger 'slum/shack/homeless people's federations and these are engaged in initiatives to upgrade 'slums' and squatter settlements, secure land tenure, develop new housing that low-income households can afford and to improve provision for infrastructure and services (including water, sanitation and policing). In all instances, they seek partnerships with local governments since inevitably, what they can achieve working independent of government is limited.

Most of the federations have succeeded in negotiating land for housing and this has allowed them to demonstrate their capacity to build - although the land allocations they negotiate are never on a scale to address needs of all their members. Many have undertaken city-wide surveys of informal settlements that then allow dialogue with local governments over planning for city-wide upgrading and, where needed, resettlement. Most have initiatives underway for upgrading or for developing new housing supported by local government - including in India, South Africa, Thailand, Namibia, Malawi, Kenya, the Philippines and Zimbabwe. Over 150,000 families within these federations secured tenure between 1993 and 2008 and upgrading in the form of housing and infrastructure improvements have taken place in most such settlements. The largest and longest established federations - the National Slum Dwellers' Federation and Mahila Milan (a federation of women's savings groups) in India - have developed partnerships with many municipal governments that have allowed much improved provision for toilets and washing facilities and for housing. These toilets have also been visited by members of other national federations and these have brokered deals with local authorities to design, construct and maintain toilet blocks in Cambodia, South Africa, Kenya and Uganda.

What gives these federations of grassroots organizations their capacity to act are the savings groups that are their foundation. Most savers and most savings-managers are women. So most of the federations are made up of hundreds (or in some nations thousands) of savings groups. For each such group, savings scheme members or potential savers are visited every day by the savings group manager. Savers can put small sums (including any spare change they have) into their savings account and most members do so every three or four days. This daily visit means that they have the opportunity to save whenever they can. These savings form a pool of money. Many savings groups also provide emergency and income-generation loans to their members. These can be accessed quickly and easily, from the daily visits. As savings group members work together to gather and manage their funds, they increase their financial management skills and build trust between each other. Over time, as they meet often, they talk about their problems and their needs. Together they begin to think about how they can address larger issues of housing and basic services.

These savings schemes form the federations and the federations are strengthened as their member savings groups visit other savings groups or residents thinking of forming savings groups in their own city and then others in other settlements and cities. The savings group managers also visit savings groups in other nations or grassroots groups

that are interested in the Federations' experiences. These exchanges catalyse an attitude of "can do" - on each visit they see what others have accomplished and they have a chance to talk about their own experiences. As more savings groups form in the informal settlements of any city, so the federation of these savings groups provides the possibility of a city-level partner for local government. These federations have demonstrated a capacity to undertake city-wide surveys of informal settlements that include detailed profiles of each settlement and maps. They have also shown their capacity to do detailed household enumerations of every household in informal settlements that can then form the information base needed for upgrading and infrastructure and service provision. These are both valuable for any local government wishing to improve conditions in informal settlements. These have been done in a wide range of nations and cities.

One example of a partnership between grassroots organizations and a city government that is working at city scale to build resilience to extreme weather is from the city of Iloilo in the Philippines. The partnership established between local and national government, grassroots organizations and the Homeless People's Federation of the Philippines started before the devastation caused by Typhoon Frank in 2008 but was strengthened after it. The city government recognized that the urban poor and their support organizations are partners in the city's development. It provided many opportunities for them to participate in local decision-making through representation in technical working groups and multi-sectoral bodies and allowing more room for effecting change in local policies. The scale and scope of housing delivery, upgrading, post-disaster assistance and other basic services were much increased because of the resource-sharing from the partnership. Local government extended facilities/equipment and personnel (site engineer, surveyors, mappers) to provide technical assistance to the Federation on housing and disaster rehabilitation measures and these also lowered the cost of projects. A portion of the relocation site was allocated to the construction of temporary housing units and communal facilities for Typhoon-Frank affected families.

Being a member of the Resettlement and Monitoring Task Force, the Federation assisted in social preparations and other resettlement-related activities conducted by local government. This include an Information Dissemination Campaign among communities living in danger zones (along riverbanks, shorelines and those directly affected by the city's infrastructure projects) who will be transferred to government relocation sites. The city government, through the Iloilo City Urban Poor Affairs Office, assisted in the federation's social mobilization which include mapping of high-risk/disaster-affected communities, identification and prioritization of communities to be given post-disaster assistance (temporary houses and material loan assistance for housing repair).

The city of Manizales in Colombia provides an example of a city government committed to community-government partnerships in disaster risk reduction. This included the involvement of the population in each district in risk mapping and responses and discussions that brought together all key local stakeholders. The risk mapping of each district identified risk zones and settlements particularly at risk from landslides and the city government worked with their inhabitants to relocate them to safer sites and convert the land at risk into neighbourhood parks with measures to stabilize the slopes. 112 women were trained as "Guardians of the slopes" to create and maintain slope stabilization in their neighbourhood and to report on any problems. Environmental observatories have been created in each of the 11 comunas into which the city is divided to support public engagement and the implementation of the city's environmental plan. These monitor progress on environmental conditions and progress on these is summarized and displayed publicly in a simple set of indicators - the environmental traffic lights (semaforos ambientales). The city also introduced a system of collective voluntary insurance to allow low-income groups to have insurance for their buildings and the city government has an agreement with an insurance company and allows any city resident to purchase insurance coverage through municipal taxes.

We have fewer precedents on how city and municipal governments can manage urban expansion in ways that address development and environmental needs - including needed measures to maintain, restore and enhance productive and protective ecological services. Protecting and managing urban wildscapes and green spaces (as interconnected systems - sometimes termed green infrastructure) is often among the most effective ways of reducing flood risks and reducing high temperatures and lessening heat island effects - while also providing for sport, recreation and children's play that are themselves also important for health. It can also contribute to low-carbon development.

The city of Durban has developed a climate change adaptation strategy that recognizes the importance of working at a regional scale and incorporating landscape management into climate change adaptation. The benefits of inter-jurisdictional collaboration is shown by the ten municipalities within the Ayuquila river basin in Mexico who formed a collaborative association to reduce river pollution and, more generally, to work together to improve living conditions and promote more sustainable management of natural resources within and across their administrative boundaries. In Sao Paulo, there have been initiatives that seek to protect and restore watersheds and protect key reservoirs while working with those who live in informal settlements. The city of Ilo in Peru managed rapid population growth by making land for housing available for low-income groups and supporting the inhabitants of each neighbourhood to work with them in improving conditions and expanding public areas. In Mombasa (Kenya), a park has been developed by the rehabilitation of a disused quarry with local groups contracted to undertake the rehabilitation and now this 220 hectare park attracts 150,000 visitors a year.

International funding mechanisms to support bottom-up action

Bilateral agencies and development banks were not set up to support civil society groups. Or to support local governments. Yet as this paper has emphasized, effective action depends on more effective and accountable local governments that are capable of and willing to work with their low-income citizens.

There are two financial mechanisms that show how this can be done. The first is the Urban Poor Fund International. In 2001, a fund was set up on which the federations of slum or shack dwellers could draw. It was managed by ILED and Slum/Shack Dwellers International, a small umbrella organization formed by the federations and their support NGOs. This provided small grants to the federations' savings groups to enable them to work out how to secure tenure, improve their basic services, and address their shelter needs. Since 2001, this has channelled around US\$ 6.93 million (£4.5 million) to over 100 grassroots initiatives and activities in 17 nations.

Up to 2007, most funding went to support projects of up to 100 households - for instance for

- Tenure security (through land purchase and negotiation) in Cambodia, Colombia, India, Kenya, Malawi, Nepal, Philippines, South Africa and Zimbabwe

- 'Slum/squatter upgrading with tenure security in Cambodia, India and Brazil

- Bridge financing for shelter initiatives in India, Philippines and South Africa (where government support is promised but slow to be made available)

- Improved provision for water and sanitation in Cambodia, Sri Lanka, Uganda and Zimbabwe

- Enumerations and maps of informal settlements in Brazil, Ghana, Namibia, Sri Lanka, South Africa and Zambia that provide the information needed for upgrading and negotiating land tenure

- Exchange visits by established federations to urban poor groups in Angola, East Timor, Mongolia, Tanzania and Zambia (in Tanzania and Zambia, these helped set up national federations)

- Community-managed shelter reconstruction after the 2004 Indian Ocean tsunami in India and Sri Lanka

- Federation partnerships with local governments in shelter initiatives in India, Malawi, South Africa and Zimbabwe

Since 2008, the Fund has grown substantially, with support from the Bill and Melinda Gates Foundation. By 2008, some of the federations were ready to implement larger initiatives in areas where they had worked for many years. Since 2008, the Fund has supported many larger-scale initiatives in land development, housing and basic services in over 22 towns and cities.

The second example is the Asian Coalition for Community Action (ACCA) which provides small grants to catalyze and support city-wide upgrading and partnerships between community organizations. Set up and managed by the Asian Coalition for Housing Rights, in its first year of operation, it provided support in 64 cities. It sets very low budget ceilings for the funding it provides (and leaves it to the implementing communities to work out how best to use it and raise other funding). It explains the principle of 'insufficiency' because there is not enough development funding to fund 'sufficiently' all that needs to be done in informal settlements. As the report on its first year of operation explained:

"The \$3,000 for small upgrading projects and the \$40,000 for big housing projects which the ACCA Program offers community groups is pretty small money but it is available money, it comes with very few strings attached, and it's big enough to make it possible for communities to think big and to start doing something actual: the drainage line, the paved walkway, the first 50 new houses. It will not be sufficient to resolve all the needs or to reach everyone. But the idea isn't for communities to be too content with that small walkway they've just built, even though it may be a very big improvement. Even after the new walkway, the people in that community will still be living in conditions that are filled with all kinds of "insufficiencies" - insufficient basic services, insufficient houses, insufficient land tenure security and insufficient money..... the ACCA money is small but it goes to as many cities and groups as possible, where it generates more possibilities, builds more partnerships, unlocks more local resources and creates a much larger field of learning and a much larger pool of new strategies and unexpected outcomes."

Both these initiatives have worked out funding mechanisms that respond to the needs and priorities of urban poor groups while also being accountable to the institutions that fund them.

## Conclusions

It is difficult for politicians, civil servants or aid agency staff to see those living in informal settlements or squatting on open spaces as potential partners. Their homes and often their livelihoods contravene laws and regulations. Their settlements present a visual image that may be viewed as obstacles to attracting new investments. Their living environments are clearly very poor. The organizations formed by their inhabitants may be seen as troublesome lobbies - or even if viewed more positively, at least as sources of demands that local government cannot meet. City and municipal governments are often faced with an enormous gap between what is needed in terms of basic infrastructure and the cost of fulfilling it using conventional means that work within official codes and standards. Meanwhile, in any successful city, many of the informal settlements may occupy land that is valuable and may be considered as needed for new infrastructure or commercial developments. Local politicians may be more prepared to work with those in informal settlements for their votes but this is usually from the perspective of the politician considering that when elected they have the mandate to make decisions and determine what is done. In such circumstances, they may view community-based organizations formed by the residents of informal settlements as potential sources of opposition.

Now, there are the additional pressures brought by climate change and this makes even more urgent a capacity to manage land-use and changes in land use. Land-use management has always had to bring together support for a prosperous economy and ensuring sufficient land for housing (so low-income groups do not have to develop new informal settlements). It has to protect the ecological services on which cities and many peri-urban livelihoods depend - and now integrate into this resilience to climate change impacts.

The successful precedents described in this paper depended on politicians and civil servants:

- 1: Viewing those who live in informal settlements as legitimate citizens with a right to make demands on them
- 2: Seeing them and their settlements as key parts of the city's society and economy
- 3: Involving them in discussions about priorities
- 4: Seeing the resources and capacities that they can bring to what needs to be done
- 5: Seeing their own community organizations and the local NGOs that work with them as useful for this
- 6: Working out how to work with these organizations as partners.

None of these is easily achieved. The last of these changes is also particularly difficult, because many progressive local governments that have gone through all but the final change see the community organizations and local NGOs as groups they contract to undertake particular tasks, not as partners. To state the obvious, partnerships need partners who want to work together. In some instances, clearly it was changes in the attitudes of those within local government that were an important catalyst to this. In others, the key catalyst was grassroots organizations and their networks or federations demonstrating to local governments their capacities and their willingness to work in partnerships and then senior civil servants or politicians responding positively.

For aid agencies and development banks, there is a need to consider how their institutional structure at headquarters and within country offices can support what is outlined above. This includes developing the financial mechanisms through which they can support city and municipal governments. It also includes the financial mechanisms that can support the urban poor groups and their federations to take action and to offer local governments partnerships, as illustrated by the Urban Poor Fund International and the Asian Coalition for Community Action. This is not easily done. But without mechanisms to support these two critical actors - city or municipal governments and representative organizations of the urban poor - it is difficult to see urban poverty being reduced, resilience to climate change built - and needed global reductions in greenhouse gas emissions achieved.

What is the role of the private sector in combating poverty and caring for the environment?

Frederic Dalsace and David Menasce

(Chair Social Business, Enterprise and Poverty, HEC)

The issue of the relationship between combating poverty and caring for the environment has been a matter of public debate for a very long time. As long ago as 1972, we saw the establishment of ENDA, the international non-profit organization dedicated to environmental development in the third world, with the precise aim of simultaneously addressing the issues of development and environmental protection in southern countries. Nevertheless, the convergent involvement of the private sector in these two issues is a more recent development, and one that has its roots primarily in the concept of corporate social and environmental responsibility that has established itself so strongly over the past fifteen years or so as a recurrent theme in this sector. Corporate Social Responsibility (CSR) is still the subject of lively debate: although considered by some as nothing more than another type of communication or even manipulation, others see CSR as holding out the hope of becoming an effective social lever for change.

Lively as this debate undoubtedly is, it rarely addresses the legitimacy of a concept that links together two areas that are, by definition, independent as far as the private

sector is concerned: environmental protection and combating poverty.

It is a revealing fact that the acronym CSR is used as a single catchall term to describe social and environmental responsibility: Corporate Social Responsibility. This ambiguity of language is an accurate reflection of the inaccuracies of the concept that intermittently encompasses environmental issues. This limited concept is also misleading, because it ignores the potential contradiction between social and environmental disciplines.

In reality, social and environmental responsibility is seen by the most critical observers as a highly partisan area of discussion: by linking environment and society in this systematic fashion, the concept not only avoids addressing the question of possible trade-offs between the two, but also presupposes a simultaneous and positive contribution to both by the private sector.

Nevertheless, a closer inspection of these issues confirms that the linkage between them has been the focus of very little shared research in the management sciences (Kandachar, 2008). Networks of professionals working on social and environmental questions also remain isolated and compartmentalized. It is this paradoxical situation that explains the highly antagonistic positions adopted in this debate.

On one side there is a clear and conscious optimism, combined with the belief that the private sector offers THE solution to solving social and environmental problems as parts of the same process. From this point of view, the constant and obligatory quest of the private sector to identify new sources of growth and dovetail with consumer requirements is capable of seamlessly connecting economic growth, environmental protection and the fight against poverty in the same virtuous process. This is very much the sense that emerges from the literature published over the last decade or so, which treats environmental and social problems not as a negative external reality requiring correction, but rather as a source of opportunity for the private sector. At the heart of this virtuous circle lie innovation and technical progress.

Conversely, others see the private sector as the INCARNATION of the PROBLEM on the basis of very similar reasons: its constant and obligatory quest for new sources of growth inevitably results in a race to exploit resources and people. At the same time, and in some developed countries at least, we are seeing a profound mistrust of technical progress in the resonance achieved by the precautionary principle in public debate. It then becomes necessary to consider a kind of 'prosperity without growth' in order to be able to break the vicious circle between social demand for rampant consumerism, exploitation of resources and social damage.

These two opposing visions of essentially the same situation seem both exaggerated and dangerous. In our view, it is vital that a more precise and nuanced approach is taken to analyzing the contribution made by the private sector to reconciling the fight against poverty with the need to protect resources.

From this viewpoint, such analysis is guided by four factors:

- Zones of interdependence: the point here is not to analyze the possible contribution of the private sector to better management of resources or the fight against poverty independently, but rather to understand the intersections and challenges common to the triangle formed by the private sector, the need to combat poverty and the need to protect resources.
- Business models: having identified these zones, the goal shifts to identifying the possible contribution to be made by the core business of the private sector to solving the problems of poverty without compromising the environment. This means that we are not interested here in the indirect business contributions of the private sector represented by wealth creation, salaries and the contribution to public funds, or in the direct but non-business contributions of philanthropy and what Stuart Hart refers to as 'greening' strategies, by which he means limited adaptations made to existing practices for the purpose of anticipating changes in environmental regulations (Hart, 1997). Our intention is to take a broader view in order to devise economic models that move beyond discussion to the practical integration of social and environmental challenges as part of the same process.
- Governance: these new models will undoubtedly call for revised governance methods that must be clearly identified. In our view, the issues surrounding governance are central to combating poverty and protecting the environment. They will be a non-negotiable element of any initiative adopted by the private sector to combine the two objectives into a single positive process. In this context, it is vital to build governance models that involve public authorities and organizations rooted in civil society. Such governance is not only a precondition for the legitimacy of private sector involvement, but also a source of efficiency for whatever action it may take.
- Funding: Appropriate funding is crucial, because it provides well-considered support for initiatives that, in most cases, offer a lower return on investment than that offered by the market. We see the emergence of the Impact Investing sector, whose goal is to respond to this need to identify patient capital methods as a first element of response.

1. Despite their interpenetration, the private sector has traditionally addressed social and environmental issues quite separately

1.1. Two largely-independent fields of analysis

It is striking to observe the analogue approach that the private sector has taken to addressing social and environmental issues.

In the first instance, the relationship between growth, the environment and inequality is often modeled using the same self-regulating mechanism represented by the Kuznets curve. Developed in the 1950s by economist Simon Kuznets, this curve was originally intended to model the link between growth and economic inequality, but is now being used as an illustration of the relationship between growth, poverty and the environment. Kuznets begins with the assumption that economic growth initially benefits a restricted elite, and therefore begins to make inroads against inequality. Once growth is established, it begins to benefit an increasing number of people, thereby reducing economic inequality. The relationship with the environment is characterized in the same way (Grossman, Krueger, 1994): growth would begin as a source of damage to the environment, but as environmental concerns increased as a result of improved wellbeing, the result would be the introduction of environmental protection policies.

Nevertheless, over and above this self-regulating mechanism, an increasing number of companies - mostly multinationals - have in recent years focused on implementing strategies intended to protect the environment and contribute to development. Historically, these mechanisms have been motivated by defensive attitudes, since the primary responsibility of the private sector in terms of environmental and social issues is to avoid doing any harm. The many widely-publicized environmental and social disasters occurring simultaneously in many different countries have scandalized public opinion. The most polluting or socially-impactful sectors - especially heavy industry - have therefore been obliged gradually to introduce programs designed to reduce their impact or, alternatively, compensatory mechanisms.

In the 1990s, adopting terms like 'license to operate' or 'access to resources', companies developed strategies for reducing poverty or damage to the environment whenever they felt themselves to be morally or contractually dependent on particular parts of the world, and obliged to maintain high-quality relationships with local communities. Those industries involved in natural resources extraction have therefore introduced a number of so-called 'community' programs (Renouard, 2007), usually as a result of pressure from civil society or public authorities.

It wasn't until the 2000s that the management sciences began to flag up commercial opportunities related to environmental and social issues - the parallel attitude remains striking. Books like *Green is Gold* (Esty and Winston, 2009) and *The Fortune at the Base of the Pyramid* (Prahalad, 2004) are based on the same twin premise. They begin by legitimizing the role of the private sector by stressing the appropriateness of market-based approaches for solving social and environmental issues, at the same time as criticizing the involvement of national and international public authorities and excessively restrictive regulation. They go on to turn environmental and social challenges into sources of profit and innovation for the company. This therefore reflects a gradual trend away from responsibility and the management of negative externality to social and

environmental innovation. Even so, the two fields remain largely independent.

#### 1.1.1. The environmental challenges involved in market-based approaches to combating poverty

Over the last decade or so, we have seen the development of alternative market-based approaches intended implicitly or explicitly to combat poverty. Even today, the two main forms adopted by these market-based approaches to combating poverty take only marginal account of the environmental issue.

On the one hand, the Base of the Pyramid (Prahalad and Hart, 2002) strategies respond to one natural trend of globalization: the quest for new unexploited markets. Using these strategies, multinationals seek to incorporate a proportion of the 4 billion people who live on less than \$5 or \$6 a day into their business models in order to identify new opportunities for growth. One aspect of the Base of the Pyramid (BoP) approach proposed by Prahalad and Hart (2002) is the way in which it reconciles the traditional argument of economic rationality with the fight against poverty. The BoP approach urges companies to address the 'fortune' at the base of the pyramid in their own interest (maximizing value for shareholders). The BoP logic is one of seeking out new economic opportunities, with Prahalad and Hart reviving the ideas of Adam Smith and applying them to the slums of poor countries. Consumer goods companies in particular have conducted pioneering programs to adapt their economic models to rural areas. In this way, Hindustan Lever, the Indian subsidiary of Unilever, has made many of its products more accessible by using an individual product packaging system and a tailored distribution system to reach Indian villages. The mobile phone industry has also achieved very strong growth amongst poor populations by introducing prepayment systems and alternative distribution methods.

In parallel with the BoP theories, the Nobel Peace Prize Winner Muhammad Yunus has popularized the concept of social business (2007, 2009) that has formed the basis for many partnerships with companies for the purpose of implementing new development models. The aim of social business is to contribute to solving a social problem: it operates on the 'no loss, no dividend' principle. In other words, social business aims to provide underprivileged populations with access to a basic service - such as credit, water or energy - through the creation of companies that are 'traditional' in the sense that they must be financially sound in the long term, but at the same time 'social' in the sense that any profits are reinvested in the company itself. A number of multinationals, including Danone and Veolia, have committed to this approach by creating joint ventures with Grameen Bank or its subsidiaries. Danone and Grameen have formed Danone Grameen Food Limited, with the stated aim of improving infant nutrition in rural Bangladesh. Similarly, Veolia has got together with Grameen Healthcare to create a water treatment and distribution company to serve Bangladeshi villages. This form of company offers a more legitimate way of combating poverty and creating partnerships with non-profit organizations, since the absence of the profit motive creates a de facto 'demilitarized zone' (Yunus, 2010) open to all partnerships.

The emergence of these strategies has been the subject of intense debate and criticism regarding their real contribution to combating poverty and their ability to reach the poorest in society, rather than the emerging middle class (Karnani, 2007, 2009). Over and above these criticisms, it is important to note that the environmental issue remains a virtual blind spot for both BoP and social business. In his 12 principles for successful innovation, Prahalad refers to the necessity to avoid exploiting environmental resources (principle 4), but proposes no other practical method of reducing any negative impacts imposed by the models offered. Furthermore, the examples offered may reasonably be questioned from the environmental point of view. The unprecedented growth in individual packaging, particularly in consumer goods, provides a perfect illustration of the tension that exists between accessibility and environmental protection. Although these products may be tailored to the purchasing power of the poor, they remain largely harmful to the environment, and it was not long before the individual sachets of HLL products spread right across the Indian subcontinent.

In the same way, Yunus makes environmental protection one of the seven points of social business (2010), but the issue is hardly addressed in any depth. So the requirement for economic viability relegated the attempts made by Danone to develop a green packaging product (PLA) into second place, and the company had no choice but to market its yoghurts in traditional plastics (Ardoin et al 2011).

So in reality, the social and environmental goals would be difficult to reconcile, leaving us with a choice between inter-generational fairness and intra-generational fairness. Worse still, setting more than one extra- economic target for the private sector would ultimately prove totally paralyzing. The result would be to fall into the multiple target trap (Garrett and Karnani, 2009).

#### 1.1.2. The social challenges of 'green business'

Conversely, the economic models developed with the aim of contributing to improved environmental protection take little account of social issues. Their main thrust is to decouple economic growth from the pressure on resources, but without introducing mechanisms capable of including the poorest populations. This 'decoupling' may be achieved in many different ways, but we will focus on two particular levers for action: economic models and the behavioral lever (Hahn, 2008).

##### a. The business models

###### Eco-efficiency

The term 'eco-efficiency' was coined at the Rio Earth Summit in 1992 (WBCSD, 1992). Its underlying concept is not to produce less, but to produce better, whilst reducing the impact of production on the environment. Its basis lies in the shared observation that growth cannot be sustained indefinitely given the pressure it places on natural resources. In seeking to reconcile the two contradictory imperatives of growth and caring for the environment, eco-efficiency aims to progressively reduce ecological impact and the intensity of natural resource extraction to achieve a level compatible with the recognized capacity of the planet to sustain itself. This theme has been taken up by a very large number of economic actors - it is no longer just companies that have introduced initiatives in this direction - because it explicitly reconciles private interests (savings in terms of raw materials and energy) with public interests (environmental impact). Indispensable as it may be, this model will however fall far short of being sufficient in itself. The sheer extent of the needs that go hand-in- hand with poor populations points to the fact that the ecological impact of eco-efficient models seems hardly tenable (Hahn, 2008).

###### The economy of functionality

The economy of functionality is the complete or partial replacement of a product sale by the sale of a service with the aim of decoupling the equation that says profit equals the use of natural resources. In other words, by proposing models in which profit is derived from usage or maintenance services, it is possible to conceive of economic models that substantially limit the exploitation of natural resources. This direction is followed by many companies, including Schneider Electric, Michelin and Hilti. For example, Michelin has rethought its economic model and now offers major road haulage operators a total tyre management service. The billing for this service is no longer based on tyres sold, but on the total mileage covered by the entire vehicle fleet. This radically changes the business goal of the tyre manufacturer, because to maximize its profit, Michelin must now focus on ensuring that its road haulage customers consume as little rubber as possible; a virtuous objective from the environmental point of view (Renault, Dalsace and Ulaga 2009).

###### Green technologies

New technologies are ultimately sources of economic opportunity, and the aim here is to design new products or processes that consume much lower levels of natural resources. The generation of energy from renewable sources using solar or wind technology, making best use of the energy we have by means of smart grids, introducing electrically-powered vehicles and constructing energy-positive buildings are just some examples that illustrate how new technologies can help to reconcile growth with

environmental protection. Nevertheless, these practices and thought processes - and their implementation - have usually been restricted to the developed countries of the world, where their impact would be the greatest. From this viewpoint, green technologies are usually highly sophisticated technologies, and therefore expensive technologies. In other words, given the relative proportional importance of developed countries, the private sector has tended to focus chiefly on OECD countries.

#### b. The behavioral lever and patterns of consumption

The second lever is behavioral. It involves analyzing the behavioral changes needed to achieve 'prosperity without growth' (Jackson, 2009). In other words, the private sector must contribute to raising consumer awareness of better ways to use products and services in order to reduce their environmental footprint. Naturally, this lever is not particularly appropriate for the already-restricted patterns of consumption seen amongst poor populations; here again, it cannot be denied that the considerations surrounding the role of the private sector in environmental issues are applied principally to the developed countries of the world.

In overall terms, and despite all the talk that links environmental issues with poverty via the umbrella concept of social and environmental responsibility, the proactive mechanisms that the private sector is currently trying to implement remain very largely independent of each other in reality.

#### 1.2. Nevertheless, both these questions are very profoundly interdependent

A closer interconnection between the issues of poverty and environment are nevertheless vital in today's world, both for poor populations and for companies.

##### 1.2.1. Convergence: a necessity for the populations concerned

The BoP and social business theories have raised the profile of a phenomenon that is well-known, but little researched in its entirety: the penalties of poverty or 'double squeeze'. The fact is that poor populations pay more in absolute and relative terms for their goods and services than wealthier populations (Prahalad, 2004). Prahalad also demonstrates the price differentials that exist for many goods and services (including water, credit, medications and rice) between the residential district of Bombay Warden Road and the Dharavi slums. There is also a third 'penalty' to be considered: the environmental damage that acts retrospectively and very significantly to depress the incomes of poor populations. The very great majority (75%) of the world's poorest people - those who live below the \$1 per day income threshold - live in rural areas. They depend very heavily on services provided by ecosystems in order to live, but 60% of such services are now degraded or damaged (Millennium Eco-system Assessment, 2005). These populations have potential recourse to four different types of environmental revenue: cultivated land, forests, fisheries and mineral resources. In fact, 2.6 billion people rely for their living on agriculture, whilst a further 1.6 billion depend on forests in one way or another. The ecosystems built around agriculture, forestry and fisheries represent between 6% and 17% of GDP in Indonesia, India and Brazil, and contribute between 47% and 89% of the income generated by the poor in these countries (Eloi, 2011).

##### 1.2.2. Convergence: a necessity for companies?

At the same time, and more surprisingly, acceptance of the interdependence between the two issues seems to be becoming a genuine route to innovation for companies.

Both the BoP and 'green' strategies require genuine step-change innovations across all company business sectors, in terms not only of products, but also of production processes (Lehman Ortega, Faivre-Tavignot, Moingeon, 2010). It is imperative for companies to renew their economic models as part of facing up to increasing competition from companies in emerging countries (Govindarayan, Immelt and Trimble, 2009). Consequently, tackling the issues of 'green' innovation and 'social' innovation head-on and making them a priority direction for research has, for some years, been a necessity for proponents of the BoP approach. One of the most recent articles published by CK Prahalad focuses on this 'holy grail of innovation' (Prahalad, 2010); an innovation capable simultaneously of addressing the twin needs to conserve resources and combat poverty.

Prahalad defines this new form of innovation as 'Gandhian innovation' (Prahalad, 2010), because it is based on Gandhi's twin principles of accessibility and sustainability summarized in two maxims of India's great leader: "I would prize every invention of science made for the benefit of all," and "Earth provides enough to satisfy every man's need, but not every man's greed." This type of innovation, referred to by some as frugal innovation (The Economist, 2010) to reflect the radical process it presupposes, would enable the creation of tomorrow's economic models, thereby creating considerable comparative benefits. Similarly, it is interesting to note the creation of 'The Great Leap': a research program led by Stuart Hart to examine convergence between 'green technologies' and 'BoP'. This 'convergence' would be all the more well-advised were it not for the fact that the real market for green technologies is not to be found in developed countries, but in emerging countries. It is therefore important to make a distinction between two types of green company. On the one hand, there are the 'green giants' of developed countries, like wind energy and solar energy projects that require public investment and centralized coordination, and on the other hand, there are the 'green sprouts' involved in small-scale decentralized systems (Hart, 2010).

These small-scale green technologies seem to be difficult to implement in developed countries, since those companies already established in these markets put obstacles in the way of their development in order to defend their own positions and profits. In this regard, the maturity of developed markets would be the main obstacle to the establishment of new technologies. In other words, the introduction of green technologies into emerging countries would require a 'creative creation' mindset (Hart and Christensen, 2002), which is the opposite of the situation in developed countries, where new technologies are introduced largely at the expense of existing technologies. BoP markets therefore provide the most relevant laboratories in which to experiment with green technologies.

The example of the Indian company D-Light provides an effective illustration of this possible convergence. D-Light Design is a for-profit company whose mission is to: "Enable households without reliable electricity to attain the same quality of life as those with electricity". Traditionally, Indian communities - and especially those in rural areas - make very extensive use of kerosene. This solution is nevertheless costly, dangerous (it causes nearly one-third of all cases of lung cancer in India) and polluting (100 million metric tons of CO<sub>2</sub> are emitted every year as a result of the use made of kerosene) (Kennedy and Novogratz, 2010). It is against this background that D-Light Design offers a solution that is both accessible and more environmentally-friendly: an LED lamp of which more than 50,000 were sold in 2009, generating revenue equivalent to around €1 million. The company believes that it has helped to save 30,000 metric tons of CO<sub>2</sub> emissions since it was formed (Kennedy and Novogratz, 2010).

#### 2. The convergence strategies are co-creation solutions that require patient capital and are based on specific conditions of governance

##### 2.1. New innovation processes built on co-creation

2.1.1. Co-creation with the populations concerned The reasoning put forward as the basis for success in achieving the twin objectives of protecting the environment and achieving universal access is that of frugal innovation, as proposed by CK Prahalad. In practice, this means offering essential goods and services created using a minimum of resources. This innovation process must also involve the populations concerned in work based on co-creation, which is in turn subject to a series of imperatives.

The first of these is that of acceptability and local adoption. Regardless of whether they address environmental protection or the fight against poverty, a very large number of development programs have failed in practice simply because they have not been adopted by the populations concerned. 'Beneficiary education' has emerged as one of the responses to this problem. The presupposition of this educational initiative is that although the solutions implemented by experts, whether from the world of development or the corporate world, are relevant, they are not immediately understandable by beneficiary populations. This education initiative nevertheless risks reinforcing a debatable form of multiple definition of solutions and contributing to disrupting local ways of life. A number of companies are seeking to move away from this risk of multiple definitions towards approaches based on co-creation and participation with the communities concerned (Chambers, 1997). For example, SC Johnson has introduced such a co-creation process in the slums of Nairobi (Thieme and DeKosmovsky, 2010). This involves proposing a local enterprise model based on micro- entrepreneurship, which enables slum

households to be offered a sanitation service. The company has addressed the environmental issues by introducing a new product packaging system that produces very little waste.

From this point of view, companies must come to terms with a type of innovation that intrinsically erodes skills and 'learn to unlearn' (Hart and London, 2004): the process of education that was destined for local populations not so long ago must then be applied to companies in general, and multinationals in particular (Murphy, 2008)

Participation is also an economic imperative. Many research projects based on company pilot initiatives have demonstrated that there is no BoP market as such, and have analyzed the difference between 'needs' and 'demand' (Simanis, 2010, Perrot, 2010). In other words, there are currently no pre-existing economic opportunities that can be intelligently grasped in this way. On the contrary, companies must work concomitantly to create supply and demand (Simanis, 2009, London and Hart, 2010).

Creating a market enables demand to emerge gradually as an expression of the needs of local populations and their ways of life. Participation and co-creation avoid the painstaking work of constructing demand on the basis of a supposed need; a practice that is also questionable in terms of imposing external changes on existing ways of life. On the contrary, co-creation is based on understanding the aspirations of the populations concerned. The BoP protocol (Hart and Simanis, 2008) sets out to offer a practical methodology for co-creation.

The co-creation obligation also raises questions of reproducibility. If each initiative requires a long period of co-creation, is it possible to reproduce successful projects on a larger scale? This question is particularly pertinent for multinationals, whose favored operating method is based on economies of scale.

#### 2.1.2. New innovation processes

Involvement in these new markets therefore requires a real cultural step-change in approaches to innovation, which has yet to be studied in the broader sense. One central question here is that regarding the ability of traditional companies, especially multinationals, to deliver market-focused breakthrough innovations rather than technology-focused breakthrough innovations. Emerging companies would be best placed to implement this type of strategy.

This question relates directly to the classic problem of innovation: are large organizational structures actually capable of delivering breakthrough strategies? Former IBM President Lou Gerstner answered the question ironically in *Who Says Elephants Can't Dance?*, his classic book on the subject. The first way of 'getting elephants to dance' refers to the concept of open innovation (Chesbrough, 2003), which involves opening up the process of innovation by collaborating with other organizations (technology suppliers, smaller companies, NGOs, etc.) and accepting the need to participate in creating a more open intellectual property market in which innovations may be bought or sold. For example, Procter & Gamble has made a major commitment to open innovation by seeking to create an innovation ecosystem involving start-ups, P&G research laboratories and consumer networks, with the goal that 50% of the new products it launches into the market will be co-created in this way (Huston and Sakkab, 2006)

A second innovation lever lies in the incubation of existing structures in combination with the creation of dedicated investment funds. Many initiatives that have proved effective in terms of combating poverty have been originated by social entrepreneurs or very small businesses with the flexibility required to put in place pilot projects and move forward with the development of innovative solutions using an iterative process of error and adjustment. In this context, the role of mid-size and large companies may be not one of replacing those small structures, but rather of supporting them and, where appropriate, incorporating those whose initiatives have proved effective over time. For example, Schneider Electric has created the Schneider Electric Energy Access fund, one aspect of which is investment in structures focused on developing innovative solutions to energy access issues.

#### 2.2. Tailored funding solutions: the growth of impact investing

The increasingly-popular concept of Impact Investing refers to investment strategies that target not only profitability, but also - and simultaneously - social and environmental profitability and impact. This concept has emerged to describe the initiatives already undertaken by some investors, which although very different in nature (environment-focused or social-focused on opportunities in underprivileged areas of developed countries or poor countries), all seek to generate extra-financial value from their investment (Monitor Institute, 2009).

The interesting thing about this idea is its proposition of a single concept to describe inherently-disorganized emergent movements, where the act of conceptualization enables consistency and encourages convergence. These funds take a more intensive approach than socially responsible investment (SRI) funds, which are based essentially on a best-in-class approach that excludes those sectors seen as problematic. The emphasis here is no longer on 'doing no harm', but on aiming to maximize the social and/or environmental impact of financial investment.

The Impact Investing sector is a broad term that also includes the investment strategies of Foundations and 'traditional' investors wishing to take account of social or environmental impact factors. These funds are currently responding to demand by developing special expertise in particular sectors and/or regions of the world. Founded in 1994, E+Co concentrates on the business models of companies seeking to develop universal access to clean energy in emerging countries, whilst the Acumen Fund created in 2001 by Jacqueline Novogratz works on key sustainable development issues, such as access to water, energy, housing and healthcare. The Monitor Institute now makes a distinction between two major types of strategy - 'Financial First' and 'Impact First' - as a way of distinguishing between goal and constraint (2009). Typically, traditional financial institutions follow the first type of strategy as the basis for adopting the concept of social value creation, whilst those traditional development actors that seek to use financial markets as a tool for development tend to adopt the second type of strategy.

#### 2.3. Cooperative strategies involving public and non-profit actors

Lastly, it is important to stress that companies will not be able to act alone in connecting the fight against poverty with the need to protect the environment. The fact is that the private sector can no longer ignore existing provisions or take the place of locally-involved actors in addressing these issues: it is through partnership that the private sector will be best placed to contribute its added value.

In these cooperative strategies, the work done alongside non-profit organizations and public authorities would seem to be decisive. This often means overcoming the cultural barriers between organizations whose mindsets and operating methods are fundamentally different. But it is essential for companies to be able to benefit from the experience and expertise of professionals in social engineering and public policy.

Furthermore, poverty is not limited simply to a lack of financial resources, and access to essential goods and services at a better price will not in itself deliver a definitive response to poverty.

As Sen has demonstrated, poverty should not be confused with low income, but refers primarily to a 'loss of capacity'. Sen also reminds us that: "the aim of development is to expand the real freedoms that people enjoy" (Sen, 1999). Human development must therefore be understood as a process whose goal is to expand the choices of people and increase their capacity to be and to do. Far from eradicating financial poverty, the point of combating poverty is to put people at the centre of development. In other words, it means contributing in ways that enable development program beneficiaries to achieve their full potential, enjoy more choices and benefit from the freedom to live the lives they wish.

In the same way, relationships to the environment are very closely linked with local cultures. The need is therefore not only to create and distribute new goods, but also to

create new social and cultural links. It is from this viewpoint that the role of the private sector should be analyzed: is the company acting in good faith and does it have the ability to address the many different dimensions of poverty? It seems more reasonable to take the view that at the same time as offering well thought-out solutions to combat financial poverty, companies can also become involved in wider partnerships in order to contribute to bringing about social change.

Although many companies are committed to working alongside NGOs, there is still a lot of work to be done on partnerships involving local public authorities (Cholez et al, 2010).

Furthermore, the success of all strategies intended to combat poverty at the same time as protecting the environment relies on establishing a trust-based relationship with the people targeted by these initiatives. Building trust takes time, and that trust is often the privilege of non-profit organizations, which, regardless of form, have been operating at local level for many years.

There exists today an awareness of the ability of the private sector to reconcile the need to combat poverty with the need to protect the environment. This awareness can be seen in an increasing amount of research and the emergence of new forms of innovation, and is now finding its way into the practices of companies committed to bringing forward innovative economic models.

But this awareness is still too limited, and the very small number of 'exemplary' achievements bears witness to the practical difficulties involved in establishing both a real economic interest in taking action and effective methods of implementing a long-term financial framework.

The challenge now is therefore to move beyond 'anecdotes' to create a more coherent and far-reaching approach to these issues. Intellectual commitment is the first condition required for success in such a project.

#### ORGANIZERS

##### INSTITUT VEOLIA ENVIRONNEMENT

> Created in September 2001, the Veolia Environment Institute's main goal is to contribute to a fuller understanding of the transformations occurring in the field of the environment.

> Its actions aim at detecting implications of those environmental changes on public policy, private initiatives and society in general. The Institute relies on its Foresight Committee to guide its reflections thanks to the diversity of expertise of its 7 eminent members: Helene Ahrweiler, Harvey Fineberg, Pierre Marc Johnson, Philippe Kourilsky, Rajendra K. Pachauri, Mampela Ramphele and Amartya Sen.

> The Veolia Environment Institute promotes foresight reflection on subjects related to the environment in partnership with universities or research organizations in order to shed light on the important issues for the upcoming decades. These investigative efforts aim to contribute to public debate on an international scale.

> Its work relies on three kinds of activities: a research program, led in partnership with academic experts; a publication program based on two new publications: S.A.P.I.EN.S, a multidisciplinary scientific journal, and FACTS Reports dedicated to field actions. As a third initiative, it develops an international conference program.

> The Institute has a program for a series of Future Environmental Trends Conferences internationally. Jointly organized with academic partners, these events seek to create a forum for discussion and to raise awareness on the major themes defined by the Institute among university circles, institutional organisations and civil society.

##### AGENCE FRANCAISE DE DEVELOPPEMENT

> AFD, the Agence Française de Développement, is a public development finance institution that has worked to fight poverty and support economic growth in developing countries and the French Overseas Provinces for 70 years. AFD executes the French government's development aid policies.

> Through offices in more than fifty countries and nine French Overseas Provinces, AFD provides financing and support for projects that improve people's living conditions, promote economic growth and protect the planet: schooling, maternal healthcare, help for farmers and small business owners, clean water supply, tropical forest preservation, and fighting climate change, among other concerns.

> In 2010, AFD approved more than €6.8 billion for financing aid activities in developing countries and the French Overseas Provinces. The funds will help 13 million children go to school, improve drinking water access for 33 million people and provide €428 million in microloans benefiting more than 700,000 people. Energy efficiency projects financed by AFD in 2010 will save nearly 5 million tons of carbon dioxide emissions annually.

[www.afd.fr](http://www.afd.fr)

#### CONTRIBUTORS

##### CHAIR SOCIAL BUSINESS, ENTERPRISE AND POVERTY, HEC

The aim of the chair, launched in 2008 by HEC, with the support of Danone and Schneider Electric, is threefold:

- To educate the next generation of managers, in order for them to become more aware of societal challenges and aspire to be part of the solution.
- To develop quality research on strategic innovation in societal fields: academic research, applied research, and action research, writing case studies on themes involving social business and the ways in which business can contribute to alleviating poverty.
- To carry out action research on specific initiatives for a more inclusive economy in developed countries focusing on experimentation lead by the Action Tank Enterprise and Poverty.

[www.hec.edu](http://www.hec.edu)

##### INITIATIVE POUR LE DEVELOPPEMENT ET LA GOUVERNANCE MONDIALE (IDGM )

> In order to meet the challenges facing humankind, global governance now calls for a better understanding of the facts and a greater mobilisation of ideas. This dual objective was behind the creation of the Initiative for Development and Global Governance (IDGM in French).

> The aim of the IDGM is to provide France with an independent think tank at the interface between public and private decisionmakers and the academic world. Its main objectives are to observe and evaluate public policy and international cooperation mechanisms, and to organise and lead public debates and political discussions, all with the

aim of generating new ideas.

> Its creation has been supported by France and has received specific funding support from the AFD. The IDGM depends on two internationally known Institutions, whose missions are complementary, the Ferdi (Fondation pour les études et recherches sur le développement international) and the IDDRI (Institut du développement durable et des relations internationales).

## Institute for Agriculture and Trade Policy

### INSTITUTE FOR AGRICULTURE AND TRADE POLICY

Submission to the UNCSD Bureau as input to the Zero Draft Outcome Document for the UN Conference on Sustainable Development (Rio+20)

Submitted by the Institute for Agriculture and Trade Policy, USA and Endorsed by over forty Indian national and regional farmers organizations and other civil society organizations

#### Executive summary

1. Agriculture both contributes to and has the potential to help resolve the multiple crises the world faces today. As a sector that supports the livelihoods of the majority of the poor in the world, agriculture has the potential to address not only sustainable development but also lift many millions of people out of poverty. Affirming the inputs provided by hundreds of our ally organizations towards the outcome document, we support the call to locate agro-ecological practices and small farmers at the center of food production in the green economy. This would help us pay equal attention to all three pillars of sustainable development—economic, environmental, and social—in the context of agriculture.

2. Rio+20 must place realization of the right to water and the right to food at the center of national plans to build a green economy and any future global development framework. Towards this, the outcome document must make explicit references to these rights as it elaborates on the green economy.

3- Rio +20 must address the means to reduce food price volatility, including support for measures to prevent excessive speculation on commodity markets in agriculture and energy derivatives contracts. Rio+ should reduce ambitious targets for biofuels in global frameworks and national plans around the green economy.

4. Rio+20 must redirect investments towards the greener and more pro-poor options across key economic sectors and the outcome document must support a green economy that works for the poor.

5. Rio+20 must ensure that Precautionary Principle be applied to national and international green economy plans. Twenty years after the Rio Earth Summit, the planet is in a deeper environmental, energy and financial crisis. The period has also seen increasing political and social crisis in many regions. Several leaders have recognized that "business as usual is not an option".

We could not agree more, and we have options.

#### General Content

Expectations for the outcome of Rio+20: We expect a commitment to poverty eradication, investment in healthy, fair and sustainable food and agricultural systems; commitment to the realization of right to water and realization of right to food; re-affirmation of the principle 15 of agenda 21; commitment to support for measures to curb excessive speculation on commodity markets and reconsideration of ambitious targets for biofuels in the context of sustainable development.

#### Specific Elements of this submission:

Endorsing the objective of the conference, our submission focuses on the following sectoral priorities: food security, sustainable agriculture, water, biodiversity and climate change. In addition, we address the challenges and potential of the green economy in the context of sustainable development and poverty eradication.

With its focus on the green economy, Rio+20 attempts to address one of the negative consequences of the development path we have followed: environmental degradation. As a market based mechanism that helps address issues related to environmental crisis, it is believed that the green economy will help the world achieve sustainability.

This assumption ignores the role of global capital and finance in the continuation of social injustice and creation of the political crisis. A green economy divorced from social, political and financial concerns will not help address the multiple crises the world faces today.

In this brief submission we will look at these issues with a focus on the right to water and the right to food, as well as environmentally sustainable, economically viable, socio-economically just food and agricultural systems, with special attention to rights of women, indigenous groups and rural communities.

Recalling Resolution 64/236 that describes the focus of the Conference: The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development" we suggest the following:

1. Inclusion of agriculture in all its dimensions as a core issue at the UNCSD in Rio and subsequently in global policy and practice.

Agriculture sits squarely at the center of the challenges we face in the beginning of this century. Over the last 50 years many nation-states have made amazing progress towards achieving food security. Unprecedented levels of agricultural production ensure that globally we produce enough food to feed humanity. Yet, millions of households and close to a billion individuals remain food insecure. A still larger number, more than double, do not have access to water for meeting basic needs such as sanitation, an essential service by modern standards of development. Also, most of the increase in agricultural productivity has been at the cost of water pollution and depletion, land degradation, global warming and biodiversity loss.

It does not have to be this way. The right kind of agricultural and trade policies that support healthier food systems (and accompanying water governance) can not only help us meet challenges in realizing right to water and right to food, but can also ensure biodiversity protection, climate adaptation and emission mitigation.

We request that "Socially just, ecologically sustainable and economically viable agriculture [i.e. agriculture that ensures sustainable development] in the context of poverty eradication and the institutional framework for sustainable development" should be a major focus of this conference. This request accords with submissions made by over a hundred civil society organizations from around the world.

2. Inclusion of international human rights at the center of future global development frameworks and at the center of national plans around the green economy\_ We will focus on right to water and right to food in this submission, but also will refer to a few other rights.

#### A. Right to water

The global water crisis has become a powerful symbol of inequality in our world. Diarrhea caused by lack of clean drinking water and sanitation has killed more children than malaria, measles and HIV/ AIDS combined. 4 More people die as a result of polluted water than are killed by all forms of violence including wars. 5 Over 80 percent of people with unimproved drinking water and 70 percent of people without improved sanitation live in rural areas." Most of them live in developing countries and emerging economies.

Emphasizing the centrality of access to drinking water and sanitation UNSG's Advisory Board on Water and Sanitation (UNSGAB) calls for the incorporation of water and sanitation in the three pillars of sustainable development: "i). Social: [...] A healthy living environment, one that supports human dignity and is free of disease-transmitting agents and conditions, is impossible if open defecation is widely practiced. Access to safe, clean toilets brings dignity, equity and safety, particularly for women and girls. Toilets and safe water in schools increase attendance, particularly for adolescent girls. Without sanitation and clean water, sustainable development's social objectives remain unmet. 2). Economic: A growing body of empirical evidence shows that poor sanitation and a lack of clean water curbs economic growth. The economic objectives of sustainable development will be greatly advanced by the expansion of basic sanitation services.).

Environmental: Clearly, a healthy environment depends on sanitation. [...]."7 We endorse this call to incorporate right to water in the outcome document.

Recognizing the importance of sanitation to sustainable development, the World Summit on Sustainable Development agreed in 2002 to include sanitation in the list of targets to achieve Millennium Development Goal 7 on environmental sustainability. Later on, in November 2002 the Committee on Economic, Social and Cultural Rights adopted General Comment 15 on the right to water, which elaborated on the international obligations in relation to the right to water and sanitation!" In 2010 the "right to safe and clean drinking water and sanitation" was recognized by the UN General Assembly as "a human right essential to the full enjoyment of life and all other human rights—.

The creation of any future global development framework must build on this growing international recognition of the right to water and sanitation.

#### B. Right to food

According to the World Food Summit Plan of Action (1996), which took place four years after the Earth Summit in Rio, "Food Security exists when all people, at all times, have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life". This was followed in 1999 by the General Comment 12 on Right to Food, which elaborated on the international obligations in relation to the right to water. In November 2004, 187 Member States of the General Council of the FAO, adopted the Voluntary Guidelines to Support the Progressive Realization of the Right to Adequate Food in the Context of National Food Security."

Realization of the right to food remains a mirage, however. According to the U.N Food and Agriculture Organization, 925 million people in the world suffered from hunger (which is the world's leading health risk) in 2010." At the same time, as a result of unhealthy foods and diets 1.5 billion people were overweight and obese (making it the fifth leading risk for global deaths) in 2008.12 These contradictions are not only a powerful symbol of global inequality, but also indicative of the broken nature of our food and agricultural systems.

While the idea of the green economy seeks to address the question of resource efficiency in agriculture, it has not yet grappled with the challenges and contradictions of our current food and agricultural systems. In this context, the green economy can become more meaningful by emphasizing food sovereignty, which calls for an overall framework for "food and agricultural policies that put the right to sufficient, healthy and culturally appropriate food for all individuals, peoples and communities [...] at the center of food, agriculture, livestock and fisheries policies."" This concept, which has been endorsed by farm organizations around the world, values food providers, localizes food systems, and values the knowledge and skills of small-scale food providers. It works in harmony with nature through using smaller-scale, ecological forms of food provision. Social justice and ecological sensitivity are essential components in this framework.

The creation of any future global framework on agriculture and food systems must build on the international recognition of right to food and food sovereignty.

#### C. Inclusion of Rights of Women and Rights of Indigenous Peoples

The Special Rapporteur on the Right to Food saw a clear connection between access to water and the right to food. In his preliminary report to the UN General Assembly, in 2001, he pointed out that, "As a component of the right to food, access to safe, clean drinking water and basic irrigation water must be protected under the obligations to respect, protect and fulfill the right to food and through international cooperation." He elaborated: "everyone must have access to drinking water on equal terms and that irrigation water should also be accessible for poor peasants who depend on their land to feed themselves:

This focus on water for poor peasants is particularly relevant for farm women's food security. Women play major roles in food production, processing and preparation, and yet a majority of the food insecure are women. The future of agricultural and food systems has to be built on the firm foundation of women's empowerment for it to be sustainable and equitable. Also, as women form a large majority of world's hungry, ensuring the food security of all women requires recognizing women's rights as central to the green economy. The outcome document and national plans that deal with green economy must take cognizance of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), often described as an international bill of rights for women.

Similarly, the outcome document must place the implementation of UN Declaration on the Rights of Indigenous Peoples at the center of the green economy.' Across the world, indigenous communities and pastoralists are victims of discrimination, oppression and even expulsion from their home lands and alienation from their livelihoods. Rio+20 should recognize that sustainable development is possible only if the right to food and right to water obligations to these communities are met through the realization of Rights of Indigenous Peoples.

3. Address the means to reduce food price volatility, including support for measures to prevent excessive speculation on commodity markets and reduce ambitious targets for biofuels use

Almost 70 percent of the global poor reside in rural areas. In developed countries too, family farmers and rural inhabitants are forced to leave their communities in search of employment. In that context, investments in agriculture and food systems will provide livelihood options for people, allowing them the opportunity to stay in their communities, and meet their food security needs.

Proposals for valuing ecosystem services and incentivizing biodiversity protection offer projects for financial flows to rural areas. However, these opportunities also open up the potential for new forms of commodification of nature. In the past, commodification of nature (be it in the form of food, timber, metals or minerals) has usually resulted in the marginalization of rural communities. Most of the flow of wealth is away from the communities, leaving impoverished communities and devastated natural resources behind. Similar patterns of extractive exploitation have been the norm in international trade too, where countries dependent on exports of primary commodities reap few of the benefits of that production.

This extractive form of wealth accumulation has left the large majority of the world's people poorer. Deregulation of the financial sector has increased commodity speculation

and derivative trading, which has left those involved in primary production at the mercy of the vagaries of markets driven more by financial speculators than market fundamentals of supply and demand. A report issued in June 2011 by a UNCTAD on the growing influence of financial speculators on commodity markets, including agriculture prices, said: "The 'financialization' of commodity markets has changed trading behaviour and significantly affects the prices of such basic goods as staple foods."

Volatility has also been increased by new pressures on food stocks, among them rising demand for biofuels. The recent report on food price volatility by the High Level Panel of Experts explores this issue in detail. That panel, which presented its recommendations at the 17Lb Session of the Committee on Food Security, concluded that both subsidies and the ambitious targets for biofuel use set by the U.S. and European Union should be reconsidered.

While the environmental benefits of biofuels are questionable, biofuels development can contribute to improvements in rural livelihoods and farm prices, particularly in the U.S. and Europe, where corporate-driven agriculture policies have historically driven overproduction of commodities, resulting in prices for these crops often dropping below the cost of production. At the same time, profit demands by foreign biofuels investors have contributed to land grabs in developing countries. Subsidies to biofuel production should be immediately eliminated, with funding redirected to agro-ecological production systems that is environmentally and socially sound. Mandates and targets must be reduced based upon realistic and sustainable production levels that prioritize local and domestic food security needs.

Volatility could also be ameliorated by new initiatives to advance food reserves. The G20 agriculture and development ministers have endorsed a new initiative to test food reserves in West Africa. This experiment should be expanded, building on recent experiences with food reserves in other countries and regions.

#### 4. Redirect investments towards a green economy that works for the poor: Lessons from carbon markets

Every crisis is can be an opportunity for addressing the root causes: be it food crisis, financial crisis or climate crisis. Yet most often the responses tend to be transactional in nature; rarely transformational, and rarely help us move towards solving the crisis itself. The financial flows involved simply benefit global capital. The crisis in the environment (biodiversity, water quality, water availability) has given rise to plans around the green economy. Unless it is a green economy that works for the poor, some of these initiatives around offsets (such as biodiversity derivatives) could further marginalize them.

Any definition of the green economy should refrain from projects for environmental offsets, both because of questions around the environmental integrity of such credits and because of the well reported market integrity failures of carbon derivatives markets. For example, carbon offsets, often promoted as the preferred solution for climate change mitigation, attempts to compensate for the scientific uncertainties about carbon sequestration with aggressive accounting methodologies especially if one is to go by the example of the new pilot project to develop an offset market for soil carbon sequestration in Kenya. According to a recent study by IATP,

"The World Bank, through its BioCarbon Fund, is showcasing the Kenya Agricultural Carbon Project as an "early action" to demonstrate a "triple win" for mitigation, adaptation and food security for small-scale producers, while delivering carbon finance through the sale of credits in the carbon market. It claims that, The Kenya Agricultural Carbon Project is not only the first project that sells soil carbon credits in Africa, it is also paving the way for a new approach to carbon accounting methodologies." While the project will support improvements in agricultural practices that could -benefit local farmers, the carbon market approach is a very shaky foundation for climate finance. Nearly half of the monetary benefits from the proposed offset credits would be absorbed by project developers as "transaction costs," with miniscule returns to the farmers who would be implementing the project [emphasis added]."

An alternative approach should ensure that the funds for incentivizing ecosystem protection are generated through better regulation, and that financial flows would actually reach the communities in question, rather than being captured by carbon accountants. Investments in infrastructure development (including in transport, education and health, and those in developing viable livelihood options that are qualitatively at par with urban centers, as desired by these communities) are central to sustainable and equitable development, so that rural areas no longer continue to function as a colonies for meeting the resource needs of urban centers or wealth accumulation of middlemen and intermediaries.

The prosperity of the urban areas continues to be often at the cost of rural areas. The poverty of the urban centers is borne by the poor of the rural areas. The emphasis on the green economy, which has emerged in the context of environmental crisis, has the potential to either become yet another route for capital accumulation of the few, or, done right, it has the potential to charter a new path towards equitable development which puts rural areas and urban poor at the center of future development efforts.

Rio must commit public finances not only towards incentivizing environmental protection but also towards enhancing rural services delivery. We call on Rio+20 to ensure that the outcome document support a green economy that works for the poor.

In addition to the above,

we endorse the calls made by other civil society organizations, in asking Rio+20 to recognize the reformed UN Committee on World Food Security (CPS), as the primary mechanism with mandate for identifying current deficiencies and shortcomings that impede the implementation of existing plans and proposals on sustainable agriculture and food. We recommend that Rio+20 select for implementation policy options approved by more than 50 governments and outlined in the reports of International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD), within the mandate to develop a work plan for implementing the decisions of UNCSD 2012.

We also endorse the call by United Nations Development Programme (UNDP), to redirect investments toward the greener and more pro-poor options across key economic sectors. The submission elaborates on a green economy which works for the world's poor as one that would:

1. maintain growth while reducing greenhouse gas emissions in the economy as a whole, and promote job creation and other economic opportunities in key economic sectors that predominantly employ the poor
2. generate more public revenues to enable investment in environment-friendly quality services, to which the poor would have equitable access;
3. retain biodiversity and ecosystem services, while also maintaining the livelihoods of the poor and creating opportunities for local sustainable enterprises to thrive;
4. promote equitable access to energy and its efficient use;
5. build resilience to economic, social, environmental and other risks;
6. empower the poor and marginalized, including women and indigenous peoples, to play an active role in the investment decisions that have an effect on their well-being;
7. pursue pro-poor environmental fiscal and financial tools, including financing mechanisms that benefit local communities.

We wish to conclude by drawing attention to some principles that we must revisit and inform Rio+20.

Some of the assumptions we made regarding our ability to manage environmental risks related to economic growth have proven to be wrong. But some of the key principles that were adopted during the Earth Summit, such as the Precautionary Principle, must be reaffirmed in Rio+20 as central to future global development framework." Central to the precautionary principle is the element of anticipation; other important elements include - plausible threats of harm, lack of scientific certainty, as well as precautionary

actions which take a long-term approach and which might anticipate changes on the basis of current scientific knowledge. An example of this is the civil society call to include, technology assessment based on the precautionary principle with full civil society participation to assess the social and environmental impacts, on the agenda for Rio+20.

Most importantly Rio+20 must recognize that we have an obligation to prevent harm to the commons that we hold in trust for future generations and that governments, in consultation with communities have a key role to play in protecting the commons, and in doing this they should be guided by ethics rather than by profits.

## Institute for Essential Services Reform (IESR)

INSTITUTE FOR ESSENTIAL SERVICES REFORM position for UNCSD (Rio+200) on Combating Energy Poverty as a Mean to Improve Green Economy in Order to Alleviate Poverty

Access to energy is instrumental in achieving poverty alleviation and sustainable growth. Lack of access to modern clean energy is serious hindrance to well being, as well as social and economic development, and must be overcome in order to achieve Millennium Development Goals (MDGs). Access to modern form of energy is essential to the provision of clean water, sanitation and health care, and can contribute to the development through the provision of lightning, heating, cooking, telecommunication and transport services. Furthermore, without meeting the required energy, both in terms of quality and quantity, it is impossible for one to achieve their sustainability; which leads to unsustainable development.

Billions of people globally are living in energy poverty condition. Currently over 1.4 billion people are without access to electricity, and 2.7 billion people are heavily reliant on traditional biomass. Mostly of those are living in sub-Saharan Africa and developing Asia, and about 85% are living in the rural area. According to IEA (2030), these figures will not change significantly in 2030, and leave about 15% of population still without access to the electricity, and even more with lack of clean cooking fuels. Failure to act significantly, will hamper many communities and countries, not only to growth in sustainable pathways, but also will grow the inequalities between developed and developing countries, as well as among communities within the countries.

Henceforth, the occasion of Rio+20 will be an opportunity for:

- Renewing and increasing the political commitments to combat energy poverty by supporting universal access to clean energy. Commitment for energy provision, not only from the demand side, but also from the supply side.
- To promote actions and accountability in areas such as the green economy and post-MDG framework which are inseparable from the issue of energy.
- To ensure that fairness and equity, to be the center of any sustainable development means.

To increase the political commitments on energy provision

At Rio+20, there should be an increasing of political commitments of governments, with supports from international agencies and civil society, which will result in implementation of energy provision, both in the demand side and also in the supply side. There are several elements that should be strengthened, in terms of future commitments in the energy provisions.

- Assessing the 20 years of progress since Rio 1992, on the access to modern energy for 20 years, then to raise the ambition to increase the universal access to modern energy services taking the account of equity principle.
- Needs to make bold commitment on fossil fuel subsidies reform. As all nations have been highly depending on fossil fuel, and fossil fuel subsidies, in many forms have consumed up public funding and have made renewable energy less competitive.

Without alternative energy form widely available, and lower cost for fossil fuel, have created more dependency on the fossil fuels. All countries should commit themselves to phase out fossil fuel subsidies gradually, and shifted it to all means that will enforce the access to energy for all through better policy tools and mechanism that help the poor for accessing modern clean energy services.

- To increase the access to modern energy, all country members should commit to transfer of technology, and formulate the energy-financing scheme that carries the principle of equity.

On Green Economy

At Rio+20, all country members should come up with an agreed understanding of green economy since there should not be a one-size-fits-all definition on green economy. The understanding of green economy should accommodate the level of development, equity and also common but differentiated responsibilities principles. There are

several elements that should be incorporated in the understanding of green economy. Green economy should be an economy that will increase the number of jobs, restoring the quality of environment, efficient use of natural resources capital, improving the quality of life of human being.

The green economy that is formulated in Rio+20 should consist of:

Commit to full adoption of clean energy

Clean energy is the key element to develop one's economy. A clear definition of clean energy should also be agreed at Rio+20 Summit which should not consist the burning of coal, nuclear power plant, or any other facilities where environment and social impacts are disturbed as the result.

Renewable energy facilities should be widely used throughout the member countries. At the same time, energy efficient economy should also be developed accordingly. Developed countries should provide assistances in both knowledge and funding to developing countries in making transition to low carbon energy pathways. Ensuring the Access to Energy

The access to energy should also be highlighted in the context of fair green economy. Access to energy should address the need to energy provision that is affordable, ensuring its availability, transparency in technology acceptability, and also to improve the accessibility. In this regards, access to information should also be improved in order to ensure that all the above criteria are met.

Capacity building and access to information should be embedded into the issue of ensuring the access to energy. Both are highly important in order to enhance the access to energy. Without capacity building and also proper access to information, the improvement of access to energy will not be sustained.

Phasing Out the Fossil Fuel Subsidies

Fossil fuel subsidies should be phased out. According to IEA (2011), global fossil fuel subsidies reached more than \$ 409 billion annually in 2010, increased from \$ 312 billion in 2009. Without meaningful reform, this subsidy is estimated to reach \$ 660 billion in 2020 or 00,7 percent of global gross domestic product.

Not only the subsidies have increased its favorable option compare to renewable energy, but also fossil fuel subsidies will lead to more dependency to fossil fuel and accelerate climate change. There should be an agreement to shift the fossil fuel subsidies to further development and deployment of renewable energy to combat global warming, and at the same time ensuring the equitable access to energy services for all.

Energy Financing and Technology Transfer

In order to increase the access to energy, financing for energy should also be established. IEA estimated that to provide universal access to modern energy services in 2030 requires \$ 776 billion additional financing or about \$ 36 billion investment annually. Strengthening political commitment for supporting universal energy services in Rio+20 should include commitment to generate additional investment from public sources.

Furthermore, Rio+20 should come up with the framework on scheme for alternative financing mechanism for supporting universal access to energy which shall be accessed by all countries. This funding must be governed by the principle of transparency, accountability, and practicability, with proper monitoring and evaluation mechanism in place.

Given that the biggest challenge for energy provision is in the rural areas, off-grid and decentralized energy system based on renewable energy technologies will be suitable for this purpose. However, cost for renewable energy systems applied for rural electrification are considered expensive, therefore limits the ability of most developing countries to deploy renewable energy extensively to meet their rural energy provision target.

Therefore, in addition to the availability of finance, developing countries through various channel must assist developing countries with the state-of-art renewable energy technology with higher efficiency, and cost effective, through a global technology transfer mechanism program. This program must come with the objective to enable developing countries to develop and manufacture renewable energy technology such as: low cost photovoltaic (PV) technology, low cost solar thermal, high efficient micro and mini-hydro, advance improved cook-stove technology, wind power, and biomass technologies.

## EXECUTIVE SUMMARY

### Vision Statement

IGES maintains that sustainable development can only be achieved by addressing the three interdependent dimensions of economy, society, and environment in an integrated manner. A Green Economy, supported by a strengthened Institutional Framework for Sustainable Development is based on safe, secure, and low-carbon energy, with integrated climate change and development priorities taking into account resilience to natural and manmade hazards.

Simultaneously, over the next few decades, international society will need to focus on achieving global goals that address these dimensions:

- (1) Eradicate poverty and meet the basic human needs of all people including safe food, safe drinking water, adequate sanitation, health care, and universal primary education;
- (2) Reorient the world's economic system towards a low-carbon approach, sustainable resource use, and sustainable use of ecosystem services; and
- (3) Secure environmental integrity, particularly through dealing with climate change and biodiversity.

In the Asia-Pacific region, these challenges have become more significant due to population growth, industrialisation, urbanisation, and economic growth based on unsustainable consumption and production patterns. The IGES vision foresees the emergence of interlinked global governance institutions and resilient social and economic systems based on the principles of sustainable development.

IGES believes that one of the key concepts underpinning integration of the three dimensions of sustainable development is resilience, and it should be revisited by all countries. The international community has been reminded by the recent disaster in Japan of the severe consequences of unchecked vulnerabilities, but also of the value of resilience to minimize the impact of disasters and hasten recovery. Greater emphasis in policy and research should be given to resilience, vulnerability and risk management in sustainable development.

To achieve such a resilient and sustainable society in the long-term, discussions should begin in the Rio+20 process to develop Sustainable Development Goals (SDGs) aimed at reducing absolute and relative poverty, changing consumption patterns, securing sustainable energy systems (including renewable energy targets), and increasing resilience.

### Resilient and Sustainable Society

A resilient society has the adaptive capacity and robustness to handle shocks while maintaining functionality, and over time, grow stronger. Sudden extreme events can damage past achievements and delay progress on sustainable development. The world's poor are disproportionately exposed to risk, but vulnerability is not necessarily mitigated simply through economic development or increased income. Globalization, climate change, and unsustainable development paths will contribute to increasingly frequent extreme

vii

The IGES Proposal for Rio+20  
Version 1.0

events with global implications such as natural disasters and economic crises. The key components for a sustainable and resilient society recommended by IGES include:

- (1) Multi-stakeholder/multi-level governance with better participation and a pro-poor and vulnerable approach for agile, flexible and effective social/political support through better coordination and utilization of local social ties and knowledge;
- (2) Financial schemes for immediate and medium-term recovery which supports households and small-medium business; and
- (3) Decentralized and diversified infrastructure for energy, water, transportation etc. with

balanced management of supply/demand sides.

The extent to which these components are adopted and integrated in each country are determined by the local context and through the development of enabling conditions.

#### Green Economy in the Context of Sustainable Development and Poverty Eradication

IGES recognises that a key challenge in pursuit of sustainable development is the social, economic and environmental vulnerability caused by one-sided pursuit of economic growth and efficiency. An emerging paradigm shift to overcome these key challenges is the concept of a green economy supported by investment, job creation, international policy coordination, and the precautionary approach. Towards this goal, IGES proposes the following.

##### (1) For a low-carbon economy with a resilient, secure energy system

ĩ,Ÿ Investing in renewable energy, storage and a smart grid is vital to reducing vulnerability by enhancing a decentralised electricity supply, which would secure a backup system during a disaster, and by enhancing demand-side management. Governments should promote this trend by introducing incentives such as feed-in-tariffs and phase out of fossil fuel subsidies.

##### (2) For sustainable consumption and production

ĩ,Ÿ Policy for requiring producers to internalise the costs of recycling and other actions for reducing resource consumption, e.g. extended producer responsibility (EPR) and green tax, as well as for making environmental impacts visible to consumers, e.g. green labelling, must be introduced and supported by increased efforts on education, training and skills enhancement. The effectiveness of these interventions depends on environmental awareness of consumers as well as ability of producers to improve product design and production processes.

ĩ,Ÿ A phased approach to introduce these policies taking into account the developmental stages of implementing countries along with international policy cooperation will be most effective.

ĩ,Ÿ An international fund for sustainable resource management should be established.

##### (3) For sustainable use of ecosystem services

ĩ,Ÿ Wide application of payment for ecosystem services (PES) will contribute to appropriate pricing and sustainable use of ecosystem services in the context of poverty eradication. To promote this, accounting systems should incorporate the

viii

The IGES Proposal for Rio+20  
Version 1.0

economic benefits of ecosystem services from project level to national accounts.

ĩ,Ÿ Current practice of pricing ecosystem services based on our willingness-to-pay does not necessarily promise sustainable use of ecosystems. To overcome this limitation, the price of ecosystem services can be determined such that policies or actions to ensure sustainable use of ecosystem services would improve social welfare.

#### Institutional Framework for Sustainable Development

As the challenges to sustainable development have outgrown existing institutional capacities, it is now time to update the institutional framework for sustainable development (IFSD).

IGES's vision on the key principles and directions for IFSD is that it should include: multilevel governance and participation; integration and mainstreaming among the three dimensions of sustainable development; the subsidiarity principle; and strengthening environmental governance, because environment is the foundation for all other human and economic activity. IGES believes that fundamental reform of IFSD and international environmental governance (IEG) should be undertaken with a graduated and phased approach. Each sequence will provide necessary momentum for subsequent steps.

For the short-to-medium term, IGES encourages governments to support the creation of a Sustainable Development Council to better coordinate and oversee budgeting of all UN programmes and agencies. IGES also recommends appointing a High Commissioner for SD.

Similarly, at the national level, SD concerns should receive greater attention and be harmonized and mainstreamed into sectoral work programmes through enhanced national coordination.

For IEG, UNEP reform should start with universal membership of its Governing Council to enhance legitimacy of IEG and eliminate the time-consuming elections of representatives to the GC. Subsequently, UNEP should be upgraded to a specialized agency, with a decision making mandate and legal independence. In the longer term, IGES suggests the strengthening of regional environmental governance through, for example, formation of a regional environmental hub to be developed in the long run into an Asian Environmental Organization, similar to regional cooperation frameworks in other regions.

#### Conclusion

IGES foresees the emergence of interlinked global governance institutions and resilient social and economic systems based on the principles of sustainable development. The Green Economy is an important interim milestone in this vision, in particular for poverty eradication and as a step towards sustainable consumption and production. To support this transition, a reinforced Institutional Framework for Sustainable Development (IFSD) is a necessary condition, in which multi-level and multi-stakeholder governance, as well as equity and social inclusiveness, are crucial.

ix

The IGES Proposal for Rio+20  
Version 1.0

#### 1. Introduction

The Institute for Global Environmental Strategies (IGES) 1 proposes the following key messages and recommendations on the two themes of Rio+20, namely Green Economy in the Context of Sustainable Development and Poverty Eradication and the Institutional Framework for Sustainable Development (IFSD) and on the response to the triple disaster in Japan. Each section incorporates answers to the questions raised by UNDESA's Guidance Note, including the expectations for the outcomes of Rio+20 and views on existing concrete and new proposals, by considering forward-looking perspectives on the way forward post-Rio+20.

##### 1.1. Vision Statement

IGES maintains that sustainable development can only be achieved by addressing the three interdependent dimensions of economy, society, and environment in an integrated manner. Simultaneously, over the next few decades, international society will be focusing on global goals that address these dimensions: (1) eradicate poverty and meet the basic human needs of all people including safe food and drinking water, adequate sanitation, health care, and universal primary education; (2) reorient the world's economic system towards a low-carbon approach, sustainable resource use, and sustainable use of ecosystem services; and (3) secure environmental integrity, particularly through dealing with climate change and biodiversity. In the Asia-Pacific region, these challenges have become more significant due to population growth, industrialisation, urbanisation, and economic growth based on unsustainable consumption and production patterns.

Over the years, gaps in interests and priorities within and among countries have hindered international cooperation for sustainable development. However, the international community has been reminded by the recent Great East Japan Earthquake and the subsequent tsunami and the nuclear accident of the severe consequences associated with modern development patterns. Japan may have not paid sufficient attention to vulnerability, rather, it may have too strongly pursued economic development to the detriment of social and environmental risks, thereby undermining the resilience of society to manmade and natural hazards—all with tremendous economic, social and environmental costs. One of the key concepts underpinning integration of the three dimensions of sustainable development is "resilience," which should be revisited by all countries.

The IGES vision foresees the emergence of interlinked global governance institutions and resilient social and economic systems based on the principles of sustainable development. The Green Economy is an important interim milestone in this vision towards sustainable development. To support this transition, a reinforced IFSD is a necessary condition, in which multi-level and multi-stakeholder governance, as well as equity and social inclusiveness, are crucial. A Green Economy supported by a strengthened IFSD is based on safe, secure, and low-carbon energy, with integrated climate change and development priorities taking into account natural and manmade hazards.

1

IGES is an international research institute conducting practical and innovative research for realising sustainable development with a special focus on the Asia-Pacific region.

1

The IGES Proposal for Rio+20  
Version 1.0

To achieve such a resilient and sustainable society in the long-term, discussions should begin in the Rio+20 process to develop sustainable development goals (SDGs). Similar to the millennium development goals (MDGs), potential SDGs may include reducing absolute and relative poverty, changing consumption patterns, and restructuring energy systems including renewable energy targets. Indicators for the carrying capacity and boundaries of natural systems could provide an early warning system for human activities that potentially exceed thresholds of the planet's life support systems. Strengthening IFSD on issues such as climate change mitigation and adaptation, biodiversity and forests, oceans and water resources, and food security among other global issues, could be a solid foundation for goal setting in order to achieve sustainable development beyond Rio+20. This may require streamlining and harmonisation of multilateral environment agreements, with more quantitative targets to enable progress to be more accurately measured than is currently possible.

The following sections of this proposal introduce IGES views on (i) Resilient and Sustainable Society, (ii) Green Economy, and (iii) IFSD to contribute to effective policy formulation for sustainable development beyond Rio+20.

Version 1.0

## 2. Resilient and Sustainable Society

### 2.0. Background

To attain sustainable development, it is essential to understand the impacts of human activities on the environment and the environment's limited ability to recover from these impacts and support continued growth. However, in reality, society, the economy, and the environment are exposed to the devastating impacts of unforeseen events such as natural, social, and economic disasters. Natural hazards such as earthquakes, volcanic eruptions, and hurricanes occur every year. Climate-related natural hazards such as extreme floods and droughts are predicted to increase in frequency and intensity, in part due to the effects of climate change exacerbated by increasing levels of greenhouse gas (GHG) emissions from human activities. Social, cultural, and economic events also trigger disruptive clashes such as conflicts and economic crises. To make matters worse, these sudden, extreme events can quickly erase past achievements and delay progress towards sustainable development.

Loosely defined, resilience is the capacity of a system to be it an individual, a forest, a city, or an economy to deal with change and continue to develop. It is both about withstanding shocks and disturbances (like climate change or financial crisis) and using such events to catalyze renewal, novelty, and innovation. (Folke, 2009)

A resilient society has the adaptive capacity and robustness to handle shocks while maintaining functionality, and over time, grow stronger. Japan has developed resilient social systems and invested heavily in disaster management, but the impacts of the triple disaster on March 11, 2011 showed a continuing vulnerability to such disasters. Globalisation, climate change, and unsustainable development paths will, inter alia, contribute to the increasing occurrence of extreme events with global implications, such as natural disasters and economic crises. Thus, greater emphasis in policy and research should be allocated to the relationship between resilience and vulnerability in sustainable development.

Figure 2-1 Sustainable development and resilience

3

The IGES Proposal for Rio+20

Version 1.0

## 2.1. Key Challenges

Japan is one of the few countries in the world with sophisticated disaster management policies and practices and has played an important role in establishing an international cooperation framework for disaster risk reduction by hosting two world conferences on natural disasters (Yokohama, May 1994 and Kobe, January 2005). In Kobe at the World Conference on Disaster Reduction in 2005, Japan contributed to the development of the Hyogo Framework for Action (HFA) with priorities for action expected to result in “the substantial reduction of disaster losses, in lives and in the social, economic and environmental assets of communities and countries” (UNISDR, 2007).<sup>2</sup>

However, despite Japan’s excellent early warning system on extreme weather, the disasters in the northeast of Japan on March 11, 2011 revealed the vulnerability of Japan’s highly centralised socio-economic and political systems. The earthquake and tsunami affected a broad area and resulted in widespread damage, including a major accident at the Fukushima Daiichi Nuclear Power Plant which has triggered a persisting crisis.

As the disasters unfolded, it became immediately apparent that emergency and relief operations would be needed on a massive scale; but there were frustrating delays, amongst other factors, due partly to the time consuming process of decision making within the central government, and to damage to the key functions of local governments.

Japan has also suffered massive damage to key economic activities as a result of the disasters. Factories in the area producing essential components for automobiles and electric appliances were demolished. This resulted in stoppages in the automotive and consumer-electronics industry in the eastern part of Japan and shortages around the world for weeks after, which highlighted the short-term vulnerability of global supply chains and “just-in-time” manufacturing systems. The power shortages caused subsequent to the nuclear accident led small and medium enterprises and households to dramatically reduce energy consumption. The radioactive materials leaked from the nuclear power plant resulted in heavy damage to the local agriculture and fishing industries, not to mention the impact on domestic tourism and exports.

These damages represented significant obstacles to recovery and reconstruction of society and the local economy. Moreover, due to the damage and subsequent reconstruction, earlier progress to protect the environment and develop a sustainable society and economy are also at risk. For instance, radioactive contamination of farmland, water resources, and fishing areas impose a heavy burden on the government and residents in terms of livelihood and safety. The disposal of waste material including those contaminated by nuclear radiation and the rebuilding of homes and infrastructure will also have substantial environmental implications. To make up for the power deficit due to the stoppage of nuclear plant operations throughout the country, conventional coal power plants have resumed operations, which is making it more difficult for Japan to reduce GHG emissions in accordance with international agreements.

2

The HFA, based in part on Japan’s experience in the Hanshin-Awaji Earthquake in 1995, was the first document of its type on disaster risk reduction developed and agreed upon internationally.

3

Major damages include the loss of about 20,000 lives, thousands of residences, key production bases and sources of livelihood, and damage to supply chain linkages.

4

The IGES Proposal for Rio+20

Version 1.0

As reported in the International Disaster Database EM-DAT, maintained by the Centre for Research on the Epidemiology of Disasters (CRED), global damages caused by natural disasters are on an upward trend. Asia is particularly vulnerable. From 2000-2009, almost

85% of global deaths from natural disasters occurred in the region (UNISDR, 2010). The trends are set to continue mainly due to unplanned urbanisation, environmental degradation and climate change.

In order to pursue sustainable development in a world repeatedly hit by such crises and disasters, including those related to climate change, IGES proposes that national governments and international society draw lessons from the challenges that Japanese society is facing following these disasters. The following issues are not only important with regard to disaster responses, but also for associated issues which require comprehensive action, such as climate change adaptation.

## 2.2. Key Approaches/Principles

Achieving a sustainable and disaster resilient society requires multi-level and multi-stakeholder adaptive governance, protection of vulnerable people, financial schemes to insure against and mitigate natural disasters, and decentralised and diversified infrastructure for energy, water, and transportation suitable to the local conditions.

Figure 2-2 Key directions and principles

### 2.2.1. Governance for a resilient and sustainable society

#### Multi-stakeholder collaboration

In order to build a resilient society, a multi-level governance scheme needs to be developed in which each stakeholder must conduct complementary actions which can be delivered most efficiently (WCDDR, 2005; Leighton et al., 2011). A flexible system of collaboration among various national and local governments and communities works more effectively than simple systems, such as an independent, centralised system or decentralised systems with no internal collaboration.

Multi-stakeholder collaborative approaches should be incorporated into economic and social development planning, environmental policies, and disaster management plans. Neither top-down nor bottom-up approaches alone are sufficient in dealing with major natural

5

The IGES Proposal for Rio+20

Version 1.0

disasters; rather, there is a need for a balanced and convergent approach. Policy frameworks have come under scrutiny in light of the increasing number and intensity of climate-related disasters, and often conflicting actions by different ministries responsible for climate change and disaster risk reduction indicate the importance of horizontal cooperation. Resilient societies should build upon cooperation among local municipalities, as well as between municipalities, NGOs and private companies. A challenging task is to aid the progress of sustainable relief aid from these stakeholders, which requires that national governments create an enabling environment to facilitate sustained voluntary relief from different groups of stakeholders. It is also critical to establish aid and volunteer coordination mechanisms for the early stages of a disaster. Long-term partnerships, twinning, and pairing between local governments, schools, a wide range of experts, and business sectors have proven to be useful in responding to disasters. Important lessons can be learned through international cooperation and capacity development where countries share their experiences and best practices.

#### Public participation

Characteristics of each local community and government, such as geography and industrial and population structure, vary by region and by the type of disaster. Thus, there is a need to respect such differences in planning and implementing disaster management, mitigation measures, disaster relief aid, and reconstruction policies. On this account, it is vital to encourage public participation in disaster management policies as well as overall socio-economic development (Tobin, 1999; Godschalk et al., 2003; Shaw & Goda, 2004; Palen et al., 2007), particularly for two reasons. First, the local community may often have greater in-depth knowledge of the local environment and society than other stakeholders. Their collective historical knowledge is vital for disaster prevention and during the recovery stage. Second, reliable and consistent information sharing and crisis management is vital to

strengthen people's awareness, preparedness, and cooperation among governments at all levels as well as local communities. Public participation is a key element to make relief aid and rehabilitation sustainable, in a similar fashion, it is necessary to point out that it is to support the self-reliance of the disaster victims, not to obtrude assistance" (Tama, 2011). The Japanese experiences in disaster relief and recovery well illustrate this point.

6

The IGES Proposal for Rio+20  
Version 1.0

For emergency rescue activities, the first few days following a disaster are absolutely critical. Thus, a strong community can better manage rescue efforts immediately following a disaster using their collective knowledge of the area and local society, as well as their well-developed lines of communication with different stakeholders. However, if the affected area is too broad, communities experience difficulty in providing support to each other. In this regard, inter-community and inter-municipality relief aid as elaborated by Box 2-1 below is considered to be an effective solution for larger areas. When organising relief in the aftermath of the Sichuan earthquake, the Chinese central government paired disaster affected communities with communities in unaffected areas (UNCRD, 2009).

Box 2-1 Case study: Inter-community/inter-municipality relief in Japan

The value of inter-community support during the relief and recovery stage has been observed in the aftermath of the earthquake/tsunami as well as disasters in other countries. As national and sub-national governments must cover all areas directly impacted by the disaster and because of their internal rigidities, they have often found it difficult to supply timely relief on a priority basis. Community-to-community relief has been observed as more flexible than the vertical relief channel of national government to local community.

Tono City, located in Iwate Prefecture, where the impacts of the earthquake and tsunami were particularly severe, escaped relatively unscathed and acted as a base for the relief supply activities of NGOs. An advantage of this inter-community aid was Tono City's proximity to the devastated areas, which facilitated information collection and logistics. This is a somewhat unusual example as in a widely damaged area it is often difficult to find less-affected communities that can extend assistance. Communities further removed from the disaster affected areas can also provide important support, however. Sugunami Ward in Tokyo and the Union of Kansai Governments (UKG) are good examples. Sugunami Ward and other cities have a long shared history with Minami Souma Cho, one of the areas affected by radiation from the Fukushima Daiichi Nuclear Power Plant, as sister cities. Sugunami Ward used its inter-municipality network to provide relief assistance to Minami Souma Cho, while UKG sent water and sewerage technical teams to the area.

In Kurihara City, which suffered from the Iwate-Miyagi Nairiku Earthquake three years ago, the city focused on tightening neighbourhood relations through jichikai (local neighbourhood community associations), in which every household takes on a particular role in the community. After the disasters, the Kurihara City officials could easily assess the level of damage within a few days, thanks to the jichikai. Since then, Kurihara City has become a centre of inter-municipality relief aid, especially for neighbouring towns and cities along the coastal area. Kurihara learned from its past experiences and strengthened information technologies in conjunction with Keio University. The technologies significantly helped open up communication with the most affected areas and facilitated estimates of the demand for different levels of assistance in the area. Kurihara's autonomous relief is based upon the city's disaster resilient mitigation and lessons from past events. (Scheyvens et al., 2011)

In Japan, inter-community relief gained popularity after the Hanshin earthquake in 1995. After the triple disaster in March 2011, relief was provided by various communities and municipalities, from both inside and outside the disaster affected areas. Matching affected and unaffected cities to ensure that the relief provided is timely and based on actual needs can be challenging immediately after a major disaster. In particular in disaster-prone areas having pre-established sister city relationships would facilitate this process by making use of existing networks and relationships for relief and rebuilding. Further thought is now required on how governments can encourage and finance inter-community/inter-municipality

7

The IGES Proposal for Rio+20  
Version 1.0

relationships as part of the process to build more effective channels to provide relief in the aftermath of disasters.

## Pro-poor and vulnerable approach

A pro-poor approach has been recognised as vital to the achievement of sustainable development (UNDP, 1997; United Nations, 2000; World Bank, 2001) and to reducing vulnerability to natural disasters (OECD, 2009; World Bank, 2011). In a disaster, both rich and poor alike are affected, however as history has shown, it is the poor who are disproportionately affected and the least resilient. This is not simply because of a lack of finances or other resources but due to the way socio-political systems influence how hazards affect different social groups. Reducing vulnerability to hazards requires an approach that is based on an integrated assessment of social, economic, environmental and geographical vulnerability factors as these are the factors which affect vulnerability and determine if hazards will become disasters. This type of integrated vulnerability assessment is valid for both developed and developing countries. After a disaster occurs and after the emergency relief phase has ended and the community shifts to rebuilding, governments, NGOs, and the private sector need to closely cooperate and coordinate so as to ensure that all receive the necessary level of support and are not further adversely affected as a result of personal conditions such as nationality, family structure, or language ability.

## 2.2.2 Financial schemes for risk mitigation and smooth recovery

As time passes, the focus of disaster reconstruction moves from life saving activities and distribution of aid supply to revitalisation of livelihoods and local economic activities. When discussing “resilience” in the case of extreme disasters, financial support for reconstruction is crucial especially in the intermediate to long run (Cummins and Weiss, 2009). Considering the impacts of natural disasters on economic activities, the country’s fiscal balance may be under considerable strain. Consequently, development of financial schemes to alleviate risks and stimulate post disaster economic recovery is an important point that must be addressed.

Damage to public facilities and infrastructure causes considerable financial strain; nonetheless, the impact of the disaster also requires quick and appropriate financial support to be provided to local businesses and livelihoods. Coordination among different ministries and other stakeholders to deliver financial support for those affected is certainly needed. Consequently, a significant challenge is to mobilise sufficient finances to satisfy the monetary demands needed to revamp the economy and livelihoods of those in the affected areas (Carpenter, 2010).

The establishment of a disaster reconstruction fund is one example of a public finance scheme for disaster recovery. Exemplary cases include the reconstruction fund for the earthquake in Taiwan in 1999, as well as the Hanshin-Awaji reconstruction fund in Japan in 1995.

After experiencing the Great Hanshin Earthquake in 1995, Japanese government established an Act Concerning Support for Reconstructing Livelihood of Disaster (Cabinet Office, Government of Japan, 2011), which generated a fund to assist financial rehabilitation of business and people’s livelihoods. For this fund, Japan’s national government promises 50% of financial support on the budget of the fund. Nonetheless, since the fund is organized nationwide, it is still necessary to meet people’s monetary needs in a timely manner.

8

The IGES Proposal for Rio+20  
Version 1.0

Consequently, after the Great East Japan Earthquake, new funds were created by local governments, NGOs, private companies, and local stakeholders to provide financial support for designated people and business on time. For economic recovery, it is crucial to have start-up cost for business equipment, raw materials, facilities, and labour. It is important to provide such financial support quickly, since the community needs to be self-reliant, otherwise the community will lose the opportunity for self-sustaining recovery.

Another scheme is Alternative Risk Transfer for disaster risks utilising the financial market, such as insurance linked securities (catastrophe bonds) and weather index derivatives. These approaches are often discussed as potential responses to climate change adaptation. The Caribbean Catastrophic Risk Insurance Facility (CCRIF) for natural disasters is a successful example. The Facility plays a significant role to provide timely financial support to businesses and communities since the CCRIF offers an efficient solution to the short-term liquidity gap faced by CARICOM governments in the aftermath of a major hurricane or earthquake (World Bank, 2007). It is important for policy makers to use these schemes to reflect social needs and support individuals and small businesses. The availability of financial support in the intermediate/long run is necessary for planning disaster resilience and building a pro-vulnerable society.

For the local businesses in affected areas, quick and fair distribution of relief funds is crucial;

nonetheless, it is frequently observed that people in need do not receive financial support in a timely manner. Consequently, micro-finance schemes are often developed for local businesses and industries. The growing number of “micro funds” meets the monetary demands of local businesses and significantly supports the rebuilding of the local economy and livelihoods in the months and years after devastating events.

### 2.3. Decentralised and diversified infrastructure

Decentralised and diversified infrastructure is characteristic of an economy that is able to mitigate the impact of disasters and quickly spring back to normalcy after a major crisis. In Japan, large scale and regionally centralised electric supply systems, and the tightly integrated structure of manufacturing supply chains, which were considered most effective economically, ended up being particularly vulnerable to disruptions caused by the disaster. Since being highly dependent upon a single energy system discriminates against alternative energy supply, it means that “society excludes the backup system” (Niitsuma, 2011).

For an economy to be resilient, there must be integration of continuity planning into business practices, building in a certain amount of redundancy, making sure that various scenarios for disaster losses have been considered, and fully understanding the residual risks and underwriting them with relevant insurance policies.

#### Safe, secure, and green energy systems

An island country having no significant indigenous fossil fuel resources, Japan finds it difficult to meet its enormous domestic energy demand without a stable, reliable and affordable fuel supply from overseas sources. This may be one of the major reasons for the country’s continued reliance on and promotion of nuclear energy programmes. However, the accident at the Fukushima nuclear power plant revealed that the risks related to any nuclear accident are enormous in terms of geographical expanse, tenure of impacts and array of damage. Thus, faced with huge energy demands, uncertainty surrounding the safety of nuclear

9

The IGES Proposal for Rio+20  
Version 1.0

energy and climate change implications of increasing use of fossil fuels, Japan is now at a crossroads trying to figure out how to balance energy demand and supply and which direction to take to secure future energy supply for the country. Japan now needs to come up with much enhanced demand-side management in the short to medium-term and a new long-term supply strategy that will be sustainable and acceptable from an economic, environmental and social perspective.

IGES’s research on post-disaster impacts to Japan’s energy policy aims at exploring potential policy options for filling gaps created by the nuclear power plant accident with a mix of renewable sources, advanced clean energy technologies and intensive energy demand-side measures. Scenario assessment suggests that Japan may abandon nuclear energy from its supply mix in the middle of this century with a moderate cost burden on the economy as a whole. Using existing conventional fossil fuel facilities to full capacity can reduce the financial burden of setting up new green field power plants in the immediate future (Asuka, 2011). In the longer term, renewable sources can minimise dependence on energy imports with extremely high costs and enhance energy security. Indigenous resources like solar, wind, geothermal and tidal power will need to be explored further and should be supported by strengthened renewable energy promotion policies, e.g. a new feed-in-tariff law to promote renewable energy in Japan, introduced in August 2011.

However, sudden fuel switching could leave the domestic economy vulnerable, especially because of potential power shortages. It is therefore imperative that the reframing of Japan’s energy policy be carefully monitored and precisely managed, taking into consideration the socio-political and economic landscape. It is also critical to re-examine the overall balance of energy demand and supply in order to strengthen the policy processes towards energy transition (Katayama, 2011). Policy discussion in the past tended to excessively emphasise supply side measures. We need to place a greater emphasis on demand side management, including at the household and small- and medium-size enterprise level. The level of electric power conserved in the eastern part of Japan this past summer was more substantial than the government anticipated.

To address the post-Fukushima electricity supply constraints in Japan, policy makers and civil society should promote a comprehensive energy policy package which would encompass: (1) analysing the energy demand structure and enhancing demand-side management; (2) diversifying energy supply sources; and (3) reforming the electric power system and distribution grid to enable expanded use of renewable sources. These reforms should be

supported by policy and regulatory measures along with greater participation of civil society. Strengthening regulations and policy tools towards reframing energy policy is hence an urgent priority.

In conclusion, the promotion of renewable energy through feed-in-tariffs and appropriate policies, as well as policies to promote energy saving, are considered to be an important part of achieving a safe, secure and green energy system.

 Version 1.0

### 3. Green Economy in the Context of Sustainable Development and Poverty Eradication

#### 3.1 Key Challenges

IGES recognises that a key challenge in pursuit of sustainable development is the excessive social, economic and environmental vulnerability caused by one-sided pursuit of economic efficiency (see Figure 3-1).

Economic efficiency   Environmental   Social   Economic  
 Profit maximisation   vulnerability   vulnerability   vulnerability  
 Competitiveness  
 Poverty & Price volatility of  
 Mass consumption & income gaps   natural resources  
 production  
 Ecosystem   Worsened labour  
 degradation   conditions  
 & natural disasters

Figure 3-1 Vulnerability caused by excessive pursuit of economic efficiency

While rapid economic growth in Asia and the Pacific has improved the material standard of living for hundreds of millions of people, many have been left behind in poverty, and expanding income gaps are undermining social and political stability. In the name of competitiveness and labour productivity improvement, employment conditions have deteriorated in many countries, and the consequent loss of stable livelihoods, including increasing unemployment, has aggravated social vulnerability. Rapidly increasing consumption of food, energy and natural resources such as crude oil and iron ore triggers price volatility of these commodities, which is further amplified by financial speculation. Over-consumption of such resources mainly driven by the lifestyles and consumption patterns of the richer segment of the world has accelerated climate change and ecological degradation, which worsens vulnerability to natural disasters.

An emerging paradigm shift to overcome these key challenges is the concept of a green economy, although at this stage an internationally agreed definition does not yet exist.

#### 3.2 Key Approaches/Principles

The principles or directions of a green economy in the context of sustainable development and poverty eradication can be discussed under three major economic-environmental domains, i.e. low-carbon economy, sustainable consumption and production, and sustainable use of ecosystem services (see Table 3-1). The political momentum for a green economy is predicated on investment on green technologies and infrastructure, and "green" job creation with due attention to current environmental challenges. Such transitions are already underway (UNEP, 2011b), but further acceleration is required to achieve the implied paradigm shift. International policy coordination is another aspect to avoid green protectionism and to make a global green economy attractive and beneficial for developing

countries.

### 3.2.1 Low-carbon economy

In the face of climate change and the accompanied risks of intensifying natural disasters, IGES believes that a precautionary (no-regrets) approach is needed, starting with building a low-carbon economy with a resilient, secure energy supply system. Investing in renewable energy coupled with enhanced demand-side energy efficiency measures has the potential to supplement and eventually replace nuclear and thermal fossil fuel power in the country's energy mix and can contribute to establishing a decentralised electricity supply which would secure a backup system during a disaster (Bhattacharya, 2011). Renewable energy can also help mitigate natural disaster risks associated with climate change, create thousands of new green jobs (OECD, 2011; UNEP, 2011b), and improve access to green technology through investment in research and development and subsequent unit price decline, which will benefit the poor in developing countries through improved energy access.

Governments should promote this trend by introducing incentives, e.g. shifting the tax base from labour and income to taxing environmental damage such as pollution and unsustainable resource consumption (OECD, 2011; UNEP, 2011b), and gradually phasing out environmentally harmful subsidies (Bhattacharya and Kojima, 2010a). However, most countries fear that such reforms may put their export industries at a disadvantage, making it difficult for individual countries to take the lead. The acceptance of tax and subsidy reforms will be significantly enhanced if a large number of countries agree on a joint schedule. While a global agreement may not be feasible in the short run, major economies having more financial and human resources, such as the G20, have agreed on phasing-out harmful fossil fuel subsidies. Therefore, if they agreed on a more comprehensive integrated approach to ecological tax reform, this would be a significant step towards a global green economy.

Moreover, the mechanisms to promote international cooperation, such as regional energy market integration (Bhattacharya and Kojima, 2010b), and technology transfer between countries, not only North-South but also within the South, need to be further developed. Such international cooperation, however, should not encourage exports of highly polluting brown sectors from one country to another. Also, a number of countries are concerned about green protectionism (UN-DESA, 2011).

14

The IGES Proposal for Rio+20

Version 1.0

Technology transfer for low carbon economy only works if there is capacity to effectively use the adopted technology, so emphasis should be given to promoting information sharing and knowledge building rather than concentrating on funding arrangements only. To this end, promoting existing national information centers, or establishing new ones, could help develop comprehensive technology needs assessments for each recipient country and a comprehensive technology availability assessment for each provider country. Strengthening existing regional technology centers, such as UNEP and APEC environmental knowledge hubs, to include not only collecting and sharing information but also knowledge building and advisability, could be done at the regional level and international level (IGES, forthcoming in 2012).<sup>4</sup>

IGES believes that, in the short-run, border carbon adjustments should not be implemented unilaterally, but should be done under the umbrella of an international agreement that ensures trust and shared understanding of the purpose of the measures and limits the scale and scope to clearly address leakage concerns (Zhou et al., 2011). In the medium-term, promoting nationally appropriate mitigation actions (NAMAs) in Non-Annex I countries of the UNFCCC is a more effective and important approach than border carbon adjustments. A layered approach which categorizes NAMAs and defines what to measure, report and verify for each category is quite a useful and practical framework for the emerging measuring, reporting and verifying (MRV) system (Fukuda and Tamura, 2010).

### 3.2.2 Sustainable consumption and production

Under the internationally growing demand for limited natural resources, the decoupling of economic growth and resource use and environmental impacts through the promotion of green technologies is one instrument to combat resource depletion. Promotion of 3R (reduce, reuse, recycle) policies and “top-runner” approaches play an important role in this regard. Policy interventions for requiring producers to internalise the costs of recycling, e.g. introduction of extended producer responsibility (EPR), green tax and subsidies, as well as for making environmental impacts clearly visible to consumers, i.e. green labelling are needed. These policies should be introduced in parallel with increased efforts on education, training and skills enhancement as effectiveness of these interventions depends on environmental awareness of consumers as well as ability of producers to improve product design and production processes.

However, there is a limit to pursuing decoupling via increasing resource efficiency at the unit level of each product, service, and technology. Indeed, decoupling is not a panacea for the world as a whole: individual countries can achieve a certain degree of decoupling by outsourcing polluting and resource consuming activities to other countries, but at the global level there is no opportunity for outsourcing. On the contrary there is growing literature showing that very little (if any) decoupling has been achieved to date and indicating that rebound is likely to render global efforts on decoupling ineffective (UNEP, 2011a; Jenkins et al., 2011). Therefore, to tackle overconsumption against the carrying capacity of the Earth,

4 IGES publishes its White Paper every two years, comprehensively compiling its strategic research results. IGES Fourth White Paper, which will be published in 2012, focuses on environmental governance and institutions in Asia Pacific and its contribution to international environmental governance, tentatively entitled as “Greening Governance in Asia Pacific: Institutional for Greener Economy.” For more information on IGES White Paper, please see [http://www.iges.or.jp/en/news/topic/wp3\\_about.html](http://www.iges.or.jp/en/news/topic/wp3_about.html).

15

The IGES Proposal for Rio+20  
Version 1.0

innovative policies for reducing resource consumption, e.g. introduction of resource tax or resource consumption cap, may need to be introduced. In this regard, further efforts to improve sustainability of resource consumption with a full examination of the appropriate stage of policy intervention along the life cycle of the products (life cycle assessment) must be made (Kojima, 2011).

Considering the significant disparities in the level of development of industrial infrastructure, major stakeholders, awareness, and market structure needed for greener and sustainable consumption and production activities, the priority tasks of policy intervention to create a green economy naturally differ between the developed, emerging, and least developing countries as well as among different regions in any one country. In this sense, a phased approach to introduce these policies considering the developmental stages of implementing countries along with international policy cooperation will be effective in setting priorities in production and consumption. The priorities of policy intervention for SCP should in general be assigned to policies that satisfy basic needs, such as sanitation and health and other public services for less-developed economies, and then to the integration of externalities into consumption and production patterns for emerging economies and into systems innovation for greener designs and systems for goods, services, and infrastructure for more developed economies. The consumption patterns of the richer segment of the world, which includes both ordinary consumers in the North and the rapidly expanding consumer class in the South, need to be drastically reconsidered. Changes in the way these groups live and consume goods and services are prerequisites for freeing up natural resources necessary to meet the needs of the poor and future generations. Such changes are not possible without a significant shift in mindsets to the point that increased consumption becomes socially unfashionable, in the way that littering is no longer acceptable in most developed countries.

Thus, current policies should be revised to promote less resource-intensive development, resource circulation, resource substitution, total reduction of environmental impact from consumption, and wider investment for green industries through development of packaged policy at all stages of the life cycle of products and services. To develop a persuasive argument for policy makers, analytical tools must be developed to identify effective policy interventions so as to facilitate a shift in consumption and production patterns and achieve positive social, economic, and environmental impacts from such a shift. To avoid negative impacts and secure the effectiveness of policy intervention in consumption and production patterns, internationally integrated policy approaches are necessary. To financially back-up such policy integration for SCP, IGES is examining the possibility of establishing an international fund for sustainable resource management or resource efficiency by utilising a portion of tax-income from economic policy instruments at different stages of the life cycle of products and services.

### 3.2.3 Sustainable use of ecosystem services

Especially for the poor who are more directly dependent on ecosystem services, ecosystem degradation due to human activities casts a dark shadow over stable livelihoods in terms of food and water security, natural disaster risks and loss of traditional culture (TEEB, 2011). Appropriate pricing and sustainable use of ecosystem services in the context of poverty eradication will be essential for a green economy. An economic system that does not internalise or recognise nature's contribution to the air we breathe, the water we drink, or the soil that provides our food, cannot be regarded as "green". In this context, biodiversity

16

The IGES Proposal for Rio+20

Version 1.0

conservation is an essential tool as loss of biological diversity undermines the value and resilience of ecosystems (Elmqvist et al., 2003).

Policymakers should internalise negative ecological externalities into the current economic system, and thereby promote sustainable agriculture and greening of the production supply chain. The keys to achieving this will be enhancement of economic incentives, e.g. payment for ecosystem services (PES), and visualisation of the benefits and costs relevant to ecosystem services, e.g. an accounting scheme incorporating valuation of ecosystem services. The PES approach encourages shifts from conventional practices that extract maximum production from the land to more sustainable agriculture and forestry through payments to landholders in exchange for providing more regulating services (Pagiola and Platais, 2007). PES also helps to create jobs in local areas because sustainable agricultural practices are more labour intensive than those depending on excessive use of chemical fertilisers and machinery. One limitation of this approach is that pricing ecosystem services which are currently unmarketable based on our willingness-to-pay does not necessarily promise sustainable use of ecosystem services. For example, pollution charges are one way of pricing the ecosystem sink services provided by receiving waters or the atmosphere. While there is a price incentive to reduce the level of pollution, lack of enforcement, poor collection of fees, or inadequate fines may result in failure to reduce the level of pollution. An alternative "ecological economic valuation" approach is suggested (Kojima, 2011) in which the price of ecosystem economic is determined such that policies or actions to ensure sustainable use of ecosystem services would improve social welfare.

The relatively new mechanism of reducing emissions from deforestation and forest degradation (REDD+) is another approach to reward forest managers for maintaining a carbon sink, as one way of mitigating the greenhouse gases causing climate change. Combining REDD+ with community-based forest management may be an effective way of recognizing the valuable ecosystem services provided by the stewardship of forest-dependent communities and contribute to their economic well-being. Designing such a system to verify the carbon sequestration benefits and to avoid capture by elites, however, still requires further work and trial in a range of countries.

17

The IGES Proposal for Rio+20

Version 1.0

Accounting that incorporates the economic benefits of ecosystem services, as well as the costs of environmental degradation will enable decision-making on a country's natural

capital, based on a longer-term perspective (World Bank, 2010). As a first step towards the application of such an accounting scheme, governments need to evaluate the full costs of loss of ecosystem services due to the construction of public infrastructure, such as hydropower dams, and make final decisions based upon a comparison of the potential gains and losses. Simultaneously, green procurement needs to be re-evaluated from these perspectives to visualise not only its positive environmental effects, but the economic benefits derived from less ecological degradation as well. Following these governmental initiatives, enterprises should be required to assess the ecological impacts of their projects and production processes, through enhanced environmental impact assessment procedures, review their supply chain management in this regard, and be required to report on the sustainability impacts of the company through regular annual reporting procedures, using models such as those developed by the Global Reporting Initiative.

#### Box 3-1. Community forest management and REDD+

By stabilizing the Earth's climate through carbon sequestration and storage, forests provide an ecosystem service that is critical for human survival. Recognizing that deforestation and forest degradation are contributing to global warming, Parties to the United Nations Framework Convention on Climate Change (UNFCCC) are in the process of agreeing on a global mechanism known as REDD+ that foresees the provision of incentives to developing countries to manage forests for climate change mitigation. REDD+ encompasses activities to reduce/avoid emissions from deforestation and forest degradation (REDD), and to enhance and conserve carbon stocks (symbolized by the "plus" sign).

In their search for more sustainable models of forest management and to rehabilitate forests degraded by logging, governments in the Asia-Pacific region have enacted legislation and established support programmes to provide forest rights to local communities (Scheyvens et al. 2007). Today, community forest management (CFM) is widely accepted as essential for promoting sustainable forest management and human wellbeing. CFM has developed particularly in areas of degraded (logged over) forests (Sam and Shepherd 2011), and has played a significant role in the rehabilitation of landscapes, forests and environmental services. In South and Southeast Asia, millions of hectares of degraded forests are being managed by communities (Pfoffenberger 2006), making them key REDD+ stakeholders (Chhatre and Agrawal 2009). Even though some countries in Asia-Pacific are more advanced than others in the implementation of CFM, and in spite of "legal, technical and human" limitations that different CFM models face (Scheyvens et al. 2007; Scheyvens 2011), several aspects make CFM conducive to the implementation of REDD+. CFM promotes the management of forests through local consensus-based organizations with democratically elected leaders/committees, and it supports the drafting of norms and regulations (by communities) to control forest access and use. CFM thus can provide strong local institutional foundations for forest rehabilitation and management, as well as for the realization of the social and environmental safeguards for REDD+ that international negotiators have agreed upon. The safeguards include respect of knowledge and rights of indigenous peoples and local communities, and full and effective participation of indigenous peoples and local communities in REDD+ (UNFCCC 2010). Additionally, CFM could also facilitate the participation of communities in forest measurement and monitoring, reporting and verification, which are all essential elements of REDD+ (Skutsch 2010). Elaborating the existing CFM models to enable local people to play these roles would contribute to address concerns over effective engagement of indigenous peoples and local communities in REDD+.

(IGES, forthcoming in 2012)

#### 4. Institutional Framework for Sustainable Development

(IFSD)

##### 4.1. Key Challenges

Scientists have identified nine planetary boundaries which should not be crossed if human civilisation is to continue to thrive (Stockholm Resilience Institute, 2009). Three boundaries (climate change, biological diversity, and nitrogen input to the biosphere) have been crossed already, with potentially devastating consequences for environmental, economic and societal stability if this trend is not reversed (assuming it is possible to reverse these trends once a threshold has been breached). It is clear that current environmental and sustainability governance arrangements are inadequate to halt the continuing environmental degradation. To change the direction of economic systems and stave off ecosystem collapse, fundamental institutional changes and coherent goals that are reinforced at global, regional, national, and local levels by consistent incentives, regulations, policies, and action will be required.

It is widely agreed that the current institutional structure, much of which was developed in the middle of the 20th century, prior to the recognition of SD, is no longer adequate to address current challenges. Some progress has been made, as there are now over 500 multilateral environmental agreements (MEAs) and nearly every country has environmental laws and a national level environment agency responsible for implementation. Governments and organisations at all levels—including the UN, regional, national, and local levels, as well as businesses and individual persons—are now making efforts to work on sustainable development. However, these efforts do not adequately match the magnitude of the challenges or the pace of change. Current IFSD—at all levels and in many countries—suffers from several serious challenges such as inadequate leadership and coordination, fragmentation, insufficient funding and human resource capacity, as well as inadequate compliance and enforcement. At the global level, the sheer number of treaties, organisations, and meetings complicate effective attendance at meetings and conferences, and may also divert human resources from urgently needed implementation.

##### 4.2. Key Approaches/Principles

IGES considers the following three principles/approaches to be critical in strengthening IFSD:

1) multi-level and multi-stakeholder governance; 2) subsidiarity; and 3) compliance and enforcement.

###### 4.2.1. Multi-level and multi-stakeholder governance

The challenges to sustainability will have to be addressed by intergovernmental institutions and governments, and not only at one level. Multi-level governance is necessary for coherent and effective action. Vertical and horizontal cooperation between and within levels is needed to minimise policy tradeoffs and maximise synergies between traditionally

22

The IGES Proposal for Rio+20

Version 1.0

separate sectors and policy domains, and sustainability goals need to be mainstreamed into all major societal decisions and sectoral plans. Key functions of multi-stakeholder participation are to improve coordination among stakeholders, create consensus on information input into decisions, cohesive implementation, legitimacy, and accountability of governing stakeholders and decisions made. While multi-stakeholder participation is already practiced in the intergovernmental arena, it should be strengthened further to include genuine, effective participation rather than token consultation, not only for the sake of awareness, but also to improve accountability of decision makers, which can lead to better enforcement and compliance of environmental laws and regulations (Antonio, 2011). Progress on other governance levels is required to empower stakeholders by promoting greater institutionalisation of participation. At the practical level, securing transparency of decision making processes, involving stakeholders in the early stages of planning, and effective facilitation functions are vital to synchronise top-down and bottom-up governance aimed at achieving common goals as seen in Box 4-1 below.

Box 4-1 Supporting multi-level governance through information exchange and networks  
Information exchange via networking among cities is a simple and effective option to strengthen relationships between local and national governments and improve capacity and enhance local actions for environmental management. The nature of the exchange varies by the type of network, which can be categorised into three types according to size: (1) networks with many members mainly for information sharing among them; (2) networks with limited number of members, designed for more intensive information exchange; and (3) bilateral, or city-to-city, relationships for learning directly from each other. A fourth type is based on having an award programme for recognizing outstanding achievements or innovation.

Over its lifetime a network may evolve to take on any of these forms, and may at times simultaneously perform the function of more than one type of network through the action of individual members. A typical network function is establishing an information sharing platform for members. For example, the Kitakyushu Initiative for a Clean Environment (KI) has organised meetings every 2-3 years by convening member cities to exchange knowledge and experience on effective environmental practices. Thematic seminars were also held in parallel almost once a year on specific environmental subjects such as solid waste management, water supply and sanitation, and use of information and communication technologies. Although the KI ended in 2010 the secretariat, IGES, has continued on a similar path with the High Level Seminar on Environmentally Sustainable Cities. This was developed under the framework of the East Asia Summit Environment Ministers Meeting, where central government officers and local government officers, as well as other organisations and research institutions are invited to exchange views and activities toward development of environmentally sustainable cities. In this way, the networking function has expanded not only horizontally but also vertically, providing opportunities to connect various types of organisations through multiple levels of government. Multi-level networking can be enhanced through information sharing platforms – such as offering awards and giving opportunities to outstanding cities to present their activities and achievements in front of other member cities and other stakeholders, thereby sharing best practices and giving recognition and further encouragement for them to perform better. In addition such platforms are also an opportunity to attract external support from central governments and other supporting organisations.

(IGES, forthcoming in 2012)

#### 4.2.2. Subsidiarity

The outcomes of Rio+20 on strengthening IFSD must address how institutions can best secure vertical integration of policies from international agreements, through national policy

23

The IGES Proposal for Rio+20

Version 1.0

to local implementation. Decisions relating to the implementation of environmental and SD governance should therefore be carried out in accordance with the subsidiarity principle, which prescribes that issues ought to be dealt with by the smallest, lowest or least centralised competent unit (Elder, 2011). Doing so may help integrate aspects of top-down and bottom-up environmental governance. For subsidiarity to really work coherently with the goals set at the intergovernmental level, it is also important to establish clear procedures for advancement from policy formulation to action and from planning to implementation, and to also ensure that the necessary resources are made available at each stage. Under the principle of common but differentiated responsibility, those who can afford it (not just developed countries) should assist vulnerable groups and developing countries to build the necessary human resource capabilities to implement sustainable development activities at the local level.

#### 4.2.3. Compliance and enforcement

Laws and regulations suited to country specific conditions are among the most important instruments for transforming environmental and development policies into action. Generally MEAs can only be implemented if there are matching national laws and regulations. Without effective compliance and enforcement of these laws and regulations, however, the intended improvements in human wellbeing and sustainable development inevitably will fail. Accordingly, it is critical to enhance cooperation between countries to share best practices on environmental compliance and enforcement, to provide technical assistance to developing countries in need of capacity strengthening, and to continuously upgrade regional, national, sub-national and local compliance and enforcement actions.<sup>5</sup>

#### 4.3. Roadmap and Main Proposals

IGES believes that fundamental reform of IFSD together with international environmental governance (IEG) should be undertaken through a phased approach at all levels. Each

sequence will provide necessary momentum for subsequent steps, as can be seen in the following figure:

5 One of the examples of compliance and enforcement in Asia is Asian Environmental Compliance and Enforcement Network (AECEN). Since 2005, national and sub-national environmental agencies throughout Asia, with support from the United States Agency for International Development, have cooperated through AECEN, sharing information on innovative policies and best practices in compliance and enforcement. Member agencies include Cambodia, India, Indonesia, Japan, Republic of Korea, People's Republic of China, Lao PDR, Malaysia, the Maldives, Nepal, Pakistan, Philippines, Singapore, Sri Lanka, Thailand, and Vietnam. AECEN's predominant cooperation mode is through South-South cooperation, where a mentor country is "twinning" with a beneficiary country, and environment agency staff from the mentor agency conduct on-the-job capacity strengthening and training. For more details, see <http://www.aecen.org>.

24

The IGES Proposal for Rio+20  
Version 1.0

Figure 4-1 Reform phases for IFSD

For the short-to-medium term, we encourage governments to support the creation of an SD Council to better coordinate and oversee budgeting of all UN programmes and agencies. To function more effectively, IGES recommends that the SD Council cooperate closely with international finance institutions (IFIs) and Bretton Woods Institutions, along with the G8/G20, as currently financial and environmental agendas are not well coordinated and sometimes offset each other. For IFSD, IGES's long-term vision is for a revision of the UN Charter to (1) enhance the global focus on sustainability issues; and (2) to equip a globalised world in the 21st century with rules and regulations for the future, not of the past.

25

The IGES Proposal for Rio+20  
Version 1.0

Table 4-1 Short/medium and long-term IFSD reforms

For IEG, we recommend that UNEP should have universal membership of its Governing Council. This is important to enhance legitimacy of international environmental governance and will also eliminate the necessity of Governing Council elections (although may impose minor additional costs). Subsequently, IGES recommends that UNEP be upgraded to a specialised agency, with a decision making mandate and legal identity. Both these IEG reform steps can strengthen environmental governance and support downstream implementation.

Given a clear need to strengthen currently dispersed regional as well as sub-regional environmental governance in Asia, IGES suggests the formation of a regional environmental focal point, which in the long run could be developed into an Asian Environmental Organisation, similar to increased regional cooperation that is happening in other regions such as Africa, the Americas, and the EU, and is commensurate with the increased regional cooperation on economic, trade, and security fronts in Asia. Asian countries should work towards creating a multilateral environmental information exchange network. Issues related to energy, resource-use, biodiversity, climate change, and disaster management are transboundary and can be addressed cost-effectively by regional cooperation, capacity building, and exchange of information and expertise.

At the national level, IGES recommends that high level focal points and coordination committees be appointed above the sector ministries to ensure that SD concerns receive sufficient attention and are vertically integrated and mainstreamed. Specific actions are mostly taken at the local level, thus initiatives such as those promoting low carbon cities are

of great importance. The national level environmental governance should be improved in such a way that will further promote local level actions in close collaboration with municipalities.

26

The IGES Proposal for Rio+20  
Version 1.0

The following sections provide more detailed information on each reform step, as well as elaborate on essential issues related to functions, funding, and other crucial issues.

#### 4.3.1. Umbrella organisation for SD

Options for creating an umbrella organization for SD include: (1) a reformed ECOSOC with a change in name and mandate to focus on promoting SD; (2) a new Sustainable Development Council, separate from ECOSOC; and (3) a reformed and strengthened CSD, by according it a stronger mandate.

Option 1, changing ECOSOC's mandate to SD and changing its name, would require revision of the UN Charter, but if SD is a high priority, countries can agree to limit the discussion and amendment of the UN Charter to this one issue. Changing the name and mandate of ECOSOC to that of SD Council would institutionalise participation of non-environment ministries of each country, a crucial requirement for the mainstreaming of sustainable development governance. ECOSOC already works on SD to some extent. However, a name change is important to signal that SD is its main focus. With the current name, there may still be some resistance to SD efforts by ECOSOC, and some may think that non-sustainable economic activities can still be promoted as ECOSOC's main responsibility, while SD is a side effort.

Option 2 would maintain ECOSOC in its present form, but establish a new SD council. This could either be new, or as in option 3, be based on a restructuring of the CSD. The CSD could continue to function as a forum for intergovernmental discussions on SD. However, its focus would have to be sharpened; it would undertake assessments of the progress towards SD and work to attract key decision makers from ministries other than environmental ministries. Regardless of the specific institutional form of the umbrella organisation for SD, in the long term, it will be necessary to align the efforts to combat climate change with the work on sustainable development, including their respective institutional frameworks. Agencies and programmes representing the three dimensions of SD need to work harder to cooperate, convening regularly to ensure coherence and synergy.

#### 4.3.2. High profile individual to promote SD

It is highly desirable to have a high level person to lead and promote SD, regardless of which form the umbrella organisation eventually may take. This person could have the title of High Commissioner for Sustainable Development. Previous efforts to promote coordination of SD have centred on the establishment of committees. Several coordinating committees have been formed and disbanded over the years, but their effectiveness has been limited. Also, UNEP has not been very successful in coordinating UN activities on environment for a variety of reasons, although steady progress on integrating environmental concerns into other agencies has been made by the efforts of these agencies. Overall, it is difficult to expect UN agencies to coordinate themselves, and a main result of past coordination efforts has resulted in turf battles. A high profile person in charge of SD could be beneficial in terms of coordination and mainstreaming of SD concerns within the UN, and as a public face of SD in

27

The IGES Proposal for Rio+20  
Version 1.0

the media and to the public. Sadako Ogata, who was the UN Commissioner for Refugees, has had considerable success in promoting refugee issues and could be a good model to follow.

#### 4.3.3. Greater participation and coordination with Bretton Woods Institutions and regional development banks

Bretton Woods institutions and regional development banks should more actively participate in a system-wide committee to better align their work with SD objectives. A system-wide committee may have a better chance of success with a high level individual as its chair. It could be worth considering participation of the proposed High Commissioner for SD at Board of Directors Meetings of IFIs such as the World Bank, International Monetary

Fund, Asian Development Bank and other development banks.

Bretton Woods institutions and G20 central bankers should attend Rio+20 and clarify how they will promote SD and coordinate with other actors. Moreover, development banks should be called upon to expand the SD aspect of their development assistance at the Rio+20 conference. Some are already extensively engaged in SD work, and have emphasised their SD contributions. However, SD is typically not part of their official mandate. Calling on these organisations to officially change their mandate could be considered. In addition, new donor countries should be called upon to “green” their development assistance and orient it towards SD objectives.

#### 4.3.4. SD financing mechanisms

Securing additional financing and making effective use of existing financing are crucial for enhancing the effectiveness of SD institutions. One way to persuade countries to provide more funding is to help them understand that SD issues can have security implications and should be the focus of more interest from defence ministries. For example, environmental degradation may have grave consequences for food and water supply, which in turn could lead to security concerns and conflicts over resources. Environmental refugees may potentially also pose security related problems. Countries should allocate a small amount from their defence budgets for environmental and sustainable development funding. Increased small contributions from defence budgets to UN organisations such as UNEP and MEA secretariats could be a cost effective way to mitigate problems before they degenerate into expensive and difficult security problems. Other innovative funding options could include taxes on international financial transactions (Tobin Tax), mining of virgin materials, international air-passenger mileage and freight transport, etc. Currently the EU is strongly supporting the introduction of a Tobin Tax and other countries should seriously consider supporting this initiative. These financing options have the advantage that they do not derive directly from countries’ budgets. Nevertheless, governments of UN member countries would still oversee the spending.

#### 4.3.5. Convention on Access to Information and Participation

To institutionalise participation and access to environmental information and decision making, IGES recommends supporting a regional or global convention on Rio Principle 10

28

The IGES Proposal for Rio+20  
Version 1.0

(Murharjanti and Paramita, 2011). Such a convention would strengthen multi-level governance by improving stakeholder dialogue, policy adoption, and ownership at local levels. For Europe, a convention on Rio Principle 10 already exists in the form of the Aarhus Convention, but up-scaling it to the global level is necessary. Moreover, the provision of a global convention on Principle 10 of the Rio Declaration would help to institutionalise it at all levels of governance.

#### 4.3.6. Two-phased reform for IEG: universal membership for UNEP, and then a specialised agency (WEO/UNEO)

IGES believes that incremental reforms to the IEG system are important and should be undertaken, such as those already underway in, for instance, greening of UN initiatives as well as clustering of MEA secretariats (JIU, 2010). However, ultimately these measures will be insufficient, so IGES supports more ambitious and fundamental reform options. Specifically a two-phased approach to enhance UNEP is recommended. In the first phase, the UNEP Governing Council could adopt universal membership. In the current system, the UNEP Governing Council only has 58 members, and decisions must be sent to the Second Committee of the General Assembly for approval. There is universal participation in the UNEP GC, in which non-members may participate in discussions, but non-members may not vote. Non-members already send delegates to the Global Ministerial Environment Forum, which meets in conjunction with the GC. Universal membership would lend greater legitimacy for UNEP GC to be the “global voice for the environment” which is difficult with only 58 members. Universal membership would also eliminate the need for governing council elections, which consume much time and energy.

Universal membership might also help improve coordination and synergies among MEAs, which, due to comprehensive membership and centralised decision making of the GC forum, could be deliberated in clusters, as already practiced in biodiversity related conventions and the chemicals cluster. It would make it possible have MEA COPs to coincide with the UNEP GC, thereby creating significant financial as well as time efficiencies. Currently, without universal membership it is difficult for UNEP GC to make recommendations to MEAs that have members which are not represented in UNEP’s GC. Moreover, IGES suggests that any

new MEA secretariats should be placed at either UNEP in Nairobi, or in Geneva. Recent IGES research (Olsen, 2011) shows that, compared to the current status, the financial implications of establishing universal membership are not very large.

In the longer-term, IGES recommends upgrading UNEP to a Specialised Agency i.e. World Environment Organisation (WEO) or United Nations Environment Organisation (UNEO). Legally, this might be accomplished through a GA resolution (UN Charter Article 57) rather than a treaty, which could be difficult to ratify in some countries. This would mean that decisions no longer have to be referred to the General Assembly where they might be affected by unrelated issues. Thus, a WEO would provide a legal mandate and autonomy to enhance the strength of environment ministers. Capacity building should be an important function of a WEO/UNEO, particularly in areas related to policy formulation, reporting, negotiation, and implementation of MEAs, and there is evidence that developing countries

29

The IGES Proposal for Rio+20  
Version 1.0

are interested in more capacity building from UNEP. UNDP, the World Bank, and regional development banks, among others, already undertake some capacity building, although this tends to be more focused on projects. However, overall efforts are still inadequate. Increased effort should take place in cooperation and coordination with other agenciesâ€™™ work according to the â€œDelivering as Oneâ€™™ UN initiative, including adequate representation of UNEP in UN Country Teams. Of course, additional funding would be needed. But the mandate would need to be agreed on before contentious issues regarding funding could be deliberated, perhaps agreeing on innovative funding options, such as those summarised in previous sections. The flowchart below depicts how reforms could be undertaken in phases, each creating momentum for the next step:

Figure 4-2 Thrust of IEG reform (Olsen, 2011)

The UN should lead by example and practice what it preaches. Recommendations such as those suggested in the UN Joint Inspection Unit (JIU 2008), which include clear division of labour among UN organisations, limitations on the creation of new MEA secretariats, and improving transparency of use and management of programme support costs are useful to be considered.

#### 4.3.7. Regional initiatives (Asia-Pacific)

It is important also to consider how IFSD will translate to regional and sub-regional levels. In

30

The IGES Proposal for Rio+20  
Version 1.0

particular for Asia-Pacific, this will be an important consideration: as the region increasingly becomes the worldâ€™™s economic and production centre, adverse impacts are taking a toll and many countries are facing serious environmental issues that include pollution and depletion of natural resources. IGES suggests that improvement in coordination and information sharing among countries in the region is a good first step that can enhance transparency and access to environmental information, as well as exchange of good practices in the region; these are the foundations for better environmental and SD governance. One possibility to improve coordination would be to create a relatively small regional organisation or focal point, which in the long run could be developed into an Asia Environmental Organisation. .

Figure 4-3 Proposed structure for enhancing information exchange and harmonization in Asia-Pacific  
Source: Adapted from EEA/EIONET model (EEA, 2011).

The flowchart above depicts how such a focal point could act as an information hubâ€™™ both collecting and disseminating information on the state of the environment. The institution would use identified Asian Topic Centres (ATCs) of expertise in a given area. The National Focal Points then could be appointed from ministries or agencies as key partners of the focal point and should preferably include a mixed range of ministries. In addition to encompassing

the link from regional to national level, they would also coordinate with National Reference Centres (NRCs), who would be appointed by the NFPs to collect information as required by the central institution.

The Asia-Pacific region already has a wide-range of existing institutions at the sub-regional level, including the North-East Asian Sub-regional Programme for Environmental Cooperation (NEASPEC), Secretariat of the Pacific Regional Environment Programme (SPREP), South Asia Co-operative Environment Programme (SACEP), and the Regional Environmental Center for Central Asia (CAREC). The focus and potential of each of these institutions would have to be subject to additional research to identify the extent to which extent they could

31

The IGES Proposal for Rio+20

Version 1.0

become involved as “Asian Topic Centres” and information collection hubs. It would also have to be determined which organisation would become the central hub collecting and disseminating the information. Similar approaches may also be needed in other regions.

#### 4.3.8. National initiatives (environmental policy integration)

On national levels, IGES believes that greater efforts should be made to improve synergies between environmental and developmental policies and practices. One way to do this is to enhance environmental policy integration (EPI), which is defined as a “deliberate attempt to prioritize the protection of the environment before any trade-offs are made between environmental, economic and/or social objectives” (Lenschow, 2009:8). Sustainable development, therefore, should be designated as an overarching principle of policy decisions in any sector or level. This is important because significant impact can only be achieved if environmental concerns are integrated into those ministries that are the main contributors to environmental damage (Mueller in Lenschow, 2002:58). Full integration is complex and presupposes political continuity and support. IGES suggests that improving vertical integration will benefit the persistent implementation gap at the local level. For that to happen it will be necessary to strengthen the national decision making processes and involve local governments to ensure that both funding and capacity is made available.

#### 4.3.9. Local initiatives

Local governments in many areas have already made strong efforts to effectively address SD issues in an integrated way, including efforts related to Local Agenda 21. Good examples of local action in the Asia-Pacific include the development of low carbon cities, smart cities, and other partnerships between local governments. City level networks help to share best practices and assist with capacity building. These initiatives should be further developed and strengthened. At the same time, multi-stakeholder involvement and cooperation with the private sector, educational institutions and other stakeholders should be promoted. Finally, IGES believes that solid reporting mechanisms should be established and maintained to ensure vertical coherence and consistency between planning and implementation.

Day 1 26 July

#### Morning Session on the Hayama Proposal and Implications of Japan's disasters

People recognized the importance of thinking about the future energy mix of Japan with new and flexible perspectives after the Fukushima triple disaster. Energy policy and climate policy are different sides of the same coin and we should seek low carbon, high safety, and high energy security "keeping in mind there may be costs to bear for these positive goals. Research institutes such as IGES should play an important role to provide qualitative and quantitative analysis and concrete proposals to contribute to the ongoing discussion on Japan's future courses of action. In this regard, it was urgently called for continued dialogue among stakeholders such as the ones we had at ISAP 2011, learning from the German experience. The future direction of the international regime for climate change mitigation is

very unclear. Parties including Japan should make compromises to make the discussion move ahead for our common future. The Hayama Proposal as proposed by the IGES climate change group may stir further discussion inside and outside of Japan.

#### Afternoon Session on Resilient Societies

A decentralized system for risk reduction, relief, and recovery with differentiated roles under a comprehensive plan was proposed and discussed during this session in which:

- National governments have a facilitating and enabling role

- Local government has the responsibility for decision making and implementation, and for promoting horizontal cooperation and participation of different stakeholders.

It is essential to revitalize decentralized, localized, and self-reliant socio-economic systems which value and support inclusive and meaningful participatory processes as a way to facilitate effective risk reduction, relief work, and reconstruction on the pathway to a transition towards a resilient and sustainable society. In this regard, the importance of community-based approach was emphasized.

Day 2 27 July

#### Morning Session on Governance for Sustainable Development

Despite the many challenges we need transformational change in addressing the weaknesses in current governance arrangements.

- Greater attention must be paid to horizontal and vertical integration – genuine and informed multi-stakeholder participation and multi-level integration: the involvement of women and civil society groups, business and local governments at all levels need to influence the outcome of Rio+20.

- Access to information and meaningful public participation in policy decision making process to enhance accountability and implementation, possibly through a global or regional convention.

- International and regional organizations need to play a proactive role in engaging with national and sub-national stakeholders, while sub-national stakeholders can take a more proactive role to engage with the national government to promote change.

If we agree that the status quo is not sufficient to address current and future sustainable development problems, then we cannot fear the challenges and consequences of making fundamental changes in the UN charter.

#### Afternoon Session on Green Economy

The East Japan disasters, including the Fukushima nuclear accident, reveal that the existing social and economic system does not fully account for environmental and social costs. The concept of green economy is important in this context. The session discussed how the implication and definition of a green economy may vary depending on the developmental stage, but sharing the common goal of sustainable development. One of the key discussion points was how green economy can improve the daily lives of poor people, not only in developing countries but also in developed countries. The importance of technology transfer and application, particularly exploring opportunities between south-south was emphasized, indicating a need for improving education to develop the capabilities necessary for technology transfer and to provide the skills that will sustain green job growth.

#### Conclusion

In closing Prof. Hamanaka and Mr. Rae Kwon Chung, Director, Environment and Sustainable Development Division of UNESCAP shared their final thoughts for ISAP2011. Prof. Hamanaka recapped the main messages from each plenary session, which he said he hoped would be used towards developing a sustainable and resilient society and promoting green economy in the context of achieving sustainable development and alleviating poverty, bearing in mind the diversity of the Asia-Pacific region. Mr. Chung closed ISAP2011 by offering a reminder of two points – the first challenge is to reach out to convince the

other two pillars, the other ministries, the other NGOs, as speaking to the converted is no way to achieve cross-cutting goals. The second challenge is to have more clarity within the environmental policy community as internal disagreements weaken the messages and do little to clarify the misperceptions and understanding about sustainable development. IGES and other institutes need to clarify and educate the national delegates going to Seoul and Rio de Janeiro. That is the challenge of our times, to overcome the knowledge gaps by working together and overcoming our collective challenges to human survival on planet Earth.

Impact Assessment of No-Nuclear and More Renewable Energy Policies

in Japan (Preliminary findings)

Anindya Bhattacharya, Senior Energy Economist, Economy and Environment Group, IGES

July 29, 2011

#### Objectives

To estimate the impact of reduction and substitution of nuclear energy and increasing use of renewable energy in the electricity supply mix in Japan using bottom-up technology driven energy systems model (TIMES-Japan).

