Over the last two decades the mining and metals industry has been particularly active in innovative, sustainability-related policies and practices because:

- the potential implications – both positive and negative – of mining activities and the minerals and metals that result are significant, for people, for their economies for the environment;
- many interests are touched by mining and metals;
- the role of many of these interests in decision-making is growing (e.g., communities, consumers and indigenous people);
- the nature of contemporary communications systems has brought the often dramatic nature of mining operations into the public eye;

- industry, governments, civil society organizations, and the public, in general, have taken great interest in ensuring that mining and its products make a net positive contribution over the long term; and
- the importance of minerals and metals to meeting society's needs.

The above factors also underscore the importance of communicating the full life cycle sustainable consumption and production processes to the general public. Without this understanding, the linkage between everyday uses of products, their origins, and the true costs of bringing them from that origin to use, is lost.

#### The Activities of Mining and metals Production

The nature of mining and metal production activities sets them apart from all other human activities. Mines are situated where natural geological deposits dictate. There is little to no choice in location. Conditions and resulting mine design (technical, social, environmental) will vary dramatically between sites. Because of the hugely varying nature of ores, the processing technologies required to make these materials available for use will also vary from site to site.

The mine project life cycle comprises a series of steps including exploration, design and construction, operation, closure and post closure. This life cycle varies in length from a few to many decades, sometimes stretching to centuries. Thus, the connection to people and their communities reaches across generations and the relationships developed between mines and their host communities are long-term.

Each phase of the mine project life cycle described above brings different environmental, economic and social challenges and opportunities. Sometimes, the national economic benefits can seem out of proportion relative to local level benefits where the immediate disruptions are most likely to be felt. The full spectrum of implications must be carefully managed and all of the costs, benefits, risks and responsibilities shared in an equitable manner.

Poor management can bring serious social disruption, economic decline and environmental degradation.

Effective management of extractive resources requires long time horizons and a need for multiple interests to be involved in the governance and development of natural resources. However, managed effectively and efficiently, the opportunity to contribute to societal development is significant.

The mining industry often serves both as a foundation and as a catalyst for economic and social development. It is often the first to make significant inward investment in low income countries, placing it in a position to catalyze a positive contribution at a critical stage in the host nation's economic and social development. Working in partnership, mining and metals operations can spark local economic activity through other service oriented businesses and industries. Nurtured effectively, these can strengthen and diversify, leading to benefits that exist long after the original mining activities cease.

In resource rich parts of the world and with effective systems of private and public governance in place, mining and metals production can provide a significant boost to achieving the Millennium Development Goals.

#### Products and innovative uses

Mined ores and minerals require processing into a usable form. The intrinsic properties of the resulting minerals and metals (for example, electrical conductivity, recyclability, and durability) are indispensable for meeting essential societal needs in an efficient way.

There are three fundamental categories of materials in the world: metals and minerals; fibre-based from bio-mass; and synthetics from petroleum products. Of these, only metals and minerals have a proven capacity for continuous re-cycling (though we are far from achieving optimum efficiency in this matter). This recycling capacity and the energy savings that it represents are powerful technical reasons why metals and minerals have a key role to play in the green economy.

Much of the "green economy" concept is based on a quest for greater efficiencies in energy and resource production and use. A key is the development of alternative energy sources. Many metals are crucial to innovations in the development of this technology (e.g. the use of platinum in automotive catalytic converters, or metallurgical coal in wind turbines or copper for more efficient electrical motors). Most innovations in these fields are only possible with the use of metals.

#### Two Decades of Progress in the Mining and Metals Industry

Since the 1992 Earth Summit, practices in the mining and metals industry have evolved significantly. The creation of ICMM as a change agent specifically tasked with strengthening environmental and social performance and enhancing mining and metals' contribution to sustainable development is in itself a significant indicator.

The evolution of SD reporting in the industry provides another indicator. Prior to the 1980s, no companies reported out on non-economic performance indicators. In the mid-1980s, state-of-environment reporting; in the 1990s corporate sustainability reporting followed. ICMM's sustainable development principles were approved in 2003; a Metal Mining Sector Supplement (MMSS) was jointly developed with the Global Reporting Initiative during 2005 - 2009. ICMM members reported publicly for the first time in 2009. Now, over 100 mining and metals companies are annually reporting following the MMSS. Starting with the early treatment of environmental and health and safety topics, they now include such issues as equity, social justice and human rights.

This evolution marks a step change not only in reporting and assurance, but also in the commitment to transparency and accountability, a commitment that is underlined by ICMM's early and strong support for and engagement with the Extractive Industry Transparency Initiative.

The following initiatives all reflect mining's commitment to engage actively and openly in addressing many of today's most pressing sustainable development-related issues. It is unlikely that many of these would have occurred in the past.

- good practice for addressing mining and biodiversity (with the International Union for the Conservation of Nature, 2006),
- good practice for materials stewardship (2006)
- metals environmental risk assessment guidance (MERAG, 2007)
- health risk assessment guidelines for metals (HERAG, 2007)
- integrated treatment for addressing mine closure (2008)
- managing HIV/AIDS, TB and Malaria (with the World Health Organization in 2008)
- effective community development (with the World Bank, 2009)
- effective health impact assessment (2010)

- intense engagement with John Ruggie as Special Representative to the UN Secretary General on Business and Human Rights through to his final report published in 2010
- ICMM's publication of guidance on building effective relationships with indigenous people (2010)
- International Network for Acid Prevention (INAP) published its Global Acid Rock Drainage (GARD) Guide in 2010
- Initiation of ICMM's climate change program, publication of its principled approach to developing climate change policy
- establishing a formula for avoiding the resource curse through building effective partnerships for development (2005 - 2011)

#### 4. Further Input to Rio + 20

Rio +20 offers an exciting opportunity for new forms of collaboration, particularly between the private sector and multilateral organizations like the United Nations. Expectations have been set that the private sector will be the largest funding source for concrete actions to achieve sustainable development. If this is to be achieved, effective mechanism to include the private sector in policy discussions as a full partner must be established. To date, that has not happened.

We are not able to comment at this time on such important topics as: (1) concrete desired outcomes of Rio + 20 and the structure of the Outcome Document; (2) a specific framework for action, renewed SD Goals; (3) closing the implementation gap; and (4) specific implementation tools. We believe that these should be designed collaboratively through the Rio + 20 process and we look forward to playing our part in doing so over the next eight months and beyond

#### Appendix 1: The International Council on Mining and Metals

##### Overview

ICMM is a collaborative of 21 companies that together reflect about one-third of the formal mining industry. We also serve as an umbrella for some 32 affiliated industry associations through which we can significantly increase our reach to other companies across the industry. Our member companies have about 800 operations in over 65 countries and employ about 800,000 of 2.5 million in the formal mining sector.

##### Vision

ICMM's vision is one of leading companies working together and with others to strengthen the contribution of mining and metals to sustainable development. The clear implication of this vision is to create value for shareholders while simultaneously creating value for host communities and countries. We serve as a change agent to catalyze improved environmental and social performance for its members, strengthening mining and metals' contribution to sustainable development.

##### Origins

ICMM was created in the lead up to the 2002 Johannesburg World Summit on Sustainable Development. A decade earlier, at the time of the 1992 Rio Earth Summit, the mining and metals industry was in the earliest stages of applying sustainable development ideas. A predecessor organization to ICMM – the International Council on Metals and the Environment (ICME) – had been created in 1991 in response to the rise of contemporary environmental concerns and as a vehicle for the mining and metals industry to participate in the expanding international discussion about environmental issues.

The second half of the 1990s saw a precipitous drop in commodity prices while public concern over practices in the mining industry reached an unprecedented high.

Late in the 1990s, a small group of mining industry leaders initiated an innovative "Global Mining Initiative (GMI)" to review issues facing the industry and develop an action plan for aligning mining and metals industry with the newly emerging ideas of sustainable development. At the core of this initiative was an unprecedented multi-stakeholder international public debate about how mining and metals could contribute better to the transition to a more sustainable future. The Mining, Minerals, and Sustainable Development (MMSD) project not only identified the challenges but also identified the roles that each of the major stakeholder groups should play."

Running from 2000 through 2002 and led by the London-based NGO, the International Institute for Environment and Development (IIED), MMSD involved some 50,000 people across the world from all parts of society. ICMM (administratively born of the earlier ICME) was established in 2001 as the delivery mechanism for the action plan that was generated through MMSD. The work allowed the industry to make an active and well informed contribution to the 2002 Johannesburg World Summit on Sustainable Development.

The fact of ICMM's existence may represent in itself the most significant single indicator of change in mining, metals and sustainability during the last 20 year period.

## International Diabetes Federation

### NCDs in the Rio+20 conference outcomes

The NCD Alliance, an international network of over 2000 organizations working on non-communicable diseases (NCDs) including cancer, cardiovascular disease, chronic respiratory diseases, and diabetes, believes the outcome document from the Rio+20 conference must contain a strong focus on health, specifically the threat to sustainable development and poverty eradication posed by the global NCD epidemic.

Rio +20 will be a critical opportunity to build on the efforts already underway to accelerate progress towards sustainable development and reduce poverty and inequality, which will ultimately contribute toward the prevention and control of NCDs worldwide.

Overall outcomes of the conference should be sustained political commitment and willingness to adequately address and invest in NCD prevention and control on the local, national, regional, and international levels. The conference will also provide a platform for Member States and other stakeholders to follow up on the commitments made during the UN High-level Meeting (HLM) on the Prevention and Control of Noncommunicable Diseases, held on 19-20 September 2011 at UN Headquarters.

NCDs since the Johannesburg Declaration

The 2002 Earth Summit in Johannesburg, South Africa, put forth a comprehensive agenda for action on sustainable development. Paragraph 19 of the Johannesburg Declaration on Sustainable Development highlights a key area for further attention in the Rio+20 Outcome Document. It states:

'We reaffirm our pledge to place particular focus on, and give priority attention to, the fight against the worldwide conditions that pose severe threats to the sustainable development of our people, which include...endemic, communicable and chronic diseases, in particular HIV/AIDS, malaria and tuberculosis...'1

In the 10 years since the adoption of the Johannesburg Declaration, NCDs (referred to as chronic diseases in the declaration above) have emerged as one of the foremost development challenges of the 21st century. There is growing evidence that NCDs are impeding progress to achieving the UN Millennium Development Goals (MDGs). Effective prevention and control of NCDs requires that these diseases not be dealt with in isolation but be fully integrated into all aspects of the global development agenda.

#### NCDs and the eradication of poverty

The linkages between NCDs and sustainable development, particularly as a means toward the eradication of poverty, are clear and require concrete actions on the part of all stakeholders.

Member States unanimously adopted a Political Declaration during the HLM recognizing NCDs as a global development priority and the "the vicious cycle whereby NCDs and their risk factors worsen poverty, while poverty contributes to rising rates of NCDs, posing a threat to public health and economic and social development."

According to the World Health Organization, 100 million people are pushed into poverty annually because they have to pay directly for health services, which results in up to 5% of the population being forced into poverty in many countries.

In addition to the economic burden they place upon individuals, families, and communities, NCDs are already having devastating consequences on the global economy. A recent study by the World Economic Forum and Harvard University estimates that NCDs will cost the world economy \$47 trillion over the next 20 years, representing 75 percent of annual global GDP and surpassing the cost of the current global financial crisis.

#### NCDs in the green economy

WHO's Health in the Green Economy series, published in spring of 2011, highlights the relationship between sectors of the green economy and health and recommends solutions that both mitigate climate change and improve health conditions, particularly in low-income settings.<sup>5</sup> The NCD Alliance urges Member States and other stakeholders to strongly consider these solutions in the discussions and outcomes of the Conference.

The NCD Alliance suggests the following priorities for consideration during the Rio+20 Conference:

**Health systems integration:** The NCD Alliance urges governments to integrate NCDs into existing health policies and health systems strengthening initiatives, refocusing health systems on prevention, health education, and chronic disease care. Strengthened health systems will also benefit other diseases and conditions, including HIV/AIDS and other infectious diseases. The Rio Declaration should reaffirm the commitment made by Heads of State in the Political Declaration issued at the HLM to 'promote, establish or support and strengthen, by 2013, as appropriate multi-sectoral national policies and plans for the prevention and control of non-communicable diseases' (para 45).

**Development goals:** The MDGs currently contain no goals or targets for NCDs. Yet, NCDs cause 60 % of all deaths globally (36 million) each year and four out five of these deaths occur in low- and middle-income countries. It is therefore critical that Member States include NCDs in discussions at the Conference and at the 2013 MDG Review Summit, and commit to including targets on NCDs in the follow up development framework when the current MDG goals expire in 2015.

**Donor assistance:** Less than 3% of official development assistance (ODA) on health is spent on NCDs.<sup>6</sup> The NCD Alliance requests all governments with major overseas aid programmes to low and middle income countries to end the policy ban on funding NCDs that most bilateral donors operate now. Bilateral donor countries must live by the commitments made in the Paris Declaration on Aid Effectiveness. The Rio Declaration should support the commitment in HLM Political Declaration to 'promote all possible means to identify and mobilize adequate, predictable and sustained financial resources and the necessary human and technical resources, and to consider support for voluntary, cost-effective, innovative approaches for a long-term financing of non-communicable disease prevention and control' (para 49).

**Whole of Government engagement:** NCD plans must involve the whole of government, not just the health sector. Action to prevent and control NCDs requires the active engagement of ministries of finance, foreign affairs, education, agriculture, and transportation, trade and others.

**Adopt policies to prevent NCDs:** Only governments have the power to regulate environments so that healthy food, smoke free places and physical activity are the norm and not the exception. The NCD Alliance expects governments to regulate unhealthy food content – salt, trans-fats and sugar - and harmful use of alcohol through policies on price, availability and marketing. Governments must accelerate implementation of the Framework Convention on Tobacco Control (FCTC) and tax tobacco to the level recommended by the WHO to both reduce tobacco use and generate revenues that can be used for sustainable development.

**Universal access to NCD medicines, technologies and care as a human right:** Today, over 100 million people with NCDs are denied access to the basic medicines (including for pain relief), technologies, education and care they need to stay alive and stay healthy.<sup>7</sup> Individuals and families in many contexts are being tipped into poverty by catastrophic expenditure on NCD care. NCDs are not new diseases and many can be treated effectively with off patent medicines. NCD prevention, and investment in early NCD diagnosis and treatment, is both morally right and sound economic strategy.

**Follow Up Action on Non-communicable Diseases:** Heads of State committed to a 'comprehensive review and assessment in 2014 of the progress achieved in the prevention and control of non-communicable disease' (para 65) in the HLM Political Declaration.

The Rio Declaration should recommend that this review culminate in a High-Level Meeting of the United Nations to ensure that prevention and control of NCDs are given adequate follow-up as a priority factor in achieving sustainable global development.

---

## International Disability Alliance (IDA)

### INTERNATIONAL DISABILITY ALLIANCE (IDA)

**Member Organizations:** Disabled Peoples' International, Down Syndrome International, Inclusion International, International Federation of Hard of Hearing People, World Blind Union, World Federation of the Deaf, World Federation of the DeafBlind, World Network of Users and Survivors of Psychiatry, Arab Organization of Disabled People, European Disability Forum, Red Latinoamericana de Organizaciones no Gubernamentales de Personas con Discapacidad y sus familias (RIADIS), Pacific Disability Forum

## Draft IDA contribution to the Rio+20 Conference

### Introduction

Persons with disabilities need to be considered in all initiatives that are undertaken in the area of sustainable development at international and national level.

To ensure this, the Rio + 20 Conference outcome document must include references to persons with disabilities.

IDA and its members are exploring together with other stakeholders, including some UN agencies, the convening of a side event on sustainable development and the rights of persons with disabilities during the Rio + 20 Conference.

IDA would also like to remind that a Conference like this needs to be fully accessible to persons with disabilities, both in terms of access to the facilities and within the premises, as well as related to access to all the information produced by this Conference, including the official website of this Conference. Too often, Conference like this are not organized in an accessible way, excluding therefore many persons with disabilities from participating in these events.

### Population with disabilities and the consequences of exclusion

The recently published World Report on Disability<sup>1</sup> produced by the WHO and World Bank has updated the statistics on persons with disabilities, indicating that one out of 7 persons, i.e. one billion persons, have a disability.

Sustainable development goals cannot be achieved if such an important group of the population is not adequately taken into account in national and international actions in this area.

<sup>1</sup>World Bank and World Health Organization, *World Report on Disability*, World Health Organization, Geneva, 2011, at pp. 237-9.

Like in many other areas, including the MDGs, persons with disabilities have been largely invisible in the sustainable development agenda. The new UN Convention on the Rights of Persons with Disabilities (CRPD), which has already now been ratified by 105 Member States of the UN and by the European Union, states very clearly in its article 4 that persons with disabilities and their representative organizations need to be consulted on all policies affecting them. Sustainable development initiatives cannot be an exception to this.

### Poverty eradication and persons with disabilities

Poverty eradication is one of the key issues on the agenda of the Rio + 20 Conference.

It is a commonly accepted fact that persons with disabilities are overrepresented among persons living in poverty and extreme poverty worldwide.

This has been confirmed again by the recently published World Report on Disability produced by the WHO and World Bank, which noted that "adults with disabilities tend to be poorer than those without disabilities". Furthermore, the World Report reminds how the cost of exclusion of persons with disabilities affects the gross domestic product.

### The need for coherence and consistency of different global initiatives, all of which need to include persons with disabilities

There are a number of important initiatives (in place or being negotiated) at the global level all of which are relevant to persons with disabilities.

While poverty eradication is an objective in all these initiatives, more needs to be done to establish a coherent approach across initiatives, all of which are also related to sustainable development.

#### MDGs and post-2015 framework

The outcome document of the 2010 MDG Review Summit includes a number of references to persons with disabilities in recognition of the fact that the MDGs in general and MDG 1 in particular cannot be reached if persons with disabilities are excluded from these initiatives. As an example of this, the World Report on Disability stressed that MDG 2 cannot be achieved without ensuring access to education for children with disabilities.

Thus paragraph 28 of this document indicates that: "We also recognize that policies and actions must focus on the poor and those living in the most vulnerable situations, including persons with disabilities, so that they benefit from progress towards achieving the Millennium Development Goals. In this respect there is a particular need to provide more equitable access to economic opportunities and social services.

Even more relevant is subparagraph d) of paragraph 70 which refers to sustainable development and marginalized groups, including persons with disabilities:

"(d) Pursuing job-intensive, sustained, inclusive and equitable economic growth and sustainable development to promote full and productive employment and decent work for all, including for women, indigenous people, young people, people with disabilities and rural populations, and promoting small-and medium-sized enterprises through initiatives such as skills enhancement and technical training programmes, vocational training and entrepreneurial skills development. Employers and workers' representatives should be closely associated with these initiatives;"

Subparagraph v) reminds us about the extreme vulnerability of many persons with disabilities in the area of food security:

"(v) Making special efforts to meet the nutritional needs of women, children, older persons and persons with disabilities, as well as those living in vulnerable situations, through targeted and effective programming;"

These important references need to be the first step towards an adequate inclusion of the rights of persons with disabilities in the international framework that will be established for the post-2015 period.

#### Social Protection Floor Initiative

IDA welcomes the decision taken by the ILO Labour Conference in 2011 to produce an ILO recommendation on a Social Protection Floor.

This initiative has a very important potential to address poverty in developing countries through the provision of a number of basic services as well as cash benefits. IDA is following closely the start of the negotiation process towards this important document, in order to ensure that persons with disabilities will benefit from this initiative.

The need for an approach that promotes participation (and not dependence) of persons with disabilities is central to our demand in this area.

#### Global Pact for Jobs

The other key global initiative resulting from the global financial and economic crisis, the Global Pact for Jobs, is also extremely relevant to persons with disabilities.

It is widely accepted (see also evidence in the World Report on Disability) that persons with disabilities have much higher levels of unemployment and much lower levels of activity rates compared with the general population.

#### Aid effectiveness

IDA will be present at the High Level Forum on Aid Effectiveness in Busan at the end of November 2011 in order to ensure that aid effectiveness, which started with the Paris Declaration and continued with the Accra Agenda for Action, respects disability-rights inclusive development.

All too often, international co-operation in general, and official development aid in particular, is provided in such a way that it further discriminates against and excludes persons with disabilities.

Development cannot be effective or sustainable if it excludes a large part of the population.

The need to ensure that international co-operation is inclusive of the rights of persons with disabilities is reflected in article 32 of the CRPD, the only UN human rights treaty with a stand-alone article on international co-operation.

#### The three pillars of sustainable development are relevant for persons with disabilities

All three pillars of sustainable development (environmental, economic and social) have a great impact on persons with disabilities.

The UN Secretary-General Report on the Objective and themes of the United Nations Conference on Sustainable Development recommends that the Preparatory Committee:

"(b) Continue to give high priority to policies that directly aim at poverty reduction, such as investments in education and access to basic services such as water, sanitation and energy;

(f) Put in place social safety nets that support incomes and limit the impacts of unemployment on long-term outcomes such as access to education;"

All those policies and investments should include persons with disabilities.

It is crucial that sustainable development does not further hide persons with disabilities. As highlighted by the World Report on Disability, "children and youth with disabilities are less likely to start school or attend school than other children. They also have lower transition rates to higher levels of education. A lack of education at an early age has a significant impact on poverty in adulthood".

The UN Secretary-General recommends in his report that the Preparatory Committee: "(c) Prioritize green economy policies that have the potential to deliver social benefits,". The green economy has a huge potential to create new jobs and this opportunity should be seized to also address the employment situation of persons with disabilities. There are examples, albeit very insufficient, of persons with disabilities working in the green economy, thus showing the important contribution persons with disabilities can make in this area.

It is also a fact that persons living in poverty are the most affected by environmental issues, including the consequences of climate change.

Public procurement policies play an important role in ensuring that sustainable development is taken into account in the different initiatives supported by the public sector. There are good examples of public procurement being used to promote environmental objectives and also some, but still far too few, examples of how public procurement can support social issues, including accessibility for persons with disabilities to any infrastructure, as well as employment of persons with disabilities.

Any initiatives in the area of sustainability evaluation and reporting must include the impact of initiatives on persons with disabilities.

#### Conclusion: good governance through the involvement of persons with disabilities and their representative organizations

The Rio + 20 guidance document refers to the objective of the Conference to revise also the institutional framework at international level dealing with sustainable development.

In this respect, IDA would like to insist that the meaningful involvement of civil society, including organizations that represent population groups directly affected by these policies, like persons with disabilities, need to be part of this new framework.

The new standard of good governance established by the Convention on the Rights of Persons with Disabilities can serve as a good example for other global processes, which are still too often lacking adequate participation of those populations that are most affected. The direct participation of these constituencies will improve the quality and effectiveness of decisions taken and will prevent leaving large groups of the population out of these initiatives.

---

## International Environment Forum

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

a) Objective of the Conference - sectoral priorities: natural disaster preparedness and climate change adaptation

## PREPARING FOR ENVIRONMENTAL MIGRATION

### Basis for action

With accelerating climate change, sea level rise, resource degradation and water shortages, the projected scale of forced environmental migration in coming decades will exceed anything previously experienced, with estimates of 100-500 million people or more permanently displaced. This will be traumatic for those displaced, and represents an enormous challenge for the receiving countries and communities where immigration is presently a major source of tension and human rights violations.

### Objective

To organize an appropriate international response to forced environmental migration with institutional, financial and humanitarian dimensions in a proactive response to prevent crises, widespread human suffering and environmental impact.

### Activities

1. Undertake scientific assessments of the human carrying capacity of different regions of the world and anticipated changes with climate change to determine which regions and countries will be unable to support their present or projected populations and which areas have the space and resources to receive environmental migrants.
2. Create an international legal framework for environmental migrants comparable to that already functioning for political refugees, to recognize their status as displaced persons with no possibility of return, and to protect their human rights as far as possible. Provision could be included for migration in groups or as whole communities to assist in preserving social relationships, community structures and cultures.
3. Establish a mechanism under the United Nations, similar in function to the World Trade Organization, to negotiate a lowering of barriers to immigration and to allocate environmental migrants equitably among countries able to receive them. This could include a financial mechanism to ensure that the costs of resettlement are equitably shared by the international community.
4. Initiate wide public discussion of environmental migration, the imperative of showing solidarity with victims of climate change and other environmental changes based on underlying ethical principles, the advantages of immigration for receiving communities, and the means to build unity in diversity among peoples of diverse origins and cultures.

---

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

b. Green Economy

## PRINCIPLES FOR THE GREEN ECONOMY

### Basis for action

The controversy surrounding proposals for the green economy reflects fears that a superficial response will not address fundamental concerns about justice, equity, and social and environmental responsibility. Some relevant principles have already been adopted in the Rio Declaration and elsewhere. To achieve consensus, an explicit statement is needed of the principles underlying the green economy, recalling previous principles and extending them where necessary. The following are some suggestions to be elaborated further.

### Objective

To develop a clear declaration of the principles underlying the green economy for a sustainable society.

### Principles

The green economy should:

- further a dynamic and thriving social order that is just, fair and equitable to all;
- be strongly altruistic and cooperative in nature;
- provide meaningful employment;
- help to eradicate poverty in the world while reducing extremes of wealth;
- ensure sustainable environmental management;
- provide the peoples and institutions of the world with the means to achieve the real purpose of development: that is, the cultivation of the limitless potentialities latent in human consciousness for the betterment of the world.

## INDICATORS

### Basis for action

The dominant economic indicators such as GDP do not provide signals for sustainability, and even sustainable development indicators miss some of the most important driving forces necessary to move on a trajectory towards sustainability. In particular, the underlying materialistic assumptions of most economic thinking do not reflect the views of a majority of the peoples of the world. The development in Bhutan of a Gross National Happiness measure is an example of what can be done at the national level. Recent research has shown the practicality of values-based indicators at the project or group level (<http://www.esdinds.eu>).

### Objective

Develop indicators reflecting the values and ethics underlying individual and collective choices and behaviour necessary to achieve sustainability, while incorporating and adapting to the diverse cultural, ethnic and spiritual traditions of nations and peoples, to express a more complete vision of the goals and purpose of a sustainable and ever-advancing civilization and of desires for happiness and prosperity.

#### Activities

1. Encourage research and public debate on rethinking prosperity and happiness in the context of human well-being and community development in a sustainable society, as the basis for developing national indicators of progress towards these goals.
2. Add values-based and ethical indicators to the indicators of sustainable development prepared under the Commission on Sustainable Development.
3. Stimulate and encourage work on values-based indicators of education for sustainable development for use at all levels in organizations, communities, projects, governments and businesses.

---

#### **c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

##### c. Institutional framework for sustainable development

#### ETHICAL SUPPORT TO POLICY-MAKING

##### Basis for action

The UN has adopted ethical principles in the UN Charter, the Universal Declaration of Human Rights, the Rio Declaration and other instruments, but too often they remain as generalities and their implications are not sufficiently considered in policy and decision-making. Paragraph 6 of the WSSD Plan of Implementation on the importance of ethics for sustainable development requires further action to be effective. Civil society has also completed the Earth Charter after Rio.

##### Objective

Ensure that both recognized international ethical principles and the ethical concerns of civil society are available to UN bodies and decision-makers when adopting policies, programmes and actions.

##### Activities

1. Establish a UN Permanent Forum on Ethics and Religion, patterned after the Permanent Forum on Indigenous Issues, where faith-based organizations and those addressing ethical issues, that accept the principles of the UN Charter, declarations and covenants, can consider the ethical and spiritual implications of UN policies, activities and proposals and make submissions to ECOSOC and other relevant UN bodies.
2. Create within the UN Secretariat an Office of Ethical Assessment to prepare reports, at its own initiative or on request for the General Assembly, the Security Council, ECOSOC and other UN bodies, programmes and agencies, on the ethical implications of issues, policies and programmes, with reference to the ethical principles in the UN Charter, the Universal Declaration of Human Rights, the Rio Declaration and other instruments and covenants, and to the world's spiritual, philosophical and cultural traditions.

#### SCIENCE AND TECHNOLOGY FOR COMMUNITY EMPOWERMENT

##### Basis for action

The foundation of human development is our inherent capacity to learn. Science and technology should be accessible to everyone in accordance with their capacity, but they remain largely the preserve of an educated elite with a top-down process of delivery. Most technological development today is driven by market forces that neither reflect nor respond to the basic needs of the world's peoples. To achieve sustainability, everyone should be empowered with the tools and approaches of science: evidence based reasoning, understanding cause and effect, experimentation, thinking in terms of systems in a long-term perspective, and learning adaptive management in a time of dynamic change. The natural and social sciences, crafts, and local and indigenous knowledge based on similar processes of observation and experimentation, can all contribute to sustainable community development. Institutional capacity and learning processes should be developed within local populations to create and apply knowledge in ways that address the specific needs of that population.

##### Objective

Build a base for the universal extension of natural and social sciences and technology through educational programmes and regional centres of research and training accessible to everyone and allowing widespread participation in the generation and application of knowledge.

##### Activities

1. Support the development and implementation of curriculum materials that introduce scientific thinking and methods into all levels of education, with particular attention to developing countries.
2. Encourage the efforts of civil society organizations in community and neighbourhood education and consultation on the science and ethics of environmental responsibility, climate change, moderation in consumption, sustainable use of energy and resources, environmental migration, and local environmental management.
3. Facilitate the integration of natural and social sciences and indigenous knowledge systems in defining sustainable environmental management adapted to local conditions and cultures and to community needs.
4. Adapt methodologies for environmental impact assessment and monitoring to make them accessible to local communities and resource users regardless of their educational level, supported by extension programmes in their use to support local sustainability.
5. Establish regional centers of research and training for sustainable development empowered to create technologies addressing locally defined needs and priorities that take into account both the material and moral prosperity of society as a whole.

---

#### **d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and**

## poverty eradication and the institutional framework for sustainable development".

The International Environment Forum (<http://iefworld.org>), a Bahá'í-inspired professional organization for environment and sustainability with members in over 50 countries, accredited to WSSD in the science and technology major group, offers the following specific elements for the compilation of the zero draft outcome document for UNCSD next year.

## International Environmental Governance Architecture Research Group

Towards a Charter Moment

Hakone Vision on Governance for Sustainability in the 21st Century

The International Environmental Governance Architecture Research Group

### Introduction

The issues and political dynamics in the 21st century are different from those in 1945 when the institutions in the United Nations were founded. Today's problems are characterized by temporal, spatial, and sectoral interdependencies, complexity, as well as uncertainty. While incremental changes have enabled certain progress towards sustainability, the current system governing sustainable development is no longer sufficient given the number, impact, interdependence and complexity of problems associated with global change. Governance for sustainability requires transformative reforms with clear vision. The 2012 United Nations Conference on Sustainable Development (Rio+20) could be a charter moment -- the beginning of a reform process leading to transformative change of sustainability governance.

The Hakone Vision Factory proposes principles and recommendations to guide this transformation clustered around three interrelated issues: Aspirations, Actors, and Architecture. Aspirations

We are living in a highly dynamic, human-dominated earth system in which non-linear, abrupt, and irreversible changes are not only possible but also probable. Governance for sustainability in the era of the "anthropocene" requires that objectives, underlying values and norms, as well as knowledge and uncertainty be refined and operationalized.

- Planetary boundaries illustrate the finiteness of natural resources and resource use and define the safe operating space for humans. Governance for integrative economic, social, and environmental sustainability must respect these, and other limits to human, intellectual and natural resources and simultaneously ensure just and equitable development and stewardship.

- Governance for sustainability must be capable of governing the legitimate and effective policy responses to potential changes to natural systems that could result from crossing planetary boundaries and potentially triggering tipping points in the earth system.

- Similarly, policy responses to natural disasters that are likely to occur more frequently and with larger magnitude due to global change require new effective governance mechanisms at the global level to complement, coordinate and improve existing disaster reduction and management policies on national and local levels.

- Governance goals have changed from those in 1945 when the post-WWII institutions were established. This requires changes in governance systems. The international community should discuss the priorities, pathways and qualitative and normative goals of sustainability.

- The economic, social, and environmental pillars of sustainable development are strongly interrelated. Horizontal harmonization therefore is crucial to ensure that actions are mutually reinforcing and to realize the governance goals for sustainability. Vertical integration is needed within each pillar to achieve improved implementation of sustainable development.

- The emerging discussion on Sustainable Development Goals (SDG's) in line with and complementing the Millennium Development Goals (MDG's), could become an important political target, providing momentum and drawing attention to sustainable development. Careful consideration is required to determine how the SDG's can be positioned alongside the successful MDG's, which continue to be of high relevance and importance.

- Approaches to sustainability governance based on economic values are insufficient - and partly the cause of unsustainable development. There is a clear need to go beyond GDP and market-value in measuring development. Human well-being and the quality of life are important additional values, as are considerations of ecosystem services and the non-anthropocentric values of other living beings.

- Alternative metrics to GDP have been developed, such as the Human Development Index. Further development of the goals of sustainable development and methodologies could result in a sustainable development indicator, combining variables from the three pillars of sustainable development, or a small suite of indices that have to be pursued simultaneously and without tradeoffs. This is considered to have potential as a useful and policy relevant tool, but only when institutional and financial underpinnings are provided.

### Actors

Governance for sustainability demands the broadening of meaningful and accountable participation and solutions from people for people.

- Governance for sustainability should be as inclusive as possible for all groups in society. Inclusiveness requires governance systems to listen to all voices and to have transparent mechanisms to moderate, synthesize and prioritize them to allow for inclusive, representative, and effective decision making. The level of inclusiveness, the kind of inclusion of voices, and the mechanisms to ensure this, could be tailored differently for each distinct step in the policy cycle, noting that there is a distinction between listening and decision-making. Deciding whose voices shall be heard and whose views should help determine decision-making outcomes is a highly normative and extremely sensitive process that needs further research and deliberation as well as a system of checks and balances. Initially, meeting basic human needs could be the core criterion for making these choices.

- Information technologies, including social media, have the potential to support governance for sustainability by giving voice to those groups and individuals that have been marginalized in the decision making process, and stimulating and facilitating trans-boundary communication and deliberation. However, contentious issues remain regarding the legitimacy and accountability of decentralized participation (e.g. referenda), in particular because these technologies are not universally available and affordable.

- The evolving nature of governance and the problems of global change have engaged a wide variety and large number of non-state actors. Mechanisms to include non-state actors in the intergovernmental UN system (for example through Major Groups in the CSD) are laudable but insufficient and not truly inclusive, often leading to misrepresentation. One way to improve representation in the current intergovernmental system would be to add a mechanism of checks and balances (between governments and non-state actors) that could be inspired by the example of the EU Parliament in relation to the EU Council. In designing such a mechanism, attention should

also be paid to the risk of paralysis. o Mechanisms to enable meaningful involvement of other actors, including persons or organisations of high respect, cities, communities, and social movements in governance for sustainability are needed.

- The emergence of new actors requires a governance system with a larger range of instruments. While states are the central actors, non-state actors are necessary for accountable and effective governance for sustainability. Options include improved private governance (such as the Forest Stewardship Council or Marine Stewardship Council) and public-private partnerships. Safeguards need to be in place to ensure the accountability and legitimacy of non-state actors.

#### Architecture

The architecture for sustainability governance needs to be re-built to include better integration, as well as improved institutions and decision-making mechanisms.

- Proposals for the required transformative changes in the architecture of governance for sustainability need to be assessed based on a set of criteria, including:

1. Membership: Meaningful participatory approaches that are inclusive and account for power differentials between nation states, non-state actors, and other groups in society.
2. Funding: Appropriate and stable levels of funding.
3. Authority/Mandate: Appropriate authority and efficiency.
4. Compliance and Implementation: Appropriate capacity to address compliance and implementation.
5. Adaptability: Effective adaptive approaches that could include sunset clauses and scheduled re-chartering moments in agreements, dynamic criteria to all selection and decision-making mechanisms to reflect changes in natural and social systems, and network approaches.
6. Accountability: Strong accountability and transparency safeguards

The absence of suitable arrangements on one or more of these criteria will jeopardize prospects for transformative change.

- Governance for sustainability concerns governance at all levels, from global to local. Efficient and legitimate governance mechanisms at the global level are important to support efforts at other levels. Likewise, governance mechanisms at other levels can support governance initiatives at the global level.
- Effective management of the global commons is in each country's interest, as global problems increasingly have local impacts, and local problems have trans-boundary consequences. Responsible decisions are needed that respect the trans-boundary nature of causes and consequences of global change as well as of the appropriate policy responses.
- The UN System plays a key role in the current and future architectures for sustainability governance. Transformative change will require stronger links between the institutions and organisations working within the UN System and those of the Bretton Woods System and other sustainable development activities taking place outside the UN System.
- Accountability, legitimacy and authority within the UN System need improvement, and for global efforts towards sustainable development outside the UN, mechanisms need to be newly developed.

#### Sustainable Development Council

Drawing on the discussion of Aspirations, Actors, and Architecture, the Hakone Vision Factory discussed and evaluated many of the proposals for a re-structured institutional framework for sustainable development that would improve governance and determined that proposals for a Sustainable Development Council deserve more serious consideration.

- The process towards the establishment of the Sustainable Development Council needs to be carefully balanced with other governance reforms for sustainable development and with consideration to the oversight of the process, and the positioning and configuration of the Council in the constellation of the institutional framework for sustainable development, including but not limited to the UN System. The six requirements for the architecture of the governance for sustainability, as mentioned above, should be applied when assessing IFSD.
- The mandate of the Sustainable Development Council needs to result from further research and a deliberative process that could be set in motion at the 2012 United Nations Conference on Sustainable Development. Amongst others, the mandate and charter of such a Council could include mechanisms and authority for governance of crisis, for example along the lines of the WHO.
- The Sustainable Development Council could include the following set of members, whereby different responsibilities could be assigned to different member groups. The optimal number of members for each member group needs further exploration.
  1. Primary member states. Countries with high capacity to contribute to implementation of sustainable development through various forms of capital. These same countries also have a high capacity to contribute to the problem of unsustainable development, if their actions are not changed in significant ways. Selected based on a set of criteria (of which GDP could initially be an important part until adequate alternative metrics are common and accepted, for example also including scores of countries on the SDG's). At set points in time (not too frequent), membership will be re-assessed based on changed scores on criteria.
  2. Rotating member states. Countries most affected by specific issues of sustainable development and thus called into the group depending on the issue on the table.
  3. Non-state actors. Selected through a mechanism that reflects the criteria for architecture of governance for sustainability.
- The total number of members should be kept sufficiently small to allow decisions to be made reasonably efficiently.
- Taking into account the evolving nature of governance, gradually, and over the medium to long-term, the Council could create a dual-chamber system, consisting of governments on one side and issue specific representatives from non-state actors on the other.
- Generally, qualified majority voting is a promising way to improve the quality and decisiveness of decision making in governance for sustainable development. Given the high level of the Council, careful development of decision-making procedures, whether based on the common one-state one-vote unanimous decision making procedures, re-definition of consensus, or on innovative other models, is needed.
- The academic and political considerations and development of a Sustainable Development Council should not exclude the required strengthening of the environmental pillar (such as upgrading UNEP) of sustainable development; and should take place with meaningful involvement and strengthening of integration with economic governance. But

such reform directions suggest a review on the role and future of CSD.

Rio+20 and beyond

Fundamental improvements in the economic system are necessary in addition to improved governance for sustainability. Green economy should be linked up with IFSD in this regard. We see Rio+20 as the beginning of a charter moment. Ultimately, this may involve amending the UN Charter to better reflect the challenges of the 21st century.

---

## International Federation of Landscape Architects (IFLA)

Resolution to be put forward to Rio+20

Towards a UNESCO International Landscape Convention

General content:

a) Expectations:

We urge the Rio+20 conference to recommend the development of an International Landscape Convention (ILC).

b) relationship to existing proposals

This proposal deals with the relationship populations have with the landscape. This sets it apart from other charters and categorisations of a more scientific, or specifically delineated territorial nature and from those concerned with the protection, or sanctuary of more exclusively natural environments.

Whilst many of these documents may refer to the cultural, recreational, aesthetic and social aspects of landscape, they are seen as elements that play a supporting role as part of a complex range of topics affecting a defined area. The distinctive nature of this proposal is that it deals with the experience people have of, and with the landscape, shaped by ideas, materiality and culture. It is an entirely different approach.

c) What are opinions on the implementation and how to reduce lags about it?

The aim is for the ILC to stimulate a more integrated, democratic approach that establishes the landscape as a holistic tool for planning, managing and creating sustainable development. Dealing with the protection of the past as well as the shaping of the future, it would recognise the vital connections between governance, culture, health and economics.

Rather than being an enforceable tool, it was agreed that the convention should:

- offer inspiration through principles and guidelines;
- encourage work across established institutional, geographical and disciplinary boundaries;
- provide leadership;
- share and reward good practice; and
- deal with the whole space, the rural and the urban, wilderness and man-made, the most treasured and memorable and as well as the unloved and degraded (see attached leaflets).

Recognising that different cultures have different ideas about the landscape, a convention will be comprehensive and overarching yet flexible, encouraging national, regional and local interpretation and application. The idea will empower communities and people who are concerned with economy, health, and sustainability of their culture and environment.

The urgent need for an international convention will capitalize on the intense interest in this proposal from across the world, and will give leadership, complement and reinforce the bottom up approach which has led to existing and proposed landscape charters in Argentina, Brazil, Costa Rica, Colombia, Mexico, Peru, Venezuela, Bolivia, Chile, Uruguay and Peru, national charters in Australia and New Zealand, regional charters in The Mediterranean, West Africa, East Africa and South Africa, and the European Landscape Convention (signed by 39 nation states).

d) What specific cooperation mechanisms, partnership arrangements or other means of implementation are expected to use and what is the term appropriate to adopt the proposed decisions and apply the measures?

Establishing the need for and shape of a proposed international landscape convention has been a collaborative effort. An expert seminar organised by and held at UNESCO in October 2010, was attended by 23 experts including lawyers, landscape architects, architects, geographers, planners, engineers, biologists, anthropologists, ecologists and developers, with representatives from Africa, Europe and North America, Latin America, the Caribbean and the Arab States, international NGOs including ICOMOS, IUCN, ICCROM, IFLA, ISOCARP, UIA, FIDIC, and other organizations including Council of Europe. It was also attended by representatives from the UNESCO Centre for Traditional Knowledge and the UNESCO World Heritage Centre, Division of Ecological and Earth Sciences and Legal Affairs and members of IFLA.

The report was circulated internally on 29th October, and distributed in mid November for comment. In January 2011 governments, officials and individuals were encouraged to inform the UNESCO ambassadors of the executive committee about the globally recognised need for an ILC. The groundswell of support for this proposal was overwhelming, with notices and messages on Facebook, Linked In and various blogs across the world, requests for articles in journals and newsletters, and letters of support from many international organizations, including ICOMOS, IUCN, ISOCARP and UIA, as well as national and regional institutions including RECEP-ENELC and CIDCE. The proposal was discussed at special meeting in UNESCO to celebrate the publication of National Register of the Historical Rural Landscapes, funded by the Italian Ministry of Agriculture Food and Forestry and the University Consortium for Industrial and Managerial Economics.

Although not adopted by the UNESCO Board in May 2011, the level of support for this important and vital initiative was such that we strongly believe that its adoption is a matter of time. As the proposal helps to promote sustainable development we believe the sooner it is adopted, the better, if possible by 2013.

### 4 Specific Elements

a. Objective of the Conference: Securing renewed commitment policy to achieve sustainable development, assessing the progress so far and the gaps in the implementation of the outcomes of major summits on sustainable development and addressing new and emerging challenges.

The quality of the environment is a key component of every society's identity and robust economic growth. Certain remarkable, valuable, historical and beautiful landscapes are given sanctuary, but at present, the everyday landscape, the social, economic and physical context of our lives, has no champion. Fragmented into various components that are green, grey or blue, agricultural, historical or ecological, landscapes are often undervalued and neglected, seemingly belonging to everyone, but actually to no one.

b. Green economy in the context of sustainable development and Poverty Eradication: Opinions on how the green economy provide a means for achieving sustainable development in its three dimensions, and the eradication of poverty, what is its value added potential, experience to date, including what has worked and how to get good results, what are the challenges and opportunities and how to address these challenges and opportunities, and possible elements according to a final document on a green economy in the context sustainable development and poverty eradication.

Each week, across the world, communities are experiencing benefits, but also feeling the impacts of industrialisation, urbanisation, and the search for energy. Lives are endangered or affected by poor or badly planned development. Problems are caused by demographic shifts and changing patterns of work and habitation, as well as climate change, the depletion of natural resources, de/reforestation, difficulties relating to food production, biodiversity, heritage, and a host of other issues relating to aspects of land use change and development. The quality of the landscapes of daily life is constantly being eroded. A more strategic and holistic approach is desperately needed to provide support to communities in dealing with these global threats and challenges.

c) Institutional framework for sustainable development priorities and proposals for strengthening the different pillars of sustainable development, -3 -11-42780 (S) to strengthen the integration of the three pillars on multiple levels - local, national, regional and international levels.

A new international convention would encourage a different way of thinking about the landscape by:

- Considering the landscape as a cultural and natural concept, a physical and abstract entity, having economic and social value.
- Focusing on the experience people have of their physical environment, dealing with the protection of the past as well as the shaping of the future.
- Recognising the vital connections between governance, culture, health and economics.
- Offering inspiration through principles and guidelines, encouraging work across established institutional, geographical and disciplinary boundaries.
- Providing leadership, sharing and rewarding good practice.
- Dealing with the whole space, the rural and the urban, wilderness and man-made, the most treasured and memorable and as well as the unloved and degraded, will help establish the landscape as a holistic tool for planning, managing and creating sustainable development.

d. Any proposal to improve the two issues. It is recalled that in resolution 64/236 described the priority of the Conference: "The Conference will focus, among others, the following issues, which will tested and perfected in the preparatory process: the green economy in the context of sustainable development and poverty eradication, and the frame institutional framework for sustainable development."

A UNESCO convention would encourage intergovernmental, transnational and public-private cooperation. Stimulating integrated policy making, unlocking greater value for people and the economy for now and in the future, it will help raise aspirations, reinforce democracy, encourage local culture and by recognising the true value of the landscape help ensure the creation, protection and long-term management of memorable, equitable and sustainable landscapes to improve the quality of life for all.

Kathryn Moore Chair of the IFLA Working Group for an International Landscape Convention

Desiree Martinez, President of the International Federation of Landscape Architects

## International Federation of Medical Students Associations (IFMSA)

"Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature" – Principle 1 of the Rio Declaration on Environment and Development, 1992

This position statement and submission is delivered in response to the request for input from the co-chairs of the UNCSD Bureau, dated 14 March 2011, to the compilation document used to prepare the zero draft of the UNCSD Rio+20 outcome framework.

### Preamble

The International Federation of Medical Students' Associations (IFMSA) represents 1.3 million medical students from 91 countries across the globe.

We affirm our commitment to the principles outlined in the 1992 Rio Declaration on Environment and Development, and of Agenda 21. In particular, we believe that human health and wellbeing must be a central tenant of any global agreement made at the UNCSD Rio+20.

Whilst acknowledging the considerable improvements achieved in development and poverty eradication (in no small part as a result of the Millennium Declaration), we note the limited progress made in bringing together historically independent social, environmental and economic policy at a national and international level.

Rio+20 must support global recognition that social, economic and environmental principles underpinning sustainable development are mutually enhancing, not mutually exclusive. Evidence and experience have proven that health and sustainable development are interdependent and indivisible. Progress thus far in sustainable development has been impeded by constrained thinking, which assumes that economic growth coupled with a focus on specific disease and discrete sectors in isolation to one another, will stimulate development.

### Objectives from Rio+20

We call for a return to the principles of health and human rights as enshrined in Article 1 of the 1992 Rio Declaration and of health as the highest social goal as enshrined in the 1978 Declaration of Alma-Mata. This should place health at the centre of the international negotiation process, as a necessary precondition for sustainable development, fundamental to social, environmental and economic development. Such an approach must address the social, environmental and economic determinants of health as a means to reduce health inequities through integration of health in all outcomes of the summit.

Shifts in a geopolitical world have exacerbated many of the challenges faced by Majority World Nations. Chief among them are the provision of access to medicines, health services, adequate food and clean water for drinking and sanitation. We look to Rio+20 to elevate and further validate the social determinants of health nexus as a core

concept in sustainable development.

Rio+20 must provide a comprehensive and ambitious plan of action for the mainstreaming, enhancement, and accelerated implementation of Agenda 21. Such strategies should include formal mechanisms to ensure the co-implementation of social, economic and environmental policies and the securing of resources for development and implementation of Action Plans.

#### Health in the Green Economy

We view the green economy as a means to achieving the overarching goals of global poverty eradication and improved health and well-being for all, and not an end in itself. We support the initiatives and strategies outlined in the World Health Organisation's 'Health in the Green Economy' Series<sup>1</sup> which proposes a series of co-beneficial solutions for health and climate change mitigation and adaptation, relating to health systems, housing and household energy, and the transport sector. We call for a Health in All Policies (HiAP)<sup>2</sup> approach to sustainable development, which outlines the need for cooperation between all sectors of society, to advance human development, sustainability, and equity. Such an approach emphasise that all implementation strategies which emerge from Rio+20 will be best achieved when integrated with health and well-being as a key component of their policy development. A key factor in the green economy must involve strengthening the capacity of national healthcare systems with an emphasis on devolved yet integrated care, and embedded prevention thinking to face the emerging epidemiological and demographic challenges in health. Such an approach will coincide with the development and implementation of sustainable practices within healthcare systems.

The promotion of holistic and long-term sustainable city planning based on environment-sensitive master planning that takes into account population growth, resource utilization, building design, efficient transportation and waste management. Sustainable architecture should strive to improve living conditions, reduce vulnerability and diminish exposure to hazardous materials, tackling the social determinants of health. This could be made possible through financial incentives and mandatory technical standards for new developments.

The implementation of environmental policies must stress green strategies which enhance health and economic benefits in an equitable fashion, rather than environmental protectionist strategies, concerned only with environmental benefit.

#### Youth Engagement and Capacity Building

Article 25 of Agenda 21 states that "Youth comprise nearly 30 per cent of the world's population. The involvement of today's youth in environment and development decision-making and in the implementation of programmes is critical to the long-term success of Agenda 21." We agree with the sentiment expressed in Article 25 and call upon all parties to engage youth organisations and in particular young professional organisations, with sustainable development decision making processes. As future health professionals who will be involved in the delivery of healthcare and as young people whose health will be affected by failing to develop sustainably we request all parties to listen to the views of future health professionals on sustainable development.

With regards to capacity building, we take the concepts outlined in Article 6 of the UNFCCC and would like to see them applied to the field of sustainable development. We call on parties to further 'the development and implementation of education and training programmes, including the strengthening of national institutions and the exchange or secondment of personnel to train experts in this field in particular for developing countries'. We would also like to see this incorporated within existing professional education programs so as to enable future professionals to actively participate in tackling sustainable development problems and promoting of their solutions.

#### Implementation, Accountability, and Building Momentum

We support the use of key health-based indicators as a measure of global progress, and in the evaluation of all sustainable development policies implemented as a result of Rio+20. Unlike sustainable development, health is a simplistic and tangible concept, with immediate and personal benefits. As such, health outcomes generate significant public interest and additional political will.

We look to the World Health Organisation, and their established tools and instruments useful in evaluating the social impacts of policies across all sectors. Member states should implement similar evaluation and monitoring mechanisms to obtain specific data on the effectiveness of the policy agreements made at the Earth Summits, feeding back to regional reporting and support systems to ensure enhanced political accountability.

Whilst broadly supportive of proposals to upgrade the UNEP to a Specialised Agency, in that it would advance the sustainable development agenda, we believe the integration and strengthening of health and human rights institutions to tackle issues in sustainable development to be of equal importance. As such, any additional Specialised Agency should include the economic, social and environmental principles of sustainable development in its mandate.

We support an evidence based, precautionary approach to sustainable development detached from the biases of the political process. As such, we see great merit in the establishment of an intergovernmental scientific body tasked with reviewing and assessing the scientific, technical, and socio-economic information relevant to sustainable development. Such a body would simultaneously act to form a link between policy- and decision- makers, and sustainable development science.

---

## International Federation of Organic Agriculture Movements (IFOAM)

IFOAM Submission to the UNCSD Rio+20 Zero Draft – November 1st, 2011

IFOAM is the global umbrella organization of the international organic movement with over 750 member organizations in over 110 countries worldwide. IFOAM represents millions of certified and non-certified organic farmers and consumers around the world as well as the hopes of many more who want to see a transition to resilient, humane and equitable food and farming systems that nourish everyone as well as the planet. IFOAM believes that only farming that nourishes Nature and supports biological activities, efficient use of water, climate, seeds, breeds and naturally developed soils can guarantee food and nutrition for all; now and in the future.

#### The Definition of Organic Agriculture

Organic agriculture is a production system that sustains the health of soils, ecosystems and people. It relies on ecological processes, biodiversity and cycles adapted to local conditions, rather than the use of inputs with adverse effects. Organic agriculture combines tradition, innovation and science to benefit the shared environment and promote fair relationships and a good quality of life for all involved.

#### Introduction

Farmers represent one-third of the world's population and one-half of its poor and unacceptably many of its hungry and starving and almost all are in developing countries and subject to unjust policies and climate change that significantly reduces their livelihood opportunities. The real structural reasons behind hunger, obesity, and diet related diseases and inequality must be acknowledged. Massive perverse subsidies for industrial agriculture in developed countries, dismantling of research and extension services and land grabbing in developing countries have deprived millions of their livelihoods and sent many into hunger, exploitation and slums.

In 2008 the United Nation's IAASTD report (the most comprehensive study into the future needs of agriculture ever undertaken) shattered the paradigm that technological fixes were the solution to food security. It stressed the multi-functionality of agriculture and has led to the increased focus on small holders by policy makers. Many of its recommendations, including an essential shift towards ecosystem-based farming, have yet to be implemented however, as they call for the business as usual approaches favored by the interests of a minority yet powerful group of stakeholders to be fundamentally addressed.

Rio+20 comes at a critical time when despite significant increased awareness of the multiple negative impacts of industrial agriculture and the global commodity market, the expansion of industrial agriculture is actually accelerating. Given the wide range of issues from climate, to biodiversity, to trade, to food security, to poverty, desertification, deforestation and global ecosystem integrity, UNCSD 2012 offers a highly significant opportunity to change course by holistically addressing the core structural reasons behind poverty and our unsustainable path. We therefore urge the UNCSD Secretariat to be bold in preparing the Rio+20 Zero Draft and include solutions to addressing food and agriculture systems in the context of sustainable development and poverty eradication as outlined in this document. IFOAM is ready to provide any support or clarification that might be required.

Rio+20 decisions and outcomes:

1. Rio+20 must comprehensively address the urgent transition to Sustainable and Equitable Food and Agriculture Systems. This must be reflected in a major section in the Outcome Document
2. Rio+20 must ensure all people and communities both today and in the future are nourished with healthy, diverse and culturally appropriate food that respects animal welfare and the integrity of natural ecosystems at both the local and global level.
3. Rio+20 must recognize that the scaling up of agro-ecology through the reorientation of policies that support small-scale farmers is today's main and most urgent food and agricultural challenge, and that a transition to an ecologically based, resilient, fair and fully inclusive and humane agriculture is essential if the goals of sustainability and poverty eradication are to be simultaneously achieved.
4. Rio+20 must recognize agro-ecological based farming or organic farming practiced by small-scale farmers as the most effective approach in addressing climate change adaptation and mitigation, food and water security, biodiversity loss, poverty eradication and sustainable development. Smallholder farmers with their diverse farming systems produce the most sustainable and nutritious and fresh food for local and regional communities throughout the world. Such investments in sustainable nutritious food security are the key to alleviating poverty throughout much of the developing world and for stimulating green growth and addressing diet related disease in the developed world.
5. Rio+20 must put smallholder farmers, pastoralists and indigenous and traditional farming systems at the center of sustainable food and agriculture policies at all levels. Rio+20 must ensure that they are appropriately strengthened, especially their rights, so that they can continue to not only be the backbone of food security but also the basis of healthy and diverse diets throughout the world.
6. Rio+20 must support food sovereignty as the overall framework for food and agricultural policies and encourage communities, peoples, states and international institutions to recognize and realize food sovereignty. Food sovereignty puts the right to sufficient, healthy and culturally appropriate food for all individuals, peoples and communities at the center of food, agriculture, livestock and fisheries policies, rather than the demands of markets and corporations that prioritize internationally tradable commodities.
7. Rio+20 must pave the way for an urgent transition to sustainable, humane and socially inclusive and fair food and agriculture systems that nourishes all people without compromising the natural capital of future generations. It must put the needs of all the world's citizens and the planet above the interests of a few powerful stakeholders that are currently driving the agriculture agenda across many aspects of international governance (climate, food security, trade etc.).
8. Rio+20 must recognize the 2008 IAASTD report and its multi-stakeholder process, supported by multiple countries and UN institutions, as the most comprehensive and legitimate study for guiding the ongoing re-orientation of agriculture to socially inclusive and ecological based systems.
9. Rio+20 must adopt the recommendations of the IAASTD Report and those of other UN reports, policy briefs and agreements (outlined below) that increasingly call for an urgent shift to ecological-based and people centered food and agriculture systems:
  - a. The UN the Special Rapporteur on the Right to Food's report; "Agro-ecology and the Right to Food" presented to the Sixteenth Session of the Human Rights Council of the United Nations General Assembly on the 8th March 2011. The report demonstrates that agro-ecology, if sufficiently supported, can double food production in entire regions within 10 years while mitigating climate change, alleviating rural poverty and strongly contributing to broader economic development.
  - b. The high quality and groundbreaking papers prepared by FAO for the FAO/OECD Expert Meeting on Greening the Economy with Agriculture (GEA) in Paris, France, 5 - 7 September 2011 bravely outline the structural reasons for many of the agriculture related problems that the world faces today and brings together and systematically evaluates a wide range of potential solutions for addressing the challenges – many of which are already happening and can be scaled-up and further enhanced with the right support.
  - c. The agreements relevant to agriculture made at UNCSD 16 and 17
  - d. The FAO High Level Panel of Experts on Food Security and Nutrition report "Price volatility and Food Security" of the UN's Committee on World Food Security integrates a rights-based approach to food security and nutrition.
  - e. UNCTAD's Policy Brief on Sustainable Agriculture and Food Security strongly outlines the economic reasons for shifting to ecosystem-based and people centered farming systems in LDCs.
10. Rio+20 must increase the proportion of overseas development assistance focused on agriculture and rural development to 20% and prioritize the needs of small-scale food producers, indigenous peoples, peasants and the rural poor.
11. Rio+20 must mark the end of perverse policies that undermine sustainability and the livelihood and well being of agricultural based communities especially in LDCs.
12. Rio+20 must reshape the Research for Development (R4D) institutions so that they can address sustainability issues from the perspective of transitioning to ecosystem based and people-centered approaches.
13. Rio+20 must recognize the urgent need for the public sector to fund research and development activities (as outlined in the IAASTD Report), since food security is a matter of national security and so falls within the responsibility of government. Public spending on research on agriculture must increase and the bulk of research should be refocused to agro-ecological solutions for the challenges ahead by promoting bio-diverse and resilient farming systems and enabling food sovereignty. There must be much higher investment in pro-smallholder science, technology, infrastructure, services and innovation.
14. Rio+20 must usher in an era of Rights based approaches in food and agriculture for small scale food producers, pastoralists, indigenous peoples, peasants and the rural poor in which the Right to Food, the Right to Free, Prior and Informed Consent, The Right to Justice, The Right to their land and resources and The Right to Protect and

Utilize their knowledge and innovations are acknowledged, respected and universally implemented and realized.