The impacts are to be estimated under three main parametric contexts prevailing in the market to evaluate the nuclear energy's acceptance or rejection compared to other technologies:

- i) Technical feasibility,
- ii) Cost of supply and
- iii) Environmental impacts.

#### Primary research questions

What will be the total system cost?

What will be the electricity supply cost in the country?

What will be the energy and electricity supply portfolio of the country?

What will be the impact on GHG emissions reduction target?

#### Scenarios

1. Reference Energy Scenario (REF): This is the business as usual scenario with pre-disaster conditions of energy supply and demand.

2. Fossil Fuel Scenario-Long Run (SFF-LR): In this scenario a long term nuclear power supply reduction policy has been adopted. Nuclear power supply gradually goes off from the supply mix by 2050 with a three-step reduction target. In addition to that CCS (carbon capture and sequestration) technological intervention is also restricted until 2040 based on its current level of R&D status in Japan.

- 2020: Nuclear power supply reduces to 13% from 30% at 2009

- 2030: Nuclear power supply reduces to 5% from 30% at 2009

- 2050: Nuclear power reduces to 0% from 30% at 2009

3. Fossil Fuel Scenario-Short Run (SFF-SR): In this scenario an immediate cut off of all nuclear power supply is considered by 2015.

1

4. Renewable Energy Scenario (REN): In this scenario a moderate renewable energy supply policy is introduced with 15% wind and 25% solar energy supply by 2050 in Japan. Due to various environmental and regulatory obstacles geothermal development is not very prospective in Japan as of now. Therefore, we deliberately restricted the penetration of geothermal in the supply mix only to 10% by 2050.

#### Basic assumptions

Following are the basic energy service demand drivers in the model to determine the final energy demand.

#### REF Demand Driver

2.5

2

GDP

2005 value=1

Fig.1: Ref case energy service demand drivers

Note: GDP: GDP per capita, GDP/HOU: GDP per household, HOU: Number of households, POP: Population

Primary energy prices are also very important for the bottom-up models. The basic assumptions are shown in the figure below:

Fuel price assumption in the model

2  
Fig.2: Primary fuel prices

In addition to above mentioned assumptions the model also assumed there is no changes in the final energy service demand in the market due to policy changes. Therefore, the scenarios simulate the steady state conditions of the demand function. As a matter of fact, only supply curve shifts over the constant demand curve to achieve the partial equilibrium conditions for the optimal solutions under different conditions mentioned under three policy scenarios. Work is in progress to also estimate the energy service demand changes due to various policy measures.

The costs of technologies are also very important for this study as they determine the final technological intervention in the system. The following table shows the reference case cost comparison between different nuclear technologies and renewable mainly solar and wind.

Table 1: Reference case technology investment cost comparison (selected technologies only)

Technologies ( USD@2000 /KW)	2003	2004	2005	2008	2010	2018	2023
Advanced Nuclear	2380.00	4200.00					
Nuclear Fusion	4200.00						
Nuclear LWR	2100.00	3705.88					
Solar PV Centralized	9399.18	8354.78	6300.00	4760.00	3133.06		
Solar PV Decentralized	10997.00	9775.08	7371.00	5569.20	3360.14		
Wind centralized on-shore	2800.00	1775.40	1775.40				

Wind centralized off-shore 4177.60 3236.80

Wind decentralized-onshore 1671.60 1662.66

Source: Data has been drawn from the TIMES Integrated Assessment Model (Version 4.3.3) base data which are primarily collected from IEA and other external sources.

#### Preliminary Results

1. Impact on overall electricity supply portfolio: This result indicates that LNG and Natural Gas will be dominating the supply fuel market in Japan especially for electricity production. Coal will still remain as one of the major sources of power in the country under all the scenarios analyzed here unless it is deliberately replaced by other technologies. Geothermal is a potential alternative for nuclear base load supply in Japan. However, it requires plenty of regulatory and environmental policy changes to become viable. High cost due to high labor cost and high land cost in the country may hinder the introduction of the Biomass energy in Japan.

Fig. 3: Electricity supply portfolio for Japan under different scenarios

2. Impact on total energy supply system cost: This is the net present value of the total cost required to achieve the target set under the scenarios in the system. The discount factor is around 10% which is factored over the total life time of each individual technology in the system. This shows that if Japan goes for immediate replacement of nuclear power supply with other sources the country has to take the maximum burden of energy supply which will be 2.5% higher than the current cost or 225 Billion USD additional cost. Renewable energy scenario is expected to have much lesser financial impact on Japan which is around 105 Billion USD of additional cost compared to the reference condition.

Fig.4: Changes in system cost under different scenarios

3. Electricity production cost and retail price in the market: In this analysis we estimated only the electricity production cost and not the other costs like transmission and distribution, commercial costs etc. However, it is assumed that the majority of the supply cost of power in Japan is the production cost. Given the condition that there is no change in other cost component then % change of the production cost of electricity can be attributed to the % change of the supply costs and retail price of electricity that the consumers are paying. Based on this assumptions we have estimated the following changes in the electricity prices in the market under different scenarios:

100% REN

50%

0%

2020 2030 2040 2050

Fig.5: Changes in electricity supply/production cost under different scenarios

5

This result indicates that under the fossil fuel based scenario with immediate nuclear energy cut off plan may increase the electricity generation cost and thereafter the supply cost by 250% compared to the current level by 2020. However, it has been estimated that under all the potential alternative scenarios, price escalation is must. But renewable energy option with no nuclear supply beyond 2050 predicts the lowest price escalation until 2050.

The following figure (Fig.6) shows how the market price of different fuels changes compared to the REF scenario in Japan. Oil Crude is also predicted here which shows that 2020 is the most expensive year for Japan under all scenarios except renewable energy. All other fuels show some increasing trend in the mid to long term horizon for Japan as the fossil fuel demands still remain high for the country. Among all fuels, natural gas is expected to have very high price escalation in Japan (around 400%-500%) due to high demand by the power companies.

4. GHG emission: To achieve better CO<sub>2</sub> emissions reduction, Japan needs to have aggressive renewable energy penetration policy in place. Model predicts that under both the fossil fuel scenarios, CO<sub>2</sub> emissions will increase rapidly over the reference scenario. Moreover, faster penetration of renewable energies than REN is necessary to satisfactorily reduce CO<sub>2</sub> emissions until 2040. After 2040 when the percentage of renewable energy supply goes above the fossil fuels, then only the emissions reduction impacts are observed. Therefore, renewable energy supply is one of the key controlling factors of GHG emissions in Japan.

#### Preliminary conclusions 1

Japan may go forward with no-nuclear option but the financial burden of system development will be generated. It appears that use of existing facilities to full capacity can reduce the additional investment burden in the short run. Renewable energy scenario is expected to have much lesser financial impact.

Japan needs to develop its base load alternatives like geothermal and tidal to substitute nuclear. Solar and Wind appears intermittent compared to nuclear power supply. More aggressive renewable energy policy is required.

Retail power price is expected to increase under both the scenarios. Fossil fuel scenarios will increase the crude and gas import burden and subsequent cost of supply.

Primary energy prices are expected to shoot-up in the short run due to sudden surge in demand and lack of supply. However, the prices are expected to fall gradually.

Japan needs to commercialize its geothermal potential to reduce the environmental impact of non-nuclear supply portfolio. Geothermal and tidal seems to be viable as alternative to massive replacement of base load nuclear power.

In the short-run LNG (liquefied natural gas) import increases with increase in NG (natural gas) based power generation. Coal is expected to be dominating the supply under no nuclear scenario at least until 2050.

Japan needs to develop the CSP (concentrated solar power) technology for grid connected solar supply enhancement. So far roof-top standalone PV is predominant.

Discussion Paper: Building Resilient Societies

Prepared for the plenary session on building resilient societies at the International

Forum for a Sustainable Asia-Pacific (ISAP) 2011 held in Yokohama, Japan

Henry Scheyvens (IGES), Hideyuki Mori (IGES), Robert Kipp (IGES), Shinano

Hayashi(IGES), SVRK Prabhakar(IGES), Izumi Tsurita (IGES), and Masanori Kobayashi

(IGES)  
July 26, 2011

The purpose of this draft of the discussion paper is to frame the discussions that will take place in the Resilient Societies Plenary Session in the International forum for Sustainable Asia and the Pacific (ISAP) in July 26, 2011. The discussions will later be reflected in this paper and IGES will publish it as one of the outputs of ISAP 2011.

This discussion paper begins by looking at the only international agreement on disaster risk reduction, the Hyogo Framework for Action, and considers the review of progress made on this agreement in light of the current situation facing Japan – the so-called East Japan Great Earthquake/Tsunami (EJGET). In the discussion the question is raised as to what is a resilient society – in particular in the context of modern development and technological advances. Cases are given drawing on recent fieldwork carried out in the areas most severely affected by the triple disaster in Japan (tsunami, earthquake, nuclear) which provides a backdrop for the deeper discussion on building resilience to extreme events and making resilience a part of the recovery and rebuilding process.

#### 1. The need to invest more in building disaster resilient societies

Globally, the frequency and magnitude of catastrophic disasters is projected to increase. The series of disasters in eastern Japan that the nation is now grappling with highlight the need and urgency for greater attention towards building disaster resilience through national and sub-national policy and planning.

Just a few weeks after the 2004 Indian Ocean tsunami the World Conference on Disaster Reduction was held in Hyogo, Japan. The main output from that meeting was the Hyogo Framework for Action 2005-2015: Building Resilience of Nations and

#### 1

Communities to Disasters, a comprehensive and systematic guidance document to strategically reduce disaster losses which was endorsed by 168 member states in 2005. The Hyogo Framework for Action (HFA) builds on a previous document, the Yokohama Strategy, and was the first document of its type to be developed and agreed upon internationally on disaster risk reduction. With the expected outcome of – the substantial reduction of disaster losses, in lives and in the social, economic and environmental assets of communities and countries – the HFA outlines five priorities for action:

1. Ensure that disaster risk reduction is a national and a local priority with a strong institutional basis for implementation.
2. Identify, assess and monitor disaster risks and enhance early warning.
3. Use knowledge, innovation and education to build a culture of safety and resilience at all levels.
4. Reduce the underlying risk factors.
5. Strengthen disaster preparedness for effective response at all levels.

The 2009-2011 HFA progress review shows increasing attention to risk identification, preparedness, and monitoring; in addition the HFA and associated processes have contributed to creating a common language and understanding of the key components of disaster risk management.<sup>ii</sup> However, across income levels and regions achievements have been much slower or even regressing in addressing the underlying risk drivers, developing governance structures and institutions, and in using education and knowledge to build a culture of resilience. The result is an impaired ability to prepare for and respond to disasters, often as a result of disaster risk management being spread across multiple ministries or located in institutions with little resources or power to influence change to address extensive and intensive disasters.

Extensive risk develops through mainly localized but frequently occurring disasters spread across a country or region and are often related to climate variability such as flooding in Bangladesh.<sup>iii</sup> In the case that a particular area is subject to infrequent but highly destructive disasters with relatively greatly loss of human life, the intensive risk of the area is said to be high (Ibid.). The Haiti earthquake in 2010 which resulted in almost 500,000 casualties and 1.2 million displaced persons,<sup>iv</sup> and the

triple disaster in Japan which resulted in almost 25,000 dead or missing and over 100,000 displaced persons<sup>v</sup> are recent examples of intensive disasters.

2

Natural disasters can be classified as biological, geophysical, hydrological, meteorological and climatological. There is potential for the human toll and economic costs of all of these to increase. Due to climate change, some areas are likely to become more vulnerable to biological disasters, such as insect infestation. The series of disasters in eastern Japan and the recent series of earthquakes in Christchurch, New Zealand remind us that developed countries are not immune to geophysical events such as earthquakes and volcanic eruptions, though deaths are likely to be greatest in countries experiencing rapid, unplanned urbanization, such as Haiti, <sup>vi</sup> where 222,570 deaths were reported from the January 12th 2010 earthquake.<sup>vii</sup> Hydrological disasters such as flooding are projected to increase in some areas because of climate change, but experiences in China, the Philippines and other countries of the region show that environmental degradation, e.g. reduced forest cover in upper catchments, also contributes to the frequency and scale of these disasters. The summer heat wave in Russia in 2010 responsible for wildfires that destroyed a third of the wheat crop and that caused up to 56,000 deaths<sup>viii</sup> was an example of an abnormal weather event, many of which have been reported from around the globe in recent years. These provide signals of the increasing frequency and severity of meteorological disasters (storms) and climatological disasters (extreme temperature, drought and wildfire) that are projected due to climate change.

Due to better preparedness and recovery planning made possible in part by economic growth, over the past 40 years mortality risk from natural hazards has been decreasing; however economic growth has not resulted in lowered economic loss from natural hazards.<sup>ix</sup> From the 1970s to 2008 while the number of fatalities from disasters significantly decreased, world economic losses due to natural disasters has been steadily <sup>and often times sharply-</sup> rising.<sup>x</sup> However these losses only account for the direct physical impacts of disasters <sup>the long term effects on the local economy in a case such as the recent disasters in Japan could result in significant impacts on Japan's economic outlook in addition to their energy future</sup> <sup>and that of other countries which have included nuclear energy as a major part of their energy mix. In terms of extensive disasters the impacts have been greater in lower income countries and those with governance issues, but as the recent incidents in Japan shows new vulnerabilities can arise as a result of the complexities and interdependencies created in technologically advanced, modern, higher-income countries if resilience is not reassessed in terms of the new development context. Without suitable governance and institutional arrangements risk can actually be</sup>

3

constructed rather than mitigated through development, regardless of the size of the economy or system of government.

The interconnectedness of development, technology, and disaster risk raises questions as to the resilience and vulnerability of societies <sup>not just developing societies, as has been the primary focus of discussions on these two factors, but also the resilience and vulnerability of modern developed societies in the face of intensive risk, partly as a result of technology and infrastructure development, and increasing extensive disasters due in part to climate change, the so called emerging risks</sup>.

Globally, the number of natural disasters and their costs are increasing  
The EJET is set against a  
backdrop of upwards trends in the  
number of global disasters  
reported and the costs of their  
impacts. As reported on the  
International Disaster Database  
EM-DAT, which is maintained by  
the Centre for Research on the  
Epidemiology of Disasters (CRED),  
2010 was the deadliest year in at  
least two decades for natural

disasters. CRED reports that in 2010 some 385 natural disasters killed more than 297,000 people worldwide, affected more than 217 million others and caused damages Time trend of to the tune of US\$124 billion.xi Asia reported natural is particularly vulnerable. From disasters, 1975-2010. 2000-2009, almost 85% of global deaths from natural disasters Source: UNISDR. Undated. occurred in the region. xii These 2010 Disasters in Numbers. upward trends are set to continue due to unplanned urbanization, environmental degradation and climate change.

4

What is a disaster resilient society?

Until the EJGET, Japan was presented as an example of a resilient nation, well advanced in mitigating and bouncing back from natural disasters. The magnitude of the EJGET, however, was not planned for. With a large population, much of whom resides on the coastal plains and fringes, a modern economy in which production chains are spread across the country (and globally), and with a centralised domestic energy system, Japan found itself vulnerable to this catastrophic event. Already, central and local governments are discussing a range of practical solutions, but these specific solutions need to be underpinned by a shared vision of what a disaster resilient society looks like, and a set of principles for building disaster resilience into the recovery process.

As Brenton Prosser and Colin Peters point out, it can be difficult gaining agreement amongst policy makers on what resilience actually means.xiii Nevertheless, there appears to be enough common ground to build policy.xiv

Put simply, a disaster resilient community can be defined as “the safest possible community that we have the knowledge to design and build in a natural hazard context”xv “minimizing its vulnerability by maximizing the application of disaster risk reduction measures”xvi The expressions “safest” and “minimizing its vulnerability” are important. We cannot completely insulate our communities from natural disasters. We cannot conquer the more powerful forces of nature, and indeed this has been a painful lesson from the EJGET.

In terms of the disaster management cycle, which consists of disaster prevention (mitigation and Disaster prevention preparedness), response, and recovery and reconstruction, a disaster resilient society is one that “mitigates and prepares for the possibility of natural disasters, is able to deliver quick and Recovery and effective emergency assistance to Response reconstruction victims, and is capable of a smooth transition to implementation of recovery and reconstruction.”xvii

5

There are several concepts that are useful for understanding disaster resilience. First is the notion that resilience consists of a number of elements: Robustness “inherent strength, resistance; Redundancy “system properties that allow for alternative options, choices, substitutions; Resourcefulness “capacity to mobilise resources; and Rapidity “speed with which disruption can be overcome and services, income, etc. restored.xviii

Second is the notion of “resilience domains”<sup>xi</sup>. These are: Technical “physical systems” location based and distributed critical facilities; Organization “attributes, dynamics of organizations and institutions; Social “attributes, dynamics of communities and populations; and Economic “attributes, dynamics of organizations and institutions. xix In Japan, perhaps too much emphasis and confidence has been placed on the technical domain, i.e. engineering feats designed to protect communities and infrastructure from natural hazards, and too little on organizational, social and economic domains.

The concepts of levels and scope of preparedness are also important. The literature on disaster resilient communities focuses on the local level, and discusses the broader context for community resilience in terms of “enabling conditions”<sup>xii</sup>. However, in a highly integrated economy, such as Japan, the EJGET teaches us that resilience requires the state to provide more than just enabling conditions for local, community-level resilience. Disaster resilience at the national level requires a whole-of-government approach that builds disaster resilience into the national economy. The EJGET has taught us that in Japan even energy policy must be considered in the design of national disaster mitigation strategies.

Facing once in hundreds of years natural disaster, the society which can minimize the damage and return normal as soon as possible, is sustainable. Above all, building resilient society means nothing more or less than establishing sustainable society.

6

Principles for building disaster resilient society

In his reflection on the series of disasters in eastern Japan, Professor Ryokichi Hirono proposes a set of principles relevant to building disaster resilience in Japan using the concept of the 4H™s (Horizon, Head, Hands, Hearts).xii

He discusses horizon as the need for “national and local visions of long-term development of all regions of the country”<sup>xiii</sup>, with a particular emphasis on areas previously affected by catastrophic disasters. Here, a scenario approach to natural and man-made disaster prevention and impact minimization that lays out cost-effective alternatives would be useful.

7

Heads, he explains, refers to:

Immediate and early drafting by local governments on the basis of the closest consultation among the people in the [disaster affected areas], with assistance and support of central government, of immediate, short-, medium- and long-term measures to be taken by individuals, communities and all the other stakeholders, to prevent and minimize the adverse impact of all disasters, all of which requires the following: i) strong political leadership at the top, ii) transparency of public information and accountability of local and central governments to all stakeholders, iii) closest possible cooperation and collaboration among all stakeholders; iv) clear definition of the responsibilities of all stakeholders, particularly the roles of local and national governments, v) cross-sectoral coordination and integration among sectors and government ministries and departments, e.g. agriculture, fishery, forestry, manufacturing, power, transportation, communication, finance, services, housing, health, education, welfare, security and armed forces, etc.xii

Hands, Professor Hirono explains, is about mobilising all traditional and recent knowledge and experiences, as well as generating new knowledge, through public participation and expert analysis to prevent and mitigate both natural and man-made disasters.

Hearts is about:

Involving all stakeholders in the decision-making processes related to disaster

prevention and impact minimization through: i) basic education at school and in communities, ii) practical skill training and exercises at all levels, c) inculcating of the sense of ownership and participation among all citizens in local communities.xii Although Professor Hirono's discussion is specific to Japan, many of the principles are generic and have broad application.

Japan faces its most severe crisis and largest reconstruction effort since WWII

Just before 3pm on 11 March 2011, at a magnitude of 9.0 Mw one of the largest earthquakes since modern recording began occurred off the eastern coast of Japan. With its epicenter approximately 72 km east of the Oshika Peninsula, the earthquake generated a massive tsunami that breached and washed over wave barriers and destroyed entire towns on Japan's eastern coast. Analysis later showed that the tsunami was over 20 – 30 meters in some areas.

8

Magnifying the scale of the disaster, the tsunami also washed over wave defenses protecting the Fukushima I and II Nuclear Power Plants, destroying reactor cooling systems at the No. 1 Plant and triggering a meltdown in three of its reactors. Hydrogen explosions destroyed the storage chambers of two reactors. On 12 March 2011, the Government ordered residents within 20km of the Fukushima power plants to evacuate. A scheduled evacuation order was released for some villagers located in the 20 – 30 km zone. Other areas in the 20 – 30 km zone were designated as "emergency evacuation preparation areas".

The impacts of the EJGET have been enormous and a massive humanitarian relief effort involving government, civil society and international support is now underway. 15,550 deaths, 5,688 injured, and 5,344 people missing have been confirmed.xx Almost half a million houses and buildings were totally or partially destroyed, xxi and more than 130,000 people have been placed in temporary shelters. The survivors have experienced shortages of food, water, shelter, medicine and fuel. Prime Minister Kan described the aftermath of the EJGET as the most difficult crisis that Japan has faced since the Second World War. With the Government setting aside US\$48.5 billion in emergency spending as a first step, Japan's largest reconstruction effort since the War is now underway.

As a mountainous island nation located on the "Pacific Rim of Fire" in one of the most tectonically active parts of the world, and with a climate that features both typhoons and heavy snowfalls, Japan is used to natural hazards, whether earthquakes, tsunamis, floods, or landslides. Japan has built up a certain degree of resilience to these and, in fact, people from around the world have travelled to Japan to study the lessons it has learned and its technological advances on disaster preparedness. New Zealand, for example, is interested in learning from Japan on how to reconstruct the city of Christchurch, which was badly damaged by a series of earthquakes beginning in September 2010.

While Japan continues to struggle with the resulting humanitarian and nuclear crisis, discussion has already begun on how to build a more disaster resilient society. In a press Conference on 01 April 2011, Prime Minister Kan presented an ambitious vision for reconstruction:

We must then begin preparations toward reconstruction. In fact, we will go beyond mere reconstruction, creating an even better Tohoku and even better Japan. We

9

are moving forward with the creation of a reconstruction plan that has this big dream at its core. I have received many opinions over the telephone from the mayors of each city, town and village in the disaster-stricken area. These opinions will be incorporated into the plan for instance, in some areas we will level parts of mountains in order to create plateaus for people to live on. Those residing in the area will then commute to the shoreline if they work in ports or the fisheries industry. We will create eco-towns, places which use biomass and plant-based fuel to provide natural heating. We will outfit cities with infrastructure to support the elderly. We aim to create new kinds of towns that will become models for the rest of the world.

The Cabinet Office established the multi-stakeholder reconstruction planning

council (officially named “The Reconstruction Design Council in response to the Great East Japan Earthquake”). The Council held 12 meetings over three months and adopted an action plan that underscores the need to promote reconstruction driven by the local communities. Disaster preparedness and wider use of renewable energy were also highlighted as guiding principles. Each prefecture and city has also formed reconstruction committees.

10

Case study: Rikuzentakata, Iwaki Prefecture

Rikuzentakata, a city located on the coast in Iwaki Prefecture, is one of the tsunami affected areas. The city’s death toll was 1,087 with 704 people recorded missing as of May 2011, out of a total population of 24,246. Economic damages included 3,159 houses completely destroyed; 1,368 fishing boats destroyed (the loss valued at 6.4 billion yen); seaweed and shellfish farming facilities destroyed and fish products damaged; damage to the harbor to the tune of 3.5 billion yen; livestock farms destroyed in two places (3 million yen); horticulture destroyed in 99 places (77.4 million yen); and 336 ha of rice paddy inundated (7.1 billion yen). The number of persons evacuated reached 10,143 and as of May 2011 49 evacuation shelters were operating. The temporary housing is being developed, with 2,200 units expected to be available.

In Rikuzentakata, about 10 fishery ports were operating before disaster. One contentious issue is whether to restore all the ports or consolidate them into a few that will be reconstructed. Funds are limited but the local fishermen are generally against privatizing the ports. The fishermen prefer to maintain schemes based on fishing rights that are in the form of collective fishstock/marine resource management. The current reconstruction financing is bound to support the restoration of the previously existing infrastructure, and is not designed to support the rationalization or consolidation of infrastructure systems. Private partnerships have also been considered, for instance, to support oyster farming restoration in Miyagi. However, this is closer to philanthropic donations rather than investment, and the volume of financing is still far below actual needs.

## 2. Building resilience to contend with extreme events (infrequent, catastrophic disasters)

Building resilience for infrequent, catastrophic disasters needs special attention.

Economic imperatives may lead to a playing down of the risks and likely consequences of extreme, irregular events, though Professor Ryokichi Hirono argues that that Japan should have been prepared for the EJGET and provides a list of previous large-scale events that pointed to the possibility of this type and scale of geophysical event.xxi

11

Restoration of inundated and salinity affected paddy lands

Restoration of inundated and salinity affected paddy lands is another important task in the reconstruction process in the aftermath of the EJGET. Farmers face financial and physical constraints to restore damaged paddy land and farms. Options that have been suggested include removing saline soil and replacing it with deeper lying unaffected soil or soil from other areas. Phytoremediation “the treatment of environmental problems by growing plants” such as rice, sunflower and rape/colza has been suggested. However, once paddy land is converted to farmland, it would take years to convert the farmland back to paddy land. The pros and cons of these proposals need further assessment.

Extreme events are sometimes labelled “black swans”. They are events that are outside of normal expectations as past experience does not suggest their likelihood of occurrence. Human memory may not span sufficient generations to ensure that lesson from the history of extreme events is incorporated into today’s planning and decision-making, or there simply may be no past human experience of a similar event. Even when there is living memory, the profit motive or competing demands on public funds may lead to avoidance of the costs for preparing for infrequent disasters.

A lesson from the EJGET is that human engineering feats that aim to obstruct the forces of nature cannot protect against the most powerful natural phenomena. Wave barriers have, in the past, successfully protected parts of Japan from tsunamis and will continue to do so for more frequent events of average magnitude. But this type of engineering solution can lull people into a false sense of security, with

potentially very high human and economic costs, as we have witnessed with the EJGET. The discussion in Japan has turned to the organizational, social and economic domains of disaster resilience.

12

Case study: Inter-community relief

The value of inter-community support during the relief and recovery stage has been observed in the aftermath of the EJGET as well as disasters in other countries. As national and prefectural (state) governments must cover all areas directly impacted by the EJGET and because of their internal rigidities, they have found it difficult to supply timely relief on a priority basis. Community-to-community relief has been observed as more flexible than the vertical relief channel of national government to local community.

When a community not directly impacted by the disaster is coupled with a disaster affected community to provide relief, the relief work can be better focused and thus more effective. When organizing relief in the aftermath of the Sichuan earthquake, the Chinese central government paired disaster affected communities with communities in unaffected areas. The unaffected communities competed between themselves to assist their counterpart communities, and this unconventional approach of inter-community relief aid worked successfully.

In Japan, inter-community relief gained popularity after the Hanshin earthquake in 1995. After the EJGET, relief was provided by various communities and municipalities; from both inside the disaster affected area (Tono City, Kurihara City, etc.), and outside the area (League of Kansai Municipalities, Sugunami Ward, etc.).

Tono City, located in Iwate Prefecture, where the impacts of the earthquake and tsunami were particularly severe, was relatively unscathed and became a relief supply center for non-governmental organizations (NGOs). An advantage of this inter-community aid was that Tono City is close to the devastated areas, which facilitated information collection and logistics. This is somewhat of an unusual example as in a widely damaged area it is difficult to find less affected communities that can extend a helping hand. Communities further removed from the disaster affected areas can also provide important support, however. Sugunami Ward in Tokyo and the Unions of Kansai Governments (UKG) are good examples. Sugunami Ward and other cities have long relationships with Minami Souma Cho, one of the areas affected by radiation from the Fukushima Daiichi Nuclear Power Plant, as sister cities. Sugunami ward used its inter-municipality network to provide relief assistance to Minami Souma Cho while UKG sent water and sewerage technical teams to the area.

A challenge in organizing inter-community relief aid is coordination. Matching affected and unaffected cities to ensure that the relief provided is based on needs can take time, though sister city affiliation certainly facilitate this process. In Japan, further thought is now required on how government can encourage inter-community relationships as part of a process of building more effective channels to provide relief in the aftermath of disasters.

13

3. Building resilience into recovery and reconstruction

In the aftermath of a catastrophic disaster, decisions will be taken that have long-term consequences. At an early stage there is a need to identify effective processes for ensuring that resilience building is integrated into the recovery and reconstruction process, so that the impacts of future natural hazards are better mitigated and societies more able to cope with these. Disaster management planning should provide a framework for making informed decisions in a time of chaos and uncertainty, as well as direct decision-makers towards the longer term goal of disaster resilience.

Diagram below presents holistic approach for recovery from catastrophic disasters. It lays out a general governance structure for building resilient society by taking a multi-level, multi-stakeholder scheme. There are many stakeholders involved; nonetheless, it is necessary for each of them to conduct actions which can be delivered most efficiently. For instance, national government should provide atmosphere where local stakeholders can play active roles such as providing funds, decentralizing authorities, creating special economic zone, etc.

14

At the local level, local government needs to know community specific demand of assistance, and implement policies. At the same time, options and tools – regulatory (e.g. land use zoning) and non-regulatory (e.g. the acquisition and setting aside of hazard-prone lands) – should be set out and their costs and benefits closely studied. Relief aid conducted by NPOs and private companies is important as well as that of other municipalities. Coordination of these stakeholders’ activities is crucial, since national and prefectural governments cannot flexibly correspond various needs in local areas. Challenging task is to maintain consistent relief aids from these stakeholders; therefore, national government should set environment to facilitate enduring voluntary relief from different kinds of stakeholders.

#### Renewable energy promotion in Kuzumaki Town

Kuzumaki Town is a leading locality in promoting renewable energy. Based in the mountainous area in Iwate Prefecture, Kuzumaki produces far more energy through its wind turbines, wood chips and bark, and cow dung than it consumes and sells the surplus to the local power company. The success of Kuzumaki can be attributed to its entrepreneurial mayor and ingenious staff of the town office trained in the leading dairy farm, Koivai. Kuzumaki was successful in obtaining subsidies from the government. On the other hand, it also faces some constraints in expanding renewable energy. The local power company has a quota to buy renewable energy and it prevents the town from investing in renewables. The distance between the site and settlement area makes it difficult to promote cogeneration and household waste for biogas application.

#### 4. Moving from linear to holistic thinking and contemplating deeper structural reforms

Prosser and Peters explain that disaster resilience is characterized by its –complexity, interactivity and interconnectedness– that traditional linear policy thinking, which is reductionist and works from policy to solution within –tightly defined conceptual modes–, is unable to handle.<sup>xiii</sup> They call for non-linear and holistic policy approaches, which require disaster resilience to be the collective responsibility of all members of society. The challenges are to facilitate both bottom up and high level engagement, and implement the principle of subsidiarity to promote local level flexibility within a strong national framework for disaster resilience.<sup>xiv</sup> This understanding leads to the definition of a disaster resilient community as one that –works together to understand and manage the risks that it confronts, but is also aware of the responsibility of all levels of government.–<sup>xv</sup>

15

Resilience includes the ability to –bounce back–, but this should not be viewed as merely returning to the way things were. Catastrophic natural disasters can highlight structural weaknesses in societies that make them vulnerable to large-scale natural hazard events. Deep structural reforms may be required, and the aftermath of a major disaster may allow for discussion of reforms that otherwise could not take place in –normal– circumstances.

#### Dealing with waste

Millions of tons of waste were generated by the EJGET that is now obstructing the reconstruction process but might also provide opportunities. Basic separation of waste has been undertaken, but this is not sufficient for final disposal. Biofuel production from wooden waste has been suggested as one way to make constructive use of the waste; however, this requires time for storing the waste and could interfere with reconstruction processes. Creating wave/tide breaking woodlands on waste mounds or using them for memorial parks have also been suggested, though the technical feasibility of these proposals needs to be further examined.

The EJGET has shown that the belief that the preventive measures taken against earthquakes and tsunamis at nuclear power plants were adequate was mistaken. This has led to a deep review of the nuclear power policy in Japan. At the G8 Summit in France, Prime Minister Kan explained his government’s determination to, as soon as possible, reduce Japan’s dependence on nuclear power by increasing the use of renewable energy such as solar, wind and geothermal power to 20% of the total electricity requirement of Japan by 2020. Will this be possible or –enough–? What other deep reforms are necessary for building disaster resilience in Japan that should now be on the discussion table? How can these reforms be embraced by a future vision for a low carbon, resource efficient, and resilient Japan? These and

similar questions about deep reforms and a future national vision now need to be placed on the discussion table. Determining who should participate in this discussion and how it should be facilitated are equally important as deciding the subject matter.

In light of these questions, and to facilitate discussion on solutions, the following framework for rehabilitation in the Fukushima area of Japan near the damaged nuclear power plant was created:

16

Approach to disaster areas in Fukushima should be different with others, since effects of radioactive materials need to be considered carefully. The diagram above lays out holistic approach divided into various levels. Considering characteristics of the hazardous materials, compensation scheme is major part of relief actions, including providing alternate lands for locals.

17

#### 5. Conclusion and the way forward

The preceding sections have outlined major global issues facing policy makers and other stakeholders facing disaster management challenges using the triple disasters in Japan as a current case of risk, relief, and recovery. Globally the most outstanding success factor has been a marked reduction in mortality-risk from disaster. Saving lives is, for obvious reasons, of primary importance, but quality of life is also a fundamental development and disaster management issue. Economic growth and technological advances have added immeasurably to quality of life and changed the social, political, and environmental landscape more rapidly in the past century than any other period of time in history. However these advances have also opened up new risks due in part to the human contributions to climate change generated by our rapid growth, to remarkable technological advances such as nuclear energy, and infrastructure developed without sufficient planning for disaster risk. The latter two situations are arguably made all the more troubling by poor governance and institutional failures due in no small part to short-term thinking. The results of such actions are more extensive and intensive risks suffered mainly by the most vulnerable populations, and increasingly within more developed areas.

The sudden, shocking, and in some ways unexpected nature of the recent disasters, in particular the triple disasters in Japan, are cause for deeper discussion on vulnerability, risk, and the policy decisions that need to be made for building a resilient and sustainable society.

POLICY BRIEF June 2011 vol.12

Green Economy for Sustainable Development:

Japan should lead the policy shift towards global poverty alleviation

Policy Proposals

The present socioeconomic activities of developed countries are in excess of environmental carrying capacity. Accordingly, the adoption of environmental taxes and payment for ecosystem

Satoshi Kojima

services (PES) schemes that reflect the consumption of ecosystems services and environmental

Director

services on economic activities is required to establish a genuine green economy model that is

IGES Economy and

compatible with environmental carrying capacity of the Earth. The creation of such a model calls Environment Group for shifting away from values that excessively seek convenience and reconsidering lifestyles dependent on mass production and mass consumption. de-kojima@iges.or.jp

In order to spread the advanced energy and environmental technologies of Japan to emerging and developing nations eager to switch to green economy models, it is essential to carry out precise matching of needs, giving consideration both to Japan's green innovation and to the green economy models of emerging and developing countries. A detailed plan for international standardisation of technologies, regulations, norms and standards in the environmental field (in cooperation with other Asian countries) is also urgently required. Kei Kabaya

Associate Researcher

In order to prevent policy on green economy from leading to green protectionism, efforts are nec-

IGES Economy and

essary to create mechanisms by which green economy policies promote sustainable production Environment Group within exporting countries. This can be accomplished through the bilateral combination of green kabaya@iges.or.jp certification and technology transfer to promote sustainable methods of production that fulfil the conditions of green certification.

A framework to carry out effective green economy-related discussions that overcome the differing standpoints of countries must not be based on any uniform definition of green economy. Rather, we must promote flexible approaches that allow countries to utilise not only their own green economy policies but also those of others to achieve their priority goals, including poverty eradication, while sharing a common objective: to shift to green economy on a global scale. Takashi Yano

Policy Researcher

Policy Brief #10 April 2010

Renewable Energy: A Strategic Policy for

Author:

Sustainable Development

Anindya Bhattacharya

There is ample evidence of underproduction of renewable energy across the world, in spite of there being the necessary resources to produce RE, including technology and finance. It seems politicians and law-makers have yet to be persuaded about the importance of renewable energy to solve the problem of energy security and sustainable development and to act on it seriously. As a matter of fact, renewable energy sectoral investment is highly correlated to the

Anindya Bhattacharya

Policy Researcher

international oil price movement. This further proves the continued myopic views

IGES Economy and

of the law-makers about the spectrum of benefits that renewable energy brings.

Environment Group

bhattacharya@iges.or.jp Hence, a lack of steady policy support for renewable energy is not only jeopardising the matured development of this promising market but also stopping the world from taking advantage of using it for multipurpose benefits including its use as a risk hedging instrument in the increasingly uncertain conventional energy market. Renewable energy policy has fallen into the trap of a boom-bust cycle of world economy and the corresponding international energy price fluctuation. Such policy is therefore unable to deliver its full benefit to society, including creation of green collar jobs and even reducing the electricity tariff for consumers. To overcome this bottleneck, the author has suggested a two-tier solution. First, mainstreaming risk-explicit cost benefit analysis of renewable energy policy at a country-specific level and second, improving regional cooperation to harness the maximum benefits of available resources scattered across countries with geographical proximity. It is indeed a strategic choice for the policy-makers to decouple renewable energy development activities from the boom-bust cycle of economy for seamless progress towards sustainable development.

Many Governments and law makers have not yet been persuaded on the direction of mainstreaming renewable energy generation in the overall energy policy development processes in the world. Renewable energy-based green power policy is still considered to be an expensive path for development, and so even after several boom-bust cycles of the world economy, policy makers remain hesitant to take a target based approach to increase green energy supply in the total energy mix. There are several other cases in and around Asia where in spite of having excellent potential and a good enabling environment, renewable energy is still heavily underproduced. It seems that politicians Environmental Strategies. All rights reserved. and lawmakers are yet to be persuaded about the use of renewable energy to address the Although every effort is made to ensure issues of energy security especially in the case of energy price fluctuation. It has been objectivity and balance, the publication of research results or their translation does not estimated that out of 2700 Twh total theoretical potential of renewable energy in Asia, imply IGES endorsement or acquiescence only around 6% has been harnessed (Romero et al 2008). In fact, technical and financial with their conclusions or the endorsement of IGES financiers. IGES maintains a position of constraints can limit the commercially available renewable energy by around a half of the neutrality at all times on issues concerning public policy. Hence conclusions that are total theoretical potential. While it is true that many governments are now proactively reached in IGES publications should be promoting renewable energy in the face of imminent price hikes for fossil fuels due to understood to be those of the authors and not attributed to staff-members, officers, increasing demand, there are several countries which have not yet taken actions to add directors, trustees, funders, or to IGES itself.

more renewable energy into the supply mix and which are still focusing on a future energy supply based on fossil fuel. As a matter of fact, the new concept of Green New Deal, a green economy policy initiative which also includes renewable energy, might also Environmental Strategies be very short lived indeed as it primarily depends on the individual country's plan of future development and growth.

-1-

In the past, whenever the price of fossil fuel fell for various reasons including economic recession, there was a sharp reduction in renewable energy investment and Research and Development (R&D) budget along with a drop in decisions to adopt new policies to promote renewable energy. Figure 1 below consists of two juxtaposed graphs showing the trend in the last couple of decades of total research and development budget allocation for renewables especially solar and wind in IEA member countries, and Whenever there is an increase compares this trend to international oil price fluctuations. It indicates that whenever in oil price, more green energy there is an increase in oil price, more green energy budgets tend to be introduced into budgets tend to be introduced the market. This is not only the case for the developed world but also in developing into the market. countries too. Anticipating more uncertainties in the world economy in the near future,

oil and other fossil fuel prices are expected to remain volatile in nature. Hence, renewable energy will continue to be subject to the boom-bust cycle of fossil fuel prices in the international market.

Figure 1: Renewable energy R&D budget compared to the crude oil price

The major problems arising out of such fluctuation in renewable energy policies are a decrease in investment interest from the private sector companies in this sector as well as an increasing amount of sunk cost<sup>1</sup> which is finally becoming

irrecoverable and is a bad investment for the whole economy. Overall, the inconsistent and fluctuating government policies in the renewable energy sector creates boom/bust cycle in the market jeopardising any long-term investment planning by companies. The renewable energy sector is still in the developing stage boom/bust cycle in the market and so needs continuous policy support from the Government to become matured. It is difficult for private sector investors to afford longer market uncertainties while investment planning by the main onus is on the government to create enabling environment for renewable companies.

1

Sunk cost refers to the investment which never gives a return to the investors.

-2-

Policy Brief #10 April 2010 © IGES

energy investment. As a matter of fact, abandoning one 5 MW wind farm (on-shore) project during its construction period will generate around USD5 million in sunk assets which will never give any return. Similarly, a 10 MW solar PV project if abandoned can generate USD25 million in sunk assets plus around 70 year-round jobs (Kobos et al.)

Lack of understanding of comprehensive benefits of renewable energy use is perhaps the main reason of failure to persuade the law makers for having a stable renewable energy policy in the country. There could be three main reasons for lack of understanding. The first one is, having negative perception about the relatively longer time span needed to accrue the benefits of high-cost renewable energy about the relatively longer time compared to conventional energy. Although the gestation periods for renewable span needed to accrue the energies are much shorter than conventional large scale power plants but their pay back periods are still very long mainly due to high installation costs and lower off-energy take level.

In Japan, pay back time is around 10 years for solar energy even with the increased level of Feed-in-Tariff scheme. It may take more than 5 to 10 years to observe the net benefits of the green energy supply in the economy.

The second one is, underestimating the co-benefits of renewable energy co-benefits of renewable such as power sector investment risk coverage. Benefits are accruable even in a energy such as power sector shorter time. Renewable energy investment in an investment portfolio for the investment risk coverage. The electricity sector can be considered a substitute to risk insurance premium which is paid mainly to mitigate the adverse impacts of a sudden rise in oil prices or a sudden increase in carbon price. The mechanism of using renewable energy as risk coverage insurance is based on the modern financial market portfolio theory whereby an increasing number of less risky assets in an investment portfolio whose investment returns are not correlated among each other can actually hedge the risk of single asset investment. The investment return should be seen from the portfolio's total return perspective rather than any individual investment return. Energy portfolio diversification with more renewable energy options whose fuel supply risk is nil or very low could actually give a wider space for risk mitigation of fossil fuel price fluctuation.

The third one is, ignoring the benefit of larger use of renewable energy to create downward pressure on retail energy prices. More renewable energy means use of renewable energy to

reduced demand of fossil fuels for power generation and therefore, reduced price of fossil fuels in the market. Less expensive fuel can further help to compensate retail energy prices.

consumers' additional spending on higher electricity tariff due to increased level of expensive renewable energy supply. It has been estimated that in the United States, a 1% drop in natural gas demand can reduce the long-term wellhead gas price by 0.75-2.5% (Wiser, 2004) and there would be a subsequent reduction of retail gas prices on the market. In certain cases like wind and solar PV technologies, use of renewable energy may not increase the retail tariff for the consumers (like remote area water pumping, refrigeration, street lighting etc. WEC, 1994) but can still help to reduce the fossil energy demand and prices subsequently. Moreover, as explained by Neij (1997), learning-by-doing can also reduce the costs of renewable energy supply which further increases the net benefits of renewable energy for retail fossil energy price reduction. There are three different studies (EIA, UCS and Tellus) shown together in Figure 2 below which demonstrate the impacts of increasing

renewable energy generation ( by increasing RPS quota from 10% to 20%) on average wellhead gas price on the US market. It has been estimated that increasing RE generation from 50 to 800 Billion kWh can reduce the average wellhead gas price by 60 cents/MMBtu. This indicates that even though renewable energy is apparently expensive, it has a certain damping effect on the fossil fuel price by controlling the demand in the market<sup>2</sup>

Figure 2: Renewable energy generation Vs Wellhead Natural Gas Price

2

Set of these studies predict that increase in renewable energy generation can cause a reduction in US natural gas consumption within the range of 1 to 11% and this can further suppress the natural gas prices within the range of zero to 18% ( Bolinger et al. 2008) ( The broken line indicates the trend of decreasing well head gas price compared to increasing level of renewable energy generation)

-3- Policy Brief #10 April 2010 © IGES

Figure 2: Renewable energy generation Vs Wellhead Natural Gas Price

It is a policy decision of the law-makers to create an enabling environment first where investors can invest more in renewable energy in spite of it not being cost competitive. In the end, by virtue of the economy of scale and learning by doing, the renewable energy sector itself can break the inertia of growth which will bring benefits to the consumers by helping to reduce the electricity tariff. Thus an increase in the supply of renewable energy can bring an additional benefit to the whole economy in the long term.

**Risk explicit cost benefit** In this respect, risk explicit cost benefit analysis of the renewable energy is analysis of the renewable very much needed. Policy makers should think of an effective alternative to reduce energy is very much needed. the risk of international fossil fuel price fluctuation and its negative economic and financial consequences on the national economy. Risk covering financial instruments like forward contracts and options which sometimes account for a half of the total supply cost, often play a decisive role in investment planning in the highly price-sensitive energy market. In natural gas importing countries like the United States, power companies are paying 0.4 to 1.7 cents/kWh (Bolinger et al, 2008) additionally to the gas supplier as price premium just to have a long-term price contract to avoid very high prices in the spot market. From 1996 to 1999 oil importers in the United States already paid around USD 5 per barrel as premium for a 12 month contract compared to the world average price of crude oil, which is around 17 to 20 billion USD per annum (EIA, 2009). Very recently, US crude oil futures for delivery in 2014 are traded at USD 80/barrel while the market price was just USD 50 /barrel. This further indicates that even during the lower crude oil price oil importers are still ready to pay hefty premiums (USD 30/barrel in this case) just to avoid supply uncertainty. Risk explicit cost benefit analysis of the power sector investments can influence the investors in favor of renewable energies even though they are apparently more expensive than the conventional sources. It is therefore, important for the law makers to create an enabling environment in the market where the investment risks not covered by the government are explicit. It has been estimated that a 1% increase in renewable energy supply in the Japanese electricity supply portfolio can reduce the portfolio risk by 1% which can significantly reduce the expenditure on risk-covering premiums (Bhattacharya and Kojima, 2010).

**Regional cooperation can help** Regional cooperation can help to have cost competitive renewable energy to have cost competitive supply domestically. Policy-makers can also think of increasing multi-country renewable energy supply regional cooperation to enhance the utilisation of renewable energy in the domestic market. There is unlikely to be uniform distribution of the renewable energy potential among the countries. To avoid both underutilisation and higher marginal production costs, regional cooperation among the countries to harness all possible potential of renewable energy can overall bring a win-win solution to the problem of high cost. Quite often it happens that the RE potential lies within the country which has less capacity to harness, in contrast to having less potential than a more capable country. To avoid such disparities, having cross border renewable energy infrastructure development can be a win-win solution. It has been estimated that

-4-

Policy Brief #10 April 2010 © IGES

Jinghong hydro power project in the Yunnan province of China can export more than 3 million kW of electricity to Thailand over a cross border transmission system by 2017. This would be around 30% less expensive compared to the cost of same amount of electricity production in Thailand (Bhattacharya et al. 2009). Similarly, a

power transmission line connecting China, Republic of Korea (ROK) and Russian Far East (RFE) can help to bring hydro electric power from RFE to ROK during summer and RFE to China during winter to meet the peak demands. RFE power flows to China can displace coal-fired power generation within China. As a matter of fact the net benefits of such interconnection could be around USD 750 million per year as avoided costs in the recipient countries like China and ROK (Hippel, 01). Moreover, this kind of project can also bring a win-win solution to the macroeconomic effects on both the countries in terms of increased GDP. Both China and Thailand can expect their respective GDP to increase by USD76 and USD47 million respectively thanks to this Jinghong hydro power project alone. In addition, both the countries would be able to reduce CO2 emissions by 1 million tonnes each. Table 1 shows the impacts of Jinghong cross border hydro power project investment on China and Thailand.

Creating green collar jobs. Creating green collar jobs. Policy-makers can use renewable energy to create a new employment category called "green collar jobs" and can then even improve the national employment rate amidst global economic downturn. Table 2 shows the job creation potential of each renewable energy technology on a global average basis which is indeed comparable to conventional power generation cases. In fact, the US economy under the Obama administration is now emphasising the green growth mechanism in spite of the ongoing economic recession to create more "green-collar" jobs to address both the environmental and the economic development issues together. It is expected that this new economic stimulus package worth around USD one trillion, can create more than 3.5 million jobs in the United States. Table 2 below shows how different renewable energy technologies can create employment at different stages of development. It appears that there are more jobs created during the commissioning period than after commissioning. Nevertheless, the renewable energy sector can further nourish the development of a skilled global labour force that is required for its long term operation and maintenance activities. In Asia, given the potential of renewable energy generation and given its employment generation capacity, around 1 million jobs can be created<sup>3</sup>. Apart from such organized sector job creation, renewable energy can immensely contribute towards the rural livelihood generation through unskilled and semi-skilled job creations. Renewable energy can even engage women in the income generating activities in the rural areas which can further create multiplier effects on the national economy as well ( Mehta et al.). Finally, while the policy-makers puzzle over the issue of effective utilisation of the billions of dollars of special stimulus money to revitalise the economies across the world, investment in renewable energy can bring relief to the economy.

3

3

Number of jobs has been estimated using both the REN21 projection of number job creation per MW of renewable energy and estimated Asian renewable energy potential (Romero et al. 2008). As a conservative estimate it is assumed that only 50% of the total theoretical potential would be harnessed.

## Conclusion

By virtue of its less risky characteristics coupled with other benefits including dampening impacts on fossil fuel prices, electricity tariff and enlarging “Renewable energy can bring a impact on macroeconomic outputs, employment status etc., renewable energy can win” win solution to this world bring a win” win solution to this world which is reeling under severe economic, which is reeling under severe social and environmental crisis. Moreover, based on the previous discussion, economic, social and renewable energy can be treated as context neutral strategic solution for sustainable environmental crisis. development and can be freed from any conditionality of the surrounding economic situation. Unfortunately, global renewable energy policies appear to be very unpredictable and closely follow the trends in fossil fuel prices, which is further linked to the economic boom-bust cycle. Instead of their context neutrality nature, the reality surrounding renewable energy development is still very much subject to context. However, we can no longer afford to continue with such swinging policies of renewable energy which can permanently jeopardize sustainable economic growth. The world cannot afford to see another oil shock in the near future either, and so needs to invest more on renewable energy. If so, that will determine the point of no return on the path to sustainable development. Policy and law makers should realise that given the level of uncertainties in the modern economy, it is almost impossible to predict the energy market with any reasonable certainty. As a matter of fact any delay could prove very costly. It is much safer to develop an alternative like renewable energy to protect the world from future energy uncertainties and to ensure a sustainable growth path. Continued promotion of renewable energy is therefore indispensable for modern society.

## ABSTRACT

This paper aims to contribute to the debate on strengthening international environmental governance (IEG) architecture towards more effectively promoting environmental

sustainability. To this end, the paper will analyse two broad reform options: 1) introducing universal membership of UNEP's Governing Council, and 2) elevating the status of UNEP to a specialized agency. The paper will analyze the broad reform options by focusing on their legal, financial and structural implications as well as on potential benefits and drawbacks of each option. In addition to these broad reform options, the paper acknowledges the importance of incremental reform of environmental governance that is taking place to enhance efficiency of environment work within the United Nations (UN) and on national levels. While these incremental improvements are valuable, the paper argues broader reform of IEG and UNEP in particular will be necessary to improve environmental governance, as stronger legal clout is ultimately necessary to arrive at more effective environmental governance architecture. Proposing broader reform, the paper argues that the two summarized IEG reform options should be implemented in a phased approach, and that benefits of broader reform would accrue not only to international environmental policy making, but also strengthen the role of environmental vis-à-vis economic policy making on national and local levels. Thus, the paper recommends that countries and citizens support the broad IEG reform options for the benefit of both international and national environmental governance.

1

## 1. INTRODUCTION: DEFINING THE SCOPE OF THE PAPER

Many countries are making progress addressing their environmental problems, but it is unlikely that a purely nation-state approach will suffice in addressing the international and global dimensions of environmental issues. At the same time, however, the current international governance architecture that has emerged over the last four decades is disjointed and inefficient and therefore unable to function effectively. As a result, environmental legislation remains notoriously weak. Stronger international environmental governance (IEG) architecture is necessary to safeguard the international and national environment and ensure that human well-being does not suffer from environmental degradation.

IEG refers to the international mechanisms, institutions and stakeholders that manage environmental challenges. The concept is related to how environmental issues reach the political agenda, how policies are formulated, and how programmes are implemented (IGES 2006). To match the limited scope of this paper, IEG will be defined as governance in context of the United Nations and particularly its relation to reform of the United Nations Environment Programme (UNEP). It should be pointed out that IEG is undertaken by a multitude of actors, and even though its role looks to be primarily international, bolstering it on the intergovernmental level would possibly benefit both national and local environmental decision-making.

### 1.1 IEG REFORM AND MULTILEVEL RELEVANCE

While much of the IEG debate has taken place in the intergovernmental arena, vertical linkages must be made to the realities on domestic implementation level. For example it should be emphasized that stronger legal and financial capacity of the IEG architecture will have multilevel benefits. Neglecting the impact on national level will make little sense, as decision makers, who represent their nation states, will not recognise the relevance and interest in supporting IEG. IEG reform should therefore be analysed for the potential contributions to national level policy making.

Apart from the need for vertical integration to enable to downstream flow of benefits from the international to the national and local levels, environmental policymaking can be bolstered by horizontal integration. This can happen by uniting ministries, as for example the ministry of ecology, sustainable development, transport, and housing in France. Germany introduced green cabinets, which improved the agenda setting capacity of its environmental ministry (Lenschow 2009:102). Sweden and the Netherlands have experimented with green reviews of national budgets (ibid.:75). Above and beyond national levels it has also been possible to strengthen environmental legislation. For example the Treaty establishing the European Union (EU) states that environmental protection, 'requirements must be integrated into the definition and implementation of the Community policies' (EU1997).

These tools and processes exemplify how national level environmental policy making has been strengthened to allow environmental concerns to gain more influence compared to traditional economic policy making. While these examples are inspirational and encourage reproduction in other contexts, the strengthening will continue ad-hoc and in a haphazard fashion as long as the main agenda setter on the international level remains weak. The paper will therefore emphasize

2

that strengthening UNEP by altering its legal, structural and financial composition would realize

considerable scope for improving effectiveness of multilevel environmental governance.

## 1.2 WHY BROADER REFORM IS NEEDED AND WHY IT WOULD MATTER

IEG needs to be strengthened not only because of the emerging environmental problems faced by multiple countries, but also to allow environmental decision-making to better match economic decision-making. Before examining the details of that argument in the context of UNEP, it will be necessary to provide a brief overview of some of UNEP's inbuilt shortcomings. UNEP was founded in 1973 with a broad mandate establishing it as the designated authority of the United Nations system in environmental issues at the global and regional level (UNEP 2011). However, it was never given autonomous decision-making power, and with the global increase of environmental issues, the lack of legal independence and funding has proven detrimental for its ability to successfully address environmental challenges. Earlier research (WRI 2002; Ivanova 2010; Biermann and Bauer 2007) establishes a number of reasons to the mixed successes of UNEP, which "among other factors - emphasize limited authority and funding as main reasons for UNEP's weakness.

The lack of centralized authority on IEG has resulted in the current fragmented environmental governance architecture. As could be observed over the last four decades, the gradually emerging environmental challenges have resulted in an impressive web of multilateral environmental agreements (MEAs) and programmes both within and outside of the UN's purview. It has been established (Kanie 2007, Najam et al. 2006) that there currently are well over 500 such MEAs. Many of them overlap, and governments, especially those with limited financial and human capacity, are severely challenged with their administration (ECOLOGIC 2004). Thus, the decentralized decision-making regarding these agreements can be said to be one detrimental characteristic of the currently fragmented IEG regime. In response to that fragmentation, the section on universal membership (see below) will argue that universal membership of UNEP GC/GMEF has the potential to address the issue.

Universal membership could centralize decision-making, which would resemble a significant efficiency and effectiveness improvement of IEG. However, the paper will argue that establishing universal membership is not an end in itself, but a strategic step towards strengthening IEG. The paper argues that a universally representative forum of environment ministers begs the subsequent provision of autonomous decision-making authority. Equipping environment ministers at the GC/GMEF with such authority would enable stronger international environmental policy making. This benefit can be assumed not only because of the purely environmental mandate and specialization of the GC/GMEF, but also in comparison to the current situation it would be an advantage for IEG. Currently, environmental proposals are always at risk of being sidelined in the United Nations General Assembly (GA), where decisions from the GC/GMEF have to be approved.

Finally, it must be emphasized that IEG reform must be approached with a view to make a change to some of the above-mentioned weaknesses. It would make little sense for example to increase the authority of UNEP without matching funding to enable the institution to address the environmental issues. The sections below will address the issues of decision-making as well as funding.

3

## 1.3 CHRONOLOGY OF THE IEG DEBATE

The debate on environmental governance goes as far back as the Stockholm Conference on Human Environment in 1972, which resulted in the creation of UNEP. Twenty years later, the Rio Summit gave birth to the Commission for Sustainable Development (CSD), with a broader mandate on sustainable development, tasked to oversee progress of Agenda 21. Later on, the UN established a Task Force on Environment and Human Settlements, which found gaps in the IEG system. To improve coordination, the Environment Management Group (EMG) and the Global Ministerial Environment Forum (GMEF) were created, the latter as a bi-annual forum to take place with the UNEP Governing Council. In the first years after the millennium, European and French initiatives attempted in vain to create sufficient momentum for the establishment of a World Environment Organization (WEO). Subsequently, the UN itself established a High Level Panel on System-wide Coherence, which articulated "Delivering as One" as a priority undertaking to improve coherence and coordination within the UN system (UN 2006). Two internal assessment reports of the Joint Inspection Unit (JIU) followed in 2008, and 2010, respectively, making concrete recommendations towards UNEP reform (Inomata 2008). The debate also went to the General Assembly, which resulted in a draft paper on options for strengthening IEG, however this never led to a Resolution, and in 2009, the GA tabled the issue due to lack of consensus. Although there was consensus on the overall need for stronger IEG, the way forward was still out of reach for agreement in the GA. In 2009, the GC/GMEF revived the process by establishing a consultative group of ministers of high-level representatives, who were tasked with identifying options for strengthening IEG. Late in 2010, the group presented the Nairobi-Helsinki Outcome on the options for reform (UNEP/GC.26/L.4/Add.1 2011). The

recommendations were subsequently debated in UNEP's 26th Governing Council in February 2011, which brought overall agreement on the options, but lacked consensus on which of them should be taken to strengthen IEG. It is now hoped that the occasion of Rio20 could serve as a platform for countries to make headway on the issue.

Research on the issue has brought a large number of analysis of the situation and proposals for a way forward. They can be classified as ranging from 1) those that support broader reform (Biermann 2007 and 2011; Biermann and Bauer 2004 and 2005); 2) those that debate whether reform would benefit the delivery of governance on the ground (Ivanova 2011; Tarasofsky 2002 and 2003) those that believe that incremental changes are the best, ranging from extending membership of the UNEP GC/GMEF to universality (Tarasofsky 2002), or the most realistic (Najam, Moltke, and Adil Najam, Tarasofsky 2002), given the lack of commitment to broader reform from governments at large. The research of this paper leans on the existing body of work on IEG in the way that it does not dispute the utility of incremental reforms, however it takes vantage point in assuming the feasibility of the most ambitious of the existing research proposals, if they could be carried out in the right sequence, as illustrated in subsequent sections.

4

#### 1.4 THE REFORM OPTIONS

The introductory section above established that there are shortcomings to the current IEG architecture and that reform is needed. However, several details have to be clarified to determine the actual steps that the international community needs to take to realise a stronger IEG architecture. Addressing demand for such information, the paper will argue for the feasibility of two options: a) introducing universal membership (UM) of UNEP's Governing Council/Global Ministerial Environment Forum (GC/GMEF); and b) establishing a specialized agency on environment. The paper will highlight both benefits and drawbacks of these options, as providing more information on the implications can garner more support for strengthening IEG. In addition to providing information on the feasibility of these options, the paper will argue that a phased approach of introducing the legal and structural changes would be the most successful. The sequence in which the reform options could be introduced is depicted in the figure below, essentially arguing that incremental reforms, as ongoing, are fundamental to broader reform, where universal membership of UNEP GC/GMEF represents the initial step, and the creation of a specialized agency, the second step. Of course this kind of contextual sequence is artificial and begs the question as to how precisely such institutional upgrading would benefit environmental governance at multiple levels. To answer this, the subsequent chapters will examine each reform option, and propose a structure on implementation levels as well. 1

Figure 1: Thrust of IEG Reform

Source: Authors interpretation

See Figure 4 – Cooperation on implementation levels on page 23.

1

5

Apart from the broad reform options, there are other areas that need strengthening, both within the UN and outside of the UN's regime, and particularly on national and local levels. Incremental reform options to IEG in a UN context are often supported by UN member states. The incremental changes can be immediately implemented within UNEP's current mandate and within the UN system. For example, the recent report of the UN Joint Inspection Unit (JIU) has made a series of recommendations that fall into the "incremental category" (JIU 2008 and 2010). These are mainly focused on improving effectiveness within the UN system.

Many improvements can be introduced that can benefit effectiveness of environmental governance and efficiency of overall UN response, including the "One-UN Initiative", which aims to bring more coherence into UN response at all levels. The incremental reform options are certainly important, because their implementation may determine the level of subsequent support to broader reform. In addition, they can be implemented under the current institutional settings. However, if environmental governance is supposed to be strengthened in earnest, incremental options will not suffice. Broader reform is necessary to equip UNEP with the authority and budget to better carry out the tasks related to environmental governance.

The need for better institutional infrastructure to respond to current and emerging challenges can be seen in another significant anthropogenic effect, namely climate change, whose abatement is arguably one of the most important global concerns. There is significant global agreement that greenhouse gases (GHGs) have to be drastically reduced by the middle of this century, but the details and sources of mitigation are still cause for much disagreement among countries. Nevertheless, it can safely be assumed that the current business-as-usual will not effectuate the needed reduction in GHGs, and that a socio-economic transformation, aided by effective and strong institutional architecture will be necessary.

## 1.5 THE ARGUMENTS

The last decades have given birth to a wide variety of actors and institutions in the environmental governance field. This has happened as a result of growing demand for research, capacity building on implementation, multi-level governance, monitoring, reporting and information sharing, and participation to name but a few. The various areas as well as their cross-cutting nature makes it clear that many actors, not one, will be necessary to answer to the demands for stronger environmental governance. Acknowledging this multi-stakeholder aspect of the discussion on improving environmental governance, the paper will approach the IEG discussion in the context of the United Nations, its reform and what IEG reform could mean for UNEP (GA 2010). The paper will focus on the financial, legal, and structural implications of the options and will assess their feasibility and potential benefits and drawbacks.

The paper will argue that the creation of universal membership of the Governing Council (option a) may be necessary to create the appropriate forum for examining other more broad reform options, including the option of elevating UNEP to a specialized agency for the environment (option b). It is important to remember that the discussion on a specialized agency has been addressed in the Governing Council before. At the same time, a proposal for universal membership has also been submitted to the UN Economic and Social Council (ECOSOC) for approval at the UN GA in the past. But neither proposal succeeded in achieving ratification.

6

For one, this hints that ECOSOC and the GA may not be appropriate forums for decision-making on environmental governance, and secondly, that another forum could be better suited for this debate. ECOSOC's mandate may be too broad and the GA too preoccupied with other issues. Additionally, proposals to strengthen environmental governance may have been met with scepticism because decision makers there have viewed the proposed measures for strengthening environmental governance as potentially compromising political and economic issues that are primarily dealt with in these larger decision-making forums.

The lack of attention can be appreciated, as ECOSOC serves as the central forum for discussing international economic and social issues, and for formulating policy recommendations addressed to Member States and the United Nations system (UN 2011). It is with this experience in mind that the creation of universal membership of the Governing Council must be viewed not as an end in itself, but as an important step towards creating a legally autonomous decision-making forum. A dedicated forum for decision-making on environment may better be able to make subsequent decisions on environmental governance, needed to more effectively address the mounting challenges to environmental sustainability.

In view of the above, the paper will argue that both options (a and b) for reform are feasible and effective means for strengthening IEG and must be considered seriously by decision makers if the stalemate of international environmental governance is to be solved. The options are presented in logical succession, arguing that achieving agreement on universal membership would be an initial step to strengthen IEG. Providing universal membership (see figure above) to the GC/GMEF would turn it into a global environmental governance forum with global representation and universal decision-making capacity. Arguably, such a forum could be better suited than ECOSOC or GA for debate and decisions on subsequent reform options for IEG, in particular also on option b) the establishment of a specialized agency on environment (Section 3).

## 2. REFORM PHASE 1: UNIVERSAL MEMBERSHIP OF UNEP GC/GMEF

The option of universal membership dates back to 1998, when a UN task force recommended it in a report on environment and human settlements (UN 1998). Member States were unable to agree on the issue, because its advantages were not clear (UNEP 2004). Universal membership, however, clearly relates to a part of UNEP's mandate, and introducing it would enable UNEP to better keep under review the world environmental situation in order to ensure that emerging environmental problems of wide international significance receive appropriate and adequate

consideration by Governments<sup>10</sup> (GA 1972).

The added emphasis shows one of the shortcomings on non-universal membership; because how can a non-universal council like the current Governing Council with its 58 members adequately address global environmental issues? This shortcoming is known, and has been one of the main arguments in earlier proposals for universal membership (UNEP 2004). Related to this lack of representation, the limitation of 58 members of the GC can also be said to perpetuate the north-south divide and inhibit the establishment of global governance including effective environmental cooperation.

Establishing universal membership is an important step signaling commitment of the international community to equal participation and responsibility, which are important aspects

7

of empowerment and sustainable development governance. Universal membership is certainly no guarantee that the north-south divide may be bridged as negotiation blocks may form that perpetuate the schism. But creating a global decision-making forum will send an important political signal that values such as common responsibility and inclusiveness are taken seriously.

## 2.1 THE DIFFERENCE BETWEEN UNIVERSAL MEMBERSHIP AND UNIVERSAL PARTICIPATION

When universal membership was proposed in the past, a compromise was achieved by establishing the UNEP's Global Ministerial Environment Forum. This provided for the next-best solution: universal participation. Subsequently that forum would take place in parallel with the UNEP GC. However, participation does not equal membership. In reality, once decisions have to be made, the GMEF becomes the "exclusive" GC with only 58 voting members. Counterarguments to the proposal for universal membership have emphasized the benefits that universal participation already lends to the GC/GMEF. Certainly these have to be acknowledged, and much awareness and capacity has been built by this arrangement that has provided a forum for the world's environmental policy makers to meet and greet. However, universal membership should be viewed as a step towards establishing global representation of environmental decision makers in the true sense of "decision-makers".

If universal decision-making were achieved it would subsequently be possible to argue for the provision of legal autonomy to the GC. Doing so would ensure that environmental issues could find sufficient response amongst the world's environment ministers, who are mandated to give importance to environment related issues. This could remove some burden from the United Nations General Assembly (UNGA), which in any event may give environment issues attention in the way they relate to economic and political issues. Addressing environmental issues in an economic and political forum is also important but just not sufficient. Instead, it may be necessary to grant universal membership to UNEP GC and create a more dedicated decision-making body necessary to address many challenges facing environmental sustainability.

The need to create a stronger environmental decision-making body can be recognised in the historical context. Since UNEP's inception in 1972, crosscutting environmental problems have increased globally. Coherence in addressing issues related to air, biodiversity, climate, desertification, or water has become relevant for all countries' development. Extending the membership to all states would match the global scope of overarching environmental challenges, including the need to properly address Principle 7 of the 1992 Rio Declaration on common but differentiated responsibilities. Moreover, it would empower the GC/GMEF to better determine the course of environmental governance as it was originally envisioned in Resolution 2997 from 1972.

Skeptics argue that universal membership would make decision-making cumbersome when many voices have to agree on many points. This is a valid concern, which could be partly addressed by establishing either an executive board or an elected bureau of GC representatives. This bureau would be mandated to deal with day-to-day management issues and leave

It was established in 2000.

2

8

overarching issues related to the governance of the environment to the GA of the UNEP Governing Council.

One major drawback to introduction of universal membership is that it could mean that some

countries lose comparable advantage in the GC decision-making process, as their vote will mean less with increased numbers of voting members. This has to be acknowledged as a significant hurdle hindering its introduction. In addition to the issue on influence, some countries oppose universal membership, because they fear it would create precedence for other UN organisations and bodies. Universal membership may be viewed as cumbersome for decision-making. To accommodate this, it could be possible to alter the decision-making structure of the GC. The following sections will summarize legal, financial and structural aspects of universal membership of UNEP's Governing Council as well as provide information to the benefits and drawbacks of such decisions.

## 2.2 LEGAL ASPECT OF UNIVERSAL MEMBERSHIP

The legal implications of universal membership are related to the convening role of the GC/GMEF and, as previously mentioned, it should be noted that the GC/GMEF has a dual function, distinguishing between the GMEF with universal participation, and the GC with its decision-making mandate limited to the 58 members. It can therefore be observed that the plenary of the GC, called the Committee of the Whole (COW) shifts between acting as GC and GMEF, depending on whether decisions have to be made or not. Changing this practice by extending decision-making responsibility to all countries would require a UNGA resolution, but it would not be considered impossible, as UNEP could remain a subsidiary body of the UNGA. <sup>3</sup>

## 2.3 UNIVERSAL DECISION-MAKING

Currently the GC uses the UN unanimity rule of decision-making. While this may be the most democratic method of voting, it also has certain drawbacks, including the increasing difficulty and inefficiency in reaching consensus amongst a greater number of voting members. To address this it could be possible to consider introducing new decision-making techniques. This could avoid opaque negotiation situations, <sup>4</sup> as well as lowest-common-denominator decisions or stalled negotiations due to inability to reach consensus.

There are examples from existing institutions that utilize multi-level co-decision-making systems. The co-decision procedure has become central to the European Community's decision-making. It is based on the principle of parity and means that neither the European Parliament nor the Council of Ministers (CM) may adopt legislation without the other's agreement (EU 2008). If agreement cannot be reached at initial attempt, disagreeing parties have the option of proposing changes to the proposal. These then have to go through a second reading by

If UNEP's status is elevated to that of Specialized Agency, then its reporting line may change. Legally, <sup>3</sup>

specialized agencies are not required to report to the UNGA but can specify the nature of their relationship to ECOSOC and the GA additionally.

<sup>4</sup> The World Trade Organization (WTO), which bases decision-making on consensus-based voting, has

been criticized for being non-transparent in its decision-making process. It is said that negotiations often are kept informal with major developed countries being the most influential representatives in these negotiations <http://www.towside.org.sg/title/bg13-cn/htm>.

<sup>9</sup>

the European Parliament in order to either pass or be vetoed. This modality could be used in two instances being a) cases where block politics happen and working compromises need to be identified; and b) in cases where the GC/GMEF and the UNGA disagrees.

Other European Union (EU) voting practices can enhance efficiency of decision-making. At the moment, EU proposals are decided by qualified majority voting. <sup>5</sup> In a qualified majority voting scenario, a majority of over 71 percent of voting members' weight has to agree before a decision can pass. In practical terms it means that each member is assigned a weight (a number of votes); and in order for the CM to pass a bill, the aggregate weight of those voting for it must equal or exceed a set quota of 71 percent. <sup>6</sup>

Due to increasing number of EU member countries, the Lisbon Treaty (2009) decided to amend the voting structure to double majority voting in 2014. This means that the qualified majority condition specifies requirements not only in terms of a certain percentage of voting members but also with regards to the proportion of population represented. The new system is meant to ensure fairness in decision-making, as larger countries can benefit in terms of their share of population, while the one-country-one-vote part of the double weighed system in turn benefits smaller countries.

Primarily, the new voting system will be introduced to ensure that the larger countries will not be able to force decisions without sufficient support by smaller countries. <sup>7</sup> As a secondary

benefit majority voting speeds up the decision-making process, when compared to consensus based decision-making and thus can be considered useful also for efficiency improvements. A potential drawback to this kind of decision-making could include its apparent complexity. Implementing such a system may require awareness-raising of its functions and advantages. In the case of UNEP, Nairobi could design voting software that calculates the qualified thresholds automatically so that only the essential delivery of position remains as key task for negotiators.

A similar method is practiced by the Global Environmental Facility (GEF), which uses double weighed majority. In a GEF voting scenario, support for a proposal requires at least 60 percent majority from all member countries and 60 percent majority from total contributions. This ensures that important decisions are not made only by those members that contribute the most to GEF's budget, but provides voice also to those that do not necessarily have the most financial capacity for a certain decision (Werksman 2003).

The evolving voting systems of the EU (supplemented by the example from GEF) indicate that increasing memberships of any group or forum will result in more complex decision-making procedures. However, the example shows that decision-making systems can be adjusted to accommodate both needs for efficiency as well as for democratic influence even in face of increasing (or universal) membership. Overall this indicates that institutions can evolve to respond better to the demands of the environment and that of their growing membership. Moreover, and perhaps most importantly, it also shows how decision-making systems can be

Also called weighted decision rule.

5

The concept of weight is calculated by countries' population size.

6

7 In detail the double majority voting system means that at least 55% of EU states must vote in favour of a

proposal and at least 65% of the EU population must be represented in that group. To block a proposal, at least four countries must form a so-called "blocking minority" [http://www.eu-opsyningen.dk/euo\\_en/spsv/all/43/](http://www.eu-opsyningen.dk/euo_en/spsv/all/43/)

10

designed to anticipate the heterogeneity of members and bring the highest degree of transparency and fairness into the decision-making modalities.

## 2.4 APPLICATION IN PRACTICE

Double weighted majority could be applied to situations for decisions involving larger funding for programmes. One factor could include funding as a variable additional to number of supportive countries. When legislative changes were proposed, a special triple weighted majority could be envisioned, in which not only funding but also number of countries as well as population determine the outcome of a vote. At the same time changing the voting structure would not be a precedent, because as shown above, if GEF is considered as a part of environmental institutions, then decision-making systems of the current environmental institutions are already diverse. This being said, it may be useful to propose additional research into the benefits and drawbacks of these options, to better provide information on the most suitable option for decision-making at a Global Environmental Governing Council (GEGC). This could be a conditionality to be managed by initiating countries that make the proposal for universal membership in Rio.

## 2.5 FINANCIAL ASPECT OF UNIVERSAL MEMBERSHIP

Similar to the overall core funding of UNEP, funding of the GC/GMEF is administered by the UNGA. This is a normal *modus operandi* for programmes and funds that are subsidiary to the UNGA. Financing of the annual GC/GMEF derive from the UN Environment Fund.

It is important in this respect to note that the GC/GMEF itself absorbs only around one percent of UNEP's total annual budget. Thus, compared to the funding that is in fact needed to halt the destruction of the environment, the financial consequences of introducing universal membership of the governing council are negligible at best (ECOLOGIC 2004)). Since the event itself spends only miniscule proportions of UNEP budget, it makes little sense to use financial implications to argue against universal membership.

Earlier research on the issue of funding support for GC/GMEF revealed that the budgeting of the GC already anticipates and calculates the participation by non-members as well as members (reflecting the current universal participation of the GMEF). Countries are aware of that, and even developing countries that are not current members of the GC are invited to participate at the GC/GMEF with the understanding that the UN will cover the logistical cost of their participation. As this kind of support for participation is already common practice, universal

membership would not place any additional financial burden on member states, neither directly as financial expenses for their participation, or indirectly on member states' contributions to UN budget.

## 2.6 ESTABLISHING PERMANENT COUNTRY REPRESENTATION

A drawback related to the financial implications of universal membership, however, could concern states that do not yet have permanent representation in Nairobi (Ecuadorian Ministry

11

of Foreign Affairs 2011). 8 Especially Latin American countries do not have embassies in Kenya, 9 and universal membership would incur additional expenses to establish a permanent presence in Nairobi. However, it can be expected that the bulk of the cost would be a one-time expense to establish a consulate or embassy on location. Until that is achieved, currently practiced interim solutions are possible: Latin America appoints representative focal points to ensure that information from UNEP's Committee of Permanent Representative (CPR) meetings is forwarded to all countries concerned (Danish Ministry of Environment 2011). 10 However in the long run, countries would have to establish permanent missions on location, and additional cost would be expected from that.

## 2.7 UNANSWERED QUESTIONS OF FUNDING OF THE GOVERNANCE REGIME

In a larger perspective, universal membership of the GC could form a suitable platform for discussions on expanding UNEP's funding options. Perhaps the granting of universal membership could come with a conditionality that requires the universal forum to earnestly deal with the larger issue of lacking funding for IEG. Fair decisions on this issue could then be made in a forum with global membership consisting of developed and developing countries at equal level and with equal influence in the decision-making process (see section above on change of voting structure).

The modalities of introducing innovative financing mechanisms such as Tobin Tax, levies on international air-travel, or assessed contributions as a miniscule proportion from countries' defense budget should also be openly discussed. These are well-known options for financing the environmental governance regime. More focus on such discussions would be timely; as would more focus on a related issue being the overall lack of consistency of funding, which is hampering with effectiveness of planning and execution of UNEP's operations. 11

There remain additional questions pertaining to financing of a functional environmental regime and financing of the implementation of Multilateral Environmental Agreements (MEAs) on national level. Universal membership is clearly not a silver bullet for environmental governance, but it should be considered as an important intervention to strengthen it. It is clear, however, that much higher budgets for environment will be necessary in the coming years to address implementation gaps, as well as lacking capacity and access to technology - all pertinent issues repeatedly addressed by developing countries in intergovernmental negotiations. These substantial hurdles to implementation could be addressed by a GC/GMEF with universal membership.

## 2.8 STRUCTURAL ASPECT OF UNIVERSAL MEMBERSHIP AND ITS RELATION TO MEAS

As was briefly mentioned in the introductory paragraphs, the sense in establishing a global forum to address international environmental issues could be considered a normative truism.

Personal communication

8

See <http://embassy.goabroad.com/embassies-in/kenya#> for a list of embassies in Nairobi. Currently the

9

only Latin American countries represented are Argentina, Brazil, Chile, Colombia Costa Rica, Honduras and Venezuela.

10 Personal communication

11 Personal communication

12

And as such, most people would tend to agree with need for a better IEG architecture. However, it should be clearly illustrated how universal membership could better address shortcomings in

the current environmental governance structure as well as how it would contribute to improving the environment. This is necessary to make a convincing argument for universal membership.

One oft mentioned criticism of environmental governance focuses on the problem of overall fragmentation, overlap and inefficiency. In response to this critique, mainstreaming efforts have been undertaken in the chemicals cluster and the biodiversity related conventions. These efforts show that MEAs can either be clustered according to issue-based, functional/organizational criteria, or they can have a particular regional scope by co-locating and merging secretariats (Najam 2006; Fauchald 2010).

In this regard, introducing universal membership could potentially contribute to enhancing coherence and efficiency of the several hundred existing environmental agreements by creating an umbrella forum for centralized decision-making on MEAs. The close relationship between UNEP and many MEAs is written in the text of the conventions. For example, the following excerpts from the Convention on Biodiversity (CBD) show structural and financial links between UNEP and the MEA:

Decision I/4: “Designates the United Nations Environment Programme to carry out the functions of the Secretariat of the Convention while ensuring its autonomy to discharge” (CBD 1994).

Decision I/6: “Designates the United Nations Environment Programme as the Trustee of the Trust Fund for the Convention on Biological Diversity” (CBD 2010).

The Rotterdam Convention contains similar decisions, cementing its relationship with UNEP (and the FAO):

Decision RC-1/9: “Invites the Executive Director of the United Nations Environment Programme and the Director General of the Food and Agriculture Organization of the United Nations to appoint an Executive Secretary in consultation with the Conference of the Parties through the Bureau” (Basel 2010).

“The Executive Director of UNEP and the Director-General of FAO delegate their authority to the Executive Secretary from UNEP and FAO, to act on their behalf, to represent the Secretariat and to carry out its functions” (WHO 2007).

## 2.9 CLUSTERING MEAS UNDER A GC UMBRELLA

The examples above illustrate the institutionalized relationships between UNEP and the MEA Secretariats. They show that, in addition to being responsible for the initial establishment of

13

many MEAs, UNEP functions as a secretariat for many of them. As can be seen in the legal text from these conventions, there may be possibilities for further developing the relationship between UNEP and the MEAs, in particular if UNEP GC/GMEF is equipped with universal membership and decision-making capacity. That way, the forum could become a venue for co-reporting, sharing of best practices and enhance coherence among MEAs. Establishing such a forum might incur some up-front cost for establishing it, but it is expected that it could yield cost-benefits in the long term (Urho 2010).

The possibilities for introducing such co-reporting and decision-making on MEAs at GC/GMEF would have to be researched in detail, since drawbacks could include that it might compromise the legal autonomy of MEAs as well as overlap with the functions of the Conference of Parties (COP). Such potential for conflict between UNEP and MEAs may also be one of the major reasons to why universal membership has not been accepted despite repeated suggestions and arguments in its favour. 12 To avoid the potential for conflict between UNEP and MEAs it would be necessary to formulate agreements that clearly designate the roles of the respective forums. Doing so might make the option of MEA COP co-location with UNEP GC a politically viable and acceptable option for UNEP and for the established MEA secretariats. This could make the current IEG system less fragmented and more efficient, both in terms of time, and finances.

Apparent discrepancies between the universality of the GC/GMEF and MEAs with only limited membership could be addressed by way of discerning between “multilateral” and “plurilateral” agreements (Biermann 2011). Accordingly, members of GC that would yet have to ratify an

agreement could participate with observer status, as is already practiced in other forums. Such multi-tier membership could also have the potential of enhancing ratification ratios of MEAs among laggard states.

Finally, positioning some MEAs under a UM GC/GMEF would present a good opportunity for effectiveness gains, as doing so could result in better reasoning for national level policy and implementation committees that could better articulate policies and measures to respond to the needs of thematically related MEAs on the ground. In the long-term, the clustering of MEAs in a single forum could enhance compliance and enforcement of the agreements. Modalities used in the trade regime hint at possible measures, as the WTO is utilizing a system of “cross-agreement sanctioning” (Wendell 2011). This option allows the suspension of concessions under other agreements, if some reason or another, penalties under the non-compliant agreement is impossible.

## 2.10 IN SUM

UNEP GC 26 was not able to make a decision on universal membership. While some countries stated their support, others clearly did not; and diverging views on this issue remain. The arguments presented above will hopefully contribute to a better understanding of the potential advantages of universal membership and the options for introducing new voting systems to

See Fauchald, Ole 2010. International Environmental Governance: A Legal Analysis of Selected Options.  
12

Fridtjof Nansens Institut. <http://www.fni.no/doc&pdf/FNI-R1610.pdf> for a detailed analysis of the benefits of clustering MEAs under UNEP. Additionally, see <http://www.iisd.ca/vol16/enb1619e.html> for details on countries’ in favour of universal membership.

14

outweigh and avoid some of the potential drawbacks of increased membership. As stated, it will be important to clearly demonstrate to decision makers that universal membership will not change the amount of funding needed to convey the annual GC/GMEF. The following table summarizes some of the main points made in the previous section:

### Expected benefits Potential challenges

• Global representation and increased voice of • Some countries may perceive increasing ministries of environment and better recognition of number of “voices” in GC/GMEF as loss of global environmental issues; comparable advantage in decision-making  
• Increased efficiency in decision-making; process;  
• Enhancement of coherence and efficiency of MEAs;  
• Could create precedence for other UN  
• Clustering of MEAs under a forum with universal organizations and bodies’ membership membership could yield long term cost-benefits; structure;  
• Better addressing MEAs would enhance UN  
• Financial consequences of introducing universal credibility with member states and increase likelihood membership of the UNEP GC should be fully of continued support for subsequent broader reform investigated and reported;  
of IEG;  
• Not all countries have permanent representatives in Nairobi;  
Required input Expected output

• Change decision-making modality from consensus to • Global forum could make strong decisions on qualified majority; environment and improve effectiveness of IEG;  
• Establish executive board or elected bureau for day- • Faster decision-making process; to-day management;  
• Possibility to cluster decision-making on MEAs;  
• If GC/GMEF becomes decision-making umbrella over  
• Lessen operating cost of COP/MOPs when related MEAs, “cross-agreement sanctioning” to mainstreamed with GC/GMEF;  
incentivize compliance with agreements could be  
• Possible to enhance compliance by use of introduced;

â€¢ Multiple MEAs under one roof should be handled by â€“cross-agreement sanctioningâ€” between related MEAs;  
 way of discerning between â€“multilateralâ€” and  
 â€“plurilateralâ€” agreements;  
 â€¢ Certainty among member states that universal

Table 2: Universal Membership  
 membership will not change cost of annual  
 GC/GMEF;

Source: Authorâ€™s compilation

Trade-offs will have to be taken into consideration if environmental governance is to be meaningfully reformed. The tradeoffs refer to the potential efficiency gains from locating a number of MEAs under UNEP GC. Existing MEA secretariats might not agree to that. However it is worth to remember that the final decision to change the location of the MEAs or not can be executed gradually, and ultimately depends not on the willingness of the MEA Secretariat but the intentions of member states.

Finally, the introduction of universal membership could be combined with a conditionality, i.e. that the empowerment of the forum shall be linked with commitment and responsibility to deal with other central issues to the IEG process such as predictability of funding, proposing the establishment of legal autonomy and decision-making power, implementation assistance from UNEP in support of MEAs on country level, and other concrete steps needed to strengthen

15

environmental governance and bridge the implementation gap. However, these issues require consensus on important but contentious further steps that a universal forum equipped with decision-making power could address. Subsequent tasks of determining detailed strategies for supporting MEAs on country level, additional capacity building for governments, and other crucial issues needed to strengthen environmental governance could be approached effectively by elevating the status of UNEP from its current programme to a specialized agency on environment.

### 3. REFORM PHASE 2: ESTABLISHING A SPECIALIZED AGENCY ON ENVIRONMENT

The discussion on strengthening international environmental governance has progressed over the last decades but a conclusion is as lacking as ever. The recent Nairobi-Helsinki consultation process established points on forms, functions and responses that, if implemented, will bolster IEG. The discussions concluded with agreement to focus on five different forms, some of which entail incremental improvements to existing bodies as well others with broader reform objectives (UNEP 2010). This section will limit its focus to the option for establishing a specialized agency on environment.

#### 3.1 LEGAL ASPECT, BENEFITS AND DRAWBACKS OF A SPECIALIZED AGENCY:

In the UN context, specialized agencies are created to address issues that UN and member States deem important enough to justify the creation of an autonomous agency. Such agencies have their own legal identity, a plenary decision-making body (General Assembly), a representative executive body and a secretariat. They can be established by a resolution from UNGA (UN Charter, Article 57), to which they are linked through ECOSOC. In addition, the UNGA (UN Charter, Article 63) can determine the details of the agencyâ€™s relationship with the UN, and to what extent it would have to follow recommendations of ECOSOC.

Establishing a specialized agency for environment would demand great political commitment from the international community, because it entails creating a legally autonomous agency with its own decision-making power. This is a conscientious issue, because doing so could remove environmental decision-making power from the GA and ECOSOC. Critical voices argue that this drawback is sufficient to consider elevating UNEPâ€™s status to a specialized agency for environment as an unrealistic option.

#### 3.2 DECENTRALISED DECISION-MAKING

The decentralization of autonomous decision-making may certainly deter some parties from supporting this option. However, it might be helpful to consider this issue in a different context and argue that if decision-making on environment related issues were to be deliberately

removed from ECOSOC and GA, it would be possible for the latter bodies to better focus on overarching economic and political governance issues. Indeed, these issues have an environmental dimension, but concentrating environmental decision-making in an autonomous agency could potentially make environmental decision-making more effective, and this is needed for the current governance structure.

16

EU practices indicate that decentralization of power can be useful. In its establishing treaty (Amsterdam Treaty), the institution acknowledged the importance of "proportionality, and subsidiarity" and made them central and determining principles of its decision-making structure (EU 2011). Accordingly, subsidiarity is used to decentralize decision-making on behalf of the EU "in areas which do not fall within its exclusive competence" (EU 2006). For environmental governance on the UN level it could mean that the UNGA delegated technical decisions on environment to the specialized agency. Contrarily, similar rules would apply to the GA of the specialized agency, which would have to (and legally could, by means of UN Charter Article 63) consult decisions of great economic and social importance with the UNGA before making decisions.

### 3.3 STRENGTHEN THE ENVIRONMENT VOICE ON INTERNATIONAL AND NATIONAL LEVELS

While the call for establishing a specialized agency on environment is pertinent, it has not yet been accepted and international environmental governance remains crippled. A similar situation can be observed on country levels, where ministries of environment often find themselves positioned rather badly in the national decision-making hierarchy. There is a need for elevating the status of environmental agencies and ministries on national as well as on international levels, because UNEP in a sense is representing all national environmental authorities. Compared to the situation in 40 years ago, environmental authorities in the world have become full-fledged ministries in many countries. This gives a good reason for strengthening UNEP accordingly. Establishing a specialized agency for environment would create an autonomous decision-making structure on the international level that could help policy makers translate international decisions into national level environmental policies. More national level clout of environmental ministries could benefit not only increased capacity of environmental officials, but also enhance agenda setting and negotiation power in the national policy formulation and assessment processes.

The potential drawback of creating a separate decision-making structure has often been used as one of the main arguments for UNEP retaining its status as a programme. Countries have argued that a programme by its very definition is nimble, flexible and therefore able to better mainstream environment throughout decision-making (Ivanova 2007). It is an important point; in fact the increase of cross-cutting environmental issues has only lent more amplitude to the need for integrating environmental concerns throughout policy making processes at all levels. However, the question is whether weak and badly funded programmes are really the right vessels to enhance the voice of the environment in a choir of strong singers.

As was mentioned, an environment programme has not been able to sufficiently determine the international political agenda. A stronger body with legal impetus to oversee the integration of environmental concerns throughout decision-making is becoming increasingly relevant to halt environmental degradation. In relation to the sustainable development discourse, it has also become clear that the environmental dimension of sustainable development has been neglected in favour of economic growth. Realizing the need to reaffirm the importance of the environment as fundamental foundation economies and well-functioning societies, it is therefore argued that ministries of environment and natural resources need a much stronger and autonomous body to place the environmental agenda better at all levels of the governance discourse.

17

### 3.4 COMBINING TOP-DOWN AGENDA SETTING WITH BOTTOM-UP INTEGRATION

A specialized agency would not displace environmental focal points in other ministries, nor would its purpose be to unite and mainstream all environmental divisions and programmes under one. This kind of bottom-up integration on the implementation level is already underway. Environmentalists perceive as a significant progress that many public and private sector institutions have established either environmental terms of reference as part of their mission, or have positions dealing with environmental mainstreaming. At the same time, however, bottom-up integration is not sufficient, and a specialized agency would be needed to steer top-down integration of environmental concerns into planning, policy-making and evaluation. Options that are specific to the legal clout and personality of a specialized agency would include better agenda setting in the policy making process, stronger legal and regulatory purview, and the ability to raise serious concerns with regards to other environmentally harmful policy proposals.

### 3.5 FINANCIAL ASPECT, BENEFITS AND DRAWBACKS OF A SPECIALIZED AGENCY

In addition to considerable political will for its establishment, a specialized agency will need more and predictable funding to position environment higher on the agenda and carry out the functions of its mandate. Normally agencies determine the details of their funding arrangements with their constituents. Many specialized agencies, as for instance the International Labour Organization (ILO), the World Meteorological Organization's (WMO) and the World Health Organization (WHO) derive parts of their funding from assessed contributions.

Assessed contributions are normally based on countries' capacity to pay and measured by factors such as national income and size of population. There are minimum and maximum ceilings to the contributions, ensuring that no state pays more per capita than the per capita contribution of the highest contributor (WHO 2000). Other parts of the budget can derive from extra budgetary donations, trust funds and partnership agreements that can be earmarked for special cooperation programmes.

### 3.6 MEMBERSHIP DEFINED BY LEVEL OF CONTRIBUTION

Some agencies, including the WHO, also allow for differentiated memberships that provide space for countries, territories, or other actors with lesser contributions to partake as observers, or with a limited voting capacity (WHO 2009). A concrete example of heterogeneous membership systems can be seen in the World Tourism Organization that was elevated to become a UN Specialized Agency in 2003. It has differentiated membership status that apart from effective members also accommodates associate members, affiliate members and observers (UNWTO 2011). The membership status however, does not depend on level of financial contributions, as these are decided on an assessed scale, but membership status is tailor made to sovereign states, territories, associations, or private entities. While this example shows the option of differentiated membership status, it would have to be determined whether similar differentiation would be possible as a factor of funding contributions, since such could potentially increase the political willingness towards establishing a specialized agency. However, such proposal should also be cautiously approached, since it might result in an agency without "effective" and paying members.

18

The ILO introduced a flexibility mechanism in 2006 to give countries some leeway in the event that they were unable to cover their assessed contributions. Since resilience to financial and economic fluctuations would be considered a necessary element of any funding structure for the future, it could be useful to design the financing structure of a specialized agency with such an inbuilt flexibility mechanism. In addition, a specialized agency could derive parts of its funding from "other" sources and "miscellaneous income", and allow fund raising from the private sector and philanthropists to play a role that matches the expected responsibility from various stakeholders in a more effective and multi-level environmental governance system. A related issue was also briefly mentioned in the section on universal membership, where the intention would be to establish the GC/GMEF as suitable forum determining the details of such "innovative funding" systems.

Comparing the financial implications of a specialized agency with those of universal membership of the GC/GMEF, it becomes clear that the former would entail much greater changes to funding structure and amount to have a fair chance to succeed. Merely establishing a specialized agency without making inroads on funding issues would be a recipe for disaster and probably even weaken environmental governance if that is possible. A honest effort therefore requires that details are determined with regards to how the agency should respond to requirements set forth in its mandate, including concrete budget lines for implementation activities. The funding related issues may also constitute one the most major drawbacks of the specialized agency option, and also explains why, despite prolonged attention in international negotiations, it has been impossible to introduce such upgrading of UNEP.

### 3.7 STRUCTURAL ASPECT, BENEFITS AND DRAWBACKS OF A SPECIALIZED AGENCY:

As seen in Resolution 2997, a main component of UNEP's mandate is to coordinate as well as review the direction of the environmental work within the UN system (UNEMG 2011). Formerly, this part of the mandate fell under the System-wide Medium Term Environment Programme (SWMTEP). It was introduced in 1999, but then abandoned and replaced with the current Environment Management Group (EMG).

### 3.8 ENVIRONMENTAL MAINSTREAMING IN THE UN: DONE DEAL?

Today there are as many as 44 environmental divisions and offices in the UN. Most of those have appeared not because of UNEP's success in mainstreaming environment in the UN, but because agencies and UN bodies themselves have gradually mainstreamed environment in the system. It may therefore be that a new UNEP as specialized agency should not even be primarily

concerned with the UN response to environment, but should focus more on serious problems related to persistent implementation gap of environmental agreements on national and local levels, regional and national capacity building etc. Therefore, elevating UNEP to a specialized agency on environment is not so much about effectively mainstreaming environment throughout the UN system but more about the need for a stronger institution to position environment issues better on the global political agenda and create a body with the mandate to respond to demands on regional and national levels. Strengthening of UNEP only at the international level would not be sufficient. Asia, which has become the world's production center, should have much stronger regional environmental institutions to better deal with increasing environmental issues. A stronger regional representation could in turn strengthen

19

the environmental work of regional and sub-regional bodies, including Tripartite Environment Ministers Meeting (TEMM) in North-east Asia, or the environmental programmes of the Association of Southeast Asian Nations (ASEAN).

Interviews with current and former UN staff identified one of the main reasons for UNEP's failure to coordinate environment within the UN system as being rooted in the fact that the programme, with its relative legal weakness, has been unable to sufficiently leverage and influence many of the larger programmes and agencies within the UN (UN 2011).<sup>13</sup> And as mentioned, the mainstreaming task is already happening to a large extent, throughout UN bodies and their initiatives. However, the 44 existing environment divisions and UN initiatives indicate that fragmentation and overlap is still a problem that needs to be addressed both inside the UN system and on country level. In this regard, expanding the "One-UN Initiative" would be beneficial as would clustering MEAs. This might also enhance the UN's level of credibility and also support from member States both to the UN at large and to broader reform options as those discussed in this paper. While larger efforts are needed to address fragmentation and overlap, initial steps would include signing of Memorandums of Understanding (MoUs) between UNEP and the respective agency or institution aimed at effectively harmonizing the environmental work among the institutions.<sup>14</sup>

Finally, if UNEP were to become an agency it would also be better positioned to suggest and debate legal instruments in its plenary forum (GC/GMEF) as well as adopting them in its own General Assembly. Even though a specialized agency would not be as closely related to the UN as a programme is, provisions could be made so that the Agency remained a central member of the UN's Chief Executives Board for Coordination (CEB).<sup>15</sup> Doing so would be important to ensure that, also in the future, it would remain central to coherence and cohesion of environmental work within the UN and its related specialized agencies.<sup>16</sup>

### 3.9 IN SUM

The discussion on programme vs. specialized agency has been tabled at many intergovernmental discussions, and while on several occasions many UN member States have supported the upgrading of UNEP to a specialized agency - there has never been sufficient impetus for the establishment of a specialized agency on environment.<sup>17</sup> However, Rio 2012 can create sufficient momentum and support from governments to agree on a Roadmap that can determine the direction as well as milestones to strengthen IEG, and perhaps consider the possibilities for establishing a specialized agency on environment. The following table sums up some of the points made in the text above:

Personal communication; Nairobi and Bangkok (2011).

13

Member states could initiate this development by submitting a request for a UN GA resolution.

14

15 Additionally, a previous paragraph also summarized Article 63 of the UN Charter, which provides

options for legal affiliation between the UN and a specialized agency.

16 <http://www.unsceb.org/ceb/home>

17 Biermann (2007) states that, over time 50 countries have supported the creation of a Specialized

Agency.

20

Source: Authorâ€™s interpretation

#### 4. CONCLUSION:

By highlighting a number of weaknesses of current IEG, the above sections have argued for a broad reform to UNEP in order to strengthen IEG and to enable a better response to current and anticipated environmental challenges. The paper has argued that reform and strengthening of

21

IEG is important because 1) environmental challenges have grown in impact and magnitude along with globalization but the architecture has not yet evolved to respond to these emerging challenges; and 2) governance has become multi stakeholder and more participation is needed from all stakeholders in order to ensure coordinated and synergetic governance.

To address the issue of environmental governance reform, the paper has established that incremental reform options, while important, will not suffice to significantly strengthen IEG.

Instead it has proposed a phased reform consisting of two broader reform options and summarized key points related to each. The analysis has focused on legal, financial, and structural implications of the reform options, and emphasized possible benefits and drawbacks as summarized in the tables above. The two options have been presented in succession to argue for their relatedness and make a case for how countries could create momentum towards broader reform and strengthening of environmental governance by mobilizing support for introducing universal membership of the UNEP GC/GMEF.

As for the first reform option of universal membership, the paper has argued that it would be possible to accommodate the increased complexity of universally voting members by adopting a qualified majority voting system to improve efficiency of decision-making. The feasibility of the decision-making was exemplified by the EU, which has gradually adopted qualified majority voting to accommodate increasing members. Apart from empowering global environment ministers by creating such universal membership, the paper has also shown how it could become a decision-making umbrella for MEAs, thereby clustering debate and decision-making of those of the treaties that already have a close relation to UNEP written in their legal texts. This would benefit both coherence and efficiency of IEG.

Apart from being the first phase of a broader reform of UNEP, it is of course true that universal membership can be viewed as a reform option in itself and without connection to other reform options. It is conceivable that it could be introduced primarily for the benefits of global representation and better decision-making on IEG issues, arguably these benefits are significant and sufficient to justify it. If the UNGA were to provide the GC/GMEF with universal membership and decision-making power, it is very likely that it would significantly empower the ministers at the GC/GMEF to make strong environmental decisions, because conversely to the GA, the GC would be a forum especially mandated for environmental issues. This would give a different priority to environmental decision-making when compared to the GA, where other issues have had higher priority.

Subsequent to universal membership of the GC/GMEF, the second broad reform phase of establishing a specialized agency, was also emphasized. In this regard the paper argued that an environmental policy makers' forum with universal membership could propel the creation of a globally representative decision-making forum for international environmental policy. If this could be achieved it would be an obvious next step to negotiate a UN GA Resolution towards establishing a specialized agency with legal independence, but affiliated to the UN. Such a mandate could have a tremendously positive effect on the clout of environmental agenda setting and policy making, internationally and nationally.

22

#### 4.1 FROM PLEDGE TO ACTION: COOPERATION AMONG STAKEHOLDERS

Since international environmental agreements often fall short on national levels and in the stages of implementation, it will not be sufficient to keep IEG purely on the intergovernmental arena. To address this issue, the paper has argued that benefits for national level environmental policy have to be identified. To do so, more support must be provided to environmental ministries and agencies on national and local levels. Strengthening environmental ministries on national and local levels is a two-way process. For the UN-bodies, it will be necessary that they continue to cooperate and implement cohesively expanding on the "One-UN" initiative and articulate ways of cooperation as well as demarcation between and among the agencies. Environmental governance in this way will fall beyond UNEP as an agency and some tasks will have to be undertaken in cooperation or by representation of other UN agencies, NGOs and national stakeholders, according to which solution is the most effective and efficient. The cooperation could be visualized by means of the following figure:

Figure 4: Cooperation on implementation levels

Source: Author's interpretation

Exchange of knowledge and good practices between countries and sectors is also depicted in the figure, this kind of initiative can take place bilaterally decided and organized by countries

23

themselves and with the help of agencies. Reporting of progress for least developed countries (LDCs) and reporting on MEA commitments overall could then be done to the plenary forum of the specialized Agency (UNEO/WEO). For national policy makers, the strengthening of the environmental mandate in comparison with other ministries will have to be implemented in

national decision-making processes. As was emphasized in the paper, a direct benefit could be harnessed if policy makers were to take advantage of the efficient decision-making in the GC/GMEF and agree on issues to strengthen implementation of environmental agreements on national level. Moreover, a specialized agency could initiate the establishment of domestic "interlinkages" committees tasked with identifying thematic links between environment and other important sectors of the economy such as water, energy, transport, etc. In this regard the paper has argued that additional integration of environmental concerns could be achieved politically through enhanced environmental agenda setting, influence on national budgeting or other interventions that may vary according to national circumstances. The paper has argued that doing so would result in better enforcement of MEA commitments, especially if MEA co-decision could become part of the GC/GMEF as decisions could be made more efficiently.

While the two-phased reform proposal establishing universal membership of the GC/GMEF and establishing a specialized agency resemble significant reform options, essentially the improvement of IEG has to be carried forward by decision makers themselves. This implies that the conscientious issues concerning amounts and predictability of the IEG regime's funding need to be addressed along with capacity building for developing countries, better integration of environment issues into decision-making, monitoring and assessing the environment, access to information and environmentally sound technology and other emerging issues.

#### 4.2 REASONS FOR RESISTANCE AND REASONS FOR SUPPORT

If universal membership and specialized agency options resemble the way forward, the question still lingers then why governments have not chosen to sufficiently back them up and initiate their implementation long ago. Partly this can be explained by an overall lack of trust in the UN and the multilateral system of negotiation and decision-making as a whole. Countries and their citizens have increasing trouble seeing the relevance of the complex international governance structures. The UN itself should continue to emphasize its internal reform to show that incremental efficiency improvements are being undertaken. Among other measures it will therefore be important to undertake thorough analysis of how the identified options in the Nairobi-Helsinki Outcome will actually improve the functions and tasks identifies as important for IEG. Additionally, it is important that the UN leads by example and shows not only how environmental governance can be effectively mainstreamed in their organization, but also why it should remain a relevant and credible institution for the global community.

National level governments also play a decisive role in determining support or resistance to strengthening environmental governance. On these levels it could be advised to place effort on national awareness campaigns and information dissemination. The public must clearly understand the role of the UN, the links between international environmental governance structures and their lives and how the international environment affects the well-being of local communities.

It is important to make this point; because many states remain convinced that strong international governance would compromise their national sovereignty. In fact, global

24

governance will not compromise the sovereignty of states. On the contrary, because global environmental impacts can be felt increasingly on the local scale, globalization has extended the reach of nation states' interest. It should therefore be in the interest of sovereign nation states to upgrade and mandate institutions whose purpose is to address global environmental issues to improve the quality of the global and local environments.

## Institute of Global Education

THE INSTITUTE OF GLOBAL EDUCATION IS A USA 501 © (3) NONPROFIT WITH SPECIAL CONSULTATIVE ECOSOC STATUS AT THE UNITED NATIONS AND OPERATES IN INDIA, CANADA AND THE USA. THIS EFFORT IS TO PROVIDE INPUT AND PROGRAM CONSIDERATIONS TO RIO PLUS 20 ON SUSTAINABLE AND ENVIRONMENTAL DEVELOPMENT AND RELATED ISSUES

The Institute for Global Education has developed a strong connection to Northeast India which has over 200 tribes and a culture significantly different from the rest of India. Our worldwide experience with indigenous cultures and twenty years experience in India has led us to propose, with local institutional support, an innovative program to transform how local indigenous communities relate to their physical environment and the emerging worldwide culture.

The Northeast is a remote part of India, dependent on slash and burn agricultural base, which has had major immigration, with resulting intercommunal competition and violence. The Area has abundant water and significant unused land. Local leadership needs to be educated to sustainable economic practices and the views of their youth aware of the wider world. A successful program could help enable indigenous leaders and youth who could reach out to India's huge indigenous population, which is largely at the bottom of the social and economic ladder. A comprehensive economic and social development plan has been officially adopted for the NE by the local and national government but needs to be implemented

### PROPOSED STRATEGY

1.Target limited resources to educate and reorient tribal leaders/elders in a two year demonstration program

- 2.Focus efforts in 30-40 villages in 2 states with 4 million people –Meghalaya and Manipur
- 3.Create a key role for youth in educating elders in new economic and social realities especially their views using permaculture, village photography, puppetry and access to a worldwide pen pal network
4. Create competition among villages for new outside educational and economic development resources including scholarships
5. Educate tribal elders in permaculture and new economic development opportunities
6. Offer conflict resolution training and possible vipassana meditation for elders and youth
7. Identify and promote future female and male leaders with scholarships
8. Improve quality of schools using gardening and other new curriculum
9. Work to implement the officially adopted NE Plan and seek additional demo grants from the Indian Government and elsewhere.
10. Encourage agricultural donations from outside India via the internet
- 11.Increase economic opportunities for women
- 12.Strengthen leadership role of key local universities and institutions especially Martin Luther Christian University
- 13.Utilize the educational experiences of the Institute for Global Education in Mucherla, Andhra Pradesh
- 14.Train teachers in permaculture
- 15.Use children's puppetry and photography to improve family harmony and potentially discourage spousal abuse/ alcoholism and revision local villages.
16. Bring in a large number of Peace Corps type workers from many countries to help implement permaculture, gardening, puppetry and other strategies.
- 17.Document the process in a video/film that can be shown to other tribals in the NE and elsewhere
- 18.Create speakers bureau to utilize village leaders and students to share their experiences in other villages
19. Develop conflict resolution models for villages
- 20.Develop traveling exhibits and shows to many villages
- 21.Network with tribals into Bangladesh and Myanmar if possible
- 22.Promote project successes in United Nations
- 23.Identify additional potential resources from the UN, US and elsewhere 24.Establish a network of traditional herbalists and identify possible economic opportunities for them
- 25.Utilize successful education resource groups from elsewhere in India including the Indian Educational and Peace /Consortium, an Andhra Pradesh permaculture group and the Institute for Global Education
26. Have the Institute for Global Education be the lead organization responsible for the program

#### CONCLUSIONS

- 1.The proposed program is very sweeping and encompasses many elements.
2. Each part of the program has been tested and found useful in comparable venues.
3. The budget, while small, is realistic for the proposed program.
4. The overall program goal is to create new, more open attitudes in tribal leadership
5. The program strategy starts with education and then reaches into the minds and imaginations of the village/tribal leaders. The children will play a key role in educating elders.
6. The villages and state governments have expressed strong interest in the program. Their participation will increase the probabilities for local acceptance of new ideas
7. A limited amount of money will generate a tremendous amount of in kind and volunteer contributions.
8. The Proposal, while ambitious, could lead to add on efforts such as teaching English, computer satellite access and other valuable programs as funding becomes available.
9. A sense of competition among villages increases the potential local openness to new ideas.
10. Our proposed staff leadership has very strong connections with and credibility with local tribes.
11. We need to review the program after year one to see lessons learned and required modifications in approach.
12. The program approach, if successful, could be widely replicated elsewhere in India and neighboring countries.

THIS IGE PROPOSAL HAS BEEN SUBMITTED TO THE UN DEMOCRACY FUND AND OTHERS. IT FITS WELL WITH THE GOALS FOR RIO PLUS 20 PROPOSALS AND IS A HANDS ON LOCAL DESIGNED EFFORT. IT WOULD STRENGTHEN THE GOALS AND DIRECTIONS FOR RIO PLUS 20. A CONSORTIUM OF ORGANIZATIONS AND GROUPS HAS BEEN ESTABLISHED AS THE PROJECT IS LOCAL LEADERSHIP BASED.

THE SCIENCE OF EDUCATING, COUNSELING, AND HEALING WITH NATURE (ECHN) IS THE MONUMENTAL SENSORY TOOL THAT EMPOWERS CIVIL SOCIETY TO REMEDY THE POINT SOURCE OF OUR CRITICAL PERSONAL, SOCIAL AND ENVIRONMENTAL PROBLEMS AS A CONTRIBUTION TO RIO PLUS 20

We live excessively indoor lives. Our significant separation from the natural world interferes with our body, mind and spirit being part of the way nature works to sustain our planet's self correcting health, balance and purity, around and in us.

Because the indoor process that teaches us how to think and feel is excessively nature disconnected, its disconnection from nature's restorative powers creates mind pollution in our psyche. This warp causes us to create and suffer personal, social and environmental problems. They are not found in unadulterated nature or nature connected people (s).

In Industrial Society, our contaminated mentality and the disorders it produces, have a point source of origin. For a peaceful world in balance and wellness, we must each identify and help correct that point source. Project NatureConnect gives any interested person the tools to accomplish this crucial feat. The point source of our troubles is our denial. We deny that our natural senses and sensitivities are excessively strained due to our disconnectedness from nature. We seldom recognize that we traumatize our natural senses because our society's prejudice to conquer nature makes these sensibilities endure unbalanced, destructive, nature disconnected fulfillments.

The profound loss to our senses of nature's purifying and healing powers causes us to continually want and when we want there is never enough. The torment of our wanting is a form of mind pollution. It produces a wounded sensory imbalance, a warp in our psyche that results in destructive stress, greed, disorders and dysfunctions, locally and globally.

The remedy for our mind pollution is the science of Educating, Counseling and Healing with Nature (ECHN). It holistics methods and materials are tools that let sensory contact with nature's self correcting powers, backyard or back country, help us improve well being at every level.

There is hope. The ECHN organic antidote and preventative for our disorders provides us with a unique, social technology, Natural Attraction Ecology. It is a practical application of Ecopsychology that enables us to remedy our polluted thoughts and feelings. ECHN works because it lets nature's ways help our thinking compost the destructive addictions of civil society and recycle them into constructive relationships.

ECHN starts with a subsidized, online course whose nature connecting methods and materials can immediately be applied to any person's life and livelihood. In addition, one can teach them, or use them to enhance their career or hobby. The course can lead to a Master's or Ph.D. degree in Applied Ecopsychology.

ECHN provides us with the special tool that we need to effectively address our problems. It helps us, locally or globally, walk hand in hand while empowered by the real life beauty and cooperation of nature's amazing grace.

The calm, joy and restorative powers of a quiet walk in a natural area are well known. ECHN helps us strengthen these powers and use them to reduce our prejudice against nature (PAN) and our other great disorders.

Nature's special perfection is the ability of its natural attraction essence to peacefully maintain pristine optimums of life, diversity and cooperation in balance and beauty. Its cyclic intelligence seldom produces garbage or pollution, or our excessiveness, abusiveness, isolation, wars and disorders.

We are nature, it is us. Every five to seven years the purifying flow of nature, through, within and around us, replaces every molecule in us. Part of our DNA is plant DNA. This confirms that we are, and that we inherently think, feel, resonate and communicate with the way nature works.

Sadly, for excessive profit, our prejudice against nature socializes our thinking to conquer or exploit nature in and around us. We bias our thinking to demean or fear nature. This wounds our psyche and senses; it reduces our natural restorative abilities. Their self correcting ways can't help us remedy the troubles that our misguided thinking creates.

To counteract this folly, engaging in sensory nature connecting activities, backyard or backcountry, revitalizes nature's flow through us so its streaming better heals and renews our injured rational, emotional and spiritual self. This releases Dopamine. We feel rewarded and happy.

From five decades of research and experience, a scientific tool, Natural Attraction Ecology (NAE), enables our excessively nature disconnected thinking to benefit from conscious sensory contact with nature's recycling and transformative powers.

The hands on process of NAE is rooted in these empirical truths:

1. Since the beginning of time, the flow of natural attraction has been everywhere. From sub atomic particles to the Universe, space is filled with natural attraction energy. Natural attraction holds things together. It grows, heals and is aware of itself. We call it Love or Whole Spirit (holly), Tao, Reiki, Chi, Quantum, or Ki.
2. Like all of nature, humanity is the flow of natural attraction manifesting itself as us.
3. Natural attraction consciously registers in our psyche as at least 53 intelligent and rewarding natural senses. For example, our sense of thirst communicates our need/attraction for water. Thirst wisely turns on when we need Earth's water cycle to flow through us, and turns off when we don't need water. In addition, our sense of excretion intelligently tells us to feed our waste water to nature; this perfect food nurtures nature. Similar to the above, our other 51 natural attraction senses operate in the same balanced way. They include our senses of place, touch, community, taste, music, sight, literacy, happiness, reason, respiration, consciousness and belonging. Each produces a special joy when our thinking fulfills it in nature's mutually supportive ways.
4. Throughout the eons, Nature and Earth have been a non literary way of knowing and being. Although their minerals and creatures communicate and, in cooperation, coordinate their attractions with each other, they don't accomplish this through the literacy of our written or spoken words, labels, stories or mathematics.
5. On average, industrial society's linguistic story has us spend more than 95 percent of our time indoors, and 99 percent of our thinking and feeling while separated from authentic nature and its pre literate, attraction prone intelligence. For this reason, our scientific and creative stories about life are often nature disconnected illusions about how natural attraction works. To our cost, we addictively train ourselves to think with these deceptions. Many problems result.
6. Our stories and science of nature are seldom fully true because they are stable abstracts; they are shortcuts and vicarious ways of knowing. In contrast, real nature, including us, is not a stable laboratory. Mother Earth is a living being. Nature is alive, an ever changing, ever growing act, the flow of natural attraction relationships in the present moment.
7. Nature is the fountainhead of authority on how its natural attraction essence works. If natural areas were literate they might describe themselves as a cathedrals of natural attraction in support of life on Earth.
8. Most substitutes for authentic nature are imperfect; they produce adverse side effects.
9. Natural sensory perceptions are the most tangible, true and unifying things that our thoughts and feelings register. To our loss, society pays us to think while suppressing the empirical, nature connected, sensation facts that our natural senses introduce to our mentality in support of our, and our Living Planet's survival.

10. We cannot solve our personal and global problems if our thinking disengages us from the unifying natural attraction wisdom present in the "now" of connection moments with each other and the web of life. To reverse our disorders, we need to think and feel with the full powers of our natural sensory intelligences.

Backyard or backcountry, NAE sensibly enables us to intermingle and fulfill our 53 natural senses with the renewing ways of natural attractions. By strengthening them, we enjoy rewarding natural attraction experiences. This is a crucial element for improving our personal, social and environmental relationships. It fits perfectly into the Rio Plus 20 directions and goals as an important contribution.

## Instituto de Ingenieros de Chile

Instituto de Ingenieros Chile

FUNDADO EN 1888

Santiago, 1 de Noviembre de 2011.

Estimados Señores:

En respuesta a lo solicitado en la invitación pública realizada a los Estados Miembros y a otras partes interesadas a que presenten sus contribuciones por escrito a más tardar el 1 de noviembre de 2011 para ser incluidas en un documento de compilación que servirá de base para la preparación de un borrador preliminar, adjunto encontrará documento preparado por el Instituto de Ingenieros de Chile en el que se presentan "20 Propuestas para la Comunidad Científica y Tecnológica de Río + 20" (Agenda 21, Capítulo 31).

El Instituto es una Corporación de Derecho Privado sin fines de lucro, fundado en el año 1888, que promueve la excelencia de la ingeniería y su contribución al desarrollo del país.

Dentro de los fines del Instituto se encuentran: fomentar el conocimiento y progreso de la ciencia y el arte de la ingeniería; tratar los problemas que interesen o afecten a la ingeniería; contribuir al prestigio y desarrollo de la ingeniería nacional; fomentar la vinculación profesional y social entre los ingenieros, procurando la agrupación de las distintas ramas o especialidades de la Ingeniería; establecer vínculos con las organizaciones que tengan afinidad con la Ingeniería; mantener relaciones con sociedades extranjeras de ingenieros y con instituciones que agrupen a otros profesionales del país; colaborar en la solución de problemas de interés nacional, haciendo valer la opinión de los ingenieros en materias técnicas y económicas.

Los temas a ser tratados en esta conferencia no han sido ajenos a la labor del Instituto de Ingenieros de Chile. En los últimos tres años, se han constituido tres comisiones de trabajo: Energía (2008), Medio Ambiente y Desarrollo Sustentable (2009) y Aguas (2011) que han efectuado aportes importantes a la discusión y solución de los problemas ambientales del país. A estas comisiones que ya terminaron su trabajo entregando, en sus respectivos informes, propuestas generales y específicas, se suman dos comisiones de trabajo: Cambio Climático y Administración de Desastres, cuyas propuestas aun se encuentran en proceso de preparación.

Si bien las propuestas desarrolladas o, en proceso de preparación, tienen su origen y son aplicables a la realidad chilena estas han sido revisadas por un grupo de trabajo del Instituto de Ingenieros de Chile con el objeto de evaluar su vigencia y su grado de aplicabilidad para otras realidades, particularmente en el contexto latinoamericano.

Junto con agradecer la oportunidad de poder realizar un aporte efectivo al Desarrollo Sostenible y esperando que estas propuestas sean de utilidad para los fines de la conferencia, los saludan atentamente,

Elias Arze Cyr

Presidente Instituto

Juan Carlos Carros

## RESUMEN EJECUTIVO

Entre el 4 y 6 de junio de 2012, se realizará en Río de Janeiro, Brasil, la Conferencia de Naciones Unidas sobre Desarrollo Sustentable. Para esta actividad, que se efectúa 20 años después de la cumbre de Río de Janeiro en 1992, Naciones Unidas ha invitado a los Estados, a la sociedad civil y a los ciudadanos a “sentar las bases de un mundo de prosperidad, paz y sustentabilidad”.

Los temas a ser tratados en esta conferencia no han sido ajenos a la labor del Instituto de Ingenieros de Chile. En los últimos tres años, se han constituido tres comisiones de trabajo: Energía (2008), Medio Ambiente y Desarrollo Sustentable (2009) y Aguas (2011) que han efectuado aportes importantes a la discusión y solución de los problemas ambientales del país. A estas comisiones que ya terminaron su trabajo entregando, en sus respectivos informes, propuestas generales y específicas, se suman dos comisiones de trabajo: Cambio Climático y Administración de Desastres, cuyas propuestas aun se encuentran en proceso de preparación.

Si bien las propuestas desarrolladas o, en proceso de preparación, tienen su origen y son aplicables a la realidad chilena estas han sido revisadas por un grupo de trabajo

del Instituto de Ingenieros de Chile con el objeto de evaluar su vigencia y su grado de aplicabilidad para otras realidades, particularmente en el contexto latinoamericano. Las propuestas desarrolladas han sido agrupadas en las siguientes cinco categorías: - Desarrollar e implementar Estrategias Nacionales que permitan enfrentar escenarios futuros.

- Crear conocimiento y disponer de información de calidad para desarrollar estrategias y tomar decisiones.
- Establecer compromisos de DS por parte de los diferentes actores de la sociedad junto con formar una opinión pública informada.
- Integrar y coordinar las acciones en el ámbito del DS que realizan las diferentes instituciones gubernamentales.
- Desarrollar la capacidad de anticiparse a probables eventos futuros y de tener respuestas rápidas a los requerimientos más urgentes de la población.

En el resumen ejecutivo se presenta una síntesis de estas propuestas, las que serán desarrolladas en mayor detalle en el documento.

Desarrollar e implementar Estrategias Nacionales que permitan enfrentar escenarios futuros

En el trabajo realizado por las diferentes comisiones de trabajo del Instituto de Ingenieros de Chile destaca la necesidad de desarrollar e implementar estrategias nacionales que permitan enfrentar escenarios futuros. Algunas de las propuestas en este ámbito son:

Establecer estrategias nacionales para enfrentar el cambio climático, desarrollando medidas de mitigación y de adaptación con el objeto de estar preparados para enfrentar los posibles cambios climáticos.

Estas estrategias deben orientarse a desarrollar medidas de mitigación que permitan evitar que el cambio climático se desarrolle con impactos significativos sobre el medioambiente y a desarrollar medidas de adaptación que permitan preparar al país para enfrentar los cambios climáticos que están ocurriendo o que podrían ocurrir a futuro.

Desarrollar una Planificación Energética Integrada en la que se conjugué no solo el costo de la energía sino que también, el beneficio social, el abatimiento de las emisiones de gases efecto invernadero (GEI) y otras externalidades.

La planificación energética debe buscar minimizar el costo de uso de la energía, maximizando el beneficio social, considerando el beneficio privado, el abatimiento de las emisiones de GEI y otras externalidades. Esta planificación debe abarcar no solo los diferentes tipos de energéticos utilizados para generar energía eléctrica sino que también aquellos utilizados para el transporte.

Diseñar políticas nacionales de Desarrollo Sustentable (DS) y realizar una adecuada planificación territorial.

Es fundamental que los países de la región diseñen una política nacional de desarrollo sustentable que comience con una definición estratégica de sus objetivos, los valores asociados y se definan metas cuantificables, medibles y reportables. Los problemas ambientales y sociales asociados a las urbes son de gran complejidad y alcance, por lo que mucho se juega en cómo se planificará la infraestructura y los servicios en las próximas décadas.

Desarrollar e implementar un Plan Estratégico Nacional de Gestión de Riesgos de Desastres.

Es fundamental desarrollar en cada país un plan estratégico que permita establecer mecanismos coordinados para la gestión de desastres que modo de disponer acciones oportunas de prevención, mitigación, preparación, respuesta y recuperación ante desastres.

Establecer políticas que fomenten el uso eficiente de la energía, el desarrollo de las ERNC, su ingreso al sistema eléctrico y el aprovechamiento del potencial de energía disponible.

En los países en vías de desarrollo, a diferencia de los países desarrollados, cuyas economías, en términos relativos, cuentan con una estructura productiva más intensiva en la prestación de servicios y menor en la actividad productiva, el consumo de energía eléctrica crece a un ritmo similar al crecimiento económico. Por ello es importante aplicar políticas que fomenten el uso eficiente de la energía, promuevan el desarrollo de ENRC y su incorporación al sistema eléctrico.

Estudiar nuevas opciones de generación de energía eléctrica para el largo plazo. En el largo plazo, al menos en Chile, se visualiza una disminución en los recursos hidroeléctricos significativos aprovechables económicamente. Por ello se debe explorar el uso de nuevas fuentes de generación de Energía tales como la Energía Nuclear.

Establecer zonificaciones y crear Planes Maestros de Cauces Naturales.

Es fundamental delimitar los terrenos de dominio público, establecer zonificaciones en zonas inundables, coordinar las acciones orientadas al control de las crecidas, establecer los criterios y normativas que aseguren el equilibrio mecánico fluvial, y responder a las dinámicas urbanas presentes en su curso y la conservación de los bienes ambientales asociados a los cauces naturales junto con avanzar en la creación de Planes Maestros de Cauces Naturales, como instrumentos básicos de gestión en aquellos cursos naturales que presenten una elevada presión como consecuencia de la actividad humana.

Crear conocimiento y disponer de información de calidad para desarrollar estrategias y tomar decisiones

El desarrollo de las estrategias planteadas en el punto anterior requiere disponer de los conocimientos y de las competencias necesarias además de información de calidad para poder tomar decisiones. Algunas de las propuestas en este ámbito son:

Desarrollar programas de investigación y monitoreo de los aspectos más relevantes en la prevención de los efectos de las catástrofes naturales y crear redes de conocimiento.

Es muy importante el desarrollo de programas de investigación conjuntos entre el Estado, las universidades, la industria y las instituciones científicas a la vez que monitorear aspectos relevantes en la prevención de los efectos de las catástrofes naturales. Es preciso además, para fortalecer la gestión del conocimiento, crear redes de instituciones que compartan sus experiencias en el campo de la Gestión de Riesgos de Desastres (GRD) junto con incentivar la cooperación internacional y regional.

Obtener información de calidad para manejo de datos y generación de conocimiento sobre recursos hídricos a la vez que establecer y hacer cumplir normas sobre calidad del agua.

Es fundamental, para el desarrollo de políticas y planes de acción, disponer de información de recursos hídricos de calidad y que posea una extensión de años. Por ello se debe desarrollar un plan de mejoramiento de las redes de medición, con énfasis en la vigilancia de la calidad ambiental de los cursos de agua, en el control de las extracciones de agua por los usuarios, en la medición de niveles en acuíferos críticos, en el mejoramiento la red sedimentométrica, y en la ampliación de la red fluviométrica y pluviométrica en zonas específicas junto con crear un Sistema Nacional de Información integrado, incluyendo las mediciones y archivos manejados en la actualidad por instituciones diversas además de desarrollar un amplio Plan de Mejoramiento de la Red de Medición de la Calidad del Agua orientado a satisfacer los requerimientos

normativos. Analizar las externalidades del uso excesivo de aguas sobre el resto de los usuarios.

Entre los temas que debieran ser analizados, cabe mencionar las externalidades sobre el resto de los beneficiarios asociadas al uso sucesivo del agua por los distintos usuarios así como los cambios de los balances oferta demanda de agua en las cuencas, como resultado de decisiones relativas a proyectos y programas, de origen público o privado, o a decisiones regulatorias sectoriales.

Disponer de información de calidad para tomar decisiones.

Para la correcta toma de decisiones, es absolutamente relevante disponer de información de calidad. En relación a esto se propone utilizar las herramientas que provee la ingeniería para realizar un aporte sustantivo en la generación de información de base y en la comprensión de los modelos económicos, sociales y ambientales que servirán para interpretar los fenómenos asociados al desarrollo sustentable.

Establecer compromisos de DS por parte de los diferentes actores de la sociedad junto con formar una opinion publica informada.

Cada vez es más relevante la participación de la ciudadanía en el desarrollo de las estrategias nacionales. Por ello, es fundamental establecer compromisos de DS por parte de los diferentes actores de la sociedad a la vez que contar con una opinión pública informada que pueda participar en la elaboración de los diferentes planes nacionales sobre la base de posiciones fundamentadas. Algunas de las propuestas en este ámbito son:

Integrar el DS a la Responsabilidad Social Empresarial (RSE) e incentivar el desarrollo en los actores sociales de un comportamiento ético y social responsable.

Considerando el papel que juegan las empresas en la generación de riquezas, empleo y en la vinculación entre desarrollo económico y protección y conservación ambiental se propone integrar el DS como un paso adicional a la Responsabilidad Social Empresarial. El comportamiento ético y socialmente responsable de todos los actores sociales es fundamental para el logro de un DS. Por ello se propone incentivar el desarrollo de una evolución ética de los actores sociales que permita alcanzar un desarrollo que mejore la calidad de vida sobre la base del crecimiento económico, la equidad social y la sustentabilidad ambiental.

Desarrollar planes comunicacionales para disponer de una sociedad informada.

Las preocupaciones en relación a las trabas para la tramitación de los grandes proyectos de generación eléctrica se han acentuado. Actualmente la opinión pública en Chile se ha visto arrastrada a campañas de oposición a la realización de los grandes proyectos energéticos requeridos por el país. Se propone por lo tanto establecer una política de comunicación permanente de los proyectos que están en estudio de modo de que estos tengan una mejor aceptación social y se eviten futuras crisis de abastecimiento y de altos precios de la energía que tienen un impacto importante en el desarrollo de los países y en las posibilidades de superación de la pobreza.

Educar a la población en la prevención de los riesgos asociados a los desastres naturales y en el cumplimiento de normas éticas de construcción.

Es fundamental desarrollar la capacidad de prevención de riesgos en la población, generando conciencia, educando y capacitándola para que este preparada para enfrentar los desastres y una vez que estos han ocurrido, que estén en condiciones de administrar los planes de respuesta a desastres. Además de lo anterior, es necesario considerar las exigencias e implicancias éticas relacionadas con la prevención y reducción de los desastres para prevenir corrupción y propiciar un balance adecuado entre el desarrollo tecnológico y la calidad de vida.

Integrar y coordinar las acciones en el ambito del DS que realizan las diferentes instituciones gubernamentales.

En general, en los países existen diferentes instituciones que tienen relación con los aspectos involucrados en el desarrollo sustentable observándose en ocasiones problemas de superposición y/o competencia en relación con algunas funciones y actividades lo que se traduce en un mal aprovechamiento de los recursos públicos asignados al sector. Algunas de las propuestas en este ámbito son:

Integrar, coordinar y modernizar las instituciones relacionadas con la gestión de recursos hídricos.

Esta propuesta considera implementar una solución institucional, que integre en una sola entidad los temas relativos a la gestión de la calidad del agua y los aspectos ambientales asociados al recurso hídrico o, en su defecto, crear coordinaciones institucionales eficaces junto con desarrollar una solución institucional, que permita resolver los problemas de inadecuada delimitación y coordinación de funciones, como son las relativas a la gestión de la calidad del agua, gestión de los cauces naturales, autorización de obras en los mismos y regulación de los aspectos ambientales relativos a los recursos hídricos.

Adaptar el concepto de Gestión Integrada de Recursos Hídricos al marco general del país.

Es necesario abordar el tema de la gestión integrada de recursos hídricos. Esto involucra considerar aspectos históricos, institucionales, legales y geográficos, entre otros. Este esfuerzo adaptativo es clave para que las propuestas y acciones tengan una proyección que permita ponerlas en práctica y se prolonguen en el tiempo.

Desarrollar la capacidad de anticiparse a probables eventos futuros y de tener respuestas rápidas a los requerimientos mas urgentes de la poblacion

En general, en los países latinoamericanos, se observa una posición más reactiva que proactiva frente a probables eventos futuros. Es fundamental, que los países no solo se anticipen a los problemas que se espera que se produzcan sino que además, desarrollen una adecuada capacidad de respuesta una vez que estos ocurran. Algunas de las propuestas en este ámbito son:

Adelantarse a las exigencias internacionales en medición de huella de carbono y desarrollar acciones tempranas que sean reconocidas internacionalmente.

Los países latinoamericanos que han basado su desarrollo económico en la exportación de recursos naturales deben adelantarse a las exigencias de medición de la huella de carbono de los productos y servicios que comercializan y que preocupan a los mercados mas desarrollados. Lo anterior debe complementarse con acciones tempranas tratando de que estas sean reconocidas internacionalmente. Algunos ejemplos de esto pueden ser:

desarrollar un programa país de eficiencia energética o establecer programas gubernamentales de Fomento a las Energías Renovables No Convencionales (ERNCC).

Incorporar en los procesos de planificación urbana la gestión de riesgos de desastres a la vez que revisar, actualizar permanentemente y fiscalizar el cumplimiento de las normas de diseño y construcción junto con desarrollar normas para zonificación urbana.

Es importante disminuir el nivel de exposición al riesgo de las personas. Por ello es necesario contar con información de calidad tal como mapas en los que se identifiquen los riesgos potenciales y que estos se incorporen en los procesos de planificación y desarrollo urbano. Es necesario que el Estado genere los mecanismos para que se revisen y actualicen permanentemente las normas de diseño y construcción, y se fiscalice además su cumplimiento. Es fundamental incorporar en estas normas las medidas de mitigación del riesgo como una componente importante en el desarrollo de las grandes obras de infraestructura y desarrollo.

Desarrollar una capacidad de respuesta eficiente y oportuna una vez ocurrida una catástrofe junto con asegurar la continuidad de los servicios básicos y un marco

regulatorio extraordinario que permita una rápida reconstrucción.

Es de extrema importancia que las instituciones públicas tengan, una vez ocurrido un desastre, una capacidad de respuesta eficiente, que se pueda asegurar el restablecimiento de los servicios básicos tales como energía eléctrica, agua potable y comunicaciones, en especial en los lugares críticos que deben atender la emergencia tales como: hospitales, colegios, albergues e instituciones públicas y que se disponga de un marco regulatorio extraordinario que permita dar una respuesta rápida luego de ocurrida la catástrofe y un proceso de reconstrucción expedito.

Reducir incertidumbres respecto a plazos, criterios y condiciones para aprobación de permisos ambientales.

Es fundamental, para asegurar un suministro de energía eléctrica seguro, de calidad y económico que los proyectos de generación de energía obtengan oportunamente los permisos ambientales de modo que se puedan desarrollar en plazos considerados normales, de acuerdo a la experiencia de la industria. Por ello se deben reducir al máximo las incertidumbres en cuanto a plazos, resultados y exigencias que se producen en el Sistema de Evaluación de Impacto Ambiental (SEIA), establecido en la ley sobre Bases Generales del Medio Ambiente además de revisar las normas, plazos, criterios y condiciones bajo las cuales se califican los proyectos de generación, transmisión y distribución de energía con el objeto de disminuir los tiempos que demora la tramitación de los permisos ambientales, en particular para los proyectos que tienen un gran efecto en la economía nacional.

1. INTRODUCCIÓN Entre el 4 y 6 de junio de 2012, se realizará en Río de Janeiro, Brasil, la Conferencia de Naciones Unidas sobre Desarrollo Sustentable. Para esta actividad, que se efectúa 20 años después de la cumbre de Río de Janeiro en 1992, Naciones Unidas ha invitado a los Estados, a la sociedad civil y a los ciudadanos a "sentar las bases de un mundo de prosperidad, paz y sustentabilidad".

La cumbre tratará dos temas que constituirán su eje central: La economía verde en el contexto del desarrollo sostenible y la erradicación de la pobreza; y el marco institucional para el desarrollo sostenible.

Los temas a ser tratados en esta conferencia no han sido ajenos a la labor del Instituto de Ingenieros de Chile. En los últimos tres años, se han constituido tres comisiones de trabajo: Energía (2008), Medio Ambiente y Desarrollo Sustentable (2009) y Aguas (2011) que han efectuado aportes importantes a la discusión y solución de los problemas ambientales del país. A estas comisiones que ya terminaron su trabajo entregando, en sus respectivos informes, propuestas generales y específicas, se suman dos comisiones de trabajo: Cambio Climático y Administración de Desastres, cuyas propuestas aun se encuentran en proceso de preparación.

Si bien las propuestas desarrolladas o, en proceso de preparación, tienen su origen y son aplicables a la realidad chilena estas han sido revisadas por un grupo de trabajo del Instituto de Ingenieros de Chile (Grupo de Trabajo Río + 20) con el objeto de evaluar su vigencia y su grado de aplicabilidad para otras realidades, particularmente en el contexto latinoamericano.

2. CAMBIO CLIMÁTICO Y VULNERABILIDAD DE LOS PAISES EN DESARROLLO El cambio climático afecta a la humanidad en su conjunto pero, los países latinoamericanos, al ser menos desarrollados y basar su economía en la exportación de recursos naturales, se ven más afectados que otros países. En el presente capítulo se plantean algunas de las propuestas, en desarrollo por la Comisión de Cambio Climático del Instituto de Ingenieros de Chile, que se estima que pueden ser aplicables en el contexto latinoamericano.

Los países Latinoamericanos y el Cambio Climático

En general, debido a que las pérdidas económicas y humanas en posibles escenarios climatológicos futuros podrían ser considerables, los países latinoamericanos son, desde un punto de vista social, ambiental y económico, mas vulnerables al cambio climático que los países desarrollados. Además, al estar estos países en vías de desarrollo y depender para su progreso de la inserción en el contexto internacional están sometidos a una presión cada vez mayor para cumplir con los estándares de gestión ambiental, particularmente en lo relacionado con la huella de carbono de los productos y servicios que estos comercializan.

Propuestas en el Ámbito de Cambio Climático

Es fundamental, para poder cumplir con las metas y objetivos propuestos para los países de la región en materia de reducción de emisiones, contar con el apoyo de la comunidad internacional. En el ámbito del Cambio Climático se plantean las siguientes propuestas: Establecer estrategias nacionales para enfrentar el cambio climático, desarrollando medidas de mitigación y de adaptación con el objeto de estar preparados para enfrentar los posibles cambios climáticos

Los países de Latinoamérica deben establecer estrategias nacionales que les permitan enfrentar los desafíos del cambio climático. En este trabajo deben participar todos los actores del país: Estado, sector privado y sociedad civil. Las estrategias deben orientarse a desarrollar medidas de mitigación que permitan evitar que el cambio climático se desarrolle con impactos significativos sobre el medioambiente y a desarrollar medidas de adaptación que permitan preparar al país a enfrentar los cambios climáticos que están ocurriendo o que podrían ocurrir a futuro.

Desarrollar una Planificación Energética Integrada en la que se conjugue no solo el costo de la energía sino que también, el beneficio social, el abatimiento de las emisiones de gases efecto invernadero (GEI) y otras externalidades.

La planificación energética debe buscar minimizar el costo de uso de la energía, maximizando el beneficio social, considerando el beneficio privado, el abatimiento de las emisiones de GEI y otras externalidades. Esta planificación debe abarcar no solo los diferentes tipos de energéticos utilizados para generar energía eléctrica sino que también aquellos utilizados para el transporte. En este aspecto es importante establecer incentivos por ejemplo para el cambio en la distribución modal de los sistemas de transporte procurando el uso de medios de transporte menos intensivos en emisiones GEI. Adelantarse a las exigencias internacionales en medición de huella de carbono y desarrollar acciones tempranas que sean reconocidas internacionalmente.

Los países latinoamericanos que han basado su desarrollo económico en la exportación de recursos naturales deben adelantarse a las exigencias de medición de la huella de carbono de los productos y servicios que comercializan y que preocupan a los mercados mas desarrollados. Lo anterior debe complementarse con acciones tempranas tratando de que estas sean reconocidas internacionalmente. Algunos ejemplos de esto pueden ser:

desarrollar un programa país de eficiencia energética o establecer programas gubernamentales de Fomento a las Energías Renovables No Convencionales (ERNC).

### 3. PILARES PARA EL DESARROLLO SUSTENTABLE

El desarrollo sustentable (DS) considera tres pilares: económico, social y ambiental. En muchos países, el progreso se ha basado en el ámbito económico seguido del social en desmedro del pilar ambiental. En el presente capítulo se plantean algunas de las propuestas presentadas en los años 2009 por la Comisión de Medio Ambiente y Desarrollo Sustentable del Instituto de Ingenieros de Chile que si bien fueron desarrolladas en un contexto nacional, pueden ser aplicables también en el contexto latinoamericano.

Propuestas en el Ámbito del desarrollo sustentable

Es importante integrar adecuadamente los tres pilares del desarrollo sustentable indicados anteriormente de modo de aspirar a tener un DS. Este se obtiene a través del concepto de "calidad de vida" ya que el sujeto del DS es el ser humano. Para ello es necesario que la calidad de vida mejore sostenidamente, que esta sea socialmente equitativa y que esté fundada en medidas apropiadas de conservación, protección y uso racional del medio ambiente. Las propuestas en el ámbito del DS son:

Diseñar políticas nacionales de Desarrollo Sustentable (DS) y realizar una adecuada planificación territorial.

Es fundamental que los países de la región diseñen una política nacional de desarrollo sustentable que comience con una definición estratégica de los objetivos de DS, los valores asociados y metas cuantificables, medibles y reportables.

Por otra parte, los problemas ambientales y sociales asociados a las urbes son de gran complejidad y alcance, por lo que mucho se juega en cómo se desarrollarán la infraestructura y los servicios en las próximas décadas. Estos temas serán a futuro cada vez más relevantes.

Por ello se propone:

- Generar una política de desarrollo sustentable basada en objetivos claros: metas de largo, mediano y corto plazo: programas adecuados a la obtención de dichas metas e indicadores apropiados que sean robustos, fáciles de medir, públicos y que muestren tendencias, junto a los indicadores tradicionales de producto, niveles de pobreza y empleo entre otros.

- Promover, en un marco de estabilidad de políticas públicas, el uso de indicadores ambientales como emisiones de GEI, superficie bajo protección u otros.

- Realizar una adecuada planificación del territorio nacional con buena información, modelos apropiados y participación en el proceso de los involucrados junto con la aplicación gradual de los cambios.

Disponer de información de calidad para tomar decisiones

Para la correcta toma de decisiones, aún en contextos con ciertos grados de incertidumbre, es absolutamente relevante disponer de información de calidad. En relación a esto se propone utilizar las herramientas que provee la ingeniería para realizar un aporte sustantivo en la generación de información de base y en la comprensión de los modelos económicos, sociales y ambientales que servirán para interpretar los fenómenos asociados al DS.

Integrar el DS a la Responsabilidad Social Empresarial (RSE) e incentivar el desarrollo en los actores sociales de un comportamiento ético y social responsable. Considerando el papel que juegan las empresas en la generación de riquezas, empleo y en la vinculación entre desarrollo económico y protección y conservación ambiental se propone integrar el DS como un paso adicional a la Responsabilidad Social Empresarial. El comportamiento ético y socialmente responsable de todos los actores sociales es fundamental para el logro de un DS. Por ello se propone incentivar el desarrollo de una evolución ética de los actores sociales que permita alcanzar un desarrollo que mejore la calidad de vida sobre la base del crecimiento económico, la equidad social y la sustentabilidad ambiental.

#### 4. IMPACTO DE LOS DESASTRES NATURALES EN LOS PAISES EN DESARROLLO

Los desastres naturales tienen un impacto directo sobre la vida de las personas y ponen en peligro el desarrollo de los países. Aproximadamente el 75 % de la población mundial vive en zonas que han sido afectadas, al menos una vez entre 1980 y 2000, por un desastre natural. El 94% de las víctimas fatales en desastres se deben a: terremotos, ciclones tropicales, inundaciones y sequías. En el presente capítulo se presentan los aspectos más relevantes del trabajo que actualmente está realizando la Comisión de Administración de Desastres del Instituto de Ingenieros de Chile y que ha sido orientado a elaborar un Plan Estratégico Nacional de Gestión de Riesgos de Desastres (GRD).

Bases para una política de Gestión de Riesgos de Desastres

En general, a pesar del impacto que tienen los desastres naturales sobre la vida de las personas y la economía de los países, en muchos de ellos se observa una falta de planes de prevención y mitigación de riesgos y de planificación de acciones de respuesta y de recuperación ante desastres.

En el caso de Chile, el terremoto del 27 de Febrero de 2010 demostró que si bien nuestro país estaba preparado en ámbitos tales como normativas de construcción y su correcta aplicación, presentando un buen desempeño en el comportamiento de su infraestructura, se detectaron falencias en áreas relacionadas con el suministro de energía y agua potable, sistemas de comunicación y la organización para la respuesta oportuna.

Considerando la experiencia pasada, es conveniente abordar esta temática en su conjunto de una manera sistémica y con la profundidad y la prevención que cada país requiere. Es preciso formular políticas nacionales para la gestión del riesgo de desastres a través de un proceso multisectorial e interinstitucional a la vez que establecer medidas efectivas de mitigación frente a los desastres naturales más relevantes, preparando a las autoridades y a la población civil para que reaccionen adecuadamente una vez que estos ocurran. Por ello se entregan los lineamientos generales para la elaboración de un Plan Estratégico Nacional de Gestión de Riesgos de Desastres.

Vision

Ser un país seguro y resiliente ante los desastres, proactivo para enfrentar de manera sistémica los desastres, permeado en todos sus niveles por una cultura de prevención, mitigación, preparación, respuesta y recuperación, reconociendo para ello la gestión de desastres como un elemento clave para el desarrollo nacional.

Propuestas en el ámbito de desastres naturales

Las propuestas que se indican a continuación están basadas en la experiencia de Chile en la Gestión de Desastres pero se estima que podrían ser de aplicables a otros países de la región. Las propuestas son:

Desarrollar e implementar un Plan Estratégico Nacional de Gestión de Riesgos de Desastres.

Es fundamental establecer en cada país un plan estratégico que permita establecer mecanismos coordinados para la gestión de desastres que modo de disponer acciones oportunas de prevención, mitigación, preparación, respuesta y recuperación ante desastres.

Este Plan debe considerar mecanismos eficientes para identificar, evaluar y monitorear riesgos de desastres junto con sistemas integrados y seguros para el manejo de la información asociada a una catástrofe de modo de establecer de manera temprana la situación en la que se encuentra la población para poder tomar decisiones oportunas en base a información confiable.

Incorporar en los procesos de planificación urbana la gestión de riesgos de desastres a la vez que revisar, actualizar permanentemente y fiscalizar el cumplimiento de las normas de diseño y construcción junto con desarrollar normas para zonificación urbana. Es importante disminuir el nivel de exposición al riesgo de las personas. Por ello es necesario contar con información de calidad tal como mapas en los que se identifiquen los riesgos potenciales y que estos se incorporen en los procesos de planificación y desarrollo urbano.

Es necesario que el Estado genere los mecanismos para que se revisen y actualicen permanentemente las normas de diseño y construcción, y se fiscalice además su cumplimiento. Es fundamental incorporar en estas normas las medidas de mitigación del riesgo como una componente importante en el desarrollo de las grandes obras de infraestructura y desarrollo.

Desarrollar una capacidad de respuesta eficiente y oportuna una vez ocurrida una catástrofe junto con asegurar la continuidad de los servicios básicos y un marco regulatorio extraordinario que permita una rápida reconstrucción.

Es de extrema importancia que las instituciones públicas tengan, una vez ocurrido un desastre, una capacidad de respuesta eficiente, que se pueda asegurar el restablecimiento de los servicios básicos tales como energía eléctrica, agua potable y comunicaciones, en especial en los lugares críticos que deben atender la emergencia tales como: hospitales, colegios, albergues e instituciones públicas y que se disponga de un marco regulatorio extraordinario que permita dar una respuesta rápida luego de ocurrida la catástrofe y un proceso de reconstrucción expedito.

Educar a la población en la prevención de los riesgos asociados a los desastres naturales y en el cumplimiento de normas éticas de construcción

Es fundamental desarrollar la capacidad de prevención de riesgos en la población, generando conciencia, educando y capacitándola para que este preparada para enfrentar los desastres y una vez que estos han ocurrido, que estén en condiciones de administrar los planes de respuesta a desastres.

Además de lo anterior, es necesario considerar las exigencias e implicancias éticas relacionadas con la prevención y reducción de los desastres para prevenir corrupción y propiciar un balance adecuado entre el desarrollo tecnológico y la calidad de vida.

Desarrollar programas de investigación y monitoreo de los aspectos más relevantes en la prevención de los efectos de las catástrofes naturales y crear redes de conocimiento. Es muy importante el desarrollo de programas de investigación conjuntos entre el Estado, las universidades, la industria y las instituciones científicas a la vez que monitorear aspectos relevantes en la prevención de los efectos de las catástrofes naturales. Es preciso además fortalecer la gestión del conocimiento creando redes de instituciones que compartan sus experiencias y conocimientos en el campo de la GRD junto con incentivar la cooperación internacional y regional.

## 5. SUMINISTRO DE ENERGIA Y DESARROLLO ECONÓMICO

El desarrollo económico de los países requiere de un suministro de energía eléctrica seguro, de calidad, económico y ambientalmente sustentable. En el presente capítulo se plantean alguna de las propuestas presentadas en los años 2006/2007 por la Comisión de Energía del Instituto de Ingenieros de Chile en el informe "La Crisis Energética y el Mercado Eléctrico" que se encuentran vigentes y que pueden ser aplicables en el contexto latinoamericano. Sin perjuicio de que el Instituto ha considerado oportuno revisar y ampliar sus recomendaciones en el campo energético, por lo que ha decidido constituir una nueva comisión que debiera emitir sus recomendaciones a fines del 2012, se incluyen en este informe las conclusiones emitidas por el Instituto en Julio de 2008"

Aspectos Claves para el desarrollo del sector

A continuación se resumen los aspectos clave que el Instituto, según el informe "La Crisis Energética y el Mercado Eléctrico" de la Comisión de Energía recomienda para el desarrollo del sector eléctrico:

- Disponer de una institucionalidad y una política energética adecuadas
- Poseer regulaciones bien estructuradas
- Contar con una tramitación ágil para la aprobación de proyectos energéticos
- Contar con una opinión pública bien informada y un país con educación en temas

de energía

Acciones a mediano y largo plazo

- Impulsar y apoyar la materialización de proyectos económica y ambientalmente viables, como una forma de lograr el ajuste del mercado eléctrico,
- Apoyar la materialización de grandes, medianos y pequeños proyectos hidroeléctricos y de los proyectos de centrales a carbón. Muy relevante es la agilización en el otorgamiento de concesiones y los trámites de aprobación ambientales
- Las energías renovables no convencionales son un aporte, pero no bastan para satisfacer las crecientes necesidades de energía del país
- Debe evaluarse seriamente la viabilidad del uso de la energía nuclear

Recomendaciones

- El pronóstico de las necesidades energéticas y en el conocimiento de las tecnologías disponibles
- La liberalización del mercado
- La promoción del uso eficiente de la energía
- Remover barreras burocráticas que retrasan la introducción de nuevas tecnologías y la concreción de proyectos grandes
- Mejorar los procedimientos para acelerar la aprobación ambiental de proyectos energéticos
- Desarrollar las capacidades y la legislación requeridas para el desarrollo de fuentes de energía, incluyendo la nuclear

Propuestas en el ámbito de energía

Las propuestas en este ámbito son:

Reducir incertidumbres respecto a plazos, criterios y condiciones para aprobación de permisos ambientales

Es fundamental, para asegurar un suministro de energía eléctrica seguro, de calidad y económico que los proyectos de generación de energía obtengan oportunamente los permisos ambientales de modo que se puedan desarrollar en plazos considerados normales, de acuerdo a la experiencia de la industria. Para ello se propone:

- Reducir al máximo las incertidumbres en cuanto a plazos, resultados y exigencias que se producen en el Sistema de Evaluación de Impacto Ambiental (SEIA), establecido en la ley sobre Bases Generales del Medio Ambiente. Si bien es importante y beneficioso para el país el hecho que los proyectos sean sometidos a un exhaustivo proceso de aprobación ambiental, la experiencia, al menos de Chile de los últimos años requiere:

- Revisar las normas, plazos, criterios y condiciones bajo las cuales se califican los proyectos de generación, transmisión y distribución de energía con el objeto de disminuir los tiempos que demora la tramitación de los permisos ambientales, en particular para los proyectos que tienen un gran efecto en la economía nacional. Se ha observado que estos proyectos, particularmente las centrales hidroeléctricas, han enfrentando serias oposiciones de parte de algunos grupos ecologistas y de otros sectores de la población, aún antes de completar sus estudios de impacto ambiental.

Por ello se propone:

- Instar a las autoridades encargadas de aplicar la legislación rigurosidad en el cumplimiento de las resoluciones ambientales de manera que aquellos proyectos que satisfagan adecuadamente los requisitos de la normativa ambiental, sean aprobados sin mayor dilación ni uso de otro tipo de argumentos.

Establecer políticas que fomenten el uso eficiente de la energía, el desarrollo de las ERNC, su ingreso al sistema eléctrico y el aprovechamiento del potencial de energía disponible

En los países en vías de desarrollo, a diferencia de los países desarrollados, cuyas economías, en términos relativos, cuentan con una estructura productiva más intensiva en la prestación de servicios y menor en la actividad productiva, el consumo de energía eléctrica crece a un ritmo similar al crecimiento económico. Por ello se propone:

- Aplicar políticas que fomenten el uso eficiente de la energía, incentiven el uso del potencial hidroeléctrico como principal fuente de energía renovable de modo de evitar recurrir a fuentes basadas en carbón y petróleo, con la consecuente elevación de la emisión de CO2.

Si bien no se cuenta con los antecedentes que permitan asegurar que la micro generación y el uso de fuentes de Energías Renovables No Convencionales, ERNC, contribuyan en forma sustantiva a la solución del problema de suministro de electricidad, se propone - Promover por parte del Estado el desarrollo de ENRC, facilitando los trámites para su instalación y su ingreso a los sistemas eléctricos, en la medida de que esto no encarezcan las tarifas eléctricas, en caso de que estas fuentes energéticas no logren desarrollarse de manera competitiva.

Estudiar nuevas opciones de generación de energía eléctrica para el largo plazo En el largo plazo, al menos en Chile se visualiza una disminución en los recursos hidroeléctricos significativos aprovechables económicamente por lo que se propone que el Estado prepare la institucionalidad necesaria y explore de manera indicativa las ubicaciones posibles para plantas de energía nuclear para traspasar a los particulares la iniciativa y el riesgo de la inversión, dentro del marco legal del negocio de la energía ya existente en el país.

Desarrollar planes comunicacionales para disponer de una sociedad informada Las preocupaciones en relación a las trabas para la tramitación de los grandes proyectos de generación se han acentuado. Actualmente la opinión pública se ha visto arrastrada a campañas de oposición a la realización de los grandes proyectos energéticos requeridos por el país. Se propone por lo tanto establecer una política de comunicación permanente de los proyectos que están en estudio de modo de que estos tengan una mejor aceptación social y se eviten futuras crisis de abastecimiento y de altos precios de la energía que tienen un impacto importante en el desarrollo de los países y en las posibilidades de superación de la pobreza.

## 6. RECURSOS HIDRICOS Y DESARROLLO

El fundamental para el desarrollo futuro de la sociedad y de una parte importante de las actividades económicas de un país, contar con el suministro de agua. En el presente capítulo se plantean alguna de las propuestas presentadas en el año 2011 por la Comisión de Aguas del Instituto de Ingenieros de Chile en el informe "Temas prioritarios para una Política Nacional de Recursos Hídricos". Estos temas, si bien son prioritarios para Chile, también podrían ser de interés para otros países de la región.

Propuestas en el ámbito de recursos hídricos

Las propuestas en este ámbito son:

Establecer zonificaciones y crear Planes Maestros de Cauces Naturales

Es fundamental avanzar en la creación de Planes Maestros de Cauces Naturales, como instrumentos básicos de gestión en aquellos cursos naturales que presenten una elevada presión como consecuencia de la actividad humana. En este aspecto se deberían delimitar los terrenos de dominio público, establecer zonificaciones en zonas inundables, coordinar las acciones orientadas al control de las crecidas, establecer los criterios y normativas que aseguren el equilibrio mecánico fluvial, y responder a las dinámicas urbanas presentes en su curso y la conservación de los bienes ambientales asociados a los cauces naturales.

Obtener información de calidad para manejo de datos y generación de conocimiento sobre recursos hídricos a la vez que establecer y hacer cumplir normas sobre calidad del agua

Es fundamental, para el desarrollo de políticas y planes de acción, disponer de información de recursos hídricos de calidad y que posea una extensión de años. Con miras a afrontar los complejos desafíos presentes y futuros, se propone

- Desarrollar un plan de mejoramiento de las redes de medición, con énfasis en la vigilancia de la calidad ambiental de los cursos de agua, en el control de las extracciones de agua por los usuarios, en la medición de niveles en acuíferos críticos, en el mejoramiento la red sedimentométrica, y en la ampliación de la red fluviométrica y pluviométrica en zonas específicas.

- Crear un Sistema Nacional de Información integrado, incluyendo las mediciones y archivos manejados en la actualidad por instituciones diversas.

- Generar acuerdos y coordinaciones institucionales para una colaboración eficaz entre el sector público y privado en relación a la obtención de información sobre el agua.

- Desarrollar un plan de apoyo a la investigación en temas específicos relativos al agua, sobre la base de una alianza entre el sector público y privado, incluyendo los centros de investigación universitarios

En relación a la calidad el agua se propone:

- Desarrollar un amplio Plan de Mejoramiento de la Red de Medición de la Calidad del Agua orientado a satisfacer los requerimientos normativos de calidad de los cuerpos de agua, constituir un sistema de vigilancia efectivo, y avanzar en el conocimiento de la situación ambiental de los cuerpos de agua, así como de las relaciones entre los ecosistemas acuáticos y los recursos hídricos.

- Completar el ámbito normativo, dictando las normas de calidad en los distintos cursos y cuerpos de agua, y las normas referidas al control de la contaminación difusa, en

especial en el ámbito de la agricultura.

Integrar, coordinar y modernizar las instituciones relacionadas con la gestión de recursos hídricos

En el país existe un importante y variado número de instituciones que se relacionan con la gestión del recurso hídrico, observándose problemas interinstitucionales por superposición y/o competencia en relación con algunas funciones y actividades, lo que, junto con las dificultades y complejidad de la coordinación interinstitucional, se traduce en un mal aprovechamiento de los recursos públicos asignados al sector. En Chile, el ordenamiento institucional de cada sector tiene un marco regulatorio definido, sin embargo en la gestión del agua se observan problemas que se manifiestan tanto en la interacción entre distintas normativas como en los efectos de iniciativas individuales o sectoriales, generando ineficiencias en el aprovechamiento de los recursos disponibles, pérdida de oportunidades y situaciones de conflicto.

En este aspecto se propone:

- Estudiar e implementar una solución institucional, que integre en una sola entidad los temas relativos a la gestión de la calidad del agua y los aspectos ambientales asociados al recurso hídrico o, en su defecto, crear coordinaciones institucionales eficaces.
- Desarrollar una solución institucional, que permita resolver los problemas de inadecuada delimitación y coordinación de funciones, como son las relativas a la gestión de la calidad del agua, gestión de los cauces naturales y autorización de obras en los mismos, y regulación de los aspectos ambientales relativos a los recursos hídricos.
- Avanzar en la modernización y profesionalización de las organizaciones de usuarios de aguas.

Analizar las externalidades del uso excesivo de aguas sobre el resto de los usuarios

Entre los temas que debieran ser analizados, cabe mencionar las externalidades sobre el resto de los beneficiarios asociadas al uso sucesivo del agua por los distintos usuarios así como los cambios de los balances oferta demanda de agua en las cuencas, como resultado de decisiones relativas a proyectos y programas, de origen público o privado, o a decisiones regulatorias sectoriales. En ese sentido se propone:

- Analizar las limitaciones del sistema de seccionamiento de ríos para abordar temas tales como la contaminación de las aguas, control de crecidas, y la gestión de situaciones de sequía.
- Estudiar las limitaciones existentes para una gestión conjunta de las aguas superficiales y subterráneas.
- Promover la coordinación de las iniciativas que se relacionan, en forma directa o indirecta, con el control y vigilancia de la calidad de las aguas, y con el desarrollo de planes de conservación ambiental asociados al agua, así como también aquellas para el aprovechamiento de las oportunidades de uso intersectorial del agua.

Adaptar el concepto de Gestión Integrada de Recursos Hídricos al marco general del país Con el propósito de enfrentar este tipo de materias, que no tienen una respuesta satisfactoria en el ordenamiento actual, ha surgido la necesidad de abordar el tema de la gestión integrada de recursos hídricos. Esto involucra considerar aspectos históricos, institucionales, legales y geográficos, entre otros. Este esfuerzo adaptativo es clave para que las propuestas y acciones tengan una proyección que permita ponerlas en práctica y se prolonguen en el tiempo.

## Instituto Ethos

Proposals from the Signatories Institutions for Brazil, Civil Society and Government positioning to the negotiations to the United Nations Conference on Sustainable Development (Rio+20)

### CONTEXT

The UN Rio+20 Conference, as we all work to guarantee its success and effectiveness, is a privileged experience to discuss measures and mechanisms to implement decisions and agreements firmed 20 years ago, at the Rio(Eco) 92 Conference. The latter was able to advance themes previously proposed, still in an elementary way, at the Stockholm Conference, in 1972, and to produce a robust set of agreements among nations, expressed under the 27 Principles of the Rio Declaration, the Agenda 21, 1 the Declaration of Forest Principles and the Conventions on Biological Diversity, Climate Change and to Combat Desertification. It also opened the way to later agreements, such as the Millennium Declaration and the Millennium Development Goals, the Johannesburg Plan of Implementation, the Latin American and Caribbean Initiative for Sustainable Development, the Monterrey Consensus of the International Conference on Financing for Development, the Doha Declaration, the Barbados Programme of Action for Sustainable Development of Small Island Developing States, the Mauritius Strategy and the Bali Strategic Plan for Technology Support and Capacity-building. It will be Rio+20 responsibility, therefore, to build a substantial political agreement, increasing the implementation capacity of the multilateral agreements previously signed and provide effective mechanisms to decisions already taken.

There are expressive contextual differences between the last big conferences (Stockholm, 1972 Rio, 1992 Johannesburg, 2002) and the 2012 summit. The first three represented, in their discussions and decisions, parallel worlds in relation to the economic context to which they were immersed in. The Stockholm Conference took place at the end of the period of real effectiveness of the Bretton Woods institutions and preceded two oil crises (1973 and 1979) that changed the global economy. Rio92 occurred along with the process of economic deregulations, the overcoming of national frontiers and the reduction of social protection networks, in contradiction with the sustainable development effort. The agreements generated from Rio92 were fundamental, but were not implemented, as they contradicted the logic of a growing globalization that also tried to sustain itself. The Johannesburg Summit happened at the climax of the movement of financialization of the global economy, when the world's capital was allocated predominantly in service of its own reproduction. In each of these historical moments it was verified a disparity among the summit's proposals and deliberations and daily decisions from governments and businesses. With these, the traditional economic vision and logic predominated over the political agreements.

Rio+20 will face the challenge and the opportunity to analyze the global crisis started in 2008 and unfolded in 2010/2011, taking into account the exhaustion in the traditional development model and the reinforced imposition of short term economic imperatives over political decisions, proposing a change of course based on sustainable development principles and imperatives. Surely, there will be conflicts of interests and of visions, being the responsibility of more advanced voices, Brazil among them, to defend a political affirmation in its multilateral dimension with impacts in internal orders, also leading to the end of the crisis. In this sense, concrete proposals must be presented to internalize decisions in the real politics and in the real economy, in their global and local dimensions, observing the principle of non-regression in relation to previous commitments. If Rio+20 is not able to construct this path, there will be a great risk to miss the accumulation of all decisions mentioned above, which are fundamental in building a fairer, inclusive, whole, and environmentally-friendly global order. With this context, and with this spirit, we offer the following suggestions, proposing the internalization of Rio92 decisions in the political sphere, as well as in the economic sphere through the adoption of goals and concrete actions that, we believe, will contribute to overcome the crisis and to build a new development paradigm.

### 1. CONSTRUCTION OF THE TRANSITION TO A GREEN ECONOMY IN A POVERTY ERRADICATION CONTEXT

Given the accumulation of compromises and agreements shown above, as well as the difficulties in implementation imposed by choices based on a short term financial-economic vision, it is necessary to develop a road map to internalize compromises in the economic order, internally and externally, fostering a transition agenda to a green, inclusive and responsible economy. These concepts are understood as follows:

A green economy seeks to ensure a friendly relationship between society's production processes and natural processes, promoting conservation, restoration and the sustainable use of ecosystems, treating the services they offer to life as assets of public interest.

An inclusive economy seeks to meet the needs and the rights of all human beings, promoting a balanced development among financial, human, social and natural capitals, equitable distribution of wealth and of income-generating opportunities, access to public goods and services, securing decent life conditions for all the population, eradicating poverty and reducing social inequalities.

A responsible economy seeks to strengthen a set of humanistic and universal principles and values that sustain the democratic functioning of societies and markets, through the development of ethical and integrity values, promoting a transparency culture and mechanisms to fight corruption.

For the internalization of compromises in national economies, we propose that all participating countries at the United Nations Conference on Sustainable Development (Rio+20) commit to adopt the following directives:

- i. Adoption, progressively, of a new national accountability standard to measure development, while the United Nations system develops a standard that could, in the medium term, be adopted by all nations (according to item 2.ii). The new national standard should redefine the concept of prosperity at a national level, considering not only the effective GDP (for mediation) and the potential GDP (for planning purposes), but also the costs of natural assets and services implied in the production of goods and availability of services, the social impacts resulting from the growth model adopted and the level of national income vis-a-vis the local population's access to adequate sanitation, health, education, consumption, mobility, culture and well being. The new national standards should, therefore, measure the natural, social, human and financial capitals, modeled in the studies developed by the Stiglitz-Sem-Fatoussi Commission and by research conducted by Ethical Markets in partnership with GlobeScan (Beyond GDP);
- ii. Pricing of carbon and the creation of an internal carbon market. It is suggested to study the adoption of a local standard for carbon pricing, considering the characteristics of local markets and economic agents, as well as the creation of an internal carbon market so the agents can operate and contribute to the achievement of national emission-reduction goals;
- iii. Payment for ecosystem s services. It is suggested to study forms of pricing of natural resources and environmental services as a way to make individual perceptions and market controls effective, leading to productive systems that considers the closed, full cycle of production and the sharing of generated benefits from the use of biodiversity and of traditional knowledge;
- iv. Establishment of Minimum Operating Standards. It is suggested to study and define local minimum sustainable operating standards for public national companies and utilities, as well as national companies that operate internationally (in issues such as decent work relations inclusion of minorities and equality , socio-environmental practices compatible with sustainable development and production's closed cycle), or submitting them to global minimum operating standards, when these are already established (see item 2.1.v). National states must also create conditions in order for multinational corporations to operate locally based on their best world standard, when this is above the local or global minimum. Furthermore, it is suggested to include among the minimum operating standards as a requirement for large national companies that operate internationally, as well as to public companies and utilities the public annual disclosure of sustainability activities modeled in global reporting standards (e.g. GRI) or a justification of impossibility of report;
- v. Inclusion of four aspects in the decision-making process: social, environmental, economic and ethical, encouraging a culture of peace and solidarity among nations and translating in concrete objectives on poverty eradication, reduction of inequalities, promotion of decent work conditions and of a system of integrity and combat against corruption;
- vi. Linkage between public and private actions in developing and following through with the 3 national plans. Additionally, the articulation between governments, intergovernmental organizations and non-governmental organizations, market and civil society based (major groups), is also fundamental for the transition to a new economic model;
- vii. Adoption of sustainable purchasing policies for governments, in a way to redirect local production, as well as measures that encourage both production with less pressure on natural resources, low emissions and decent work conditions studying differentiated taxation regimes to encourage it as well as new consumption patterns, establishing mechanisms that promote the acquisition of more sustainable products. At the same time that production patterns are shifting, it is imperative that there is a change of culture and behavior from consumers. In this sense, it is suggested to promote responsible advertising that acts as guidance to consumers, as proposed by the EthicMark® Award for Advertising that Uplifts the Human Spirit and Society. Finally, it is necessary to encourage the sustainable treatment of waste from producers as well as consumers, and the financing of R&D processes to develop sustainable products;
- viii. Effective investments, public and private, in a new education model focusing on developing values and culture aiming to develop citizens aware of their socio-cultural heritage, of their position in relation to the environment and of their power to influence and their responsibility as citizens, voters, parents, consumers, investors and entrepreneurs. Assessment mechanisms on the internalization of concepts and practices from a student perspective can be particularly effective in this sense;
- ix. Incorporation to regulation tools, inducing the planning and development of sustainable cities, through urban and rural infrastructure investments, such as greater sanitation coverage, depollution and recovery of water resources, promotion of a sustainable urban transportation system and energy generation from a diversified and renewable matrix.

Even as the plans are of national character, it is encouraged, whenever possible, the exchange of experiences and the search for cooperation among countries.

## 2. CONSTRUCTION OF A NEW INSTITUTIONAL FRAMEWORK

Regarding the internalization of commitments in national and international politics, we understand as fundamental:

2.1 A real commitment from countries to align their national planning and development agendas with sustainable development criteria, through the elaboration of national plans on sustainable development, to be presented to the new "umbrella body", to be created within the United Nations (see item 2.2), within a deadline convened with the parties (suggested, initially, two to four years).

The plans should be adapted to the different local realities and should contemplate, necessarily, a minimum agenda, consisting of goals in:

- a) Reduction of the ecological footprint, considering reducing the consumption of resources, the impacts on ecosystems and their conservation and restoration;
- b) Poverty eradication and reduction of social, political and economic inequalities, translating into access to goods, income and public services;

c) Implementation of a system of integrity and transparency for commitments in public- private relations, including a mandatory public annual disclosure of sustainability policies and practices by multinational corporations, public companies and utilities, or justification of impossibility of report.

It will be the responsibility of the United Nations to Encourage and Support National Plans and to promote spaces for sharing and exchanges that provoke synergies and scale gains, through:

i. Establishment of a International Fund to guarantee the feasibility of the national plans, which could be based on: the proportional contributive capacity of member countries of the United Nations, advancing the agreement (during the 34 Session of the UN General Assembly , 1980), which was never fulfilled, of 0.7% of GDP from developed countries, to 1% of GDP; resources from the rights of maritime and air space usage; and a tax of 0,05% on speculative international financial transactions (Tobin Tax). These resources would be redistributed according to voluntary goals and commitments agreed by nations, submitted to external and independent accountability.

ii. Adoption, by the UN, of a new national accountability standard to measure development and monitor the national voluntary plans, taking into consideration recent research among which we highlight the works of the Stiglitz-Sen-Fitoussi Commission and the studies conducted by Ethical Markets in partnership with GlobeScan (Beyond GDP) , as well as the experiences from the various nations and blocs of nations on defining their internal prosperity and development standards (according to item 1.i). The accumulation of these researches and information, and their thorough evaluation, should develop, in the medium run, into a new standard that can be adopted by all nations;

iii. Pricing of carbon and creation of a global carbon market. It is suggested to study the adoption of a global standard for carbon pricing, as well as the creation of a global carbon market. Both the carbon pricing and the operational model of the carbon market shall consider countries' experiences and the overall information from the implementation of the Clean Development Mechanisms (CDM), within the Kyoto Protocol context;

iv. Payment for ecosystems services. It is suggested to study forms of pricing of natural resources and environmental services as way to direct production systems to a closed cycle. Experiences from countries and blocs will serve as reference for global definitions that shall also consider the effective access to biodiversity and the sharing of generated benefits from its use, in accordance with previous commitments (Convention on Biological Diversity);

v. Establishment of Global Minimum Operating Standards. It is suggested to establish, at a global level, minimum operating standards for multinational corporations (in issues such as decent work relations inclusion of minorities and equality , socio-environmental practices compatible with sustainable development and productions' closed cycle); Furthermore, it is suggested to present annual disclosure reports of sustainability activities modeled in global reporting standards (e.g. GRI) or a justification of impossibility of report;

vi. Redefinition of a Geography of Technical and Scientific Cooperation, suggesting the coordination of efforts and the creation of networks that encourage the exchange of experiences, expertise and skills among regions that are similar geographically (organized by biomes), geopolitically, and by their development stage, in a way to create synergies and accelerate scale gain, with a resulting lowering of costs to the transition agenda.

2.2 Overcoming the current global institutional failure, modifying the institutional framework both in the national and global spheres, in a way to eliminate the imbalance among the four sustainable development dimensions (social, economic, environmental and ethical). Only the creation of a new institutional framework can offer the mechanisms of coordination, cooperation, evaluation and control necessary to an ambitious transition agenda. 5

In this sense, it is proposed to strengthen the management systems in the social, environmental and ethical dimensions within the United Nations, and the creation of an "umbrella body" responsible for planning, coordination, encouragement and implementation of sustainable development commitments. This new body, that shall have a hierarchical level comparable to the Security Council and absorb the Commission on Sustainable Development, shall provide directives to other bodies, agencies and programmes within the United Nations system, specially: ECOSOC, UNEP, UNDP, WTO, WCO, ILO, UNIDO, UNCTAD, FAO, OHCHR, UNFPA and UNESCO. The new body shall also articulate policies and efforts from multilateral financial institutions (International Monetary Fund and the World Bank), settle disputes, mediate conflict of interests and litigate within the International Court of Justice and the International Criminal Court, gather and provide subsidies to other multilateral organizations (such as G20 and G77), and maintain a dialogue and consulting forums with non-governmental organizations (market and civil society based), guaranteeing legitimacy to decisions and processes.

Besides being responsible for the encouragement and support to the agendas and national plans, this new multilateral institutional architecture would intervene in all situations of social, financial, food, energy, environmental, and cultural crises and in any other issues related to sustainable development.

#### Signatories Institutions

(In Alphabetical order, with international organizations highlighted in bold)

- Global Union for Sustainability
- Instituto Ethos de Empresas e Responsabilidade Social

## Interfaith Consortium for Ecological Civilization

Interfaith Consortium for Ecological Civilization

Introduction:

Interfaith Consortium for Ecological Civilization (ICEC) is a consortium of religious and secular organizations offering an ethical framework for the RIO+20 Compilation Document expressing renewed reverence for the Earth and each other.

We live at a critical moment, with devastating economic inequities and environmental changes that threaten our collective humanity and future. Unless our values and actions are in line with the common good and mutual responsibility for future generations we cannot thrive. We recommend an ethical framework to guide our actions: to encourage actions that focus on the common good for all, on clean air and water and food for all. Deep listening can help us develop empathy and compassion, to connect with our universal humanity, to hear the Earth and all of nature, reminding us of the joy of being alive and awake with vitality in line with the creative force. Life is about being more, not having more. May this understanding give us strength for our collective work. We offer moral guidance from many sources here in brief form following the Rio+20 guidelines for contributions; our website [www.ic4ec.org](http://www.ic4ec.org) offers an appendix with full citations.

### AN EARTH ETHIC

Ethics offers a lens through which to evaluate the actions of international bodies, governments, corporations and individuals. Sustainability must be about the sacredness of all life, of timeless principles of gratitude, humility, and compassion, of the truth of human interconnectedness, and commitment to justice and equality. We will have to deepen conversations and negotiations to honor this and bring fruit from it. This is the work of an earth ethic.

It is in the enlightened self interest of all - in economic, social, and spiritual terms - to develop our commitment to ethical relations with Earth. Our consortium of religious and secular leaders affirms that the environment is sacred and that humans are part of the earth's living ecosystem. We humans call each other to our universal responsibility and moral obligation to stand in solidarity, justice and equity, and offer acts of service. Collectively we insist on eradicating poverty, ensuring universal education and gender equality, and restoring our relationship to the earth.

### Our Expectation of the General Content of the RIO+20 Document

a. - we need an outcome document that can inspire and galvanize action, acknowledging:

- the youth of the world are an immense resource, voicing ethical guidelines and calling us to intergenerational equity.
- the importance of the spiritual dimension of sustainability-that after basic needs are met, life is about being more, not having more, as put forth in The Earth Charter Preamble.
- the need for fundamental changes in values, institutions, and ways of living. Earth Charter Principle 7.f. urges us to Adopt lifestyles that emphasize the quality of life and material sufficiency in a finite world."

b. Principles to be followed - we affirm the following principled approaches:

- Justice - Reduce disparities between rich and poor, and achieve social and economic justice, within a sustainable use and fair share of the world's resources while leaving sufficient essential space for wildlife and wilderness.
- The Right to Development - Human development in harmony with the environment is fundamental to the achievement of sustainable development, so that individuals and societies are empowered to achieve positive social and environmental outcomes including access to healthcare, education and sustainable livelihoods.
- Information, participation and accountability - All citizens have a right of access to information concerning the environment, as well as the opportunity to participate in decision-making processes. To ensure that environmental issues are handled with the participation of all concerned citizens, institutions at all levels (national and international) must be democratic and accountable, and make use of tools that enable civil society to hold them to account. In this regard, the access to justice by citizens for redress and remedy in environmental matters is a cornerstone of enhancing accountability.
- Just Transition - There will be costs in making the transition to a low carbon, green economy in the pursuit of sustainable development. Some States and actors are better able to bear those costs than others and are more resilient to transitional changes. In the process of change, the most vulnerable must be supported and protected. Developing countries must have access to appropriate financial and technical assistance, citizens and communities must also have access to new skills and jobs.

c. Examples of Sustainable Development:

- We know that immense changes can be made, as the Green Belt Movement proves, with actions based in a spirit of service, love, gratitude, and respect for the earth's resources, towards development that honors the earth and effectively intervenes in poverty.
- Indigenous peoples around the world continue to call for the right relationship to Mother Earth as a living being, with inherent rights.
- The Earth Charter calls us all to take on the mantle of global citizens, in full responsibility and solidarity, to end poverty and inequality. Its example of participatory democracy through a worldwide conversation sets a new standard for inclusion that can be enhanced through communications technology.

d. Cooperation:

- Religious leaders can insist on being part of the solutions. In Africa, religious leaders are already offering a joint statement to the United Nations Framework Convention on Climate Change (UNFCCC), and committing to action on all levels, taking on responsibility while they demand it from decision makers. They offer renewed moral vision and call for economic and political systems based on ecological principles.

Specific Elements:

Stated Objectives of the Conference:

a. To secure political commitment for sustainable development:

We recommend the adoption of the Sustainable Development Goal focused on Sustainable Production and Consumption as articulated in the Bonn Declaration (442- 463), in

particular calling "on nations and populations engaged in wasteful over consumption to reduce their impacts and help increase the consumption of vital goods and services for impoverished nations and peoples, so they also can enjoy reasonably high standards of living that provide equitable access to health care, decent work opportunities and education."

b. To establish a green economy:

- Many, including the Mary Robinson Foundation's Climate Justice initiative, are standing for equitable stewardship, human rights, the rights of the most vulnerable, gender equality and education as the means to a true "green economy."
- Climate Ethics calls us to reduce carbon pollution as a moral obligation, to protect against suffering and degradation, to preserve justice and equity and insist now on stopping the worst violations of human rights caused by environmental degradation.
- The Earth Charter principle 7.d. insists we "Internalize the full environmental and social costs of goods and services into the selling price."
- The Bonn Declaration recognizes "that the market and institutional failures take the form of prices that do not reflect their true environmental and social costs, underinvestment in natural, human, built and social capital, harmful and perverse subsidies, restricted access to information about production technologies and their impacts, lack of democratic economic governance, increasing unemployment and inadequate indicators of progress. (212-215)
- The Bonn Declaration calls "for replacement of the current inefficient, unsustainable and inequitable economic, monetary, financial and commercial models with policies that advance rather than detract from sustainable development goals and that build rather than deplete the stocks of natural, human, built and social capital on which human well-being ultimately depends. We propose that where the current economy aids inequity, destruction and greed, it should be replaced by an economy that cares for the human-earth community.(166-170)
- We recommend the creation of an economic bottom line based on strong sustainability and adoption of alternative economic indicators to GDP as genuine indicators of progress which include social and environmental costs. This is a moral imperative, to measure in an integrated and holistic way such that the reality of the interconnections of environmental, justice, and development issues are seen together, with externalities included.

c. To develop an institutional framework for sustainable development:

Priorities for strengthening and integrating pillars at multiple levels.

- Establishment of Ombudspersons for Future Generations at global, national and local levels as called for in the Bonn Declaration calls "for the, who will advocate for sustainable development as envisaged and defined by the Brundtland Commission: to enhance the well-being and prospects of present and future generations to meet their needs, and to serve as an auditor at the heart of governments and deal with citizens complaints. (283-286)
- Responsibility to future generations by changing the discount rate, adopting the precautionary principle and establishing Ombudspersons for Future Generations at global, national and local levels.
- Strengthening of UNEP so that it may serve as a stronger international force for the respect and care for the environment and protection of our common good and common future. The market economy does not adequately protect common goods such as fresh water, health soil and clean air, so we must institutionalize the preservation of these common goods and protection of Earth's vitality, diversity, beauty and sacredness.

In conclusion, we strongly recommend that an ethical framework be integrated into the content of the Compilation Document. There are other organizations calling for ethical standards; we support their recommendations.

Thank you for considering our recommendations.

For more information on ICEC, our leadership, membership, and initiatives, please visit [www.ic4ec.org](http://www.ic4ec.org).

## Interfaith Peacebuilding and Community Revitalization

A Four Page Summary of The IPCR Initiative

[Note: All of the documents, resources, etc at the website of The Interfaith Peacebuilding and Community Revitalization (IPCR) Initiative ([www.ipcri.net](http://www.ipcri.net) ) are accessible for free. The IPCR Journal/Newsletter (Winter 2010-2011 issue, 58 pages) is referenced in this "Four Page Summary of The IPCR Initiative" because it is the most comprehensive short introduction to The IPCR Initiative yet created in the almost six years The IPCR Initiative has been on the Internet.]

Many Difficult Challenges Ahead

We now live in very complex world. There are many difficult challenges ahead. These challenges include, but are not limited to:

- a) global warming and reducing carbon emissions
- b) peak oil and reducing dependence on petroleum based products
- c) global inequities and the tragic cycles of malnutrition, disease, and death
- d) an increasing world population requiring more resources when many resources are becoming more scarce (with a special emphasis on the increasing number of people who are consuming resources and ecological services indiscriminately)
- e) cultures of violence, greed, corruption, and overindulgence—which have become so common that many of us accept such as inevitable; which are a significant part of the current crises of confidence in financial markets; and which are in many ways slowing the restructuring of investment priorities needed to respond to an increasing number of other critical challenges
- f) a marginalization of the wisdom associated with religious, spiritual, and moral traditions

More and more people are coming to the realization that overcoming the challenges of our times will require problem solving on a scale most of us have never known before—and that there is an urgent need to restructure our economic systems and our education systems to respond to these challenges.

How can we get more “on track” with the problem solving we so urgently need to do?

#### Gaining a Deeper Appreciation for How Comprehensive Peacebuilding Efforts Can Be

There are many propositions which are explored in depth by The IPCR Initiative—for their potential to provide solutions. Here are three which are at the center of The IPCR peacebuilding approach:

- a) There are countless numbers of “things people can do in the everyday circumstances of their lives” which will contribute to peacebuilding, community revitalization, and ecological sustainability efforts, in their own communities and regions—and in other parts of the world.
- b) Everyone is involved when it comes to determining the markets which supply the “ways of earning a living”. (The ways we “invest” our time, energy, and money have a direct impact on the “ways of earning a living” that are available).
- c) People can, one by one, decide to deliberately channel the way they “invest” their time, energy, and money so that these “investments” are in many ways supportive of solution-oriented activity. (All of us have important responsibilities associated with resolving a significant number of very serious challenges in the months and years ahead.)

The feature article in The IPCR Journal/Newsletter (Winter 2010-2011 issue) is “The IPCR Initiative: Creating a Multiplier Effect of a Positive Nature”. From this article, and other supporting pieces in the 58 page issue, an IPCR peacebuilding approach emerges which may be summarized as follows:

1. A central focus of The IPCR Initiative is its advocacy for a combination Community Visioning Initiatives, “Community Teaching and Learning Centers” with ongoing workshops, and “sister community” relationships as a way of generating an exponential increase in our collective capacity to overcome the challenges of our times.
2. Community Visioning Initiatives can be described as a series of community meetings designed to facilitate the process of brainstorming ideas, organizing the ideas into goals, prioritizing the goals, and identifying doable steps. One of the main goals of Community Visioning Initiatives is to maximize citizen participation in identifying challenges, and in solution-oriented activity.
3. The concept of “Community Teaching and Learning Centers” (created by the “TeachersWithout Borders” organization) (modified and expanded by the The IPCR Initiative) is about creating many local community points of entry which function as information and resource centers, locations for workshops, and locations for the training of “teacher-leaders”.
4. Results from well thought out preliminary surveys (circulated to at least 150 key leaders from a significant variety of fields of activity in the community) can help residents appreciate the need for a Community Visioning Initiative, and for “Community Teaching and Learning Centers” (CTLCs)—and help determine the topics to be covered by workshops in the CTLCs. The IPCR Initiative advocates for Community Visioning Initiatives—supported by many “Community Teaching and Learning Centers”— which are time-intensive, lasting even as much as 1½ years (18 months), so as to give as much importance to developing a close-knit community as it does to
  - a) accumulating and integrating the knowledge and skill sets necessary for the highest percentage of people to act wisely in response to challenges identified as priority challenges
  - b) helping people to deliberately channel their time, energy, and money into the creation of “ways of earning a living” which are directly related to resolving high priority challenges
  - c) assisting with outreach, partnership formation, and development of service capacity for a significant number of already existing (or forming) organizations, businesses, institutions, and government agencies
  - d) helping to build a high level of consensus for specific action plans, which will help inspire additional support from people, businesses, organizations, institutions, and government agencies with significant resources
5. Sister community relationships: communities with the resources to do so matching up with communities in other countries where there has been well documented calls for assistance with basic human needs. These “sister community” relationships can create service work capable of uniting diverse communities of people, and a variety of opportunities for person-to-person peacebuilding.
6. Specific evidence for Proposition a) above (of the countless numbers of “things people can do...”) is provided by the “Links” section at The IPCR Initiative website, which
  - a) identifies 117 fields of activity related to peacebuilding, community revitalization, and ecological sustainability
  - b) provides comprehensive, detailed, and practical starting points for becoming involved—or increasing involvement—in these fields of activity.
7. In addition, one very important feature of the Community Visioning Initiatives the IPCR Initiative advocates for is the job fairs which come at the end of the Community Visioning Initiative process. Such job fairs provide opportunities for all key stakeholders in the community (businesses, organizations, institutions, government, etc) to demonstrate their upgraded awareness—and their interest in the welfare of the community—by offering and facilitating new employment opportunities... and thus assisting with a just transition from patterns of investment which in only limited ways represent solutions to prioritized challenges to patterns of investment which in many ways represent solutions to prioritized challenges.
8. This approach to maximizing citizen participation in solution-oriented activity also provides many opportunities for local newspapers to contribute very valuable community services (for example: making preliminary survey results accessible; carrying out ongoing community specific surveys; highlighting inspirational role models and initiatives associated with the 117 related fields of activity; describing workshop activity in the “Community Teaching and Learning Centers”; reporting on the planning, implementation, evaluation, and follow up stages associated with Community Visioning Initiatives; etc).

This writer feels it is critical for people in every variety of circumstances to gain a deep appreciation for how comprehensive peacebuilding efforts can be—how every person in communities around the world can do something to contribute to the greater good of the whole. And yet...even with all the potential associated with the Internet , and even with community building processes like the ones outlined above, we can still fail to overcome the challenges of our times... if we are not completely honest with ourselves about our shortcomings... and if we fail to access—and apply—the treasured wisdom of religious, spiritual, and moral traditions (the accumulated storehouses of wisdom on how to cultivate compassion and forgiveness—for our fellow human beings... and for ourselves).

#### We Must Help Each Other—and Restore Confidence in the Higher Values of Life

We must be honest with ourselves about what is going on: people who are not sufficiently informed about critical issues are everywhere, and they are investing their time, energy, and money—voting—all the time... and yet...an exponential increase in compassion for our fellow human beings is not, currently, widely recognized as an essential and critical element of truly comprehensive response to the challenges of our times. (One of the most persistent ironies in life is that with so many opportunities to provide real assistance to fellow human beings—and with the potential for such assistance to result in happiness “to those who extend help as well as to those who receive it”—there are still many, many people in this world who cannot find a “way to earn a living” providing such assistance.) This writer believes that there are many serious challenges before us

now, and that we will need to invest our time, energy, and money very wisely to overcome these challenges. How can we do it? We must help each other.

There may be many people in our communities who use irresponsible and disrespectful language in ways which do not suggest that their motive is to respectfully provide good service to their fellow human beings, and contribute to the greater good of the whole. And there may be people in our communities who—regardless of the difficulties and urgencies associated with resolving multiple crises—choose to focus their attention of trying to make money by preying of people's fears, manipulating people's trust, and/or encouraging people to abandon hope in higher aspirations, and indulge in unhealthy, or immoral behavior. The IPCR Initiative recognizes that such behavior is clearly counterproductive to the building of caring communities; it can be very dangerous for community morale; and it can become a crippling obstacle in times of crises.

Many people may think it is naïve to imagine that people from so many diverse religious, spiritual, moral, and cultural traditions can decide to come together in such a way as to not only encourage, but participate in, a high percentage of constructive thinking and constructive action in response to the difficult challenges ahead (as in the high levels of participation encouraged by comprehensive Community Visioning Initiatives). From this writer's point of view, such skepticism and cynicism depend for their existence on doubts as to whether it is possible for people to achieve highly advanced forms of wisdom and compassion through genuine instruction and sincere effort. Thus it is that there is a great responsibility on those people who are in any way representatives of religious, spiritual, and/or moral traditions—to demonstrate what is possible along the lines of wisdom and compassion, to provide genuine instruction when sincere efforts are being made, to contribute to the greater good of the whole, and to help restore confidence in the higher values of life.

The IPCR Initiative is developing tools and resources with the belief that it must somehow be possible for people from many diverse religious, spiritual, moral, and cultural traditions to come together in such a way as to not only encourage, but participate in, a high percentage of constructive thinking and constructive action in response to the difficult challenges ahead... and that—as a result of that being possible—it will also be possible for many people to achieve highly advanced forms of wisdom and compassion through genuine instruction and sincere effort.

The IPCR Journal/Newsletter (Winter 2010-2011 issue; 58 pages) includes:

- a) an 11 page introduction to The IPCR Initiative ("Creating a Multiplier Effect of a Positive Nature")
- b) a 15 step outline for Community Visioning Initiatives
- c) 8 sample questions for a preliminary survey
- d) a list of 117 related fields of activity
- e) an introduction to the concept "Peace Returned on Resources Invested"
- f) a 9 page section titled "A Call to Women's Organizations Associated with Peacebuilding and Philanthropy"
- g) a section describing opportunities for local newspapers to contribute valuable community service —and thus contains enough detail associated with the IPCR peacebuilding approach outlined above to be a valuable starting point for brainstorming sessions, exploratory meetings, and workshops associated with planning and implementing a Community Visioning Initiative.

I invite readers of this message to access The IPCR Journal/Newsletter (Winter 2010-2011 issue) for free, at the website of The IPCR Initiative ([www.ipcri.net](http://www.ipcri.net)).

We have the resources necessary to overcome the challenges of our times... and--

--as a result of the unprecedented opportunities created by the expansion of the Internet, we have now arrived at a very auspicious moment in time... for at no other time in the course of history has so many people had access to so much in the way of time-tested guidelines, inspiring role models, and serviceoriented initiatives relevant to peace, prosperity, and happiness.

Never before has a generation of human beings had such opportunities as are accessible to this generation of human beings. Thousands of years of human efforts in every field of activity has now culminated in opportunities to discover how much of this potential can be fulfilled. This writer urges every one of the readers of this message to make the sacrifices necessary to discover how much of the potential can be fulfilled.

## Interim Secretariat of the Carpathian Convention

### Submission by the Interim Secretariat of the Carpathian Convention (ISCC) for

#### UNCSD 2012

#### Background

The Third Meeting of the Conference of the Parties to the Carpathian Convention (Slovak Republic, 25-27 May 2011, called "upon the interim Secretariat of the Carpathian Convention and all relevant institutions to promote the Carpathian Convention as a best-practice example of institutional framework for promoting sustainable development and green economy, in the

context of the process leading to the Rio+20 Earth Summit in 2012", The Carpathian Convention is an active Member of the Mountain Partnership.

The Framework Convention on the Protection and Sustainable Development of the Carpathians (Carpathian Convention) was adopted and signed by the seven Parties (Czech Republic, Hungary, Poland, Romania, Serbia, Slovak Republic, Ukraine) in May 2003 in Kyiv, Ukraine, and entered into force in January 2006. It is the only multi-level governance mechanism covering the whole of the Carpathian area and besides the Alpine Convention the

other sub-regional treaty-based regime for the protection and sustainable development of a mountain region worldwide.

The common vision of the Parties to the Carpathian Convention is to pursue comprehensive policy and cooperation in order to guarantee protection and sustainable development of the Carpathians. The improvement of the quality of life, the strengthening of local economies and communities, and the conservation of natural values and cultural heritage should go hand in

hand in the Carpathian area.

The Convention provides a framework for cooperation and multi-sectoral policy coordination, a platform for joint strategies and projects for sustainable development, and a forum for dialogue between all stakeholders involved – from the local community and various NGO's up to the regional and national Governments, Institutions of the European

Union and the United Nations.

The adoption of Protocols is one of the most important means for achieving the overall objectives of the Convention through effective implementation. At the moment the Protocol on Conservation and Sustainable Use of Biological and Landscape Diversity entered into force and the Protocols on Sustainable Tourism and Sustainable Forest management have been adopted.

As a regional mountain agreement the Carpathian Convention gains also importance on the global level in terms of contribution to the implementation of Multilateral Environmental Agreements (MEAs) such as the Convention on Biological Diversity (CBD) and its related Programmes of Work (PoWs) (e.g. on Mountain Biodiversity or Protected Areas) or the United Nations Framework Convention on Climate Change (UNFCCC).

The Carpathian Convention likewise the Alpine Convention follows a ecosystem-based management approach, taking into account socio-economic and environmental concerns at the same time. This approach is also in line with the principles of integration and interdependence

as enshrined in numerous political documents such as the Johannesburg Declaration on Sustainable Development 2002.

#### **Possible considerations by the ISCC for the process leading to Rio Earth Summit 2012**

· Further capitalizing on the results gained through UNEP's Green Economy Initiative, such as the synthesis for policy-makers entitled "Towards a Green Economy: Pathways to Sustainable Development and Poverty Eradication" (2011) and in sector chapters available as part of the Green Economy Report (2011) as well as a number of other significant documents that have been published on this concept.

· Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably. Moreover, the ability of **mountain systems to provide essential goods and services for all of humanity** is increasingly under threat from climate change, globalization, a chronic lack of investment and ongoing land degradation.

· The natural capital is source of ecological functions, which are essential for the human well-being. Mountains host a wide range of ecosystems, different in quantity and quality and generally in a good state of conservation. Consequently, mountain areas provide significant ecosystem services of which we are only partially aware, at present. In order to promote the enduring and sustainable development of mountain areas, generally less competitive from a socio-economic point of view, it is essential to identify the natural capital held by these areas, as well as the ecosystem services that they offer. Moreover, this also ensures the preservation of such a capital and the integrity of the services provided. Such ecosystem services are not fully recognized by the conventional measures of income and wealth. Therefore it is necessary to promote actions aimed towards the recognition and the valuation of mountain ecosystem services, by applying market-based mechanisms in the transition to green economy, according to the requirements of mountain territories and consistent with the preservation of the multi-functionality of these ecosystems. **In the context of a Green Economy, new opportunities for investments by the private sector are emerging in mountain regions, especially in renewable energy, sustainable agriculture, and ecosystem goods and services.**

· However, **innovative institutional arrangements are urgently required to trigger governance models and decision support systems** aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, as well as the actual mainstreaming of mountains into overall national development and conservation processes. The Carpathian Convention is a regional governance mechanism and a best-practice example of institutional framework for promoting sustainable development and green economy.

· The Lucerne Call for Action as outcome of the Lucerne World Mountain Conference, 11 to 12 October 2011, organized by Switzerland is an important strategic document in the field of Sustainable Mountain Development that needs to be taken into account for the discussions and preparation of the Rio Earth Summit 2012.

**Further information:** [www.carpathianconvention.org](http://www.carpathianconvention.org)

#### **Mountains for the World: Call for Action**

Mountains are vital for sustainable development and human wellbeing. More than half of the earth's population depends on fresh water coming from mountains. Mountains also provide a number of important global goods and key services which are under increasing pressure from globalization and climate change.

Following the invitation of the Swiss Agency for Development and Cooperation and the Mountain Partnership Secretariat (FAO), international experts and policy makers met in Lucerne on 11 and 12 October 2011 to convey the importance of mountains to the Rio +20 summit.

Protecting future water supplies, reducing poverty in mountain populations and unlocking the economic potential of mountains calls for the following actions:

- 1) **Adapt** and develop mountain governance that takes into account the unique characteristics of mountains in order to overcome poverty, food insecurity, and social exclusion.
- 2) **Facilitate** mountain communities to gain fair access to resources and share benefits of their use equitably.
- 3) **Involve** mountain people in decision making processes that concern their livelihood, economy, environment, and culture.
- 4) **Strengthen** and develop national, regional and global institutions that address highland-lowland interactions and transboundary cooperation, support capacity building, generation and dissemination of knowledge, technical expertise and innovation for sustainable mountain development.
- 5) **Provide** enabling conditions and incentives for investment by the private sector in sustainable development in mountain areas and include appropriate funding in national budgets in order to enhance wellbeing and reduce disparities.
- 6) **Recognize** the vulnerability of mountain ecosystems within the three Rio conventions and adopt action plans for each related to sustainable development.
- 7) **Make best use of** all new and existing funding mechanisms such as the Global Environment Facility.

**Lucerne, 11 October 2011**

## INTOSAI CONTRIBUTION TO THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT (RIO+20)

### INTOSAI Contribution to the Rio + 20 Conference of the United Nations on Sustainable Development

Supreme Audit Institutions (SAIs) are cornerstones of good governance and play with their audits of government operations - including the economic, environmental and social sphere - a vital role in the area of sustainable development. SAIs provide independent and reliable information on government spending and operations which facilitates transparency and accountability and contributes to the implementation of the Millennium Development Goals (MDGs).

To be able to contribute to sustainable development effectively, SAIs must be independent of the governmental agencies they audit, and be protected from any form of outside influence. The Declarations of Lima (1977) and Mexico (2007) delineated the basic principles of independence of public sector auditing by SAIs. On 26 April 2011, ECOSOC recognized the important role of INTOSAI and the Declarations of Lima and Mexico by adopting resolution 2011/2, which states in its OP 2:

"Takes note with appreciation of the work of the International Organization of Supreme Audit Institutions in promoting greater transparency, accountability and efficient and effective receipt and use of public resources for the benefit of citizens and of the Lima Declaration of Guidelines on Auditing Precepts of 1977 and the Mexico Declaration of Supreme Audit Institutions Independence of 2007, which set out the principles of independence in government auditing, and encourages the wide dissemination of these principles;"

On the occasion of the 21st UN-INTOSAI Symposium on "Effective practices of cooperation between supreme audit institutions and citizens to enhance public accountability" the United Nations invited INTOSAI to contribute to the Rio + 20 UNConference on Sustainable Development in 2012.

INTOSAI warmly welcomes the invitation, especially in the light of the fact that sustainable development has emerged as a relevant issue in the work of the audit institutions worldwide: "Environmental Auditing and Sustainable Development" was one main theme of INTOSAI's last triennial congress of Supreme Audit Institutions, INCOSAI XX, held in Johannesburg in November 2010. In that congress, all SAIs committed to prioritizing environmental and sustainable development issues in their audit work while multilateral environmental agreements and coordinated audits between SAIs were underlined as key focus areas.

INTOSAI aims to further improve the use of audit instruments in the field of environmental protection policies through its Working Group on Environmental Auditing (WGEA), chaired by the Auditor General of the National Audit Office of Estonia. The WGEA has already started to prepare for the Rio+20 event with its special project team working on a document compiling the experiences of SAIs on sustainable development related issues. We would appreciate it if you considered involving INTOSAI to the preparatory process as early on as possible.

The INTOSAI WGEA will additionally take part of the UNEP World Congress on Justice, Governance and Law for Environmental Sustainability, which will be held prior to Rio+20.

Following the Rio+20 invitation the Governing Board of INTOSAI suggests to include a reference to the work of SAIs in the area of sustainable development and the therefore necessary preconditions in the final document of the Conference as follows:

- Recalling the UN Millennium Declaration;
- recalling the ECOSOC resolution 2011/2;
- emphasizing that efficient, accountable, effective and transparent public administration has a key role to play in the implementation of the internationally-agreed development goals, including the MDGs and multilateral environmental agreements;
- emphasizing the need to improve the efficiency, transparency and accountability of public administration in order to contribute more effectively to the implementation of the MDG and sustainable development;
- recognizing SAIs role in the improvement of efficiency, transparency and accountability of public administration, which is conducive to achieving the internationally agreed development goals, including the MDGs and multilateral environmental agreements;
- emphasizing the importance of SAIs' independence from the agencies they audit;
- recognizing the crucial role SAIs can play in achieving the international goals of identifying and addressing the gaps and building accountability in the implementation process of the global sustainable development agenda;
- taking note with appreciation of the work of INTOSAI and the Declarations of Lima and Mexico as well as the recommendations of the XX INCOSAI;
- calling upon UN member states to implement and apply the principles set out in the Lima and Mexico declarations in order to improve the position of SAIs to contribute to sustainable development.

#### WGEA Rio+20 Project – Report Summary

##### Environmental auditing supports better governance

Good governance, the process of decision-making and the process by which decisions are implemented or in turn not implemented, is essential to ensuring that environmental protection and sustainable development promises produce credible results. Governance is one of the key themes to be addressed at the United Nations Conference on Sustainable Development (or Rio+20) to be held in Rio de Janeiro, Brazil on 4-6 June 2012.

National auditors and their audits play a critical role in supporting good governance by advancing accountability, and providing practical, objective and rigorous examinations of how environmental and sustainability programs, regulations, targets and laws are managed and implemented at the national and international level. Some countries have regional auditors or evaluators that play a similar role. This paper summarizes some key observations from two decades of work by supreme audit institutions, which play a major role in auditing government accounts and operations.

Supreme audit organizations (SAIs) go by different names – sometimes National Audit Office, Court of Audit, Audit Board, and Office of the Auditor General – and have different mandates but similar responsibilities to provide legislatures and society with the information they need to hold governments accountable. SAIs audit governments' financial management, compliance with domestic laws and international agreements, domestic and international policy implementation and performance. SAIs are independent, non-political, and fact-based in their work. Between 1993 and 2011, National audit offices in 107 countries have conducted over 3200 environmentally related financial, compliance and performance audits.

Environmental audits have resulted in governments taking action to improve water quality in rivers, strengthen protection of flora and fauna, and reduce pollution. Benefits to environmental governance include the development of new legislation and regulations and stronger compliance with those that already exist. The implementation of

multilateral environmental agreements has been improved through elements such as improving the designs of linked programs and better results reporting mechanisms.

The vast majority of SAI's environmental audits have examined national and sub-national programs such as climate change, acid rain, toxic substances, biodiversity, protected areas and natural parks, environmental assessment, green economy – sustainable energy, sustainable development, environment and human health, forestry, fisheries, mining, waste, water, and multilateral environmental agreements (MEAs). With regards to MEAs, around 80 audits were conducted between 2003 and 2011 on agreements such as the Kyoto Protocol, UN Framework Convention on Climate Change, UN Convention on Biodiversity, UN Convention to Combat Desertification, Montreal Protocol, and Basel Convention. A comprehensive database of these audits can be found at [www.environmental-auditing.org](http://www.environmental-auditing.org).

Since 1992 the International Organization for Supreme Audit Institutions (INTOSAI), the professional association for SAI's, has had an active Working Group on Environmental Auditing. The Working Group has assisted SAI's in acquiring a better understanding of the specific issues involved in environmental auditing; facilitating the exchange of information and experience among SAI's; and publishing guidelines and other informative material for their use. Joint auditing by SAI's of cross border environmental issues and policies, and the audit of international environmental accords, has had the Working Group's special attention.

The Working Group has worked with the United Nations Environment Programme to develop a Guide on Auditing the Implementation of Multilateral Environmental Agreements. The objective of the Guide is to serve as a useful resource for auditors worldwide who evaluate the implementation of those agreements by their national governments and whether the policy tools that their governments use to manage and protect the environment and implement MEAs have produced the intended results. The guide can also be useful in improving future MEAs as it identifies key aspects that we look for in our audits that are important to good governance and accountability.

The Working Group has also produced a number of other guidance documents to aid auditors in auditing a variety of issues including climate change, waste management, water, forestry, and sustainable development. An important upcoming guidance document in 2012 will be on environmental data.

Under the auspices of the Working Group and its regional groups, a number of cooperative audits between different SAI's have been undertaken. The Coordinated International Audit on Climate Change: Key Implications for Governments and their Auditors (2010) involved fourteen supreme audit institutions (Australia, Austria, Brazil, Canada, Estonia, Finland, Greece, Republic of Indonesia, Norway, Poland, Slovenia, South Africa, United Kingdom, and United States of America) from six continents who worked cooperatively to design and undertake performance audits of their national governments' implementation of commitments and programs related to the mitigation of and adaptation to climate change. The SAI's involved included those from both developing and developed countries and the results from 33 audits.

Amongst the six regional groups of the Working Group on Environmental Auditing, over 50 cooperative audits have been conducted since 1995. Important ones have included:

- Pacific Association of SAI's – Solid Waste Management Audit (2011, ten SAI's) - Organization of Latin American and Caribbean SAI's – Compliance against United - Nations Framework Convention on Climate Change Commitments Audit (2011, 7 SAI's) and Environmental Protection and Conservation of Natural Resources of the Amazon Region Audit (2010, 5 SAI's)
- African Organization of SAI's – Lake Victoria Basin Audit (2002, 5 SAI's)
- European Organization of SAI's – Convention on the Protection of the Black Sea Against Pollution Audit (2011, 6 SAI's)

#### Putting Our Audits to Work

In 2011, a survey of the members of the INTOSAI Working Group on Environmental Auditing was conducted for this paper to identify the key observations that SAI's around the world are consistently finding when conducting their environmental audits. The ten top issues identified by 37 countries are listed below along with examples of the type of issues identified.

- Unclear/overlapping of responsibilities – In some audits the institutional framework for sustainable development is cross-governmental and requires more work from governments in order to integrate economic, social, and environmental aspects. Governments have adapted to this new reality by creating more integration among ministries, departments and agencies, and among programs and projects. However, there is a lack of clarity regarding the specific role each one of those entities plays and what they are responsible for, resulting in overlapping of responsibilities across agencies and departments that compromise the effectiveness of policy coordination and generate duplication of efforts.
- Lack of coordination between sub-national levels and the national level – Through the audits conducted, it has been noted that environmental problems occur at all levels from local to global, and involve municipal, regional and national governments. There is a need to improve integration and coordination between governance institutions at different levels. When local entities are involved in implementing national policies and in the interest of transparency and accountability for national funds and results, it is essential that some credible and verifiable means exist for reporting on how these funds were spent and what results were achieved.
- Absent or deficient policy or strategy – According to some audits some governments have not yet created effective policy tools and systems to govern environment and sustainable development or have not improved public policy tools and process as demanded. With regards to some policies, targets, objectives, or commitments may be in place but they are not always supported by comprehensive and specific national, regional or sectoral strategies and plans. Without the involvement by all affected levels of government an overall policy or strategy cannot hope to achieve the desired national results.
- Insufficient assessment of environmental impacts of governmental policies and programs – Audits have noted that governments are not using policy tools to ensure more timely consideration of environmental aspects before large sums are committed to a policy, program or project. High-level regulatory impact assessment or strategic environmental assessment is not a concern for many governments.
- Lack of analysis (economic, social, and environmental) supporting decisions – In some audits the findings have noted that policy makers are not taking into account the three pillars of sustainable development – economic, social, and environmental aspects - when making decisions. Sustainable development governance requires better "integration" of economic, social and environmental policies, particularly within the broader development planning frameworks.
- Lack of long-term planning to implement environmental policies and programs – Audits have noted that issues requiring long-term planning to resolve, such as climate change adaptation, do not have corresponding planning processes or plans in place.
- Inadequate financial management of environmental policies and programs – Audits have noted financial management problems can be caused by: insufficient planning resulting in the costs of delivering environmental policies and programs not being anticipated and programmes then requiring an extensive amount of unanticipated funds; lack of appropriate financial management framework to support the implementation of environmental policies and programs; and lack of financial management skills and misuse of funds.
- Lack of enforcement of domestic environmental legislation – National audits have indicated that environmental laws are not self-executing and governments must ensure compliance with domestic environmental legislation, by taking appropriate, effective and proportionate policy measures. It requires administrative capacities and strong

government commitments to implement and enforce the regulatory framework.

- Deficient monitoring and reporting systems – Through the audits it was noted that high-quality accountability and reporting systems are often lacking. Evaluation of key policy choices and instruments is not always in place. In the absence of good evaluation it is difficult for governments to report and measure their progress towards sustainable development and identify where further policy action is required.

- Lack of environmental data for decision-making – Audits have noted that government bodies do not have sufficient and robust environmental data to support their decisions and to evaluate their performance. There are problems in data availability, timeliness, quality, and accuracy. Overall, there is a lack of knowledge and information about various aspects of ecosystems and a failure to adequately use the existing information to support management decision. Independent environmental audits can collect and report information for decision-makers where information is lacking.

For the participating national governments at the United Nations Conference on Sustainable Development to be held in Rio de Janeiro, Brazil on 4-6 June 2012, the lessons are twofold. First, national governments can use the survey results and national audit reports, findings and recommendations to improve the effectiveness and cost-efficiency of a range of domestic environmental and sustainable development programs, policies and tools. The results of twenty years of national auditing work can also be used to better design and implement national policies and programs moving forward. Second, at the international level, the results of this survey and the audits conducted by SAs can provide national governments as well as MEA secretariats with important feedback for evaluating the implementation of international commitments. They also show national governments and MEA secretariats the key features of good governance that should be built in from the start against which compliance can be monitored.

The full report will be published in time for the conference in Rio de Janeiro in June 2012.

#### Background on INTOSAI

The International Organization for Supreme Audit Institutions (INTOSAI, [www.intosai.org](http://www.intosai.org)), as a non-governmental organization, is the professional association of SAs in countries that belong to the United Nations or its specialized agencies. INTOSAI provides a forum in which government auditors from around the world can discuss issues of mutual concern and keep abreast of the latest developments in auditing and other applicable professional standards and best practices.

INTOSAI has increasingly recognized over the past two decades that the environment and sustainable development is an important issue that requires attention by the auditing community. The relevance of this topic was recognized by INTOSAI through the establishment of an active Working Group on Environmental Auditing ([www.environmental-auditing.org](http://www.environmental-auditing.org)) in 1992, the same year that the United Nations Earth Summit was held in Rio de Janeiro. At INTOSAI's most recent triennial International Congress of Supreme Audit Institutions (INCOSAI XX) held in 2010 in Johannesburg, South Africa, the resulting Johannesburg Accords noted that "environmental protection and sustainable development is one of the most topical issues that face governments in the new millennium." In addition, "the expectation that sustainable development and environmental protection should be subject to independent audit by SAs has grown in the last decades. By exercising the highest values of professionalism, independence, objectivity and transparency, and through effective cooperation with fellow SAs on environmental issues of common interest, SAs can make significant contributions toward addressing sustainable development issues that are becoming increasingly regional, and even global, in nature."

---

## International Association for Impact Assessment

### International Association for Impact Assessment

The International Association for Impact Assessment - IAIA ([www.iaia.org](http://www.iaia.org)) is a professional association founded in 1980. IAIA has 3400 individual members from over 100 countries, including those from its 13 national affiliates.

IAIA is active in promoting the practice of Strategic Environmental Assessment (SEA) and Impact Assessment (IA) worldwide. We respectfully invite the Rio+20 Conference Secretariat and the participant governments to consider the following:

#### Recognising that

- Over 100 countries already successfully use Strategic Environmental Assessment (SEA) and Impact Assessment (IA) through directives, policy or laws.
- The Organization for Economic Cooperation - OECD has a new policy on SEA (2008), the European Union has the SEA Directive (2001), and many developing countries in the last 5 years have been applying SEA to sectoral planning.
- SEA and IA help ensure that high level policies, programs and projects are designed and implemented with more sustainable outcomes while also reducing poverty and advancing green economy objectives.
- SEA and IA work to ensure that development activities of individual sectors complement rather than undermine other sectors. They provide a systematic means for minimizing potential adverse outcomes and maximizing benefits early in policy, program and project design.
- SEA and IA are used to find legislative and policy gaps that would hinder achievement of sustainable development.
- When SEA and IA processes take root in key, cross-sectoral line ministries, the projects that get approved and implemented will have gone through a very rigorous sustainability filter, where full social and economic costs are examined.
- SEA and IA, underpinned by participatory processes, ensure development processes are inclusive and give a voice to society's most vulnerable.
- SEA and IA can alert decision makers to risks, improve community engagement, incorporate traditional knowledge, and facilitate cooperation across sectors and boundaries prior to strategic decisions being taken.
- The results of SEA and IA are used to inform the development of future proposals. They also inform on-going decision-making relating to a given geographic entity such as a country, a province or a river basin, including transboundary and shared basins.
- Political support for sustainable development and the Green Economy, which are core objectives of Rio+20, can be advanced if countries take full advantage of effective existing tools such as SEA and IA.

IAIA urges the Rio+20 Conference Secretariat and the participant countries to consider the adoption of the following statement in the Conference Final Declaration:

Strategic Environmental Assessment (SEA) and Impact Assessment (IA) be recognised by States as effective high level decision support processes that can assist in the implementation of political commitment to Sustainable Development and Green Economy initiatives.

---

## International Association for the Advancement of Innovative Approaches to Global Challenges (IAAI)

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

Introduction/Problem analysis:

United Nations Conference on Sustainable Development (Rio+20) comes at a time of rapidly accelerating global challenges, like e.g. climate change, ecosystem degradation, biodiversity loss, increasing income disparities, financial and economic crises on the one hand and sovereign (public) debt crises and austerity budgets in many countries of the world on the other hand.

Thus the world is facing increasing global challenges with increasingly weak national governments and the central international response mechanism to global challenges - the United Nations - not being equipped with resources on an adequate level. In addition to the resource problem there comes the inadequacy of many sustainable development governance processes based on sectoral ministries (often SD issues are assigned to ministries of environment) not able to integrate the environmental, economic and social dimension of sustainable development and not able to reach out to the many other public and private stakeholders who have great potentials to contribute substantially to sustainable development governance.

Rio+20 therefore stands for a window of opportunity of humankind not only to move towards sustainable global socio-economic resource allocation systems which respect planetary boundaries ('green economy') but Rio+20 is also a window of opportunity for systemic innovation of United Nations system towards being connected more directly with global citizens and their resources (financial, intellectual, emotional, etc.) through ambitious and innovative redesign of the institutional framework for sustainable development (IFSD) towards multi-stakeholder and multilevel governance.

General Content Input:

#### **a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

In line with what has been said above that Rio+20 should aim at ambitious and innovative redesign of the institutional framework for sustainable development (IFSD) towards multi-stakeholder and multilevel governance, the expected outcome should include

- legally binding outcome document(s) with ambitious global standards and public administration instruments that reflect intergovernmental agreement on green economy and IFSD with appropriate provision on monitoring and enforcement of implementation (standard UN document) and
- a shared vision document of UN system leadership, national governments, local and regional communities, private sector and leading global civil society organizations/networks for multi-stakeholder and multilevel sustainable development (SD) governance/partnership including
  - o global citizens' sustainable development resource mobilization programs (see point d) below)
  - o an integrated global multilevel and multi-stakeholder SD efforts documentation system based on integration of different types of sustainable development resources (natural, intellectual, financial, social, emotional, etc.) as new measures of wealth (e.g. based on the IAAI/GloCha 'collaborative global commons growth' concept as presented at Annual Meeting of Academic Council on the United Nations System 2011 <http://www.glocha.info/index.php/latest-news/138-reportiaaiacuns2011> and UN DPI NGO conference 2011 in Bonn <http://www.glocha.info/index.php/latest-news/149-bonn-2>)
  - o outline of processes and institutions for future political participation of global citizens in global SD governance that harnesses the full potentials of modern informational and communication technologies
  - o reference to a 'Charter of Shared Social responsibility for Global Commons' as 'central global volunteering reference point for civic engagement in UN lead multi-stakeholder engagement in multilevel SD efforts. Such a charter has to be developed based on a UN – civil society dialogue process and which would link up on a voluntary basis global citizens SD efforts with UN system based on above mentioned shared vision and integrated global documentation system (those who would endorse the Charter would be asked on an annual basis to report their contributions to global commons growth/sustainable development in multilevel governance perspective)

With outcomes of Rio+20 that go beyond intergovernmental consensus towards partnering with global citizens, that reach the so called 'man and woman on the street', linking conceptually global SD efforts with individual everyday lifestyle, consumption and resource sharing decisions of 7 billion global citizens would make Rio+20 a landmark event in United Nations Intellectual History (see [www.unhistory.org/](http://www.unhistory.org/) for more info about the intellectual history of the UN system, the evolution of UN ideas, concepts and institutions over time).

#### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

Although we at IAAI did not study all existing proposals in depth, our impression in general is that the ongoing Rio+20 preparatory debate on green economy and IFSD does not focus sufficiently on systemic innovation and substantial correction of market failures, governance failures and systems engineering towards delivery of environmental, social and intergenerational justice.

It has to be noted here that the highly participatory design of UNCSD/Rio+20 preparatory process (online consultation regarding outcome document, minutes of all preparatory meetings online, 'donate' button, ...) and the way in which Rio+20 secretariat works with civil society and other stakeholders reflects in many ways already this modern 'spirit of time' of a new level of partnership of UN system with global citizens and we (IAAI) herewith express our thanks and appreciation for these efforts of UN system in general and UNCSD secretariat staff especially.

#### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

Global citizens can be very valuable partners in implementation monitoring by using Web 2.0 technologies, Geographical Information Systems etc. (interesting lessons for innovative SD implementation monitoring can be drawn from 'The International Network of Crisis Mappers' <http://crisismappers.net/> and already existing international law implementation monitoring systems of civil society in the field of human rights, etc.)

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

International Association for the Advancement of Innovative Approaches to Global Challenges (IAAI) has developed in cooperation with partners like e.g. the Academic Council on the United Nations System, UNESCO, UN DPI/UNIS Vienna, UNEP Vienna office, UN Academic Impact initiative, UN Alliance of Civilizations, several UN Associations, IPCC, Earth Charter International, International Human Dimensions Programme on Global Environmental Change research initiative "Knowledge, Learning, and Societal Change: Finding paths to a sustainable future", Regional Cooperation Council for Southeast Europe, youth organizations and individuals from around the world etc. over the last 4 years several concepts and outlines of initiatives for systemic and cultural change towards strengthened civil society participation in global governance:

- Blueprint for a Knowledge and Philanthropy/Ethics driven Global Civil Society Reform <http://www.glocha.info/index.php/glocha-initiatives/iaaiinitiatives/126-cpwc> & <http://www.glocha.info/conferenceindex.html>
- Global Citizenship Ethics for Effective Global Governance – The Rio+20 Window of Opportunity <http://www.glocha.info/index.php/glocha-initiatives/iaaiinitiatives/98-gce/139-rio2012>
- Collaborative Global Commons Wealth Generation (basic rationale: framing all resources that are needed by present and future generations for sustainable development as 'global commons') <http://www.glocha.info/index.php/glocha-initiatives/collaborative-global-commons>
- Building the Knowledge Base for Global Governance [www.investsciencesees.info/ccandun/](http://www.investsciencesees.info/ccandun/), [www.uncsd2012.org/rio20/index.php?page=view&type=13&nr=372&menu=27](http://www.uncsd2012.org/rio20/index.php?page=view&type=13&nr=372&menu=27) and Multilevel Climate Change/SD Governance from an Innovation System perspective <http://www.glocha.info/images/stories/news2011/acuns2011/acunspresentationpolzer.pdf>
- Global Challenges Song World Cup – Rio+20 Global Youth Music Contest <http://www.glocha.info/index.php/glocha-initiatives/gcsw>, <http://www.glocha.info/index.php/latest-news/137-rio-2012-youth-song> (report on Rio+20 GYMCA presentation at UN High level Meeting on Youth) and (formal and informal) Global Citizenship Education and Global Community building by means of music and arts <http://www.glocha.info/index.php/glocha-initiatives/globalcanin>
- Establishing a global network of 'Global Challenges (GloCha) centers' that facilitate sustainable development multi-stakeholder partnerships on local level (including foresight/ shared vision building, needs and capacities assessments, 'think global – act local' action plans and resource mobilization) linked globally with UN system by a shared vision, a transparent global financial transaction documentation system and a collaborative/participative global commons growth assessment and documentation system <http://www.glocha.info/index.php/latest-news/149-bonn-2> & [www.glocha.info/index.php/events/upcomingevents/sarajevo-workshop1](http://www.glocha.info/index.php/events/upcomingevents/sarajevo-workshop1)

All these elements of innovative sustainable development governance can be brought together and boosted in Rio+20 with a '15/15/15 UN – Civil Society Partnership' formula as cooperation mechanism/target, meaning:

That Civil Society sets itself the target to mobilize in support of the work of UN system

- 15 billion Euros of financial resources for centrally documented global multi-stakeholder multilevel governance sustainable development efforts and
- 15 million volunteers (documented in cooperation with UN Volunteers and CIVICUS including local feed-back and assessment based on web2.0 technologies)
- by the year 2015

The details of the cooperation mechanism/partnership arrangement shall be adopted at a joint event of UNCSd and "People's Summit of Rio+20 for Social and Environmental Justice" in Rio de Janeiro in June 2012 (IAAI can offer to facilitate the process).

Tools for implementation of this cooperation partnership and for resource mobilizations and allocation:

- a shared vision document of UN system leadership, national governments, local and regional communities, private sector and leading global civil society organizations/networks for multi-stakeholder and multilevel SD governance/partnership including (see point a) above)
- a 'Charter of Shared Social responsibility for Global Commons' which has to be developed based on a UN – civil society dialogue process and which would link up on a voluntary basis global citizens SD efforts with UN system. Such a Charter should be systemically linked with Earth Charter and UNESCO's efforts for a 'Universal Declaration on Ethical Principles related to Climate Change' <http://www.unesco.org/new/en/social-and-human-sciences/themes/science-and-technology/climate-change/>
- Rio+20 Global Youth Music Contest <http://www.glocha.info/index.php/glocha-initiatives/gcsw> for public awareness building, youth participation and fund raising facilitation (globally broadcasted 'Rio+20 Global Challenges Song World Cup Gala Night' with the finalists from all continents and supporting pop stars to inform about Rio+20 outcomes and to promote and achieve the 15/15/15 objective, charity concerts on regional, national and local level (in cooperation with GloCha centers) shall follow)
- a 'Global Youth Call for Sharing of Resources' (to be prepared in cooperation with UN CSD Major group 'Children and Youth', UN Youth program et al.)
- a High Level Fund Raising event with leading global philanthropists [http://www.efc.be/Networking/InterestGroupsAndFora/Global/Documents/201105\\_GPLI\\_OnePager.pdf](http://www.efc.be/Networking/InterestGroupsAndFora/Global/Documents/201105_GPLI_OnePager.pdf), The Giving Pledge <http://givingpledge.org/>, the global umbrella organization of foundations/philanthropy networks WINGS [www.wingsweb.org](http://www.wingsweb.org) and UN Office for Partnerships [www.un.org/partnerships/](http://www.un.org/partnerships/) & many (web 2.0) micro-philanthropy activities (combined with Global Challenges Song World Cup contests)
- a Global Forum on Social Investment (Philanthropy) and Research, Education and Innovation Funding (see <http://www.glocha.info/gce.html> for more info)
- Global Citizenship Ethics standard setting based on Article 29 (1) of Universal Declaration on Human Rights ('Everyone has duties to the community in which alone the free and full development of his personality is possible')
- UN- Civil Society Joint Task Force or Commission for institutional engineering towards integration of public and private resources for sustainable development in the context of a renewed UN system. Basic idea: if global citizens succeed to mobilize 15 billion € of financial resources and 15 million + volunteers for global sustainable development governance than global citizens should also be provided with adequate global governance participation possibilities. United Nations is and will stay the central and universal global response mechanism to global challenges but it needs to systemically integrate resources of global civil society to be effective.

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

About

"International Association for the Advancement of Innovative Approaches to Global Challenges IAAI" [www.glocha.info](http://www.glocha.info) is a not-for profit private association, which has been established under Austrian law of associations by an international group of scientists, science managers and futures studies experts in April 2007.

IAAI main objective is to explore and promote systemic innovation regarding resource mobilization of global civil society for effective global governance in support of the work of United Nations System. IAAI is a United Nations Department for Public Information (UN DPI) associated NGO and member of United Nations Academic Impact Initiative. Since IAAI General Assembly 2011 global youth representatives constitute the majority of IAAI membership and Rio+20 Global Youth Music Contest is the most important IAAI flagship initiative [www.glocha.info/index.php/glocha-initiatives/gcsw](http://www.glocha.info/index.php/glocha-initiatives/gcsw).

## International Centre for Integrated Mountain Development

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

- The Rio+20 conference should recognise the contribution of mountain systems and their ecosystem goods and services to a green economy, sustainable development, and human wellbeing and should set principles and policies for global, regional, and national actions in support of sustainable mountain development.
- Considering the increasing importance of mountain ecosystems for downstream communities, the high incidence of poverty and unequal access to resources in mountain areas, the growing vulnerability of upstream and downstream populations, and the threats to the availability of mountain ecosystem services, global stakeholders should revisit the criteria of the mountain agenda and Chapter 13.
- International organisations and national governments are implored to favour policies and all possible efforts to strengthen the efforts of mountain communities to ensure a continued availability of fresh water, biodiversity (including agro biodiversity), cultural diversity, and space for tourism, recreation, and spiritual renewal, as well as to cope with the consequences of climate and environmental change.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

- Green economy should bring new opportunities for investment in ecosystem services (e.g. freshwater, biodiversity conservation, and carbon sequestration), renewable energy, and creation of jobs while meeting the challenges which are sure to come. It must be pursued with a balanced approach of economic, environmental, and social development and appropriate policy and institutional measures to avoid increasing pressure on an already fragile environment and scarce resources. To this end it is necessary to revisit the mountain agenda. The Rio+20 conference offers an important opportunity to do so, taking into account recent developments and ongoing global challenges.
- Climate change and eradication of poverty take the centre stage in sustainable mountain development. The focus of the Rio+20 is on green economy but the number one priority in developing mountain countries is poverty alleviation including the mountainous regions of India and China. What relation does this Asian transition to green economy have on sustainable mountain development (SMD)?
- Some of the specific issues and questions relating to situating the green economy in the context of sustainable mountain development are: a) How to build documentary evidence of national and regional/global influence or contribution of the ecological footprints of mountains? b) What specific roles can mountains play in transforming the "brown" economy of the countries to "green" economy since the current perception and opinion of the national policy makers is that it may be marginal and negligible. For example, in national reports for Agenda 21, chapter 13, the policy space allotted to mountains is very small. It is therefore challenging to use the green economy plank for leveraging more space in national policies.
- Although mountain regions in developing countries face numerous challenges in the context of a green economy, the green economy development model opens windows of opportunity to rectify earlier development models which have tended to exclude the concerns and interests of mountain regions. The green economy can provide the framework for valuing and compensating critical services of mountain regions that benefit downstream communities, and in the process encourage conservation and address mountain poverty. The green economy paradigm of development can hence unlock the potentials of mountains while preserving mountain values towards sustainable development.

In order to promote sustainable development in mountain regions, the following challenges will need to be addressed in the green economy framework;

**Lack of Compensation for Mountain Ecosystem Goods and Services**

Mountain ecosystems are important for national, regional, and global economic growth and human wellbeing. However, their services do not receive adequate recognition in national economic decision-making, including development planning and resource allocation. Mountain ecosystem services are often taken for granted, and the role of mountain communities in generating them receives little or no attention. GDP does not account for depletion of natural capital, which is the fundamental basis for all economic activities.

**Difficulty of Valuating Mountain Ecosystem Services**

The benefits of mountain ecosystem services are largely intangible, and there is no defined market for them, making it difficult to assign a monetary value to particular ecosystems and to demonstrate their value to national, regional, and global economies and to the environment

**Unclear Property Rights with Regard to Mountain Ecosystem Services**

With markets emerging for carbon, watershed services, and biodiversity, these are now marketable resources, as they were not in the past. However, there are no clear

property rights for these resources; the concept of property rights applies largely to assets and products. Without clear property rights, mountain farmers cannot negotiate and benefit from voluntary markets for environmental services such as carbon sequestration and storage, biodiversity, and water protection.

#### Nascent Market for Mountain Ecosystem Services

While markets for mountain niche products are growing, markets for mountain ecosystem regulation and support services are not yet well developed. Complex rules and regulations, precise measurements, and rigorous verification requirements at different stages bar mountain communities managing small plots of forest land from enjoying the benefits of the global carbon market, for example.

#### Fragile Mountain Ecosystems

Geographic and climatic features make mountain systems extremely fragile. The fragility of mountain ecosystems represents a considerable challenge to a green economy and sustainable development. The impacts of unsustainable development in the mountains have been more rapid, have taken a heavier toll, and have been more difficult to correct than in other ecosystems (MA 2005). The lowlands are also heavily influenced by undesired changes in mountain areas, because of their dependency on mountain resources and ecosystem services.

#### Persistent Poverty and Marginalisation of Mountain Areas

Livelihoods in mountain areas are considerably more susceptible to environmental and economic changes than those in lowlands because of rough topography, remoteness, and poor socioeconomic infrastructure. The incidence and severity of poverty and vulnerability are disproportionately high in many mountain regions of the world.

#### Lack of Disaggregated Mountain-Specific Data

Mountain ecosystems and production systems are closely interrelated, and geographically referenced data are essential to their sound management and planning for sustainable development. Disaggregated economic and social data on mountains are difficult to obtain and, in many cases, not available.

### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

#### Institutional Framework for Sustainable Development (IFSD):

IFSD in the context of the Mountain region should aim to identify the actors at local, national and regional levels and set out the functions of institutions for achieving better coherence and coordination among agencies implementing sustainable development activities, especially in the mountains. Therefore, any new institutional framework must avoid overlaps and duplication of activities, and synergies need to be achieved in programming efforts of international as well as national organisations through enhanced participation of all stakeholders for attaining good governance. Similarly, at the UN level there should be clear and resourceful mechanism to advocate the Mountain Agenda, gradually integrating it with other sustainable development agenda, otherwise there is a great danger of continuation of ignorance of sustainable mountain development in the UN processes.

#### Key challenges for institutional strengthening for SMD

Mountain countries and regions face multiple challenges in creating good institutional framework and more importantly, for avoiding the past track record of poor implementation of SMD commitments and policies. The latter was caused by weak national setups and lack of capacity, coordination, and integration efforts that need to be addressed effectively to ensure clear institutional functions and accountability safeguards at all levels.

#### Role of research-based knowledge and information

Developing proper institutional framework will also have to consider the role of research organisations both at national and regional levels for filling the knowledge gap. SMD issues in the HKH are of transboundary nature e.g., water, biodiversity, markets, and quality standardisation for green products. Before transforming into a green economy, these countries must set green accounting policies and green technology adaptation institutions to assist the shift from GDP to GMP. Consumerism today is a driver of change, changing values and attitudes of the people, but in the green economy context consumers need to also give premium to green products that will require awareness raising, in which data and information will play an important role.

#### Role of technology and technical capacity building

Green economy will require 'green technologies' that will need a suitable framework and mechanism for enabling technology adaptation, retrofitting, and transfer to developing mountain countries. Therefore, strengthening of multi-lateral and research institutions focusing on mountain friendly technologies and knowhow, given the specificity of mountain systems, should be a pre-requisite in the new institutional framework.

### **d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

#### What specific actions are required?

##### Recognition of benefits deriving from mountain regions

As mountain ecosystem services contribute to sustaining and enhancing the Earth's sustainability and prosperity, the green economy framework and Rio+20 need to recognise the benefits arising from mountain ecosystems and should set principles and policies for global, regional, and national actions in support of sustainable mountain development.

##### Improved governance mechanisms

To provide incentives for mountain populations to maintain ecosystem services, environmental governance systems must frame the mountain agenda in environment and development policy. Strengthened governance is needed at all levels, national, regional, and global. National governments have a central role in putting in place policies, strategies, and instruments to create enabling conditions for investment in mountain ecosystem conservation and to attract other actors such as the private sector to finance conservation. The international policy framework needs to recognise the value of mountain ecosystems and the needs of mountain people, and to support international, regional, and country-level implementation of the mountain agenda.

##### Enhanced economic security and poverty alleviation to facilitate peace and stability in mountain areas

Governments must ensure that the green economy contributes to eradicating poverty, ensuring livelihoods, and promoting social equity and security, in line with the MDGs. Promotion of green economy must be based on equitable access to resources, well defined property rights, and inclusive growth. Governments must take steps to ensure that benefits reach poor and marginalised people including women, indigenous people, and ethnic minorities.

##### Institutional strengthening and capacity building

Achieving and maintaining a low carbon economy in the mountains requires substantial changes in policies, priorities, and strategies, the increased application of market-based instruments for conservation and development, and the use of new technologies.

##### Transboundary cooperation

Many of the mountain ecosystems and their services are transboundary in nature; thus their conservation and management demands regional cooperation. Strengthened networks and regional conventions like the Alpine Convention may enhance coordination of activities and assist in raising mountain concerns in international governance and protocols.

##### Financial Instruments

Conservation of mountain ecosystem services and the transition towards a more low-carbon path of development require financial resources. The international community

must provide the necessary support to leverage financial resources, for example through establishment of dedicated funding windows for mountains in existing funding mechanisms (such as GEF), insofar as they link to other global priorities such as climate change, water, and biodiversity. International and regional payment for ecosystem services (PES) schemes may be introduced to stimulate the provision of vital non-marketed ecosystem services at the global and regional levels.

Indicators of progress

Mountain-specific indicators need to be developed for measurement of progress towards a green economy, such as investment in mountain ecosystem conservation, resource allocation in mountain regions, and stock and health of mountain ecosystem resources such as water, biodiversity, and the cryosphere (e.g., river flow, sedimentation control).

Operationalising the Framework of Green Economy and Good Governance: Recommendations

The above elements may be pursued in a three-pronged policy approach focused on global responsibilities, regional interests, and national tasks. The following are some proposed institutional approaches at the three levels.

National level

- Adopt mountain-specific strategies in national development plans and programmes to achieve the twin goals of conservation and poverty reduction.
- Internalise the costs and benefits of conserving mountain ecosystems in national wealth accounting, resource allocation, and development plans. The costs of producing environmental goods and services need to be factored into the design of policies, strategies, programmes, and projects. In this way the costs and benefits of mountain ecosystems will be integrated into actual prices, markets, and incentive structures.
- Promote markets for mountain ecosystem services. Encourage the private sector through appropriate policy and regulatory support such as clear property rights and access and benefit sharing frameworks so that the market can become an option for financing mountain ecosystem management.
- Develop policies for institutionalising incentives and compensation for mountain ecosystem services, and make mountain ecosystem conservation central to economic decision making.
- Modify and correct policy, institutional, and market failures related to undervaluation of mountain ecosystem services or failure to recognise them in national economic decision making.
- Invest in mountain regions to unlock their potential in a green economy and sustainable development, e.g., for energy, water, high-quality mountain agricultural products, and nature-based and organic products. Investment in mountain regions will generate long-term benefits. Owing to positive externalities, investment in mountains brings high welfare gains. To attract green investment in mountain areas, governments may grant financial support such as low-interest loans or exemption from certain regulations, to build economies of scale and competitiveness. Generating new public-private partnerships is equally important in the overall approach to unlocking the potential of mountains; they can be an important source of revenue to ensure the long-term sustainability of mountain ecosystems while relieving pressure on public budgets.
- Create a conducive environment for investment in mountains and green infrastructure, and provide incentives for promoting industry and business for the benefit of mountain and rural communities. As the returns from green sectors (e.g., conservation and management of forests, watersheds, soils, rangelands, and glaciers) comes only after some time, government support (direct or indirect) is necessary at least in the initial stages to attract private investment.
- Adopt alternative forms of energy such as hydropower, wind power, biogas, and solar energy to reduce negative impacts from the use of fossil fuels and fuelwood.

Regional level

- Promote and strengthen networks and partnerships among mountain regions. International and regional development and research organisations should facilitate transfer of knowledge and experience as well as capacity building for key mountain institutions.
- Promote regional mechanisms for the compensation of ecosystem services provided by upstream communities.
- Strengthen value chains to benefit mountain communities, for example through branding of mountain goods and services.
- Strengthen the information and knowledge base on sustainable mountain development and make it accessible to all concerned.
- Use transboundary approaches and facilitate regional cooperation to address issues of water management, biodiversity, and protected areas, and establish regional funds for management of transboundary ecosystem resources.

Global level

- Create compensation mechanisms and markets for globally significant mountain ecosystem services such as biodiversity and carbon sequestration. Establish institutional mechanisms for providing economic incentives to conserve mountain ecosystems and improve the lives of mountain communities.
- Remove trade barriers and price distortions on green goods and services of mountain regions.
- Enhance international and regional cooperation on mountain issues.
- Pursue a global commitment to conservation and low-carbon development of mountain ecosystems. Provide adequate financing targeted to the mountain regions of developing countries for conservation and development of globally significant ecosystems. Support technology transfer and capacity building for institutions engaged in development of mountain regions.
- Strengthen and expand alliances of mountain stakeholders to lead and undertake the process of sustainable mountain development beyond Rio+20. Strengthen cooperation and networking among the different mountain regions. Regional conventions in mountain regions might be pursued following the example of the Alpine and Carpathian Conventions.
- Strengthen international support for research on mountain systems of global relevance.

## Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

Alternative energy technology: improving lives and reducing carbon footprint

People in mountain areas mostly use fuel wood for cooking and heating, which can have detrimental effects on the environment, air quality, and human health. In the Hindu Kush-Himalayan region, there are also indications that aerosols containing large amounts of black carbon are contributing to regional climate change and glacier melt. Investments in alternative, cleaner forms of energy to replace fuel wood and fossil fuels would reduce carbon emissions, improve human health, and secure mountain livelihoods by conserving mountain forest resources.

Green practices in water management

Water for human consumption, irrigation, and hydropower development constitutes a premium resource of mountain regions. There is ample scope for investments in scaling up green practices in water and watershed management. Scaling up represents both an opportunity and a challenge in the mountain regions.

Diversification and value addition in mountain agriculture

Despite sloping land generally unfavourable to cultivation, agriculture is the main economic sector in many mountain regions of developing countries, accounting for between 30% and 60% of gross domestic product (GDP) and employing up to 80% of the workforce. The market for mountain agriculture is largely organic and is therefore likely to grow, providing opportunities for mountain regions to diversify their agricultural sector. The green economy can help shift agriculture away from subsistence levels through promotion of organic farming, horticultural development, herbal and traditional medicine, and value-added products such as handmade paper, tea, bamboo-based handicrafts, floriculture, horticulture, and mushroom processing, among others. Organic products from mountain agriculture can be marketed for their health values.

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked**

**and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

The green economy can provide the framework for valuing and compensating critical services of mountain regions that benefit downstream communities and in the process encourage conservation and address mountain poverty. The green economy paradigm of development can hence unlock the potentials of mountains while preserving mountain values towards sustainable development. A number of opportunities for developing mountain regions in the context of a green economy are explored below.

**Realising the Value of Mountain Ecosystem Services**

Conventional economics does not take into account depletion and degradation of natural capital and the value of ecosystem services which used to be regarded as 'free public goods'. The green economy recognises the value of the ecosystems in the production of goods and services for downstream economies and for securing overall human wellbeing at local, national, regional, and global scales. This recognition provides an opening for mountain people to be duly compensated and rewarded for stewardship of mountain ecosystems and their services.

**Accessing Growing Market for Niche Mountain Products**

Mountain goods and products such as medicinal and aromatic plants and other non-timber forest products, mountain crafts, and ecotourism hold special values and have niche markets. Enabling policies and supporting rules and regulations for Marketing Mountain products can benefit mountain regions and help them get value for their products and efforts.

**Conserving ecosystem services to fight poverty and enhance livelihood security**

Rural poor people depend heavily on natural resources. Around 350 million people who live within or adjacent to dense forests, for example, depend on them for a high degree of subsistence and income (World Bank 2004, cited in Gundimeda 2011). By linking natural resource based livelihoods to production of ecosystem services, the green economy can help reduce poverty and enhance environmental sustainability.

**Policy innovations in government for conservation and development of ecosystems**

Innovative policy options that are emerging to provide incentives for conserving and developing ecosystem services have potential for mountain regions. For example, the Government of India has established fiscal transfer from the central government to the states for forest ecosystem services.

**Introducing Incentive-based Mechanisms for Mountain Ecosystem Services**

Ongoing global and national efforts to develop policies, strategies, and regulatory frameworks for better ecosystem services are creating emerging markets for mountain ecosystem services. Incentive-based mechanisms such as payment for ecosystem services (PES) and Reducing Emissions from Deforestation and Forest Degradation (REDD+) are emerging opportunities for financing conservation and development of mountain regions.

**Creating New Investment and Employment Opportunities**

Shifting investment from the brown or industrial sector to a green sector may create interest and bring opportunities in green investments and transfer of green technology.

Mountain regions can benefit from green investments in areas such as:

enhanced production and processing of mountain ecosystem goods and services; appropriate pricing and reward or payment systems for proper valuation of mountain goods and services; reducing mountain fragility and the impact of disasters; creation of green employment opportunities (e.g., in agriculture and horticulture) in mountain regions. Promotion and transition towards a green economy need capacity development in education, research, advocacy and policy reforms. Similarly, enabling policies and institutions are needed to provide necessary incentives to producers of mountain-based ecosystem goods and services. Regional as well as upstream-downstream approaches are needed for promoting green markets and for addressing the challenges of poverty, biodiversity loss, trade barriers and climate change. In summary, there is a need to develop a green economy roadmap for the mountains in the Mountain region based on comparative advantages in terms of different eco-systems niches and/or those where nations have and building competitive advantages through training, skills development, provision of appropriate technologies and financial support. Capacity building of policy makers remains the utmost priority because good policies are needed to drive the new development process.

**Role of technology and technical capacity building**

Green economy will require 'green technologies' that will need a suitable framework and mechanism for enabling technology adaptation, retrofitting, and transfer to developing mountain countries. Therefore, strengthening of multi-lateral and research institutions focusing on mountain friendly technologies and knowhow, given the specificity of mountain systems, should be a pre-requisite in the new institutional framework.

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**Role of regional institution for sustainable development of the Mountains:**

Given the growing interest in mountain issues among the Mountain countries and the changing regional and global contexts, the role of regional institutions will have to match with the growing expectations of regional and international stakeholders. The growing importance of the Mountain ecosystems goods and services need more collective and concerted management actions at the regional level to ensure sustainable development. Since issues such as freshwater shortage, increasing natural hazards, environment pollution, ecosystem degradation, rapid melting of ice, loss of biodiversity, persistent poverty and increasing vulnerability, and human insecurity are common and interconnected issues, they will need common solutions.

**Promoting the mountain agenda globally:** While the role of mountain systems as a provider of essential services to the global community has been recognised, countries and relevant international organisations have yet to set priorities in support of mountains. Regional institutions can play an important role in raising awareness, and providing concrete data and evidence on Mountain ecosystems and environment in order to enhance regional and global commitment and actions to support sustainable development in the Mountains, while strengthening upstream-downstream relationships.

**Facilitating regional cooperation:** While the need for transboundary regional cooperation has now been realised, implementation is a real challenge given the difficult geo-political situation in many mountain regions. Non-political regional knowledge-based organisation should be developed and /or strengthened for providing a neutral and common platform for knowledge exchange, sharing and learning. This can facilitate regional dialogue and cooperation among the HKH countries, and enhance common understanding on sustainable solutions

**Facilitating information and knowledge sharing for disaster risk reduction and resilience building:** The Mountain region is classified as the most vulnerable region due to its exposure to multiple risks of extreme events and natural disasters including landslides, floods, droughts, and glacial lake outburst floods that can endanger sustainable development infrastructure. Reducing the risk of natural disasters is critical for poverty alleviation and for sustaining development efforts. There is a need for a regional organisation that can play the role of a catalyst in sharing information and real time data in order to reduce such risks and vulnerabilities.

**Reducing scientific uncertainties and knowledge gaps:** There is a lack of mountain disaggregated data. Easy availability of accurate socio-economical, environmental and biophysical data is vital for policymakers, resource managers and researchers for sustainable management and allocation of limited natural, human and financial resources for achieving sustainable development. Data generated by national and international institutions in the Mountain region are often of a national nature. There is a need for an

agency that can contribute by developing and continuously tracking the trends of key indicators of sustainable development.

**Valuing mountain ecosystem services:** In the context of green economy, there has to be proper valuation of the role of the Himalayan mountain system as the providers of critical ecosystem goods and services. These values need to be translated into enabling policies and actions to help reorient national and global policies towards Mountain region resulting in increased investment in research, conservation and development. Providing more realistic economic value for these green services is possible through carbon financing tools such as REDD+, PES and other compensation mechanisms. This is expected to provide incentives to the mountain people to sustainably manage and preserve the vital goods and services while enhancing their own livelihoods by practicing sustainable resources management.

**Facilitating cross-country learning in sustainable mountain development solutions:** The new agenda of the green economy and good environmental governance will require new knowledge, technologies, and capacities. Although institutions have been generating valuable knowledge in the MOUNTAINS, the knowledge has largely been country specific. Regional institutions can play an important role in consolidating this knowledge, bringing in regional perspectives and facilitating cross-boundary learning for promoting multi-disciplinary and integrated approaches that can enhance SMD.

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Green projects are suitable for subsistence economies:

Most of the mountain areas of the HKH region are under subsistence agriculture. Some are more primitive while others have varying degrees modernisation and inroads of the market economy. Nepal and Bhutan, typical mountainous countries, are over 80 per cent rural. Development has come to these areas due to emphasis on specific niche products such as apples, vegetables, rice as well as services and it has come in different scales due to remoteness. In most of the mountain cities and towns development models have been transported from the plains without much regard to mountain specificity and therefore the environmental consequences have been rather devastating, especially in more fragile valleys.

Traditional and low-external-input agriculture systems have potential for organic production:

Mountain areas of the North Eastern States of India and the Chittagong Hill Tracts of Bangladesh have been practicing traditional forms of agriculture called shifting cultivation for centuries that have been blamed for deforestation and environmental degradation. A more sustainable solution is community resource management strategy and policy under which land and tree tenure is assured, access to technical and extension service is improved and communities are allowed to choose the crops, and trees, including agro-forestry practices.

Decentralization and devolution can lead to good governance:

Change in mindset has followed the acceptance by governments of the need to accommodate local developmental aspirations, without suspecting secessionist tendencies, which still exist in parts of mountain areas. These social movements and conflicts are about identity politics, caste and class grievances, and protests against general irresponsiveness to local aspirations. Mountain communities that have been given economic freedom and political autonomy to choose the development path have addressed to SMD goals better as shown by case studies of Community Forestry (Van Panchayats) in Uttarakhand, India and Nepal.

Southeast Asia and Pacific (SEAP) mountains, which are spread across two geographic regions – mainland Asia and island/archipelagic states in the Pacific Ocean – form one of the world's highest but also most severely threatened biodiversity pools. A number of indigenous peoples who are marginalized, poor, and underserved by their respective nation states live in structurally weak and fragile SEAP Mountains even made more vulnerable by increased frequency and intensity of rainfall, extreme temperatures and severe tropical storms. Expanding global population and economic pressures are driving migrant lowland settlers toward SEAP Mountains while extractive companies harness the mountains' timber, minerals and water resources without giving due share to the local communities. In general, the mountains have not been mainstreamed in the governance of most Southeast Asian countries, which highlight the need for policy reforms to protect social and ecological systems in the mountains, strengthen sustainable development, prevent environmental damage, and improve national and regional food security.

Governments and civil society organizations, international and local donors, and development agencies have played key roles in facilitating development and/or resolving conflicts arising from competing demands on SEAP mountain resources. Lessons learned in addressing conflicts showed that these involve a slow process that is best initiated by creating an environment for dialogues to take place. Toward this end, stakeholders must be capacitated on collaborative negotiations and non-adversarial communication skills to enable them to engage in multi-stakeholder dialogues that strive for win-win solutions and aim to do the greatest good for the greatest number of people in the long run. Improving governance, meeting the economic needs of the people, and making them more self-reliant through proper education avert conflicts that border on terrorism in remote regions of SEAP Mountains.

People in the SEAP Mountains need to take charge of development of the welfare of their communities and the mountains in partnership with civil society, particularly for advocacy and building public support for mountain-specific policies and development approaches. Partnerships need to be forged with the private sector based on corporate social responsibility initiatives to provide innovative, simple technological and market solutions to livelihoods problems in the mountains following low carbon or green growth pathways. Specifically, private sector support can be directed for empowering mountain stakeholders with community-based technologies and for developing business skills. Product value chains through cooperative efforts among the primary producers and private businesses can result in reasonable returns on their investments for both the mountain people and downstream commercial enterprises. Ecotourism can be promoted to help generate income in mountain communities and among indigenous peoples as strategies, to counter violent conflicts and finance mountain conservation and sustainable development.

Participatory action research that takes into account local good practices and indigenous knowledge are needed to determine carrying capacity of mountains and for implementing plans and measures for adapting to and mitigating the worsening impacts of climate change and unregulated human activities on mountain resources. There is growing awareness on the benefits provided by the SEAP Mountains in terms of ecosystem goods and services. Increasing frequency of mountain-originated disasters both in the uplands and lowlands has raised policy level awareness for integrated approaches. Combining the increased awareness, with traditional and scientific knowledge will help improve sustainability in resource use by creating opportunities for multi-stakeholder participation that can address pressing mountain issues and challenges. Effective participation of communities in mountain governance – supported by enabling policies – can pave the way for sustainable mountain resource management practices, and help end pervasive poverty in the uplands through carefully-planned and community-controlled, human development initiatives. In summary, this report advocates:

- Developing good governance mechanisms that account for unique characteristics and wealth of mountains and meet needs and aspirations of mountain people in reducing poverty and conserving the region's once-rich biodiversity through sustainable development approaches.
- Assisting mountain communities in negotiation and collaborative dialogues for resolving conflicts and enabling them to participate in sustainable mountain development activities in collaboration with government, civil society, donors and the private sector.
- Strengthening research by combining traditional practices and scientific knowledge for developing actionable plans for implementing with the meaningful participation of stakeholders both in the mountains and downstream.

- Consolidating international and national funding mechanisms and resources for financing sustainable development programmes and achieving well being of mountain people.

#### Executive Summary

Mountains of the Hindu Kush-Himalaya (HKH) have abundant natural resources and unique landscapes that provide valuable ecosystem goods and services for livelihoods. However, the harsh terrain and lack of enabling institutional framework and policies pose major challenges to sustainable mountain development. The region includes four global biodiversity hotspots, 330 important bird areas, and 60 global eco-regions. The 488 protected areas in the HKH provide vital ecosystem goods and services to more than 1.5 billion people in the uplands and the lowlands. The greater Himalayas – the water tower of Asia – is source of 10 major river systems that provide the vital resources such as water, food, biodiversity and energy for a large number of people in countries of the region, including India and China – two fast growing economies.

The region is home to more than 40 per cent of the World's poor and is also ranked as being at "extreme" risk from climate change. Progressive warming at higher altitudes has been three to five times the global average. The region has witnessed increased snow and glacial melt and frequency of extreme events that have exacerbated livelihood risks including poverty, food insecurity, hazards and social inequity. Climate-induced changes have not only made it difficult for mountain countries to attain the Millennium Development Goals (MDGs) but also threaten to slow down or even reverse the progress achieved so far. The HKH countries face frequent food and energy crises and growing social and political unrest while climate impacts have shrunk development space. Progress on past global commitments to sustainable development remains largely unfulfilled.

The Rio+20 conference is an opportunity for the HKH region to take stock of progress made towards meeting the Sustainable Mountain Development goals defined in Agenda 21/Chapter 13. This report assesses constraints and opportunities in three major areas: environmental quality, economic development, and social equity. It examines community-level progress by studying people-centric, vertically integrated, and participatory efforts made since Rio'92. It reviews policies, legal instruments, and programmes that aimed at benefitting mountain people and highlights the opportunities for transforming to a green economy. Both upstream-downstream relations and benefit sharing mechanisms needed for sustaining resource flows and maintaining ecosystem goods and services for driving the green economy are examined in terms of linking incentivised producers of ecosystem services with both local and distant markets.

The report includes learning from 10 specifically commissioned case studies on sustainable development programmes in forestry, watershed management, agriculture, clean energy, eco- tourism, biodiversity, and community development. The studies indicate that biogas and micro hydro for clean energy, community-based approaches for managing natural resources, eco-tourism for equitable income distribution, organic agriculture and watershed management for enhancing and sustaining productivity of ecosystem goods and services, are some of the best practices that can help achieve sustainable goals.

The report also captures the insights of hundreds of stakeholders on the Green Economy and Institutional Framework – two agenda items of Rio+20 conference. The general consensus is that these concepts were defined somewhere else and passed down to stakeholders and therefore lack clarity from a mountain perspective, and need elaboration to suit mountain specificities – fragility, marginality, inaccessibility, and richness of niche ecosystem products and services. There is also an agreement on the need to look beyond Rio+20 and come up with actionable programmes and concrete proposals for embarking on the green growth and environmental governance pathways focusing on ecosystem management, water resources, biodiversity conservation and poverty reduction as key themes. This would require investment by national and global agencies in creating green jobs through green projects, and policy reforms to incentivise agriculture, natural resources and enterprise development sectors facilitated by enabling policies, knowledge sharing, regional cooperation, environmental governance and substantial and dependable support from the global community.

To sum up, the HKH report calls for:

- Adapting and developing good governance systems for the HKH Mountains taking into account their unique characteristics as 'water towers' and biodiversity hotspots for addressing poverty reduction and enhancing human well being.
- Reducing increased vulnerabilities and risk of HKH mountain ecosystems and linking adaptation and resilience-building plans to sustainable development to create green jobs and develop green infrastructures.
- Empowering and assisting mountain communities to gain fair access to and benefits from ecosystem goods and resources they have been safeguarding as the primary stakeholders.
- Providing enabling conditions and incentives for investment through public-private ventures with appropriate funding mechanisms and technological support for enhancing wellbeing and reducing disparities.
- Strengthening national and regional institutions to facilitate upstream-downstream exchanges, trans-boundary cooperation, capacity building, and generating and disseminating knowledge, technical expertise and information for promoting SMD, and
- Consolidating all new and existing funding mechanisms related to Climate Change, Biodiversity, and MDGs for adequately funding SMD actions in vulnerable and least developed mountain countries and regions.

#### Kathmandu Declaration on Green

#### Economy and Sustainable Mountain

#### Development

7 September 2011, Kathmandu, Nepal

#### Preamble

Following the invitation of the International Centre for Integrated Mountain Development (ICIMOD) and the United Nations Environment Programme (UNEP), 120 participants including scientists, development practitioners, policy makers, and civil society and private sector representatives met in Kathmandu from 5 to 7 September 2011 to deliberate on the role of mountains in green economy. Recalling the recognition of the importance of mountains at the United Nations Conference on Environment and Development (UNCED) in Rio de Janeiro, Brazil in 1992 through adoption of Chapter 13 in Agenda 21, and realising the need to revisit the mountain agenda in the upcoming United Nations Conference on Sustainable Development in June 2012 (commonly called Rio +20), the participants put forward the following declaration.<sup>1</sup> Declaration Recognising that: - mountain systems support about half of the earth's human population by providing numerous goods and services including fresh water, food, life-saving medicinal herbs, energy, rich biodiversity and associated traditional knowledge, as well as cultural diversity;

- global drivers of change such as growing human population, increasing urbanisation, industrialisation, globalisation, other socioeconomic changes, and climate change put increasing pressure on the available natural resources of the world and the mountains in particular;

- mountain ecosystem goods and services have therefore to respond to an increasing demand, while prevailing policies have not adequately prepared mountain populations and regions for the new challenges, and global dynamics create strong externalities for mountainous areas;
- mountain communities are characterised by their resilience, and their adaptation efforts have produced promising solutions relevant not only locally but also to the global community at large;
- promoting the sustainability of mountain ecosystems and services for future generations and for the continued prosperity of both upstream and downstream areas requires targeted actions and the concerted efforts of local, national, regional, and global institutions, calling for a joint effort of all sectors of society;
- the call for a low carbon economy has the potential to strengthen sustainable mountain development and help to create the conditions necessary for achieving the Millennium Development Goals in mountain areas;
- mountain economies are characterised by their low carbon footprint and by their potential to contribute low-carbon products to the local and global markets;
- however, the low carbon footprint is accompanied by a high incidence of poverty; the participants formulate the following recommendations. General
- The Rio+20 conference should recognise the contribution of mountain systems and their ecosystem goods and services to a green economy, sustainable development, and human wellbeing and should set principles and policies for global, regional, and national actions in support of sustainable mountain development.
- Considering the increasing importance of mountain ecosystems for downstream communities, the high incidence of poverty and unequal access to resources in mountain areas, the growing vulnerability of upstream and downstream populations, and the threats to the availability of mountain ecosystem services, global stakeholders should revisit the criteria of the mountain agenda and Chapter 13.
- International organisations and national governments are implored to favour policies and all possible efforts to strengthen the efforts of mountain communities to ensure a continued availability of fresh water, biodiversity (including agrobiodiversity), cultural diversity, and space for tourism, recreation, and spiritual renewal, as well as to cope with the consequences of climate and environmental change.

#### Recognition, valuation and capture of benefits deriving from mountains

- More focused research, reliable data and information, dissemination of positive experiences, applicable knowledge, and good practices, and systematic efforts to create awareness among grassroots communities, civil society, and government institutions are required.
- Considering the ecological, economic, and cultural diversity of the global mountain systems, regional centres of excellence and knowledge should be created and strengthened.
- Approaches to green economy in mountains shall be designed according to local conditions and must be context appropriate, taking into account mountain specificities such as environmental fragility, vulnerability, and low economies of scale.

#### Appropriate policy frameworks

- International efforts to include the use and value of natural resources in gross domestic product (GDP) are commended and should be adopted at the national level. Concrete mechanisms, customised for mountain areas, must be promoted at the global, national, and local levels to reward and compensate mountain communities for conservation and provision of ecosystem services.
- Governments should create incentives and provide support for market-driven investments and flow of financial resources (including remittances) for low-carbon production and sustainable development in mountains.
- Development of services for mountains (e.g., knowledge, technology, business development, and infrastructure) should be low carbon, environment friendly, and mountain adapted. International organisations, intergovernmental organisations, and the private sector should contribute to the promotion of niche products and services of mountains through mechanisms such as mountain branding, labelling, and standards.
- Approaches must be promoted to improve markets for ecosystem services, to simplify processes of international instruments such as REDD+, and to develop and improve methods for valuation of environmental services.
- The transboundary aspects of mountain ecosystem services call for regional cooperation, collaborative institutional partnerships, and a strengthening of upstream-downstream linkages.

#### Ensuring equity

- Promotion of green economy in mountains needs to be based on equitable access to resources and property rights, inclusive growth, and ensuring that benefits reach poor people including women, men, and children, indigenous people, and ethnic minorities.
- Marginalised groups must have a role in resource governance and a voice in decision making.
- Traditional knowledge and practices need to be documented, evaluated, and built upon to solve problems at the local level and beyond, and to conserve and develop mountain ecosystem services.
- A dynamic green economy and society must be supported so that mountains become attractive to youth and to emigrants from the mountains.

#### Sustainable Mountain Development

##### Draft Regional Report Hindu Kush – Himalaya

prepared for the Lucerne World Mountain Conference 10-12 October 2011

From Rio 1992 to Rio 2012 and beyond

HKH Region Rio+20 Assessment Report

DRAFT FOR DISCUSSION

From Rio 1992 to 2012 and beyond:

## Sustainable Mountain Development

### Hindu Kush Himalaya (HKH) Region

The report aims to provide an overview and assessment of trends, issues, and challenges for promoting sustainable mountain development in the HKH region highlighting progress made since 1992, and encapsulating the lessons learned in key areas. It covers all the three pillars of sustainable development and scopes the opportunities in the two themes of Rio+20 conferences – Green Economy and Institutional Framework for sustainable development and poverty reduction.

The Swiss Development Cooperation (SDC) a participant in the Mountain Partnership Consortium (MPC) provided financial support for carrying out this study. The views expressed in this document are those of the authors, and do not necessarily reflect views of their organisations or that of the SDC.

2.2.1d. Securing livelihoods and natural resource management through community empowerment: The Experience of Natural Resource Management Groups of	

Mountains of the Hindu Kush-Himalaya (HKH) have abundant natural resources and unique landscapes that provide valuable ecosystem goods and services for livelihoods. However, the harsh terrain and lack of enabling institutional framework and policies pose major challenges to sustainable mountain development. The region includes four global biodiversity hotspots, 330 important bird areas, and 60 global eco-regions. The 488 protected areas in the HKH provide vital ecosystem goods and services to more than 1.5 billion people in the uplands and the lowlands. The greater Himalayas – the water tower of Asia – is source of 10 major river systems that provide the vital resources such as water, food, biodiversity and energy for a large number of people in countries of the region, including India and China – two fast growing economies.

The Rio+20 conference is an opportunity for the HKH region to take stock of progress made towards meeting the Sustainable Mountain Development goals defined in Agenda 21/Chapter 13. This report assesses constraints and opportunities in three major areas: environmental quality, economic development, and social equity. It examines community-level progress by studying people-centric, vertically integrated, and participatory efforts made since Rio'92. It reviews policies, legal instruments, and programmes that aimed at benefitting mountain people and highlights the opportunities for transforming to a green economy. Both upstream-downstream relations and benefit sharing

mechanisms needed for sustaining resource flows and maintaining ecosystem goods and services for driving the green economy are examined in terms of linking incentivised producers of ecosystem services with both local and distant markets.

The report includes learning from 10 specifically commissioned case studies on sustainable development programmes in forestry, watershed management, agriculture, clean energy, eco-tourism, biodiversity, and community development. The studies indicate that biogas and micro hydro for clean energy, community-based approaches for managing natural resources, eco-tourism for equitable income distribution, organic agriculture and watershed management for enhancing and sustaining productivity of ecosystem goods and services, are some of the best practices that can help achieve sustainable goals.

The report also captures the insights of hundreds of stakeholders on the Green Economy and Institutional Framework – two agenda items of Rio+20 conference. The general consensus is that these concepts were defined somewhere else and passed down to stakeholders and therefore lack clarity from a mountain perspective, and need elaboration to suit mountain specificities – fragility, marginality, inaccessibility, and richness of niche ecosystem products and services. There is also an agreement on the need to look beyond Rio+20 and come up with actionable programmes and concrete proposals for embarking on the green growth and environmental governance pathways focusing on ecosystem management, water resources, biodiversity conservation and poverty reduction as key themes. This would require investment by national and global agencies in creating green jobs through green projects, and policy reforms to incentivise agriculture, natural resources and enterprise development sectors facilitated by enabling policies, knowledge sharing, regional cooperation, environmental governance and substantial and dependable support from the global community.

To sum up, the HKH report calls for:

- Adapting and developing good governance systems for the HKH Mountains taking into account their unique characteristics as 'water towers' and biodiversity hotspots for addressing poverty reduction and enhancing human well being.
- Reducing increased vulnerabilities and risk of HKH mountain ecosystems and linking adaptation and resilience-building plans to sustainable development to create green jobs and develop green infrastructures.
- Empowering and assisting mountain communities to gain fair access to and benefits from ecosystem goods and resources they have been safeguarding as the primary stakeholders.
- Providing enabling conditions and incentives for investment through public-private ventures with appropriate funding mechanisms and technological support for enhancing wellbeing and reducing disparities.
- Strengthening national and regional institutions to facilitate upstream-downstream exchanges, trans-boundary cooperation, capacity building, and generating and disseminating knowledge, technical expertise and information for promoting SMD, and
- Consolidating all new and existing funding mechanisms related to Climate Change, Biodiversity, and MDGs for adequately funding SMD actions in vulnerable and least developed mountain countries and regions.

## PART I: Setting the stage

### 1.0 HKH mountain ecosystem goods and services

#### 1.1 Overview

The Hindu Kush-Himalaya (HKH) region are rich in natural resources, including an abundance of water, biodiversity, scenic landscapes, steep heights and deep gorges, and fragile but diverse ecosystems and fertile valleys that provide a bundle of ecosystem goods and services. The HKH is the source of 10 of Asia's major river systems. It includes all or part of four global biodiversity hotspots, 330 important bird areas, two mega-diversity countries (India and China), and 60 eco-regions of which 12 are among the global 200 eco-regions. The 488 protected areas cover 39 per cent of the HKH region. The mountains in the HKH provide fresh water and ecosystem goods and services to more than 210 million mountain people and close to 1.3 billion people living in the plains downstream. The river basins are an important source of water, food, biodiversity and energy. However, recent climatic changes and warming have been threatening these mountain ecosystems, including fresh water, high elevation biota including forests, agro-biodiversity, and range and pasture ecosystems. The following section discusses major ecosystem goods and services of the HKH region.

##### 1.1.1 Water – the lifeline of the people

Water and water cycle are the most important ecosystem goods and the services the HKH region provides to downstream populations and the rest of the earth. This is why they have been referred to as the 'water tower of Asia' for the lowlands (Viviroli 2007; UNEP-WCMC 2002). The 10 major rivers originating in the HKH region provide fresh water to about 1.5 billion people. The rivers also supply water for irrigation. Recent estimates on the extent of ice and snow in the mountains of the HKH region is about 60,000 sq. km. Besides, the region also has a large number of fresh water lakes and groundwater.

##### 1.1.2 Biodiversity: the source for food, nutrition, fibre, and medicine

The HKH Mountains are a treasure trove of biological and agricultural diversity including food, fibre and medicinal plants. The region is rich in medicinal and aromatic plants, different types of mushrooms, fibres such as cashmere, and mountain crops such as amaranths, buckwheat and different types of millet that are in great demand in downstream and global markets. The mountains are also sources of different types of timber, firewood fruits, vegetables, forage plants, and non-timber forest products that support downstream economies. Similarly, the vast and diverse gene pool especially wild relatives of important crops found in the HKH region are important resources for humanity.

##### 1.1.3 Ecosystem services

Besides supporting livelihood in the mountains and downstream the HKH region provides support a healthy and safe environment and climate. For example, the mountains play a vital role in natural water purification and water retention in the form of groundwater, ice, and snow as well as in lakes, forested watersheds and streams. Mountain ranges are also responsible for atmospheric and climate regulation and modulate the climate beyond their geographical boundaries. For example, the cryospheric environment comprising of 'water-ice-air-ecosystem-human' systems in the HKH is believed to influence and respond to the global and regional environmental change processes and mechanisms including the Asian monsoon systems (TPE/CAS 2010). Mountain soils are important reservoirs for water and carbon as well as nutrients that enhance soil fertility in the valleys, and downstream. Mountain forests (28% of the world's forests) are highly relevant as protective shields natural hazards and they help ensure slope stability and prevent or reduce erosion, landslides, and avalanches. Mountain forests, especially in the tropics, have high genetic diversity and serve as important as wildlife habitats. Together with highland wetlands, mountain forests play a significant role in biospheric carbon storage (IPCC 2007b). The predominant land use of the HKH region is forest, range and shrub lands and therefore has a major role in carbon storage

##### 1.1.4 Cultural services

Mountain areas support high diversity of cultures. Many of these cultures have rich traditional agricultural knowledge that promotes sustainable production systems. However, these lifestyles are severely threatened, (The Royal Swedish Academy of Sciences 2002) by climate and other changes that are taking place globally. For many of these cultures, mountains play an important spiritual role: they are living forces, sources of power and symbols of the sacred (Bernbaum 1997). Additionally, the mountains and many aspects of the cultures of the people attract tourists, who in turn can contribute towards improving local livelihoods. Every year thousands tourists from downstream areas and all over the world visit the unique HKH landscape for rest, recreation and relief from the unbearable summer heat and urban pollution.