15. Rio+20 must ensure small scale food producers, pastoralists, indigenous peoples, peasants and the rural poor are provided with enhanced access to information as basis for decision-making; access to justice; and free, prior and informed consent for both policy development and implementation actions on the ground including issues that pose a threat to local food security, livelihoods and tenurial rights such as land-grabbing.

16. Rio+20 must guarantee the rights of small scale food producers, pastoralists, indigenous peoples, peasants and the rural poor to participate in decision making processes in all aspects of agriculture processes including production, distribution, pricing, marketing, standard setting, policy making and regulation of the agricultural commodities market, and empower them to exercise these rights.

17. Rio+20 must protect the rights of small-scale food producers, pastoralists, indigenous peoples, peasants and local communities to utilize their knowledge, resources, practices and innovations (including traditional and indigenous) and ensure their unimpeded access to them.

18. Rio+20 must recognize the importance of knowledge and innovations (including traditional and indigenous) of small-scale food producers, pastoralists, indigenous peoples, peasants and local communities for achieving sustainable development. This recognition must be part and parcel of the body of agricultural knowledge that includes Knowledge, Science and Technology. This is a very important for agriculture and sustainable development as farmer's knowledge is usually not peer reviewed.

19. Rio+20 must ban 'Terminator' type agricultural technologies. There are moves by some governments to overturn the global moratorium on 'Terminator' technologies. Rio+20 must urgently establish a global ban.

20. Rio+20 must condemn the patenting of genetic information (including multi-genome patent claims) and encourage governments to block or rescind such claims. Governments must also develop a clear intergovernmental process for examining the impact of intellectual-property regimes on living materials and processes.

21. Rio+20 must support in situ conservation and breeding strategies of peasant, communities and other small-scale producers. The diversity of the peasant food web offers enormous potential to respond to climate change and enhance nutrition security – yet it's under threat. The peasant food web conserves approximately 50,000 species of wild relatives, breeds and nurtures 7,000 food crop species and has contributed over 2 million food and feed varieties. Policies must strengthen their efforts to diversify the food web especially as the industrial food chain concentrates on just 150 species with almost all research focused on only 12 species.

22. Rio+20 must recognize the important role that States and donors have to play in the transition to socially inclusive and ecological based farming systems as agro-ecology is knowledge-intensive rather than external input / product / capital intensive and is therefore less attractive to private companies that develop and supply such products. As a consequence the transition will require public policies supporting agricultural research and the wide dissemination of outcomes and outputs including through the development of participative extension services.

23. Rio+20 must commit States to transition to an ecological-based and socially fair and inclusive food and agriculture systems as outlined in this document. States can immediately start to implement actions locally such as; prioritizing the procurement of public goods in public spending rather than solely providing input subsidies; investing in knowledge by reinvesting in agricultural research and extension services; investing in forms of social organization that encourage partnerships, including farmer field schools and farmers' movements innovation networks; investing in agricultural research and extension systems; empowering women; and creating a macro-economic enabling environment, including connecting sustainable farms to fair markets.

Specific Mechanisms & Actions for Implementing Outcomes & Decisions:

24. Rio+20 must give the FAO's Committee on World Food Security (CFS) a mandate to develop a work plan for implementing:

- a. the decisions of UNCSD 2012,
- b. the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD),
- c. the recommendations on agro-ecology by the United Nations' Special Rapporteur on the Right to Food in his report presented at the 16th Session of the United Nations Human Rights Council in March 2011,
- d. the relevant parts of Chapter 14 of Agenda 21, and
- e. UNCSD 16/17, making sure that the views and concerns of small scale food providers are taken into account

25. Rio+20 must establish an 'International Multi-stakeholder Panel on Agriculture and Food Systems', based on the IAASTD process and its objectives, that informs the transition to a green, fair, ecologically sound and humane agriculture through the provision of regular updates on Agricultural Knowledge, Science and Technology options that address food and water security within the context of sustainable development and which complements the role of the CFS of FAO.

26. Rio+20 must establish a new, broad, participatory and transparent UN environmental network. Within this network, Southern governments, backed by civil society, can coherently address the full range of climate, environmental and social issues currently covered by a variety of treaty bodies, funds and offices.

27. Rio+20 must support the adoption of a UN Declaration on Peasant Rights. Across the world, peasants and small farmers, agricultural workers and landless people are victims of violent oppressions, criminalization, discrimination, and expulsion and alienation from their lands and livelihoods. In order to address these unique patterns of violations, there is a need for specific provisions and mechanisms to fully protect the rights of peasants. An international instrument to respect, protect, fulfill, and uphold peasants' rights must therefore be created within the UN.

28. Rio+20 must establish a multi-stakeholder technology (bio, nano and geo-engineering) assessment and information mechanism at the global and regional levels that assesses the potential environmental, health and social economic impacts of new and emerging technologies based on the precautionary principle. Such a mechanism must be transparent and participatory and build the capacities of countries and communities in all aspects of technology assessment.

29. Implementation is urgent. States and donors as well as all other stakeholders need not wait for international agreements or mechanisms to be in place to start implementing the following:

- a. the decisions of UNCSD 2012,
- b. the findings of the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD),
- c. the recommendations on agro-ecology by the United Nations' Special Rapporteur on the Right to Food in his report presented at the 16th Session of the United Nations Human Rights Council in March 2011,

- d. the relevant parts of Chapter 14 of Agenda 21, and
- e. UNCSO 16/17, making sure that the views and concerns of small scale food providers are taken into account
- f. all points outlined in this document

---

## International Forum for Rural Transport and Development (IFRTD)

Mobility and accessibility is crucial for poor people in remote mountainous areas to pull themselves out of isolation and poverty. Environment friendly technology, therefore, must be used as leverage for empowerment. This, indeed, was the consensus among the participants at International Forum for Rural Transport and Development (IFRTD) organised international workshop on Transport in the Mountains held at the Godavari Village Resort in Kathmandu, Nepal in November 2010.

The workshop participants agreed to a Statement of Intent and some of them as mentioned below, are mentioned as key recommendations to the United Nations Conference on Sustainable Development (Rio+20), in regard to the transportation in the mountainous areas. It should be an important concern of governments, local governments, UN Agencies and other relevant sectors to ensure the environmental protection of the fragile and active mountains, to minimize the construction of conventional transport infrastructure (e.g. Roads).

The transport systems, infrastructure, services and means required by and available to poor people living in mountainous ecosystems may challenge our traditional perception of what are suitable and appropriate solutions. The participants have witnessed and commend the level of expertise that Nepal has on complementary technological solutions such as trail bridges, ropeways - including gravity ones - and trails which are essential in areas where access by roads is not economically and environmentally viable. Given the impact that such options can have on the lives and livelihoods of the poor and any technological options promoted should consider the necessary safeguards and maintenance required. Government Ministries, Departments and Agencies dealing with infrastructure, in general, and (rural) roads in particular must synchronize their efforts. Any Sector Wide Approach (SWAp) of a Ministry must clearly define how it interacts with other government bodies also dealing with infrastructure.

The current "island approach" where each institution operates as if the other does not exist affect negatively the effective use of limited public resources and must be avoided. Based on the experiences from developing countries with mountain regions, workshop participants believe that the following Good Governance principles should be introduced:

With respect to sustainable road construction:

1. Ensuring quality control of mountain roads by defining and enforcing norms, standards, and technologies.
2. Local communities must be informed, consulted and if possible involved in the planning, construction and maintenance of infrastructure passing their location or vicinity thereof.
3. Enhancing transparency and accountability markedly by introducing Cost Accounting and facilitating access to the accounts by the public through the web and other accessible information means.
4. Keeping Central and Local Governments more efficient by ensuring the safeguarding of natural resources and avoid constructions leading to man-made disasters.
5. Applying the Feasibility Study Approach to include procedures on how to compute the per km capita cost and requirements to adjustments with respect to Geology, Hydrology, Drainage, Resettlement-needs, and replacing (heritage) trails. The respective Ministries are to set the acceptable upper limits on the per capita cost and tolerable limits on the adjustments.
6. Workshop participants acknowledge the tensions between road infrastructure works and environmental protection. Thus it is very important to ensure that Environmental Impact Assessments and mitigation plans for environmental damage and biodiversity loss are comprehensive, well conceived and properly implemented. In view of increasing vehicle imports and the consequent air pollution, a favourable duty system for carbon emissions-free vehicles should be considered.
7. Workshop participants are conscious that the isolation of people living in mountains exacerbates their poverty and the conditions of inequality they face in our societies. Thus, workshop participants endeavor to continue exchanging ideas, identify areas of potential collaboration and promote this important debate at national and international levels.

The above extracts were taken from the Statement of Intent (The Godavari Statement of Intent) published at the conclusion of the International Workshop on Mountain Transport held in Kathmandu, Nepal, from 21 -27 November, 2010.

## International Human Rights Consortium, Worldwide Creative Solutions, LLC and the Spalding International BrainTrust

Uniting Nonprofit, Business, and Elected Officials

Using ABCDE Solution-Creating Model and Proposed Wellness Hubs

from International Human Rights Consortium, Worldwide Creative Solutions, LLC

and the

Spalding International BrainTrust

Media Motto:

"Honoring the past, acting in the present, and positively impacting the future."

Purpose: To bring together individuals, groups, peoples, and nations from different perspectives of expertise at local hubs (and virtually), to assess best overviews for

successful implementation and actionables with sensitivity to traditional roots and ways to revitalize living heritages to assist in the achieving of MDGs and beyond.

Special focus for Rio+20 "Inputs for Compilation Document, Co-Chairs' Guidance Note, Item 3 (c) and (d)"

Offering the ABCDE Method©

Apply a local "Appreciative Enquiry" Survey; then, create a small (no more than 10 individuals) solution-creating group composed equally of an (A) academic, (B) business person, (C) person representing culture and the arts, a (D) 'diplomat' or a respected, non-confrontational mediator type, and (E) a grassroots person who is known as a person who brings out the Excellence in others.

Give the group only five minutes to create a solution to an issue that is handed to them just prior to their 5-minute solution-creating task. Enjoy the plenarity of successes and breakthroughs!

From the March 2011 SIBT "The Fabric of Life: Reasons for Hope" prep for Rio+20 held at the School of Law, Wake Forest University, Winston-Salem, NC, USA and subsequent sessions. Utilizing the above ABCDE Method©, a number of proposals and commitments to the success of Rio+20 were made including the offering to assist work with interactive data collection of an International Organic Growers Cooperative--- working together for soil enrichment, water harvesting and oceanic/river healthy life, CO2 containments and other air concerns, organic vegetable household gardens and larger tended acreage, fish farming, and other opportunities for greater community garden sustainability research and production. Serving a as part of a larger interaction between traditional and interactive/biophysics wellness, sustainable equitable job production and rehabilitation of wounded persons, other species, and the life-giving forces of this planet. Using as three points of Phase I: The Peruvian Amazon Rainforest, The Triad of North Carolina, and partners in Africa including Lesotho, Ghana, and Liberia in its first phase.

For further information, contact: IHRC via [wspalding3@gmail.com](mailto:wspalding3@gmail.com)

## International Hydropower Association

### IHA MESSAGES FOR RIO+ 20 - HYDROPOWERING THE GREEN ECONOMY

The International Hydropower Association (IHA) was founded in 1995 under the auspices of UNESCO. It is an international not-for-profit organisation, established to further knowledge on all aspects of hydropower. IHA's mission is to advance sustainable hydropower by championing continuous improvement and sustainable practices, building consensus through strong partnerships with other stakeholders and driving initiatives to increase the contribution of renewable energy.

The International Renewable Energy Alliance (REN Alliance) was formed during the Bonn 2004 International Renewable Conference and has been established to advance policy and information on renewable energy by providing a combined voice for renewable energy technologies and practice. The REN Alliance goal is to advance policies that favour the increased deployment and use of renewable energy by fostering collaboration, removing barriers, promoting successful implementation strategies, enhancing business conditions and developing markets.

Renewable energy resources will be critical in meeting climate change mitigation and the Millennium Development Goals (MDGs). Furthermore, hydropower has a key role in both mitigating against further climate change and assisting in adapting to the effects of climate change: in mitigating further change, it is the largest renewable energy by capacity and a valuable renewable energy in its own right, and a key enabler, as the only viable energy storage technology, of the integration of other renewable energies. In adapting to climate change, multi-purpose storage projects provide significant water infrastructure benefits, often only paid for through the hydro generation element.

IHA presents the following key messages as input to Rio+20:

#### 1. Expectations for the outcome of Rio+20 and the associated outcomes document

##### 1.1 The role of renewable energies is identified as key to achieving sustainable development and climate change targets

1.2 The role of hydropower in contributing to both adaptation and mitigation is recognised; in mitigating against further climate change, a valuable renewable energy and a key tool in the integration of other renewable energies at required scales.

#### 2. Key actors for implementation of Rio+20 goals

Current opportunities for non-governmental, non-public-sector finance actors from the renewable energy and water sectors, to influence and provide guidance to policy-making on UN-level is limited, specifically private sector actors expected to contribute significantly to the Rio +20 goals.

Recognition of the key role of the private sector, and the facilitation of its involvement in system design and implementation, is proposed as fundamental to achieving the Goals. This involves recognition that the private sector cannot be treated as a single homogenous entity – key actors will be private sector players directly engaged with renewable energy, and, separately, water.

3. What are specific implementation tools and relevant time frames for implementation of Rio+20 goals? Implementation tools require frameworks designed to ensure that they are effective. Ensuring engagement of appropriate private sector representatives will facilitate implementation tools effective in delivering Rio+20 goals.

Specific to the hydropower sector, this technology must be developed in a sustainable manner to ensure that it realises its significant potential in contributing to the Rio+20 goals

The Hydropower Sustainability Assessment Protocol (the Protocol) is an enhanced sustainability assessment tool to measure and guide performance in the hydropower sector. The Protocol assesses the four main stages of hydropower development: Early Stage, Preparation, Implementation and Operation. Assessments rely on objective evidence to create a sustainability profile on some 20 topics depending on the relevant stage, and covering all aspects of sustainability. The Protocol is the result of intensive work from 2008 to 2010 by the Hydropower Sustainability Assessment Forum, a multi-stakeholder body involving representatives from social and environmental NGOs (Oxfam, The Nature Conservancy, Transparency International, WWF); governments (China, Germany, Iceland, Norway, Zambia); commercial and development banks (Equator Principles Financial Institutions Group, The World Bank); and the hydropower sector. More information can be found at: <http://www.hydrosustainability.org/>.

#### 4. Suggested objectives of the conference

Developing countries require significant increases in current energy capacity to meet MDG's. A key objective of the conference is to ensure that this increase in capacity is delivered in a manner that contributes to both climate change goals and MDG's. It is proposed that this will require recognition of the following objectives:

- A recognition of the fundamental role of renewable energies in achieving the goals;

- Facilitation of appropriate systems to ensure that renewable energies are able to meet these goals without perverse outcomes ( a systems approach to the integration of renewables energies into existing grids);
- Financing systems that allow for both large scale centralised integration of renewable energies, and that recognise the role that small scale renewable energies systems can play in addressing the MDGs in least development countries/ remote areas.

Adaptation will require significant investment in water infrastructure, investments that can be financed through appropriate hydropower development. A further objective should be facilitation of financial mechanisms to aid this investment, specifically incentivising traditionally non-financial elements of water infrastructure development, such as irrigation and flood control.

#### 5. Suggestions for the two conference themes

##### a) Green Economy

The Green Economy requires appropriate energy generation systems to support its implementation. The integration of renewable energies, as fundamental to the Green Economy, must be ensured. This integration must also be technology neutral, and focussed on systems that guide implementation without resulting in perverse outcomes.

##### b) Institutional Framework for sustainable development

Appropriate energy systems (and especially the required increases in capacity in developing regions) are fundamental to achieving the Rio+20 goals. Institutional frameworks to realise these systems demand increased collaboration between existing environmental, social, energy, economic, and climate change agencies. This entails recognition of the fundamental nexus between water, energy and food.

Furthermore, there needs to be stronger collaboration between different government bodies within countries, and also between national governments at the regional/international level, including collaboration between agriculture, energy, environment, development, finance, and water ministries and agencies. There also needs to be more opportunity for regional power pools and river basin organisations to play an increased role in future institutional frameworks.

Official pathways for public-private partnerships should be initiated and promoted by governments.

---

## International Indian Treaty Council

Monday, October 31, 2011

Secretariat, United Nations Conference on Sustainable Development (Rio + 20)

RE: Input and Contributions to the Rio + 20 compilation document to serve as a basis for the preparation of zero draft of the outcome document.

Dear UNCSD Secretariat,

The Dene Nation (Northwest Territories, Canada), the Nishnawbe Aski Nation (Thunder Bay, Ontario, Canada), the International Indian Treaty Council (IITC), the Indigenous Environmental Network (IEN), the Indigenous Peoples Council on Biocolonialism (IPCB), Indigenous World Association IWA, as well as Alaska Community Acton on Toxics (ACAT), and Ms. Mirna Cunningham, President, UN Permanent Forum on Indigenous Issues and on behalf of CADPI (Nicaragua), all Indigenous Nations, Organizations and individuals of the Arctic, North America and Mesoamerica and other regions<sup>1</sup>, present the following recommendations for the compilation document which will serve as a basis for the Zero draft of the outcome document of Rio + 20.

We acknowledge with approval the Manaus Declaration and in particular affirm the Conclusions and Recommendations adopted by Indigenous Peoples at the Preparatory Conference for the United Nations Conference on Sustainable Development, Rio + 20, June 4 – 6, 2012.

We affirm that Indigenous peoples and individuals are free and equal to all other peoples and individuals and have the right to be free from any kind of discrimination, in the exercise of their rights, in particular that based on their indigenous origin or identity.

#### A. Indigenous Peoples and UNCED (Rio)

As does the Manaus Declaration, we recall the United Nations World Conference on the Environment and Development (UNCED, more popularly known as the "Earth Summit" held in Rio de Janeiro, Brazil, in 1992. We note that Indigenous Peoples, although denied access to the UNCED, are prominently mentioned in the outcome documents and the activities that the United Nations committed to carry out, including: The Rio Declaration (Principle 22); Agenda 21 (Section 3 and Chapter 26 therein) The Statement of Principles of Forests (Principles 5(a) and 2(d) ); The Intergovernmental Panel on Forests (Theme: traditional forest-related knowledge); the Commission on Sustainable Development (Cluster: Roles of Major Groups including Indigenous Peoples and Chapter 26); and the Convention on Biological Diversity (Article 8j).

The Rio Declaration, in Principle 22, stated that, "Indigenous people and their communities... have a vital role in environmental management and development because of their knowledge and traditional practices. States should recognize and duly support their identity, culture and interests and enable their effective participation in the achievement of sustainable development."

Chapter 26 within Section 3, "Recognizing and strengthening the role of indigenous people and their communities," calls for the objectives of Agenda 21 to be accomplished, "in full partnership with indigenous people and their communities." Chapter 26 also recognizes Indigenous Peoples' traditional knowledge of ecology and sustainable development. It calls upon the states to strengthen and facilitate Indigenous Peoples' participation in their own development and in external development activities that may affect them: "Indigenous Peoples should be accorded greater self-control over Indigenous lands and resources, recognition of traditional subsistence practices and the strengthening of national legislation (26.3)."

Chapter 26 does not refer specifically to right to food, it provides for the protection and strengthening of indigenous peoples' access to and utilization of resources which form the basis for ensuring indigenous peoples' food security. Chapter 26.3 highlights the special status of indigenous peoples in the development process that is a basis for the control of land and resources necessary food security and food sovereignty. Chapter 26 also recommends, as activities in furtherance of Agenda 21, the ratification of international instruments relevant to Indigenous Peoples; action within the UN and international development agencies, including financial and technical support that incorporates the views of Indigenous Peoples and their organizations in the implementation and design of policy and; the adoption or strengthening of policies to protect Indigenous Peoples' intellectual and cultural property. (26.4 and 26.5)

Chapter 17 refers to Indigenous Peoples' traditional fisheries (17.17), the incorporation of traditional knowledge concerning marine ecosystems into domestic management

plans [17.75(b)] and the recognition of subsistence rights in the negotiation of international instruments on marine resources (17.83).

Chapter 11, "Combating deforestation," recommends Indigenous participation in state activities pertaining to forests [11.1(b)]; capacity building programs to facilitate research and implementation of measures to protect forest ecosystems and biodiversity [11.1(g) and 11.19]; the creation of protected reserves and areas, including the traditional territories of Indigenous Peoples [11.13(b)]; programs to support the participation of Indigenous Peoples in forestry management [11.13(i)], and support for Indigenous organizations and communities [11.14(c)(c)].

## B. Indigenous Peoples since Rio

It was not encouraging that in the 74 pages of the Commission on Sustainable Development's report on its second session, Indigenous Peoples are specifically mentioned only twice (paragraphs 100 and 101, under the heading, "health, human settlements and freshwater").

Other statements in Rio Documents with regard to Indigenous knowledge and its relevance to sustainable development have been effectively undermined by the focus of UNCED and the subsequent World Summit on Sustainable Development (2002), as well as other UN Conference such as the World Food Summit (1996) and the World Food Summit Five Years Later (2002). All of these Summits and Conferences called for more "sustainable" development and a reliance on globalization that has proven unsustainable and detrimental to global food and water security, the loss of biodiversity, deforestation, and an increased addiction on fossil fuels.

UNCED did not address the problem of over-consumption of the world's resources and the actual and growing inequitable distribution of wealth. Agenda 21 does not address the issue of wellbeing or how it is measured. It only addresses Gross National Product and defines "well being" in terms of dollars produced by development, but shared more "equitably." In effect, it called for more consumption and more development.

The rights of Indigenous Peoples have been universally recognized since UNCED in 1992 though the adoption in 2007 of the UN Declaration on the Rights of Indigenous Peoples, now supported by all States. As noted in the Manaus Conclusions and Recommendations, the UN Declaration is the now the accepted minimum standard which contains many provisions that are directly relevant to the issues under discussion at Rio + 20. Nevertheless, Indigenous Peoples rights have still not been mainstreamed or effectively safeguarded in the various processes which were created by the UNCED, nor, overall, in international discussions about development. Our lands and resources remain fodder for the machine that continues at an alarming, exponential rate to consume not only the world's biological diversity, but forests, waters and fisheries, air, and all that we hold sacred, including our cultures and identities. The focus of Rio + 20 and its slogan, "the green economy" promises to change very little."

In response, and do offer a different direction, we underscore the affirmation in the Manaus Conclusions and Recommendations that, in preparation for Rio + 20 as follows:

"Indigenous Peoples continue to challenge the development model based on resource extraction and market-based models, which fails to recognize that we human beings are an integral part of the natural world, and also fails to respect human rights, including the inherent rights of Indigenous Peoples. International standards like the UN Declaration on the Rights of Indigenous Peoples affirm that development is social and cultural, as well as economic. Indigenous Peoples maintain the right to define and freely pursue our own vision of development based on our needs, priorities, traditional understandings and responsibilities, including the cultural and spiritual relationships with the Natural World, our ancestral territories and the ecosystems that have sustained us since time immemorial. We also affirm our sacred responsibility to defend the lives and survival of future generations of our Peoples."

Indigenous Peoples have much to offer the world in maintaining its sustainability. Our vision of the Sacred relationship to our Mother the Earth is real and has allowed us to maintain the Earth's remaining biological diversity and its life creating and life sustaining capacity. Not considering humanity's relationship to the Earth and ensuring the Earth's capacity to create and maintain life can only lead to humanity's destruction.

Even by accepted western scientific measurement, the focus on globalized development is inexorably going down that destructive road. The world's monetary crisis should serve as a lesson on the greed and indifference to humanity and human rights that characterizes the liberalization of trade. Indigenous Peoples are most directly and most profoundly affected by this indifference. Now the rest of the world is as well affected by this crisis and its causes.

But all things are related. The relevance of the fact of Indigenous Peoples living in harmony and balance within very diverse ecosystems demonstrate the essential relationship between cultural diversity and biological diversity. The focus of UNCED and now, Rio + 20, on assigning monetary "value" to "ecosystem services" are themselves related to the creation of markets and the destruction of biodiversity and with that, the destruction of Indigenous cultures, of identities and sacred relationship with the Earth.

## C. Rio + 20 and the "Green Economy"

The themes of Rio + 20 promise much as did UNCED 20 years ago: "Green Economy in the context of sustainable development and poverty eradication;" and, "Institutional Framework for sustainable development." It is clear by the discussions so far, that the icons of 'green' including the solar panel, the wind turbine and the neon light bulb are not the sole agenda items. Global Industrialized Agriculture and biomass are included in the discussion on the "Green Economy."

As in the discussions on climate change, the Green Economy debate places great importance on renewable sources of energy and the production and manufacturing of materials now petroleum based, as the basis for a new vision of "sustainable development." The transition to the Green Economy calls for agriculture as the primary source of renewable material for bio-fuels and new technologies for non-petroleum based manufacturing. New biological technology is being touted as the provider of renewable and thus "sustainable" development, for food security, "clean" energy and poverty alleviation. As all things are related, it is no accident that the largest transnationals in the world are developing technologies on bio-mass and its use in renewable fuels and manufacturing materials.

A world-wide "bio-economy" is proposed as the solution to climate change and sustainable development. Again, as in proposals for "market based solutions" to climate change, the Earth's biological resources are the target for this new "green" economy and the markets that it will create. The very basis of life, genetic material, both plant and animal, become potential markets in this formula. The experience of Indigenous Peoples, particularly those that inhabit bio-rich environments, is that their lands, territories, waters and total environments are targets for the new technologies, industrialized agriculture and the concentration of productive lands, their lands, in the hands of the private few, for the production of so-called "renewable" resources.

Rio + 20 must include a deeper examination of global sustainability and not merely an opportunity for more markets and business as usual in the name of a "Green Economy". It is an opportunity to examine why the promise of UNCED, in spite of the many UN fora, conventions and subsidiary bodies that it created and the billions of dollars spent in its search for sustainable development, failed not only to alleviate poverty, but produced a major and growing loss of biological diversity, the pollution of the world's waters, oceans, rivers and streams, growing food insecurity and an unsustainable world economy. As in climate change, there is also an ecological debt outstanding. As many have said and are saying, "Business as usual is not an option. And Governance as usual is not an option."

Specific Text Recommendations for the Zero Draft

Zero Draft Preamble

Keeping in mind the United Nations Declaration on the right to development and its recognition that the right to development is an inalienable human right by virtue of which every human person and all peoples are entitled to participate in, contribute to, and enjoy economic, social, cultural and political development, in which all human rights and fundamental freedoms can be fully realized,<sup>ii</sup>

Noting the relevance of the United Nations Declaration on the right to development to sustainable development, that the human right to development also implies the full realization of the right of all Peoples, including Indigenous peoples, to self-determination, which includes, subject to the relevant provisions of both International Covenants on Human Rights, the exercise of their inalienable right to full sovereignty over all their natural wealth and resources,<sup>iii</sup>

Recognizing that sustainable development is a process that leads to the fulfillment of all human rights,<sup>iv</sup>

Recognizing and reaffirming the human rights basis of sustainable development and rejecting unsustainable development practices that violate human rights, in all programmes and outcomes of Rio + 20, States shall recognize, respect and fulfill all human rights and particularly the rights recognized in the United Nations Declaration on the right to Development as the right of all Peoples and individuals, emphasizing its goal of a participatory development by all,<sup>v</sup>

Keeping in mind, General Assembly Resolution A/Res/60/1 of 24 October 2005, on the outcomes of the World Summit, that: "the sustainable development of indigenous peoples and their communities is crucial in our fight against hunger and poverty", and its commitment,: "to respect, preserve and maintain the knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant to the conservation and sustainable use of biological diversity, promote their wider application with the approval and involvement of the holders of such knowledge, innovations and practices and encourage the equitable sharing of the benefits arising from their utilization"

Reaffirming the General Assembly's "commitment to continue making progress in the advancement of the human rights of the world's indigenous peoples at the local, national, regional and international levels, including through consultation and collaboration with them." in that same resolution,

Affirming that all decisions, programs and actions pertaining to sustainable development shall be carried out in conformity with international human rights norms and standards including the United Nations Declaration on the Rights of Indigenous Peoples.<sup>vi</sup>

Further affirming, the United Nations Declaration on the rights of indigenous peoples (2007) article 32 that the Right of Development for Indigenous Peoples must be based on the right to Free Prior and Informed Consent.

Operative paragraphs f of the Zero Draft

General Provisions

1. Indigenous Peoples have much to offer the world in maintaining its sustainability. Our vision of the Sacred relationship to our Mother the Earth is real and has allowed us to maintain the Earth's remaining biological diversity and its life creating and life sustaining capacity. Not considering humanity's relationship to the Earth and ensuring the Earth's capacity to create and maintain life can only lead to humanity's destruction.

2. But all things are related. The relevance of the fact of Indigenous Peoples living in harmony and balance within very diverse ecosystems demonstrate the essential relationship between cultural diversity and biological diversity. The focus of UNCED and now, Rio + 20, on assigning monetary "value" to "ecosystem services" are themselves related to the creation of markets and the destruction of biodiversity and with that, the destruction of Indigenous cultures, of identities and sacred relationship with the Earth.

3. Rio + 20 must include a deeper examination of global sustainability and not merely an opportunity for more markets and business as usual in the name of a "Green Economy". It is an opportunity to examine why the promise of UNCED, in spite of the many UN fora, conventions and subsidiary bodies that it created, the billions of dollars spent in its search for sustainable development, failed not only to alleviate poverty, but produced a major and growing loss of biological diversity, the pollution of the world's waters, oceans, rivers and streams, growing food insecurity and an unsustainable world economy. As in climate change, there is also an ecological debt outstanding. As many have said and are saying, "Business as usual is not an option. And Governance as usual is not an option."

The "Green Economy"

4. The call of UNCED for "national and international efforts to implement environmentally sound and sustainable development should recognize, accommodate, promote and strengthen the role of indigenous peoples and their communities" is reaffirmed along with a call for the full respect, protection and fulfillment of Indigenous Peoples' rights as recognized in the United Nations declaration on the rights of indigenous peoples, in all outcomes of Rio +20.<sup>vii</sup>

5. In this context, we continue to challenge the development model that promotes the domination of nature, relentless economic growth, resource extraction without limits with profit, consumption and production patterns, products and unregulated financial markets. The prevailing econometric system fails to understand that humans are an integral part of the natural world, and does not respect the inherent human rights, including rights of indigenous peoples. We believe that our world view and respect for natural law, our spirituality and culture and values of reciprocity, harmony with nature, solidarity, community, caring and sharing among each other, are crucial to a more just, equitable and sustainable.<sup>viii</sup>

6. The proposed "Green Economy" should be defined and differentiated from the model of development based on market approach and resource extraction. It is important that developed countries emphasize conservation and reduced consumption levels and that projects and proposals for sustainable development support the functioning, protection and restoration of Indigenous economies, food systems and local production, respect and implementation of human rights including the rights of indigenous peoples and respect for our development proposals. Any discussion of green economy must include full and effective participation and the Free, Prior and Informed Consent of indigenous peoples in all stages.<sup>ix</sup>

7. The "Cultural Pillar" should be adopted at Rio + 20 as the missing "4th Pillar" of Sustainable Development based on the perspectives, rights, traditional knowledge, cultural integrity, identity and sustainable practices of Indigenous Peoples which are integral to our vision, practice and understanding of development, thus effectively, reflecting the international accepted definition of the right to development, as a fundamental component of self-determination of all peoples.

8. The "Green Economy" shall focus sustained efforts to fund and ensure sustainable communities and not on global markets and globalized activity.

Poverty: Food Sovereignty as the basis of Food Security

9. Food Sovereignty is the right of Indigenous Peoples to define their own policies and strategies for sustainable production, distribution, and consumption of food, with respect for their own cultures and their own systems of managing natural resources and rural areas, and is considered to be a precondition for Food Security for Indigenous Peoples.<sup>xi</sup>

10. For indigenous peoples, "living well" is not about per capita income or economic growth; it is about cultural identity, harmony between human beings and Mother Earth. Living well is based on the values of the culture of life, coexistence and complementarities not only between individuals, but in the harmony between them and nature, responding to the protection of the common good and benefit of all life. Food sovereignty and food security is a crucial aspect of the notion of "living well" of indigenous peoples. Everyone has the right and responsibility to participate in the decision on how to produce and distribute food. The vision of food sovereignty entails transforming the current food system to ensure that those who produce food have equitable access to and control over, land, water, seeds, fishing and agricultural biodiversity.<sup>xii</sup>

11. Emphasizing the importance of ensuring sustainable access to water resources for agriculture to realize the right to adequate food, attention should be given to ensuring that disadvantaged and marginalized farmers, including women farmers, have equitable access to water and water management systems, including sustainable rain harvesting and irrigation technology. Taking note of the duty in article 1 in Common., which provides that a people may not "be deprived of its means of subsistence", States, international financial institutions and investors should ensure that there is adequate access to water for subsistence farming and for securing the livelihoods of indigenous peoples.<sup>xiii</sup>

12. Indigenous Traditional Practices related to agro-ecology, and various forms of food production (fishing, hunting, farming, gathering and pastoralism) as a basis of Food sovereignty, which also serve to protect biological diversity and traditional knowledge should be recognized and supported as alternatives to the non-sustainable industrial food production models, based on genetically modified seeds, plants and animals and the use of toxic pesticides and other agro-chemicals.<sup>xiv</sup>

13. In all processes related to Rio + 20, the rights to lands, territories and natural resources of the Indigenous Peoples, their vision of well-being and sustainability based on a harmonious relationship with the Natural World be formally incorporated, respected and included, as a vital contribution to prevent the urgent threats to the destruction of the global environment.<sup>xv</sup>

14. Indigenous peoples' guaranteed and uninterrupted access to and their utilization of their traditional lands, territories and resources is the basis for ensuring the preservation of biodiversity and indigenous peoples' right to food sovereignty and food security in their own means of subsistence and shall be a particular focus of all efforts, programmes and measures undertaken in furtherance of the outcomes and objectives of Rio + 20.

15. Indigenous knowledge and cultural heritage, innovations, technologies, traditional cultural expressions, indigenous peoples' spiritual beliefs and their relevance to sustainable development, food sovereignty and food security and the alleviation of poverty are inalienable and shall be recognized and protected in all intellectual property regimes and schemes.

16. Environmentally sound and sustainable development shall include Indigenous Peoples' right to development, including their right of free, prior and informed consent before any development activities are planned or implemented on their traditional lands and territories.

17. Recognizing the important contribution Indigenous Peoples' traditional knowledge of ecology and sustainability to sustainable development, the objectives of Rio + 20 shall be accomplished in full partnership with indigenous people and their communities and their right of free, prior and informed consent.

18. The traditional knowledge, held, used and transmitted to future generations by Indigenous women, particularly in regard to methods of adaption and mitigation must be respected, promoted and strengthened and that their roles as leaders and actors in all levels of discussion and decision making regarding sustainable development and wellbeing for Indigenous Peoples be respected and protected.<sup>xvi</sup>

19. Consistent with Agenda 21, Chapter 26, one global economic system of free markets for the world has proven to be destructive to sustainability, biodiversity, and water as a source of self sustaining production of means of subsistence, Indigenous Peoples food sovereignty, food security, cultures, spiritual lives and identities shall be protected.

20. Particularly for Indigenous Peoples and world sustainability, an alternative emphasis on sustainable communities and green economies should be emphasized;

21. Consistent with the United Nations Declarations on the Right to Development and on the Rights of Indigenous Peoples, we affirm Indigenous Peoples' right to participate in sustainable development as subjects and not objects of development. We further affirm Conclusion # 1 from the Manaus Declaration that "The United Nations Declaration on the Rights of Indigenous Peoples, adopted by the UN General Assembly in 2007 and now supported by all UN member States, provides a framework for the full and effective participation of Indigenous Peoples in all stages of the Rio + 20 process."

22. As 80% of the world's population is fed by small scale food producers, including Indigenous Peoples, industrialized agriculture is not a solution for Indigenous Peoples food security and food sovereignty as it creates poverty by displacing Indigenous and local communities from their lands and resources necessary for their subsistence, and leads to the loss of biodiversity, the pollution of our oceans, groundwater, rivers and streams; industrialized agriculture deprives small scale food producers and subsistence based indigenous food production of land, biodiversity and other resources causing even more poverty and food insecurity.

23. Existing human rights standards that call for the return of lands and territories taken from Indigenous Peoples without their free, prior and informed consent be returned to them shall be respected and affirmed, and States shall take effective measures toward environmentally sound and sustainable food sovereignty particularly for these lands and territories and Indigenous communities.

#### Water, Food security, Food Sovereignty

24. Indigenous Peoples' relationship with their lands, territories and water is the fundamental physical cultural and spiritual basis for their and humanity's existence and should be respected and protected for the benefit of humanity: This relationship to our Mother Earth requires us to conserve our freshwaters and oceans for the survival of present and future generations. We assert our role as caretakers with rights and responsibilities to defend and ensure the protection, availability and purity of water. We stand united to follow and implement our knowledge and traditional laws and exercise our right of self-determination to preserve water, and to preserve life.<sup>xvii</sup>

25. Indigenous peoples have the right to determine and develop priorities and strategies for the development or use of their lands or territories and other resources. States shall consult and cooperate in good faith with the indigenous peoples concerned through their own representative institutions in order to obtain their free and informed consent prior to the approval of any project affecting their lands or territories and other resources, particularly in connection with the development, utilization or exploitation of mineral, water or other resources.<sup>xviii</sup>

26. The UNESCO Universal Declaration of Cultural Diversity (2001) and the Johannesburg Declaration on Sustainable Development (2002) urges the dialogue and cooperation within human society and among cultures in order to wisely use and sustainably manage earth's resources. Water is a vital resource, having economic, ecological, social and spiritual functions. Consequently its management determines to great extent sustainability. Due to its fundamental role in society's life, water has a strong cultural dimension. Without understanding and considering the cultural aspects of our water problems no sustainable solution can be found.<sup>xix</sup>

27. UNESCO lists issues that must be positively addressed at Rio + 20 in order to find sustainable solutions to the world's water and food crisis:<sup>xx</sup>

- Relations between peoples and their environment are embedded in culture.

- The ways in which water is conceived and valued, understood and managed, used or abused, worshipped or desecrated, are influenced by the cultures of which we are a part.
- Water is life, physical, emotional and spiritual. It should not be considered merely as an economic resource. Sharing water is an ethical imperative and expression of human solidarity. The intimate relationship between water and peoples should be explicitly taken into account in all decision-making processes.
- As the frequent failure of "imported solutions" has proven, water resources management will fail without the full consideration of these cultural implications.
- Cultural diversity, developed during the millennia by human societies, constitutes a treasure of sustainable practices and innovative approaches. Indigenous knowledge holders should be full partners with scientists to find solutions for water-related problems.
- Indigenous ways of life and knowledge are an integral part of humanity's heritage and cultural diversity. Indigenous peoples have an important role to play in sustainable water resources management. In this context, due respect must be given to indigenous peoples' rights.

#### Treaty Rights, Food Security and Food Sovereignty

28. "Our ancestors in some areas have secured our traditional ways and food systems in Treaties. These international agreements were signed for "so long as the sun shines, the grass grows, and the rivers flow"<sup>xxi</sup>

29. "The Privilege of hunting, fishing, and gathering the wild rice upon the lands, the rivers and the lakes is guaranteed."<sup>xxii</sup>

30. Indigenous Peoples' have stated that Inherent and Treaty Right to Food<sup>xxiii</sup> includes the need to:

1. Affirm that our Right to Food is an Inherent Right affirmed in our Treaties, and that Food Sovereignty is an essential aspect of our Sovereignty as Treaty Nations.
2. Affirm that our traditional foods are essential to our physical, cultural and spiritual health, identity and survival.
3. Recognize that the Creator placed us on our traditional lands and provided clean food and water for our health and survival and that we have a inherent and Treaty right and responsibility to care for and protect the land, plants, animals and water, and our sacred Mother Earth as a whole, from destruction and contamination.
4. Affirm that any attempt to restrict or curtail our rights to hunt, fish, grow or gather our traditional foods and to use the water on our Treaty lands by federal, provincial or municipal government laws, regulations or ordinances are fundamental violation of our human rights and Treaty rights, including our Treaty Right to Food.
5. Recognize the negative impacts of imposed development such as mining, damming, drilling, Tar Sands extraction and clear cutting, as well as climate change and environmental contamination on our traditional foods and water sources. We recognize our Inherent and Treaty rights and responsibilities to care for and protect the food and water sources that have been the basis of our survival since time immemorial.
6. Recognize that we continue to have the traditional knowledge and wisdom within our Nations about how to use and protect our traditional foods, and that our elders, spiritual leaders and other traditional practitioners carry this knowledge as passed down from our ancestors.
7. Recognize the urgent need to make sure that our children, young people and future generations learn about our Treaty Rights, including our Treaty Right to Food and how to use and care for our traditional subsistence foods, waters and medicines. This is fundamental for our continued survival.
8. Recognize the importance of re-establishing the traditional trade relationships that always existed between our Nations as part of our Indigenous development, Nation-to-Nation relations, and food sovereignty; we recognize the importance of reestablishing these Indigenous trade relations that include the exchange of traditional foods and knowledge as a response to the urgent situations now facing many of our Nations as their traditional foods become more scarce (such as urbanized areas).
9. Call upon all of our Treaty Nations to assert and put into practice these rights and responsibilities, to exercise their Inherent and Treaty Right to Food and Food Sovereignty on their traditional and Treaty lands, to protect these resources from contamination and destruction, and to accept this responsibility for the survival of our Nations, especially our children, grandchildren and future generations.

31. An objective of Rio + 20 shall be to ensure the implementation of Treaty Rights to Food and Food Sovereignty in accordance with these internationally binding treaties and agreements made between Indigenous Peoples and Colonialist States and their successors.

#### Indigenous Women: Biodiversity, Climate Change, and Food Sovereignty

32. The UN Rapporteur on the Right to Food Olivier de Schutter reported to the UN Human Rights Council 10th session in March 2009 that "Climate change constitutes the single most important threat to food security in the future".<sup>xxiv</sup>

33. "Indigenous women are life givers, life sustainers and culture holders. Our bodies are sacred places that must be protected, honored and kept free of harmful contaminants in order for the new generations of our Nations to be born strong and healthy."<sup>xxv</sup>

34. Indigenous knowledge systems and the diversity of life within our territories are collective resources under our direct control and administration. Indigenous women play a key role in the protection and maintenance of the biodiversity in diverse ecosystems including forests, dry and sub-humid, inland waters, and marine and coastal, mountains regions. Our lifeways, our artistic expressions, are dependent on and the bounty of the land. Any erosion of biodiversity irreversibly impacts not only our Indigenous cultural heritage but the ability of the world to sustain itself and its future generations.<sup>xxvi</sup>

35. Medicinal knowledge of Indigenous women is widespread and in their vast expertise, they are our midwives, spiritual leaders, healers, herbalists, botanists and pharmacists. Their knowledge, use and control of these medicinal plants must be protected from external research and commercialization efforts in order that they continue to heal us and maintain all related biodiversity necessary for sustainability and food sovereignty.<sup>xxvii</sup>

36. Technologies and policies such as the Intellectual Property Rights (IPR) regimes that violate Indigenous Peoples' rights to maintain our traditional knowledge, practices, seeds and other food related genetic resources threaten biological diversity and food sovereignty and food security. The introduction of genetically engineered life-forms, and genetic use restriction technologies (GURTs) which pose serious negative impacts to biodiversity as well as Indigenous peoples' food security, health, environment, and livelihoods,<sup>xxviii</sup>

37. Indigenous communities have been and continue to be expelled from their lands and to be victimized by the despoilment of their lands and sacred sites, on the pretext of the establishment of protected areas and national parks. The rights of Indigenous women and all Indigenous Peoples should be restored and that these acts, which violate

our human rights and the rights of women, cease immediately.<sup>xxix</sup>

38. Protected Areas should serve to protect Indigenous and local communities, who should manage and control those areas consistent with the rights of local communities and the UN Declaration on the rights of Indigenous Peoples. Protected areas should protect their biodiversity, for future generations. Unsustainable logging, mono-crop industrialized agriculture, mining and mineral extraction should not be permitted. Concerted efforts should take place to restore and sustain their sustainability as communities.

39. Adequate compensation for all the past wrongs and damages inflicted by the establishment of protected areas should be provided for their restoration and protection.

40. Current debate regarding the protection of traditional knowledge and genetic resources that is taking place in various UN fora is centered on mechanisms for exploitation of these resources, not their protection. These discussions focus on the use of Western Intellectual Property Rights to be used as the mechanisms for the protection of Indigenous knowledge. These mechanisms are not only inadequate, but dangerous to biodiversity and life itself, creating markets for the very source of life, subjecting it to commercialization and exploitation.

41. To ensure that truly sui generis systems of protection of Indigenous peoples are adequate to the task, sui generis systems of protection should be based on Indigenous customary laws and traditional practices. Indigenous existing protection systems are legitimate on their own right and any new mechanisms for protection, preservation and maintenance of traditional knowledge and associated biological resources must respect and be complementary to such existing systems and not undermine or replace them.<sup>xxx</sup>

Forests and Climate Change including Global Warming, REDD, and Biodiversity

42. The potential loss of traditional knowledge and of the cultural and spiritual identity of indigenous peoples and local communities shall be addressed in any safeguards, including the concern that REDD-related payments could alter and undermine the traditional way of life and related knowledge and customary practices of indigenous peoples and local communities. REDD-plus efforts should build on community-based governance systems, and acknowledge the shared responsibility of national governments in strengthening community-based institutions of indigenous and local communities with regards to the sustainable management, use, and control of biodiversity and natural resources.<sup>xxxiv</sup>

43. There is a need for monitoring the impacts of REDD-plus on indigenous peoples and local communities, in accordance with the main risks identified by the Nairobi Global Expert Workshop. Indicators could include: (i) indicators on full and effective participation; (ii) status and trends of boundaries of indigenous territories, land tenure, and access rights; (iii) involuntary resettlements; (iv) changes in livelihoods and traditional knowledge related to REDD-plus, and (v) gender equality and rights and livelihoods of women. However, it should be noted that the social indicators identified here are not necessarily indicators to be used at global level, and that any monitoring of social impacts on a significant scale will be costly and requires adequate resources and capacity.<sup>xxxv</sup>

44. The Cultural Indicators for Food Sovereignty and Sustainable Development, the Indigenous Peoples' Indicators of Bio-diversity and the "Indicators of Well-being", developed by the UN Permanent Forum shall be considered and applied as important assessment tools directly related to the themes of Rio+20 and should be used as a basis of indicators for any assessments of programmes and policies of Rio+20.<sup>xxxvi</sup>

45. Indigenous women and peoples and local communities can also be essential in cost- effective monitoring of impacts of REDD-plus on biodiversity. This could include links to indicators about traditional knowledge, for example the quality and quantity of natural resources and biodiversity that is used for traditional purposes such as cultural ceremonies.<sup>xxxvii</sup>

46. The detrimental effects of climate change are most directly, immediately and most acutely felt by Indigenous Peoples in the Arctic Region where the overall magnitude of warming in the Arctic is nearly twice that of the global average. The Arctic is a hemispheric sink for persistent organic pollutants (POPs) many of which originate from thousands of miles away, traveling northward via oceanic and atmospheric currents. POPs accrue in the north through global distillation, as the cold climate and fat-based food web favor retention of pollutants. Arctic Indigenous Peoples suffer levels of POPs contamination in blood and breast milk that are among the highest of any population on earth, even though these chemicals have never been produced in the Arctic. Because of this long-range transport of POPs, even those toxic chemicals that have been banned (e.g. DDT and PCBs) continue to accumulate in the Arctic and sub-Arctic and certain currently used POPs such as PBDEs and PFCs are increasing exponentially. Increasing global temperatures accelerate transport and mobilization of POPs into and within the Arctic. Contaminants threaten the health of present and future generations of Indigenous Peoples who rely on traditional diets of fish and marine mammals, and their biodiversity and Food Sovereignty.<sup>xxxviii</sup>

47. We call for the rapid phase-out of chemicals that are subject to long-range transport and that cause adverse health effects, including those chemicals that are carcinogenic, cause harm to learning and neurodevelopment, damage the immune system, or disrupt our endocrine and reproductive systems.<sup>xxxix</sup>

48. Indigenous Peoples continue to reject market-based mitigation and adaption models regarding climate change and reaffirm paragraph 6 of the "Anchorage Declaration" regarding carbon markets and forest offsets, as follows: "We challenge States to abandon false solutions to climate change that negatively impact Indigenous Peoples' rights, lands, air, oceans, forests, territories and waters. These include nuclear energy, largescale dams, geo-engineering techniques, "clean coal", agro-fuels, plantations, and market based mechanisms such as carbon trading, the Clean Development Mechanism, and forest offsets. The human rights of Indigenous Peoples to protect our forests and forest livelihoods must be recognized, respected and ensured."<sup>xli</sup>

49. Mining is an activity that produces large amounts of environmental contamination, including greenhouse gasses, and is vastly destructive to natural ecosystems, biodiversity, our health and well being, and the water and food sources upon which Indigenous Peoples and other communities depend. We therefore call for a moratorium on mining in fragile and culturally important ecosystems such as forests, deserts, near water sources, in sacred, subsistence, in fragile arctic ecosystems and in or near the traditional lands or territories of Indigenous Peoples.<sup>xlii</sup>

50. Particularly environmentally and biologically damaging fossil fuel extraction such as hydraulic fracturing (fracking) and tar sands oil extraction should immediately be reduced and eliminated.

51. Principle 16 of the Rio Declaration on Environment and Development should be fully implemented, requiring all polluters to internalize the environmental cost of their pollution. National authorities should promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution.

Agriculture, Sustainable Development, Food Sovereignty, Biodiversity, and Poverty

52. Agricultural methods and practices used traditionally by Indigenous communities based on safe alternatives to toxic pesticides be recognized and supported. The "precautionary approach" (principle 15 of the Rio Declaration on Environment and Development) is reaffirmed at Rio + 20, together with a renewed commitment by States to eliminate the production, use and dumping of chemicals that are toxic, persistent and hazardous that pose dire threats to the health of impacted communities and ecosystems, and most of all violate human rights; including the rights of Indigenous Peoples to free, prior and informed consent as stated in Article 29 of the UN Declaration on the Rights

of Indigenous Peoples. We call upon States to make a commitment to utilize and implement the Precautionary Principle as an alternative to the models of “risk assessment” and “management” of toxic chemicals presented in sections 19 and 20 of Agenda 21<sup>xliii</sup>.

53. The practice of exporting banned pesticides and other chemicals by the USA and other States should cease immediately. The provisions within UN Conventions and national laws which permit this practice without the free, prior and informed consent of the Indigenous Peoples and communities, who may be impacted at the source of exposure as well as through global transport, be reviewed immediately and revised.<sup>xliiv</sup>

54. The indiscriminate use of pesticides and other toxic chemicals promoted and applied by industry poisons the food chain and causes involuntary infertility, premature births, and severely affects infant health. Environmental reproductive justice must address involuntary infertility and the inordinately high level of birth defects among Indigenous Peoples and other local communities exposed to these agricultural toxics, and the disproportionate numbers of premature births, miscarriages, and developmental disabilities that is occurring with alarming frequency and part of a global trend. Impaired fecundity over the past two decades has increased in all reproductive age groups, but most sharply in younger women under age twenty-five. Data (together with a growing body of epidemiological research) show a causal link between male and female fertility impairment and a wide array of modern chemicals.<sup>xliv</sup>

55. Indigenous Peoples, and in particular women and children suffer the detrimental, devastating, multi-generational and deadly impacts of environmental toxins and contaminants that were unheard of in their communities prior to industrialization, including:

- Contamination of mothers’ breast milk at 4 to 12 times the levels found in the mother’s body tissue in some Indigenous communities;
- Elevated levels of contaminants such as POPs and heavy metals in infant cord blood; Disproportionate levels of reproductive system cancers of the breasts, ovaries, uterus, prostate and testicles, including in young people;
- Increasing numbers of miscarriages and stillbirths, and;
- High levels of sterility and infertility in contaminated communities.<sup>xlvi</sup>

56. States, international financial institutions, United Nations programmes and actions, as well as private investors and corporations must do due diligence and fully disclose to all Indigenous Peoples, Nations, tribes, and communities, their activities and potential risks. Peoples and individuals who may be affected by or exposed to pesticides, mining, dumping, incineration and other forms of toxic chemical production, the complete known or suspected affects of the chemicals in question, the location and names of corporations producing them, any current or prior legal sanctions or cases filed against them, the Indigenous Peoples in the same or other countries who have experiences with the given process or corporation, so that informed decisions can be made as part of Indigenous Peoples right to free, prior and informed consent.

57. Commercial pressures on land are rapidly growing. Biofuels, large-scale infrastructures projects, carbon-credit mechanisms, and speculation lead to rapid changes in land rights, creating new threats for vulnerable land users, particularly Indigenous Peoples. Climate change and population growth will exacerbate tensions within countries and between them. Guidelines on land governance, consistent with the UN Declaration on the rights of indigenous peoples and other International human rights Standards should be adopt rules on land investment, and harmful investments to the detriment of local populations – so- called land grabbing - be warded off by securing the underlying rights of indigenous peoples, small scale farmers, herders and fisherfolk.<sup>xlvii</sup>

58. States, International financial institutions and other investors must strengthen security of tenure for small-scale food producers, such as Indigenous Peoples, smallholder farmers, nomadic herders, and fisherfolk, all of whom are gravely threatened by the current commercial pressures on land.<sup>xlviii</sup>

59. In encouraging responsible investment in land, States should be wary of the dangers of speculation over land and concentration of ownership when land rights are transferred to investors offering to ‘develop’ farmland. We must escape the mental cage that sees largescale investments as the only way to ‘develop’ agriculture and to ensure stability of supply for buyers. Focus should be placed on the improvement of access to markets for Indigenous Peoples and other small-scale farmers.<sup>xlix</sup>

#### Institutional Framework f or Sustainable Development:

##### Governance

1. The Precautionary Principle, Principle 15 of the Rio Declaration on Environment and Development shall be applied to all technologies and practices, existing and proposed for sustainable development by Rio + 20. “In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.”

2. The Polluter Pays, Principle 16 of the Rio Declaration on Environment and Development should be fully implemented, requiring all polluters to internalize the environmental cost of their pollution. National authorities should promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution.

3. The focus of Rio + 20 shall be on sustainable “communities” and not on sustainable “development.”

4. Food Sovereignty should be the framework for food security and the alleviation of poverty.

5. The “Cultural Pillar” be adopted at Rio + 20 as the missing “4th Pillar” of Sustainable Development based on the perspectives, rights, traditional knowledge, cultural integrity, identity and sustainable practices of Indigenous Peoples which are integral to our vision, practice and understanding of development, thus effectively, reflecting the international accepted definition of the right to development, as a fundamental component of self-determination of all peoples.

6. All Human Rights, particularly the rights recognized by the United Nations Declaration on the rights of indigenous people must be recognized, protected and fulfilled by States, international funds and financial institutions and private investors, in all Rio + 20 programmes, actions and activities,

7. Reliance on carbon fossil fuels must be reduced as it is the major element in the world’s unsustainable and environmentally damaging economy. False market solutions such as carbon trading, carbon offsets and the creation of markets in sequestration have not worked and have actually led to higher carbon emissions, the loss of biological diversity, land grabs, forced displacement of Indigenous Peoples and local communities, and the violations of human rights, and should be rejected.

8. A moratorium shall be declared for the development of the extraction of fossil fuels; particularly environmentally and biologically damaging fossil fuel extraction such as fracking and tar sands oil extraction should immediately be reduced and ultimately eliminated.