## 1.2 Key physical characteristics of the HKH Mountains

The HKH region, which is also known as the greater Himalayan region or "the roof of the World" extends from 15.95° to 39.31° N latitudes and 60.85° to 105.04° E longitudes. It encompasses mountains of eight South and East Asian countries: Afghanistan, Pakistan, China, India, Nepal, Bhutan, Bangladesh and Myanmar, from west to east. The region has extensive, rugged, and enchanting high altitude landscapes and the largest areas covered by glaciers and permafrost outside the Polar Regions, and are often also referred to as the 'Third Pole'. The HKH including the Tibetan plateau region plays a significant role in global atmospheric circulation that influences two major weather systems: monsoon and the Westerly as shown in the figure below (Figure 1). It is a geo- morphologically unique region in that the mighty Himalayas act as the geological buffer protecting the lush green south slopes from the dry and arid winds of the north thus supporting a unique mosaic of several biota and eco-regions.

Figure 1: The role of HKH Mountains as atmospheric and climatic modulators and 'water tower' (UNDESA: Please Reference Full Submission for Figure)

Largely these weather systems together with the massive heights of the HKH Mountains define the nature and extent of biodiversity, forest, agriculture, human settlements and hydropower potential as well as diverse range of industrial raw materials extracted from the region for industrial uses and export to the market worldwide (Eriksson & Jianchu 2009).

### 1.2.1 'Water tower of Asia': The 10 river basins of the Hindu Kush-Himalayan Region

The geographic qualifier 'Hindu Kush-Himalaya' is not very precise. The region extends 3,500 km over all or parts of eight countries from Afghanistan in the west to Myanmar in the east and is the source of 10 major Asian river systems — the Amu Darya, Indus, Ganges, Brahmaputra (Yarlungtsanpo), Irrawaddy, Salween (Nu), Mekong (Lancang), Yangtse (Jinsha), Yellow River (Huanghe), and Tarim (Dayan). These rivers provide water, ecosystem services, and the basis for livelihoods to about 210.5 million people (see Figure 2). People living in the basins of these rivers directly depend on the water mainly for irrigation, drinking, sanitation, and industrial uses (Jianchu et al 2009). The river water also recharges and nurtures some of the richest ecosystems and farmlands in the world (ICIMOD 2009).

Figure 2. The ten river basins of the HKH region (UNDESA: Please Reference Full Submission for Figure)

The Himalayan range alone has the snow and ice cover of 35,110 sq.km containing 3,735 cu. km. of eternal snow and ice (Qin 2002). The total snow and ice cover for the HKH region is about 60,000 sq. km. (ICIMOD 2011). Hills and mountains, particularly the HKH mountain system, have been the sites of adaptation, mitigation, and resilience of the local people. Since time immemorial, they have maintained a rich cultural identity, food security and biogenetic diversity within the parameters of their own traditions.

### 1.2.2 Geographic features of the HKH Mountains

The HKH region spreads over 3.44 million sq. km. and has a population of around 210.5 million (ICIMOD 2009).

Table 1. HKH regional area (Total estimated area: 3,441,719 sq.km)

Estimated	Afghanistan	Bangladesh	Bhutan	China	India	Myanmar	Nepal	Pakistan
HKH component (sq.km)*	390,475	13,189	38,394	1,647,725	482,920	317,640	147,181	404,195
% Proportion of country	60%	9%	100%	17%	14%	47%	100%	51%

Source: Sharma. P, Pratap. T., 1994, Population, Poverty, and Development issues in the Hindu Kush-Himalayas, Development of Poor Mountain Areas, ICIMOD

\* Estimate based on earlier definitions of the HKH region, which is smaller than the area used for estimating population.

### 1.2.3 River basin areas of the HKH

Different authors have reported different areas for the HKH region. The tables below reports 4.193 million sq. km. and the total area of river basins is. 8.99 million sq. km. of which 2.79 million sq. km. lie within the HKH region (Tables 2 and Figure 3)

Table 2: Area of 10 major basins of HKH region derived from Albers and UTM projections

S.N.	Basins	Area in km2							
		TEN Major River Basins				TEN Major River Basins within the HKH			
		UTM	Albers	Differences (Albers - UTM)		UTM	Albers	Differences (Albers - UTM)	
				km2	%			km2	%

Note: - Details of projection parameters and technical literatures are available at MENRIS Division, ICIMOD.

Figure 3. Major basin boundaries in the Hindu Kush-Himalaya (ICIMOD, 2011) (UNDESA: Please Reference Full Submission for Figure)

### 1.3 Trends in the HKH region over the last 20 years

#### 1.3.1 Demographic changes

Birth and death rates in Europe have shifted from very high to very low over the last 2-3 centuries. This model of demographic change seems useful to understand global population change including those of developing countries, albeit with some modifications. One such modification is the quicker rate of demographic change in developing countries starting only half a century ago. For remote mountain areas of the HKH, this change began much later, only a few decades before 1992. The more remote the area, the longer the time lag for major demographic shifts due to the extreme weather and harsh terrains that make life extremely difficult.

The change has been much faster than that in developed countries, primarily due to the easier access to knowledge and technology and the spread of information and communication technologies. However, all changes have not been positive. While the problems of malnutrition and high child mortality rates have not been fully addressed, there has been good progress in education, public service and communications.

Table 3. Population estimates for the HKH region (Total mountain population: 210.53 million)

Estimated Population	Afghanistan	Bangladesh	Bhutan	China	India	Myanmar	Nepal	Pakistan
millions	28.48 (2)	1.33 (3)	0.71 (1)	29.48 (4)	72.36 (5)	11.01 (2)	27.8 (1)	39.36 (2)
Density (per sq.km)	73	100	15	17	150	34	189	97

Sources: (1) Population Reference Bureau, 2007 World Population Data Sheet. (2) Estimated based on data and information from Population Reference Bureau, 2007 World Population Data Sheet and Banskota, m. 2004. The Hindu Kush-Himalayas: Searching for Viable Socioeconomic and Environmental Options, pp. 57-105, In: Banskota et al. (eds.) Growth, Poverty Alleviation and Sustainable Resource Management in the Mountain Areas of South Asia, ICIMOD, and Nepal (3) Bangladesh Bureau of Statistics, 2004. (4) China Population Information and Research Centre (CPIRC) : (accessed on 5 June, 2008). (5) Census of India, Population Projection, 2007.

[HKH region and adjacent mountain areas include: Afghanistan – all provinces except Kandahar, Helmand, Nimroz, Farah, and Herat; Bangladesh – Chittagong Hill Tracts; Bhutan – whole country; China – parts of Yunnan (Diqing, Nujiang, Dali prefectures), Sichuan (Ganzi, Aba, Liangshan prefectures), Gansu (Gannan, Wuwei, Zhangye prefectures), Xinjiang (Kashigar, Kezilesu, Hetian, Altai prefectures), whole of Tibet Autonomous Region and Qinghai; India – the 11 mountain states (Arunachal Pradesh, Himachal Pradesh, Jammu and Kashmir, Uttarakhand; Assam, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, and Tripura) and Darjeeling district of West Bengal; Myanmar – the states of Kachin, Chin, Shan and Rakhain; Nepal – whole country; Pakistan – North Western Frontier Province (NWFP), Federally Administered Tribal Areas (FATA), Northern Areas, Ajud Jammu and Kashmir (AJK), and 12 districts of Baluchistan]

The population growth rates have been mixed with high birth and death rates. The growth rate is higher in urban areas (Kathmandu city in Nepal has experienced one of the highest rates of 6.8% per annum) and this is associated with conflict and high remittances. Almost all the mountain areas of the HKH are subsistence agricultural economies, some very primitive while others have varying degrees of modernisation and influences of the market economy. Typically, most mountain areas are predominantly rural. The total population of the HKH member countries is 1.81 billion – almost one third of the global population with an average annual growth of two per cent. Afghanistan has the highest growth rate and China the lowest. China has the best indicators of human and economic development except the Gini coefficient, where Bangladesh as well Nepal fare better (Table 5).

Table 4. Basic socio-economic including demographic data for HKH countries

#### 1.3.2 Globalisation and economic liberalization

Globalisation and economic liberalisation have been major factors in the economic transformation of India, Pakistan, and China (Kemal 2004). The global economy has also undergone profound changes over the last 15 years. The most spectacular change has taken place in China and India. China is likely to become the second biggest economy in the world by 2016, and India the third largest by 2035 (Kaplinsky and Messner 2008). With growing economic leverage, China and India are in a position to play a major role in the global economic, technological, and political arenas and will influence the “rules of the game” in international trade and other aspects of the global political economy. Kaplinsky and Messner (2008: 197) said, “The rise of China and India as global economic and political powers is one of the most important transformative processes of our time - challenging the international political economy dominated by the “transatlantic West. It is likely to remain significant for many years to come”. Similarly, in Global Economic Prospects: Managing the Next Wave of Globalization the World Bank (2007a) has predicted that ‘in the next 25 years the growth in the global economy

will be powered by the developing countries, whose share in global output will increase from about one-fifth of the global economy to nearly one-third'. The publication argues that China and some countries of South Asia, particularly India and Pakistan, will be the future drivers of the global economy. Table 6 indicates economic asymmetry of the HKH countries (Rahman and Amin 2009). Further, the emergence of Asian drivers has created both opportunities and challenges for both developing and developed countries. It is necessary to understand the complexities and dynamism of the economies of the HKH countries in order to promote trans-border economic cooperation in the region. Table 7 below provides a snapshot of the HKH macro economy.

Table 5: Pattern of intraregional trade (% annual growth) in BCIM (Bangladesh, China, India, and Myanmar) sub-region

Country	1990	1995	2000	2005	2007	1990	1995	2000	2005	2007
Bangladesh	2.80	1.79	1.08	1.96	2.39	8.06	24.62	18.16	27.82	29.49
China	0.96	1.35	1.19	1.61	2.39	0.40	0.45	0.66	153	1.58
India	1.78	4.14	3.91	8.36	10.41	0.57	3.05	3.39	7.74	10.98

Constraints to Cross-Border Trade in HKH Region: Although South Asian countries and China have made significant progress in integrating with the global economy, integration within the region has remained limited (World Bank 2007b). South Asian countries have consistently maintained greater level of protection than that in other regions. This has actually negated other comparative and competitive advantages such as common geography and low production costs. Consequently, South Asia has remained the least integrated region in the world. Besides, geo-politics and restrictive trade policies, there are several other factors constraining cross-border regional economic cooperation. Some of the key constraints are explained in the following sections.

Political Issues: Political differences due to unsettled boundary disputes and other geo-political interests have seriously affected efforts to foster regional economic cooperation in South Asia. As result the region, despite the huge development potential, has lagged behind all other regions in achieving minimal cooperation not in economics, politics, culture and communications. As a consequence the countries in the region have not been able to realise the benefits of the potential bilateral and intra-regional trade.

Lack of Communication and Transportation Links: Effective and integrated transportation and communication links are lacking among the HKH countries. The production, consumption and trade patterns of potential trading partners within the region have also not been well documented and shared. Three land locked countries: Bhutan, Nepal and Afghanistan have to depend on the goodwill and trade facilitation provided by their neighbours. However, since these countries themselves lack efficient mechanisms, both export and intra-regional trade suffer from inherent disadvantages and vulnerabilities. For example, Nepal's trade with overseas and in the region fully depends on transit facilities provided by India. These facilities are, however, often constrained by high handling and transportation charges and administrative delays hampering the exchanges between Nepal and its trading partners in the region despite the existence of favourable bilateral trade agreements between Nepal and most of its trading partners.

Restrictive Trade Policies: Most HKH countries still have restrictive trade policies that are responsible for the exceedingly low level of intra-regional trade (Kemal 2004). The restrictions have affected the intra-regional exports in the region. However, since the onset of globalisation, the HKH countries have gradually liberalised their economies resulting in growth of trade volume especially between India and China. Significant trade liberalisation has also occurred under the South Asian Free Trade Agreement (SAFTA) regime, which among others accords preferential duty treatment to almost 5,000 products from all SAARC member countries. However, the region still a long way to go for developing intra-regional trade to its full potential.

#### 1.3.3 Political changes and democratization movement

A wave of democracy has been sweeping the HKH region that has been hotbed of ethnic and political conflicts for identity assertion and equitable rights. While absolute monarchy has ceased to exist in the region dictatorship has also been mellowing down. Nepal is undergoing social and political transformation for establishing newer, smaller, federal units that could be more effective to meet local needs. India's Uttarakhand has become an autonomous hill state and has begun focusing on mountains both in policy and practice. In Pakistan, even previously "sensitive" mountain areas such as Gilgit and Hunza now have self-governance and institutional reforms following the creation of Gilgit Balistan province.

Such ecological and economically challenging cultural identities have begun to push and accelerate changes in access, ownership and management of resources giving fresh identities to local institutions for contributing to sustainable mountain development (SMD). These new identities need external resources to achieve SMD for harnessing natural resources and hydroelectricity for development. Economic autonomy can strengthen political and cultural identities of local institutions for contributing to SMD. Decentralisation combined with meaningful devolution as a means of empowering communities is at the centre of the conflict resolution strategy across the HKH. Though it is still too early to assess the impact of smaller governance units, there are indications that they augur well for the on-going socio-political transition.

#### 1.4 Climate change as a major driver of change

The assessment report no. 4 (AR 4) issued by the International Panel on Climate Change (IPCC 2007) characterised the HKH as a 'data deficit' region. Only a limited number of studies provide climatic scenarios that too, only of the Eastern Himalaya and especially on the situation with glacier melting and change in the ice mass. The projected temperatures are expected to be about 3°C warmer than the baseline by the middle of the century and about 4°C warmer by the end of the century. Models project about 20 per cent and 30 per cent increases in annual precipitation in the eastern Himalayas by the middle and the end of the century, respectively. These projections are influenced

by the emission scenarios and have are biased, particularly in the case of precipitation (Shrestha and Devkota 2010). The incidence and impact of aerosol (ABC) and black carbon mixed with green house gases of upper, especially glaciated, slopes is becoming equally important in contributing to the melting of ice and snow. Climate change is believed to impact water availability and water-related hazards. According to the latest report released by the United Nations Environment Programme (UNEP) on the impacts of Black Carbon (BC) in glacier recession says that a large BC sources in South and East Asia enhances cryosphere vulnerability in the HKH region because of large surface insulation owing to low latitude, high altitude, and low vegetation cover. The region is not downwind from the BC emitting regions but is still impacted. A small, but growing body of peer-reviewed literature suggests that BC is driving significant warming and melt in the HKH region (UNEP 2011). Further, climate change would have multiple implications on this and other aspects of livelihoods and pose new challenges to both the environment and development in the region.

The data collected from the eastern Himalayas show that there is a definite warming trend at higher altitudes and that areas at altitudes above 4,000m seem to be experiencing the greatest warming. The warming trend observed ranges from 0.01 to 0.06 °C/yr (Shrestha 1999) and the annual mean temperature is expected to increase by 3 °C by the middle of the century (Shrestha and Devkota 2010). Only a limited number of studies provide climatic scenarios for the HKH, especially on the situation with glacier melting and change in the ice mass.

#### 1.4.1 Biophysical implications of climate change

A number of authors and ICIMOD (2009) have argued that the HKH mountain regions have experienced above-average warming in recent years (av. 0.06 °C /year recorded in Nepal) with significant implications on the environment and livelihoods of millions of the people living in both the upstream and downstream areas. In the eastern Himalayas (ICIMOD 2009), progressive warming at higher altitudes has much higher rates than the global average warming (up to 0.09 °C/year). The most noticeable impact of climate change has been the increased frequency and ferocity of extreme events such as floods and droughts and rapid recession of Himalayan glaciers. Formation of dangerous glacial lakes at high altitudes is creating increased risks to the lives and livelihoods downstream. Scientists are forecasting that the cascading effects of rising temperatures and loss of ice and snow in the region will affect the amount and seasonality of future water supply including the monsoon patterns. Degradation of permafrost and reduction of snow and ice caps in the Himalayas will reduce water availability affecting diverse ecosystem services that are vital for supporting the livelihoods of millions of people in the region. Of particular concern to the eastern Himalayan region is the impact on lean season river flows that affect the supply of fresh water and energy to downstream populations in the Ganga Brahmaputra Meghna (GBM) basin. Further, the changing socio-economic and demographic scenarios are also contributing to increased risks. Figure 4 below provides the emission share of some of the major HKH countries in relation to the global contribution.

Figure 4. Emission share of major HKH countries and the rest of the world (UNDESA: Please Reference Full Submission for Figure)

Glacial melt now widely observed in the HKH region is changing the river flow regime resulting in severe dry season water shortages. In Nepal, this change in the river flow regime caused by climate change is affecting the operation of many hydro power plants. In some places, glacial lake outburst floods damaging habitats, life and property of the people. These impacts can have severe consequences for a wide range of environmental and economic activities, including substantial negative impacts on food security and human health (IPCC 2008). In Pakistan, for example, climate change is already having severe adverse effects on the natural water supply and glacial release threatening both food and energy security (Sheikh 2008). Pakistan is highly vulnerable to climatic variability and its impact on land resources as water availability is already a serious concern in many part of the country. Climate change has already caused decline in precipitation by 10-15 per cent in the arid and hyper-arid regions over the last 30-40 years. Furthermore, climatic changes increase the vulnerability to drought and flash floods. These natural calamities often pose serious threats to local food production and trigger land degradation and desertification (UNDP 2010).

#### 1.4.2 Implications on biodiversity and land use

Severe climatic conditions, lack of market linkages, and small fragmented farms have forced the farmers to adopt subsistence farming systems that heavily depend on forest resources across the HKH region. The consequent land use and land-cover changes directly impact biodiversity in mountain ecosystems (Körner 2004); contribute to local and regional climate change as well as feedback to global climate warming (Houghton et al. 1999); and by altering ecosystem services, Himalayan environmental change affects the ability of biological systems to support 1.3 billion people in the 10 river basins in the region (Xu et al 2007). Such changes also determine, in part, the vulnerability of people and places to climatic, economic or socio-political perturbations. Communities cannot be expected to remain stationary one their income sources wither leading to, migration within and beyond the region. The shrinking population-land ratio, reduced economic viability and decreasing interest in agriculture have amplified the impact of climate change on land use and land-cover in the HKH region.

The HKH Mountains are likely to experience a wide range of climate change effects on the environment, biodiversity, and socioeconomic conditions (Beniston 2003). Changes in the hydrological cycle may significantly change precipitation patterns leading to changes in river runoff and affect the environment, flow and nutrient cycles along the river basin ecosystems with adverse impacts on ecosystem and agricultural productivity, and the gene pool including from agro- biodiversity and wild relatives of food crops in the natural systems. However, there has been little research on climate change on the mountain ecosystem productivity and functions, and generalizations have been made from scattered studies at sites widely separated in space and time (IPCC 2007a; Noguez-Bravo et al. 2007). The limited evidence that exists (Shrestha et al. 1999; Liu and Chen 2000; Shrestha et al. 2000; Xu et al. 2009) is already ringing alarm bells on the fate of Himalayan biodiversity and the services it has been providing. Recent scientific understanding, led by the Intergovernmental Panel on Climate Change (IPCC), is that global climate change is happening and will present practical challenges for local ecosystems (IPCC 2007a). These include the prospect of more severe weather, longer droughts, and higher temperatures (milder winters), heat waves, changes in local biodiversity, and reduced ground and surface water quantity and quality. These changes will impact everything from the terrestrial biodiversity to human health, built infrastructure, and socioeconomic conditions. The global community is currently trying to understand the nexus between climate change and mountain vulnerability, especially in the most remote and highest mountains of the world i.e., the Hindu Kush-Himalayas. According to Körner (2009) and Scherrer D, Körner Ch. (2011) the real issue of the ongoing and expected climatic changes in the Himalayas is not the pace and magnitude of the changes but how the changes are affecting the ecosystem dynamics forcing species to migrate to cope. In response to fast rising temperatures and changing rainfall patterns, species are moving upslope into already occupied territory and are facing heavy competition, and many may not be able to adapt and eventually may face extinction (Eriksson et al. 2008).

The land use/cover change in the key basins in the HKH region is alarming. While Indus and Ganges basins have lost 90 per cent and 84.5 per cent of their original forest cover, Yangtze is down to 84.9 per cent and the Brahmaputra basin is a shade better with 73 per cent. Climate change, agriculture intensification and rapid urbanisation have contributed to this change. The traditional methods of dealing with water scarcity have been fading away in recent years. Additionally, the relatively small size of landholdings in mountain areas has pronounced the net impact of temperature and rainfall variability on the farm-based economy.

#### 1.4.3 Implication on Ecosystem Goods and Services

The HKH region is extremely rich in ecosystem goods and services including water, biodiversity, medicinal and aromatic plants, wild food crops, and eco-tourism resources. The natural capital in the region provide the basis for a substantial part of the region's total Gross Domestic Product (GDP) besides supporting the subsistence vocations of more than a billion people. The global importance of the ecosystem capital of the HKH has been widely recognised (Penland & Kulp 2005; Nicholls 1995; Woodroffe et al. 2006; Niou 2002; She 2004; Macintosh 2005; Sanlaville & Prieur 2005; & ICIMOD 2009). The rapid economic growth in China and the economic advances underway in India can be attributed partially to the availability of a good natural resources base, especially water and industrial raw materials. Conserving and regulating water, preserving soil, supporting forest management and biodiversity conservation, providing fodder and forage resources for pastoral development, maintaining good environmental conditions for agriculture development, and producing timber and non-timber forest products are some of the most prominent ecosystems services the HKH mountains offer. Scientists (Yao

2008; Lu et al. 2004) put the annual ecosystem service value of the ecosystems of Himalayas at US\$ 150-170 billion. Climate change especially global warming is already having pronounced negative effects on all these services. It has led to the shrinkage of many alpine lakes, reduction of river flow, glacial retreat, decrease of water availability, degradation of permafrost, forests, pasture, desertification, water and soil loss and degradation of rangeland resources. Highly mobile organisms, hardy species (growing on wasteland, weeds, etc.), mid-slope species will be the likely winners in the uncertain ecosystem change scenario resulting from climate change and likely losers are late succession plants, species with small, restricted populations and species confined to mountains or the plains.

#### 1.4.4 Impacts on the Rangelands

As the largest land use type and terrestrial ecosystem, rangelands (Stoddart et al. 1975) account for over 60 per cent of the surface of the HKH. Over 100 million people in the region have a direct though not complete dependence on the rangeland resources for daily subsistence while over 1 billion people are benefiting from water resources conserved and regulated by these ecosystems. What is more, rangelands in the HKH are habitats for globally important fauna and flora and are therefore comprise of many Biodiversity Hotspots (CI 2000) and a great number of protected areas of various types and sizes, especially in Tibetan plateau. Climate-induced negative changes are presenting enormous threats to provision of rangelands ecosystems services that are being felt across the HKH. In China, more than 90 per cent of the rangelands are degraded with about one quarter of them being under severe degradation or threat of desertification (Yi et al. 2009). This has resulted in sharp declines in fodder productivity and carrying capacity and has also engendered the social-economic wellbeing of pastoral communities.

Even though people attribute these changes to human factors such as overgrazing and poor governance, there is increasing evidence and belief that natural factors such as climate change are playing the fundamental role. In Afghanistan, annual precipitation determines the available rangeland resources that range between 40 per cent (in poor rainfall years) and over 85 per cent (in good rainfall years) of the total land area (FAO 1995). Frequent and unpredictable droughts in recent decades have further aggravated the unpredictability of the rangeland productivity and have caused high losses to life and property in Afghanistan. Some 70 per cent to 80 per cent of domestic livestock in the northern and western parts of the country perished in the prolonged drought from 1997 to 2004. Similarly, an extremely harsh winter in 2007/08 claimed the life of over 300,000 animals and 800 people (Yi et al. 2009). Another severe drought in the first half of 2008 caused the drying up of pasturelands and reduced water sources in several northern provinces (including Samangan, Balkh, Jowzjan, Herat and Badghis) causing death of thousands of animals, and failure of around 80 per cent of the rain-fed agriculture (Qazi 2008). Case studies initiated by ICIMOD (unpublished) in Afghanistan, Nepal and Pakistan suggest that decreased rainfall in rangelands has often resulted in expansion of degraded area and accelerated desertification, which further weaken the basis for livestock development. The same studies also indicate that the disappearance of water resources due to prolonged drought has forced people to change their migration routes or even abandon pastoralism.

Alpine Himalayan meadows are very important venues for summer grazing vegetation, medicinal plants and endemic biodiversity, and also in the eastern periphery of the Tibetan Plateau (Yi et al. 2007, 2008). However, it is reported (Mosley 2007; Yi et al. 2007) that upward advancement of the treeline triggered by global warming is reducing the area of summer pastures, which are important for the continued existence of local traditional agro-pastoral transhumance. Some others (Singh, SP; Singh, V; Skutsch, M; 2010) have suggested that such upward movement of the treeline is also edging out endemic alpine species. Changing environment is threatening the habitat of some economically important medicinal plants such as *Cordyceps* spp. that has for years been the major income source for many mountain people.

The east of the Changthang area of Tibet Autonomous Region (TAR) of China is becoming warmer and dryer. Alpine steppe dominated by *Stipa* spp. and *Poa* spp. that prefer warm and dry weather are spreading to the south at a rate of 14.2km/10a, causing a corresponding retreat of alpine meadow community. This change is unfavourable for livestock development since the alpine steppe has much lower primary productivity than the alpine community, which prefers a more humid environment (Wang et al. 2004). In northern parts of Tibet, the warming in the spring months is becoming slower but temperature drops more quickly during autumn (Wang et al. 2004). This change has enhanced conflicts in seasonal fodder supply sources and severely affected pastoral development.

Additionally, improper land use and governance and climate change have combined to increase stress on the mountain ecosystems in the HKH. For example, in the TAR of China, decades of overstocking and poor management, rangelands are suffering from a process of degradation and desertification turning the carbon-rich grass turf black, and exposing them to gales and blizzards that are becoming more extreme and devastating. Over grazing is widespread and plant biomass is releasing carbon from peat land and underground soils due to grazing pressure. The high alpine meadows are particularly under threat as top-soil cover is being eroded by strong winds making restoration of vegetation more difficult. The rampant degradation of the rangelands is also forcing nomads to change their vocations. To summarise, it can be concluded that Tibetan Plateau is highly prone to heating, drying and more extreme weather conditions, which is having pronounced impacts on rangelands besides influencing the Asian monsoon system as well.

#### 1.5 Community movement in natural resources management

Lateral and vertical integration of communities in local administration is critical to attaining equity and justice leading to good governance, especially environmental governance. Inspiring initiatives of collective actions for natural resources management do exist across the region but their integration into the existing institutions have been slow. However, there are some promising initiatives that could help in attaining the SMD goals.

Uplands of North-east India, comprising of the eight hilly and mountainous states are categorised as underdeveloped regions and also exemplify the classical paradox of 'poverty in the midst of plenty'. Through an IFAD supported North-eastern Community Resources Management Project (NERCOMP) project the region is now focusing on interventions that are technically appropriate, culturally sensitive and institutionally effective, for which a 'genuine partnership between communities, government and civil society' has been forged to ensure that the interventions are demand-driven and client oriented.

Since its inception in mid 1970s, the community forestry programme has been the largest and longest participatory green initiative wherein 40 per cent of Nepal's population is involved in managing 25 per cent of country's forest area. Not only is the programme inclusive and equitable, it has also been able to address socio-political and environmental concerns at the national and regional levels. The emerging carbon payment through the REDD+ mechanism promises to provide incentives and co- benefits to the community thereby exposing local communities to a competitive world wherein protecting community rights would be crucial.

First started as projects, these institutions have now work with genuine local participation and support and have successfully arrested the deforestation and also helped to improve forest cover. These have the potential to be expanded through legal provisions as has been already demonstrated by Nepal's community forestry programme. Though the case studies are country specific, their strengths lie in the diversity of approaches to suit varied socio-economic situations. Nobel laureate Elinor Ostrom whose award winning research on partly based on Nepal's community forestry says, 'When collective action is high, forest users themselves monitor regularly, forest conditions get better; and when local groups have long-term rights and can harvest from a forest, they protect its conditions more'. She added, 'Having rights does not mean taking all; if they have no rights at all, why will they have interest in protecting their resources? The crucial problem is how to match forests with the interests of the people and the communities.' This has been a fundamental philosophy of Nepal's community forestry policies.

#### 1.6 Information and communication technologies (ICTs)

Information technologies, especially computers and mobile phones and increasing internet connectivity in rural areas, have made significant inroads in the HKH region. Tele-density in Nepal reached 41.5 per cent in 2011 from a low of 27 per cent in 2010. Bhutan has 50 per cent mobile penetration; Pakistan has had a cumulative average growth of the mobile market by five per cent during last three years and mobile and Internet penetration in the mountain regions of India has been impressive (Thulasi Bai et

al. 2007).

ICTs can play an important role in development by connecting people to more accurate and up-to-date information. However, there is concern that the 'digital divide' is increasing the gap between the information 'haves' and 'have-nots' especially in mountain regions that are poor and are remote. Studies have shown that market information transmitted via mobile phones has helped farmers reduce transport costs by 33 per cent. Farmers in remote regions, like Humla in Western Nepal, have benefitted from mobile penetration for marketing medicinal plants. However, the impact of ICTs has not been uniform across the region.

Accessibility, both physical and electronic, has increased across the region during last two decades. However, subsistence farmers have found that cost of communication, about 11 per cent of their total cost of production, prohibitive. While extensive road and communication networks have played significant role in access to services and markets, there is need for policy to create mechanisms for easy access for marginal farmers.

Countries of the HKH region have begun to acknowledge the digital divide in policy but the issue of access and equity has remained unaddressed largely because of the overwhelming presence of the private sector in extending telecommunication services. Broadly speaking, computers, mobile phones and Internet access have connected remote areas to the mainstream of development. But road building rarely confirms to region's ecological fragility and vulnerability. While technology can enhance the options for mountain communities to adapt and survive at cheaper costs by accessing market opportunities, its impact on enhancing resilient livelihoods has yet to be fully assessed.

#### 1.7 Expansion of eco-tourism

The HKH region has always attracted tourists. Mt. Everest – the 'jewel of the Himalayas', lies on the border between Nepal and China. This is definitely one of the most sought natural attractions by tourists as it is the highest mountain on earth. Trekking tourism to Khumbu valley, Nepal is still a popular activity in the region.

The growing access of ICTs has contributed to the spread of tourism in the HKH region. They have made it easy for 15-20 per cent of tourists and tourism businesses for locating potential ecotourism sites and making travel plans. It is estimated that 50 million people visit mountains each year (Mountain Partnership 2008). The relationship between tourism and SMD has featured prominently in Agenda 21, and in related scientific and political debates and discussions. Tourism holds special significance for countries like Nepal as tourism earnings comprise around seven per cent of the GDP and during best tourism years (2009) the industry generated 4.7 per cent of the total employment. Tourism's share in India's GDP is 8.6 per cent. However, the impacts of tourism on mountain ecosystems and biological resources are of great concern because of the high fragility and environmental sensitivity of the HKH. Cultural identities and diversity in the mountains are also under threat due to the expansion of economic activities, social and environmental forces associated with mountain tourism. Tourism as an important industry in HKH region has suffered from a narrow interpretation of the allure of the mountains. Reserved as a preserve for extreme sports and adventure or romanticized as a pristine wilderness, mountain tourism especially in the HKH region has long been regarded as an escape from the woes of urban life, unblemished by the civilization-inflicted scars carried by regions at lower elevations. Whatever the purpose of visiting, tourists from around the world and the region have been attracted to the mountains; those visiting mountains comprise about 15-20 per cent of the global tourist trade.

However, many HKH countries, especially the middle-hills, have suffered the impact of this resource intensive industry, with over construction of resorts and other tourist facilities. Further, the mountain landscapes have had the unintended effect of rendering people living there invisible. They have largely ended up working as menials or porters, while the overwhelming share of the tourism revenue flows to interests outside the region.

India's 'National Mission for Sustaining the Himalayan Ecosystem' has laid stress on regulatory mechanisms for controlling tourist in flows in ecologically sensitive areas. Effective April 2008, the Government of Uttarakhand has restricted the number of tourists visiting the source of the holy river Ganga to 150 per day. Similarly, the Indian state of Sikkim has been employing an environmental fee, permits for entries, and stay time restrictions in some environmentally sensitive high altitude/ areas. Sikkim had a 25 per cent increase in tourist inflows in the past two decades and has developed a benchmark that can serve as a basis of responsible tourism in other parts of the HKH. Tourism holds potential to contribute to economic development in the HKH region but its expansion cannot be at the cost of loss of biodiversity, local cultures and livelihoods. The need to address such concerns while harnessing the potentials tourism to mountain livelihoods is now being recognised. However unlike the Alps, mountain tourism in the Himalayas is still in infancy. Although record annual growth rates have been forecast for South Asia (5%) – compared to 4.1 per cent for the rest of the world – the overall tourism potential remains underutilised. South Asia attracts less than one per cent of the global tourists leaving the potentially largely untapped.

#### 1.8 Major policy and legal reforms

The policy environment for managing natural resources, especially forests, has been improving consistently since the 1990s although there is lack of compliance on account of a legacy of failed institutions in South Asia. Although progress in policy reform, for example, the 1988 forest policy of India has been mixed regarding the institutionalisation of Joint Forest Management, the potential it holds to transform forestry into green economy wealth is promising. By setting up the National Green Tribunal -- an apex legal body – India has joined the ranks of 47-odd countries in the world that attach significance to Right to Information and justice as enshrined in Agenda 21. India has also recently launched the Green India Mission.

Pakistan has already approved several policies including the National Environmental Policy (2005), National Forest Policy (Draft), National Energy Conservation Policy (2006), National Renewable Energy Policy (2006) and the Policy for Development of Renewable Energy for Power Generation (2006). The National Environment Commission is the key policy institution in Bhutan. In Nepal the National Environment Policy Action Plan has been in existence since 1993. Forest policies of Nepal and Bhutan of 1993 are landmark documents that are now being considered for a global award. India has recently passed a Land Rights Bill, which assures land rights to forest dwellers and dependent indigenous community. It has also developed a range of policies and enacted many laws covering various environmental sectors. Within the ambit of environment policy and forest laws HKH countries are framing mountain specific regulations. The Assam Hill Land and Ecological Sites (Protection and Management) Bill, 2006 is one such legislation that aims at preventing indiscriminate cutting of hills and filling up of water bodies in urban areas, which had led to serious ecological problems in places like Guwahati.

Uttarakhand has recently implemented a policy for harnessing renewable energy sources with private sector/community participation targeting power generation and management through a power council. The policy permits power generation by individuals, Gram Panchayats (village councils), registered societies, and private companies. Such diversity of policies reflects mountain specificity with a possibility of adoption and replication across the HKH region. Many of such policies are also backed by fiscal incentives. Recognising forests as national wealth, the 12th Finance Commission of India recommended an incremental grant of Rs 1000 crores or USD 250 million for maintenance of forests from 2005 to 2010. This amount was distributed among the states based on their forest area. The existing system needs to be modified to adequately account for the mountain states. Such initiatives have the potential to be up-scaled and have possibility of emulation across the HKH region as a national payment for environmental services (PES) programme.

Policies and laws within the respective countries in the HKH reflect environment stewardship at one level. Within the region, China and India have signed up a number of acts together because only cooperate forces can solve global environmental crises, especially taking into account the fact that these two countries contribute greatly to world air and water pollution. Both, China and India are the active members the Asia – Pacific Partnership on Clean Development and Climate. This partnership among the region's two biggest economies auger well for better environmental quality of the HKH Mountains also.

#### 1.9 Harnessing the potential of water resources

The growing water stress, plans for mega dams on shared rivers, and uncertainties about the precise impact of climate change on water supply have brought water to the centre of the political agenda of major HKH countries. The problem is compounded by the shifting patterns of precipitation and river run-off associated with climate change, which is likely to push South Asia to the second-lowest position in terms of per capita volume of freshwater alongside the Middle East and North Africa. Overcoming the impending water crises should merit serious policy consideration in a declining resource environment scenario. But legacies of distrust, bitterness and disinclination to cooperate dampen the possibility of such a policy option. Politically the HKH remains a volatile and unstable region. Its capacity to face water crises is limited; yet a regional approach to resolve water-sharing conflicts does not exist.

Domestic and intra-country riparian water-sharing concerns have persisted in South Asia for decades despite the existence of water-sharing treaties between India, Pakistan, Nepal and Bangladesh. The Ganges-Brahmaputra basin is one site that is most contentious that could become complex once the water crisis deepens. Even though the countries in the region have been able to harness some water resources for irrigation as well as for drinking purposes, their preparedness for an impending water shortage and increasing water hazards on account of glacial meltdown is lacking. The alarming glacier melt rate in the HKH region could mean serious water insecurity everywhere from the Indus Plains to the Yellow River basin; the problem is already being experienced in Amu Darya command area. Lack of water resources for agriculture and hydro-power could even lead to conflicts. On 25 August 2011, the Prime Minister of Bhutan issued a warning saying that their Gross National Happiness Index might be affected if the water they depend on for the Chilkha Hydel project dries up due to glacier melt. The HKH glaciers seem to be melting faster than that in other parts of the world not only due to greenhouse gases but also due to atmospheric black soot that settle on the Himalayan snows and absorb ambient heat to accelerate snowmelt. Water is an emotive as well a political issue that countries often use to divert public attention away from their policy failures. Without doubt, it is for the political leadership in the HKH region to decide on a course of action to overcome the consequences of climate change on water supply, because no outsider can undertake this important task for the region.

#### 1.10 Emergence of major socio-political conflicts

The HKH region has been of great interest to the world due to its geopolitical, cultural, developmental and bio-cultural importance – and of late for matters related to security. Despite the geographical proximity, countries in the HKH region are caught up in mistrust and suspicions. China and India, two largest countries in the region had a less than co-operative relationship for a long time due primarily to border disputes. As a result cross-border economic cooperation could not grow. The situation, however, began improving after the 2001/02 after the two countries signed a bilateral trade agreement.

The socio-political issues in the HKH region are complex and where mutual distrust and hostility have existed between different countries. Even at the best of times these countries find it difficult to resolve their differences, even though the failure to address the issues of climate change, poverty, water crises, and biodiversity loss would be disastrous for all.

Strategic analysts have suggested that the future may remain uncertain for the South Asia region because, unlike Europe, it does not have a history of collaborative actions for developing region-wide policies. The situation has been further complicated by religious positions that have influenced political decision-making, the absence of functioning democratic institutions, and the existence of asymmetric relations and weak implementation. The growth of extreme religious positioning has, as a consequence, has made it more difficult for nation-states to develop region-wide policies. Climate change and the critical need for collaboration for preserving the Water Tower of Asia offer a unique opportunity for these countries to develop a cooperative agenda for benefiting both the mountain communities and downstream beneficiaries of the eco-system services provided by the mountains.

#### 1.11 Major activities in promoting the Mountain Agenda

Agenda 21, Chapter 13 has focussed and institutionalised global attention on mountains. The establishment of an International Center for Integrated Mountain Development in 1983 and the continued support to the centre is one example of such global interest in securing the environment and livelihoods of mountain communities in the HKH region. The Asia Pacific Mountain Forum was formed in 1997 to create virtual platform for exchanging knowledge in the region. Similarly, the Mountain Partnership Consortium (MPC) in an arrangement created to strengthen the Mountain Agenda at the global level.

Both bilateral and multi-lateral institutions have actively pursued projects in sustainable mountain development in the HKH region. The World Bank has been active in Pakistan, as also in the lower hills in India and Nepal; the International Fund for Agricultural Development (IFAD) has a fairly large portfolio in the region and so has the Asian Development Bank (ADB); IUCN is active in Nepal, Bhutan and Bangladesh. These agencies have brought active interest, resources and knowledge on sustainable mountain development. ICIMOD has remained the lead agency for promoting the mountain agenda through cross-sector linkages with governments of member countries, research institutes and civil society. To give a fillip to its efforts to promote mountain development, ICIMOD has now begun celebrating ICIMOD Day in member countries and not just its headquarters. A large number of sustainable mountain development initiatives are under or have been undertaken in the HKH region and these have created synergistic impacts and contributed to learning about socio-political institutions, economic-enterprise linkages and cross-sectoral complementarities but at the cost of losing focus on social equity, economic self-reliance and environmental sustainability – the three pillars of sustainable development. This report has commissioned a number of case studies to provide a snapshot of activities in these areas at a micro level.

#### 1.12 Poverty reduction measures and successes

There are many facets of poverty in the HKH region. It is manifested by low income, poor health, low access to health facilities, malnutrition, poor education, low skills, high dependence on the natural environment, high insecurity and physical vulnerability, drudgery and limited capability and entrepreneurial capacity. These dimensions of poverty are directly or indirectly associated with mountain bio-physical and socio-economic specificities characterised by geographic isolation, socio-cultural marginalisation, poor physical and economic infrastructures, poor access to market, technologies, information, poor institutional services, and limited economic opportunities. Geographic isolation, often compounded by differences in language and customs, prevents the benefits of markets, its niche products, and national economic growth from reaching the mountain people.

Limited employment and economic opportunities, and insecurity trigger out-migration keeping back only women, the elderly and economically less active populations in the mountain areas and therefore, the lower entrepreneurial capabilities. Therefore, the nature, causes and dimensions of mountain poverty differ significantly from that in the lowlands and the need to be understood from a mountain perspective. Yet, policy makers have not fully understood poverty in a mountain context. As result, market-driven value chain initiatives and tourism have contributed to poverty reduction only for a limited population and policy and institutional response to poverty reduction has been poor across the HKH region.

India's Mahatma Gandhi National Rural Employment Guarantee Scheme is perhaps the most significant initiative in the region. It guarantees 100 days of assured employment to the rural poor in a calendar year. Though results of the cash-to-work transaction are mixed, reports indicate that the scheme has been able to reduce rural-urban migration and promoted natural resource conservation in the villages.

#### 1.13 Growing urbanisation and high labour migration

For a long time now the mountains and hills have been a region of high migration from north to south (and sometimes the other way around), as well as from the west to the east. There has been substantial seasonal migration of labour to the plains to make up for both the unskilled labour shortages in the plains and the need for cash earnings in

the otherwise non-monetised mountainous areas. This quest for food and additional sources of income has created durable exchanges across the HKH region. In addition, rulers have repeatedly provided inducements to encourage people to migrate – often for political reasons – to under-populated areas and to transform forests into arable land. This movement of people from the mountains and hills to the plains have also resulted in building many economic, political and cultural relationships.

Migration and population mobility are essential elements of human and economic development. In fact migration is increasingly being used as a strategy to raise family income and also adapt to the changes taking place, including that caused by climate change. New destinations have opened up for migrants over the last two decades. These have mainly been the Gulf States, South and North East Asian countries and the West. These population movements have created new regional and transnational links, connecting very distant countries and different cultures. The effects of the remittances on the recipient economies have received much media attention, but have been not been assessed thoroughly. A study carried out by ICIMOD indicates that close to 15 per cent or 30 million of the world's migrants come from countries in the Hindu Kush-Himalayas. Bangladesh, India, China, and Pakistan are among the largest countries with out-bound migrants, a significant percentage of this population come from mountain countries. Labour migration is a major livelihood strategy of mountain people. The countries of HKH region have the highest inflow of remittances that any region in the world (Kollmair and Hoermann 2011).

After Rio, migration from Nepal has tripled, and that from China has doubled. The remittances reaching the region were close to US \$ 70 billion in 2007, or 21 per cent of global flows. No other region has such a large inflow. Diaspora contribution to SMD has remained a myth as home economies have not been able to encourage migrants to return and invest in productive areas thus fuelling unsustainable urbanisation as seen in Kathmandu, Nepal. Skilled migrants never return to their countries of origin. This is particularly true for educated migrants who are often unable or uninterested in investing in their own country and find the host country more attractive thus resulting in net loss to the mountains. Unless migration is purposefully managed, there is no way to make the skilled human capital relevant for SMD.

Almost all the mountain areas of the HKH region are subsistence agricultural economies, some more primitive while others have varying degrees of modernisation. Nepal and Bhutan, typical mountainous countries, are predominantly rural. Development has come to these areas last, and it has come in small scales owing to their physical and social remoteness. Again development models that worked in the plains have been transplanted to the mountains disregarding the upland specificities. Consequently, the results have not led to effective poverty reduction or sustainable development.

#### 1.14 Growing awareness and importance of indigenous and traditional knowledge

Significance of indigenous technical knowledge (ITK) is now being incorporated in development protocols. Over one 1000 villages in Nagaland in North-east India have been organised into Village Development Boards (VDBs), with the specific purpose of taking into consideration the traditional village organization of the specific cultural group. Using this institutional mechanism, the highly distorted shifting agricultural system is now being redeveloped by strengthening the tree component that had been weakened by high deforestation. Keeping in view the traditional approaches, the state government has launched a programme called Commoditisation of Public Institutions and Services.

The programme seeks to augment existing agricultural systems, rather than attempting to bring a radical change. The approach relies on participatory testing rather than transplanting new species through extension agents at the test sites. A dozen tree species have been tested in over 200 test plots. Water being a critical factor in sustainable management of land resources in a monsoonal region where water scarcity is acute for a major part of the year, ITK combined with appropriate water management has been demonstrated as a major factor for sustainable management of natural and human-managed ecosystems not only for the Northeast, but also for other parts of the Himalayas. Converting ITK, often seen as location-specific, into generalisations that are applicable across socio- ecological systems has been a major step undertaken to incorporate research results in public policy and development initiatives. There is a growing realisation in the HKH region that development approaches that link cultural diversity with biological diversity can form the basis for ensuring human security socio-ecologically fragile mountain systems. The Apatani tribe of Arunachal Pradesh has sound ITK of forest, land and water management, and has a highly developed system of growing rice in the valley. The Apatanians under the overall supervision of their village headman have optimised water use along with nutrient use in their rice fields.

The HKH region is home to hundreds of ethnic tribes, and it is their ITK that helped them survive in the harsh mountain environments. It is only recently that countries in the region have begun tapping in the ITK to address some of the current concerns related to climate-induced changes in cropping pattern and for adapting to extreme weather conditions. Institutionalising indigenous knowledge can therefore be a critical element for inter-generational resources enrichment and transfer.

#### 1.15 Regime changes and social movements towards good governance

Since 1992, there has been a general move towards greater devolution and decentralisation of power to local governments, which has to some extent reduced the marginality of mountain people and helped them attain their aspiration for self-governance. Some countries considered mountain areas as “sensitive” borders and were kept under strict restrictions on movement of outsiders and even locals. As consequence either those areas were ignored in terms of development needs or were rapidly developed in terms of roads and other infrastructures.

The entire HKH has witnessed widespread grassroots social movements that have sometimes turned violent (such as the Maoist insurgency in Nepal) while others have been non-violent (Chipko movement in Garhwal, India). While local grievances range from complaints of marginality in national and regional governance for reasons of identity, power, religion, poverty or other socio- political causes, scholars have claimed that other factors such as environmental degradation, and lack of access to political process are key triggers for such movements (Sedon and Karki 2004). While central governments, global powers, and sometimes state powers have looked at mountain regions as possible sources of global terrorism (Afghanistan), the aspiration of mountain people are similar and much of the acrimony can be resolved when more effective governance in sustainable mountain development is achieved as in the case of smaller, mountain-specific governing units such as the case of Uttarkhand in India (Tolia, 2011).

#### 1.16 Emergence of China and India as an economic power

Together, India and China make up almost 40 per cent of the world's population and produce six per cent of the global output. These are two very large markets. With greater integration their economic performance will have externalities—good and bad—in the neighbourhood and in the rest of Asia and the world. China began to open up its economy in 1978, and in 30 it considerably enlarged its share in global export of manufactured goods. India started a process of economic liberalisation about 10 years after China, and by 1991 it had achieved its best export performance in the services sector.

The global financial crisis has further accelerated the shift in economic power to emerging economies. Measured by GDP in purchasing power parity (PPP) terms, which adjusts for price level differences across countries, the largest E7 emerging economies are likely to be bigger than the G7 economies by 2020, and China is likely to overtake the US by then. India could also overtake the US by 2050 on this basis.

The rise of China, followed by India, has led to a new balance of world economic power. Their growth has driven attention to other developing and transition economies, which also have a high potential for growth, based on cheap labour, opening up to foreign technology and capital, economic liberalisation and market regulation. Since the end of 2008, all emerging economies have been hit by the global meltdown. However, India and China – thanks to their large domestic markets – have sustained growth rates that are still high compared to advanced economies. Thus, even during the crisis, the “catch-up” process is still underway.

The rise of China and India as economic and political forces has created both complexities and opportunities, particularly for the smaller countries in the region. Will the high rates of economic growth with increasing interactions with the rest of the world force both India and China to cooperate and settle unresolved disputes? The fundamental

differences between the two with regard to governance systems and international policy positions could deter such a development at least in the near future..

China and India pursue entirely different political paths and in practical terms, policy success has a somewhat different meaning in each country. The philosophical underpinning of their respective policies is different, and divergent political and economic ambitions, increasing rivalry over market share, access to natural resources or selection of strategic partners could even drive them further apart. Consequent to such posturing, conflict over sharing natural resources (mainly water) would remain contentious and could even fuel new conflicts.

China is increasingly demonstrating its commitment to the spirit of international conventions such as the UNFCCC. However, China still classifies itself as a developing country and identifies itself both as member of the G8 and G-20 while maintaining its association with G77. The major strategic concern of all HKH countries in the region, therefore, is how best to work together and reconcile their respective national interests while thinking for the greater good of the region, and jointly promote sustainable mountain development.

## PART II: Progress of changes in the HKH region since 1992

### 2.1 Assessment objectives, methods and activities

The assessment adopted a common framework for case study selection and methodology to be used. The report required to ensure the inclusion of the three-pronged objective of securing renewed political and financial commitment, assessing the progress to date and remaining gaps, and addressing new and emerging challenges as a strategic entry point to the Rio+20 agenda. The assessment focused on the two major themes of the Rio+20 Conference: Green Economy for Poverty Reduction and Institutional Framework for Sustainable Development. Additionally, good environmental governance was included to reflect the specific needs of the region. The report tries to highlight the specific context of the HKH region and reflects the views collected through multi-stakeholder dialogue and consultations as summarised below:

#### A. Virtual (e-conference) consultations

Table 7: Summary three e-Conferences (Stakeholder Consultation on Rio+20) organised by ICIMOD

e-conference event	Event Duration	No. of stakeholders	Participating countries	Total contribution and key issues
HKH	4-24 April 2011	296	20 countries in Asia Pacific, Europe, North and Latin America (majority from HKH)	Over 210 Key topics: climate change, deforestation, shifting cultivation, water and globalisation
South and Central Asia (Youth Perspective)	9-29 May 2011	550	38 countries Asia Pacific, Europe, North & Latin America (mostly from HKH & Central Asia)	Over 400 Key topics: green jobs, technology transfer and alternative energy, mainstreaming youth in the Rio+20 process

#### B. Commissioning of case studies

Table 8: Distribution of case studies by countries and themes

Event	Countries covered	Total case studies/remarks	Thematic focus
HKH (covered by commissioned case studies)	India, Bhutan, Nepal, and Pakistan	10 (Balance between 3 pillars – economic, ecological and social/institutional of SD/SMD); policies and implementation)	Biodiversity, Community Forestry; Eco-tourism; Micro-hydro; Biogas; Organic Agriculture; Watershed; CBNRM; REDD+
HKH (key informant's sharing)	Bangladesh, China, Myanmar, Afghanistan	Country representatives presented country priorities	Capacity building, Ecotourism, bio-geographic diversity and climate impacts

#### C. Workshop of stakeholders from the HKH and Asia Pacific region

Table 9: Asia Pacific regional capacity building and knowledge sharing workshops

Event	Participating Countries	Key highlights	Major outputs
Asia-Pacific Youth Forum on Climate Actions and Mountain Issues (convened as Asia Pacific Youth meeting on Rio+20), 8-12 August 2011	43 Youth from 17 countries HKH Countries: Afghanistan, Bangladesh, Bhutan, China, India, Myanmar, Nepal and Pakistan	- Capacity building sessions - Motivational sessions - Sustainability exercises - Team work for developing youth statements for Rio+20	- Asia Pacific Youth Declaration on Climate Change and Sustainable Development - Asia Pacific Youth Position paper on Rio+20
Regional Sharing Workshop on Assessment of Challenges and Opportunities in the Asia Pacific region for Rio +20, 23-25 August 2011	50 participants from 7 countries: Afghanistan, Bangladesh, China (one each), India (9), Myanmar (1), Nepal (12) Pakistan (3)	- Presentation of and discussion of case studies - Presentation of Key Informants - Sub/regional group work to assess key issues, challenges and opportunities and develop recommendations	- Finalisation of structure of Assessment Report - Documentation of key issues, challenges and opportunities - Development of key recommendations

### 2.2 Overview of the Sustainable Mountain Development efforts in the HKH region

This section deals with broad changes that have affected sustainable mountain development since 1992, from changes in its global definition and practice to more specific drivers of change in the Hindu Kush Mountains. What have we learned that can provide us a way forward to meet emerging challenges? What are the opportunities in sustainable mountain development, post Rio+20? These lessons are drawn primarily, though not exclusively, from specific case studies.

In the United Nations Conference on Environment and Development (UNCED) in Rio in 1992, a global consensus was formalised around the need to promote development aspirations of developing nations. This was called the Agenda 21. Various global environmental concerns were listed for concerted global action on different Chapters of which Chapter 13 addressed the issues of mountain environment and development.

The decade of 1992-2002 mainstreamed environmental concerns in development and many actions were offered as examples of sustainable development that culminated with the World Summit on Sustainable Development in Johannesburg or Rio+10, in 2002.

Progress continued in reducing the ambiguity of the concept with the development of quantifiable indicators in sustainable development such as GINI coefficient, forest area per capita, and GDP growth per capita. Critics, however, maintained that sustainable development was a theoretical oxymoron with the word "sustainable" implying a world of limits from ecology and the World Conservation Strategy 1980, and "development" implying a world of no limits, from economics and "Our Common Future 1987 (Redclift 2005).

With the collapse of multilateral environmental governance envisioned in the Kyoto Protocol, there is now a trend to remould the SMD agenda along the broad parameters of Green Economy and effective Environmental Governance - the twin themes for Rio+20. Most countries are responding to these as an opportunity to better access climate change funds and other low carbon opportunities. There is a fear that this may cause diversion of debate, funding, goals and priority from mountains to elsewhere such as the Green Economy – once again ignoring the need to maintain balance among the three pillars and promote intergenerational equity.

How can the concerns of sustainable mountain development (SMD) be addressed in this context? How can the persistent poverty and livelihoods vulnerability of mountain peoples be addressed in more effective ways? Even with the general slowing down of ecological degradation in the mountains, how can equity concerns and access to the dividends of SMD be brought to unremittingly marginalised indigenous people in this region?

To answer these and other research and development questions, the HKH assessment team carried out 10 case studies selecting topics that while thematically covering all three pillars of sustainable development in a cross cutting manner also addressed the institutional framework and good governance issues. What follows is a description of their key findings.

#### 2.2.1a. Van Panchayats or Community-managed forestry, Uttarakhand, India

##### Case Description

The Van Panchayat (VP: Village Forest Councils) is the oldest community forestry institution in the Indian State of Uttarakhand. The conservation efforts of VPs also contribute in providing a number of ecosystem services including carbon sequestration, which has acquired a significant value in the context of climate change. There is a potential for rewarding VPs through carbon payment mechanisms in Uttarakhand as it is happening in Nepal with support from ICIMOD. In India there is a distinct possibility to do so under the Green India Mission of the National Action Plan on Climate Change that can augment the green economy.

##### Spatial scale/location

Uttarakhand is a newly formed mountainous state formed to respond to the development aspirations of the hill and mountain people. Although approximately 80 per cent of the population of Uttarakhand depends on agriculture but only 14 per cent of 53,000 sq. km. of its total area is under crops. This also indicates the limited scope for the growth of an agrarian economy. Moreover, agriculture and allied sectors depend heavily on forest resources. Forests in the hilly parts of Uttarakhand were not codified or government-managed till 1865 and the local communities followed informal socio-cultural norms to manage and harvest the forests. The VPs are legally recognised, first under the District Schedule Act and later the Indian Forest Act 1927. The overall management of VPs, their constitution, elections, management, planning, representation of marginal groups/ women, various rights of members, etc. are governed by rules notified under the present Uttarakhand Panchayati Forest Rules (UPFR) 2005. The highlights of the UPFR, 2005 include empowerment of women and weaker sections of society, promotion of flexible site-specific community planning, and liberal benefit sharing of usufructs under the VP rules, 2005.

The 12,089 VPs in Uttarakhand (Van Panchayat Atlas, Uttarakhand 2007) manage over 5,449 km<sup>2</sup> of forests in 11 hill districts. This accounts for about 16 percent of the total forest area in the state. Nearly half of the VPs were formed after the creation of Uttarakhand and was made possible by the state policy of "each village having its own VP". There have been significant new interventions, such as Community Carbon Forestry through the Kyoto: Think Global, Act Local (K:TGAL) project, managed by ICIMOD. The project addresses livelihood based management of natural resources, income generation from forest biomass residue, the case of pine needle briquetting for clean domestic energy, and financial resources for strengthening of VPs through the Compensatory Afforestation Fund Management and Planning Authority (CAMPA), for promoting green economy by strengthening institutional governance.

The major stakeholders in the management of the VPs are the local village community, State Forest Department, State Revenue Department, civil society and funding agencies, both government and private.

Most of the VPs have been facing some major challenges, including:

- (i) Inadequate forest area with regard to number of households in a village: nearly 60 per cent of the VPs are of 15 ha while 13 per cent VPs are have 3 ha forest area under their management. Policy and technical interventions are required to have adequate attention on determining viable/ optimum size of a VP;
- (ii) Non-holding of timely elections for democratic governance;
- (iii) Lack of adequate financial resources and appropriate incentives for effective and broad-based participation of the local community;
- (iv) Lack of sensitivity and awareness on the part of government forestry personnel about the significance of VP and its role in improving livelihood options; shortage of skilled and well- oriented human resources in line departments, which has resulted in bureaucratic delays and complexities to linking livelihoods with forest conservation; and
- (v) Inadequate attention to the capacity and leadership building needs of VP members and office holders, especially as regards equipping them with technical capacity and management skills to handle the challenges, and administrative and technical issues related to managing and protecting forest resources.

##### Relevance to Green Economy

- Create fodder banks in VPs and linking them with local dairies by promoting stall-feeding.
- Encourage integrated organic farming (including apiculture and floriculture) with support of VPs.
- Promote and add value to products like Tejpatta (Bay leaves) locally through grading and packaging.
- Produce energy using Chir Pine (*Pinus roxburghii*) needles.
- Encourage plantation of broad-leaf species and build capacity of villagers to generate livelihood opportunities.
- Promote medicinal and aromatic plant, oil seed, fibre and natural dyes cultivation and harvesting, and resin tapping and other non-timber forest products.

- Promote eco-tourism in VP forest and village areas, and
- Improve water conservation techniques and charge royalty on sale of clean drinking water as forest produce of VPs.

#### Relevance to institutional governance

- Formulate and reform policy to improve the property rights of people on tree and tree products.
- Allocate optimum/minimum area of forest under the VP forest according to the size of the forest dependent population to make it a functional and viable proposition.
- Formulate policy to reward community for management and conservation of forests as carbon sinks. This should be at international, national and state level through carbon credits, Central Finance Commission and State Finance Commission, respectively.
- Formulate/ align State and Central ecotourism policies taking into consideration the Forest Conservation Act (FCA), 1980.
- Institute mechanisms for ensuring functional democratically elected local institutions for governance.
- Institute a mechanism to build capacity of communities to handle complex natural resource management issues (protection, regulation, micro planning, implementation, value addition, sustainable harvesting) for sustainable management practices, in addition to the programmes now underway.
- Assess the implication of human-wildlife conflicts in forest rich regions.
- Strengthen existing traditional forest governance institutions rather than creating new ones for new project based interventions, and
- Conduct trainings on participatory skills and attitudinal changes for key stakeholders, including the forestry and revenue staff of the government.
- Emphasise protection and conservation models of forestry rather than target-oriented afforestation (low cost and more sustainable) and link conservation with economic benefits through clear institutional mechanisms.

#### 2.2.1b. Community forestry and good forest governance in Nepal

Community forestry is a nationwide programme covering all districts and physiographic regions of Nepal. The programme has helped in re-greening of the mountains to a large extent. Probably, it is one of the largest and longest ongoing participatory green initiatives that involve about 40 per cent of the population in managing about 25 per cent of the country's forests. In the last three decades, community forestry has evolved from a programme to an effective forestry resources management model for Nepal. Encouraged by the success of the programme, Nepal has adopted community-based approaches to also managing protected areas and watersheds. Experience of community-based resource management in Nepal confirms that the "tragedy of the commons" results not from the sharing rights, but from the absence of well-defined rights, roles, responsibilities and resources (4Rs) of different stakeholders. Furthermore, it clearly shows that poor are neither bad resource managers nor agents of deforestation. Given proper incentives and tenure rights, the poor invest in and can contribute to protecting their environments.

Since its inception in the mid 1970s, the programme has evolved continuously and has been a good learning experience for government agencies, local communities, international development organisations, NGOs and CBOs. The programme has been successful in embracing changing local needs, national development priorities and international environmental concerns. The growth trajectory of community forestry has a linkage with global and national progress and is also contributing to social, economic and environmental agendas at the local, national and international levels. The community forestry took a participatory turn in early 1990s when the government enacted enabling policies, laws and regulations. It directly and indirectly incorporates the spirit of all three objectives of the CBD in policy and practice. The programme is also an excellent example of the local application of the global agenda on environment, sustainable development and human rights; and has been helping the government in fulfilling its international commitments.

Over the years, the community forestry programme has evolved in focus from subsistence-based forestry to good green governance contributing to local democracy and sustainable rural development. Community Forestry Users Groups (CFUGs) are one of the largest and strongest civil society organisations in the country. The community forestry initiative has also been an intervention that includes marginalised communities in the rural socio-political processes and has empowered thousands of rural women as important local development stakeholders. The CFUGs have been an important development engine at local level and in many mountain areas CFUGs have been contributing to local development by performing collaborating with at least 20 ministries. In many ways, the community forestry programme has been successful in tackling the three key constraints of sustainable mountain development – marginality, poverty and environmental fragility. Evidences also suggest that all five important livelihood assets of mountain communities have improved after the implementation of community-based forest resources management in Nepal. Evidences also suggest that community forestry has been contributing directly towards the achievement of five MDGs goals such as poverty reduction, environmental conservation, gender equality, primary education and partnerships for development, and also indirectly, to three other MDGs. These outcomes are testimony that the community-based approach to resource management supports the twin goals of both conservation of mountain ecosystems and improving wellbeing of mountain communities.

Despite the wide acceptance and visible outcomes the community based forestry resources management programmes of Nepal also have deficiencies, controversies and complications. The challenges community-based forestry has been facing are multifaceted and include institutional, social, economic, geographical, and environmental issues. For some time, social justice and inclusion have been the core issues of community forestry governance. The big challenge in community forestry has been how to overcome elite capture and make the process more equitable. These issues will become more complex when community forestry begins to benefit more from global environmental services such as Reducing Emissions from Deforestation and Degradation (REDD+).

Since mid-2000, community forestry of Nepal has been in the process of transformation. Community forestry management has been taking more inclusive, equitable and integrated approaches to address the changing socio-political, economic and environmental issues at the national and global levels. At present, national policy debates on community forestry have been dominated by commercialisation of forest products and climate change. Emerging carbon and other PES-related businesses have increased the potentials of community forestry, and possibilities of local communities to contribute to attaining the global environmental goals. These new green mechanisms can create opportunities for the wellbeing of mountain communities. Also commercialisation of community forest products and environmental services in the national and international markets can expose local communities to larger social competition. A "multi-layer and multi-centric" institutional arrangement may therefore emerge. In the absence of proper institutional and policy safeguards, the community-market interface may generally benefit the "most capable" at a cost to the "most incapable".

A good forest management practice like community forestry should focus on creating a sustainable green economy to further enhance the harmonious relationship between human beings and nature. It can be argued that new innovations and special efforts are necessary to address the issues of integration, inclusion, empowerment and enterprise, and also to manage the changing and challenging national and international contexts. A whole new set of institutions, skills and knowledge would be required to manage climate change adaptation and financial mechanisms, landscape-based resource conservation, forest-based green economy, etc. The government and community forestry institutions should be prepared to ensure that local communities in general and poor users in particular, are not deprived from a fair share of benefits from emerging green businesses. The level of future environmental and livelihood impacts of community forestry will depend on the capacity and cooperation among government agencies,

community forestry institutions and the private entrepreneurs in promoting green economy and creating green jobs for rural communities.

#### 2.2.1c. Forest Watershed CDM, Himachal Pradesh, India

##### Case Description

This case study describes how small farmers and forest user communities in the mid-Himalayan state of Himachal Pradesh, India are working to sequester over 839,582 tons of carbon dioxide equivalent over the next two decades through forestation and reforestation work on 4,000 hectares of variedly degraded agriculture and forest land. For their conservation activity each family in 177 village panchayats (councils) will earn between US\$ 83 to US\$ 145 per hectare per year as payment for carbon stocked.

As a sub-component of the World Bank-supported US\$ 75 million Mid-Himalayan Watershed Development Project, the creation of carbon sinks through afforestation is likely to accrue a net gain of US\$ 4.1 million to the communities over the next 20 years. The World Bank, a trustee of the Bio Carbon Fund, is brokering the transfer of funds between the host country and the client DNA (Oficina Espanola de Cambio Climatico) of Spain.

As the first project of its kind in the mountains, the project, which is larger than the 3,500 ha Clean Development Mechanism (CDM) project in China, will not only generate environmental benefits through carbon sequestration but will also improve income-generating capacity of small farmers. Through restoration of highly vulnerable degraded forestlands in Kangra and Bilaspur districts, the planned afforestation and watershed management activities are expected to generate 343 person days of employment per hectare while resulting in other environmental co-benefits such as natural water storage.

##### Relevance to Green Economy

The recent agreement between the Government of Himachal Pradesh and the World Bank, effective till December 2018, ensures that the carbon credits will go to the community, providing them the necessary incentive to protect watersheds and forests. The flow of "green money" will start reaching communities in end-2011; 10 per cent of the total carbon revenue will be retained by the Forest Department as overhead charges. Some conditions will apply before the carbon credit starts to flow. The landowners need to ensure that tree density is not less than 1,100 plants per hectare; that there is no felling of trees from land under the project; and that no part of the land brought under such plantations shall be diverted for non-forestry purposes. Even though issues related to social and gender equity and community participation remains to be addressed, the project does open the door for accessing "green payment". The success of the project will also open opportunities for afforestation and reforestation in an estimated 2.48 million hectares of degraded wasteland in the state.

#### 2.2.1d. Securing livelihoods and natural resource management through community empowerment: The Experience of Natural Resource Management Groups of NERCORMP

##### Case Description

North-eastern India is characterised by rich biodiversity and also extreme poverty. Aid dependency had eroded self reliance before the North Eastern Region Community Resource Management Project for Upland Areas (NERCORMP) – jointly funded by IFAD and the Government of India – was launched in Assam (in N C Hills & Karbi Anglong), Manipur (in Senapati & Ukhrul) and Meghalaya (in West Garo Hills & West Khasi Hills) benefitting some 87,000 households. The overall objective of NERCORMP is to improve the livelihood of vulnerable groups in a sustainable manner through improved management of the resource base in a way that contributes to protecting and restoring the environment. Its major components are capacity building of communities and participating agencies; economic livelihood activities; community-based biodiversity conservation; social sector activities; and village roads and rural electrification. Encouraged by its success and as response to local demand, the project has now been extended to Arunachal and Manipur states of India.

The project promotes "inclusive" and "client driven" decision-making and development through deliberate formation of Natural Resource Management Groups (NaRMGs) tasked with decision making, fund management, implementation, monitoring, participatory planning of activities (Perspective and annual plans), and gender mainstreaming. Self-help Groups and Federations empower women through affinity groups and alliances. Women are involved in savings and micro credit schemes as well as income generating activities. There is emphasis on reducing dependency on jhum by providing other livelihood options such as home gardens, extended home gardens with incorporation of horticulture, and wet rice cultivation. Off farm income generating activities such as weaving, handicrafts, groceries, and petty business are also promoted. Infrastructure development such as building of small irrigation systems for agriculture and village roads for accessing education and markets are also undertaken. The community has set up elephant reserves and python reserves, and have conserved fish breeding sites. Participatory 3- Dimensional Model pioneered in the Philippines is being used for community planning and decision making. The project has so far formed and used 24 different Participatory 3-D models.

The key messages from this project for Rio+20 are:

- Encourage community-led decision making, planning, implementation and monitoring
- Empowered communities can bring about transparency, accountability, inclusive growth and greater ownership of development initiatives
- Empowered communities can contribute to sustainable mountain development goals

- Social inclusion, empowerment of the marginalised
- Economic development – local resources, value addition, alliances of marginalised
- Environmental conservation – sustainable use and management of resources.

##### Relevance to Rio+20 agenda

There is a great degree of diversity among communities across the three states of India's North East. There is general acceptance of NaRMGs and its harmonisation with traditional institutions. However, at higher level, more work is needed to ensure harmonisation. Linkages are also being formed with the private sector and the government. There is a mix of community and individual approach to development that is being tried out. In North-eastern India, 80-90 per cent of the land belongs to the community or village chiefs. As NaRMGs represent the community, there is no problem in implementing the project because the self-help groups engage entire households, especially women, in meaningful activities.

#### 2.2.1e. Watershed Management in Pakistan – an adaptation and Sustainable Development practice

##### Case description

The Tarbela Watershed Management Project (TWMP) was initially started to control siltation in the Tarbela dam with community involvement. It has gradually evolved into a community-based natural resources management and sustainable development project in Pakistan. The project began in the 1970s and its evolutionary process was parallel with global developments like the Stockholm Conference (1972), the Rio Summit (1992), and the present discourse on the green economy. Alongside field activities related to integrated watershed development and creation of alternative livelihood opportunities, the watershed field stations also addressed the second component of Chapter 13 of

Agenda 21 i.e. knowledge generation about the ecology and sustainable development of mountain ecosystems. Watershed management as a discipline has also been incorporated in the curriculum of the Pakistan Forest Institute (PFI).

Key informant interviews and review of literature reveal that the local processes of the TWMP project have addressed the global concerns but evolved without juxtaposing the Agenda 21 or other global process documents in perspective. The global processes have been the major factors influencing the preparation of the TWMP project documents through other ongoing processes in Pakistan.

The results of this study show that the achievements of the TWMP are significant. An area of more than half a million acres has been brought under tree cover and soil conservation, and check damming has had a positive impact on silt load in the dam. Meeting the main objective of the TWMP – the reduction of silt load through participatory watershed management – is the project's main success story. However, progress could have been much more holistic and sustainable had the concerns of biodiversity conservation also been incorporated in the project's design. Biodiversity concerns that remained largely un-addressed are the creation of buffer zones or biological corridors for wildlife in the mountains catchments. After completion of 30 years of watershed management under different phases the project now stands at a crossroads. There is a huge pressure and high community expectation for securing livelihood benefits commensurate with the sacrifices they have made for protecting watersheds.

#### Relevance to Rio+20 agenda

Climate Change as an external driver has become the most important factor affecting sustainable development in the post 1992 era and the importance of forestry in mitigation has now been recognised. Green economy is currently viewed as the viable path for low-carbon economic development and REDD+ is recognised as the best option for promoting green economy through forestry. The TWMP has been analysed for its relevance to the current discourse of Rio+20, in particular its niche in the green economy. The findings of this study show that TWMP has all the required institutional and social setups to start it as a REDD + project. However, capacity building of communities and TWMP staff, legal and technical arrangements are also required.

#### 2.2.2 Conservation and Development of Medicinal and Aromatic Plants in Uttarakhand, India

##### Case Description

Medicinal and aromatic plants (MAPs) form an important component of biodiversity and these are closely linked with local health care systems, rural livelihoods, and herbal industries. The Himalayan region is extremely rich both in the diversity of MAPs and indigenous/traditional knowledge on the use of herbal medicines. A majority of the communities are socio-economically marginalised and depend heavily on the MAPs for their primary health care needs. However, more than 90 per cent of the MAPs used in herbal industries today are extracted from the wild resulting in rapid decline of high value species. In accordance with the Agenda 21 commitment, and subsequent action plans under the Convention on Biodiversity (CBD) all member countries and the Himalayan states need to develop long and short-term strategies for conservation, sustainable and scientific harvesting, utilisation, cultivation and marketing of MAPs with the involvement of all stakeholders.

India's Uttarakhand state is also known as the "herbal state" for its tremendous wealth of MAPs. The state has about 5,000 species of vascular plants, of which about one third are known to have some medicinal properties. Of these, nearly 150 species are sold to the herbal industries and are mostly sourced from the wild.

After the formation of the new state in 2000, there was a paradigm shift in biodiversity conservation and management, and efforts aimed primarily at enhancing the impact on local livelihoods. Since much of the land is hilly and unproductive for regular agriculture, the government realised that forests have potential to sustain local livelihoods if managed through meaningful community participation. An important administrative reform was introduced and a new position of the Forest and Rural Development Commissioner (FRDC) was created. The role of the FRDC is to link forests, biodiversity, and agriculture to rural development. This has resulted in a number of new policies, strategies and actions that included the reforms in MAPs sector.

The state has also made major changes to reorganise its research and development programmes in the MAP sector to include medicinal plant business, policy instruments and long-term strategies for the sustainable development of the herbal sector. A State Medicinal Plants Board (SMPB) headed by the Chief Minister issues necessary policy directives and technical guidelines. The state has also established an Herbal Research and Development Institute (HRDI) for developing and disseminating knowledge. A large number of government and non-government organisations, including traditional practitioners and scholars, have contributed to the development of state's herbal sector.

Uttarakhand also has the advantage of access to a number of national research and development institutions based in Dehra Dun. A rapid MAP inventory and mapping project has been initiated for generating baseline data for preparing Conservation, Development and Harvest (CDH) plans that are to become a part of the Forestry Working Plans. Most significantly, the forestry administration has mainstreamed conservation and development of MAPs in divisional management plans and annual plans of operation. The Forest Department has also made provision for improved access of local communities to NTFPs.

#### Relevance for Rio+20 themes

The experiences of developing Uttarkhand's herbal sector hold promise not only for the development of the state but also for other states and neighbouring countries in the HKH region. MAPs will continue to remain the most important bio-diversity resources for socio-economically marginalised communities in the Himalayan region and for the herbal industries. MAP development in the state therefore has to be comprehensive and must consider its links with nutraceuticals, pharmaceuticals, and traditional medicines (like Ayurveda) while aiming to promote and strengthen the MAP sector in order to impact on all the three pillars of sustainable development – ecological, economic and social. Integrated and systematic development of the MAPs and NTFP sectors can be good examples of how the green economy can work in the mountains. However, a partnership with private sector that can facilitate value addition close to the production areas and better linkages to markets through buy-back guarantees will be necessary to promote the green economy. Multi-sectoral and multi-disciplinary approaches are necessary because cultivation of rare and endangered MAP species is required to allow regeneration in the natural habitats. This explains the state policy of promoting cultivation, processing, marketing, and research in a holistic manner.

#### 2.2.3 Transboundary Eco-tourism in Eastern Himalaya: A case of Sikkim (India) and Bhutan

##### Case description

Ecotourism, which aims to protect the natural environment and cultural diversity by attracting nature enthusiasts and generate revenue for local people without harming nature, has emerged as a successful mechanism for contributing to all three pillars of sustainable mountain development in the Eastern Himalaya. People involved in mountain tourism have witnessed an increase in tourist arrivals, longer length of stay, increasing visitor expenditure and retention. India and Bhutan have been promoting tourism as one of the most promising means for attaining sustainable development. Their cooperative policies are having major impacts on development. In the Eastern Himalaya region, where this case study was focused, visitors experience a safe environment and unique hospitality, with good local awareness about the opportunities that eco-tourism presents. Visitors have also appreciated the quality and maintenance of the unique bio- cultural landscape. The region's highly distinctive natural beauty and Buddhist culture are being conserved for retaining the unique identity and also for benefitting from tourism.

Both Bhutan and India have their own tourism policies and action plans. The formulation of policies that address the place and people in the adjoining transboundary regions can assist in promoting tourism in the across borders and to foster pro-poor tourism enterprises. Regional tourism has not flourished in the HKH region as yet but the model has scope for up scaling. The case study provides an overview of the regional tourism status in Sikkim in India, and Bhutan, and suggests the need for furthering regional

cooperation in tourism in a larger scale. The paper aims to explore the tourism potential in the region by promoting ecotourism as an example of transboundary cooperation between India and Bhutan.

#### Relevance to Rio+20 agenda

ICIMOD has been facilitating regional cooperation through its transboundary conservation initiatives. ICIMOD's Regional Cooperation Framework, developed through consultative processes harmonises national policies and legislation for effective management of the Kanchenjunga landscape and it has been a key instrument for achieving environmental and economic sustainability among the countries that share this territory. Promoting nature tourism in this framework can have a maximum benefits and can help improve the livelihoods of people and the environment of the Eastern Himalaya.

#### 2.2.4 Organic Agriculture in Uttarakhand – a green solution for mountain agriculture

##### Case Description

Organic farming is the manifestation of the traditional environmental stewardship of the people that provides a meaningful outcome in the form of economic growth. Agriculture is the mainstay of economy in mountain regions and therefore sustainable development is directly linked to agricultural development.

The green revolution technologies did not really reach the mountain regions primarily because the farmers could not afford the expensive chemical fertilisers and irrigation. Other inputs – intensive extension services and machineries – were also not available in the hills. Therefore, the indigenous technologies and inputs-based diversified agriculture suited the mountain regions, which Uttarakhand is using for promoting organic agriculture or “green agriculture”. Mountains and hills have a long tradition of collecting of forest waste and using it in barn management, and that gets recycled as an important source of carbon (humus) for soil in mountain farms. This was the only input used in crop production. This tradition also sequestered carbon under the ground as soil organic carbon, which is another benefit of green agriculture. The success of organic agriculture in Uttarakhand can thus be attributed to its rich agro-biodiversity and forestry resources (above 60% of the land). Other reasons are the very high literacy among farmers, the large number of educated rural youth not wanting to pursue traditional agriculture and state's good network of roads, railways, and air links connecting it to large markets in Delhi and even Europe.

Creation and strengthening of farmers associations has served as a tool to ensure participation and equity for small farmers, and also a mechanism to take care of supply chain issues such as marketing, certification, and integration of internal quality management system to help ensure traceability and organic compliance. The Uttarakhand Organic Commodity Board (UOCB) was set up in 2003. The state approached Sri Ratan Tata Trust (SRTT) for support and an initiative, Himmothan Pariyojna, was given the responsibility to run the programme. The State and the SRTT contributed equally to finance the initiative with support of the UOCB, which is viewed as a model institution in a totally new sector in the country. As a support mechanism the state government has tasked the state seed certification agency to undertake organic certification and has also named the State Organic Certification Agency (USOCA), as another major support measure.

#### Relevance to Rio+20 themes (Green Economy)

Organic agriculture that includes forestry, range and pasture development fits into the sustainable development agenda of mountains like “fish in water”. Recent global reports indicate how organic agriculture can contribute to climate change adaptation and provide resilience to farmers in vulnerable regions. Organic agriculture that localises food systems has the potential to mitigate nearly 30 per cent of the global green house gas (GHG) emissions and save one sixth of global energy use (Mae Wan Ho and Lim Li Ching, 2009). Sarah Borron,(FAO, 2006) has argued that environment disturbances affect farmers from marginalised regions and organic agriculture techniques can increase resilience in the areas of soil and water, biodiversity, landscapes as well as community knowledge systems. These are essential for building resilience for the climate change impacts in the HKH region. As discussed above the Organic Production Initiative now needs to be brought into a long-term policy framework of mountainous countries and regions. Institutions supporting the programmes need to be strengthened with realistic budgets. Private sector participation needs to be encouraged and consumer forums need to be built to bring about sustainable and fair trade mechanisms. The government has to take a position on the harmful factors like genetically modified organisms (GMOs), intensive agriculture policy and contract farming.

Development agencies can play a supportive role by fostering reliable institution support systems that can initially help provide the components that farmers find difficult to access such as bio-pesticides and organic fertilisers. Besides, technical capacity building, acquisition of adequate technology and skill-based training, marketing, initial financing for certification and localised input production are some of the immediate requirements. Further, Participatory Guarantee System of group certification schemes can be launched in order to take advantage of scale economies (marketing, production, and certification).

#### 2.2.5a. Case Study on Nepal's Bio-Gas Programme – Opportunities for Green Economy and Sustainable Mountain Development Goals

##### Case description

Biogas, as source of clean energy for rural households in Nepal, is environmentally friendly, economically feasible, and socially accepted. Biogas technology has been in use in Nepal since 1977. The Biodiversity Support Programme (BSP) has also been a successful rural development programme that has fostered a partnership among government agencies, donors, the private sector, NGOs, and Community Based Organisations (CBOs). Initial investment subsidies and low interest loans with long repayment periods were some of key elements for the success and expansion of the programme.

At the local level, the biogas programme has multiple social benefits. A major household benefit is the reduction in the time and energy spent by women and children in collecting firewood for cooking. Reduction in air pollution, including CO<sub>2</sub> and black carbon emissions, is a major environmental benefit. Biogas plants with attached toilets have also promoted better sanitation. The biogas programme also promotes local employment because it requires skilled workers for construction, maintenance, marketing, and financing of biogas plants. Further, the residual biological slurry can be used as organic fertiliser. The biogas programme supports the government's goals of promoting sustainable energy, improving access to energy for the rural poor, and reducing poverty by providing high quality biogas plants to poor households at affordable price. The biogas programme also provides economic benefits through energy and fertiliser substitution, and increased yields from animal husbandry and agriculture.

This case study shows that Nepal has appropriate infrastructure at the macro level, with as many as 243,065 domestic plants installed across the country by July 2011. Effective enforcement of quality control has ensured that around 93 per cent of the plants are operating satisfactorily. This statistic is very high compared to neighbouring countries. Initially greater emphasis was given to extension and promotion while Research and Development (R&D) was given low priority. However, in recent years a number of organisations have initiated programmes to carry out applied research on various issues not only limiting to domestic biogas plants but also on the benefit to rural farmers communities.

#### Relevance to Rio+20 agenda

Nepal's biogas programme has made significant contribution in the improvement of the local, national and global environment. It supports forest conservation goals by substituting the traditional cooking fuel – firewood. Such use of renewable energy contributes to improving the local and global environment by reducing GHG emissions. However, the government has not devised clear policies for providing incentives to promote institutional or community biogas plants. Due emphasis is also needed to support R&D activities for promoting biogas in the mountainous regions for meeting sustainable mountain development goals.

## 2.2.5b. Micro-hydro Energy Development in Northern Pakistan

### Case Description

This study documents a good practice in decentralised development of renewable energy and climate change mitigation in one of the most fragile ecological settings of the world that faces unsettling climate change impacts. With coordinated support from government, NGOs and research and development organisations and funding/ lending agencies, communities in the remote mountains of the HKH region are not only meeting their energy needs from close to 300 self-managed Micro Hydel Projects (MHPs), but are also helping in offsetting carbon emissions and in generating and trading certified emission reductions (CERs) under a UNFCCC recognised CDM project.

The MEPs are changing rural livelihoods in the geographically remote, ecologically fragile and socioeconomically marginalised mountain valleys of Gilgit-Balistan and Chitral (GBC) in northern Pakistan. The entire area is prone to natural disasters and, in recent years, climate change impacts have become visible as weather patterns show extreme swings. Pakistan in general and the remote off- grid valleys of GBC in particular face acute energy shortages. The insufficient provision of energy, despite high potential for clean hydropower, forces people to cut alpine trees and other vegetation to meet their basic energy needs. The use of diesel and other fossil fuels has also increased both by small businesses and local power utilities.

The Aga Khan Rural Support Programme (AKRSP) introduced MHPs as a community-led development initiative in the region in 1990. The management of MHPs has been built on the traditional practices of common property management. By 2005, these communities had built 240 MHPs, with a combined installed capacity in excess of 10 MW. When Pakistan ratified the Kyoto Agreement in 2005, a CDM project was conceived, which after a rigorous and long process was registered with the UNFCCC in October 2009. The bundled CDM Project envisages constructing 103 new MHPs with a total capacity not exceeding 15 MW, at a cost of US\$ 18 million over a seven-year period. The participating communities have provided 20 per cent cash as equity contributions towards the total investment; 50 per cent of the cost is contributed by the Pakistan Poverty Alleviation Fund (PPAF) in small grants, and carbon income and loan financing make up for the remaining 30 per cent.

### Relevance to Rio+20 agenda

The main lesson is that MHPs are an ideal fit for remote and fragile mountain environments where the population is scattered and where extending and maintaining the national grid over long distances in a difficult terrain is expensive. Therefore, decentralised approaches to generating and distributing clean energy may be the best option in such isolated areas. However, the scaling-up of the approach will require strong commitment by the government in terms of enabling policies and incentives. One practical way to do this is for the public sector to build and maintain "mini grids" and allow local investors and community organisations to generate clean hydroelectricity to feed such grids.

The financing mechanism and business model also provide a scalable partnership approach. Public funds are leveraged to raise community equity from capital and carbon markets. The ownership of smaller units is community-based, and units of 0.5 MW and higher, are designed to operate as formal power utilities with three goals: economic gain, social services and environmental protection.

## 2.3 Major institutions and networks launched or strengthened

Agenda 21, Chapter 13 has institutionalised global attention on mountains. Although ICIMOD was established in 1983, it was Rio'92 that contributed to its strengthening through continued support for its operations including the setting up of other similar organisations and networks. Using the spirit of the Chapter 13, ICIMOD is providing an example of a mountain-focused initiative that is making efforts in securing the environment and livelihoods of mountain communities of the HKH region,

The Asia-Pacific Mountain network was set up by ICIMOD in 1995 after the Rio'92. It was based on the recommendation of the 'SUDEEMA Call to Action 1994 and Asia regional response to Agenda 21 Chapter 13. The initiative was supported by the Swiss Agency for Development and Cooperation (SDC). It is intended to be a knowledge-sharing platform connecting mountain regions and individual members through dialogue and networking. The network captures, enriches, and disseminates information from a variety of sources on mountain development issues in and for the Asia-Pacific region. The APMN acts as the Asia-Pacific node of Mountain Forum (MF) – itself an outcome of the Chapter 13 – a role it has played since 1996. In more than a decade of its operation, the APMN has been able to make notable contributions to build knowledge repositories and expertise by collaborating and networking with its large membership[1] that includes organisations for promoting SMD. APMN has over 250 organisational and 2300 individual users.

The APMN operates as a hybrid network within ICIMOD supporting the Mountain Partnership Consortium that includes both the Mountain Partnership (MP) and Mountain Forum. ICIMOD has defined APMN as its 'communication arm' and plans to enhance its role in communication, networking and information and knowledge sharing activities beyond the ICIMOD regional member countries for greater Asia Pacific-wide integration and to fill the gap in knowledge, information, and data among the ICIMOD member countries and beyond.

The Mountain Forum operated as a network of regional networks (in Africa, Asia Pacific, Europe, Latin and North America) and was supported by the Mountain Forum Secretariat (or global Node) based in ICIMOD till 2010. Is is now based at CONDESAN, at NGO working in the Andean Mountains in Lima, Peru. The Mountain Partnership (MP) was set up post after the WSSD in 2002 and is a voluntary alliance of partners dedicated to improve the lives of mountain people and protecting mountain environments. APMN housed in ICIMOD presents itself as key knowledge sharing partner in the Asia Pacific region as a decentralised hub of the Mountain Partnership Secretariat.

Across the HKH region, various bi- and multi-lateral institutions have pursued projects to demonstrate sustainable mountain development. The World Bank has been active in Pakistan, and also in the lower hills across India and Nepal; the International Fund for Agricultural Development (IFAD) has a fairly large portfolio in the region and so has the Asian Development Bank (ADB); and IUCN is active in many countries of the HKH region. These have brought active interest, resources and knowledge on sustainable mountain development.

Among the development partners, IFAD has specifically channelled funding to the poor in the uplands aiming at livelihood improvement through community-based resource management. The projects in Northeast India, Uttarakhand, and Nepal have benefitted the poor, women and marginalised mountain communities in the HKH region. One of the most relevant programmes that can be cited in the context of Rio+20 is Rewarding Poor People for Environmental Services (RUPES). According to IFAD (2010), poor rural people have the potential to be important players in natural resource management and carbon sequestration. An IFAD-supported programme has helped build momentum and public interest in rewards for environmental services, and has developed ways to reward poor farmers who protect ecosystems in China, Indonesia, Laos, Nepal, the Philippines and Viet Nam in upland farming and forest systems.

According to Dennis Garrity, former director general of the World Agroforestry Centre, "Many people living in Asia's upland communities manage landscapes that provide environmental services to outside beneficiaries. These services include clean and abundant water supplies from watersheds, biodiversity protection and stocks of carbon that alleviate global warming. Rewarding communities for providing these services reduces poverty and provides incentives to manage uplands in ways that enhance the sustainability of the lowlands, compensate for carbon emissions elsewhere and support global biodiversity conservation goals." (<http://www.ifad.org/climate/perspectives/rupes.htm>)

## 2.4 Social and gender equity and inclusion

Two decades after from Rio'92, the discourse on women's equality and empowerment in the context of development has become sharper and more focused. Concretely, the focus has shifted from Women in Development (WID) and Gender and Development (GAD) approaches to approaches that are more nuanced and critical. The early conceptual basis of WID did not address the basic structures of inequality in relations between women and men, as it had a tendency to focus solely on "women's" issues. This realisation led to much broader discourses and a wider working framework leading to GAD, which focused on the socially constructed dimensions of power, the division of labour and gender as they cross-cut with other dimensions of difference (i.e. class, caste, age, marital status, life-cycle positioning, profession, etc.) and the unequal power relations between and among women and men, as central categories of analysis (Marchand and Parpart, 1995; Verma, 2001). Further shifts in approaches in gender analysis and research have been concerned with transformations in gender power relations and women as active agents of change and important knowledgeable managers of their environments. In many parts of the HKH Mountains, however, gender is still considered to be synonymous with the category women, and is inter-connected social, economic, and cultural roles and relations between women and men are normally confined to largely academic discussions. There is also the tendency to shy away from critical questions regarding transformations in gender power relations (Marchand and Parpart, 1995).

In mountain regions, gender inequalities in access to resources and decision-making processes that affect communities, cultures and environments (U.N. General Assembly Resolution 64/205, 2010) are some key challenges that hinder active participation of women and men in sustainable development processes. Although women in the HKH have always played a critical role in local development, agriculture and natural resources management, in recent years, their workloads in these work domains have intensified without corresponding increases in access to development resources, decision-making and land rights. In the hills of Nepal and Uttarakhand for instance, women have taken up pioneering roles in managing forests and taking up leadership of community responsibilities. However, women continue to face differential access to resources, ownership and control over critical natural resources. Despite a number of development programmes and initiatives by different agencies on gender and development, including agriculture and natural resource management issues, there is limited evidence-based data on the role of differently positioned women in sustainable mountain development, and the weak focus on transforming existing skewed gender power relations have led to limited impact.

Moreover, different drivers of change also create new, or exacerbate on going dynamics. For instance, high rates of male out-migration mean that women experience intensive workloads, responsibilities and burdens, which in turn often results in low enrolment and drop out of girls from formal education as well as increase in gender-based violence and trafficking of girls and women. Increased labour burdens have not translated into increased roles in decision-making or control over resources. These trends are further exacerbated by changes in the climate and environment, and during times of climate induced disasters (ICIMOD, 2009; Mehta, 2007). It is also well known that women are further constrained by unequal power relations, gender-biased attitudes and sometimes, systematic exclusion and under-representation. It is therefore important to increase knowledge of how inequality and drivers of change such as climate change are linked and how unequal power relations are affected by social, economic, cultural and political constraints in dealing with adaptation and sustainable development measures.

## 2.5 Food security situation in the region

The HKH region made tremendous progress in food production during 1960s, 1970s, and 1980s. With impressive growth in food production, China, India, Pakistan, and Bangladesh, transformed themselves from countries with chronic food-deficit to those that were almost self-sufficient in the early 1990s. Except Afghanistan and Nepal, all the HKH countries had exported some food grain during the late 1990s. This growth in the agricultural sector has faced setbacks (Rasul 2010). Productivity of major food grains has slowed and has even declined for some crops (Kumar et al. 2008) with food production failing to keep pace with population growth. As a result, South Asian countries are now finding it difficult to meet the most basic food and nutritional needs of their people and remain vulnerable to food insecurity.

In South Asia Afghanistan is the most vulnerable in terms of food security. Wheat – the staple food crop – has seen a decline in both the productivity and production and other major crops have also suffered owing to conflicts and droughts. Because of its mountainous terrain and an arid to semi-arid climate, crops are cultivated on only about 14 per cent of the country's total area. In 2006, consumption in each income group was estimated to have fallen below the minimum nutritional requirements. The unstable political and security environment combined with limited resources and very high population growth (more than 2.0 % per year) may force per capita consumption to continue to decline over the next decade.

Nepal's food security situation has deteriorated sharply over the years. Nepal was exporting agricultural commodities such as rice, jute, timber, garments, hide, and skin up to mid 1980s. In 1975– 76, Nepal's food-grain exports were worth NPR 5,954 million. Exports declined drastically in the 1980's and Nepal has now become a net importer of food. From having one of the highest agricultural productivity rates during the 1960's, Nepal's agricultural productivity became the lowest in the subcontinent in the 1990s (as cited in Cho et al, 2004). Food security has remained a serious concern in remote areas. Generally, those in the lowest income quintile fall short of the minimum needed to fulfil their nutritional requirements. According to a UN report, 2.5 million people in Nepal need urgent food assistance (Pyakuryal, 2009). The WFP estimated population of moderately, highly and severely food insecure people to be 3.6 million (Nepal Food Security Bulletin, 2010). Nepal's food security has remained a serious concern in remote areas. In 2009, the WFP reported that 43 of Nepal's 75 districts faced a food deficit, and 23 districts were chronically food insecure. There was surplus production of cereal grains in Nepal in 1999/2000 and up to 2007/08 except in 2006/07. It had a surplus of 68,496 MT in 1999/2000 and 83,051 MT in 2000/01. However, the deficit in 2008/09 was 132,916 MT (Figure 5)

Figure 5: National Production Surplus/Deficit (UNDESA: Please Reference Full Submission for Figure)

Bangladesh is also considered a vulnerable country in terms of food security. Although the rice yield is marginally increasing and there is significant progress in overall food production, the production lags behind domestic demand fuelled by population growth. The per capita food consumption is close to the minimum nutritional requirement (2199 calories per day in 2004). Only the top two income groups were estimated to have exceeded the nutritional target in 2006 (Rasul, 2010). The food security situation has been made more fragile due to regular floods and cyclones that damage crops and affect food production. Bangladesh currently imports three to five million tonnes of cereal per year on average, depending on weather conditions (Rasul, 2010).

Bhutan is also vulnerable in terms of food insecurity although country's food affordability index is continuously increasing. Only 3.4 per cent of its land is suitable for arable agriculture, although more than 80 per cent of the people depend on agriculture for livelihood. Productivity is low and variation in cereal production is very high. More than one tenth of the cereal consumed in the country is imported or comes as food aid (Rasul, 2010).

India experienced the success of the green and white revolutions, and has made significant progress in food production since the 1960s – it became self-sufficient in food grain and was exporting a sizeable volume of food in the late 1990s. However, production began declining from 2000 while the population has continued to increase. In 2000, net cereal production was 172 million tonnes and it decreased to 163 million tonnes in 2001 and in 2003 it further declined to 143 million tonnes. An estimated 222 million Indians (20% of the total population) in 2006 were below the minimum nutritional requirements (Rasul, 2010). As the major food grain producer and consumer in South Asia, India's challenge is not only to feed its growing population but also to help the neighbouring countries meet their deficits, especially during crises.

Pakistan has also made tremendous progress in its agricultural sector compared to 1960s and the country achieved near self-sufficiency in food during the 1980s. However, food production has remained erratic and has failed to keep pace with population growth (2.4 %). As a result, food security has remained a persistent concern of the government. In 2006, 10 per cent of the population was estimated to have less food than required and the situation could deteriorate further over the next decade due to the gap between population growth and food production (Rasul, 2010).

## 2.6 Analysis of initiatives: challenges, opportunities, lessons learned, links to Rio+20

Mountains of the HKH region face multiple issues and continuing, and new challenges. While the persistent challenges of poverty, rapid urbanisation, population growth and environmental degradation are having greater impact, there are new challenges resulting from climate change, youth migration and growing social conflicts that have aggravated the old challenges. Climate change induced threats and higher rate of global warming in the mountains are causing disproportionate impacts on the HKH Mountains and hills. Economic and food crises, social and political unrest, shrinking development space, and slow progress on past commitments are the key challenges facing the mountains. Globalisation and ecosystem degradation are also seriously affecting and changing agriculture and ecosystem production and productivity directly increasing food insecurity and social and gender inequity. The HKH Mountains are important for their role as water towers of Asia, as biodiversity hotspots or shelter for fragile faunal and floral species, and most importantly as the global environment regulators resulting from their unique location and landscape.

### 2.6.1 Frame conditions for the analysis of progress in SMD

HKH Mountains unlike other mountain systems of the World support many different ecosystems and provide key goods and services that provide livelihoods to millions of people and are also the basis for human activities beyond their natural boundaries (Beniston 2005). Most of the goods and services provided by these mountains have their origin in the upper slopes that are sparsely populated. The consumers of these goods and services are mostly in the lowlands, especially water and energy. Highland and lowland systems are thus highly interdependent in terms of ecology and economy and also social and religious linkages. Himalayan mountain communities with their rich traditional ecosystem knowledge and highly adaptive capacity contribute significantly to the quality and the sustainability of these goods and services. However, they are rarely and/or poorly compensated for the services they provide to downstream communities.

### 2.6.2 Analysis of the case study findings in the context of SMD

The case studies provide a snapshot of micro level changes. Looking at the macro picture based on the messages of the case studies indicate, that while India and China have boomed economically, the rate of change in the HKH region, which is largely rural, has been modest in terms of pace and scale of change. Ethnic conflicts, cross-border tensions, demographic transition including outmigration and increased and unplanned urbanisation have had adverse influence on local economies and the environment. In contrast, growing tourism, increased remittances and improved market linkages for natural and organic products have helped the mountain and hilly regions to register modest growth although growth has not been uniform.

Despite relative invisibility, the significance of sustainable mountain development (SMD) has been established on the global agenda on account of the above mentioned micro-to-macro level progress and changes much of which have also been documented by the 10 case studies in 5 countries of the region (Table 1 provides the list of the case study topics):

Table 10. Summary highlights of the case studies in the HKH region

Case study theme	Major findings
Medicinal Plants/NTFPS	Identification and removal of policy barriers can improve access to medicinal plants by local people and double the benefits; can be a model sub-sector for SMD
Community-based NRM	Enabling communities to participate in planning, designing, implementing and monitoring of NRM at local level can empower and lead to improved resource governance
Community forestry and REDD+	Good model of forest resource governance enabling farmers to improve livelihoods and participate in and benefit from REDD+; CF of Nepal is a good practice case for SMD as it gives "triple dividend": improved environment in terms of watershed management and biodiversity conservation, enhanced local income and carbon sequestration -adaptation, mitigation and poverty reduction
Eco-tourism	Important source of income to local community with relatively more distributive effect achieving income equity.
Van Panchayats (Community forestry)	Generate multiple products such as clean energy, compost, fodder banks; carbon co-benefits (REDD) and lead to biodiversity conservation
Forestry CDM	CO <sub>2</sub> sequestration; helps to develop new forestry institutions; benefits and sharing are issues that need to be addressed.
Organic agriculture	Improved agro-ecosystem resilience, soil organic carbon deposits; reduced costs; increased net income; high community acceptance.
Bio-gas promotion	A good program promoting massive peoples' participation; significant social and economic benefits (carbon credits being paid) and recognised environmental benefits (CDM board has awarded CER certificate).
Micro-hydel projects	Low-cost, clean and sustainable source of energy for remote mountain communities (off-grid locations) offsetting carbon emissions and generating and trading CERs under a UNFCCC recognised CDM programme.
Watershed management	Watershed conservation in catchment areas of a major storage and hydroelectricity dams has multiple benefits; Policy weaknesses have led to poor sectoral coordination and thematic integration of social and environmental pillars; future potentials are high including that through REDD+

### 2.6.3 Major learning from the case studies

Green projects are suitable for subsistence economies: Most of the mountain areas of the HKH region are under subsistence agriculture. Some are more primitive while others have varying degrees modernisation and inroads of the market economy such as Kullu Valley in Himachal Pradesh, India; Kathmandu in Nepal; and Kunming in Yunnan, China. Nepal and Bhutan, typical mountainous countries, are over 80 per cent rural. Development has come to these areas due to emphasis on specific niche products such as apples, vegetables, rice as well as services and it has come in different scales due to remoteness. In most of the mountain cities and towns development models have been transported from the plains without much regard to mountain specificity and therefore the environmental consequences have been rather devastating, especially in more fragile valleys.

Traditional cultivation systems have potential for organic production: Mountain areas of the North Eastern States of India and the Chittagong Hill Tracts of Bangladesh have been practicing traditional forms of agriculture called shifting cultivation for centuries that have been blamed for deforestation and environmental degradation. Social and ecological scientists have been documenting evidences and suggest that shifting cultivation with adequate fallow cycle can guarantee sustainability. Sedentarisation of agriculture has been a preferred policy for both greater service provision and maintenance of public security. The case study has indicated that, sedentary agriculture alone will not provide food and ecological security besides being culturally inappropriate. A more sustainable solution is community resource management strategy and policy under which land and tree tenure is assured, access to technical and extension service is improved and communities are allowed to chose the crops, and trees, including agro-forestry practices. These have demonstrated that not only food security is qualitatively improved but area under low-intensity shifting cultivation or for that matter nomadic and ranging lifestyle, results in preservation that is evident in parts of the TAR of China and Afghanistan.

Decentralization and devolution can lead to good governance: After 1992 there has been a general trend towards greater devolution of powers to local governments. Most of

mountain areas were considered sensitive border areas and were kept under strict watch of central governments or as parts of larger plain dominated governance units that either ignored mountain people's development needs or awarded them with development projects in terms of roads, infrastructure or industry which were captured by non-mountain intermediaries, civil servants and or local elite thus disrespecting local ecology, culture and needs. Change in mindset has followed the acceptance by governments of the need to accommodate local developmental aspirations, without suspecting secessionist tendencies, which still exist in parts of mountain areas. These social movements and conflicts are about identity politics, caste and class grievances, and protests against general irresponsiveness to local aspirations. Mountain communities that have been given economic freedom and political autonomy to choose the development path have addressed to SMD goals better as shown by case studies of Van Panchayats in Uttarakhand in India and Gilgit Balistan in Pakistan.

#### 2.6.4 Finding a balance among the three pillars of sustainable development

The nature and extent of the problems, issues, gaps and possible solutions in SMD have changed and/or multiplied in some cases since 1992. The multiple challenges and threats are bringing in new perspectives in the region and demanding a new strategy and orientation on the part of scientists, researchers and policy makers for finding a balance among the three SMD pillars. While in the 1970s, the region was concerned about rural development, in the 1980s the shift was to deforestation and soil erosion and general environmental degradation – all linked to the vicious cycle of population growth, environment degradation, and poverty. The issue of development and environment was thus within the region and the problem was considered to be caused by internal forces leading to unsustainable land use.

In the first decade of the 21st century, and with climate change, the fragile Himalayan ecosystem has come under threat, primarily from external drivers of change. Therefore, the challenge of balanced development in the HKH Mountains faces a set of challenges resulting from its specific geological, socio-cultural and geo-political situation (Moddie, 2008). In the 1990s, globalisation and economic liberalisation swept the region and India and China are emerging as economic and political powers. The analysis below provides indications on how the mountain countries have approached their social, developmental and environmental policies in the HKH region: they have attempted to attain SMD in an un-uniform and unbalanced manner.

**Social Pillar:** The challenges of reducing poverty that were identified 25 years ago are still real and as imposing as they were. Only the context, in terms of the trends that are unfolding, and in terms of our understanding of the problems, has changed. During the last 20 years mountain poverty has come down but not in terms of absolute numbers and amounts of natural resources used. Even though deforestation and forest degradation was reduced in many countries, they have once again increased due to social conflicts and poor governance in some countries like Nepal, Afghanistan and Pakistan. As roads link the remote regions to national and international markets, the very notion of subsistence farming is undergoing a fundamental change, and in many areas it is fast losing relevance. The small farmer in the HKH is facing multiple challenges both from within and outside. There has been slow but steady increase in access to resources including credit, increased literacy, and opening up of new opportunities outside the countries e.g., labour market in emerging economies – though this remains limited or inaccessible.

Nepal's economy has been surviving largely on remittances. However, the remittance is not fuelling the rural economy due to lack of investment opportunities, the required entrepreneurship among the youth, and lack of security. The migrants move in increasing numbers with their families from villages to market towns and urban centres. With the increased role of remittances, economies have also exposed themselves to increased vulnerability. Outside interests are benefiting from many opportunities in the mountains – tourism, biodiversity resources, hydropower, both micro and mega, development. The challenge is to create an enabling and favourable investment climate and security environment where mountain communities can benefit and prosper from these new opportunities.

Although sustainable mountain development is being morphed to green economy, poverty alleviation remains the top challenge for the economies in the HKH. What relation does gradual or fast transition to green economy have with SMD and its outcomes are still unclear? Should mountain regions have specific indicators for measuring the green index such as a Gross Mountain Product (GMP), to draw attention to cost of and benefits could be a way of measuring the use of the ecosystems goods and services? Addressing these and other related questions are crucial for articulating and eventually achieving sustainable mountain development in the HKH region.

**Environmental pillar:** Global warming and climate change have added a new dimension to our understanding of environment and related challenges. This has brought to fore the complexity of the policies and processes that need to be reformed and/or formulated to redefine the sustainable development path. It is already clear that climate change impacts are much more pronounced on the mountains than on the plains. In two decades since Rio, while the world is back to reinforcing 'sustainable development' through a global transition to low carbon or green economy in which climate change and poverty eradication centre stage. The HKH region, despite economic gains in fast growing developing countries such as in India and China, is struggling to end mountain poverty. The region still hosts more than 400 million of the world's poor.

Rapidly increasing events and surface warming demand a major shift in the way the critical ecosystem services including rangelands, biodiversity and forestry are managed. While the poverty reduction requires continuation of economic growth, the type of future natural resources management regime needs to incorporate measures to build resilience and adaptation to the impacts of climate change. The Himalayan countries face a daunting set of tasks in building more resilient agriculture and natural resources sectors to protect food, energy, water and ecological security. There is also need for greater understanding and response to the threat of climate-induced migration. More than 60 per cent of the economically active population in the HKH depends on agriculture. A pro-growth, pro-poor, and pro- mountain development policy agenda that supports agricultural sustainability, including more targeted adaptive management programme for ecosystem services, can improve resilience. The agriculture and forestry sector can also help mitigate GHG emissions in the HKH region if we can provide appropriate incentives and innovative institutions, capacity building support, technologies, and management systems and by sequestering carbon in standing trees, soils and range lands. Incorporation of agricultural adaptation and mitigation in the on going international climate change negotiations can open opportunities for financing of sustainable growth under climate change constraints in the mountains. Mitigation strategies that support adaptation and development investments with climate change co-benefits should be favoured for enhancing ecosystem services in the mountains.

**Economic pillar:** The region is faced with challenges that are not only specific to its sub-regions but also those rooted in its socio-cultural distinctiveness. Barring Bhutan, the country that has pioneered Gross National Happiness (GNH) as an indicator of gross happiness based on good conservation of environment, economic development and social and cultural identity, other countries are focused on achieving higher economic growth rates measured by GDP. The later approach is obviously facing questions and challenges mainly for its sustainability. Road networks have made inroads into the mountain and information and communication technologies (ICTs) have connected remote valleys, and even small and large hydro projects have adversely impacted environment and natural habitats. Infrastructure development and ecosystem destruction has kept pace in the mountains, creating economic impact at the cost of forest degradation, and increased hazards in the form of landslides, floods and displacement of people.

#### 2.6.5 What has worked and what has not

Many initiatives on sustainable mountain development have been undertaken in the HKH region and they have led to synergistic impacts and also contributed to learning. The development has often taken place at the cost of losing focus on social equity, economic self-reliance and environmental sustainability – the three pillars of sustainable development. Some of the key lessons learned are analysed in the following sections.

Accessibility, both physical and electronic, has increased across the region. Extensive road and communication networks have played significant roles in improving access to services and markets. Computers, mobile phones and Internet access have connected remote areas to the mainstream of development. However, while policies across the region have helped reduce the cost, the issue of access, equity and cultural identity has remained unaddressed. Road building has rarely conformed to the region's ecological fragility and vulnerability although the concept of 'green roads' was successfully demonstrated by Switzerland – the Lamosangu-Jiri road – in Nepal. The gap is non-existence of policies and regulations and where they do exist, the little attention there is on implementation. How availability of technologies have enhanced options for

mountain communities to adapt and survive at cheaper costs by reaching out to wider market opportunities remains to be assessed.

In recent years, many examples of grassroots, medium-scale, and state level initiatives have emerged and these have potential for building on the existing momentum to reverse the negative trends of environmental degradation. This has been demonstrated by various case studies.

- Community-led initiatives in the ecologically fragile and economically-vulnerable mountain valleys of Gilgit-Balistan and Chitral have demonstrated the virtue of micro hydro projects, both as means to weather unreliable power supply and to leverage carbon credits for expanding the reach of such projects. While 240 micro-hydro units (10 MW) are operative, 103 such units are to be built over next seven years.

- In terms of number of plants and per capita biogas generation, Nepal has conclusively demonstrated the efficacy of an eco-friendly technology. With 93 per cent of the 243,065 domestic biogas plants operating effectively, there has been a 30 per cent reduction in the use of firewood. Since biogas has been covered under the Emission Reduction Purchase Agreement, CDM has opened a new opportunity for further promotion of the technology.

The impact of community-led decentralised energy generation notwithstanding, many parts of the HKH region have been converted into power-houses for generating hydroelectric power for use in the plains. Within the framework of SMD, there is need for a policy push in favour of private sector participation for low-carbon energy development options in the mountains with adequate safeguards for inclusive development and local benefits. Lateral and vertical integration of communities in local administration is critical to attain equity and justice. There are inspiring initiatives across the region but their integration in existing institutions have been lacking. Some of the promising initiatives are discussed below.

- Uplands of North-east India, comprising of the eight states, are one of the most under developed regions in India. Through an IFAD-supported NERCOM project, the region is now focusing on interventions that are technically, appropriate, culturally sensitive and institutionally effective, for which a 'genuine partnership between communities, government and others' has been forged to ensure that the interventions are demand-driven and client oriented.

- Van Panchayats are managing 16 per cent of state's total area in 11 hill districts of the Uttarakhand state and are examples of decentralized planning and management for access and benefit sharing of forest resources. As a consequence, ecosystem services emanating from the forest of Uttarakhand are worth USD 50 billion per year. The Government of India has allocated USD 272 million to forest rich states for better managing their forests for 2005- 2010. This fund has been increased by 10 per cent to be used over the next five years.

- Since its inception in mid 1970s, Nepal's community forestry programme has been the largest and longest participatory green initiative wherein 40 per cent of the population has been involved in managing 25 per cent of country's forest area. The programme is inclusive and equitable and has also been able to address socio-political and environmental concerns at the national and regional levels. Emerging carbon and PES in the form of REDD+ are exposing local communities to a competitive world wherein protecting community rights would be yield triple dividends – mitigation by sequestering carbon, adaptation by conserving biodiversity and watersheds and reducing poverty by improving livelihoods.

Created experimentally, such institutions have proven to work with true local participation from planning to benefit sharing and have the potential to be expanded with legal protections. Though these approaches also suggest that one-size-does-not-fit-all, their strength lies in the diversity of approaches to suit varied socio-economic situations and therefore the potential for generating knowledge and disseminating it in other mountain regions. Such bottoms-up institutions also strengthen the three pillars of SMD and ought to be preserved through legal provisions.

Many areas in the HKH region have been the last to open up to outside forces and processes. Though the rate of opening has been varied, markets have penetrated faster and deeper into the mountain hinterlands and areas with very little government presence. Efforts have also been made to connect the communities with markets but the challenge has been to protect and enhance local livelihoods in the process.

- With over 1.020 million small tea farmer households as members, the West Garo Hills Tea Farmers Federation has been able to arrest price crashes and ensure better returns for growers. The next step is to solicit support to set up a tea-processing factory and open up the option of the growers in adding value to their produce, and marketing finished product. The federation has set an example and demonstrated that alliances of small producers with a supportive administration can help them to take charge of their livelihood options and move towards economic development. Markets are not intrinsically bad and the existence of powerful and committed intermediary institutions with knowledge, legitimacy and joint venture links can increase the bargaining power of local mountain people and such efforts can result in win-win opportunities.

- In the state of Uttarakhand, India, the setting up of the Organic Board has reduced the transaction costs of having a reliable institution for certified organic products. The right institution-at-the-right-place greatly enhances the carrying capacity, resilience, sustainability and social equity goals of SMD. When they are backstopped with proper legal support, they can take off to a national scale as is the case of community forest management led by FECOFUN in Nepal, Van Panchayats and organic farmers in India.

Markets for mountain good and services are important for the green economy or low carbon growth path. Following the failure of the Kyoto Protocol and other multilateral agreements to allocate global warming penalties to historical polluters, there is now a shift towards decoupling economic growth from greenhouse pollution. There is a great shift towards a low carbon economy and India and China are making great strides in this direction (see the green indicators in the chart attached). The scale of impact in reducing global warming by mountain areas of the HKH region might be modest but they serve as important learning experiences for leveraging new marketable opportunities.

- One opportunity that can be stressed is the greater need for regional and national institutions to help local mountain communities tap to national and global resources for accessing markets, availing public services, and gaining legitimacy and power to influence through instruments such as Free Prior Informed Consent (FPIC). Such institutions can promote sustainable mountain development more effectively.

Despite political and economic uncertainty, the HKH region has been a veritable laboratory of innovative approaches towards SMD. It is, however, another matter that neither has these approaches have not been integrated nor scaled up to desired levels for creating impact. As a consequence, the social pillar in the form of social and gender equity and equality, has largely remained unachieved and poverty has continued to persist. The challenge is to build upon existing initiatives from an equitable poverty alleviation perspective.

- Good work on watershed management must be sustained, value-added and up-scaled. Climate Change adaptation can piggyback watershed projects in conflict ridden regions like Afghanistan, Nepal and North-east India where conserving soil and water for addressing food security is critical. Elsewhere in the region, watershed management alone can help reduce siltation in large dams viz., Tarbela in Pakistan as shown by the case study. Watershed management can be multi-purpose approach and also help address equity concerns.

Sustainable mountain development calls for integration of thinking and action around diverse approaches. Multidisciplinary in approach, interdisciplinary in thinking and trans-disciplinary in actions would be the way to go for achieving the elusive goal of sustainability in the mountains. This would need empowering communities, educating and engaging youth and re-crafting and strengthening supportive institutions.

## 2.7 Progress in poverty reduction, social and environmental sectors

According to the MDG progress report, China has achieved the highest progress in poverty reduction by bringing the percentage of people below the poverty line from 60.2 per cent in 1990 to 15.9 per cent in 2005. Pakistan has also reported a very good success and brought poverty numbers down from 64.7 per cent to 22.6 per cent. Bangladesh and Bhutan have also made modest progress while Nepal and India are poor performers (Annex 1, Table 2).

Bhutan has the highest literacy rates among the women and China has the highest literacy rates for both the male and females among the HKH countries (Annex 1, Chart 1). In terms of occupation, close to 50 per cent of the mountain people are still engaged in farming and animal husbandry, with the highest numbers in China's mountainous provinces (Annex 1, Chart. 2). Mountain people across the region perceive food and fodder shortages as the most likely crises in the future (Chart 3). Mountain households in Afghanistan are the poorest (79%) followed by Nepal (27%) and Pakistan (20%); their incomes are less than USD 500/year (Annex 1, Chart 4). Animal dung, shrubs and branches, and firewood are the major sources of domestic energy for more than 90 per cent of mountain people in China, Nepal and Bhutan (Annex 1, Chart 5).

Among the environmental indicators in the region, both China and India have increased their CO<sub>2</sub> emission by 50 per cent between 1990 and 2005. In terms of the energy use, Bangladesh has the highest GDP per unit of energy use at PPP b\$ 9.8/kg. oil equivalent followed by China and India but the highest growth is once again in China ( 2.1 to 4.4 Kg oil equivalent) (Annex 1 Table 3).

In terms of land cover change, during 1990-2005 China increased its tree cover from 16.8 percent to 21.2 percent and India from 21.5 percent to 22.8 percent. In terms of deforestation rate, Afghanistan lost 3.1 percent of its forest cover per year followed by Pakistan, Nepal and Myanmar. During this period, Nepal's forest cover came down from 33.7% to 25.4% (Annex 1 Table 3).

### PART III: Challenges and opportunities for sustainable mountain development

#### 3.0 General overview

The HKH region faces enormous environmental, political, social and developmental challenges. The scale of the challenge is shown by the fact that out of the six countries which account for almost 50 per cent of the annual growth of the human population in the world, four belong to the HKH region – India, China, Pakistan, and Bangladesh (UNPD 2001). This demographic challenge, which over the years has rapidly changed the region from a nature-dominated landscape to a human dominated environment, is expected to result in acceleration in the rate of environmental degradation and natural resource use, and an increase in the vulnerability of mountain societies and economies due to pressure for more natural resources for meeting the increasing demands for food, energy, biodiversity and water. It is clear that major natural processes – local, regional and global – will be influenced by increased human activity, creating a much higher degree of complexity through the interaction of human, natural, economic and political driving forces (Messerli et al. 2000, Steffen et al. 2004). Climate change will aggravate and accelerate the socio-economic and demographic challenges with devastating consequences.

Without going into the complex arguments, scientific controversies and/or political disagreements to challenges mentioned above, this report uses most recent data, information and knowledge and presents findings from the perspectives of climate change, disasters, economic growth, and social and political conflicts juxtaposed in the context of democratisation, devolution, good governance, and growing global attention on the HKH region.

Two years after the Earth Summit, the average living standards have improved but so has poverty, deprivation and gaps between rich and poor. Although decentralised and devolved governance have been pursued, conflicts have multiplied and the rising social aspirations and quests for identity politics are threatening the pace of development. Global market forces have made deep inroads into the region but out-migration continues to depress local production potentials. Some SMD has been achieved in parts of the HKH but others are either not learning or the customisation and transfer of knowledge and south-south collaborations are not taking place as much as they should.

#### 3.1 Emerging trends and opportunities for sustainable mountain development

Climate change has brought about complex problems but for mountain countries it has also opened up a number of opportunities. For example, increasing warming in the highlands also mean that a number of new crops can be cultivated and also new pasture and forest species can appear at higher slopes. This also allows new forms of scientific explorations and livelihood pursuits.

What is required is rethinking of mountain development for building ecological infrastructures not only to produce goods for subsistence but to also generate services that can benefit downstream communities (e.g., water storage). However, environment being an overriding concern, the approach has to be on building resilience of successful programmes (e.g. community forestry, biogas energy and organic farming) and on addressing poverty and inequity, improving property rights and governance. Other emerging opportunities for SMD include expansion of green practices, such as ecotourism, high-value mountain products, and harnessing mountain forestry for carbon sequestration and biodiversity conservation with in-built mechanisms to address equity and environmental sustainability concerns.

**3.1.1 Building on the success stories and learning from the failures** The links between mountain resources and sustainable livelihoods in the HKH region are intricate and tightly knit; almost 1.3 billion people rely on the limited mountain resources, especially water. In Bhutan, for instance, an estimated 78 per cent of the population are rural dwellers and depend extensively on mountain resources to sustain livelihoods. The situation is somewhat similar in Afghanistan, Nepal, and Myanmar. Tighter demographic controls, quest for long-term conservation and policies for harnessing hydro-power resources are helping Bhutan to attain higher GNH.

In Hindu-Kush Himalayan region, countries are united by geography and thereby face common problems, issues and challenges. But the political landscape is different and climate change, political instability and transboundary contentions threaten the region's ability to thrive and prosper. From the perspective of SMD, the HKH region has not been a success story largely because of the inability of the countries to implement the sustainable development agenda they signed on at Rio. The failure is partly also because of the multiple crises such as climate change, energy crises, food insecurity, increased disasters and growing conflicts. These have made mountain communities more vulnerable and perhaps less resilient, and the region more fragile. However, the opportunities to manage water, biodiversity including agro biodiversity, tourism and agriculture are immense. For this the region would need effective regional co-operation and collaboration in sharing policy and institutional support, financial backing, multi-stakeholder partnerships and above all, learn from each other.

#### 3.1.2 Scope for Green Economy for sustainable development and poverty reduction

Markets for mountain goods and services, which are invariably natural and increasingly organic or environmental friendly, have been growing. For example, the global trade in herbal medicines including pharmaceutical and nutraceuticals based on medicinal and aromatic plants is estimated at USD 120 billion/year where China's share is between USD 5-10 billion and that of India about USD one billion/year. Green economy has attracted global attention as a major agenda at the Rio+20 conferences. Due to the failure of the Kyoto Protocol to mitigate the alarming increase in global warming, especially in the mountains and with the prospects of reaching no legal agreement on GHG replacement at the end of 2012, there is now a shift towards decoupling economic growth from GHG related issues. There is global agreement that all countries have common but differentiated responsibilities to pursue low carbon economic growth paths. India and China are already making strides in this direction. The scale of impact of global warming on the HKH Mountains is one of the highest and it is plausible to argue for global policies and financial support to a transition to a green economy in the mountainous regions. The transition to a low carbon economy involves gigantic domestic resource allocation on the Green Economy, estimated at USD 1.4 trillion a year by the global communities. The HKH countries are not in a position to mobilise such resources.

The modest scale of mountain economy terms of the green economy is underscored in the state of Uttarakhand in India. Toila (2011) found that the plains-based economy had the fruits of green revolution in agriculture pushing GDP growth by around 8-9 per cent a year while the hill economy remained at 2-3 per cent and was limited to forest and rain-fed agriculture. The over-riding theme is that while progress and change in the HKH region might be unprecedented by historical comparison to its own records, such changes have been eclipsed by change in the larger non-mountain economies. As result the mountains have remained invisible on national and global agendas.

Climate change and eradication of poverty take the centre stage in sustainable mountain development. The global focus is on green economy but the number one priority in developing mountain countries is poverty alleviation – including the mountainous regions of India and China. What relation does this Asian transition to green economy have on SMD? Is there need for developing a mountain specific indicator like GMP (Global Mountain Product) to draw attention to costs of and benefits of development in the mountains, instead relying only on GDP?

Some of the specific issues and questions relating to situating the green economy in the context of sustainable mountain development are: a) How to build documentary evidence of national and regional/global influence or contribution of the ecological footprints of mountains? b) What specific roles can mountains play in transforming the “brown” economy of the countries to green economy since the current perception and opinion of the national policy makers is that it may be marginal and negligible. For example, in national reports for Agenda 21, chapter 13, the policy space allotted to mountains is very small. It is therefore challenging to use the green economy plank for leveraging more space in national policies.

Global effects of climate change on mountain ecosystem services and globalisation are eroding local culture and values, traditional management systems and knowhow and rules of natural resources governance. Therefore, land use and ultimately local environment management need special analysis and focus. Climate change compensation funding instruments may simply be a change of the label of development aid to make it part of climate change action/green economy support with attached conditionality.

Access to funds remains slow and requires specialised human resources, relevant data and legal regime, and grant seeking is generally a difficult and tedious process to go through. Demand for SMD must therefore articulate local payoff mechanisms as part of global green economy, such as low carbon economy. Decoupling the economy and GHG emissions is fine but there should be a separate window for funding for mountain development.

The green economy focus on production should include the negative implications of unbridled consumerism. One pertinent question to ask will be: Can the green economy actually deliver in terms of changing ground realities for indigenous, local and poor people and rewards (through PES, REDD, REDD+) for good environment stewardship and helping in carbon sequestration through good forest management and use of indigenous knowledge for ecological farming?

Balance between social and environment, and institutional and economic issues; and emphasis on equity and inclusion in the green economy are important. Countries, states and mountain areas should be ranked on their progress on SMD to draw attention to the lack of success on the three pillars of sustainable development.

Ethical values of justice can be explored through suitable international policies for mountains for seeking just redress and rewards for mountain peoples from regional (downstream) or global restitution for the loss and damage caused to mountain ecosystem goods and services alongside provisions for restoring ecosystem services.

It has been scientifically established that the HKH region influences global climatic systems through jet flows, heat exchanges and the distribution of climatic change and that is could be affected by the adverse impacts of climate change on fresh water resources, biodiversity, food security and disasters. The mountainous regions therefore need to be compensated for the damage and loss through suitable climate and non-climate finance mechanisms.

The HKH region is particularly vulnerable to extinction of globally important biodiversity, threatening future sources of medicines, food and other non-timber forest products – all of which are essential to fuel a green economy. Many of these genetic resources are being forced to move higher up the slopes on account of climate change, causing habitat degradation and replacement.

### 3.2 Green Economy: Driving factors and key issues for the HKH Mountains

A recently released preview of the 2011 Global Green Economy Index (GGEI), a robust analytic tool ranking expert perceptions of national green reputations against a new custom index of 37 datasets measuring their performance, indicated that China, the second largest green house gas emitter, is also the second in green performance. ([www.dualcitizeninc.com/ggei2011.pdf](http://www.dualcitizeninc.com/ggei2011.pdf))

However, to date, there is no unified view among the HKH countries on what represents and drives a green economy and there is also no clarity on what it means for the Mountains 3. We need to identify opportunities from developing and least developed mountain country contexts for promoting SMD, and identify specific and strategic approaches to implement green and low-carbon economy concepts. There is a need for new global policies and finance to support poverty reduction and sustainable development through green economy solutions. Here the critical role of good governance cannot be overstressed. The key outcomes that can be desirable for mountains is a mountain ecosystem services- based economy that is both pro-poor and pro-growth and addresses the issues of ecological fragility, social inequity (creating employment for the poor and reducing inequality and marginality) and economic underdevelopment (by reducing poverty and reducing costs of living) that is run by mountain communities and supported by suitable and capable national and regional agencies.

#### 3.2.1 Green Economy: opportunities

Green economy has ample opportunities in the mountain eco-systems but there also are risks. Any green and low carbon solutions in mountain regions should create jobs, promote access to markets and prioritise poverty reduction. Green economy transition in developing and least-developed countries should not constrain the policy space of countries to pursue their development paths, which have been limited. There is a need for a separate programme of work for mountains in the UNCSD process to develop green growth pathways in the mountainous regions by recognising, valuing, and realising the ecosystem goods and services produced by the mountains.

#### 3.2.2 Green Economy: challenges

Mountain countries will face numerous challenges in adapting and adopting green economy policies. Different countries are interpreting green economy differently and are embarking on different approaches to promote green growth concepts and practices to achieve sustainable development and SMD. Some authors are equating green economy and sustainable development, which is not correct. Green economy can be a means to achieve the end i.e., SMD in the mountains. The common challenges mountain countries are or will face are: How to document good green economy relevant cases on which the future pathway can be charted correctly? How effective are the approaches, and what lessons can be learnt from the experiences?

### 3.3 Institutional Framework for Sustainable Development (IFSD)

According to the Rio+20 Secretariat 4 ‘a key motivation for the Rio+20 Conference to include this agenda is the lack of progress in the achievement of agreed sustainable development goals’ across the globe. The general objective of this theme is to achieve ‘the overall integration of environment and development issues at national, sub-regional, regional and international levels, including in the UN systems’. Some of the key issues identified were: a) lack of implementation of commitments; b) absence of national setup and lack of mainstreaming; c) lack of capacity building, d) lack of coordination and integration among and between sectors, and e) lack of accountability. These were all relevant and true for the HKH region.

Therefore, IFSD in the context of the HKH region should aim to identify the actors at local, national and regional levels and set out the functions of institutions for achieving better coherence and coordination among agencies implementing sustainable development activities, especially in the mountains. Although the UNDESA is focusing more on reforming the UN systems based on the 'one UN' concept, for the HKH mountain countries, the need is to reform the traditional and overly bureaucratic national and regional institutions into modern service delivery type of organisations bringing in more transparency, accountability, good governance and knowledge management. Replacing and reforming out dated policies, reconciling the contradictions among different overlapping policies and implementing the laws and policies will be equally important. In general, there is lack of coherence, coordination and effective monitoring of progress based on agreed targets at all levels. Therefore, any new institutional framework must avoid overlaps and duplication of activities, and synergies need to be achieved in programming efforts of international as well as national organisations through enhanced participation of all stakeholders for attaining good governance.

### 3.3.1 Key challenges for institutional strengthening for SMD

Mountain countries and regions face multiple challenges in creating good institutional framework and more importantly, for avoiding the past track record of poor implementation of SMD commitments and policies. The latter was caused by weak national setups and lack of capacity, coordination, and integration efforts that need to be addressed effectively to ensure clear institutional functions and accountability safeguards at all levels.

### 3.3.2 Role of research-based knowledge and information

Developing proper institutional framework will also have to consider the role of research organisations both at national and regional levels for filling the knowledge gap. SMD issues in the HKH are of transboundary nature e.g., water, biodiversity, markets, and quality standardisation for green products. Before transforming into a green economy, these countries must set green accounting policies and green technology adaptation institutions to assist the shift from GDP to GMP. Consumerism today is a driver of change, changing values and attitudes of the people, but in the green economy context consumers need to also give premium to green products that will require awareness raising, in which data and information will play an important role.

### 3.4 Role of technology and technical capacity building

Green economy will require 'green technologies' that will need a suitable framework and mechanism for enabling technology adaptation, retrofitting, and transfer to developing mountain countries. Therefore, strengthening of multi-lateral and research institutions focusing on mountain friendly technologies and knowhow, given the specificity of mountain systems, should be a pre-requisite in the new institutional framework.

Promotion and transition towards a green economy need capacity development in education, research, advocacy and policy reforms. Similarly, enabling policies and institutions are needed to provide necessary incentives to producers of mountain-based ecosystem goods and services. Regional as well as upstream-downstream approaches are needed for promoting green markets and for addressing the challenges of poverty, biodiversity loss, trade barriers and climate change. In summary, there is a need to develop a green economy roadmap for the mountains in the HKH region based on comparative advantages in terms of different eco-systems niches and/or those where nations have and building competitive advantages through training, skills development, provision of appropriate technologies and financial support. Capacity building of policy makers remains the utmost priority because good policies are needed to drive the new development process.

### 3.5 Opportunities for social and gender equity and inclusion

Future work under this topic needs to focus on achieving equitable and inclusive sustainable development. Development that reduces economic poverty and enables all groups of people in contributing to creating opportunities, in sharing benefits, and participating in decision-making will go a long way in ensuring that SMD makes a real difference to both women and men equally. Gender inclusive development means that a number of issues that affect the differentiated relationship between and among women and men and their ability to participate in the green economy and environmental resource governance in the HKH region are taken seriously. In a rapidly changing climate, environment and socio-cultural context, women need to assume active leadership and decision-making positions. The challenge development interventions face will be how sustainable development measures and policies take into account the prominent role of women and gendered knowledge in shaping an equitable and inclusive green economy, natural resource management and for ensuring access to and provision of development resources (water, information, education, health, income, agricultural inputs, etc.). Taking into account the role of women in the mountains, especially in agriculture and natural resources management, institutions need to be supported in strengthening their resilience to climate change impacts mainly in the context of valuing indigenous knowledge, the sustenance of low-carbon development pathways and SMD. Research also needs to focus on the collection and analysis of gender-disaggregated data, indicators and differentiated experiences of women and men as they adapt to multiple drivers of change.

The initial findings of ICIMOD's the Himalayan Climate Change Adaptation Programme (HICAP) work indicate that women in general are more vulnerable than men to climate change as they face more social, cultural, economic and political barriers that limit their ability to cope and access resources that are critical for livelihoods and survival. At the same time, they are also at the frontline of climate change (Nellemann, Verma and Hislop 2011). Women's increased responsibilities, indigenous knowledge and stewardship in managing natural resources, households, communities, environments and income generating activities in the context of the migration of males, and rapid economic changes, position them well in contributing to effective strategies for adaptation to climate and global changes (HICAP Bulletin, ICIMOD/CICERO/UNEP/GRID Arandal 2011).

### 3.6 Role of regional institution for sustainable development of the HKH Mountains

#### 3.6.1 Overview

Given the growing interest in mountain issues among the HKH countries and the changing regional and global contexts, the role of regional institutions will have to match with the growing expectations of regional and international stakeholders. The views expressed by the regional stakeholders, indicate that organisations such as ICIMOD will have a challenging role ahead as a result of the impacts of global climate and environmental changes and ongoing regional socio-political and economic transformations. The growing importance of the Himalayan ecosystems goods and services need more collective and concerted management actions at the regional level to ensure sustainable development. Since issues such as freshwater shortage, increasing natural hazards, environment pollution, ecosystem degradation, rapid melting of ice, loss of biodiversity, persistent poverty and increasing vulnerability, and human insecurity are common and interconnected issues, they will need common solutions. (Schild, 2008; and Jodha, Karki and Yadav, 2008) Coordinated efforts from all countries of the region, and continuous support from global development partners will be needed to address the challenges. The changing regional context offers an increased role for regional knowledge development, sharing and enabling institutions. Some of works that can help in the promotion of SMD goals are given below.

#### 3.6.2 Promoting the mountain agenda globally

While the role of mountain systems as a provider of essential services to the global community has been recognised, regional countries and relevant international organisations have to set priorities in support of mountains. Regional institutions can play an important role in raising awareness, and providing concrete data and evidence on Himalayan ecosystems and environment in order to enhance regional and global commitment and actions to support sustainable development in the HKH Mountains, while strengthening upstream-downstream relationships.