9. Industrialized agriculture and particularly its introduction of genetically modified seeds and foodstuffs, toxic chemicals, non-native species and the production of bio-fuels and other non-food plants are not a solution to sustainable development and actually lead to the mounting loss of biodiversity, displacement of indigenous and local

communities, the loss of livelihood and the loss of production of means of subsistence.

## International Institute for Sustainable Development (IISD)

Joint Submission to the UN Conference on Sustainable Development, Rio+20:

A pledge to phase out fossil-fuel subsidies

This submission proposes that, at the UN Conference on Sustainable Development on June 4-6, 2012, countries adopt a pledge to phase out fossil-fuel subsidies and provide the necessary technical and financial support to assist developing countries reform their subsidies.

Fossil-fuel subsidy reform has become an international priority. Already, 53 countries in the G-20 and APEC forums have committed to phasing out fossil-fuel subsidies over the medium term. The United Nations Conference on Sustainable Development, Rio+20, is an opportunity to expand that commitment, and to broaden the pledge beyond the G-20 and APEC countries.

From a sustainable development perspective there is a strong argument for reforming fossil-fuel subsidies. If the goal of sustainable development is the balancing of economic, environmental and social considerations, then fossil-fuel subsidy reform delivers on all three fronts:

1. Fossil-fuel subsidies are costly. Global fossil-fuel consumption subsidies amounted to US\$409 billion in 2010 (International Energy Agency (IEA), 2011). In addition, the OECD estimates that subsidies for fossil-fuel production and consumption in its member countries cost US\$45-75 billion annually (OECD, 2011). Globally, producer subsidies are estimated by the GSI to be at least US\$100 billion annually (GSI, 2010).

2. Phasing out fossil-fuel subsidies would reduce growth in global energy demand by 4.1% and carbon dioxide emissions by 4.7% by 2020 (IEA, 2011). Fossil-fuel subsidies create incentives for higher levels of consumption, which in turn produce more local and global pollutants on behalf of both industry and consumers.

3. Fossil-fuel subsidies are socially regressive; the IEA estimates that only 8% of the US\$409 billion spent subsidizing fossil-fuel consumption went to the poorest 20% of the population. While fossil-fuel subsidies are often designed for the interests of poorer populations, they typically benefit medium- to high-income households or lead to diversion. Subsidy reform should be complemented with measures to protect poor and vulnerable groups in society.

The G-20 and APEC commitments have helped to raise the political importance of subsidy reform and have led to increased international activity on the issue. Building on that foundation, we encourage United Nations Member States to use Rio+20 to widen the country coverage of the reform commitments and endorse a comprehensive strategy for fossil-fuel subsidy reform, including technical and financial assistance for developing countries.

By adopting a pledge to phase out fossil-fuel subsidies at Rio+20, Member States would show their commitment to an important means to achieving sustainable development. The pledge could also be expanded to include subsidies to other energy sources, such as nuclear, for greater impact.

The undersigned organisations propose that countries adopt the follow pledge:

COUNTRIES PLEDGE TO:

1. Phase out fossil-fuel subsidies that undermine sustainable development.

2. Assist developing countries to phase out fossil-fuel subsidies that undermine sustainable development. IN ADDITION, COUNTRIES PLEDGE TO PROVIDE THE FOLLOWING SUPPORTING MEASURES:

1. Reporting and Review Countries commit to annual reporting of:

- a. Prices they charge each consumer group for each energy product. These reports should be delivered to an international organisation such as the IEA, a UN agency or another organisation experienced in collecting data.
- b. Subsidies they grant to fossil-fuel consumers and producers. Existing reporting mechanisms, such as the World Trade Organization's Agreement on Subsidies and Countervailing Measures (ASCM) or UNFCCC National Communications, are recommended for this process. More specific formats for reporting could also be used, such as those developed by the IEA (energy consumers) and OECD (energy producers and consumers).
- c. Subsidy reform, detailing the subsidies under reform, progress towards reform and the expected outcomes. Countries should review progress against the commitment annually, using a peer review process or delegating to a third party such as an international organisation. All reports and reviews should be made public. Databases of energy prices, subsidies and subsidy reform should be developed and maintained.

2. Technical and financial assistance for developing countries

Technical and financial assistance may be needed to help governments improve their reporting of subsidies or to assist industries or consumers transition away from fossil-fuel subsidies. For example, assistance may be needed to establish a transparent pricing mechanism, design social safety nets (such as a cash transfer), finance cash transfers or restructure investment incentives. Technical and financial assistance can be provided directly or through organisations such as intergovernmental organisations and development banks.

3. Common research and analysis

While country-specific considerations are important, common problems are faced across the world, and solutions in one country can have generic application in many others. Setting up a common research and analysis program to support the Pledge initiative is proposed.

4. Secretariat support

Countries will investigate options for providing Secretariat support to countries. This is likely to include meetings of officials and expert groups to facilitate the exchange of information and best practices This proposal is submitted on behalf of:

## International Institute of Monetary Transformation (IIMT)

### MONETARY JUSTICE:

The Guiding Principle of Global Governance?

A contribution to the UN Commission for Sustainable Development's Compilation Document serving as the basis for preparing the zero draft of the outcome document of Rio 2012 Earth Summit

Frans C. Verhagen, M.Div., M.I.A., Ph.D., sustainability sociologist

International Institute of Monetary Transformation, [www.timun.net](http://www.timun.net); [gaia1@rcn.com](mailto:gaia1@rcn.com)

<http://ipra-peace.com/index.html>

New York City

October 28, 2011

"As to methods there may be a million and then some, but principles are few. The man who grasps principles can successfully select his own methods. The man, who tries methods, ignoring principles, is sure to have trouble."

Ralph Waldo Emerson, 1890s

### INTRODUCTION

A main theme of Tierra Fee & Dividend (TFD) system, following Emerson's observation, is the need to first search for principles before searching for methods. One of the main shortcomings in UN conferences and negotiations seems to be a basic lack of interest, unwillingness, or inability in dealing in a substantial and coherent way with the ethical dimension of the various global challenges the UN and the world community face.

Thus, the main premise of the TFD system is that no stability in the monetary, financial, economic and commercial systems is possible without the principles of equity and sustainability. Underlying the principle of monetary sustainability is the principle of monetary justice not only in its social, ecological and procedural meanings, but especially in its transformational meaning as the foundation of a carbon-based international monetary system. Monetary justice is proposed here to be the main guiding principle that unifies many other important principles as spelled out in the recent Bonn DPI/NGO Declaration. Monetary justice is proposed here to function as the organizing principle for the much discussed integration of the three pillars of sustainable development as called for by the UN SG Report of December 2010 and in various DESA Reports. Consequently, monetary justice is presented as the guiding principle for sustainable global governance or, in Rio 2012 terms, as the guiding principle for the development of a global institutional framework that can lead to green economies and low-carbon and climate resilient development.

The world over millions of people are demonstrating and protesting in various Occupy settings the gross inequality between people and demand basic overhaul of the monetary, financial, economic and commercial systems, because these systems do not work for the 99% of them as these systems continue to enrich the few, impoverish the many and imperil the planet. It is most important that government, business and civil society leaders in the Rio process respond to this demand for fundamental and transformational change. The TFD system is presented as a transformational pathway of an integrated solution to a non-working international monetary system, an increasing global threat of catastrophic climate change and an unsustainable model of development.

### WHAT IS MONETARY JUSTICE?

International monetary justice is the application of social, environmental, procedural and intergenerational justice principles to the international monetary system with its volatile exchange rates, imbalances in the balance of payments, fluctuating national and reserve currencies and an expensive global reserve system that costs non-reserve currency nations hundreds of billions annually. These justice principles also apply to domestic or regional monetary policies, which, in this globalizing world, are ever more intertwined as has become very apparent in the upheavals in the euro-zone countries.

There is little social monetary justice in the present international monetary system because this most basic system supports financial, economic and commercial systems that enrich the few and impoverish the many. Because of an unnecessary global reserve system, developing countries pay about \$100 billion annually to maintain a 3 or 4 month supply of hard currencies. Nobel Economics laureate Robert Mundell has called this monetary system a "non-system" and "criminal." There is also little environmental or climate justice in the international monetary system because it imperils the planet's climate and other Earth's services by supporting those other international systems that continue to cause environmental damage, particularly climate damage.

There is also little procedural justice in the international monetary system because the major decisions are controlled by the industrialized nations using the rules of the IMF, Bank of International Settlements, World Bank and the World Trade Organization to set monetary rules of the road. One of the major reasons for both the Great Depression of the 1930s and the Great Contraction at the end of last decade is the instability of the international monetary system due to the lack procedural justice where rules of the road were and are presently set within a context of great inequality.

There is also little intergenerational justice in the international monetary system because the present international monetary leadership thinks short-term and is unable to take the hard decisions for fundamental reform. The recent euro agreements are more stopgap measures than measures of monetary craft for the common well-being of present and future generations. In conclusion: Without monetary justice no monetary stability and sustainability is possible.

### MONETARY JUSTICE IS IMPORTANT AND POSSIBLE

The international monetary system is the foundation upon which the other international systems rest. It functions as glue according to monetary historian Eichengreen, binding the monetary, financial, economic and commercial systems together. Pope Pius XI pointed to the lending of money as the life blood of the economic system—another

metaphor indicating the connectedness of the monetary system with the economic system. However, the present international system is inequitable and, therefore, unstable and unsustainable. Monetary justice in its transformational sense of unifying the various forms of justice is necessary to transform it.

Needed for this transformed international monetary system is a plan that would lead to a financial system that is credit- rather than debt-based and that would be democratically governed by a Global Central Bank. The Chicago Plan of the 1930s was proposed by many outstanding economists to deal with the Great Depression. It withdrew the privilege of fractional reserve banking by privately-owned banks, making them utilities without the privilege of creating money.

Monetary justice in its transformational meaning demands realigning the inequality in the monetary system by the adoption of a standard, not a gold standard but a carbon standard that introduces fixed exchange rates and currencies, reduces volatility, affords little opportunity for currency manipulation and speculation and removes the need for a costly global reserve system.

Such carbon-based international monetary system is possible if government, business and civil society and particularly their leaders are able to think outside the box. Such thinking is demonstrated by Maurice Strong who believes that basing the international monetary system on a carbon standard is "innovative" and that such system "seems to be very promising particularly in light of the stalemate in post-Kyoto prospects". (October 8, 2011 email); by author Bill McKibben, leader of the global [www.350.org](http://www.350.org) who believes a carbon-based international monetary system "deserves careful attention" in these times where politics and biology increasingly intersect and demand a global solution; by those who signed an international petition entitled "Make monetary justice the basis of your Rio negotiations" at <http://www.change.org/petitions/g20-and-rio-summitteers-make-monetary-justice-the-basis-of-your-negotiations>

#### MONETARY JUSTICE AND THE 21st CENTURY CARBON MONETARY STANDARD

Proposals for monetary reform, not monetary transformation, suggest moving away from the US dollar as reserve and vehicle currency to a basket of currencies, a particular set of commodities or the IMF's Special Drawing Right (SDR). A carbon-based international reserve currency could even be a possible alternative. However, all these reforms make an ineffective system a little less ineffective. Others want to return to a gold standard. This standard, never perfect in the past, has rigidity and liquidity problems. Moreover, given the expanding global economy, there would not be enough gold to meet the needs of all.

The International Institute of Monetary Transformation has developed a carbon-based monetary standard with the Tierra as its unit of account. It is set to a specific ton of CO<sub>2</sub>e per person, determined by the GHG emission targets set by the IPCC. It is based upon the assumption that the control of the changing climate is humanity's foremost challenge in the 21st century and that climate justice is an essential value in redressing the ecological imbalance caused by the ecological indebtedness of industrialized nations. This standard would transform the international monetary system and go beyond the suggested monetary reforms.

This transformed, i.e. carbon-based, international monetary system is integrated with the Fee & Dividend carbon reduction method as opposed to the cap-and-trade and other carbon reduction methods. Thus, the system is called the Tierra Fee & Dividend system (TFD). The main aim of the TFD is to introduce a just, stable and sustainable international monetary system, to combat the climate crisis and to advance low carbon, climate-resilient development.

Adopting the TFD with its carbon-based monetary standard would mean fixed exchange rates and stable currencies which would be convertible to each other because they are all based upon the same standard. That standard could also become the basis of the global currency of the Tierra. No longer would a costly global reserve system be necessary. Adopting the TFD with its carbon-based monetary standard would also mean an institutionalized transfer of funds from carbon debtor nations in the global North to the carbon creditor nations in the global South. Thus, carbon accounts would be settled in the nations' balance of payments. Adopting the TFD with its carbon-based monetary standard means the establishment of the Tierra, UN affiliated, federally structured Global Central Bank with its administering, monitoring, regulating and money creating functions. This global bank would be the centerpiece of the global governance framework that is one of the two main topics of the Rio 2012 process.

Note that the notion of a carbon-based international monetary system such as the TFD is new and novel or, in Mr. Strong's terms, "innovative". The other two components of the TFD, i.e. banks being utilities and an international financial system being credit-based rather than debt-based are positions that are increasingly being advocated, following the example of the supporters of the Chicago Plan of the 1930s.

Major references to the TFD are: IIMT's forthcoming book entitled THE TIERRA SOLUTION: Monetary Transformation, Climate Change and Sustainable Development. (Cosimo Books January 2012); articles for the 2nd Yale/UNITAR conference on Global Environmental Governance (September 17-9, 2010), for the Stakeholder Forum's Sustainable Development Governance program; Powerpoint presentations at the IPRA Conference in Sydney, Australia in July 2011, at the UNFCCC Cancun Conference in December 2011, and the upcoming ones at the CoNGO Sustainable Development Committee and at the Riverside Church conference called "Monetary Justice: The Guiding Principle for Global Governance?" which, beside the UK Christian Council for Monetary Justice at <http://www.ccmj.org> would be the first US religious organization that engages in monetary justice discussions as basis of global governance The following table presents a comparison along some dozen features that illustrates the basic differences between the present IMF international monetary system and the proposed carbon based Tierra global monetary governance system.

#### COMPARISON OF THE PRESENT IMF AND TIERRA MONETARY SYSTEMS

FEATURES	PRESENT SYSTEM	TIERRA SYSTEM
Monetary standard	None	Carbon standard
Currencies	Most are non-convertible	All are convertible
Reserve currencies	Several	None –no need
Global reserve system Yes and costly	Yes and costly	Removed
Currency manipulation & speculation	High	Well-nigh absent
single world currency Difficult to achieve	Difficult to achieve	Phase 2 of Tierra MS
Exchange rates	Floating and volatile	Fixed and stable
Balance of payments	Financial accounts	Financial and carbon accounts
BOP imbalances	Financial	Financial and ecological
Governance	IMF, BIS, WTO, IBRD	UN Federal Central Bank
Surveillance	No enforcement authority	Enforcement authority
Philosophy	Neo-classical economics	Sustainability economics
Equity social/procedural	Minor emphasis	Major emphasis
--climate justice	Missing value	Crucial value
Earth Charter	Absent	Important common value base
Long-term orientation	Weak	Strong
Connection to climate crisis	Absent	Strong and essential
Historical perspective	Reformist	Transformational

#### CONCLUSION

The September 2011 DPI/NGO Bonn Conference's Declaration states in line 265 that governments, among many other things, are "to rethink the monetary system based upon a carbon standard." Given that the Earth Summit wants to develop "New Foundations for the Future", it is essential that among those foundations the monetary foundation is going to be considered because it is the international monetary system functioning as glue, a lubricant for the other international system that can be considered to be the linchpin of those systems. As a consequence it is crucial that the Rio 2012 Earth Summit process basing itself on the requirements of monetary justice give priority to monetary governance as the basis of governance systems for the 21st century.

---

## INTERNATIONAL INSTITUTE-ASSOCIATION OF REGIONAL ECOLOGICAL PROBLEMS

Proposal WEC UA 31.10.11-1

for zero draft of the outcome

document of Earth Summit Rio+20

Division for Sustainable Development

UNCSD Secretariat

UN-DESA, DC2-2212, 2 UN Plaza, New York, NY 10017, USA

Dear Colleagues!

NGO International Institute-Association of Regional Ecological Problems (IIAREP) proposes to include into the zero draft of the outcome document of the Earth Summit "Rio+20" the following provision:

Transform UNEP into a fully-fledged UN Agency named World Environmental Organization (WEO) and simultaneously initiate the process of elaborating the World Environmental Constitution (WEC) as the only way of reaching the required efficiency of the WEO and as a legal framework for the transition to "green" economy.

The proposal concerns the strengthening of integration of the three pillars of sustainable development (environment, economy and social aspect) at international level.

Arguments for the proposal in brief

The discussion on establishing the World Environmental Organization (WEO) and the beginning of the process of creation of the World Environmental Constitution (WEC) in their indissoluble unity would add an enhanced integrity and deeper understanding of the three pillars of sustainable development at Rio+20 Summit and will make the work of the Summit more constructive. In prospect, Rio+20 decisions on WEO and WEC would provide for: institutionalization of proposals and ideas for dealing with problems of climate change, prevention of other global environmental threats and problems of transition to "green" economy in the wake of relevant initiatives and declarations made by world politicians during the 20 years after the "Rio-92"; creation of a permanent effective mechanism for a global dialogue of all interested parties, for reducing the conflict of interests between the South and the North and for the elaboration of a universal legal framework to achieve the goals of sustainable development, relying, among other things, upon a huge array of over 500 treaties and conventions concerning the environment, which are currently valid but ineffective.

Yours sincerely

Yuriy Tunytsya

Executive Director, Dr., Professor

## International Movement ATD Fourth World

November 2011

Contribution by the International Movement ATD Fourth World to the United Nations Conference on Sustainable Development zero draft outcome document.

Eradicating extreme poverty is a necessary condition for the realization of sustainable development. For this to be possible, the social, economic and environmental dimensions of sustainable development must be fully integrated and treated with equal importance in programming and delivery. It is within this context that the International Movement ATD Fourth World proposes that the outcome document of the United Nations Conference on Sustainable Development contain the following elements:

1- Outcomes from the Conference should be based on internationally agreed human rights principles and standards. The work of the Human Rights Council in developing Guiding Principles on Extreme Poverty and Human Rights provides a useful reference in developing a human-rights based approach to sustainable development and poverty eradication. A rights-based approach will ensure the following:

- Specific attention is given to the poorest and most vulnerable people who have been historically, and remain at present, most affected by both environmental degradation, and social and economic exclusion. Proposals on environmental protection, climate change mitigation and adaptation and economic transition should include mechanisms to ensure that benefits reach people living in extreme poverty. This should include guaranteeing a social protection floor which enables universal access to social, economic and cultural rights.
- All sectors of society are able to participate in the planning, implementation and assessment of sustainable development policies and programs, including people living in extreme poverty. This requires relevant decision-making bodies at all levels to establish specific mechanisms and institutional arrangements through which persons living in extreme poverty can also effectively and meaningfully participate in all stages of decision-making processes. Obstacles to participation must also be identified and addressed, such as lack of access to relevant and understandable information and opportunity costs.
- Priority is given to climate change mitigation and adaptation strategies that build on local knowledge and capacities, and empower local communities with the technologies, financial resources and skills required in order for these strategies to be sustainable. To the extent possible, small-scale, inclusively managed projects will be promoted and supported, in order to protect the environment and improve the living conditions of people living in poverty.

2 – An outcome of the Conference to create Sustainable Development Goals must have at its core the eradication of extreme poverty, in each of the three pillars of a sustainable development: environmental, economic and social. This will ensure complementarity with efforts to achieve the Millennium Development Goals. It will also

contribute to the development of a post-2015 development framework that maintains the eradication of extreme poverty as a central aim.

## International Network for Environmental Compliance and Enforcement (INECE).

The Importance of Environmental Compliance and Enforcement for Sustainable Development for the Rio+20 Conference

Submitted by

The International Network for Environmental Compliance and Enforcement (INECE), 2300 Wisconsin Ave, NW, Suite 300B, Washington, D.C., 20007, [inece@inece.org](mailto:inece@inece.org),

<http://www.inece.org>

Summary

Robust national environmental compliance and enforcement systems for environmental and energy laws are critical parts of an effective overall governance strategy to meet green economy, poverty eradication, and sustainable development objectives. Multidisciplinary approaches to capacity building for parliamentarians, inspectors, prosecutors, and judges are keys to this process.

Well designed environmental laws and regulations, which include implementation and enforcement systems, advance a green economy by improving the health and safety of the workforce and communities, conserving natural resources and ecosystem services, promoting sustainability in the business community, expanding markets for environmental goods and services, creating sustainable jobs, driving technology innovation, and leveling the playing field for investment by reducing costs.

Recommendation for Language in the Rio+20 Outcomes

Robust national environmental compliance and enforcement systems for environmental and energy laws are critical parts of an effective overall governance strategy to meet green economy, poverty eradication and sustainable development objectives. Chapter 8 of Agenda 21 specifically directs States to develop their compliance and enforcement capacity. The outcomes of the Rio+20 Conference should emphasize institutional mechanisms at the international and domestic levels for implementation, accountability, compliance, and enforcement, supported by a science-based approach.

a) Expectations for the outcome of Rio+20

The International Network for Environmental Compliance and Enforcement (INECE) anticipates that the Parties to Rio + 20 recognize that robust national environmental compliance and enforcement systems for environmental and energy laws are critical parts of an effective overall governance strategy to meet green economy, poverty eradication and sustainable development objectives. The outcomes of the Rio+20 Conference should emphasize institutional mechanisms at the international and domestic levels for implementation, accountability, compliance, and enforcement, supported by a science-based approach.

INECE calls on the conveners of the Rio+20 process to recognize that compliance with and enforcement of national environmental and energy laws are critical components of an overall strategy for achieving green economic growth. In part, green economy objectives can be achieved through a modern approach to regulation and compliance that creates value and opportunities by reducing costs for industry and business, creating markets for environmental goods and services, reducing business risk and increasing investor confidence, creating sustainable jobs, improving the health of the workforce and the wider public, and conserving natural resources. Well-designed environmental regulation can trigger innovations within firms that partially or fully offset the costs of compliance with those regulations.

b) Comments on existing proposals

Recognizing the importance of well-designed institutions for international environmental governance and echoing the recommendations of the Key Messages from North American Major Groups and Stakeholders, INECE encourages Rio+20 to emphasize the need for countries to develop domestic enforcement mechanisms that empower all citizens to call for and seek legal recourse in terms of compliance to commitments, laws and regulations.

c) Views on implementation and closing the implementation gap, including relevant actors

1. Views on implementation

Environmental laws and policies must be designed with compliance and enforceability in mind. For the regulated community to comply, it must be aware of the rules, willing to comply, and able to comply. Laws must therefore be no more complex than necessary, cost-effective to comply with, and consider the social, cultural and psychological profile of the regulated community. Rules running counter to cultural practices or ignoring economic incentives are likely to fail. Rules that reward environmental leadership, build on best practices, and ensure a level playing field are more likely to succeed in securing compliance.

Investing in compliance and enforcement benefits the public by securing a healthier and safer environment for themselves and their children. It benefits individuals, firms and others in the regulated community by ensuring a level playing field governed by clear rules applied in a fair and consistent manner. Economically, firms meeting or exceeding environmental standards regularly build customer loyalty, increase efficiency, and enhance their profits. Countries benefit by creating a predictable investment climate based on the rule of law thereby promoting economic development. And through strengthening compliance with international obligations, countries ensure that multilateral environmental agreements are implemented by all parties through effective domestic action.

2. Closing the implementation gap

Closing the implementation gap will require building the capacity of countries to enforce domestic laws and multilateral environmental agreements. Even the best designed rules may still pose difficulties to those who lack technical, financial, or administrative capacity. Securing compliance therefore calls for renewed efforts to raise awareness of the law, to strengthen compliance assistance programs, and to enhance incentives for compliance. Efforts at the national level must be designed to address the needs of small- and medium-sized enterprises, and, at the international level, the needs of the least developed and developing countries. International institutions and donors have a particular role to play in supporting these efforts.

d) Specific cooperation mechanisms, partnership arrangements and other implementation tools and the time frame for their implementation

Trans-governmental Networks Advance Cooperation for Sustainable Development

Cooperation among government officials help create a level playing field for regulated industries domestically and internationally, resolve and prevent transboundary environmental problems, respond to environmental crimes, create efficiencies in the development of tools and programs, and foster the political will needed to strengthen implementation of environmental standards.

Operating as transgovernmental networks focused on environmental compliance and enforcement, the International Network for Environmental Compliance and Enforcement and its regional and topical networks provide the forums and mechanisms that enable direct interaction among and between domestic officials, international institutions, and private actors. The Rio+20 process should recognize the role of transgovernmental networks in improving compliance with and enforcement and implementation of environmental law.

Strengthening environmental compliance and enforcement requires renewed efforts by individuals and institutions everywhere. Government officials, particularly inspectors, investigators, and prosecutors, must exercise public authority in trust for all of their citizens according to the standards of good governance and with a view to protecting and improving public well-being and conserving the environment. Legislators play a key role in creating legislation that can be effectively enforced to achieve its goals. The judiciary has a fundamental contribution to make in upholding the rule of law and ensuring that national and international laws are interpreted and applied fairly, efficiently, and effectively.

The regulated community and the public have a responsibility to comply with the letter and spirit of the law and to encourage compliance by others. Non-governmental organizations play a leading role in public education and assisting enforcement agencies. The media has a responsibility to raise public awareness by providing objective analysis and information about environmental challenges and efforts to address them. The international community, including donors and international organizations, has a responsibility to strengthen domestic efforts through capacity building, technical and financial support, and by promoting an enabling environment for more effective compliance and enforcement.

---

## International Network for Sustainable Energy (INFORSE)

INFORSE<sup>1</sup> Proposal for the Rio+20 UN Conference

Transition to Sustainable Energy

Must Be a Central Result of Rio+20

When the countries of the world meets again in Rio de Janeiro this coming June, 2012, 20 years after the original UN Conference on Environment and Development (UNCED), it is urgently needed that the countries take up the issues that were discarded in 1992 and that are still imperative for a sustainable development. The transition to sustainable energy<sup>2</sup> is the most important of these issues. It is increasingly evident from the climate science as well as from the depletion of the easier accessible fossil energy resources that a fast energy transition is necessary. At the same time the technological development has resulted in better technologies for the transition. Therefore the transition can be done with known technologies, without significant sacrifices, and in parallel with the elimination of poverty. It will also bring additional benefits such as improved employment.

In the INFORSE network we have shown how a timely transition can be made in Northern countries with high greenhouse gas emissions as well as in villages in the global South, where this transition can be one of the steps on the way out of poverty.

Unfortunately, the negotiators at the UNCED conference discarded ideas to build a global cooperation and a structure for promotion of sustainable energy. Later the focus on energy at Commission for Sustainable Development (CSD) lead to no results, as countries as well as the UN system showed lack of leadership.

From INFORSE the expectation for the outcome of Rio+20 is that the transition to sustainable energy is not only welcomed, but also included as a major cooperation issue for the coming years. This must involve international organisations as well as the countries of the world. All countries and most international organisations are already promoting renewable energy and energy efficiency in some form. In addition the countries have agreed in the international climate negotiations to keep global warming to below 2°C. This climate target can in reality only be reached with a transition to sustainable energy. The challenge of Rio+20 is then to transform this global agreement into increased global action and cooperation to realise the sustainable energy transition and thereby the climate target. A part of this challenge is to make it clear that the unsustainable energy sources, like nuclear power, should not be supported internationally, in spite of large vested interests. Such support will divert resources from the sustainable energy transition, and could even make it impossible.

Comments on Existing Proposals

The Green Economy Roadmap (Towards a Green Economy, published by UNEP 2011) gives many arguments for a transition to sustainable development and it also shows that sustainable energy must be in the center of the transition. Half of the proposed investments shall go to renewable energy and energy efficiency in the model proposal of the Roadmap. In spite of this priority, the proposed energy transition is too slow to meet the climate objectives or the need to replace dwindling fossil energy resources. In effect, faster actions than proposed in the Roadmap are needed. The proposed actions in the Roadmap are shown to be cost-effective compared with business as usual, which mean that also faster actions will probably also be cost-effective.

<sup>1</sup> International Network for Sustainable Energy (INFORSE), see [www.inforse.org](http://www.inforse.org)

<sup>2</sup> By sustainable energy we mean efficient use of renewable energy in sustainable ways

The Roadmap report also has an appropriate focus on the need to phase out subsidies for fossil fuels globally as this holds back the sustainable energy transition in many countries. The challenge for Rio+20 is now to turn visions, as those shown in the Green Economy Roadmap, into reality at a fast pace with international cooperation. The cooperation must deliver advices and support to countries on how to choose the green solutions.

INFORSE supports a continuation of global sustainable development goals, as we have seen the positive effect of the Millennium Development Goals. It is important that the goals to be agreed at Rio+20 include a goal for universal access to sustainable energy to eradicate poverty and also a goal for transition to sustainable energy.

INFORSE supports that the framework for global partnerships are revitalized as many global partnerships have proven to be effective means of cooperation on specific topics. Therefore, INFORSE is member of several partnerships. The partnerships should be used where they are useful to foster multi-stakeholder action. They should not be an excuse for not acting on the intergovernmental level as well.

Comments on the Implementation Gap

The lack of action to reduce greenhouse gas emissions is probably the most severe "implementation gap" in the world today, but unfortunately, not the only one as also many development goals and environmental goals are not reached.

To reduce greenhouse gas emissions and meet environmental objectives, a concerted actions are needed from the international community including financing institutions as well as a change of the promotion mechanisms and the economic drivers in most economics. These must include change of subsidies and taxation.

To end poverty, concerted actions are needed from the global North and South to build sustainable and inclusive economies in all countries that can provide basic needs for all populations, including basic energy services.

#### Proposals for Specific Mechanisms

For the transition to sustainable energy, involvements of most international institutions are needed including intergovernmental banks. There are also needs for new international structures. An international agency for renewable energy is already established in the form of IRENA, but it should be better integrated in the international cooperation. In parallel, an organisation is needed for energy efficiency.

In addition, a revision of the International Atomic Energy Agency (IAEA) is needed, which is presently supporting the use of nuclear power including the establishment of nuclear power plants in poor countries. This support is directly counterproductive as this inadequate solution will make the countries even poorer and give them, as well as the world, new safety and proliferation problems. Further, it is necessary to make international regulation and taxation of the fossil fuel combustion of aviation and shipping, which cannot be regulated by individual countries.

#### Other Specific Elements of the Outcome of Rio+20

In addition to the proposals for agreements and institutions given above, it is needed to establish a new mechanism to promote sustainable development to replace the CSD. The process should focus directly on improving international cooperation including existing institutions. It should not spend two years for discussions of one issue, but instead should have better managed and better prepared discussions during a maximum of one year for each issue.

---

## International Organisation of Employers (IOE)

### About the IOE

The International Organisation of Employers (IOE) is recognised as the only organisation at the international level that represents the interests of business in the labour and social policy fields. Our mission is to promote and defend the interests of employers in international fora. To this end we work to ensure that international labour and social policy promotes the viability of enterprises and creates an environment favourable to enterprise development and job creation. Today, the IOE consists of 150 national employer organisations from 143 countries from all over the world. In line with our mandate we will focus, in this contribution, on the social pillar of sustainable development. The IOE has been working with other business organizations, such as the ICC and the Business and Industry Advisory Committee to the OECD (BIAC), and we endorse and support their submissions on the broader conference themes.

### The IOE view of the purpose of RIO+20

The IOE supports a balanced discussion of social elements in the discussion topics to be taken up in Rio+20 and believes that the conference must

 deliver an appropriate institutional framework to enable conditions for the transition to the current concept of a „green economy“, monitor and respond to the evolution of the „green economy“ and eradicate poverty. It must look to practicalities, learning and experience, to enable action and empower the relevant actors to deliver renewed commitment for sustainable development.

 set up clear measures and means to allow stakeholders to monitor the assessment of progress to date and enable them to identify and provide solutions for the remaining gaps in the implementation of the outcomes of the major summits on sustainable development and achievement of the millennium development goals.

 set up clear measures and means to allow stakeholders to monitor, identify, prioritise and propose solutions to address new and emerging challenges.

### Business Engagement

Business and industry is one of 9 “major groups” recognized by Agenda 21, and engaging employers in the RIO+20 processes is essential to the pursuit of sustainable development. Business and employment creation provides not just skills, technological and innovative developments and finance but also inclusive livelihoods capable of transforming social systems.

What progress has been made, what remains to be done.

The 3 dimensions of sustainable development require that all policy developments and activities should be analysed pre and post implementation for their potential and actual impact on the economy, the environment and social infrastructure. That way we can follow whether policy developments had their desired impact and make appropriate adjustments to keep on course to achieve targets.

The aspirations of previous conferences on Sustainable Development and achievement of the Millennium Development Goals (MDGs) have not yet been met. But as well as some setbacks, there have been many recent positive developments, capable of delivering solutions. There has been a major increase in scientific information, public awareness and involvement on environmental issues, largely because of the development of internet communications. Many nations have developed economically, socially and environmentally, providing them with new powers, along with which come new roles and responsibilities. Future economic growth is likely to be fastest in emerging economies, and if well managed, can help lift the majority of their people out of poverty.

### How business can help deliver the solutions

Business will be key to providing the solutions to the interlinked challenges of

 meeting the expectations of improved living standards for a growing world population and

 at the same time not degrading the economic, environmental and social systems on which they depend

Many employers recognize and have risen to the challenge of sustainable development by controlling emissions and resource uses from their products, services and operations. Voluntary business initiatives and innovative solutions for resource efficiency, emission control, waste management, protection of ecosystems, food and energy security, renewable and low carbon technologies are being commercialized and shared.

Business to business partnerships via multinationals and their supply chains will help diffuse the information and technologies. However in order to do this in a fair and equitable way businesses will have to work with governments and international governance bodies to develop instruments and incentives, sensitive to market needs and set the enabling conditions for investment and innovation, including rule of law, sound science and risk, open markets and trade and protection of intellectual property rights.

Critical long-term policy and market frameworks are being developed in many influential inter-governmental discussions and it is vital that these frameworks and their implementation support economic prosperity and growth, job creation and livelihoods. Job creation, in particular, is a critical path out of poverty, and more urgent than ever in the current economic situation.

#### The green economy as the solution

The themes of RIO+20 postulate that if the challenge is the gap between what has been achieved and what needs to be achieved, then the solution is the green economy. The IOE believes that if the green economy is to be the solution to the challenge to be addressed by the conference, of delivering sustainable development and the MDGs, then it has to be structured to do so.

Solutions to these challenges will come from business initiatives, products and services facilitated by policy measures that promote the right kind of growth. Economies need to be able to secure growth and development, while at the same time improving human well-being, providing sustainable jobs and enterprises, reducing inequalities, tackling poverty and preserving the natural resources on which we depend.— this is what is implied by a green economy. However the green economy will evolve as technologies and economies develop and provide other challenges and solutions. It will be a dynamic process requiring continual review and revision as the concept of what constitutes a green economy shifts over time.

#### Understanding the green economy

Employers believe that the first challenge is for the concepts of the „Green economy" and „Green jobs" to be more clearly understood and have resonance with and endorsement by all stakeholders. The green economy cannot be divorced from the economy in general and green jobs are reliant on other jobs. Ordinary people need to be able to see what it means and that it means something different and better than the economic model they have now. They need to understand how their current model can move towards the concept of a green economy and have a clear idea of some of the policy and practice tools needed to get there. Employers have risen to their crucial role in influencing policy measures to structure a framework conducive for enterprises to deliver sustainable jobs, economically viable products, processes, services and solutions that promote a greener economy. They also play their part in informing consumers of what actions, products and services will help deliver a green economy.

#### The priorities to achieve a green economy

Moving towards a green economy requires resilient enterprises and communities who are able to withstand the inevitable natural and man-made shocks that will occur in the future. They will enable challenges to be transformed into economic opportunities, not only reversing negative environmental trends, but also driving future growth and jobs. This will facilitate the preservation and investment in the assets of key natural resources. It will enable the use of low-carbon and resource efficient solutions and increasing efforts to promote sustainable consumption and production patterns. All this involves greater business involvement in establishing the right regulatory frameworks, creating strong incentives for markets and innovation, leveraging financial resources, and promoting entrepreneurship.

The green economy offers opportunities to all countries, irrespective of their level of development and the structure of their societies and economies. While in many cases investments to move towards a green economy can result in short-term win-win solutions, in other cases a medium to long term perspective will be needed and transitional costs will have to be addressed. These may require support for developing nations and SMEs

#### Priorities for future action resulting from RIO+20

The IOE believes that the future should be aimed at action, based on an analysis of what needs to be done, how it can be done and by whom. The development of a suitable green economy, requires addressing the following priorities

-  Building resilience for enterprises and communities
-  Establishing efficient use and sustainable management of key resources
-  Developing well-functioning markets and effective regulatory conditions
-  Improving governance and stimulating private sector involvement

The IOE will focus its efforts on strengthening the social pillar of sustainable development by Building resilience for enterprises and communities and look at how the other priorities support this.

#### Building resilience for enterprises and communities Resilience to deal with uncertainty

Examination of the existing plans to move towards sustainable development and achieve the Millennium Development Goals shows that the world must be ready for the unexpected. Whilst many projects will go to plan, as the expected has been anticipated and factored in, some plans will always be knocked off course by natural disasters, financial or political turmoil, resource scarcities or supply chain and service disruptions. Employers seek to minimize disruption and maintain sustainable enterprises, jobs and economies, whatever the challenge. Resilience is seen as an active approach of using the available tools to take responsibility for one's own enterprise, community and self, in sustaining and developing wellbeing, competences, resources and entrepreneurship to adapt and thrive in a fast-changing and uncertain world, giving governments, enterprises and individuals the means of turning uncertainty, risk and turmoil into opportunity.

Realizing a green economy, that in itself will also evolve, will require a low-emission society that offers substantial opportunities, ensures growth and sustainable development, based on innovative technologies and more sustainable production and consumption, while ensuring sustainable enterprises and jobs.

#### To face the uncertainties involved,

-  Governments need access to resources and expertise to plan for, not just implementation, but also disruption, disaster and recovery
-  Enterprises need the versatility and flexibility to unleash their innovative technologies and service and the skills and creative potential of all their employees.
-  Individuals need jobs and opportunities that enable them to develop and use their competencies, skills and creative potential to the full in their work and in their communities

People encouraged to develop problem solving, creativity, and team or community building in a high-trust environment are more likely to respond to change as an opportunity rather than as a threat. They need to be provided with the skills, knowledge and experience needed to deal with it successfully. Individuals, their workplaces and wider society are highly interdependent, so national governments and regional authorities have a key role to play in helping to support and develop enterprises which promote resilience for their workers and communities.

#### Health and wellbeing

The sustainable management of resources, such as land, agriculture, forests, water and the oceans are underpinned by ecosystems and biodiversity, which determine the longer term resilience and health of the environment are major factors contributing to the wellbeing of people necessary as a foundation for their resilience.

Solutions to many of the challenges of sustainable development as well as disaster aversion and recovery are trans-boundary and need to be addressed at the regional and international level. Governments, international organisations and businesses need to coordinate their resources and expertise in times of crisis.

#### Employment

Just as jobs have a direct relationship to economies, then green jobs are seen to have a similar relationship with green economies. This is important as considerable sums, within recent economic stimulus packages, have been earmarked for green growth and green jobs. Policy decisions, measures and funding to address green issues are now so extensive that they have a direct effect on business decision making and will affect enterprises of all sizes and sectors. Enterprises need to understand the funding implications, the sources and how to access the funds.

Business will be the key to providing solutions to climate change and environmental concerns and new industries developed solely as a response to these challenges will owe allegiance to other technologies and businesses. New jobs – green or otherwise- will mainly be created by the market, to satisfy market needs and utilise innovative developments. It should be recognized that green jobs and green technologies will rely greatly on all jobs and technologies and the distinction will become even more blurred in the future.

The green economy should aspire to full employment for all, whether it is returning to full employment post-economic crises or creating employment to overcome poverty. Policies aimed at creating so called green jobs should not come at the cost of a net reduction of jobs across the overall economy, nor should such policies create temporary, unsustainable jobs or those that reduce productivity or have unacceptable working conditions.

#### Skills, education and training

In order to operationalise the green economy concept, there is a need for society to build competencies for resilience and for enterprises to have access to the right skills for the right jobs. The moves to greener economies will mean all skills requirements will be affected to a greater or lesser extent. Human capital, the quality of jobs, and generational shifts also need to be addressed.

Without the necessary skills and know-how, a transition to a green economy will not be possible. Economic policies need to be aligned with labour policies to equip employees with new skills and help create new job opportunities. A thorough analysis is needed on a regional basis of the demographics, state of current and potential economic development and the major skills requirements needed to move that region from where it is now to a greener economy.

Government, employers, education and training providers and individuals need to work in partnership to benefit from a continuum from education, training and lifelong learning. It is necessary to build and develop resilience into the economy and population so that they are capable of dealing with change.

#### Establishing efficient use and sustainable management of key resources Holistic life cycle thinking

The efficient use and sustainable management of key resources will require holistic life-cycle thinking and will be a long term effort with no certainly defined end point. There is a growing awareness of the benefits of ecosystem services, efficient resource and waste management, for businesses and society at large, and of the potential of investing in natural capital for the green economy.

#### Managing key resources

People's livelihoods rely on resources such as water, energy, land, agriculture and marine food sources. Especially in developing countries, the lack of access to quality resources, as well as the inability to manage them sustainably, are important underlying causes of poverty. Where the sustainable management of these resources become the economy's key growth markets they can underpin future economic development, create jobs, alleviate poverty and embed resilience in the population.

Developing well-functioning markets and effective regulatory conditions Framework for open markets and trade A number of market and regulatory conditions need to be put in place to enable and direct growth in the above areas. Such enabling conditions are not only key to promote environmental objectives, but also to ensure predictability, resilience and equitable treatment for business. They also provide a sound basis for investments and fostering eco-innovation through new technologies and new ways of working.

Open trade and investment are critical enablers of technological dissemination and financing that will be required to move to greener economies. Policies to promote green economy concepts should be incorporated into domestic and global markets in a way that promotes competition within open markets on an equitable basis.

#### Stimulating innovation

Innovation for the solutions to move to a green economy requires major progress in the development and deployment of key technologies, better use of existing knowledge and technologies across sectors and geographical boundaries, and increased international and public-private co-operation. It will also require the institutions and framework to foster such development, key of which is appropriate recognition and protection for intellectual property rights

Governments should avoid choosing winners and losers, and refrain from using regulations that benefit certain sectors to the detriment of others. Well-intentioned measures focused on improving environmental performance and generating employment may not necessarily create lasting employment and may introduce sector distortions that should not be seen as a substitute for long term job creation through the market. Small and medium-sized enterprises (SMEs) need equitable treatment to be able to access the expertise and finance needed for making the necessary investment.

There are opportunities now to green enterprises and the current economy, using tools and facilities already available, as a step en-route to realizing the full benefits of the transition to a greener economy. Governments should provide appropriate incentives (ranging from information, demonstration, application, taxation, incentivisation, regulation) so businesses in all sectors and consumers will see the practical benefits of adopting resource efficient and lower carbon-intensive practices.

#### Regulatory improvement

Regulatory instruments should be objective seeking and well-structured to maximise compliance and minimize unintended consequences. They should be combined with market-based instruments (such as taxes, tradable permits and environmental subsidies) which are flexible and cost-effective tools that can help achieve combined economic, social and environmental objectives. Fiscal reforms that shift tax burdens from labour to environmental impacts can create highly visible incentives that send messages to society to influence their behaviour and provide win-win outcomes for employment and the environment.

#### Financing and investment

To enable the transition to a global green economy, large scale financial resources will have to be mobilized to help finance flow towards and in the green economy. Such policies should provide clear, legally-binding, long-term signals wherever possible. This will require action by all countries, international organisations and banks and will require a significant change in approaches to financing, enabling countries to make use of innovative public and private solutions. Access to finance and venture capital coupled with a favourable regulatory environment is crucial to stimulate eco-innovation, environmental technologies and green SMEs.

#### Improving governance and stimulating private sector involvement Measuring progress

Progress towards a greener economy will benefit from development of transparent measures and indicators that make sense in societal, economic and environmental terms, at the level of individual enterprises and at national, regional and global levels. Reporting requirements should not add further burdens on business but should be part of a rationalization process for the development of indicators to be used alongside Gross Domestic Product (GDP). Improving governance It is widely recognized that current governance structures need significant reform to help deliver sustainable development, make economies greener, eradicate poverty and measure and track progress. There are several options to strengthen sustainable development governance within the UN organizations involved, either by strengthening the mandates of the main players or enhancing the scope of one to give it overarching responsibility. All options have advantages and disadvantages, and will have to be further discussed, but the outcome should be defined by minimizing duplication of effort and maximizing coordination and efficiency in the delivery of the objectives.

Sustainable development governance needs to be reinforced and mainstreamed within the UN system, by enhancing coherence and policy integration between the activities carried out under the economic, social and environmental pillars. Dedicated teams focused on sustainable development should ensure regular interaction between and within organizations. Corresponding regional, national and local structures also need attention with new roles and responsibilities defined for emerging economies.

Today, „Green Economy“ remains an aspirational concept. As it evolves elements of greening economies may require new governance procedures. The UN governance structures should be regularly reviewed to ensure they are fit for purpose. Stimulating private sector involvement and partnerships

Moving towards a green economy is a shared, cross-sectoral, and economy-wide challenge which no actor can achieve on its own. The green economy needs to provide the governing structures and platform which allow new and transformative partnerships, involving business, to be shaped and activated. They should recognise that business plays a crucial role in the social and economic development of a country. Prosperity is contributed largely by activities of business, including jobs, investments, technologies, products and services that drive the changes and innovations needed to move towards a green economy.

A greener economy depends on an engaged and incentivized private sector working in alliance with the public sector to create essential knowledge, skills, and to promote a continuum of life-long learning, technology, investment and financing required. In particular, boosting the participation of business will be essential. Business operates in supply and value chains, many of which are global and have influence beyond national governance structures. Achieving improved conditions for transparency and integrity in doing business in all countries is of paramount importance for private and public sector actions.

Measures to green businesses and contribute to green economies is most efficient and effective if they are aligned and integrated with other business systems and initiatives. Many businesses have already made significant progress in making their operations more resilient and resource efficient. They have excellent examples of good practice to share. Business involvement needs to be taken further through more dynamic public/private partnerships, new business networks and alliances.

#### Achieving the Objectives - Key messages

All countries and players have to work together to make sure that the outcomes of Rio+20 can meet our global challenges. In particular the business community must be empowered to put in place emission-reduction and resource-efficient technologies and solutions that create jobs, that raise standards of living, and that address major environmental problems. To give renewed impetus to achieving sustainable development and eradicating poverty, Rio+20 needs to involve business in Creating a shared vision that is understood, endorsed, publicized and actioned by all stakeholders on

 what is the current visions for a green economy

 what changes are needed to get there

 what tools and policies will be available to use

 how success can be measured and publicized at the international level Developing cohesive action plans at all levels

These will need to be developed at enterprise, community, national and international levels. Actions should build on existing efforts and could be incorporated into national economic and development strategies, also bringing together low carbon strategies and sustainable consumption and production plans. Where needed, donor countries and international organisations could provide assistance, in line with national development strategies. Measuring effectiveness of policies and actions for all pillars of sustainable development

All policy developments and activities should be assessed pre and post implementation for their potential and actual impact on the economy, the environment and social infrastructure Focusing on the issues identified as requirements for a green economy

 Building resilience for enterprises and communities

 Establishing efficient use and sustainable management of key resources

 Developing well-functioning markets and effective regulatory conditions

 Improving governance and stimulating private sector involvement the following specific actions, where business has particular leverage, are proposed as contributions to the action plans.

#### Developing skills and training for the enterprises of the future

 As the transition to a green economy will create jobs and replace others, the re-skilling of the existing workforce will be needed. Rio+20 should establish the main elements for green skills training programmes in priority areas such as energy, agriculture, construction, natural resource management, waste and recycling. Based on this work and the analysis of the likely effect of the transition to a green economy, Governments, training providers and businesses should identify

o What skills will be needed for future business architecture,

o What programmes have to be put in place to develop those skills

o How will the workforce, that do not have those skills, be managed

<sup>64</sup> Youth and community training programmes are also needed. These should support life-long learning and the school-to-work transition with specific training and competence development on the green economy in mind. Developing partnerships for making key resources sustainable

<sup>65</sup> Many private companies are involved globally in the delivery of water supplies of the appropriate quality for the task. Water management and water governance needs to have firmer linkages to economic as well as environmental aspects. This could be achieved by establishing international partnerships on water involving public and private-sector enterprises and governments.

<sup>66</sup> Similarly partnership involving governments, public and private-sector enterprises must be established to increase energy access, achieve secure energy supplies, promote renewable energy and energy efficiency and leverage private investment for a low carbon economy.

<sup>67</sup> Frameworks should be developed to ensure protection of intellectual and physical property rights and provide access to the fair and equitable sharing of benefits derived from the utilisation of genetic and other resources.

<sup>68</sup> There is an urgent need to promote sustainable agriculture and forestry, land-use and food security by involving businesses more closely in strengthening existing initiatives on sustainable agriculture, building on multilateral actions (such as the FAO), regional activities (such as sustainable farming). There is merit in establishing new partnerships on food commodities involving business to make the consumption and production of food commodities more sustainable.

<sup>69</sup> Now is a good time to establish a more robust and coherent international regime on chemicals and hazardous substances and Rio+20 could launch a process to achieve this. Businesses should be involved in the design of such a regime building on their experience of existing initiatives.

<sup>70</sup> All these challenges will involve business in scientific and technological cooperation at the global level and a mechanism for greater global science and research cooperation on societal challenges of global importance should be put in motion.

#### Achieving well-functioning markets

<sup>71</sup> Business should assist in the development of well-designed domestic and regional market-based instruments with a view to reducing emissions at least cost. Such instruments may also play an important role in generating innovative finance.

<sup>72</sup> Financial Institutions should play a strong role, working with private financial institutions to commit to establish green economy financing strategies that can lead to demonstrable results. An important focus of these financing facilities and schemes should be to assist developing countries, vulnerable regions as well as SMEs. Improving governance and stimulating private sector involvement

<sup>73</sup> Better and more efficient global governance is needed to accelerate global action towards a greener and more sustainable economy, greener and more sustainable jobs and to eradicate poverty. As businesses are the engines of the economy, Rio+20 must strengthen and formalize the engagement of business in the variety of partnerships and schemes proposed. The arrangements should address the special needs and realities for employers in developing countries and vulnerable regions, particularly SMEs and should provide opportunities for capacity building between groups in developed and developing countries.

---

## International Partners for Sustainable Agriculture (IPSA)

Promoting urban rural linkages for food and nutrition security in the context of the green economy and sustainable governance

Submission to the UN Secretariat from International Partners for Sustainable Agriculture (IPSA)

"Making urban market facilities accessible to regional and local producers will create urban-rural linkages that could slow rural-to-urban migration, stimulate local economic development, and strengthen food security."

- Vision Statement from Gerda Verburg,

Chair of the Seventeenth Session of the Commission on Sustainable Development upon successful conclusion of the Session, 15 May 2009

International Partners for Sustainable Agriculture (IPSA) is a civil society organization ([www.practice2policy.org](http://www.practice2policy.org)) that has worked to promote coherent policy that meets good practice in scaling up of agroecological and sustainable agriculture serving small farmers and vulnerable peoples since the first Rio UN Conference on Environment and Development. IPSA worked with sustainable agriculture and rural development (SARD) initiatives led by civil society major groups, supported by governments and facilitated by intergovernmental organizations from the Johannesburg World Summit on Sustainable Development (WSSD) through the CSD 16th and 17th sessions in 2008-9.

As a result of Major Group and government collaboration facilitated by IPSA during CSD 17 related to issues of agriculture, land, water, desertification and sustainable development for Africa, recognition was given to the importance of urban rural linkages for food security. In addition to the Chair's Vision Statement cited above the final text calls on governments to "encourage strong rural-urban linkages and partnerships between countryside and communities, to enhance livelihoods and food security".

Since 2009 major conferences hosted by Local Governments for Sustainability (ICLEI), UN Habitat, FAO and other organizations have highlighted the importance of urban rural linkages in the context of a volatile urbanizing world, and transformations to the food system resulting from climate change, economic instability and biodiversity loss. As one of the pillars of sustainable development, agriculture and the food system are necessarily linked to, and part of, the solutions to these challenges.

Food and agriculture systems are instrumental in the greening of the economy and the coming transformation of agriculture demands a multi-level governance response from local to national and international levels. Urban to rural and rural to urban linkages for food and nutrition security, environmental resilience and economic vitality, can bring to the foreground "bundled solutions" to conserve biodiversity, improve land use and natural resource management and adapt to climate change while increasing food security and fostering sustainable diets that reduce non-communicable disease worldwide.

Policy outcomes related to urban rural linkages in the UN Conference on Sustainable Development are:

1. Key roles of local and national governments, collaborating with civil society and the private sector, need to be acknowledged and formally engaged in coming efforts and collaborations.
2. Improvements of the technical competencies of partners to address challenges to food and nutrition security, and to provide educational and policy guidance to national

governments and ministries to enable local urban and rural decision makers and planners are needed.

3. Collaborative strategies for implementing technical and policy support need to be developed in greater detail.

4. Recommending areas of policy support for effective implementation from the global and national levels to engaging local authorities and communities in a more coordinated and systematic manner is also a key step in addressing the challenges of food and nutrition security, agriculture and natural resources management in an urbanizing world.

The elements of greening food and agriculture systems that need to be understood in linking growing cities to both urban and rural landscapes, and the dimensions of approaches in a multi-level governance approach to food system resilience are topics of the recently published multistakeholder FAO paper: Food, Agriculture and Cities: the challenges of food and nutrition security, agriculture and ecosystem management in an urbanizing world. This paper was presented at a side event in the recent 37th session of the FAO Committee on World Food Security (available at <http://www.fao.org/index.php?id=28645>)

IPSA plans to work with Major Group partners, FAO, UN Habitat and interested governments during upcoming intersessional and preparatory meetings for the Rio20 conference. For more information, contact Thomas Forster at [Thomas.Forster@practice2policy.org](mailto:Thomas.Forster@practice2policy.org).

---

## International Planned Parenthood Federation

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

At the Earth Summit in 1992 it was agreed that population is inextricably linked to consumption patterns, production, environment and long-term sustainability. As the world's population reaches 7 billion, the issue is more pressing than ever and contributes to the degradation of natural resources already under pressure due to climate changes. At the same time this increases the resilience of society's most vulnerable populations, especially women and children. Therefore, the ability and right of women or couples to choose the number, timing and spacing of pregnancies is a pre-requisite for sustainable development.

It is our expectation that the Rio+20 Outcome document will include a strong focus on the inter-relationship between population dynamics, sexual and reproductive health and rights and sustainable development, especially seen in the context of the effects of climate change, with an emphasis on protecting and promoting the rights, including sexual and reproductive rights, of women and young people.

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

It is important to create a comprehensive framework that captures all sustainability challenges facing the world. It is essential therefore, that SDGs include objectives for sustainable consumption and production in the global North, as well as for development issues in the global South. In specific regard to the goals and objectives focusing on the Global North, it is important to set targets that deal with unsustainable consumption and production patterns, as such targets are a prerequisite to enforce global transformation to a green and fair economy. This would also align itself to Agenda 21. In regard to the Global South, it is important to address the lack of implementation of universal rights for the world's poor and marginalized populations. As we are approaching 2015 and the deadline for the MDGs, it is clear that many of the MDGs will not be met in the poorest countries. This is especially the case for MDG 5b "Achieve universal access to reproductive health" which is the MDG furthest off track, but which at the same time is one of the most cost-effective health interventions for reaching sustainable development. Furthermore, it is important that the SDG Framework entails a clear inter-relationship between the social, economic and environmental pillars, and is seen in an adaptation perspective.

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

In agreement with the Declaration of the 64th Annual UN DPI/ NGO we call for full engagement and "involvement of youth, women, and wider civil society in decision-making processes and partnerships, as stressed in Agenda 21, Section 3, is critical to the success of sustainable development initiatives".

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

In agreement with the Declaration of the 64th Annual UN DPI/ NGO we call for full engagement and "involvement of youth, women, and wider civil society in decision-making processes and partnerships, as stressed in Agenda 21, Section 3, is critical to the success of sustainable development initiatives".

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Submission by the International Planned Parenthood Federation (IPPF) for the Rio+20 compilation document

This submission argues why Rio+20 must recognize the centrality of sexual and reproductive health and rights (SRHR) to sustainable development and particularly to the well-being of women and young people in a changing world.

IPPF urges the Rio+20 process and all member states to ensure the conference outcome:

1. Recognizes that SRHR and gender equality are essential components of sustainable development;
2. Highlights the importance of adolescents and young people's access to comprehensive sexuality education in advancing a sustainable development agenda; and,
3. Supports policies and legal measures that will ensure universal access to reproductive health.

#### Introduction and Argument

Human rights and sustainable development both aim to promote well-being and freedom based on the inherent dignity and equality of all people. The 1992 United Nations Conference on Environment and Development (UNCED – 'Rio Summit') recognized that human beings are at the centre of concerns for sustainable development, and that all people are entitled to a healthy and productive life, in harmony with nature.<sup>i</sup> The principle of sustainable development is to integrate an approach to development that balances social, economic and environmental justice goals. These principles were adopted at the 1992 Rio Summit and reaffirmed at the Johannesburg 2002 World Summit on Sustainable Development. However, the implementation of these principles and their integration into national policies and programs continues to receive insufficient attention.

Echoing the 1992 Rio Summit, governments agreed at the 1994 International Conference on Population and Development (ICPD) that population and development, human rights, patterns of consumption and production and the environment were inextricably linked and could not be examined in isolation. The ICPD also marked a paradigm shift, focusing on the needs and rights of individuals rather than on demographic targets. It deemed that empowering women and meeting their reproductive health and rights were crucial for both individual advancement and sustainable development. Advancing gender equality and ensuring women's rights and ability to control their own fertility therefore, became cornerstones of population and development policies.

Population variables — including growth rate, household size, population distribution by age and sex, and urban versus rural orientation — all affect the ability of individuals, families and communities to manage their natural resources and to respond appropriately to the impacts of climate change. Population growth, density and migration may place additional pressures on the natural environment by increasing demand for natural resources. This in turn exacerbates environmental problems, including deforestation, land and water shortages and degradation, loss of biodiversity due to habitat destruction and the depletion of natural resources. As such women's empowerment is threatened and stalled by many issues related to environmental sustainability, including the impacts of climate change.

Allowing individuals the ability to realize their sexual and reproductive rights, access appropriate services and avoid unwanted births, leads to the creation of more opportunities for individuals to break the poverty-cycle and take positive steps towards securing a healthier, more educated, economically productive and sustainable present which will not just benefit current generations, but positively impact on those of the future. This is critical to the Rio+20 themes of the green economy in the context of sustainable development and poverty eradication, and the institutional framework for sustainable development. It is thus vital that the cross-cutting contribution that sexual and reproductive health services can make towards long term sustainable development is highlighted and prioritized in negotiations leading up to and during the Rio+20 Summit.

Protecting and realising the rights of the most vulnerable and promoting the sexual and reproductive health and rights of poor and marginalized groups must be a cornerstone of efforts to support adaptation to change and seize development opportunities. Intensified efforts to improve sexual and reproductive rights, including rights-based voluntary family planning, should – in helping reduce vulnerability to impact – be a vital component in supporting countries and communities adapt and respond to climate change. The ability of women to control their own fertility and realise their sexual and reproductive health and rights are fundamental to and inseparable from efforts to promote better health, gender equity, economic and political opportunity and sustainable growth – all of which will better equip countries and communities to cope with and respond to the challenges posed by climate change and contribute to sustainable development.

IPPF laments that one of the rights that remains unfulfilled for hundreds of millions of women around the world, and especially for young women, is the right to decide on all the aspects related to their reproduction and their sexuality, including the possibility to avoid a pregnancy through access to contraception. The denial of the right to choose if, when and how many children to have increases human vulnerability to the impacts of climate change. In addition, 1.8 billion young people between the ages of 10 and 24 years are increasingly demanding access to these services and have expressed the desire to have smaller families than their parents, but need family planning to realize this goal. UNFPA estimates that demand for voluntary family planning is expected to increase by about 50 to 75 per cent from 2005-2020 in many developing countries.<sup>ii</sup>

In October 2011 the world's population reached seven billion. This has led to a resurgent interest in discussion on the role of population dynamics, especially in the context of sustainable development and climate change. IPPF acknowledges the evidence that climate change is one of the major threats to human wellbeing, especially for the poor and the most vulnerable sections of the populations in the poorest and most marginalized countries. IPPF also recognizes the scientific evidence that meeting the unmet need for voluntary family planning contributes to ensuring sustainable development,<sup>iii</sup> including the management of climate change and finite resources such as arable land and drinkable water, and can contribute to reducing carbon emissions.<sup>iv</sup> Whilst climate change is a global challenge to which all countries must respond, the primary drivers of climate change - and responsibility for mitigation and the support needed to help poor countries adapt - rest with the more wealthy industrial and new economies as the main generators, consumers and emitters of pollutants contributing to climate change.

IPPF therefore specifically urges the Rio+20 process and all member states to ensure the conference outcome:

1. Recognizes that SRHR and gender equality are essential components of sustainable development;
2. Highlights the importance of adolescents and young people's access to comprehensive sexuality education and SRH services in advancing a sustainable development agenda; and,
3. Supports policies and legal measures that will ensure universal access to reproductive health.

1. Recognize that sexual and reproductive health and rights and gender equality are essential components of sustainable development

The ICPD Programme of Action recognises that the empowerment of women and women's equity are important ends in themselves and essential for the achievement of sustainable development<sup>v</sup>. Addressing women's reproductive health and rights positively impacts on gender equality, population growth, environmental issues and sustainable development.

Yet the lack of priority accorded to comprehensive sexual and reproductive health continues to perpetuate the inter-generational cycle of poverty and exacerbate gender inequality. Some 215 million women still have an unmet need for safe and effective family planning and are unable to meet this need because they are denied the right to choose the number, timing and spacing of their pregnancies, lack access to the relevant information and services, or the support of their partners and communities. In 2008, an estimated 358,000 women died due to complications developed during pregnancy and childbirth and for every woman who dies a further 20 more suffer injury, infection or disability - approximately seven million women every year.<sup>vi</sup> Ninety nine per cent of this maternal mortality and morbidity occurs in developing countries where resources and

priority for gender equality and sexual and reproductive health services is lacking. Between 2000 and 2008, funding from Official Development Assistance (ODA) for family planning declined from 8.2% to 3.2 % meaning there are now less resources to fund reproductive and maternal health programmes than in the year 2000.<sup>vii</sup>

Climate change and environmental degradation have the greatest impact on poor and vulnerable populations, especially women and young people who often have the fewest resources and are the least resilient to environmental changes and shocks. For example, at the individual level women and girls, who are often responsible for agriculture and supplying water for the household, must work harder and travel further to fulfill their duties,<sup>viii</sup> leaving them less time to spend in school or engage in income-generating activities which would otherwise contribute towards poverty alleviation and long term sustainable development.. Increased environmental degradation may be exacerbated by population dynamics and and climate change. In the absence of appropriate policy measures and investment, consequences could include: an increase in pressure on fresh water availability; an increase in soil degradation/erosion and its negative consequences for agriculture; over-grazing and shortage of land per capita, increased deforestation and more rapid urbanisation.

Women and young girls must be able to make free and informed decisions regarding their fertility which could otherwise negatively impact on their productivity potential as well as ability to participate in these processes. The consequence of this lack of priority for women's empowerment also exacerbates the gradual depletion and deterioration of natural resources which in turn can have a negative impact on population dynamics, economic development and women's empowerment. As highlighted in the Rio Declaration "Women have a vital role in environmental management and development".<sup>ix</sup> Yet for women to be able to participate fully and contribute to sustainable development it is essential to recognize their participation in decision-making processes and governance at all levels including their role as "agents of change".<sup>x</sup>

"Addressing women's reproductive health and rights is a goal in itself. It will in turn positively impact gender equality, population growth, environmental issues and sustainable development."<sup>xi</sup>

Ministry of Foreign Affairs of Denmark

"Climate change is already undermining the realization of a broad range of fundamental rights for many people – the right to health and even life, rights to food, water, shelter and property, rights associated with livelihood and culture are all affected. Our challenge is to build accountability for human rights into future efforts to address climate change."

Mary Robinson, October 2009

2. Highlights the importance of adolescents and young people's access to comprehensive sexuality education and access to SRH services in advancing a sustainable development agenda

Today, the world has the largest generation of young people in history with the least developed countries having particularly large and rapidly expanding youth populations - sub-Saharan Africa is for example, the "youngest" region in the world with 28 per cent of the population ranging between 12 and 24 years of age.<sup>xii</sup> As young people enter working age, they can significantly contribute to sustainable development. However, they can only do so provided that they benefit from good health and adequate education and meaningful employment.

While everyone has important contributions to make to society, the rights, needs and contributions of young women and girls must be prioritized so as to improve health outcomes and accelerate sustainable development. Yet many young women have only limited opportunities for contributing to their own well-being or to society as they are often denied the right to secondary education and essential health services, including sexual and reproductive health services. Young people account for a disproportionate burden of sexual and reproductive ill health because society continues to deny their needs. This is not only a denial of their individual human rights but also makes it increasingly difficult for many countries to eliminate poverty and achieve the internationally agreed development goals, including the Millennium Development Goals (MDGs). Empowering young people in this way is critical to achieving their individual development and well-being, and human rights for all. Yet young people remain largely invisible in internationally-agreed development frameworks. As a result, their needs and the realities of their lives are largely ignored. This results in the perpetuation of a cycle of poverty from which it difficult to escape. It is vital, therefore, that any sustainable development agreement takes into account the need and rights of young people to be able to secure a livelihood, good health and good quality of life.

Comprehensive Sexuality Education<sup>xiii</sup> (CSE) helps young people develop awareness about their sexual and reproductive health and rights, strengthen critical thinking skills, acquire the ability to develop healthy relationships and negotiate safer sexual practices, including whether and when to engage in sexual intercourse. However, many young people around the world lack access to CSE, which prevents them from being equipped with the knowledge, attitudes and life skills required to make informed evidence-based decisions. As is known, more and more young women and couples of reproductive age are choosing to have fewer children than the previous generation<sup>xiv</sup>, but are unable to fulfill these desires because of their lack of access to sexual and reproductive health services, information or education. Addressing the sexual and reproductive health and rights of young people is therefore critical if long term sustainable development is to be realized. Investing in education, including comprehensive sexuality education, plays a major role in addressing these concerns along with targeted investment in the provision of and access to sexual and reproductive health supplies, services and information. Nearly 13 million adolescent girls give birth each year in developing countries, most often before they are physically, emotionally or financially prepared to so<sup>xv</sup>. As a result pregnancy is the primary cause of death among teenage girls in developing countries<sup>xvi</sup>. This is not just a major health issue that puts significant pressure on health systems, but also affects girl's resilience and decreases their ability to adapt to the consequences of climate change and degradation of essential natural resources.

If sustainable development is to be realized it is imperative that young women and girls are meaningfully engaged in all levels of decision-making. Sustainable development not only affects their lives today, but the principle of inter-generational equity is a further imperative to ensure their active leadership and engagement with decision-making in the future. In addition to young people's intellectual contribution and their ability to mobilize support, they bring unique perspectives that need to be taken into account.

A girl growing up in Chad today is more likely to die in childbirth than she is to attend secondary school.<sup>xvii</sup>

UNICEF 2010

When a girl in a developing country receives seven or more years of education, she marries four years later and has 2.2 fewer children<sup>xviii</sup>

UNFPA 1990

3. Universal access to reproductive health (MDG5b) is key to sustainable development

The Millennium Development Goals (MDGs) serve as the framework for sustainable development, setting social equity goals and targets that contribute to economic development while ensuring environmental sustainability<sup>xix</sup>.

MDG 5 (improve maternal health) is closely inter-connected to all of the MDGs and is at the heart of the MDG framework, and therefore central to sustainable development. For example, reducing maternal mortality strongly affects newborn mortality (MDG4); while MDG 6 aims to combat HIV and AIDS and malaria which are important indirect

causes of maternal mortality. Promoting gender equality and women's empowerment (MDG3) will help achieve MDG 5. And MDG 1 and 2, increasing primary education for girls and eradicating extreme poverty and hunger, are a means to empower women that will again positively influence the achievement of MDG 5. In addition MDG 5 strongly resonates with MDG 7 'ensure environmental sustainability'. This is because enabling people to realize their sexual and reproductive rights, access appropriate services and avoid unwanted births, helps families make informed choices about family size making it more possible to be able to adapt to the changes brought about by climate change. There will also be benefits for the age structure, and it will help reduce levels of urban migration, reduce pressure on existing infrastructure, social services and natural resources, reduce pressure on food and water and their security, improve sustainable use of space and land and enhance women's empowerment and role as resource managers.<sup>xx</sup> Universal access to reproductive health is therefore a central component of any sustainable development strategy. And since 'sustainable development' is the overall theme of the UNCSD it is crucial that MDG 5b - "Achieve universal access to reproductive health" is prioritized if sustainability is to be achieved.

MDG 5 "Improve Maternal Health", aims to empower women and girls to exercise their rights to reproductive health. Later first pregnancy, fewer pregnancies and birth spacing results in healthier pregnancies, and mothers and children are more likely to survive and are less likely to be malnourished or suffer from chronic morbidity. Yet MDG 5 and particularly its target 5b - the main goal of the ICPD - is the most off-track of all MDGs. MDG 5 recognizes that the well-being of women is influenced significantly by the health, knowledge and choices available to them while they are adolescents. Yet alarmingly few low- and middle-income countries are on track to achieve MDG 5. And although the use of contraception has improved during the past two decades in many regions, the unmet need for family planning remains unacceptably high in these countries.

The decrease in funding for MDG 5 is one of the main reasons why the goal is off-track in most developing countries and means there is now less funding for reproductive and maternal health programmes than in 2000, the year the MDGs were adopted. After being neglected for almost a decade, MDG 5 has in recent years experienced an increased focus resulting in a small step forward. But if we are serious about achieving long term sustainable development it is vital that there is support for the attainment of the health MDGs. As highlighted in the Declaration of the 64th Annual UN DPI/NGO Conference<sup>xxi</sup> it is essential that "By 2015, to support attainment of the health MDGs, and to contribute to health, well-being and sustainable development, ensure universal access to health care and services, wherever feasible, free at the point of use for women and children, and including sexual and reproductive health, and thus strengthen the resilience of people and communities to the consequences of climate change and environmental degradation".

"The Millennium Development Goals, particularly the eradication of extreme poverty and hunger, cannot be achieved if questions of population and reproductive health are not squarely addressed. And that means stronger efforts to promote women's rights, and greater investment in education and health, including reproductive health and family planning."

KOFI A. ANNAN (UNSG 1997 - 2006)

"Today, maternal mortality is the slowest moving target of all the Millennium Development Goals – and that is an outrage. Together, let us make maternal health the priority it must be. In the 21st century, no woman should have to give her life to give life."

BAN KI-MOON (UNSG 2006 - )

## International POPs Elimination Network (IPEN)

DRAFT

IPEN Submission

UN Conference on Sustainable Development

Rio+20 June 2012

Thank you for the opportunity to provide input and comment to the UNCSD Secretariat's preparation of the zero draft for the outcome document for adoption by governments at Rio+20.

IPEN

The International POPs Elimination Network (IPEN) was formed in response to the global recognition of the need to eliminate persistent organic pollutants. Since its inception in 1998, IPEN has grown to a global network of over 700 public interest non-governmental organisations (NGOs) from more than 100 countries united in support of the common goal of a 'toxics-free future.' IPEN facilitates the engagement of public interest NGOs in efforts to eliminate POPs and other persistent toxic substances (PTS), and works for a world where exposure to chemicals is no longer a significant source of harm to public health and the environment. IPEN has emerged as a broad-based international chemical safety network with a global reach. It has the ability to translate chemical policy into concrete action on the ground and provides developing country NGOs with a voice at international forums.

This submission was prepared on behalf of IPEN (the International POPs Elimination Network) and its Participating Organizations by:

Dr Mariann Lloyd-Smith PhD (Law)

Introduction

The chemical industry plays a significant role in the global economy with sales in 2007 of more than three trillion U.S. dollars.<sup>1</sup> A steadily increasing share of the world's chemical production is shifting to developing and transition countries<sup>2</sup> and by 2020 developing countries are expected to lead in highvolume chemicals production.<sup>3</sup> The United Nations Environment Programme (UNEP) has noted rapidly rising import and use of chemicals in developing countries and estimates that by 2020, they could account for one-third of global consumption.<sup>4</sup> Almost all developing countries are increasing their use of pesticides and industrial chemicals, including substances contained in consumer and commercial products such as plastics, paints, adhesives, dyes, metals, and so forth.<sup>5</sup>

To achieve a sustainable future where individuals and societies can truly have green livelihoods, a sustainable chemical industry is essential. Many chemicals still on the market are simply unmanageable and industry can no longer be allowed to outsource its harmful impacts and expect communities to pay the 'costs'. Achieving a sustainable chemical industry is a significant challenge for Rio+20. This submission will address this challenge and identify expectations and desired outcomes of Rio+20.

Expectations for the outcome of Rio+20

Expectation 1 - Taking Stock a Generation On A prime expectation of Rio+20 is a 'taking stock of progress' against the goals and objectives of the previous Rio Earth Summit in 1992 and the outcomes of the World Summit on Sustainable Development (WSSD). It has been a generation since Rio and it is time to both assess progress and reinvigorate the Rio Principles of intergenerational equity, precaution, right to know, polluter pays and participation.

In 1992, governments meeting at the Rio Earth Summit acknowledged that chemical contamination could be a source of "grave damage to human health, genetic structures and reproductive outcomes, and the environment."<sup>6</sup> The subsequent Chapter 19 of Agenda 21 focused on Environmentally Sound Management of Toxic Chemicals, and in particular, the needs of developing countries when faced with the chemical hazards of their rapidly industrialising economies.

<sup>5</sup> Joe Digangi, Civil Society Actions For A Toxics-Free Future, New Solutions, Vol. 21(3) 433-445, 2011

<sup>6</sup> Agenda 21, Chapter 19, Environmentally Sound Management of Toxic Chemicals, Including Prevention of Illegal International Traffic in Toxic & Dangerous Products, Section 19.2 Available at [http://www.un.org/esa/dsd/agenda21/res\\_agenda21\\_19.shtml](http://www.un.org/esa/dsd/agenda21/res_agenda21_19.shtml)

Yet, 20 years on, toxic chemicals contaminate all living things, including vulnerable populations such as children and indigenous peoples. Since 1992, many more new

synthetic chemicals have been manufactured and released into the environment, with estimates of over 1,500 new chemicals being introduced each year. Approximately 80,000 are currently in use. The vast majority of pesticides and industrial chemicals have still not been adequately tested for their long term health and environmental impacts, particularly in terms of emerging concerns such as endocrine disruption and the impacts of mixtures of chemicals, which is how they occur in the environment. The little information that does exist is often not available to workers and exposed communities, particularly in developing countries and countries with economies in transition.

The developing world still faces dirty industries setting up in countries with limited capacity and compliance, as well as the escalating threats of ever increasing waste streams and illegal dumping by developed countries. In particular, the quantity of hazardous electronic waste finding its way to developing countries is still growing exponentially.

A generation on, our water, soil, air and food chain are contaminated with toxic persistent chemicals and 'toxic trespass' of our bodies and those of wildlife continues unabated!

It is essential that Rio+20 reviews its past and takes stock of progress against Chapter 19 of Agenda 21. It should also assess the lack of progress in regards to the WSSD 2020 goal and incorporate activities that would address the systematic failings into its outcomes.

To achieve a sustainable future, Rio+20 will need to develop a program to eliminate the toxic legacy faced by countries as a result of unsound chemicals management and provide concrete and measureable deadlines crucial to ensure focus, credibility and public trust.

#### 4. Specific Elements: a. Objectives of the Conference:

##### Reinvigorate Rio Principles and WSSD Objectives Pertaining to Chemicals and Waste

Rio+20 provides an appropriate opportunity to reinvigorate the original Rio principles and WSSD objectives pertaining to chemicals and waste. Chapter 19- "Environmentally Sound Management of Toxic Chemicals"- focused on the generation, harmonisation and dissemination of chemical data, and strengthening capacity for chemical management. It contained specific reference to the right of communities to chemical information and the obligations on industry and governments to generate and provide that information. It was acknowledged that it is in the public interest for the community to be informed, to exercise their right to understand, to make informed choices and to participate in informed decision-making. Informed consumers can help drive cleaner production and reduce the generation of hazardous waste.

Right-to-know was also supported by the Aarhus Convention and the Strategic Approach to International Chemical Management (SAICM), which aimed to ensure that information about chemicals throughout their life cycle, including chemicals in products, was available to all stakeholders.<sup>7</sup> There is a clear acknowledgement that right-to-know is essential to implement the WSSD 2020 goal; "to achieve the sound management of chemicals throughout their life-cycle so that, by 2020, chemicals are used and produced in ways that lead to the minimization of significant adverse effects on human health and the environment."<sup>8</sup>

Despite this, two decades after the Rio Earth Summit, the rhetoric of community right-to-know and access to chemical information still outstrips the reality. In many countries, information on product ingredients is still withheld under commercial confidentiality regimes. While some countries have implemented right-to-know initiatives like the Pollution Release Transfer Registers, their effectiveness is restricted by the limited number of chemicals covered and their dependence on industry estimations. Environmentally sustainable chemical management requires reliable, comprehensive and accessible information, yet legal and regulatory frameworks still often do not allow for an open and equal exchange of information among stakeholders.

The application of the Precautionary Principle is crucial to the assessment of chemicals and new technologies; nevertheless, new and emerging technologies including bio-engineering and nanotechnology have been introduced with little or no oversight or assessment. The principles of substitution and elimination of hazardous substances as envisaged by SAICM, established to implement the WSSD Plan of Action for chemical management, are integral to protection of vulnerable populations, like agricultural workers, indigenous peoples and children.

Rio+20 must reinforce a global commitment to the Rio principles, their implementation by all governments and to the WSSD 2020 goal. These are essential to achieving a sustainable future and green livelihoods.

Rio+20 must reaffirm the central role of sustainable development in the international agenda and revive public trust in sustainable development as a policy that can finally make a positive breakthrough.

It is necessary to acknowledge that certain industries, which cannot fulfill these principles, cannot be part of a sustainable future. Clear criteria need to be developed to encourage sustainable investments into chemical industry that will help to phase out unsustainable chemical production.

<sup>7</sup> SAICM Overarching Policy Strategy, para 15 (b) (i)

<sup>8</sup> Strategic Approach to International Chemicals Management (SAICM), Overarching Policy Strategy, paragraph 13

##### Commitment to the chemical management objectives to ensure intergenerational equity

Two decades after the Rio Earth Summit, babies are born pre-polluted with hundreds of manmade toxic chemicals present in their small bodies. The developing foetus is contaminated by chemicals bio-accumulated in the mother's body and that readily cross over the placental barrier. Newborns take more in through breast milk or formula, and as they grow are exposed to hazardous chemicals through residues in their food, indoor and outdoor air pollution, and through household products and contaminated house dust.<sup>9</sup> Many of the synthetic chemicals they are exposed to are persistent and bio- accumulative, remaining in the human body long after exposure. There are still no regulatory approaches to assess the combined impacts of the chemical soup to which children are exposed.

The unique vulnerability of children to hazardous chemicals was recognised by the Intergovernmental Forum on Chemical Safety, the World Health Organisation (WHO), the United Nations Children's Fund (UNICEF) and UNEP<sup>10</sup> when they identified a growing number of children's health impacts from chemical exposure. These include asthma, birth defects, (eg, hypospadias), behavioural disorders, learning disabilities, autism, cancer, dysfunctional immune systems, neurological impairments, and reproductive disorders.<sup>11</sup> The WHO has estimated that three million children under the age of five die every year due to environmental hazards.<sup>12</sup> All children, both in the developing and developed world, are affected by exposure to hazardous chemicals. In 2004, the European Union's Ministerial Conference on Children's Environmental Health concluded that reducing exposure to hazardous chemicals could save the lives of many children.

For Rio+20, to achieve real sustainability, the impacts of our chemical activities, products, and waste on future generations must be addressed in the Rio+20 outcomes. All governments and intergovernmental organisations will need to ensure a long term, sustainable, intergenerational commitment to chemical reform.

#### Specific Elements:

Sound Management of Chemicals to Achieve Sustainable Development In February 2006, Ministers of over 140 governments endorsed the Strategic Approach to International Chemicals Management (SAICM) High Level Declaration, which states:

The sound management of chemicals is essential if we are to achieve sustainable development, including the eradication of poverty and disease, the improvement of human health and the environment and the elevation and maintenance of the standard of living in countries at all levels of development. <sup>13</sup>

Many developing and transition countries continue to face burgeoning industrial growth as industries, many of them hazardous, set up where there are few regulations and little capacity to control effluent, air pollution and waste. While there is a global consensus that sound management of chemicals is an integral part of the sustainable development agenda and that an inability to manage chemicals can negatively affect development and poverty reduction initiatives, sound chemicals management has not been successfully integrated into development assistance. Some of the problems stem from limited resources, the multitude of other obligations, and the urgent need to address other global environmental issues such as climate change. However, another obstacle includes the view that chemicals management is an environmental issue not a health and development concern. Hence there is not a strong demand by developing countries to include chemical safety in development assistance. While donor countries insist on country driven programs, there remains a disconnect between chemical safety and the development agenda.

As sound chemical management is essential to achieve the Millennium Development Goals, Rio+20 outcomes must ensure that chemical safety and chemical policy reform occupies a place at the core of the economic and development policy agenda. Rio+20 must recommend that sound chemical management be taken into account while determining the direction of all international development assistance.

In order to achieve this, IPEN offers the following model for Rio+20 activities: In 2007, IPEN collaborated with UNEP Chemical and the SAICM Secretariat to initiate and coordinate the Global NGO SAICM Outreach Campaign. <sup>14</sup> The purpose of the campaign was to raise awareness about SAICM and to secure commitments from NGOs in all regions to undertake efforts to elevate the threats posed by toxic chemicals. The campaign targeted not only environmental NGOs, but also organisations from other sectors including

<sup>13</sup> United Nations Environment Programme, Strategic Approach to International Chemicals Management: SAICM texts and resolutions of the International Conference on Chemicals Management, 2006, [http://www.saicm.org/documents/saicm%20texts/SAICM\\_publication\\_ENG.pdf](http://www.saicm.org/documents/saicm%20texts/SAICM_publication_ENG.pdf)

<sup>14</sup> See Global SAICM Outreach Campaign. Available at <http://www.ipen.org/campaign>

health, agriculture and labour. As a result of the campaign, more than one thousand NGOs in over 100 <sup>15</sup> countries endorsed a civil society statement supporting SAICM and its objectives, committing themselves to contribute to the SAICM implementation. The campaign spread the message for the need for chemical management to ensure the protection of human health and the environment but also human rights and national development.

This model could be utilised as an activity from Rio+20 to assist in achieving greater awareness of the role of chemical management in sustainable development.

#### Sound Management of Chemicals to Ensure the Protection of Human Rights

The protection of the environment is a vital part of contemporary human rights doctrines. It affects the right to life and the right to health. The International Court of Justice has found that damage to the environment undermines all human rights spoken of in the Universal Declaration and other human rights instruments. <sup>16</sup>

In 2001, the United Nations Human Rights Committee found that 'living in a pollution-free world is a basic human right' <sup>17</sup> and those who pollute violate these rights. It was noted that, 'human rights cannot be secured in a degraded or polluted environment' and that 'the fundamental right to life is threatened by exposures to toxic chemicals, hazardous wastes, and contaminated drinking water.'

The rise of chronic diseases such as cancer, heart disease, diabetes, degenerative diseases and mental health have all shown to have links to pollution of air, water and/or food. WHO has assessed almost a quarter of all disease is caused by environmental exposure, which can be averted. <sup>18</sup> Their report, 'Preventing disease through healthy environments - towards an estimate of the environmental burden of disease,' shows that in one way or another, the environment significantly affects more than 80% of major diseases.

The Convention on the Rights of the Child <sup>19</sup> recognises the dangers of environmental pollution <sup>20</sup> and places an onus on all parties to ensure the

<sup>18</sup> WHO Media Release 'Almost a quarter of all disease caused by environmental exposure' 16 JUNE 2006 | GENEVA Available at <http://www.who.int/mediacentre/news/releases/2006/pr32/en/index.html>

<sup>19</sup> Convention on the Rights of the Child, opened for signature 20 November 1989, 1577 UNTS 3 (entered into force 2 September 1990). Australia ratified the CRC on 17 December 1990.

<sup>20</sup> Article 24 2(c) To combat disease and malnutrition, including within the framework of primary health care, through, inter alia, the application of readily available technology and through the provision of adequate nutritious foods and clean drinking-water, taking into consideration the dangers and risks of environmental pollution;

healthy development of the child, to the maximum extent possible. To achieve this, the epigenetic basis of health and disease must also be considered, for once there is a mutation in a gene, this intergenerational impact cannot easily be remedied. All children have a right to a healthy, toxic-free environment with clean air, clean water and food free from chemical residues, as well as safe and toxic-free toys.

The human rights of indigenous people are also badly affected by chemical contamination. Under the Declaration on the Rights of Indigenous People 2007,<sup>21</sup> indigenous people have the right to practice and revitalise their cultural practices, customs and institutions; however, the ongoing contamination of the food chain seriously threatens indigenous peoples' right and need to consume traditional foods.

In the Stockholm Convention on Persistent Organic Pollutants (POPs) 2001 preamble, Arctic peoples are given special consideration which acknowledges that the Arctic ecosystems and indigenous communities are particularly at risk because of the biomagnification of POPs in their traditional foods. The blood and breast milk of Arctic peoples are contaminated with the full suite of POPs chemicals and their metabolites. The level of perfluorooctanoate (PFOA), a carcinogen and immunotoxin, is doubling in the Arctic environment every 5 years. Perfluorooctanesulfonate (PFOS), a newly listed POPs chemical with no known breakdown, already contaminates every aspect of the Arctic environment and its inhabitants. Despite this, governments permit the continuation of this pollution by allowing a wide range of acceptable uses and exemptions for PFOS.

Rio+20 outcomes must include active support for activities to reduce chemical contamination to protect basic human rights. They need to facilitate the phase-out of all ongoing uses and exemptions for POPs, which are transboundary, intergenerational poisons that cannot be managed.

Rio+20 must provide a clear pathway for global phase-out of particularly hazardous chemicals, specifically PBTs (persistent bioaccumulative toxins), vPvBTs, (very persistent, very bioaccumulative toxins), genotoxics, carcinogens, chemicals affecting the immune and nervous system, and endocrine disruptors. The SAICM emerging policy issue on endocrine disruptors needs to be supported.

Recommendations for Rio+20 Specific Chemical Safety Activities needed to achieve a sustainable future

- Life Cycle Analysis and Polluter Pays -

To achieve a sustainable future, Rio+20 outcomes must support a move away from the standard risk assessment paradigm to an assessment of the complete life cycle of a chemical, product or activity. Understanding the systems of production, distribution, use, and disposal reveals a more

<sup>21</sup> See United Nations Declaration on the Rights of Indigenous Peoples, GA Resolution 61/295, UN Doc A/61/L.67 (2007) at article 5, 9 and 11

complete view of chemical relationships and where a given chemical may create threats to human health or the environment.<sup>22</sup>

Through a life cycle approach, the full cost of a product or activity can be properly assessed, ensuring extended producer responsibility for all aspects and impacts of the chemical's life cycle. A polluter pays approach is essential, as countries can no longer afford to pay the burgeoning costs of chemical contamination and hazardous waste management in terms of adverse environmental health impacts and the economic imposts on the public purse.

Currently, much of the cost of chemical production, use and waste management has been externalized as costs to governments and society. These encompass legacy issues such as obsolete stockpiles, contaminated sites and children whose development has been impaired as a result of pre- natal and post-natal chemical exposure; others whose health has been injured as a result of chemical exposure, eg, workers; those providing health care services to such people; property owners or users whose property value decreases as a result of chemical contamination; fishers, hunters, small farmers, and others whose livelihoods are impaired by chemical contamination; indigenous peoples whose way of life has been undermined through contamination of their traditional foods; people whose water supply is contaminated; and others.

Externalities of modern industrial agriculture include depletion of water, soil, and biodiversity; pollution by pesticides and fertilizers; loss of livelihoods and knowledge, and the resulting economic and social costs to communities. These externalities retard economic productivity, harm the environment, and impose additional burdens on a country's health delivery and education systems.

While the Polluter Pays Principle and its internalization of costs helps address these impacts, economic instruments that internalize costs of chemicals management have not been widely implemented.

Rio+20 outcomes should provide support for cost internalization mechanisms as an effective method to provide the resources needed to establish infrastructure and foster investment in safer practices and in the substitution of less hazardous chemicals and materials. Rio+20 outcomes must support a cradle-to-cradle approach to product design, giving due consideration to the chemical components and an acceptance of what is not recyclable, should be degradable.

- Substitution and elimination of hazardous substances in consumer products -

In most countries, the consumption of products containing hazardous chemicals is increasing, resulting in a growth in emissions from the

<sup>22</sup> Geiser, K., Redesigning Chemicals Policy: A Very Different Approach, NEW SOLUTIONS, Vol. 21(3) 329-344, 2011

manufacture and use of products as well as a massive growth in the waste generated. SAICM acknowledged fundamental changes are needed in the way products are manufactured, consumed and managed in their waste or recycling phase.

Many low quality products are supplied to and also made in developing countries and economies in transition, including cosmetics, household goods, paints, toys and other goods for children that are contaminated with a range of heavy metals and chemicals. In most cases, no information on contents of hazardous chemicals in products is available to governments or civil society and there remains inadequate public awareness of health risks associated with many products.

Lead content in paint is a pertinent example. Lead levels in paint sold in developing countries are significantly higher than those of developed countries. Lead is renowned for its toxic effects, particularly on children, and the removal of lead from paint is an iconic intergenerational and equity issue, which needs immediate global attention.

While right-to-know about product ingredients will help drive cleaner production, the onus must remain with manufacturers and governments to ensure hazardous substances are eliminated from consumer products and substituted with safer ingredients.

Rio+20 outcomes will need to ensure not only a reduction in product obsolescence but chemical management reforms based on green product design, substitution and the elimination of toxic substances. A primary outcome of Rio+20 outcomes must be a complete phase-out of toxic substances from all children's products, including toys, by 2020.

- Addressing the Toxic Ewaste Trade -

Many developing countries already facing their own domestic waste pressures are experiencing import of hazardous waste, particularly electronic waste, from other countries, including developed countries. The export of old computers to 'bridge the digital divide' is still being used as an excuse for toxic waste dumping on some of the poorest communities and countries in the world. It is estimated that between 50% and 80% of ewaste collected for recycling in the developed countries each year is being exported.

Developed countries have not invested in adequate ewaste recycling/treatment facilities and have not provided adequate legislation, monitoring and compliance to stop the

toxic exports. The lack of adequate infrastructure in developing countries to manage ewaste safely results in the burning of ewaste in open air or dumping in sewers, rivers or on the ground, with global impacts.

The phenomenal growth in ewaste requires that all countries develop sound capacity to prevent, minimise, re-use or recycle materials from ewaste. Active support must be given to green product design to design-out toxic components in electronics, as well as green procurement policies.

To achieve sustainability, Rio+20 outcomes need to support countries and help build capacity for the prevention, management and recycling of ewaste

. Rio+20 should encourage all Governments to ensure prompt ratification and entry into force of the Basel Ban Amendment by 2016 at the latest to assure developing countries are not dumping grounds for external toxic waste.

#### - Hazardous Stockpiles and Destruction Technologies -

Many developing and transition countries have large stockpiles of obsolete pesticides that pose a serious threat to human health and the environment in these countries themselves and in neighbouring countries as well. These legacy stockpiles need an international approach to ensure their destruction using environmentally sound techniques.

In the last decade, the availability of non-incineration destruction facilities has been seriously impaired through a lack of institutional support. While these technologies are still available, the market approach has resulted in the preference for what appears to be cheaper incineration options. This is despite emitting air pollutants and producing toxic ash requiring permanent storage, as well as ongoing public opposition in all continents.

Rio+20 outcomes need to provide support for non-incineration destruction technologies to urgently address the legacy wastes. Rio+20 outcomes must provide awareness-raising and capacity-building for developing countries and countries in transition to help them resist the attempts to push through old incineration technologies.

#### - Ban Highly Hazardous Pesticides -

The agricultural use of pesticides that are highly hazardous to human health and the environment is long overdue for replacement by sustainable alternatives. As part of its commitment to implementing the objectives of SAICM, the Food and Agriculture Organisation (FAO) has called for the global phase-out of highly hazardous pesticides and has developed criteria to identify them. These include pesticides that are highly acutely toxic (WHO Classes 1a and 1b), carcinogenic, mutagenic, reproductive toxins, those listed under the Stockholm or Rotterdam Conventions, or pesticides with active ingredients and formulations that have shown a high incidence of severe or irreversible adverse effects on human health or the environment.<sup>23</sup>

FAO has also called for the use of these pesticides to be replaced by an ecosystem approach to agriculture based on biological process and the use of

<sup>23</sup> <http://www.fao.org/agriculture/crops/core-themes/theme/pests/pm/code/hhp/en/>

pesticides only as a last resort.<sup>24</sup> This approach echoes that of the UN Special Rapporteur on the Right to Food, who found that in order to combat hunger and malnutrition, states should implement policies to adopt agroecological practices, as agroecology raises productivity, reduces rural poverty, improves nutrition and contributes to adapting to climate change.<sup>25</sup>

A World Bank report on community managed sustainable agriculture in India found that non-pesticide management of the agro-ecosystem significantly increases farmers' net income, improves household food security and reduces environmental damage.<sup>26</sup> The agroecological approach to agriculture in place of the use of highly hazardous pesticides is also supported by the United Nations Conference on Trade and Development (UNCTAD);<sup>27</sup> the United Nations Environment Programme (UNEP) in its report on the Green Economy;<sup>28</sup> and the International Assessment of Agricultural Knowledge, Science and Technology for Development (IAASTD), a World Bank initiative in partnership with FAO, UNEP, UNDP, WHO, governments, civil society, the private sector and scientific institutions.<sup>29</sup>

Despite this high level support for replacing hazardous pesticides with an agroecological approach to food production, little progress has been made. Many governments and others continue to believe, despite abundant evidence to the contrary, that chemical-based agriculture is the only way to feed the world. In ignorance, many farmers continue to use highly hazardous pesticides, poisoning themselves, their families, future generations and the environment, usually also diminishing their potential returns and food security.

Rio+20 outcomes must provide a process for the global phase-out of highly hazardous pesticides and endorse and actively support an agroecological approach to agriculture.

#### - Achieving Mercury Phase-Out through a Global Treaty -

The impacts on human health from exposure to mercury are well documented, with children most at risk from its neurotoxicity. The current negotiations need to result in a convention text that covers the full life cycle of mercury in all media, including in products and waste streams. BAT/BEP (best

<sup>24</sup> FAO. 2010. Report of the twenty-second session of the Committee on Agriculture, Rome, 29 November – 3 December 2010. Rome. Also see FAO, 2011. Save and grow: A policymaker's guide to the sustainable intensification of smallholder crop production. <http://www.fao.org/ag/save-and-grow>

<sup>28</sup> UNEP Green Economy report: Towards a Green Economy: Pathways to Sustainable Development and Poverty Eradication, 2011 <http://www.unep.org/greeneconomy/v2/GreenEconomyReport/tabid/29846/Default.aspx>

<sup>29</sup> IAASTD: The International Assessment of Agricultural Knowledge, Science and Technology for Development, 2008. <http://www.agassessment.org/>

available techniques/best environmental practice) should be required for all new and existing release sources, as well as adequate financial and technical assistance for developing and transition countries to assist them in meeting BAT/BEP requirements and other aspects of treaty implementation.

All Parties should be required to develop a national goal consistent with treaty goals for reducing and eliminating its mercury emissions, and implement education, training and awareness-raising with regard to the action plan.

The treaty should address both large and small scale mining and refining operations, and in particular address artisanal small scale gold mining (ASGM). Mercury imports and other sources of mercury supply for ASGM should be banned and measures to prohibit, restrict, or discourage should include child labour. Importantly, all mercury waste must be covered by the treaty.

Rio+20 outcomes should support the development of an effective and comprehensive mercury treaty.

#### - Interaction of Climate Change and Chemicals -

In 2011, UNEP acknowledged that chemical management reform needs to be undertaken in the context of the growing interaction of climate change on chemical releases, transport, degradation, exposure and toxicity.<sup>30</sup> The report by the United Nations Environment Program (UNEP) and the Arctic Monitoring and Assessment Programme (AMAP) Expert Group, 'Climate Change and POPs: Predicting the Impacts,' concludes that higher temperatures increase primary emissions and releases of POPs. Temperature also changes rates of mobilisation from materials, products or stockpiles and alters use patterns, eg, increased demand for disease vector control/DDT. It was demonstrated that increased exposure to POPs also results from secondary re-volatilisation and re-mobilisation from sinks, eg, melting of ice, glaciers and permafrost, flooding of contaminated lands, waste sites and landfills, as well as increase partitioning of POPs from water to atmosphere. There is already evidence of increased remobilization of POPs and heavy metals from glacial and permafrost melt. While enhanced degradation of POPs due to temperature increases is possible, if microorganisms have a higher degradation capacity, this could also lead to increased formation of toxic transformation products.

POPs exposure has direct impacts on individuals and populations, including endocrine effects on reproduction, immunosuppression and epigenetic effects (heritable changes) at cellular level. Temperature has been shown to affect POPs toxicity, and climate change impacts on salinity, ocean acidification, eutrophication and water oxygen levels could (either alone or in combination) enhance the toxic effects of POPs.

<sup>30</sup> Climate change and POPs: Predicting the Impacts, Report of the United Nations Environment Program (UNEP)/Arctic Monitoring and Assessment Programme (AMAP) Expert Group, January 2011 Available <http://chm.pops.int>

Rio+20 outcomes must ensure a coordinated and global response to counteract immediate, medium and long-term effects on human health and ecosystems of concurrent exposure to POPs and changing climates.

Rio+20 outcomes should endorse the precautionary approach to guide development of policy actions to address combined negative impacts of climate change and POPs, including support for mitigation activities with co-benefits.

#### - Support for Zero Waste and Recycling and the Removal of Single Use Plastics -

To achieve sustainability, societies and governments must succeed in implementing Zero Waste policies,<sup>31</sup> which requires improvement of product design and content to better ensure the ease and safety of recycling. Industries and governments have argued that recycling costs are in some cases more than the production of new items, but this fails to assess the full costs of the life cycle impacts including the waste phase and the impact on finite resources.

A pertinent example is the cost of plastic marine debris. The plastic 'gyres' of the Pacific, Atlantic and Indian oceans are growing as the result of low recycling rates for plastic. Either via direct dumping, river transport or unsecured landfill, waste plastics find their way to the ocean vortices. As plastics do not biodegrade easily in the environment, the amount of plastic in the vortices is increasing substantially. About 250 billion pounds of plastic raw material are produced annually worldwide with unintentional releases to the environment during manufacturing and transport. Plastic pellets are now widely distributed through the world's ocean along with plastic wastes.<sup>32</sup> The plastic accumulates pollutants including nonylphenols, DDE and PCB, which can be up to one million times more concentrated on the surface of the pellets than in the ambient seawater. This high accumulation potential means that plastic resin pellets serve both as a global transport medium and a source of toxic chemicals in the marine environment. Mortality due to plastic ingestion is now common in seabirds, marine mammals and sea turtles. The extent to which the ingestion of hazardous chemical components attributes to wildlife deaths is not available.

To achieve sustainability, Rio+20 outcomes will need, as a priority, to ensure single use plastics are phased-out and provide a clear path to a global reduction of plastic use and disposal.

<sup>31</sup> Zero waste is a philosophy that encourages the redesign of resource life cycles so that all products are reused. SAICM agreement refers to "zero waste resource management, waste prevention, substitution and toxics use reduction, to reduce the volume and toxicity of discarded materials"

<sup>32</sup> Mato, Isobe, Takada, Kahnehiro, Ohtake, and Kaminuma. Plastic Resin Pellets as a Transport Medium for Toxic Chemicals in the Marine Environment Environ. Sci. Technol. 2001, 35, 318-324

#### - Ensure Precautionary Principle and Adequate Assessment is applied to Nanotechnology and Nanomaterials -

In recent years, a wide variety of nanomaterials (substances smaller than 100 nanometers in size) have been added to an increasing numbers of consumer products used in day-to-day life, eg., food packaging, sunscreens, clothing (odor-resistant textiles), pharmaceuticals, cosmetics, agrochemicals, household appliances, and medical devices. This is despite the lack of adequate toxicity assessment, labeling, government regulation or environmental monitoring; and despite the SAICM requirement for publically available information about all stages of a chemical's life-cycle, including in products.

There is huge uncertainty regarding the health impacts and toxicity of nanoparticles.<sup>33</sup> Without mandatory labelling and registration of nano- products, no one, not even governments, knows which products contain nanoparticles. Surveys show that many companies do not conduct risk assessments.<sup>34</sup> Yet both in vitro and in vivo studies have shown that manufactured nanoparticles, now in widespread commercial use, pose new toxicity risks<sup>35</sup> including asbestos-like pathogenicity and the onset of mesothelioma in test mice,<sup>36</sup> and granulomas, lesions, cancer or blood clots.<sup>37</sup> There is evidence that some nanoparticles can cross the placenta, posing particular risks to developing embryos.<sup>38</sup> Nanoparticles have been shown to have a potential for biomagnification and bioaccumulation in the environment,<sup>39</sup> and a recent study provides clear evidence that nanoparticles

can build up in a terrestrial food chain;<sup>40</sup> even in important staple crops like rice where transmission of nanoparticles from plant to seed to the next generation was demonstrated.<sup>41</sup> The potential impacts of these processes on both food safety and the environment are unknown.

The United Kingdom's Royal Society, the world's oldest scientific institution, has recommended that given the emerging evidence of serious nanotoxicity risks, nanoparticles should be subject to new safety assessments prior to their inclusion in consumer products, and the release of nanoparticles into the environment should be avoided as far as possible.<sup>42</sup> Still, the overwhelming majority of nanoproducts are reaching the marketplace without specific safety assessments, and with the workers handling nanoparticles not informed of this fact. No nano-containing products are required to be labeled, and as uses continue to expand, the societal and environmental exposure to nanomaterials, both deliberate and unintentional, will inevitably increase.

Current international efforts, such as the OECD nanomaterials sponsorship program, focus on only a fraction of the nanomaterials already in circulation or nearing commercialization, and are not expected to provide results that can assist risk assessment for some years. It is likely that nanotechnology will do little to redress the systemic causes of poverty, hunger or pollution, and developing countries may even disproportionately bear nano-risks, by hosting manufacturing that wealthy countries reject, or becoming dumping grounds for waste.

Rio+20 outcomes must ensure the precautionary principle is applied throughout the life cycle of manufactured nanomaterials, and that global governance and assessment processes for nanomaterials are transparent, inclusive, equitable and driven by sustainability.

Rio+20 outcomes must ensure consumers' and workers' right-to-know and right-to-choose in respect to nanotechnologies and nanomaterials be respected, as well as a country's right to reject particular applications or uses of nanotechnologies and nanomaterials.

In conclusion -

In this time of increasing globalisation, there is a growing acceptance of the need for a social license and community consent for industrial activities, including new and emerging technologies, to go forward. This is critical for a sustainable future and for the protection of the environment, intergenerational equity and basic human rights. Taking into account Agenda 21 requirements, industries must function within these parameters and have no right to operate

unless they satisfy social needs and meet the requirements for a safe, toxic- free environment.

With the added pressure on the planet posed by climate change and world population, the limits of sustainability in a 'business as usual' model have been reached. The urgency has never been greater for sound chemical management, environmental protection and social justice. If a sustainable future is to be possible, the protection of our global commons and, in particular, our shrinking resources of clean air, water and soil, is paramount.

While communities and civil society view a social license in terms of a dynamic, ongoing relationship between companies, government, stakeholders and communities, many regulators still see a 'social license' in terms of a formal permission linked to the regulator granting the 'license.' This is simply not adequate. There are many worrying examples of the failure of this model, for example, in many parts of the world, mining activities and the search for unconventional gas (shale gas, coal seam gas) has resulted in companies undertaking activities that contaminate the global commons and the life support systems on which we all depend. Regulation has not stopped the intentional release of vast quantities of unassessed industrial chemicals into waterways, aquifers and airsheds. The time when an industrial activity can be undertaken purely for profit or economic growth has gone. Sustainable futures depend on access to clean water, soil, air, food and products as well as the right to be protected against toxic trespass. These are basic inalienable human rights for all peoples of the planet and to ensure and protect them is the real challenge for Rio+20.

## International Rivers

October 2011

The UN Conference on Sustainable Development 2012 offers an opportunity for world leaders to confront the challenges of natural resource depletion, poverty and climate change in an integrated way. With bold thinking and concrete commitments, Rio+20 could help transform the global economy to one that promotes equity, sustainability and security. It could facilitate a shift in investment away from destructive, outdated technologies towards innovative, pro-poor, sustainable solutions to meet the world's food, water and energy needs. International Rivers welcomes the opportunity to provide input into this critical process and offers the following comment and recommendations on the conference's Green Economy theme.

#### Executive Summary

Poor and marginalized communities are especially dependent on natural resources for their livelihoods. Therefore, sustainably managing, conserving and valuing these natural assets while meeting the world's food, water and energy needs is essential to reducing poverty. The impacts of climate change, particularly on water, will make sustainable-development challenges more acute. Water, energy and food security in a warming world will require major improvements in water-use efficiency, sustainable agricultural intensification, and in decentralized techniques that are flexible and adaptable. Small-scale, bottom-up water and energy projects offer win-win solutions in terms of efficient and low-impact water supply, strengthened food security, improved access to energy, and enhanced resilience to climate change. They include local check dams, other water harvesting techniques, mechanic treadle pumps, drip irrigation, the system of rice intensification, as well as wind, small hydro, solar and geothermal energy technologies. These projects empower poor people, enhance their livelihood security, promote climate resilience and have an impressive track record. If adapted to local circumstances and backed with the necessary legal, scientific and financial support, bottom-up approaches can be scaled- up significantly. Future development strategies need to move away from energy and water projects that depend on stable climatic conditions and subsidies for environmentally and socially harmful technologies must urgently be phased out. Avoiding the errors of the past will require the application of participatory planning and decision-making processes as well as strict, mandatory social and environmental standards. The guidelines that have been recommended by the World Commission on Dams (WCD) are the most appropriate framework for decision making on water and energy projects.<sup>1</sup>

<sup>1</sup> See World Commission on Dams (2000), pp. 195ff.

#### Green Economy: Food, Water and Energy Security in a Changing Climate

Sustainable strategies for meeting food, water and energy needs while conserving natural capital must be central to a green economy that seeks to eradicate poverty. Poor and marginalized communities are especially dependent on natural resources for their livelihoods. Therefore, sustainably managing, conserving and valuing these resources and the services they provide is a necessary pre-condition for achieving global targets to reduce poverty. Without a reversal of current trends that favor natural capital depletion by, in part, failing to value ecosystem services and subsidizing unsustainable activities, poverty eradication will remain an elusive goal.

The threat posed by climate change exacerbates the challenges of addressing food, water and energy needs of a growing population. Some of the worst impacts of climate change on both people and ecosystems will be felt through its impacts on water. Rivers, the lifelines of our planet, are already experiencing a higher rate of species extinction than any other major ecosystem. Climate change will compound the problems caused by large dams and other water infrastructure for species as well as for people who depend on rivers for their livelihood. Additionally, more extreme floods will threaten the safety of existing infrastructure, and unprecedented droughts will reduce the hydropower and water supply services that dams are built to provide. A new paper in the scientific journal, PLoS Biology, found that "particularly for large [water] infrastructure projects, the risks for investors, communities, and ecosystems are extremely high given uncertainties in future hydrological conditions". It concluded that "climate-infrastructure mismatches may make poor nations even poorer".<sup>2</sup> Water security in a warming world will require major improvements in water-use efficiency and in decentralized techniques such as rainwater harvesting and improved groundwater management. These low-impact solutions allow more flexible responses to changing rainfall and streamflow patterns than large centralized infrastructure projects.

It will be essential to intensify agriculture and improve water security to meet the water, energy and food security challenges of the future. Yet intensification should not be equated with an increase in chemical inputs and traditional irrigation techniques, just as water security should not be equated with big dams and centralized reservoirs. Organic and sustainable agriculture practices should be expanded as much as possible. Decentralized, smallscale water and energy projects offer win-win solutions in terms of efficient and low-impact water supply, strengthening food security, improving access to energy, and strengthening resilience to climate change. These projects empower poor people and enhance their livelihood security.

Fortunately, solutions that integrate water, food and energy security with climate resilience exist. They include a wide spectrum of small, decentralized, bottom-up approaches such as local check dams, other water harvesting techniques, mechanic treadle pumps, drip irrigation, and the system of rice intensification (SRI). Combining traditional knowledge and innovative techniques, these approaches rely on farmers' initiatives, use water efficiently, cost less than

<sup>2</sup> Matthews JH, Wickel BA, Freeman S (2011) Converging Currents in Climate-Relevant Conservation: Water, Infrastructure, and Institutions. PLoS Biol 9(9): e1001159. doi:10.1371/journal.pbio.1001159.

large dams, enhance the food security of the poor, and typically help conserve our natural wealth. Similarly, a diverse mix of decentralized renewable energy projects – including wind, small hydro, solar and geothermal – can strengthen our resilience to climate change, improve energy access for the rural poor, and minimize negative environmental impacts.

Bottom-up solutions have an impressive track record. For example, SRI increases yields and makes the rice crop more resilient to climate change through reduced use of water, fertilizer and pesticides, but increased attention to soil biology. SRI methods have been validated in 42 countries in tropical, subtropical and moderate environments and across dry and humid climates.<sup>3</sup> SRI has typically shown marked increases in rice yields of 50-100%, water savings of usually 25-50%, cost savings of 10-20%, strengthened resistance to pests and diseases, and improved resilience to the stresses of extreme weather events linked with climate change.<sup>4</sup> The methods of SRI have also been extended to the growing of wheat, sugar cane and several other crops. Making use of labor, the one factor that poor farmers typically control, they have strengthened food security and resilience to climate change while simultaneously reducing the need for water inputs.

Water supply initiatives, such as the small check dams that the Tarum Bharat Sangh (TBS) has pioneered, have revived several rivers and brought prosperity to arid regions throughout Western India. In Rajasthan, supplying water from the check dams promoted by TBS costs \$2 per person, whereas water supply from the massive Sardar Sarovar multipurpose dam costs approximately \$200 per person. The simple treadle pumps that International Development Enterprises (IDE) developed have also cost-effectively lifted millions of farmers out of poverty. Irrigating a hectare of land from the Sardar Sarovar Project costs \$3,800 but only \$120 using the treadle pumps promoted by IDE.<sup>5</sup> UNDP's 2006 Human Development Report on water security strongly supports such a soft, decentralized approach to water infrastructure and food security. It estimates that with an initial investment of \$7 billion, extending Gujarat's check dams all across India's rainfed farming areas could raise the value of the country's monsoon crop from \$36 billion to \$180 billion a year.<sup>6</sup>

## Enabling Conditions

Building decentralized, small-scale water infrastructure not only improves the access of the poor to water, but also makes the water sector more resilient to the impacts of climate change. Yet these approaches have so far only received a minuscule proportion of the aid, investment and political support that large water and energy projects receive. If adapted to local circumstances and backed with the necessary legal, scientific and financial support, bottom-up approaches can be scaled-up significantly. Local communities and small farmers deserve legal rights to the land and water that they have worked with for generations. Small

<sup>3</sup> See Uphoff Norman (2011), The System of Rice Intensification: An Alternate Civil Society Innovation, in: Technikfolgenabschätzung – Theorie und Praxis, July 2011, pp. 45-52, p. 47.

<sup>4</sup> Ibid.

<sup>5</sup> See International Rivers Network (2006), Spreading the Water Wealth: Making Water Infrastructure Work for the Poor, pp. 2ff.

<sup>6</sup> UNDP (2006), Human Development Report 2006, Beyond Scarcity: Power, Poverty and the Global Water Crisis, p. 196.

farms and rainfed agriculture require research support on the same scale that was poured into the green revolution. Decentralized renewable energy options deserve priority over fossil fuels and large dams if development aid is to reduce energy poverty in a sustainable manner. Projects that address the nexus of water, energy and food security should be focused at the local level.

Future development strategies need to move away from harmful technologies that depend on stable climatic conditions. A recent World Bank report warns that “long-lifespan infrastructure, such as hydropower plants, is generally less adaptable” to climate change.<sup>7</sup> In addition to their often significant environmental and social impacts, large, centralized water and energy projects tend to prioritize the needs of urban centers, industry, and export markets. In comparison, small, decentralized and diversified renewable energy projects are more effective at providing access to electricity to the poor, safeguarding the environment, and strengthening resilience to climate change.<sup>8</sup> In many cases, renewable energy projects are not more expensive than large, conventional energy technologies, with the added benefit of not externalizing social and environmental costs. Subsidies for environmentally and socially harmful technologies must be phased out.

While decentralized, cost-effective approaches to water and energy supply and food security have huge potential, building large dams and other centralized water and energy projects may still be appropriate under certain conditions. Avoiding the errors of the past will require the application of participatory planning and decision-making processes as well as strict, mandatory social and environmental standards. The guidelines that have been recommended by the World Commission on Dams (WCD) are the most appropriate framework for decision making on water and energy projects.<sup>9</sup> This will include thoroughly assessing all available options; recognizing affected and, in particular, indigenous peoples’ land rights; sharing benefits; and addressing the unresolved problems of existing projects.

## Recommendations

- Before any water and energy programs and projects are initiated, national governments and intergovernmental organizations should carry out comprehensive, balanced and participatory assessments of all needs and options. These assessments should integrate social, environmental and economic aspects with equal weight.
- Given the perverse incentives and vested interests favoring new projects over efficiency improvements and restoration of existing infrastructure, national governments, parliaments and intergovernmental organizations should make low-impact solutions such as mechanic treadle pumps, drip irrigation, decentralized rainwater harvesting and groundwater recharging, the use of underground storage, decentralized renewables, the restoration of existing infrastructure and the installation of hydropower components at

<sup>7</sup> World Bank ESMAP (2011), Climate Impacts on Energy Systems, Key Issues for Energy Sector Adaptation, Jane Ebinger and Walter Vergara, 2011, p. 58.

<sup>8</sup> For the risks of centralized hydropower projects in terms of climate resilience, see World Bank ESMAP (2011), Climate Impacts on Energy Systems, Key Issues for Energy Sector Adaptation, Jane Ebinger and Walter Vergara, 2011, pp. 48, 58, 93.

<sup>9</sup> See World Commission on Dams (2000), pp. 195ff.

existing irrigation facilities an explicit priority of their agriculture, water and energy sector policies to improve access and security.