### 3.6.3 Facilitating regional cooperation

While the need for transboundary regional cooperation has now been realised, implementation is a real challenge given the difficult geo-political situation. ICIMOD as a non-political regional knowledge-based organisation has been providing a neutral and common platform for knowledge exchange, sharing and learning. This can facilitate regional dialogue and cooperation among the HKH countries, and enhance common understanding on sustainable solutions

### 3.6.4 Facilitating information and knowledge sharing for disaster risk reduction and resilience building

The HKH region is classified as the most vulnerable region due to its exposure to multiple risks of extreme events and natural disasters including landslides, floods, droughts, and glacial lake outburst floods that can endanger sustainable development infrastructure. Reducing the risk of natural disasters is critical for poverty alleviation and for sustaining development efforts. There is a need for a regional organisation that can play the role of a catalyst in sharing information and real time data in order to reduce such risks and vulnerabilities.

### 3.6.5 Reducing scientific uncertainties and knowledge gaps

There is a lack of mountain disaggregated data. Easy availability of accurate socio-economical, environmental and biophysical data is vital for policymakers, resource managers and researchers for sustainable management and allocation of limited natural, human and financial resources for achieving sustainable development. Data generated by national and international institutions in the HKH region are often of a national nature. There is a need for an agency that can contribute by developing and continuously tracking the trends of key indicators of sustainable development.

### 3.6.6 Valuing mountain ecosystem services

In the context of green economy, there has to be proper valuation of the role of the Himalayan mountain system as the providers of critical ecosystem goods and services. These include water, watersheds, biodiversity, and rangelands, its role as regulator of regional and global air circulations, as a destination for eco-tourism, and in pollination through indigenous honey bees. These values need to be translated into enabling policies and actions to help reorient national and global policies towards HKH region resulting in increased investment in research, conservation and development. Providing more realistic economic value for these green services is possible through carbon financing tools such as REDD+, PES and other compensation mechanisms. This is expected to provide incentives to the mountain people to sustainably manage and preserve the vital goods and services while enhancing their own livelihoods by practicing sustainable resources management.

### 3.6.7 Facilitating cross-country learning in sustainable mountain development solutions

The new agenda of the green economy and good environmental governance will require new knowledge, technologies, and capacities. Although institutions have been generating valuable knowledge in the HKH, the knowledge has largely been country specific. Regional institutions can play an important role in consolidating this knowledge, bringing in regional perspectives and facilitating cross-boundary learning for promoting multi-disciplinary and integrated approaches that can enhance SMD.

### 3.6.8 Accessing and customizing global knowledge for the HKH region

Scientific knowledge, experiences, simple technologies, and good practices generated in other mountain systems of the world especially the Alps, the Andes, and the Pacific mountains, might have relevance for conservation and sustainable development in the Himalayas. However, external knowledge, technologies and practices may not always suit the needs in the HKH region due to different socioeconomic contexts and capacity levels. Tailor making, retrofitting and customising the tools, technologies and knowledge are needed and this can be done by a regional sustainable development organisation.

### 3.6.9 Networking and building partnerships

Mountains provide global services and therefore promotion of the mountain agenda will need regional and global partnerships and networking. ICIMOD has its footprints in Chapter 13 and has been an active member of different global forums on mountains and mountain development, while focusing in the HKH region. Therefore, in order to play the role as a specialised agency on mountain issues, it will have to build strategic partnerships with relevant regional and global organisations with a view to promoting symbiotic and synergistic relationships to better address the multiple challenges confronting the HKH region and their implications at global level.

## 3.7 Conclusions

a) Our analysis of the case studies and e-discussion outputs indicate that mountain people have not been the real drivers of change in the HKH Mountains. The key players or drivers have been the people in power – the political leaders, bureaucrats, non-governmental actors and international development players including donors. Traditional or public sector institutions are generally centralised and function in archaic ways – still they have been the predominant drivers of change. Changes have occurred since the Rio 92 summit – both spatially and temporally – and some have been for the better, others for the worst. Historically speaking, as argued by an e-conference contributor, the HKH Mountains have been the refuge for people who escaped the violence of wars and social conflicts in the plains. The prevailing peace and tranquillity allowed them to develop unique socio-cultural 'bonding' with the mountains. However, due to neglect, marginality and poverty, these mountain communities have generally been the losers in the seemingly good processes of decentralisation, devolution and governance.

b) In general, changes introduced by successive regimes have been at the cost of peace and harmony of co-existence in the HKH Mountains. Peace has meant more than just the absence of war. New kinds of conflicts over sharing and appropriating natural resources such as water, forest, pasture, and biodiversity have been simmering all across, going beyond the management capacity of the traditional social institutions. Seemingly beyond repair, the undesirable changes of the past can only be reversed by engaging and connecting with diverse mountain dwellers in multi-stakeholder discussion and dialogue frameworks by creating a neo-institutional mechanism of nurturing green economy that suits the mountain people, and by investing in developing technology conducive to the fragile Himalayan geo-morphology.

c) Translating good intentions into sustainable or smart actions would warrant re-thinking new institutional frameworks and developing good governance practices while promoting a low- carbon growth path in the HKH Mountains. There is a downstream demographic push to extract more resources and pressure the ecological balance in some parts of the HKH region. Multi-pronged strategy through education, awareness raising, making the playing field level, developing enabling policies, and creating institutional spaces can help in creative management of the growing demand on mountain resources and services. Learning from local cultures, rebuilding on local knowledge, and strengthening good practices could be crucial drivers of change. Participatory conflict resolution techniques as practiced in the Philippines may also be useful in the HKH communities.

d) Trans-boundary nature of natural resources, especially water, and cross-border relations in managing the mountain resources has yet to get the attention the issues deserve. Should not the countries of the region develop joint policies, programmes, regulations and institutions for sustainable development of the HKH region? They should – perhaps – given that they share many common problems and potential solutions. Only cross-scale and cross-border linkages can help resolve the complexities of equitable sharing of natural resources across diverse social systems. Clearly, there is a case for negotiating out-of-the-box solutions, which should be possible through collaboration and co-operation amongst the key players involved in sustainable management of the HKH Mountains.

e) It is understood that a diverse group of people are aiming to influence the Rio+20 agenda and are interpreting and positioning the green economy agenda using their own understanding and contexts. From the HKH region, the views are that the green economy should not be an alternate to sustainable development that was agreed 20 years ago. Instead it should be a revamped mechanism to reinvigorate the SMD. The crucial question for the mountain is: what form of the green economy can be a good instrument for addressing the problems? Like sustainable development, which has limitations in terms of its interpretation and application, the green economy too can be applied at cross-purposes and that should be avoided.

f) It is being argued that the 'top down' agenda of the green economy is to break the current inertia in the global climate change debate. The views of the HKH mountain regions, however, are that the gain for the environmental pillar need not be a loss for the economic pillar if the green economy can be made to deliver green products and green jobs. Therefore, a balanced approach is needed while promoting green economy concepts in the mountains. Issues of scale, indigenous peoples' rights to resources, and the poverty reduction related outcomes of green economy will be important to consider more than the agenda itself. The green economy concept has already been criticised as being heavy on technology, financial and human resources. Therefore its implications on feasibility, sustainability and gender dimensions must be critically examined. Also important is addressing governance issues, especially social and gender equity and participation of stakeholders in design, implementation and benefit sharing of green economy initiatives.

g) It is clear that the proposed or evolving development and institutional frameworks for any low-carbon or green growth agenda should clearly and properly reflect the needs and aspirations of the mountain people. The drivers for the transformation to green economy and new institutional governance should be the people of the mountain regions and not external forces who might fund and benefit from the initiatives. Change agents and community leaders should be the real drivers of change.

#### Policy messages

h) From the discussions of challenges, issues, and opportunities above it can be concluded that SMD from the perspective of sustainable mountain development in the HKH region has not been a success story. The main reasons for this are the emergence of new and multiple challenges and crises such as climate change, energy crises, food insecurity, market meltdown, increased disasters and growing conflicts. Together, the global, regional and local drivers of change have made the mountain communities more vulnerable, exposed to new risks and therefore, less resilient. The resulting impact on downstream populations could be more severe owing to increasing occurrences of extreme events such as floods and droughts. However, there are also some opportunities for mountain communities. What is lacking is awareness, knowledge, change of mind-sets and above all, good policies and institutional frameworks.

i) The Mountain Agenda cannot be revived for the sake of the mountains alone. It would need to be argued for all from the upstream-downstream perspective, showing the importance of the mountain ecosystem goods and services in a wider context. Equitable and enabling trade regimes, cross border co-operation, knowledge management, common markets, combined with benefit sharing mechanisms by harnessing water resources and promoting public- private-civil society partnership could be the new rallying points for developing a comprehensive green economy agenda for the mountains. A shift from the piecemeal watershed approach to the higher level, of integrated river basin approach with cross-sectoral integration, is vital for addressing the impending challenges including climate change and food security. Mountains specific institutions also need to be strengthened through capacity enhancement and expansion of knowledge because 20th century institutions cannot resolve 21st century problems.

j) The case studies and e-discussions have captured the essential contours of the emerging issues and the impending challenges in mountain development. In the lead up to the Rio+20 summit the task will be to get stronger, incremental and meaningful political and financial commitments from member country leaders so that mountain friendly green economy programmes and instruments get the desired attention that is needed for converting the green opportunities into economic incentives for the vulnerable mountain communities. Least developed and developing mountain countries and regions will also need easy development finance, technology adaptation and transfer mechanisms, and concessional market access for green products.

k) The role and importance of ecosystem goods and services of the HKH Mountains has increased with clear recognition that they have equal or higher role for downstream countries as well as the outside world. The global view of mountains has also shifted towards developing better understanding on the specificity of mountain systems. Enhanced appreciation of Asian mountains as the drivers of change is perfectly timed for renewed attention to the issues and challenges for developing a mountain agenda that is imaginative and forward looking both for the mountain dwellers and those who live downstream.

l) Although costly, mountain countries must invest in green projects and carry out necessary policy reforms to provide incentives to sectors such as agriculture, natural resources and industrial development for promoting green technologies and practices in the mountains.

m) Regional cooperation is necessary for promoting the green economy and good environmental governance since accessing markets, finance and technologies will be critical for the green economy to succeed.

n) Green economy based on national conditions and context can provide opportunities to promote human wellbeing and intergenerational equity and the mountains can contribute significantly to make it happen.

o) Rio+20 should be an opportunity for not only reinforcing the spirit of Agenda 21 but must be a step forward for bringing the environmental and social pillars of SMD at par with the economic pillar in terms of importance in order to harmonise the global processes in favour of mountains and other vulnerable countries because the mountains matter to everyone, in terms of the broader roles they play in regulating the natural global systems.

Annexes (UNDESA: Please Reference Full Submission for Annexes)

#### Sustainable Mountain Development

In 1992, at the United Nations Conference on Environment and Development (UNCED) – commonly referred to as 'Rio 1992' or 'the Rio Earth Summit' – mountains received unexpected high political attention. They were granted a chapter in the 'Agenda 21' as fragile ecosystems that matter for humankind.

Since then, a wide range of efforts by different actors have been undertaken to promote 'Sustainable Mountain Development'. Some of them relate to the above event others just emerged on their own. However, in view of the forthcoming UN Conference 'Rio +20' in 2012 it seems relevant to assess and understand what has been achieved by whom and how. It appears equally important to learn what has worked or not and why in order to draw lessons for more effective interventions in future. The anticipation of possible future challenges or opportunities may further help to be better prepared for their management. This will certainly encompass the adaptation and mitigation of Climate Change as the 'main stream concern of the last decade' well as probably the 'new mainstream paradigm' of Green Economy. But as in the past, major unexpected and unpredictable political, social, economic or even technological changes and innovations may overshadow any of these mainstreams.

In this complex world of today, the Swiss Agency for Development and Cooperation as one of the most committed agents in global Sustainable Mountain Development (SMD) over the past 20 years, has commissioned a number of regional reports to assess achievements and progress in major mountain regions such as in particular Central Asia, Hindu Kush-Himalaya (HKH) and the South East Pacific, South and Meso America or the Middle East and North Africa (MENA). The Swiss Federal Office for Spatial Development (ARE) has commissioned - in the context of the Swiss Presidency of the Alpine Convention 2011/12 – a specific report on the Alps. In addition, UNEP has provided a separate report on Eastern Europe and started compiling a report on Africa's mountains.

The insights gained through these assessments in which key local, regional and global actors have been actively involved are meant to feed into a range of processes such as the UN Secretary General's High Level Panel on Global Sustainability (commonly referred to as 'GSP'), the preparation of the UN Conference in Rio 2012 and possibly the next cycle of the 'Commission for Sustainable Development' (CSD) or its possible successor structure. The present document is to be considered as a 'work in progress'. Hence the Organizers of the 'Lucerne World Mountain Conference' highly welcome inputs, feedbacks, and suggestions for further improvement.

From Rio 1992 to Rio 2012 and beyond

## International Centre for Research in Agroforestry (ICRAF)

Submission to the Secretariat of the United Nations Conference on Sustainable Development

The importance of trees for their contribution to sustainable development is well understood by the international community. However, most attention has been paid to trees in forests, and much less to trees in agricultural settings and pastoral lands. It has been calculated that at least half of the world's farmland has at least 10% tree cover. This amounts to over one billion hectares of land where 558 million people live. On over a quarter of the world's agricultural land, tree cover is over 20%. These trees on farms represent a huge and largely untapped resource both for production and better management of the environment. There is great potential to enhance tree cover in agricultural landscapes through better management but this requires supportive policy, appropriate institutional development and improved tree germplasm and technology options for farmers. More and better managed tree cover on farms could lead to higher and more stable farm incomes, greater food security, more resilient production systems and enhanced environmental services.

Agroforestry is the practice of incorporating trees within agricultural landscapes. The trees are perennial crops that can provide food for people, fodder and shade for livestock, timber and renewable wood energy. They can also contribute to biodiversity conservation, store carbon, maintain and improve soil fertility, regulate water flows, and reduce land degradation and improve water use efficiency. Agroforestry is at the heart of the three Rio UNCED conventions and is vitally important for food security.

### Agroforestry and climate change

Climate change adaptation and mitigation come together in agroforestry. Most agricultural land has been obtained by clearing forests and rangelands, resulting in increased carbon emissions from land use change. In turn, many agricultural livelihoods are facing challenges as a result of climate change. Agroforestry, by increasing tree cover on farmland and pastures, helps to mitigate climate change by sequestering carbon, and assists the sustainable management of land thus helping people to adapt to the effects of climate change. Despite its proven efficiency to improve livelihoods with mitigation and adaptation co-benefits, agroforestry has frequently fallen between the gaps of the climate negotiations in relation to agriculture and forestry. A whole landscape carbon accounting approach that recognizes adaptation and livelihood benefits will bring agroforestry into the centre of ways to sustainably manage natural resources for the future. The micro- and mesoclimatic effects of trees are absent from most discussions of adaptation options in agriculture, although tree cover has large effects on maximum and minimum temperatures, windspeed and humidity, relative to global climate change predictions.

### Agroforestry and biodiversity

Trees on agricultural land can provide a wide range of niches and corridors that support biodiversity and enhance habitat connectivity. For example, trees on pastures and coffee farms surrounding protected forest in Central America facilitate the migration of important bird species that are essential for maintaining the integrity of wildlife reserves. Hotspots of abundance and activity of soil organisms have also been found close to trees on agricultural land, indicating that they promote below-ground biodiversity that underpins soil health. Using trees in agricultural systems can both enhance biodiversity conservation and improve the stability and resilience of crop yields.

### Agroforestry and desertification

Trees are a key component of dryland systems that are susceptible to desertification. Tree roots hold the soil and reduce erosion caused by wind and water. They facilitate the infiltration and penetration of water into the soil and mediate the loss of water through run-off and evaporation. Trees provide sustainable sources of fodder for livestock and can reduce grazing pressure. Trees can improve soil fertility through nitrogen fixation and tightening nutrient and water cycling, thereby increasing the productivity of the land. Trees provide shade and windbreaks that can increase crop and livestock productivity as well as improving animal welfare. Trees have often been seen as free goods provided by nature and they have been lost across many dryland landscapes, but in some places farmers, realizing the multiple benefits they bring, are managing their natural regeneration. For example, in Niger, farmers have nurtured tree cover over almost 5 million hectares of Sahelian farmland. Because of their role in improving food security, improving livelihoods and sustainably managing land, trees play an important role in efforts to restore desertified land.

### Agroforestry, food security and ecosystem services

Trees on farms help to improve food security. Fruits and leaves contribute to human nutrition and fodder feeds livestock. Appropriate trees, if well managed in crop fields can also improve the fertility of the soils and increase crop yields. Timber and fuelwood are harvests that can be used or sold, fuelwood still being the most important source of cooking fuel in many rural communities. Trees on farms also contribute to a broad range of ecosystem services that landscapes provide. Trees regulate run-off, helping to conserve water in the soil. Trees and their roots reduce soil erosion, especially when managed as part of agricultural systems that utilize various systems of conservation tillage. Trees on farms produce numerous products including food, medicines, fencing, timber and fuel.

### Decisions on agroforestry for the Conference

Some text that The United Nations Conference on Sustainable Development could adopt is as follows:

- 1) Agree that agroforestry lies at the heart of the three Rio Conventions and food security, and contributes to the Green Economy.
- 2) Agree that agroforestry is an important form of farming and that international and national policies are needed to promote its broader adoption. Recognize that agricultural policies need to embrace agroforestry, rather than agroforestry being discussed exclusively in the context of forests. That said, it is often forest legislation that constrains the use of trees by farmers, so integrated approaches amongst sectors is required.
- 3) Agree that trees on farms contribute to climate change mitigation and adaptation, and recommend that the UNFCCC work towards a whole landscape accounting approach with mitigation, adaptation and livelihood benefits.
- 4) Agree that agroforestry can contribute to biodiversity conservation and utilization, and recommend that plans to achieve the Aichi targets should include agroforestry.
- 5) Agree that agroforestry is vital to the achievement of the targets of the Ten Year Strategic Plan of the UNCCD and recommend that agroforestry should be included in plans to achieve those targets.

6) Agree that agroforestry is an important contributor to improving food security and also to improved livelihoods through the provision of a wide range of ecosystem services. Recommend that agroforestry should be included in Green Economy practices in order to create productive multi-functional landscapes that include mosaics of farmland, agroforests, woodlots, pasture and forest that work synergistically to produce food and provide other ecosystem services.

7) Finally, recognize that through the incorporation of trees on farms, agroforestry creates green jobs that contribute to a Green Economy.

World Agroforestry Centre

1 November 2011

## International Centre for Trade and Sustainable Development (ICTSD)

### Proposals on behalf of the International Centre for Trade and Sustainable Development (ICTSD) to the RIO+ 20 preparatory process

#### 1. Proposal for a Global Green Innovation and Technology Partnership

1-According to the UNGA Resolution ( A/RES/64/236), the objective of the RIO+20 Conference is to secure "renewed political commitment for sustainable development, assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges."

2-In this regard, the transfer of environmental sound technologies has been a major item on the international sustainable development agenda in particular since the Rio Earth Summit in 1992. It should thus figure prominently in discussions leading to the RIO+20 conference and in the conference's outcome.

Background: The transfer of environmental sound technologies and sustainable development

1-In 1992, the First Rio Earth Summit adopted Agenda 21, as a comprehensive plan of action to be taken globally, nationally and locally by organizations of the United Nations System, Governments, and Major Groups in every area in which human impacts on the environment.

2-Chapter 34 of Agenda 21 addressed: "Transfer of Environmentally Sound Technology, Cooperation And Capacity-building" and had a number of objectives in particular:

- a. To help to ensure the access, in particular of developing countries, to scientific and technological information, including information on state-of-the-art technologies;
- b. To promote, facilitate, and finance, as appropriate, the access to and the transfer of environmentally sound technologies and corresponding know-how, in particular to developing countries, on favorable terms, including on concessional and preferential terms, as mutually agreed, taking into account the need to protect intellectual property rights as well as the special needs of developing countries for the implementation of Agenda 21; (Chapter 34, paragraphs a) and b)).

3-In 1997, a United Nations General Assembly meeting in special session carried out a five year review of Earth Summit progress. Resolution A/RES/S-19/2 called for the urgent fulfillment of all the Earth Conference commitments concerning concrete measures for the transfer of environmentally sound technologies to developing countries. In particular, it suggested "the creation of centers for the transfer of technology at various levels, including the regional level, could greatly contribute to achieving the objective of transfer of environmentally sound technologies to developing countries" (Paragraph 93).

4-In 2002, the Johannesburg Plan of Action called upon Governments as well as relevant regional and international organizations and other relevant stakeholders to implement actions to:

- a. Accelerate the development, dissemination and deployment of affordable and cleaner energy efficiency and energy conservation technologies, as well as the transfer of such technologies, in particular to developing countries, on favorable terms, including on concessional and preferential terms, as mutually agreed.
- b. Promote networking between centers of excellence on energy for sustainable development, including regional networks, by linking competent centers on energy technologies for sustainable development that could support and promote efforts at capacity-building and technology transfer activities, particularly of developing countries, as well as serve as information clearing houses;

5-In 2011, the UNEP Green Economy Report and the UN World Economic and Social Survey, highlighted the key role of technology in the transition towards a green economy.

Progress, Gaps and Proposals:

6-Wide diffusion and transfer of green technologies continues to be a pressing challenge facing the international community.

7-Since the Earth summit, diffusion and transfer of green technologies, in particular of climate change technologies, has taken place via a number of channels such as: development and climate financing, in particular by the Global Environmental Facility (GEF); carbon markets, in particular the Clean Development Mechanism (CDM) projects as well as trade flows in environmental goods and services. However, these channels remain insufficient in relation to the massive scale up of transfer of green technologies required to match the magnitude of the climate change challenge. Furthermore, there are no effective methods of measuring and verifying the extent of technology transfer which have taken place.

8-There is better information and data available about the technological needs of developing countries, particularly in the area of climate change thanks to the technological needs assessments (TNAs) conducted under the framework of the United Nations Convention on Climate Change (UNFCCC).

9-There are greater technological capabilities in a number of developing countries paving the way for more effective and tangible South-South cooperation in the area of green technologies, in particular clean energy technologies.

10-However, obstacles to enhancing technology transfer to developing countries continue to be multiple and range from lack of financing to lack of enabling environments and lack of absorptive capacities. They call for multiple solutions and responses. At the international level, concrete mechanisms have often lacked to operationalise actions and provisions on transfer of environmentally sound technologies agreed upon at the multilateral level.

11-In this regard, the decision by the sixteenth session of the Conference of the Parties to the UNFCCC in (2010) to establish a *Technology Mechanism* to enhance the technology transfer and diffusion of climate adaptation and mitigation technologies is of great significance. The Technology Mechanism is composed of a Technology Executive Committee (TEC) and of an operational body to facilitate networking among national, regional, sectoral and international technology bodies, to be called the Climate Technology Centre and Network (CTCN).<sup>1</sup> The CTCN materializes and elaborates upon previous proposals along the same vein that have been mentioned in

previous international documents such as the Johannesburg Plan of Action.

12-The RIO+20 Conference should welcome of and support the creation of the UNFCCC Technology Mechanism as an important milestone in efforts to operationalise international commitments aiming at meaningful and effective actions to enhance the technology transfer and diffusion. It should also emphasize the importance that the Mechanism is endowed with the adequate financial resources to enable it to carry out its tasks effectively and that it is made operational without delay.

13-In this context, the RIO+20 might wish to examine the possibilities of replicating the precedent of the Technology Mechanism at a wider scale by establishing a *Global Green Innovation and Technology Partnership* to galvanize efforts and know how to accelerate the diffusion of green technologies at a wide world scale.

14-As in the case of the Technology Mechanism with the Cancun Conference, the RIO+20 conference could take the decision in principle to create such a partnership and define its broad functions and leave more detailed aspects of its operationalisation to a time bound process of intergovernmental discussions with the participation of all relevant stakeholders.

15-Without duplicating the work of the Technology Mechanism, the broad functions of a *Global Green Innovation and Technology Partnership* could be:

<sup>1</sup> For further information about the Technology Mechanism, see ICTSD, *The Climate Technology Mechanism: Issues and Challenges*, ICTSD Information Note, 2011 available at: <http://ictsd.org/i/publications/103789/>.

- a. Accelerate the deployment and diffusion of green technologies and know-how in particular to developing countries and ensuring coherence and coordination in efforts aiming at this purpose.
- b. Encourage 'green innovation' taking into account the technological and socio-economic needs of developing countries and their development objectives.
- c. Promoting collaboration between a wide range of stakeholders, particularly private-public stakeholders, to accelerate the deployment and diffusion of green technologies as well as green innovation
- d. Facilitate a 'green' network of national, regional, sectoral and international technology centres, networks, organizations and initiatives to respond to the needs of developing countries in a variety of areas including technical assistance, identification of best practices and addressing to barriers to the wider dissemination of green technologies.
- e. Encourage the availability of better information about green technologies through adequate technology platforms.

16-The Partnership should remain a flexible instrument that that can be hosted by an existing international institution. It would act at the same time as a hub, a platform and a catalyst for global efforts to transfer and diffuse green technologies, in particular to developing countries.

17-Finally, the role of intellectual property rights has been a long standing issue in discussions about the transfer of environmental sound technologies, and was mentioned in chapter 34 of agenda 21. Discussions on this issue should be technical, evidenced based and seek to identify and explore means to address existing knowledge and information gaps.

18-In 2010, UNEP, the European Patent Office and ICTSD released a study on *Patents and Clean Energy* in order to contribute towards addressing the evidence gap in this area.<sup>2</sup> The study identified three main policy implications :

- a. Policy processes can have a positive impact on technology development and innovation
- b. Accurate and publicly available information on existing and emerging clean energy technology, including IPRs and licensing, is urgently needed.
- c. There is a need to facilitate untapped potential in licensing of clean energy technologies to developing countries.

<sup>2</sup> The study is available at: <http://ictsd.org/i/publications/85887/>

## 2. Proposal for a Sustainable Energy Trade Agreement

According to the UNGA Resolution (A/RES/64/236), the objective of the Rio+20 Conference is to secure "renewed political commitment for sustainable development, assessing the progress to date and the remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges."

One of the greatest future challenges that Rio+20 will need to address in the transition to a green economy and poverty eradication is the decarbonisation of the global energy system. The dual problem of providing sustainable energy access for all and mitigating climate change is currently hindered by a number of political, economic and institutional factors.

In this context, trade can and should provide part of the solution. Currently, the rapid global deployment of clean energy technology is hindered by significant border and behind-the-border trade barriers.

A Sustainable Energy Trade Agreement (SETA) -aimed at enabling the rapid scale up in innovation, diffusion, and use of goods, services, and technologies in the non-fossil fuel energy sector -could provide a concrete solution. Addressing sustainable energy trade in a comprehensive manner and building on a plurilateral approach, a SETA would fill a major current governance gap.

Numerous possibilities exist regarding the manner in which the scope of issues and market barriers could be addressed within a SETA. Issues could be addressed in two phases, with a first phase addressing clean energy supply goods and services, starting with solar, wind, small-hydro and biomass, and eventually extending to marine, geothermal, clean coal, and transport-related biofuels. A second phase could address the wider scope of energy efficiency products and standards, particularly those related to the priority sectors identified by the Intergovernmental Panel on Climate Change (IPCC) for greenhouse gas mitigation: buildings and construction, transportation, and manufacturing.

The first Global Green Growth Forum (3GF) in Copenhagen in October 2011 saw the proposal of a Sustainable Energy Trade Agreement (SETA). As the UN has declared 2012 to be the International Year of Sustainable Energy for All, the coincidence with Rio+20 marks an exciting opportunity to provide a platform for endorsing and further developing the concept.

Background information on the SETA -developed by ICTSD in cooperation with the Peterson Institute for International Economics, the Global Green Growth Institute (3GI), and drawing on ideas discussed in the Renewable Energy Global Agenda Council of the World Economic Forum's (WEF) Global Redesign Initiative – is available in a report entitled *Fostering Low Carbon Growth: The Case for a Sustainable Energy Trade Agreement* on the ICTSD website:

(<http://ictsd.org/downloads/2011/11/fostering-low-carbon-growth-the-case-for-a-sustainable-energy-trade-agreement.pdf>)

## International Centre of Comparative Environmental Law (C.I.D.C.E.)

Objet : soumission des contributions écrites auprès du secrétariat de la Commission du développement durable Pièces jointes :

Annexe 1 : Appel des juristes (Limoges, France)

Annexe 2 : Recommandations Franco-Brésiliennes des juristes de l'environnement (Rio de Janeiro, Brésil)

Annexe 3 : Recommandations Franco-Brésiliennes des juristes de l'environnement (Sao Paulo, Brésil)

Annexe 4 : Recommandations de Limoges (France)

Chère Madame, Cher Monsieur,

La présente lettre vise à soumettre auprès du secrétariat de la Commission du développement durable les contributions écrites du Centre International de Droit Comparé de l'Environnement (C.I.D.C.E.) (France), du Centre de Recherches Interdisciplinaires en Droit de l'Environnement, de l'Aménagement et de l'Urbanisme (CRIDEAU-OMIJ) (France), de la Fondation Vargas (Brésil) et de la Procuradoria fédérale de Sao-Paulo (Brésil) dans le cadre de l'élaboration de la première version provisoire du document final de la Conférence. L'objectif est de proposer des recommandations juridiques porteuses de protection de l'environnement et de les faire prendre en compte par la Conférence des Nations-Unies sur le développement durable qui se déroulera du 4 au 6 juin 2012 à Rio de Janeiro (Brésil).

Le droit est un instrument indispensable pour traiter les deux thèmes fixés par la résolution de l'Assemblée Générale de l'ONU du 24 décembre 2009 (A/RES/64/236) : "l'économie verte dans le cadre du processus du développement durable et l'élimination de la pauvreté" et "le cadre institutionnel du développement durable".

Nous souhaitons ainsi contribuer à faire progresser le droit de l'environnement, à renforcer son application et à conclure de nouvelles conventions.

Dans cette optique, le Centre International de Droit Comparé de l'Environnement (C.I.D.C.E.) et le Centre de Recherches Interdisciplinaires en Droit de l'Environnement, de l'Aménagement et de l'Urbanisme (CRIDEAU-OMIJ) ont organisé trois manifestations scientifiques qui ont permis de rassembler, de discuter et de formuler des propositions concrètes en s'inspirant en partie mais pas exclusivement des thèmes cités et de les soumettre au secrétariat de la Commission du développement durable. De plus un appel international des juristes de l'environnement a été ouvert à la signature par internet (<http://www.cidce.org>) (textes en français, anglais, annexe 1).

1. Des journées scientifiques Franco-Brésiliennes des juristes de l'environnement à Rio de Janeiro les 24 et 25 juin 2011 (Brésil), (Recommandations en anglais et en portugais, annexe 2),
2. Des journées scientifiques Franco-Brésiliennes des juristes de l'environnement à Sao Paulo les 27 et 28 juin 2011 (Brésil), (Recommandations en anglais et en portugais, annexe 3),
3. Une « 3ème réunion mondiale des juristes et des associations de droit de l'environnement à Limoges (France) », du 29 septembre au 1er octobre 2011, (Recommandations en français et en anglais, annexe 4),

Liste des thématiques :

I. Droits de l'homme et environnement : les défis du droit

- 1- Le principe de non régression en droit de l'environnement
- 2- Environnement et équité ou « environmental justice »
- 3- Les catastrophes écologiques et les droits de l'homme
- 4- L'effectivité du droit de l'environnement déjà existant
- 5- Le droit fondamental à la terre et à l'alimentation
- II. Les nouvelles conventions mondiales sur l'environnement
- 6- Le Projet de convention mondiale sur l'environnement (covenant de l'UICN)
- 7- Le projet de convention mondiale sur les évaluations environnementales
- 8- Le projet de convention sur les sols (IUCN)
- 9- Pour une convention sur la pollution d'origine tellurique des mers et des océans
- 10- Le projet de convention relative au statut des déplacés environnementaux
- 11- Pour une convention pour la protection de l'environnement en cas de conflits armés

12- Le projet de convention sur l'exploitation pétrolière offshore

13- Le projet de convention sur le mercure

14- Le projet de convention mondiale sur le paysage

III. Le cadre institutionnel du développement durable et la gouvernance internationale de l'environnement

15- La Cour mondiale de l'environnement

16- L'organisation mondiale de l'environnement

17- La transformation du Conseil économique et social des Nations-Unies en Conseil économique, social et environnemental

18- La place de la société civile et des ONG en droit international de l'environnement

IV. L'économie verte dans le cadre du développement durable et l'élimination de la pauvreté : des enjeux pour verdier la planète

19- Les forêts

20- Les aires marines protégées en Haute-mer

21- La gestion intégrée des zones côtières

22- La responsabilité environnementale des entreprises

23- Les énergies alternatives et durables

24- Les nanotechnologies

25- Biodiversité, problème foncier des terres agricoles et mécanismes de compensation

26- Le tourisme durable

Pour chacune des recommandations issues du colloque de Limoges (France), un rapport général est disponible sur le site du CIDCE. En vous remerciant par avance pour la compilation et la diffusions de nos contributions, je vous prie de croire en l'assurance de ma considération très distinguée.

Objet : submission of the writing contributions

Appendix 1 : Call for action from lawyers (Limoges, France)

Appendix 2 : French-Brazilian recommendations (Rio de Janeiro, Brazil)

Appendix 3 : French-Brazilian recommendations (Sao Paulo, Brazil)

Appendix 4 : Limoges recommendations (France),

Dear Madame, Dear Sir,

The objective of this letter is to submit writing contributions of the International Centre of Comparative Environmental Law (C.I.D.C.E., France), the Interdisciplinary Research Centre on Environmental, Urban and Planning Law (CRIDEAU-OMIJ, France), Foundation Getulio-Vargas (Brazil), Federal Prosecution of the Federative Republic of Brazil to the UNCSO Secretariat in order to serve as basis for the preparation of zero draft of the outcome document. The objective is to elaborate legal recommendations carrying environmental protection and to make them take into account by the Conference "Rio + 20" in June 2012.

Law is an essential instrument to treat the two topics fixed by the Resolution 64/236: "green economy" and "the institutional framework of sustainable development".

We want to contribute to make progress the environmental law, to reinforce its application and to conclude new conventions. Thus, the International Centre of Comparative Environmental Law (C.I.D.C.E., France), the Interdisciplinary Research Centre on Environmental, Urban and Planning Law (CRIDEAU-OMIJ, France), Foundation Getulio-Vargas (Brazil) and the Federal Prosecution of the Federative Republic of Brazil have organized meetings :

1. French-Brazilian scientific workshops of the environmental lawyers in Rio de Janeiro, 24th and 25th of June 2011 (Brazil), (Recommendations in English and in Portuguese enclosed, appendix 2),

2. D French-Brazilian scientific workshops of the environmental lawyers in Sao Paulo 27th and 28th of June 2011 (Brazil), (Recommendations in English and in Portuguese enclosed, appendix 3),

3. The third worldwide conference of environmental law NGO and lawyers in Limoges (France), September 29-30th, October 1st 2011, (Recommendations in French and in English enclosed appendix 4),

These events made it possible to gather, discuss and formulate specific proposals while being inspired partly but not exclusively\* quoted topics and to submit them to the UNCSO secretariat. Moreover a call for action from lawyers and environmental law organizations was opened for signature on Internet (<http://www.cidce.org>), appendix 1.

\*Listing of the themes:

I. Human rights and environment: the challenges of the law

1 – The non regression principle in environmental law

2 – The environmental justice

3 – The ecological disasters and human rights

4 – The effectiveness of the existing environmental law

5 - The fundamental right to land and food

II. The new world conventions on environment

6 – The draft world convention on environment (IUCN's covenant)

7 – The draft world convention on environmental evaluation

8 – The draft convention on soil (IUCN)

9 - For a convention on land-based pollution of the seas and oceans

10 - The draft convention on the status of environmentally-displaced people

- 11- For a convention on environmental protection in case of armed conflicts
- 12- The draft convention on the offshore oil exploitation
- 13- The draft convention on mercury
- 14 – The draft world convention on landscape
- III. The institutional framework for sustainable development and international environmental governance
- 15- The World Environmental Court
- 16- The Environmental World Organization
- 17- The transformation of the UN Economical and Social Council in Economical, Social and Environmental Council
- 18- The place of the civil society and NGO in international law of the environment
- IV. The green economy in the context of sustainable development and poverty eradication: issues for greening the planet
- 19 – The forests;
- 20-21 – The sea and the coast
- 20 – The protected marine zones on the high seas
- 21 – Integrated management of coastal zones
- 22 – Corporate social responsibility
- 23 – The alternative and sustainable energies
- 24 – The nanotechnologies
- 25 – Biodiversity, agricultural land tenure problem and compensatory mechanisms
- 26 – The sustainable tourism

For each recommendation resulting from the third worldwide conference of environmental law NGO and lawyers in Limoges (France), a general report is available on the site of the CIDCE.

Thank you in advance for the compilation and the diffusion of our contributions.

Best regards.

#### APPEL DES JURISTES ET DES ASSOCIATIONS DE DROIT DE L'ENVIRONNEMENT

Ouvert à la signature le 1er octobre 2011 pour être adressé aux États PARTICIPANTS À LA CONFÉRENCE DE RIO (4-6 juin 2012) Nous juristes, exhortons solennellement tous les participants à la Conférence des Nations Unies de Rio de Janeiro (Brésil) des 4-6 juin 2012, à faire en sorte que cette Conférence soit au service de la protection du vivant et de l'Humanité dans le souci de préserver les générations présentes et futures des désastres écologiques notamment dus au changement climatique,

Nous juristes, préoccupés par la dégradation accélérée de l'environnement et désireux que les activités humaines respectent les limites écologiques de la Terre,

Nous juristes, réaffirmant le rôle indispensable du droit et des moyens mis en oeuvre pour son application effective au plan international, régional, national et local afin de contribuer à l'amélioration continue de la qualité de l'environnement humain et naturel auquel chacun a droit,

Tenant compte des thèmes énoncés pour la conférence de Rio + 20 : « une économie verte dans le contexte du développement durable et de l'éradication de la pauvreté » et « le cadre institutionnel du développement durable ».

I. Appelons les Etats du monde entier à marquer l'importance politique de la Conférence de Rio par des signaux forts :

- 1. La présence des chefs d'Etat et de gouvernement à la Conférence de Rio les 4-6 juin 2012,
- 2. La réaffirmation solennelle des principes de solidarité internationale et de développement durable conditionnant la lutte contre la pauvreté et les inégalités,
- 3. La proclamation de l'interdépendance entre la paix et la sécurité dans le monde, le respect des droits de l'homme et la protection de l'environnement.

II. Appelons les Etats à combler d'importantes lacunes du droit de l'environnement par :

- 1. La consécration d'un principe de non-régression en droit de l'environnement,
- 2. L'engagement des Etats à mettre en oeuvre effectivement la démocratie environnementale telle que définie au principe 10 de la Déclaration de Rio de 1992 à travers les droits à l'information, à la participation et à l'accès à la justice, soit en ratifiant les instruments conventionnels existant dans ce domaine, soit en créant de nouvelles conventions régionales ou mondiale,
- 3. L'engagement des Etats, selon les cas, à ratifier ou adhérer aux conventions de protection de l'environnement mondiale et régionales, déjà en vigueur ou non,
- 4. L'engagement des Etats à signer à Rio la convention mondiale sur le mercure en cours de négociations sous l'égide du PNUE.

III. Appelons les Etats à s'engager dans des négociations devant aboutir à une véritable gouvernance mondiale de l'environnement :

- 1. Par l'invitation transmise à l'Assemblée Générale et au Conseil de Sécurité des Nations Unies d'élargir à l'environnement les compétences du Conseil Economique et Social des Nations Unies et d'y assurer une représentation adéquate des ONG d'environnement,
- 2. Par la création d'une Organisation Mondiale de l'Environnement (OME), institution spécialisée des Nations Unies regroupant tous les Etats avec de nouvelles missions,

dotée d'importants moyens et capable de renforcer les actions entreprises par le Programme des Nations Unies pour l'environnement,

3. Par la création de mécanismes juridictionnels de résolution des conflits environnementaux y compris une Cour mondiale de l'environnement,

4. En donnant une place accrue à la société civile et en particulier aux ONG d'environnement dans les processus décisionnels internationaux et régionaux touchant l'environnement et/ ou le développement durable par l'adoption d'un ensemble de lignes directrices garantissant des standards minimum de participation dans ces processus ainsi que dans les organismes internationaux et régionaux,

5. Par le renforcement de l'indépendance des organisations internationales garantissant l'absence de conflits d'intérêts. En particulier pour garantir l'indépendance de l'Organisation mondiale de la Santé (OMS) en demandant de mettre fin à l'accord du 28 mai 1959 qui la soumet à l'AIEA pour les questions relatives à l'exposition aux substances radioactives et à ses conséquences pour la santé.

IV. Appelons les Etats à s'engager de plus dans des négociations devant aboutir à la conclusion de nouveaux instruments conventionnels sur l'environnement répondant à la fois à des nécessités impératives de santé, de préservation de la biodiversité et de droits humains :

- Un Pacte international sur l'environnement et le développement,
- Une convention relative à la protection des sols,
- Une convention relative aux évaluations environnementales intégrant les aspects sociaux et culturels ainsi que les effets sur la consommation d'énergie,
- Une convention relative à la pollution d'origine tellurique des mers et des océans,
- Une convention relative aux aires marines protégées en haute mer,
- Une convention relative à l'exploitation pétrolière offshore,
- Une convention relative aux paysages,
- Une convention relative à la protection de l'environnement en cas de conflits armés,
- Une convention relative aux catastrophes écologiques,
- Une convention relative au statut juridique des déplacés environnementaux.

V. Appelons les Etats à promouvoir une économie à même de favoriser la mise en oeuvre du développement durable et participant entre autres à l'éradication de la pauvreté :

1. En renforçant la responsabilité environnementale des entreprises sous son double aspect préventif et réparateur et en consacrant internationalement l'obligation de gouvernance sociale et environnementale incluant le respect de l'ensemble des normes en vigueur,

2. En renforçant la capacité des juges à trancher les conflits environnementaux au moyen de formations garantissant de leur indépendance et de leur professionnalisme y compris en créant, si besoin est, des tribunaux spécialisés sur l'environnement,

3. Allant au-delà de l'Instrument international non contraignant actuel sur les forêts, en adoptant une convention sur les forêts dans les meilleurs délais et au plus tard à la date butoir de 2015 envisagée par le Forum des Nations Unies sur les Forêts,

4. En consacrant le droit à l'eau et à l'assainissement dans le cadre du développement durable,

5. En renforçant les droits sociaux et environnementaux du traité sur la Charte de l'énergie et en visant un accès universel à l'énergie dans un plan ambitieux de l'Agence internationale des énergies renouvelables (IRENA),

6. Face au phénomène de l'accaparement massif des terres agricoles et des espaces naturels et ruraux et à l'accélération des impacts sur la sécurité alimentaire, la biodiversité et les sols :

- en entamant d'urgence des négociations pour un Protocole à la Convention sur la Biodiversité dans le domaine foncier et des aires protégées ;
- en créant rapidement, au sein de la FAO, un programme international d'actions pour le développement des agro-systèmes et leur préservation,

7. En développant de nouveaux indicateurs qualitatifs et quantitatifs pour mesurer les progrès de l'environnement et du développement,

8. En mettant en place, en application du principe de précaution, un mécanisme de contrôle et de régulation des nanotechnologies susceptibles d'affecter l'environnement et la santé,

9. En favorisant la promotion et la valorisation d'un tourisme durable en cohérence avec les exigences conjointes de l'environnement et du développement.

Nous juristes, sommes convaincus, afin d'aboutir à une rapide mise en oeuvre du développement durable, qu'il est vital de faire progresser le droit de l'environnement et de mieux l'intégrer dans les autres droits.

Pour une application effective du droit de l'environnement, il est nécessaire de renforcer l'action conjuguée des gouvernements et des parlements, des collectivités et communautés locales, des organisations internationales et régionales, de la société civile, des entreprises privées, des organisations de travailleurs, des ONG d'environnement et de développement durable.

Les juges, procureurs et avocats, tant nationaux que régionaux et internationaux ont une responsabilité particulière dans cette application effective vis-à-vis des générations présentes et futures.

Nous juristes, appelons les Etats représentants des Peuples à faire de la Conférence de Rio 2012 un moment décisif pour l'avenir commun de l'humanité et des écosystèmes.

Centre International de Droit Comparé de l'Environnement (CIDCE)

À Limoges, France, le 1er octobre 2011

Appel lancé suite aux travaux de la réunion mondiale des juristes des cinq continents et associations de droit de l'environnement réunis à Limoges (France) les 29, 30

septembre et 1er octobre 2011 (rapports disponibles accompagnés de 25 recommandations : [www.cidce.org](http://www.cidce.org)).

#### CALL FOR ACTION FROM LAWYERS AND ENVIRONMENTAL LAW ORGANIZATIONS

Open for signature 1 October 2011, to be delivered to the PARTICIPATING STATES OF THE RIO+20 CONFERENCE (4-6 JUNE 2012) We, the undersigned lawyers, solemnly appeal to all participants in the United Nations Conference in Rio de Janeiro, Brazil, on 4-6 June 2012, to ensure that the Conference serves all living beings and humanity in an effort to preserve and protect present and future generations from ecological disaster, including climate change,

We, the undersigned lawyers, concerned about the accelerating degradation of the environment, and desiring that human activities respect global ecological limits of the Earth,

We, the undersigned lawyers, reaffirming the indispensable role of law and of the measures in place to provide for effective implementation of the law at the international, regional, national and local level so as to contribute to the continual improvement of the quality of the human and natural environment to which all are entitled, and

Taking into account the announced themes of the Rio+20 Conference, namely "a green economy in the context of sustainable development and eradication of poverty" and "the institutional framework for sustainable development",

I. Call upon the States and Governments of the world to highlight the political importance of the Rio+20 Conference through the following strong signals:

1. The presence of Heads of State and of Government at the Rio Conference on 4-6 June 2012,
2. The solemn reaffirmation of the principles of international solidarity and sustainable development, as essential elements in the struggle against poverty and inequality,
3. The proclamation of the interdependence between world peace and security and the respect for human rights and protection of the environment.

II. We further call upon World leaders to fill significant gaps in environmental law through:

1. Establishing a principal of non-regression in environmental law,
2. Committing States to implement and give effect to environmental democracy as defined in Principle 10 of the Rio Declaration of 1992 through the rights to information, to participation and to access to justice, either by ratifying relevant existing conventions or by creating new global or regional conventions,
3. Commitment by States either to ratify or adhere to, as the case may be, global and regional conventions on environmental protection that are either already in force or not,
4. Commitment by States to sign in Rio the global convention on mercury currently being negotiated under the auspices of UNEP.

III. We further call on World leaders to commit to negotiations that will lead to true global environmental governance:

1. By inviting the General Assembly and the Security Council of the United Nations to broaden the jurisdiction of the United Nations Economic and Social Council (ECOSOC) to include the environment and to assure adequate representation in ECOSOC of environmental NGOs,
2. By creating a World Environment Organization (WEO) as a specialized institution of the United Nations joining together all States with new missions, endowed with significant capacities and able to reinforce actions undertaken by UNEP,
3. By creating judicial mechanisms for environmental conflict resolution, including a World Environmental Court,
4. By giving civil society and in particular environmental NGOs a greater role in international and regional decisionmaking processes concerning the environment and/or sustainable development, through the adoption of a set of guidelines guaranteeing minimum standards of participation in such processes, as well as a greater role in international and regional organizations.
5. By reinforcing the independence of international organizations so as to guarantee the absence of conflicts of interest; and in particular so as to guarantee the independence of the World Health Organization (WHO), by seeking an end to its agreement of 28 May 1959 to defer to the International Atomic Energy Association on questions related to exposure to radioactive substances and resulting health consequences.

IV. We further call on World leaders to commit themselves to negotiating new Conventions or similar instruments on the environment that respond to urgent needs in regard to health, preservation of biodiversity and human rights, namely :

- An international Pact on environment and development
- A Convention on protection of soils
- A Convention on environmental impact assessment that includes consideration of social and cultural impacts and impacts related to energy consumption
- A Convention regarding pollution of the oceans and seas from terrestrial sources
- A Convention on marine protected areas on the high seas
- A Convention on exploitation of offshore oil
- A Convention on landscapes
- A Convention on environmental protection in the context of armed conflict
- A Convention on ecological catastrophes
- A Convention on the legal status of persons displaced for environmental reasons

V. We further urge World leaders to promote an economy capable of supporting the implementation of sustainable development and contributing among other things to the eradication of poverty:

1. By reinforcing the environmental responsibility of private enterprises, in regard to both prevention and rehabilitation, and by establishing internationally the duty of social and environmental governance, including full respect of existing norms,

2. By reinforcing the capacity of judges to handle environmental disputes through training that ensures their independence and professionalism, including by creating, as needed, specialized environmental tribunals,
3. By going beyond the current non-binding international agreement on forests to adopt a convention on forests as soon as possible and in any event no later than the deadline of 2015 fixed by the United Nations Forum on Forests (UNFF),
4. By embedding the right to water and to sanitation in the framework of sustainable development,
5. By reinforcing social and environmental rights under the Energy Charter Treaty and aiming for universal access to energy through an ambitious plan of the International Renewable Energy Agency (IRENA),
6. In light of evidence of the globalization of massive acquisitions of agricultural lands and natural and rural areas, and the acceleration of impacts on food security, biodiversity and soils:
  - by initiating negotiation of a Protocol to the Convention on Biological Diversity on land acquisition and control and protected areas, and
  - by creating within the FAO an international program of action for the development and preservation of agro-ecosystems,
7. By developing new qualitative and quantitative indicators for measuring progress in the environment and in development,
8. By establishing, in accordance with the precautionary principle, a mechanism for the control and regulation of nanotechnology that may pose a risk to the environment and health,
9. By supporting the promotion and development of sustainable tourism consistent with both environmental and developmental needs.

We, the undersigned lawyers, are convinced that in order to make rapid progress toward sustainable development, it is vital to make advances in environmental law and to better integrate it with other areas of the law.

To fully implement and give effect to environmental law, it is necessary to reinforce concerted action by governments, legislatures, local communities, international and regional organizations, civil society, private enterprises, worker organizations, and environmental and sustainable development NGOs.

Judges, prosecutors and lawyers, at the national as well as regional and international levels, have a particular responsibility to present and future generations in implementing and giving effect to environmental law.

We, the undersigned lawyers, call upon States, on behalf of the people they represent, to make the 2012 Rio+20 Conference a decisive moment toward the common future of humanity and ecosystems.

Centre international de droit comparé de l'environnement (International Center for Comparative Environmental Law)

Limoges, FRANCE, 1 October 2011

A call issued following the working sessions of the world meeting of lawyers and environmental law organizations from five continents, in Limoges, France on 29-20 September and 1 October 2011 (reports, along with 25 recommendations, available at : [www.cidce.org](http://www.cidce.org))

#### NORMATIVE RECOMMENDATIONS FOR RIO + 20

The recommendations in this document are the result of initiatives that were undertaken and continue to be organized by the Program in Law and Environment - PDMA of FGV Law School Rio. Among them may be mentioned: the International Preparatory Journey for Rio + 20, on 24th and 25th June 2011. The theme of the Journey, "The green economy in the context of sustainable development: the governance of public and private actors" resulted in a book edited by Carina Costa de Oliveira and Rômulo Sampaio. Two other initiatives were: the Forum for Sustainability Rio+20 FGV Law School (<http://riomais20.direitorio.fgv.br/>), which remains stimulating discussions on 70 topics related to discussions of the Rio + 20; and the PDMA participation in The Access Initiative - a network of nongovernmental organizations that works with the implementation of Principle 10 of Agenda 21 which addresses the issues of access to information and public participation.

Several partnerships were essential and are co-authors of this proposal: Centre International de Droit Comparé de l'Environnement, Pace University, Núcleo de Estudos e Pesquisas do Senado Federal Consultoria do Senado, Instituto de Direito e Meio Ambiente Brasil-Estados-Unidos, EMERJ – Escola da Magistratura do Estado do Rio de Janeiro, Academia Paranaense de direito ambiental, Ministério Público da União, PUC-Goiás, Secretaria de Assuntos Estratégicos, Universidade Católica de Brasília, Uniceub, Universidade Federal do Pará, IEDC - Instituto Estudos Direito e Cidadania, Mackenzi-SP, Prefeitura do Rio, CEDA, NKF advogados, Tribuna Animal, CEDAM, FEMPERJ, PUC-São Paulo, IBRADA and Universidade Estadual do Amazonas. In addition, teachers, researchers and professionals who do are not part of institutions mentioned above participated in proposal making: Priscila Pereira de Andrade, Carole Peychaud, João Renato L. Paulon, Larissa Clare Pochmann da Silva, Luiz Gustavo Escorcio Bezerra, Maria Collares, Meryem Deffairi, Patricia Pellanda, Rafael Prado, Sandro Schmitz, Tatiana Falcão Octaviano, Virgilio Gibbon, Maria Morelli, Luiz Borges, Teresa Vilac, Colin Crawford. Some recommendations will be made on the general themes of the conference based on the following major topics: 1) Definitions, 2) Sustainable Trade and Investments, 3) National and International Governance, 4) National Institutional Framework for Sustainable Development, 5) International Institutional Framework for Sustainable Development. In each topic there are national and international recommendations on the theme.

#### GREEN ECONOMY ON SUSTAINABLE DEVELOPMENT AND ERADICATION OF POVERTY CONTEXT

##### 1) Definitions

##### a) Important aspects for Green economy concept

- 1) The internalization of externalities of social and environmental costs. Some policies to promote internalization would be, for example, the valuation of natural resources through taxes and tax incentives to encourage sustainable practices (PDMA).
- 2) The determination of social goals that could be implemented by the "green economy". The goals could include: job expansion, consumption decline, production more sustainable and housing guarantee. Relevant policies would promote sustainable bidding criteria, enable regulation and encourage public investment in priority areas (PDMA).
- 3) Concerning to the green economy, it is observed that the more sectorized it is analyzed, can be more easily identified policies that could encourage the construction of "green" perspective. Each specific area, such as construction, tourism, biodiversity, energy, cities, has their peculiarities. The concept of green economy could be taken from the sustainable progress of each economic sector (PDMA).

b) Important aspects for sustainable development concept

1) Identify general criteria of sustainability from a definition given by each country. Each country can send to the UN Secretariat for the Rio + 20 its definition of sustainable development. This proposal stems from disparities between economic, social and environmental performance of each state. Each one must identify how it can contribute to the present and future lives.

2) It is suggested to build a Brazilian concept of sustainable development in accordance with the priorities of public policies for the country.

3) Opinion on the relevance of the concept of each state:

"A concept is an abstraction that is used to intellectualize a complex issue. Thus, it is possible to explain the complexity of reality that becomes more accessible. However, the risk that comes with the use of a concept is the simplifying and trivializing of it. It can be regarded as the perfect mirror of reality. And both a methodological and scientific error. Sometimes this path is taken to the concept of sustainable development. People who work on this issue want to universalize and standardize the concept. Therefore, it kills the content of sustainable development. The principles of sustainable development must be implemented by each state. Each state has its own level of development, its economies and its society. Therefore, they are different and have neither the same goals, or the same means to accomplish their goals. Environmental considerations, for example, have the same value in each state. In this sense, what is sustainable development for a state is not necessarily the same thing to another state. Therefore, it is useful to have a single definition of the concept of sustainable development. Practically every state knows its needs within its development. Therefore, it can decide its policies according to its reality. Finally, it is useful to highlight a point. The final containers of development and sustainable development theories – humans - are sometimes forgotten and neglected by those working on these issues. Their realities are so complex, so different that it is difficult to understand how you can make a theory of sustainable development without realizing some practical studies. Moreover, these theories are often built in offices, in few hours. It is one reason why sustainable development has little practical effect "(Nitish Monebhurrun).

2) Sustainable Trade and Investments

a) Forests

International Recommendations

1) Adopt a convention on the theme (Luciene Araújo).

2) Increased input of financial resources for implementation of payment for environmental services such as the Global Environment Facility – GEF. (Luciene Araújo).

3) Establish social environmental certification (José Antônio Tietzmann Silva).

4) Include recommendations for environmental damage under Human Rights Council and UN councils or commissions of the regional system of protection of Human Rights (José Antônio Tietzmann Silva).

National Recommendations

1) Implementation of mechanisms and instruments for conservation, through voluntary and coercive measures. (Fernando Meneguim).

2) Implementation of policies and measures that encourage the reduction of illegal deforestation. (Fernando Meneguim).

3) Implementation by the states of financial incentives for environment preservation, with the possibility of public and private entities participation. (Fernando Meneguim).

REDD:

4) Utilizing, not carbon stocks, but the annual fluctuations in the opportunity costs in forested areas. (Virgílio Gibbon).

5) Unifying the credit registries of all the states into a single registry office to avoid duplicative valuations of credits on the national level. (Virgílio Gibbon).

6) The need to incorporate the concept of opportunity cost searching for solutions to the issue of deforestation of native forests. (Virgílio Gibbon).

7) Establishing a REDD+ regime demands rights and responsibilities are clarified in the international and national levels. (PDMA).

8) Local participation and transparent processes while defining access to benefits and allocation of REDD+ resources are crucial for guaranteeing effective governance. (PDMA).

b) Renewable energy

International Recommendations

1) Specifically, a framework convention could be :

a) To establish a renewable energy list classified under economic criteria (cost of production, level of necessary energy, the necessary resources for its production, levels of importation/exportation, capacity to create jobs, etc) and environmental (rate of substitution of fossil fuels, environmental impact, carbon balance of the production process, etc..) defining. (Meryem Deffairi).

b) Establish a binding target, "a minimum" of renewable energy in 10 years for developed countries and in 15 or 20 years for developing countries (obligation of result, leaving the states free of the means used to achieve this) and finally integrate the planning requirements for each state. (Meryem Deffairi).

c) Provide a mechanism for financial sanctions applicable in 10 years, and every five years, depending on the level of renewable energy in each state, by paying a fine to an independent international institution responsible for "re-injection" of funds in development projects technology for producing renewable energy. (Meryem Deffairi)

2) Instead of discussing a new institutional framework we should be questioning capacity of action of the International Agency for Renewable Energy established in January 2009 (IRENA - <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade) National Recommendations

1) Be part of International Agency for Renewable Energy established in January 2009 (IRENA - <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>)

2) Adoption of government policies to encourage substitution of energy sources based on fossil fuels by renewable energy (Luciane Mascarenhas).

3) Implementation by local government of legislation and regulations to promote the use of renewable energy (Luciane Mascarenhas).

- 4) "Breaking Patents" or your purchase more favorable for the need for investment in renewable energy due to weather problems experienced. (Luciane Mascarenhas)
  - 5) Public policies aimed at reducing consumption in order to also reduce power consumption (Luciane Mascarenhas).
  - 6) Promotion of granting intellectual property rights relating to renewable energy that may favor developing countries (Luciane Mascarenhas).
  - 7) Patents acquisition more favorable in view of the need for investment in renewable energy due to weather problems experienced. (Luciane Mascarenhas).
  - 8) Reduction of tariffs and subsidies in order to implement technologies used to generate renewable energy to reduce costs and increase their production.(Luciane Mascarenhas).
- c) Biodiversity and compensation mechanisms

#### International Recommendations

- 1) Juridically qualify biodiversity and give it a legal statute in the international arena (Jessica Makowiak).
- 2) Define in international area the compensation and its criteria (Jessica Makowiak). 3) Situate the compensation notion with recognized principles of international and environment law (the precautionary principle, polluter-pays). The compensation can anticipate or intervene prior to the damage (Jessica Makowiak)
- 4) Rank priorities in relation to biodiversity reduction, losses reduction and compensation. (Jessica Makowiak).
- 5) Restrict the actions of compensation for projects that do not cause major or irreversible reduction of biodiversity (Jessica Makowiak).
- 6) Define, classify and prioritize compensation arrangements in the context of biodiversity (Jessica Makowiak).
- 7) Provide, in the texts that allow compensation, measures for monitoring, surveillance and control. (Jessica Makowiak).
- 8) Provide sanctions in case of disrespect of measures for monitoring and its effects. (Jessica Makowiak).
- 9) Evaluate the experiences of compensation at the institutional level (problem of the actors who must decide, implement and monitor measures of compensation) (Jessica Makowiak).
- 10) Identify means to channel economic resources for biodiversity conservation to biodiversity-rich developing states. (Luiz Gustavo Bezerra).

#### d) Green Private Contracts

#### International Recommendations

- 1) In the private law area, the inclusion of social environmental clauses and also the exclusion of "stabilization" clauses to enable the adoption of rules of human and environmental rights ratified after the signing of agreements. (Sílvia Pinheiro)

#### e) Technology Transfers

#### International Recommendations

- 1) Protection to international finance of technology transfer mechanisms, with respect to intellectual property rights, but focused on development promotion. (Renata Calsing, Maria Marinho and Carlos Henrique Rubens Tomé Silva).
- 2) Formation of a fund that allows purchase of clean technologies, considered relevant to the environment protection. (Renata Calsing and Maria Marinho).
- 3) Need to stimulate the formation of sharing platforms of clean technology licenses. (Renata Calsing and Maria Marinho).
- 4) Promotion of the discussion about mandatory license adaptability to accessing necessities to clean technologies and the discussion about other mechanisms. (the invention is an improvement, a reduction of production costs and that's why the holder company uses its exclusive right to differentiate themselves in the market. So the incentive to transfer technology through licensing will only be effective if states establish mechanisms to encourage holder private sector or co-holder of proprietary technologies that impact on environmental protection). (Renata Calsing and Maria Marinho).

#### National Recommendations

- 1) Nationally, evaluation of creative forms to give flexibility to intellectual property rights, which do not violate the State's international commitments and, at the same time, make possible the incorporation of new technologies developed abroad. (Carlos Henrique Rubens Tomé Silva).
- 2) Creation and improvement of national mechanisms about technological innovation financing and tax exemption, especially focused on healthy environmental technologies. (Carlos Henrique Rubens Tomé Silva). 3) Adoption of more effective policies to stimulate technological innovation in the business atmosphere. (Carlos Henrique Rubens Tomé Silva).

#### f) International trade systems

- 1) Put the U.S. government securities that comprise the international reserves of BRICS members (Brazil, Russia, India, China and South Africa) in an investment fund managed by the shareholders. (Virgílio Gibbon).
- 2) To develop rules for the Investment Fund regarding the possibility to issue a "Green Currency" to the limit of its assets. The Green Money shall only be applied to actions or funding of sustainable projects of countries that accept to be beneficiaries of the Fund. (Virgílio Gibbon)
- 3) To subscribe to a Shareholders Agreement that give the Green Currency the same treatment given to the U.S. dollar today. That is, it is computed as international reserve and gives rise to the issuance of the corresponding national currency. (Virgílio Gibbon)
- 4) To adopt social and environmental indices on the stock market. Examples: Domini 400 Social Index (DSI), Dow Jones Sustainable Index. (PDMA)

#### g) Sustainable Production

- 1) Conduct an integrated product policy based on an examination of the impact of products throughout their life cycle. Promote discussion between public and private powers

on the subject, so that the measures can be effective and have the lowest cost (PDMA).

2) Corporate Social Responsibility for the entire production cycle, including: local communities, salaried, shareholders, business partners, suppliers, customers, public authorities. (PDMA).

3) Sustainable financing: direct funding for specific areas: the funding would benefit some communities or disadvantaged municipalities. Making loans through local development banks in deposits, with rates equal to or below the market price (PDMA).

h) Sustainable Consumption

1) Accountability of individuals and companies for their sustainable consumption (PDMA).

2) Control of misleading consumers by companies that have clauses in their codes of conduct on environmental protection or certifications related to Corporate Social Responsibility. (PDMA).

3) Green Economy on Sustainable Development context: Governance and Institutional Framework

a) Liability of the State

International Recommendations

1) All Signatories shall promote sustainable management, especially within the public administration. (Maria Augusta Ferreira)

2) Sustainable management means the one conducted with transparency, ethical behavior, respect for interests of interested parties (stakeholders - employees / servers, customers, suppliers, society, government), respect for human rights, respect for the environment. (Maria Augusta Ferreira)

3) Respect for the environment in public administration is based on the following pillars: the rational use of resources, proper disposal of waste, sustainable public procurement, environment, healthy work. (Maria Augusta Ferreira) National Recommendations

1) The environmental responsibility of federal, state and local organs includes, besides the liability for damage provided for in art., prevention of damage by reducing the environmental impact of state activities, from the adoption of sustainable management practices. (Maria Augusta Ferreira)

b) Liability of business

International Recommendations

1) Device that indicates the strict liability of companies for environmental damage caused by companies, with solidarity between the headquarters and branches (Carole Peychaud).

2) Agreement on "Rights and responsibilities of market players" with devices such as: (PDMA)

a) Minimum criteria that compose the Code of Conduct for companies (recipients and obligations must be precise and clear);

b) Obligation to make annual statements considering the environmental and social criteria;

c) Responsibility for voluntary certification obtained by ISO, for example.

3) Increase in environmental conventions devices on law and jurisdiction conflicts indicating the laws and courts that could best repair the damage. Some rules (PDMA):

a) conflict of laws:

1) in the case of compensation for environmental damage, the more favorable rule to the victim and to protection the environment should be applied,

2) if there are environmental insurance, the law on the rights of the insured should be applied,

3) in the case of environmental damage, the law of the headquarters can be applied if it has control over the activities of its branch.

b) conflict of jurisdictions:

1) The victims of environmental damage can choose the court that may decide for the best damage repair, for example, the proximity of the evidence;

2) If the headquarter has control over the activities of its branch, the jurisdiction of the headquarter has jurisdiction over the case;

3) An action against a multinational may be brought before the court of the domicile of the defendant. If the defendant is a corporation, the domicile of the defendant may be found in any of three places: a) where the company has been registered, b) the place where its central administration is located, c) the main place of activities society.

Specific Recommendations for International Law of Investments

1) The integration of clear environment protection provisions in international investment agreements: the future investment agreements or the renegotiation of existing agreements should include specific provisions on environment protection. These provisions can consider (Nitish Monebhurrn):

(i) The definition of an investment activity: The activities of those companies which are constituted in utter ignorance of domestic environmental laws should not be qualified as an investment and therefore should not benefit from the protection of the investment agreement. The international investment agreement provision on the definition of the investment must underscore this point. The agreement must state that the investor has a duty to check, examine and understand the legal framework on of the host State, especially the one applicable to the environment, and that he must start and conduct his activity accordingly.

(ii) The definition of the environment: Environment is not an abstraction and in the vein of the previous proposition, some details must be available to define or to identify what is to be understood by environment. It might be a complex task to give an exhaustive definition but it is not impossible to give a list of indicators. These indicators may vary from one State to another.

(iii) Affirming the right of States to regulate as per its environmental concerns: The investment agreements should specify that whenever it comes to environmental matters, States should be free to regulate the investor's activity. It should assert that environment is a component of the public interest<sup>42</sup> and that the latter cannot be sacrificed at the benefit of private economic interests. However, a control of these interests can be injected by the means of a proportionality test. In any case, investment protection standards

cannot prevail over environment protection norms.

(iv) The legitimate expectations of States: The agreement must furthermore affirm that States have a legitimate expectation that private companies investing on its territory will always act in good faith to collaborate with them whenever environmental goals are concerned. Private companies therefore have a duty to act accordingly and must not frustrate these expectations.

2) The integration of clear rules of conflict in international investment agreements: highlighting the prevalence of environment protection norms over investment protection norms (Nitish Monebhurrn):

(i) The principle: Whenever there is a potential conflict between the investor's or the investment's protection and the environment protection, the investment agreements must provide for clear rules of conflict. The investment agreement can state that whenever an investment protection provision is in conflict with an environmental norm, the latter shall prevail over the former. As environment protection is a unanimous objective which is considered as being fundamental, priority must be given to it.

3) Promoting the use of the systemic integration principle (Nitish Monebhurrn):

(i) The principle: By this means, agreements should provide that international investment law is not clinically isolated from the rest of international law and that the interpretation of an international investment treaty does not exclude references to other non-investment norms, like environmental norms. This is in direct line with article 31(1)(c) of the Vienna Convention on the Law of Treaties. Hence, environmental norms can be integrated in international investment dispute settlements. They can be invoked by States and will have to be considered by arbitral tribunals.

#### National Recommendations

1) Implement and publicize the system of National Contact Points in the OECD so that companies can be questioned about their actions in society.(PDMA).

2) Control the private activities through: 1) creation of accurate sustainability criteria which companies should present; 2) submission of mandatory criteria and 3) government oversight of the information published. These criteria may be based on the GRI (PDMA).

#### c) Liability of financial institutions

1) The public and private, national, foreign or international organizations, donors or sponsors of activities or projects of polluting or potentially polluting activities shall require the submission of all documents relating to the environmental licensing of the project financed by them, issued by agencies control officers, under penalty of becoming co-responsible for any effects arising from the violation of this Act or its regulations. (Bruna Acerbi)

2) Also has to pay attention to cost-benefit analysis of environmental, defining the object and identifying its impacts, defining them according to their relevance and measurement in physical units, valuing them in monetary terms. (Luiz Borges). d)Access to information and public participation

#### International Recommendations

1) It is necessary to define the meaning of the right of access to information in both international and national levels. (PDMA).

2) Sign a Regional Convention in Latin America to be implemented in the region the access to information under control of an institution such as ECLAC network (TAI).

3) Ratify the Aarhus Convention.(PDMA).

#### National Recommendations 1) Deadlines for the publication of all documents related to environmental decisions. (PDMA).

2) Fines for noncompliance with the deadlines for publication. (PDMA).

3) Ratify the Aarhus Convention.(PDMA).

4) Sign a Regional Convention in Latin America to be implemented in the region the access to information under control of a regional institution. (PDMA).

5) Decree full detailed of terms that are usually very inaccurate on citizen participation, with some examples of articles (PDMA):

a) Public audiences may be conducted, for example, by sector, population or community, in order to not allow domination of the audience by people who have greater chance to express themselves (Colin Crawford).

b) Require that there are effective mechanisms for access by population and interested communities to all documents relevant to the public audience, as well as access to versions with comprehensible language of details of the proposed projects. (PDMA).

c) Provide training courses for community leaders and mediation techniques in order to qualify the ones who need the procedure of public audience (PDMA).

d) Require that public participation occurs from the beginning of the procedure or of the process to reach the community (PDMA).

6) Require the preparation of Environmental Impact Report (EIR) linked to the Preliminary Study Environmental Impact Assessment (EIA) (PDMA).

7) Availability of environmental documents on the Internet and procedural materials (Larissa Pochmann Clare da Silva).

#### e) Oversight and Accountability

1) Implementation of the monitoring system, such as the GRI, in the states. (PDMA).

2) Control of information provided by the companies in its annual statements by the state through a government agency (PDMA).

3) Disclosure of corporate balance sheets over the Internet (with comparable data set by States) (PDMA).

4) Rule on the requirement of social balance, with the prediction of environmental and social aspects. (PDMA).

5) Decree stipulating criteria that should be in the company's annual social report, in order that information is comparable. (PDMA).

#### f) Green Bidding

#### International Recommendations

1) Writing more specific guidelines on the green bidding topic at Rio +20 (Teresa Villac).

2) Strengthening of sustainable public hiring in the MERCOSUL. (Teresa Villac).

#### National Recommendations

1) Insertion of sustainable hiring in the planning activities of public bodies. (Teresa Villac).

g) Water: The Creation of Protected Areas on the High Seas 1) In order to achieve sustainable development, the States should create marine protected areas. (Fernanda Borges).

2) Marine Protected Areas should be considered as strictly protected areas, essential for the preservation of biodiversity and the maintenance of essential ecological marine processes. (Fernanda Borges).

3) Any activity affecting or potentially affecting the ecological balance and biodiversity conservation in marine protected areas should be considered prohibited in respect of the right to an ecologically balanced environment for present and future generations. (Fernanda Borges)

4) Marine Protected Areas should ensure the protection of biodiversity and the quality of marine waters, to avoid acidification and death of organisms required for biotic and abiotic catchment of carbon from the atmosphere, responsible for mitigating global warming and climate change (Fernanda Borges)

5) Marine Protected Areas should ensure the preservation of natural fisheries resources, required for food security of present and future generations (Fernanda Borges)

h) Water: The Management of Aquifers Located under the Territories of Several Countries

1) Reduce asymmetric information (specific case of Guarani Aquifer)

2) Increase regional and local involvement (awareness, capacity-building and traditional knowledge). (David Cassuto e Romulo Sampaio)

3) Harmonization of national legislation. (David Cassuto e Romulo Sampaio)

4) Regulatory structures (ecosystem services). (David Cassuto e Romulo Sampaio)

i) Taxation as a Means of Environmental Management International Recommendations

1) Establish a limit (cap) for each country of carbon emissions. The initial cap will be the result of the average carbon emissions over the past three to five years. A transition rule can be created (more lenient rule) for developing countries and LDCs (Least Developed Countries - as classified by the WTO) - so that these countries are not disadvantaged because of their low level of current development, and so they can develop despite the targets for carbon reduction (Tatiana Falcão Otaviano).

2) The carbon emitted in each country shall henceforth be taxed in order to encourage companies to use resources in developing new technologies for clean energy production. The tax rates should be the same in each country (we suggest the establishment of a maximum rate and minimum rate), so they are not created "carbon tax havens" (Tatiana Falcão Otaviano).

3) The establishment of maximum and minimum rates will also prevent the adoption of tariff adjustments on imports of products (Border Tax Adjustments "BTA") (Tatiana Falcão Otaviano).

4) Create-a treaty that establishes a origin for the carbon emitted as a result of international activities (Tatiana Falcão Otaviano).

5) Creation of a new international body endowed with police powers to monitor and eventually penalize those who do not comply to the limits imposed by the treaty (Tatiana Falcão Otaviano).

#### National Recommendations

1) Green tariff:

a) Establish a less onerous form for the final consumer, for fuel tax, so as to encourage the consumption of cleaner fuels (such as biodiesel and alcohol) in order to reduce the fuel of high carbon concentration consumption and therefore more pollutants such as diesel and coal burning (Tatiana Falcão Otaviano).

b) Establish a green contribution (purposing creation of a fund to combat climate change and reduce the harmful effects of global warming) on fuel. The contribution would be progressive, more burdening the diesel fuel and less the biodiesel, for example. (Tatiana Falcão Otaviano).

c) The funds raised with the contribution should be used in development of green Brazilian technology for mounting of electric cars, development of new forms of biodiesel (for example, it is possible to transform peel potatoes and other vegetables into fuel) and even for the promotion of "green" initiatives such as increased efficiency in the recycling project, replanting of forests (which are also internationally known as "carbon sinks" as we consume and re-absorb carbon from the atmosphere), construction of bike lanes to encourage bicycle use by local people, etc.. (Tatiana Falcão Otaviano).

j)The Non-Regression Principle in Environmental Law

#### International Recommendations

1) Integration of the principals of non-regression from the area of human rights into environmental law. (Michel Prieur).

2) In order to preserve the sustainable development and ensure the necessary protection of the environment, States may not take legislative, administrative or judicial measures importing an unlawful reduction of their levels of protection granting by laws that protect the environment except in public interest prevalent case. (Maria Morelli).

3) In the event that the States adopt a legislative, administrative or judicial measure which reduces levels of environmental protection in force, shall justify the reasonableness and proportionality of the measure. (Maria Morelli)

#### National Recommendations

1) The environmental objectives should be achieved in a gradual manner, through interim and final targets, projected on the basis of a state planning that facilitates the implementation of activities related to these goals (Maria Morelli)

2) Efforts to ensure environment protection and conservation can not decrease. In this case, it is forbidden to adopt appropriate legislative, administrative or judicial measures

that illegitimately reduce levels of environmental protection legislation, except in public interest prevalent case. (Maria Morelli)

#### 4) Green Economy on Sustainable Development context: eradication of poverty

##### a) Regularization

1) The proposal of fixing of property rights in forested areas and biomes in order to prevent illegal deforestation. (Fernando Meneguín).

2) The concession of rights to public lands to ensure better monitoring of national resources and to facilitate land regularization. (Fernando Meneguín).

3) Imposing limits on land use; the concession of land rights, which are not absolute, but provide benefits to the title holder and to the state through terms and restrictions on the use of the land. (Fernando Meneguín).

4) Establish an effective policy and a coordinated regional planning (Jose Heder Benatti).

a) The State must be proactive and coordinate the process of regional planning for public policies that are effective, because the lack of a policy for allocation of public goods may leave space for the occurrence of a chaotic land of the public areas, through land grabbing and deforestation - which often happens when there is no such policy.

b) Therefore, it is necessary to establish a regional planning policy to include: regulation; environmental licensing of rural properties; fulfill the social function of ownership; control, enforcement and economic instruments to stimulate the sustainable management of natural resources, specially the forest.

i) For example, the economic or tax incentives can stimulate private spending in certain areas, discourage bad behavior, and correct the market trends that can encourage actions against nature conservation and protection of natural resources.

5) The regularization to ensure control and define property rights, allowing the public power to know who is occupying land and how they are being used. (Jose Heder Benatti).

a) To overcome the current chaos, must first be defined party areas - who is the owner of the land, public or private? If public, which federative entity?

b) The official recognition of the different existing forms of occupation should allow the state and society the control over the use of land and other natural resources. Therefore, the regularization will be positive and not negative, since it prioritizes the family occupation.

c) Another positive effect of land tenure policy is to combat illegal occupation of public lands.

6) There are several necessary steps to implement a land use: (José Heder Benatti).

d) to overcome the limited management capacity of agencies responsible for planning land, whether in its technical or staff.

e) understand that the consolidation of rural property, respecting the social and environmental assumptions, represents an important step towards the strengthening of citizenship and environmental protection.

7) The process of regularization of land occupation should: (José Heder Benatti)

f) be accompanied by descriptive memorandum plant and georeferenced. The financial costs for its preparation should be the responsibility of recipient of legitimacy, with exception of the processes of settlement of small estates.

g) include in the title-deeds issued by the national land, clauses requiring the beneficiary to maintain, conserve and, where appropriate, to restore the permanent preservation areas and legal reserves.

8) Other necessary and complementary actions to the regularization (Jose Heder Benatti).

h) scanning of the land collection;

i) modernization of access to registry information of rural land in order to increase the reliability of the processes of property records and ensure that information can be obtained quickly and the distance by public authorities relating to questions of land federal unit.

##### b) Environmental Education

#### International Recommendations

1) Make the investment in education a priority in developing countries and underdeveloped countries, since the lack of education contributes to unemployment, which reflects in crime and poverty. And also ensure that education serves as a tool for public awareness to the current problems in the world, such as politics, health and environmental preservation. The maldistribution of wealth is also a result of poor education. (Patricia Pellanda).

#### National Recommendations

1) Environmental Education, at all levels, is everyone's responsibility because it reflects the reduction of social inequalities, and in schools, should be adhered to the principle of transversality. (Maria Collares). 2) Public Power should be able to train teachers to teach environmental education at all levels of government and to monitor the effectiveness of the method adopted. (Maria Collares). 3) Information on Environmental Education requires transparency necessary for understanding of all because it contributes to the protection of natural resources, to promote population health and to collaborate with the eradication of poverty. (Maria Collares).

4) Environmental education propels sustainable development, due to it would be compulsory in schools, social, professional and public activities. (Maria Collares). 5) The inclusion of Environmental Law as a subject in graduation aims to form student as a professional to make effective environmental legislation in all work activities. (Maria Collares).

##### c) The fundamental right to land and food International Recommendations

1) Regarding the right to food is the focus of discussion on hunger eradication of people. This problem can not be based on instruments that aim at increasing food production in the world, but on appropriate means to combat social inequalities and unequal distribution of wealth. (Patricia Pellanda).

2) Promote the application of the Solidarity Economy in the countries, aware that the private donations and supportive attitudes may contribute to the results of the company itself (Patricia Pellanda).

#### National Recommendations

- 4) Value and respect the concept of land and territories granted to indigenous people and traditional communities as a collective right, transcending the idea of merely individual property (Patricia Pellanda).
- 5) Prevent the assimilation of indigenous lands to the family farm in the States domestic law, through the international commitment and recognition of specific features to indigenous people and their cultural practices. This measure will prevent even the rampant development of agribusiness lands and other explorations that have been occurring frequently on these populations (Patricia Pellanda).
- 3) The commitment of states to their respective populations in order to reduce / eliminate corruption policy and allocate funds to sectors that should be effectively benefited by punishing those who divert funds, individual enrichment and 'forget' their true function forward the government and social powers. (Patricia Pellanda).
- 4) The public awareness that many problems can be solved in the short term from the measures introduced and practiced by the population itself, independent of the Government and effective political action, since problems like world hunger and the current devastation environmental problems are all human problems in the world. If each citizen help only one needy person, the difference would be huge. (Patricia Pellanda).
- 5) In addition to food in sufficient quantity to meet basic human needs, should also be prioritized food (including water) quality, mainly food security internationally wanted. By quantitatively and qualitatively adequate food may also be displayed positive results in the health sector, with the reduction of diseases, especially those arising from the use and consumption of pesticides and new technologies such as transgenic (Patricia Pellanda).

#### d)Definition and Criteria for a Sustainable City

National Recommendations 1) Definition and promotion of sustainability indicators that can be used for the formulation of local environmental policies. Indicators that reconcile the protection and preservation of goods, services and environmental and cultural resources with the needs of economic and social development (PDMA).

#### e)The rights of indigenous people and of traditional communities

#### International Recommendations

- 1) Protocol to bring definitions, obligations and rights more accurate on (PDMA):
  - a) prior, free and informed consent in relation to any activity held in indigenous areas;
  - b) participation in project implementation;
  - c) protect and guarantee access to land, natural resources and the benefits derived there from;
  - d) recognition of traditional knowledge of indigenous peoples (how?), protection of people relocating to other areas (how?)
  - e) monitoring mechanism should be created at the international and national levels to ensure transparency and effectiveness of these rights in practice.
- 2) Indigenous people may be impacted from the consequences of global climate change. It is necessary to ensure that such impacts are mitigated and that training and adaptation to climate change are rights of these peoples (PDMA).
- 3) Indigenous people have a crucial role in the conservation of environmental resources and this role should be recognized for compensation for environmental services and distribution of benefits of REDD (Reducing Emissions from Deforestation and Degradation) (PDMA). National Recommendations
  - 1) Greater access to information and participation of indigenous people in the implementation and development of projects that affect them directly or indirectly (PDMA).
  - 4) Value and respect the concept of land and territories granted to indigenous people and traditional communities as a collective right, transcending the idea of merely individual property (Patricia Pellanda).
  - 5) Prevent the assimilation of indigenous lands to the family farm in the States domestic law, through the international commitment and recognition of specific features to indigenous people and their cultural practices. This measure will prevent even the rampant development of agribusiness lands and other explorations that have been occurring frequently on these populations (Patricia Pellanda).
  - 6)Define the meaning of traditional communities. (Colin Crawford).

#### NATIONAL AND INTERNATIONAL INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT.

#### 5) National Institutional Framework

#### a) Legal/Procedural instruments

#### International Recommendations: procedural instruments

- 1) Forecast for civil society participation through representative bodies in case of conflict resolution in international environmental institutions as amicus curiae. (Larissa Clare Pochmann da Silva).
- 2) Establishment, into national tribunals, of a right to action with the aim to punish the International Conventions noncompliance. (G rard Mon d aire).
- 3) Creation of Regional Unions, provided with a distinct legal personality from the Member States, that can sign Environmental Treaties, resulting in a better engagement of these States with environmental issues. (G rard Mon d aire).
- 4) Need of a right to petition to the citizen or to the society, with what they can intervene in the Legislative Assemblies or the Committee. (G rard Mon d aire).
- 5) Imposition of financial sanctions to noncompliance or incomplete compliance of the Tribunals decisions or laws concerning environment. (G rard Mon d aire).
- 6) Reversal of burden of proof in environmental disputes. (Carole Peychaud).

#### International Recommendations: legal instruments

- 1) Preparation of a treaty on the repair of environmental transnational damage affecting direct and individually citizens of other countries. (Larissa Clare Pochmann da Silva).

National Recommendations: procedural instruments

1) Disclosure of the values of a conviction for environmental damage to the environmental fund, allowing the advertising of such values should be applied from convictions for environmental degradation in repairing the environment (Larissa Pochmann Clare da Silva)

b) Analytical methods to measure the effectiveness of law enforcement

International Recommendations

1) The Secretariats of the Conventions require states to designate national institutions that are National Points of Contact responsible for identifying the breach of environmental treaties that have been ratified by the states. (PDMA).

2) The priority is not the creation of new laws and international treaties, but in political and social commitment to the implementation and effectiveness of existing standards. (Patricia Pellanda).

National Recommendations

1) Goals for improving environmental quality (eg, goals to ban the use of pesticides that harm human health and the environment, already banned in Europe). (Solange Teles).

2) Creation of legal environmental sustainability indicators - indicators of environmental governance and policy of environmental governance.(Solange Teles).

6) International Institutional Framework

a) Existing Institutions

International Recommendations

1) Creation of a new international council within the United Nations to discuss sustainable development. This new body would incorporate the UNEP and the committee inside the ECOSOC responsible for sustainable development. (PDMA).

2) Creation of a committee inside this new body that would represent international NGO's, previously chosen by of group of experts, that are know by their efforts in the subject. (PDMA).

3) Focus on UNEP.

4) The transformation of the UN Economic and Social Council to the Economic, Social, and Environmental Council (PDMA).

5) Reform of the Commission on Sustainable Development in the General Assembly (PDMA).

b) New Necessary Institutions: The World Environmental Court

International Recommendations

Considering the International Court of Justice (ICJ) importance in the international community, we propose reform of the ICJ or the foundation of a World Environment Court, based on the following proposals (Rafael Prado):

1) Flexibility of ICJ Environmental Chamber, and encouragement of the use of principle of participation and access of stakeholders to justice (not just government but also civil society). The principle of participation, a fundamental one in International Environmental Law, was recognized by the ICJ Judgment in the same case of the Pulp Mills on the River Uruguay. (Rafael Prado).

2) Manifestation of ICJ on its wide competence in environmental matters involving Member States, and no modifying necessity in its Statute entered in the UN Charter, which allows the materialization of the principle of participation and access to information and to justice in the case of environmental issues that directly affect national populations of litigants countries. (Rafael Prado).

c) New Necessary Institutions: World Environmental Organization

International Recommendations

1) Environmental conventions Secretariats, as technical instances of conventions, would be specialized organs in the new International Organization. (Sandro Schmitz dos Santos).

2) One of the body structure proposed is a Settlement Body in the model used by the WTO with activities of mediation and arbitration of violations of International Environmental Law performing functions similar to the Inter-American Commission on Human Rights (IACHR). (Sandro Schmitz dos Santos).

3) Three would be the sources of the new organization: the quota-share of the participant countries, the resources of the major environmental damage penalties, and fees on their roles certification of carbon credits and environmental economics in general. (Sandro Schmitz dos Santos).

FGV DIREITO RIO+20

Terceira fase do Forum de Sustentabilidade

FGV DIREITO RIO+20

(14 de setembro até 2 de outubro)

A terceira fase consiste no debate em português, espanhol e inglês sobre as recomendações que serão feitas sobre os temas da Rio+20. Essas recomendações decorreram das Jornadas que foram realizadas pelo PDMA e das discussões que ocorreram durante a 2. fase do fórum.

As recomendações internacionais serão entregues para o Secretariado da ONU para a Conferência Rio+20 e as recomendações nacionais serão entregues para a Comissão Nacional formada para construir a posição brasileira para a Rio+20.

## RECOMENDAÇÕES NORMATIVAS PARA A

## RIO + 20

As recomendações que serão feitas nesse documento são resultado de iniciativas que foram realizadas e que continuam a ser organizadas pelo Programa em Direito e Meio Ambiente-PDMA da FGV-Direito Rio. Entre elas podem ser citadas: a Jornada Internacional Preparatória para a Rio + 20, nos dias 24 e 25 de junho de 2011. O tema da Jornada, "A economia verde no contexto do desenvolvimento sustentável: a governança dos atores públicos e privados" resultou em um livro organizado por Carina Costa de Oliveira e Rômulo Sampaio. Duas outras iniciativas foram: o site Forum de sustentabilidade FGV Direito Rio + 20 (<http://riomais20.direitorio.fgv.br/>), que continua fomentando o debate sobre 70 temas ligados às discussões da Rio + 20; e a participação do PDMA no The Access Initiative – rede de organizações não governamentais que trabalham com a implementação do Princípio 10 da Agenda 21 que trata dos temas de Acesso à informação e de participação pública.

Diversas parcerias foram fundamentais e são co-autoras dessa proposta: o Centre International de Droit Comparé de l'Environnement, a Pace University, o Núcleo de Estudos e Pesquisas do Senado Federal Consultoria do Senado, o Instituto de Direito e Meio Ambiente Brasil-Estados-Unidos, a EMERJ – Escola da Magistratura do Estado do Rio de Janeiro, a Academia Paranaense de direito ambiental, o Ministério Público da União, a PUC-Goiás, a Secretaria de Assuntos Estratégicos, a Universidade Católica de Brasília, o Uniceub, a Universidade Federal do Pará, o IEDC - Instituto Estudos Direito e Cidadania, o Mackenzi-SP, a Prefeitura do Rio, a CEDA, NKF advogados, a Tribuna Animal, o CEDAM, FEMPERJ, PUC-São Paulo, a IBRADA e a Universidade Estadual do Amazonas. Além disso, os seguintes professores, pesquisadores e/ou profissionais, que não fazem parte das instituições supra-citadas, tiveram uma participação nas propostas: Priscila Pereira de Andrade, Carole Peychaud, João Renato L. Paulon, Larissa Clare Pochmann da Silva, Luiz Gustavo Escorcio Bezerra, Maria Collares, Meryem Deffairi, Patricia Pellanda, Rafael Prado, Sandro Schmitz, Tatiana Falcão Octaviano, Virgílio Gibbon, Maria Morelli, Luiz Borges, Teresa Vilac, Colin Crawford.

Serão feitas algumas recomendações sobre os temas gerais da conferência tendo por base os seguintes grandes tópicos: 1) Definições; 2) Investimento e Comércio Sustentáveis; 3) Governança nacional e internacional; 4) Quadro institucional nacional para o desenvolvimento sustentável; 5) Quadro institucional internacional para o desenvolvimento sustentável. Cada tema possui recomendações nacionais e internacionais. As nacionais representam o aspecto da governança nacional, da implementação e da efetividade de temas ligados à economia verde e ao desenvolvimento sustentável. As internacionais tratam de aspectos de governança internacional desses temas.

## A ECONOMIA VERDE NO CONTEXTO DO DESENVOLVIMENTO SUSTENTÁVEL E DA ERRADICAÇÃO DA POBREZA

### 1) Definições

#### a) Aspectos importantes para o Conceito de economia verde

1) A internalização das externalidades dos custos sociais e ambientais. Algumas políticas para fomentar essa internalização seriam, por exemplo, a valoração dos recursos naturais por meio de taxas e os incentivos fiscais às práticas sustentáveis (PDMA).

2) A determinação de objetivos sociais que poderiam ser implementados pela "economia verde". Os objetivos poderiam ser: o aumento de empregos, a diminuição do consumo, a produção mais sustentável ou a garantia de moradia. As políticas correspondentes seriam promover licitações com critérios sustentáveis, viabilizar a regularização fundiária e incentivar investimentos públicos em áreas prioritárias (PDMA).

3) Com relação à economia verde, observa-se que quanto mais setorizada é feita a análise, mais facilmente podem ser identificadas políticas que possam fomentar a construção da perspectiva "Verde". Cada área específica, como as construções, o turismo, a biodiversidade, a energia, as cidades, têm as suas peculiaridades. O conceito de economia verde poderia ser tirado dos avanços sustentáveis de cada setor econômico (PDMA).

#### b) Aspectos importantes para o conceito de desenvolvimento sustentável

1) Identificar critérios gerais de sustentabilidade a partir de uma definição dada por cada país. Que cada país possa enviar ao Secretariado da ONU para a Rio + 20 sua definição do que seja desenvolvimento sustentável. Essa proposta decorre das disparidades entre o desenvolvimento econômico, social e ambiental de cada Estado. Cada um deve identificar de que modo poderá contribuir com as vidas presentes e futuras (PDMA).

2) Sugere-se que seja construído um conceito brasileiro de desenvolvimento sustentável de acordo com as prioridades de políticas públicas para o país (PDMA).

3) Opinião sobre a relevância do conceito de cada Estado:

"Um conceito é uma abstração que é utilizando para intelectualizar um assunto complexo. Assim, é possível explicar a complexidade da realidade que se torna mais acessível. No entanto, o risco que nasce com a utilização de um conceito é a sua simplificação e a sua banalização. Ele pode ser considerado como o espelho perfeito da realidade. E um erro tanto metodológico quanto científico. Às vezes, este caminho é tomado para o conceito do desenvolvimento sustentável. Há uma vontade das pessoas que trabalham com esse assunto de universalizar e de uniformizar o conceito. Por conseguinte, elas matam o conteúdo do desenvolvimento sustentável. Os princípios do desenvolvimento sustentável devem ser aplicados por cada Estado. Cada Estado tem seus próprios níveis de desenvolvimento, suas economias e sua sociedade. São, portanto, diferentes e não possuem nem os mesmos objetivos, nem os mesmos meios para realizar seus objetivos. As considerações ambientais, por exemplo, não têm o mesmo valor em cada Estado. Nesse sentido, o que é o desenvolvimento sustentável para um Estado não é necessariamente a mesma coisa para um outro Estado. Por isso, não é útil ter uma única definição do conceito do desenvolvimento sustentável. Praticamente cada Estado conhece suas necessidades no âmbito de seu desenvolvimento. Portanto, ele pode decidir sozinho suas políticas em função de sua realidade. Finalmente, é útil sublinhar um último ponto. Os recipientes finais das teorias do desenvolvimento e do desenvolvimento sustentável - os humanos - são às vezes esquecidos e negligenciados pelas pessoas que trabalham sobre esses assuntos. Suas realidades são tão complexas, tão diversas que é difícil entender como é possível fazer uma teoria sobre o desenvolvimento sustentável sem nunca realizar alguns estudos práticos no campo. Além disso, essas teorias são frequentemente construídas nos escritórios, em poucas horas. É uma razão porque o desenvolvimento sustentável tem poucos efeitos práticos" (Nitish Monebhurrn).

### 2) Investimento e Comércio Sustentáveis

#### a) Florestas Recomendações Internacionais

1) Adoção de uma Convenção sobre o tema. (Luciene Araújo)

2) Maior aporte de recursos financeiros para implantação de Pagamento por Serviços Ambientais como o Fundo Mundial para o Meio Ambiente (Global Environmental Facility – GEF). (Luciene Araújo).

3) Estabelecer certificação socioambiental (José Antônio Tietzmann Silva).

4) Que sejam inseridas recomendações relativas a danos ambientais, no âmbito do Conselho de Direitos Humanos da ONU e em conselhos ou comissões do sistema regional de proteção aos Direitos Humanos. (José Antônio Tietzmann Silva). Recomendações Nacionais

1) Implementação de mecanismos e de instrumentos de conservação, por meio de medidas coercitivas e voluntárias. (Fernando Meneguim).

2) Implementação de políticas e de medidas que incentivem a redução do desmatamento ilegal. (Fernando Meneguim).

3) A implementação pelos Estados de incentivos financeiros para a preservação do meio ambiente, com a possibilidade de participação de entes públicos e privados.

(Fernando Meneguín).

- 4) Foco na regularização fundiária e definição de direitos e benefícios oriundos de instrumentos diversos para a conservação. (Fernando Meneguín).
- 5) Definição de um marco regulatório nacional que privilegie a conservação e valorize a floresta em pé (PDMA).
- 6) Conciliar políticas públicas de desenvolvimento (ex. PAC) com políticas de conservação (ex. PNMC) (PDMA).
- 7) Direitos de propriedade claros e reconhecidos, visto que tal segurança trará a possibilidade de fazer um planejamento a longo prazo pelo detentor da terra (Fernando Meneguín e PDMA).

REDD:

- 8) Utilizar, não os estoques de carbono, mas os fluxos anuais de custo da oportunidade das terras com cobertura florestal (Virgílio Gibbon).
- 9) Unificação dos registros dos créditos de todos os Estados em uma única Empresa de Registro para evitar a dupla contagem no nível nacional (Virgílio Gibbon).
- 10) Necessidade de incorporar o conceito de custo de oportunidade na busca de soluções para o tema do desmatamento das florestas nativas (Virgílio Gibbon).
- 11) Estabelecer um regime de REDD+ demanda que os direitos e os deveres sejam claros tanto no nível nacional quanto no internacional (PDMA).
- 12) A participação local e a transparência no processo de definição do acesso a benefícios e da alocação de recursos de REDD+ são cruciais para a garantia de uma governança efetiva. (PDMA).

b) Energias renováveis

Recomendações Internacionais

1) Especificamente, uma Convenção-Quadro poderia:

- a) Estabelecer uma lista das energias renováveis classificadas de acordo com critérios econômicos (custo de produção, nível de tecnologia necessário, os recursos necessários para a sua produção, os níveis de importação / exportação, a capacidade de criação de emprego, etc.) e ambientais (taxa de substituição de combustíveis fósseis, impacto ambiental, balanço de carbono do processo de produção, etc.) (Meryem Deffairi).
  - b) Estabelecer uma meta vinculativa, "um mínimo", de energia renovável em 10 anos para os países desenvolvidos e em 15 ou 20 anos para os países em desenvolvimento (obrigação de resultado, deixando os Estados livres dos meios utilizados para alcançar este) e, finalmente, integrar as necessidades de planejamento para cada Estado (Meryem Deffairi).
  - c) Fornecer um mecanismo para sanções financeiras aplicáveis em 10 anos, e a cada 5 anos, dependendo do nível de energia renovável em cada Estado, mediante o pagamento de uma multa a uma instituição internacional independente, responsável pela "reinação" de fundos em projetos de desenvolvimento de tecnologia de produção de energia renovável. (Meryem Deffairi).
- 2) Ao invés de discutir um novo marco institucional deveríamos questionar a função e a capacidade de atuação da Agência Internacional para Energia Renovável criada em Janeiro de 2009 (IRENA - <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade). Recomendações Nacionais
- 1) Fazer parte da Agência Internacional para Energia Renovável criada em Janeiro de 2009 (IRENA - <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade).
  - 2) Regulamentação do etanol no Brasil – promulgar o Regulamento de Avaliação da Conformidade para Etanol combustível, cuja finalidade é estabelecer os critérios para avaliar as propriedades intrínsecas do etanol, considerando as normas técnicas estabelecidas, além de avaliar os requisitos socioambientais aplicáveis a seu processo produtivo, baseados nas legislações trabalhistas e ambientais brasileiras e internacionais, das quais o Brasil é signatário (PDMA).
  - 3) Adoção de políticas governamentais de incentivo à substituição das fontes de energia baseadas em combustíveis fósseis por energias renováveis (Luciane Martins).
  - 4) Implementação dos governos locais de legislação de fomento e de regulamentação da utilização de energias renováveis (Luciane Martins).
  - 5) Promoção de concessão dos direitos de propriedade intelectual relativas às energias renováveis que possam favorecer os países em desenvolvimento (Luciane Martins).
  - 6) Aquisição mais favorável de patentes tendo em vista a necessidade de investimento em energias renováveis em função dos problemas climáticos vivenciados (Luciane Martins).
  - 7) Redução de tarifas e de subsídios visando a implementação de tecnologias empregadas para a geração de energias renováveis a fim de diminuir os custos e aumentar a sua produção (Luciane Martins).
  - 8) Políticas públicas visando redução no consumo com o objetivo de reduzir também o consumo de energia. (Luciane Martins).

c) Biodiversidade e mecanismos de compensação

Recomendações Internacionais

- 1) Qualificar juridicamente a biodiversidade e dar-lhe um estatuto jurídico no âmbito internacional (Jessica Makowiak).
- 2) Definir no âmbito internacional a compensação e os seus critérios (Jessica Makowiak).
- 3) Situar a noção de compensação juntamente com os princípios reconhecidos e consagrados do direito internacional do meio ambiente (princípio da prevenção, do poluidor-pagador). A compensação pode antecipar ou intervir antes da realização do dano (Jessica Makowiak).
- 4) Hierarquizar as prioridades com relação à supressão da perda da biodiversidade, de redução das perdas e da compensação das perdas (Jessica Makowiak).
- 5) Reservar as ações de compensação aos projetos que não causem uma perda importante ou irreversível da biodiversidade (Jessica Makowiak).
- 6) Definir, classificar e hierarquizar as modalidades de compensação no âmbito da biodiversidade (Jessica Makowiak).
- 7) Prever, nos textos que permitem compensação, as medidas de acompanhamento, de fiscalização e de controle das medidas de compensação (Jessica Makowiak).

8)Prever as sanções em caso de desrespeito às medidas de compensação e de acompanhamento de seus efeitos (Jessica Makowiak).

9) Avaliar as experiências de compensação no plano institucional (problema dos atores que devem decidir, implementar e controlar as medidas de compensação) (Jessica Makowiak).

10) Identificar meios para canalizar recursos econômicos de conservação da biodiversidade para os países em desenvolvimento com rica biodiversidade. (Luiz Gustavo Bezerra).

d) Contratos privados verdes

Recomendações Internacionais

1) Na área de Direito Privado, a inserção de cláusulas socioambientais e também a exclusão de cláusulas chamadas de “estabilização” para permitir a adoção de regras de direitos humanos e ambientais ratificadas posteriormente à assinatura dos acordos (Sílvia Pinheiro).

e) Transferência de tecnologia

Recomendações Internacionais

1)Promoção de mecanismos de financiamento mais favoráveis para aquisição de tecnologias limpas por empresas de países em desenvolvimento (Renata Calsing, Maria Marinho e Carlos Henrique Rubens Tomé Silva).

2) Formação de um fundo que permita a compra de licenças de tecnologias consideradas relevantes para a proteção do meio ambiente (Renata Calsing e Maria Marinho).

3)Necessidade de um estímulo à formação de plataformas de compartilhamento de licenças de tecnologias limpas (Renata Calsing e Maria Marinho).

4)Promoção da discussão sobre a adaptabilidade da licença compulsória às necessidades de acesso a tecnologia limpas e discussão de outros mecanismos (o invento representa um avanço, uma melhoria, uma redução de custos de produção e por isso a empresa titular utiliza de seu direito de exclusividade para se diferenciar no mercado. Logo, o estímulo a transferência de tecnologia, através do licenciamento só será efetivo se os Estados criarem mecanismos de incentivo ao setor privado titular ou co-titular de tecnologias protegidas que tenham impacto na proteção do meio ambiente) (Renata Calsing e Maria Marinho). Recomendações Nacionais

1)Avaliação, no âmbito doméstico, das formas criativas de flexibilização dos direitos de propriedade intelectual, que não violem os compromissos internacionais assumidos pelo País e, ao mesmo tempo, possibilitem a incorporação de tecnologias desenvolvidas no exterior (Carlos Henrique Rubens Tomé Silva).

2)Criação e aprimoramento de mecanismos nacionais de financiamento e desoneração tributária da inovação tecnológica, em especial voltados para as tecnologias ambientalmente saudáveis (Carlos Henrique Rubens Tomé Silva).

3)Adoção de políticas mais eficazes de estímulo à inovação tecnológica no ambiente empresarial (Carlos Henrique Rubens Tomé Silva).

f) Regimes financeiros nacionais e internacionais

1) Colocar os títulos da dívida pública americana que compõem as reservas internacionais dos países integrantes do grupo dos BRICS (Brasil, Rússia, Índia, China e África do Sul) em um Fundo de Investimentos administrado pelos próprios cotistas (Virgílio Gibbon).

2) Elaborar um regulamento para esse Fundo de tal forma que ele possa emitir “Moeda Verde” até o limite de seu ativo, e que tal moeda só possa ser aplicada em ações ou financiamento de projetos sustentáveis de países que aceitem ser beneficiários das aplicações do Fundo (Virgílio Gibbon).

3) Assinar um Acordo de Cotistas de tal forma que a Moeda Verde tenha, por parte dos países cotistas, o mesmo tratamento que hoje se dá ao dólar. Isto é, seja computada como reserva e enseje a emissão correspondente de moeda nacional (Virgílio Gibbon)

4) Adoção de índices sociais e ambientais nas bolsas de valores. Exemplos: Domini 400 Social Index (DSI) , Dow Jones Sustainable Index (PDMA).

g) Produção Sustentável

1)Realizar uma política integrada de produtos fundada em um exame do impacto dos produtos ao longo de seu ciclo de vida. Promover o debate entre o poder público e privado sobre o tema para que as medidas sejam eficazes e que tenham o menor custo (PDMA).

2) Responsabilidade social da empresa para todo o ciclo de produção, incluindo: comunidades locais, salarizados, acionistas, parceiros comerciais, fornecedores, clientes, poderes públicos (PDMA).

3) Financiamento sustentável : financiamento direto para áreas específicas : o financiamento beneficiaria algumas comunidades ou municípios desfavorecidos. Fazer empréstimos por meio de depósitos em bancos desenvolvimento local, com taxas iguais ou abaixo do preço do mercado (PDMA).

h) Consumo Sustentável

1)Responsabilização dos indivíduos e das empresas pelo seu consumo sustentável (PDMA).

2)Controle pelos consumidores da publicidade enganosa das empresas que têm cláusulas em seus Códigos de Conduta sobre proteção ambiental ou certificações ligadas à Responsabilidade Social das Empresas (PDMA).

3) A Economia Verde no contexto do desenvolvimento sustentável: a governança nacional e internacional

a) A responsabilidade dos Estados

Recomendações Internacionais

1)Todas as Partes signatárias devem promover a gestão sustentável, especialmente no âmbito da Administração Pública (Maria Augusta Ferreira).

2)Por gestão sustentável entende-se aquela realizada com transparência, comportamento ético, respeito aos interesses das partes interessadas (stakeholders – trabalhadores/servidores, consumidores, fornecedores, sociedade, governo), respeito aos Direitos Humanos, respeito ao meio ambiente (Maria Augusta Ferreira).

3) O respeito ao meio ambiente na gestão pública se fundamenta nos seguintes pilares: o uso racional dos recursos, a destinação adequada dos resíduos, as contratações públicas sustentáveis, o meio ambiente do trabalho sadio (Maria Augusta Ferreira). Recomendações Nacionais

1) A responsabilidade socioambiental dos órgãos públicos federais, estaduais e municipais compreende, além da responsabilização por danos causados, a prevenção a esses danos, pela redução do impacto ambiental causado pelas atividades estatais, a partir da adoção de práticas de gestão sustentável (Maria Augusta Ferreira).

b) A responsabilidade das empresas

#### Recomendações internacionais

1) Dispositivo que indique a responsabilidade objetiva das empresas no caso de danos ambientais causados por empresas, com solidariedade entre a matriz e as filiais (Carole Peychaud).

2) Acordo sobre "Direitos e responsabilidades dos atores do mercado" com dispositivos como: (PDMA).

a) Critérios mínimos que componham o Código de Conduta das empresas (destinatários e obrigações precisas e claras) (PDMA).

b) Obrigação de realizar os balanços anuais considerando critérios ambientais e sociais (PDMA).

c) Responsabilidade pelas certificações voluntárias obtidas de certificadoras como a ISO. (PDMA)

3) Acréscimo nas Convenções ambientais de dispositivos de conflito de leis e de conflito de jurisdição que indiquem as leis e os tribunais que poderão trazer a melhor reparação para os danos. Exemplo de regras (PDMA):

a) De conflito de leis:

1) no caso de indenizações por danos ambientais, deverá ser aplicada a regra mais favorável à vítima e à proteção do meio ambiente;

2) no caso de existirem seguros ambientais, a lei relativa aos direitos do segurado deve ser aplicada;

3) no caso de danos ambientais, a lei da matriz pode ser aplicada caso ela tenha controle sobre as atividades de sua filial.

b) De conflito de jurisdições:

1) As vítimas de danos ambientais podem escolher o tribunal que poderá decidir pela melhor reparação dos danos em razão, por exemplo, da proximidade das provas;

2) Se a matriz tiver o controle sobre as atividades de sua filial, a jurisdição da matriz terá competência para julgar o caso;

3) Uma ação contra uma multinacional pode ser interposta diante do tribunal do domicílio do réu. Se o réu for uma empresa, o domicílio do requerido pode ser localizado em qualquer um dos três lugares: a) onde a empresa tiver sido registrada; b) o local onde está a sua administração central, c) o principal local de realização das atividades da sociedade.

#### Recomendações específicas para o Direito internacional dos investimentos

1) A integração das disposições de proteção ao meio ambiente nos Acordos Internacionais de Investimento: os Acordos de investimento futuros ou a renegociação da existência de Acordos deveria incluir disposições específicas de proteção ao meio ambiente. Essas disposições podem considerar (Nitish Monebhurrn):

(i) A definição de uma atividade de investimento: as atividades das companhias constituídas de uma absoluta ignorância em leis ambientais nacionais não deveriam ser qualificadas como um investimento e, portanto, não deveriam se beneficiar de uma proteção a acordos de investimento. As disposições nos acordos internacionais de investimento sobre a definição do ambiente deveriam ressaltar esse ponto. O acordo deveria constatar que o investidor tem o dever de checar, examinar e entender o quadro legal do Estado de acolhimento, especialmente aquele aplicável ao ambiente e, assim, ele deverá começar e conduzir sua atividade conforme o acordo.

(ii) A definição de meio ambiente: meio ambiente não é uma abstração e, seguindo a linha do raciocínio acima, alguns detalhes devem estar disponíveis para definir ou identificar o que deve ser entendido por meio ambiente. Pode ser uma tarefa complexa prover uma definição exaustiva, porém, não é impossível listar indicadores de seu significado. Tais indicadores podem variar de um Estado para o outro.

(iii) Afirmação dos direitos dos Estados de regular de acordo com seus interesses ambientais: compensação é, normalmente, feita em caso de exploração, por exemplo, expropriação com motivos ambientais deveria ter um status específico e a compensação por essa expropriação deveria ser modulada para dar legitimidade ao objetivo de proteção ambiental.

(iv) As legítimas expectativas dos Estados: o Acordo deve, além de tudo, afirmar que os Estados tenham expectativas legítimas em que companhias privadas que investem em seu território sempre agirão de boa-fé para colaborar com eles, sempre que objetivos ambientais estão envolvidos. As empresas privadas devem agir de acordo com essas regras e não devem frustrar essas expectativas.

2) A integração de regras claras de conflito em Acordos internacionais de investimento, destacando a prevalência de normas de proteção ambiental sobre normas de proteção de investimentos (Nitish Monebhurrn):

(i) O princípio: toda vez que houver um conflito potencial entre a proteção ao investidor ou ao investimento e a proteção ao ambiente, os acordos de investimento devem apresentar regras claras de conflito. O acordo do investimento pode declarar que sempre que a proteção a um investimento entrar em conflito com uma norma ambiental, o último deve prevalecer sobre o anterior. Como a proteção ambiental é um objetivo unânime, considerado fundamental, deve-se dar a ela prioridade.

3) Promoção do uso de princípios sistêmicos de integração (Nitish Monebhurrn):

(i) O princípio: por este meio, os Acordos deveriam observar que as leis internacionais de investimento não são clinicamente isoladas do resto das leis internacionais e que a interpretação de um tratado internacional de investimento não exclui referências a outras leis que não tratem de investimento, como leis ambientais. Isso está de acordo com o artigo 31 (1) c) da Convenção de Viena sobre Tratados. Logo, normas ambientais podem ser integradas em setores de disputa sobre investimentos internacionais. Elas também podem ser invocadas por Estados e deverão ser consideradas por tribunais arbitrais.

#### Recomendações Nacionais

1) Implementar e divulgar o sistema de Pontos de Contatos Nacionais da OCDE no Brasil para que as empresas possam ser questionadas sobre as suas ações pela sociedade (PDMA).

2) Controlar as atividades privadas por meio de: 1) criação de critérios de sustentabilidade precisos os quais as empresas deveriam apresentar; 2) apresentação obrigatória

desses critérios e 3) fiscalização do governo das informações publicadas. Esses critérios podem ter como base o GRI (PDMA).

3)Votação do Projeto de Lei 6826/2010 sobre a responsabilização administrativa e civil de pessoas jurídicas pela prática de atos contra a administração pública, nacional ou estrangeira e dá outras providências. Disponível em: <http://www.camara.gov.br/proposicoesWeb/fichadetramitacao?idProposicao=4...> (PDMA).

c) A responsabilidade das instituições financeiras Recomendações internacionais

1) As organizações públicas e privadas, nacionais, estrangeiras ou internacionais, financiadoras ou patrocinadoras de atividades ou de projetos de atividades poluidoras ou potencialmente poluidoras, devem exigir a apresentação de todos os documentos referentes ao licenciamento ambiental do empreendimento por elas financiados, emitidos pelos órgãos de controle responsáveis, sob pena de se tornarem co-responsáveis pelos eventuais efeitos decorrentes do descumprimento desta Lei ou de sua regulamentação (Bruna Acerbi).

2) Deve-se, também, atentar para análise de custo-benefício ambiental, definindo o objeto e identificando seus impactos, definindo-os de acordo com sua relevância e quantificação em unidades físicas, valorando-os monetariamente (Luiz Borges).

Recomendações nacionais

1) O Conselho Monetário Nacional deverá estabelecer uma resolução sobre os critérios de análise de riscos ambientais na concessão, pelo sistema financeiro brasileiro, de créditos para atividades efetiva ou potencialmente poluidoras (Bruna Acerbi).

2) O Conselho Monetário Nacional deverá estabelecer resolução sobre a limitação da responsabilidade dos agentes financiadores de projetos que venham a causar dano ao meio ambiente, proporcionalmente aos cuidados de análise prévia de riscos ambientais na concessão, pelo sistema financeiro brasileiro, de créditos para atividades efetiva ou potencialmente poluidoras (Bruna Acerbi).

3) Criação, no âmbito do Ministério do Meio Ambiente, de uma Comissão de Risco Ambiental, com o objetivo de auxiliar na implementação e da fiscalização da incorporação da variável ambiental nas instituições financeiras, além de aperfeiçoar a gestão de recursos financeiros governamentais e privados aplicados ao meio ambiente (Bruna Acerbi).

d) O acesso à informação e a participação pública

Recomendações internacionais

1) É necessário definir melhor o que significa o direito de acesso à informação tanto no âmbito internacional como no nacional (PDMA).

2) Que seja assinada uma Convenção Regional na América Latina para que seja implementado o acesso à informação na região, sob o controle de alguma instituição como a CEPAL (rede TAI).

3)Que seja ratificada a Convenção Aarhus (PDMA). Recomendações nacionais

1) Prazos para a publicação de todos os documentos referentes a decisões ambientais (PDMA).

2) Multas por descumprimento dos prazos de publicação (PDMA).

3) Que seja ratificada a Convenção Aarhus (PDMA).

4) Que seja assinada uma Convenção Regional na América Latina para que seja implementado o acesso à informação na região, sob

o controle de alguma instituição como a CEPAL (PDMA).

5) Que um Decreto seja promulgado com um maior detalhamento de termos que são normalmente muito imprecisos sobre a participação cidadã, com alguns exemplos de artigos (PDMA):

a) Que as audiências públicas possam ser realizadas, por exemplo, por setor, por população ou por comunidade para que não haja uma dominação das audiências por populações que tenham maior possibilidade de se expressar (Colin Crawford).

b) Obrigar que haja mecanismos eficazes de acesso da população e das comunidades interessadas a todos os documentos pertinentes à audiência pública, bem como o acesso a versões com linguagem de fácil compreensão para leigos dos detalhes dos projetos propostos(PDMA).

c) Oferecimento de cursos de capacitação para líderes comunitários e técnicas de mediação com o objetivo de qualificar os que necessitam do procedimento da audiência pública(PDMA).

d) Obrigar que a participação pública ocorra desde o início do procedimento ou do processo que atingirá a comunidade específica(PDMA).

6) Obrigar a elaboração de Relatório de Impacto Ambiental (RIMA) vinculado ao Estudo Prévio de Impacto Ambiental (EIA) (PDMA).

7)As leis devem compor os três níveis de controle (Federal, Estadual, e Municipal) e devem conter a provisão das audiências públicas por setor, ao menos no início dos processos ambientais. (Colin Crawford).

8) A disponibilização na internet dos Termos de Ajustamento de Condutas (TACs) e das Ações Cíveis Públicas em matéria ambiental, nos termos da Resolução Conjunta nº 02 do CNMP e do CNJ, destacando especificamente o objeto da presente ação, com a separação na indicação do que seria para prevenir danos ao meio ambiente e do que seria para reparar danos já causados ao meio ambiente. (Larissa Clare Pochmann da Silva).

e) O Monitoramento e a Accountability

1) Transposição do sistema de Monitoramento, como o exemplo do GRI, no Brasil(PDMA).

2) Controle das informações dadas pelas empresas de seus balanços anuais pelo Estado, por meio de um dos Ministérios. Esse Órgão nacional poderia representar o GRI no Brasil. Hoje essas informações não são controladas pelo Estado (PDMA).

3) Divulgação dos balanços das empresas pela internet (com dados comparáveis estabelecidos pelos Estados) (PDMA).

4) Norma sobre a obrigatoriedade dos balanços sociais, com a previsão de aspectos ambientais e sociais. (PDMA).

5) Decreto estipulando quais critérios devem constar no balanço social anual da empresa, para que as informações sejam comparáveis (PDMA).

f) As licitações verdes

#### Recomendações Internacionais

1) Redação de diretrizes mais específicas sobre o tema na Rio +20 (Teresa Villac). 2) Fortalecimento das contratações públicas sustentáveis no MERCOSUL (Teresa Villac).

#### Recomendações nacionais

1) Necessidade de regulamentação do art. 6º, XII e da Lei 12.187/09 (Teresa Villac).

2) Atuação governamental em prol da ampla disseminação da constitucionalidade e legalidade das contratações públicas sustentáveis em todos os entes federativos (Teresa Villac).

3) Fortalecimento do assessoramento jurídico-ambiental nos órgãos públicos de consultoria para que, nos processos licitatórios (artigo 38, parágrafo único, Lei 8.666/93) orientem a implementação das contratações públicas sustentáveis com segurança jurídica e observância dos princípios constitucionais, da Administração Pública e licitatórios (Teresa Villac). públicos (Teresa Villac).

5) Atuação integrada das contratações sustentáveis como mecanismo de gestão pública socioambiental (Teresa Villac).

6) Divulgação de programas existentes, como Agenda Ambiental na Administração Pública (A3P – MMA) (Teresa Villac).

g) Águas: A cobrança pelo uso da água

#### Recomendações Nacionais

1) A Tarifa Progressiva deve ser abolida do sistema jurídico por representar uma ameaça à hidrodignidade com a categorização dos excluídos da água (João Renato L. Paulon).

h) Águas: A criação de áreas protegidas em alto-mar

1) A fim de se alcançar o desenvolvimento sustentável, compete aos Estados a criação de áreas marinhas protegidas (Fernanda Borges).

2) As áreas marinhas protegidas devem ser consideradas como áreas de proteção integral, essenciais para a preservação da biodiversidade e para a manutenção dos processos ecológicos marinhos essenciais (Fernanda Borges).

3) Toda e qualquer atividade lesiva ou potencialmente lesiva ao equilíbrio ecológico e à preservação da biodiversidade nas áreas marinhas protegidas devem ser consideradas proibidas, em respeito ao direito ao meio ambiente ecologicamente equilibrado das presentes e das futuras gerações (Fernanda Borges).

4) As áreas marinhas protegidas devem garantir a proteção da biodiversidade e a qualidade das águas marinhas, para se evitar a acidificação e a morte dos organismos bióticos e abióticos necessários à captação de carbono da atmosfera, responsáveis pela mitigação do aquecimento global e da mudança climática (Fernanda Borges).

5) As áreas marinhas protegidas devem garantir a preservação de recursos naturais pesqueiros, necessários à segurança alimentar das presentes e futuras gerações (Fernanda Borges).

6) As áreas marinhas e as zonas costeiras consideradas pelo Ministério do Meio Ambiente Brasileiro, no PROBIO I e II, devem ser constituídas, por lei, como áreas marinhas protegidas e Unidades de Conservação, para o fim de preservar e manter os processos ecológicos marinhos essenciais (Fernanda Borges).

i) Águas: a gestão de aquíferos sob o território de diversos Estados

1) Redução da informação assimétrica no âmbito dos aquíferos (caso específico: Aquífero Guarani) (David Cassuto e Romulo Sampaio).

2) Aumento do envolvimento regional e local (sensibilização, capacitação e conhecimento tradicional). (David Cassuto e Romulo Sampaio)´.

3) Harmonização das legislações nacionais. (David Cassuto e Romulo Sampaio).

4) Estabelecimento de estruturas regulatórias (serviços ambientais). (David Cassuto e Romulo Sampaio).

j) A tributação como mecanismo de gestão ambiental

#### Recomendações Internacionais

1) Estabelecer um limite (cap) para cada país, de emissão de carbono. O cap inicial deverá ser resultado da média de carbono emitido ao longo dos últimos 3 a cinco anos. Uma regra de transição poderá ser criada (regra mais leniente) para países em desenvolvimento e para os países menos desenvolvidos (Least developed countries – conforme classificação da OMC) – para que estes países não sejam prejudicados em virtude de seu pouco grau de desenvolvimento atual, e para que eles possam desenvolver-se a despeito das metas para redução de carbono (Tatiana Falcão Octaviano).

2) O carbono emitido em cada país deverá passar a ser tributado, de modo a incentivar as empresas a empregarem recursos no desenvolvimento de novas tecnologias para produção de energia limpa. As alíquotas do imposto deverão ser uniformes em cada país (sugerimos o estabelecimento de uma alíquota máxima e uma alíquota mínima), de modo a que não sejam criados “paraísos fiscais de carbono” (Tatiana Falcão Octaviano).

3) O estabelecimento de alíquotas máxima e mínima também impedirá a adoção de ajustes tarifários de importação de produtos (Border Tax Adjustments “BTA”) (Tatiana Falcão Octaviano).

4) Criar-se um tratado que estabeleça uma origem para o carbono emitido em decorrência de atividades internacionais (Tatiana Falcão Octaviano).

5) Criação de um novo organismo internacional, dotado de poder de polícia para fiscalizar e eventualmente penalizar aqueles que não estiverem obedecendo aos limites impostos pelo tratado (Tatiana Falcão Octaviano).

#### Recomendações Nacionais

1) Do tributo verde:

- a) Instituir uma forma menos onerosa para o consumidor final, de tributação dos combustíveis, de modo a incentivar o consumo de combustíveis menos poluentes (tais como o biodiesel e o álcool) com o objetivo de reduzir o consumo de combustíveis de maior concentração carbônica e, portanto, mais poluentes, tais como o diesel e a queima de carvão (Tatiana Falcão Octaviano).
- b) Instituir uma contribuição verde (cuja finalidade tivesse o fim precípuo de criar-se um fundo para o combate das alterações climáticas e a redução dos efeitos nocivos do aquecimento global) sobre combustíveis. A contribuição seria progressiva, onerado mais o combustível diesel e menos o biodiesel, por exemplo (Tatiana Falcão Octaviano).
- c) Os recursos arrecadados com a contribuição verde devem ser empregados no desenvolvimento de tecnologia brasileira para montagem de carros elétricos, desenvolvimento de novas fórmulas de biodiesel (por exemplo, sabe-se que é possível transformar casca de batata e outras verduras em combustível) e até mesmo para a promoção de iniciativas “verdes” tais como aumento da eficiência no projeto de reciclagem, replantio de florestas (que também são internacionalmente denominadas “carbon sinks,” já que consomem e re-absorvem o carbono presente na atmosfera), construção de ciclovias para estimular a utilização de bicicletas pela população local, etc. (Tatiana Falcão Octaviano).

## 2) ICMS

- a) Sugerimos que seja concedido pelo governo federal uma dedução na base de cálculo do imposto de renda, para as pessoas jurídicas que comprovarem estar adotando práticas que contribuam para a redução das emissões de carbono. Este é um incentivo que já foi testado em países europeus e se mostrou altamente efetivo na redução das emissões de carbono (Tatiana Falcão Octaviano).
- b) Sugere-se que o governo federal estabeleça metas para que cada estado reduza a quantidade de carbono emitida em seus respectivos estados (Tatiana Falcão Octaviano).
- c) Instituir incentivo governamental na forma de um “prêmio” em dinheiro. Os cinco Estados que conseguissem efetuar a maior redução de emissões (proporcionalmente à média histórica de cada estado) ganhariam este prêmio, que nada mais seria do que um repasse adicional de recursos para utilização no desenvolvimento de obras de infraestrutura “verdes” tais como a construção de novas linhas de metrô e de trem. Esta sugestão estadual é compatível com a política mundial de controle às mudanças climáticas (Tatiana Falcão Octaviano).
- k) O princípio da interdição do retrocesso no direito ambiental

## Recomendações Internacionais

- 1) Migração dos princípios da interdição de retrocesso do âmbito dos direitos humanos para o de direito ambiental (Michel Prieur).
- 2) Com o objetivo de preservar o desenvolvimento sustentável e garantir a necessária tutela do meio ambiente, os Estados não poderão adotar medidas legislativas, administrativas ou judiciais, que importem uma redução ilegítima dos respectivos níveis de proteção que concedem as leis protetoras do meio ambiente, exceto que concorresse um interesse público prevalente (Maria Morelli).
- 3) No caso que os Estados adotem uma medida legislativa, administrativa ou judicial, que reduza os níveis de proteção ambiental vigentes, deverão justificar devidamente a razoabilidade e a proporcionalidade da medida (Maria Morelli).
- Recomendações Nacionais
- 1) Os objetivos ambientais devem ser obtidos em forma gradual, através de metas provisórias e finais, projetadas sobre a base de uma planificação estatal que facilite a execução das atividades relacionadas com esses objetivos. (Maria Morelli).
- 2) Os esforços feitos para garantir a devida proteção e conservação do meio ambiente não podem diminuir. Neste sentido, é proibida a adoção de medidas legislativas, administrativas ou judiciais que reduzam ilegítimamente os níveis de proteção da legislação ambiental, exceto no caso de concorrência com um interesse público que seja prevalente. (Maria Morelli).

## l) Definição e critérios para a sustentabilidade local

## Recomendações Nacionais

- 1) Definição e promoção de indicadores de sustentabilidades que possam ser utilizados para formulação de políticas públicas ambientais locais. Indicadores que compatibilizem a proteção e a preservação dos bens, serviços e recursos ambientais e culturais com as necessidades de desenvolvimento econômico e social. (PDMA).
- 4) A Economia Verde no contexto do desenvolvimento sustentável: a erradicação da pobreza
- a) A regularização fundiária
- 1) Propõe-se a fixação de direitos da propriedade nas florestas e biomas para evitar o desmatamento ilegal (Fernando Meneguín).
- 2) A concessão dos direitos da propriedade imóvel pública para melhorar o controle dos recursos nacionais e facilitar a regularização fundiária (Fernando Meneguín).
- 3) A imposição de limites no uso da terra; a concessão de direitos que não sejam absolutos, mais forneçam benefícios a detentor do direito e ao Estado por meio de diretrizes voltadas para o uso da terra (Fernando Meneguín).
- 4) É necessário estabelecer uma política efetiva e um processo coordenado do ordenamento territorial (José Heder Benatti).
- a) O Estado deve ser proativo e coordenar o processo do ordenamento territorial para que suas políticas públicas sejam eficazes, pois a falta de uma política de destinação de bens públicos pode deixar espaço para que ocorra um ordenamento caótico das áreas públicas, por meio da grilagem e do desmatamento – o que, na maioria das vezes, acontece quando tal política não existe.
- b) Para tanto, é necessário estabelecer uma política de ordenamento territorial que inclua: regularização fundiária; licenciamento ambiental das propriedades rurais; cumprimento da função social da propriedade; controle, fiscalização e instrumentos econômicos capazes de estimular a gestão sustentável dos recursos naturais, de maneira especial, da floresta.
- i) Por exemplo, o incentivo econômico ou fiscal pode estimular gastos privados em certas áreas, desestimular comportamentos danificados, e corrigir tendências do mercado que podem encorajar ações contra a conservação da natureza e proteção dos recursos naturais.
- 5) A regularização fundiária para assegurar o controle e definir o direito de propriedade, permitindo o poder público conhecer quem está ocupando as glebas de terra e como estão sendo utilizados. (José Heder Benatti).
- c) Para superar o atual caos fundiário, primeiramente deverá ser definida a dominialidade das áreas – quem é o proprietário da terra: público ou privado? Se for público, de

qual ente federativo?

d) O reconhecimento oficial das diferentes formas de ocupação existentes permitirá ao Estado e à sociedade o controle sobre o uso da terra e dos demais recursos naturais. Portanto, a regularização fundiária terá impacto positivo e não negativo, desde que priorize a ocupação familiar.

e) Outro efeito positivo da política de regularização fundiária é o combate à grilagem de terras públicas.

6) Há várias medidas necessárias para implementar um ordenamento territorial: (José Heder Benatti).

f) superar a limitada capacidade de gestão dos órgãos competentes para o ordenamento fundiário, seja no seu corpo técnico, seja no material.

g) compreender que a consolidação da propriedade rural, respeitando os pressupostos sociais e ambientais, representa um importante passo para o fortalecimento da cidadania e para a proteção ambiental.

h) no caso amazônico, a institucionalização da propriedade privada é, também, uma condição para a consolidação de um modelo democrático e participativo de distribuição e de gestão da terra e dos recursos naturais e, conseqüentemente, de proteção do meio ambiente.

i) promover “[a] arrecadação das terras devolutas, hoje ocupadas ilegalmente, [que] torna-se o primeiro passo no processo de ordenamento territorial.

7) Os processos de regularização de ocupação de terra devem: (José Heder Benatti).

j) ser acompanhados de planta e de memorial descritivo georreferenciado. Os custos financeiros para a sua elaboração deverão ser de responsabilidade da (o) beneficiária (o) da legitimação, com exceção dos processos de regularização das pequenas propriedades.

k) incluir, nos títulos de domínio expedidos pelo órgão fundiário, “cláusulas que obriguem o beneficiário a manter, a conservar e, se for o caso, a restaurar as áreas de preservação permanente e de reserva legal.

l) realizar o processo de varredura fundiária territorial, que leva “um processo de gestão territorial contínua, transparente e democrática, pactuado com os diferentes atores sociais – federal, estadual, municipal e sociedade civil,” seguindo o exemplo do programa já testado no Estado do Pará.

8) Outras ações indispensáveis e complementares à regularização fundiária: (José Heder Benatti).

m) a digitalização do acervo fundiário dos órgãos fundiários estaduais e federais” para contribuir à “resolução de várias problemáticas referentes às questões de terra, principalmente aquelas relacionadas à segurança jurídica dos títulos de propriedade rural.

n) a modernização do acesso às informações de registro de imóveis rurais” com o objetivo de “aumentar a confiabilidade dos processos de registros de imóveis e garantir que as informações possam ser obtidas de maneira rápida e a distância pelas entidades públicas ligadas às questões de terra da unidade federativa.

o)

a implementação do cadastro ambiental rural” (CAR) seguindo o exemplo do Estado do Pará (CAR-PA)

b) A educação ambiental

Recomendações Internacionais

1) Tornar o investimento em educação prioridade em países em desenvolvimento e subdesenvolvidos, uma vez que a inexistência de educação contribui ao desemprego, que, por sua vez, reflete na criminalidade e na pobreza. E, ainda, garantir que a educação sirva como instrumento para a conscientização da população para os atuais problemas no mundo, como a política, a saúde e a preservação do meio ambiente. A má distribuição das riquezas também é fruto de uma precária educação (Patrícia Pellanda).

Recomendações Nacionais

1) A educação Ambiental, em todos os níveis, é responsabilidade de todos porque tem reflexo na redução das desigualdades sociais, devendo, nas escolas, ser obedecido ao princípio da transversalidade. (Maria Collares).

2) O poder Público deverá capacitar professores para o ensino da Educação Ambiental em todos os níveis de governo e acompanhar a eficácia do método adotado. (Maria Collares).

3) As informações sobre a Educação Ambiental exigem a transparência necessária para a compreensão de todos porque contribui para a proteção dos recursos naturais, para promover a saúde da população e para colaborar com a erradicação da pobreza. (Maria Collares).

4) A EducaçãoAmbiental é propulsora do desenvolvimento sustentável, razão de ser obrigatória nas escolas, nas atividades sociais, profissionais e públicas. (Maria Collares).

5) É obrigatória a inclusão da matéria Direito Ambiental na graduação objetivando formar o estudante um profissional capacitado para tornar efetiva a legislação ambiental em todas as atividades laborais. (Maria Collares).

c) O direito fundamental à terra e à alimentação

Recomendações Internacionais

1) No que tange ao direito à alimentação o foco da discussão encontra-se na erradicação da fome das populações. Tal problema não pode basear-se em instrumentos que objetivem o aumento da produção de alimentos no mundo, mas sim em meios adequados ao combate das desigualdades sociais e da má distribuição das riquezas. (Patrícia Pellanda).

2) Incentivar a aplicação da Economia Solidária nos países, conscientizando a iniciativa privada de que doações e atitudes solidárias podem contribuir aos resultados da própria empresa, a exemplo da interpretação e aplicação conjunta do Decreto Municipal nº 51.907, de 5 de novembro de 2010, e da Portaria nº 40.497, de 27 de abril de 2001, da cidade brasileira de São Paulo (Patrícia Pellanda).