- Strengthening water, energy and food security for the poorest population groups requires a shift of financial resources, research and institutional support from large, centralized projects to decentralized, small-scale projects that can be managed at the local level. National governments and parliamentarians should redirect resources from international financial institutions to civil society organizations and others that are able to effectively support local-level initiatives.
- Intergovernmental organizations, national governments and parliaments should explicitly acknowledge and guarantee the customary and formal rights of local communities to their land, water, forests and other resources in their infrastructure strategies. This includes the right of indigenous peoples to free, prior informed consent (FPIC) regarding projects on their lands.
- Public and private financial institutions should establish or strengthen mandatory social and environmental standards to guide project selection and implementation. These standards should include evaluations of the risk that climate change poses to a proposed project as well as the expected impact of the project on climate change.
- A global initiative for universal energy access by 2030 should be carried out, with energy efficiency and decentralized renewable options – which are more effective at expanding energy access for the poor than centralized large dams – as top priorities.

## International Road Assessment Programme (iRAP)

Sustainable Mobility at Rio+ 20

A submission to the UN Conference on Sustainable Development by the international Road Assessment Programme ([www.irap.org](http://www.irap.org))

1. Sustainability of life and development on this planet requires the prevention of actions that destroy life. With over 1.3 million people killed and 20-50 million people injured every year on the world’s roads the elevation of road safety as a global development priority is essential. Unsustainable mobility contributes negatively to the environment, our climate and poverty eradication.

2. Sustainable and safe mobility will enhance life and directly improve the quality of life for millions of affected people in every community across the world. Safer roads and mobility must become a priority goal of the international community and action accelerated as part of the UN Decade of Action for Road Safety 2011-2020.

3. All forms of sustainable development and poverty eradication require sustainable mobility to enable progress. Mobility for goods and services to link suppliers with markets; access of people to employment, health services and market opportunities. Without sustainable mobility, sustainable development will not be possible.
4. Meeting mobility needs worldwide is currently unsustainable. Crashes predominately impact the young and economically productive members of society. "Unless immediate and effective action is taken, road traffic crashes are predicted to become the fifth leading cause of death in the world, resulting in an estimated 2.4 million deaths each year."<sup>1</sup>
5. Road traffic fatalities are preventable. Safe vehicles on safe roads at safe speeds with safe road users and effective post crash care will eliminate road crashes as a major cause of death. This will unlock the estimated 2-5% of GDP that is lost every year as a direct result of road crashes. The significant burden on hospitals will be lifted and the long term social and financial impacts on families who need to survive after the loss of the income earner or while supporting a permanently injured family member will be avoided.
6. More than half of the world's road deaths occur on less than 10% of roads. The international Road Assessment Programme (iRAP) is a registered charity with the vision for a world free of high risk roads. The elimination of one and two star iRAP roads (the lowest two safety ratings out of a five star standard) with high return proven improvements has the potential to save one in every three fatalities and serious injuries on both urban and rural road networks.

<sup>1</sup> United Nations Global Plan for the Decade of Action for Road Safety [http://www.who.int/roadsafety/decade\\_of\\_action/en/](http://www.who.int/roadsafety/decade_of_action/en/)

7. iRAP programmes are now active in over 60 countries and are typically lead by the Government and/or FIA affiliated automobile club in that country. 55% of all roads assessed by iRAP globally are currently one or two star. Death rates are estimated to halve for each star rating improvement achieved.
8. iRAP estimates that the elimination of high risk one and two star roads has the potential to reduce road death and injuries by more than 1,700,000 every year. This equates to an economic benefit of US\$250 billion every year and a discounted benefit of over US\$3,700 billion over the twenty year life of the road upgrades. The potential benefits are highlighted in the table below.<sup>2</sup>

[\[UNDESA/DSD: Please download the original document to see this image\]](#)

<sup>2</sup> McInerney, Turner, Smith (2010), A world free of high risk roads, ARRB Conference Proceedings, Melbourne, Australia

9. Together with sustainable mobility policies that encourage travel demand management and shifting to more sustainable urban transport modes, a world free of high risk roads will have direct benefits to environmental outcomes. This must be connected with safe urban transport provision for pedestrians (e.g. minimum four star iRAP standard for pedestrians in high use areas) to ensure shifts to public transport do not lead to an additional increase in global road deaths.
10. Rio+20 must address sustainable mobility as a priority issue to address sustainable development and poverty eradication. Sustainable mobility and safer roads must be part of the institutional framework to support sustainable development and the millennium development goals.
11. The United Nations Global Plan for the Decade of Action for Road Safety<sup>1</sup> must be elevated to a key global priority and resourced to achieve the desired outcomes of removing road death as a leading cause of death and injury and a by-product of unsustainable development.

## International Union of Railways (UIC)

### General Content

**a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

3.1 The UIC has been involved in many different UN conferences and discussions (including for example the World Summit on Sustainable Development in 2002, through to the 19th session of the UNFCCC COP meetings).

3.2 In our view the output documents from many such conferences lack a clear focus on concrete actions that national governments and international institutions should take to deliver sustainable development. Where action plans have been created (e.g. Agenda 21), it is not clear who is holding governments to account for the delivery of these plans.

3.3. With these points in mind, we propose that the Outcome document for Rio+20 should be structured in the following way:

Section 1: Objectives

This section should be divided between specific sustainable development objectives (e.g. goals on the Green Economy; Access to Information, etc) and objectives on Institutional Reform.

## Section 2: How these Objectives will be met

For objectives on specific issues, e.g. the Green Economy, the Outcome document

should describe the process by which these objectives will be reached. For example, how roadmaps be developed to meet the objectives, and national governments will come together to assess progress.

For objectives concerning Institutional Reform, the Outcome document should already be able to provide a clear roadmap on how these reforms will be implemented.

3.4 These two sections will have some overlaps – for example, it may be necessary to reform the UN CSD process to accommodate the goals reached in the Rio+20 conference. The document should also have a section on how to measure the results and check if the objectives have been met.

---

### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

3.5 UIC supports the concept of the Green Economy, however it is crucial that the question of transportation is included in this debate. There must be a discussion on how we can accommodate people's need for greater mobility, and the transportation of goods, with environmental constraints. From our perspective, railways, and public transport in general, must play a greater role in both emerging and developed economies, to offer transport solutions with comparably lower environmental and social costs than road and air transport.

3.6 We would also like to briefly comment that from our long experience in UN negotiations and conferences, it is quite clear that there is an urgent need for a revitalized global partnership for sustainable development, both globally and regionally.

3.7 We hope that Rio+20 to achieve this, and in our own way we will contribute to this goal by encouraging and supporting railway organizations around the world to embrace the concept of sustainable development and incorporate it into their business operations.

---

### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

3.8 The UIC is accredited to ECOSOC and is a member of the Business and Industry Major Group. From our experience of being involved in the process we have found the Major Group process relatively effective as we can find consensus and make statements in partnership with colleagues from other sectors.

---

### **d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

3.9 The UIC would like to see a stronger and more prominent role for UN CSD, to allow this unit of the United Nations to track the implementation of sustainable development at the national level.

3.10 The UIC would urge the Rio+20 Secretariat to conduct a "mapping" exercise to highlight all the United Nations agencies, departments and institutions currently playing a role in Sustainable Development (e.g. UN CSD, UNEP, UNDP etc) and assess which of these should be the lead partner with a coordinating role. Currently, from the point of view of a neutral observer, it can seem as if the various sections of the UN are competing with each other to take a lead on Sustainable Development.

---

## **Specific Elements**

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

4. Specific Elements:

a. Objective of the Conference:

4.1 The UIC proposes that the Outcome theme should include a sectoral initiative for the transportation sector. More specifically, we would recommend that the Outcome Document contain a "Challenge to Transport", constructed in the following way:

a)Challenge to each transport mode

The Rio+20 Outcome Document should challenge the global representatives of the motorized transport modes (e.g. UIC, IATA, IRF, IRU) to present, within 1 year of publication, a comprehensive roadmap for sustainable development for their mode.

The UIC already has a global sustainability initiative – our Declaration on Sustainable Mobility and Transport, which has been signed by 49 of our 200 members. A copy of the Declaration is attached. More information can be found here: <http://www.uic-sustainability.org/spip.php?article76>

b)Multi-Modal Challenge

The Rio+20 Outcome Document should challenge the global transport organizations to produce a joint action plan for improving multi-modal cooperation in the interests of sustainable development worldwide. This should also be produced within 1 year of the Rio+20 conference.

4.2 This concept of a "Challenge" could be introduced for other sectors too, and coordinated via the Business Action for Sustainable Development 2012 (BASD 2012).

---

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

Please see paragraph 3.5

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

Please see paragraphs 3.9 and 3.10

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

No specific remarks.

Paris, 24th October 2011

UIC Input to the Rio+20 Compilation Document

This is the submission of the UIC (International Union of Railways) to the Rio+20 compilation document. UIC is an accredited member of ECOSOC and regularly participates in UNCSD activities as a member of the Major Group – Business and Industry. This submission follows the structure proposed in the guidance document for submissions.

3. General Content

a. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

3.1 The UIC has been involved in many different UN conferences and discussions (including for example the World Summit on Sustainable Development in 2002, through to the 19 th session of the UNCSD in 2011 and many UNFCCC COP meetings).

3.2 In our view the output documents from many such conferences lack a clear focus on concrete actions that national governments and international institutions should take to deliver sustainable development. Where action plans have been created (e.g. Agenda 21), it is not clear who is holding governments to account for the delivery of these plans.

3.3. With these points in mind, we propose that the Outcome document for Rio+20 should be structured in the following way:

Section 1: Objectives

This section should be divided between specific sustainable development objectives (e.g. goals on the Green Economy; Access to Information, etc) and objectives on Institutional Reform.

Section 2: How these Objectives will be met

For objectives on specific issues, e.g. the Green Economy, the Outcome document should describe the process by which these objectives will be reached. For example, how roadmaps be developed to meet the objectives, and national governments will come together to assess progress.

For objectives concerning Institutional Reform, the Outcome document should already be able to provide a clear roadmap on how these reforms will be implemented.

3.4 These two sections will have some overlaps – for example, it may be necessary to reform the UN CSD process to accommodate the goals reached in the Rio+20 conference. The document should also have a section on how to measure the results and check if the objectives have been met.

b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

3.5 UIC supports the concept of the Green Economy, however it is crucial that the question of transportation is included in this debate. There must be a discussion on how we can accommodate people's need for greater mobility, and the transportation of goods, with environmental constraints. From our perspective, railways, and public transport in general, must play a greater role in both emerging and developed economies, to offer transport solutions with comparably lower environmental and social costs than road and air transport.

3.6 We would also like to briefly comment that from our long experience in UN negotiations and conferences, it is quite clear that there is an urgent need for a revitalized global partnership for sustainable development, both globally and regionally.

3.7 We hope that Rio+20 to achieve this, and in our own way we will contribute to this goal by encouraging and supporting railway organizations around the world to embrace the concept of sustainable development and incorporate it into their business operations.

c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);

3.8 The UIC is accredited to ECOSOC and is a member of the Business and Industry Major Group. From our experience of being involved in the process we have found the Major Group process relatively effective as we can find consensus and make statements in partnership with colleagues from other sectors.

d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

3.9 The UIC would like to see a stronger and more prominent role for UN CSD, to allow this unit of the United Nations to track the implementation of sustainable development at the national level.

3.10 The UIC would urge the Rio+20 Secretariat to conduct a "mapping" exercise to highlight all the United Nations agencies, departments and institutions currently playing a role in Sustainable Development (e.g. UN CSD, UNEP, UNDP etc) and assess which of these should be the lead partner with a coordinating role. Currently, from the point of view of a neutral observer, it can seem as if the various sections of the UN are competing with each other to take a lead on Sustainable Development.

#### 4. Specific Elements:

##### a. Objective of the Conference:

4.1 The UIC proposes that the Outcome theme should include a sectoral initiative for the transportation sector. More specifically, we would recommend that the Outcome Document contain a "Challenge to Transport", constructed in the following way:

##### a) Challenge to each transport mode

The Rio+20 Outcome Document should challenge the global representatives of the motorized transport modes (e.g. UIC, IATA, IRF, IRU) to present, within 1 year of publication, a comprehensive roadmap for sustainable development for their mode.

The UIC already has a global sustainability initiative – our Declaration on Sustainable Mobility and Transport, which has been signed by 49 of our 200 members. A copy of the Declaration is attached. More information can be found here: <http://www.uic-sustainability.org/spip.php?article76>

##### b) Multi-Modal Challenge

The Rio+20 Outcome Document should challenge the global transport organizations to produce a joint action plan for improving multi-modal cooperation in the interests of sustainable development worldwide. This should also be produced within 1 year of the Rio+20 conference.

4.2 This concept of a "Challenge" could be introduced for other sectors too, and coordinated via the Business Action for Sustainable Development 2012 (BASD 2012).

##### b. Green economy

Please see paragraph 3.5

c. Institutional framework for sustainable development: Please see paragraphs 3.9 and 3.10

d. Any proposals for refinement of the two themes No specific remarks.

I hope this input is useful, and the UIC wishes the UN all best wishes for the Rio+20 conference.

Alexander VEITCH

Head of Unit – Sustainable Development

Attachment: Declaration on Sustainable Mobility and Transport

## Internationale Touaregue

### CONTRIBUTION DE L'ONG INTERNATIONALE TOUAREGUE POUR RIO+20

«On aurait continué à garder le silence, si, de ce qu'on le gardait, plusieurs personnes n'avaient conclu qu'on y était réduit.» Montesquieu, De l'Esprit des lois, II

Sur la question de la gouvernance mondiale :

1-La participation de la société civile

Rappelant que l'article 38.5 de l'Action 21, sur l'importance de la participation active des ONG

Rappelant l'article 38L de l'Action 21 sur les moyens de rendre efficace la participation des ONG

Rappelant le chapitre 27 de l'Action 21 sur le renforcement du rôle des organisations non gouvernementales

Rappelant la reconnaissance et le renforcement du rôle des peuples autochtones et de leurs communautés, énoncé au chapitre 26 de l'Action 21 Notant que la gouvernance mondiale souffre d'un déficit démocratique certain s'agissant de la participation active des ONG

Recommande :

(a) La fusion de la CDD avec l'ECOSOC pour devenir un conseil économique, social, culturel et environnemental ECOSOCE, qui serait renforcé par une Charte de l'environnement

(b) L'attribution à ce nouveau Conseil des compétences en matière environnementale, quant au suivi des normes juridiques internationales.

(c) Que plutôt que la création d'un forum permanent à l'instar de l'UNFPII, présentant les risques d'une expression trop parallèle, d'intégrer directement les ONG accréditées ECOSOCE dans les négociations internationales relatives à l'environnement

(d) Que la représentativité des différents modes de vie des peuples (peuples sédentaires ou mobiles), à travers leurs ONG soit garantie

2-Sur l'opportunité d'une Organisation Mondiale de l'Environnement et d'une juridiction internationale spécialisée

Rappelant que l'idée d'une Organisation Mondiale de l'Environnement a émergé avec la Conférence de Rio de juin 1992

Rappelant que le Conseil d'administration du PNUE, réuni du 21 au 24 février 2011 en forum ministériel mondial sur l'environnement a adopté et transmis au Comité préparatoire dans le contexte de la préparation de RIO+20 la création d'une OME, « comme option privilégiée ».

Aussi nous recommandons :

(a) La création de l'Organisation de Mondiale de l'environnement OME, son siège serait en Afrique, nous proposons Accra, capitale du Ghana

(b) Cette organisation aurait pour but d'amener tous les peuples à pouvoir vivre dans un environnement sain d'un niveau le plus élevé possible, par des dispositifs permettant la protection de la nature.

(c) L'Organisation pour atteindre son but exercera les fonctions suivantes :

- L'organisation aura une autorité de direction et de coordination dans le domaine de l'environnement et du développement durable

- Etablir et maintenir une collaboration effective entre les différentes parties prenantes dans le respect de la démocratie environnementale.

- Fournir l'assistance technique appropriée et dans les cas d'urgence, fournir l'aide nécessaire, certes à la requête des gouvernements, mais aussi via tout autre système d'alerte

- Fournir et aider à fournir les Nations Unies une assistance dirigée aux groupements spéciaux tels que les peuples autochtones et particulièrement les peuples mobiles.

- Stimuler en coopérant au besoin avec d'autres institutions spécialisées et les ONG, des mesures propres à prévenir les dommages environnementaux

- Proposer des conventions, accords et règlements, faire des recommandations concernant les questions internationales en matière environnementale

- Aider à former les peuples à une opinion éclairée en ce qui concerne l'environnement

- Favoriser tous les modes de vie, notamment ceux se rapportant à l'établissement et la préservation de relations harmonieuses entre l'homme et son environnement, comme par exemple ceux des peuples autochtones

- Renforcer la gouvernance au niveau régional et local

- Mettre en place un mécanisme de règlement des conflits environnementaux, plus particulièrement une procédure de référé

- Restaurer les terres dégradées ou à défaut prévoir une compensation en regard des dégradations environnementales causées par les industries ou l'agriculture intensive

- Pour cela, créer une cour internationale de l'environnement

- Cette cour pourrait se décliner au niveau national, et être compétente pour des questions préjudicielles en matière d'environnement

- La saisine de cette cour internationale doit être ouverte aux Etats, et ONG spécialisées dans le domaine de l'environnement.

- Sans qu'il puisse être objecté la question de la spécialité, les organisations autochtones accréditées pourront saisir cette cour

3-La place des entreprises et leur responsabilité en matière environnementale

Ce serait une gageure de traiter les questions environnementales sans intégrer la question de l'implication des entreprises. Le monde des entreprises est une partie prenante au même titre que les états et la société civile. Pour autant, il est parfois difficile de ne pas considérer que les états et les entreprises ne sont en fait pas qu'une seule et même partie prenante, d'autant que certains états sont actionnaires de ces entreprises.

Ainsi, rappelant la déclaration de Stockholm des 5-16 juin 1972 et plus particulièrement ses affirmations selon lesquelles « l'Homme a un droit fondamental à la liberté, l'égalité et à des conditions satisfaisantes dans un environnement dont la qualité lui permette de vivre dans la dignité et le bien être », et « tous, citoyens et collectivités, entreprises et institutions, à quelque niveau que ce soit, assument leurs responsabilités et se partagent équitablement les tâches ».

Rappelant aussi les principes de la déclaration de Rio et plus particulièrement le Principe 13 qui pose que « Les Etats doivent élaborer une législation nationale concernant la responsabilité de la pollution et d'autres dommages à l'environnement et l'indemnisation de leurs victimes. Ils doivent aussi coopérer diligemment et plus résolument pour développer davantage le droit international concernant la responsabilité et l'indemnisation en cas d'effets néfastes de dommages causés à l'environnement dans des zones situées au-delà des limites de leur juridiction par des activités menées dans les limites de leur juridiction ou sous leur contrôle ».

Rappelant la résolution de l'Assemblée Générale des Nations Unies du 11 décembre 1987 indiquant que "la notion de développement durable... devrait devenir le principe

directeur fondamental pour ... les institutions, organisations et entreprises privées".

Rappelant le Plan de mise en œuvre du Sommet mondial pour le développement durable (§140 f) sur la nécessité de « Promouvoir la responsabilité des entreprises, leur obligation de rendre des comptes et les échanges des meilleures pratiques au regard du développement durable, y compris, lorsqu'il convient, par des dialogues multipartites... ».

Rappelant La déclaration de Johannesburg sur le développement durable et particulièrement son § 27 souligne que « dans le cadre de ses activités légitimes, le secteur privé dans son ensemble, c'est-à-dire les grandes entreprises comme les petites, a le devoir de contribuer à l'émergence de communautés et de sociétés équitables et durables »

.Rappelant les principes directeurs de l'OCDE dans chapitre VI sur l'environnement « Les entreprises devraient, dans le cadre des lois, règlements et pratiques administratives en vigueur dans les pays où elles opèrent, et eu égard aux accords, principes, objectifs et normes internationaux pertinents, tenir dûment compte de la nécessité de protéger l'environnement, la santé et la sécurité publiques, et d'une manière générale, de conduire leurs activités d'une manière qui contribue à l'objectif plus large de développement durable »

rappelant la Déclaration des nations unies dans son article 29 «1. Les peuples autochtones ont droit à la préservation et à la protection de leur environnement et de la capacité de production de leurs terres ou territoires et ressources. À ces fins, les États établissent et mettent en œuvre des programmes d'assistance à l'intention des peuples autochtones, sans discrimination d'aucune sorte. »

nous recommandons :

(a) de rendre contraignant dans le cadre des Nations Unies, les principes directeurs de l'OCDE impliquant des mécanismes de contrôle

(b) afin d'éviter le « law shopping » ou « forum shopping », les conventions régionales doivent pouvoir s'appliquer pour les activités extra-régionales des entreprises. Ainsi la Convention d'Aarhus doit pouvoir être invoquée s'agissant d'activités en dehors du territoire européen. La responsabilité des entreprises doit pouvoir être engagée sur le plan national, régional et international.

(c) la création de voies de recours adéquates au niveau national par la création de cour spécialisée, et au niveau régional sur l'exemple de la CEDAO, la création d'une procédure qui échapperait à l'obligation d'épuisement des voies de recours internes

(d) l'environnement étant une partie intégrante des droits de l'homme, il doit être de manière systématique dans tous les textes fondamentaux, car la protection de l'environnement ne saurait se faire sans normes juridiques contraignantes.

A propos de l'économie verte

Le pastoralisme constitue un exemple d'investissement au sein duquel le double objectif de développement et de conservation de la biodiversité peut être atteint par la reconnaissance de la contribution importante de ce système aux cultures, traditions, moyens d'existence et service des écosystèmes.

Le pastoralisme représente un mode de vie qui concerne 100 à 200 millions de personnes dans le monde.

Les systèmes de production pastoraux extensifs couvrent 25% de la surface des terres émergées. En Afrique sub-saharienne, environ 16% de la population dépendent du pastoralisme

les terres arides occupent 41% de la surface des terres émergées et abritent plus de 2 milliard d'habitants.

L'évaluation des écosystèmes pour le millénaire, un projet qui impliqua plus de 1300 experts dans 95 pays, a fait l'état de 24 services écosystémiques contribuant directement au bien-être des êtres humains et tira la conclusion suivante : les politiques qui visent à remplacer une agriculture sédentaire dans les zones de parcours contribuent à la désertification et donc à la diminution des moyens d'existence et conduisant à l'accroissement de la pauvreté.

Les défis environnementaux auxquels doivent faire face les systèmes pastoraux sont multiples : changement climatique, surexploitation des ressources en eau par des acteurs extérieurs, non accès au foncier, politiques nationales ou internationales défavorables, colonisation de peuplement, pression foncière de sédentaires agriculteurs et d'industriels.

Selon une étude de 2006 de Hatfield et Davis, la désertification apparaît souvent là où les choix politiques ont sous-estimé les systèmes pastoraux. Ainsi, rappelant l'article 1ier b de la convention internationale sur la lutte contre la désertification, définissant cette lutte en désignant les activités qui relèvent de la mise en valeur intégrée des terres arides, semi-arides et subhumides sèches en vue d'un développement durable en :

•en prévenant et/ou réduisant la dégradation des terres

•en remettant en état les terres dégradées et restaurer les terres désertifiées.

Nous recommandons :

(a) la création d'un Haut-Commissariat à la Biodiversité

(b) prendre en compte le droit territorial et foncier des peuples autochtones en général et des peuples mobiles en particulier

(c) lorsque les impacts sur l'environnement ne peuvent pas être évités ou réduits, la compensation ne doit pas être financière. La compensation doit être foncière fondée sur une équivalence de valeur (écologique, moyens de subsistance etc...). ce principe repose sur la priorité locale

(d) d'encourager les états à promouvoir leurs aires protégées, à les protéger de manière constitutionnelle

(e) la reconnaissance des APAC (aires de patrimoine autochtones et communautaires).

Bordeaux, le 1ier novembre 2011

## Interregional Public Movement of Aborigines - The Innovative Ecocity System - New World

The Interregional Public Movement of Aborigines The Innova Ecocity ive System "New World", hereafter called as IPMA NW MOD(A NM), expects that at the Rio+20 Summit

the priorities will be identified allowing all the people on the Earth to rise to a new level of development complying with modern eco-safety requirements of the Planet.

Within the framework of the Summit the foundations of an entirely new policy should be laid, which aim to preserve an environmental and ethnic-cultural heritage, the basis of an eco-orientated education for the Earth's population. At the same time, a historical heritage should be interpreted as a memory, a sort of the genetic code of ethnic groups and human species as a whole.

IPMA "NW" (MODA "NM") offers the following issues for consideration at the Summit: ethnic diversity preservation and indigenous rights protection of aborigines. It is native minorities and large nations who are considered to be real bearers of national culture, wardens of folk wisdom and customs, and traditional nature management, accordingly, that provides human existence in harmony with the environment. The present day situation in the society is in urgent need to put more emphasis on indigenous culture as an important factor. It is ancestral tortuaries - long experience in symbiosis with state-of-the-art technologies that will contribute to soil-fertility restoration and help an individual get used to climate changes.

Being granted de-jure political status of aboriginal peoples, the mankind would be able to take advantage of their ancestors' knowledge and cultural heritage for the sake of preserving the Planet. To that effect, it is necessary to focus on developing and enriching cultural identity, international cultural cooperation, eco-ethnic tourism, using utterly green technologies and expanding public participation in cultural life.

It is the aborigines' knowledge of ecological way of human coexistence with nature in definite regions and understanding of phenotypic national diversities that the 'geopolitical tolerance' notion, should be based on because studying the other nations way of life will guarantee global prosperity and peaceful coexistence of the representatives of different nations.

In that respect IPMA "NW" (MODA "NW") proposes

1. To hold a round-table meeting on the cultural issues and traditions of the Indigenous Peoples of the World aimed at preserving centuries-long wisdom and passing it over to future generations.
2. To discuss the necessity of drafting Ecological (Green) Constitution of the Planet.

As an example IPMA "NW" (MODA "NW") submits the project allowing to implement gradual transition from carbon to Green Economy - the innovative Ecocity system "New World". - The scale transition to green technology will provide the world as a whole and Russia in particular with CO2 emissions reduction and thus fulfil Kyoto Protocol's conditions.

"New World" is a unique project as it includes all spheres of life activity of modern human. The main emphasis is put on culture, tourism and education - those branches which need to be developed and supported in the post-industrial society.

The "New World" project originated in December 2001 after the economic crisis in Argentina, which demonstrated the importance of food safety development for the society and state. The project transparent structure allows it to be updated and transformed amid market turbulence. In that connection, it was repeatedly re-edited and upgraded according to innovative technologies development which contribute to rational use of the environment.

In the contemporary world the urbanized territories crisis has become evident: small towns are losing their importance in connection with a number of economic factors such as drop in product prices, fixed capital irrational usage and natural urbanization, whereas large megapolises are suffering from overpopulation, ecological, social-demographic and other problems.

3. To discuss the possible solution of some ecological, economic and social issues through advertising the opportunities of urban-to-ecovillage migration. Such a decision might be the only possible in the period of crisis, dramatic climate changes under the influence of devastating atmospheric effects, natural disasters, mass migration, megapolis ecological hazards, possible terror acts and infectious subversive actions in the places of urban population concentration.

The strategy of ecocity development amid global drinking water and food shortage will help solve the problems of abandoned land colonization and make possible to live without giving up urban comfort and in full agreement with the environment. IPMA "NW" (MODA "NM") sees way out of this situation in ecovillages competent management which is able to solve social, economic and ecological problems:

- unemployment;
- regular displacement over the territory of the Planet which will favourably affect demographic conditions and result in avoiding economic skewness in the development of countries;
- fair housing for orphanage residents, needy families and returnees;
- food self-supporting families;
- agricultural eco-production;
- remote work opportunities to solve urban transport and ecological problems;
- craftsman enterprise renewal and rural tourist centres due to small and family businesses in ecovillage;
- budget overspending due to reassignment of funds from pension provision to medical provision;
- urban environmental condition because of overpopulation;
- food crisis danger;
- free-of-anthropogenic activities land development;
- preservation of multinational palette, world natural and cultural heritage - far from being a complete list of issues, which can be solved in the process of the project implementation. The rural tourism development on these territories will also let raise additional funds to federal and local budgets through fiscal revenues.

The representatives of Indigenous Peoples have worked out the Ecocity Project based on communal villages which is being offered to all the countries as the basis for transition to the 'green economy' concept.

The "New World" Ecocity project can be applied all over the world.

In connection with above mentioned, IPADAM <sup>33</sup>NNMW ) (applMOes ifor accreditation at the RIO+20 Summit in 2012.

Sincerely, Director IPMANW

Anna Vititina

The International System of innovative

cities "New World"

"New World" - a comprehensive solution priorities of the Russian Federation

- The project, developed under government programs, the modernization of Russia and the renewal of "green" lifestyle.
- "New World" - a project of the first city in Russia, which will be built in - line with the elements of broadcast shows.
- "New World" - the format of the new concept of living in the XXI century.
- "New World" - a demonstration platform of innovative technologies of construction, production, educational programs, maintenance of farm and agro - industrial farms, and just a comfortable existence.
- "New World" - an ideal platform for the introduction of IT- technologies in farming and agricultural sector.
- "The new world - a complex for the implementation of educational and scientific programs

"New World" - the goals and objectives

- Create an innovative environment-friendly village with a complete self assurance and inner, modern infrastructure.
- Development of innovative technologies of agriculture in harmony with nature.
- Creation of cultural - historical basis for the initiation of young people in agriculture, nature, traditional crafts.
- Involve young people in the agricultural field.
- Provide young professionals with jobs in rural areas.
- Reduction in unemployment in the country.
- Training and retraining to change careers professionals.
- Provision of housing to socially disadvantaged people, young professionals, families and other groups.
- Ensure that the resettlement of young people from children's homes in new housing estate.
- Attracting young families in the agricultural settlement.
- Providing the population with ecologically pure products.
- Obtaining a platinum international certificate of environmental quality.
- Introduction of innovative technologies in farming.
- Create a free base for recreation and education of children in harmony with nature, involve young people to a healthy lifestyle.

"New World" - the investment

attractiveness

- Novelty - on the market today there are no analogues of the project, and the need for acomfortable accommodation for Russians is the most acute problem for the state.
- Relevance - Russia's policy aimed to build one-story house, focuses on villages that are not designed, to meet all the needs of residents and leave the dependence of the settlers to the city. "New World" covers the full range of services to the public. Thus save people from traveling into the city. The project includes the execution of a number of government programs, the introduction of innovative technologies, considers most comfortable living conditions.
- Development - given the unprecedented nature of all components of the project, the construction of these cities will be in every region of Russia.
- Exclusivity - the world has a similar project a green city in the U.S., the establishment of settlements in the "New World" will be unique not only in Russia but also for entire Eurasian continent

"New World" - the stages of implementation

- Selection of land corresponding to the construction and agricultural household goods
- Architectural plans
- Harmonization of the construction plan
- The architectural design competition
- Conducting PR campaigns
- Conduct planning areas and landscaping
- Construction of major buildings

- Placing production and tourism zone
- Construction and landscaping on individual plots and common area • Conducting planned presentation of reports of construction green Design
- Carrying out planned activities to attract professionals and the organization of space
- Start the farms and household plots
- The organization of social programs of the project

Pilot version of the implementation of systems of innovation eco-city

The city projected onto a circular system. Town buildings dismantled by thematic quarterly, with the possibility of expanding residential and industrial zones on the perimeter.

Parts:

1. administrative
2. technical
3. residential
4. tourist
5. Cultural en-US educPilot vationaler sion of the implementation of systems
6. agro-industrial
7. airport

New World "- All-Russian project

- Residential District "New World"
- "Star Home" street of houses built with the participation of stars of show business and politics with the demonstration of innovative "green" construction techniques and finishes.

- "Elite complex" high-tech luxury single-family houses with a demonstration of "smart house".

"Affordable housing" single-family houses for the residents of an area of 100 - 150 sq.m.as an example of real quality, comfortable accommodation for each Russian.

Homes are designed with the system energy saving and heat preservation. Greenhouse equipped with a system

"Winter Garden"

Home obledeneny 4-6 houses with internal patio, children / playground and place under the Private Farmland

The main component of green plants City - fruit trees. All residents Have the opportunity to make free harvest and eat the fruit straight from the trees

"New World" - a socially significant project

- Agro-industrial quarter "Farm area" - area of environmentally friendl products and livestockbreeding and conservation of endangered species of animals.

Plant Nurseries

- Research and production facilities - laboratories, experimental fields for practical experiments and the agricultural production base of bio-preservation and cultivation ofgenetically pure media. Water resources for industrial fish farming, seaweed, Service farmland and compliance with fire security

"New World" - an international, independent project

- Technopark

Industrial zone - final products: Finishing materials, energy saving and energy- producing products, foods, household items. Environmental Center, representatives of international organizations. Scientific-Technical Complex. Craft workshops. Technical Station of Service life Space.

- Bio-base.

"New World" - an international youth project

- sports quarter

Multifunctional stadium quickly collecting

School of the military-patriotic education of youth Children's band of sports equipment SPA center "pascivnogo" sports for people with problems musculoskeletal Polygon "special forces" training historic landfill The site of parachuting Rock climbing The festival site

"New World" - the first independent Russian conceptual design

- Tourist quarter

The hotel complex. Sanatorium "Family House".

- Shopping center. 3D complex innovations. Innovation Exchange. Health center. Restaurant street. Tea yard. Landscape Sculpture exhibition, Topiary. children's recreation program, "The world of fairy tales." Eco circus. Museum exhibitions, thematic exhibitions of Russian and foreign artists, jewelers andphotographers. Ethnocultural cycle, the

revival of Russian culture and daily life.

- On-line exhibition of the latest developments in the field of housing.

"New World" - caring for future generations

- Health
- The project provides a sanatorium complex for children's activities
- Center for Healthy lifestyle Eco dentistry
- Medical Center prenatal training
- Education
- Platform for students trainees
- School of historical education of the youth
- School of IT technologies of 3D modeling and design
- Center for Vocational and further education
- School revival of Russian villages Gleb Tyurin
- Preschool program to prepare children for the unique author's program

"New World" - an innovative project

• "New World" is being built in an open broadcast on the Internet, with regular stories on the center channel, press - releases in foreign media. Weekly magazine will keep the body:

- On the construction of
- To hold contests and quizzes on entertainment stages of the project
- Maintain the casting of future residents - Promote and highlight current "economic technology" construction, and the least cheap building materials
- Perform ratings among heads of districts and municipalities on the title of the best and most advanced self-management
- Provide legal advice in
- Housing and land issues
- Lighting the world achievements in the field of Eco

" New World "- anti-corruption project

A key feature of the concept of the project to provide free housing project participants, the organizers of the local productions of "New World", including crafts and farming, intellectuals, and families with children and Curators of the permanent eco-city projects of the Russia "New World"

"New World" is aimed at solving social problems

- Current solution to housing and jobs for young families and specialized professionals
- Will significantly reduce human-induced pressures and have a healthy effect on the surrounding environment and people; Solve the problem of overcrowding in cities, the problem of unemployment;
- To contribute to the awakening of this sense of the motherland; Reduce transport costs associated with forced travel to work;
- Solving problems internally displaced persons;
- Involve young people to realize themselves outside of the city and to promote the revival of the village;
- Solve the problem of crime;
- Solve the problem of abandoned children and orphans;

"New World" focuses on the implementation and development of state programs

- State Program "Development of physical culture, sport, tourism and improving the implementation of youth policy", including the federal programs - "Development of physical culture and sports in the Russian Federation for 2006-2015" and "Development of domestic tourism in the Russian Federation (2011 - 2016) "
- State Program "Development of Science and Technology"
- State program "Economic Development and Innovation Econom"
- The State Programme "Information Society (2011 - 2020 years)"
- State Agricultural Development Programme and the regulation of markets of agricultural products, raw materials and foodstuffs
- State Program "Development of fish-economic complex"
- State Program "Development of Foreign Economic Activity"

- The State Program "Regional policy and federal relations"

"New World" focuses on the implementation and development of state programs

- State Program "Russian Culture"
- State Program "Environmental Protection - State program" Energy saving and energy efficiency for the period up to 2020 "
- The state program "Social support to citizens"
- State Program "Providing quality housing and utility services of the Russian population"
- The State Programme "Promotion of Employment"
- The state program "Protecting the population and territories from emergency situation protect populations, territory, critical infrastructure of the population and critical threats from natural and man-made, fire safety and security at water bodies"
- State support for small business

"New World" was developed in the framework of federal programs

## INTOSAI Working Group

INTOSAI Contribution to the Rio + 20 Conference of the United Nations on Sustainable Development

Supreme Audit Institutions (SAIs) are cornerstones of good governance and play with their audits of government operations - including the economic, environmental and social sphere - a vital role in the area of sustainable development. SAIs provide independent and reliable information on government spending and operations which facilitates transparency and accountability and contributes to the implementation of the Millennium Development Goals (MDGs).

To be able to contribute to sustainable development effectively, SAIs must be independent of the governmental agencies they audit, and be protected from any form of outside influence. The Declarations of Lima (1977) and Mexico (2007) delineated the basic principles of independence of public sector auditing by SAIs.

On 26 April 2011, ECOSOC recognized the important role of INTOSAI and the Declarations of Lima and Mexico by adopting resolution 2011/2, which states in its OP 2:

"Takes note with appreciation of the work of the International Organization of Supreme Audit Institutions in promoting greater transparency, accountability and efficient and effective receipt and use of public resources for the benefit of citizens and of the Lima Declaration of Guidelines on Auditing Precepts of 1977 and the Mexico Declaration of Supreme Audit Institutions Independence of 2007, which set out the principles of independence in government auditing, and encourages the wide dissemination of these principles;"

On the occasion of the 21<sup>st</sup> UN-INTOSAI Symposium on "Effective practices of cooperation between supreme audit institutions and citizens to enhance public accountability" the United Nations invited INTOSAI to contribute to the Rio + 20 UN-Conference on Sustainable Development in 2012.

INTOSAI warmly welcomes the invitation, especially in the light of the fact that sustainable development has emerged as a relevant issue in the work of the audit institutions worldwide: "Environmental Auditing and Sustainable Development" was one main theme of INTOSAI's last triennial congress of Supreme Audit Institutions, INCOSAI XX, held in Johannesburg in November 2010. In that congress, all SAls committed to prioritizing environmental and sustainable development issues in their audit work while multilateral environmental agreements and coordinated audits between SAls were underlined as key focus areas.

INTOSAI aims to further improve the use of audit instruments in the field of environmental protection policies through its Working Group on Environmental Auditing (WGEA), chaired by the Auditor General of the National Audit Office of Estonia. The WGEA has already started to prepare for the Rio+20 event with its special project team working on a document compiling the experiences of SAls on sustainable development related issues. We would appreciate it if you considered involving INTOSAI to the preparatory process as early on as possible.

The INTOSAI WGEA will additionally take part of the UNEP World Congress on Justice, Governance and Law for Environmental Sustainability, which will be held prior to Rio+20.

Following the Rio+20 invitation the Governing Board of INTOSAI suggests to include a reference to the work of SAls in the area of sustainable development and the therefore necessary preconditions in the final document of the Conference as follows:

- Recalling the UN Millennium Declaration;
- recalling the ECOSOC resolution 2011/2;
- emphasizing that efficient, accountable, effective and transparent public administration has a key role to play in the implementation of the internationally-agreed development goals, including the MDGs and multilateral environmental agreements;
- emphasizing the need to improve the efficiency, transparency and accountability of public administration in order to contribute more effectively to the implementation of the MDG and sustainable development;
- recognizing SAls role in the improvement of efficiency, transparency and accountability of public administration, which is conducive to achieving the internationally agreed development goals, including the MDGs and multilateral environmental agreements;
- emphasizing the importance of SAls' independence from the agencies they audit;
- recognizing the crucial role SAls can play in achieving the international goals of identifying and addressing the gaps and building accountability in the implementation process of the global sustainable development agenda;
- taking note with appreciation of the work of INTOSAI and the Declarations of Lima and Mexico as well as the recommendations of the XX INCOSAI;
- calling upon UN member states to implement and apply the principles set out in the Lima and Mexico declarations in order to improve the position of SAls to contribute to sustainable development.

#### WGEA Rio+20 Project – Report Summary

##### Environmental auditing supports better governance

Good governance, the process of decision-making and the process by which decisions are implemented or in turn not implemented, is essential to ensuring that environmental protection and sustainable development promises produce credible results. Governance is one of the key themes to be addressed at the United Nations Conference on Sustainable Development (or Rio+20) to be held in Rio de Janeiro, Brazil on 4-6 June 2012.

National auditors and their audits play a critical role in supporting good governance by advancing accountability, and providing practical, objective and rigorous examinations of how environmental and sustainability programs, regulations, targets and laws are managed and implemented at the national and international level. Some countries have regional auditors or evaluators that play a similar role. This paper summarizes some key observations from two decades of work by supreme audit institutions, which play a major role in auditing government accounts and operations.

Supreme audit organizations (SAls) go by different names – sometimes National Audit Office, Court of Audit, Audit Board, and Office of the Auditor General – and have different mandates but similar responsibilities to provide legislatures and society with the information they need to hold governments accountable. SAls audit governments' financial management, compliance with domestic laws and international agreements, domestic and international policy implementation and performance. SAls are independent, non-political, and fact-based in their work. Between 1993 and 2011, National audit offices in 107 countries have conducted over 3200 environmentally related financial, compliance and performance audits.

Environmental audits have resulted in governments taking action to improve water quality in rivers, strengthen protection of flora and fauna, and reduce pollution. Benefits to environmental governance include the development of new legislation and regulations and stronger compliance with those that already exist. The implementation of multilateral environmental agreements has been improved through elements such as improving the designs of linked programs and better results reporting mechanisms.

The vast majority of SAls' environmental audits have examined national and sub-national programs such as climate change, acid rain, toxic substances, biodiversity, protected areas and natural parks, environmental assessment, green economy – sustainable energy, sustainable development, environment and human health, forestry, fisheries, mining, waste, water, and multilateral environmental agreements (MEAs). With regards to MEAs, around 80 audits were conducted between 2003 and 2011 on agreements such as the Kyoto Protocol, UN Framework Convention on Climate Change, UN Convention on Biodiversity, UN Convention to Combat Desertification, Montreal Protocol, and Basel Convention. A comprehensive database of these audits can be found at [www.environmental-auditing.org](http://www.environmental-auditing.org).

Since 1992 the International Organization for Supreme Audit Institutions (INTOSAI), the professional association for SAls, has had an active Working Group on Environmental Auditing. The Working Group has assisted SAls in acquiring a better understanding of the specific issues involved in environmental auditing; facilitating the exchange of information and experience among SAls; and publishing guidelines and other informative material for their use. Joint auditing by SAls of cross border environmental issues and policies, and the audit of international environmental accords, has had the Working Group's special attention.

The Working Group has worked with the United Nations Environment Programme to develop a Guide on Auditing the Implementation of Multilateral Environmental Agreements. The objective of the Guide is to serve as a useful resource for auditors worldwide who evaluate the implementation of those agreements by their national

governments and whether the policy tools that their governments use to manage and protect the environment and implement MEAs have produced the intended results. The guide can also be useful in improving future MEAs as it identifies key aspects that we look for in our audits that are important to good governance and accountability.

The Working Group has also produced a number of other guidance documents to aid auditors in auditing a variety of issues including climate change, waste management, water, forestry, and sustainable development. An important upcoming guidance document in 2012 will be on environmental data.

Under the auspices of the Working Group and its regional groups, a number of cooperative audits between different SAls have been undertaken. The Coordinated International Audit on Climate Change: Key Implications for Governments and their Auditors (2010) involved fourteen supreme audit institutions (Australia, Austria, Brazil, Canada, Estonia, Finland, Greece, Republic of Indonesia, Norway, Poland, Slovenia, South Africa, United Kingdom, and United States of America) from six continents who worked cooperatively to design and undertake performance audits of their national governments' implementation of commitments and programs related to the mitigation of and adaptation to climate change. The SAls involved included those from both developing and developed countries and the results from 33 audits.

Amongst the six regional groups of the Working Group on Environmental Auditing, over 50 cooperative audits have been conducted since 1995. Important ones have included:

- Pacific Association of SAls – Solid Waste Management Audit (2011, ten SAls)
- Organization of Latin American and Caribbean SAls – Compliance against United Nations Framework Convention on Climate Change Commitments Audit (2011, 7 SAls) and Environmental Protection and Conservation of Natural Resources of the Amazon Region Audit (2010, 5 SAls)
- African Organization of SAls – Lake Victoria Basin Audit (2002, 5 SAls)
- European Organization of SAls – Convention on the Protection of the Black Sea Against Pollution Audit (2011, 6 SAls)

#### Putting Our Audits to Work

In 2011, a survey of the members of the INTOSAI Working Group on Environmental Auditing was conducted for this paper to identify the key observations that SAls around the world are consistently finding when conducting their environmental audits. The ten top issues identified by 37 countries are listed below along with examples of the type of issues identified.

- Unclear/overlapping of responsibilities – In some audits the institutional framework for sustainable development is cross-governmental and requires more work from governments in order to integrate economic, social, and environmental aspects. Governments have adapted to this new reality by creating more integration among ministries, departments and agencies, and among programs and projects. However, there is a lack of clarity regarding the specific role each one of those entities plays and what they are responsible for, resulting in overlapping of responsibilities across agencies and departments that compromise the effectiveness of policy coordination and generate duplication of efforts.
- Lack of coordination between sub-national levels and the national level – Through the audits conducted, it has been noted that environmental problems occur at all levels from local to global, and involve municipal, regional and national governments. There is a need to improve integration and coordination between governance institutions at different levels. When local entities are involved in implementing national policies and in the interest of transparency and accountability for national funds and results, it is essential that some credible and verifiable means exist for reporting on how these funds were spent and what results were achieved.
- Absent or deficient policy or strategy – According to some audits some governments have not yet created effective policy tools and systems to govern environment and sustainable development or have not improved public policy tools and process as demanded. With regards to some policies, targets, objectives, or commitments may be in place but they are not always supported by comprehensive and specific national, regional or sectoral strategies and plans. Without the involvement by all affected levels of government an overall policy or strategy cannot hope to achieve the desired national results.
- Insufficient assessment of environmental impacts of governmental policies and programs – Audits have noted that governments are not using policy tools to ensure more timely consideration of environmental aspects before large sums are committed to a policy, program or project. High-level regulatory impact assessment or strategic environmental assessment is not a concern for many governments.
- Lack of analysis (economic, social, and environmental) supporting decisions – In some audits the findings have noted that policy makers are not taking into account the three pillars of sustainable development – economic, social, and environmental aspects - when making decisions. Sustainable development governance requires better "integration" of economic, social and environmental policies, particularly within the broader development planning frameworks.
- Lack of long-term planning to implement environmental policies and programs – Audits have noted that issues requiring long-term planning to resolve, such as climate change adaptation, do not have corresponding planning processes or plans in place.
- Inadequate financial management of environmental policies and programs – Audits have noted financial management problems can be caused by: insufficient planning resulting in the costs of delivering environmental policies and programs not being anticipated and programmes then requiring an extensive amount of unanticipated funds; lack of appropriate financial management framework to support the implementation of environmental policies and programs; and lack of financial management skills and misuse of funds.
- Lack of enforcement of domestic environmental legislation – National audits have indicated that environmental laws are not self-executing and governments must ensure compliance with domestic environmental legislation, by taking appropriate, effective and proportionate policy measures. It requires administrative capacities and strong government commitments to implement and enforce the regulatory framework.
- Deficient monitoring and reporting systems – Through the audits it was noted that high-quality accountability and reporting systems are often lacking. Evaluation of key policy choices and instruments is not always in place. In the absence of good evaluation it is difficult for governments to report and measure their progress towards sustainable development and identify where further policy action is required.
- Lack of environmental data for decision-making – Audits have noted that government bodies do not have sufficient and robust environmental data to support their decisions and to evaluate their performance. There are problems in data availability, timeliness, quality, and accuracy. Overall, there is a lack of knowledge and information about various aspects of ecosystems and a failure to adequately use the existing information to support management decision. Independent environmental audits can collect and report information for decision-makers where information is lacking.

For the participating national governments at the United Nations Conference on Sustainable Development to be held in Rio de Janeiro, Brazil on 4-6 June 2012, the lessons are twofold. First, national governments can use the survey results and national audit reports, findings and recommendations to improve the effectiveness and cost-efficiency of a range of domestic environmental and sustainable development programs, policies and tools. The results of twenty years of national auditing work can also be used to better design and implement national policies and programs moving forward. Second, at the international level, the results of this survey and the audits conducted by SAls can

provide national governments as well as MEA secretariats with important feedback for evaluating the implementation of international comments. They also show national governments and MEA secretariats the key features of good governance that should be built in from the start against which compliance can be monitored.

The full report will be published in time for the conference in Rio de Janeiro in June 2012.

#### Background on INTOSAI

The International Organization for Supreme Audit Institutions (INTOSAI, [www.intosai.org](http://www.intosai.org)), as a non-governmental organization, is the professional association of SAls in countries that belong to the United Nations or its specialized agencies. INTOSAI provides a forum in which government auditors from around the world can discuss issues of mutual concern and keep abreast of the latest developments in auditing and other applicable professional standards and best practices.

INTOSAI has increasingly recognized over the past two decades that the environment and sustainable development is an important issue that requires attention by the auditing community. The relevance of this topic was recognized by INTOSAI through the establishment of an active Working Group on Environmental Auditing ([www.environmental-auditing.org](http://www.environmental-auditing.org)) in 1992, the same year that the United Nations Earth Summit was held in Rio de Janeiro. At INTOSAI's most recent triennial International Congress of Supreme Audit Institutions (INCOSAI XX) held in 2010 in Johannesburg, South Africa, the resulting Johannesburg Accords noted that "environmental protection and sustainable development is one of the most topical issues that face governments in the new millennium." In addition, "the expectation that sustainable development and environmental protection should be subject to independent audit by SAls has grown in the last decades. By exercising the highest values of professionalism, independence, objectivity and transparency, and through effective cooperation with fellow SAls on environmental issues of common interest, SAls can make significant contributions toward addressing sustainable developments issues that are becoming increasingly regional, and even global, in nature."

## Investigadora Instituto Latinoamericano para una Sociedad y un Derecho Alternativos (ILSA)

Colombia: aportes de algunas organizaciones de la sociedad civil

Las organizaciones ambientalistas, no gubernamentales, campesinas, de mujeres rurales y de la sociedad civil colombiana abajo firmantes, someten algunas consideraciones para el documento de compilación que servirá de base para la preparación de un borrador preliminar del documento final de la Conferencias de las Naciones Unidas sobre Desarrollo Sostenible, Río + 20.

Lo primero que hay que anotar es que las preguntas guía responden a una orientación específica en el marco de los temas que han sido definidos como centrales (economía verde y marco institucional para el desarrollo sostenible), pero no permiten abordar otros temas ambientales desde una visión holística. Particularmente, la centralidad en la economía verde, por un lado, sigue supeditando lo ambiental a lo económico, por otra parte, está desplazando otros aspectos que debieran ser abordados en la conferencia y, además, no permite proponer el indispensable cambio drástico de rumbo que la situación ambiental requiere.

Adicionalmente, anotamos que el contexto desde hace 20 años ha cambiado y son manifiestos los límites de la naturaleza frente a la explotación de los recursos naturales. De ahí que se requieran acciones concretas por parte de los Gobiernos, que partan de una evaluación sobre los compromisos adquiridos y los resultados durante estos años. Estos temas se desarrollan a continuación con base en las preguntas planteadas.

a. ¿Cuáles son las expectativas en relación con los resultados de Río+20, y qué propuestas concretas hay a este respecto, incluidas las opiniones sobre una posible estructura del documento final?;

El punto de partida de Río + 20 debe ser una evaluación de los compromisos adquiridos por los Estados respecto del medio ambiente, en el mismo período. Esta evaluación debe permitir no sólo una medición del cumplimiento, sino también un análisis causal, una búsqueda del por qué y quienes son los responsables. Algunas preguntas que se deben resolver en Río + 20 son:

- ¿Cuál es el estado actual del cumplimiento de los compromisos de los Estados en materia ambiental?
- ¿Qué se ha cumplido?
- ¿Cuáles son los resultados?
- ¿Cómo ha sido la implementación de las medidas de acuerdo a los tratados, convenciones, declaraciones, planes, declaraciones y programas adoptados por los Estados?
- ¿Cuáles son las causas del cumplimiento/incumplimiento de los compromisos?
- ¿Cuáles son las medidas realistas que se pueden adoptar?
- ¿Cuáles son los mecanismos para garantizar el cumplimiento de los compromisos estatales?
- ¿Cuáles son las pérdidas irreversibles?

Este proceso de evaluación debe producir propuestas concretas, a través de medidas de carácter vinculante, que puedan traducirse en una política ambiental al interior de los Estados. Anotamos que Río + 20 debería contar con la presencia de jefes de Estado, por la centralidad de los temas a tratar y por la necesidad de generar compromisos internacionales de carácter vinculante.

Además, del ámbito internacional y regional, Río + 20 debe tener efectos al interior de los Estados, en el nivel local y nacional. Se debe hacer un llamado para la generación de una agenda ambiental, que tenga carácter vinculante, que contemple mecanismos de cumplimiento y que pueda ser exigida por la sociedad civil. En los últimos años ha habido un proceso de flexibilización de lo Estatal derivado del modelo de desarrollo, que ha desplazado su atención a los sectores económicos, quienes también deben asumir responsabilidad por la devastación ambiental, pero sin perder de vista la responsabilidad estatal. Por ello, es imprescindible que los Estados creen, reformen o mejoren entidades y designen funcionarios competentes, capaces y con formación en el área. Así mismo, que se articulen acciones conjuntas entre entidades responsables en el tema ambiental, que exista una actividad legislativa que considere los efectos ambientales y una actuación decidida de los órganos de control.

En el mismo sentido, se debe garantizar: el empoderamiento de la sociedad civil, particularmente, de las mujeres, indígenas, jóvenes, campesinos y afrodescendientes, en la toma de decisiones en materia ambiental, mediante las veedurías ciudadanas y el ejercicio de acciones judiciales y administrativas.

Río + 20 no puede centrar su discusión en la economía verde, sino que debe abordar otros temas urgentes, como: los efectos por el cambio climático, la seguridad alimentaria, el acceso a la tierra, el acceso al agua potable, aplicabilidad y desarrollo de energías alternativas, biodiversidad, entre otros. Consideramos que en materia ambiental es difícil establecer una priorización o sectorización de temas, puesto que la mirada debe ser holística. Se requiere la transversalidad del tema ambiental en el desarrollo de planes y programas. Adicionalmente, el cumplimiento de compromisos ambientales involucra a diversos actores y a diversas entidades al interior de los

Estados, que de una u otra forma están relacionadas con estos temas.

Asimismo, se debe fomentar acciones para una cultura ciudadana ambientalista que se base en la sensibilización, conocimiento, capacitación y organización de la sociedad civil para promover el cuidado, la ética y cultura ambiental.

También es necesario que se reconozcan los saberes ancestrales y tradicionales en el uso del suelo y los recursos naturales; en el manejo, preservación y conservación del material genético; y los demás aspectos culturales derivados de la relación de las comunidades locales con sus territorios.

Por otra parte, Río + 20 debe hacer un llamado a la cooperación de los organismos especializados, a los países desarrollados y a las instituciones financieras internacionales, para que incorporen y adopten criterios ambientales en sus decisiones. La cooperación al desarrollo pese a que tiene efectos en la explotación de recursos naturales, no obedece a criterios de sostenibilidad o aspectos ambientales, sino que está orientada por la pobreza. De igual manera, no existen recursos para la investigación, condiciones o acuerdos que respondan y respeten aspectos ambientales.

Adicionalmente, se deben renovar y definir compromisos respecto del cambio climático. El compromiso internacional que se derivaba de la implicación sobre cambio climático expira en el 2012, por tanto resulta insuficiente. Además, los grandes contaminadores no hacen parte del mismo. Por ello, es necesario que existan instrumentos vinculantes, que superen la voluntariedad de los Estados, para llegar a acuerdos obligatorios al respecto.

b. ¿Cuáles son las observaciones, en caso de que las haya, en relación con las propuestas existentes? (por ejemplo, una hoja de ruta para la economía verde, un marco de acción, unos objetivos de desarrollo sostenible, una asociación mundial revitalizada para el desarrollo sostenible, u otras?;

No se trata de generar rutas u objetivos que respondan a cuestiones que desde hace 20 años se vienen advirtiendo, ni de generar una agenda verde, sino de compromisos reales que partan de una evaluación.

Respecto de la propuesta de Objetivos de Desarrollo Sostenible, valoramos la iniciativa del Gobierno Colombiano, pero señalamos que los documentos aún no han tenido suficiente divulgación para ser una posición nacional. Ha habido escenarios de retroalimentación de la propuesta que no se han visto reflejados en cambios sustanciales.

La propuesta no parte de una evaluación de resultados o una línea de base construida con la participación de la sociedad civil. Los objetivos deben tener indicadores, que sean: medibles, verificables, adecuados, pertinentes, y elaborados con base en un enfoque de derechos humanos, entre otros.

Adicionalmente, estos objetivos se basan en una visión de desarrollo sostenible, que debe ser discutida en Río + 20.

c. ¿Qué opiniones existen sobre la implementación y sobre cómo reducir los desfases al respecto? ¿Cuáles son los agentes pertinentes cuya participación se contempla (gobiernos, grupos principales específicos, sistema de las Naciones Unidas, instituciones financieras internacionales, etc.)?;

Independientemente de la implementación de medidas, creemos que el esquema de participación de los grupos principales no da cuenta de todos los interesados. Por ejemplo, observamos que los grupos étnicos sólo están representados por indígenas, pero en algunos países hay otros grupos, como ocurre en Colombia con las comunidades afro- descendientes. Así mismo, existen otros grupos interesados que no se encuentran representados como los campesinos, en particular, las mujeres rurales.

d. ¿Qué mecanismos de cooperación específicos, arreglos de asociación u otros medios de implementación están previstos utilizar y cuál es el plazo pertinente para que se adopten las decisiones propuestas y se apliquen las medidas?