Recomendações Nacionais

- 1) Valorizar e respeitar o conceito de terras e territórios reconhecidos aos povos indígenas e às comunidades tradicionais como direito coletivo, transcendendo a ideia de propriedade meramente individual (Patricia Pellanda).
- 2) Impedir a equiparação de terras indígenas à propriedade rural familiar no ordenamento jurídico interno dos Estados, por meio do compromisso internacional e do reconhecimento das características específicas aos povos indígenas e suas práticas culturais. Tal medida impedirá, ainda, o desenvolvimento desenfreado do agronegócio em terras indígenas e demais explorações que vêm ocorrendo com frequência sobre essas populações (Patricia Pellanda).
- 3) O compromisso dos Estados com as suas respectivas populações, no intuito de reduzir/erradicar a corrupção política e destinar as verbas aos setores que efetivamente devem ser beneficiados, punindo aqueles que desviam verbas, enriquecem individualmente e 'esquecem' a sua verdadeira função frente ao poder público e social (Patricia Pellanda).
- 4) A conscientização da população de que muitos problemas podem ser resolvidos em curto prazo a partir de medidas criadas e praticadas pela própria população, independente do Poder Público e da ação efetiva de políticos, uma vez que problemas como a fome no mundo e a atual devastação do meio ambiente são problemas de todos os seres humanos no mundo. Se cada cidadão ajudasse apenas uma pessoa necessitada, a diferença já seria imensa (Patricia Pellanda).
- 5) Além da alimentação em quantidade suficiente para satisfazer as necessidades básicas humanas, também devem ser priorizados alimentos (incluindo a água) com qualidade, com vistas à segurança alimentar internacionalmente almejada. Por meio da alimentação quantitativa e qualitativamente adequadas também poderão ser visualizados resultados positivos no setor da saúde, com a redução de doenças, especialmente aquelas provenientes do uso e consumo de agrotóxicos e novas tecnologias, como os transgênicos (Patricia Pellanda).
- d) O direito dos povos indígenas e das populações tradicionais

#### Recomendações Internacionais

- 1)Protocolo que traga definições, obrigações e direitos mais precisos sobre (PDMA):
    - a) consentimento prévio, livre e informado em relação a qualquer atividade realizada em áreas indígenas;
    - b)participação na implementação de projetos;
    - c) proteção e garantia do acesso à terra, dos recursos naturais e dos benefícios oriundos dos mesmos;
    - d) reconhecimento do conhecimento tradicional de povos indígenas (como?), proteção contra realocação de povos para outros territórios (como?);
    - e) mecanismo de monitoramento deve ser criado no âmbito internacional e nacional para garantir a transparência e a efetividade de tais direitos na prática.
  - 2)Os povos indígenas podem sofrer impactos das consequências das mudanças climáticas globais. É necessário garantir que tais impactos sejam mitigados e que capacitação e adaptação às mudanças climáticas sejam direitos desses povos (PDMA).
  - 3) Os povos indígenas têm um papel fundamental na conservação de recursos ambientais e esse papel deve ser reconhecido para fins de compensação por serviços ambientais e distribuição de benefícios de REDD (Redução de Emissão de Desmatamento e Degradação)
- (PDMA). Recomendações Nacionais
- 1)A FUNAI deve se estruturar melhor para garantir que os compromissos assumidos pelo Brasil a nível internacional sejam implementados. É preciso garantir o cumprimento efetivo de princípios e direitos indígenas (PDMA).
  - 2)Deve haver um maior acesso a informação e participação de povos indígenas na implementação e na elaboração de projetos que possam afetá-los direta ou indiretamente (PDMA).
  - 3)É necessário garantir que povos indígenas exerçam o direito previsto na Constituição Federal de usufruto dos benefícios de suas terras, incluindo os serviços ambientais prestados pelas florestas nas quais vivem (PDMA).
  - 4)Valorizar e respeitar o conceito de terras e territórios reconhecidos aos povos indígenas e às comunidades tradicionais como direito coletivo, transcendendo a ideia de propriedade meramente individual. (Patricia Pellanda).
  - 5)Impedir a equiparação de terras indígenas à propriedade rural familiar no ordenamento jurídico interno dos Estados, por meio do compromisso internacional e do reconhecimento das características específicas aos povos indígenas e suas práticas culturais. Tal medida impedirá, ainda, o desenvolvimento desenfreado do agronegócio em terras indígenas e demais explorações que vêm ocorrendo com frequência sobre essas populações. (Patricia Pellanda).
  - 6)Definição do que seriam populações tradicionais (Colin Crawford).

#### QUADRO INSTITUCIONAL NACIONAL E INTERNACIONAL PARA O DESENVOLVIMENTO SUSTENTÁVEL.

##### 5) O Quadro Institucional Nacional

##### a) Instrumentos processuais e materiais

#### Recomendações Internacionais: instrumentos-processuais

- 1) Previsão de participação da sociedade civil por meio de entidades representativas no caso de solução de conflitos em matéria ambiental nas instituições internacionais como *amicus curiae*. (Larissa Clare Pochmann da Silva).
- 2) Estabelecimento de um direito de ação nos tribunais nacionais para punir o descumprimento de Tratados ambientais (Gérard Monédaire).
- 3) Criação de Uniões regionais dotadas de uma personalidade jurídica distinta dos Estados Membros, que possam assinar Tratados Ambientais, tendo como resultado um maior engajamento desses Estados nas questões ambientais (Gérard Monédaire).
- 4) Necessidade de que o cidadão ou a sociedade civil tenha direitos de petição para intervir nas Assembleias Legislativas ou nas Comissões (Gérard Monédaire).
- 5) Imposição de sanções financeiras para o descumprimento ou cumprimento incompleto das decisões de Tribunais ou das leis voltadas para o meio ambiente (Gérard Monédaire).

6) Inversão do ônus da prova em disputas ambientais (Carole Peychaud).

Recomendações Internacionais: instrumentos materiais

1) Elaboração de um tratado sobre a reparação de danos ambientais transnacionais que afetem direta e individualmente nacionais de outros países (Larissa Clare Pochmann da Silva). Recomendações Nacionais: instrumentos-processuais

1) Realização de audiências públicas ou de consultas antes de se firmar Termos de Ajustamento de Conduta em matéria ambiental, discutindo-se os termos que o compromisso será proposto, para que haja a participação dos demais legitimados e da sociedade civil na construção da melhor solução na reparação de danos ambientais (Larissa Clare Pochmann da Silva).

2) Criação de varas especializadas em tutela coletiva nos Códigos de Organização e Divisão Judiciária de cada Estado, para que seja dado um tratamento mais técnico e prioridade de tramitação nas questões ambientais (Larissa Clare Pochmann da Silva).

3) Divulgação dos valores de condenação a danos ambientais destinados ao fundo em matéria ambiental, permitindo a publicidade de como serão aplicados os valores oriundos de condenações por degradações ambientais na reparação do meio ambiente (Larissa Clare Pochmann da Silva).

b) A integração das políticas municipais, estaduais e federais

Recomendações Nacionais

1) A integração de políticas ambientais passa pela criação de critérios claros sobre regras de cooperação entre os entes das diferentes esferas da federação. Capacitação do regulador, principalmente do local, visando aumentar o grau de confiança institucional para evitar o controle estatal múltiplo e ineficiente (PDMA).

c)

Métodos de análise da efetividade da aplicação das leis

1) Os Secretariados das Convenções requeiram aos Estados a designação de instituições nacionais que sejam de Pontos Nacionais de Contato competentes para identificar o descumprimento dos Tratados ambientais que tiverem sido ratificados pelos Estados (PDMA).

2) A prioridade não está na criação de novas leis e tratados internacionais, mas no comprometimento político e social para a aplicação e efetividade das normas já existentes (Patrícia Pellanda). Recomendações Nacionais

1) Analisar a efetividade das leis ambientais com variáveis como o fato de possuir Plano Diretor, lei instituindo o Conselho Municipal de Meio Ambiente, dotação orçamentária prevista em lei e ser habilitado a realizar licenciamento ambiental – método utilizado na pesquisa do PDMA e CPDE (Romulo Sampaio).

2) Metas para melhoria da qualidade ambiental (por exemplo, metas para banir o uso de agrotóxicos que causam danos a saúde humana e ao meio ambiente já proibidos na Europa). (Solange Teles).

3) Criação de indicadores jurídicos de sustentabilidade ambiental - indicadores de governança ambiental ou de política de governança ambiental. (Solange Teles).

6) O Quadro Institucional Internacional

a) Instituições existentes

Recomendações Internacionais

1) Criação de uma agência no âmbito da ONU com competência para o tratamento do desenvolvimento sustentável - esse novo órgão deverá incorporar o PNUMA e o comitê dentro do ECOSOC responsável por desenvolvimento sustentável (PDMA).

2) Criação de um comitê dentro do novo órgão que representaria ONGs internacionais selecionadas por sua atuação (PDMA).

3) Foco no PNUMA.

4) Transformação do Conselho Econômico e Social das Nações Unidas em Conselho Econômico, Social e Ambiental (PDMA).

5) Reforma da Comissão de Desenvolvimento Sustentável na Assembleia Geral (PDMA).

b) Necessidade de novas instituições: Corte Mundial do Meio Ambiente

Recomendações Internacionais

Tendo em consideração o papel e o peso desempenhado pela Corte Internacional de Justiça (CIJ) na comunidade internacional, propomos fundamente a reforma da CIJ ou a fundação de uma Corte Mundial do Meio Ambiente, com base nas seguintes propostas (Rafael Prado):

1) Que a CIJ flexibilize a sua Câmara Ambiental, e que fomente a utilização do princípio de participação e de acesso à justiça das partes interessadas (não apenas estatais, mas também da sociedade civil). O princípio de participação, um dos fundamentais do Direito Internacional Ambiental, foi reconhecido pela CIJ mesma na Sentença do Caso das Usinas de Pasta de Papel no rio Uruguai (ARG vs. URU) (Rafael Prado).

2) Que a CIJ se manifeste sobre a sua competência abrangente em matéria ambiental entre Estados-membros, e que sem necessidade de modificar o seu Estatuto inserido na Carta das Nações Unidas, que se permita a materialização do princípio de participação e acesso à informação e à justiça no caso de questões ambientais que afetem diretamente populações nacionais dos países litigantes. (Rafael Prado)

c) Necessidade de novas instituições: A Organização Mundial do Meio Ambiente

Recomendações Internacionais

1) Os Secretariados das Convenções ambientais, assim como as instâncias técnicas das Convenções seriam Órgãos especializados da nova Organização Internacional (Sandro Schmitz dos Santos).

2) Um dos Órgãos da Organização seria um Órgão de Solução de Controvérsias (OSC) no modelo da estrutura da OMC, com consultas e arbitragem sobre controvérsias

relacionadas ao Direito Internacional do Meio Ambiente. O Órgão seria constituído também por uma Comissão com competências similares à Comissão Interamericana de Direitos Humanos (CIDH) (Sandro Schmitz dos Santos).

3) Três seriam as fontes de recursos da nova organização: as cotas-partes dos Estados que a integram, os recursos de condenações a grandes danos ambientais e taxas cobradas em suas funções de certificação de créditos de carbono e da economia ambiental em geral (Sandro Schmitz dos Santos).

FGV DIREITO RIO+20

Terceira fase do Forum de Sustentabilidade

FGV DIREITO RIO+20

(14 de setembro até 2 de outubro)

A terceira fase consiste no debate em português, espanhol e inglês sobre as recomendações que serão feitas sobre os temas da Rio+20. Essas recomendações decorreram das Jornadas que foram realizadas pelo PDMA e das discussões que ocorreram durante a 2.ª fase do fórum. As recomendações internacionais serão entregues para o Secretariado da ONU para a Conferência Rio+20 e as recomendações nacionais serão entregues para a Comissão Nacional formada para construir a posição brasileira para a Rio+20.

CHART OF SAO PAULO PRE RIO +20 / 2011

Participants of the International Symposium towards the UN Conference on Environment, Rio - 2012 Workshop and MPF Rio + 20, which featured the participation of lecturers Antonio Herman V. Benjamin, Minister of the Superior Court of Justice and Professor of Environmental Law and Comparative Law and Bio-diversity at the University of Texas / USA, Gérard Monédiaire - Professor at the University of Limoges / France, Director of the Center for Interdisciplinary Research on environmental law, planning and urbanism (CRIDEAU), Jessica Ma-kowiak, master of conferences at the University of Limoges, Frederic Bouin, master of conferences at the University of Perpignan, Michel Prieur, Professor Emeritus at the University of Limoges (2004) – France and the gold medal of environmental law of the University of Brussels and Paulo Affonso Leme Machado, lawyer, professor of environmental law at the Methodist University of Piracicaba (UNIMEP); of the debaters Alvaro Luiz Valery Mirra, Judge - TJ / SP, Solange Teles da Silva, lawyer and Professor of Environmental Law at the Mackenzie University / SP, Colin Crawford, professor of environmental law in the Law School at Tulane University, New Orleans / USA; Ricardo Stanzola Vieira, lawyer and coordinator of projects on human rights and public policies at the IEDC - Institute of Studies on Law and Citizenship, Consuelo Moromizato Yoshida, federal judge, TRF/ 3rd Region, and Sandra Cureau – Sub General Republic Prosecutor and Vice Electoral General Prosecutor, the panels being chaired by José Leonidas Bellem de Lima, the Regional Republic Prosecutor /PRR-3ª R, Regina Helena Furtado Strong, Promoter of Justice, MP / SP and Nicolao Dino Neto, Regional Republic prosecutor/PRR-1st region, General Director of the Union Public Prosecution School, held on 27 and 28 June 2011, at the headquarters of the Regional Republic Prosecutor of the 3rd Region, São Paulo, after discussing the themes of the International Symposium towards Rio + 20 in workshops, expose and, ultimately, conclude the following:

I) Regarding environmental displaced people:

Considering that according to the report "Climate Change and Forced Migration Scenarios," prepared by the Institute for Sustainable Development for the European Commission, and presented during the conference of Poznan (Poland, 1st to 12th, December, 2008), the number environmental displaced people exceeded 25 million, and is expected to have achieved 50 million people last year (2010); Considering that the "United Nations Office for the Coordination of Humanitarian Affairs (OCHA) in partnership with Internal Displacement Monitoring Centre (IDMC) conducted a study on the relationship between people displacement and climate change. In this research it became clear that in 2008 approximately 36 million people were displaced as a result of natural disasters, including: earthquakes, floods and rains. About 28 million people have completely lost their homes, and nearly 8 million had to be evacuated from their homes because they were temporarily uninhabitable. The most affected region by these disasters was Asia. (OCHA / IDMC, 2009) In the same year, for comparison, the number of internally displaced due to conflicts accounted for 26 million people. (UNHCR, 2009)."

Considering that soon the number of environmental displaced people can exceed the number of refugees as established by the Geneva Convention (1951), recorded at the United Nations High Commissioner for Refugees (UNHCR), following predictions of the United Nations Institute for Environment and Human Security;

Considering that "The Global Humanitarian Forum (GFH) recently did a survey showing the impact of climate change on human society, exploring issues of that impact on food, health, poverty, security and human displacement.

Regarding this last item, the study acknowledges that it is difficult to prove that a heavy rain or a cyclone arises from the effects of climate change. However, the conclusion shows that 40% of weather-related disasters come from the climate change effect, taking in account the increase of this kind of event in the last thirty years. As a result, the research argues that it should be used the concept of displaced people due to climate reasons, which has grown to 26 million people and will triple by 2020."

Considering that, in a prediction exercise, Conisbee and Simms (2003) report that, until 2050, in case of continuing the present level of ecological degradation, about 150 million people will move due to global warming. International reports of the Intergovernmental Panel on Climate Change (2008) and the International Federation of Red Cross and Red Crescent Societies (2004) also point to the growing number of people affected by extreme environmental events such as hurricanes, floods and landslides. The rise in the average sea level will affect even urban areas such as Alexandria, Manila, Shanghai and Jakarta, with estimation of the Intergovernmental Panel on Climate Change (IPCC), predicting that the number of displaced people will reach 190 million by 2050, population close to the Brazilian territory;

Considering that even countries like Brazil, where climatic conditions historically have produced favorable conditions, keeping it free of major disasters, there are problems with the environmental "displaced" or "plagued" people (as in the case of northeastern drought, forcing the secular people displacement towards large urban centers, especially the city of São Paulo), stated that in the case of torrential rains with flooding and landslides, as the recent drastic hydrological events in the states of Santa Catarina, Rio de Janeiro, Alagoas, Pernambuco and Vale do Paraíba (São Paulo State), there were many dead and displaced people; Considering that "The Stockholm Conference of 1972, already provides for the recognition of early and differentiated responsibilities of States. And the Rio Declaration on Environment and Development, in the Principle 13 also provides for State responsibility for environmental damage and cooperation of those States to the development of international environmental law rules relating to liability and compensation."

Considering that the environmental displaced people, to be covered by the Legal Global Statute are those "forced", that is, those to which there is no alternative but to leave their "habitat", not to be confused with voluntary movement, of free choice of individuals and affected groups.

Considering that the concept of forced displacement also includes the displacement of livelihoods, especially in cases of tribal and traditional populations, situations in which displaced people choose to stay in the degraded environment also deserve protection; Considering that the forced displacement caused by development projects are linked to economic activities, in most cases predominantly private interest, and that the principle of solidarity implies the costs transfer of economic activities for the whole society, there should be the accountability of the entrepreneur, based on the polluter pays principle.

Participants of the International Symposium towards the UN Conference on Environment, Rio - 2012 Workshop and MPF Rio + 20, convinced of the urgency of taking appropriate measures for effective protection of the environmental displaced people, conclude: 1. Aimed at ensuring human dignity and effectiveness of the Universal Declaration of Human Rights to deterritorialized people or groups, often victims of economic marginalization, should be approved the "Draft Statute of the International Convention on Environmental Displaced People" as independent and binding standard, rather than as an addendum or supplement to the 1951 Geneva Convention, 1967 New York Protocol on the Status of Refugees and the United Nations Convention for Climate Change, in order to avoid creating situations of discrimination and inequalities in relation to other refugees. This convention shall be prepared as part of an international conference, with the participation of various international organizations and with invitation to all countries. 2. It is necessary to create a Global Legal Statute, with international and domestic norms, with the objective of protection of the environmental displaced people, as well as providing preventive principles to combat its alarming growth. There should also be provided chances of repatriation to the country of origin or resettlement and transfer of environmental displaced people to a third country, as well as integration with the population to which they were displaced, either the stay may be temporary or permanent. The details of that legal statute will occur at the regional level, such as the Convention of Kampala, October 2009, for the Protection and Assistance of Internally Displaced Persons in the African Union, due to natural or human-made disasters, recognized in the United Nations Guiding Principles on People Internal Displacement.

3. In principle, the Global Legal Statute should cover the obligation of the signatory States, on behalf of solidarity laid down in ECO -92 Principle 13, to provide full legal and material support to victims of extreme environmental events consequences, according to the category of displacement (temporarily, due to changes in the "habitat" or search for better living conditions), taking into account the origin, speed and degree of the displacement cause - events, as well as the real mobility needs, distances and degree of organization of origin country of those displaced people and affected group itself.

4. In case of livelihoods displacement, States shall take all measures aiming at the recovery of degraded environments, ensuring the restoration of livelihoods and full compensation for losses incurred by the displaced people;

5. Such Convention should provide protection for persons affected by events such as earthquakes, tsunamis, droughts (difficulties in food production and access to water), erosion, landslides, storms (tornadoes, hurricanes, typhoons), floods, desertification, destruction of biodiversity, epidemics, disappearance of rivers and lakes, the appearance of hydroelectric dams or similar ones, water pollution, industrial accidents, nuclear accidents, mining activities, changes in sea level, temperature increases, natural causes, with or without evidence of anthropogenic interference and geological risks. Besides these causes, others may be included with the prior hearsay of the International Program on Human Dimensions of Global Environmental Change (IHDP) or specific international body to be created, always open to interdisciplinary scientific contributions of civil society organizations or other public or private militants in the area.

6. The forced displaced people due to development projects linked to economic activities imply cost responsibility to the developer, based on the polluter pays principle. II) Regarding the right to landscape:

Considering that the landscape is an "autonomous legal good", with aesthetic value or not, placed in the unitary conception of the environment, object of an integrated management, in view of its cultural, natural and social aspects;

Considering the cooperation between UNESCO Conventions in the field of culture and the Convention on Biological Diversity (1992), which resulted in the recent Declaration on Biocultural Diversity (Montreal, June 2010);

Considering that the landscape is a major factor in cultural identity formation and consolidation, as well as shared by all human beings, involving current and future generations;

Considering that everyone has the right to the landscape and share responsibility for its protection, with social interconnectivity, and between territories and regions, justifying its collective protection and cross-border and regional protective approaches, and cooperation among nations in an intergovernmental and intersectoral collaboration;

Considering that the quality of life also depends on the landscape and that the physical, social and cultural conditions influence the welfare of the people; Participants of the International Symposium towards the UN Conference on Environment, Rio - 2012 and MPF Rio + 20 workshop, convinced of the urgency of taking appropriate measures for effective protection of the landscape heritage, conclude:

1. That civil society, international organizations and States should be engaged in the structuring of a World Landscape Convention; 2. To be taken in account the landscape features such as: dynamic, not static and complex, multidisciplinary, sensitive, spiritual, heterogeneous, integrative and public interest, demanding to preserve its diversity;

3. That the concern about the ambience requires planning and new legal instruments to preserve the landscape.

4. That should be found solutions and mechanisms that safeguard the information and participation of civil society and communities directly involved in protecting the landscape, through consultations, public hearings, prior advertising of projects, studies and decisions, and foster global environmental governance;

5. For the necessary enhancement of environmental education in tourism related to the landscape protection;

6. That countries should be urged to sign and ratify UN and UNESCO international conventions and declarations, considering their instruments of landscape protection, incorporating such protection systems into their systems;

7. That it should be created within UNESCO and UN context, in relation to their respective conventions, oversight committees regarding compliance with the commitments made about landscape protection;

8. To be highlighted and promoted the urgent need for international co-operation for the sustainable use of spaces and territories, given the frequent threats to the global landscape.

9. To be created financial and non-financial instruments, for landscape improvement also in the urban environment, in order to prevent or mitigate pollution in the city, aiming at integrating the built spaces with natural environments. III) Regarding the effectiveness of environmental law:

Considering that since the 1972 Stockholm Declaration, the international community recognizes that "the protection and improvement of the human environment is a fundamental issue that affects the welfare of people and economic development around the world, an urgent desire of the worldwide people and a duty of all governments";

Considering that the 1992 Rio Declaration Principle 11 says that "States should enact effective laws for the protection of the environment";

Considering that Agenda 21 provides the basis for actions, objectives, activities and means of implementation for strategies and measures to halt and reverse the effects of environmental degradation in the context of intensifying national and international efforts to promote environmentally healthy and sustainable development in all countries;

Considering that the 2002 Johannesburg Declaration and Plan of Action highlights the need of international community's commitment to act and take concrete measures at all

levels for effective environmental protection;

Considering that several national legal systems have constitutions, like the 1988 Brazilian Constitution, which expressly provide a right to an ecologically balanced environment, including the stipulation of obligations and instruments to guarantee this fundamental right, besides the infra constitutional normative texts that supplements the legal environmental protection;

Considering that despite the existence of the international and national normative framework in a significant number of States, "the global environment continues to suffer, biodiversity loss continues, fish stocks continue to be depleted, desertification claims more and more fertile soils, the adverse effects of climate change are already evident, natural disasters are more frequent and devastating, developing countries are the most vulnerable, and the air, water and the sea pollution keep millions of people away from a decent life". This scenario has been only worse since the 2002 -Johannesburg Declaration;

Considering the Chart of Limoges II, providing subsidies for the 2002 -Johannesburg Summit, contains several instruments ensuring the effectiveness of environmental legal protection, and that their proposals were not fully adopted in international legal texts;

Participants of the International Symposium towards the UN Conference on Environment, Rio – 2012 and MPF Rio + 20 workshop, convinced of the urgency in accomplishing the environment protection instruments, conclude for the adoption of the following measures: 1. Ratification of all propositions contained in the Chart of Limoges II;

2. Promotion of campaigns within the United Nations system to promote and encourage, even financially if necessary, the membership of the largest possible number of countries to the Conventions on environmental protection, especially to their Additional Protocols, with the articulation with non-governmental organizations in order to clarify to citizens the importance of the commitment of their States representatives for international standardization of environmental protection;
3. Express provision about the necessary considering of the environmental issue in internal regulations and in international forums resolutions on trade, agriculture, human rights, energy exploration, military agreements and all other matters object of the international community deliberation;
4. Deliberation of the United Nations system in the sense that the States hosting international sport events as World Cups, meetings of various sports and Olympics, should observe existing environmental standards in carrying out the necessary works and economic activities related to these events;
5. Resolution of the United Nations system to bind conditions for the international and national financial institutions funding, to the commitment of application the resources in compliance with international and national environmental standards, and evaluation of environmental impacts in the case of specific works, emphasizing the public character of all information on environmental matter involved in these financing processes;
6. Affirmation of the principle of Non Retrogression in environmental protection, whether at international or national sphere, in occasion of the legislative procedural or material amendments, or organizational changes, considering that by the time of application of environmental standards it should always be privileged the highest protection level of the healthy environment;
7. The statement of administrative and financial independence of the environmental agencies, with mechanisms able to support the declaration of incompatibilities and impediments of any nature of its officers and servants;
8. Recognition of the express admissibility of the broad legitimacy to environmental protection postulation, including citizens (individually or collectively represented), the local regional and international forums, and ensuring that legitimate access to justice in environmental matters is free;
9. The inclusion of disciplines on environmental, technical and legal ones, in formation and training schools of legal professions and public servants in general that can act on the environment issue;
10. Combination of greater efforts into the environmental education promotion at all teaching levels, as well as courses in applied social sciences, so that environmental law should be a compulsory course in the legal area, with the ongoing training of teachers;
11. Establishment of juridical bodies specialized in environmental and socio-environmental conflict resolution, members or not of the existing judiciary framework, but having, necessarily, the appropriate technical support;
12. The implementation of economic instruments for environmental public management already included in the National Environmental Policy of Brazil (forest concession, environmental insurance) and others such as the generation desertification combat credits, the creation of positive environmental balance systems, based on a universal environmental metric;
13. The implementation by national governments of environmental mapping for contexts likely to suffer environmental impacts in all its areas, in a way to provide citizens, with previous environmental information within the environmental impacts evaluation processes;
14. The incorporation of economic compensation mechanisms at the international level under the principle of common but differentiated responsibilities in the forest conservation and reforestation processes, as well as the establishment of mechanisms for these environmental resources distribution in the domestic plan, in order to encourage sustainable development practices;
15. The statement at the international level, of a principle which recognises that the legal liability of multinational corporations that exploit environmental resources is the most protective of the environment, whether based in the corporation headquarters host country, whether based in the environmental exploitation country;
16. The effective protection of environmental leaders in all countries, especially in remote areas, due to the upsurge of political persecution and attacks on the lives of those who engage in the struggle of environmental protection in various quarters of the world, as it is succeeding in the Northern region of Brazil;
17. Assurance of information, participation and transparency of environmental data to allow an effective participatory management of environmental resources as well as giving rise to the corruption combat in environmental matters;
18. Affirmation of the principle of the prevalence of most protective environmental criteria in all spheres - international, regional, national and local ones;
19. The improvement of assistance measures to States that have difficulty in complying with international environmental goals, whether by structural deficiencies whether by conjunctural limitations such the occurrence of disasters;
20. Recognition of the need to emphasize the adoption of preventive measures, including the implementation of environmental management tools, such as management plans, previous studies of environmental impact, environmental zoning, without neglecting the need to mitigate the use of the material fact theory in environment matter, both in the adoption of administrative policies as in judicial decisions, since the continuity of environmental degradation also deserves to be fought.

IV) Regarding environmental governance:

Participants of the International Symposium towards the UN Conference on Environment, Rio ± 2012 and MPF Rio + 20 workshop, convinced of the urgency in accomplishing the environmental protective standards, conclude for the adoption of the following measures:

1. Transform the United Nations Economic and Social Council into Eco- nomic, Social and Environmental Council. This change is essential, even for countries that are not currently members of this Council. This is because it is essential that the UN structure include a permanent commitment to environ- mental governance.
2. Encourage States to take part of the Aarhus Convention. It is essential to pay attention to the geographical and economic peculiarities of the States concerned, which may state exceptions and adjustments according to their real- ity. It is suggested that the mobilization for adoption of this convention happens at the regional level through organizations such as ECLAC.
3. Make effective at the State level the 26 February 2010 UNEP directive. It is worth emphasizing again that any application of this policy, even as 'soft law', must take into account local peculiarities.
4. Encourage international organizations to adopt NGOs conduct code. The conduct code established under the Barcelona Convention of 1976 through the 2009 decision, should be taken as a reference.
5. Approve the Almaty statement in every international organizations. It is extremely important to create mechanisms that enable that the rights to infor- mation and participation of NGOs in the international arena be guaranteed, in- cluding the possibility of administrative appeals. It is suggested to create an in- dependent board, under this and / or other conventions, for the prosecution of remedies for alleged denial of access to information and / or participation.
6. Generalize the "amicus curiae" institute in all international jurisdictions as well as in administrative bodies. The intervention of the "amicus curiae" must be given since the beginning of the process with proof of interest and legitimacy, according to its institutional objectives.
7. Invite the Conference of the Parties to establish a controlling board in all conventions. The assembled group agreed with this suggestion. Furthermo- re, this is the essence of the idea already expressed in the second paragraph of Item 5 above.
8. Give NGOs the right of having access to all existing controlling com- mittees. Also, the assembled group supports this idea. The suggestion is that there ought be well-defined and widely disseminated access mechanisms.

V) Regarding the right to information, and environment:

Considering that the Convention on Access to Information, Public Partic- ipation in Decision-Making Process and Access to Justice in Environmental Matters (known as "Aarhus Convention" of 25 June 1998) aims at guaranteeing certain rights, imposes Member States and public authorities obligations regard- ing access to information, public participation and access to justice in environ- mental matters.

Considering that the improvement of access to information and broader participation in decision-making processes, as well as access to justice are es- sential and indispensable tools to strengthen and make more effective environ- mental protection policies and the consolidation of the democratic State of Law itself.

Considering that ratification, acceptance, approval or accession to the Aarhus Convention implies of recognition by Member States of the importance of its objectives and a commitment to adopt the necessary measures to accede to the Convention, adopting binding instruments to align the countries domestic legislation to the requirements of the Convention.

Considering and remembering the Stockholm Declaration on the Human Environment Principle 1, and also Rio Declaration on Environment and Devel- opment Principle 10;

Participants of the International Symposium towards the UN Conference on Environment, Rio ± 2012 and MPF Rio + 20 workshop, convinced of the ur- gency in accomplishing the environmental protective standards, conclude for the adoption of the following measures:

1. That the Aarhus Convention should be ratified by the largest poss- ible number of Member States, including Brazil, which should be encouraged to that;
2. That the public right to environmental information be effectively recognized and guaranteed;
3. To be adopted concrete and immediate measures taken by States seeking to assure everyone, without distinction and regardless demonstration of particular interest, free access to environmental information, eliminating legal and administrative constraints which would avoid the achievement of environ- mental information;
4. That the environmental information should be provided in a truth- ful, timely and complete way for all. Confidentiality and secrecy are limits to the information and constitute exceptions to the principle of publicity, and should be expressed and properly grounded when invoked. However, it cannot be argued to contradict the social interest, harm to human health and the environment.
5. That environmental information should be collected, organized, updated, made available and disseminated in the most efficient, comprehensive and accessible way, using all available means of communication, current and future, media, electronics and others. In case of complex technical content is- sues, they should be transmitted in clear and understandable way to every one;
6. Effective measures should be taken in order to inform the public of the participation procedures, creating mechanisms that allow free access to them and to their use; there also must be ensured, to the public, including or- ganizations, the access to judicial effective mechanisms in a way to protect their legitimate interests and ensure enforcement of the law.
7. That environmental education should be encouraged and pro- moted, encouraging the widespread public awareness and participation in deci- sions affecting the environment.
8. That instrument should be created and enhanced in order to en- sure transparency, participation and social control in the design of public poli- cies in the process of decision-making and policy implementation. In case of non-observance, should be considered invalid administrative acts performed.
9. That there should be an improvement and effectiveness of civil liability, criminal and administrative cases of omission, refusal, withdrawal or any form of undue restriction of information access, participation and exercise of social control.
10. That juridical and political means should be encouraged, to ensure the direct popular participation, as the plebiscite, the referendum and the popu- lar initiative, putting in practice and extending such participation forms and its scope.
11. That a new communications regulatory framework should be sought, aiming at ensuring the full dissemination of information, a prerequisite for the exercise of citizenship in the ecological and democratic State.

Attached to this Propositions Chart, follows the poster, the event schedule and the list of participants.

São Paulo, June 28, 2011.

#### CARTA DE SÃO PAULO PRÉ-RIO+20/2011

Os participantes do Simpósio Internacional rumo a Conferência da ONU sobre Meio Ambiente, Rio ± 2012 e Oficina de Trabalho MPF Rio + 20, que contou com as participações dos conferencistas Antônio Herman V. Benjamin, Ministro do Superior Tribunal de Justiça e Professor de Direito Ambiental e Comparado e Direito da Biodiversidade na Universidade do Texas/EUA, Gérard Monédiaire ± Professor na Universidade de Limoges/França, Diretor do Centro de Pesquisas Interdisciplinares em direito ambiental, de ordenamento e de urbanismo (CRIDEAU), Jessica Makowiak, mestre de conferências da Universidade de Limoges, Frederic Bouin, mestre de conferências da Universidade de Perpignan, Michel Prieur, Professor Emérito na Universidade de Limoges (2004)- França e medalha de ouro do direito do meio ambiente da Universidade de Bruxelas e Paulo Affonso Leme Machado, jurista, professor de direito ambiental na Universidade Metodista de Piracicaba (UNIMEP); dos debatedores Álvaro Luiz Valery Mirra, Juiz de Direito - T J/SP, Solange Teles da Silva, advogada e Professora de Direito Ambiental na Universidade Mackenzie/SP, Colin Crawford, professor de direito ambiental na Faculdade de Direito da Universidade de Tulane, Nova Orleans/EUA; Ricardo Stanzola Vieira, advogado e coordenador de projetos sobre direitos humanos e políticas públicas do IEDC - Instituto Estudos Direito e Cidadania, Consuelo Moromizato Yoshida, Desembargadora Federal, TRF/3ªR e Sandra Cureau - Subprocuradora-Geral da República e Vice Procuradora-Geral Eleitoral, sendo os painéis presididos por José Leonidas Bellem de Lima, Procurador Regional da República/PRR-3ªR, Regina Helena Fortes Furtado, Promotora de Justiça, MP/SP e Nicolao Dino Neto, Procurador Regional da República/PRR-1ªR e Diretor-Geral da Escola Superior do Ministério Público da União, realizados nos dias 27 e 28 de junho de 2011, na sede da Procuradoria Regional da República da 3ª Região, em São Paulo, após debaterem as temáticas do Simpósio Internacional rumo a Rio + 20 em oficinas de trabalho, expõem e, ao final, concluem

I) No que se refere a deslocados ambientais:

CONSIDERANDO que o segundo o relatório Alterações Climáticas e Cenários de Migrações Forçadas, elaborado pelo Instituto para o Desenvolvimento Sustentável para a Comissão Europeia, e apresentado durante a Conferência de Poznan (Polônia, 1º a 12 de dezembro de 2008), o número de deslocados ambientais ultrapassava 25 milhões de pessoas, com previsão de ter alcançado no ano passado 50 milhões de pessoas;

CONSIDERANDO que o Gabinete das Nações Unidas para o Coordenação dos Assuntos Humanitários (OCHA) em parceria com o Centro de Monitoramento de Deslocamento (IDMC) realizaram um estudo sobre a relação entre o deslocamento de pessoas e a mudança climática. Nessa pesquisa ficou evidenciado que, em 2008, aproximadamente 36 milhões de pessoas foram deslocadas em virtude de desastres naturais, entre os quais:

terremotos, enchentes e chuvas. Cerca de 28 milhões de pessoas perderam completamente suas casas; e perto de 8 milhões tiveram que ser evacuadas de suas residências, porque elas estavam temporariamente em condições inabitadas. A principal região afetada por esses desastres foi a Ásia. (OCHA/ IDMC, 2009) No mesmo ano, para efeitos de comparação, o número de deslocados internos por conflitos representou 26 milhões de pessoas. (ACNUR, 2009) .

CONSIDERANDO que em breve esse número de deslocados ambientais pode ultrapassar o número de refugiados assim considerados pela Convenção de Genebra (1951), contabilizados pelo Alto Comissariado das Nações Unidas para Refugiados (UNHCR), segundo previsões do Instituto para o Meio Ambiente e Segurança Humana da ONU;

CONSIDERANDO que o Fórum Humanitário Global (GFH) fez recentemente uma pesquisa que mostra o impacto das mudanças climáticas na sociedade humana, explorando as questões desse impacto na alimentação, saúde, pobreza, segurança e deslocamento humano. Com relação a este último item, o estudo reconhece que é difícil provar que uma forte chuva ou um ciclone tenha origem nos efeitos da mudança climática. No entanto, a conclusão aponta que 40% dos desastres relacionados com o tempo são oriundos do efeito das mudanças climáticas tendo em vista o aumento desse tipo de evento nos últimos trinta anos. Como resultado, a pesquisa defende que seja utilizado, o conceito de deslocados por razões do clima, que já chegam a 26 milhões de pessoas e triplicará até 2020.

CONSIDERANDO que Num exercício premonitório, Conisbee e Simms (2003) referem que, até 2050, no caso de continuar o nível de degradação ecológica agora verificado, se deslocarão cerca de 150 milhões de pessoas devido ao aquecimento global. Relatórios internacionais do Intergovernmental Panel on Climate Change (2008) e da International Federation of Red Cross and Red Crescent Societies (2004), apontam também para o crescente número de populações afetadas por manifestações ambientais extremas, como furacões, cheias e deslizamentos de terras. A subida do nível médio das águas do mar afetará mesmo áreas urbanas como Alexandria, Manila, Xangai ou Jacarta, havendo previsão do Painel Intergovernamental sobre Mudanças Climáticas (IPCC), prevendo que o número de deslocados chegará a 190 milhões de pessoas até 2050, população próxima à do território brasileiro;

CONSIDERANDO que mesmo países como o Brasil, cujas condições climáticas historicamente têm apresentado condições favoráveis, mantendo-os isentos de grandes catástrofes, há problemas com os deslocados ou "flagelados" ambientais (como no caso da seca do nordeste obrigando o secular deslocamento de pessoas para grandes centros urbanos, especialmente a cidade de São Paulo), sendo que no caso das chuvas torrenciais, com deslizamento de terras e inundações, como os recentes eventos hidrológicos drásticos nos Estados de Santa Catarina, Rio de Janeiro, Alagoas, Pernambuco e no Vale do Paraíba (Estado de São Paulo), houve inúmeras pessoas mortas e desalojadas;

CONSIDERANDO que A Convenção de Estocolmo de 1972, já previa o reconhecimento das responsabilidades primeiras e diferenciadas dos Estados. E, a Declaração do Rio sobre o Meio Ambiente e Desenvolvimento, no princípio 13, também prevê a responsabilidade dos Estados pelos danos ambientais e a cooperação desses Estados para o desenvolvimento de normas de direito ambiental internacional relativas a responsabilidade e indenização.

CONSIDERANDO que os deslocamentos por causas ambientais que devem ser abrangidos pelo Estatuto Jurídico Mundial são aqueles forçados, ou seja, aqueles aos quais não resta alternativa que não a de deixar o seu habitat, não se confundindo com o deslocamento voluntário, de livre escolha dos indivíduos e grupos afetados.

CONSIDERANDO que o conceito de deslocamento forçado abrange ainda os deslocamentos de modos de vida, especialmente nos casos de populações tribais e tradicionais, situações em que os deslocados optam pela permanência no ambiente degradado também merecem proteção;

CONSIDERANDO que os deslocamentos forçados decorrentes de projetos de desenvolvimento são ligados a atividades econômicas, na maior parte das vezes de interesse predominantemente privado, e que a aplicação do princípio da solidariedade implicaria na transferência de custos da atividade econômica para toda a sociedade, deve-se buscar a responsabilização do empreendedor, com base no princípio do poluidor-pagador.

Os participantes do Simpósio Internacional rumo a Conferência da ONU sobre Meio Ambiente, Rio ± 2012 e Oficina de Trabalho MPF Rio + 20, convencidos da urgência em adotar medidas apropriadas para a efetiva proteção dos deslocados ambientais:

1. Visando garantir dignidade humana e efetividade da Declaração Universal dos Direitos Humanos às pessoas ou grupos desterritorializados, não raro vítimas da marginalização econômica, deve ser aprovado o Projeto de Convenção do Estatuto Internacional dos Deslocados Ambientais, como norma independente, vinculante e não como adendo ou complemento da Convenção de Genebra de 1.951, Protocolo sobre o Estatuto do Refugiado de New York de 1967 e Convenção das Nações Unidas para Mudanças do Clima, visando a evitar que se criem situações de discriminação e desigualdade em relação aos demais refugiados. Tal convenção deverá ser elaborada no âmbito de uma Conferência Internacional, da qual participem diversos organismos internacionais e com convite a todos os países.

2. Há necessidade de criação de um Estatuto Jurídico Mundial, com normas internacionais e internas aos países signatários, com o objetivo de proteção dos deslocados ambientais, bem como prevendo princípios preventivos para combater seu alarmante crescimento. Também deverão estar previstas hipóteses de repatriação ao país de origem, reassentamento ou traslado dos deslocados ambientais a um terceiro país, bem como integração com a população do local para onde houve o deslocamento, quer a permanência seja temporária ou definitiva. O detalhamento desse estatuto jurídico ocorrerá em nível regional, a exemplo da Convenção de Campala, de outubro de 2009, para Proteção e Assistência dos Deslocados Internos na União Africana, em razão de calamidades humanas ou naturais, reconhecidos nos Princípios Orientadores Relativos ao Deslocamento Interno de Pessoas da ONU.

3. Como princípio, o Estatuto Jurídico Mundial deverá abarcar a obrigatoriedade dos Estados signatários, em nome da solidariedade prevista no princípio 13 da ECO-92, prestar integral apoio material e jurídico às vítimas de eventos ambientais de consequências extremas, segundo a categoria dos deslocamentos (temporário, por mudanças no "habitat" ou busca de melhores condições de vida), levando-se em consideração a origem, velocidade e grau dos fatos geradores do deslocamento, bem como as reais necessidades de mobilidade, as distâncias e o grau de organização do país de origem desses deslocados e do próprio grupo afetado.

4. No caso de deslocamentos de modos de vida os Estados deverão adotar todas as providências com vistas à recuperação dos ambientes degradados, garantindo a reconstituição dos modos de vida e a plena reparação das perdas suportadas pelos deslocados;

5. Tal convenção deverá prever proteção às pessoas afetadas por eventos como terremotos, tsunamis, secas (dificuldades na produção de alimentos e no acesso à água), erosões, deslizamentos de terras, tempestades (tornados, furacões, tufões), alagamentos, desertificação, destruição da biodiversidade, epidemias, desaparecimento de rios e lagos, surgimento de represas hidrelétricas ou similares, poluição hídrica, acidentes industriais, acidentes nucleares, atividades minerárias, alteração no nível do mar, aumentos de temperaturas, causas naturais, com ou sem comprovação de interferências antrópicas, e riscos geológicos. Além dessas causas, outras poderão ser incluídas, com prévia oitiva do Programa Internacional de Dimensões Humanas das Mudanças Globais Ambientais (IHDP) ou específico organismo internacional a ser criado, sempre com abertura às contribuições científicas interdisciplinares da sociedade civil organizada ou de outros organismos públicos ou particulares militantes na área.

6. Os deslocamentos forçados decorrentes de projetos de desenvolvimento ligados a atividades econômicas constituem custo de responsabilidade do empreendedor, com base no princípio do poluidor-pagador.

II) no que se refere ao direito à paisagem:

Considerando que a paisagem é um bem jurídico autônomo, dotado ou não de valor estético, inserido na concepção unitária de meio ambiente, sujeito a uma gestão integrada, tendo em vista seus aspectos culturais, naturais e sociais;

Considerando a cooperação entre as convenções da UNESCO no campo da cultura e da Convenção sobre a Diversidade Biológica (1992), que resultou na recente Declaração sobre a Diversidade Biocultural (Montreal, junho de 2010);

Considerando que a paisagem é um fator determinante para a identidade cultural, sua formação e consolidação, enquanto bem compartilhado por todos os seres humanos, envolvendo presentes e futuras gerações;

Considerando que todos têm o direito à paisagem e compartilham a responsabilidade por sua proteção, com interconectividade social e entre territórios e regiões, justificando sua tutela coletiva e abordagens protetivas regionais e transfronteiriças e cooperação entre as nações, em colaboração intergovernamental e intersetorial;

Considerando que a qualidade de vida depende também das paisagens e que as condições físicas, sociais e culturais condicionam o bem estar das populações;

Os participantes do Simpósio Internacional rumo a Conferência da ONU sobre Meio Ambiente, Rio + 2012 e Oficina de Trabalho MPF Rio + 20, convencidos da urgência em adotar medidas apropriadas para a efetiva proteção do patrimônio paisagístico, concluem

1. que a sociedade civil, os organismos internacionais e os Estados se envolvam na estruturação de uma Convenção Mundial Sobre a Paisagem;

2. que seja considerada a natureza de bem dinâmico, complexo e não estático, multidisciplinar, sensitivo-espiritual, heterogênea, integrativa e de interesse público da paisagem, devendo ser preservada a sua diversidade;

3. que a preocupação com a ambiência exige planejamento e novos instrumentos jurídicos para se preservar a paisagem; (aprimorar redação)

4. que sejam buscadas soluções e mecanismos que resguardecam a informação e participação da sociedade civil e das comunidades diretamente envolvidas na proteção da paisagem, através de consultas, audiências públicas, publicidade prévia dos projetos, estudos e das decisões e estimulando a governança ambiental mundial,

5. pela necessária valorização da educação ambiental do turismo em relação à proteção da paisagem;

6. que os países seja instigados a assinar e ratificar convenções e declarações internacionais da UNESCO e da ONU, considerando seus instrumentos de proteção da paisagem, incorporando tais sistemas de proteção em seus sistemas;

7. que sejam criados no âmbito da UNESCO e da ONU, em relação às suas respectivas Convenções, comissões de fiscalização quanto ao cumprimento das compromissos assumidos, em relação à proteção da paisagem;

8. que seja ressaltada e divulgada a necessidade urgente de colaboração internacional para o uso sustentável dos espaços e territórios, haja vista as frequentes ameaças globais às paisagens.

9. Que sejam criados instrumentos financeiros e não financeiros de melhoria das paisagens também no ambiente urbano, com vistas a evitar ou mitigar a poluição na cidade, visando à integração dos espaços construídos com os ambientes naturais.

III) no que se refere à efetividade do direito ambiental:

Considerando que, desde a declaração de Estocolmo de 1972, a comunidade internacional reconhece que "a proteção e o melhoramento do meio ambiente humano é uma questão fundamental que afeta o bem-estar dos povos e o desenvolvimento econômico do mundo inteiro, um desejo urgente dos povos de todo o mundo e um dever de todos os governos;

Considerando que o Princípio 11 da Declaração do Rio de 1992 afirma que "os Estados deverão promulgar leis eficazes para a proteção do meio ambiente;

Considerando que na Agenda 21 são descritas as bases para as ações, os objetivos, as atividades e os meios de implementação para elaborar estratégias e medidas para deter e inverter os efeitos da degradação do meio ambiente no contexto da intensificação de esforços nacionais e internacionais para promover o desenvolvimento sustentável e ambientalmente saudável em todos os países;

Considerando que a Declaração de Joanesburgo de 2001 e seu Projeto de implementação atenta para a necessidade do compromisso da comunidade internacional a atuar e a adotar medidas concretas em todos os níveis para a efetiva proteção do meio ambiente;

Considerando que várias ordens jurídicas nacionais contam com Constituições, como a Constituição brasileira de 1988, que prevêem expressamente o direito ao meio ambiente ecologicamente equilibrado, inclusive com a estipulação de obrigações e de instrumentos para a garantia deste direito fundamental, além de textos normativos infra-constitucionais que complementam a proteção jurídica ao meio ambiente;

Considerando que a despeito da existência do arcabouço normativo internacional e nacional, em significativa parcela dos Estados, o meio ambiente global continua sofrendo, a perda de biodiversidade prossegue, estoques pesqueiros continuam a ser exauridos, a desertificação toma mais e mais terras férteis, os efeitos adversos da mudança do clima já são evidentes e desastres naturais são mais frequentes e mais devastadores, países em desenvolvimento são mais vulneráveis e a poluição do ar, da água e do mar segue privando milhões de pessoas de uma vida digna, quadro que só vem se agravando desde a sua constatação na Declaração de Joanesburgo de 2002;

Considerando que a Carta de Limoges II, contendo subsídios para a Conferência de Joanesburgo de 2002, contém vários instrumentos asseguradores da efetividade da tutela jurídica ambiental, e que suas propostas não foram plenamente adotadas nos textos jurídicos internacionais;

Os participantes do Simpósio Internacional rumo a Conferência da ONU sobre Meio Ambiente, Rio + 2012 e Oficina de Trabalho MPF Rio + 20, convencidos da urgência na efetivação das normas protetivas ao meio ambiente, concluem pela adoção das seguintes medidas:

1. a ratificação de todas as proposições constantes da Carta de Limoges II;
2. a promoção de campanhas pelo sistema da Nações Unidas para promover e fomentar, inclusive, financeiramente, se necessário, a adesão do maior número possível de países às Convenções de proteção ao meio ambiente, especialmente a seus Protocolos adicionais, com a atuação articulada com organizações não governamentais de modo a esclarecer aos cidadãos a importância do compromisso dos representantes dos seus Estados com a normatização internacional de proteção ao meio ambiente;
3. a previsão expressa da necessidade do pronunciamento sobre a variável ambiental nos regimentos internos e nas resoluções dos foros internacionais sobre comércio, agricultura, direitos humanos, exploração de energia, acordos militares e todos outros assuntos objetos de deliberação da comunidade internacional;
4. a deliberação pelo sistema das Nações Unidas no sentido de que os Estados que sediem eventos esportivos de dimensão internacional como Copas de mundo das diversas modalidades esportivas e Olimpíadas, observem as normas ambientais vigentes na realização das obras necessárias e das atividades econômicas relacionadas a estes eventos;
5. a deliberação do sistema das Nações Unidas pelo condicionamento dos financiamentos de instituições financeiras internacionais e nacionais ao compromisso de aplicação dos recursos com observância das normas ambientais internacionais e nacionais, e à avaliação dos impactos ambientais no caso de obras específicas, ressaltando o caráter público de todas as informações de natureza ambiental envolvidas nestes processos de financiamento;
6. a afirmação do princípio da proibição do retrocesso na proteção ambiental, seja na esfera internacional ou nacional, quando das alterações normativas materiais e procedimentais, ou mudanças organizacionais, devendo no momento da aplicação da norma ambiental sempre se prestigiar a máxima protetividade ao meio ambiente sadio;
7. a afirmação da independência administrativa e financeira dos órgãos e agências ambientais, com a previsão de mecanismos para ensejar a declaração de incompatibilidades e impedimentos de qualquer natureza de seus dirigentes e servidores;
8. o reconhecimento da expressa admissibilidade da ampla legitimidade para postulação da defesa do meio ambiente, abrangendo cidadãos (individual ou coletivamente representados), nos foros internacionais regionais e locais, sendo legítimo que este acesso à justiça em matéria ambiental seja gratuito;
9. a inclusão de disciplinas de meio ambiente, técnicas e jurídicas, nas escolas de formação e de capacitação de carreiras jurídicas públicas e de servidores públicos em geral que possam atuar em matéria ambiental;
10. a conjugação de maiores esforços na promoção da educação ambiental em todos os níveis de ensino, bem como nos cursos das ciências sociais aplicadas, devendo o direito ambiental ser disciplina obrigatória nos cursos da área jurídica, com a capacitação permanente dos professores;
11. o estabelecimento de órgãos jurisdicionais especializados em soluções de conflitos ambientais e sócio-ambientais, integrantes ou não da estrutura judiciária já existentes, mas contando, necessariamente, com devido apoio técnico;
12. a implementação dos instrumentos econômicos de gestão ambiental públicos já contemplados na Política Nacional do Meio Ambiente (concessão florestal, seguro ambiental) e outros como por exemplo a geração de créditos de combate à desertificação, a criação de sistemas de saldos ambientais positivos, com base em uma métrica ambiental universal
13. a realização pelos governos nacionais de mapeamentos ambientais e demais aspectos passíveis de sofrerem impactos ambientais em todas suas áreas, de modo a fornecer aos administrados, previamente, as informações ambientais suscitadoras de questionamentos no âmbito dos processos de avaliação de impactos ambientais;
14. a incorporação de mecanismos de compensação econômica no plano internacional à luz do princípio das responsabilidades comuns mas diferenciadas nos processos de conservação das florestas e no reforestamento, bem como estabelecimento de mecanismos de distribuição desses recursos ambientais, no plano interno, de modo a estimular práticas de desenvolvimento sustentável;
15. a afirmação, na esfera internacional, de princípio que preconize que o regime legal da responsabilidade das empresas multinacionais que explorem recursos ambientais seja o mais protetivo ao meio ambiente, seja do país de sede da matriz ou do local de exploração ambiental;
16. a proteção efetiva das lideranças ambientalistas em todos os países, especialmente em áreas remotas, em virtude do recrudescimento da perseguição política e dos atentados à vida daqueles que se engajam na luta da defesa do meio ambiente em vários quadrantes do mundo, como vem ocorrendo na região Norte do Brasil;
17. a garantia da informação, da participação e da transparência dos dados ambientais, para permitir uma efetiva gestão participativa dos recursos ambientais bem como ensejar o combate à corrupção em matéria ambiental;
18. a afirmação do princípio da prevalência dos critérios mais protetivos ao meio ambiente, em todas as esferas, internacional, regional, nacional e local;
19. o aprimoramento das medidas de assistência aos Estados que tenham dificuldade no cumprimento das metas internacionais ambientais, seja por deficiências estruturais seja por limitações conjunturais como na ocorrência de catástrofes;
20. o reconhecimento da necessidade de ênfase na adoção de medidas preventivas, com a implementação dos instrumentos de gestão ambiental, como planos de manejo, estudos prévios de impacto ambiental, zoneamento ambiental, sem descuidar da necessidade de mitigar o uso da teoria do fato consumado em matéria ambiental tanto na

adoção de políticas administrativas quanto em decisões judiciais, uma vez que a continuidade da degradação ambiental merece também ser combatida.

IV) no que se refere à governança ambiental: Os participantes do Simpósio Internacional rumo a Conferência da ONU sobre Meio Ambiente, Rio ± 2012 e Oficina de Trabalho MPF Rio + 20, convencidos da urgência na efetivação das normas protetivas ao meio ambiente, concluem pela adoção das seguintes medidas:

- 1.Transformar o Conselho Econômico e Social da ONU em Conselho Econômico, Social e Ambiental. Essa alteração é fundamental, mesmo para os países que não sejam atualmente membros desse Conselho. Isso porque é indispensável que a própria estrutura da ONU passe a contemplar de modo permanente o compromisso com a governança ambiental.
- 2.Encorajar os Estados a aderirem a Convenção de Aarhus. É imprescindível atentar para as peculiaridades geográficas e econômicas dos Estados interessados, que poderão fazer as ressalvas e adequações à sua realidade. Sugere-se que a mobilização para a adesão se dê em nível regional por meio de organizações, como é o caso da CEPAL.
- 3.Fazer aplicar pelos Estados a Diretiva de 26 de fevereiro de 2010 do PNUMA. Vale frisar novamente que qualquer aplicação dessa diretiva, mesmo que como « soft law », deve levar em conta as peculiaridades locais.
- 4.Fazer adotar pelas organizações internacionais os códigos de condutas das ONGs. Fazer com que o código de conduta estabelecido no âmbito da Convenção de Barcelona de 1976, através da decisão de 2009, seja tomado como referência.
- 5.Fazer aprovar a declaração de Almaty em cada uma das organizações internacionais. É extremamente relevante criar mecanismos para viabilizar que os direitos de informação e participação das ONGs no cenário internacional sejam garantidos, inclusive com a possibilidade de interposição de recursos administrativos. Sugere-se criar um conselho independente, no âmbito dessa e/ou de outras convenções, para o julgamento de recursos em caso de alegada recusa de acesso à informação e/ou participação.
- 6.Generalizar o « amicus curiae » em todas as jurisdições internacionais e também nas instâncias administrativas. A intervenção do « amicus curiae » deve se dar desde o início dos processos, com comprovação do interesse e da legitimidade, de acordo com seus fins institucionais.
- 7.Convocar a conferência das partes a instituir um comitê de controle em todas as convenções. O grupo reunido concorda com essa sugestão. Inclusive, essa é a essência da ideia já exposta no segundo parágrafo do item 5 acima.
8. Dar às ONGs o direito de ter acesso a todos os comitês de controle existentes. Igualmente, o grupo reunido apoia essa ideia. A sugestão é que haja mecanismos de acesso bem definidos e amplamente divulgados.

V) no que se refere ao direito à informação e meio ambiente:

Considerando que a Convenção sobre Acesso à Informação, Participação do Público no Processo de Tomada de Decisão e Acesso à Justiça em Matéria de Ambiente (designada "Convenção de Aarhus" de Junho de 1998) destina-se a garantir determinados direitos, impondo aos Estados-Membros e às autoridades públicas obrigações em matéria de acesso à informação, de participação do público e de acesso à justiça em questões ambientais.

Considerando que a melhoria do acesso à informação e da ampla participação nos processos de tomada de decisões, bem como de acesso à justiça são ferramentas essenciais e indispensáveis para reforçar e tornar mais eficazes as políticas de proteção do ambiente e a própria consolidação do Estado Democrático de Direito.

Considerando que ratificação, aceitação, aprovação ou adesão da Convenção de Aarhus importa no reconhecimento pelos Estados-Membros da importância dos seus objetivos e no compromisso de adoção das medidas necessárias para aderir à Convenção, adotando-se instrumentos vinculativos que alinhem a legislação interna dos países às exigências da Convenção.

Considerando e recordando o Princípio nº 1 da Declaração de Estocolmo sobre o Ambiente Humano e igualmente o Princípio nº 10 da Declaração do Rio sobre Ambiente e Desenvolvimento.

Os participantes do Simpósio Internacional rumo a Conferência da ONU sobre Meio Ambiente, Rio ± 2012 e Oficina de Trabalho MPF Rio + 20, convencidos da urgência na efetivação das normas protetivas ao meio ambiente, concluem pela adoção das seguintes medidas:

1. Que a Convenção de Aarhus seja ratificada pelo maior número possível de Estados-membros, inclusive pelo Brasil, os quais devem ser encorajados a is- so;
2. Que seja reconhecido e garantido efetivamente o direito público à informação ambiental;
3. Que sejam adotadas medidas concretas e imediatas pelos Estados visando a assegurar a todos, indistintamente e independentemente de demonstração de interesse particular, o livre acesso à informação ambiental, suprimindo os entraves jurídicos e administrativos que obstem a obtenção de informações ambientais;
4. Que as informações ambientais sejam prestadas de forma veraz, tempestiva e completa a todos. O sigilo e o segredo são limites à informação e constituem exceções ao princípio da publicidade, devendo ser expressos e devidamente fundamentados quando invocados. Porém, não podem ser arguidos quando contrariarem o interesse social, prejudicarem a saúde humana e o meio ambiente.
5. Que as informações ambientais sejam coletadas, organizadas, atualizadas, disponibilizadas e difundidas da forma mais eficiente, ampla, integral e acessível, utilizando-se de todos os meios de comunicação disponíveis, atuais e futuros, midiáticos, eletrônicos e outros. Na hipótese de conteúdos técnicos complexos, estes deverão ser transmitidos de forma clara e compreensível a todos;
6. Que sejam adotadas medidas eficientes no sentido de dar conhecimento ao público dos procedimentos relativos à participação, criando mecanismos que viabilizem o livre acesso aos mesmos e à sua utilização. Há que ser assegurado, ainda, ao público, bem como às organizações, o acesso a mecanismos judiciais eficazes de forma a proteger os seus interesses legítimos e a garantir a aplicação da lei.
7. Que seja incentivada e promovida a educação ambiental, encorajando a ampla sensibilização do público e a sua participação nas decisões que afetem o ambiente.
8. Que sejam criados e aprimorados instrumentos que assegurem a transparência, a participação e o controle social na concepção das políticas públicas, no processo de tomada de decisões e na execução das mesmas. No caso de inobservância, deverão ser considerados nulos os atos administrativos praticados.
9. Que haja aperfeiçoamento e efetividade da responsabilização civil, penal e administrativa nos casos de omissão, recusa, supressão ou qualquer forma de cerceamento indevido do acesso à informação, à participação e do exercício do controle social.
10. Que sejam fomentados meios jurídicos e políticos que assegurem a participação popular direta, como o plebiscito, o referendo e a iniciativa popular, concretizando e

ampliando tais formas de participação e seu âmbito de aplicação.

11. Que seja buscado um novo marco regulatório das comunicações que vise garantir a plena difusão da informação, pressuposto para o exercício da cidadania ecológica e do Estado Democrático de Direito.

Acompanham a presente Carta de Proposições o cartaz, a programação do evento e a lista de presença de seus participantes.

São Paulo, 28 de junho de 2011.

## RECOMMANDATION N° 1

### LE PRINCIPE DE NON RÉGRESSION EN DROIT DE L'ENVIRONNEMENT

La réunion mondiale des juristes et associations de droit de l'environnement réunis er à Limoges (France) du 29 septembre au 1 octobre 2011 soucieuse de contribuer aux progrès du droit de l'environnement,

1. Constatant que toutes les conventions internationales en vigueur sur l'environnement, tant universelles que régionales, proclament comme une évidence que les Etats ont pour objectif l'amélioration continue de l'environnement en lien avec le progrès social et la lutte contre la pauvreté,
2. Qu'il en résulte un consensus international sur la nécessité de prendre des mesures juridiques visant à atteindre un niveau élevé de protection et une amélioration de la qualité de l'environnement ce qui a pour effet de diminuer progressivement les pollutions portant atteinte à la santé et d'augmenter la préservation de la biodiversité indispensable à l'équilibre biologique entre les hommes et la nature,
3. Affirmant que des mesures juridiques visant à empêcher la régression des niveaux actuels de protection de l'environnement sont indispensables pour respecter l'engagement d'améliorer progressivement la protection de l'environnement,
4. Considérant que le droit et les politiques environnementales participent d'une évolution positive des sociétés,
5. Prenant acte que l'environnement sain est désormais reconnu comme un droit de l'homme tant au niveau international que dans un grand nombre des Constitutions nationales,
6. Constatant que les pactes internationaux des droits de l'homme de 1966 visent la progression constant des droits protégés ce qui est interprété comme interdisant la régression des droits fondamentaux,
7. Mettant en évidence que le droit à un environnement sain est indispensable pour parvenir au développement durable
8. Considérant que nous avons tous une responsabilité collective de ne pas porter atteinte aux droits des générations futures à la vie, à la santé et à l'environnement, et de

leur transmettre le patrimoine environnemental dans le meilleur état possible,

9. Soucieux des menaces multiples qui pèsent sur les politiques environnementales et qui, de façon explicite ou insidieuse, aboutissent à réduire les protections de la biodiversité et à augmenter les risques de pollutions et de désordres écologiques,

10. Persuadés de la nécessité de prendre toutes les mesures qui empêchent tout recul ou toute régression dans le niveau de protection de l'environnement atteint par chaque Etat selon son propre rythme de développement,

11. Considérant que la non régression peut résulter d'une disposition expresse contenue dans la Constitution ou dans des lois aussi bien que de la jurisprudence des tribunaux s'appuyant sur le principe du droit de l'homme à l'environnement ce qui conduit nécessairement à empêcher toute mesure ayant pour conséquence une diminution de la biodiversité ou une augmentation du niveau des pollutions,

12. Prenant acte avec satisfaction de la résolution du Parlement européen du 29 septembre 2011 sur l'élaboration d'une position commune de l'Union dans la perspective de la conférence des Nations unies sur le développement durable (Rio+20) qui dans le paragraphe 97. « demande que le principe de non-régression soit reconnu dans le contexte de la protection de l'environnement et des droits fondamentaux », Demande solennellement aux chefs d'Etat et de gouvernement réunis à Rio de Janeiro en juin 2012 pour le 20 anniversaire de la Déclaration de Rio de proclamer officiellement dans la déclaration finale en tant que nouveau principe de droit de l'environnement complétant les principes déjà proclamés à Rio en 1992 que : « Pour empêcher tout recul dans la protection de l'environnement, les États doivent, dans l'intérêt commun de l'humanité, reconnaître et consacrer le principe de non régression. Pour ce faire les États doivent prendre les dispositions nécessaires pour garantir qu'aucune mesure ne puisse diminuer le niveau de protection de l'environnement atteint jusqu'alors. »

#### RECOMMANDATION N°1

##### THE PRINCIPLE OF NON-REGRESSION OF ENVIRONMENTAL LAW

The international meeting of jurists and environmental law associations, having met in Limoges (France) from 29 September to 1 October 2011, and with a view to contributing to the advancement of environmental law,

1. Noting that all current international environmental conventions, whether universal or regional, provide that an objective of States is the continuous improvement of the environment along with social progress and combatting poverty,

2. Observing therefore that an international consensus exists on the need for legal measures to attain a higher level of environmental protection and improvement in environmental quality, including progressive reduction of pollution affecting health and greater preservation of biodiversity which is essential for harmony between humans and nature,

3. Affirming that legal measures preventing regression of environmental protection are an essential component of the commitment to continuous improvement of environmental protection,

4. Considering that sound environmental policy is a reflection of societal progress,

5. Taking into account that a healthy environment is henceforth recognized as a human right at the international level as well as in the majority of national Constitutions,

6. Acknowledging that the United Nations Human Rights Agreements of 1966 aim for the continual advancement of protected rights and are interpreted as prohibiting regression of fundamental rights,

7. Underscoring that the right to a healthy environment is an essential element of sustainable development,

8. Considering that human society has a collective responsibility not to harm the rights of future generations to life, health and a sound environment and to pass on the environment in the best possible condition,

9. Mindful of the multiple threats that weigh on environmental policies and that, either explicitly or by stealth, may lead to reduced protection of biodiversity and increased risks of pollution and ecological distress,

10. Convinced of the need for measures that prevent all backsliding or regression of the level of environmental protection attained by each State according to its development status,

11. Considering that non-regression may be based on an express provision in the Constitution or laws of a State, as well as on judicial jurisprudence founded on the principle underlying the human right to a healthy environment, which necessarily calls for the prohibition of all measures having the effect of reducing biodiversity or increasing pollution levels,

12. Taking note of the European Parliament resolution of 29 September 2011 on developing a common EU position ahead of the United Nations Conference on Sustainable Development (Rio+20) which in the paragraph 97 calls for the recognition of the principle of non-regression in the context of environmental protection as well as fundamental rights;

HEREBY solemnly asks the Heads of State and of Government who will assemble in Rio de Janeiro in June 2012 for the 20th anniversary of the Rio Declaration to proclaim officially in the final declaration, as a new principle of environmental law complementing the principles already proclaimed in Rio in 1992, that :

« To prevent any weakening of environmental protection, States shall, in the common interest of humanity, recognize and adopt the principle of non-regression. To this end, States shall take the steps necessary to guarantee that no measure may diminish the existing level of environmental protection. »

#### RECOMMANDATION N°2

##### L'ÉQUITÉ ENVIRONNEMENTALE

Considérant le droit à la vie et à un environnement sain et équilibré pour tous,

Considérant que l'équité environnementale permet de protéger prioritairement les populations, communautés et individus vulnérables exposés aux risques environnementaux ou subissant une situation écologique défavorable,

Considérant le principe de non discrimination,

Considérant l'intérêt général de l'humanité de vivre dans un environnement sain et dans la paix,

Considérant l'équité entre les générations et les droits des générations futures,

Considérant que les injustices environnementales contribuent à accroître la pauvreté,

Considérant que les impératifs de la justice sociale et de l'équité environnementale font partie des règles reconnues par la communauté internationale fondées sur le respect mutuel des États, des peuples et des individus participant à une communauté de vie,

Considérant les objectifs du développement durable,

Considérant la responsabilité des États de protéger les populations et les individus sans discrimination,

Considérant la responsabilité de la Communauté internationale d'assurer le respect de l'équité dans les relations internationales,

Considérant la nécessité d'assurer la sécurité internationale en évitant les déséquilibres et l'instabilité en matière d'environnement,

Considérant les principes de souveraineté, d'indépendance et d'intégrité territoriale des États,

Considérant le droit à l'indépendance environnementale des peuples pour une meilleure protection de l'environnement,

Considérant la compétence de l'État sur son territoire et le droit de ne pas subir de dommages causés par des activités exercées en dehors de sa juridiction,

Considérant que chaque État est le premier responsable de son propre développement durable, La Réunion mondiale des juristes de l'environnement de Limoges recommande l'adoption d'une déclaration de principes selon laquelle :

- 1) L'équité environnementale est l'expression de l'intérêt général de l'humanité et du devoir de respect envers la nature.
- 2) Les États s'engagent dans des modes de production et de consommation compatibles avec le respect de l'intérêt général de l'humanité et la protection des droits des générations futures.
- 3) Les États doivent s'abstenir de provoquer de manière directe ou indirecte par leurs politiques commerciales toute forme de surexploitation des ressources naturelles sur leur territoire ou sur celui d'autres États.
- 4) Les États reconnaissent un principe de solidarité internationale pour faire face aux catastrophes écologiques et s'engagent à soutenir par des moyens financiers et matériels ceux qui sont frappés par de telles catastrophes.
- 5) Les États s'engagent à mettre tout en œuvre pour assumer leur contribution à la « dette écologique » mondiale en application du principe pollueur-payeur et du principe de responsabilités communes mais différenciées.
- 6) Les États doivent s'assurer du contrôle sur le territoire sous leur juridiction de toutes pratiques économiques et/ou commerciales susceptibles de menacer l'équité environnementale sur leur territoire ou sur le territoire d'un autre État. Ils doivent éventuellement prévoir des sanctions significatives pour les entreprises qui contreviendraient par leurs activités ou leurs pratiques aux principes d'équité environnementale. En cas de dommage environnemental, ils s'engagent à recourir et à appliquer la loi de l'État où s'est produit le fait générateur.
- 7) Les principes d'équité environnementale guident les actions de coopération internationale dans tous les domaines. Les États leur reconnaissent une valeur juridique supérieure.
- 8) L'équité environnementale oblige les États à élaborer des politiques respectueuses de l'intégrité et de la sécurité environnementales.
- 9) L'équité environnementale repose sur les principes suivants :
  - a. Le droit à un environnement sain et équilibré. Toute personne a droit à la préservation des conditions essentielles à sa subsistance et à des conditions de vie respectueuses de l'environnement quelque soit sa situation économique, sociale, culturelle, politique, ethnique, sa nationalité, son âge, son sexe, son lieu de résidence ou d'accueil. Aucune personne physique ou morale ni aucune entité ne peut faire supporter des risques environnementaux à une autre personne du fait de son action ou de son inaction, de son activité ou/et de sa méconnaissance du droit national ou/et international.
  - b. L'égalité en matière de sécurité environnementale basée sur le respect des obligations internationales notamment en matière de prévention de risques environnementaux et de lutte contre toutes les formes de pressions ou d'agressions écologiques transfrontières.
  - c. Le droit à l'éducation environnementale pour tous dans des conditions adaptées à la situation sociale, économique et culturelle de chacun et en considérant les risques environnementaux encourus.
  - d. L'accès pour tous dans des conditions équivalentes à des voies de recours auprès de juridictions internes ou/et internationales pour protéger le droit de chacun à un environnement sain et équilibré.
  - e. La solidarité des États et des peuples en matière d'accès aux ressources vitales
  - f. L'interdiction de toute activité susceptible de nuire aux écosystèmes et donc le contrôle de son territoire par l'État.
  - g. La précaution et la prévention en particulier pour toute activité humaine susceptible de nuire à une répartition équitable des bénéfices du développement durable.
  - h. La non-régression du droit de l'environnement.
  - i. L'obligation pour les États de prévenir et de réparer les dommages environnementaux dont ils ont la responsabilité.
  - j. La coopération internationale « éclairée » dans le domaine de l'environnement basée sur l'échange d'informations, le renforcement des capacités d'action et la gestion des risques environnementaux.
  - k. Des mécanismes de gouvernance environnementale internationale favorisant une participation éclairée de tous les membres de la société internationale.
- 10) Les groupes de population les plus vulnérables sur le plan social et économique doivent faire l'objet d'une attention particulière. Les droits des femmes en matière d'accès et de gestion des ressources vitales, et de participation aux décisions environnementales doivent être prioritairement soutenus.

11) Les États s'engagent à utiliser tous les moyens juridiques, humains, matériels et financiers pour assurer la mise en œuvre de l'équité environnementale et notamment par les instruments suivants :

- a. La fiscalité ;
- b. L'étude d'impact environnemental ;
- c. Le suivi et l'expertise de la réglementation environnementale ;
- d. Les droits procéduraux : le droit à l'information, la participation, l'accès à la justice pour contester toute action ou décision susceptible de menacer l'équité environnementale ;
- e. Les institutions juridictionnelles.

#### RECOMMANDATION N°2

##### ENVIRONMENTAL JUSTICE

Considering the right to life and to a clean and balanced environment for all,

Considering that environmental justice allows for priority protection of vulnerable populations, communities and individuals who are exposed to environmental risks or subjected to an unfavourable ecological situation,

Considering the principle of non-discrimination,

Considering the general interest of humanity to live in a clean environment and in peace,

Considering intergenerational equity and the rights of future generations,

Considering that environmental injustice contributes to increase poverty,

Considering that the imperatives of social justice and environmental equity are part of the rules recognized by the international community based on mutual respect of States, peoples and individuals participating in community life,

Considering the objectives of sustainable development,

Considering the responsibility of States to protect populations and individuals without discrimination,

Considering the responsibility of the international community to assure respect of equity in international relations,

Considering the need to ensure international security by avoiding environmental imbalance and instability,

Considering the principles of the sovereignty, independence and territorial integrity of States,

Considering peoples' right to environmental independence to improve environmental protection,

Considering the authority of each States over its territory and its right not to be subjected to harm caused by activities outside of its jurisdiction,

Considering that each State is primarily responsible for its own sustainable development, The world meeting of environmental lawyers at Limoges recommends the adoption of a declaration of principles as follows :

- 1) Environmental justice is the expression of humanity's general interest and duty of respect with regard to nature ;
- 2) States commit to developing modes of production and consumption compatible with respect for the general interest of humanity and protection of the rights of future generations ;
- 3) States shall refrain from directly or indirectly promoting through their trade policies all forms of overexploitation of natural resources on their territory or the territory of another State ;
- 4) States recognize a principle of international solidarity in confronting ecological disasters and commit to provide material and financial support to those who are affected by such catastrophes ;
- 5) States commit to taking responsibility for their contribution to the global « ecological debt » by applying the polluter-payer principle and the principle of common but differentiated responsibility ;
- 6) States shall ensure control on all territory under their jurisdiction of all economic and/or commercial practices that may threaten environmental justice on their territory or the territory of another States. They shall put in place significant sanctions for enterprises that contravene the principle of environmental justice through their practices or activities. In case of environmental harm, they commit to using and applying the laws of the State in which the harmful act occurred.
- 7) Principles of environmental justice guide the acts of international cooperation in all areas. States accord these principles the highest legal value ;
- 8) Environmental justice requires States to elaborate policies that respect environmental integrity and security ;
- 9) Environmental justice is based on the following principles :
  - a. The right to a clean and balanced environment. Every person has a right to the preservation of conditions necessary for subsistence and conditions for life that respect the environment, regardless of economic, social, cultural, political or ethnic status, or nationality, age, gender, or place of permanent or temporary residence. Not physical or legal person or entity may subject another person to environmental risks through their actions or inactions and/or their ignorance of national or international law.
  - b. Equality regarding environmental security based on respect for international obligations, including prevention of environmental risks and the struggle against all forms of transboundary ecological pressure and aggression.
  - c. The right to environmental education for all, under conditions suited to social, economic and cultural conditions and taking into account existing environmental risks.

- d. Access for all in equivalent conditions to remedies from domestic and/or international courts to protect the right to everyone to a balanced environment, favourable to human health.
- e. Solidarity of States and peoples in terms of access to vital resources.
- f. Prohibition of any activity likely to damage ecosystems and thus the control of its territory by the State.
- g. Precaution and prevention especially for any human activity that may affect the equitable distribution of benefits of sustainable development.
- h. The principle of non-regression in environmental Law.
- i. The obligation of States to prevent and remedy environmental damages in accordance with their responsibility.
- j. International cooperation "enlightened" in the field of environment based on exchange of information, capacity building action and management of environmental risks.
- k. Mechanisms of international environmental governance to promote enlightened participation for all members of international society.

10) Instruments of environmental justice must be used in national policies to promote preservation and long-term protection of the right to a healthy environment for all. Population groups most vulnerable socially and economically should be given special attention. Women's rights of access and management of vital resources, and participation in environmental decisions should be primarily supported.

11) States undertake to use all legal instruments, human, material and financial resources to ensure implementation of environmental justice, including the following measures:

- a. Taxation;
- b. Environmental impact assessment;
- c. Monitoring and expertise in environmental regulation;
- d. Procedural rights: the right to information, participation, access to justice to contest any action or decision that would threaten environmental justice;
- e. Jurisdictional institutions.

#### RECOMMANDATION N°3

#### LES CATASTROPHES ÉCOLOGIQUES ET LES DROITS DE L'HOMME

La réunion mondiale des juristes et associations de droit de l'environnement réunis à er Limoges (France) du 29 septembre au 1 octobre 2011, et considérant que :

1. Les catastrophes écologiques d'origine naturelle ou technologique sont caractérisées par leur dimension collective, l'incapacité des victimes de réhabilitation sans aide extérieure et la causalité complexe qui résulte de différents facteurs interdépendants, notamment les vulnérabilités environnementales et socioéconomiques qui affectent la capacité de prévention, de réponse et de réhabilitation.
2. Un cadre juridique des catastrophes écologiques doit adopter une définition élargie considérant tout le cycle des catastrophes (prévention, assistance et reconstruction) et faisant l'option pour une stratégie de gestion de catastrophes centrée dans la promotion du développement durable, la réduction des vulnérabilités environnementales et socioéconomiques, le renforcement de la résilience et la promotion des droits de l'homme, remplacent une vision restrictive centrée sur l'aide humanitaire et la réhabilitation.
3. Les causes diffuses et complexes qui sont derrière les catastrophes et l'intensification de leurs risques et leurs effets comme la dégradation de l'environnement, la pauvreté et d'autres vulnérabilités socioéconomiques, les obstacles au développement durable et les violations aux droits de l'homme, qui exigent l'attribution d'une approche éthique et environnementale au cadre juridique et institutionnel des catastrophes centré dans la promotion et la protection des droits de l'homme et de l'environnement dans un contexte de prévention, ainsi que dans les cas d'urgence et de reconstruction.
4. L'augmentation des risques de catastrophe et des mouvements de population dues aux changements climatiques et la modification des écosystèmes ont des conséquences sur les droits de l'homme, ce qui exige l'incorporation de la réduction des risques de catastrophe dans les stratégies d'adaptation aux changements climatiques ainsi que le respect des droits de l'homme.
5. L'absence de réglementation sur le sujet, une fois qui la plupart des documents et des textes juridiques internationaux ne sont pas contraignants et ne considèrent pas l'approche éthique de la gestion des catastrophes. Si le sujet a été déjà bien développé par rapport à la prévention, à la réponse et à la reconstruction, d'autre part la protection des individus par rapport à leurs droits, la situation des personnes déplacées, les responsabilités des organisations internationales, régionales et nationales et d'autres institutions doivent être développées, ce qui justifie les initiatives capables de donner cette approche éthique et environnementale exigée pour faire face à toutes les dimensions des catastrophes écologiques.
6. Les documents existants concernant la protection des personnes et leurs droits en cas de catastrophe ne sont pas contraignants et donnent la priorité aux catastrophes naturelles, s'appliquant la plupart des cas exclusivement pendant et après les catastrophes.

Les recommandations suivantes sont présentées :

- La relation entre la protection des droits de l'homme et la gestion des catastrophes doit être abordée à partir d'un cadre juridique capable d'intégrer le Droit de l'Environnement, le Droit International des Droits de l'Homme, le Droit Humanitaire et les normes spécifiques concernant les catastrophes, en considérant les différents facteurs qui sont derrière les risques de catastrophes et qui peuvent affecter la résilience.
- Les droits touchés par la catastrophe doivent être protégé de façon pleine et indivisible, en considérant les droits civils et politiques et droits économiques, sociaux et culturels. Les droits économiques, sociaux et culturels ont un rôle important dans la prévention et la reconstruction, compte tenu de leur contribution pour renforcer la résilience face aux risques et aux conséquences des catastrophes.
- L'adoption d'un texte international contraignant indiquant les droits de l'homme à protéger et à promouvoir dans la prévention, la réponse et la reconstruction des catastrophes concernant les victimes potentielles et effectives et le personnel de secours, et qui vise à renforcer la résilience et à réduire les vulnérabilités.
- Le texte contraignant doit adopter une définition intégrale de la gestion des catastrophes, concernant les catastrophes naturelles et les catastrophes technologiques, et tout le cycle des catastrophes, de la prévention à la reconstruction. L'accent doit être mis sur les mesures préventives. Il doit considérer les causes complexes et diffuses qui sont

derrière les catastrophes et qui renforcent leurs effets comme la dégradation de l'environnement, la pauvreté et d'autres vulnérabilités socio-économiques, les obstacles au développement durable et les violations des droits de l'homme, ce qui exige une approche éthique et environnementale du cadre juridique des catastrophes. Cinq idées centrales doivent guider le texte:

1. Le développement durable comme le paradigme pour construire et renforcer la résilience en vue de réduire et de faire face aux risques et aux effets des catastrophes;
2. Les vulnérabilités socio-économiques et environnementales comme un facteur clé de l'exposition aux risques de catastrophes, notamment la pauvreté, ce qui exige la réduction des vulnérabilités et l'éradication de la pauvreté comme mesures de gestion des catastrophes dans une approche éthique et environnementale;
3. L'impact des catastrophes sur la jouissance des droits de l'homme et l'importance de renforcer leur protection comme une mesure pour réduire la vulnérabilité, promouvoir le développement durable et, en conséquence, renforcer la résilience;
4. La contribution des risques et des impacts des catastrophes sur l'augmentation des déplacements et des migrations et la condition spéciale de la vulnérabilité des personnes déplacées;
5. La protection de l'environnement comme une mesure nécessaire pour réduire les risques de catastrophes et de renforcer la résilience, par les services environnementaux rendus par les écosystèmes et leur fonction protectrice, ainsi que les effets de la dégradation de l'environnement sur l'augmentation des risques de catastrophe.

- Considérant qu'il y a un lien étroit entre la qualité de l'environnement, le niveau d'exposition aux risques de catastrophes et la capacité des communautés de faire face aux catastrophes, un droit à un environnement sain devrait être reconnu. Les services environnementaux rendus par les écosystèmes doivent être également reconnus et valorisés comme un moyen de réduire et de prévenir les risques de catastrophes et de préserver les ressources naturelles en tant que des moyens importants pour la reconstruction. Des mesures devraient être prises pour sauvegarder et réhabiliter l'environnement au plus vite possible après une catastrophe.

- Le droit aux mesures préventives et à la préparation aux catastrophes doit être reconnu, comme l'éducation, la formation et la prise de conscience des risques et le droit à une information appropriée pour créer une culture de la prévention en tant que moyens de résilience.

- Des mesures de précaution spéciales doivent être adoptées pour les personnes vulnérables. Les individus et les collectivités sont touchés de manière différente par les risques et les effets des catastrophes et il y aura différents degrés d'exposition selon les vulnérabilités, ce qui donne lieu à la nécessité d'intégration des principes de justice environnementale dans le cadre juridique relatif à la gestion des catastrophes. Les individus et des communautés vulnérables doivent bénéficier de mesures de prévention des catastrophes qui sont adaptés à leur vulnérabilité.

- La connaissance des populations autochtones et communautés traditionnelles sur son environnement et leur histoire peut être une contribution majeure à la réduction des risques et de la reconstruction après les catastrophes et devrait être reconnue et renforcée. Une attention particulière doit être accordée aux populations autochtones et les communautés traditionnelles dans les situations de catastrophes, compte tenu de leur forte relation avec leur environnement qui est essentiel pour le maintien de leur culture et de leur mode de vie.

- Parmi les groupes vulnérables, les personnes forcées de quitter leur domicile en raison des catastrophes, ou à risque d'être déplacées doivent avoir une attention particulière afin d'éviter les déplacements, ou lorsque c'est déjà arrivé, d'avoir leurs droits protégés compte tenu de leur extrême vulnérabilité. Cette vulnérabilité est aggravée par l'absence d'un statut juridique international des personnes déplacées. Par conséquent, les droits de l'homme concernant les personnes déplacées ou les personnes exposées au risque de déplacement en raison de catastrophes doivent avoir une reconnaissance et une protection internationales.

- Le droit à l'assistance humanitaire doit être reconnu, considérant que l'assistance humanitaire n'est pas actuellement reconnue officiellement pour le Droit International. L'assistance humanitaire doit être fournie de façon équitable, impartiale et sans discrimination, considérant et respectant la vulnérabilité des victimes et des groupes ayant des besoins spécifiques.

- Toutes les personnes et les communautés touchées par les catastrophes doivent être tenues informées et ont le droit de prendre part aux prises de décision en matière de réponse aux catastrophes.

- Toutes les personnes victimes des catastrophes doivent avoir reconnu leur droit à la dignité et l'accès à toutes les conditions requises pour mener une vie digne, afin de protéger la dignité humaine. La dignité humaine doit être au centre de la démarche éthique d'un cadre juridique sur la gestion des catastrophes.

- Les droits des personnels de l'aide et de secours doivent être également protégés.

- Les Etats doivent continuer à assurer la jouissance et le respect des droits de l'homme pendant et après les catastrophes. Les États ont la responsabilité de protéger les personnes sur leur territoire en assurant, en dépit de la catastrophe, la pleine application des droits de l'homme, tant pour leur peuple et pour le personnel d'aide humanitaire et de santé. Les entreprises et les autres organismes d'aide économique et humanitaire impliquée dans la reconstruction sont responsables du respect des droits humains et de la dignité de toutes les personnes impliquées dans les opérations de reconstruction ainsi que des victimes.

- Le rôle des juridictions internationales et régionales de protection des droits de l'homme dans l'analyse et la reconnaissance des violations des droits de l'homme en conséquence des catastrophes doit être reconnu et renforcé, ainsi que l'accès des victimes à ces juridictions.

#### RECOMMANDATION N°3

#### ECOLOGICAL DISASTERS AND HUMAN RIGHTS: CONSTRUCTING RESILIENCE BY AN ENVIRONMENTAL AND ETHICAL APPROACH

The International meeting of lawyers and environmental law associations, having met in Limoges (France) from 29 September to 1 October 2011, and considering that:

- Ecological disasters, with a natural or technological origin, are characterized by their collective dimension, by the incapacity of victims to rehabilitate without external assistance and by complex causes, as a result of different interrelated factors, in particular environmental and socio-economic vulnerability, which affect the ability to prevent, to react and to rehabilitate.

- A legal framework on ecological disasters should adopt a broader approach which considers all the aspects of the disaster cycle (prevention, assistance and reconstruction) and opts for a strategy of disaster management based on the promotion of sustainable development, the reduction of environmental and socio-economic vulnerabilities and the protection of human rights, which framework would replace a restrictive view of humanitarian assistance and rehabilitation.

- The complex and diffuse causes that are behind disasters and the growing intensity of their risks and their effects, like environmental pollution, poverty, socio-economic vulnerabilities, obstacles to sustainable development and human rights violations, gives rise to a need for a legal and institutional framework on disasters with an ethical and environmental approach, focusing on the promotion and protection of human rights and the environment in the context of measures for the prevention of such disasters as well as emergency measures and in reconstruction activities.

- The increase in disaster risks and in population movements due to climate change and ecosystems modification have consequences for human rights and requires the incorporation of disaster risk reduction measures and the protection of human rights into strategies for adaptation to climate change.
  - There is a lack of regulation on this matter and most of the documents and legal international instruments on disasters are not binding and do not address the ethical approach to disaster management. Although the subject may have already been extensively explored in relation to prevention, preparedness and recovery, the protection of individuals and their human rights, the situation of displaced persons, the responsibilities of international, regional and national organizations needs to be developed and initiatives adopting the ethical and the environmental approach are required to cope with all aspects of ecological disasters.
  - The existing documents dealing with the protection of persons and their rights in disasters are not binding and prioritize natural disasters and apply, for the most part, exclusively during and after disasters. Present the following recommendations:
  - The relationship between the protection of human rights and disaster management must be addressed in a legal framework capable of integrating Environmental Law, International Human Rights Law, Humanitarian Law and specific norms applied to disasters, taking account of the different factors behind disaster risks, which affect resilience to them.
  - The rights affected by disasters must be protected in a full and indivisible way, having regard to civil and political rights and economic, social and cultural rights. Economic, social and cultural rights have an important role in disaster prevention and reconstruction, having regard to their contribution in reinforcing resilience against risk and catastrophic consequences.
  - The adoption of an internationally binding text that defines the human rights to be protected and promoted in disaster prevention, response and reconstruction measures and dealing with actual and potential victims and rescue workers, with the aims of strengthening disaster resilience and reducing vulnerability.
  - This binding text should adopt an integrated approach to disaster management dealing with both natural and technological disasters, and dealing with the whole disaster cycle with an emphasis on preventive measures. It must consider the complex and diffuse causes behind disasters and which [contribute] to their effects, such as environmental pollution, poverty, socio-economic vulnerability, obstacles to sustainable development and breaches of human rights, which gives rise to a need for an ethical and environmental approach to a legal framework for disasters. The binding text must be based on five central themes:
1. Sustainable development as the paradigm to construct and reinforce resilience in order to reduce and manage the risks and effects of disasters;
  2. Regarding socio-economic and environmental vulnerabilities as key factors in exposing people to disaster risks, especially poverty, which gives rise to a need to reduce vulnerability and the eradication of poverty, as measures to manage disaster in an ethical and environmental way;
  3. The impact of disasters on the enjoyment of human rights and the importance of strengthening their protection as a measure to reduce vulnerabilities, to promote sustainable development and, in this way, to strengthen resilience;
  4. The contribution of disaster risks and impacts on the increase of displaced persons and migration and the vulnerability of the displaced persons;
  5. The protection of the environment as a necessary measure to reduce the risks of disasters and to reinforce resilience and having regard to ecological services provided by ecosystems and the effects of environmental pollution on increasing disaster risks and their impacts.
- Considering the relationship between the quality of the environment, the level of exposure to disaster risks and communities' ability to cope with disasters, a right to a healthy environment should be recognized. The environmental services provided by ecosystems must also be recognized and valued as a means of reducing and preventing disaster risk and preserving natural resources as important means to reconstruction. Measures should be taken to safeguard and rehabilitate the environment as soon as possible after the occurrence of disasters.
  - A right to preventive measures and disaster preparedness must be recognized, as to include education, training and awareness of disaster risks and rights to adequate information to create a culture of prevention and as means to strengthen resilience.
  - Special preventive measures must be adopted for vulnerable persons. Individuals and communities are affected in different ways by the risks and effects of disasters and there will be different degrees of exposure depending upon vulnerabilities, which gives rise to the need for incorporation of environmental justice principles in the legal framework on disaster management. Vulnerable individuals and communities must benefit from disaster prevention measures, which are tailored to their vulnerability.
  - The knowledge of indigenous people and traditional communities about their environment and their history can be a major contributor to risk reduction and to reconstruction after disasters and should be recognized and supported. Special attention must be given to indigenous people and traditional communities in disaster situations, having regard to their strong relationship with their environment, which is essential to the maintenance of their culture and way of life.
  - Among such vulnerable people, those people forced to leave their home due to disaster risk or at risk of being displaced, should have particular attention in order to avoid displacement or if that has already happened, to have their rights protected having regard to their extreme vulnerability. This vulnerability is compounded by the lack of any international legal status for such displaced persons. Therefore, the human rights of displaced persons or persons exposed to the risk of displacement as a result of disaster, should have international recognition and protection.
  - The right to humanitarian assistance should be recognized, considering that humanitarian assistance is not formally recognized in International Law. Humanitarian assistance should be provided fairly, impartially and without discrimination, having due regard to the vulnerability of victims and people's specific needs.
  - All persons and communities affected by disasters shall be kept informed of and have the right to take part in decisions dealing with the response to disasters.
  - All persons who are actual or potential victims of disaster should have their right to dignity recognized and have access to all the conditions required to lead a dignified life, so as to protect their human dignity. Human dignity should be at the center of an ethical approach to a legal framework on disaster management.
  - The rights of assistance and rescue workers must also be equally protected.
  - States must continue to ensure the enjoyment and respect for human rights during and after disasters. States have responsibility to protect people in their territory by ensuring that despite a disaster, human rights both for their people and for the humanitarian and health and aid personnel will be enforced. Companies and other economic and humanitarian aid agencies involved in reconstruction must respect the human rights and dignity of all people involved in reconstruction operations as well as of the victims.
  - The role of international and regional courts dealing with the protection of human rights in recognition and analysis of human rights violations arising from disasters should be recognized and reinforced, as well as the access of victims to these courts.

RECOMMENDATION N°4

## L'EFFECTIVITÉ DU DROIT INTERNATIONAL DE L'ENVIRONNEMENT

Considérant que l'environnement est un bien commun de l'Humanité,

Considérant qu'un environnement sain est vital pour la santé humaine,

Considérant que face aux enjeux environnementaux, l'utilisation de l'outil juridique ne peut être pleinement bénéfique que si l'effectivité des normes qui en résulte est assurée,

Considérant que l'effectivité du droit est indispensable à une « bonne » gouvernance,

Considérant que l'effectivité des normes internationales dans le domaine de l'environnement résulte de multiples facteurs qu'il convient d'envisager globalement,

Considérant qu'une action en faveur de l'effectivité des normes internationales dans le domaine de l'environnement implique des réformes internationales au niveau de l'architecture des normes et du contrôle de leur respect par les Etats,

Considérant que l'effectivité des normes internationales dans le domaine de l'environnement résulte en outre de la capacité de la société internationale à institutionnaliser les processus normatifs et juridictionnels, de même que de la reconnaissance du rôle des acteurs de la société civile,

Réaffirmant la place du droit, des acteurs et des mécanismes de contrôle au niveau interne pour l'effectivité du droit international de l'environnement, ème La 3 réunion mondiale des juristes et associations de droit de l'environnement recommande de:

1. Reconnaître que le droit à l'environnement tout comme ses principes fondateurs font partie du jus cogens international, entendu comme une norme impérative du droit international général universellement acceptée et reconnue par la société internationale ;
2. Renforcer l'institutionnalisation de l'environnement au sein des organes permanents et spécialisés de l'ONU, de même qu'au niveau des conférences des parties des accords multilatéraux sur l'environnement;
3. Reconnaître et mettre en œuvre le principe d'équilibre, selon lequel l'ambition des normes environnementales doit être en parfaite adéquation avec le niveau des enjeux environnementaux, notamment en intégrant en droit international, des procédures d'évaluation de l'impact sur l'environnement des traités;
4. Favoriser la participation du public à l'élaboration et au suivi de l'application des traités internationaux ;
5. Rendre le droit accessible, intelligible et prévisible, de même qu'en favoriser la diffusion ;
6. Améliorer de façon globale la mise en œuvre et l'application du droit international de l'environnement ;
7. Multiplier et améliorer les procédures de non compliance dans les accords multilatéraux sur l'environnement en prenant comme exemple le compliance committee de la Convention d'Aarhus et en prévoyant leur ouverture aux ONG et au public ;
8. Favoriser la création d'une Cour internationale de l'environnement ouverte aux acteurs non étatiques;
9. Institutionnaliser le dialogue des juges en créant des mécanismes de renvoi préjudiciel entre juridictions internationales et entre juridictions nationales et internationales ;
10. Ratifier largement la Convention d'Aarhus pour l'étendre au niveau universel ; appliquer son article 3 §7 au niveau de toutes les COP, de toutes les procédures de non-respect et devant toutes les juridictions internationales qui ont à connaître des affaires portant sur l'environnement ; appliquer les trois piliers de la Convention d'Aarhus au niveau national et régional.

## RECOMMANDATION N°4

### THE EFFECTIVENESS OF INTERNATIONAL ENVIRONMENTAL LAW

Considering that the environment is a common good of Humanity,

Considering that a healthy environment is vital for human health,

Considering that given the environmental stakes, the use of legal tools can only be fully useful if the effectiveness of international environmental norms is guaranteed,

Considering that the effectiveness of law is crucial for "good" governance,

Considering that the effectiveness of international environmental norms depends on multiple factors that have to be viewed globally,

Considering that action to advance the effectiveness of international environmental norms implies international reform of the normative architecture and of measures to ensure compliance by States,

Considering that the effectiveness of international environmental norms also depends on the capacity of international society to institutionalize normative and jurisdictional processes, as well as recognising the role of civil society parties,

Reaffirming the role of the law, relevant actors, and compliance mechanisms at the domestic level to improve effectiveness of international environmental law,

The third world meeting of environmental lawyers and environmental law associations recommends States to:

- 1) Recognize that the right to the environment, as well as the main principles of environmental law, are part of international jus cogens, to be understood as a peremptory norm of general international law universally accepted and recognized by the international community;
- 2) Reinforce institutionalization of the environment within permanent and specialized UN bodies, as well as within conferences of the Parties of multilateral environmental agreements;
- 3) Recognize and implement the principle of equilibrium, according to which environmental law should be fully adequate to address the needs of environmental degradation, notably by integrating within international law, procedures to assess the impact of the international treaties on the environment;
- 4) Promote public participation in the formulation and implementation of international treaties ;

- 5) Make the law accessible, intelligible, predictable and transparent to all, simultaneously promote awareness of and disseminate international environmental law;
- 6) To improve in a global manner the implementation and enforcement of international environmental law;
- 7) Multiply and improve the non-compliance procedures in multilateral environmental agreements by using as an example the Aarhus Convention Compliance Committee and by providing access to these procedures to NGOs and to the public;
- 8) Encourage the creation of an International Court of the Environment open to non-state actors ;
- 9) Institutionalize dialogue among judges by creating preliminary ruling procedures between international jurisdictions and between international jurisdictions and domestic courts;
- 10) Encourage wider ratification of the Aarhus Convention to give it universal application; apply its article 3(7) in all Conferences of the Parties, in all non-compliance procedures and before all international jurisdictions in which environmental cases may be brought; and apply the three pillars of the Aarhus Convention at the national and regional levels.

#### RECOMMANDATION N°5

#### DROIT À L'ALIMENTATION ET DÉVELOPPEMENT DURABLE

La réunion mondiale des juristes de l'environnement :

Consciente de la nécessité de lier la réalisation du droit à l'alimentation à un accès équitable aux ressources naturelles, en particulier pour les populations les plus vulnérables;

Consciente de la nécessité d'assurer la sécurité juridique des droits relatifs à la terre, à l'eau, aux forêts, et aux pêches;

Consciente de la menace qui pèse sur la sécurité alimentaire et le droit vital à l'alimentation des populations autochtones et des communautés locales, d'une part par une exploitation irrationnelle des ressources naturelles; et d'autre part, par un accès inéquitable à ces ressources;

Considérant que la survie de l'humanité se fera, également, par la réalisation du droit à une alimentation suffisante et adéquate, à travers une agriculture durable et une gestion intégrée de toutes les ressources naturelles;

Considérant la Résolution du Parlement européen du 29 septembre 2011, appelant à une réalisation effective du droit à l'alimentation ;

Recommande:

##### 1. Sur le fondement conceptuel:

a) qu'en se fondant sur le concept d'agroécologie, il faut lier le développement agricole au droit à l'alimentation, pour faire en sorte que les systèmes alimentaires garantissent la disponibilité de la nourriture pour tous et que l'offre puisse répondre aux besoins mondiaux;

b) de veiller à ce que le développement agricole contribue à accroître les revenus des petits exploitants, réduisant ainsi la faim autant que la pauvreté ;

c) que le souci d'équité se double d'une exigence de durabilité, en veillant à ce que l'agriculture maintienne sa capacité à satisfaire les besoins des générations présentes et futurs moyennant la sauvegarde de la biodiversité agricole, la préservation de la qualité de l'eau et des sols, ainsi que la lutte contre la désertification et la sécheresse, le changement climatique et les catastrophes naturelles.

##### 2. Sur le cadre juridique:

d) de reconnaître constitutionnellement, au profit de chaque être humain, le droit à une alimentation adéquate, lui permettant d'accéder à des aliments sains et nutritifs en quantité suffisante afin de jouir pleinement de ses capacités physiques et mentales;

e) d'adopter un dispositif juridique - éventuellement sous forme de loi-cadre - spécialement consacré au droit à l'alimentation, qui en spécifie le contenu normatif et définisse les obligations qui en découlent ainsi que les mesures d'ordre institutionnel, judiciaire, éducatif, budgétaire ou autres visant à renforcer son application;

f) que les Etats adhèrent aux divers instruments internationaux pertinents, régionaux et mondiaux, relatifs au droit à l'alimentation;

g) l'application des orientations fournies par les Directives volontaires à l'appui de la concrétisation progressive du droit à une alimentation adéquate dans le contexte de la sécurité alimentaire nationale (2004);

h) la mise en œuvre des futures Directives volontaires sur la gouvernance responsable de la tenure des terres, pêches et forêts dans le contexte de la sécurité alimentaire nationale (en cours de négociation).

##### 3. Sur les politiques et législations foncières:

i) d'adopter, réviser et mettre en œuvre des politiques foncières nationales cohérentes qui tiennent compte du droit à l'alimentation;

j) de réformer les législations foncières en ayant à l'esprit le droit à l'alimentation, notamment en termes d'accès à la terre agricole et aux autres ressources naturelles qui s'y rattachent;

k) de reconnaître la pluralité des régimes fonciers qui coexistent, y compris les droits coutumiers, afin de mieux répondre aux besoins de sécurisation des différents acteurs en milieu rural;

l) de réguler les marchés fonciers en vue de lutter contre la spéculation, en particulier sur le foncier urbain, en vue d'atténuer l'exclusion des populations les plus vulnérables par les mécanismes du marché.

##### 4. Sur la gestion des ressources naturelles (terres, forêts, pâturages, eau, pêche, ressources phytogénétiques):

m) de réformer les législations relatives à la gestion des ressources naturelles en s'efforçant de mettre en cohérence le droit à l'alimentation avec les normes, pratiques et contraintes locales;

n) d'accorder une attention particulière aux mécanismes idoines de gestion locale des ressources naturelles, privilégiant la concertation entre les différents usagers (par ex. à

travers des conventions locales consensuelles);

o) d'associer tous les acteurs concernés, notamment locaux, au processus d'élaboration, de mise en œuvre et de suivi des législations relatives à la gestion des ressources naturelles.

5. Sur l'accès aux ressources par les groupes spécifiques (femmes, populations autochtones, minorités):

p) de veiller au respect des instruments internationaux relatifs aux droits des femmes, des populations autochtones et des minorités, et leur faciliter l'accès au moyens de recours en cas d'atteinte à leurs droits;

q) de mettre en place, et veiller à l'application effective, de dispositifs juridiques adaptés, équitables et non discriminatoires, garantissant l'accès des femmes, des populations autochtones et des minorités aux terres et autres ressources naturelles;

r) d'associer les femmes, les populations autochtones et les minorités à la gestion des terres et autres ressources naturelles assurant leur droit à l'alimentation, au partage des bénéfices qui en découlent et aux processus décisionnels y relatifs.

6. Sur les investissements agricoles et acquisitions foncières en milieu rural:

s) de promouvoir les investissements publics et privés en faveur de l'agriculture, notamment paysanne, ainsi que des activités agro-sylvo-pastorales et de la pêche artisanale;

t) d'adopter un cadre juridique garantissant la sécurité des investissements dans le foncier rural, en tenant dûment compte des dimensions environnementales et sociales;

u) de réaliser ces investissements sans mettre en péril la sécurité alimentaire locale et nationale, dans le respect de l'ensemble des droits individuels et collectifs y compris les droits fonciers existants, individuels comme collectifs, et suivant des procédures participatives transparentes;

v) d'encadrer juridiquement les acquisitions foncières à moyenne et grande échelle en milieu rural, en soumettant les cessions privées au consentement préalable informé des populations concernées, en sauvegardant les droits fonciers locaux et en garantissant le paiement effectif de la valeur réelle des terres cédées.

## RECOMMANDATIONS N°5

### THE RIGHT TO FOOD AND SUSTAINABLE DEVELOPMENT

The environmental legal experts global meeting:

Conscious of the necessity to link the achievement of the right to food to a fair access to natural resources, in particular for the most vulnerable populations;

Conscious of the necessity to ensure legal safety of the rights to land, water, forest, fisheries;

Conscious of the threat to food safety and to the vital right to food of indigenous people and local communities, due on the one hand to irrational exploitation of natural resources; and on the other hand to unfair access to these resources;

Considering that the survival of humanity will be done through the achievement of the right to sufficient and adequate food, and through sustainable agriculture and integrated management of all the natural resources;

Considering the European Parliament Resolution of 29 September 2011 calling for an effective achievement of the right to food;

Recommends:

1. Regarding the conceptual basis:

a) That by referring to the concept of agroecology, agriculture development and right to food should be linked so that food systems ensure food availability for all and that the supply satisfies the global needs;

b) To make sure that agriculture development contributes to the increase of small-scale farmers, thus reducing hunger as well as poverty;

c) That the concern for equity be associated with a requirement of sustainability, by ensuring that agriculture maintains its capacity to the needs of the present and future generations provided that agriculture biodiversity is safeguarded, that water and soil quality is preserved, and that desertification and drought, climate change and natural disasters are combated against.

2. Regarding the legal framework:

d) To constitutionally recognize the right to adequate food to every human being so that he/she can access sound and nutritious food in sufficient quantity to fully enjoy his/her physical and mental capacities;

e) To adopt a legal system- which may be in the form of a framework law- specifically focusing on the right to food that specifies its content and defines the resulting obligations as well as institutional, legal, educational, budgetary measures or any other measure aiming at strengthening its implementation;

f) That States accede to the relevant regional and international right to food instruments;

g) The implementation of the orientations of the Voluntary Guidelines to support the progressive realization of the right to adequate food in the context of national food security (2004);

h) The implementation of the future Voluntary Guidelines on the Responsible Governance of Tenure of Land, Fisheries and Forests in the context of national food safety (under negotiation).

3. Regarding land policies and legislations:

i) To adopt, review and implement coherent national land policies which take into account the right to food;

j) To reform land policies bearing in mind the right to food, in particular in terms of access to agricultural lands and to other related natural resources;

k) To recognize the plurality of land tenures that exist, including customary rights, in order to better satisfy the needs of security of the different actors of the rural area;

l) To regulate the land markets in order to fight against speculation, in particular on the urban land market, so as to mitigate the exclusion of the most vulnerable populations by the market mechanisms.

4. Regarding the natural resources management (land, forest, pasture, water, fisheries, plant genetic resources):

m) To reform legislation related to natural resources management through seeking to bring coherence between the right to food and the local rules, practices and constraints;

n) To grant specific attention to the appropriate mechanisms of local management of natural resources, giving priority to concertation/discussions between the different users (e.g. through consensual local conventions);

o) To associate all stakeholders, including the local ones, to the elaboration process, implementation and follow up of legislation related to the management of natural resources.

5. Regarding the access to resources by specific groups (women, indigenous people, minorities):

p) Ensure the respect of international instruments related to women, indigenous people and minorities rights, and to facilitate their access to appeal in case of infringement to their rights;

q) To establish and ensure the effective implementation of appropriate, fair and non discriminatory legal mechanisms that guarantee women, indigenous populations and minorities access to land and other natural resources;

r) To associate women, indigenous populations and minorities to the management of land and other natural resources guaranteeing their right to food, and to the resulting benefit sharing and decision process.

6. Regarding agriculture investments and land acquisition in rural area:

s) To promote public and private investment in favour of agriculture, including peasant agriculture, as well as agro-sylvo-pastoral and small-scale fisheries;

t) To adopt a legal framework that guarantees the safety of investments in rural land sector, duly taking into account the environmental and social aspects;

u) To realize the afore mentioned investments without jeopardizing the local and national food safety, respecting all individual and collective rights including the existing individual and collective land rights, and according to transparent participative procedures;

v) To legally define the rural small and large scale land acquisitions by submitting the private transfers to the prior consent of the populations involved, by safeguarding the local land rights and by ensuring the effective payment of the real value of the transferred lands.

#### RECOMMANDATION N° 6

#### PACTE SUR L'ENVIRONNEMENT ET LE DÉVELOPPEMENT

La Réunion mondiale des juristes de l'environnement,

Ayant examiné le statut et le contenu actuels du projet d'un « Pacte international sur l'environnement et le Développement » qui comprend la plupart des principes acceptés par consensus depuis la conférence de Stockholm,

Notant que ce dernier a été introduit auprès de la communauté internationale en 1995 à l'occasion du cinquantième anniversaire de l'Organisation des Nations Unies,

Saluant la contribution de l'UICN et du Conseil international de droit de l'environnement à la formulation et à la promotion de cette initiative ;

Considérant que le projet de Pacte contribue au développement du droit international de l'environnement vise à renforcer, la construction d'un véritable droit du développement durable ;

Notant avec satisfaction les progrès accomplis depuis la présentation du projet de Pacte pour le développement durable qui a fait depuis lors l'objet de trois révisions qui l'ont périodiquement actualisé ;

Préoccupée fortement par l'absence persistance de versions du projet en d'autres langues de travail des Nations unies, particulièrement dans une version française,

Convaincue que la traduction en français du projet de Pacte est d'une haute importance pour les pays en développement de l'espace francophone qui doivent jouer un rôle important dans le processus d'adoption d'un tel instrument,

1. Accueille favorablement le projet de Pacte international sur l'environnement et le développement, dont elle recommande l'adoption ;

2. Décide de le recommander fortement à l'attention de l'AGONU pour discussion et adoption ;

3. Propose qu'à ces fins, l'AGONU, par l'intermédiaire d'un État membre, se saisisse du projet de Pacte et l'introduise en tant que document officiel en vue de garantir sa traduction dans les langues de travail des Nations Unies ;

4. Attire l'attention de l'Organisation internationale de la Francophonie sur l'urgence d'une version française avant la conférence Rio + 20, en vue de faciliter les discussions au sein de la communauté francophone ;

5. Recommande que l'AGONU adopte directement le projet de Pacte international sur l'environnement et le développement en Plénière, le cas échéant, sur recommandation de la 6 commission ;

6. Relève que plusieurs Etats ont utilisé le projet de Pacte international comme référence pour leur législation nationale ;

7. Relève également que les pays de l'UA ont utilisé le projet de Pacte international comme base de révision de la convention d'Alger de 1968 sur la conservation de la nature et des ressources naturelles et que les chefs d'Etats et de gouvernement l'ont accepté à Maputo en 2003 ;

8. Invite les Etats membres de l'UA à une ratification rapide de la convention africaine révisée adoptée lors du sommet des chefs d'Etats et de gouvernements à Maputo ;

9. Propose, si l'adoption par l'AGONU en plénière n'est pas possible, que l'AGONU crée sous son égide un Comité intergouvernemental de négociation chargé d'élaborer de la négociation et de l'adoption d'un tel instrument, en tenant compte des propositions que pourront soumettre les États participant au processus de négociation, de façon à ce que la convention soit mise au point d'ici à juin 2014 ;

10. Recommande instamment qu'une résolution de l'AGONU envisage rapidement la mise en place des conditions d'une adoption du projet de Pacte sur l'environnement et le développement, conformément à la pratique établie de l'AGONU ;

11. Prie le Secrétaire général de saisir dès que possible l'AGONU du projet de pacte aux fins de son examen et adoption ;

#### RECOMMANDATION N°6

##### PACT ON ENVIRONMENT AND DEVELOPMENT

Having examined the actual status and content of the draft for an « International Covenant on Environment and Development » which includes a large number of principles accepted by consensus since the Stockholm Conference,

Noting that the draft International Covenant on Environment and Development was introduced to the international community in 1995 on the occasion of the fiftieth anniversary of the United Nations,

Recognizing the contribution of the International Union for the Conservation of Nature and Natural Resources (IUCN) and the International Council of Environmental Law -toward sustainable development- (ICEL) in the formulation and promotion of this initiative;

Considering that the draft Covenant contributes to the development of international environmental law, and aims to build a real sustainable development law;

Noting with satisfaction the progress made since the initial presentation of the draft International

Covenant on Environment and Development, which has since undergone three revisions to periodically update it in accordance with the newest developments in the field;

Deeply concerned by the continuing lack of a version of the draft Covenant in other working languages of the United Nations, particularly in French;

Convinced that the French translation of the draft Covenant is of paramount importance to Francophone developing countries, which have an important role to play in the process of adopting such an instrument;

The Third Worldwide Conference of Environmental Law NGOs and Lawyers in Limoges (France), September 29-1 October, 2011:

1. Welcomes the draft International Covenant on Environment and Development, and recommends its adoption;
2. Decides to recommend it strongly to the attention of the United Nations General Assembly (UNGA) for discussion and adoption;
3. Provides for such purposes that the UNGA, through a Member State, embrace the draft Covenant and introduce it as an official document to ensure its translation into the working languages of the United Nations;
4. Draws the attention of the International Organization of La Francophonie to the urgent need for a French translation before the Rio+20 Conference, to facilitate discussions within the Francophone community;
5. Recommends that the UNGA, upon recommendation of the 6th Committee, directly adopt the draft International Covenant on Environment and Development in Plenary; ;
6. Notes that several states have used the draft Covenant as a check list for their national legislation, especially African Union (AU) Member States;
7. Further Notes that AU Member States have concretely used the draft Covenant as a basis for the revision of the 1968 African Convention on the Conservation of Nature and Natural Resources and that all Heads of State and Government adopted this Revised African Convention (Maputo Convention) at the Second Summit of the African Union in 2003;
8. Invites AU Member States to quickly ratify the Revised African Convention adopted by the Heads of State and Government at the Second Summit of the African Union in Maputo in 2003;
9. Proposes, that if adoption of the draft International Covenant on Environment and Development by the UNGA in Plenary is not possible, the UNGA establish, under its aegis, an Intergovernmental Negotiating Committee for the negotiation and adoption of such an instrument, taking into account proposals that could be submitted by the States participating in the negotiation process, so that the Convention be developed by June 2014;
10. Urges the adoption of a resolution by the UNGA to quickly consider the establishment of conditions for the adoption of the draft International Covenant on Environment and Development, in accordance with the established practices of the UNGA;
11. Requests the Secretary-General, as soon as possible, to bring the draft Covenant to the attention of the UNGA for its consideration and adoption;

#### RECOMMANDATION N° 7

##### POUR UNE CONVENTION MONDIALE SUR LES ÉVALUATIONS ENVIRONNEMENTALES

Les participants à la réunion mondiale de juristes et des associations du droit de l'environnement sont conscients des incidences réciproques des activités économiques et de leurs conséquences sur l'environnement et de la nécessité d'intensifier la coopération internationale dans le domaine de l'évaluation environnementale pour une gestion de l'environnement et du développement durable meilleure et plus rationnelle.

Ils proposent l'élaboration d'une convention mondiale opérative (en anglais, implementable) sur les évaluations environnementales et la durabilité, sur la base des considérations suivantes :

1. Des nombreux Etats ont adopté des mesures pour que l'évaluation de l'impact sur l'environnement soit pratiquée en application de leurs lois et règlements administratifs et de leur politique nationale. Pourtant, les dispositions nationales existantes n'offrent pas toutes le même niveau d'exigence ni ne répondent à des critères harmonisés. Ce manque d'uniformité des législations nationales sur les évaluations a des effets indésirables sur la protection de l'environnement et peut générer des distorsions ayant des effets inéquitables dans les échanges économiques internationaux.
2. La jurisprudence internationale, notamment de la Cour Internationale de Justice (CIJ) et du Tribunal International de Droit de la Mer (TIDM), a constaté « qu'il existe, en droit international général, une obligation de procéder à une évaluation de l'impact sur l'environnement lorsque l'activité industrielle projetée risque d'avoir un impact préjudiciable important dans un cadre transfrontière, et en particulier sur une ressource partagée ». Cependant, la CIJ reconnaît aussi que « le droit international général ne précise (pas) la portée et le contenu des évaluations de l'impact sur l'environnement » et que, par conséquent « il revient à chaque Etat de déterminer, dans le cadre de sa

législation nationale ou du processus d'autorisation du projet, la teneur exacte de l'évaluation environnementale requise dans chaque cas ». Ce cadre normatif, manifestement incomplet, implique l'élaboration urgente de règles harmonisées, décidées par les États dans une convention internationale de portée mondiale, pour définir les standards minimaux que les dispositions nationales et internationales sur les évaluations environnementales et de durabilité devraient respecter.

3. À l'heure actuelle, les dispositions nationales et internationales sur les évaluations environnementales ne s'appliquent pas généralement aux espaces situés au-delà des juridictions nationales. Il est urgent de mettre en place des instruments juridiques qui comblent cette lacune pour renforcer la protection environnementale des espaces communs de la Planète.

4. Dans l'élaboration de la Convention, les lignes directrices suivantes devraient être prises en compte.

a. La Convention devrait avoir une portée mondiale, quitte à être suivie d'autres instruments de portée régionale et sous-régionale

b. Champ d'application : La Convention devrait avoir une portée étendue comprenant les études d'impact sur l'environnement et les évaluations stratégiques et transfrontières ainsi que la surveillance continue. Les évaluations devraient intégrer les aspects sociaux et culturels ainsi que les effets sur la consommation d'énergie.

c. Floor but no ceiling : La Convention établira les conditions minimales des procédures d'évaluation, tout en permettant aux Parties d'adopter des normes nationales plus protectrices. La Convention établira le contenu minimal de l'étude d'impact, la qualité technique et l'indépendance scientifique des auteurs de l'étude d'impact.

d. Screening : La Convention devra fixer la liste d'activités soumises aux procédures d'évaluation, soit sur la base de critères généraux soit par une énumération spécifique.

e. Ex ante approach : La procédure d'évaluation devra être complétée avant qu'une décision soit prise par l'autorité compétente autorisant le projet d'activité ou les lois, plans et programmes correspondants.

f. Global commons: La Convention s'applique aux évaluations transfrontières qui risquent d'affecter d'autres États ou des zones situées au-delà des juridictions nationales. Dans le cas des évaluations transfrontières, les procédures de notification et de consultation entre les États concernés seront exigées. Tous les États concernés pourront participer aux procédures d'évaluation.

g. Public participation : Dans tous les cas, la participation du public à la procédure d'évaluation sera garantie et prise en considération.

h. Compliance mechanisms : La Convention inclura un mécanisme de contrôle et de suivi avec un Comité composé d'experts indépendants qui peut recevoir des demandes de la part du public (independent body + public trigger)

i. La Convention pourra être complétée par des Protocoles en tant que de besoin.

#### RECOMMENDATION N°7

#### FOR A WORLD CONVENTION ON ENVIRONMENTAL ASSESSMENTS

The participants in the global meeting of lawyers and environmental law associations are conscious of the reciprocal impacts of economic activities and their consequences on the environment and the need to intensify international co-operation in the field of environmental assessment for a better and more rational management of the environment and for sustainable development.

They encourage the commencement of a process for the drafting of an enforceable world convention on environmental assessment and sustainability, based on the following considerations:

1. Many States have adopted measures to ensure that environmental impact assessment is carried out as part of their laws and administrative regulations and their national policy. But existing national laws and regulations do not provide for the same requirements nor reflect harmonized criteria. This lack of uniformity of national laws on assessments has adverse effects on the protection of the environment and can generate distortions with unfair effects on international trade.

2. International jurisprudence, particularly of the International Court of Justice (ICJ) and the International Tribunal of the Law of the Sea (ITLOS), has found "that there is, in general international law, a duty to undertake an environmental impact assessment when the proposed industrial activity may have an adverse impact in a transboundary context, and in particular, on a shared resource". However, the ICJ recognizes also that "general international law does not specify the scope and content of an environmental impact assessment" and that therefore "it is up to each State to determine, in its national legislation or in the authorization process, the specific content of the environmental assessment required in each case". This clearly incomplete, normative framework gives rise to an urgent demand for the development of harmonized rules, agreed upon by States, in an international convention of global scope, to set minimum standards that must be complied with by national and international instruments dealing with environmental assessment and sustainability.

3. Currently, national and international provisions on environmental assessments do not generally apply to areas located beyond national jurisdiction. Legal instruments to fill this gap and to strengthen environmental protection of the common areas of the planet should be put in place as a matter of urgency.

4. In drafting the Convention, the following guidelines should be considered:

a. The Convention should have global scope, even if it is to be followed by other instruments of regional and sub-regional scope.

b. Scope of application: the Convention should have broad scope covering environmental, strategic and transboundary assessments and continuing surveillance and monitoring. The assessments should integrate the social and cultural aspects and the effects of planned activities on consumption of energy.

c. Floor but no ceiling: the Convention should establish the minimum requirements of the assessment procedures, while allowing the Parties to adopt more protective national standards. The Convention should establish the minimum content of the environmental assessment report and the technical quality and the scientific independence of its authors.

d. Screening: the Convention should fix the list of activities subject to assessment procedures, either on the basis of general criteria or by a specific enumerating list.

e. Ex-ante approach: the assessment procedure must be completed before a decision is made by the competent authority authorizing the project activity or under the corresponding laws, plans and programmes.

f. Global commons: the Convention should apply to transboundary assessments which might affect other States or areas beyond national jurisdictions. In the case of transboundary assessments, procedures for notification and consultation among the States concerned will be required. All the States concerned can participate in the assessment procedures.

g. Public participation: in all cases, public participation in the assessment procedures should be guaranteed and taken into consideration.

h. Compliance mechanisms: the Convention should include a compliance mechanism with a Committee of independent experts who can receive requests from the public (independent body + public trigger)

i. The Convention may be supplemented by Protocols as needed.

#### RECOMMANDATION N°8

##### LA SÉCURITE ET L'UTILISATION DURABLE DU SOL

Considérant que le sol, en tant que base première pour toute biodiversité terrestre, a été jusqu'alors largement ignoré dans les forums internationaux et par les gouvernements nationaux, excepté dans le contexte de la désertification ;

Comprenant que le manque de prise en considération du sol constitue un déficit substantiel dans les politiques environnementales et que le sol, en tant que ressource biologique vitale, nécessite une protection urgente et spécifique, au même titre que d'autres régimes de protection, en particulier la diversité biologique et le changement climatique ;

Réalisant la nécessité d'initier une approche intégrée de la conservation, de la sécurité et de l'utilisation durable du sol et qui prenne le sol en considération dans les régimes environnementaux multilatéraux de la désertification, de la diversité biologique et du changement climatique ;

Rappelant que les objectifs de la Convention relative à la lutte contre la désertification doivent être poursuivis conformément à ses dispositions pertinentes, pour combattre la désertification, réduire les effets de la sécheresse, utiliser des stratégies à long terme axées sur l'amélioration de la productivité des terres, la remise en état, la conservation et la gestion durable des ressources du sol et de l'eau, conduisant à une amélioration des conditions de vie, en particulier au niveau de la communauté ;

Reconnaissant que plus de 70 % des terres pastorales dans le monde sont gravement touchées par la dégradation du sol et en vue de leur contribution dans l'adaptation au changement climatique, la gestion des risques de catastrophes, la protection de la biodiversité et l'agriculture durable et le développement rural ;

Prenant en compte le texte adopté à la séance du Parlement européen du 29 Septembre 2011 sur l'adoption d'une position commune de l'UE avant la Conférence des Nations Unies sur le développement durable (Rio +20), notamment l'article 52 qui « déplore la lenteur de l'avancée des négociations et des engagements dans le cadre de la Convention des Nations unies sur la lutte contre la désertification (CLD), estime que les sols sont une ressource rare et que leur dégradation et leur réaffectation nécessitent une réponse à l'échelle mondiale; appelle de ses vœux des actions concrètes et efficaces et des mesures de contrôle, notamment pour ce qui concerne la production de biocarburants »;

Il est recommandé que, dans une première étape pour résoudre les problèmes de la conservation mondiale des sols, un protocole sur la sécurité et l'utilisation durable des sols soit négocié sous l'égide de la Convention relative à la lutte contre la désertification.

Il est en outre recommandé que la Conférence de Rio + 20 envisage l'élaboration d'un projet détaillé de Convention sur la sécurité et l'utilisation durable du sol, en se concentrant sur la dégradation des sols et la contamination et comportant des dispositions concernant le rôle du sol dans la conservation de la diversité biologique, l'atténuation et l'adaptation aux effets du changement climatique et la sécurité alimentaire à l'égard de toutes les terres.

#### RECOMMANDATION N°8

##### SECURITY AND SUSTAINABLE USE OF SOIL

Recognizing that soil, as the primary basis for all terrestrial biodiversity, has until recently been largely ignored in international fora and by national governments, except in the context of desertification.

Understanding that the lack of consideration of soil represents a substantial gap in global policy making on the environment and that soil, as a vital biological resource demands urgent and specific protection on the same level as other environmental regimes, in particular biological diversity and climate change.

Accepting that it is necessary to initiate an integrated approach to soil conservation, soil security and sustainable use of soil and which takes soil into account within the multilateral environmental regimes of desertification, biological diversity and climate change.

Recalling the objectives of the Convention to Combat Desertification, to be pursued in accordance with its relevant provisions, to combat desertification, mitigate effects of drought, use long-term strategies that focus on improving productivity of land, rehabilitation, conservation and sustainable management of land and water resources, leading to improved living conditions, in particular at the community level;

Recognizing that over 70 percent of the world's pastoral lands are severely affected by soil degradation and in view of their contributions to climate change adaptation and mitigation, disaster risk management, biodiversity protection, and sustainable agriculture and rural development;

Taking into account the text adopted at the sitting of the European Parliament on 29 September 2011 on developing a common EU position ahead of the United Nations Conference on Sustainable Development (Rio+20) in particular clause 51 which "Regrets the slow progress of negotiations and commitments in the context of the UN Convention to Combat Desertification (UNCCD); considers that soil is a scarce resource and that land degradation and land use change require a global response; calls for concrete action, efficient measures and monitoring, especially as regards the production of biofuels";

It is recommended that, as a first step in addressing issues of global soil conservation, a Protocol on Security and Sustainable Use of Soil be negotiated under the Convention to Combat Desertification It is further recommended that the Rio + 20 Conference consider the drafting of a comprehensive Convention on Security and Sustainable Use of Soil, focusing on soil degradation and contamination as well as including provisions concerning the role of soil in the conservation of biological diversity, mitigating and adapting to the effects of climate change, and food security with regard to all lands;

#### RECOMMANDATION N°9

##### CONVENTION POUR LA LUTTE CONTRE LA POLLUTION MARINE D'ORIGINE TELLURIQUE

La troisième réunion mondiale des juristes et associations de droit de l'environnement

Considérant que la pollution tellurique représente 80% de la pollution des mers,

Considérant le très grand nombre de sources de cette pollution, toutes situées à terre,

Considérant l'insuffisance du cadre international général et régional traitant de la question, il est nécessaire de proposer une convention mondiale de lutte contre ce fléau,

Recommande l'adoption de la convention selon les principes suivants:

1. recommande la prise en compte de toutes les sources de cette pollution y compris les apports sédimentaires, les déversements de déchets solides et les retombées aériennes de polluants volatiles;
2. recommande la prise en compte des trois origines des polluants: rivages, cours d'eau et retombées atmosphériques;
3. recommande la création d'une convention cadre contenant les dispositions minimales et de protocoles additionnels tenant compte des spécificités des écosystèmes océaniques et du développement économique des riverains de ces écosystèmes;
4. recommande que la convention repose sur trois piliers: la mise en place de programmes d'action de 5 à 6 ans déterminant des priorités, l'obligation pour les États parties de se doter de mesures législatives nécessaires pour une application effective des programmes d'action, l'instauration du principe de pollueur payeur mais dont les sanctions pécuniaires serviraient à inciter les acteurs économiques à se doter d'équipements diminuant ou supprimant les déversements polluants;
5. recommande que soit introduit un système de listes de produits interdits de déversement et de produits provisoirement autorisés sous la responsabilité de l'Etat.
6. recommande que la convention soit dotée d'organes permanents dont un secrétariat assurant la continuité et les liens entre les parties, une commission administrative dotée de pouvoirs de décision et de recommandation évaluant la mise en œuvre de la convention, aidant à la coordination des actions, recevant les rapports annuels des parties. Les décisions de cette commission seraient adoptées par voie de consensus. Le recours à la votation serait évité autant que possible;
7. les protocoles additionnels permettraient une approche spécifique *ratione materiae* mais également une approche chronologique *ratione temporis* afin de privilégier les actions prioritaires et de permettre aux États les moins avancés de monter progressivement en puissance. Il conviendrait de prévoir des protocoles précisant les niveaux de rejet, tenant compte des bassins hydrographiques, luttant contre les eaux usées, instaurant une surveillance en continu, adoptant un schéma directeur pour les programmes d'action, fixant les objectifs des politiques publiques;
8. recommande de mettre en place un système de responsabilité des États parties assurant le respect des dispositions conventionnelles. Les États manquant à leurs obligations devraient réparer les dommages causés. Mais dans toute la mesure du possible, les États parties devraient aider l'État défaillant de bonne foi. Les Etats doivent prévoir des sanctions pénales au niveau national;
9. recommande aux parties d'utiliser toutes les formes de règlement pacifique des différends. En cas de non accord, le recours obligatoire au tribunal international du droit de la mer est privilégié.

#### RECOMMANDATION N°9

##### CONVENTION FOR THE LAND-BASED MARINE POLLUTION

The third global meeting of lawyers and associations for environmental law

Considering that the land- based marine pollution represents 80% of the pollutions of the seas,

Considering the great number of causes of this pollution, all of them land-based,

Considering the deficiency of juridical international and regional conventions on this question,

Think it necessary to propose a global convention to fight this pollution and recommend the adoption of a convention to take account of the following:

1. to take account of all the causes of this pollution, including sedimentary deposits, the dumping of solid waste and the atmospheric fallout of volatile pollutants;
2. to take into account the three origins of the pollutants : sea shores, rivers, and atmospheric fallout;
3. the creation of a framework convention including minimum provisions and additional protocols taking into account the requirements of oceanic ecosystems and of the economic development of coastal states;
4. the convention to be based on three pillars : the putting in place of programs of action for 5 or 6 years setting out priorities, the obligation on member States parties to adopt the legislative measures needed for the effective enforcement of the programs, the adoption of the polluter-pays principle while also providing for financial penalties to incite economic actors to adopt equipment to diminish or suppress polluting discharges;
5. the introduction of a system of lists of products which are prohibited from dumping and of products provisionally authorized under State responsibility;
6. the convention to provide for the establishment of permanent bodies to include a Secretariat ensuring continuity and links between parties, an administrative Commission with decision making powers and to make recommendations on the enforcement of the convention, helping to co-ordinate actions and receiving the annual reports of the parties. The decisions of the Commission would be adopted by consensus, recourse to voting being avoided insofar as possible;
7. the additional protocols would allow a specific approach *ratione materiae* and also a chronological approach *ratione temporis* in order to prioritise actions and to allow the less developed States to gradually increase their participation. Protocols should be provided specifying waste standards, taking account of hydrographic basins, waste waters and the putting in place of continuous surveillance and the putting in place of a development plan for action programs, setting out public policy objectives;
8. to set up a responsibility system for the State parties assuring respect for the convention provisions. The non-compliant States would be obliged to make good the damage caused. However, whenever possible, the States parties should help the defaulting bona fide State. The State parties should set up penalties in their national laws;
9. the parties should use lawful peaceful means to resolve their disputes. If they do not resolve them, an appeal to the international tribunal of the law of the sea would be preferred.

#### RECOMMANDATION N°10

##### SUR LES BESOINS D'UNE PROTECTION DES DÉPLACÉS ENVIRONNEMENTAUX

- Considérant l'urgence de la situation de l'environnement mondial qui ne cesse de se dégrader, en raison des changements climatiques et/ou de la perte de diversité biologique, de la sécheresse, de la désertification, du déboisement, de l'érosion des sols, des épidémies, de conflits armés, des grandes infrastructures et, plus généralement, des risques naturels et technologiques,

- Considérant que les victimes de ces phénomènes sont confrontées à la disparition de leur environnement entraînant la dégradation de leur santé et de leur dignité, mettant en cause la substance même de leur droit à la vie,
- Considérant que l'augmentation exponentielle d'ores et déjà prévisible de ces déplacements constitue une menace sur la stabilité des sociétés humaines, la pérennité des cultures et la paix dans le monde,
- Considérant que plusieurs déclarations internationales soulignent l'existence de cette catégorie de déplacés (Déclaration de Rio, principe 18 relatif à l'assistance écologique, juin 1992 ; Agenda 21, chapitre 12, 12.47, élaboration de plans de secours ; Principes directeurs relatifs au déplacement de personnes à l'intérieur de leur propre pays),
- Considérant que de nombreuses conférences internationales évoquent aussi ces situations, telles que :
  - la Conférence de Kyoto (1997) et celle de La Haye (2000), qui mettent en avant les risques de fortes migrations liées aux changements climatiques ;
  - la Conférence mondiale sur la prévention des catastrophes naturelles (Hyogo, janvier 2005) qui a insisté sur l'ensemble des aspects préventifs liés en particulier aux réfugiés écologiques,
- Considérant que certains organes des Nations Unies sont intervenus en ce sens :
  - l'Assemblée générale des Nations Unies à travers les résolutions n° 2956 en 1972 et n° 3455 en 1975 sur les personnes déplacées, la résolution n° 36/225 du 17 décembre 1981 sur le renforcement de la capacité du système des Nations Unies de faire face aux catastrophes naturelles et autres situations revêtant le caractère d'une catastrophe, la résolution 43/131 du 8 décembre 1988 sur l'assistance humanitaire aux victimes des catastrophes naturelles et situations d'urgence du même ordre, la résolution n° 45/100 du 14 décembre 1988 sur l'assistance humanitaire aux victimes des catastrophes naturelles et situations d'urgence du même ordre, la résolution n° 49/22 du 13 décembre 1994 concernant la décennie internationale de la prévention des catastrophes naturelles ; e
  - le Conseil de sécurité (5663 séance du 17 avril 2007) en établissant un lien entre l'impact des changements climatiques et la sécurité du monde en particulier par rapport aux personnes qui risquent d'être déplacées d'ici 2050 ;
  - le Secrétaire général des Nations Unies (message du 5 juin 2006) en exhortant les gouvernements et les collectivités du monde entier à penser à ceux qui ne peuvent subsister dans les zones arides et deviennent des réfugiés écologiques,
- Considérant que les institutions spécialisées des Nations Unies telles que l'Organisation mondiale de la santé, l'UNESCO, la Banque mondiale, d'autres institutions du système des Nations Unies telles que le Haut-commissariat aux réfugiés, le Programme des Nations Unies pour l'environnement, le Programme des Nations Unies pour le développement, des organisations régionales telles que le Conseil de l'Europe, l'Union européenne, l'Union africaine attirent l'attention sur les enjeux des migrations écologiques,
- Considérant que des conventions internationales prennent déjà en partie en considération les déplacements environnementaux, notamment :
  - la Convention (No 169) concernant les peuples indigènes et tribaux dans les pays indépendants du 27 juin 1989 (Organisation Internationale du Travail) ;
  - la Convention sur la lutte contre la désertification du 12 septembre 1994 ;
  - la Convention africaine pour la protection et l'assistance aux personnes déplacées en Afrique du 22 octobre 2009,
- Reconnaissant le principe d'assistance à un Etat écologiquement sinistré comme un devoir de la communauté internationale,
- Considérant les Principes de Nansen rédigés les 6 et 7 juin 2011,
- Considérant l'article 14 § f) de l'accord de Cancún

1. Propose l'adoption d'une nouvelle Convention internationale sur les déplacées environnementaux permettant une définition harmonisée des « déplacées environnementaux »
2. Propose d'instituer un mécanisme institutionnel inédit de « double protection » des déplacés environnementaux inter et intra étatiques
3. Propose l'adoption de 11 droits communs aux déplacés environnementaux intra et inter-étatiques : Droits d'être secouru, Droit à l'eau et à une aide alimentaire de subsistance, Droit aux soins, Droit à la personnalité juridique, Droits civils et politiques, Droit à l'habitat, Droit au retour, Droit au respect de l'unité familiale, Droit de gagner sa vie par le travail, Droit à l'éducation et à la formation, Droit au maintien des spécificités culturelles).
4. Propose l'adoption de principes clefs du droit international, droit international de l'environnement, du droit international des droits de l'Homme, du droit international des réfugiés et des déplacés : Principe de solidarité, Principe de responsabilités communes mais différenciées, principe d'humanité, principe de protection effective, Principe de non-discrimination, Droit à l'information et à la participation, Droit au déplacement, Droit au refus du déplacement
5. Recommande la mise en place d'un mécanisme institutionnel de coopération avec la création de Commissions nationales des déplacés environnementaux dans chaque Etat partie, chargée de l'examen des demandes de reconnaissance du statut, d'une Agence mondiale pour les déplacés environnementaux composée d'un conseil scientifique, d'un conseil d'administration et d'un secrétariat
6. Recommande la mise en place d'un mécanisme de suivi de la bonne application de la Convention avec la réunion de Conférences aux parties et la production de rapports nationaux.
7. Encourage enfin la création d'un mécanisme de financement avec le Fonds mondial pour les déplacés environnementaux

#### RECOMMANDATION N°10

#### A PROTECTION FOR THE ENVIRONMENTALLY DISPLACED PEOPLE

- Considering the alarming condition of the global environment and the increasing rate of its deterioration,
- Considering that these negative environmental phenomena produce victims who encounter injury to their health and their dignity, and even impairment of their fundamental right to life,
- Considering that the gravity of environmental harm necessitates the displacement of individuals, families and populations,

- Considering that the exponential growth and clear foreseeability of such movements constitute a threat to the stability of human societies, the preservation of cultures, and world peace,
- Considering the many appeals from non-governmental organizations to recognize a status for environmentally-displaced persons, and insisting on the urgent necessity of responding to their plight,
- Considering that several international declarations underline the existence of this category of displaced persons (Principle 18 of the Rio Declaration on Environment and Development, concerning ecological assistance, June 1992; Agenda 21, Chapter 12, 12.47 ; and the Directive principles relating to internally displaced persons),
- Considering the numerous international conferences that also refer to such situations, including:
  - the Kyoto Conference (1997) and that of The Hague (2000) which set forth the risks of large migrations linked to climate change,
  - the World Conference on the Prevention of Natural Disasters (Hyogo, January 2005) which insisted on prevention linked in particular to ecological refugees,
- Considering that certain organs of the United Nations have spoken of this matter:
  - The General Assembly of the United Nations in resolutions 2956 (1972) and 3455 (1975) on displaced persons, resolution 36/255 of 17 December 1981 on strengthening the capacity of the United Nations system in the face of natural disasters and other catastrophes, resolution 43/131 of 8 December 1988 on humanitarian assistance to victims of natural disasters and emergency situations of the same type, resolutions 45/100 of 14 December relative to humanitarian assistance to victims of natural disasters and emergency situations of the same type, resolution 49/22 of 13 December 1994 concerning the international decade for the prevention of natural disasters,
  - The Security Council (5663rd session of 17 April 2007) making the link between the impact of climate change and international security, in particular in respect to persons who risk displacement by 2050;
  - The Secretary General of the United Nations in his message of 5 June 2006 exhorting governments and societies through the world to think of those who cannot subsist in arid zones and will become ecological refugees,
  - Considering that the specialized institutions of the United Nations such as the World Health Organization, UNESCO, the World Bank, and other institutions in the United Nations system, such as the High Commissioner for Refugees, the United Nations Environment Programme, and the United Nations Development Programme, regional organizations such as the Council of Europe, the European Union, and the African Union have drawn attention to the challenges of environmental migrations,
- Considering the international agreements that already take into consideration environmental displacements, notably:
  - The International Labour Organization's Convention No. 169 concerning Indigenous and Tribal Peoples in Independent Countries of 27 June 1989;
  - The Convention to Combat Desertification of 12 September 1994;
  - The African Union's Convention for the Protection and Assistance of Internally Displaced Persons in Africa of October 22, 2009;
- Considering Principles Nansen prepared 6 and 7 June 2011,
- Considering article 14 § f) Cancun agreements .

1. Proposes the adoption of a new international convention on environmental displacement that includes a clear definition of "environmentally displaced persons".
2. Proposes to establish an institutional mechanism unprecedented protection of environmentally both those displaced within their own country and those who are displaced to other states .
3. Proposes the adoption of common rights for environmentally displaced internally-and inter states -persons including: Right to assistance, Right to water and to subsistence food aid, Right to health care, Right to juridical personality, Civil and Political Rights, Right to housing, Right to return, Right to respect for the family, Right to work, Right to education and training, Right to maintain cultural specificity.
4. Proposes the adoption of key principles of international law, international environmental law , international law of human rights, international law of refugees and displaced persons including: Principle of Solidarity, Principle of humanity, Principle of common but differentiated responsibilities, Principle of effective protection, Principle of non-discrimination, Rights to information and participation, The Right to Displacement, The Right to Refuse Displacement.
5. Recommends the establishment of an institutional mechanism for cooperation with the National Commissions on Environmental Displacements in each State Party, in charge of reviewing applications for recognition of the status of a World Agency for Environmentally-Displaced Persons composed of a scientific council, board of directors and a secretariat .
6. Recommends the establishment of a mechanism to monitor the proper implementation of the Convention through Conferences of the parties and national reporting.
7. Encourages the creation of funding mechanism with the World Fund for the Environmentally-Displaced persons.

#### RECOMMANDATION N°11

#### CONFLITS ARMÉS ET ENVIRONNEMENT

Convaincue que les prétendues nécessités de guerre ne sauraient justifier un manqué de respect pour l'environnement et, par conséquent, des conditions de vie des générations futures ;

Note que la protection de l'environnement en temps de conflit armé par voie de dispositions spécifiques est insuffisante ;

Demande, pour cette raison, qu'un traité soit adopté qui disposerait de problèmes spécifiques à cet égard, applicable aussi bien en temps de conflit international que non-international, à savoir :

- Afin d'assurer la protection de l'environnement en tant qu'objet civil, certains élément de l'environnement doivent avoir le statut de « zone démilitarisée » ;
- Un processus de désignation de telles zones devrait être réglé par un traité, qui pourrait prévoir une désignation par des tiers, notamment par le Conseil de sécurité ;
- Ceux qui préparent et décident une attaque doivent tenir dûment compte de la protection de l'environnement naturel ;

- En particulier, le risque d'un dommage environnemental, y inclus un dommage à long terme, doit être prise en compte dans l'application du principe de proportionnalité en ce qui concerne les dommages causés incidemment ;
- Des activités entreprises pour réparer ou mitiger des dommages environnementaux en temps de conflit armé doivent être protégées et respectées ;
- La réhabilitation de l'environnement entreprise après la fin des conflits armés devrait être aidée et promue.

Demande au Comité international de la Croix-Rouge et aux Etats de tenir compte de cette demande lors de leurs consultations relatives au développement du droit international humanitaire.

#### RECOMMANDATION N°11

##### WAR AND ENVIRONMENT

Convinced that purported necessities of war cannot justify disregard for the environment and, thus, for the living conditions of future generations,

Notes that the protection of the environment in times of armed conflict by way of specific treaty provision is insufficient;

Demands, therefore, that a treaty is adopted regulating a number of specific problems related to armed conflicts, both for international and domestic conflicts, that

- Ensures the protection of the environment as civilian objects, and as "demilitarized zones",
- Provides for a special designation process for environmental areas that should be protected, which could include a designation by third parties such as the Security Council;
- Requires that those who plan and decide upon an attack must pay due regard to the protection of the natural environment;
- Mandates that the risk of environmental damage, including long term damage, must be taken into account in the application of the so-called proportionality principle relating to incidental damage,
- Assures that activities undertaken for the purpose of repairing or mitigating environmental damage during an armed conflict are protected and respected.
- Promotes and makes provision for post-conflict environmental rehabilitation.

Requests the International Committee of the Red Cross and States to take this demand into consideration in consultations concerning the further development of international humanitarian law.

#### RECOMMANDATION N°12

##### SUR L'EXPLOITATION PETROLIERE OFFSHORE

La réunion mondiale des juristes de l'environnement :

Considérant le contexte actuel de développement de l'offshore profond et ultra-profond (plus de 3000 mètres).

Considérant que le prix actuel du baril de pétrole permet de tirer des bénéfices de l'exploitation de ces gisements profonds et ultra-profonds.

Considérant l'extension des plateaux continentaux autorisée par les Nations-Unies ouvrant aux États la possibilité d'engager des forages profonds plus nombreux.

Considérant que les progrès importants des techniques d'exploitation marquent le pas face à l'augmentation constante de la profondeur des forages.

Considérant que les contrats pétroliers liant les États et les sociétés d'exploitation contiennent des clauses de sécurité pour les chantiers mais qu'il n'est jamais question de la protection de l'environnement.

Considérant que l'article 204 de la Convention des Nations-Unies sur le Droit de la Mer prévoit pourtant que les États doivent surveiller les effets des activités qu'ils autorisent sur leur territoire.

Constatant que ces événements, et de façon générale les risques potentiels liés aux activités d'exploitation offshore, attirent l'attention sur les déficiences du droit international face à un développement qui ne peut qu'affecter l'intégrité des océans et des mers en tant que biens communs. Ainsi il convient qu'une résolution des Nations-Unies propose des lignes de conduite qui devraient s'imposer aux États possédant des ressources pétrolières.

Recommande :

- a) qu'en se fondant sur le principe de précaution, les Conventions Mers Régionales qui n'en sont pas encore pourvues se dotent de protocoles sur cette approche.
- b) que les États riverains doivent réaliser un rapport annuel concernant les mesures de protection de l'environnement imposées aux sociétés d'exploitation pétrolière. Ce rapport devra être remis à une agence spécialisée ou à une éventuelle future Organisation Mondiale de l'Environnement.
- c) une interdiction globale des forages dans les aires marines protégées.
- d) que la responsabilité de l'État soit systématiquement engagée en cas de pollution qui serait le fait d'une négligence ou d'un manquement dans les restrictions imposées aux sociétés d'exploitation.
- e) qu'une étude d'impact soit systématiquement réalisée antérieurement à toute délivrance d'un permis d'exploitation.
- f) que soit mis en place un système d'inspection des installations pétrolières offshore par des observateurs tiers désignés par une agence spécialisée ou par l'éventuelle future Organisation Mondiale de l'Environnement.
- g) que soit constitué un fond de réparation des dommages en cas de pollution alimenté à la fois par les entreprises pétrolières et par les États de la ressource.

#### RECOMMANDATION N°12

##### REGARDING A RESOLUTION ON OFFSHORE OIL DRILLING

The world meeting of environmental lawyers :

Considering the current context of deepwater and ultra-deepwater (more than 3000 meters) offshore oil development ;

Considering that the current price per barrel of oil allows such deepwater and ultra-deepwater to be cost-effective ;

Considering that the extension of the exclusive economic zone authorized by the United Nations (PLEASE CHECK, NOT SURE IF THAT'S WHAT THIS REFERS TO) opens the possibility for a greater number of deepwater wells ;

Considering that significant advances in drilling technology allow an ongoing increase in the depth of deepwater well ;

Considering that oil contracts between States and oil companies contain security questions that do not account for environmental protection ;

Considering that Article 204 of the United National Convention on the Law of the Sea nevertheless anticipates that States shall monitor the effects of activities that they allow on their territory ;

Noting that these activities, and in general the potential risks from offshore drilling, draw attention to deficiencies in international law to deal with a form of development that will undoubtedly affect the integrity of the oceans and seas, and public goods. It is therefore appropriate that a United Nations resolution propose rules of conduct that should be imposed on States with oil resources.

Recommend :

- a). Consistent with the precautionary principle, Regional Sea Conventions ( ??) should be based on the precautionary principle, to the extent that they currently are not.
- b) Coastal States shall prepare an annual report on environmental protection measures imposed on oil development companies. This report should be submitted to a specialized agency or to an eventual World Environmental Organization.
- c) A global prohibition on drilling in marine protected areas.
- d) States shall systematically impose liability in the case of pollution caused by negligence or failure to abide by restrictions imposed on oil development companies.
- e) Impacts assessments shall be required systematically prior to the issuance of all oil drilling permits.
- f) A system shall be established for inspections of offshore oil installations by third-party observers designated by a specialized agency or by an eventual World Environment Organization.
- g) A contingency fund shall be established to cover cleanup and restoration in the event of pollution, to be financed by oil companies and oil States.

RECOMMANDATION N°13

SUR L'INSTRUMENT INTERNATIONAL JURIDIQUEMENT CONTRAIGNANT SUR LE MERCURE (DIT CONVENTION DE MINAMATA) :

La réunion mondiale :

Considérant les dangers avérés du mercure dans l'environnement, notamment relevés dans l'évaluation mondiale du mercure réalisée par le Programme des Nations Unies pour l'Environnement (PNUE) ;

Affirmant que seule une action mondiale peut être engagée sur le mercure, tout en l'adaptant aux réalités locales d'usage de ce métal et de ses dérivés ;

Considérant la nécessité d'une réponse globale aux problèmes posés par le mercure, portant sur l'intégralité de son cycle de vie ;

Constatant les nombreuses injustices environnementales causées par les rejets anthropiques de mercure ;

Recommande :

De veiller à la signature dans les plus brefs délais et si possible lors de la Conférence de Rio 2012 de l'instrument international juridiquement contraignant sur le Mercure dite « convention de Minamata » ;

De poser clairement la définition et l'objectif de l'instrument international juridiquement contraignant sur le mercure, à savoir garantir la protection concomitante de la santé des individus et de la nature, en réduisant au minimum, et, dans la mesure du possible, en éliminant à terme les rejets anthropiques de mercure dans l'air, l'eau et le sol ;

De reconnaître expressément la pertinence des principes de prévention, précaution, pollueur- payeur et de responsabilités communes mais différenciées dans le traitement des problèmes liés au mercure au niveau international ;

D'apporter aux pays où le mercure est utilisé pour des activités artisanales difficilement contrôlables, un soutien technique et financier à la reconversion de cette économie, notamment par la mise en place d'un mécanisme financier, possiblement administré par le fonds mondial pour l'environnement ;

De s'assurer de l'inclusion, dans le texte même de la Convention de Minamata, d'un mécanisme de mise en conformité, étroitement lié à la fourniture effective du soutien technique et financier nécessaire aux pays en voie de développement ;

De régler, le plus en amont possible, la question de l'articulation entre l'instrument international juridiquement contraignant sur le mercure et les conventions connexes (Bâle, Rotterdam, Stockholm, Protocole « métaux lourds » de la Convention de Genève, CNUCC) ;

De réfléchir à un type de structure conventionnelle susceptible de permettre l'inclusion future d'autres métaux lourds que le mercure dans le cadre de la convention, en particulier le plomb et le cadmium ;

D'informer sans attendre les populations sur les risques du mercure et notamment sa présence dans les activités et les objets de la vie quotidienne (piles, ampoules, activité de soins, produits cosmétiques...) ;

De participer avec l'Organisation Mondiale de la Santé (OMS) à la sensibilisation des acteurs de la santé sur la présence de mercure dans les activités de soins pour supprimer son usage.

RECOMMANDATION N°13

#### THE LEGALLY BINDING GLOBAL TREATY ON MERCURY (CONVENTION OF MINAMATA)

Considering the known risks from mercury in the environment, in particular raised in the Global Mercury Assessment Report of the United Nations Environment Programme (UNEP);

Acknowledging that only a united global action can result in an effective response to mercury pollution, as long as it is adapted to local realities of the use of this metal and its derivatives; Considering the need for a global answer to the problems posed by mercury, and its lifecycle;

Noting that many environmental injustices are caused by anthropogenic mercury emissions:

Recommend:

The signature, as soon as possible and if possible at the time of Rio+ 20 in 2012, of the legally binding global treaty on Mercury known as "Convention of Minamata";

To request the elaboration of terms and objectives for the legally binding global treaty on Mercury, in order to guarantee the protection of health of the individuals and nature, while minimizing, and, as far as possible in the long-term, eliminating the anthropogenic mercury emissions into the air, water and soil;

To expressly recognize the relevance of the principles of prevention, precaution, polluter pays and of common but differentiated responsibilities in any response to problems caused by mercury at the international level;

To bring to technical and financial support to countries where mercury is used for local-level artisanal activities to replace mercury-based economic activities, in particular by the installation of a financial mechanism, possibly managed by Global Environment Facility (GEF);

To ensure the inclusion in the text of the Convention of Minamata of a mechanism for establishing a standardized approach to mercury regulation, closely linked with an effective supply of the technical and financial support for developing countries;

To regulate mercury, as far upstream as possible, through the harmonization of international instruments and conventions related to mercury (Basel, Rotterdam, Stockholm, "heavy metals" Protocol of the Geneva Convention, CNUCC);

To develop a convention structure to enable the future incorporation of other heavy metals, including, in particular lead and cadmium, into the framework of the convention;

To inform people without delay on the risks of mercury and in particular its presence in the activities and the objects of the daily life (batteries, light bulbs, health care activities, cosmetic products ...);

To take part with the World Health Organization (WHO) in the education of public health workers on the presence of mercury in healthcare tools and procedures, and to seek to eliminate the use of mercury.

#### RECOMMANDATION N°14

##### LE PROJET DE CONVENTION MONDIALE SUR LE PAYSAGE

Considérant

Que le paysage est un élément indissociable de la qualité de la vie et du droit de l'homme à l'environnement ;

Que la perception du paysage dépend des cultures et de leur diversité ;

Qu'il existe plusieurs textes juridiques au niveau international dans le domaine du paysage, mais que leur portée est limitée soit géographiquement, soit matériellement ;

Que l'UNESCO a engagé une réflexion sur l'opportunité et la faisabilité d'un nouvel instrument mondial sur le paysage ;

Que les paysages subissent des dégradations croissantes et qu'il convient de les préserver.

Recommande

La reconnaissance du paysage comme l'un des éléments fondamentaux du développement durable dans la déclaration finale de la Conférence de Rio+20.

La poursuite du processus engagé par l'UNESCO concernant l'opportunité d'élaborer un instrument mondial sur le paysage ;

A cette fin :

1. D'engager des études pluridisciplinaires sur les concepts liés aux paysages et sur les instruments existants aux niveaux mondial, régional et national
2. D'élargir le débat à tous les acteurs internationaux concernés (institutions, société civile, secteur économique ...)

La prise en compte, dans la réflexion sur cet instrument mondial, des éléments suivants :

La bonne gouvernance des paysages à travers la participation des populations et la coopération à tous les niveaux (mondial, régional, local).

La considération de tous les paysages, y compris les paysages ordinaires ou dégradés, et quel que soit l'espace (urbain, rural, naturel...).

La nature juridique de l'instrument, qui devrait permettre à la fois de fixer des principes généraux et cohérents au niveau mondial, tout en laissant aux Etats du monde la faculté de se doter d'instruments régionaux adaptés à leur diversité administrative, juridique et politique, géographique, sociale, culturelle...

#### RECOMMANDATION N°14

##### THE PROJECT OF A GLOBAL LANDSCAPE CONVENTION

Considering

That the landscape is an element which is inseparable from the quality of life and the human rights to the environment;

That the perception of landscape depends on cultures and their diversity;

That there are various international legal texts on the topic of landscape but their scope is limited either geographically or in contents;

That the UNESCO has begun a reflection on the opportunity and feasibility of a new world instrument on landscape;

Those landscapes undergo increasing degradation and should be preserved.

Recommends

The recognition in the final declaration of the Rio+20 Conference of landscape as one of the fundamental elements of sustainable development.

The continuation of the process initiated by UNESCO concerning the opportunity of developing a global instrument on landscape;

To this end:

- 1) To undertake multidisciplinary studies regarding the concepts related to landscapes and the existing instruments at international, regional and national scale.
- 2) To broaden the discussion to all relevant international actors (institutions, civil society, economic sector ...).

Taking into account the following elements while reflecting on the global instrument: The good governance of landscapes through the participation of populations and co-operation at all levels (global, regional, local).

The consideration of all landscapes, including everyday or degraded landscapes, and every kind of space (urban, rural, natural, etc.).

The legal nature of the instrument, which should allow both the establishment of general and coherent principles worldwide, while allowing States around the World the ability to develop regional instruments adapted to their administrative, legal, political, geographical, social and cultural diversity.

#### RECOMMANDATION N°15

##### POUR UNE COUR INTERNATIONALE DE L'ENVIRONNEMENT (CIE)

«Nous, participants à la troisième Conférence mondiale des juristes et des associations de droit de l'environnement,

Convaincus que l'appel à la création d'une CIE doit être appréhendé à la lumière du problème plus général des procédures de suivi des traités et du règlement des litiges en droit de l'environnement,

Insistant sur le fait que les accords multilatéraux environnementaux (AEM) ne prévoient que rarement des règles obligatoires de règlement des différends,

Reconnaissant qu'en conséquence, la contribution des tribunaux internationaux et nationaux au développement du droit international de l'environnement est entravée par leur incapacité juridictionnelle à générer des décisions sur la base des AEM,

Prenant note de la Résolution du Parlement européen visant à développer une position commune de l'UE avant la Conférence des Nations Unies sur le Développement Durable (29.IX.2011), Rappelant que l'idée d'une CIE doit être maintenue en vie malgré la difficulté de la considérer comme une priorité absolue dans l'agenda international,

Avons approuvé les recommandations suivantes concernant la création d'une CIE: 1. Il est important que le Statut de la CIE soit adopté en prévoyant que les différends concernant l'interprétation et l'application des AME puissent être soumis unilatéralement par l'État qui considère que ses droits ont été violés.

2. Les nouveaux AME et protocoles conclus à l'avenir devraient toujours inclure un règlement des différends obligatoire et des mécanismes efficaces du contrôle du respect des conventions.

3. Une large compétence devrait être accordée à la CIE ; des mécanismes pour éviter une concurrence de juridiction doivent être prévus.

4. Le statut de la CIE serait un instrument utile si les États étaient d'accord pour modifier tous les AME existants afin que les différends concernant leur interprétation et leur application puissent y être soumis par la requête d'une partie. Cela impliquerait que:

(i) les AME soient soumis à une juridiction obligatoire alors qu'actuellement ils ne peuvent être soumis à un juge ou un arbitre que par un accord spécial ou lorsque la «clause facultative» de l'article 36 (2) du Statut de la CIJ (ou des accords régionaux ayant des effets similaires) est applicable;

(ii) l'on aboutirait à une interprétation uniforme des différents accords.

5. Les États pourraient également attribuer à la CIE

(i) une compétence de juridiction pour des questions préjudicielles sur des questions d'interprétation ou d'application des AEM relevant des tribunaux nationaux ou internationaux;

(ii) une compétence consultative sur les questions de droit de l'environnement soulevées par les organisations non gouvernementales et les organisations internationales.

6. Même si il n'existe actuellement pas de réelle possibilité d'intégrer un projet de création d'une CIE au niveau universel, un certain nombre raisonnable d'États pourrait déjà donner à la CIE compétence pour adopter des décisions à titre préjudiciel sur les questions environnementales à la demande des tribunaux nationaux et commencer à préparer des amendements appropriés à la législation nationale. Un tel projet semble complexe mais pas impossible.

7. L'utilisation de l'arbitrage concernant les questions environnementales (qui peut recourir à des arbitres spécialisés en droit de l'environnement) devrait être considéré comme une alternative aux procédures judiciaires.

8. La CIE pourrait être un complément nécessaire à la proposition de convention mondiale sur l'environnement.

#### RESOLUTION N°15

##### FOR AN INTERNATIONAL ENVIRONMENTAL COURT (IEC)

"We, attendees to the Third worldwide conference of environmental law NGOs and Lawyers, Convinced that the call for the establishment of an IEC should be considered in light of the more general problem of environmental law non-compliance and disputes,

Emphasizing on the fact that multilateral environmental agreements (MEAs) only rarely provide for compulsory dispute settlement rules,

Recognizing that, as a consequence, the contribution of both international and national courts to the development of international environmental law is hindered by their jurisdictional incapacity to generate MEA-based decisions,

Taking note of the European Parliament's Resolution developing a common EU position ahead of the United Nations Conference on Sustainable Development (29.IX.2011),

Recalling that the idea of an IEC should be kept alive in spite the difficulty of considering it as a top-priority in the international agenda,

Approved the following recommendations regarding the creation of an IEC:

1. It is important the IEC Statute be adopted providing that disputes concerning the interpretation and application of MEAs could be submitted unilaterally by the State that considers its rights as being violated.
2. New MEAs and Protocols concluded in the future should always include compulsory dispute settlement and efficient compliance mechanisms
3. A broad jurisdiction should be granted to the IEC ; mechanisms for avoiding concurrent jurisdiction must be provided.
4. The ICE statute would be an useful instrument if States were to agree to amend all existing MEAs so that disputes concerning their interpretation and application could be submitted to it at the request of one party. This would entail that:
  - (i) MEAs would be submitted to compulsory jurisdiction while now they can be submitted to a judge or arbitrator only by a special agreement or when the "optional clause" of art.36(2) of the ICJ Statute (or regional agreements of similar effect) are applicable;
  - (ii) uniform interpretation of different agreements would be obtained.
5. States could also attribute to the IEC
  - (i) jurisdiction for preliminary rulings on questions of interpretation or application of MEAs arising before domestic or international courts;
  - (ii) consultative jurisdiction on questions of environmental law raised by non- governmental and international organizations.
6. Even if there is currently no real opportunity to mainstream any project of creating an IEC on the international level, a reasonable number of States could give to the IEC the competence to adopt preliminary rulings on environmental questions at the request of domestic courts and start preparing appropriate amendments to domestic law. Such a project would be complex but not impossible.
7. The use of arbitration concerning environmental matters (which can use arbitrators specialized in environmental law) should be considered as an alternative to judiciary procedures.
8. The IEC would be a necessary complement to the proposed global convention on the environment.

#### RECOMMANDATION N°16

#### ORGANISATION MONDIALE DE L'ENVIRONNEMENT (OME)

##### La réunion mondiale

- Considérant que la protection de l'environnement exige une institution à la hauteur des enjeux relatifs aux luttes contre les pollutions et pour la conservation de la nature,
- Considérant que la gouvernance environnementale mondiale est, pour une large part, fragmentée, inefficace, incohérente, et dotée de moyens souvent dérisoires,
- Considérant que le PNUE, même si le travail qu'il a accompli a été considérable, est doté d'une structure qui n'est pas assez démocratique, d'un mandat qui n'est pas assez large, de pouvoirs et de moyens beaucoup trop faibles,
- Considérant que, comme le commerce international qui a son institution, il est vital que le domaine de l'environnement ait un tel moyen institutionnel décisif,
- Considérant que l'idée et le projet d'une OME ont commencé depuis la Conférence de Rio de juin 1992 et se sont poursuivis à travers de multiples réunions, en particulier au niveau international,
- Considérant que le Conseil d'Administration du PNUE, réuni du 21 au 24 février 2011 en Forum ministériel mondial sur l'environnement rassemblant 144 ministres, a transmis formellement au Comité préparatoire de la Conférence de Rio de juin 1992 les recommandations ministérielles sur le renforcement de la gouvernance de l'environnement qui identifie notamment « la création d'une OME comme une option privilégiée ».

##### Recommande

- (a) de créer une Organisation Mondiale de l'Environnement (OME), son siège sera à Nairobi
- (b) d'établir des structures démocratiques fondées sur une vocation universelle, une plus grande équité dans le fonctionnement entre Etats du Nord et Etats du Sud, des organes classiques d'une institution spécialisée des Nations Unies, des ONG ayant des pouvoirs consultatifs particulièrement participatifs, un appui à la mise en œuvre internationale des instruments de participation environnementale des citoyens.
- (c) d'amplifier la démocratie environnementale de l'OME, par exemple après cinq années de fonctionnement, et cela par deux moyens.. Une représentation symbolique, avec voix consultative, des générations passées et futures serait organisée au sein de l'OME. L'Assemblée générale et le Conseil exécutif verraient six collèges s'ajouter à celui des Etats : ONG et syndicats, entreprises, organisations internationales et régionales, communautés locales et peuples autochtones, collectivités territoriales, experts. Leur représentativité, leur élection, leur poids dans la votation et les processus de décision seraient déterminés pendant la cinquième année de fonctionnement de l'OME.
- (d) de fixer les objectifs de l'OME. L'OME a pour objectif la protection de la nature et les luttes contre les pollutions, dans le respect de la démocratie environnementale. Elle assure cette responsabilité dans l'intérêt des générations présentes et futures, sans oublier le respect dû aux générations passées, elle le fait dans l'intérêt de l'ensemble du vivant.
- (e) de déterminer les fonctions correspondant à ces objectifs. Ces fonctions, dans un ensemble opérationnel et global, seraient au nombre de 16 :
  1. déterminer les orientations stratégiques mondiales de l'environnement,
  2. renforcer la cohérence et l'efficacité des accords multilatéraux sur l'environnement,

3. gérer un certain nombre de secrétariats de conventions et participer sous différentes formes aux renforcements de l'ensemble des moyens de tous les secrétariats,
4. renforcer l'expertise scientifique, l'alerte précoce et l'information,
5. contribuer à la promotion massive de l'éducation à l'environnement dans tous les systèmes d'enseignement du monde,
6. renforcer la gouvernance au niveau régional,
7. conduire des évaluations rigoureuses et complètes des instruments juridiques classiques et des instruments économiques de marché afin de mettre en lumière les avantages et les inconvénients respectifs des uns et des autres et d'éclairer les raisons de leur faible efficacité. Aucune priorité de principe ne doit être accordée à l'une ou l'autre catégorie d'instrument, étant entendu que leur fonctionnement doit supporter, compte tenu du principe d'information, la plus grande transparence démocratique sans que puissent être invoqués les secrets protégés industriel, commercial, financier et des affaires, compte tenu de la prééminence du droit de l'Homme à l'environnement,
8. contribuer à répondre aux besoins spécifiques des pays en développement,
9. initier la création d'une Organisation Mondiale d'Assistance Ecologique (OMAE) et agir étroitement avec elle,
10. initier la création d'une Organisation Mondiale pour les Déplacés Environnementaux (OMDE) et agir étroitement avec elle,
11. initier l'élaboration de nouvelles conventions universelles de protection de l'environnement,
12. mettre en œuvre un mécanisme d'aide relatif à l'application des conventions,
13. contribuer à organiser une écofiscalité globale mondiale,
14. mettre en place un mécanisme de règlement des conflits environnementaux,
15. représenter la nature comme patrimoine des générations présentes et futures, et être garante de ses besoins,
16. mettre en place un mécanisme de sanction fondé, en particulier, sur la remise en état. Certaines fonctions, considérées par certains Etats comme trop radicales, en particulier les trois dernières, seraient mise en œuvre au bout de cinq ans de fonctionnement de l'OME.

(f) de donner à l'OME des moyens à la hauteur de ses objectifs et de ses fonctions, moyens financiers, moyens juridiques, personnels particulièrement nombreux, sièges régionaux renforcés et siège de l'OME à Nairobi.

(g) de planifier, dans le temps les moyens et les conséquences, la transformation juridique du PNUE en OME laquelle deviendrait une institution spécialisée des Nations Unies.

#### RECOMMANDATION N°16

##### WORLD ENVIRONMENT ORGANIZATION (WEO)

The world meeting (of environmental lawyers in Limoges)

- Considering that environmental protection calls for an institution up to the tasks related to confronting pollution and conserving nature,
- Considering that global environmental governance is largely fragmented, inefficient, inconsistent and vastly underfunded,
- Considering that UNEP, despite its considerable accomplishments, has a structure that is insufficiently democratic, a mandate that is too limited, and powers and resources that are too weak,
- Considering that, just as international trade has its own institution, it is essential that the environment have a comparable institution,
- Considering that the idea and plans for a WEO originated at the Rio Conference of June 1992 and have been pursued at numerous meetings, in particular at the international level,
- Considering that the Governing Council of UNEP, meeting from 21-24 February 2011 at the Global Ministerial Environment Forum that brought together 144 ministers, formally transmitted to the preparatory committee for the Rio Conference of June 1992 (SHOULD THIS BE 2012 ?) ministerial recommendations on the strengthening of environmental governance that included « creation of a WEO as a favored option ». (NOTE : THIS SHOULD BE CHECKED AGAINST THE ORIGINAL DOCUMENT IN ENGLISH)

##### Recommends

- (a) the creation of a World Environment Organization (WEO), headquartered in Nairobi
- (b) establishment of democratic structures based on UNE VOCATION UNIVERSELLE (NOTE : I DON'T KNOW WHAT THIS MEANS), greater equity between States of the North and States of the South, and constituent bodies typical of specialized institution of the United Nations, with NGOs given a strong consultative and participatory role, and support for international implementation of instruments on environmental participation of citizens.
- (c) an increase in the environmental democracy of the WEO, for example five years after the WEO is created, by two principle means. A symbolic representation, with a consultative role, of past and future generations will be established within the WEO. The General Assembly and Executive Council would recognize six groups in addition to States : NGOs and unions, private enterprises, international and regional organizations, local communities and indigenous peoples, local authorities and experts. Their representation, election and weight of authority in voting and other decisionmaking processes would be determined in the WEO's fifth year.
- (d) Establish the goals of the WEO. The goal of the WEO is to protect nature and combat pollution, while respecting environmental democracy. It undertakes this responsibility in the interest of present and future generations, with respect for past generations, and in the interest of all life.
- (e) The determination of the functions related to these goals. 16 functions are proposed :
  1. determine global environmental strategy,
  2. strengthen the consistency and efficiency of multilateral environmental agreements,

3. manage several secretariats of conventions and participate in various ways to strengthening them,
  4. strengthen scientific expertise, early warning systems and information,
  5. contribute to a vast promotion of environmental education in educational systems throughout the world,
  6. strengthen regional governance,
  7. conduct rigorous and thorough assessments of traditional (command-and- control) legal and market-based mechanisms (RELATED TO THE ENVIRONMENT) in order to shed light on their advantages and disadvantages and to clarify their weaknesses and inefficiencies. No preference should given to either type of mechanism, given that they should support, consistent with rights to information, as much transparency as possible, without overreliance on protected industrial, trade, financial and business secrets, given the preeminence of the human right to the environment,
  8. help respond to the specific needs of developing countries,
  9. initiate the creation of, and work closely with, a World Organization of Ecological Assistance,
  10. initiate the creation of, and work closely with, as World Organization for Environmental Refugees,
  11. initiate the development of new global conventions on environmental protection,
  12. implement means to support the implementation and enforcement of environmental conventions,
  13. help put in place comprehensive global system of eco-taxes,
  14. establish a mechanism for resolution of environmental conflicts,
  15. represent nature as a heritage of present and future generations, and ensure that its needs are met,
  16. put in place a sanctions mechanisms based especially on restoration. Some functions, which some States might find too radical, especially the last three, should be implemented five years after creation of the WEO.
- (f) Give the WEO sufficient resources for fulfillment of its goals and functions, including financial resources, legal tools, adequate staff, strengthened regional offices, and a headquarters in Nairobi.
- (g) Plan for the transformation of UNEP into a WEO, which would be a specialized institution of the United Nations.

#### RECOMMANDATION N°17

#### LA TRANSFORMATION DU CONSEIL ÉCONOMIQUE ET SOCIALE DES NATIONS- UNIES EN CONSEIL ÉCONOMIQUE, SOCIAL ET ENVIRONNMENTAL

Considérant que le chapitre 38 d'Action 21 recommande la mise en place de mécanismes institutionnels adaptés à une gestion internationale efficace de l'environnement ; Considérant que le chapitre XI du plan d'application de Johannesburg recommande le renforcement du cadre institutionnel du développement durable à l'échelon international; Considérant que le chapitre 27 d'Action 21 recommande le renforcement du rôle des organisations non gouvernementales (ONG) en tant que partenaires du développement durable ; Considérant la nécessité d'améliorer la représentation des ONG dans le système institutionnel international de l'environnement et d'assurer leur participation aux processus décisionnels en la matière ;

Notant que la gouvernance internationale souffre d'un déficit démocratique certain, et que la communauté internationale montre des signes encourageants d'acceptation d'une participation active de la société civile, particulièrement des ONG., dans la recherche de solutions aux problèmes d'environnement ;

Recommande :

- (a) D'entreprendre une réforme institutionnelle de la protection de l'environnement dans le système des Nations Unies, à travers la fusion de la Commission du développement durable (CDD) et du Conseil économique et social (CES) en un Conseil économique social et environnemental (CESE) renforcé et doté explicitement par la Charte d'une compétence en matière d'environnement et de développement durable ;
- (b) D'attribuer au nouveau Conseil le rôle de superviseur des Conventions environnementales et de coordination des compétences environnementales des divers organes du système des Nations Unies ;
- (c) De créer un Forum permanent pour le développement durable, organe subsidiaire du Conseil, chargé d'assurer un suivi et une expertise technique dans les trois domaines concernés par le développement durable ;
- (d) D'assurer au sein de ce Forum une représentation des Etats et de la société civile (ONG sociales et environnementales, industriels, scientifiques), afin d'impliquer au même titre tous les acteurs concernés par la question du développement durable en fonction de leurs compétences, et afin d'assurer une meilleure représentation de la société civile au sein de la gouvernance internationale de l'environnement;
- (e) De garantir l'indépendance des représentants de la société civile par un processus de nomination interne aux membres des secteurs concernés, sans que l'avis ni des Etats intéressés ni du Conseil ne soit nécessaires ;
- (f) Que la société civile ait accès, par l'intermédiaire des membres du Forum représentant les ONG, à l'information en matière d'environnement
- (g) Que ce droit soit garanti par la création d'une obligation pour les organes de l'ONU et les Etats de communiquer toutes les informations nécessaires au Forum, dont les membres pourront participer à toutes les sessions au sein de l'ONU intéressant le développement durable.

#### RECOMMANDATION N°17

#### LA TRANSFORMATION DU CONSEIL ÉCONOMIQUE ET SOCIAL DES NATIONS- UNIES EN CONSEIL ÉCONOMIQUE, SOCIAL ET ENVIRONNMENTAL

Considering that Chapter 38 of Agenda 21 recommends the implementation of institutional mechanisms which are adapted to the effective international management of the environment;

Considering that Chapter XI of the Johannesburg Plan of implementation recommends the strengthening of the institutional framework for sustainable development at

international level;

Considering that Chapter 27 of Agenda 21 recommends the strengthening of the role of Non governmental organizations (NGOs) as partners for sustainable development;

Considering the necessity to improve the representation of NGOs in the international institutional system of environment and to ensure their participation in decision making in this area;

Noting that international governance suffers from a certain democratic deficit, and that the international community shows encouraging signs of acceptance for an active participation of the civil society, especially NGOs, in finding solutions to environmental matters;

Recommends:

(a) To undertake an institutional reform of the environmental protection in the UN system, by merging the Commission on Sustainable Development (CSD) and the Economic and Social Council (ECOSOC) in an Economic Social and environmental Council (ECOSOEC), reinforced by the Charter explicitly with a competence in environmental matters and sustainable development;

(b) To give the new Council the role of supervisor of Environmental Conventions, and coordinator of environmental competences of the various organs of the UN system;

(c) To establish a Permanent Forum on sustainable development, as a subsidiary body of ECOSOEC, responsible for monitoring and technical expertise in the three areas of sustainable development;

(d) To provide in this Forum an equal representation of the states and the civil society ( social and environmental NGOs, industry and scientists), to engage in the same way all the actors involved in the issue of sustainable development according to their skills, and to ensure better representation of civil society in international governance of the environment;

(e) To ensure the independence of the representatives of civil society by an internal appointment process for members of the sectors concerned, without notice of the states or the council required.

(f) That civil society could access, through the Forum members representing NGOs, to information about international negotiations on the environmental ;

(g) To guarantee this right by creating an obligation for the UN bodies and the States to provide all the necessary information to the Forum, whose members will serve for all UN sessions interesting sustainable development;

#### RECOMMANDATIONS N°18

##### LA PLACE DE LA SOCIETE CIVILE ET DES ONG EN DROIT INTERNATIONAL DE L'ENVIRONNEMENT

(1) La conférence de Rio + 20 devrait décider d'engager un processus de négociation pour l'adoption d'une convention globale sur le principe n° 10 de la Déclaration de Rio, dans le but qu'un texte puisse être proposé à l'adoption en 2017. Le processus de négociation doit lui-même être transparent et participatif.

(2) La conférence de Rio + 20 devrait (a) encourager le développement de traités régionaux basé sur le principe n° 10 de la Déclaration de Rio en s'inspirant de la Convention d'Aarhus, et (b) encourager les Etats intéressés à accéder à la Convention d'Aarhus et à son Protocole PRTR, étant donné que ces deux instruments sont ouverts à tous les Etats membres des Nations-Unies.

(3) La conférence de Rio + 20 devrait exiger du PNUJ qu'il apporte une assistance aux Etats pour leur permettre de mieux mettre en œuvre les lignes directrices de Bali sur le principe 10, et inviter les gouvernements et les institutions donateurs à apporter une aide financière à cet effet.

(4) Tous les nouveaux instruments ou processus établis par la Conférence Rio + 20 devrait être « mis à l'épreuve du Principe 10 », c'est-à-dire qu'ils doivent intégrer des dispositions et/ou des exigences visant à promouvoir un accès effectif à l'information, à la participation du public et à la justice dans leurs domaines respectifs.

(5) Au sein de ses conclusions sur le cadre institutionnel du développement durable, la Conférence Rio + 20 devrait inviter les organes gouvernementaux des Parties aux traités internationaux relatifs à l'environnement, y compris les Parties aux traités multilatéraux sur l'environnement, à s'assurer que les résultats substantiels de ces instruments promeuvent un accès effectif à l'information, à la participation du public et à l'accès à la justice.

(6) La Conférence Rio + 20 devrait adopter une série de lignes directrices garantissant des standards minimum sur la participation de la société civile dans les processus de décision internationaux.

#### RECOMMENDATION N°18

##### THE PLACE OF CIVIL SOCIETY AND NGOs IN INTERNATIONAL LAW ON THE ENVIRONMENT

(1) The Rio+20 Conference should take a decision to start negotiating a global treaty on Principle 10 of the Rio Declaration, in order to have a text ready for adoption in 2017. The negotiation process itself should be transparent and participatory.

(2) The Rio+20 Conference should (a) encourage the development of regional treaties on Principle 10 along the lines of the Aarhus Convention, and (b) encourage interested States to accede to the Aarhus Convention and its Protocol on PRTR, both of which are open to accession by any UN Member State.

(3) The Rio+20 Conference should request UNEP to provide assistance to countries to enable them to better implement the Bali Guidelines on Principle 10, and invite donor governments and institutions to provide financial assistance for this purpose.

(4) Any new instruments or processes established pursuant to the Rio+20 Conference should be 'Principle 10-proofed', i.e. they should contain provisions and/or requirements promoting effective access to information, public participation and access to justice in relation to their subject matter.

(5) In its conclusions on the institutional framework for sustainable development, the Rio+20 Conference should invite the governing bodies of and Parties to international treaties relating to the environment, including but not limited to multilateral environmental agreements, to ensure that the substantive outcomes under such instruments promote effective access to information, public participation and access to justice.

(6) The Rio+20 Conference should adopt a set of guidelines guaranteeing minimum standards for civil society participation in international decision-making processes.

#### RECOMMENDATION N°19

##### RENFORCEMENT DU DROIT FORESTIER AU NIVEAU NATIONAL, REGIONAL ET INTERNATIONAL

La Réunion:

Consciente que les forêts, dans la richesse de leur diversité, matérialisent des processus écologiques indispensables à l'entretien de toutes les formes de vie;

Alarmée par la poursuite, à un rythme élevé, de la régression et de la dégradation de la couverture forestière mondiale, en dépit de l'expansion notable des reboisements;

Convaincue que la capacité des forêts de satisfaire les besoins globaux de l'humanité ne peut être maintenue à long terme que par une gestion durable et équitable de leurs ressources, dans l'intérêt des générations présentes et futures, des points de vue écologique, économique, social, culturel et spirituel;

Se félicitant des avancées significatives du droit forestier au niveau national, réalisées à travers de multiples réformes législatives conduites par de nombreux Etats, et convaincue de la nécessité de poursuivre ces efforts afin d'adapter, de perfectionner, de compléter, d'actualiser et d'appliquer les dispositifs juridiques nationaux relatifs aux forêts dans tous les pays;

Appréciant l'importance, dans ce contexte, de la Déclaration de principes, non juridiquement contraignante mais faisant autorité, pour un consensus mondial sur la gestion, la conservation et l'exploitation écologiquement viable de tous les types de forêts, adoptée en 1992 par la Conférence des Nations Unies sur l'environnement et le développement;

Saluant les résultats obtenus au sein du Forum des Nations Unies sur les forêts et dans le cadre de l'Arrangement international sur les forêts, ayant débouché sur l'adoption en 2007 de l'Instrument juridiquement non contraignant concernant tous les types de forêts par l'Assemblée générale des Nations Unies;

Notant la tendance croissante de la part des pays consommateurs à imposer des restrictions directes ou indirectes à l'importation de produits forestiers pour assurer la légalité des abattages et la gestion durable des forêts;

Considérant qu'il n'existe pas encore de convention mondiale, de portée générale, applicable à l'ensemble des forêts que compte la planète et constatant la divergence de vues persistante sur l'opportunité d'élaborer une telle convention, aussi bien entre les Etats que parmi les acteurs non gouvernementaux;

Convaincue qu'une convention forestière mondiale créerait un cadre juridique idoine pour une bonne gouvernance et une coopération accrue en matière de protection et de mise en valeur des forêts, et qu'elle permettrait de renforcer la synergie avec les conventions existantes relatives à des domaines connexes, au service du développement durable, de la lutte contre la pauvreté, la préservation de la biodiversité et l'atténuation des changements climatiques;

Recommande:

a) la poursuite du dialogue, dans un esprit constructif, en vue de rapprocher les positions et de dégager un consensus permettant d'initier, dans les meilleurs délais, la négociation d'une convention forestière qui: (i) aurait une portée mondiale; (ii) s'appliquerait à toutes les catégories de forêts et à tous les produits et services qui en dérivent, dans le respect des diversités éco- régionales; (iii) traiterait des dimensions environnementale, économique, sociale, culturelle, sacrée et spirituelle de la conservation et de l'utilisation des écosystèmes forestiers; (iv) se baserait sur les principes de légalité, de durabilité, d'équité, de solidarité, d'éthique et de transparence, en tenant compte du pluralisme juridique; (v) mettrait en œuvre des mécanismes financiers viables et permettrait d'accroître l'aide publique au développement destinée à la gestion durable des forêts;

b) la promotion des initiatives nationales, bilatérales, régionales et mondiales tendant à adopter et parfaire les instruments politiques et juridiques de protection et de mise en valeur des forêts, en particulier: (i) les outils de planification et de programmation forestière; (ii) les critères et indicateurs de l'aménagement durable des forêts; (iii) les programmes de certification forestière; (iv) les directives volontaires concernant des aspects spécifiques de la gestion et l'utilisation des forêts; (v) les accords bilatéraux et les conventions régionales visant à renforcer la coopération en matière de gestion et de protection forêts, y compris sur les questions de gouvernance, de légalité et de commerce dans le secteur forestier;

c) la généralisation et l'approfondissement des réformes visant à améliorer, actualiser et compléter les législations forestières nationales afin qu'elles assurent notamment:

(i) la valorisation des fonctions environnementales, sociales, économiques, culturelles et spirituelles des forêts;

(ii) la planification de l'aménagement forestier et l'encadrement de l'exploitation forestière dans le respect de la durabilité et de la légalité;

(iii) la lutte contre les défrichements et les abattages illicites, la transparence du commerce du bois et la traçabilité des produits forestiers;

(iv) la réduction de la perte de la biodiversité forestière; (v) la certification des produits forestiers;

(vi) une gestion plus équitable, participative et décentralisée des forêts, impliquant tous les acteurs concernés, publics et privés, respectueuse des intérêts des populations usagères et autochtones, des collectivités locales et de la communauté nationale;

d) un meilleur encadrement juridique du rôle des forêts dans l'atténuation des incidences négatives des changements climatiques, notamment au regard:

(i) des droits de propriété liés au stockage, à la fixation et à la vente du carbone;

(ii) des initiatives REDD+, en tenant dûment compte des intérêts des communautés locales et des populations riveraines des forêts;

e) la mobilisation des financements, la formation des capacités, le développement de la recherche et le transfert des technologies nécessaires à la mise en œuvre des mesures énoncées aux paragraphes précédents.

RECOMMANDATION N°19

STRENGTHENING OF FORESTRY LAW AT THE NATIONAL, REGIONAL AND INTERNATIONAL LEVEL

The Meeting:

Aware that forests, in the richness of their diversity, support ecological processes which are indispensable for maintaining all forms of life;

Alarmed at the continued high rate of loss and degradation of the world's forests, despite the notable expansion of reforestation;

Convinced that the capacity of forests to satisfy the global needs of humanity cannot be maintained in the long term except by the sustainable and equitable management, in the interest of present and future generations, from the ecological, economic, social, cultural and spiritual points of view;

Welcoming the significant progress of forestry law achieved at the national level through the many legislative reforms undertaken by numerous States, and convinced of the

necessity to pursue such efforts to adapt, improve, complement, update and enforce the national legal frameworks relating to forests in all countries;

Appreciating the importance, from this perspective, of the Non-Legally Binding Authoritative Statement of Principles for a Global Consensus on the Management, Conservation and Sustainable Development of all Types of Forests, adopted in 1992 by the Nations United Conference on Environment and Development;

Welcoming the results achieved in the framework of the United Nations Forum on Forests and under the International Arrangement on Forest, which led to the adoption in 2007 of the Non- legally Binding Instrument on all Types of Forests by the General Assembly of the United Nations;

Noting the rising trend for consumer countries to impose direct or indirect restrictions on the import of forest products to ensure legal logging and sustainable management of forests; Bearing in mind that there is still no global convention, of general scope, applicable to all the forests which the planet relies on, and noting the persistent divergences in opinion on the desirability to develop such a convention, both between States and amongst non-government actors;

Convinced that a global forestry convention would provide a sound legal basis for good governance and increased cooperation for the conservation and development of forests, and also enhance synergies among existing conventions dealing with related areas, in order to foster sustainable development, the fight against poverty, the preservation of biodiversity and a reduction in greenhouse gas emissions;

Recommends:

a) a dialogue should be initiated, in a constructive spirit, to bring positions closer together so as to reach a consensus allowing negotiations to start as soon as possible on a forestry convention which would: (i) have a worldwide scope; (ii) be applicable to all categories of forests and all forest products and services derived therefrom, respecting eco-regional diversities; (iii) cover the environmental, economic, social, cultural, sacred and spiritual dimensions of the conservation and utilisation of forest ecosystems; (iv) be grounded on principles of legality, sustainability, equity, solidarity, ethics and transparency, taking into account legal pluralism; (v) provide for viable financial mechanisms and help to raise official development aid for sustainable forest management;

b) the promotion of national, bilateral, regional and global initiatives aiming at the adoption and improvement of policy and legal instruments for the conservation and development of forests, especially: (i) forestry planning and programming tools; (ii) criteria and indicators for sustainable forest management; (iii) forest certification programmes; (iv) voluntary guidelines on specific aspects of forest management and use; (v) bilateral agreements and regional conventions intended to strengthen cooperation on forest conservation and development, including governance, legality and trade issues in the forestry sector;

c) the dissemination and deepening of reforms to improve, update and complement national forestry legislation in order to promote, inter alia: (i) environmental, social, economic, cultural and spiritual values of forests; (ii) forest planning and management and regulation of forest use, in compliance with sustainability and legality; (iii) the fight against illegal clearing and logging, transparency of trade in timber and traceability of forest products; (iv) reduction of forest biodiversity loss; (v) certification of forest products; (vi) more equitable, participatory and decentralized management of forests, involving all concerned actors, public and private, respecting the interests users, indigenous peoples, local entities and the national community;

d) a better legal regime for encouraging the role play of forests in reducing the negative impacts of climate change, notably in respect of: (i) tenure rights related to forest carbon stocks, sinks and credits; (ii) the REDD+ initiatives, taking due account of the interests of local communities and those living in the vicinity of forests;

e) the raising of funds, building of capacities, development of research, and transfer of technologies necessary to implement the measures mentioned in the preceding paragraphs.

#### RECOMMANDATION N°20

##### LES AIRES MARINES PROTEGEES EN HAUTE MER

1) Les États devraient lancer des négociations pour un accord de mise en œuvre de la Convention des Nations Unies sur le droit de la mer qui énoncerait sous la forme d'un «paquet» commun un régime mondial sur la conservation et l'utilisation durable de la biodiversité marine dans les zones situées hors des juridictions nationales;

2) Le contenu de base de ce futur accord de mise en œuvre comprendrait :

- l'établissement d'un réseau des aires marines protégées en haute mer,
- une procédure d'évaluation de l'impact environnemental dont le contenu et l'effectivité garantissent un haut niveau de protection,
- un régime pour les ressources génétiques marines, comprenant l'accès et le partage des bénéfices,
- des dispositions sur le renforcement des capacités et le transfert de technologie.

3) En ce qui concerne les aires marines protégées, la priorité devrait être accordée à un certain nombre d'éléments, parmi lesquels inter alia:

- l'établissement d'une liste des aires marines protégées en haute mer d'importance mondiale;
- la définition de critères communs pour déterminer les aires marines protégées en haute mer (importance pour la conservation de la diversité biologique, des écosystèmes ou habitats d'espèces menacées ; intérêt particulier pour la science, l'esthétique, la culture ou l'éducation; etc.);
- une procédure pour l'inscription des aires marines protégées en haute mer sur une liste basée sur une décision des parties à l'Accord de mise en œuvre;
- l'adoption au cas par cas d'un ensemble de mesures de protection et de conservation, contraignantes pour toutes les parties à l'Accord de mise en œuvre;
- l'obligation pour les parties d'adopter des mesures appropriées, compatibles avec le droit international, afin de s'assurer que nul ne s'engage dans une activité contraire aux principes et aux objectifs de protection et aux mesures de conservation adoptées pour chacune des aires marines protégées en haute mer d'importance mondial.
- Les dispositions sur les arrangements institutionnels et les mécanismes financiers nécessaires à l'application de l'Accord.
- Des mesures concernant les aires marines protégées en haute mer relevant pour partie d'une juridiction nationale.

#### RECOMMENDATION N° 20

##### MARINE PROTECTED ZONES ON THE HIGH SEAS

1) States should start the negotiations for an Implementation Agreement of the United Nations Convention on the Law of the Sea that would set forth a commonly agreed "package" on a global regime for the conservation and sustainable use of marine biodiversity in areas beyond national jurisdiction;

2) The basic components of the future Implementation Agreement should be:

- the establishment of a network of high seas marine protected areas,
- a procedure for environmental impact assessment of high level dont le contenu et l'effectivité garantissent un haut niveau de protection,
- a regime for marine genetic resources, including access and benefit sharing,
- provisions on capacity building and transfer of technology;

3) As regards marine protected areas, consideration should be given to a number of elements, such as, inter alia:

- the provision of a List of high seas marine protected areas of world importance;
- the definition of common criteria for the choice of high seas marine protected areas (importance for the conservation of biological diversity, ecosystems or habitats of endangered species; special interest at the scientific, aesthetic, cultural or educational level; etc.).
- a procedure for the inscription of high seas marine protected areas on the List based on a decision taken by the parties to the Implementation Agreement;
- the adoption on a case by case basis of a set of protection and conservation measures, which are binding on all the parties to the Implementation Agreement;
- the obligation of the parties to adopt appropriate measures, consistent with international law, to ensure that no one engages in any form of activity contrary to the principles and purposes of the protection and conservation measures adopted for each high seas marine protected areas of world importance.
- the provisions of institutional arrangements and financial mechanisms necessary for the implementation of the Agreement.
- the provision of measures regarding marine protected zones on the high seas which are partly within national jurisdiction.

#### RECOMMANDATION N°21

#### LA GESTION INTEGREE DES ZONES CÔTIÈRES

Préambule :

Considérant que, nonobstant la participation, les autorités publiques sont les premières responsables des conditions de mise en œuvre de la GIZC

Considérant l'état écologique des mers dont 80% des pollutions sont d'origine tellurique

Considérant la dérive de véritables îlots de déchets sur tous les océans (notamment Pacifique et Atlantique) dont l'origine terrestre est établie

Considérant les enjeux que représente la biodiversité côtière et marine

Considérant les risques technologiques auxquels sont soumises les zones côtières et marines, notamment par les pollutions d'origine terrestre et d'origine marine

Considérant les risques naturels, caractéristiques de ces zones, notamment les risques d'évolution du trait de côte et de submersion

Considérant les enjeux que représentent les zones côtières et marines pour l'humanité, en termes :

- De ressources halieutiques
- De transport (personnes et/ou biens)
- D'activités portuaires,
- De tourisme,
- De production énergétique
- D'urbanisation
- D'activités économiques diverses liées à la mer

Considérant aussi qu'il est nécessaire de prendre en considération :

- L'impact du changement climatique caractéristique sur l'interface terre/mer
- L'impact croissant des activités humaines sur les zones littorales terrestres et maritimes
- La croissance exponentielle de l'humanité, notamment son implantation dans les zones côtières

Recommande que les chefs d'Etat et de gouvernement s'engagent:

I - A mettre en œuvre, en préalable:

- une gestion intégrée des zones côtières, fondée sur la réalisation de leur développement durable,
- une application des droits en vigueur (environnement, urbanisme, aménagement, mer etc..)
- des politiques publiques redéfinies, développées sur le principe d'une démarche intégrée et participative
- une approche prioritaire fondée sur les écosystèmes côtiers et marins,
- une approche transnationale/régionale, fondée sur les bassins fluviaux côtiers et maritimes
- des orientations précises: protection de la biodiversité, maîtrise de l'urbanisation en zone littorale (avec des zones d'interdiction de construire en zone littorale), zones de

protections renforcées, une économie littorale et marine au service des finalités environnementales et sociales

- le développement d'une culture de la GIZC auprès de tous les acteurs, notamment les populations locales

## II - A définir des objectifs pour la GIZC

Les politiques publiques en matière de GIZC doivent reposer sur :

### A - La connaissance

Compte tenu des enjeux et de la complexité des écosystèmes côtiers et marins, seront développées les connaissances sur les écosystèmes côtiers dans un cadre transnational.

En se référant à la création en 2009 du Centre Mondial de Surveillance pour la Conservation de la Nature ([www.wdpa-marine.org](http://www.wdpa-marine.org)) : seront créés d'ici 5 ans des observatoires régionaux

### B - Un ensemble d'objectifs

Dans un cadre régional et/ou interétatique pertinent, des objectifs prioritaires seront définis

Compte tenu des liens terre/mer, et de la nécessaire transversalité des problématiques, mais aussi du rôle de ces écosystèmes et de leur dégradation caractérisée, des objectifs qualitatifs prioritaires concerneront :

1. Les récifs coralliens
2. Les estuaires
3. Les mangroves

Ces objectifs conduiront à :

- a. restaurer les milieux dégradés
- b. préserver les milieux de qualité

### C - Une coordination

La gestion intégrée des zones côtières exige de mettre en œuvre une coordination :

4. des stratégies : d'une part la stratégie GIZC au niveau géographique et d'autre part les dispositions de protection existantes, entre autres la Convention de Montego Bay, la Convention de Ramsar, la Convention sur diversité biologique, la Convention sur la gestion des déchets, les nombreuses Convention régionales ou bilatérales sur la gestion de l'eau etc..
5. des acteurs : ceux de la GIZC et les acteurs des autres politiques publiques, les acteurs publics régionaux et les acteurs nationaux et locaux, les acteurs publics et les acteurs privés
6. des instruments : planification et instruments opérationnels, programmes et financements

## III - A mettre en œuvre des moyens opérationnels dans les cinq ans

Les zones côtières et maritimes, comme les estuaires, les deltas ou les embouchures des fleuves constituent toujours des frontières politiques et administratives, au niveau international et au niveau national.

Le fondement de l'intervention opérationnelle doit reposer sur la volonté des Etat à développer la coopération transfrontalière pour la gestion durable des grands estuaires ou deltas du monde.

Afin d'atteindre les objectifs qualitatifs, sera mis un programme de 2013 à 2018 conduisant à :

7. Renforcer la coordination entre les institutions universelles (PNUE/ONESCO/FAO) etc., mais aussi régionales et locales, à la fois verticale et horizontale
8. Etablir un plan d'action régional intégré aux grands écosystèmes ( Océans), fondée sur les - grands bassins côtiers
9. Etablir un plan national d'action, associé à une démarche locale. La planification spatiale côtière et marine doit être développée de façon transversale et à l'échelle des bassins fluviaux et maritimes, qu'ils soient nationaux ou transfrontaliers
10. Renforcer le processus participatif (Aarhus)
11. Etablir un programme durable associant tous les programmes et tous les acteurs
12. Assurer un financement durable
13. Renforcer l'adaptabilité dans le temps du processus de la GIZC
14. Mettre en œuvre un droit opposable : planification, réglementation, incitation
15. Sensibiliser et former les autorités de police et les magistrats
16. Assurer une évaluation reposant sur des indicateurs partagés
17. Renforcer les capacités de recherche sur les moyens opérationnels et efficaces à développer
18. Renforcer la coopération internationale
19. Développer une culture de la GIZC, s'appuyant sur les cultures locales

VI- A instaurer des outils de contrôle partagés

En s'appuyant sur les acquis des évaluations existantes, sera mise en œuvre une évaluation de la GIZC, reposant sur une expertise indépendante et un ensemble d'indicateurs qualitatifs et quantitatifs communs à tous les Etats, complétés par des indicateurs locaux, notamment :

20. l'urbanisation et l'artificialisation (aménagements, infrastructures) des zones côtières

21. la démographie

22. la biodiversité marine et côtière

23. la qualité des eaux côtières et marines

24. la gestion des déchets

25. le paysage

Afin de disposer d'outils pertinents pour réaliser une gestion intégrée et durable des zones côtières, seront créés :

26. un panel d'indicateurs contribuant à mesurer l'empreinte écologique sur les zones côtières

27. une évaluation ex-post des résultats

28. des pôles d'expertise indépendante

Sur la base de ces propositions, nous recommandons la promotion à Rio+20 d'une résolution pour l'AG des nations unies sur les exigences de la GIZC,

Et une négociation sur des principes universels et les modalités d'intervention de la GIZC, conduisant à une convention cadre, qui sera déclinée par chacune des mers régionales en conventions régionales détaillées.

RECOMMANDATION N°21

INTEGRATED COASTAL ZONE MANAGEMENT (ICZM)

Preamble:

Whereas, notwithstanding public participation, public authorities have the primary responsibility for the implementation of ICZM

Considering the ecological status of marine pollution, 80% of which is from land-based sources

Considering the drift of islands of waste in every ocean (including Pacific and Atlantic)

Considering the challenges for the protection of coastal and marine biodiversity

Considering the technological risks that coastal and marine areas are subject to, including

pollution from land and marine sources

Considering the hazards, characteristics of these areas, including the risks of evolution of the coastline and flooding

Considering the challenges posed by coastal and marine areas for humanity in terms of:

- Fisheries resources
- Transport (people and / or property)
- Port activities,
- Tourism,
- Energy production
- Urbanization
- Various economic activities related to the sea

Considering also the need to consider:

- The impact of climate change on the land / sea interface
- The growing impact of human activities on coastal land and sea
- The exponential growth of humanity, including its presence in coastal areas

Recommend that the Heads of State and Government undertake:

I - To be implemented in advance:

- Integrated management of coastal zones, based on the achievement of sustainable development,
- An application of Fees (environment, urban planning, land, sea etc. ...)
- Public policy redefined, developed on the principle of an integrated and participatory
- An approach based on priority coastal and marine ecosystems,

- A transnational / regional, based on river basins and coastal shipping

- Specific directions: protection of biodiversity, land-use planning in coastal areas (with closed areas to build in coastal areas), areas of enhanced protection, coastal and marine economy in the service of environmental and social goals

- Developing a culture of ICZM from all stakeholders, including local

II- A set of objectives for ICZM

Public policy on ICZM should be based on:

A - Knowledge

Given the stakes and the complexity of coastal and marine ecosystems will be knowledge on transboundary coastal ecosystems will be developed.

Referring to the creation in 2009 of the World Conservation Monitoring Centre for Conservation of Nature ([www.wdpa-marine.org](http://www.wdpa-marine.org)):

- Regional Observatories will be created in 5 years

B - A set of objectives

Based on regional and / or interstate relevant priorities, objectives will be defined

Given the links land / sea, and the transboundary nature of these issues, but also the role of these ecosystems and their degradation characterized by qualitative targets of priority concern:

1. Coral reefs
2. Estuaries
3. « Mangroves »

These objectives will lead to:

- a. restoration of degraded environments
- b. preservation of environmental quality

C - Coordination

Integrated management of coastal areas requires coordination of:

4. Strategies: first ICZM strategy in geographical and other steps to protect existing, including the Montego Bay Convention, the Ramsar Convention, the Convention on Biological Diversity, the Convention on the management of waste, many regional and bilateral Convention on the water management etc. ..
5. Actors: those of ICZM and other policy actors, public actors and regional national and local actors, the public and private actors
6. instruments: planning and operational tools, programs and funding

III - To implement operational capacity within five years

The coastal and marine zones, such as estuaries, deltas and river mouths are always political and administrative borders, international and national levels.

The basis of the operational response must be based on the will of the state to develop cross- border cooperation for the sustainable management of large estuaries or deltas in the world.

To achieve the qualitative objectives, a program will be conducted from 2013 to 2018 leading to:

7. Strength coordination between universal institutions (UNEP / UNESCO / CAM) etc. ..., but also regional and local, both vertical and horizontal
8. Establish a regional action plan integrated with major ecosystems (oceans), based on - coastal basins
9. Establish a national plan of action, combined with a local approach. The coastal and marine spatial planning should be developed in a transversal way across river basins and sea, whether national or transboundary
10. Strengthen the participatory process (Aarhus)
11. Establish a sustainable program involving all programs and all stakeholders
12. Ensure sustainable funding
13. Enhancing the adaptability of the process in time of ICM
14. Implement an enforceable right planning, regulation, incentives
15. Raise awareness and educate law enforcement and judges
16. Provide an assessment based on shared indicators
17. Build capacity for research on ways to develop operational and effective
18. Strengthen international cooperation
19. Develop a culture of ICZM, drawing on local cultures

#### VI- Establishing shared control tools

Building on the achievements of existing assessments, an evaluation of ICZM will be conducted, relying on independent expertise and a set of qualitative and quantitative indicators common to all states, supplemented by local indicators, including:

4. Urbanization and the artificialization of coastal zones (facilities, infrastructure)
5. Demographics
6. Marine and coastal biodiversity
7. The quality of coastal and marine waters
8. Waste management
9. The landscape

In order to have appropriate tools to achieve integrated and sustainable management of coastal areas:

10. A panel of contributing indicators to measure the ecological footprint on coastal areas will be created
11. An ex-post evaluation of results will be conducted
12. Centers of independent expertise will be established

On the basis of these proposals, we recommend the promotion at "Rio +20" of:

- A resolution to the General Assembly of the United Nations on the requirements of ICZM and
- Negotiations on universal principles and methods of intervention of ICZM, leading to a framework agreement, which will be adapted by each of the regional seas in detailed regional conventions.

#### RECOMMANDATION N°22

#### LA PLACE DES ENTREPRISES DANS LE DÉVELOPPEMENT DURABLE ET LEUR RESPONSABILITÉ

Vu la déclaration de Stockholm de 1972 et plus particulièrement ses affirmations selon lesquelles «l'Homme a un droit fondamental à la liberté, l'égalité et à des conditions satisfaisantes dans un environnement dont la qualité lui permette de vivre dans la dignité et le bien être», et « tous, citoyens et collectivités, entreprises et institutions, à quelque niveau que ce soit, assument leurs responsabilités et se partagent équitablement les tâches»,

Vu les principes de la déclaration de Rio et plus particulièrement le Principe 13 qui pose que «Les Etats doivent élaborer une législation nationale concernant la responsabilité de la pollution et d'autres dommages à l'environnement et l'indemnisation de leurs victimes. Ils doivent aussi coopérer diligemment et plus résolument pour développer davantage le droit international concernant la responsabilité et l'indemnisation en cas d'effets néfastes de dommages causés à l'environnement dans des zones situées au-delà des limites de leur juridiction par des activités menées dans les limites de leur juridiction ou sous leur contrôle »,

Vu le Plan Action 21,

Vu la résolution de l'Assemblée Générale des Nations Unies du 11 décembre 1987 indiquant que « la notion de développement durable... devrait devenir le principe directeur fondamental pour ... les institutions, organisations et entreprises privées »,

Vu, la déclaration de Johannesburg sur le développement durable et particulièrement son § 27 qui souligne que «dans le cadre de ses activités légitimes, le secteur privé dans son ensemble, c'est-à- dire les grandes entreprises comme les petites, a le devoir de contribuer à l'émergence de communautés et de sociétés équitables et durables»,

Vu le Plan de mise en œuvre du Sommet mondial pour le développement durable (§140 f) rappelant la nécessité de «Promouvoir la responsabilité des entreprises, leur obligation de rendre des comptes et les échanges des meilleures pratiques au regard du développement durable, y compris, lorsqu'il convient, par des dialogues multipartites...»,

Considérant que les entreprises, privées comme publiques, devraient être reconnues comme des acteurs à part entière du Droit International de l'Environnement au même titre que le sont les Etats, les ONG, ou la société civile, qu'elles sont notamment les mieux placées pour relever les défis du développement durable, et permettre l'émergence d'une économie verte. Que leur rôle est essentiel dans l'innovation et le développement de technologies respectueuses de l'environnement,

Considérant qu'il est nécessaire de se placer dans la perspective des principes de précaution et pollueur-payeur en encourageant l'esprit d'entreprise, la compétitivité et l'innovation,

Considérant que les entreprises se doivent de faire progresser à tous les niveaux les piliers interdépendants et complémentaires du développement durable que sont les piliers économique, social et environnemental en adoptant une approche intégrée,

Considérant que les entreprises ont le devoir de préserver l'environnement des impacts négatifs générés par leurs activités, tant à l'égard des générations présentes que futures ; qu'elles doivent par conséquent adopter un comportement responsable à l'égard de l'Homme et de l'environnement,

Considérant qu'elles ont l'obligation de respecter les règles contraignantes propres à assurer la protection de l'environnement, en vigueur tant au niveau local, national, régional qu'au niveau international, que trop souvent ces règles sont méconnues et ne sont pas respectées,

Considérant que l'effectivité de la protection de l'environnement doit être assurée,

Considérant que les atteintes graves causées à l'environnement peuvent constituer des violations des droits fondamentaux internationalement consacrés et qu'il est indispensable de garantir ; qu'il est important de renforcer ces droits en matière environnementale et sociale,

Considérant qu'il est nécessaire d'affirmer avec force et vigueur, à l'échelle internationale, le droit fondamental de chacun à vivre dans un environnement viable, sain et garantissant sa dignité ; que chaque Etat a pour obligation de protéger ce droit,

Considérant que de nombreuses conventions existent en matière de responsabilité du fait de certaines pollutions et nuisances générées par les acteurs économiques, qu'il

est toutefois nécessaire de dépasser cette approche sectorielle par une approche plus globale, générale,

Considérant que le temps est donc venu d'élaborer un texte international contraignant dans ce domaine, qu'une telle option avait été d'ailleurs envisagée lors du Sommet de Johannesburg en 2002 et avait même donné lieu à l'engagement d'œuvrer en ce sens,

Considérant qu'il convient de s'adresser à l'ensemble des acteurs économiques multinationaux ou nationaux, privés comme publics, et ce quel que soit leur statut, leur structure ou leur domaine d'activités.

Considérant que ce texte relatif à la responsabilité environnementale des entreprises doit être contraignant pour être efficace, qu'il ne saurait s'analyser en un catalogue de principes directeurs non contraignants, qu'il doit en outre faire l'objet de mécanismes efficaces de surveillance et de sanctions,

Considérant que la notion de responsabilité environnementale, au sens de la présente recommandation, doit s'entendre comme l'obligation de répondre tant de ses actions que de ses inactions pouvant, directement ou indirectement, causer des dommages graves à l'environnement, que ces dommages soient purement environnementaux ou se traduisent par des atteintes aux personnes ou aux biens, et de réparer les atteintes ainsi causées,

Considérant que les Etats sont responsables des atteintes causées à l'environnement par les acteurs économiques qui relèvent de leurs juridictions, qu'il pèse sur les Etats des obligations positives de tout mettre en œuvre pour prévenir et réprimer ces atteintes, dans le respect du principe pollueur-payeur,

Considérant que les Etats ont l'obligation de mettre en place une réglementation nationale adéquate et de s'assurer de sa pleine efficacité sur le terrain, d'informer et d'alerter le public, ainsi que de prévoir et de s'assurer de l'existence et de l'efficacité de voies de recours adéquates et accessibles devant un juge national, permettant d'obtenir une réparation satisfaisante,

Considérant que les Etats doivent également adopter des mesures propres à endiguer les phénomènes de law shopping ou forum shopping par l'instauration de règles de droit international privé, ayant pour finalité d'assurer la protection effective de l'environnement, Considérant qu'il est de la responsabilité des entreprises de prévenir les atteintes graves à l'environnement résultant de leurs activités et de réparer les dommages qu'elles pourraient avoir causé, que cette responsabilité doit pouvoir être engagée au plan national, régional, et international,

Considérant que la prise en compte des enjeux environnementaux et sociaux ne doit pas se faire au détriment des règles de concurrence et que la mise en œuvre de la présente recommandation ne doit pas être discriminatoire,

Les Chefs d'Etat et de gouvernements devraient arrêter ce qui suit :

#### Article 1

Il n'est pas possible d'atteindre les objectifs du développement durable sans une pleine participation des entreprises qui en sont des actrices essentielles. Une bonne gestion des entreprises repose sur la juste appréhension des données sociales et environnementales, à côté des données économiques. Les entreprises doivent intégrer la pluralité des objectifs économiques sociaux et environnementaux dans l'ensemble de leurs activités et pouvoir justifier de l'application des principes et critères du développement durable. Les Etats mettent à la disposition des entreprises les instruments nécessaires à la détermination des coûts écologiques et doivent tout mettre en œuvre pour favoriser des modes de consommation et de production respectueux de l'environnement et de la santé. Ils doivent notamment veiller à ce que les règles du droit de la concurrence garantissent la prise en compte des objectifs du développement durable.

#### Article 2

Les entreprises doivent répondre des atteintes graves à l'environnement et à la santé résultant de leurs activités, produits ou services. Leurs initiatives volontaires en matière environnementale, sociale et de gouvernance doivent être encouragées et il ne doit pas pouvoir être reproché à une entreprise d'aller au-delà des exigences légales.

#### Article 3

Les entreprises doivent adopter une attitude responsable, sur la base des Principes internationalement reconnus, dans le respect de l'ensemble des législations qui leurs sont applicables.

Une entreprise s'implantant dans un pays doit le faire sur la base d'un diagnostic clair de la situation et des possibles impacts de son activité sur l'environnement et la société, et pouvoir justifier de la prise en compte de ce diagnostic et des réponses apportées aux enjeux environnementaux identifiés ainsi que de l'accueil de ces réponses par les collectivités concernées.

#### Article 4

Au sens de la présente, on entend par « entreprise » toutes les entreprises, privées ou publiques, simples ou composées de plusieurs entités. En cas de pluralité d'entités, le terme « entreprise », se réfère aux diverses entités.

Lorsqu'une entreprise exerce une influence déterminante sur une entité contrôlée, elle peut être tenue pour responsable du comportement de celle-ci.

#### Article 5

Dans le cadre de leurs relations commerciales avec leurs sous-traitants et fournisseurs, et au-delà, dans le cadre de leur sphère d'influence, les entreprises doivent s'assurer du respect de l'ensemble des obligations environnementales et sociales légalement formulées.

Dans le respect des obligations applicables à chacun, les entreprises doivent s'assurer de l'absence de défaillance environnementale dans leur chaîne d'approvisionnement et, le cas échéant, assister leurs partenaires pour les aider à y mettre fin.

#### Article 6

Les entreprises doivent évaluer les impacts de leurs actions et proposer des mesures d'accompagnement limitant, le cas échéant, les conséquences sur l'environnement et la santé de l'introduction sur un marché donné de produits.

#### Article 7

Afin de réduire les consommations de matières premières non renouvelables, d'encourager l'utilisation rationnelle des ressources naturelles et de prévenir la production de déchets, les exigences d'éco-conception doivent être systématiquement intégrées aux processus de production. Une préférence doit être accordée à la valorisation et au recyclage, tant des résidus de production que des produits en fin de vie. L'obsolescence programmée des produits doit être combattue.

Les Etats doivent mettre en place un cadre de recyclage permettant la récupération des matières premières dans des conditions respectueuses de l'environnement et de la santé des personnes. A défaut de réglementation étatique, il appartient à chaque opérateur de recyclage de s'assurer du respect de ces intérêts.

Conformément au principe pollueur-payeur, les producteurs de produits générateurs de déchets doivent être incités à prendre en charge les coûts de collecte, de recyclage ou d'élimination des déchets issus de leurs produits.

#### Article 8

Les entreprises mettent en place des structures d'échanges avec les «parties prenantes» (Stakeholders), s'assurent de la qualité des informations qui leurs sont dispensés et prennent en considération leurs recommandations.

#### Article 9

Les Etats doivent garantir l'effectivité du droit de l'environnement et la mise en œuvre des principes du développement durable. A cette fin ils garantissent l'accès à la justice et s'assurent de la réparation des dommages à l'environnement, à la santé et aux conditions de vie.

#### Article 10

La gouvernance des entreprises repose sur une juste identification des informations sociales et environnementales et leur mise à disposition tant des organes dirigeants que des associés et des tiers intéressés.

#### Article 11

Les règles de comptabilité des entreprises doivent intégrer les informations pertinentes en matière d'environnement. Ces informations doivent être présentées de manière accessible et intelligible et être cohérentes avec l'ensemble des données environnementales disponibles. Un auditeur indépendant doit pouvoir attester l'exactitude et la sincérité des informations ainsi produites.

#### Article 12

Les rapports diffusés en matière de résultats économiques des entreprises sont accompagnés des informations environnementales et sociales appropriées.

Les entreprises dont l'activité est susceptible d'avoir des conséquences importantes pour l'environnement doivent élaborer un code de conduite, ou adhérer à un code existant, préconisant les meilleures pratiques et rendre compte de son application ou expliquer pourquoi elles ne le font pas.

#### Article 13

Les salariés et leurs représentants ont accès à l'ensemble des informations environnementales détenues par l'entreprise et sont associés à la gestion des enjeux qu'elles représentent. L'environnement de travail ne doit pas présenter de dangerosité pour les salariés. Ils sont, comme leurs représentants, associés aux mesures réalisées et à la gestion des questions d'environnement au travail.

Les entreprises doivent s'assurer que leurs salariés sont correctement formés aux questions liées au développement durable et notamment aux conséquences environnementales et sanitaires de leurs activités. Lorsqu'ils existent, les plans de formations du personnel doivent intégrer ces dimensions. Lorsqu'ils n'existent pas, de tels plans doivent être élaborés pour permettre une bonne appréhension de ces questions.

#### Article 14

Toute entreprise doit mettre à la disposition des consommateurs de ses produits ou services et du public une information sur l'impact environnemental et sanitaire de ces produits ou services.

A chaque fois que cela apparaît possible, il sera fait référence, pour dispenser cette information, à un programme d'écoétiquetage efficace, transparent, vérifiable, et non discriminatoire. Le PNUÉ élaborera des schémas minimaux d'écoétiquetage et de labels environnementaux auxquels les Etats se référeront dans leurs procédures nationales.

#### Article 15

Toute personne ayant connaissance d'informations lui permettant de penser que des conséquences environnementales ou sanitaires graves pourraient résulter de son silence doit pouvoir alerter librement l'un quelconque des membres de sa hiérarchie ou une personne désignée à cet effet, ou une autorité juridictionnelle, ou ad hoc, désignée par l'Etat dans lequel elle exerce son activité. Chaque Etat prend, conformément à son système juridique interne et dans la limite de ses moyens, des mesures appropriées pour assurer une protection efficace contre des actes éventuels de représailles ou d'intimidation des témoins et des experts qui déposent concernant ces alertes sanitaires ou environnementales

Chaque Etat prend, des mesures appropriées pour assurer la protection contre tout traitement injustifié de toute personne qui lance une alerte environnementale ou sanitaire, de bonne foi et sur la base de soupçons raisonnables.

#### Article 16

Les entreprises qui peuvent justifier de la qualité et de la réalité de leur engagement en faveur des objectifs du développement durable doivent pouvoir en retirer avantage. Les Etats s'engageront dans une procédure de valorisation des initiatives de sollicitude environnementale et sociale.

#### Article 17

L'engagement environnemental, social et de gouvernance des entreprises doit être valorisé dans l'ensemble des procédures d'achats publics. A cette fin, les Etats s'engagent :

- Soit à réserver l'accès à la commande publique aux entreprises pouvant justifier de démarches volontaires dans les domaines environnementaux, sociaux et de gouvernance, vérifiées par un organisme tiers indépendant qu'ils agréent
- Soit à intégrer dans l'ensemble de leurs politiques de commande publique des exigences spécifiques liés aux objectifs du développement durable

Les Etats s'assureront que l'interdiction d'accès à la commande publique puisse être prononcée par les juges statuant en matière environnementale, sociale ou de gouvernance. Les entreprises condamnées par des décisions revêtue de l'autorité de la chose jugée et faisant l'objet d'une telle interdiction d'accès à la commande publique

ne pourront pas, directement ou indirectement, répondre à des appels d'offres publics.

#### Article 18

Dans les entreprises les plus importantes, et au moins dans celles dont les titres sont admis aux négociations sur un marché réglementé, la rémunération des dirigeants devrait être appréciée sur la base d'indicateurs se référant de manière significative aux objectifs du développement durable.

#### Article 19

Les institutions financières, publiques comme privées, intègrent les objectifs du développement durable dans l'ensemble de leurs activités.

Les institutions financières privées communiquent les critères de financement liés au développement durable qu'elles appliquent et dans quelle mesure elles les appliquent ou expliquer pourquoi elles n'en appliquent pas.

Les institutions financières publiques réservent leurs financements à des activités intégrant de manière significative et vérifiable les objectifs du développement durable. Les critères de sélection des projets financés doivent être prédéterminés, clairs et vérifiables et il doit être annuellement rendu compte de leur application.

#### Article 20

Les Etats intègrent systématiquement dans leurs accords économiques un volet environnemental et social afin de concourir à la satisfaction des objectifs du développement durable.

#### Article 21

Des approches sectorielles en matière de responsabilité des entreprises seront développées dans les domaines suivants :

- Transports,
- Gestion des déchets,
- Chimie,
- Eau,
- Agriculture et foresterie,
- Énergie,
- Industries extractives,
- Construction et travaux publics,
- Finance.

\*\*\*

A défaut d'un accord sur les éléments précédents, il peut être envisagé :

1 - d'étendre systématiquement et explicitement à la protection de l'environnement et à la poursuite des objectifs du développement durable les principes directeurs relatifs aux entreprises et aux droits de l'homme (principes Ruggie).

2 - De consacrer dans le cadre d'un texte adopté par les Etats les orientations fondamentales présentées dans les lignes directrices relatives à la responsabilité sociétale : ISO 26000.

3 - De consacrer et de rendre contraignants, dans le cadre des Nations Unies, les principes directeurs de l'OCDE à l'intention des multinationales et les doter de mécanismes renforcés de surveillance et de contrôle.

#### RECOMMANDATION N°22

##### COMPANIES' PLACE IN SUSTAINABLE DEVELOPMENT AND THEIR RESPONSIBILITY

Having regard to the 1972 Stockholm Declaration and more particularly its assertions according to which "Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well being" and "everybody, citizens and communities, firms and institutions, whatever ..., assume its responsibilities and share tasks on an equal level",

Having regard to the principles of the 1992 Rio declaration, and more particularly Principle 13 which says that "States shall develop national law regarding liability and compensation for the victims of pollution and other environmental damage. States shall also cooperate in an expeditious and more determined manner to develop further international law regarding liability and compensation for adverse effects of environmental damage caused by activities within their jurisdiction or control to areas beyond their jurisdiction",

Having regard to the Action Plan 21,

Having regard to the resolution of the UN General Assembly of the 11th of December 1987 indicating that ' the concept of sustainable development ...should become the directive and fundamental principle for ... institutions, organizations and private firms',

Having regard to the Johannesburg declaration on sustainable development and particularly § 27 which underlines that 'in pursuit of its legitimate activities the private sector, including both large and small companies, has a duty to contribute to the evolution of equitable and sustainable communities and societies',

Having regard to the plan implementation of the World Summit for sustainable development (§140 f) which reminds the necessity of 'promoting the corporate responsibility and being held accountable and the exchange of the best practices in the context of sustainable development, including, as appropriate, through multi-stakeholder dialogues ...',

Considering that companies, either private or public, should be considered as full-fledged actors of Environmental International Law on the same level as States, NGO, or the

civil society and that they have more particularly the best position to take up the challenges of sustainable development, and to permit the emergence of a green economy. That their role is essential in the innovation and the development of technologies which respect the environment,

Considering that it is necessary to look at things from the perspective of precautionary and polluter-pays principles by encouraging team spirit, competitiveness and innovation,

Considering that companies must make interdependent and complementary mainstays - economic, social and environmental ones - progress on all levels by adopting an integrated approach,

Considering that companies must save the environment from negative impacts generated/ caused by their activities, as well towards actual generations as towards future ones; that as a consequence they must adopt a responsible behavior towards the Human and the Environment, Considering that they have to respect the binding rules destined to assure the protection of the environment, in effect on the local, national, regional but also international level, that these rules are too often unknown and not respected,

Considering that the effectiveness of the protection of the environment has to be ensured, Considering that serious damages caused to the environment can constitute violations of the fundamental rights which are internationally recognized and that it is essential to ensure; that it is important to reinforce these rights as far as the environment and social matters are concerned, Considering that it is necessary to claim with force and vigour, on the international scale, the fundamental right of each person to live in a viable and safe environment, which ensure its dignity; that each State has to protect this right,

Considering that lots of conventions exist in terms of responsibility because of some pollutions and nuisance generated by economic actors, that however, it is necessary to overcome this sectoral approach by a more global and general one,

Considering that the time has come to elaborate an international and binding text in this field, that besides such an option had been planned during the Johannesburg Summit in 2002 and had even given rise to the involvement of acting that way,

Considering that one should speak to all the multinational or national economic actors, either private or public, and whatever their status, structure or fields of activity,

Considering that this text which concerns the environmental responsibility of companies has to be binding to be efficient, that it could not be analyzed in a range of directive and non-binding principles, that besides it has to be under efficient monitoring mechanisms and sanctions, Considering that the concept of environmental responsibility, in the context of this recommendation, has to be taken as the obligation to answer both its actions and inactions which can, directly or indirectly, cause serious damages to the environment, that these damages are purely environmental or result in violations to people or goods, and also to repair the violations thus caused.

Considering that the States are responsible for the violations caused to the environment by the economic actors which depend on their jurisdictions, that positive obligations of carrying out everything to prevent and punish these violations - which respect the principle of polluter pays - weigh on the States,

Considering that the States have to introduce adequate national rules and to be sure of its full efficiency to real conditions, to inform and warn people, and also to foresee and be sure of the existence and efficiency of adequate and available remedies in front of a national judge, permitting to obtain a satisfying compensation,

Considering that the States also have to adopt proper statements to hold back the phenomena of law shopping or forum shopping by implementing rules of private international law, which will lead to the carrying out of the final protection of the environment,

Considering that companies are responsible for preventing serious violations to the environment resulting from their activities and repairing the damages that they could have led to, that this responsibility must be held nationally, regionally and internationally,

Considering that the consideration of environmental and social issues must be done at the expense of competition rules and that the implementation of this recommendation must not be discriminatory,

The Heads of States and governments should decide on what follows:

#### Article 1

It is not possible to reach the objectives of sustainable development without a full participation of companies which are the essential actors.

An appropriate management of companies relies on the correct apprehension of social and environmental data, linked to economic data. Companies have to take into account the plurality of economic, social and environmental objectives in all their activities and be able to justify the implementation of principles and criteria of sustainable development.

The States have to make the necessary tools to work out the ecological costs available to companies and have to implement everything they can to encourage consumption and production ways which respect the environment and health. They have to ensure more particularly that the rules of competition law guarantee the recognition of the objectives of sustainable development. Article 2

Companies shall be liable to the serious violations on the environment and on health which result from their activities, products or services. Their voluntary initiatives concerning the environment, social concerns and governance have to be promoted and a company must not be blamed for going over legal requirements.

#### Article 3

Companies have to adopt a responsible behavior, based on the internationally recognized principles which respect all the legislations which are enforceable to them.

A company which establishes itself in a country has to rely on a clear diagnosis of the situation and consider the possible impacts of its activities on the environment and society, and it has to be able to justify the recognition of this diagnosis and the answers given to the environmental issues and the acceptance of these answers by the concerned authorities.

#### Article 4

In this context, the use of the word 'company' means all the companies, either private or public, either simple or composed of several entities. In the case of several entities, the word 'company' refers to these different entities.

When a company has a decisive influence on a controlled entity, it can be blamed for the behavior of this one.

#### Article 5

Within the framework of trade relationships with their subcontractors and suppliers, and beyond, within the framework of their sphere of influence, companies have to be sure of the respect of all the environmental and social obligations, legally set out.

#### Article 6

Companies must evaluate the impacts of their actions and put forward accompanying measures which limit, if necessary, the consequences of the implementation of products - on a given market - on the environment and health.

#### Article 7

In order to reduce the consumption of non renewable raw materials, to urge the rational use of natural resources and to prevent the production of waste, the requirements linked to eco-design have to be systematically integrated to production processes. Upgrading or recycling both production residues and products at the end of their life-cycle have to be underlined. The planned obsolescence of products must be fought against.

The States have to implement a framework of recycling that permits the salvage of raw material in conditions which respect the environment and people's health. Without state rules, each recycling operator has to ensure the respect of its interests.

In accordance with the polluter-pays principle, the producers of products which generate waste have to be urged on taking responsibility of the charges linked to the collection, the recycling or the destruction of the waste issued from their products.

#### Article 8

Companies implement exchange structures with the stakeholders, verify the quality of the information which are given to them and take into consideration their recommendations.

#### Article 9

The States have to guarantee the efficiency of the right of the environment and the implementation of the principles of sustainable development. To reach this purpose, they ensure the access to justice and make sure of the compensation for damages on the environment, health and living conditions.

#### Article 10

The governance of companies relies on a correct identification of social and environmental information and the availability of both the executive bodies and the associates and others taking part in it.

#### Article 11

The rules of companies' accounting must take into account relevant information concerning the environment.

These informations have to be introduced in an accessible and understandable way and be coherent with all the available environmental data. An independent hearer must be able to vouch for the accuracy and fairness of the information thus introduced.

#### Article 12

The spread reports concerning the economic results of the companies are accompanied with appropriate environmental and social information.

Companies whose activity may have important consequences on the environment have to elaborate a code of conduct, or subscribe to an existing code, which recommend the best practices and give an account of its application or explain why they do not do it.

#### Article 13

Workers and their representatives have access to all the environmental information hold by the company and are associated to the management of the stakes they represent.

The working environment must not be dangerous for workers. Like their representatives, they are associated to the implemented measures and to the management of issues linked to the working environment.

Companies have to make sure that their employees are correctly trained to issues linked to sustainable development and, more particularly to the environmental and health consequences of their activities. When they exist, training plans for workers have to take into account these issues. When they do not, such plans have to be elaborated to permit a good apprehension of these issues.

#### Article 14

Each company has to make available to its products' or services' consumers and to people information about the environmental and health impact of these products or services. Each time it seems possible, one will refer to an efficient, clear, easy to check and non- discriminatory program of eco-labelling to spread this information.

The PNUE will elaborate minimum eco-labelling and environmental labels' schemes to which the States will refer in their national procedures.

#### Article 15

Any person who will know information which will permit him to think that serious environmental or health consequences could result from his/her silence has to be able to alert freely one of the members of his/her hierarchy or a person assigned to this, or a judicial authority, or ad hoc, designed by the State in which he/she works.

In accordance with its national legal system and within the limits of its resources, each State takes appropriate measures to ensure an efficient protection against possible acts of reprisal or intimidation of witnesses and experts who testify concerning these health or environmental alerts. Each State takes appropriate measures to ensure the protection against an unfair handling by a genuine person who casts an environmental or health alert, on acceptable suspicions.

#### Article 16

The companies which can justify the quality and the reality of their involvement in favor of the objectives of sustainable development must be able to take advantage of it. The States will get involved in a procedure of promotion of the initiatives of environmental and social concerns.

#### Article 17

The environmental, social and companies' governance commitment must be promoted among all the public purchase procedures. To reach this aim, the States are committed to:

- Either reserve the access to all the public command to companies which can justify for voluntary approaches in the environmental, social and governing matters verified by a third party independent organization that they approve.
- Or integrate in all their politics of public demand of specific requirements linked to the objectives of sustainable development.

The States will make sure that the ban of an access to the public procurement can be sentenced by judges deciding on environmental, social or of governance matters. The companies sentenced by decisions which come under the force of res judicata and which are subjected to a ban of an access to the public procurement will not be able, directly or not, to answer public tenders.

#### Article 18

In the most important Companies and at least in those which titles are admitted for negotiations on a ruled market, the pay of the leadership should be determined on the basis of indicators which significantly refer to the objectives of sustainable development.

#### Article 19

The financial institutions, either public or private, integrate the objectives of sustainable development in all their activities.

The private financial institutions transmit their financing criteria linked to sustainable development that they implement and to which extend they implement them or explain why they do not implement them.

The public financial institutions put aside their financing to activities which integrate in a significant and easy to check way the objectives of sustainable development. The criteria of the choice of the financed plans have to be pre-established, clear and easy to check and a report about their implementation has to be written every year.

#### Article 20

The States systematically take into account in their economic agreements an environmental and social aspect in order to contribute to the satisfaction of the objectives of sustainable development.

#### Article 21

Sectoral approaches concerning the responsibility of companies will be developed in the following fields:

- Transport,
- Waste management,
- Chemistry,
- Water,
- Agriculture and forestry,
- Energy,
- Extractable industries,
- Building and civil engineering works,
- Finance.

In the absence of an agreement on the former elements, it can be planned to :

1 - systematically and explicitly spread to the protection of the environment and to the pursuit of the objectives of sustainable development the directive principles about companies and human rights ( Ruggie principles).

2- to devote - within the framework of a text adopted by the States -the fundamental orientations introduced in the directive lines concerning the societal responsibility : ISO 26000.

3 - to devote and to make restrictive, within the framework of the United Nations, the directive principles of the OCDE aimed at multinational companies and to establish reinforced mechanisms for supervision and control.

#### RECOMMANDATION N°23

##### POUR UNE TRANSITION GLOBALE VERS L'ENERGIE PROPRE

Conscients de l'importance de l'accès à énergie dans la réalisation de nombreux besoins humains fondamentaux,

Vu que près d'un tiers de l'humanité n'a pas accès aux sources modernes d'énergie, Convaincus que le système énergétique contemporain essentiellement fondé sur une énergie issue de ressources minières provoque des dommages irréversibles sur l'environnement et la santé humaine,

Rappelant que le secteur de l'énergie est responsable de trois cinquièmes des émissions anthropiques de gaz à effet de serre induisant un changement climatique, et que les États se sont engagés lors de la quinzième session de la Conférence des Parties de la Convention cadre sur le changement climatique tenue à Copenhague à réduire de moitié ces émissions d'ici 2050 par rapport à celles de 1990, pour ne pas dépasser une augmentation de la température moyenne de 2°C en 2100 par rapport à l'ère pré-industrielle,

Reconnaissant qu'une énergie issue de ressources minières qui s'amenuisent ne peut garantir un approvisionnement pérenne et respectueux de l'environnement, et qu'une demande croissante à son égard devrait conduire à un renchérissement des prix, voire à des conflits diplomatiques ou armés,

Alertés sur la nécessité de réaliser une transition énergétique constituée d'une réduction quantitative de l'énergie consommée et d'une amélioration qualitative de l'énergie

produite,

Éclairés par l'AIE, le PNUD et l'ONUDI sur la possibilité d'assurer un accès universel à l'énergie d'ici 2030, par le DAESNU sur la nécessité de limiter les consommations individuelles annuelles d'énergie à 70 gigajoules, et par le GIEC sur la capacité d'assurer un approvisionnement fondé à près de 80% sur des énergies renouvelables d'ici 2050,

Ayant pris acte qu'aucune source d'énergie n'est propre par nature et que la propreté d'une source dépend de la manière dont elle est utilisée par l'Homme,

Résolus sur la nécessité d'évaluer l'impact énergétique des activités humaines,

Soulignant qu'une transition vers l'énergie propre relancerait la croissance économique,

Affirmant qu'une transition énergétique présente un caractère d'urgence et que seule une action globale et coordonnée de l'ensemble des acteurs du secteur énergétique peut en assurer l'effectivité,

Insistant sur la décision de l'Assemblée générale des Nations unies de proclamer 2012 Année internationale de l'énergie durable pour tous,

Les États sont invités lors de la Conférence des Nations unies sur le développement durable qui se déroulera en juin 2012, à Rio de Janeiro, à établir une feuille de route sur une transition globale vers l'énergie propre reposant sur les engagements suivants :

1. L'accès universel à l'énergie propre doit être garanti à un coût économiquement abordable d'ici 2030, et des mécanismes de solidarités institués afin d'approvisionner gratuitement les plus démunis. A cette fin, le droit à l'énergie intègre les législations nationales et le droit international.
2. La consommation individuelle annuelle d'énergie devra être limitée à 70 gigajoules, et 80% de l'approvisionnement énergétique mondial devra provenir de sources renouvelables d'ici 2050.
3. Tout projet susceptible d'impacter significativement les besoins énergie (mise sur le marché de biens et services, ouvrages et aménagements, activités, politiques publiques, et traités internationaux) doit faire l'objet d'un bilan énergétique préalable et d'un suivi comprenant le cas échéant des mesures correctrices. Cette évaluation repose sur cinq critères: améliorer la sobriété et l'efficacité énergétique ; estimer l'énergie grise ; garantir le renouvellement de la ressource ; partager équitablement l'énergie issue de ressources minières ; et valoriser l'énergie.
4. Le traité sur la Charte de l'énergie établit un cadre juridique essentiel concernant la sécurité énergétique et devrait être amendé afin d'intégrer les droits sociaux et environnementaux fondamentaux, renforcer la coopération entre les États, et disposer de mécanismes de solidarité énergétique.
5. L'Agence internationale des énergies renouvelables (IRENA) constitue une instance de référence pour assurer une transition vers l'énergie propre. Elle est encouragée à adopter au plus vite un plan d'action visant à réaliser les présents objectifs, en impliquant l'ensemble des acteurs du secteur énergétique et en accordant une priorité aux entreprises locales.
6. Les destinataires des projets énergétiques devraient se voir reconnaître un droit à l'information et à la participation dans leur élaboration et mise en œuvre. Ne devraient être éligibles à leur réalisation que les organisations présentant les meilleures garanties en matière d'éthique sociale et environnementale.
7. Les subventions en faveur des énergies issues de ressources minières seront supprimées et remplacées par une taxe mondiale sur la production d'énergie issue de ressources minières. Les revenus générés seront affectés au développement de projets conformes à l'énergie propre, aux ménages les plus démunis, et en faveur de dépenses publiques hautement prioritaires telles que la santé et l'éducation.
8. Les gisements d'énergie issue de ressources minières devraient être conservés pour les générations futures et la préservation de l'environnement. En contrepartie, les États pourraient solliciter une indemnisation dont le financement serait assuré par le produit de la taxe mondiale sur la production d'énergie issue de ressources minières et affectée aux projets conformes à l'énergie propre, aux ménages les plus démunis, et en faveur de dépenses publiques hautement prioritaires telles que la santé et l'éducation.
9. Des objectifs quantitatifs en termes de réduction des consommations et d'énergie renouvelable seront adoptés et régulièrement actualisés. Des certificats et des garanties d'origine pourront les compléter afin d'en garantir l'effectivité.
10. Des normes techniques en matière d'éco-conception seront adoptées afin de n'autoriser la mise sur le marché que des biens, services et activités présentant les meilleures performances énergétiques.
11. Des programmes étatiques inciteront les investisseurs à développer des biens, des services et des activités présentant des performances énergétiques supérieures à l'offre du marché.
12. Tous les moyens seront mis en œuvre pour concourir à une éducation à l'énergie, en intégrant notamment ses caractéristiques et enjeux essentiels dans les programmes scolaires et dans la formation professionnelle.
13. Les biens, services et activités recourant à l'énergie ou pouvant influencer celle-ci feront l'objet d'un étiquetage sur la performance énergétique sous la forme d'une information standardisée et compréhensible pour le public.
14. Les règles concernant le management énergétique des sociétés seront renforcées afin que toute personne puisse accéder facilement à ces informations. Leur sincérité doit être garantie par le contrôle d'organismes indépendants.
15. Afin de concourir à l'effectivité de ces moyens et objectifs, les autorités publiques et les sociétés sont encouragées à collaborer avec des ONG engagées en faveur d'une éthique sociale et environnementale.

#### RECOMMANDATION N°23

#### FOR A GLOBAL TRANSITION TO CLEAN ENERGY

Given the importance of access to energy for the realization of many basic needs,

Recognizing that nearly one third of humanity has no access to modern sources of energy,

Convinced that the modern energy system, which is heavily based on energy mining, is causing irreversible damage to the environment and human health,

Recalling that the energy sector is responsible for three fifths of anthropogenic emissions of greenhouse gases inducing climate change, and that States are committed at the fifteenth session of the Conference of Parties to the Framework Convention on Climate Change in Copenhagen to halve emissions by 2050 compared to 1990, and not to exceed an average temperature increase of 2°C in 2100 compared to the pre-industrial era,

Recognizing that decreasing energy mining cannot ensure sustainable access to an environmentally friendly energy, and that a growing demand for them should lead to higher prices of energy and may even lead to diplomatic and armed disputes,

Alerted to the need for an energy transition characterized by a quantitative reduction of energy consumption and an improvement in the quality of energy,

Informed by the IEA, UNDP and UNIDO on the possibility of universal access to energy by 2030, by UNDESA on the need to limit the annual individual consumption to 70 gigajoules of energy, and by the IPCC on the ability to ensure a supply basis at almost 80% renewable energy by 2050,

Having noted that no energy source is clean in nature and the cleanliness of a source depends on how it is used by humans,

Resolved on the need to assess the impact of energy activities,

Stressing that a transition to clean energy would boost economic growth,

Stating that a transition to clean energy is an emergency and that only global and coordinated action of all actors in the energy sector can ensure effectiveness,

Emphasizing the decision of the United Nations General Assembly to proclaim 2012 International Year of sustainable energy for all,

States are encouraged at the UN Conference on Sustainable Development to be held in June 2012 in Rio de Janeiro, to adopt a roadmap for a transition to clean energy based on the following commitments:

1. Universal access to clean energy must be guaranteed at an economically acceptable cost, and solidarity mechanisms should be established to supply the poor free. To this end, the right to energy includes national legislation and international law.
2. Annual per capita consumption of energy should be limited to 70 gigajoules, and 80% of global energy supplies should be provided from renewable sources by 2050.
3. Any activities likely to significantly impact energy requirements (put up for sale of goods and services, buildings and facilities, activities, public policies, international treaties) are subject to a preliminary energy assessment and monitoring, including appropriate corrective action. This assessment is based on five criteria: improve energy sobriety and energy efficiency, estimate the embodied energy, guarantee the renewal of the resource, equitable sharing of the energy mining, and recover energy.
4. The Energy Charter Treaty establishes an essential legal framework for energy security and should include social and environmental fundamental rights, strengthen cooperation among States, as well as mechanisms of energy solidarity.
5. The International Renewable Energy Agency (IRENA) can significantly contribute to the clean energy transition. It is encouraged to adopt without delay a plan of action to achieve these objectives, involving all stakeholders in the energy sector and giving priority to local businesses.
6. The recipients of energy projects should be granted a right to information and participation in their development and implementation. Only organizations with the best guarantees of social and environmental ethics should be eligible for these projects.
7. Subsidies for energy mining will be cancelled and replaced by a global tax on the production of energy from mineral resources. The revenue generated will be allocated to the development of projects in accordance with clean energy, the poorest households, and high-priority spending such as health and education.
8. Mining energy fields should be conserved for future generations and preservation of the environment. In return, States could seek compensation based on the revenue generated by the global tax on the production of energy from mineral resources and allocated to the development of projects in accordance with clean energy, the poorest households, and high-priority spending such as health and education.
9. Quantitative targets in terms of renewable energy and consumption reduction will be adopted and regularly updated. Certificates and guarantees of origin will ensure their effectiveness.
10. Technical standards ecodesign will be adopted to ensure that only those goods, services and activities with the best energy performance are placed on the market.
11. State programs will encourage investors to develop goods, services and activities of energy performance above the market supply.
12. All measures will be implemented in order to contribute to an energy education, especially by incorporating its features and key issues in school curricula and vocational training.
13. Goods, services and activities using energy is subject to energy performance labeling, which should be standardized and easily understandable to the public.
14. The rules for energy management will be open-accessed so that anyone can easily reach this information whose sincerity will be ensured by an energy auditing.
15. To contribute to the effectiveness of these methods and objectives, public authorities and companies are encouraged to collaborate with NGOs working in favor of social and environmental ethics.

#### RECOMMANDATION N°24

#### LES NANOTECHNOLOGIES

##### Lignes directrices en matière de nanotechnologies

1. Principes directeurs
2. Nécessité d'équilibre
3. Risques potentiels
4. Démarche de précaution
5. Prise en compte des risques

## 6. Coopération entre Etats

## 7. Transfert transfrontières

## 8. Traçabilité

## 9. Obligations d'information

## 1. Principes directeurs

La Déclaration de Rio sur l'environnement et le développement durable a posé plusieurs principes qui doivent guider toute réglementation en matière de technologies émergentes, et plus particulièrement :

- Principe de coopération : « Les Etats devraient coopérer ou intensifier le renforcement des capacités endogènes en matière de développement durable en améliorant la compréhension scientifique par des échanges de connaissances scientifiques et techniques et en facilitant la mise au point, l'adaptation, la diffusion et le transfert de techniques, y compris de techniques nouvelles et novatrices » (Principe 9)
- Principe de participation : « La meilleure façon de traiter les questions d'environnement est d'assurer la participation de tous les citoyens concernés, au niveau qui convient. Au niveau national, chaque individu doit avoir dûment accès aux informations relatives à l'environnement que détiennent les autorités publiques, y compris aux informations relatives aux substances et activités dangereuses dans leurs collectivités, et avoir la possibilité de participer aux processus de prise de décision. Les Etats doivent faciliter et encourager la sensibilisation et la participation du public en mettant les informations à la disposition de celui-ci (...) » (Principe 10)
- Principe de précaution : « Pour protéger l'environnement, des mesures de précaution doivent être largement appliquées par les Etats selon leurs capacités. En cas de risque de dommages graves ou irréversibles, l'absence de certitude scientifique absolue ne doit pas servir de prétexte pour remettre à plus tard l'adoption de mesures effectives visant à prévenir la dégradation de l'environnement » (Principe 15).
- Principe pollueur-payeur : « Les autorités nationales devraient s'efforcer de promouvoir l'internalisation des coûts de protection de l'environnement et l'utilisation d'instruments économiques, en vertu du principe selon lequel c'est le pollueur qui doit, en principe, assumer le coût de la pollution, dans le souci de l'intérêt public et sans fausser le jeu du commerce international et de l'investissement » (Principe 16).
- Principe d'action préventive : « Une étude d'impact sur l'environnement, en tant qu'instrument national, doit être entreprise dans le cas des activités envisagées qui risquent d'avoir des effets nocifs importants sur l'environnement et dépendent de la décision d'une autorité nationale compétente » (Principe 17).

## 2. Nécessité d'équilibre

- Dans cet esprit, les Etats doivent tout mettre en œuvre pour éviter que les avantages attendus des technologies émergentes soient amoindris par les inconvénients qu'elles sont susceptibles de créer, tant pour la santé de l'homme que pour l'environnement.

## 3. Risques potentiels

- Les attentes placées dans les nanotechnologies tout au long de leur cycle de vie ont conduit à de forts investissements en recherche et développement. Dans le même temps cependant, elles suscitent de vives inquiétudes notamment en raison des risques qu'elles sont susceptibles de créer pour la santé de l'homme et l'environnement. L'efficacité des barrières naturelles de protection des organismes vivants peut ainsi être prise en défaut.
- Or, l'insuffisance des connaissances scientifiques actuelles sur la dangerosité des produits issus des nanotechnologies ne permet pas d'évaluer les risques qu'ils induisent.

## 4. Démarche de précaution

- Les Etats doivent, dans le respect du principe de participation, mettre en place une réglementation en application du principe de précaution à même de prévenir les effets dommageables des produits issus des nanotechnologies.
- Le risque doit être présumé et faire l'objet d'une évaluation. L'absence de caractère générique de ces produits impose une gestion des risques au cas par cas.
- La mise sur le marché d'un produit issu des nanotechnologies ne présume pas de l'absence de risques et ne doit pas être le prétexte pour cesser les recherches les concernant.
- S'agissant des nanomatériaux, si des données sont disponibles pour des objets de taille supérieure et de même nature chimique, l'hypothèse minimale pour élaborer une démarche conforme au principe de précaution est de considérer que les nanomatériaux correspondants présentent des dangers au moins similaires.

## 5. Prise en compte des risques

- Les Etats doivent n'autoriser la fabrication, la mise en œuvre, la mise sur le marché et l'utilisation des produits issus des nanotechnologies qu'à la suite de cette démarche, et notamment une évaluation environnementale et sanitaire ouverte à la participation du public.
- Une attention particulière doit être accordée aux travailleurs exposés à ces produits.
- Les Etats doivent imposer un suivi permanent des effets de ces produits. Les autorités administratives sont destinataires de l'ensemble des données disponibles et doivent disposer des moyens juridiques et techniques propres à rechercher et à faire cesser d'éventuels effets dommageables.
- Les Etats doivent subordonner les autorisations de fabrication, mise en œuvre, mise sur le marché et utilisation à l'obligation de disposer ou de pouvoir disposer de la capacité technique ou financière aux fins de prévenir et de réparer les atteintes constatées à l'environnement et à la santé. Le risque développement ne doit pas pouvoir servir de prétexte pour que les producteurs échappent à la responsabilité du fait des produits qu'ils fabriquent et mettent sur le marché.

## 6. Coopération entre Etats

- Les Etats doivent coopérer pour étudier les risques liés aux produits issus des nanotechnologies ainsi que les mesures destinées à les prévenir et les circonscrire. La protection du secret industriel et commercial et le droit des brevets ne doivent pas constituer un obstacle à cette coopération.
- Les Etats sur le territoire desquels ces produits sont fabriqués ou mis en œuvre doivent informer les autres Etats des risques encourus et des mesures adoptées.
- Les Etats doivent promouvoir le renforcement des capacités techniques et financières des pays en développement, relatives aux risques associés aux nanotechnologies et aux produits qui en sont issus.

#### 7. Transferts transfrontières

- Les Etats doivent n'autoriser la cession des produits issus des nanotechnologies à destination d'un autre Etat qu'après s'être assurés que cet Etat dispose sur son territoire des moyens propres à circonscrire ces risques ainsi que des installations adéquates, en l'état des connaissances scientifiques et techniques du moment. Une coopération doit être recherchée à cette fin.

#### 8. Traçabilité

- Les Etats doivent imposer les mesures permettant d'assurer la traçabilité des produits issus des nanotechnologies tout au long de leur cycle de vie.

#### 9. Obligations d'information

- Lorsque les produits sont issus en tout ou partie des nanotechnologies, les Etats doivent imposer que les consommateurs en soient informés.

- Les Etats doivent imposer que soient mentionnées les précautions à prendre pour l'utilisation et la déréliction de ces produits.

- Ils doivent promouvoir la sensibilisation du public et lui garantir l'accès à l'information sur les nanotechnologies et les produits qui en sont issus.

#### RECOMMANDATION N°24

#### THE NANOTECHNOLOGIES

Guidelines for international regulations concerning the nanotechnologies

##### 1. Guiding principles

##### 2. Need for balance

##### 3. Potential risks

##### 4. Precautionary approach

##### 5. Risks assessment

##### 6. Cooperation between States

##### 7. Transboundary movements

##### 8. Traceability

##### 9. Information obligations

##### 1. Guiding principles

The Rio Declaration on the Environment and Development has adopted several principles that must guide any regulation on the emerging technologies, and more specifically :

- Cooperation. "States should cooperate to strengthen endogenous capacity-building for sustainable development by improving scientific understanding through exchanges of scientific and technological knowledge, and by enhancing the development, adaptation, diffusion and transfer of technologies, including new and innovative technologies" (Principle 9)

- Participation. "Environmental issues are best handled with the participation of all concerned citizens, at the relevant level. At the national level, each individual shall have appropriate access to information concerning the environment that is held by public authorities, including information on hazardous materials and activities in their communities, and the opportunity to participate in decision-making processes. States shall facilitate and encourage public awareness and participation by making information widely available (...) (Principle 10)

- Precautionary approach. "In order to protect the environment, the precautionary approach shall be widely applied by States according to their capability. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation" (Principle 15)

- Polluter pays principle. "National authorities should endeavour to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in Principle, bear the cost of pollution, with due regard to the public interest and without distorting international trade and investment" (Principle 16)

- Preventive action. "Environmental impact assessment, as a national instrument, shall be undertaken for proposed activities that are likely to have a significant adverse impact on the environment and are subject to a decision of a competent national authority" (Principle 17)

##### 2. Need for Balance

- In that spirit, Member State must do their utmost to avoid reduction of the potential gains from the implementation of emerging technologies by the disadvantages that may be caused to the human health or the environment.

##### 3. Potential risks

- The expectations placed on nanotechnology throughout their entire life cycle have led to heavy investment in research and development. However, they raise serious concerns about the potential risks that may be caused to the human health or the environment. The integrity and effectiveness of the natural protective barriers of living organisms may be affected.

- Lack of scientific certainty due to insufficient relevant scientific information and knowledge regarding the hazardous character of the products from nanotechnology make the risks assessment difficult.

##### 4. Precautionary approach

- In accordance with the principle of participation, States have to establish regulations on the basis of the precautionary principle to prevent the potential adverse consequences of the products from nanotechnology.
- The risk has to be presumed and assessed. The lack of the generic character of these products imposing a risk management based on a case by case analysis.
- The placing on the market of the products from nanotechnology does not presume the absence of risks and the researches on these products must continue.
- With regard to nanomaterials, if informations on bigger objects with the same chemical composition are available, the minimum valuation in accordance with the precautionary principle is to consider that nanomaterials show similar dangers.

#### 5. Risks assessment

- States shall not authorize manufacture, application, placing on the market and use of the products from nanotechnology without this precautionary approach and shall impose an assessment of the environment and health situation in accordance with the principle of participation.
- Special attention should be given to the workers exposed to these products.
- States have to take measures to ensure a permanent monitoring on the effects of these products. Administrative authorities of the State must be sent all relevant information that is available and should have legal and technical capacities to search and prevent the potential adverse consequences of the products from nanotechnology.
- States should make the manufacturing, application, marketing and using authorisations upon the legal obligation to have technical and financial capacity in relation to prevent the risks potentially associated with nanotechnology and its products and repair the damages that may be caused to the human health or the environment. Liability for development risk cannot furnish a pretext for the producers to escape liability relating to the products they manufacture and market.

#### 6. Cooperation between States

- States have to cooperate to consider risks associated with the products from nanotechnology and the measures to prevent or reduce any adverse effects. Protection of commercial and industrial secrecy and patent law may not constitute an obstacle to this cooperation.
- States within whose territory these products are manufactured or implemented have to pass on information on product risk and to inform national authorities of the action taken to prevent risks.
- States have to support developing countries to build technical and financial capacity in relation to the risks potentially associated with nanotechnology and its products.

#### 7. Transboundary movements

- States shall not authorise international transfers of the products from nanotechnology without having verification that the State of destination has the technical, legal and administrative resources to safely manage the risks potentially associated with nanotechnology and its products, in the light of the present state of scientific and technical knowledge. For that purpose, a cooperation has to be achieved. -

#### 8. Traceability

- States have to take appropriate measures to ensure traceability of the products from nanotechnology throughout their entire life cycle.

#### 9. Information obligations

- When the products derived in part or in full from nanotechnology, States have to require that the consumers are adequately informed.
- States have to impose the indication of safety precautions on the label or on an enclosed leaflet for the use of these products and their management as waste.
- States have to promote the public's awareness and guarantee an access to the information on nanotechnology and its products.

#### RECOMMANDATION N°25

#### PROTOCOLE POUR LA DIVERSITE BIOLOGIQUE ET LA PROTECTION FONCIERE DES ESPACES NATURELS ET RURAUX DE LA PLANETE

Considérant que chaque année plusieurs centaines de milliers d'hectares d'espaces naturels, de forêts et de terres agricoles sont détruits ou dégradés dans le monde,

Considérant que les objectifs fixés par la Convention sur la Diversité Biologique ainsi que les objectifs désignés par l'Union européenne n'ont pas pu être atteints à l'échéance de 2010 et que l'érosion de la biodiversité se poursuit à un rythme élevé partout dans le monde,

Considérant que tant l'Organisation des Nations Unies que l'Union européenne, au vu de ce constat, ont été contraintes de revoir leurs objectifs en envisageant de nouvelles échéances,

Considérant que la disparition des terres exploitées de longue date pour l'agriculture s'oppose à l'objectif d'une alimentation suffisante pour une population mondiale qui pourrait atteindre 9 milliards d'êtres humains à l'horizon 2050 ainsi qu'à la promotion de formes locales de développement rural, en même temps qu'elle participe à l'érosion de la biodiversité,

Considérant que l'artificialisation toujours croissante des sols et leur imperméabilisation constituent une conséquence directe de la consommation des espaces naturels et ruraux,

Considérant le principe d'irréversibilité des situations qui en résulte,

Considérant également que la consommation des terres exploitées de longue date entraîne un report sur les espaces naturels, provoquant ainsi de nouveaux défrichements, la déforestation, le drainage des zones humides, la perturbation des écosystèmes, le cloisonnement des milieux et le recul des espaces naturels, dans une logique de compétition des espaces naturels et des espaces agricoles entre eux,

Considérant que les achats massifs de terres aux fins de production agricoles, énergétiques, minières ou touristiques dans plusieurs parties du monde, à l'initiative de compagnies privées et de gouvernements étrangers, accélèrent encore davantage ce processus,

Considérant que l'érosion de la biodiversité ne pourra pas être stoppée dans ces conditions,

Considérant que les politiques de création de nouvelles aires protégées doivent impérativement être poursuivies et renforcées partout dans le monde,

Considérant dès lors qu'une politique foncière pour la biodiversité doit être définie et promue à l'échelle internationale, dans l'optique d'une complémentarité aux politiques qui ont pour objet la création de nouvelles aires protégées et des autres mesures prises en faveur de la biodiversité,

Soucieuse de promouvoir le principe de non-régression du droit de l'environnement,

DEMANDE aux parties signataires de la Convention sur la Diversité Biologique, réunies, à RIO DE JANEIRO les 14-16 juin 2012, d'adopter la recommandation suivante :

#### PROTOCOLE POUR LA DIVERSITE BIOLOGIQUE ET LA PROTECTION DES ESPACES NATURELS ET RURAUX

#### I- PRINCIPES GUIDANT L'ELABORATION D'UNE STRATEGIE MONDIALE POUR LA DIVERSITE BIOLOGIQUE ET LA PROTECTION FONCIERE DES ESPACES NATURELS ET RURAUX

##### AMELIORATION DU NIVEAU DES CONNAISSANCES SCIENTIFIQUES

- Privilégier et généraliser le critère scientifique de l'habitat naturel en l'intégrant dans :

- les systèmes de comptabilité nationaux et au plan international, notamment les observatoires de la biodiversité, la mesure de l'empreinte écologique, l'évaluation des services écosystémiques rendus par la nature, les indicateurs du développement durable

- les politiques qui ont pour objet la protection de la diversité biologique au plan international et au niveau régional

##### MISE EN PLACE DE CADRES JURIDIQUES

###### Habitats naturels

- Obliger les États à mettre en place au plan national et dans le cadre d'accords régionaux d'un réseau d'habitats naturels et d'espèces

- Permettre aux pays émergents et aux pays les plus pauvres de la planète d'avoir accès rapidement aux outils scientifiques de connaissance des habitats naturels et de la diversité biologique et pour leur évaluation de leur état de conservation, et de se doter d'un cadre juridique foncier

###### Cadastre

- Aider les Etats et les pouvoirs locaux qui le souhaiteraient à se doter d'un système cadastral informatisé permettant d'asseoir les politiques foncières en général et la politique en faveur de la biodiversité en particulier, en veillant à ne pas porter atteinte aux droits coutumiers et aux droits des peuples autochtones, notamment les peuples nomades

###### Études d'impact foncières et compensation

- Obliger les États à compléter leur droit national par des mesures réglementaires sur les études d'impact, lesquelles doivent intégrer des considérations foncières et des mesures compensatoires associées :

- Inscription dans les études d'impact des projets d'ouvrages et d'équipements et dans l'évaluation des incidences sur l'environnement des plans et des programmes, d'un volet foncier faisant apparaître, à l'échelle de la parcelle, la surface totale du projet, les habitats naturels présents et lorsque le milieu est dégradé, les habitats naturels susceptibles d'être restaurés ou renaturés, ainsi que les mesures destinées à éviter, réduire, et le cas échéant compenser les impacts sur la diversité des espèces et ses habitats

- Lorsque les impacts sur la diversité biologique et sur les habitats des espèces ne peuvent pas être évités ou réduits, prévoir une mesure compensatoire foncière reposant sur les principes suivants :

- Prohibition de la compensation financière et du calcul surfacique à parité ; la compensation doit être foncière, fondée sur une équivalence de valeurs (écologiques, paysagères,... ) et avoir pour objet la conservation d'un ou plusieurs habitats ou sa renaturation

- Principe de la réalisation de la compensation, par priorité locale

- Les aires protégées, les habitats naturels présentant un intérêt particulier, notamment pour la fonctionnalité des écosystèmes et pour le renouvellement des ressources naturelles, ne doivent pas être intégrés dans un mécanisme de compensation

#### ACCES A L'INFORMATION, PARTICIPATION DU PUBLIC EN MATIERE DE PROTECTION DE LA BIODIVERSITE ET DES ESPACES NATURELS ET RURAUX

##### Suivi des transactions

- Les Etats doivent mettre en place un système de suivi des opérations portant sur le foncier dans les espaces naturels et ruraux, sur la base d'indicateurs pertinents et actualisés régulièrement

##### Transparence et accès à l'information

- Les Etats veillent à la transparence et à la publication des opérations portant sur le foncier dans les espaces naturels et ruraux, notamment au moyen de la publication en ligne des contrats fonciers et des actes de vente des terres ainsi que le montant des transactions réalisées

- L'ONU soutient des observatoires régionaux et contribue à mettre en place un observatoire mondial des habitats naturels et de la biodiversité, au moyen d'indicateurs établis sur une base scientifique et permettant une appréciation objective de leur état de conservation

- Favoriser la création de comités locaux fonciers à l'image des comités de gestion de l'environnement pour les agendas 21

##### Lanceurs d'alerte

- Les organisations internationales prennent en compte la fonction assurée par les lanceurs d'alerte dans le domaine de l'environnement

##### Formation

- L'ONU soutient des programmes régionaux de formation au droit de l'environnement intégrant le droit foncier, dans la perspective de l'émergence d'une filière

professionnelle de négociateurs fonciers pour la biodiversité

## OUTILS ET MOYENS D'INTERVENTION FONCIERE POUR LA BIODIVERSITE ET LA PROTECTION DES ESPACES NATURELS ET RURAUX

### Agences foncières

- Encourager les Etats à créer des agences spécialisées, nationales ou/et locales, destinées à mettre en œuvre, à titre principal, des mesures foncières spécifiquement orientées vers la protection des habitats naturels et de la biodiversité

### Autorités de régulation

- Encourager les Etats à créer des autorités indépendantes de régulation foncière compétentes notamment sur les questions relatives aux droits d'accès à la terre et à leur mise en œuvre équitable ainsi qu'à la mise en œuvre des mesures compensatoires

### Protections conventionnelles

- Encourager les Etats à compléter leur droit national par une réglementation en faveur de la protection conventionnelle des espaces naturels et de la biodiversité, telles que des baux sur la longue durée et des clauses contractuelles types permettant une protection et une gestion intégrées des habitats sur le long terme

### Fonds mondial

- Création d'un fonds mondial pour la conservation des habitats naturels, destiné à permettre à des organisations non gouvernementales agréées, ayant pour objet statuaire à titre principal la conservation et la gestion des espaces naturels, d'acquérir ou de louer sur le long terme de grandes superficies pour protéger les habitats naturels prioritaires, tout en associant les populations locales à une gestion durable et écologique de ces territoires, et à leur donner les moyens d'une gestion pérenne dans l'objectif de la conservation et de la fonctionnalité des habitats et des espèces

### Stratégie foncière et aires protégées

- Dans les aires protégées, les États mettent en œuvre une stratégie foncière destinée à compléter les mesures réglementaires

- Afin de concilier la protection de la biodiversité, le maintien des espaces naturels et les besoins des communautés autochtones, et notamment ceux des populations nomades, recommander la reconnaissance et la création d'aires de patrimoine autochtone et communautaire

- Encourager les États, en application du principe de non régression, à compléter leur droit national par une réglementation garantissant la pérennité du classement des aires protégées

### Droit de préemption

- Recommander aux États l'inscription dans leur droit national d'un droit de préemption aux fins de protection des espaces naturels au bénéfice des États et des pouvoirs locaux. En cas de création d'un office chargé de l'exercice du droit de préemption, une composition équilibrée de ses instances délibérantes devra être garantie, notamment vis à vis des peuples autochtones et des ONG ayant pour objet statuaire à titre principal la conservation et la gestion des espaces naturels

- Instaurer la faculté, pour les Etats et les pouvoirs locaux, d'affecter les biens préemptés à une ONG agréée ayant pour objet statuaire et à titre principal la conservation et la gestion des espaces naturels

### Régions prioritaires

- Inventorier les régions atteignant un seuil critique, identifier les aires d'intervention foncière et désigner les outils d'intervention fonciers adaptés à leur contexte

- Élaborer des programmes fonciers d'objectifs et de moyens spécifiques pour les régions prioritaires du monde, telles que l'Afrique et Madagascar, l'Amérique du Sud, l'Asie du Sud-Est

## III - UNE VALORISATION EQUILIBREE ET DURABLE DES RESSOURCES NATURELLES

### Agro-systèmes

demande aux États, aux pouvoirs locaux et aux acteurs privés de promouvoir un développement fondé sur les agro-systèmes, modèles locaux intégrant la protection de la diversité biologique, la protection des sols, l'alimentation et la lutte contre la pauvreté

encourager les États à soutenir les activités agricoles respectueuses de l'environnement, compatibles avec la structure et les caractéristiques des sols, ainsi que les débouchés des produits

obliger les États à réglementer l'utilisation des produits phytosanitaires et des organismes génétiquement modifiés dans l'optique d'assurer la protection effective des sols et de la biodiversité ainsi que dans le cadre des politiques de santé publique Principe généraux

- demander aux États d'intégrer dans leur droit national deux principes :

- principe pollueur-payeur

- principe protecteur-receveur

### Services rendus par les écosystèmes

- reconnaissance du principe des services rendus par les écosystèmes

- augmentation des ressources financières au moyen de la mise en œuvre effective des paiements pour les services environnementaux rendus, ou de mesures équivalentes, dont le produit doit être affecté à des actions de protection des habitats naturels

### Agriculture de proximité

- privilégier les circuits courts, à moindre empreinte écologique

- favoriser le rapport direct entre le producteur et le consommateur

### III. COHERENCE DES POLITIQUES ET DES PROGRAMMES INTERNATIONAUX

#### PAR RAPPORT A LA BIODIVERSITE ET A LA PROTECTION FONCIERE DES ESPACES NATURELS ET RURAUX

- Inventorier au sein des programmes internationaux les dispositions qui auraient pour effet contradictoire d'aggraver l'érosion de la biodiversité, notamment en accentuant la disparition des habitats naturels, l'érosion de la diversité biologique et la consommation des espèces naturels et ruraux
- Encourager les Etats à rechercher une complémentarité entre les programmes mondiaux et régionaux d'aide au développement et à l'alimentation avec la protection de la diversité biologique et la protection foncière des espaces naturels et ruraux
- Inscrire dans les programmes mondiaux et régionaux d'aides au développement et à l'alimentation les principes suivants :
- Intégration des objectifs de maintien des habitats naturels et ruraux dans ces programmes
- Désignation des pratiques agricoles et forestières compatibles avec le maintien du bon état de conservation des habitats naturels
- Encourager les Etats et les organisations internationales à élaborer un cadre commun entre les politiques d'aide au développement et la politique de protection de l'environnement
- Encourager les Nations Unies à compléter dans le même sens les objectifs du Millénaire pour le développement, notamment l'objectif

#### RECOMMANDATION N°25

#### PROTOCOL ON BIOLOGICAL DIVERSITY AND THE PROTECTION OF NATURAL AND RURAL SPACES ON THE PLANET

Considering that every year hundreds of thousands of hectares of natural areas, forests and farmland are destroyed or degraded in the world,

Whereas the objectives of the Convention on Biological Diversity and the objectives identified by the European Union could not be achieved at the end of 2010 and the degradation of biodiversity is continuing at a rapid pace throughout the world,

Considering that both the United Nations and the European Union, in light of this, have been forced to review their goals by considering new deadlines,

Considering that the disappearance of land used for many for agriculture is contradictory to the objective of adequate food for a world population that could reach 9 billion people by 2050 and the promotion of local rural development, while it contributes to the erosion of biodiversity,

Whereas the increasing artificiality of soils and their impermeability have direct consequences for the further conversion of natural and rural areas,

Considering the irreversibility of the situations resulting,

Considering also that the conversion of land long exploited for agriculture has further results on natural areas, leading to new land clearing, deforestation, drainage of wetlands, disruption of ecosystems, fragmentation of habitats, and the decline of natural areas, in the logic of competition between natural areas and the farmland between them, Whereas the massive purchases of land for agricultural production, energy, mining and tourism in many parts of the world, at the initiative of private companies and foreign governments, further accelerate this process,

Whereas the loss of biodiversity can not be stopped under these conditions,

Whereas it is imperative that a policy of creation of new protected areas be pursued and strengthened around the world,

Considering therefore that a land policy for biodiversity should be defined and promoted internationally, from the perspective of a harmonization of policies that are intended to create new protected areas and other measures taken for biodiversity,

Anxious to promote the principle of non-regression of environmental law,

REQUESTS the parties to the Convention on Biological Diversity, meeting in Rio de Janeiro on 14-16 June 2012, to adopt the following recommendation:

#### PROTOCOL ON BIODIVERSITY AND THE PROTECTION OF NATURAL AND RURAL AREAS

##### I - PRINCIPLES GUIDING THE ELABORATION OF A GLOBAL STRATEGY FOR

##### BIOLOGICAL DIVERSITY AND THE PROTECTION OF NATURAL AND RURAL AREAS

##### IMPROVEMENT OF LEVEL OF SCIENTIFIC UNDERSTANDING

- Prioritize and generalize the scientific criterion of the natural habitat by incorporating it into:
- National accounting systems and internationally, including biodiversity observatories, the extent of the ecological footprint, the valuation of ecosystem services provided by nature, sustainable development indicators
- Policies aimed at protection of biodiversity at the international and regional levels

##### ESTABLISHMENT OF LEGAL FRAMEWORKS

###### Natural habitats

- Require states to implement at the national level and through regional agreements network of natural habitats and species
- Allow emerging countries and the poorest countries on the planet to have timely access to scientific tools for knowledge of natural habitats and biodiversity and the assessment of their condition, and to develop a legal framework on land

###### Cadastre

- To assist States and local authorities who wish to develop a computerized land registration system on which to base land policies in general and biodiversity policy in particular, taking care not to undermine customary rights and the rights of indigenous peoples, including nomadic peoples Studies on impacts to land and compensation

- Require states to complete their national law with regulatory measures on environmental impact assessment, which must incorporate land and associated compensatory measures:

- Inclusion of a land component in impact assessments of the projects of works and equipment and in the assessment of environmental impacts of plans and programs, including the scale of the plot, the total area of the project, natural habitats present and when the environment is degraded, natural habitats that could be restored or rehabilitated, as well as measures to avoid, reduce, and possibly offset the impacts on species diversity and habitats

- Where impacts on biodiversity and the habitats of species can not be avoided or reduced, provided land compensation measures based on the following principles:

- Prohibition of financial compensation and compensation based on the surface area alone; land compensation must be based on an equivalent value (ecological, landscape, ...) and have the purpose of conservation of one or more habitats or its restoration

- Principle of achieving compensation according to local priority

- Protected areas, natural habitats of particular interest, especially for the functionality of ecosystems and for the renewal of natural resources should not be included in a compensation mechanism

#### ACCESS TO INFORMATION, PUBLIC PARTICIPATION IN BIODIVERSITY PROTECTION AND NATURAL AND RURAL AREAS

##### Monitoring of transactions

- States must implement a system to monitor transactions involving the land in natural and rural areas, on the basis of relevant indicators that must be used regularly

##### Transparency and Access to Information

- States must ensure the transparency and publication of transactions involving land in natural and rural areas, including through the online publication of land contracts and deeds of land sales and the amount of transactions

- The UN supports and contributes to regional observatories contributes to the establishment of a global observatory of natural habitats and biodiversity, using indicators established on a scientific basis for an objective assessment of their conservation status

- Promote the establishment of local land committees like the Management Committees of the environment for Agenda 21

##### Whistleblowers

- International organizations take into consideration the function provided by the whistleblowers in the field of environment

##### Training

- The UN supports regional training programs in environmental law, including land rights, in view of the emergence of a group of professional negotiators of land for biodiversity

#### TOOLS AND MEANS OF INTERVENTION IN LAND FOR BIODIVERSITY AND THE PROTECTION OF NATURAL AND RURAL AREAS

##### Land agents

- Encourage States to establish specialized agencies, national and/or local, for implementation, primarily, of land measures specifically aimed at the protection of natural habitats and biodiversity

##### Regulatory authorities

- Encourage States to establish independent land regulatory authorities with particular competence and jurisdiction over the land rights issues of right access to land and their equitable implementation and the implementation of compensatory measures

##### Conventional protection

- Encourage States to complete their national law by a regulation on the conventional protection of natural areas and biodiversity, such as the long-term leases and contractual clauses requiring long-term protection and integrated management of habitats

##### Global Fund

- Creation of a global fund for the conservation of natural habitats, designed to enable accredited non-governmental organizations established principally with the objective of conservation and management of natural areas to acquire or lease long-term large areas to protect priority natural habitat, while involving local communities in a sustainable and environmentally friendly management of these territories, and give them the means of sustainable management with the objective of conservation and habitat functionality and species

##### Land strategy and Protected Areas

- In protected areas, states are implementing a land strategy to complement regulatory measures

- In order to reconcile the protection of biodiversity, the maintenance of natural areas and the needs of indigenous communities, particularly those of nomadic peoples, recommend the recognition and the creation of areas of indigenous heritage and community

- Encourage States, under the principle of non-regression, to complete their national law by ensuring the permanence of the regulatory classification of protected areas

##### Right of pre-emption

- Recommend that States incorporate in their national law a right of first refusal for the purpose of protection of natural areas for state and local authorities. In the case of the establishment of an agency responsible for exercising the right of first refusal, equitable representation on its deliberative or management structure must be guaranteed, particularly with respect to indigenous peoples and NGOs established principally for conservation and management of natural areas

- Establish the authority for states and local governments to allocate preempted assets to an NGO accredited principally established for the conservation and management of

natural areas

Priority Regions

- Inventory regions reaching a critical threshold, identify land areas of intervention and designate land policy instruments adapted to their context - Develop land programs objectives and specific resources for priority areas of the world such as Africa and Madagascar, South America, Asia, South East

## II - EQUITABLE AND SUSTAINABLE VALUATION OF NATURAL RESOURCES VALORISATION EQUILIBREE ET DURABLE DES RESSOURCES NATURELLES

Agro-systems

Request States, local authorities and private actors to promote development based on an agro- system incorporating local models and the protection of biodiversity, soil protection, nutrition and the fight against poverty

Encourage States to support environmentally friendly agricultural activities, that are compatible with the soil structure and characteristics, as well as with markets for products

Require the states to regulate the use of pesticides and genetically modified organisms with a view to ensuring the effective protection of soil and biodiversity as well as safety within public health policy

General principles

-Require States to incorporate into their national law two principles: polluter pays principle

- protector-receiver principle

Ecosystem services

Recognition of the principle of ecosystem services

Increase in financial resources through the effective implementation of payment for environmental services, or equivalent measures, of which the proceeds must be allocated to actions to protect natural habitats

Local agriculture

Focus on short distribution systems in order to lower the ecological footprint Promote the direct relationship between producer and consumer

## III - HARMONIZATION OF POLICIES AND PROGRAMMES IN RELATION TO INTERNATIONAL BIODIVERSITY AND LAND PROTECTION OF NATURAL AND RURAL AREAS

Inventory, conducted by international programs, of provisions that would have the destructive effect of aggravating degradation of biodiversity, notably by increasing habitat loss, degradation of biodiversity and destruction of natural and rural areas

Encourage States to seek complementarity between the global and regional programs of development assistance and food for the protection of biodiversity and protection of natural and rural land

Include in global and regional programs of development assistance and food the following principles:

- Integration of the objective of maintenance of natural habitats and rural areas in these programs

- Designation of agricultural and forestry practices compatible with maintaining the good condition of conservation of natural habitats

Encourage states and international organizations to develop a common framework for development aid policies and politics of environmental protection

- Encourage the United Nations to complete the objectives of the Millennium Development Goals, especially Goal

## RECOMMANDATION N°26

### LE TOURISME DURABLE

Consciente que le tourisme, dans la richesse de sa diversité, est une source d'épanouissement humain et un facteur de paix entre les populations, mais aussi un moyen de prise de conscience des processus écologiques indispensables à l'entretien de toutes les formes de vie ;

Convaincue que la capacité des ressources naturelles, la disponibilité des populations d'accueil, les ressources énergétiques pour satisfaire les besoins globaux de l'humanité en déplacement et découverte touristiques ne peuvent être maintenues à long terme que par une gestion durable et équitable des ressources, dans l'intérêt des générations présentes et futures, des points de vue tant écologique et économique que social, culturel et spirituel ;

Considérant les valeurs de paix et d'échanges des déclarations internationales du tourisme comme la Charte Mondiale du Tourisme Durable de Lanzarote et le Code Mondial d'Ethique du Tourisme ;

Reconnaissant l'intérêt des recommandations issues de la Conférence internationale sur les petites îles en développement et autres petites îles tenue à Mahé en 2001 et rappelées lors du Sommet mondial de Québec sur l'Ecotourisme en mai 2002 ;

Considérant qu'il n'existe pas encore aujourd'hui de convention mondiale, de portée générale, applicable à l'ensemble des pratiques et des sites touristiques que compte la planète ;

Estimant qu'une telle convention mondiale du tourisme durable servirait de fondement légal à une coopération accrue en matière de protection et de mise en valeur des sites touristiques et qu'elle serait de nature à renforcer les conventions existantes relatives à des domaines connexes ;

Rappelant les principes fondamentaux du droit international de l'environnement ;

Revendiquant, qu'à défaut de convaincre de l'opportunité d'élaborer une nouvelle convention mondiale du tourisme durable aussi bien entre les Etats que parmi les institutions internationales et les organisations non gouvernementales, que les recommandations suivantes servent de base pour les déclarations adoptées lors de la Conférence des Nations Unies à Rio en juin 2012 ;

## RECOMMANDE :

1. La reconnaissance du tourisme durable comme facteur de développement socio-culturel des populations et/ou des communautés locales, par sa contribution à la lutte contre la pauvreté, à l'amélioration de leur niveau de vie, à la valorisation de leur cadre de vie et à la considération de la paix entre les peuples ; à travers des processus ad hoc de gouvernance partagée ;
2. l'intensification des réformes visant à améliorer les législations environnementales nationales afin qu'elles favorisent notamment :
  - (i) la revalorisation des fonctions environnementales et sociales des loisirs,
  - (ii) la planification de leur aménagement en vue d'assurer la durabilité de leur utilisation,
  - (iii) une gestion plus équitable, participative et décentralisée de leurs ressources, impliquant tous les acteurs concernés, au profit des populations usagères, des collectivités locales et de la communauté nationale ;
3. l'adoption d'une législation établissant une autorité de police touristique, en relation avec les ministères chargés de l'environnement et du tourisme, des autorités de police et de gardes- côtes, des divers corps d'inspection et des organismes de formation des forces de l'ordre ;
4. la capacitation juridique et économique des populations en vue de l'appropriation et de la maîtrise de leurs territoires et de leurs ressources patrimoniales matérielles et immatérielles;
5. la reconnaissance d'une portée juridique à la Charte mondiale du tourisme durable (Lanzarote, 1995) et au Partenariat mondial pour le tourisme durable (reconnu par l'OMT et le PNUE au Costa Rica, 2011) ;
6. la proclamation de la valeur juridique des chartes, codes et autres instruments institutionnels mondiaux de reconnaissance du tourisme durable, par une codification des principes d'un droit international du tourisme intégrant les exigences des politiques publiques et du droit de l'environnement ;
7. l'élaboration de codes de bonnes conduites entre les pouvoirs publics, le secteur hôtelier, les transporteurs aériens, les autres acteurs économiques du tourisme, les organisations non gouvernementales locales et la population, alliant développement du tourisme et protection de l'environnement et intégrant le principe international usager-payeur pour les activités touristiques ;
8. la promotion des initiatives nationales, régionales et universelles tendant à perfectionner les instruments politiques et juridiques de protection, de mise en valeur et de gouvernance des sites touristiques, en particulier :
  - (i) les outils de planification et de programmation touristiques locaux intégrant les principes de prévention et de participation issus du droit international de l'environnement,
  - (ii) un zonage de densité touristique sur les principales destinations touristiques (locales, régionales internationales), après réalisation d'une évaluation environnementale stratégique et dans une démarche de développement durable,
  - (iii) les critères et indicateurs de l'aménagement durable des espaces touristiques,
  - (iv) la certification environnementale des sites touristiques ;
9. la reconnaissance de l'intérêt et la pertinence d'une démarche d'intégration du changement climatique dans la définition d'un nouveau tourisme durable inscrit dans l'économie verte (Gothenburg, 2009, Copenhague, 2009), notamment par la mise en place de nouveaux instruments juridiques ou financiers d'encadrement des capacités de déplacement aérien touristique et de discrimination dans le choix des moyens de déplacement au profit des réseaux alimentés par des énergies non carbonées.