Para la implementación de las medidas que se adopten en Río + 20 se debe contar con mecanismos de veedurías ciudadanas, para hacerle seguimiento y control a las mismas. Así mismo, deben contener mecanismos que garanticen la participación de los actores de la sociedad civil en la toma de decisiones, particularmente, las mujeres rurales, los campesinos, afrodescendientes, jóvenes, y otros grupos interesados. También se debe contar con mecanismos de acceso a la información y acceso a la justicia en materia ambiental.

Elementos específicos:

a. Objetivo de la Conferencia: Asegurar la renovación del compromiso político de lograr el desarrollo sostenible, evaluando los progresos realizados hasta el momento y los vacíos existentes en la implementación de los resultados de las principales cumbres sobre el desarrollo sostenible, así como abordando los desafíos nuevos y emergentes. Entre las contribuciones podrían figurar posibles prioridades sectoriales (por ejemplo, la energía, la seguridad alimentaria y la agricultura sostenible, la transferencia de tecnología, el agua, los océanos, la urbanización sostenible, el consumo y la producción sostenibles, la preparación para los desastres naturales y la adaptación al cambio climático, la biodiversidad, etc.); asimismo, en Río+20 se podrán presentar y respaldar iniciativas sectoriales que contribuyan a integrar los tres pilares del desarrollo sostenible.

No hay un desarrollo metodológico, ni un esquema de evaluación. Las reuniones preparatorias tampoco han permitido este ejercicio, pese a la existencia de acuerdos previos sobre los cuales se puede llevar a cabo este proceso. Existen parámetros, pero no se contemplan herramientas para hacer una evaluación, generar compromisos, mecanismos de medición y acción.

b. Economía verde en el contexto del desarrollo sostenible y de la erradicación de la pobreza: Opiniones sobre cómo puede la economía verde constituir un medio para lograr el desarrollo sostenible en sus tres dimensiones, así como la erradicación de la pobreza; cuál es su valor añadido potencial; experiencias hasta la fecha, que incluyan lo que ha funcionado y cómo aprovechar los buenos resultados; cuáles son los retos y oportunidades y cómo abordar estos retos y aprovechar las oportunidades; y posibles elementos de acuerdo para un documento final sobre una economía verde en el contexto del desarrollo sostenible y la erradicación de la pobreza.

La adopción del concepto de economía verde, por un lado, no puede desplazar la discusión de otros temas centrales y, por otra parte, no puede desconocer la discusión sobre el modelo de desarrollo.

La economía verde no tiene carácter distributivo y no hay una prevalencia de lo público; por el contrario, busca estimular a determinados actores económicos, pero no a todos los sectores sociales. No existe claridad sobre el cambio que implica este tipo de economía, ni cuál es el destino de la reinversión de las utilidades que ésta produciría.

Por otra parte, no es clara la necesidad que fundamenta la adopción de nuevos conceptos (economía verde), menos aún cuando se ha hecho poco por un desarrollo que permita superar la pobreza, redistribuir la riqueza y superar la crisis ambiental. Creemos que la adopción de un nuevo concepto no es una salida a la crisis ambiental, sino que se requiere un cambio de paradigma que haga de lo ambiental un tema central y se tomen decisiones frente a lo que se ha advertido hace más de dos décadas.

c. Marco institucional para el desarrollo sostenible para el desarrollo sostenible Prioridades y propuestas para reforzar los distintos pilares del desarrollo sostenible, así como para reforzar la integración de los tres pilares en múltiples niveles — local, nacional, regional e internacional.

Se deben generar mecanismos de obligatorio cumplimiento e instancias internacionales con capacidad de acción, así como, mecanismos que aseguren la participación ciudadana, el acceso a la información y el acceso a la justicia en materia ambiental, de acuerdo con el Principio 10 de la Declaración de Río. Además, los mecanismos deben

contar con un marco sancionatorio en caso de incumplimiento.

Las reformas o ajustes necesarios en el marco institucional para el desarrollo sostenible deben partir de una evaluación de los resultados de los organismos intergubernamentales existentes.

El marco institucional debe contemplar la creación de una veeduría internacional de la sociedad civil, que también sea acogida al interior de los Estados.

d. Cualquier propuesta para perfeccionar los dos temas. Cabe recordar que en la resolución 64/236 se describe la prioridad de la Conferencia: "La Conferencia se centrará, entre otros, en los siguientes temas, que serán examinados y perfeccionados en el proceso preparatorio: la economía verde en el contexto del desarrollo sostenible y la erradicación de la pobreza, y el marco institucional para el desarrollo sostenible".

El concepto de desarrollo sostenible es discutible, pero si se mantiene en la agenda requiere de un sistema político, económico, financiero, tecnológico, administrativo, que permita una adecuada gestión ambiental. Adicionalmente, es imprescindible que la toma de decisiones involucre criterios ambientales, de planeación territorial y tome en cuenta la posición de las comunidades locales en el terreno.

Adicionalmente, se requiere un cambio de paradigma epistemológico, que haga de lo ambiental un tema central en la vida económica, política y social. Así como un fortalecimiento a la participación ciudadana, de la democracia y educación ambiental. Entre otros, se debe: reconocer el papel de las comunidades vinculadas al terreno en la conservación de la biodiversidad, en especial de las comunidades étnicas, los campesinos y las mujeres rurales; desarrollar políticas sobre el cambio climático de manera participativa; incluir medidas de prevención y atención a los impactos ambientales; reconocer la sabiduría y los saberes ancestrales de las comunidades en terreno; y garantizar la eliminación de la pobreza, entre otros.

Es necesario cambiar el rumbo. Río + 20 es una oportunidad para pensar diferente.

### 1. Introduction

The first United Nations Conference on Sustainable Development or "Earth Summit", was held in Rio de Janeiro in 1992. The main outcomes of the landmark conference included seminal documents on Agenda 21, the Rio Declaration and the Statement of Forest Principles, as well as two legally binding conventions; the United Nations

Convention on Climate Change and the United Nations Convention on Biodiversity. These documents have shaped and guided sustainable development policies and actions at international, regional, national and local levels in the intervening two decades. The Earth Summit highlighted environmental and development issues at an international level, emphasizing the importance of sustainability principles for social well-being and the economic systems they support.

There have been extensive efforts since 1992, at local, national, regional and international levels, to implement sustainable development. The UN Commission on Sustainable Development was set up in 1992 to oversee implementation of the Rio agreements. Agenda 21, the international plan of action for sustainable development, continues to provide long-term focus for balancing sustainability goals with economic and social development. The Aarhus Convention of 1998 also represented an important step for sustainable development within the UNECE in three main ways; public access to information about the environment, public participation in environmental decision-making, and widening the conditions for access to justice. The United Nations Millennium Summit in 2000 agreed on a set of Millennium Development Goals (MDGs), setting time-bound targets for addressing extreme poverty in line with the objectives of Agenda 21. Concrete steps to turn words into action were then agreed upon at the Johannesburg Summit, 2002, in the Johannesburg Plan of Implementation.

At EU level the sustainable development process has been advanced through a suite of policies and actions following on from the adoption of the EU Sustainable Development Strategy in 2001 which was subsequently renewed in 2006. Comprehensive framework Directives and other legislative instruments on waste management, air, water and biodiversity have been put in place, which have been transposed into Irish law. We have also seen the introduction of a cap and trade system, the Emissions Trading Scheme (ETS) and the setting of binding targets on greenhouse gas emissions.

Rio +20 presents an opportunity to revisit agreements and commitments made in 1992 and to consider how we will deliver on these, both collectively and individually. In order to inform Ireland's contribution to the Rio +20 preparatory process a public consultation was carried out in which all interested parties were invited to respond to a stakeholder consultation document (Appendix 1). These responses have been summarised to form this report and are referenced throughout the document (see Appendix 2).

## 2. Progress on sustainable development since the Earth Summit in 1992: Successes and Failures

In an Irish context, significant steps have been taken since the Earth Summit in Rio in 1992. Ireland has made considerable progress in environmental performance, developing environmental policies and adopting measures to promote an innovation- based, low carbon, green economy. The National Sustainable Development Strategy published in 1997 provided a comprehensive policy analysis of the issues to be addressed under Rio and outlined a series of ambitious objectives across all sectors. Since then, Ireland experienced a period of rapid economic growth, during which some progress was made towards decoupling environmental pressures from economic demands (OECD, 2009). We have seen a large expansion in Ireland's infrastructure in areas such as roads and public transport, comprehensive legislation in areas such as environmental licensing, waste management and water resource management and establishment of an independent Environmental Protection Agency, with wide responsibilities and strong powers. As a result, Ireland generally has good air and water quality and energy efficiency has improved (OECD, 2009).

Preparation is underway to publish a renewed National Sustainable Development Strategy (rNSDS), which aims to develop a framework that integrates sustainable development into key policy areas. The rNSDS will outline effective mechanisms for implementation and a concrete course of action to advance sustainable development in Ireland. Drawing on the model established by the EU Sustainable Development Strategy, the rNSDS will concentrate on gaps where limited progress has been made and which still present formidable challenges, not least among these being the need to decouple natural resource use and economic growth.

Progress has been made under Local Agenda 21, which facilitates sustainable development at a community level <sup>1,2</sup>. Sustainable Development: A strategy for Ireland was published in 1997, encouraged local authorities to drive Local Agenda 21 forward (DECLG, 2001). Some County and City Development Boards (CDBs) have made significant progress in their approach to sustainable development. For example, Waterford CDB has put a range of strategies into place, including a Climate Change Strategy, 2008-2012, an Economic Plan, 2010-2014 and the County Development Plan, 2001-2017 <sup>1</sup>. However, many communities remain unaware of Local Agenda 21 so more must be done to ensure that citizens have the knowledge and support they need to implement it in their communities <sup>1,2</sup>.

Ireland has not been successful in making progress in a number of areas, particularly with regard to clean energy <sup>1,2</sup>, green house gas (GHG) emissions <sup>1,2,5</sup> and biodiversity <sup>1,2,5</sup>. Progress in the area of clean energy has been limited and Ireland remains heavily dependent on imported fossil fuels for almost 90% of its energy needs <sup>1,2</sup> (Eurostat, 2011). This leaves the country exposed to international market price fluctuations (SEAI, 2009). Oil prices almost doubled between 2005 and 2010 and the IEA estimated that EU fuel imports increased by €70bn between 2009 and 2010. The Sustainable Energy Authority has been promoting the move away from fossil fuels and towards greater energy efficiency but more must be done to increase domestic energy sources and improve energy resilience in Ireland. Ireland has not only failed to halt increases in carbon emissions, but research demonstrates that greenhouse gas emissions for Ireland were 25% higher in 2007 than the 1990 baseline <sup>1,2,3</sup> (Eurostat, 2011). Current projections indicate that Ireland will only meet its Kyoto obligations as "a direct result of the current economic recession" (OECD, 2009) and is likely to miss annual obligations under the EU's 2020 target after 2015 <sup>2</sup> (EPA, 2011).

Ireland also failed to meet the 2010 target to halt biodiversity decline <sup>1,2,5</sup>. A number of native species have already been lost from the island and many more are in need of protection. Eight species of water beetle are regionally extinct and a further 13% are under threat (Foster et al., 2009). Byrne et al. (2009) reported that two species of non-marine mollusc are extinct, while 31% of remaining species are under threat. One mammal species has been lost and 4% are threatened (Marnell et al., 2009), one species of butterfly is extinct and 18% are threatened (Regan et al., 2010), 40% of fish and one of Ireland's three amphibian species are threatened (King et al., 2011). 16 species of bird have appeared on the red list of Birds of Conservation Concern, having shown rapid population declines in recent years.

A summary of specific successes and failures highlighted by respondents is outlined in Table 1.

[\[UNDESA/DSD: Please download the original document to see this Table 1\]](#)

## 3. Green Economy

### 3.1. What contributions can the current focus on green economy make to advancing sustainable development?

Against a backdrop of financial crisis, the current focus on the green economy may be an important tool in reaching economic stability and has the potential to significantly enhance sustainable development ambitions. Key drivers for the green economy include rising fossil fuel prices, pressure to hit targets for renewable energy and GHG emissions, green public procurement (GPP) and changing consumer preferences (High-Level Group on Green Enterprise, 2009). The Irish economy has, thus far, relied on the availability of cheap fossil fuels and the abundance of natural resources <sup>1</sup>. Despite the recession of 2008, gas prices almost doubled between 2005 and 2010 and Ireland's dependence on fuel imports have left the country exposed to market price fluctuations <sup>4</sup>. Finances are no longer available to continue importing increasingly expensive fuel <sup>1</sup> and energy price increases could lead to inflation, reduced competitiveness and increased unemployment <sup>4</sup>. Ireland's transition to a green economy requires that harmful concessions on coal, oil and gas be phased out <sup>2,4</sup> and greater investment be made into energy efficiency, renewable energy and transport technologies in order to improve energy security.

Ireland is under pressure to ensure that 16% of all energy comes from renewable sources by 2020 under Directive (2009/28/EC) (SEAI, 2010) and to reduce emissions by 20% of 1990 levels by 2020 (DECLG, 2007). Ireland is well placed to exploit wind and wave energy and a strong enterprise and research base is emerging which could help

Ireland meet renewable energy targets (High-Level Group on Green Enterprise, 2009). However, several hurdles have delayed the propagation of renewable energy in Ireland, including delays in planning and licensing approvals, delays in connecting to the grid and in 2010/2011 support was removed for Bioenergy in buildings<sup>1</sup>. Development of the green economy in Ireland must involve overcoming these hurdles and seizing the opportunity to take a lead in production and export of renewable energy<sup>1</sup>. By reducing dependence on carbon producing energy sources, Ireland will be in a better position to hit emissions targets.

Ireland has recognised its commitment to GPP and a National Action Plan on Green Public Procurement is currently in preparation<sup>2</sup>. GPP involves the inclusion of environmental, economic and social criteria in the public procurement process. This could promote sustainable development by encouraging public authorities to meet their needs for goods, services, works and utilities by seeking and choosing outcomes and solutions that have less environmental impact. GPP policy recognises that it is necessary to decouple economic growth from negative environmental impacts and takes account of the wealth of EU environmental policy and legislation put in place to protect biodiversity and ecosystem services (DECLG, 2011). Therefore, GPP has the potential to play an important role in driving the green economy forward<sup>2</sup>.

In recent years there has been a growing understanding of the value of the ecosystem services that nature provides (DECLG, 2008). This may explain increasing consumer demand for environmentally responsible goods and services (High-Level Group on Green Enterprise, 2009). The focus on the green economy has the potential to significantly enhance sustainable development ambitions in the areas of clean technology, resource efficiency, eco-design, secondary resource standards and innovation. Clean technology seeks to use environmentally friendly raw materials and processes for production of goods. Resource efficiency promotes efficient use of key raw materials, reduction, prevention and reuse of waste in manufacturing processes and service provision. Eco-design aims to make products and services more eco-friendly at the design stage by reducing or eliminating the use of dangerous chemicals, improving energy efficiency, increasing durability or re-use potential. Secondary resource standards would promote the safe use of secondary waste resources, thereby contributing to the conservation of primary resources. Innovation, both private and public is essential to drive the green economy forward<sup>2</sup>. However, there is still a long way to go in breaking the consumption cycle<sup>1</sup>. A coordinated, integrated effort to change consumers' expectations regarding products would give manufacturers the opportunity to make products and provide services that are more sustainable<sup>2</sup>.

The green economy alone does not guarantee sustainable development<sup>1,2,3</sup> and it is important that the focus on green economy does not detract attention from the broader concept of sustainable development<sup>3</sup>. A green economy is one which is low carbon, resource efficient and socially inclusive<sup>2</sup>, criteria not currently supported by our current economic model<sup>1,2,3</sup>. We need an economy that can secure growth and development while improving human well-being, providing jobs, tackling poverty and inequality and preserving the natural capital<sup>1,3,4</sup>. Respecting environmental boundaries is not enough to achieve sustainable development. A commitment must also be made to promote social justice, support inclusion and participation in decision making processes and developing a clear set of principles and mechanisms for accountability<sup>1,2,3,4</sup>. A green economy must also address key social protection systems such as income security, health security, child benefits, unemployment benefits, nutrition, education and housing, in order to reduce social vulnerability and improve resilience<sup>4</sup>.

### 3.2. Can the green economy contribute towards Irish aid efforts in developing countries?

Ireland has a good track record in championing the eradication of poverty and hunger<sup>3</sup> and has committed to raising development aid to 0.7% of GDP by 2015<sup>3,5</sup>. The core issues affecting developing countries are food security<sup>2</sup>, climate change<sup>4</sup>, access to quality resources and insufficient knowledge on how to manage them sustainably<sup>3</sup>. As a priority action area for Irish Aid, discussions on the green economy must deal with the issue of agriculture and food security<sup>3</sup>. In this regard, Rio +20 must include steps which will prioritise the situation of small-holder farmers and the agroecological approaches they use which, with the right support, can ensure more sustainable farming, rural development and greater national food security<sup>3</sup>. The majority of people living in absolute poverty live on small farms. These small holder farmers are responsible for growing the majority of the world's food. Women play a critical role in food production and efforts to ensure sustainable development should take this into account. Emphasis should be placed on producing the right kind of food sustainably<sup>3</sup>.

The Irish Aid programme also focuses on climate change and the role of the agricultural sector in adaptation and mitigation<sup>3</sup>. The impacts of climate change will be felt disproportionately by developing countries, despite the fact that these countries contribute least to causing it<sup>5</sup>. The negative impacts of climate change have already been felt, reflected in decreasing agricultural production and lower crop yields, contributing to hunger in Africa and Southern Asia<sup>3</sup>. Ireland has a responsibility as a wealthy country to take a leading role in developing a genuinely green economy in order to set an example as a successful, low-carbon, developed country and to minimise Ireland's contribution to climate change<sup>2</sup>.

The green economy promotes reduction of consumption and waste production which may help reduce "ecological debt". This is the process whereby developed nations consume and produce more waste than our environment can replace and absorb, often leaving developing nations with the repercussions<sup>2</sup>. Developing countries suffer from a lack of quality resources and insufficient knowledge on how to manage them sustainably<sup>3</sup>. Access to energy has been identified as a poverty issue<sup>1</sup>, yet around 1.4bn people globally have no access to electricity<sup>3</sup>. Economic development in many countries is hindered by unreliable power and fuel supplies, despite the fact that these same countries have an abundance of renewable energy and huge potential for improving energy efficiency<sup>3</sup>. Ireland should continue to ensure the dissemination of new technologies<sup>3</sup>, allowing developing countries to "leapfrog" to a low carbon economy<sup>2</sup> and to benefit from Ireland's experience with renewable energy<sup>1,3</sup>.

## 4. Comments on Existing Proposals/Strategies

### 4.1. Green Economy Roadmap

The European Commission has proposed a Green Economy Roadmap as a framework of action guaranteeing commitment to sustainable development goals beyond Rio +20. The Roadmap will provide a range of specific international, regional and national actions, a timeframe for implementation, a set of indicators and targets. It will also provide mechanisms to monitor progress (EU Commission, 2011). The Green Economy Roadmap highlights Europe's commitment to a green economy and sustainable development and any documents outlining best practice would be welcome in informing and shaping national and local policies and responses to global issues<sup>1</sup>.

### 4.2. What impact can the EU 2020 Strategy and particularly the Resource Efficiency Flagship Initiative have on advancing sustainable development in Ireland?

The EU 2020 Strategy aims to see Europe emerge from economic crisis by promoting development of a smart economy with sustainable and inclusive growth<sup>9</sup>. The Strategy has five headline targets:

- 75% of people aged 20-64 should be in employment
- 3% of EU GDP should go towards research and development
- Targets for renewable energy and emissions must be met
- Share of early school leavers should be under 10% and 40% of younger generation should have a tertiary level education

- 20 million less people should be at risk of poverty

In order to achieve these targets, the Commission proposed seven flagship initiatives, one of which is Resource Efficient Europe (European Commission, 2010). The Resource Efficient Europe Flagship Initiative emphasises that our economy and quality of life depend on natural resources. It provides a long-term framework for actions in a range of policy areas and promotes resource efficiency as a guiding principle for EU policies regarding energy, transport, climate change, industry, commodities, agriculture, fisheries, biodiversity and regional development (European Commission, 2010). The initiative is ambitious and Ireland is at a disadvantage at the outset as a result of the current economic climate and slow uptake on renewable energy<sup>1</sup>. However, energy is a key component of any economy and the Irish government should increase efforts to improve efficiency in energy consumption as a priority<sup>2</sup>.

One of the targets of the Resources Efficiency Flagship Initiative is to reduce energy imports from 16% to 5% by 2050. The initiative presents major economic opportunities to improve productivity, reduce costs and increase competitiveness, particularly with regards to renewable energy, and Ireland should benefit from the opportunities that arise<sup>1</sup>. Renewable energy use could increase energy security in Ireland, reduce emissions and associated financial penalties and give the country greater control over commodity prices<sup>1</sup>. The Resource Efficiency Flagship Initiative could advance sustainable development by continuing to drive forward the agenda and outlining targets for all member states<sup>1</sup>.

## 5. Implementation

### 5.1 Views on Implementation and Closing the Implementation Gap

Despite the ambitious vision laid out by Rio 1992, progress in implementation and the institutional framework for implementation have proved disappointing<sup>3</sup>. Delays in implementation have been due to a combination of factors including an ineffective institutional framework<sup>2</sup>, an economic model that does not prioritise sustainability<sup>1,2,3</sup> and a lack of knowledge dissemination<sup>1,2</sup>.

Political will to fulfil commitments has waned since 1992 and the institutional framework for making real progress on sustainable development is inadequate<sup>2</sup>. This has led to unacceptable delays in transposing EU environmental directives into Irish law<sup>1</sup> and compliance and enforcement procedures are not sufficient<sup>2</sup>. Sustainable development encompasses a broad range of sectors, which leads to challenges with coordination, implementation and assigning responsibility. A reform of the institutional framework for sustainable development is required to close the implementation gap<sup>1</sup>. This framework should have a "bottom up" structure, starting with cooperation between County and City Development Boards and local authorities<sup>1,2,3</sup>. They need to implement action in all areas of sustainable development and fully embrace new initiatives that emerge<sup>1</sup>, coordinating local, national and international decisions<sup>1,2</sup>. At national level, governments must provide direction and resources to ensure that local authorities have the knowledge, ability and funding available to implement sustainable development<sup>1</sup>. Targets agreed at Rio +20 should form the basis of all policy decisions and should be incorporated into all national and regional plans<sup>1</sup>. At a global level, there must be cohesion and cooperation between global initiatives, such as MDGs, Climate Change and Sustainable Development, which often operate in isolation despite sharing common goals<sup>3</sup>. Sustainable development does not always feature strongly in the programmes and work of UN agencies<sup>3</sup>. A UN institution is required that has a powerful, integrated mandate to deal with sustainable development issues<sup>3,4</sup> which would fall under the UN Delivering as One initiative<sup>3</sup>.

Our current economic model is based on the over consumption of finite resources<sup>3</sup>. Steps to change this have often been designed using financial incentives or penalties so the reason behind the changes, decreasing resource depletion, is often lost<sup>1</sup>. It is essential to decouple economic progress from resource exploitation<sup>1,2</sup>. A common misconception is that environmental issues hinder growth<sup>17</sup> and current measures of wellbeing rely on GDP, so social and environmental factors are often overlooked<sup>1,2,3</sup>. The way that we measure growth and success must be reassessed<sup>3</sup> and more must be done to promote awareness of the benefits that a healthy environment contribute towards economic growth<sup>2</sup>. A new economic model should embrace all three pillars of sustainable development<sup>3,4</sup> and progress indicators must be redefined<sup>3</sup>. A possible solution would be the introduction of "satellite" national accounts, which consider factors not measured in the traditional economic model and recognise the value of natural resources<sup>3</sup>.

It is also evident from the current international economic crisis that global financial markets have become increasingly linked by speculative and opportunistic transactions. Speculative transactions account for a high proportion of all financial transactions but they are completely tax free<sup>3</sup>. Financial markets must be regulated to end speculation and taxation reformed to discourage potentially harmful activity in the real economy and financial sector<sup>3,4</sup>. Support is growing for the introduction of a progressive tax targeting those who profit from speculative transactions. The tax would not only assist monitoring of the financial risks being taken but would also generate revenue which could be used for national and international development. With a potential value of €50-100bn, the annual, global revenue could be enough eliminate the worst forms of material poverty worldwide. The European Commission has taken the initiative, proposing a Financial Transactions Tax within Europe. This represents an important step towards implementation<sup>3,4</sup>.

There needs to be a stronger commitment to ensuring understanding of sustainability and increased cooperation between communities and local government<sup>1</sup>. The public and the public authorities at all levels still need to be informed and educated about the real issues facing them<sup>2</sup>. Ireland's position as the only EU country yet to ratify the Aarhus Convention represents a significant obstacle to improving public access to information, decision-making and justice regarding the environment in Ireland<sup>2</sup>. Understanding of how sustainable development addresses issues of social justice and the environment empowers people and encourages them to act<sup>1</sup>. Although school programs have improved awareness of sustainability, a gap remains in education provision on environmental sustainability in the wider community<sup>1</sup>. Some local authorities set a positive example by promoting community-based initiatives, such as the All Ireland Pride of Place competition, awareness campaigns and EcoCert, which encourage businesses and citizens to take a more sustainable approach<sup>1</sup>. There are also a number of global movements focused on sustainability. Collaboration between governance and sustainability movements would bring about enormous progress as government directives would be more easily disseminated throughout the community<sup>1</sup>. Greater involvement of non-state actors and marginal groups will also be vital in closing the implementation gap<sup>1,2</sup>.

### 5.2. Mechanisms and Tools for Implementation

- Implementation of sustainable development strategies already in place<sup>1</sup>
- Adoption of policy framework that promotes a low carbon, resource efficient and socially inclusive society<sup>1</sup>
- Appointment of local Sustainability Development Officers with relevant qualifications and experience to educate others on issues related to sustainable development<sup>1</sup>. The role could also include coordination, direction and ensuring adoption of sustainability principles within the community<sup>1</sup>.
- Formation of a national forum involving agencies and bodies involved in environmental protection, a high level Environmental Governance Network involving key stakeholders<sup>2</sup>.

- Appointment of Ombudspersons at UN and National level to ensure that sustainable development concerns are considered in all policy decisions <sup>2,4</sup> .
- Workshops on sustainability run by County/City Development Boards providing training for all board partners, particularly those within the public sector <sup>1</sup> .
- New set of indicators for well being <sup>2,3</sup>
- Resources allocated specifically towards promoting sustainability at local authority level <sup>1</sup>
- More support for non governmental organisations which promote sustainability awareness and understanding amongst their peers <sup>1</sup> .
- Use of incentives to promote action. Presenting the potential economic gains associated with green economy will promote buy in from businesses <sup>1</sup> .
- Legally binding rules prioritising the goals and targets of Rio +20 and ensuring compliance <sup>1,2,3</sup> , accompanied by penalties for failure to comply which are enforceable and respected <sup>1</sup>

## 6. Expectations for Rio +20

### 6.1. Expected outcomes

Rio +20 provides an opportunity to renew focus on sustainable development. Civil Society in Ireland would like to see:

- A reiteration of commitment to the principles of sustainable development contained in the Rio Declaration, 1992 <sup>1,2,3</sup> , particularly:
  - o A commitment to provide knowledge and support for implementation of Local Agenda 21 <sup>1</sup>
  - o Reiteration of the importance of poverty eradication in achieving a sustainable society <sup>2,3</sup> and reaffirmation from all states that they will honour pledges to provide 0.7% GDP in Official Development Aid by 2015 <sup>2</sup>
  - o Renewed commitment to the 'polluter pays' principle <sup>2,3</sup>
  - o Reemphasis of the importance of employing the precautionary principle <sup>1,2,3</sup>
- A stronger commitment from all nations to ensure greater understanding of sustainability across all sectors of society, promoting communication and cooperation between communities and the government <sup>1,2,5</sup>
- A shift in focus from the current economic model to one which combines economic, social and environmental criteria as measures of growth and success <sup>1,2,3,4</sup>
- Establishment of institutional structures to facilitate this <sup>2</sup> • A international commitment on action to halt climate change and mitigate against it's adverse effects <sup>1,3</sup>
- Recognition in UN Law of biodiversity loss as an environmental and financial crisis on par with climate change <sup>2</sup>
- Targets set based on what needs to be achieved <sup>1</sup>
- A commitment from all nations to the implementation of actions rather than just agreement to goals <sup>1</sup>
- An enhanced governance framework to promote and monitor progress <sup>3,4</sup>

### 6.2. Outcome Document

The outcome document should deliver:

- A set of specific goals <sup>1,3,4</sup>
- A clear pathway of implementation <sup>1,4</sup>
- An agreed timeline for achieving targets <sup>1,3</sup>

Rio +20 presents an opportunity to revisit agreements and commitments made in 1992 and to consider how we will deliver on these, both collectively and individually. Governments need to make firm commitments on how to tackle emerging issues, promoting compliance and enforcement procedures. All nations must show the political will to fulfill the commitments made in 1992 in order to achieve sustainable development.

## 7. Stakeholder Seminar

The Department of the Environment, Community and Local Government held a seminar on the 25<sup>th</sup> October 2011 as part of a wider consultation process. The seminar was open to the public and speakers represented environmental, social and local authority interests, from an EU and Irish perspective. The outcome from the stakeholder consultation to date was presented at the seminar and stakeholders were given a further opportunity to respond. Points raised from the following sectors:

### Local Authority

- Attention was drawn to the success of Local Agenda 21 in a number of counties in Ireland. However, a speaker from the environmental sector noted that many County and City Development Boards were not given sufficient terms of reference for implementing Local Agenda 21 and that Government support for inclusion of sustainability into their Terms of Reference is limited.
- The role of local authorities as key players in environmental and pollution control was emphasised.

### Environmental Sector

- Concern was raised over the lack of compliance with environmental law. It was suggested that a combination of low political will, low compliance and lack of enforcement could continue to hinder implementation. It was proposed that civil society be given more power to push compliance at a local level.

- It was suggested that Ireland could learn from other countries that have successfully introduced green public procurement.
- Another suggestion was that social media such as Twitter be used to keep people informed of events and programmes taking place at a local level.

#### Social/Development Sector

- Emphasis was placed on the limitations of current economic models and their failure to meet the needs of society. There was a reiteration of the need for growth and success to be measured in terms of social, environmental and economic variables, rather than depending on GDP. A suggested solution was the development of "satellite" accounts, which consider items not traditionally measured and recognise the value of natural resources.
- The importance of the role of women in food production in developing countries was highlighted. The point was raised that women are responsible for 60-80% of food production in developing countries, yet suffer huge inequalities in pay and access to primary and secondary education.

There was also general consensus that a key factor in progressing sustainable development would be the production of a new set of indicators for social well-being.

#### Appendix 1

##### Questions posed in consultation document

1. What have been the main successes/failures in progressing sustainable development since the Earth Summit in 1992?
2. What contributions can the current focus on the green economy contribute to advancing sustainable development, particularly from an Irish perspective?
3. Can the green economy contribute towards Ireland's efforts in assisting developing countries and what priorities should we be addressing in this regard?
4. What impact can the EU 2020 strategy and, in particular, the Resource Efficiency Flagship Initiative have on advancing sustainable development in Ireland and what priorities should Ireland establish in implementing the initiative?
5. What are the comments, if any on existing proposals: e.g. a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership or others?
6. What are the views on implementation and how to close the implementation gap, which relevant actors are envisaged as being involved (Government, specific Major Groups, UN system, IFIs, etc.)
7. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?
8. What are the expectations for the outcome of Rio +20, and what are the concrete proposals in the regard, including views on a possible structure of the Outcome document?

## Irish Doctors' Environmental Association (IDEA)

RIO + 20 submission by the Irish Doctors Environmental Association (IDEA):

Commitment to Sustainable Development:

Instead of acting like predators on the earth, the human species will act as stewards.

Time is running out.

The Earth is the complex, living system that sustains our species. Living systems can die. There are a variety of life-threatening symptoms that stem from the systemic pathology that is afflicting our planet and undermining its capacity to maintain the delicate balance, which sustains life as we know it. The symptoms are well known as they make up the multifaceted crisis due to unsustainable development that we are addressing in Rio+20. As in treating any medical emergency, all life threatening symptoms must be treated while the underlying cause is diagnosed and treated. At present in most international negotiations, only some symptoms are recognized (by some specialists) while Business as Usual is trying to deny any problems or looking for quick-fixes so it can carry on as usual. Yet, what has this old-world view and "business as usual" brought us? Look around our world. It has brought the break down of many systems, which have sustained us. It has brought conflict, poverty, terrorism, increasing cases of violent crime, climate change, and a rate of biodiversity loss that threatens mass extinction. Yet, we try to retain that old system and the perception that produced it while introducing or jiggling a few methods and technologies to find a quick fix. This is as helpful as shifting the furniture on a sinking ship.

If while treating the symptoms, we carry on allowing the systemic pathology to proliferate, the symptoms will continue to grow in both quantity and quality for they are only warning signs of an unabated underlying disease process. Here we offer a fundamental systemic diagnosis and treatment program as well as some recommendations for immediate symptomatic relief.

### SYSTEMIC DIAGNOSIS:

We are on the threshold of an evolutionary shift or change. As in all such cases, we, as a species, may make the necessary changes and evolve or continue business as usual into extinction. We know that our unsustainable development is a root problem but what is the source of our unsustainable development? Our perception of life: that we are fundamentally a mass of individuals usually collaborating in groups/nations to compete for whatever we can get from the earth, in whatever way we can get it to give us more comfort. The winners get the most and thrive and the losers get the least and can serve the winners in one form or another. This perception has worked for thousands of years but we are at a turning point in human history. Never before has our behaviour threatened our species with extinction.

It is our choice. We have all the knowledge, technology and energy required but do we have a system through which we can collaborate and direct all this to make the change? The required change is often referred to as a Paradigm Shift, which demands that we fundamentally change our thinking and perception so we can see beyond the mentality that we used to create these problems. The new paradigm that is dawning is based on the interdependence of all life as has been discovered over recent decades through our sciences. Throughout earth's history, at certain thresholds, the evolutionary process has demanded life/energy to rise to more united complexity or be recycled through extinction. Humanity is now facing a "supra-ordinate" problem that can only be solved through the collaboration and cooperation of all the participants (groups/nations). Unlike all previous problems facing humanity that could be solved by hierarchical group systems within a competitive framework of winners and losers, this one is a challenge that will either unite humanity to evolve from a mass of competing individuals, to work as one united complex system capable of overcoming the systemic threat or we will remain clinging to our separate competitive identities, unable to make the required evolutionary leap. Could this multi-faceted crisis that we are facing, be an evolutionary driver?

\*Recommendation:

The context for all decisions with global consequences must be taken in awareness of the impact of any decision on the health of the whole system. It becomes clear that we as a species will either be winners, evolving safely or losers, as the earth and atmosphere loses capacity for homeostasis (dynamic state of equilibrium) and can no longer support the very fine balance of conditions (i.e. temp. pH, etc) in which human life can thrive. An ecosystems approach to human health, recognizing the interdependence of our health with that of the planet's, is central to this crisis solution – NOT a fabricated system of economics.

### SOME HIGH PRIORITY SYMPTOMS & RECOMMENDATIONS

At Rio+20 we need clear concrete agreements that are legally binding together with a system to ensure implementation of them.

Most new technologies are more about business (profit for a few) rather than creating a better world. The Precautionary Principle, "Look before you leap" is the most basic principle of well-being & survival that most parents teach their children. It puts human health within the ecosystem context, in the fore.

We do not address all of the critical symptoms because it would make this submission too lengthy. However, as the symptoms are interdependent the sample of recommendations below could also help alleviate other critical symptoms such as the loss of biodiversity and water mismanagement.

#### Climate Change:

Human health is at the heart of the issue because it is health that will deteriorate with increasing natural disasters, decreasing air quality, rising water levels, the anticipated increase and shift in communicable and vector borne diseases as well as the obvious problems associated with drought, malnutrition/starvation, forced emigration, conflict over resources etc. Tackling climate change by significantly reducing green house gas emissions (as per scientific requirements) is part of a sustainable future and needs clear concrete legally binding laws that will be implemented by nation states. The current concept of a green economy is still driven by a consumerist lifestyle (old paradigm economy) rather than the precautionary principle (sustaining life).

\* Recommendation:

A green economy based on a new economic model, which would include environmental indicators, fully taking into account external costs.

Agreement to establish a world environmental court

Agreement on compliance and enforcement mechanisms, which will ensure effective environmental law.

Agreement on non-regression on environmental law, A global Aarhus convention and agreement on Principle 10. of the Rio Declaration

Health of humans and the ecosystems must be at the centre of a real green economy. Otherwise the new green economy may continue to prioritise profit-focused business. All mechanisms to lower green house gas emissions must be seen in full context of stewarding not ravaging Life.

Chemical Pollution:

Polluting Earth's water, air, soil/food and our bodies has resulted in an escalating proliferation of a vast array of debilitating chronic diseases, cancers and allergies, amid other problems. Ironically, this is also costing the national economies vast sums in lost employment and taxes, healthcare costs, pollution etc.

\* Recommendation:

The international framework on chemicals management is a first necessary step towards a legally binding agreement, which clearly establishes that by the 2020 deadline, chemicals will only be produced and used in ways that do not produce harmful effects on our health or environment.

Technology and the Precautionary Principle: in the Green Economy GM food crops and Hydrological Fracturing "fracking" (for oil/gas) are examples of technologies that give short term monetary gains to a few (the winners), and cause long-term problems/crises for humanity, biodiversity and planet (the losers). Fracking fractures the earth's geological layers, introducing and releasing both toxic chemicals and potent green house gases into the earth, water and atmosphere. This is a major assault on a faltering planet. Increasing numbers of people are suffering from symptoms and conditions, associated with the exposure to a cocktail of toxins to which we are increasingly exposed. These toxins, by-products of our consumer society, usually accumulate in bodies and in the ecosystem and interact with one another to give unpredicted results – the cocktail effect, which is usually more complex and toxic than when taken singly. Multi-systems illness is an umbrella category given to these conditions which are impacting not only on the individuals & their families lives but also on the greater socio-economic sphere, for the afflicted people can no longer function as healthy participants in life, and conventional medicine has been unable to help them because these conditions are relatively unknown and only recently started to proliferate. It is becoming increasingly apparent that these people may represent the "canaries in the coalmine".

Much recent research has identified Electro-Magnetic Frequencies (EMF) even at Extremely Low Frequencies (ELF) can add to the accumulating toxic burden on the immune system to which our bodies are exposed on daily basis. Like with many other new technologies, the Precautionary Principle was not followed and we have no idea how much this technology is impacting on our world and how to treat the problems it may create.

\*Recommendations:

Put Precautionary Principle at the fore of acceptance of all new technology into commercial capacity. Put an immediate ban to all proposed violent assaults on Nature such as "fracking". We could tick many boxes within the sustainable development/green economy with wind, hydro (tide/current) and solar, but if we start fracking or going down the route of GM food/agriculture, it would reduce those attempts to worse than meaningless. It demonstrates that we don't really understand or care about sustainable development; we are just playing business as usual with a green wash. Support the new field of Ecological Medicine in research and to train physicians so this growing number of patients can have medical treatment. Even with changes in our global system, the effect of the toxins will continue to burden immune systems for years to come.

Global Economy and Poverty

Poverty is the level of disempowerment that undermines the capacity of that/those person/s to sustain their health and well-being. It is not necessarily linked to money or the economy as such. Many peoples in the last century only discovered they were impoverished when they were told/educated that they were, because they didn't use enough cash. The current model of Economic Globalization is proving to make the rich fewer and richer and the poor, poorer with vastly increasing numbers. As well as increasing economic disparity, it is responsible for the vast majority of the ecological and social destruction in developing countries.

\*Recommendations:

Dissolve the International Monetary Fund, World Bank, and World Trade Organisation and any other bodies that were created and work by the old defunct perception, which has caused these crises. Then create new ones that are products of the new paradigm/worldview based on interdependence and collaboration (i.e. equity, respect, etc)

These institutions represent the crumbling world view, and cannot help to solve our current crises for they are the major systems that prop up and drive "Business as Usual". We need totally different systems/bodies based on totally different perception, thinking, values, objectives etc.]

Food Production/Shortages

Our global economic system has been at the heart of this crisis not so much the food production, per se. Though after years of chemical biocides and misuse of soil, soil degradation and regeneration is certainly a looming issue. GM food crops are a solution made by and for the chemical companies that produce them. They will not feed the world or even increase yields sustainably over the long term, but will create enormous profits and power for a few who own the seeds, while unleashing unknown havoc on the Earth's natural food production capacity.

It is well known in the international community that around 40% of food produced is wasted. Our food production model needs to be reviewed because it is patently illogical to be exporting and importing the same products around the world using enormous amounts of fossil fuel while poisoning the earth and destroying biodiversity.

Seen through the lens of a different worldview, this food system model would be recognized as totally inappropriate.

Governance

Few of the politicians seem to understand what is happening and how little time we have to make the necessary changes, or else they are constrained within a system that is desperately trying to survive and will not allow the necessary changes to be made. They are part, and often products, of the crumbling systems and people with fresh insight and understanding from a different perspective are needed: Ones who do not make decisions in order to save or repair failing systems but who can boldly initiate the new shoots from a unified species perspective to push through the dying old growth, for life to flourish.

The current supra-ordinate problem requires both a sense of unity (we're all in this together) and everyone's collaboration and commitment in order to solve it. A sense of division, hierarchy and competition will not solve it. This is why it necessarily requires first and foremost a change in our modus operandi. The whole system has to expand its perception so it can evolve into a new holistic system that works in harmony with the forces of life instead of competing and conflicting with them. Civil society should play a major role for they hold a range of expertise and are not bound by political or popular demand. Though there is a movement to include them it is totally inadequate. They are

as yet disempowered to take any leading or pivotal role in critical negotiations. There are many people, NGO's, think tanks etc. around the world who are already organizing and educating groups of civil society/ communities about the way forward. We need to create an integrated interdependent global system based on the new paradigm values to lead us from break down to break through.

- Update our education systems to teach how to steward the earth, contribute and thrive within a collaborative world.
- Prioritise creating systems to include civil society's expertise and participation in solving the multi-faceted crises in a pivotal role.
- Create a world or international court for the environment that will ensure implementation of conventions and treaties etc.
- The rights of nature should be enshrined in every nation's constitution (Equator has just done this).

Strong International Environmental Governance is needed. This can be achieved by reforming and upgrading an environmental body such as: UNEP with new responsibilities and resources, proposals include:

- Upgrade from a programme to a specialized agency
- Strong programme on Sustainable Consumption and Production under UNEP
- Further strengthen the Trade and the Environment activities of UNEP
- Further strengthen civil society participation in UNEP, i.e. by applying the Aarhus Convention Guidelines on 'public participation in international environmental policy processes'
- Upgrade the mandate of Panel of Natural Resources (under UNEP), to govern better the use of natural resources and the fair distribution of those.

Time Frame: Two things are propelling the urgent and necessary changes:

- 1) The speed of break down of the present system, both on the human systems (economy, food production, politics/security...) and the planet's homeostatic (self-regulation) systems to maintain its equilibrium (climate/natural disasters, biodiversity loss...) .
- 2) The incredible speed of communication through internet/technology can act as a neural system for delivering messages through the human community/body. Used in conjunction with exchanging and interpreting knowledge to activate community mobilization at local levels, we could set up systems to change our impact on the earth much faster than anything humanity has previously done.

The old/Modern system should not be reconstituted or salvaged; it is rotten and is undermining our capacity to survive. What is at stake is the survival and health of the human species because the consequences of our current development model are undermining the ability for the Earth to sustain life as we know it. Therefore, an ecosystems approach to human health needs to be the central framework in the negotiations.

There is great reason for hope as people around the world are connecting to share information and ideas about what is working. Technology now allows for solutions to be communicated, improved or interpreted communally, within seconds around the world. Growing numbers are realizing what is at stake and are willing to make the changes, to be part of the solution. People are waking up, informing themselves because they want to help to make a better world.

## ISEAL Alliance

Contribution of the ISEAL Alliance to outcomes of the Rio+20 Conference on Sustainable Development

Thematic Focus: "Green Economy in the context of sustainable development and poverty eradication"

Context

The ISEAL Alliance believes that by focusing on the theme of the Green Economy in the context of sustainable development and poverty eradication, the Rio+20 Summit will provide an unprecedented opportunity for government, business and civil society leaders to affirm and renew their commitment to advance social and environmental justice.

As part of its contribution to Rio+20 Conference preparations, United Nations Environment Programme (UNEP) (2011) in its report Towards a Green Economy: Pathways to Sustainable Development and Poverty Eradication defines the Green Economy as one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities. UNEP (2011) notes that embracing a Green Economy paradigm will require the implementation of a comprehensive set of enabling conditions to support the transition towards a low carbon, resource-efficient and socially inclusive economic system. These enabling conditions consist of national regulations, policies, subsidies and incentives, international market and legal infrastructure, as well as trade and aid protocols. One particular set of incentives identified by UNEP relates to sustainability standards systems and the associated concepts - certification and eco-labelling.

There are many examples drawn from the agriculture, forestry, fisheries, manufacturing and tourism sectors where these incentives - sustainability standards - have served as effective catalysts for green growth. Furthermore, sustainability standards can no longer be considered 'niche' approaches. They cover over ten percent of global production in key commodities and sectors, such as wild-capture fisheries, tea, coffee and bananas. The 'demonstration effect' of pioneering initiatives – such as the Marine Stewardship Council, Fairtrade, UTZ Certified, the Rainforest Alliance / Sustainable Agriculture Network and the Forest Stewardship Council – has provided solid ground to expand the application of sustainability standards into new commodities and sectors such as soy and other food and biomass crops, cattle, mining, tourism, carbon, water and electronic waste. This positive demonstration effect is evidenced by the number of new standards systems that have emerged in recent years.

At the core of any standard system is the standard: a defined set of social, environmental, or economic criteria typically developed through multi-stakeholder processes. The standard is the foundation for green growth but it is only in its application by enterprises that the abstract criteria are translated into sustainable practices. This stage often requires significant investment in capacity building. Certification then provides a level of assurance to customers that products or services comply with the standard, thus harnessing the power of the market to deliver benefits to certified enterprises and to drive more sustainable development.

Sustainability standards have enabled the market for sustainable goods and services to expand through informing consumers of products and production processes. Sustainability standards have also played a strong market leadership role in driving best practice and supporting continuous improvement. Moreover the pivotal role that sustainability standards play in the field of public procurement and the greening of government expenditure is important to note.

While UNEP (2011) is supportive of sustainability standards to drive green growth, it has been observed that standards' ability to facilitate or hinder trade depends on how

they are set up and managed. For example, if the criteria associated with the scheme are not locally applicable or relevant, they can be deemed as trade restrictive. Similarly this can be the case if the verification procedures associated with a scheme are unnecessarily complex and discriminate against small and medium size enterprises.

For the ISEAL Alliance, these issues underscore the notion that sustainability standards are only able to make a positive contribution to green growth and sustainable development if they are credible and effective. The concept of credibility relates to:

- how a standard is set - for example following a process that is consistent with the World Trade Organization (WTO) disciplines of openness, transparency and due process;
- how standards compliance is verified - is the verification process impartial and independent and is the process fit for purpose; and
- whether the impact of a standard is assessed - is the effectiveness of the standards system in contributing to its stated sustainability goals assessed on a regular basis and is this learning integrated into the system, including improvement of the standard over time.

ISEAL has developed a number of consensus-based Codes of Good Practices that define credibility in these three spheres – standard setting, assurance and impact assessment. As such, these Codes can be considered international reference documents for what constitutes credible social and environmental standards.

With this as background, the ISEAL Alliance calls for the inclusion of a statement outlining a commitment to supporting the scaling up of credible sustainability standards as part of the outcomes of the Rio+20 Conference, with the following text:

Governments, the business sector and civil society leaders all acknowledge the positive contribution that credible, effective multi-stakeholder sustainability standards can make to advance the implementation of the Green Economy concept in support of sustainable development. More specifically, the value of these market-based tools hinge on their ability to:

- provide a clear pathway for producers and manufacturers to improve sustainability practices;
- provide reliable benchmarks for supply chain buyers and consumers to make informed purchasing decisions; and
- streamline the financial due diligence process by signalling to institutional investors and lenders that good social and environmental practices are being upheld.

While sustainability standards have gained ground in recent years, in some cases representing more than ten percent of total production, they have not yet reached their full adoption potential. All governments participating in the Rio+20 Conference therefore commit to actively and comprehensively supporting the scaling up of credible sustainability standards for all commodities and sectors and in all parts of the world, especially in emerging and developing economies. They do this in line with their individual responsibilities, opportunities and constraints, duly recognising their role as actors in the public procurement sphere, facilitators of international trade, guardians of internal markets, decision makers on consumer information criteria and as initiators and supporters of international development and technical assistance.

Specific government actions that could support the scaling up of sustainability standards include:

- a) Practising credible sustainable public procurement through setting progressive targets across all product and service categories to ensure that a large, reliable market for sustainable products and services is able to evolve.
- b) Building consumer confidence in sustainability standards through:
  - collating and disseminating information on what constitutes credible sustainability standards. For example, only standards systems that follow WTO disciplines such as those that are in compliance with ISEAL's Standard-Setting Code can be considered credible and act as enablers of trade.
  - guiding corporate communication on sustainability claims and asking for measurable, verifiable and accurate information which can be substantiated by standards systems;
- c) Integrating sustainability standards in regulatory processes through setting legally binding rules for sustainable consumption. This should be enforced by requiring the use of credible standards to demonstrate these legal requirements have been met. An example of this approach is the European Union's Renewable Energy Directive (RED).
- d) Providing financial incentives for sustainably produced products or services through ensuring they receive favourable treatment by the State, such as direct subsidies, reduced tax rates, preferential tariff rates or by other means.
- e) Strengthening the implementation of sustainability standards systems by:
  - directly supporting company implementation, e.g. concessionary-rate loans for producers, support for small farmers through capacity building activities.
  - developing the supporting infrastructure for standards implementation by providing support structures and services with regards to accreditation and certification processes, registration as well as through building extension services to prepare producers to engage with sustainability standards.

---

## Italian National Council of Economy and Labour (CNEL)

National Council of Economics and Labour

OBSERVATIONS AND PROPOSALS:

THE CNEL'S CONTRIBUTION TO THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT IN RIO DE JANEIRO 2012 (RIO+ 20)

Assembly, 29 November 2011

### 1. BACKGROUND

1.1. On 24 December 2009 the General Assembly of the United Nations passed a resolution to hold a conference on sustainable development in 2012 (UN Conference on Sustainable Development -UNCSD). The UNCSD 2012 will be held in Rio de Janeiro, 40 years after the conference on the human environment held in Stockholm, 20 years after the conference on the environment and development in Rio de Janeiro (Environment and Development -UNCED) and 10 years after the world summit on sustainable development held in Johannesburg (World Summit on Sustainable Development -WSSD).

1.2. Based on the resolution of the General Assembly, the UNCSD 2012 will have three objectives, with the proceedings focussing on two topics in particular.

The objectives are:

-to guarantee a renewed political commitment to sustainable development; -to review the progress made to date, as well as the persistent delays in the enactment of the conclusions of the summits held on sustainable development; -to address the new challenges on the horizon.

The two specific topics are:

- a green economy within the context of sustainable development and the elimination of poverty;
- the institutional framework for sustainable development.

1.3. The CNEL, in light of the noteworthy contribution that the Rio summit can make to reinvigorating political determination and will, on both the global and regional levels, towards making further progress in the direction of more sustainable development, is using the present contribution to make proposals on a number of key issues that, in the opinion of the Council, are of particular importance to the success of the summit.

1.5. The CNEL welcomes the Resolution of the European Parliament and the Communication of the Commission, considering them important points of reference for a joint analysis by the various institutions of the EU, so as to arrive at a common position in preparation for the Rio+20 Conference. The CNEL is especially glad to see that the Communication of the Commission was presented jointly by the commissioners responsible for the environment and for development, making clear the connection that exists between the environment, sustainable development and aid to development.

1.6. In large part, the CNEL concurs with the opinion of the EESC on the Communication of the European Commission to the European Parliament, to the Council, to the European Economic and Social Committee and to the Committee of the Regions Rio+20: toward a green economy and improved governance.

1.7. Finally, the CNEL is confident that that all institutions and key participants in economic and social life shall work towards ensuring that the proceedings of the Rio + 20 summit serve as an incentive for reinforcing Italy's commitment to sustainable development.

## 2. OBSERVATIONS

2.1. The current situation. Although progress has been made over the last 20 years with regard to certain aspects of sustainable development, in many areas the situation has worsened. seen in absolute terms, poverty has increased: 2.6 billion people live on less than 2 euro a day;

1.5 billion workers, meaning roughly half the world total, do not have steady work. In 2010 the employment level was the highest since records have been kept;

the levels of carbon emissions in the atmosphere are continually on the rise, and climate change is having increasingly negative repercussions on living conditions in many regions of the world;

immigration is increasing on a global scale, placing additional pressure on the environment and on the security of supply flows;

based on current demographic trends, by 2050 the world's population will have reached 9 billion, making the above problems even more pressing.

2.2. New and emerging challenges. The growth of the world population, plus rising expectations in terms of standard of living and increased consumption of raw materials are beginning to place a strain on supplies of food, energy and other raw materials, leading to higher prices and serious social and political problems.

2.3. One of the most important new challenges that the world must face in the coming century is maintaining or reaching an adequate level of security in terms of food, energy and resources for everyone – both current and future generations -in a world whose population is on the rise and whose natural resources are limited. What is needed is qualitative economic growth able to contribute to eradicating poverty and social injustice while preserving natural resources for future generations. The key topics on which the 2012 world summit should concentrate its attention include the establishment of institutional structures able to meet these challenges.

2.4. Over the last three years the economic and financial crisis has been the central concern of political leaders and economic and financial bodies. Still, these pressing short-term problems should not deflect attention from the problems of the real world economy referred to above or from the impelling need to channel the activities of the world economy in the direction of increased sustainability, equity and greater respect for the environment. In and of itself, this transition should be a major source of new investments and new employment opportunities, in addition to ushering in increased levels of equity, cohesion, stability and resilience. In short, it could contribute to resolving the current economic difficulties.

2.5. A renewed political commitment. The 2012 Rio summit provides a valuable occasion for outlining this transformation and for determining the high-level political commitment that will be needed if this change is to become reality. It is of fundamental importance that the various heads of government address these problems, participating in the Conference in order to guarantee its success. Furthermore, given that the key issue is transforming the global economy, ministers of finance, the environment and economic development should also take part in the Conference.

2.6. Sustainable development is based on initiatives and on the participation of civil society, which, therefore, should also be involved in both the preparation for and the followup to the summit, as well as in the enactment of its conclusions. Forums for discussion should be created on both the national and international levels, in order to promote among the elements of civil society involved, as well as between civil society as a whole and political leaders, a dialogue on the topics of achieving the transition towards a green economy and sustainable development.

## 3. PROPOSALS

### 3.1. The green economy

3.1.1 A definition of the green economy. It is proposed that the summit arrive at a shared point of view on the definition and meaning of green economy, as well as on the reasons that make it an especially important objective for the entire world. To this end, the reflections and considerations being developed on the green economy by the UNEP (the United Nations Environmental Program) and within the OECD (the Organisation for Economic Cooperation and Development) constitute important points of reference.

3.1.2. Put concisely, the objective of the green economy is to render models of production and consumption more respectful of the natural resources they utilise, and specifically to reduce their dependence on fossil fuels. In practical terms, the intent of the green economy is to supply new tools capable of more effectively achieving the objective of sustainable development, resulting in an improved integration of these same tools within the framework of the other economic objectives pursued by governments and businesses.

3.1.3. The principles of the green economy. It is held that the RIO + 20 summit represents an excellent opportunity to establish a framework of principles capable of guiding the transition in the direction of a greener global economy. Such principles should be drawn from the underlying contents of the principles of Rio '92, of the Earth Charter, of the activities of the UNEP, the OECD and the ILO, as well as from other sources of note, so as to focus, though without taking the place of these existing principles, on those

values that prove to be of particular importance in terms of sustainable economic management. Such principles should explicitly include the internationalisation of external factors affecting the environment and social concerns, decreases in flows of natural resources, increased defence of ecosystems and the elimination of perverse subsidies, as well as the principles of equity, cooperation and shared but differentiated responsibilities.

3.1.4. In particular, a well-balanced framework of principles should ensure that the transition towards a green economy is managed in such a way as to prove advantageous for all the world's regions and not merely for a group of countries, such as those of the developed world.

3.1.5. Tools and measures. It is recommended that tools and political measures geared towards promoting sustainable development be shared: they could be grouped into five main categories:

- direct public spending geared towards sustaining the development and spread of greener technologies (for example, through R&D programs, subsidies for the start-up of new businesses and investment programs, programs of public tenders, direct consumer incentives etc.);
- tax measures designed to discourage activities damaging to the environment by ceasing to subsidise them or by taxing them;
- regulations meant to prevent or limit the less sustainable activities practiced by businesses or by other subjects, or that require the utilisation of greener methods or procedures;
- programs designed to inform, educate, supply with consulting and motivate businesses, workers, consumers etc. with respect to the challenges to be faced in terms of sustainability, as well as the contribution they can make to achieving the transition towards sustainability;
- shared tools for assessing the impact of anthropogenic activities on natural resources (the accounting of natural resources, the ecological footprint, "Factor 10" etc).