## RECOMMANDATION N°26

### SUSTAINABLE TOURISM

The 3 Global Meeting of Limoges:

Recognizing that tourism, in the richness of its diversity is a source of human development and a condition of peace between peoples, but also an awareness of the essential ecological processes for the existence of all life forms ;

Convinced that the ability of natural resources, the availability of host populations, the needs of energy resources to satisfy touristical travels can be maintained in long term only by sustainable and equitable management of resources into the benefit of present and future generations both ecological and economic, social, cultural and spiritual point of view ;

Considering the values of peace and exchange of international declarations of tourism as the World Charter for Sustainable Tourism of Lanzarote and the Global Code of Ethics for Tourism ;

Recognizing the value of the recommendations of the International Conference on small islands developing and other small islands held in Mahé in 2001 and reiterated by the World Summit on Ecotourism in Quebec in May 2002;

Whereas there is for the moment no global convention applicable to all touristical practices and attractions that exist on the Earth ;

Considering that such a global convention on sustainable tourism serve as legal basis for increased compatibility in the protection and promotion of tourist sites and would strengthen the existing conventions on related fields ;

Recalling the fundamental principles of international environmental law ;

Claim, failing to convince the opportunity to develop a new global convention on sustainable tourism among States as well as among international institutions and nongovernmental organizations, the following recommendations are the basis for the declarations adopted at the United Nations Conference in Rio in June 2012;

## RECOMMENDS:

1. The recognition of sustainable tourism as a factor of socio-cultural development of populations and / or local communities, for his contribution to the fight against poverty, to improve their standard of living, to the consideration of peace between peoples ;

2. the improvement of national environmental laws so that they promote :

(i) the revaluation of environmental and social functions of leisure,

(ii) the planning of their development to ensure sustainability of their use,

(iii) a more equitable, participatory and decentralized management of resources, involving all stakeholders for the benefit of user populations, local and national community ;

3. the adoption of legislation establishing a tourism police authority, in relation to the environment and tourism ministries, the Coast Guard, and various inspection bodies ;

4. the legal and economic empowerment of population to the ownership and control of their territories and their heritage resources ;

5. the recognition of legal value to the World Charter for Sustainable Tourism (Lanzarote, 1995) and the Global Partnership for Sustainable Tourism (recognized by the WTO and UNEP in Costa Rica, 2011);

6. the proclamation of legal value to charters, codes and other global and institutional instruments of sustainable tourism, by a codification of international law tourism principles integrating public policies and environmental law;

7. the development of codes of good conduct between public authorities, hotel industry, airlines companies, other tourism stakeholders, local NGOs and the public, combining tourism development and environmental protection and integrating polluter pays principle for international tourism activities ;

8. the promotion of national, regional and universal legal instruments for a new governance of tourist sites, including:

(i) planning tools integrating the principles of prevention and participation from the international environmental law,

(ii) a zoning density of the main tourist destinations (local, regional, international), after conducting a strategic environmental assessment and with a sustainable development approach,

(iii) the criteria and indicators for sustainable management of tourist areas,

(iv) environmental certification of tourist sites;

9. the recognition of the value and relevance of an integrating approach to climate change for a new sustainable tourism included in the green economy (Gothenburg, 2009, Copenhagen, 2009), specially with the establishment of new legal and financial supervisory capacity for air travel and with a discrimination in the choice of tourism transport for the benefit of non-carbon energy.

## International Chamber of Commerce (ICC)

Present in over 120 countries through its global network, ICC the world business organization - is a representative body that speaks on behalf of enterprises from all sectors in every part of the world. ICC would like to underscore the private sectors vital role in efforts to promote sustainable development as recognized in Chapter 30 of Agenda 21. In particular, it notes that increasing prosperity, a major goal of the development process, is contributed primarily by the activities of business and industry.

As a convener of the Business Action for Sustainable Development (BASD) 2012, ICC welcomes this opportunity to submit input to the compilation document for the outcome document for the United Nations Conference on Sustainable Development (Rio+20). Our submission complements and supports the BASD 2012 submission.

In this regard, ICC's input focuses particularly on the two Rio+20 themes a) green economy in the context of sustainable development and poverty eradication and b) institutional framework for sustainable development. It should be read in conjunction with various ICC policy statements and papers produced over the past several years.

### I. Green economy in the context of sustainable development and poverty eradication

#### Global Policy Context on Green Economy

The green economy concept has emerged prominently in various intergovernmental forums such as the United Nations Environment Programme's (UNEP) Green Economy Initiative, the Organisation for Economic Co-operation and Development (OECD) Green Growth Strategy and in discussions among G20 leaders. In addition, green economy in the context of sustainable development and poverty eradication has been declared a priority theme for the United Nations Conference on Sustainable Development in 2012 (Rio+20). Clearly governments around the globe are seeking ways to define and shape this concept into meaningful policy frameworks that advance economic growth while enhancing environmental protection.

#### Definition and Terminology

Green Economy is a term principally utilised by policy makers. There is neither yet a single agreed definition nor a set of indicators or financial measurements on what exactly consists the Green Economy. Global business would therefore rather focus on greener economies which acknowledges the many challenges and opportunities present across sectors and value chains. However, for the purpose of the upcoming United Nations Rio+20 Conference on Sustainable Development, we acknowledge the term Green Economy as a policy term and view it as a unifying theme to articulate sustainable development as the direction in which all economies need to strive towards while acknowledging existing tensions and current global economic turmoil. Whilst the concept is global in scope, the priorities and actions needed to transition towards a Green Economy may vary from sector to sector, value chain to value chain, and specific national circumstances.

#### Definition

The ICC Green Economy Task Force has thus defined the term Green Economy as follows: The business community believes that the term Green Economy is embedded in the broader sustainable development concept. The Green Economy is described as an economy in which economic growth and environmental responsibility work together in a mutually reinforcing fashion while supporting progress on social development. Business and industry has a crucial role in delivering the economically viable products, processes, services, and solutions required for the transition to a Green Economy.

#### Terminology (often used interchangeably)

- Green Growth (Bottom Up) - Operational, Process Level What enterprises do every day: Companies green products, processes, services, technologies, implement sustainable consumption and production (SCP) practices, green their supply chains, drive research and development (R&D) for green innovations and solutions, as well as integrate sustainability into business strategies.

- Green Economy (Top Down) - Strategic, System Level The term economy applies to the macro-economic policy level and addresses systemic challenges beyond Gross Domestic Product (GDP), including incorporating environmental externalities in economic terms. In this way sustainability is mainstreamed into macro-economic policy. Business acknowledges the shared need for action and the need to work on both, bottom up and top down approaches simultaneously. A one size fits all approach does not exist.

#### The Ten Systems Conditions for a Transition towards a Green Economy

A Green Economy requires the three pillars (economic, social, and environmental) of sustainable development to work in a mutually reinforcing fashion while supporting progress on social development. Efforts by all actors should reconcile the need for short and medium term profit with longer term systemic change. Economic growth is and will be essential to provide the resources and social equity necessary to build capacity and finance actions in a transition towards a Green Economy.

The private sector has already taken concrete actions towards building a Green Economy, including by reducing environmental impacts across value chains to increasing energy and resource efficiency, investing in low-carbon and renewable energy and reducing waste. To provide guidance for governments on key lessons learned, the ICC Task Force on Green Economy undertook extensive analysis and consultation to determine what is required to further a transition towards a Green Economy, including the development of the following ten high level systems conditions that will form Tier I of a longer term ICC Green Economy Roadmap as outlined below.

Graphic 1: Development of tiers for a longer term ICC Green Economy Roadmap.

(See full submission for Graphic)

Graphic 2: Interdependence of the ten systems conditions for a transition towards a Green Economy.

(See full submission for Graphic)

#### Social innovation

##### 1. Awareness

The shift towards a Green Economy requires awareness about the depth of global economic, environmental and social challenges as well as new opportunities. Awareness and understanding are pre-requisites for setting priorities and action and require a shift in the global debate. It is a shared priority and challenge for all actors, whether government<sup>4</sup>, inter-governmental bodies, business or civil society and consumers.

##### 2. Education and Skills

Education is paramount for the operationalization of the Green Economy. Education must be enhanced by policy makers, academia and business in order to build the skills and entrepreneurship needed for implementation. All skill requirements will be affected from continuously evolving environmental and scientific understandings. A Green Economy should seek to develop the necessary skills in STEM<sup>5</sup> and inter-disciplinary disciplines, in human and natural capital, sustainable livelihoods, capacity building.

##### 3. Employment

Employment is a critical element to the economy, the environment and social development. A Green Economy provides decent and meaningful employment and promotes employment throughout the world, especially as a means to overcome poverty. Policies aimed to create so called green jobs should not come at the cost of a net reduction of jobs across the overall economy. A distinction between green and brown jobs must be avoided as all jobs contribute to green all aspects of the economy.

#### Environmental innovation

##### 4. Resource Efficiency and Decoupling

A Green Economy recognizes that the world's resources are finite and must be managed with scarcity in mind. It enhances the resource efficiency of materials flows through the principle of more from less. It also seeks to take into account the economic value of natural capital and ecosystem services. Over the long term, Green Economy strives to increase economic, social, and environmental benefits to achieve sustainability while decoupling economic activities and societal developments from negative environmental impacts.

##### 5. Life Cycle Approach

A Green Economy adopts a life cycle approach which involves further minimizing the environmental footprint of all economic activity through applying science and acknowledging emerging knowledge. The life cycle of a product starts at raw material extraction, research on conceptual design and development of products and services, manufacturing, distribution, use and end of life treatment options such as recycling, recovery and re-use or re-manufacturing. At every stage of the life cycle of a product, process, technology or service, critical questions about costs, benefits, environmental responsibility and social impact are being addressed. A life cycle approach also helps identify hidden opportunities and accounts for unintended consequences, spillover implications, and competition for resources.

#### Economic innovation

##### 6. Open and Competitive Markets

A Green Economy emphasizes the importance of sustainable growth and access to open, well-functioning, and efficient markets. It recognizes that relying on markets is indispensable to the evolution of both societies and companies toward greener economic activity and prosperity. In order to become a functional economic system, Green Economy needs to become ingrained in international and global markets and operationalized in the market and business balance sheets. Economy-wide approaches should be adopted that include receptive markets for delivering business value and commercially viable products and services along the value chain.

##### 7. Metrics, Accounting, and Reporting

For a Green Economy to become operational, indicators, metrics, accounting measures and better disclosure and reporting must be developed that make sense in economic terms while ultimately including the cost for externalities. This entails the simultaneous pursuit of developing operational green growth measures at company level (bottom up) and strategic macro-political accounting standards and economic indicators at the system level beyond Gross Domestic Product (GDP; top down). A flexible approach which balances the cost-benefits remains critical for success; flexibility will also be essential to incorporate new knowledge and scientific understanding in coming decades.

##### 8. Finance and Investment

A Green Economy actively drives innovation in private and public finance and investment into the direction of sustainable development. To succeed, it should set supporting

policy and regulatory frameworks that promote informed investment decisions for both public and private investors. It stimulates new demand for innovative and responsible businesses and government services through transparency. It also provides appropriate public-private engagement mechanisms that look beyond short-term pressures and focus on the development of long term shared value.

Mutually enforcing cross-cutting elements

#### 9. Integrated environmental, social and economic policy and decision making

A Green Economy has a holistic approach to decision making. It integrates and balances policies with respect to environmental, social and economic priorities by considering the intended and unintended consequences of interlinked policies that may result in synergies or barriers and promote or hinder economy-wide, greener growth. Consequently, it will be essential to enhance scientific input and consider perspectives from a variety of stakeholders to assess policy pathways and to improve processes moving forward.

#### 10. Governance and Partnerships

A Green Economy is based on governance structures that allow all actors can meet their shared responsibilities. Governance structures at local, regional, national and global level need to be aligned and mutually reinforce each other for innovation to occur. Elements include but are not limited to multilateral rules-based trade and investment, a stable economic environment governed by the rule of law, including effective intellectual property rights protection, strong contractual arrangements, and safe and stable communities. A key modus operandi of a Green Economy is working through new approaches that facilitate innovative collaborations and partnerships between business, government and civil society. Such collaborations can take many forms including public private partnerships, business value chain engagements and alliances with academia and consumers. No one can do this alone.

#### II. Institutional framework for sustainable development

##### Key messages

„h For business, this important area can be divided into two parts:

- a) improving the institutional framework for sustainable development from the perspective of business;
- b) enhancing the role of business therein;

„h Moreover, we regard it as inextricably linked with other key matters in Rio+20, notably green economy in the context of sustainable development and poverty eradication and emerging issues.

„h Achieving improved conditions for transparency and integrity in doing business in all countries is of paramount importance for private and public sector actions in support of implementation of Rio+20 recommendations. The fight against bribery and other corruptive practices should be a shared priority.

Institutions and governance are critical elements of enabling frameworks for sustainable development, and improving their effectiveness will be an important outcome of Rio+20. Challenges of globalization require active collaboration between governments and stakeholders, particularly business. While companies doing business in globalized markets and across supply and value chains welcome and often prefer globalized approaches and integrated frameworks, they also understand the importance of tailored approaches and institutions reflecting national circumstances and priorities. Such approaches will create a mosaic of solutions and approaches across global, national and local levels - however they will pose challenges for coordination, jurisdiction, and efficiency. Finding the right balance is critical. ICC believes that the following three points should be considered in the Rio+20 outcome document:

- Development of a system-wide strategy for sustainability across the United Nations system. The long-term goal of integration will require global economic and social institutions to become more responsive to environmental concerns, but will also require more integration of social and economic dimensions by environmental institutions. We support the option of enhancing institutional reforms and streamlining existing structures, as the primary vehicle for advancing larger sustainability goals - thus, preserving and strengthening what has worked well; understanding and responding to challenges and strains; continuing progress to increase value and effectiveness for government delegations and observer groups. A system wide strategy for sustainable development across the United Nations would ensure greater coordination.

- Identification of priorities by United Nations institutions and concentration on their specific expertise: In the past two decades, a number of new challenges to sustainable development have surfaced which have required the international community to produce joint efforts. Climate change, the loss of biodiversity, the spread of desertification and land degradation, damages to marine life, governance, corruption, poverty eradication, education, amongst others, all these issues have been taken up at the UN level in an effort to offer concerted solutions. A clear process leading to a thorough assessment of emerging issues would assist in the allocation of tasks and responsibilities amongst a variety of actors within and outside the United Nations.

Following, two concrete steps that can assist in flagging the priorities, and ensuring that resources are well deployed:

- we support strengthening the science-policy interface within international institutions, with the full and meaningful participation of developing countries. This must also include channels for credible and robust science from stakeholders, particularly from business.
- another key element relates to strengthening links between policy making and financing, to widen and deepen the funding base. Governments must approach the challenge of the overall framework of intergovernmental institutions with more deliberate and strategically guided resourcing, as well as more vigilant oversight.

We encourage synergies between compatible multilateral environmental agreements. However, preserving and complementing the independence and tailored nature of multilateral agreements should be a priority.

Enabling frameworks and incentives in policies, markets and institutions are critical to effective and successful implementation of sustainability policies. In addition to sound, science- and risk-based national environmental regulations, important elements include rule of law, strong local and national institutions, and open trade and markets.

- Enhancement of the engagement of business and business organizations: Sustainability and globalization challenges cannot be addressed by governments alone, and require active collaboration between governments and stakeholders, particularly business. Since the 1992 United Nations Conference on Environment and Development in Rio, discussions in numerous forums have increasingly - whether implicitly or explicitly - acknowledged the need for engagement by business on multiple fronts: technology, investment, implementation, job creation, competitiveness, capacity building, among others. While each of the nine major groups brings varied capabilities, networks and structures to the process, we believe that business is a central actor for the achievement of the sustainable development goals.

Enhancing the engagement of business and business organizations iV along with other major groups iV is an indispensable attribute of a substantive outcome of Rio+20 discussions on institutional framework for sustainable development. Enhancing the role that business plays is one way to strengthen synergies across the various bodies

involved in the economic, social and environmental pillars of sustainable development, and thus accelerate its implementation.

From a business perspective, the starting point of strengthening its contribution is in national sustainable development efforts, that builds on compliance with national laws, in associated business planning and management systems and in implementation wherever a company operates. These can include and be reinforced by a number of additional voluntary approaches, including:

- Partnerships with governments, inter-governmental organizations, and NGOs
- Voluntary codes like ICC Business Charter for Sustainable Development or the Global Compact
- Voluntary sectoral approaches such as the chemical's sector's Responsible Care
- Soft law approaches, like the OECD Guidelines for Multinational Enterprises
- Reporting initiatives, such as the Global Reporting Initiative (GRI)
- Standards and guidance, such as ISO 14000 and ISO 26000

#### Policy Recommendations

1. affirm that the two themes of Rio+20 (a) green economy in the context of sustainable development and poverty eradication; and (b) the institutional framework for sustainable development are mutually reinforcing as there is a need for structural change in the institutions that govern the global economy.
2. affirm that a transition to a green economy will depend on structural change in the institutions that govern the global economy. Improving these institutions and their ability to enable the right frameworks are critical prerequisites for all actors to deliver on their shared responsibilities and ensure better coordination in policy implementation. Governments should support this by undertaking, inter alia, the following:
  - (a) affirming that the long-term goal of integration will require global economic and social institutions to become more responsive to environmental concerns, but will also require more integration of social and economic dimensions by environmental institutions.
  - (b) encouraging synergies between compatible multilateral environmental agreements, whilst preserving and complementing the independence and tailored nature of multilateral agreements as a priority.
  - (c) developing a system-wide strategy for sustainability in the United Nations system to better accommodate all three pillars of sustainability, and foster a more integrated approach with economic international institutions.
  - (d) creating a stronger link between global environmental policy making and financing, to widen and deepen the funding base for environment.
  - (e) developing a system-wide capacity-building framework for the environment.
3. approach the challenge of the overall framework of intergovernmental institutions with more deliberate and strategically guided resourcing, as well as more vigilant oversight.
4. build consensus on strengthening the synergistic roles of governments, business, civil society for a transition towards a green economy, and in particular seek to enhance business engagement.

## International Coastal and Ocean Organization, Secretariat of the Global Ocean Forum

Global Ocean Forum

Through its Secretariat, the International Coastal and Ocean Organization accredited to the UN Commission on Sustainable Development since 1993  
 INPUT TO RIO+20 COMPILATION DOCUMENT  
 November 1, 2011

For an in-depth analysis of ocean and coastal issues in the context of Rio+20 and detailed recommendations for each issue-area, please see our report, Oceans at Rio+20: How Well Are We Doing in Meeting the Commitments from the 1992 Earth Summit and the 2002 World Summit on Sustainable Development?--Summary for Decision Makers at <http://www.globaloceans.org/sites/udel.edu.globaloceans/files/Rio20SummaryReport.pdf>

#### INTRODUCTION

The Global Ocean Forum calls on all of the world's governments participating in the UN Conference on Sustainable Development (Rio+20) to seize the opportunity to achieve a significant ocean outcome at Rio de Janeiro on June 4-6, 2012. The new vision embodied in the 1992 Earth Summit (UN Conference on Environment and Development) represented a major paradigm shift that changed the world and many of us around the world. Twenty years later, we must take advantage of Rio+20 to assess what we have achieved (and not achieved) and to craft the way to a new future: A future where we can all live and prosper in a low-carbon global economy in health and harmony with nature. There must be sustained political attention on the importance of oceans and coasts in achieving sustainable development goals. Oceans are the quintessential sustainable development issue, essential to all three pillars of sustainable development: economic development, social development, and environmental protection. Oceans perform vital life-sustaining functions for the planet; oceans generate half of the oxygen on Earth, are a vital source of sustenance and livelihood, absorb carbon dioxide, and regulate climate and temperature. Marine and coastal biodiversity provides many valuable services and products to people, including climate regulation, cancer-curing medicines, genetic resources, nutrient cycling, carbon storage, cultural value, and sustainable livelihoods, among others. Healthy oceans are inextricably linked to the long-term management, development, and well-being of coastal populations. Just as one cannot do without a healthy heart, the world cannot do without a healthy

ocean.

However, the impacts of a number of key drivers, including overfishing, pollution, population rise, and climate change are compromising the ability of the oceans to continue providing essential resources and critically important services. The magnitude of the cumulative impacts on the ocean is greater than previously understood. As we continue to delay the urgent and critical action needed to address these negative trends, environmental conditions continue to deteriorate, coastal communities continue to suffer, and the action needed to mitigate these impacts becomes more costly and difficult.

Urgent action can no longer be delayed if we hope to provide a sustainable ocean for current and future generations. Societies must implement integrated and cross-cutting approaches to managing the world's ocean and coastal resources to ensure the survival of the planet and the safety and well-being of coastal and island populations in 183 coastal countries.

## GENERAL PERSPECTIVES

We must embrace the vision of the whole, and institute integrated oceans governance at all levels. At the global level, we need enhanced and decisive United Nations mechanisms for dealing with the new levels of risk arising from climate change impacts and realizing the opportunities that lie ahead. At the regional and national levels, we must bolster our collective capacity for addressing the intertwined issues of oceans, climate, and biodiversity in an effective and decisive manner, building on the experiences and partial successes since the 1992 Earth Summit and the 2002 World Summit on Sustainable Development. We must create and take advantage of opportunities presented by the movement towards a green economy and an improved framework for sustainable development, in order to alleviate poverty in coastal and island nations around the world and find better means by which these countries can sustainably benefit from the ocean resources found under their jurisdiction and ensure local benefits, social equity, resource conservation, and public transparency.

We must link the actions of the major global negotiating fora related to oceans (the Law of the Sea processes, the UN Framework Convention on Climate Change (UNFCCC), the Convention on Biological Diversity, etc.) to achieve coherent and decisive outcomes for ocean policy. Oceans must become a prominent aspect of the UNFCCC outcomes, given the central role of oceans in the climate system and the profound impacts of climate change on coastal and island resources and communities. We must support the implementation of a regular process for global reporting and assessment of the state of the marine environment, including socio-economic aspects (Regular Process), and the Intergovernmental Platform on Biodiversity and Ecosystem Services, and promote linkages among these initiatives, to provide a broader basis for more effective and coordinated decision making among the major fora and across all levels.

## SPECIFIC ELEMENTS

The link between healthy oceans and sustainable development must be further recognized and enhanced. We must strengthen and underpin efforts already being taken on the ground that have laid the foundations for prolonged success; but with stronger measures, more decisive actions and, most importantly, enhanced global, regional, and national institutions that can adapt to changing conditions and potential tipping point scenarios in an effective, decisive, and timely manner. These efforts should build on successful experiences and effective institutional frameworks, rely on lessons-learned, and should be supported by sustainable financing. In order to provide a basis and rationale for crafting a strong oceans outcome at Rio+20, the Global Ocean Forum, in collaboration with members of the Global Ocean Forum Working Groups and support from the Global Environment Facility, the UN Development Programme, and the University of Delaware, prepared a major report assessing progress achieved in the implementation of international commitments emanating from the 1992 UN Conference on Environment and Development (UNCED) and the 2002 World Summit on Sustainable Development (WSSD) related to oceans, coasts, and small islands, and examining the prospects of a green economy for oceans, coasts and small islands and an improved institutional framework for sustainable development. The report examines the implementation (or lack thereof) of each of the major UNCED/WSSD goals related to oceans, coasts, and island states in the following areas:

- „h Ecosystem-Based Integrated Coastal and Ocean Management
- „h Protection of the Marine Environment from Land-Based Activities, and Integrated Water Resources Management
- „h Biodiversity and Marine Protected Areas
- „h Small Island Developing States
- „h Sustainable Fisheries and Aquaculture
- „h Addressing Critical Uncertainties for the Management of the Marine Environment and Climate Change
- „h Coordination of UN Activities on Oceans
- „h A Regular Process for Global Reporting and Assessment of the State of the Marine Environment
- „h Capacity Development and Public Outreach

For each topic, we provide an overview of the issue-area as it has evolved, on the basis of the available data. We then provide a rating of progress achieved on the major UNCED/WSSD goals in the form of a Report Card. The report cards assess three major variables: 1) Extent of efforts; 2) Extent of progress, and 3) Timing; Goals reached. The report cards also provide an explanation for the grades that are given, discuss major obstacles to implementation, point to „bright spots“ or successful cases, if appropriate, and present a set of recommendations for the consideration of decision makers. The report relies, in large part, on policy analyses prepared by the Global Ocean Forum and the expert judgments of participants at the five global ocean conferences organized by the Global Ocean Forum who come from all sectors of the global ocean policy community (governments, international agencies, NGOs, industry, science groups).

## RECOMMENDATIONS FOR OCEANS AT RIO+20

Major cross-cutting recommendations which emanate from the Oceans at Rio+20 report are highlighted below.

### 1. Ecosystem-Based Management/Integrated Coastal and Ocean Management (EBM/ICM)

#### Proposal

Enhance the implementation of integrated ecosystem-based ocean and coastal management at the national, regional, and global levels, including in marine areas beyond national jurisdiction

#### Rationale/Justification

Oceans can no longer be managed solely on a sector-by-sector, use-by-use basis. Sole reliance on sectoral institutions at the national level does not provide an appropriate framework needed to manage complexity and uncertainty for effective EBM/ICM. Instead, as Agenda 21 put it, approaches that are „integrated in content, and precautionary and anticipatory in ambit“ must be adopted.

Since 1992, the paradigm of ecosystem-based integrated coastal and ocean management has been widely accepted and put into place in a growing number of countries. A major challenge in the next phase is to further enhance the implementation of integrated ocean policy, including its institutional aspects, at various levels, and consider appropriate applications in marine areas beyond national jurisdiction.

#### Recommendations

- „h Scale up successful EBM/ICM efforts at the national level to include larger portions of the coastal zone and ocean under national jurisdiction;
- „h Further strengthen integrated institutions and decision-making processes for oceans and coasts, including through the enactment of ocean and coastal laws;
- „h Accelerate the development and implementation of EBM/ICM in regional and transboundary governance approaches, including through the Large Marine Ecosystem Programs and the Regional Seas Programs, encouraging the adoption of regional protocols on EBM/ICM to guide action at the national level;
- „h Apply established EBM/ICM principles and approaches to the 64% of the ocean that lies beyond national jurisdiction (ABNJ) to address multiple use conflicts, manage new uses, and protect vulnerable ecosystems and marine biodiversity. Vest authority for applying EBM/ICM approaches in ABNJ in existing or new institutions and establish a process for multiple-use decision making;
- „h Accelerate efforts to create representative, resilient and well-managed networks of Marine Protected Areas (MPAs) in the context of the ecosystem approach, complemented by the integration of harmonized economic and non-economic valuation methodologies into development planning and sectoral management frameworks;
- „h Incorporate and apply Marine Spatial Planning, aiming to achieve, in national waters and regional areas, the Convention on Biological Diversity's Aichi target of protecting at least 10 per cent of marine and coastal areas.

## 2. Oceans and Climate Change

#### Proposal

Develop an integrated approach to addressing the interlinked issues of oceans and climate change, including through the development of an integrated strategy on oceans and climate within and outside the UN Framework Convention on Climate Change (UNFCCC)

#### Rationale/Justification

The world's oceans play a central role in global climate processes, generating oxygen, absorbing carbon dioxide and regulating climate and temperature. But climate change is now threatening the oceans' ability to continue to provide these services. The more than 50% of the human population that lives in 183 coastal countries, including 44 small island nations, are already experiencing the earliest and most pronounced effects of climate change, and will suffer disproportionate impacts from ocean warming--e.g., sea level rise, extreme weather events, glacial retreat, and ocean acidification--if bold action is not taken.

Despite the threats to these key resources, however, oceans and coasts have not figured on the agenda of the UN Framework Convention on Climate Change (UNFCCC) until very recently.

#### Recommendations

Develop an integrated strategy for oceans and climate within and outside the UNFCCC that would include provisions for:

#### Mitigation

- „h Adopt stringent reductions in greenhouse gas emissions, including from marine industries such as shipping, within a short timeframe;
- „h Support additional research on quantifying the amounts of carbon stored and released by marine and coastal ecosystems (‘Blue Carbon’), take measures to protect and restore marine ecosystems as major carbon sinks, and move toward incorporating Blue Carbon into emissions reduction and climate mitigation protocols;
- „h Sustainably develop ocean-based renewable energy (such as offshore wind power, wave energy, tidal power, etc.) and accelerate efforts to implement these approaches through marine spatial planning;
- „h Consider and, if appropriate, develop regulatory systems for possible carbon capture and storage via injection in deep seabed geological formations;
- „h Strongly discourage application of other geo-engineering approaches, such as iron fertilization, and CO<sub>2</sub> injection in the water column.

#### Adaptation

- „h Implement ecosystem-based adaptation strategies, including marine protected areas, through integrated coastal and ocean management institutions at national, regional, and local levels to build the preparedness, resilience, and adaptive capacities of coastal communities;
- „h Provide sufficient funding, supported by improved estimates of adaptation costs in coastal areas and small island States, to support adaptation for coastal and island communities that are at the frontline of climate change, including through the possible creation of a special Coastal Adaptation Fund;
- „h Develop and support measures to address the issues associated with the displacement of coastal populations as a result of climate change.

#### Capacity development, scientific monitoring, and public education

- „h Provide technical assistance to small island developing States (SIDS) and developing countries to build institutional capacity to implement adaptation measures, early warning systems, and disaster risk reduction;
- „h Improve awareness of understanding among policymakers and the general public of the importance of oceans and climate issues and the need to take bold policy measures and changes in behavior and lifestyle to avoid disastrous impacts on the world's coastal and island communities;
- „h Establish the scientific capacity in all countries for marine environment assessment, monitoring, and prediction;
- „h Expand public outreach and education efforts to improve awareness of the risks posed to coastal communities and to catalyze support for mitigation and adaptation responses.

## 3. Small Island Developing States (SIDS) and Oceans

#### Proposal

Improve the ability of SIDS to sustainably utilize and effectively govern their oceans and coastal resources to ensure the continued functioning of marine resources and ecosystems as a critical aspect of livelihood, well-being, and survival

#### Rationale/Justification

Small Island Developing States (SIDS) are stewards of vast ocean resources and play a key role in efforts to sustainably manage ocean and coastal resources. Social and economic development for most SIDS is inextricably linked to the sustainable management and use of coastal and marine resources.

Many SIDS are often unable to benefit from the resources within their EEZs due to lack of funding support, exploitation by foreign entities, and, in some cases, insufficient technical and management capacity. Climate change further threatens the very survival and economic and social well-being of SIDS, bringing the drastic possibility, in some cases, of loss of country and widespread population displacement.

Building the capacity of SIDS to equitably access and sustainably manage and utilize their oceans and coasts is critical to achieving sustainable development goals for oceans and coasts.

#### Recommendations

„h Enhance ocean use agreements in the Exclusive Economic Zones (EEZ) of SIDS by improving their design and implementation to ensure social equity, resource conservation, and public transparency, and that the benefits from EEZ resources accrue to SIDS and their peoples;

„h Provide financial support to SIDS to improve their ability to adapt to the impacts of climate change, supported by improved cost estimates, and to protect coastal and ocean ecosystems, securing their role in providing valuable ecosystem services, products, and livelihoods critical to achieving the Millennium Development Goals, especially poverty alleviation;

„h Enhance capacity development on the interrelated issues of ocean and coastal management/climate change/biodiversity, especially: 1) among high-level leaders, 2) fostering the next generation of leaders through investment in university programs, especially through the SIDS Consortium of Universities, and 3) among leaders and stakeholders in local communities.

#### 4. Capacity Development

#### Proposal

Increase capacity for ocean and coastal management, and sustainable resource use, and ensure that capacity building projects are linked to national and regional sustainable development goals

#### Rationale/Justification

The ambitious agenda on capacity development laid out by the UNCED and WSSD processes has not yet been realized. The total level of funds expended on capacity development has been very small, and there is little collaboration and coordination of efforts among the wide array of actors; educational institutions, UN agencies, multilateral and bilateral donors, and NGOs, that assist in capacity development.

Capacity development remains an issue of central importance to developing states and SIDS. With the threats of climate change, the importance of capacity development of country leaders, current and future professionals in the field, local communities, and the public, becomes even more important and urgent. Likewise, the strengthening of national institutions dealing with oceans and coasts to respond to the challenges of climate change adaptation and mitigation, represents an essential imperative. There needs to be greater collaboration and coordination among countries, donors, UN agencies, providers of capacity training and education, others, to provide an accurate assessment of needed financial investments, and to develop a strategic approach to capacity development at the global level and in various regions.

#### Recommendations

„h Develop a strategic approach to funding and capacity building for oceans and coasts, including through increased collaboration and coordination among countries, donors, UN agencies, and providers of capacity training and education. Periodically assess and track overall efforts and expenditures in capacity development, aggregate impact, and the extent to which current and emerging needs are being met;

„h Substantially increase the total amount of financing devoted to capacity development, commensurate with the needs and challenges facing developing countries and SIDS;

„h Develop and/or strengthen mechanisms for sharing of training materials and education curricula, and lessons learned in capacity development among organizations involved in capacity development for ocean and coastal governance, including the development of a clearinghouse of information on capacity building activities, courses, and training materials.

#### 5. Green (Blue) Economy in the Context of Sustainable Development and Poverty Eradication

#### Proposal

Develop a low-carbon green (blue) economy that facilitates the sustainable utilization of ocean and coastal resources that provides for improved human well-being and social equity, while significantly reducing environmental and ecological impacts

#### Rationale

A green economy has been defined as one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities. It is an economy which is low in carbon, resource efficient and socially inclusive. The oceans play a critical role in sustainable livelihoods and social well-being around the world and offer a multitude of opportunities for greening the economy, especially in key sectors such as ocean and coastal ecosystems management, sustainable fisheries and aquaculture, ports and shipping, coastal tourism, and renewable energy. Therefore, the oceans must factor critically into the movement towards a low-carbon green economy to support sustainable development and poverty eradication.

#### Recommendations

For the world's oceans and coasts, a blue approach to a green economy should:

„h Support the greening of ocean industries through efficiency measures, low carbon technologies, and enhanced access to international markets and finance, especially for

the developing and least developed countries;

„h Identify and scale-up ongoing successful green economy initiatives (e.g., responsible coastal tourism practices modeled in small island developing States, sustainable fishing practices such as through certification of sustainably caught seafood, greening of the shipping industry through efforts to reduce sulphur oxide emissions) and strengthen means of implementation, including capacity building, technology transfer, and the mobilization of financial resources from both the public and private sectors;

„h Ensure that the greening of ocean industries contributes significantly to: 1) new sources of income and jobs; 2) low carbon emissions, efficient use of resources, and reduced production of waste and pollution; and 3) sustainable development of oceans and coasts, social equity and inclusiveness, and poverty reduction in coastal communities;

„h Support the valuation and payments of ecosystem services and other biodiversity financing mechanisms for more effective decision making in development planning involving ocean and coastal environments and resources. Information on the estimated value of particular ocean/coastal ecosystems in terms of the goods and services that they provide (such as food provision, raw materials, nutrient cycling, gas and climate regulation, and recreation), is a powerful tool for justifying conservation measures and the expenditure of financial resources for management;

„h Support scientific research efforts to quantify the carbon sequestration capacity of coastal ecosystems, include mangroves in the existing REDD+ program,\* and pursue the potential for the trading of various forms of „Blue carbon“ (coastal vegetation such as mangroves, seagrasses and salt marsh grasses that sequester carbon) in a similar way to green carbon (e.g., rainforests) and how this could be incorporated into emission and climate mitigation protocols;

„h Address the gaps in the implementation of international commitments on ocean-related targets within the framework of a green economy. For example: 1) reduce fishing pressure on overfished or depleted stocks through alternative livelihood development as part of a broader green growth roadmap; 2) apply the integrated and ecosystem-based approach to marine pollution prevention through more effective engagement of industry and the private sector;

„h Enhance the capacity and participation of all stakeholders for effective ocean and coastal management and governance in a green economy through: provision of incentives for green/blue production and resources for promoting research, development, and transfer of clean technologies; investment in capacity development, and development of a toolbox of best practices and mechanisms for sharing knowledge, experience and practices, including through communities of practice.

## 6. Institutional Framework for Sustainable Development of Oceans and Coasts

### Proposal

Develop a coordinated and coherent institutional approach to sustainable development of oceans and coasts at various levels, underpinned by renewed political attention and effective institutional frameworks, to enable a crosscutting approach and timely response to major threats and opportunities

### Rationale

The institutional framework for oceans and coasts is made up of a complex web of agreements, agencies and organizations operating at various levels, characterized by overlapping mandates, substantive policy gaps, conflicting priorities, and/or lack of coordination. In light of growing drivers of change, such as climate change and population growth, and insufficient political attention on oceans, achieving sustainable development goals for oceans and coasts becomes very difficult.

A coordinated and cross-cutting approach at the global, regional, and national levels (including a greater focus at the highest political levels) is needed to provide a common vision for sustainable development of oceans and coasts, enhance the joint capacity to address difficult issues (such as climate change), facilitate cross-sectoral and trade-off decisions among different sectors, develop integrated and coordinated solutions to interrelated problems, and enable joint action with appropriate funding support.

### Recommendations

„h Elevate oceans to the highest levels of the UN system (UN Secretary General), to enable a cross-cutting approach and appropriate and timely response to major threats and opportunities for oceans, including through the establishment of a UN Secretary-General or other high-level entity/coordination mechanism on oceans;

\*Reducing Emissions from Deforestation and Forest Degradation (REDD) is an effort to create a financial value for the carbon stored in forests, offering incentives for developing countries to reduce emissions from forested lands and invest in low-carbon paths to sustainable development. „REDD+“ goes beyond deforestation and forest degradation, and includes the role of conservation, sustainable management of forests and enhancement of forest carbon stocks (UN REDD Programme).

„h Link various ocean-related fora (Law of the Sea processes, Convention on Biological Diversity, UN Framework Convention on Climate Change, UN Food and Agriculture Organization, International Maritime Organization, etc.) and reform existing institutions, including the UN Economic and Social Council (ECOSOC), the UN Commission on Sustainable Development (UNCSD), and the UN Environment Programme (UNEP), to provide for consistent and coordinated policy development and priority-setting in addressing ocean and coastal issues;

„h Develop a UN Secretary-General „Ocean Budget“ report that would address financing needs for oceans and coasts and provide an assessment of previous and current expenditures on ocean-related issues;

„h Support regional institutional approaches to cross-sectoral ecosystem-based ocean governance by further developing existing regional mechanisms or creating new regional mechanisms where they do not exist to facilitate regional cross-sectoral coordination and priority-setting;

„h Integrate ocean and coastal issues into national sustainable development strategies and frameworks providing institutional support for the critical role of oceans in sustainable development, and focus continued efforts to improve the national-level implementation of duties and responsibilities emanating from multilateral instruments and agreements.

## ABOUT THE GLOBAL OCEAN FORUM

The Global Ocean Forum, first mobilized in 2001 to help governments place issues related to oceans, coasts, and SIDS on the WSSD agenda, brings together ocean leaders from all sectors from 112 countries to advance the global oceans agenda. The Global Ocean Forum promotes the implementation of international agreements related to oceans, coasts, and SIDS by assessing progress made, and identifying obstacles and opportunities for achieving sustainable development. Through expert working groups and multi-stakeholder dialogues, the Global Ocean Forum has been reporting on progress achieved on each of the WSSD ocean-related goals. The Secretariat of the Global Ocean Forum, the International Coastal and Ocean Organization, is an international NGO that was accredited to the UN Commission on Sustainable Development in 1993, and received special Consultative Status with the UN Economic and Social Council in 2006.

## International Collective in Support of Fishworkers (ICSF)

International Collective in Support of Fishworkers

Dear Ms. Tonya Vaturi,

Sub: ICSF's Inputs towards Compilation Document

The International Collective in Support of Fishworkers (ICSF) is a non-for-profit organization working on establishment of equitable, gender-just, self-reliant and sustainable fisheries, particularly in the small-scale, artisanal sector.

I-CSF, has consultative status with the Economic and Social Council of the United Nations and Liaison status with the Food and Agriculture Organization of the United Nations. It is also admitted to ILO's special list of NGOs.

ICSF would like to submit its inputs to the compilation document, as attached. We would be thankful if the same could be acknowledged.

Looking forward to hear from you, Best regards,

Chandrika Sharma

EXECUTIVE SECRETARY Encl.: As above

Annexe

International Collective in Support of Fishworkers (ICSF)

United Nations Conference on Sustainable Development: Rio+20

Contribution of International Collective in Support of Fishworkers (ICSF) to outcomes of the Rio+20 Conference

Inputs for Compilation Document

1 November 2011

### 1. Introduction

1. ICSF welcomes the objective of the United Nations Conference on Sustainable Development: Rio+20 to secure renewed political commitment for sustainable development. We welcome its focus on 'green economy in the context of sustainable development and poverty eradication' (GESDPE) and 'institutional framework for sustainable development' (IFSD). We understand GESDPE integrates economic, environmental and social pillars of sustainable development. In the context of marine resources, GESDPE, we assume, also recognizes 'blue economy' or sustainable and equitable distribution of ocean resources. 2. ICSF is concerned that since the 1992 United Nations Conference on Environment and Development (UNCED) the dominant model of development has encompassed a very narrow conceptualisation of development that has emphasised industrial growth at the expense of the social and environmental components of sustainable development. Similarly, economic values have come to dominate discussions on green and blue economy, minimizing the importance of social, cultural and spiritual values inherent in the quest for a sustainable and equitable global society.

### 2. Expectations for the outcome of Rio+20:

#### 2. 1 Rio+20 would uphold human rights approach towards sustainable use of fisheries

3. Rio+20 should be seen as an opportunity to strengthen the social pillar of sustainable development. Towards accelerating progress on this front, principles of equity and respect for human rights need to be upheld. The fishery sector needs greater attention from a human rights perspective considering the vulnerability of the sector to resource overexploitation, unsafe working conditions, and natural disasters. Fishery conservation and management measures that are insensitive to social dimensions can be a threat to sustainable fishery and GESDPE. It is imperative, therefore, to make rights-based approaches to sustainable use of fishery resources consistent with a human rights approach.

4. Towards establishing greater parity between environmental, economic and social dimensions of sustainable fisheries, Rio+20 should support fishers and fishworkers, including fishery-dependent indigenous peoples, towards fully securing their human rights in relation to the development, use and management of aquatic (inland and marine), riparian and coastal ecosystem goods and services.

5. To improve working conditions and safety of fishing operations, and to provide social security, Rio+20 should call upon States to ratify the ILO Work in Fishing Convention, 2007, which is of direct benefit to fishers on board fishing vessels and to promoting and sustaining decent work in the fishery sector. In addition, Rio+20 should help address existing gaps and bring important provisions of post-Earth Summit international developments like the Convention on Biological Diversity, the United Nations Fish Stocks Agreement, and the FAO Code of Conduct for Responsible Fisheries to benefit fishers and fishworkers, and fishing communities.

#### 2.2 Rio+20 would exert pressure to uphold obligations for fishery governance

6. The environmental and social problems identified by Agenda 21 facing fisheries under national jurisdiction such as local overfishing, unauthorized incursions by foreign

fleets, ecosystem degradation, excessive fleet sizes, insufficiently selective gear, and increasing competition between artisanal and large-scale fishing, and between fishing and other types of activities, continue to remain unresolved in many parts of the world. The share of fully exploited, overexploited, depleted or recovering fish stocks has reached the highest percentage recorded since the mid-1970s. This is in spite of many States ratifying the 1982 United Nations Convention on the Law of the Sea, the 1995 United Nations Fish Stocks Agreement, and adopting legislation and policies that conform to the 1995 FAO Code of Conduct for Responsible Fisheries. Traditional and customary rights of fishing communities and indigenous peoples continue to be threatened. The Rio+20 should seek States to honour their legal commitments, especially towards sustainable use of fishery resources.

7. Inadequate commitment to international obligations is most evident as reflected in the state of poor governance of natural resources. Good governance, although recognized as essential for sustainable development, as pointed out by the 2002 Monterrey Consensus of the International Conference on Financing for Development, still remains elusive in many parts of the world, especially in regard to conservation and sustainable use of fishery resources.

8. In the context of the green economy, there should, in relation to fishery, be a concerted effort to promote capacity and effort reduction, as well as energy optimisation, programmes. In this context, destructive and high external input fishing methods like bottom trawling should be prohibited in a time-bound manner. While considering the appropriate model relevant to sustainable use of fishery resources, larger fishing vessels may be considered in a fishery only after exhausting the possibility of employing smaller vessels--- an approach that may be called "scale subsidiarity"— with due consideration for safety of fishing operations and for the safety and working conditions of fishers on board.

9. Rio+20 should bring greater attention to governance issues at the local, national, regional and international levels. Context-specific governance structures where governments and communities, fishers, civil society, fishworkers and indigenous groups collaborate for fishery conservation and management should be promoted. States should financially assist formation of local committees, cooperatives and trade unions, and encourage traditional associations and indigenous councils to actively participate in fishery governance, towards strengthening the bulwarks of sustainable development.

10. Rio+20 should encourage greater recognition of collective rights in the management of fisheries such as community-based fishery management regimes. Rio+20 should discourage privatization of fishery resources through quota management and other systems that confer property rights to individuals since this would undermine the social pillar of sustainable development, a key determinant in the success of sustainable development, especially in multi- species, labour-surplus fishing economies that are fully dependent on fisheries for their livelihood.

11. Whilst supporting protected areas and marine reserves in reversing overfishing pressures, habitat destruction and conservation of biodiversity, it is important to adopt these measures within the framework of sustainable use of living resources that integrates the fundamental principles of environmental justice, social justice and human rights in consultation with the resource users, especially small-scale, artisanal, indigenous and traditional fishing communities.

## 2.3 Rio+20 would recognize sustainable forms of artisanal and small-scale fisheries

12. In the context of sustainable fisheries, artisanal and small-scale fisheries are more sustainable and equitable, and are recognized as a low input system. Rio+20 may therefore seek States' support to ensure future growth in capture fishery production originates from enhanced small-scale fisheries that do not harm ecosystem health and respect ecological limits, and ensure an equitable distribution of benefits. In the context of green and blue economy, artisanal and small-scale fisheries can make significant contributions to sustainable development, particularly in labour-surplus fishing economies by sustaining livelihoods, quality of life and culture of coastal and inland fishing communities, and indigenous peoples. Artisanal and small-scale fisheries may also be seen as a vehicle for poverty eradication and food security and for promoting access to resources for women and marginalised groups.

13. Agenda 21, the UN Fish Stocks Agreement and the 1995 FAO Code of Conduct for Responsible Fisheries have recognized the importance of protecting the rights of subsistence, small-scale and artisanal fishers and fishworkers to a secure and just livelihood. Rio+20 should re-emphasize the importance of small-scale, artisanal fisheries to coastal communities and in promoting sustainable use of fishery resources, as recognized in these instruments, albeit overlooked in the Johannesburg Plan of Implementation.

14. It should be ensured that pillars of sustainable development not only draw elements from legal instruments but also from civil society initiatives. In this regard, Rio+20 should draw upon elements of sustainable development from civil society statements such as the 2008 Bangkok Statement of Civil Society on Small-Scale Fisheries and the "Shared Gender Agenda" emanating from the 2010 ICSF Workshop on defining a gender agenda for sustainable life and livelihoods in fishing communities, Mahabalipuram, India.

15. The proposed FAO Voluntary Guidelines on Securing Sustainable Small-Scale Fisheries (VG-SSF) should be seen as an opportunity to complement the FAO Code of Conduct for Responsible Fisheries, especially to build bridges between sustainable use of fishery resources and human rights as enshrined in the Universal Declaration of Human Rights, the Convention on the Elimination of All Forms of Discrimination Against Women, and other relevant legal instruments. Rio+20 should encourage States to actively participate in the process of developing VG-SSF to benefit small-scale fishworkers and fishing communities.

## 2.4 Rio+20 would promote nutritional security of the poor

16. Rio+20 should recognize the role small indigenous fish species play in nutritional security in several Asian countries, especially to address micronutrient deficiency in the diet of the poor. In this context, conservation and protection of micronutrient-dense small indigenous fish species in the wild should be promoted. It is also important to recognize and document traditional knowledge in regard to nutritional and therapeutic use of fish-based traditional food.

## 2.5 Rio+20 would promote extensive and modified extensive aquaculture

17. In promoting aquaculture production in the context of the GESDPE, herbivorous species in extensive and modified extensive aquaculture systems should be given priority. Local and domestic food security should be the primary focus of aquaculture development. Particular attention should be given to developing systems that use native species, and prohibiting systems that rely on exotic species.

## 3. Views on implementation

18. Rio+20 should develop plans of implementation, set targets, develop indicators and establish monitoring mechanisms, inter alia, for achieving social goals of sustainable development, especially for sustainable use of natural resources, including fisheries. There should be systematic follow-up post-Rio+20 through special sessions. An independent monitoring body may be set up with representation of indigenous and local communities to ensure that funds committed to realize ocean-related goals of sustainable development are utilized in a socially-just manner. Capacity-building of traditional, local and national institutions as well as State agencies should be undertaken towards better integrating economic, environmental and social pillars of sustainable development. Redress mechanisms may be established in the event of abuse of human rights of indigenous and local communities, and other legitimate users of natural resources, during the course of implementing sustainable development programmes.

## International collective of researchers in early childhood education for sustainability

Full submission to zero draft of the United Nations Conference on Sustainable Development Rio +20 outcome document

International collective of researchers in early childhood education for sustainability

Eva Årlemalm-Hagsér, University of Gothenburg, Gothenburg, SWEDEN

Hui-Ling Chua, President Singapore OMEP (Organisation Mondiale pour l'Education Prescolaire) Committee

Professor Susan Danby, Queensland University of Technology, Brisbane AUSTRALIA

Associate Professor Julie Davis, Queensland University of Technology, Brisbane AUSTRALIA

Sue Elliott, RMIT University, Melbourne AUSTRALIA

Dr Ingrid Engdahl, Stockholm University, Stockholm, SWEDEN

Professor Ann Farrell, Queensland University of Technology, Brisbane AUSTRALIA

Professor Solveig Hagglund, Karlstad University, Karlstad, SWEDEN

Professor Eva Johansson, University of Gothenburg, Gothenburg, SWEDEN

Glynne Mackey, University of Canterbury, Christchurch, NEW ZEALAND

Dr Lyndal O'Gorman, Queensland University of Technology, Brisbane, AUSTRALIA

Dr Louise Phillips, University of Southern Queensland, Brisbane, AUSTRALIA

Dr Barbara M. Sageidet, University of Stavanger, Stavanger, NORWAY

Tracy Young, Swinburne University of Technology, Melbourne, AUSTRALIA

We are a group of researchers in early childhood education for sustainability. The group is intergenerational, international and interdisciplinary. Our research focuses on the time period in children's lives from birth to eight years of age, and recognises that young children are active participants in sustainability agendas and practices. The research involves a collaborative process for social change through education, and our work is anchored in principles of envisioning, critical thinking, multiplicity, participation, systems thinking and inclusiveness. We aim to meet annually and engage in transnational critical and continuous dialogues on the importance of children's participation in sustainability issues.

Sustainability is a complex, ever-changing, messy issue that is loaded with socio-political tensions, challenges and possibilities requiring engagement with ethical and justice considerations. Voices and experiences of all ages can bring necessary multiple perspectives and wisdom to sustainability debates, discussions and deliberations. Children have experiences that provide knowledge and perspectives needed for constructive contributions to sustainability strategic plans, policy and actions. In the longer term, children have the most to lose and are the most vulnerable in the current debates. They also have rights to be involved in all matters that concern them and to participate in the decision making in matters that will impact on their futures.

We expect the outcome of Rio+20 to include a commitment to the inclusion of children's voices in all proposals, and that measures, initiatives, strategies for sustainability include people of all generations, beginning in the early years. Early education is a crucial arena for cultivating collective skills, knowledge, dispositions and responsibility for sustainability. By prioritising children's participation in the United Nations Conference on Sustainable Development Rio +20 outcome document, children will have the opportunities to rightly see themselves, and to be seen, as significant contributors to actions for a sustainable planet. From the early years, children can initiate and create sustainable change. International, national and local education and research authorities in agreement with Article 12 and 29 of United Nations Convention on the Rights of the Child (UNCRC) are necessary enablers of the enactment of children's participation and perspectives, which we expect should be clearly stated in the document.

---

## International Commission on Irrigation and Drainage (ICID)

INTERNATIONAL COMMISSION ON IRRIGATION AND DRAINAGE

SUBMISSION BY ICID

To The Preparatory Committee of United Nations Conference on Environment and Development, 2012 (RIO+20) -----

Background

This submission is a contribution to the preparatory process of the United Nations Conference on Environment and Development, scheduled to be held in Rio de Janeiro, Brazil from 4-6 June 2012 (Rio+20). The contribution is submitted to the Preparatory Committee established by the UN General Assembly, through its Secretariat, in

response to an open invitation by the Committee to all relevant stakeholders to submit their inputs by 1st November 2011 for preparing the draft outcome document for the UNCS.

#### The International Commission on Irrigation and Drainage (ICID)

The International Commission on Irrigation and Drainage (ICID) is the leading scientific, technical, professional and not-for-profit Non-Governmental International Organisation (NGO) in the fields of irrigation, drainage and flood management. It draws together the diverse disciplines and professions involved in the planning, design, operation, management and development of irrigation, drainage and flood management works throughout the world. The Commission, with active support from a network of nearly 110 member countries, provides an international forum and network in which the technical, agronomic, socio-economic, environmental and managerial complexities involved in the development, management and operation of irrigation, drainage and flood control works are discussed. Improved practices are identified and promoted through the National Committees in the member countries.

The ICID's vision is for a world that is food secure by ensuring adequate water for food following best agricultural water management practices.

While the main focus on best irrigation and drainage practices remains in the fore, risk management by addressing concerned issues like drought and floods in a climate change scenario is also on the top of agenda. Given the new situation wherein some external drivers impact some of the above actions, ICID had started addressing these issues also. These inter-alia include Poverty elimination, rural livelihood, Bio Energy, Enhancing Storage under the changing Climate scenario, MDG, waster water reuses etc., to quote a few.

#### 1. Sustainable Development and Poverty reduction

Multiple global crises have undermined the progress towards sustainable development and poverty alleviation efforts in the last 20 years. Implementation of Agenda 21 has been slack and has failed to avert the food crisis and thousands of deaths due to famine. The global population is expected to be over 9 billion by 2050 and they have to be provided for food and means of livelihood. There is increasing need to innovate in agriculture and food production in order to respond to this and other challenges posed by, inter alia, climate change, urbanization and globalization.

Directly or indirectly, agriculture provides the livelihood for 70 percent of the world's poor. Dependent on rainfed production in an increasingly variable and unreliable natural environment communities are faced with regular drought and yield losses. Locked into a scenario where spatial expansion of a household's agricultural production area, due to dense population patterns, is not possible any more, a more intensive use of their assets i.e. land and labor might therefore be a way forward.

Lack of access by the poor to adequate, safe and reliable supplies of water limits their options to improve their livelihoods. Water availability being variable in space and time; the rural well being is intimately dependent on its supply, use, disposal and reuse. Impact of climate change, on the agricultural production on one hand, and the hydrological regimes that directly impacts the production methods due to reduced water availability and precipitation variability, on the other, will undermine the rural income base. This loss of income will be further exacerbated by the need for increased spending as a result of damage caused by extreme weather events. Broad-based water resources interventions such as major infrastructure provide national, regional, and local benefits from which all people, including the poor; can gain (Camdessus, 2003). Effective water resources development and management, therefore, are basic to sustainable growth and poverty reduction, in several ways.

Poverty alleviation is therefore closely linked to agriculture and water security and how climate change impacts on the two are dealt with by the international community, particularly in addressing the needs of the most vulnerable.

#### 2. Agriculture and Food Security

Food security is a complex issue that requires complex solutions. The food security concept has evolved over the years and is presently focused on ensuring food access, its utilization, stability of the access and food availability through domestic production and import (FAO 2002). In the recent times it has been proven time and again that production both at international level as well as at domestic level needs to be assured, one cannot be sacrificed at the cost of the other. Countries that import large amounts of food will be very vulnerable to increased food prices. Therefore increased food production has to be supported more equitably, particularly in large parts of Africa. Globally, 70% more food will need to be produced to satisfy the growing demand.

Malthusian specter of a world running out of food, originally premised on satiating the demon of an exploding population now includes the livestock revolution, and most recently bio-fuels. Yet since the 1960s, the global application of science to food production has maintained a strong track record of staying ahead of these demands. Looking to 2050, demons such as water and land scarcity and climate change raises the specter once again. Considering what is in the technology pipeline, the new funding mechanism to support the small farm financing one can be cautiously optimistic about the ability of world to feed itself to 2050. But cautiously indeed!

Starting in the 1960s, the Green Revolution increased the global food production dramatically based on the development of high-yielding varieties of cereal grains, expansion of irrigation infrastructure, and distribution of hybridized seeds, synthetic fertilizers, and pesticides to farmers. Some of these tools may no longer be acceptable, while the success of others such as hybridized seed varieties depend on assured water supply through irrigation. Despite impressive gains in yields over the past 50 years in most of the world, large and economically exploitable yield gaps remain in many places, especially in the developing world and nowhere more so than in sub-Saharan Africa where food supply is the most precarious.

Producing more food will largely depend on increasing crop yields, not farming more land. Further, most of the food production in the Asian region comes from smallholders, part of the poorest segment of the population and most vulnerable to climate risks. The challenge is particularly daunting in Africa, where prospects are good, resources abundant but there is need for a paradigm policy shift, particularly in terms of financing infrastructure related to irrigation. Africa has yet to experience a green revolution in a sustained manner. The New Partnership for Africa's Development (NEPAD, 2001) sees support focusing on sustainable land management and water utilization through small-scale irrigation (SSI) as an important element of a broader development strategy for Africa.

The gravity of the current food crisis is the result of 20 years of under-investment in agriculture and neglect of the sector even though agriculture accounts for a third of GDP and two thirds of employment in many developing countries. Investment in agriculture must be increased because for the majority of poor countries a healthy agricultural sector is essential to overcome hunger and poverty and is a pre-requisite for overall economic growth. Net investments of US\$83 billion a year must be made in agriculture in developing countries if there is to be enough food for 9.1 billion people in 2050.

#### 3. Water Security

Water is crucial for food security and human well-being. Enhancing the food productivity targets have to go hand in hand with increased land and water productivity. Scarcity of and competition over freshwater is a growing concern for many regions in the world. Climate change will exacerbate water stress and other problems. It simply offsets the climatic risk that rainfed production would otherwise be exposed to but also makes possible the cultivation of a range of exotic crops that would not otherwise survive under rainfed conditions – notably horticultural products. Water security is, therefore, a pre-condition for increasing agricultural productivity and should form intrinsic part of an effective poverty reduction strategy. A water-secure world means a better quality of life.

Fresh-water is finite and is significantly unevenly distributed in time and space determined by the hydro-climatological conditions of a region. Although the global average annual water availability per capita in 2025 will be 4800 m<sup>3</sup>, due to the uneven distribution of water resources, some 3 billion people will live in countries - wholly or partly arid or semi-arid having less than 1700 m<sup>3</sup> per capita water availability. In 1990, eighteen countries in the world were 'severely water scarce', a number that could swell to 30 by the year 2025. Most of these are located in Asia and Africa that are also facing food shortages. Further, there are 12 countries with availability less than 500 m<sup>3</sup>. This number too is likely to increase to 19 by 2025. More than 1 billion people including one third of the population of China and India live in arid regions facing water scarcity. Similarly, 350 million people mostly in Sub-Saharan Africa face severe scarcity, and can't do without embarking upon massive water development projects to meet with their water needs.

The essence of water security combines the concern for the resource base coupled with concern for their quality. Services which exploit the resource base for agriculture and other economic enterprise should be developed and managed in an equitable, efficient and integrated manner. Achieving water security thus requires cooperation between different kinds of water users, and between those sharing river basins and aquifers, within a framework that allows for the protection of vital eco-systems from pollution and sustainability of the environmental services that are so crucial for rural livelihood and health.

Climate change is expected to alter hydrological regimes and the patterns of freshwater resources availability (IPCC 2008). Reduced rainfall and higher evapotranspiration are projected over the next three decades for many semi-arid areas, and drought-affected areas are likely to increase in extent with climate change. Changes in temperature, rainfall and evaporation determine the basic agro-ecological zoning which set the spatial limits to plant growth. Worldwide, this is expected to result in a decline in food production unless suitable technologies and management are developed and provided to the agricultural sector.

Water security requires tackling the extremes: too little water and too much of water. Climate variability is likely to increase with climate change. The combined effect of a change in climate and an increase in variability will result in more frequent and larger flood and drought impacts. More often these extremes produce destructive effects in terms of floods and droughts. Combination of long-term changes and the greater frequency of extreme weather events is likely to have adverse impacts on the agricultural sector. Drought and water scarcity affect the availability of food to some 600 million people of the arid and semi arid tropics of Africa and Asia and parts of Latin America.

Floods can pose taxing hazards to human lives and property, but in many parts of the world societies are increasingly taking advantage of river basins and other flooding-prone areas as vehicles for development. Accordingly, societies are more and more willing to assume the risk of coexisting with flooding, an approach which also lends itself readily to the participative themes of risk management, vulnerability and capacity building as an integrated approach to flood management (WMO 2009).

#### 4. Sustainable food production and rural development: role of irrigation

Agriculture is by far the largest user of water. Irrigated agriculture provides 40% of world's food production from 17% of cultivated land. In regions of water shortage, yield of irrigated land often is more than 2 to 3 times that of rainfed agriculture. Even in temperate and humid zones, with the timely irrigation during critical periods of growth, yield of crops may double or even treble. In case of rainfed cropped areas, if assured or even supplemental irrigation is provided, it can make significant contribution to food production. Irrigation increases productivity and value of land, which brings prosperity.

Water is used in agriculture in a great variety of situations, drawn from variety of sources and applied through various means. The spectrum covers individual efforts spanning from the small scale irrigation through groundwater abstraction, on-farm rainwater harvesting to community based tank irrigation and covers more extensive large public irrigation command areas. Aside from large public funded irrigation schemes, a major part of the sector consists of privately-financed tube wells using groundwater. Small scale irrigation is of increasing importance for smallholder farming systems in developing countries particularly in Sub-Saharan Africa and contributes to the increase of agricultural incomes, employment and reduction of poverty and malnutrition.

Irrigation serves as an important preventive tool in climate risk management that mitigates the impacts of droughts, increasing resilience of the farmers to extreme weather thereby reducing the risks in agricultural production through:

- (i) intensification and diversification of the farming system
- (ii) improving significantly agricultural productivity by reducing the effects of seasonality; and
- (iii) enabling farmers to cultivate crops with diverse vegetation periods.

Lack of assured irrigation results in unsatisfactory agriculture returns, breeding the tendency to switch over to non-agricultural occupations resulting in migration to urban areas in search of better employment. Irrigation while reversing this trend, plays a major role in poverty alleviation and builds resilience of rural people against natural disasters like droughts and famines. The poor landless segments of the communities served with irrigation have better employment opportunities in construction and maintenance works of irrigation schemes.

Irrigation and drainage schemes not only play a critical role in increasing crop yield and improving rural household income, but also help in accelerating the pace of development of rural infrastructure through improved communications and road systems, better healthcare, education facilities for rural communities. Irrigation canals often serve as the only source of potable drinking water for the rural areas of the developing world. The increased agricultural production and overall infrastructural improvements act as powerful magnets to attract investments in rural agro-based industries.

Historically, irrigation project plans have not given sufficient consideration to their environmental impacts. Additionally, the potential gains from irrigation are far from being realized optimally due to a variety of interconnected reasons such as: sub-standard design and construction; under-investment in infrastructure; poor canal management; inadequate investment in running and maintenance; poor crop production techniques and agricultural services; poor land and water management at farm level; poor coordination between agriculture scientists and water managers. Due to these and the sub optimal participation of farmers in the management of irrigation there are some adverse environmental impacts of irrigation. One of the most evident adverse impacts of irrigation development is the creation of water logged and salinated land. Subsurface drainage, an effective tool to combat this twin problem and increase the sustainability of irrigated agriculture, has attracted inadequate attention. Despite these shortcomings irrigation is likely to remain a keystone of food security policies and therefore all efforts should be made to overcome these shortcomings.

More resilient farming practices, irrigation services and adapted infrastructure are needed to cope with increasing climate variability and water scarcity situation. Investments in water storage, water harvesting and introduction of water saving technologies are required to improve food production in water scarce regions.

#### 5. Irrigation as a tool to support Green Economy

Green economy is defined (UNEP, 2011, (1)) as the one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities (Ref UNEP). It is low carbon, resource efficient and socially inclusive which lays the path to sustainable development and poverty alleviation by way of pursuing opportunities to invest in sectors that rely on use of natural resources. The move towards a green economy aims to increase access to basic services and infrastructure as a means of alleviating poverty and improving overall quality of life. However, the present literature has failed to fully appreciate the role of irrigation in Green Economy (UNEP, 2011 (2)).

Presently, irrigation covers more than 260 million hectares i.e. about 17% of world's arable land, but is responsible for around 40% of crop output and employs nearly 30% of population spread over rural areas. It uses about 70% of waters withdrawn from global river systems, 60% of which gets used consumptively, the rest predominantly returning to the river systems enabling its reuse downstream. Irrigation is a time tested and effective tool for creating rural livelihood, uses natural renewable resources, is a proactive means for reducing vulnerability against droughts and thus forms a crucial area for investment within green economies. Further, the role of irrigation both in ensuring water supplies, maintaining and restoring, wherever possible, biodiversity and ecosystem services, needs to be recognized.

In the coming decades feeding the growing world population and meeting the increasing demand for bio-fuel will call for increased output from both irrigated and rainfed agriculture. Some of this will come from an increase in the irrigated acreage, though the scope for this will be much more limited than in the past. The larger part of extra output will have to come from the more efficient use of water resources already being exploited, epitomised in the slogan more crop per drop, while restricting use of fossil fuel based energy.

Good infrastructure helps improve the land productivity. Like any socio-economic activity utilising finite natural resources, growth and sustained yield from agriculture per unit of water and land, calls for adequate financial and human investments. Water service interventions (such as water and sanitation and irrigation services for the unserved poor) play a major role in reaching some of the MDGs (Camdessus, 2003).

In certain cases, past success in irrigation has in a sense been achieved by mining of non-renewable resources underground water using fossil energy. Where groundwater is used for irrigation, the fossil energy costs of supply may be high. Energy consumption for groundwater irrigation is a regionally important and significant quantum in India and China. Better environmental management in catchments, rivers and irrigation areas with minimal use of fossil fuels is necessary for water security and sustainable food production and achieving the objectives of Green Economy.

Irrigation policies that are broad based and follow the principles of equity, economic efficiency and environmental sustainability as envisaged in the Dublin principles (ICWE, 1992) of Integrated Water Resources Management and support both the adaptation as well as mitigation efforts need to be developed. An integrated approach through a mix of irrigation sources, scales of interventions, means of applications based on the local hydro-climatic situation would serve the objectives of Green Economy.

Adaptation strategies targeted at food security may actually include i) the re-allocation of water away from the agricultural sector in order to maintain or supplement environmental stream flows thereby supporting other forms of water dependent livelihood or economic activities; or ii) the capping of spatial expansion of irrigated areas where water savings are achieved to reduce overall demand.

#### 6. Resurrecting irrigation to support Green Economies

The International Commission on Irrigation and drainage has deliberated on these issues (ICID, 2008; ICID, 2009; ICID, 2010; ICID, 2011) at length and urges the international community to resurrect irrigation and drainage to ensure water security, achieve food security and facilitate climate change adaptation and mitigation and pave the way for green economy as a pathway to sustainable development and poverty eradication. ICID has been urging the governments and the international community that:

- There is an urgent need for implementing various strategies and measures to boost agricultural production utilizing the available water and land resources with the highest efficiency possible with due consideration to the social, economic and ecological factors.
- Rainfed agriculture, which continues to perform below its potential needs to be supported to enhance food security and ecosystems sustainability. Impacts of climate change and droughts on rainfed agriculture requires greater support to research and capacity building in rainfed agriculture, especially for understanding the impacts and developing adaptation options, in addition to optimizing water management.
- Recognizing the enormous challenges and complex issues facing the irrigation sector, increased investment both from public and private sources both for expansion of irrigation area as well as for modernizing existing infrastructure are needed.
- Storage, both natural and in reservoirs, supported by improvement in management of stored water is key to reducing uncertainty and risks associated with rain fed agriculture to address the challenges at the interface of water, land, livelihoods, and the environment.
- The potential of micro-irrigation technology for saving water through precise delivery of water and fertilizer to crops and to raise farm incomes needs to be further exploited. Inexpensive small-scale versions of this technology can be used on the smallest of land holdings, making the benefits available to the poorest smallholders.
- Rehabilitation and modernization of irrigation system using an integrated and participatory approach can raise agricultural productivity significantly, often without increasing the total use of water, and is addressing that need.
- Participatory Irrigation Management (PIM) with well introduced reforms can enhance irrigation performance. National and regional governments and donor agencies are urged to support PIM, and encourage reforms by mobilizing financial and technical sources. There is a need to make Water User Associations (WUAs) economically sound and legally empowered.
- Enhanced support is needed for applied research and development, capacity building at the farm level, improved extension services in the dissemination of technology/information/ knowledge among all stakeholders, especially farmers to promote best agricultural technologies and their dissemination.
- An integrated approach of agricultural drainage by developing and adopting modern technologies and tools suited to local conditions for the reclamation of waterlogged and saline areas is required right from planning / implementation stage.
- The public private partnership in development and management of water resources for irrigation with the involvement of local stakeholders to ensure efficient management of the scarce water resources is to be given immediate attention.

Investment in improved technologies in agriculture and irrigation

Productivity improvement in agriculture rests on the removal of a number of structural constraints affecting the sector. A key constraint is climatic variability, which raises the risk factor facing intensive agriculture based on the significant inflow of private investment. Policies for rapid productivity growth, with a range of innovations in risk management, market development, rural finance, organizing and training farmers, and provision of technical advisory services, need to be strengthened to make markets work better and provide a conducive environment for technology adoption.

Large scale funding is required to provide for projected additional withdrawals of water as well as for the requirements regarding drainage and flood protection. One estimate calls for enhancement of present level of funding for irrigation by at least 40%, not only for new infrastructure but also for replacement, modernisation of ageing systems and imparting sustainability to them. Governments have to support the provision of irrigation when private agents are unwilling to do so. For modernisation, replacements and new construction, a significant part of funding will still have to come from governments. The reengagement of MFIs and donors with dams and other major hydraulic works would improve water and food security for many farmers, especially in Africa.

Global financial flows into water, after a slight increase in the 1990s, have recently fallen to a very low point. ODA for the water sector has been declining in recent years, partly because of the general decline of aid in agriculture sector, partly because of the sharp drop in aid for large dams and water storage schemes. Despite its spread into other sectors, microfinance has made limited penetration into agriculture and needs to be expanded.

Public irrigation agencies need to be granted more financial autonomy, though major reforms are going to be needed to improve their creditworthiness. Small scale farmer-financed schemes would benefit from the proposals to develop local capital markets, micro-credit and development finance institutions (Camdessus, 2003).

Affordable credit facilities to finance their investments continues to be cumbersome as a result they continue to need additional off-farm income to improve their livelihoods thereby limiting the possibilities for sustainable increase in productivity in the smallest of smallholdings to ensure their families basic needs.

#### Water productivity efficiency in agriculture

The larger part of extra agricultural output will have to come from the more efficient use of water resources already being exploited, epitomized in the slogan more crop per drop. More crop per drop implies the reduction of losses from the transport and distribution of irrigation water, and its more efficient application to crops.

Lack of regular annual maintenance results in many irrigation systems falling into disrepair. There is urgent need for modernisation of several large irrigation schemes in Asia besides replacement of old schemes. Low water use efficiency can also be attributed to low level of on-farm irrigation technology, land management as well as deficiency of operation and maintenance. The more efficient use of water in rainfed systems will have a major part to play, in some cases supplemented by irrigation water. Communities and households will need to capture more water through catchments for local productive purposes.

Lining of canals and distribution system or use of low pressure pipes for distribution wherever feasible as well as introduction of efficient on-farm facilities and practices can help achieve better efficiency. It is also necessary to set up a water accounting system based on real time monitoring of flows and water demand. Adoption of water saving sprinkler and drip irrigation systems may help to achieve not only better utilisation of scarce water resources, but also better output of crops due to application of the correct quantum of water at the critical stages of growth. It also would mean enhancement of standards for new areas of irrigation and drainage, including guarding against the risk of salinisation, and sustainable development of the rural area, for which financial resources ought to be earmarked.

Agricultural services and irrigation and drainage management agencies as service providers need to effectively engage the smallholders' WUA / WUAFs as partners in all aspects of development and management.

#### Working towards irrigation targets

Although water is the subject of only one of the goals contained in the Millennium Declaration, it is vital to achieving the others, such as poverty, education and gender equality. To take just three examples: providing segregated toilet facilities in schools is in many societies a pre-condition for the further education of girls; the availability of private toilets and water in-house or close by would make a big difference to the lives of millions of women; and irrigation is and will increasingly be a prerequisite to increasing food production to feed the growing world population and address malnutrition thereby improving health and well being.

During the last 15 years the investment in water infrastructure, particularly the irrigation sector has declined. While the Agenda 21 had identified water use efficiency, introduction of drainage, development of irrigation programs including small scale irrigation the progress has been slow and tardy, at the best, and is incommensurate with the enormity of the problem. There is lack of political support due to the complexities of the issues: financing of large infrastructure, participation of users in infrastructure management, over-exploitation of groundwater, environmental impact of irrigation etc., some of which are mired in controversies.

It is not that there are no problems in the implementation of 'Water Management System Projects'. There is a wide knowledge on these issues in ICID circles. And even willingness to tackle them. Striving to build a stronger evidence base of the contribution of improved water management which encompasses more efficient and effective use of all the 'Environmental Resources' and its contribution to 'Poverty Reduction' will be brought out effectively in the days to come. Efforts will also be made to identify the means to enhance the sustainability and effectiveness of water management systems with pro-poor objectives and moving towards achieving the goals set in MDGs.

The International Commission on Irrigation and Drainage urges the global community to commit itself to fulfilling the following targets in Irrigation sector with a view to support the sustainable development and poverty alleviation, submits that following targets need to be achieved:

1. Develop clear Irrigation Policies within next 15 years, relevant to the country, as an integral part of the National Water Policy following IWRM principles.
2. The irrigated area at the global level should be increased by 15 percent in the next 15 years with differentiated increments
3. The water productivity efficiency should be improved by 15 percent with due consideration of basin irrigation system efficiency.
4. Investment in irrigation sector should be increased by 30 percent in next 15 years

The achievement of the aforementioned targets and outcomes would help the global leaders assembled at the Rio+20 Summit to deliver a new model of human and economic development and ensure a real impact on human well-being across the world.

#### Input for Rio+20 Compilation Document

## Part 1: Priority Recommendations

### Securing renewed political commitment – and a new contract between science and society

· New scientific evidence, including work on “planetary boundaries”, reaffirms that humanity has reached a point in history at which a prerequisite for human development – the functioning of the Earth system as we know it – is at risk. Current economic patterns are responsible for many of the interlinked and growing social, environmental and economic crises facing the planet. **The Rio+20 outcome must be commensurate with the urgent need to move humanity to a sustainable path of development. It must reflect a recognition of our planetary boundaries. Poverty eradication, human wellbeing, economic prosperity, social equity and environmental sustainability must be addressed in an integrated fashion.**

(see policy brief on Interconnected risks and solutions – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

· **The Rio+20 conference should decide to launch a process to develop a new contract between science and society to deliver the knowledge necessary for a sustainable future.** There should be a better exchange and application of existing knowledge and technology towards solutions, and support for globally coordinated research initiatives on sustainable development challenges, as well as technological innovation. Commitments in the Rio+20 outcome to significantly increased large-scale investments in targeted science (natural, social, economic, health and engineering sciences and humanities), technology and innovation for sustainable development will be a crucial element to progress.

### Assessing gaps in implementation – in the light of new scientific evidence

· Implementation in many sustainable development areas has been woefully insufficient. Recognizing our planetary boundaries, policy makers need to fulfill the commitment to ‘precautionary’ policy as laid out in Agenda 21. Long term catastrophic risk must be balanced against short term economic implications. There is enough scientific evidence to call for immediate urgent action on climate change and other global environmental risks. Remaining gaps in knowledge cannot be taken as a reason to stall on making strong policies for sustainable development.

· There is a need to strengthen Principle 10 on public participation and access to data and information, through the development of regionally and nationally appropriate mechanisms following the model of the Aarhus convention on access to information, public participation and access to justice in environmental matters.

### Green economy in the context of poverty eradication and sustainable development

· Food, water, energy, resource and economic development needs should be addressed through a greening of all economic sectors. Create green economies based on ‘inclusive wealth’, which includes all forms of capital – natural, social and human as well as financial and manufactured – and in which intergenerational wellbeing increases over time.

· Unprecedented challenges require novel, innovative responses. Rio+20 must call for incentives and much enhanced public-private funding needed to strengthen national and international systems for technology, policy, economic and social innovation to achieve sustainable development, and for novel transdisciplinary research programmes in this context.

· New scientifically sound integrated indicators should be developed to monitor progress towards sustainable development and a green economy, taking into account human wellbeing, social equity and environmental sustainability, as well as economic development.

· Targeted capacity building in science (natural, social and economic sciences) and technology, including support to developing countries and attention to gender issues, will be crucial in a move towards sustainable development and a green economy.

· Unsustainable interlinked patterns of consumption, production and resource exploitation in industrialized countries and in some parts of the emerging countries should receive special attention in any road map to a green economy. Targeted policies and programmes to fundamentally reorient these patterns need to create synergies between government regulatory action and mobilizing civil society and business and industry alike.

(see policy briefs on Green Economy and Human Wellbeing – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

### Institutional Framework for Sustainable Development

· We urge decision makers to seize the opportunity of Rio+20 to develop a clear and ambitious roadmap for institutional change at all levels and bring about fundamental reform of current sustainable development and environmental governance within the next decade.

· Policies and decision making should be based on the best available natural science, social science, economic science and technology and they must benefit from scientific advances and technological, economic and social innovation. Efforts to improve the institutional framework for sustainable development at all levels, and international environmental governance institutions, must therefore include strengthening of science-policy links, and strengthening the science-base within all institutions.

· Proposals should be explored for international multistakeholder technology assessment mechanisms to evaluate the potential environmental, health, social and economic impacts of existing and new and emerging technologies, based on the precautionary principle.

(see policy brief on **Error! Hyperlink reference not valid.** – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

### New and emerging challenges

· Concerted, global and immediate action is needed to reduce the risk of fundamentally disrupting the stability of the Earth system, with consequences for global economic and political systems. Actions to enhance the resilience and decrease the vulnerability of human communities are also urgently needed. This must be accompanied by concerted global and enhanced action aimed at bridging the development gap between North and South and eradicating poverty, taking into account a growing world population.

· Specific topical priorities which require urgent action include climate change, food security, water security, energy security, biodiversity loss, disaster risk reduction, and sustainable consumption and production patterns, with an overarching goal of human wellbeing, social equity and environmental and economic sustainability.

· Other immediate challenges to be addressed include: ocean acidification, pollution and overfishing; disruption of the nitrogen and phosphorus cycles; global chemical pollution; deforestation; and megacities and urbanization; all of which need action based on the latest science and technology, coordinated targeted observations and research, and improved governance.

· Addressing human health needs and concerns should generally be among the priority actions towards sustainable development and poverty eradication. It should also be

central in addressing most if not all new and emerging challenges identified above. The increasing global mobility of people, animals and goods, as well as global warming, is leading to new disease risks in countries and regions where these diseases did not occur before.

(see the series of 9 policy briefs: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs))

#### ***Climate change:***

· The immediate priority is to stabilize the global climate at a temperature of no more than 2°C above pre-industrial levels. We must reduce the carbon intensity of the global economy, undertake a massive decarbonisation of the energy sector, and effectively manage Earth's carbon and radiant energy budgets. Strategies for adaptation will also become increasingly important.

#### ***Food security:***

· The planet needs to feed an estimated 9 billion people by 2050. There will be a need for a knowledge-based focus on enhancing sustainable production and productivity: increasing yields while minimizing environmental footprints, and greatly reducing waste at all stages of the food chain.

#### ***Water security:***

· An expanding population, growing economies and poor water management are putting unprecedented pressure on our freshwater resources. We simply cannot continue to use water as wastefully as we have in the past. We have to turn to a knowledge-based approach to water conservation and management, in which we evaluate our needs, prioritise allocations, and greatly reduce waste.

#### ***Biodiversity and ecosystem services:***

· Current trends in biodiversity and ecosystem services are sharply and dangerously negative. We must incorporate the multiple values of biodiversity and ecosystem services into policy and management decisions, and reduce inequities in access to the benefits derived from biodiversity and ecosystem services.

#### ***Energy for all:***

· Efforts to provide energy for all should be based on the development and deployment of clean energy technologies focusing in particular on technologies for energy efficiency and conservation, as well as on advanced renewable energy systems. In this context, R&D and investment in renewable and alternative sources of energy should be significantly stepped up; including feed-in-tariffs to incentivise investment in renewable energy. There is also a need to develop strategies for achieving greater energy efficiency in all sectors, notably the construction and transport sectors.

#### ***Disaster risk reduction:***

· The world faces an increasing loss of human lives, livelihoods and economic assets due to natural and human induced disasters. There is an intrinsic relationship between disaster risk reduction, sustainable development and poverty eradication. An urgent priority is to strengthen significantly disaster preparedness using knowledge, innovation and education for effective response at all levels.

#### ***Sustainable consumption:***

· Unsustainable consumption patterns in industrialized countries and in some parts of the emerging and developing economies are one of the main factors putting increasing pressure on the planet's social, economic and environmental systems. This requires special and urgent action. Solutions should be considered throughout efforts to move towards a green economy and sustainable development. Practical action, including awareness raising and education, should be underpinned by appropriate knowledge and transdisciplinary research across the multidimensional factors of economics, waste and environment, human behaviour, and lifestyle.

These recommendations are taken from work by the worldwide international scientific community for Rio+20, particularly a series of ICSU-UNESCO regional science and technology workshops in the five UN geo-political regions (see: [www.icsu.org/rio20/regional-workshops](http://www.icsu.org/rio20/regional-workshops)) and a series of nine policy briefs prepared specifically for Rio+20 (see: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)) in the context of the Planet Under Pressure science and policy conference (London, 26-29 March 2012). The recommendations also draw on consultations with the constituencies of the scientific and technological community spanning all relevant disciplines in the natural, social, economic, engineering and health sciences, in cooperation with the International Social Science Council (ISSC), the World Federation of Engineering Organization (WFEO), UNESCO, WMO, UNEP and UNU. For further information and recommendations from a disciplinary perspective see submissions for Rio+20 by ICSU's Scientific Union Members ([www.icsu.org/rio20/icsu-members](http://www.icsu.org/rio20/icsu-members)).

Part 2 provides more detailed recommendations, further background information and links to relevant sources.

## **UN Conference on Sustainable Development (Rio+20)**

### **International Council for Science (ICSU)**

in its capacity as co-organising partner of the Scientific and Technological Community Major Group

### **Input for Rio+20 Compilation Document**

### **Part 2: Expanded and more detailed recommendations**

#### **Interconnected risks and solutions**

For stated policy objectives on sustainable development to succeed, societies can no longer view the global economic system and the political systems that shape it in isolation from the Earth system. Economic development and global governance must value natural capital and respect boundaries in the Earth system, while ensuring equitable and just resource use. **The time has arrived for people to become planetary stewards.**

The urgent global risks and challenges facing all nations are interconnected: poverty alleviation; the financial crisis; economic development; political stability; pollution; food, water and energy security; health; wellbeing; climate change; ocean acidification; and loss of biodiversity, to name just some. Understanding this interconnectedness is crucial for tackling these challenges and improving the wellbeing of all societies.

The path forward hinges on an interconnected approach to policy and a rapid response. Political recognition and acceptance of the scale of the challenges has led to wide ranging efforts to solve them. Real progress has been made in reducing poverty, tackling HIV and protecting the ozone layer, for example. But political processes have had limited success in many other areas, **prompting calls for a fundamental transformation of the global economic and governance model to make it fit for 21st-century challenges** (see policy brief on Interconnected Risks and Solutions – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### **Securing renewed political commitment – and a new contract between science and society**

- New scientific evidence, including work on "planetary boundaries", reaffirms that humanity has reached a point in history at which a prerequisite for human development – the functioning of the Earth system as we know it – is at risk. Human induced global environmental change, including climate change, is occurring at an increasing rate and intensity. **The Rio+20 outcome must be commensurate with the urgent need to move humanity to a sustainable path of development. It must reflect a recognition of our planetary boundaries.**

(see policy brief on Interconnected Risks and Solutions – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

- Current economic patterns are responsible for many of the interlinked and growing social, environmental and economic crises facing the planet. **Poverty eradication, human wellbeing, economic prosperity and environmental sustainability must become part of the integrated vision and practice of sustainable development.**

- **The Rio+20 conference should decide to launch a process to develop a new contract between science and society to deliver the knowledge necessary for a sustainable future.**

- There should be a better exchange and application of existing knowledge and technology towards solutions and support for globally coordinated transdisciplinary (natural, social, economic, humanities, health and engineering sciences) research initiatives on sustainable development challenges.

- Commitments in the Rio+20 outcome to significantly increased large-scale public and private investments in targeted science, technology, and innovation for sustainable development will be a crucial element to progress.

- The contract between science and society must include a focus on poverty eradication and bridging the development gap between the North and the South. It must pay particular attention to women, vulnerable communities and indigenous peoples and their traditional knowledge.

#### **Assessing gaps in implementation – in the light of new scientific evidence**

- Implementation in many areas of sustainable development has been woefully insufficient. Recognizing our planetary boundaries, policy makers need to fulfill the commitment to 'precautionary' policy as laid out in Agenda 21. Long term catastrophic risk must be balanced against short term economic implications. There is enough scientific evidence to call for immediate urgent action, and remaining scientific uncertainties cannot be taken as a reason to stall on making strong policies for sustainable development.

- There is a need to strengthen Principle 10 on public participation and access to information, through the development of regionally and nationally appropriate mechanisms following the model of the Aarhus convention on access to information, public participation and access to justice in environmental matters.

#### **Green economy in the context of poverty eradication and sustainable development:**

- A 'Green Economy' is one of the necessary implementation tools for sustainable development, but is not a panacea, and it does not replace the goal of sustainable development.

- Food, water, energy resource, and development needs should be addressed through a greening of all economic sectors. Create green economies based on 'inclusive wealth', which includes all forms of capital – natural, social and human as well as financial and manufactured – and in which intergenerational wellbeing increases over time.

- Unprecedented challenges require novel, innovative responses. Rio+20 must call for incentives and much enhanced public-private funding needed to strengthen national and international systems for technology, policy, economic and social innovation to achieve sustainable development.

- Support is needed for novel transdisciplinary research programmes (with collaboration between the natural sciences, social sciences, humanities and technological community), which address the integrated economic, social and environmental pillars of sustainable development and a green economy. Significantly enhanced targeted funding will provide direction, momentum and coordination to global, regional and national research efforts.

- Unsustainable interlinked patterns of consumption, production and resource exploitation in industrialized countries and in some parts of the emerging countries should receive special attention in any road map to a green economy. Targeted policies and programmes to fundamentally reorient these patterns need to create synergies between government regulatory action and mobilizing civil society and business and industry alike.

- New scientifically sound integrated indicators should be developed to monitor progress towards sustainable development and a green economy, taking into account human wellbeing, social equity, and environmental sustainability, as well as economic factors.

- Targeted capacity building in science (natural, social and economic sciences) and technology, including assistance to developing countries and a focus on gender issues, will be crucial in a move towards sustainable development and a green economy.

(see policy briefs on Green Economy and Human Wellbeing – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### **Institutional Framework for Sustainable Development**

- We have to reorient and restructure our national and international institutions and governance mechanisms related to sustainable development, including environmental governance. Incrementalism will not suffice to bring about societal change at the level required; the world needs structural change in global governance.

- We urge decision makers to seize the opportunity of Rio+20 to develop a clear and ambitious roadmap for institutional change at all levels and bring about fundamental reform of current sustainable development and environmental governance within the next decade.

- Stronger consultative rights for civil society representatives in intergovernmental institutions should be introduced.

- Policies and decision making should be based on the best available natural science, social science and technology and they must benefit from scientific advances and technological, economic and social innovation. Efforts to improve the institutional framework for sustainable development at all levels, and international environmental governance institutions, must therefore include strengthening of science-policy links, and strengthening the science-base within all institutions.

- Mechanisms such as the IPCC and IPBES are examples of good practice, but further innovation and research in the area of science-policy linkages is required.

- Proposals should be explored for international multistakeholder technology assessment mechanisms to evaluate the potential environmental, health, social and economic impacts of existing and new and emerging technologies, based on the precautionary principle.
- To better integrate sustainable development policies within the UN system, governments need to support overall integrative mechanisms within the UN system that better align the social, economic and environmental pillars of sustainable development.
- In order to strengthen national governance, other policy instruments can complement regulation if they are carefully designed. But they are not panaceas.
- International economic institutions must advance transitions to a sustainable economy, including by multilaterally harmonized systems that allow for discriminating between products on the basis of production processes, based on multilateral agreement. Global trade and investment regimes must be embedded in a normative context of social, developmental, and environmental values.
- In order to fill regulatory gaps in international sustainability governance, new or strengthened international regulatory frameworks are needed in several areas, including on emerging technologies, water, food, and energy.
- Public-private governance networks and partnerships should be streamlined and strengthened. However, there is still a strong need for effective and decisive governmental action.

(see policy brief on Transforming Governance and Institutions – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### **New and emerging challenges**

- Concerted, global and immediate action is needed to reduce the risk of fundamentally disrupting the stability of the Earth system, with consequences for global economic and political systems. Actions to enhance the resilience and decrease the vulnerability of human communities are also urgently needed. This must be accompanied by concerted global and enhanced action aimed at bridging the development gap between North and South and eradicating poverty, taking into account a growing world population.
- Specific topical priorities which require urgent action include climate change, food security, water security, energy security, biodiversity loss, disaster risk reduction, and sustainable consumption and production patterns, with an overarching goal of human wellbeing and environmental and economic sustainability.
- Other immediate challenges to be addressed include: ocean acidification, pollution and overfishing; disruption of the nitrogen and phosphorus cycles; global chemical pollution; deforestation; and megacities and urbanization; all of which need action based on the latest science and technology, coordinated targeted observations and research, and improved governance.
- Addressing human health needs and concerns should generally be among the priority actions towards sustainable development and poverty eradication. It should also be central in addressing most if not all new and emerging challenges identified above. The increasing global mobility of people, animals and goods, as well as global warming, is leading to new disease risks in countries and regions where these diseases did not occur before.

(see the series of 9 Rio+20 policy briefs – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Climate change:***

- The immediate priority is to stabilize the global climate at a temperature of no more than 2°C above pre-industrial levels. We must reduce the carbon intensity of the global economy, undertake a massive decarbonisation of the energy sector, and effectively manage Earth's carbon and radiant energy budgets.
- As climate change is already occurring, action is needed by all countries to design and implement strategies to adapt to the consequences of climate change and to limit its socio-economic costs for societies worldwide, with a particular focus on the most vulnerable regions, nations and socio-economic groups. Participation of a broad range of stakeholders will be essential in this undertaking.
- Action is also critical in the domain of science. We must continue to improve our understanding of the climate and Earth system, to refine our predictive tools and reduce uncertainties in projections of future climate and its impacts, particularly at the regional level. Social science research into adaptation and good governance will also be crucial.

#### ***Water security:***

- Water security is vital to all social and economic sectors as well as the natural resource base on which the world depends. But an expanding population, growing economies and poor water management are putting unprecedented pressure on our freshwater resources.
- We simply cannot continue to use water as wastefully as we have in the past; we have to change the way we manage our water resources.
- Scientists and policy makers have a joint responsibility to work together in the development of more sustainable solutions to existing and emerging water problems.
- Water must be given the prominence it deserves on the global agenda
- Human and environmental water needs must be balanced to safeguard biodiversity and ecosystem services. Unavoidable compromises should be mediated by science rather than lobbies.
- Water security has multiple dimensions, including social, humanitarian, economic and ecological. Major decisions on water resource management must be made therefore with broad cross-sectoral input.
- There is a need to improve the availability of data and information, particularly on transboundary water resources and planetary thresholds. We need to evaluate our water needs and prioritize allocations.
- There is a need to introduce and implement strong policy and legal frameworks (i.e. water laws).
- Proper finance mechanisms are required to ensure sustainability of water services, while capacity building is required at all levels.

(see policy brief on Water Security – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Food security:***

- The planet needs to feed an estimated 9 billion people by 2050. There will be a need for a knowledge-based focus on enhancing sustainable production and productivity:

increasing yields while minimizing environmental footprints.

- Waste reduction at all stages of the food system (post harvest losses, transport, storage) and resolving distribution issues is also essential, as this would provide much of the extra food needed for a growing population.
- A strong foundation of multi-lateral and cooperative mechanisms that work across disciplines, sectors and national boundaries needs to be put in place. Institutions operating effectively at multiple levels will be at the centre of sustainable food systems; these will need to be flexible, promote appropriate use of innovative technologies and policies, and recognize the increasingly important role of non-state actors in enhancing food systems.
- As the greatest proportion of the world's poor are small-scale farmers, agriculture must also be a key focus for poverty eradication.
- Investment is needed in training, knowledge sharing and extension services for farmers at all scales.
- Greater involvement of farmers, including small holders and big agro business, in planning and decision making is needed.
- Research is needed for multiscale, multi-level analyses of the dynamic linkages between food security, environmental concerns and development issues.
- A food systems approach is recommended. This links the activities of producing, processing, retailing and consuming food with the outcomes of these activities for food security and other societal goals, showing how food insecurity arises and also providing a framework for policy development to meet the food security challenge.
- A transition to healthier diets as societies grow richer is needed to reduce both environmental and public health burdens.
- Food trade needs to be enhanced to encourage secure access to nutritious food for the poorest and most vulnerable.
- There is an urgent need to develop technologies and policies that will result in sustainable production practices.
- Above all, there is need for a strong focus on resilience, equity and sustainability.

(see policy brief on Food Security – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Biodiversity and ecosystem services:***

- We share this planet with millions of other species and varieties of life, and depend on ecosystems for all our basic needs. While current trends in biodiversity and ecosystem services are sharply and dangerously negative, the right actions, developed and implemented promptly, can restore a biologically rich and ecologically viable planet.
- The multiple values of biodiversity and ecosystem services should be incorporated into policy and management decisions.
- Green economies should be created based on 'inclusive wealth', which includes all forms of capital – natural, social and human as well as financial and manufactured – and in which intergenerational wellbeing increases over time.
- Biodiversity and ecosystem services should be incorporated into water and land-use planning at all scales from local to global, including both protected areas and production landscapes and seascapes.
- Policies and practices should be implemented that reduce inequities in access to the benefits derived from biodiversity and ecosystem services, and ensure that those who bear the cost of their provision are fairly compensated.
- Ecosystem governance and management should be restructured to recognize that ecosystems transcend political boundaries.
- Global governance institutions should be developed that work in partnership with national institutions, local organizations and the private sector, to address global-scale drivers of biodiversity change.
- The Strategic Plan for Biodiversity 2011–2020 and the Aichi Targets should be implemented at all scales.
- The important contributions played by the planet's forests and oceans should be recognised and terrestrial and marine ecosystems should be linked in policy planning.
- Indigenous peoples and their knowledge should be involved in biodiversity research and in the development of conservation strategies and plans.

(see policy brief on Biodiversity and Ecosystems – [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Energy for all:***

- There is no uniform solution for making low-emissions sustainable energy available globally, including for more than one billion people without access to modern energy services. Decisions regarding the use of any given energy technology must be based upon thorough analyses of technological and economic feasibility, diverse energy needs, as well as analyses of long-term sustainability and compatibility with the goals of climate stability, environmental protection, social equity, and personal health and safety.
- The optimal energy mix for any particular country and sector will depend upon the natural resource base, trade access to energy sources and socio-economic context.
- Efforts to further develop and deploy energy technologies must focus in particular on technologies for energy efficiency and conservation, as well as on advanced renewable energy systems.
- In this context, R&D and investment in renewable and alternative sources of energy should be significantly stepped up; including feed-in-tariffs to incentivise investment in renewable energy.
- There is a need to develop strategies for achieving greater energy efficiency in all sectors, notably the construction and transport sectors.
- In the transportation sector, urgently needed actions include diversification of engine fuels, increased use of low-emissions vehicles, and a strong emphasis on urban mass transit. Enhancing support for R&D in this sector will be essential.

(see policy brief on Energy Sustainability: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

#### ***Disaster risk reduction:***

- The world faces an increasing loss of human lives, livelihoods and economic assets due to natural and human induced disasters. There is an intrinsic relationship between disaster risk reduction, sustainable development and poverty eradication. An urgent priority is to strengthen significantly disaster preparedness using knowledge, innovation and education for effective response at all levels.
- Integrated natural and social sciences research should be developed, including improved methods for predictive multi-risk assessment and socioeconomic cost-benefit analysis of risk reduction action at all levels. The technical and scientific capacity to develop and apply methodologies, studies and models to assess vulnerabilities to and the impacts of hazards should also be strengthened.
- The resilience of nations and communities to disasters should be enhanced through people-centred approaches to the entire disaster risk cycle, including prevention, preparedness and emergency response as well as recovery and rehabilitation.

#### **Sustainable consumption:**

- Unsustainable consumption patterns in industrialized countries and in some parts of the emerging and developing economies are one of the main factors putting increasing pressure on the planet's social, economic and environmental systems.
- Addressing this problem requires urgent action, and this should be considered throughout efforts to move towards a green economy and sustainable development.
- Practical action, including awareness raising and education, should be underpinned by appropriate knowledge and transdisciplinary research across the multidimensional factors of economics, waste and environment, human behaviour, and lifestyle.
- Communication of clear messages to the public on sustainable consumption and waste reduction will be key, as will clear strategies for public action.

(see policy brief on Human Wellbeing: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)).

These recommendations are taken from work by the worldwide international scientific community for Rio+20, particularly a series of ICSU-UNESCO regional science and technology workshops in the five UN geo-political regions (see: [www.icsu.org/rio20/regional-workshops](http://www.icsu.org/rio20/regional-workshops)) and a series of nine policy briefs prepared specifically for Rio+20 (see: [www.icsu.org/rio20/policy-briefs](http://www.icsu.org/rio20/policy-briefs)) in the context of the Planet Under Pressure science and policy conference (London, 26-29 March 2012). The recommendations also draw on consultations with the constituencies of the scientific and technological community spanning all relevant disciplines in the natural, social, economic, engineering and health sciences, in cooperation with the International Social Science Council (ISSC), the World Federation of Engineering Organization (WFEO), UNESCO, WMO, UNEP and UNU. For further information and recommendations from a disciplinary perspective see submissions for Rio+20 by ICSU's Scientific Union Members ([www.icsu.org/rio20/icsu-members](http://www.icsu.org/rio20/icsu-members)).

---

## International Council of Chemical Associations (ICCA)

INTERNATIONAL COUNCIL OF CHEMICAL ASSOCIATIONS (ICCA)

INPUT FOR UNCSD 2012 COMPILATION DOCUMENT

OCTOBER 2011

### Executive Summary

<sup>[1]</sup> SAICM is the preferred international framework for achieving the 2020 goal for sound chemicals management set at WSSD, and ICCA calls for SAICM to be strengthened as an outcome of UNCSD 2012.

<sup>[2]</sup> ICCA's Responsible Care® and Global Product Strategy initiatives highlight the chemical industry's contributions to sustainability and the safe management of chemicals throughout the lifecycle.

<sup>[3]</sup> ICCA supports the development of a flexible, customizable roadmap to a green economy as an outcome of UNCSD, integrating all three pillars of sustainable development.

<sup>[4]</sup> The global chemical industry supplies many of the innovative products and technologies required for the transition to a green economy, and policy frameworks must support the production, diffusion and deployment of these products and technologies.

<sup>[5]</sup> Sound economic, social and environmental governance is a necessary prerequisite for creating the conditions to develop a green economy and promote greener growth.

<sup>[6]</sup> Reform of the institutional framework for sustainable development should be pragmatic, and form must follow function. Institutions must evolve to better accommodate all three pillars of sustainable development and pursue a more integrated approach to sustainability.

### Introduction

1. Chapter 30 of Agenda 21 recognized the vital role of the private sector in efforts to promote sustainable development. In particular, it noted that "increasing prosperity, a major goal of the development process, is contributed primarily by the activities of business and industry." The International Council of Chemical Associations (ICCA)<sup>3</sup> was an active participant at both the 1992 UN Conference on Environment and Development and the 2002 World Summit on Sustainable Development, and has played a significant role in subsequent intergovernmental initiatives to promote safer chemicals management internationally. ICCA has also committed to voluntary initiatives and self-regulation under its flagship Responsible Care® and Global Product Strategy programs that highlight the industry's commitment to sustainability and the safe management of chemicals throughout the lifecycle.

### Objectives for UNCSD 2012

2. ICCA sees UNCSD 2012 as a valuable opportunity to take stock of progress made since the 1992 Earth Summit, and to develop policies, responses and new forms of collaboration that address new and existing challenges. UNCSD should focus on outcomes that recognize all three pillars of sustainable development as essential components of recommended policies and solutions. Innovation and the deployment of new products and technologies will be critical for future sustainable development, particularly in ensuring that society makes the best use of scarce resources as the world's population rises. The global chemical industry will be instrumental to the development, production and delivery of these products and technologies.

3. In the chemical sector, while serious challenges remain, significant advances have been made since 1992 in promoting the sustainable management of chemicals worldwide. This includes international instruments focused on the key global elements of chemicals management (e.g. the Stockholm, Rotterdam and Basel Conventions, and the new instrument under negotiation on mercury); innovative multi-stakeholder partnerships such as the Strategic Approach to International Chemicals Management (SAICM); and industry-led initiatives such as the Global Product Strategy and the Responsible Care Global Charter.<sup>4</sup> Taken together, these initiatives show that the chemical sector has made real progress towards sustainable development since the Rio Earth Summit across a range of forums and initiatives.

4. In 2002, the Johannesburg Plan of Implementation (JPOI) called on stakeholders to renew the commitment advanced in Agenda 21 to sound management of chemicals throughout their lifecycle for the protection of human health and the environment.<sup>5</sup> In addition to the ratification and implementation of relevant international instruments relating to global chemicals management, the launch of SAICM in 2006, with a mandate to achieve the WSSD's "2020 goal" for sound chemicals management, has been the international community's primary contribution to advancing the 2020 goal to the regional and national levels as well. ICCA is a strong supporter of SAICM and its innovative, multi-stakeholder framework, which has brought governments and non-governmental stakeholders together to build trust and promote collaboration in addressing common challenges.

5. SAICM has made important progress towards achieving the 2020 goal for sound chemicals management, although all stakeholders recognize that there is much more to be done. ICCA supports the strengthening of SAICM as an outcome from UNCSD to enable it to achieve its mandate, including through the provision of adequate resourcing for SAICM activities and the functioning of its Secretariat. ICCA further supports continued efforts to improve the efficiency and coherence of the Stockholm, Rotterdam and Basel Conventions, while respecting the specific mandates of each Convention.

6. ICCA supports the principle that sound chemicals management is best achieved through a combination of transparent, science-based and cost-effective regulation and industry-led initiatives. Given the positive steps that have been taken on international chemicals management since 1992, and the ongoing contributions of SAICM, as outlined above, ICCA does not see the need to develop a new international regime on chemicals and hazardous substances. The mandate to promote sound chemicals management set at WSSD runs through to 2020, and UNCSD should focus on assessing progress towards the 2020 goal and providing recommendations to help facilitate further progress. Any effort to change or supersede the 2020 goal set at WSSD would be counter-productive, detracting from the considerable work that has gone into SAICM and the synergies process amongst the existing chemicals conventions. ICCA would in particular not support any effort to exclude non-governmental stakeholders from direct participation in decision making, which would undermine the innovative and constructive example set by SAICM.

#### Green Economy in the Context of Sustainable Development and Poverty Eradication

7. As the engine of economic growth, the private sector has a critical role in delivering the products, technologies, services and solutions required for the transition to a green economy. The private sector is the primary source of green jobs and the principal supplier of green products and services, through the innovation, commercialization and implementation of new technologies. Recognizing that planning for the transition to a green economy needs to account for regional, national and local priorities and development challenges, ICCA supports the development of a flexible, customizable roadmap to a green economy as an outcome of UNCSD. A green economy roadmap should be based on the following core principles:

(a) A central focus on innovation and the development of policy frameworks to facilitate the production, diffusion and deployment of products and technologies that enhance sustainable outcomes (for example, tax incentives for research and development). Innovation has an especially critical role in poverty reduction. The chemical industry today manufactures the basic building blocks that enable virtually every other sector of society, and chemistry innovations are helping other sectors to develop solutions to today's societal challenges.

(b) Policies aimed at creating green jobs should not come at the cost of a net reduction of jobs across the economy. The emphasis should be on greening all sectors of the economy, rather than attempting to identify certain sectors as "greener" than others. In addition to its own products, the chemical industry provides essential inputs for other industry sectors (over 95% of all manufactured goods rely on chemistry). Chemical products and technologies provide sustainable development solutions for industries as diverse as energy, information technology, environmental industries, and the waste sector.

(c) Resource efficiency is crucial in enhancing the sustainable use of scarce resources. The chemical industry has a key role in promoting energy efficiency. It is the principle supplier of energy efficient materials worldwide, from insulation to materials for wind and solar power. A 2009 life cycle analysis study by McKinsey and Company, validated by the Öko Institut, revealed that the GHG emission savings enabled by the chemical industry are more than double the industry's emissions. The chemical industry is unique in manufacturing, in that its use of energy enables net energy savings.

(d) Economic growth is critical to solving social and environmental problems. A focus solely on the environmental dimension risks a distorted perspective on the green economy, overestimating the viability of some "green" investments and understating the larger societal interest in investments addressing all three pillars of sustainable development. Policy frameworks need to be clear, stable and predictable to give investors and financiers the confidence to foster innovation-led green growth and development.

(e) The transition to a green economy requires a focus on sustainable consumption as well as production. Sustainable Consumption and Production (SCP) should focus on making the market work for sustainable development, with a focus on producing goods and services efficiently and consuming them differently rather than simply focusing on producing and consuming less. ICCA supports the text on SCP and a Ten Year Framework of Programs (10YFP) negotiated at CSD-19 forming the basis for consideration of SCP issues at UNCSD.

(f) Sound economic, social and environmental governance is a necessary prerequisite for creating the conditions to develop a green economy and promote greener growth. Efforts to advance the green economy, including public-private partnerships, should work within market systems and not distort markets or limit market access, with an appropriate balance between public and private sector roles. Corruption should be fought in order to make the best possible use of scarce resources.

(g) Open trade and non-discriminatory trade is indispensable for growing a green economy. The chemical industry, as a provider of innovative products and technologies addressing key societal challenges, should not be subject to tariff or non-tariff trade barriers that could hinder the application of these products and technologies to greening economies worldwide. In particular, secure and cost-effective access to key renewable raw materials for specific chemical end-use (i.e. excluding fuel uses) is of utmost importance. The global diffusion of state of the art technologies that will be crucial to progress towards a green economy (e.g. on issues such as climate change) depends heavily on free and open trade.

(h) A global culture which fosters sustainable values and life-styles is the foundation of a green economy. Public at large should know more about the science that supports sustainable development, and governmental authorities and officers, industry professionals and other decision makers should be educated through capacity building initiatives related to sustainability, particularly in developing countries. Education and skills, especially in STEM disciplines (Science, Technology, Engineering and Mathematics) are important prerequisites for priorities and action by the chemical industry.

(i) Life-cycle thinking, sound economics and scientific understanding have a fundamental role to play in framing the vision for green economies. A life-cycle approach involves further minimizing the environmental footprint of all economic activity through science and new knowledge. As an example, some chemical products, such as insulation

materials, lead to a net-reduction of CO<sub>2</sub> emissions during their use, despite the fact that CO<sub>2</sub> is emitted during their production and disposal. Trade-offs are almost always inherent in sustainable development, and at times when public and private sector financing is constrained, it is critical to set priorities, and determine how resources can best be leveraged and most cost-effectively deployed.

(j) For a green economy to become operational, indicators, metrics, accounting measures and better disclosure and reporting must be developed. These must make sense in economic terms while ultimately including the cost of externalities. This entails the simultaneous pursuit of developing operational green growth measures at company level (bottom up) and strategic macro-political accounting standards and economic indicators at the system level (top down). A flexible approach which balances the costs and benefits remains critical for success.

#### Institutional Framework for Sustainable Development

8. The current institutional framework for sustainable development has a number of shortcomings. The failure of CSD-19 to agree on an outcome is an important illustration, highlighting the way that negotiated text has taken priority over the identification of practical mechanisms for advancing sustainable development. ICCA strongly believes that the focus of discussions on the institutional framework at UNCSD must be on pragmatic reform to ensure a more integrated approach to sustainable development at the inter-governmental level.

9. Institutional frameworks should foster sustainable development rather than constrain it, and form must follow function. Relevant activities should be grouped together in clusters, without establishing additional layers of bureaucracy. Efficiencies should be pursued in all instances where they can help to promote sustainable outcomes. The private sector has technical and implementation-related expertise that can help inform policy decisions and improve the effectiveness of implementation.

10. ICCA supports the strengthening of UNEP to enable it to more effectively coordinate and address environmental issues within the overall context of sustainable development. Reform must, however, extend beyond that to include key global institutions covering all three pillars of sustainable development. These institutions should be integrated into the priority-setting process, and concentrate on their specific added value. ICCA proposes two concrete steps to assist in setting priorities and ensuring that resources are appropriately deployed:

(a) ICCA supports strengthening the science-policy interface within international institutions, with the full and meaningful participation of developing countries. This must also include channels for incorporating credible and robust science from stakeholders, including business and industry.

(b) Links between policy frameworks and the financing for relevant institutions also need to be strengthened. Government resourcing for international institutions should be more strategic, and the institutional framework should provide for vigilant oversight of resources contributed.

11. The institutional framework for sustainable development should also help build capacity and develop institutions that support implementation at the national level. National and regional differences mean that imposing a top-down global model for sustainable development is unlikely to effectively address underlying problems and challenges. Taking ownership of sustainable development through national institutions (with appropriate international support) is the most likely means of securing real impact at the national level.

12. Finally, sustainability challenges cannot be adequately addressed by governments alone. The challenges of globalization require active collaboration between governments, business and other stakeholders. In this regard, new approaches are needed that facilitate innovative collaborations and partnerships between business, government and civil society. Such collaborations can take many forms, including private-public partnerships, business value chain engagement, and alliances with academia and consumers. No one can do this alone. Public-private partnerships can supplement inter-governmental activities and act as a catalyst for improved implementation. SAICM provides an innovative model of how multi-stakeholder frameworks can help advance sustainable development objectives. Any reforms to the institutional framework for sustainable development emerging from UNCSD must recognize the contribution of non-governmental stakeholders, including business and industry, and ensure an appropriate role for these groups in the pursuit of sustainable outcomes.

---

## International Council of Environmental Law

### RECOMMENDATION N°6

#### PACT ON ENVIRONMENT AND DEVELOPMENT

Having examined the actual status and content of the draft for an « International Covenant on Environment and Development » which includes a large number of principles accepted by consensus since the Stockholm Conference,

Noting that the draft International Covenant on Environment and Development was introduced to the international community in 1995 on the occasion of the fiftieth anniversary of the United Nations, Recognizing the contribution of the International Union for the Conservation of Nature and Natural Resources (IUCN) and the International Council of Environmental Law –toward sustainable development- (ICEL) in the formulation and promotion of this initiative;

Considering that the draft Covenant contributes to the development of international environmental law, and aims to build a real sustainable development law; Noting with satisfaction the progress made since the initial presentation of the draft International Covenant on Environment and Development, which has since undergone three revisions to periodically update it in accordance with the newest developments in the field;

Deeply concerned by the continuing lack of a version of the draft Covenant in other working languages of the United Nations, particularly in French; Convinced that the French translation of the draft Covenant is of paramount importance to Francophone developing countries, which have an important role to play in the process of adopting such an instrument;

The Third Worldwide Conference of Environmental Law NGOs and Lawyers in Limoges (France), September 29-1 October, 2011:

1. Welcomes the draft International Covenant on Environment and Development, and recommends its adoption;
2. Decides to recommend it strongly to the attention of the United Nations General Assembly (UNGA) for discussion and adoption;
3. Provides for such purposes that the UNGA, through a Member State, embrace the draft Covenant and introduce it as an official document to ensure its translation into the working languages of the United Nations;
4. Draws the attention of the International Organization of La Francophonie to the urgent need for a French translation before the Rio+20 Conference, to facilitate discussions within the Francophone community;

5. Recommends that the UNGA, upon recommendation of the 6th Committee, directly adopt the draft International Covenant on Environment and Development in Plenary;
6. Notes that several states have used the draft Covenant as a check list for their national legislation, especially African Union (AU) Member States;
7. Further Notes that AU Member States have concretely used the draft Covenant as a basis for the revision of the 1968 African Convention on the Conservation of Nature and Natural Resources and that all Heads of State and Government adopted this Revised African Convention (Maputo Convention) at the Second Summit of the African Union in 2003;
8. Invites AU Member States to quickly ratify the Revised African Convention adopted by the Heads of State and Government at the Second Summit of the African Union in Maputo in 2003;
9. Proposes that if adoption of the draft International Covenant on Environment and Development by the UNGA in Plenary is not possible, the UNGA establish, under its aegis, an Intergovernmental Negotiating Committee for the negotiation and adoption of such an instrument, taking into account proposals that could be submitted by the States participating in the negotiation process, so that the Convention be developed by June 2014;
10. Urges the adoption of a resolution by the UNGA to quickly consider the establishment of conditions for the adoption of the draft International Covenant on Environment and Development, in accordance with the established practices of the UNGA;
11. Requests the Secretary-General, as soon as possible, to bring the draft Covenant to the attention of the UNGA for its consideration and adoption;

---

## International Council of Forest and Paper Associations (ICFPA)

Forest products industries at the core of the "green economy"

The International Council of Forest and Paper Associations' (ICFPA) is an organisation representing the forest, wood and paper sector globally. Its membership includes the trade associations of 43 countries. Members represent industries accounting for more than 90 percent of the world's paper and more than 50 percent of the world's wood production. ICFPA members represent an industry in transformation delivering an increasingly wide range of products - including textile fibre, chemicals, new materials, functional products, food additives, solid biomass, liquid and gaseous fuels, etc. all made of a natural renewable raw material, wood. The ICFPA is committed to the principles of sustainable development and to working with other stakeholders to ensure that environmental, social and economic benefits of our natural resources are available to current and future generations. ICFPA Members are committed to legal, certified forestry and procurement practices.

The global forest products industry contributes more than US\$ 470 billion annually to global GDP and employs over 14 million people in almost every country in the world.

The forest sector and the green economy

Commonly agreed definitions of « green economy » include elements that are already today mirrored by the forest products industries:

- Delivery of better returns on natural, human and economic capital investments
- Reduction of greenhouse gas emissions
- Resource efficiency
- Waste reduction
- Reduction of social disparities

Through numerous commitments and actions, the industry demonstrates on a daily basis its contribution to the green economy from the "cradle" to the "grave" of its products.

It is committed to sustainable forest management. Since 2000, ICFPA members have realised a 346% increase in the total area of certified responsibly managed forests, reaching a level of 273 million hectares of forests certified. 53% of the wood supply used by ICFPA member companies was certified in 2010.

It is truly bio-based. The industry represented by ICFPA uses wood as its main raw material, hence making it an industry using a natural renewable resource. Depending on the production, all qualities and wood assortments are used, including the bark and the branches.

It provides jobs to local communities, especially in rural areas. Since the wood processing mills – whether it is for veneer, fibreboards, pulp and paper or other wood-derived products – are located close to their raw material sources -- forests -- they contribute to the rural livelihood by maintaining rural infrastructures (e.g. roads, railways, etc.) and services (e.g. public transport, schools, hospitals, etc.) and offering jobs. By relying on managed forests and the raw material they deliver, they are also a source of income for local population and small businesses depending on forests.

It contributes to social and society's well-being. The wide range of products delivered by the forest products industries to society contributes to people's well-being and improved living standards: comfort and warmth thanks to reliable construction materials offering excellent mechanical properties and decorative features, literacy and culture thanks to paper being the material support to literature, culture and education resources, hygiene thanks to packaging protecting goods and offering barriers to bacteria, but also thanks to tissue paper used widely in healthcare and for daily sanitary uses.

It uses resources efficiently and responsibly. By reclaiming and recycling wood-based products after they have been used, the industry is committed to the efficient use of raw materials. In 2009, the global recovery rate for paper has reached 55.6%, compared to 46.5% in 2000. In some regions, the industry aims as well to limit the landfilling of its products by using it as biomass for energy recovery at the very end of its life cycle. It also consumes some water, but after cleaning, releases back the majority of it, sometimes even cleaner than before. At the same time, responsibly forests provide acknowledged benefits for water quality and protection.

It is part of the solution to climate change mitigation. As stated by the Intergovernmental Panel on Climate Change in its 4th Assessment Report: "A sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual sustained yield of timber, fibre or energy from the forest, will generate the largest sustained mitigation benefit." Forest products have the inherent capacity to store carbon until they decay or are converted into energy. In addition, they are replacing other less climate and environment friendly materials, as well as fossil fuels.

At the same time, it reduces its impact on the environment. It has notably reduced its direct greenhouse gas emissions per ton produced by 8% between 2004 and 2009.

Already today the forest products industries have decoupled their environmental impacts and their production.

The global forest products industries represented by ICFPA strongly believe that these achievements are giving it already today a very prominent role in the green economy and are convinced that they can further improve if the right enabling conditions are established.

Recommendations to further boost the contribution of the forest products industries to the "green economy"

The Global Forest Products Industries represented by ICFPA fully support the recommendations listed in the co-chairs' summary of the country-led initiative "Contribution of forests to a green economy" that took place in Bonn on 4 to 7 October 2011, namely, that further action is needed to:

- Ensure that the tools used to enhance and demonstrate the sustainability of forest management and production processes – including third-party verified forest certification – are guaranteeing fair competition with sectors using other resources and fair trade between countries and are not used as non-tariff barriers to trade, or as a deterrent to use wood;
- Promote public-private partnerships to strengthen dialogue and information flows between science and practice along the whole value chain, with a view to support the transformation of the industry and enhance its contribution to the "green economy";
- Dedicate seed funds from the public and/or private sector in order to (i) help local communities to develop businesses and have access to the markets and (ii) support pre-competitive research and development for innovation;
- Ensure transparency and fairness on the markets for forest products and services, including for its raw materials (both from the forests and secondary raw materials); Transparency should also apply to ownership and tenure right as a preliminary condition to a stable and predictable business environment;
- Promote the potential of harvested wood products as long-term carbon storage and as substitute to other less climate and/or environment friendly materials.

---

## International Council on Mining and Metals (ICMM)

### 1. Overview

The International Council on Mining and Metals (ICMM) is a collaborative of 21 of the largest mining and metals companies in the world. We also link 32 affiliated industry associations through which we can potentially reach an additional 1,500 companies. ICMM was created in the lead up to Rio + 10 as a catalyst for improving environmental and social performance for its members, thus enhancing mining and metals' contribution to sustainable development. ICMM seeks to create value for shareholders while simultaneously creating value for host communities and countries.

The purpose of this submission is to address the issue of mining and metals in the green economy. We argue that mining and metals are fundamental to sustainable development in the green economy – both through the mining and refining processes and through innovative uses.

Mining and metals are critical to society – today and in the future. Their contribution to the Millennium Development Goals is but one indication of this indispensable role. To achieve this end, implications must be carefully managed and specific steps must be taken by all concerned to ensure an equitable distribution of costs, benefits, risks and responsibilities. This can be done. We believe that it is in fully considering all aspects of this distribution - throughout the life cycles and complex value chains that we are tied to – that mining and metals' full contribution can be understood and realized. This realization is at the heart of the green economy.

### 2. Proposed text for the Rio+20 zero draft

#### Mining and metals in a green economy

Mining of minerals and production of metals are fundamental to sustainable development in the green economy – through the contribution of the industry itself and through innovative uses of the metals and minerals that are produced. As with any human activity, there are significant social, environmental and economic implications – positive and negative – at each step along the value chain. These can be managed effectively and efficiently to provide a foundation for environmentally and socially responsible economic development which is sustainable and which contributes to meeting the Millennium Development Goals agreed to in 2000.

A key success factor is ensuring that the benefits, costs, risks and responsibilities – local, regional, national and international – are all recognized, effectively managed and equitably distributed using a time horizon that spans the full project and product life cycles. This is only possible through public policies, instruments, and action that are designed and implemented to: (1) ensure that the interests and values of host communities and countries and project operators are considered; and (2) facilitate collaboration and partnerships between the many stakeholders important to resolving the complex issues that arise – no single party can deliver sustainable outcomes working in isolation. Important interests include governments, intergovernmental organisations, mining and metals companies (junior to major), investors, labour, service providers and associations, civil society groups, public institutions, mining affected communities, Indigenous peoples and their organizations, customers, end users, suppliers and academia.

A second key success factor is the effective and efficient use of natural resources and the materials derived from them throughout their lifecycles – in a way that maximizes their contribution to sustainable development over the long term. This will require careful development and implementation of integrated energy and materials management policy frameworks.

### 3. Mining and metals in a green economy

#### Mining and metals and sustainable development

Mining and metals lie at the very foundation of society. Their use permeates all aspects of life and it is for this reason that the 2002 Plan of Implementation of the Johannesburg World Summit on Sustainable Development recognized that "Mining, minerals and metals are important to the economic and social development of many countries. Minerals are essential for modern living".