3.1.6. It is to be hoped that the RIO + 20 summit will provide a major occasion for formulating an overview of the progress made to date in terms of sustainable development throughout the world.

Even though measures of note have been introduced in many parts of the world, including Europe, over the last 20 years, the overall impact of such initiatives is not yet sufficient to contrast the persistent tendency to engage in non-sustainable development. Seeing that today, compared to 20 years ago, any of the dangers and problems tied to unsustainable development have become all the more menacing and urgent, the summit should consider how to revive global and regional efforts to enact the objectives of sustainability. To this end, the summit should specifically reflect on how to apply the different types of tools in a more rigorous fashion, and how to mobilise the public and private capital needed to carry out the transition in an equitable and balanced way throughout the world.

3.1.7. The obstacles. It is held that the lack of sufficient progress in terms of sustainable development can be traced to four general factors that the summit should, to the extent possible, examine in greater depth:

- the lack of consistent, reliable information of the impact of the different activities on the sustainability of the economy;
- the lack of confidence in the feasibility of the transition towards more sustainable models of production and consumption, as well as in the potentially positive impact of a similar transition on the wellbeing of individuals, on employment and on equity;
- the lack of confidence in the good faith of other countries and organisations, along with the fear that being the first to enact measures for sustainability can undermine the competitive position of whomever takes such action;
- the lack of commitment to sustainability on the part of those sectors of the public administration responsible for economic and financial operations, as well as from the managers of major companies and from the representatives of financial interests.

3.1.8. Assessment of the progress made towards a greener economy. One possibility proposed is to establish parameters to measure the progress made by businesses and by other organisations in the field of sustainability. In particular, methods should be drawn up to measure the different types of natural capital found in our territory, in our seas, in our atmosphere and in the biosystems that they sustain. Another necessary step would be to measure the negative or positive impact that the various economic activities can have on this capital.

3.1.9. The summit could establish international mechanisms, together with a timeline, in order to create a uniform set of procedures to be followed when countries draw up and publish the balance-sheets for their natural capital and when annual reports are issued on the impact of economic activities in terms of strengthening or weakening the natural capital, plus, in general terms, when the framework for achieving the shared objective of sustainable development is formulated.

3.1.10. It is also proposed that international processes and mechanisms be established in order to specify and analyse the way in which the different political tools and practices in the individual countries either contribute to progress towards stability or hinder it, so as to favour, over time, a greater convergence towards more sustainable economic policies throughout the world.

3.1.11. Even today, special attention is still focussed on the growth of the GDP alone as an index of development. Little or nothing is said about the consumption of natural resources and the promotion of equity. A more sustainable approach to policies of development calls for a wider-ranging vision that also considers the maximisation of wellbeing as a full-fledged goal for society. The summit should have as one of its specific objectives arriving at a commitment to establish a system for measuring the wellbeing of communities, in order to supplement the purely economic gauging of processes of development.

3.1.12. It would also be helpful if, in each country, information on the environment, on the progress made towards a greener economy and on other aspects of sustainable development were made more readily available, in order to facilitate more fully informed public discussion of the key issues. In Europe, the 1998 convention on access to information, on the participation of the public in decision-making processes and on access to the law with respect to environmental issues (the Aarhus Convention) has broadened and reinforced public rights to obtain access to information, at the same time promoting public participation and recourse to the law. Discussions are currently being held on the possibility of drawing up a similar convention in Latin America. The UNEP has formulated a more general framework that addresses a number of these considerations. The summit should encourage initiatives geared towards establishing similar conventions in all the regions of the world, within a global context.

3.1.13. Giving visibility to instances of success. There are countries, regions, cities, companies etc. in which noteworthy results have been achieved in the course of the transition towards sustainability. They have demonstrated that it is possible to reduce the negative environmental impact of the various economic activities while, at the same time, creating new opportunities for employment, thus improving overall wellbeing. More should be done to highlight the success stories recorded throughout the world, using them as examples capable of convincing others to follow the same path.

3.1.14. Reinforcement of international trust. Certain elements of the transition towards sustainability are starting to be shared. For example, technologies featuring low carbon emissions have become widespread in a series of key sectors, and they will probably serve as one of the main driving forces behind future economic growth, improvements in wellbeing and the creation of jobs. It would be helpful if the summit were to provide further impetus to this transition, in order to increase the flow of resources and investments

earmarked for the green technologies of the future, extending the scope of the transition to attract adequate investment flows for the sectors most often neglected, or that have registered less impressive results, such as the protection of the biosphere and the marine environment.

3.1.15. Turning the tax base greener. The most important challenge facing the 2012 Rio summit will be how to reach a more practically effective, far-reaching global agreement on mobilising public and private resources allocated for the development of skills and knowhow, for transfers of technology and for programs of sustainable investment to aid the less developed countries, as well as countries currently experiencing development, to keep pace with the transition towards sustainability, but in an equitable manner. In order to arrive at a solution to this problem, it is proposed that the summit give greater impetus to national and international efforts aimed at making the tax base greener. Indeed, it is held that the time has come to launch an initiative in favour of a tax on financial transactions, through an agreement reached on a global level, with the revenues to be used to finance investments in the field of sustainable development. We hold this to be a point of paramount importance, seeing that the capacity to make the transition towards sustainability can vary significantly from one country to another in terms of natural, economic and human resources.

3.1.16. Investments in research and development activities. The competent bodies within the United Nations should be assigned to identify sectors of research and development on technologies and tools favouring a green economy that could benefit from a move to combine such efforts through international cooperation. It is important that the new, greener technologies be rapidly implemented throughout the world. The responsible bodies of the UN should specifically identify any barriers to the rapid transfer of such technologies, determining ways in which they can be overcome.

3.1.17. Programs of public tenders can constitute an effective tool for moving manufacturers in the direction of greener products and services. Europe already has experience in holding "green" public tenders in compliance with the principles of free trade and within a European framework. The competent bodies of the UN could be assigned the specific task of promoting successful practices in this field throughout the world.

3.1.18. Investment flows. A new global understanding. According to widely accredited estimates, over the next 40 years the global investment needed to achieve the transition to a low-carbon-emissions economy in the energy sector alone shall be on the order of trillions of euro. And other elements of the transition to sustainability will also require massive sums. The ability to achieve this transition varies from one country to another in terms of natural, economic and human resources. One of the most important challenges facing the Rio 2012 summit will be finding a way to arrive at a more practically effective, farther-reaching global understanding to mobilise public and private resources for the development of capabilities, transfers of technology and programs of sustainable investment meant to aid the less developed countries, as well as countries currently in the development stages, so that they can keep pace with the transition towards sustainability, but in equitable fashion. The responsible bodies of the UN should be assigned the task of monitoring the progress made in terms of financial commitments and other efforts undertaken to assist developing countries in making the transition to sustainability.

3.1.19. Involvement of economic and financial leaders. Earlier discussions on the topic of sustainable development were essentially prepared by ministers of the environment and their departments, which inevitably played the dominant role. This phase provide to be of use when it came to identifying and assessing the problems. But now that the world has moved on to taking more practical action in the field of sustainability, implementing important measures involving taxes and industrial policy and redirecting major flows of financing and investment, it is proposed that economic and financial departments take on a more leading role. The summit should stimulate the political will and commitment needed to make sustainable development a priority item on the agendas of ministers of economics, finance and industry, in addition to establishing mechanisms capable of transforming this commitment into effective action extending over a long-term time frame, both nationally and internationally.

3.2. The institutional framework.

3.2.1. International governance. For the last 19 years responsibility for international monitoring of the progress made throughout the world in terms of sustainable development was held by the United Nations Commission on Sustainable Development (CSD). Nevertheless, national participation in the activities of the CSD is handled primarily by the ministries and departments of the environment, which do not possess the authority, either individually or collectively, to take effective measures in the fields of economics or finance, or in other sectors falling outside the scope of their responsibilities, and this despite the crucial importance of such measures for the progress of sustainable development.

3.2.2. It is held that the summit can remedy this problem by establishing a more effective mechanism within the UN system, meaning one that brings together the ministries and departments of economics, industry and labour (plus other ministries, if necessary), in order to jointly formulate global policies and programs of action involving sustainability. The above mechanism could take the form of a council on sustainable development that supplements and reinforces the activities currently carried out separately by Ecosoc and by the CSD of the UN. These supplementary activities could also be supported by a committee organised to ensure coordination of all the UN agencies that handle issues of sustainable development, including the IMF, the WTO, the WHO, Unesco etc. In addition, the UNEP should be reinforced, allowing it to make a more incisive contribution within the framework of all these processes.

3.2.3. Such a council should have as its members all the countries of the world, represented by their highest-placed political leaders. The Council should give priority to global initiatives involving all aspects of sustainable development, promoting the transition towards a greener economy while initiating activities that regard new and increasingly important issues such as food and energy security.

3.2.4. This new council should establish close ties with the World Bank and with the International Monetary Fund (IMF), which would be assigned a new mission, namely that of making the promotion of sustainable development a central focus of their efforts.

3.2.5. The United Nations program for the environment (UNEP) and its development program (UNDP) should be reinforced, so that together they can make a more incisive contribution to the environmental aspect of sustainable development, as well as to development per se.

3.2.6. National governance. New vigour should be instilled in the national mechanisms designed to promote sustainable development. The primary responsibility for promoting sustainable development should be clearly placed with the government and with all the ministries most directly involved. Steps must be taken, in particular, to revive and update national strategies for sustainable development, ensuring the full involvement and support of businesses, workers and all the different sectors of civil society. At the same time, advisory bodies should be established, such as the national councils for sustainable development, and give adequate resources to make a full-fledged contribution to the introduction of new ideas, as well as to efforts to maintain the pressure for further progress.

3.2.7. Regional and local governance. Within the context of progress towards sustainable development, regional and local government bodies hold a number of key responsibilities, as shown by the many excellent examples of the results such bodies have achieved throughout the world. Nevertheless, to date the progress made has not been uniform. The summit could contribute to more widespread progress by highlighting the best results, as well as by encouraging national authorities to set objectives for further progress by their respective regional and local government bodies and to support them in fulfilling such commitments.

3.2.8. Businesses. Over the last 20 years, businesses have made noteworthy improvements, increasingly moving in the direction of sustainability. Still, progress in this sense has been uneven. It is held that the moment has arrived to encourage, based on the best examples, improved practices in terms of sustainability. The summit could serve as a useful occasion for initiating discussion and reflection on a similar effort.

3.2.9. Employment. It is held that the ILO's "Decent Work" principles and objectives should be made a full and integral part of the commitments of the UN conference. This is the main path to be taken in terms of guaranteeing fairness in the course of the transition towards equitable, sustainable development both in developed countries and in

those where development is currently underway or has been delayed. Of particular importance is the need to support programs of education and training, especially for young people, and in all countries; it is held that the promotion of new skills and know-how will contribute to creating new jobs on the global labour market, generating positive social repercussions worldwide.

### 3.3. Objectives in key sectors

3.3.1. It is proposed that the summit assess the ways in which the green economy concept will influence the primary economic sectors. Steps should be taken in each sector to encourage a more efficient use of energy, as well as of all other natural resources, so as to reduce the impact of pollution and of the production of waste, in addition to which greater attention should be focussed on the environment and on biodiversity. In the case of the developing countries, the current projects revolve around the achievement of the Millennium Development Goals (MDG). It is recommended that, on the occasion of the revision of these goals in 2015, new development objectives be set, with greater emphasis placed on objectives of sustainable development. To this end, the Rio + 20 summit could issue a mandate providing guidelines for the revision of the MDG.

3.3.2. Energy. Turning the energy sector green constitutes the single most important challenge of the overall push towards a green economy. In today's world, the production and consumption of energy practically underlie all economic activities carried out worldwide. According to the 2010 report of the IEA (International Energy Agency), the world energy outlook for 2035 is characterised by an increase in the demand for energy, together with an essentially unchanged production mix. Basic access to energy remains a pressing need in some of the world's poorer regions. Meanwhile traditional fossil fuels (especially oil) are becoming increasingly rare, in addition to proving more difficult and costly to procure. What is more, emissions from the combustion of fossil fuels are the primary cause of the accumulation of greenhouse gases in the atmosphere, as well as the ominous changes in the climate, in the levels of the sea etc., the effects of which are already starting to be seen.

3.3.3. The ambitious objectives for reducing greenhouse gases make necessary an attentive assessment of the tools available for limiting CO<sub>2</sub> emissions to the greatest extent possible, while guaranteeing, at one and the same time, minimum cost expenditures and a maximum level of safeguards for the competitiveness of industry. In identifying such tools, mention can be made of, from among other options, the production of energy from renewable sources and energy efficiency, with the synergy between the two being of fundamental importance when it comes to achieving the objectives with higher levels of flexibility and lower costs for each country system. As part of this effort, the European Commission has already established a new working plan (the Low Economy Roadmap) for achieving an 80% reduction in carbon reductions by 2050, as compared to 1990 levels. Leading the shift on the planetary level towards a low-carbon emissions economy should represent the main objective in efforts against climate change.

3.3.4. Discussions regarding the objectives and the timeline for the transition to a more ecological economy have already been initiated in any forums, in particular within the framework of the UN convention on climate change. As part of a global understanding, it would be helpful if the summit forecast the level of investment that will necessary over the next 40 years in the less developed countries and in small, relatively isolated states in order to provide them with adequate access to sources of clean energy while establishing suitable international mechanisms capable of contributing to generating the necessary funds and to monitoring the progress made.

3.3.5. Transportation. Reducing dependency on fossil fuels and promoting an efficient use of resources constitute the primary challenge with regard to sustainability in the transportation sector as well. To meet this challenge, it will be necessary to:

- reduce or limit increases in the demand for transportation through improved planning of the constructed environment;
- promote collective modes of public transportation rather than individual modes of transport;
- increase the energy efficiency of all modes of transport;
- abandon fuels with higher levels of carbon in favour of fuels with zero or low carbon emissions, such as green electric energy or bio-fuels produced in accordance with the tenets of sustainability;
- further improve existing agreements on the disposal of vehicles and other transportation materials at the end of their life cycle.

3.3.6. The constructed environment. Urban environments vary significantly throughout the world, mirroring specific climatic, physical, social and economic conditions, as well as the different historical backgrounds. Still, they all face a number of common underlying challenges tied to the need to achieve greater sustainability. For example, a decidedly higher level of efficiency must be attained in the use of energy to heat or cool all the types of buildings, as well as in the use of other materials and resources. Steps should be taken to promote forms of transportation that are greener and less damaging to the environment everywhere, and efforts must be made to improve the management and conservation of water resources worldwide. Improvements should also be made in the management of waste flows, with emphasis placed on reducing waste production and supporting reuse and recycling. Another priority objective in urbanised areas, and one whose pursuit can no longer be put off, is the objective of improving the quality of the air: this constitutes a determining factor (as reported by the WHO) not only in the health of citizens, but also in the rising levels of healthcare spending. All the above considerations call for renewed attention, in light of the ongoing growth of the urban population, with a further result of the situation being a powerful impetus towards the innovation of processes and products.

3.3.7. Agriculture and the rural environment. It is held that, from the perspective of the green economy, thoroughgoing changes must occur in agricultural practices in many parts of the world. In numerous countries government intervention is essentially geared towards safeguarding the income of farmers or limiting the prices of basic foodstuffs or meeting both goals. While these are fundamental concerns, they should be supplemented with equal attention for the roles played by the agricultural and rural worlds in guaranteeing food security, conserving the natural capital of the land and its resources of biodiversity and defending food security against the threat of hydrogeological disruptions and flooding, together with their contributions to energy policies, which are not of secondary importance either. A further concern is the development of more virtuous policies for the use of farmland exposed to continuous erosion on account of invasive urbanisation.

3.3.8. Another point to be stressed is that deforestation and the deterioration of forestry resources lead to environmental and social damage that proves difficult to reverse, such as prolonged alterations in the balance of water tables, the onset of steppe-like terrain or desertification, climate changes and a loss of biodiversity, as well as rural poverty and conflicts over land and access to resources, rights and benefits, the overall economic cost of which proves to be far greater than the cost of eventual preventive and corrective efforts; it is held that the Rio+20 Summit should set itself the objective of ensuring participatory governance in the forestry sector, together with an equitable and fair distribution of benefits, plus the conservation and sustainable use of forests worldwide.

3.3.9. The CNEL holds that the key to sustainable agriculture lies in food production that is quantitatively sufficient, qualitatively excellent and regionally diversified, being implemented throughout the territory, in compliance with respect for nature and in such a way as to safeguard and defend the rural environment, preserve the differentiation and distinctive quality of production activities and promote both cultural landscapes rich in a wide variety of different species and rural areas.

3.3.10. Effective measures should be taken to improve the operations of agricultural markets while rendering them more transparent. Unacceptable fluctuations and increases in the prices of food products should be contrasted. The use of renewable raw materials for the production of energy cannot be promoted at the expense of the procurement of food supplies worldwide. Secure supplies of food should be guaranteed by establishing reserves on a regional basis. There should also be a push to make increased use of

the residual biomass generated by agricultural activities and food production.

3.3.11. Steps must be taken to guarantee workers' rights in the agricultural sector, through application of the existing ILO conventions. The active participation of civil society in projects of regional and local sustainability is indispensable and, to this end, particular emphasis should be placed on the role of women in developing countries. 3.3.12. The FAO and the UNEP could be entrusted with the task of jointly examining the sustainability of current agricultural practices, and of the management of the land, in each country, further analysing possible options for reforming these sectors, while also looking at the regulations and incentives under which they are currently governed, all for the purpose of promoting a greener rural sector.

3.3.13. The marine environment. In the same way as we discuss the green economy, we can also speak of a Blue Economy with regard to marine resources. Here too increase attention and efforts must be forthcoming from the international community. The marine environment is currently subject to growing pressure on account of pollution and excessive exploitation of marine resources, which, in certain limits, has reached the danger level. It balances, which not only ensures flows of food resources, but also serves as one of the most potent systems of climate regulation, could be threatened by policies of unwise use. The summit should make it obligatory that a new international procedure be established to reinforce and coordinate the existing mechanisms for safeguarding the marine environment. The summit should also assign to the responsible bodies of the UN the task of implementing a new international procedure designed to strengthen and coordinate existing mechanisms in the field of defence of the marine environment, in addition to finding a more effective approach to preserving stocks of fish and other marine resources than that taken under current rules and regulations.

3.3.14. Biodiversity. The safeguarding of biodiversity should be viewed as one of the primary guarantees of survival. We ask that the Conference reiterate this principle, in light of what we hold to be an excessive tendency to underestimate the loss of living species that occurs on a daily basis. This issue undoubtedly entails an ethical problem that cannot be ignored: namely that of the relationship between mankind and nature. But even when biodiversity is considered in purely economic terms, it appears as an extraordinary resource for policies of sustainable development. And this is true not only on account of the "services" that biodiversity provides (an example being the critical importance of the pollination carried out by the very insects continually threatened with products introduced into the air), but also with regard to extremely important economic sectors, such as tourism and leisure activities.

## Jacob Soetendorp Institute for Human Values

Jacob Soetendorp Institute for Human Values

Submission to the Compilation Document in preparation of the Zero Draft Outcome Document of the United Nations Conference on Sustainable Development

The Jacob Soetendorp Institute for Human Values is building bridges between diverse cultures, religions, and generations. It helps to coordinate the international Earth Charter Task Force on Religion, Spirituality, and Ethics and brings together leaders and teachers of the world's religious and spiritual traditions to express our concern for Earth, our common home.

With the help of an interreligious steering committee we have crafted a statement which calls on our various traditions to work together for a just, sustainable and peaceful future, enlists commitments of the faith communities to become agents of change in the transition to sustainable development and highlights some basic expectations of the outcomes of the Rio + 20 conference.

Three key recommendations are:

- Create a green economy that ensures social justice and equity, protects the ecological balance and creates economic sufficiency by internalizing social and environmental costs into the economic bottom line.
- Create structures for global governance with a global trusteeship mandate for Earth's common goods such as fresh water, healthy soil, clean air, the oceans, the atmosphere and the diversity of life that are essential conditions for human life and well-being which cannot be sensibly privately owned and traded on markets.
- Affirm a framework of strong sustainability aimed at securing Earth's bounty and beauty for present and future generations, such as the Earth Charter, as a guide to development policy and practice. By the end of the year, we will further refine the statement in a process of interreligious consultation that aims to empower the world's spiritual and religious communities to redouble their efforts of acting as forces of good by weighing in on the Rio + 20 preparation and further international processes such as UNCSD and the realization of the Millennium Development Goals.

Please find below the interreligious statement in its version of 31 October, 2011:

TOWARDS RIO + 20 AND BEYOND - A TURNING POINT IN EARTH HISTORY

Speaking truth to power

As leaders and teachers of the world's religious and spiritual traditions, we express our concern for Earth, our common home. We applaud the United Nations' initiative to gather the international community in Rio de Janeiro in June 2012 for the United Nations Conference on Sustainable Development. We seek to contribute to a renewed political commitment to sustainable development and to the assessment of progress made since the historic Earth Summit in Rio in 1992.

While some progress has been made since the 1992 Rio Earth Summit, with sadness we recognize that the interconnected problems of development, equity and ecology have become more severe over the past twenty years. We painfully realize that our credibility as bearers of the image of the Divine is at stake in a world where we allow so many to live in misery, in a habitat devastated by the pursuit of short-term self interest.

The ideals of a shared responsibility for the well-being of the human family and the greater community of life have been expressed passionately in the Earth Charter, the Johannesburg Declaration, and in many other commitments since the Rio Earth Summit. What has prevented us from realizing these commitments?

Adherents of spiritual traditions should be the vanguard of speaking truth to power. We have to take part of the blame, as we have allowed ourselves to become fragmented. We acknowledge that we have failed to live as compassionately as we could have, and that some have created human misery in the name of religion. Yet we believe in the power of repentance, and seek to counter fear with hope. We cannot change the past, but from the honest acknowledgement of our mistakes, we can draw the strength and insight to change the future for the better. Our soul-searching compels us to enter the conference rooms in Rio not by preaching, but by leading through example.

The missing element – a spirit of trust and collaboration

All negotiations will fail as long as there is no trust, no respect and no hope. In our different traditions and cultures there exist similar parables that urge us to express empathy on a global scale. Humanity is one body. When one part of the body aches, the other parts feel the pain.

For breaking the threshold in the international negotiations we need to rebuild trust between governments of the North and the South, East and West, between NGOs and the business sector, and different schools of thought. When we are able to help each other transcend the prison of self interest, everything will be possible. We should not have to fear anymore the presumed hidden agendas of the others but rather be open to see in each others' eyes the manifestation of the image of the source of all being. This is the spirit which we hope to see at the Rio + 20 Conference.

Reorienting our economic bottom line towards full human development

At the heart of the great diversity of our spiritual teachings, there is a common theme: They teach that, in this world of death and suffering, ignorance, fear and desire – through right understanding and practice – an individual can connect to the deeper, ultimate, radiant and caring source of all that is, and create a way of living that assists all in finding a fulfilling and enduring life.

To make development truly sustainable, our economic, scientific and technological accomplishments should assist the processes of individual, psychological and spiritual development. We must reorient our economic bottom line to support this full human development if we wish to live in a flourishing Earth community.

Our commitments to accelerate the Great Transition towards sustainability, equity and well-being

We, who represent such a magnificent diversity of religious and spiritual expressions, commit to the following:

We commit to transcend traditional boundaries and speak in one unprecedented unified voice.

We repent where our traditions and organizations have promoted violence and injustice towards others, and have supported the destruction of the environment.

We embrace with joy the blessed opportunity to forge a global partnership to truly care for Earth and one another.

We recognize that the principle of compassion lies at the heart of all religious, spiritual, and ethical traditions, calling us always to treat others as we wish to be treated ourselves.

We commit to fully engage in the paradigm shift towards universal responsibility and global empathy with all our brothers and sisters, and the whole community of life on Earth. Manifestations of this global empathy such as the Earth Charter, the Charter for Compassion, and the Uppsala Interfaith Climate Manifesto will guide our way towards strengthened interfaith collaboration for creating a more just, peaceful, and sustainable future.

We commit to tread more lightly on Earth and regard it as our sacred duty to lead through example and demonstrate sustainable living in our religious and spiritual communities. In this, we draw strength, encouragement and inspiration from the many good practices that are already being applied by religious communities around the world.

We commit to educate ourselves to work effectively in development policy arenas, understanding the critical changes that need to be made in our economic and governance structures to create a flourishing future for all.

We commit to redouble our efforts of serving as forces for good, by weighing in on the major international processes including Rio + 20, the UN Decade on Education for Sustainable Development and the realisation of the Millennium Development Goals.

We speak out for recognizing the importance of the global ethical and spiritual consciousness awakening in civil society around the world for advancing the transition to sustainable development. In fact, we consider this global ethical consciousness as the foundation of the other three pillars of a sustainable way of life, because it involves the internalization of the values of sustainable human development; it is a source of inspiration and motivation for action, as well as an essential guide regarding the path to genuine sustainability.

This elevated intention of the world's spiritual and religious leaders to awaken a global ethical and spiritual consciousness in civil society is bound to have a vibrant impact on others. Inspired by the values and commitments of this community of leaders, it is our hope that the world community will find the courage and strength to fully engage in elevated action and shift the old paradigm, taking us beyond national self-interest.

Our appeals to the Rio + 20 Conference

We appeal to the representatives of governments and international institutions to likewise transcend national boundaries and take measures which seem to contravene national self interest but are necessary for preserving the community of life.

We applaud your courageous steps towards unified action at the beginning of the third Millennium by adopting the Millennium Development Goals. We urge you to honour your commitment to realize these goals by 2015, and adopt goals that go further by 2030, which should include the goal to completely eradicate poverty by that date.

We urge the representatives of all governments to:

- Show courageous leadership in addressing the major global challenges that threaten the very survival of humanity on this planet.
- Create a green economy that ensures social justice and equity, protects the ecological balance and creates economic sufficiency by internalizing social and environmental costs into the economic bottom line.
- Create structures for global governance with a global trusteeship mandate for Earth's common goods such as fresh water, healthy soil, clean air, the oceans, the atmosphere and the diversity of life that are essential conditions for human life and well-being which cannot be sensibly privately owned and traded on markets.
- Affirm a framework of strong sustainability aimed at securing Earth's bounty and beauty for present and future generations, such as the Earth Charter, as a guide to development policy and practice.
- Acknowledge the importance of the spiritual dimension of sustainability – that when basic needs have been met, human development is primarily about being more, not having more.

A solemn moment of existential global decision making

Our religious and spiritual traditions command us not only to feed the hungry, but to give of our own bread. This is not a deed of charity but of justice. We therefore call upon each citizen of the world community, especially within the rich countries and communities, to pledge each year an extra global empathy share of 0.1 % of one's income to raise the necessary funds to alleviate abject misery, to realize the Millennium Development Goals, and to respond to urgent humanitarian crises such as the current famine in the horn of Africa.

We hope that in time we may form out of our midst a Council of Conscience which speaks with moral authority, provides guidance on the urgent global challenges humanity is facing and issues alerts about perilous trends and hidden conflicts that escape the attention of the media and public awareness.

This is a solemn moment of existential global decision making. The Rio + 20 Conference provides a historic opportunity to lead the world into a more sustainable future. We do not have another twenty years to lose. To move forward in our best interests and even more in the interests of those yet to be born, we must change our course of negotiation and realize that only together can we forge inclusive solutions.

Humble in the recognition that we are but dust and ashes, we are conscious that the consequences of our decisions and actions will be felt by many generations to come. We turn to the Source of All Blessings for strength and courage. May our children, and our children's children not be disappointed with our actions, may we be able to make them proud.

## Japan Center for a Sustainable Environment and Society (JACSES)

Input to the Compilation Document of the United Nations Conference on Sustainable Development (Rio+20)

Japan Center for a Sustainable Environment and Society

November 1, 2011

Japan Center for a Sustainable Environment and Society (JACSES) is an NGO dedicated to achieve sustainable development and social justice. JACSES was established in June 1993. The establishment of JACSES was led by the idea of an independent NGO/think-tank, which was brought up by Japan's delegates at the 1992 Earth Summit held in Rio de Janeiro, Brazil.

JACSES has been broadly engaged with general public and experts in research, policy advocacy and awareness-raising. Currently, JACSES' activities are centered around Earth Summit Follow-up Project, Sustainable Development and Aid Program, Green Tax Reform Program, Ecological SPACE (Sustainable Production and Consumption) Project, Climate Change Program, etc.

### 1. Introduction

At the time of Rio-Summit in 1992, the expectation toward "Peace Dividend (reallocation of military expenditures in order to eradicate poverty and solve environmental problems)" was raised. We would like to remind people of the "Peace Dividend" concept, reconsider the situation of world financial crisis, and reform the international policies and frameworks toward realization of peaceful, sustainable and equitable society.

### 2. Proposals for Outcome of Rio+20

JACSES suggests the following political commitments to be adopted as the outcome of Rio +20.

#### 2-1. Proposals on Green Economy in the Context of Sustainable Development and Poverty Eradication

- a) Enhancing financial mechanisms which directly reach poor people and vulnerable people affected by environmental degradations.
- b) Creating new financial resources for sustainable development through measures including prevention of political corruption, reduction of military expenditure, and imposition of financial transaction tax.
- c) Establishing/Improving environmental and social standards, environmental management systems and evaluation systems of international financial institutions, national governments (including the emerging countries), private financial institutions and infrastructure funds in order to improve the quality of development assistance and finance.
- d) Establishing international mechanisms which provide incentives to individuals/entities that develop and/or disseminate appropriate technologies to contribute to sustainable development (e.g. highest energy-efficient technology and renewable energy technology).
- e) Reforming tax systems and fiscal policies which provide incentives to the individuals/entities contributing to sustainable development and social justice, while impose burdens to unsustainable consumption and production patterns.
- f) Promoting greater use of renewable energy except for large-scale hydroelectric generation, and starting international discussion process regarding phase-out of nuclear power.
- g) Introducing standards and indicators on environmental capacity concept including north-south and inter-generational equity.

#### 2-2. Proposals on Institutional Framework for Sustainable Development

- a) Enhancing transparency and building appropriate evaluation systems of international institutions.
- b) Strengthening the International Court of Justice and International Labor Organization.
- c) Strengthening mechanisms of environmental and social consideration in international trade and investment rules (WTO agreements, FTA etc.).

## Japan Civil Network for the United Nations Decade on Biodiversity

Submission to the UN Conference on Sustainable Development Rio+20

November 1, 2011 Stakeholder Type: Major Group (NGO) Japan Civil Network for the United Nations Decade on Biodiversity 3.11 Working Group

Contact Person: Makiko Imai [bd.seimei@gmail.com](mailto:bd.seimei@gmail.com)

### Key Message:

Convention of the Biological Diversity was opened for signature at the United Nations Conference on Environment and Development (UNCED), Rio Conference in 1992. It now has 193 Parties and is regarded as the most important convention of the world. Strategic Plan for Biodiversity 2011-2020 (Aichi Biodiversity Targets) was adopted at the tenth meeting of the Conference of Parties on Convention of Biodiversity (CBD-COP10) and the United Nations General Assembly declared 2011-2020 the United Nations Decade on Biodiversity (Resolution 65/161). Biodiversity is the basis of Society, Economy, and Culture. Without it, humanity cannot survive. Biodiversity and its concept "Living in Harmony with Nature" shall be regarded as a basis of all the discussion in the United Nations. We must all agree to build the society which values biodiversity and respects life. Outcome of RIO+20 shall well represent such important points; both in discussion of Green Economy and the Institutional Framework.

### Gap and Recommendation:

- Importance of biodiversity is still not well recognized even among the policy makers. With The UN Decade on Biodiversity, the United Nations should make every effort to improve this situation. World need philosophy, which calls for respect for life. Biodiversity can be it.
- Government vertical administrative structure has been a major obstructs. Every effect shall be taken in order to solve the problem.
- It is regretted that government with great influence, such as the United States of America, is not signed to the important conventions. Such issue shall be clearly addressed as world needs stronger political commitment.
- While the focus on low-carbon development and resource efficiency is important, we must not forget that respect for biodiversity is crucial for green economy. Inter-relationship between United Nations Framework Convention on Climate Change (UNFCCC) and the Convention on Biological Diversity (CBD) shall be closely observed.
- While Sustainable Development is the issue for all of us, it is regretted that policymaking discussion is often highly technical and majority of the people are hard to participate. Resilient society shall be matured through the continuous dialogue with various stakeholders with different background, knowledge and skills. Every effort shall be made to encourage participation of the people who rely their lives heavily on natural resources and biodiversity. Voices of vulnerable groups, local community and small farmers, mother and children, youth shall be better respected.

One learning from 3.11 Earthquake and Fukushima Daiichi nuclear disaster is that nature is not controllable. We must have awe and respect for the nature and admit the limitation of scientific knowledge. It is agenda of our generations to review the existing development policy and take significant step for denuclearization.

Reference: Strategic Plan for Biodiversity 2011-2020; Aichi Biodiversity Targets

The Vision: By 2050, biodiversity is valued, conserved, restored and wisely used, maintaining ecosystem services, sustaining a healthy planet and delivering benefits essential for all people.

The Mission: Take Effective and urgent action to halt the loss of biodiversity in order to ensure that by 2020 ecosystems are resilient and continue to provide essential services, thereby securing the planet's variety of life, and contributing to human well-being, and poverty eradication. To ensure this, pressures on biodiversity are reduced, ecosystem are restored, biological resources are sustainably used and benefits arising out of utilization of genetic resources are shared in a fair and equitable manner; adequate financial resources are provided, capacities are enhanced, biodiversity issues and values mainstreamed, appropriate policies are effectively implemented, and decision-making is based on sound science and the precautionary approach.

Strategic Goal A: Address the underlying causes of biodiversity loss by mainstreaming biodiversity across government and society

Target 1 By 2020, at the latest, people are aware of the values of biodiversity and the steps they can take to conserve and use it sustainably.

Target 2 By 2020, at the latest, biodiversity values have been integrated into national and local development and poverty reduction strategies and planning processes and are being incorporated into national accounting, as appropriate, and reporting systems.

Target 3 By 2020, at the latest, incentives, including subsidies, harmful to biodiversity are eliminated, phased out or reformed in order to minimize or avoid negative impacts, and positive incentives for the conservation and sustainable use of biodiversity are developed and applied, consistent and in harmony with the Convention and other relevant international obligations, taking into account national socio economic conditions.

Target 4 By 2020, at the latest, Governments, business and stakeholders at all levels have taken steps to achieve or have implemented plans for sustainable production and consumption and have kept the impacts of use of natural resources well within safe ecological limits.

Strategic Goal B: Reduce the direct pressures on biodiversity and promote sustainable use

Target 5 By 2020, the rate of loss of all natural habitats, including forests, is at least halved and where feasible brought close to zero, and degradation and fragmentation is significantly reduced.

Target 6 By 2020 all fish and invertebrate stocks and aquatic plants are managed and harvested sustainably, legally and applying ecosystem based approaches, so that overfishing is avoided, recovery plans and measures are in place for all depleted species, fisheries have no significant adverse impacts on threatened species and vulnerable ecosystems and the impacts of fisheries on stocks, species and ecosystems are within safe ecological limits.

Target 7 By 2020 areas under agriculture, aquaculture and forestry are managed sustainably, ensuring conservation of biodiversity.

Target 8 By 2020, pollution, including from excess nutrients, has been brought to levels that are not detrimental to ecosystem function and biodiversity.

Target 9 By 2020, invasive alien species and pathways are identified and prioritized, priority species are controlled or eradicated, and measures are in place to manage pathways to prevent their introduction and establishment.

Target 10 By 2015, the multiple anthropogenic pressures on coral reefs, and other vulnerable ecosystems impacted by climate change or ocean acidification are minimized, so as to maintain their integrity and functioning.

Strategic Goal C: To improve the status of biodiversity by safeguarding ecosystems, species and genetic diversity

Target 11 By 2020, at least 17 per cent of terrestrial and inland water, and 10 per cent of coastal and marine areas, especially areas of particular importance for biodiversity and ecosystem services, are conserved through effectively and equitably managed, ecologically representative and well connected systems of protected areas and other effective area-based conservation measures, and integrated into the wider landscapes and seascapes.

Target 12 By 2020 the extinction of known threatened species has been prevented and their conservation status, particularly of those most in decline, has been improved and sustained.

Target 13 By 2020, the genetic diversity of cultivated plants and farmed and domesticated animals and of wild relatives, including other socio-economically as well as culturally valuable species, is maintained, and strategies have been developed and implemented for minimizing genetic erosion and safeguarding their genetic diversity.

Strategic Goal D: Enhance the benefits to all from biodiversity and ecosystem services

Target 14 By 2020, ecosystems that provide essential services, including services related to water, and contribute to health, livelihoods and well-being, are restored and safeguarded, taking into account the needs of women, indigenous and local communities, and the poor and vulnerable.

Target 15 By 2020, ecosystem resilience and the contribution of biodiversity to carbon stocks has been enhanced, through conservation and restoration, including restoration of at least 15 per cent of degraded ecosystems, thereby contributing to climate change mitigation and adaptation and to combating desertification.

Target 16 By 2015, the Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization is in force and operational, consistent with national legislation.

Strategic Goal E: Enhance implementation through participatory planning, knowledge management and capacity building

Target 17 By 2015 each Party has developed, adopted as a policy instrument, and has commenced implementing an effective, participatory and updated national biodiversity strategy and action plan.

Target 18 By 2020, the traditional knowledge, innovations and practices of indigenous and local communities relevant for the conservation and sustainable use of biodiversity, and their customary use of biological resources, are respected, subject to national legislation and relevant international obligations, and fully integrated and reflected in the implementation of the Convention with the full and effective participation of indigenous and local communities, at all relevant levels.

Target 19 By 2020, knowledge, the science base and technologies relating to biodiversity, its values, functioning, status and trends, and the consequences of its loss, are improved, widely shared and transferred, and applied.

Target 20 By 2020, at the latest, the mobilization of financial resources for effectively implementing the Strategic Plan for Biodiversity 2011-2020 from all sources, and in accordance with the consolidated and agreed process in the Strategy for Resource Mobilization, should increase substantially from the current levels. This target will be subject to changes contingent to resource needs assessments to be developed and reported by Parties.

---

## Japan Women's Watch (JAWW)

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

The JAWW (Japan Women's Watch) is a Japanese women's network to enhance the empowerment of women and contribute to the world women's movement. It works for the implementation of the BPFA (Beijing Platform for Action) and other UN outcomes in close collaboration with APWW (Asia Pacific Women's Watch).

Responding to the 3.11 Great East Japan Earthquake and the subsequent nuclear power plant accident in Fukushima, JAWW received contributions from global women's networks and distributed them among women's groups which have been supporting affected people. JAWW also has been advocating for institutionalization of women's participation in decision making process in the reconstruction process.

In the process of UN Conference on Sustainable Development 2012, so-called Rio+20, representing women major group, JAWW joined the Japanese National Preparatory Committee for Rio +20 which consists of multi-stakeholders and produced an input to the compilation document. JAWW also actively participated in the the Asia-Pacific Regional Preparatory Committee Meeting for the Earth Summit 2012 on 19-20 October 2011 held in Seoul, Republic of Korea and worked as a member of women's caucus.

Representing women's network in Japan, the JAWW submits the following inputs for the compilation of the outcome document for Rio+20.

#### **a. The expectations for the outcome of Rio+20 and the concrete proposals, including views on a possible structure of the Outcome document**

Despite the 20 years' efforts worldwide since Rio, little progress has been achieved in terms of mainstreaming gender equality in sustainable development. Recalling the Agenda 21 and Johannesburg Plan of Implementation, both governmental and non-governmental organizations should re-affirm the women's empowerment and gender equality are a core principle of sustainable development in the Outcome Document of the Rio

+20.

Considering the inequality between genders that remains in various spheres of the society, especially economic situation and the participation in decision- making, governments should clearly express their commitments with concrete measures, including positive actions and cross compliances, to rectify the situation.

Based on the heartbreaking and disastrous experiences in Fukushima at the

3.11 Great East Japan Earthquakes and its long term damages on human beings, society and economy, JAWW strongly proposes that the energy policy should depart from dependency on nuclear energy and up-scale funding to renewable energy. The process of shifting to renewable energy should be transparent and participatory, so that women and other vulnerable people can participate in the decision-making process as equal to men. Women should be regarded as a producer of energy but not merely a consumer and should be guaranteed to have equal opportunities to acquire new technologies and various benefits.

Gender disaggregated data is the basis of promoting gender equality in sustainable development. More resources should be allocated for the collection, analysis and disclosure of gender disaggregated data in relation to sustainable development.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

The green economy should be defined as the one that enables gender justice and long term social and wellbeing of present and future generations, especially marginalized groups, including women in poverty. The goals and monitoring tools of the green economy should include indicators to measure the achievement of gender justice.

---

**c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

---

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

Based on its experience of advocacy to connect gender equality in the sustainable development, JAWW proposes to institutionalize that the organization/section in charge of gender equality should be a part of organization/section in charge of sustainable development. In Japan, as a result of the advocacy by women's network, the Japan's Basic Guidelines for Reconstruction which is based on the Basic Act on Great East Japan Earthquake Reconstruction (Law No. 76, 2011) clearly states that gender equality and women's participation in decision- making are the basic principle in the reconstruction process and the section/person in charge should be included in the headquarters for reconstruction at national and local levels. This must be a good example how to connect both.

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

### INPUTS FOR COMPILATION DOCUMENT

by JAWW (Japan Women's Watch)

The JAWW (Japan Women's Watch) is a Japanese women's network to enhance the empowerment of women and contribute to the world women's movement. It works for the implementation of the BPFA (Beijing Platform for Action) and other UN outcomes in close collaboration with APWW (Asia Pacific Women's Watch).

Responding to the 3.11 Great East Japan Earthquake and the subsequent nuclear power plant accident in Fukushima, JAWW received contributions from global women's networks and distributed them among women's groups which have been supporting affected people. JAWW also has been advocating for institutionalization of women's participation in decision making process in the reconstruction process.

In the process of UN Conference on Sustainable Development 2012, so-called Rio+20, representing women major group, JAWW joined the Japanese National Preparatory Committee for Rio +20 which consists of multi-stakeholders and produced an input to the compilation document. JAWW also actively participated in the the Asia-Pacific Regional Preparatory Committee Meeting for the Earth Summit 2012 on 19-20 October 2011 held in Seoul, Republic of Korea and worked as a member of women's caucus.

Representing women's network in Japan, the JAWW submits the following inputs for the compilation of the outcome document for Rio+20.

*a. The expectations for the outcome of Rio+20 and the concrete proposals, including views on a possible structure of the Outcome document*

Despite the 20 years' efforts worldwide since Rio, little progress has been achieved in terms of mainstreaming gender equality in sustainable development. Recalling the Agenda 21 and Johannesburg Plan of Implementation, both governmental and non-governmental organizations should re-affirm the women's empowerment and gender equality are a core principle of sustainable development in the Outcome Document of the Rio

+20.

Considering the inequality between genders that remains in various spheres of the society, especially economic situation and the participation in decision- making, governments should clearly express their commitments with concrete measures, including positive actions and cross compliances, to rectify the situation.

Based on the heartbreaking and disastrous experiences in Fukushima at the

3.11 Great East Japan Earthquakes and its long term damages on human beings, society and economy, JAWW strongly proposes that the energy policy should depart from dependency on nuclear energy and up-scale funding to renewable energy. The process of shifting to renewable energy should be transparent and participatory, so that women and other vulnerable people can participate in the decision-making process as equal to men. Women should be regarded as a producer of energy but not merely a consumer and should be guaranteed to have equal opportunities to acquire new technologies and various benefits.

Gender disaggregated data is the basis of promoting gender equality in sustainable development. More resources should be allocated for the collection, analysis and disclosure of gender disaggregated data in relation to sustainable development.

b. *Green economy in the context of sustainable development and poverty eradication:*

The green economy should be defined as the one that enables gender justice and long term social and wellbeing of present and future generations, especially marginalized groups, including women in poverty. The goals and monitoring tools of the green economy should include indicators to measure the achievement of gender justice.

c. *Institutional framework for sustainable development:*

Based on its experience of advocacy to connect gender equality in the sustainable development, JAWW proposes to institutionalize that the organization/section in charge of gender equality should be a part of organization/section in charge of sustainable development. In Japan, as a result of the advocacy by women's network, the Japan's Basic Guidelines for Reconstruction which is based on the Basic Act on Great East Japan Earthquake Reconstruction (Law No. 76, 2011) clearly states that gender equality and women's participation in decision-making are the basic principle in the reconstruction process and the section/person in charge should be included in the headquarters for reconstruction at national and local levels. This must be a good example how to connect both.

Convenor of JAWW, Masako Tanaka ([EZZ01606@nifty.com](mailto:EZZ01606@nifty.com)) Contact person: Yukiko Oda ([odayukiko2009@gmail.com](mailto:odayukiko2009@gmail.com))

31 October 2011

## Japanese Stakeholders for the Promotion of Sustainable Development

The Japanese National Preparatory Committee for Rio +20 and its Activities Given UN Resolution 64/236, the Japanese National Preparatory Committee for Rio +20 was established on Wednesday, July 13, 2011 as a voluntary gathering of a wide range of stakeholders with an interest in Rio +20, including the 9 major groups mentioned in Agenda 21, in order to promote dialogue for Rio +20 between stakeholders in Japan. The co-Chairs of the Japanese National Preparatory Committee for Rio +20 were selected at its first meeting on July 13, 2011. The Japanese National Preparatory Committee for Rio +20 hosted workshops with the purpose of sharing information and exchanging views on the issues of Rio +20 to reflect a wide range of Japanese stakeholders' input in the preparation of the zero draft of the Rio+20 outcome document. The opinions and recommendations of the Japanese National Preparatory Committee for Rio +20 are summarized below in this proposal.

Key Messages from Japanese Stakeholders Expecting Political Commitments to Develop a Sustainable International Society for the 21st Century Our Lessons learned from Experiences from the Great East Japan Earthquake, Tsunami, and the subsequent Nuclear Power Plant Accident

The global environment has, despite great efforts, deteriorated in the 20 years since the Rio Summit was held, while the global economy and most regional economies are floundering. We believe that now is the time to take action in cooperation with the peoples of the world so that future generations are not exposed to significant environmental risks or ecological crises and can live a comfortable and healthy life.

Amidst this backdrop, people live in Japan experienced the unprecedented Great East Japan Earthquake, tsunami and subsequent nuclear power accident in March 2011. During the reconstruction process, Japan is striving to build a resilient society that is considerate of the local environment, economy, society and cultural values. Japan has also received massive amounts of assistance for its reconstruction effort from countries around the world. We sincerely appreciate this international assistance. Based on the lessons learned during the reconstruction process in the wake of the Great East Japan Earthquake we, Japanese multi-stakeholders convey the following message for Rio +20. All countries that use nuclear power as well as international society must learn from this accident and take fundamental measures to strengthen nuclear power safety. Reviews concerning the future

direction of nuclear power and shifts to renewable energy policy should be held with participation from a wide range of domestic and international actors. In addition, radioactive contamination spread from the nuclear power accident has polluted foodstuff, water, the ocean and soil, threatened economic activities and the sound daily life of the people, and has forced local residents to evacuate their homes. This experience has taught us that 21st century society must be firmly grounded in systems that ensure environmental conservation and ecosystem services, which form critical infrastructure that is at the very heart of human survival.

The spirit of transnational and trans-regional *kyoujyo* (mutual assistance) illustrated in the wake of the earthquake and tsunami represents the exact stance required to build a sustainable society. Japan would like to provide as reference to the discussions on sustainable development in Rio +20 the example of *green reconstruction*<sup>1</sup> in which the sustainable use of natural capital<sup>2</sup> has been used as part of the earthquake reconstruction effort that is seeking to quickly restore the core industries of the disaster-affected areas, including agriculture, forestry and fisheries, while balancing biodiversity conservation with development, based on the traditions and culture of these local areas. Japan retains energy saving, environmentally sound and recycling technologies that are among the best in the world today and also has a track record of social systems such as the energy efficiency top-runner approach and the pledge and review system. There is also the fact that Japanese earthquake-resistant technologies, safety management systems, and disaster prevention measures also functioned during the Great East Japan Earthquake, as evidenced by Shinkansen bullet trains stopping safely as well as earthquake resistance technologies and safety management practices in high-rise buildings living up to their potential. We would like to further improve Japanese world-leading technologies and supporting social systems, further deepen understanding, diffusion and capacity building both in Japan and internationally, and, by doing so, make contributions to the development of a sustainable world.

We Japanese Stakeholders Expect the Following Political Commitments to be Adopted as the Outcome of Rio +20

1) Add culture as the fourth pillar of sustainable development and promote multi-layered initiatives: In order to develop a sustainable global community in the 21st century, we must attain a uniform sustainability based on multifaceted and multilayered relationships as well as add culture to the other pillars of the environment, economy and society. We need to learn from the wisdom and traditional knowledge of indigenous peoples and history rooted in local communities and the countries, such as, for example, actions embodied by the Japanese term *mottainai* or the spirit of the indigenous Ainu people that deeply reveres nature, as well as value cultural diversity and work together with the many different stakeholders that make up the global community while respecting one another. The promotion of above-mentioned multilayered initiatives is essential for sustainable development.

2) Promote sustainable development under social justice and steadfast principles: The principles that should be shared by all peoples and countries of the world are essential to the realization of a sustainable society. Specifically, these principles include respect for human rights as set forth in the Universal Declaration of Human Rights, the achievement of social justice across generations, genders and regions, control of the law, the disclosure of public information to the public, promotion of participation of women, children, youth and other socially vulnerable groups in the policy making processes, the assurance of transparency in policy formulation, implementation, oversight and evaluation, the decentralization of power and local sovereignty, the polluter-pays principle and the beneficiaries-pay principle, the establishment of decision-making rules based on scientific knowledge incorporating precautionary principles, and in particular the need for thorough, multifaceted screening of existing and new technologies.

3) Stabilize the economic infrastructure needed for sustainable development as soon as possible: In order to achieve sustainable development globally and eradicate poverty, we need to build a sound economy within the capacity of the current / future global environment, as well as make the transition from currently battered global economy to a new stable growth path as soon as possible. To that end, it is essential to rectify the skewed international distribution of capital, resolve, in particular, domestic fiscal deficits and balance of international balance of payments , as well as internationally regulate speculative money that has brought about disorder in international financial markets and unjustly inflated the international price of crude oil and mineral resources, which are the cornerstones of economic and industrial activities, as well as foodstuff essential to the daily life of humankind.

4) Develop a system internationally to conserve the natural environment and utilize natural capital in a sustainable manner: The globalization-driven competition for/exploitation of resources such as fossil fuels, mineral resources, fishery resources, water resources and forest resources has, depending on the region, amplified diplomatic tension between countries as well as the threat of armed conflict. In addition, the deterioration of natural capital is progressing due to the climate change and loss of biodiversity. In aiming to conserve the natural environment and utilize natural capital in a sustainable manner, biodiversity conservation on a worldwide scale (specifically, the achievement of the Aichi Biodiversity Targets), respect for the decision-making process of local communities, a major shift to lifestyles of sustainable consumption, and the establishment of sustainable production structures that make the production of environmentally and economically balanced products and services mainstream are desirable. In addition, with regard to the utilization of natural capital, there is also a proposal to use natural capital<sup>3</sup> based on the <sup>10</sup>gUser Recovery Principle<sup>10</sup> and we expect that discussions surrounding this proposal will be broadened.

5) Build a system in recognition of diverse values where all people can equally participate and collaborate: Together with reviewing and exploring a possibility to expand the major groups of Agenda 21, it will be important for all major groups and other stakeholders, while avoiding a dichotomy in each country and international society, to reaffirm their individual roles for sustainable development and transfer this reaffirmation into action based on deeper awareness of diverse values and perspectives achieved through multi-stakeholder dialogue. Governments must also recognize this importance and quickly push forward with building an environment to strengthen multi-stakeholder-led international collaboration and cooperation frameworks. These same efforts are required at the intergovernmental level as well.

We Japanese Stakeholders Recommend the Following Policy Measures to Build a Sustainable Global Community

We Japanese Stakeholders recommend the following policy measures for all countries to implement for achieving the aforementioned domestic and international policy targets on a global scale.

i) New energy vision required for the 21st century and the mechanisms to guarantee this vision

(a) Enhance energy and resource efficiency, encourage R&D on technologies for renewable energies, such as biomass, geothermal, small hydroelectric, (expand) existing hydroelectric, photovoltaic (sunlight), concentrated solar heat, and wind power; maximize use and utilization of renewable resources; and, implement the necessary policies (subsidies, tax benefits, consortiums, international collaboration, etc).

(b) Promote international policy initiatives to disseminate the best available technologies and best practices throughout the world.

(c) Enhance nuclear power safety based on international standards, including reviews of the appropriate timing for decommissioning reactors, and ensure the proper disposal of nuclear waste. In addition, there are different opinions on the future of nuclear power, calling for a quick and planned exit or leaving nuclear power open as an option.

ii) Promotion of low-carbon and sound material-cycle and biodiversity considering city and urban planning based on the unique characteristics and initiatives of local communities

(d) Promote related local government measures (land use, construction, transportation, energy, etc.) to create the above city.

(e) Use IT and advanced technologies that have a minimal impact on the environment.

(f) Build a sound material-cycle urban society through the advanced use of resources.

(g) Promote local production for local consumption. Encourage cooperation between producing and consuming areas of food, water and energy producing areas and consuming areas, as well as support intercity cooperation both domestically and internationally to promote technology transfers.

(h) Develop partnerships with the national government to undertake above-mentioned policy measures ((d)-(g))

iii) Mechanisms to ensure employment and economic stability aimed at establishing a stable economic infrastructure

(i) Increase the number of jobs that contribute to the environment and biodiversity (green jobs) and implement job-creation measures in conjunction with the shift in industrial structure (just transition).

(j) Build mechanisms for increasing the employment of men and women, especially young people at small and medium-sized businesses, social enterprises, and in underdeveloped regions.

(k) Promote measures to address the future rapid transition to an aging society in developed countries and most countries in Asia (tax and financial benefits for increasing the employment of senior citizens, etc.).

iv) Promotion of the UN Decade on Biodiversity, attainment of mainstream biodiversity and revitalization of agricultural, fishing, and mountain villages

(l) Share good practices from around the world in terms of conserving and recovering ecosystems, using biological resources in a sustainable manner, the fair and equal distribution of benefits resulting from the use of genetic resources, providing appropriate monetary resources and encouraging capacity building.

(m) Implement appropriate policies effectively and make biodiversity mainstream through policy linkages based on biodiversity and the dissemination of the meaning and value of biodiversity as well as take a precautionary approach to decision making.

(n) Help agricultural, fishing, and mountain villages facing economic difficulties to recover and appropriately manage their natural resources of agricultural, fishing, and mountain villages.

- (o) Promote the multifaceted use, appropriate control and sustainable management of forests.
- v) Continual implementation of the UN Decade of Education for Sustainable Development and establishment of mechanisms that encourage active and responsible actions by consumers
- (p) Develop human resources through the promotion of school education, social education, and training in business companies based on the UN Decade of Education for Sustainable Development (Decade of ESD) and formulate a concrete action plan to be implemented after the Decade of ESD.
- (q) Promote civic education for consumers to encourage responsible and active actions that lead to a shift in industrial structure as well as develop information to support this. Develop mechanisms to prevent greenwash, such as receiving evaluations from third-parties.
- vi) Develop and implement tools such as indicators that support new approaches to sustainable development
- (r)
- (p) Evaluate the contributions of the Millennium Development Goals (MDGs) and compile a roadmap to achieve an international consensus/realization of development targets and indicators for 2015.
- (s) Develop indicators to measure the quality of life and social justice as a substitute for conventional GDP growth indicators.
- (t) Establish sustainability indicators that include natural capital stock, resource productivity and reproduction speed.
- (u) Promote a mainstream shift to a low-carbon industrial structure where the production of services, products, environmentally sound technologies, and zero waste contribute to the conservation and recovery of the natural environment. Support technological innovation such as the wider application of IT to achieve this.
- (v) Develop regions based on local production for local consumption, and help maintain and innovate traditional cultures and arts. vii) Implement innovative financial mechanisms that provide the necessary funding to those in need
- (w) Offer tax incentives and preferential treatment in financial services to small and medium-sized businesses and regions with delayed development.
- (x) Give priority to the distribution of investment capital that contributes directly or indirectly to poverty reduction and sustainable development.
- (y) Secure funding for sustainable development through greening of finance.
- viii) Disseminate environmentally sound technologies and products throughout the world
- (z) Promote the mutual transfer of appropriate environmentally sound technologies (based upon the consent of local communities).
- (aa) Incorporate environmentally sound production technologies, products and services into the social system of countries (use of eco point and top-runner programs).

#### Progress since the Rio Earth Summit and Remaining Challenges

20 years have passed since the first Rio Earth Summit. Since then, the Cold War ended, the world entered the 21st century, emerging economics countries have risen to the forefront, and globalization has progressed. As a result, the structure of the world system has undergone significant change. Following the 1992 Earth Summit, the intensification of globalization and global market competition in world trade, foreign direct investment and the capital markets has accelerated the movement of people, goods, capital and information as well as had both positive and negative effects on a worldwide scale. The result of globalization has been robust economic growth, yet in developed country and developing country alike the number of hungry is increasing sharply due to a rise in the unemployed, in particular the rise in the unemployment rate among youth, and soaring food prices. In the two decades since the first Rio Earth Summit, the East Asia and

Pacific Regions have drastically increased income levels and significantly improved education, water and sanitation thanks to direct investments from foreign countries and an increase in exports. On the other hand, however, income and regional disparities within each of these countries have grown more serious, while mainly Africa and least developed countries have been left behind from the globalization of the world economy due to poverty, low levels of social development and the lack of infrastructure development.

Furthermore, the world faces serious challenges on a worldwide scale never seen before that include the deterioration and loss of biodiversity on a worldwide scale, a squeeze on energy and natural resources as well as the degradation of the environment, each in conjunction with the rapid urbanization and economic growth taking place around the world, climate change and the increase in greenhouse gas emissions. The Rio Declaration, Johannesburg Declaration and action plans have been announced in order to address these global issues, but the progress of each has been significantly delayed. On the other hand, the MDGs have been established, the United Nations Framework Convention on Climate Change and the Convention on Biological Diversity enforced, and the frameworks of the United Nations Convention to Combat Desertification in Those Countries Experiencing Serious Drought and/or Desertification Particularly in Africa, United Nations Forum on Forests and the WSSD Type II partnership model set up. Initiatives such as the Decade of ESD and the UN Decade on Biodiversity have also been launched, illustrating that perspectives on social development have grown more emphasized compared to 20 years ago. Yet, sufficient monitoring and evaluations are not taking place today. Therefore, international and domestic monitoring and evaluation systems need to be strengthened going forward.

- (a) International economy: Globalization has resulted in a structure where the economic crisis of one country can rapidly lead to a world economic crisis. The global financial crisis that 7 reverberated around the world following the Lehman Shock in 2008 showed that the results of efforts toward sustainable development made by all countries are greatly impacted by external factors. Furthermore, turmoil in financial markets is negatively affecting the real economy.
- (b) Poverty: According to the UN MDG Report 2011, the global poverty rate is expected to decline to under 15% by the year 2015, which achieve the MDG target of 23%. Although significant improvements were seen in East Asia and Latin America, more than half of the population in South Asia and Sub-Saharan Africa remain stuck in poverty. Specifically, the impacts from soaring food and energy prices as well as climate change has caused the living situation of people live in poverty to become even more grave.
- (c) Health Care: Improvements in the health of the poorest children have lagged behind in particular. According to a UN MDG Report, nearly one quarter of all children in developing countries were underweight in 2009, with the condition of the poorest children the most serious. Children from the poorest households in developing countries are more than two times as likely as children from the most affluent households to die before their fifth birthday
- (d) Sustainable Consumption and Production: Visible advancements have been seen in sustainable consumption and production in developed countries thanks to the development of 3R-related legal systems in Japan and Europe, the development of designs for the environment (DfE), designs for recycling (DfR) and recycling-related technologies as well as awareness-raising activities. In particular, consumer activities geared toward resource saving and environmental conservation perspectives are

steadily growing, having been fostered through consumer education, such as providing and illuminating correct information concerning the effects (merits and demerits) consumer activities have on environmental and urban issues. In contrast, in developing countries production and consumption has increased sharply on the back of economic growth, which has caused huge amounts of waste and resulted in the greater consumption of resources.

(e) Climate Change: A certain degree of progress was made with technology transfers to developing countries and the requirement of greenhouse reductions by developed countries after the Kyoto Protocol came into effect. Despite the establishment of the United Nations Framework Convention on Climate Change at the Rio Earth Summit based on the awareness of the need to urgently take measures against climate change, however, negotiations and efforts under the Kyoto Protocol and the Convention have lagged. Other issues have arisen such as the United States refusal to ratify the Kyoto Protocol, even though it is the world's second largest emitter of CO<sub>2</sub> emissions from energy use, or the sharp increase in greenhouse gas emissions from the economic development of emerging countries such as China, the world's largest emitter. With demand heightening for the promotion of worldwide efforts, a new framework must be built based on emerging issues. Climate changes have also progressed around the world, with countermeasures fast becoming an urgent issue. 8

(f) Biodiversity: The Convention on Biological Diversity has grown to 193 members, while the Cartagena Protocol on Biosafety has been developed (Nagoya-Kuala Lumpur Supplementary Protocol on Liability and Redress to Cartagena Protocol on Biosafety were adopted in October 2010) and the Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization and the Aichi Biodiversity Targets concerning biodiversity conservation have been agreed upon. Japan, in particular as Chair of the Convention on Biological Diversity by next COP, retains the responsibility to promote efforts itself. However, global assessments, such as the Millennium Ecosystem Assessment and the Global Biodiversity Outlook indicate that the situation surrounding biodiversity is still deteriorating.

(g) Water and Sanitation: Global water problems have grown more serious after the start of the 21st century due to climate change, urbanization, population increases and the deforestation and forest degradation that help cultivate water resources. Massive droughts, declining groundwater levels, lake pollution and water sanitation are causing human suffering. The world's population has grown by 3.7 times over the past 100 years, but water demand has grown by some 7 times over this same period. Water and sanitation are the basic human right of all people and represent basic infrastructure for gender equality, education and preventing epidemics, yet there are many countries in Africa, the Middle East and Asia where the outlook indicates difficulty in attaining the MDGs.

(h) Forests: Forest issues vary from one country to another, while individuals are less aware of the mutual relationships involving these issues. We welcome the efforts of countries and international organizations at all levels, as well as international initiatives for promoting sustainable forest management based on the non-legally binding instrument on all types forests (NLBI) and the Multi-Year Program of Work (MYPOW) passed at the UN General Assembly in January 2008. However, we are deeply alarmed by the continuing loss of 13 million hectares of forests with multi-functionality per year due to land-use change, forest fires, natural disasters, and illegal logging. Based on awareness that forest deforestation and forest degradation are closely related to global issues in the three Rio Conventions, the efforts of the international society are required to reverse this trend.

(i) Hazardous Chemical Substances and Hazardous Wastes: Regulations on the use of hazardous substances in electrical and electronic devices have been tightened over the past several years, as progress has been made in reducing the use of hazardous substances in these devices. However, developing countries have yet to create a legal framework and governing structure for recycling, and reports have been made about health hazards occurring as a result of improper recycling practices. Many developing countries have achieved rapid economic growth without sufficiently developing monitoring systems for the processing of hazardous waste, with this disposal fast becoming an issue in these countries. Furthermore, Japan's recent nuclear power accident has brought the issues surrounding the final treatment and disposal of spent nuclear fuel into the spotlight.

(j) Energy: The expansion of rural electrification and decentralized energy systems incorporated into the Johannesburg Plan of Implementation remain as before as issues. While advancements have been made in the use of renewable energy in certain developed countries and developing countries, most countries continue to face challenges in increasing their use. In addition, many issues remain that need to be examined in order to promote the greater use of renewable energy, including the proper speed of this promotion as well as the scale of costs and approaches to defraying these costs, while also anticipating use will be expanded over the long term. In addition, with regard to the assessment of nuclear power, which had been seen as a prized energy source due to increasing energy consumption, the exhaustion of fossil fuels and climate change, opinions will largely differ among stakeholders regarding future approaches concerning its use.

(k) Women and Gender: Women's employment opportunities remain limited, a large income disparity by gender remains, and women are the majority of the poor both in developing and developed countries and it continues to be a major issue. In addition, gender equality has not achieved in terms of education and capacity building and, especially, participation in decision making.

(l) Children and Youth Education: The fact that the enrolment rate for primary education, one of the MDG targets, increased significantly shows that MDG targets are attainable where there is a strong political will and funding arrangements are available. On the other hand, however, we need to note that 76 million children do not enjoy primary education. Under the Decade of ESD, there was a rise in the number of countries that had begun to incorporate ESD into their national education policies and curricula especially for primary and secondary education, as well as sustainable development and environmental strategies. Yet there are still many countries where specific ESD policies or strategies are not in place and dissemination of ESD is an issue. On the other hand, actors do exist that fulfill the function of education and raising awareness- in a variety of forms outside formal education, but analysis and assessment of these actors remains inadequate. We must reaffirm the importance of adult and lifelong education, and take comprehensive actions to improve linkages and cooperation among ESD, school education, and social education.

(m) Rights of Indigenous Peoples: The rights of indigenous peoples were greatly furthered at the 1992 United Nations Conference on Environment and Development. This was illustrated, for example, by the fact that the Convention on Biological Diversity clearly specified Indigenous and Local Communities (ILCs). At the UN General Assembly in 2007, the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) was historically adopted, and it clearly stipulated that the inherent fundamental freedom and human rights of indigenous peoples shall be respected on the basis of international law. In Japan, the House of Representatives and House of Councilors in 2008 recognized the Ainu people as an indigenous people in Japan. A report issued in 2011 by the Experts Committee on Approaches to Ainu Policy, which was set up by the Japanese government in 2009, stated, "Future Ainu policy should be developed based on the recognition that the Ainu people are an indigenous people and that the government bears a deep responsibility to promote their culture, and grounded in the Constitution of Japan, the supreme law of the nation, and the meaning of the UN DRIP as a general guideline for policy approaches to indigenous peoples."

(n) Measures against Natural Disasters: The UN International Strategy on Disaster Reduction was established to carry on the activities of the International Decade for Natural Disaster Reduction from the 1990s, while the UN World Conference on Disaster Reduction adopted the Hyogo Framework for Action (HFA) 2005 to 2015 and the Global Platform for Disaster Risk Reduction was set up to effectively and efficiently promote the HFA. This indicates that a framework has been built for international cooperation in the face of natural disasters. On the other hand, as illustrated in the Global Review of Disaster Reduction Initiatives 2011, we have once again recognized that we must build an agile and strong society that can respond to natural disasters in order to cope with emerging vulnerabilities derived from the complexity of technologies and mutual dependence found in today's society, such as the complex disaster of earthquake, tsunami and subsequent nuclear power accident that occurred as a result of the Great East Japan Earthquake.

(o) Funding Sources and Funding Mechanisms: Excluding certain countries in Europe, other countries around the world will likely be unable to achieve the target of ODA totalling 0.7% of GNI by the year 2015. At the Gleneagles Summit, Japan promised to increase its ODA spending between 2005 and 2009 by 10 billion dollars compared to

2004 levels, but its poor economy, stringent budgetary restrictions, large repayments of ODA loans from some debtor countries, and a lack of political will has meant that its current ODA spending has fallen 3.6 billion dollars below the pledged amount.

(p) Employment and Labour: The global financial crisis that begun in 2008 has provided a widespread impact on vulnerable areas such as youth, the elderly, and minority groups, depriving them of many employment opportunities. It is absolutely necessary to create stable, quality jobs to fundamentally improve the global jobs crisis. In June 2009, the International Labor Conference adopted the ["Global Jobs Pact"](#). The deteriorating quality in employment must be revitalized while also seeking the formation of new global governance, amplifying both multilayered and enterprising job policies as well as social safety nets, and surveying the expansion of what is considered ["Decent Work"](#) (the availability of employment in conditions of freedom, equity, security and human dignity).

Furthermore, in addition to the specific issues listed above, existing conventions are not being challenged. In fact, dilemmas found within the agenda itself are also becoming predominant. For example, the bio-fuel promotion policy put forth by Europe and the United States as a greenhouse gas reduction policy triggered an inflow of speculative money, which had lost its bearings following the Lehman Shock, into the futures market. This incited a worldwide price increase for food and as a result placed pressure on the lives of the poor. In order to offer global solutions, Japan has also moved forward with various initiatives. The Japanese government proposed the ["United Nations Decade of Education for Sustainable Development"](#) at Rio+10 in 2002, illustrating the notion of providing security for human beings<sup>4</sup> that it recognized to be necessary during the 1997 Asian Financial Crisis. Japan contributed funding, technologies and human resources for the development of Asian countries.. This resulted in a measure of legitimacy from other countries. On the other hand, because of the recent economic downturn and a lack of political will, Japan has yet to achieve the internationally agreed goal of allocating 0.7% of GNI to ODA spending.

## 1.2

### Emerging issues

#### 1.2.1 Emerging issues of the World

We are under pressure to address emerging issues as well. Particularly important issues include energy, food security (the stable supply of food, the issue of genetically modified food), responses to natural disasters, sustainable urban development, and the advancement of aging societies and depopulation.

(a) Increase in Global Energy Demands: With energy demands rising globally and the progress of climate change due to greenhouse gas emissions, we need to implement a shift in an energy supply system that is overly dependent on fossil fuels.

(b) Water and Food Security<sup>5</sup>:Stable Supply of Water and Food<sup>6</sup>:The increase in drought occurrences around the world is a further indication of the effects of climate change. As speculative money is causing a chain reaction that affects food prices on a worldwide scale, there is growing apprehension conflict occurring between countries over food. Humankind is faced with the issue of ensuring food security throughout the world. Water is an invaluable, fundamental right for the existence of humanity and it is the most basic element for the infrastructure needed for the sustainable development of society. Many countries which are experiencing conflict and destabilization over water should resolve these issues with regional security as their top priority. While areas where food is supplied and where food is consumed undergo globalization and the escalation of food prices by areas plagued by drought have a pervasive effect on the entire globe, not only do water conflicts that arise between areas become an issue, but global security is becoming an issue as well in what is turning into a competitive scramble between countries over food. Water and food security is becoming an even more difficult issue to face as droughts and the degradation of groundwater levels occurs around the world due to excessive water intake caused by climate change, mass consumption, urbanization and population expansion.

(c) Response to the Large Number of Natural Disasters: Not only the Great East Japan Earthquake but a rash of natural disasters are occurring around world. There is apprehension that such devastation is spreading due to the impact of climate change. Developed countries are at the forefront of amassing countermeasures against natural disasters, and it is important to disseminate and share this knowledge with the rest of the world.

(d) Concentration of Populations in Cities and Growing Demands for Urban Infrastructure: At present, urban populations have already risen to over half of the global population and by 2050 this will rise to 70%. Urban areas are consuming 67% of the world's energy and by 2030 this will increase to as high as 74%. In developing and emerging countries, urban construction is progressing at fast pace, producing one megacity after another. However, architectural structures and urban infrastructure being built today will sequester carbon dioxide emissions and energy consumption over the next several decades. A huge amount of urban construction and low carbon demands will drive a green economy forward and lead to the expansion of green jobs.

(e) Furthering the Needs of New, Sustainable Urban Development: Rural populations moving into urban areas and the growth of populations in cities are increasing at a rapid pace. The emission of greenhouse gas is increasing as urban development and economic activities become more widespread. Therefore, we need urban redevelopment and development programs that are more compact and have less energy consumption. In cities, residences, transportation, and energy supplementation are transforming into more sustainable models. There needs to be a global push for sustainable cities to present how urban development can exist in balance with nature.

(f) The Progression of Depopulation and Aging Society: Considering the long-term, aging societies, such as Japan is facing, could gradually become global issues as well. As populations increase, the world will move toward an aging society and we must anticipate new ways to respond. Young people will most likely be the ones to move into cities as described above, so it is conceivable that aging societies will spread in agricultural and mountain regions throughout the world.

(g) Constraints due to the Rapid Deterioration and Depletion of Natural Capital: Humanity is ushering in the depletion and degradation of natural capital in exchange for the rapid accumulation of industrial and financial capital. As a result, the rarity of these forms of capital has flip-flopped comparatively, especially in recent years with developed and emerging 13 countries at the heart of a sharp rise in global consumption, wherein the amount of available natural capital per capita is decreasing while being surpassed by the increasing pace of consumption.

At this current development pattern, we fear that the world population will no longer be able to support itself by the time it reaches 9 billion. Consequently, we face the urgent task of raising collective awareness among all people based on the need that we discover the extent of the constraints we must subject ourselves to due to the depletion and degradation of our natural capital, as well as the nature of the content, speed, and scale of changes we must make to our development pattern.

With international society entering the 21st century in this manner, we need to address prompt resolutions for such deep global issues. We are attempting to resolve these various issues by pushing ["sustainable development"](#) forward, but in order to do so we need to consider how ["development"](#) became ["unsustainable"](#). More specifically, the major premise for measures going forward must answer our own questions in a calm and humble manner to both discover the cause for the rise of ["gover-development"](#) and ["gmal-development"](#) and to formulate appropriate countermeasures. In order to construct a sustainable society, we must be compelled to prepare the world stage to face new emerging issues that have not been foreseen during the Rio Earth Summit.

#### 1.2.1 Issues for a the Developed Country of Japan and the Great East Japan Earthquake

##### Issues for the Developed Country of Japan

Japan is as a forerunner of emerging issues facing such as an aging society and newly emerging problems with the environment and energy, many of which are new issues that other countries have yet to experience. While Japan is working to resolve these issues, it is also under pressure to formulate a long-term vision to reach a future ideal of sustainable development to form a sustainable society.

## The Great East Japan Earthquake

The Great East Japan Earthquake that occurred on March 11, 2011 once again called into question what constitutes a sustainable society. On March 11, 2011, Japan experienced one of the world's worst natural disasters: a 9.0 magnitude earthquake noted as the fourth largest earthquake recorded in the world's history; a 40.5m high tsunami which is the tallest ever recorded in Japanese history. We did not expect such big scale of the tsunami therefore roughly 20,000 people either died or went missing in the wake of the giant wave, extensive environmental and social damage was incurred from the diffusion of nuclear substances in the environment by a nuclear power plant accident, which was later determined to be a level 7 on the International Nuclear Event Scale (INES). Even now, many afflicted people have little choice but to reside in temporary housing and the reconstruction process following the Great East Japan Earthquake is becoming a considerable challenge for the nation. Experiencing the nuclear power accident has led us to question the overconfidence Japanese society had felt toward our mass consumption of energy, our lifestyles, and our technologies.

On the other hand, we must also recognize the fact that, during the Great East Japan Earthquake, the bullet trains performed perfect emergency stops to prevent large accidents, most of the high-rise buildings remained standing, and Japan's earthquake countermeasure not all but many technologies proved effective.

Currently in Japan, people from all over the country are acting warm-heartedly, without looting or rioting, to support the nation in an effort to recover from the earthquake disaster. Amid this, many good practices have emerged thanks to the cooperative efforts of various stakeholders. Local governments and communities, as well as businesses, industries, farmers, labor unions, and cooperatives are making a spirited effort toward reconstruction. NGOs have taken up the role of coordinating by gathering the detailed needs on-site. Youth and children from around the world are working together as volunteers through the NGOs to support reconstruction. Companies and industries are contributing support and making various efforts to restore production activities and the livelihood of their employees as swiftly as possible. Labor unions have been working together on disaster countermeasures, utilizing scale merits to commence rescue and support activities in the disaster area. For example, after the earthquake struck, associations immediately established disaster response headquarters, dispatched advance teams to the disaster areas, collaborated with relevant local associations, secured means of transportation and coordinated local activity centers and shelters. In addition, they administered requests for relief supplies, emergency assistance, and rescue support donations from government bodies, political parties and business federations. Also, a great deal of local governments suffered damage and were unable to offer public services.

However, rehabilitation commenced with the unstinting support offered by several other local governments within Japan. Many local governments are endeavoring to conduct reconstruction with the local government as its nucleus while also performing revisions of their damage reconstruction strategy to plan for safe urban development that will ensure that such casualties and property damage never occurs again. In the reconstruction process, we started a lot of activities for sustainable development.

The Basic Act on Great East Japan Earthquake Reconstruction (Law No. 76, 2011) and the Basic Guidelines for Reconstruction clearly state the participation of women, elderly, children, and people with disabilities in decision-making process as a basic principle for reconstruction. This enables the needs of vulnerable people to be met.

Following the nuclear power accident, Japan is facing a paradigm shift regarding energy. Every single citizen has taken the opportunity to consider anew the importance of the energy problem. Even while opinions are split among stakeholders over whether or not to exit nuclear energy, the general consensus when looking long-term to promote the use of renewable energy with consideration of burden on industries and the people. It should also be noted that Japan could address scarcity of electricity supply in the summer of 2011 by corporate efforts and energy saving actions of citizens. Electricity crisis changed the lifestyles of the people. As addressing the crisis of the disaster and the nuclear power accident, we are taking vital steps for sustainable development as a way to reduce the environmental load by promoting the use of renewable energy and energy conservation.

It appears that these experiences for Japan can contribute strongly to the discussion on sustainable development at Rio +20. Several issues have been brought into sharp relief which may serve as a point of reference for the Rio+20 debate on sustainable development, such as reconstruction in the wake of an unprecedented natural disaster, efforts to build anew where so much had been lost, and handling of radioactive contamination from the nuclear accident.

## 2 Proposal for the Outcome of Rio+20

### 2.1 Expectations of Rio+20

We believe that many concerned stakeholders in Japan wish to take the opportunity at the Rio+20 to revise the approach for sustainable development, such as the necessity of adding a cultural pillar to existing economic, social, and environmental aspects. It is necessary to review our approach in sustainable development as we keep in mind these changing times. It is especially important to be aware of multiple points of view without becoming too wrapped up in any specific set of values as we progress with sustainable development by recognizing the difference in values and worldviews of stakeholders involved in the Rio+20 while formulating an ideal model for a sustainable society that may vary in accordance with different locations. The following points listed are of particular importance for the basic approach Japanese stakeholders have in mind for sustainable development:

- (a) Implement of multi-stakeholder dialogue: Governments should proactively participate in discussions to make the most of this opportunity to work with each stakeholder and give weight to a multi-stakeholder dialogue on both an international and domestic level. The Internet and mailing lists, etc. should be put to practical use in the dialogue in consideration of the silent majority.
- (b) Respect the views of those whose voices are not loudly echoed within society: An institutional framework for sustainable development must be established through peer study with each stakeholder and by attaining the social participation of citizens. In this regard, we must respect the views of stakeholders whose voices are not weighted within society, such as women, children, minorities, individuals with disabilities, and indigenous peoples.
- (c) Gender equality: The realization of social justice, including gender equality, must be reaffirmed as a core principle of a sustainable society. The importance of integrating gender perspectives in sustainable development should be clearly addressed in the outcome document of Rio+20. In this regard, equal participation of women in decision-making is vital for sustainable development, so positive actions should be taken to promote it. Gender equality should be ensured when shifting toward renewable and sustainable natural energy use, and the benefits of sustainable energy use should be guaranteed equally between women and men.
- (d) Global creation that reflects children and youth: The most irreplaceable and precious aspiration for the human race is that we create a peaceful global society where we live together by resolving our issues and sharing a declaration that moves toward mutual knowledge and values. It is future generations who must implement the declarations and promises we make. We need to reflect the views of children and youth in a more positive way and be aware that the issues we are addressing will have a deep impact on the youth of today and the generations that follow.
- (e) Respect the values and perspectives of indigenous peoples: As we consider development and the future of the environment, we need to place greater importance than we have in the past on the values held by indigenous peoples, such as the Ainu. Those involved in sustainable development must acknowledge that this grim disparity of a priori

(bias) exists in people's world views and values. In particular, it is vital that we maintain a sense of fairness and balance so that we will not be over-reliant on the view that sets modern science and market economy above all else. In the time between the UNCED in 1992 and today's Rio+20, the United Nations adopted the Declaration on the Rights of Indigenous Peoples in 2007 to strengthen the respect to traditional knowledge and customs<sup>6</sup>. The countries of the world must respect this declaration of the rights of indigenous peoples in this context.

(f) Support the empowerment of local government: There is a necessity to encourage international society to support local governments (institutional back-up) as a way to recognize that the single most vital role for the government is to aspire to shape resilient, low-carbon cities, provide for the conservation of biodiversity, and sustainably develop agricultural and mountain regions for the betterment of society. Stakeholders form accords as they develop a full understanding of overwhelming environmental problems. Advance efforts made by cities and governments push for international agreements as they heighten awareness about green economies and low-carbon societies. In order for the advanced practices of local government to take part internationally, we hope for the foundation of a system that can draw in international support for local government through international society's financial assistance for developing countries.

(g) Reaffirm the significance of a strong international convention to fully realize the proper care and value of forests: 1.6 billion people, nearly a quarter of the world's population, rely on forests. Just as in the Ainu proverb that "nothing falls from heaven that does not have its place," the Ainu people of Japan embrace the idea of showing gratitude and respect toward the intrinsic value of all things for their physicality and attributes, including animals, plants and objects. Forests for life, livelihoods, work, and a secure income. With diverse functionality, forests play a key role in handling complex and interlinked global issues in regards to economic and social development, poverty reduction, environmental sustainability, food security and agriculture, energy, water, adaption and mitigation to climate change, the combat against desertification and soil degradation, biodiversity conservation, river basin conservation, and disaster mitigation. In light of this, we must strengthen systems that handle problems affecting forests globally while coordinating with international authorities and a process involving the three Rio Conventions. We must take advantage of the forests' ability to absorb and accumulate carbon dioxide by promoting sustainable operations, adequate forest management and measures against illegal logging, and measures against deforestation and forest degradation in developing countries. Furthermore, there needs to be systems and mechanisms to improve each individual's recognition that forest problems differ in each country and that we require a mutually coordinated effort to address such problems.

(h) Ensure equal responsibilities and status of all partners: As the world grows ever more diverse, we cannot solve environmental problems if we consider them based on a dichotomy such as north-south problems or between developed and developing countries. If we insist on our opinions from the viewpoint of dichotomy, it will generate alienation with differing viewpoints at a personal level and we will be beleaguered by opposition. To achieve sustainable development, it is important that for stakeholders to understand have an in-depth understanding and care respect each other. It is also needed required to establish rules and environments in which sincere and faithful attitudes are valued.

(i) Establish the resolution of environmental problems as a top priority political issue: At the Rio+20, we need to summarize our progress in sustainable development made in Rio and, subsequently, Johannesburg as well. We must confirm what policies exist for the world and countries, and the status of their implementation. We must also confirm that heads of state around the globe are making the resolution of environmental problems a top priority political issue.

(j) Reaffirm the role of education: We must set aside the sectionalism among departments and each stakeholder to increase synergies in different areas by restructuring the organizational, institutional, and financial framework that moves across various plans and practices related to Capacity Building for Sustainable Development. (For example, ESD, Education for All (EFA), the MDGs, Communication, Education, and Public Awareness (CEPA) activities in various environmental conventions as well as adult education and lifelong learning.) To make these actions more effective, we must reaffirm the importance of the role education will play towards sustainable development and strengthen synergies of these actions.

(k) Ensure food security through sustainable agriculture: It is important to establish a food manufacturing system that is focused on biodiversity as well as traditional agriculture and 18 fishing methods that relate to the climates of countries around the world for the sake of food security through sustainable agriculture.

(l) Governance and management of natural capital: The inclusion of the governance and management of natural capital in economic propositions is indispensable for the sake of sustainable development. Effective governance must not only be done through government authority but also through the participation and cooperation from a wide spectrum of multi-tiered stakeholders. The people who are the most cooperative and effective in managing natural capital are the ones who are directly affected by the blessings and disasters that come along with the unique qualities and diverse land and climate of their local environment. Therefore, it is vital that we shift policy maneuvers so that communities have a form of autonomy to help oversee national land.

Many stakeholders in Japan think we should re-commit to past declarations in the Rio+20. For example, the Johannesburg Summit contained the assertion that, "We resolve to swiftly increase access to the basic requirements of clean water, sanitation, adequate housing, energy, healthcare, food security, and the conservation of biodiversity. At the same time, all of us shall work together to consider how to acquire access to financial resources, net profit from market liberalization, ensure capacity building, utilize new technologies to bring about development, and secure methods of technical transfer, human resource development, education, and training for the sake of doing away with underdevelopment for good." The topic of human resource development in particular upheld the proposal from Japan for the United Nations Decade of Education for Sustainable Development that commenced in 2005. Japanese stakeholders offered a proposal to reaffirm the importance of addressing water issues globally, the direction of food rights for independent countries, including developing countries, as extended by the United Nations General Assembly's Resolution on the

Right to Food, the FAO World Food Summit, and the World Food Security Committee, and the necessity of education, human resource development, and technology transfers.

The nuclear power accident that occurred in Japan is a profound problem that has created a significant catalyst to consider a conversion into a society of sustainable energy. Even within Japan, the topic of denuclearization is subject to a wide range of opinions, such as those who wish to exit nuclear power as soon as possible and those who see no other alternative in our current condition but to be dependent on nuclear power. It is necessary to prepare various data in order for the entire world to reassess all of the risks involved in the development and use of nuclear power. The standards of fairness in competition with other power sources must be brought to light, as well. There is also the view that we should prudently consider an option of promoting locally distributed energy-usage systems, which would entail restructuring of the energy market, rulemaking for structured coalitions, and a review of relevant legal systems. There needs to be a rational and multilateral discussion on the existence of an energy shift, which ensures transparency and the sufficient disclosure of information that is based on fact and logic. Each country should create a mid- to long-term vision that, at its heart, would further the pursuit to streamline renewable energy, energy conservation, and thermal power.

Safety should be heightened at nuclear power plants throughout the world by sharing information globally following reviews of safety standards based on a thorough determination of the cause of Japan's nuclear power accident. We obtained (or may one day learned) expertise and experience about the issues through nuclear power plant countermeasures, such as health care and decontamination, as well as short- and long-term measures following the core meltdown and the radiation leaks that occurred simultaneously. It is notable that we can improve nuclear power management worldwide using the knowledge obtained as assets to be shared globally. Japan wishes to be strongly involved in participating in joint international study initiatives and networks.

It has been pointed out how important it is to tie the Rio+20 and the post-2015 targets of MDGs together. Looking back on the past 20 years, it is notable how the development objectives of the MDGs reflect an adequate grasp of the progress made and the issues that remain. It is also notable how this, along with action plans and

necessary long-term visions, can work as an appropriate marker of progress while reviewing the post-2015 target of the MDGs.

It is important to have a renewed commitment for full collaboration with all affiliated countries aimed at accomplishing the goals of the three Rio Conventions crafted at the Earth Summit (the Convention on Biological Diversity, the United Nations Framework Convention on Climate Change, and the International Convention to Combat Desertification in Those Countries Experiencing Serious Drought and/or Desertification Particularly in Africa). It is agreed upon that the Convention on Biological Diversity, in particular, must reach the Aichi Biodiversity Targets within twenty years, which shall be the year 2020. In addition, the United Nations General Assembly resolved to achieve the Aichi Biodiversity Targets and marked the remaining ten years (2011-2020) as the U N Decade on Biodiversity. It is important that the magnitude of this be noted once more during discussions at the Rio+20.

## 2.2 Concrete Proposal for Rio+20

Many Japanese stakeholders consider that a common understanding of sustainable development should be included anew in the Rio+20 outcome document, and its essence is stated in the key message at the top of this document. Now, we are required to have a long-term vision of sustainable development and to take concrete actions in accordance with that vision. The proposals from Japanese stakeholders are as follows:

a) Proposal for energy: Energy policies are very important for stable economic growth both domestic and overseas, as well as in solving global environmental problems such as climate change. However, it is essential to implement urgent and ambitious measures both for the current and future generations, because it takes quite a long period of time before the effect of implementation can be felt.<sup>7</sup> It is expected that each country will set a long-term renewable energy target (e.g. by 2030), and start initiatives and make recommendations to introduce relevant policies and measures to reach their target. Regarding energy supplies, it is necessary to reconsider the total balance of supply and demand, shifting from a policy debate with a supply-side bias to the activation of a policy debate on energy saving at the demand-side (e.g. households and small businesses). In addition, for developing countries where future demand is expected to increase, building a platform for “thinking together” is needed, by providing a mechanism for efficient transfer of technologies and know-how for renewable energy.

b) Proposal for poverty measures: Realize the security of human rights and empowerment of the poor and vulnerable group of people. In addition, it is necessary to ensure the participation of the citizens of developing countries, especially the poorest, in policy formation, along with the formation of public opinion that supports the idea. By directly approaching poor and vulnerable people, we will form public opinion that supports the implementation of policy that reflects the needs of citizens in developing countries. We should view green economy as “a system that exists by capturing social issues such as poverty alleviation and human rights protection” and build a process to achieve coexistence, symbiosis, and social justice.

c) Proposal for water and sanitation: The water problem is rooted in various factors specific in each region, and to solve this problem, an approach must be selected that is not universal and rational, but delicate and sustainable, appreciating the culture of a particular area. In particular, there is high expectation for local governments in Japan to contribute to developing countries. Difficult problems that developing countries face are the improvement of water and sewage infrastructure, and its operation and maintenance management. In many countries, the central or local government is responsible for the improvement of water infrastructure, its operation and maintenance management, and struggle with the collection of water rates and water leakage problems. The resolution of these water problems requires a maintenance management for the water system as a whole, rather than the latest technologies. Japanese local governments are in the perfect position to respond to this request due to their long term expertise experience in the improvement of water infrastructure and its maintenance and operation. Local government in Japan began the way to the new business of the improvement of water infrastructure and its maintenance and operation in developing countries. Long lasting international contribution is neither mere volunteering nor profit-seeking principle. It is realized over a business with a reasonable profit. Japanese local governments will be the first in the world to carry out this important mission in developing countries, which will have public spirit and be a long run water business.

d) Proposal for air quality conservation/climate change: Promise to reach an agreement of a legally binding framework toward the prevention of climate change; after not having realized the agreement in Copenhagen, progress is currently being made on new framework for 2013 and beyond. In the UNFCCC process, we should promise to reach an agreement for fair, ambitious and binding framework, and support the acceleration of UNFCCC negotiation. The sustainability of life on earth is unable to be ensured unless international effort proceeds based on the latest scientific findings and the establishment of an international agreement to climate change measures. Specifically, whether it is developed or developing country, the agreement needs to be reached on the enforcement and a legally binding framework should be adopted as soon as possible for the following points: the responsibility of each country and its significant reduction dependent on each national capacity, financial support, adaptation measures, technology transfer, capacity-building, measures against deforestation and forest degradation for vulnerable developing countries. Sufficient consideration should take place for resilience against serious damages, which could be caused by the extreme climate events associated with climate change that is anticipated to become more serious in the future. In order to achieve this, the Institutional Framework for Sustainable Development (IFSD), which encourages the construction of these societies, is essential. Disclosure of the weather data of each country, which is in progress by the WMO, is also hoped to contribute to the improvement of the predictability of disasters.

e) Proposal for the conservation of biodiversity/environment conservation farming and fishery: Towards the achievement of Aichi Biodiversity Targets, the UN Decade on Biodiversity will be actively promoted with the cooperation of the United Nations, international governments and relevant stakeholders. In addition, policy guidance should be made to demonstrate again the characteristic of living with nature traditionally found in the primary industry sector in Japan (environmental conservation agriculture, forestry and fishery); and a new mechanism should be created for agriculturalists, forestry and fishermen who make an effort to follow this direction, as well as their areas, are rewarded through a direct payment system and support from urban residents.

f) Proposal for the promotion of agriculture<sup>8</sup>, forestry, and fishery village areas: To promote agriculture forestry, and fishery villages that are stagnating economically, policies that attract human and financial support from urban residents should be developed, creating a revival strategy based on local initiatives using regional natural resources and learning from successful good practices inside and outside the country. The most typical green economy gives meticulous care to the original rich natural resources of the agriculture, forestry and fishery villages using labor-intensive methods, makes production activities economically sustainable, and generates 22 employment. Now, as the depletion of stock resources is becoming a reality, a system design that fundamentally changes the preceded “development strategy” is required.

g) Proposal for strengthening nuclear power safety: Japan aims to share the issues revealed by the accident of the nuclear power plant in Japan with international community as much as possible and prevent further accidents by exchanging information on nuclear power accidents, the risk of radioactive contamination, emergency measures, and permanent measures on a global scale. Simultaneously, there is a need for contributing to the reinforcement of the safety of nuclear power in every country, carrying out the improvement of international cooperation system in case an accident occurs. It is necessary to review and revise the international safety standard based on international scientific research on the adverse effects of radioactivity on human bodies, animals and plants as well as monitoring functions.

h) Proposal for achieving gender equality and participation of women: Participation of women in decision-making is essential to respond to the diverse needs. In this context, it is important to provide concrete measures to increase in the participation of women in decision-making, such as, by setting numerical targets with time frame, incentives, quota systems and cross-compliance. Providing opportunities for capacity building of women is also important to achieve gender equality.

i) Proposal for indigenous peoples: The advancement of the rights of indigenous peoples should be the interest of Rio+20. The rights that must be assured include preservation and promotion of the Ainu people including the Ainu language, Ainu culture and religious rights, land right and rights to resources, the rights to education and information, economic and social rights, rights to participation, and the rights to self-determination. These efforts are the responsibility of the Japanese government and these

views must be reconfirmed at Rio+20.

j) Proposal for children and youth: For the implementation of Rio Declaration, it is essential to realize a global society where everyone is able to receive education as a fundamental human right.

Aim to achieve the goal through educational activities for people in every life stage, such as school education, social education, and lifelong learning. It is necessary to promote the above mentioned education in formal, non-formal and informal education through collaborative partnerships between public agencies and NGOs. It is also necessary to significantly increase opportunities for children and youth to express their views and findings in national and local policy making as well as at international conferences. An example of how a child can learn ESD is that recognizing the linkage between local and global issues, a child will carry out such actions that embody the idea of thinking globally and acting locally. Provision of sufficient funds to education sector is also quite important in development countries.

k) Proposal for local governments: It has been revealed that active measures by local governments to reduce the environmental impact in cities where population and industries 23 concentrate have brought significant effects; therefore, local governments have an important role to play. However, the need for local governments<sup>24</sup> to address global environmental issues is not yet fully understood. It is important that the international societies clearly requests local governments, such as large cities, to work towards resolving global environmental issues on the basis of outcome document emerging from the Rio+20, in order to encourage more local governments to participate actively.

l) Proposal on employment and Trade unions: Establishing the limit of social protection worldwide. It is necessary to clarify the solution to challenges such as abolishing child labor, securing gender equality in the employment opportunities, securing minimum wages, and the minimum standard in the creation of green job, particularly in developing countries. <sup>25</sup>Green Job Strategy<sup>26</sup> is a long-term strategy that aims to increase green and decent jobs by at least 50% by 2015, to progress both countermeasures against climate change issues and the structural change in employment and working conditions simultaneously, and link these to realize a low-carbon society. This strategy should be further promoted and developed, and an international agreement is expected to be formed that shares its challenges and realization. Implementation of education and training as well as assistance in housing and living condition for workers, and maintaining and generating <sup>27</sup>Decent,<sup>28</sup> <sup>29</sup>green<sup>30</sup> and <sup>31</sup>sustainable<sup>32</sup> employment, and mediating to find reemployment opportunities are needed. Through these employment measures and an official multi-stakeholder meeting, <sup>33</sup>Just Transition<sup>34</sup> that promotes climate change measures and employment measure simultaneously is needed, and it is expected that an international agreement regarding the sharing and realization of the challenge be formed. It is necessary to set and implement the minimum standards of green jobs to solve the problems of child labor and, gender equity, and to guarantee minimum wages, especially in developing countries.

m) Proposal for funding sources and mechanism: In the situation where financial deterioration is globally worsening, a mechanism for more effective use of private funds should be considered through public-private partnership projects. Also, further promotion of SRI at financial institutions is required for a smooth supply of private funds. As a motivation for this, the progress of the <sup>35</sup>greening of finance<sup>36</sup> is desired, under the United Nations Environment Program Finance Initiative (UNEP FI) rooted in the principles established or under development, and with penetration of the decision making process based on ESG (environment, society, governance) issues under the financial institutions including insurance. Also, a solid framework for more specific monitoring should be created in relation to the target of contributing 0.7% of GNI to the ODA to secure funding to achieve the MDGs. For example, a measure to be considered includes one by which each country is obliged to create a roadmap for achieving its target. In addition, some stakeholders in Japan consider that a <sup>37</sup>next generation tax<sup>38</sup> and <sup>39</sup>international solidarity levy<sup>40</sup> should be implemented as a budgeted measure that enables a variety of projects related to sustainable development. However, while tax can be a powerful tool for securing financial resources, concrete consideration has to be carried out upon the understanding and agreement of citizens of every level, clarifying the purpose and its use, and through a wide range of discussions.

n) Proposal for the improvement of support and development effectiveness: When conducting development, effort should be made to achieve the improvement of the development impact and the effectiveness of aid (as well as the realization of social justice). Government of each country will follow Paris Declaration, Accra Agenda for Action, and in addition of which they should also comply with the agreement that will be established at the High-Level Forum in Busan in December 2011. NGO should make the Istanbul principle (Open Forum CSO Development Effectiveness), which is for enhancing the impact of development, as their standard rules, and strengthen an effort to improve accountability in each group. Moreover, it is also important to involve new actors such as the emerging donors and private sector in discussions to improve the development impact and effectiveness of aid.

o) Proposal for strengthening the environmentally sound technology transfer, cooperation and the ability to handle: When considering resource constraints and environmental constraints, it is desirable that various social problems such as poverty and natural disasters faced by developing countries will be overcome, as in the future the economy of many developing countries will grow on development trajectories led by China. On the other hand, earth resource constraints and energy supply constraints will prevent such development. It is the technology to achieve the maximum wealth and social infrastructure with minimum resource consumption that will solve this dilemma. Japanese companies and industries have gained a wide range of technologies such as resources-saving technologies, energy-saving technologies, environmental protection technologies, and also the fundamental technologies for recycling economy through various recycling technologies, in the process of development in the past, overcoming a number of social and environmental constraints including the oil crisis, the recession caused by strong yen, and pollution problems. It is important to improve the sustainability of the earth as a whole, implementing the earth<sup>41</sup>s resources, energy saving and environmental protection through the diffusion of such technologies to the world and used for economic development of developing countries. Japanese environmentally sound technologies, which are at the global high level, should be transferred while maintaining a win-win relationship with developing countries.<sup>9</sup> For a smooth implementation of this transfer, security of intellectual property is crucial.

p) Proposal for the promotion of education, public awareness and training: Along with the strong promotion of the Decade of ESD (Education for Sustainable Development), it is necessary to create a mechanism that continue to promote ESD worldwide after the end of the Decade of ESD in 2014. Specifically, it is necessary to formulate the International Action Plan and funding arrangements for implementation, create a mechanism to share information and experiences regarding ESD, undertake capacity building activities for local residents with ownership awareness for their local community, train and support training for local coordinators who promote various cooperation/collaboration among stakeholders working on to building a sustainable society in the area. Such activities need to be carried out through all levels of education and training including school education and social education. Action plans should include <sup>42</sup>green economy education program<sup>43</sup> and <sup>44</sup>lifelong learning program<sup>45</sup> for sustainable development<sup>46</sup>, capacity building activities to ensure implementation of the UN Declaration on Indigenous Peoples adopted at the UN General Assembly in 2007. Actions should be designed to enhance synergy effect with communication, education, public awareness (CEPA) in the UN Framework Convention on Climate Change, the Convention on Biological Diversity, the Convention to Combat Desertification.

q) Proposal for statistical data for decision-making and information collection: The information needed to enhance the participation of women, youth and other vulnerable groups in decision-making for sustainable development is insufficient. This also hampers identifying the issues underlying sustainable development. So, it is important to collect data that is disaggregated by gender, generation, and other important criteria, and provide it in an accessible manner internationally through the Internet and other media.

r) Proposal to establish a decentralized society: The need for a decentralized and resilient society has been suggested to deal with natural disaster and to adapt to climate change. In this process, to pursue a green economy plays an important role, and for the promotion of building such society, institutional framework for sustainable development is essential. Japanese stakeholders suggested that the concept of these societies should be described anew in the Declaration.

s) Proposal for conservation of natural resources and sustainable usage: For natural capital with a characteristic of shared material to be used sustainably beyond generations, NGOs suggested to establish the <sup>47</sup>User Recovery Principle<sup>48</sup>, which is centered around the idea that <sup>49</sup>users of natural capital are responsible for restoring

its original state and its cost in cases where it was used beyond the sustainable pace<sup>1016</sup>, and the involved countries should seek an agreement on the direction of institutionalizing it.

t) Proposal on forest: Forest has the effect of carbon dioxide absorption and storage, and this function should be utilized. Also, appropriate forest management and sustainable management should be promoted. Conduct continuous discussion towards a framework with robust legal binding force that leads to the recognition of the importance of forests and a realization of 26 appropriate forest management. In addition, constructing a network and platform at the international citizen level will promote the exchange of human and information, improve the awareness of issues with forests, and generate a need to change behaviors.

## 2.3 Suggestions on the United Nations' existing proposals

With regard to the green economy road map, it is important that the sustainable use of natural resources and the realization of social justice are shared in the concept of the premise of a green economy.

As there are a variety of existing objectives and goals at the UN level, it is necessary to ensure the consistency of them. Considering the indicators to show <sup>1017</sup>development, we aim to establish versatile indicators that could become the foundation of the effort by the international community, based on the accumulation from various attempts for sustainability indicators and environment assessment methods. Fundamentally, further consideration among the international community will be encouraged, aggregating the green economy indicators being examined by Satellite System for

Integrated Environmental and Economic Accounting (SEEA), OECD and UNEP. As part of such framework for sustainability indicators, we will introduce the concept of regeneration speed and incorporate it as part of the evaluation method of natural capital of the indicators discussed here, in addition to the amount of natural capital stock and resource productivity.

It would be meaningless to establish the indicators unless every individual becomes aware of sustainability. For this purpose, the role of ESD is important. Along with an easy to understand presentation, it is necessary to recognize the limitation of numerical targets.

## 2.4

### Suggestion on the ways to close the implementation gap

Rights-based approach for poverty alleviation: In reference to Agenda 21 Action Plan and the MDGs, the progress of poverty issues has been particularly delayed. It should be understood that it is not just a problem of low income, but a problem of deprivation of social and political rights, and all the stakeholders need to play a role in guaranteeing the rights of vulnerable groups of people. Namely, further focus on the rights-based approach for poverty alleviation is crucial. Rights in this context include the rights of indigenous peoples, their own original rights stipulated in <sup>1018</sup>the United Nations Declaration on the Rights of Indigenous Peoples<sup>1019</sup>, and the fulfillment of the rights must be promoted.

Promotion of civil participation: In order to fill the gap, not only the government effort but also civil participation is needed. The private sector should be recognized as an important actor that provides solutions. As the negotiation process between countries have come close to the limit, Japanese stakeholders view that the role of the private sector in the process should be clarified upon the understanding of the importance of the private sector.

Promotion of the participation of local governments: Whilst local governments possess great potential with regard to the promotion of low-carbon cities and green economy, the understanding and policy making ability between developed and developing countries is not sufficient. In calling to local government for participation in the construction of low-carbon cities from international community, we will be able to promote it and activate the green economy. Effective participation in the construction of cities by local governments can enhance the ability to provide basic public services for the urban poor in developing countries and contribute to the improvement of their living condition. For this policy support and human resources development, cooperation between local governments is most effective. International organizations should develop programs for international cooperation between cities and support them.

Ensuring financial discipline: Fiscal deficits in both developed and developing countries have been increasing year by year, and in the present condition the financial gap has been filled by issuing deficit-covering national bonds. As imposing a financial burden to the next generation will lead to injustice between generations, it is necessary to ensure financial discipline that includes taxation as a policy to fill the gap. For example, the idea of utilizing tax to secure funding for the next generation has been shown.

Voluntary approach: Japanese companies as well as Japanese industry have had the principle of <sup>1020</sup>good cooperate citizen<sup>1021</sup> and implemented the environmental voluntary action plan with the mutual understanding and cooperation with the government administration and stakeholders from different fields, recognizing that effort towards environmental issues is an essential requirement for one's own presence and activities. As the country's unique initiatives, so far Japan has accumulated significant achievement in waste management, creating a recycling-oriented society, and climate change measures.

Incentives: In planning for sustainable development, there are some opinions that consider not only regulatory approaches but also an approach that encourages effort, such as putting a price on carbon, is also important. A typical example of this is the introduction of an economic approach that utilizes market mechanisms. However, there are also views that in Japan with superior environmentally sound technologies, this approach does not work, and it might make a negative contribution to solving global problems due, for example, to a loss of financial resources caused by further development of the latest technologies. In the introduction of the economic approach, we should consider its purpose to be fulfilled and the way we take the burden, and necessarily gain the understanding and agreement of citizens of every level.

It is also important to take an approach that encourages efforts. For example, Japanese stakeholders proposed the following: low-carbon society priority measures for research development for building a recycling society, a review of the regulation of used products to achieve a recycling society, donations that will be implemented to attain the sustainable development of society, activities for social contributions, and priority measures for investment in taxation. 28

## 2.5 Suggestion on specific cooperation mechanism, partnership arrangement, and implementation tools

Financial scheme for the resolution of water issues: In order to solve the problem of the water sector, it is necessary to establish a financial scheme that supports international contributions from private companies in the water sector and promotes the management of water and sewerage services in cooperation with private companies and local governments. Continuous human resources and technological support for the field of operation and management, promotion of small-scale projects such as sector loan projects, and flexible and enterprising suggestions with political initiatives, which are beyond the sector borderlines, are required. In addition, as the experiences of other countries show, problems have occurred because of the privatization of water services, and thus, securing water should be considered a fundamental human right.

The launch of dialogue mechanisms and organizations for promoting the UN Decade on Biodiversity and resolving the issues of biodiversity: To achieve the <sup>1022</sup>Aichi Biodiversity Targets<sup>1023</sup>, it is necessary to create a mechanism to strengthen dialogue between the sectors, which has not been sufficient so far. Solutions to the challenges related to the vertically divided administration in each country are needed. Each country should investigate the root causes of biodiversity loss, make efforts to solve them, and should have organizations that hold a clear mission to reflect the outcome in policies.

Introduction of a mechanism for promoting responsible voluntary behaviors of consumers: For the resolution of global issues, the role of consumers is important and it is necessary to promote civil education for consumers to encourage their responsible and voluntary behaviors. Furthermore, it is vital to raise each other's awareness by environment communication represented under the label of the environment. In order to make consumers interested and influence their daily choice of goods and services, the development of environmental labels, promotion of environment communication and the implementation of environmental education are needed.

Promotion of cooperation between programs for youth: For the development of children and youth, a collaborative relationship among youth programs currently promoted by governments, companies or schools and the programs voluntarily run by youth should be established. Specifically, holding a large-scale international conference dealing with comprehensive information and the internet database covering all the programs for youth is vital. While the United Nations takes a lead, governments and global companies will be expected to contribute to provide the necessary resources for these as their social responsibility.

Regional centres of expertise on ESD (RCEs): For sustainable development, it is important to have human resources development utilizing various types of educational opportunities such as school education, social education, and corporate training at the local community level. In order to achieve this, mechanisms by which a variety of stakeholders in local communities are able to have more opportunities for collaboration are needed. Such mechanisms will include ones for identification and training of local ESD coordinators, and local knowledge base (RCEs) to promote ESD.

Review of the WSSD type 2 partnerships: Requesting a review and report regarding the result and progress of the Type 2 partnership launched at WSSD, as well as considering the role that has been played by the partnership in sustainable development and its future situation, is necessary.

## 2.6

Roles of stakeholders in the promotion of sustainable development (including greening the economy)

Nine major groups were recognized at the Earth Summit in 1992, but its review is a major premise. For example, the groups that play a significant role in sustainable development such as consumers, cooperatives, and education sector should be included. On that basis, it is important that each stakeholder confirms the following roles.

Roles of women: Establish women as active promoters of green economy and promote gender equality through a green economy.

Role of children and youth: The realization of a sustainable society is an important issue with which the future generations are the concerned party, and therefore, it is essential to have their understanding, cooperation and involvement. In addition to the existing initiatives such as ESD, the capacity building activities of children and youth should be undertaken through all possible means of education/training. The practices of children and youth for their society should be strengthened and we should create a world where the voice of children and youth are better reflected in their societies. To achieve this, support from not only children and youth groups but all the stakeholders is needed.

Role of NGOs: The characteristics of NGOs are to act flexibly and sensitively in a diverse society. For example, in the recovery from the earthquake, NGOs in the affected areas as disaster volunteers made huge contributions in the area where the government did not reach. NGOs also carry out specialized activities for policy recommendation to attempt the economic transformation of existing social system. These NGOs play an important role in policy formation. NGOs play a surveillance role against the actions of government administration and companies that bring the voice of citizens to the decision-making authority (policy recommendations). Moreover, NGOs have a function as a flexible platform for individuals and various stakeholders to form partnerships and for citizens to start voluntary participation in activities.

Role of local governments: Local governments have the capacity to advance low-carbon and facilitate a green economy using their authority in the field of urban development, transportation, water and sewage services, waste disposal, education, conservation and utilization of natural resources. Local governments are able to facilitate low-carbon business as a leader in public facilities construction, infrastructure maintenance and public transport management, which could be a major project. They can also promote the improvement of energy-saving functions in buildings in 30 the entire local community, including the private sector and the restriction of GHG emission from economic and industrial activities, with a system that uses a regulatory authority and market mechanisms. In addition, as the government closest to local businesses and consumers, local governments can provide detailed guidance and advice on energy consumption, and are capable of facilitating energy measures for the demand-side thoroughly.

Role of trade union: Green job initiative, which was proposed by the ILO in June 2007 with a response to climate change, sustainable society and good quality job creation as its aim, was introduced in the joint report by ITUC, ILO, UNEP and IOE called "Green jobs" in which it is anticipated to create 20 million new jobs in renewable energy sector by 2030. In order to implement

"Just Transition" that creates "Decent Work" confirmed in the Cancun Agreement, the Japanese Trade Union Confederation (RENGO), the national center of the trade union, along with ITUC of which the RENGO is a member, should work in cooperation with civil society to encourage democratic social dialogues that propose the way we should deal with the elements which may negatively influence issues such as employment, gender, wages, working conditions, Occupational safety and Health and conduct a follow-up. In view of these needs, the Japanese Trade Union Confederation confirmed at the 59th Central Committee (December 2010) "Toward a secure society build around work as its core theme" that showed a image of society and vision to be pursued. Along with the necessity of the environmental conservation of the earth and the "creation of green jobs," which are the prerequisite for sustainability, "Decent Work," "just distribution of resources," and "detente and achievement of peace between countries," fulfilling the core labor standards are indicated as neckwear in any country. In addition, in August 2011, "Guidelines on Responsible Investment of

Worker's Capital" was adopted and workers (union members) were requested that they act to contribute to the social formation of a fair and sustainable society, by implementing a responsible investment that encourages socially responsible cooperative action and financial transactions with the contributed funds of workers or funds that workers contributed to.

Role of cooperatives: Cooperatives are autonomous organizations that sign up voluntarily to fulfill common economic, social and cultural needs and desires through a business body that is member-funded, co-owned and democratically controlled. Cooperatives have a function that stabilize life and activate communities, and by being rooted in society and encouraging mutual assistance, they play a role in encouraging a sustainable society.

Role of companies and industries: Japanese corporations and industry consider the role of Japanese industry should be to apply Japanese superior technologies to the economic development of developing countries and support sustainable development with a minimum consumption of resources and environmental impact. In addition, as the procurement power of the world, greening the supply chain (such as the promotion of environmentally friendly procurement and production) will be advanced actively. In other words, "green purchasing," which is an environmentally sound procurement of materials, including carbon footprint and ecological footprint can be promoted.

Role of scientific technology communities: In the process of each stakeholder's participation in sustainable development, it is important that each of them receives correct information. The scientists are required to play the role that conducts monitoring on the current environmental situation, predicting the future based on the monitoring data, and presenting measures based on the prediction. It is also the role of scientists that they explain such information to the public in an easy to understand manner. Japan in particular is able to contribute to the development of a circumstance for developing countries to work voluntarily on sustainable development, by providing basic scientific data on global environmental issues such as geographic information, greenhouse gas effect, and the situation of biodiversity.

Role of educators: For human resources development, the role of educators is extremely important. Higher education institutions such as universities are required to promote ESD for students who are expected to compose of the critical mass of the future society by reorienting their educational curricula. They are also requested to train teachers who understand ESD, and as experts provide advice and other support for local community activities to build a sustainable society. Regarding primary and secondary education, the perspectives of the ESD should be integrated into all the curricula from kindergartens to high schools. It is also necessary to strengthen communication and collaboration among different grades and different levels of schools, and to look for collaboration with local stakeholders. Furthermore, not only teachers but also curators at museums, libraries and town halls as well as interpreters at natural parks are expected to play an active role in promoting ESD in local communities.

Role of the media: In promoting sustainable development, it is important to encourage the reform awareness of citizens and companies on which the media has the biggest influence. Defining the media as an important stakeholder and clarifying its role is crucial. In addition, not only the one-way communication as was in the previous model, but mutual communication such as social media that promotes a participatory society is important.

Role of individuals: The role of individuals is also important. Every organization in the world is formed by individuals and often an individual belongs to multiple major groups. Individuals are required to have awareness as a consumer in compliance with purchasing for a sustainable green economy, choice of time, and choice of policies. Although individuals have certain roles at work, in private and in community, the key to all the changes is the individual's action based on firm awareness that they as an individual have the final responsibility.

## 2.7

### Shifting lifestyle to achieve sustainable development

Traditionally Japanese people have been committed to the efficient use of resources, following the idea of *mottainai*, which is roughly equivalent to the English expression, "What a waste!"

To overcome the power crisis in Japan after the earthquake, great cooperation has come from companies that have made energy and peak power saving efforts, in addition to coping through a shift in lifestyle. The lifestyle changes like Japan experienced through cutting lights and actions such as changing clothes to better adapt to weather conditions are important elements in achieving sustainable development.

There must be a catalyst that encourages us to change our lifestyles. For example, the development of environmental initiatives locally and nationally that encourage changes in household and individual lifestyles to save resources, save energy, and implement low-carbon models is being considered (e.g. improved eco-point system, introducing and popularizing an eco-community currency, labeling of agricultural/forestry/fishery products and household appliances, the idea of local production for local consumption, developing road infrastructure for the efficient use of vehicles, compiling and sharing of all relevant road transport statistic data for this purpose, promoting public transport usage, and maintaining a transportation and mobility environment that minimizes social costs).

In the transformation of lifestyle, the role education plays is also important. It is desirable to strengthen educational activities currently promoted under the Decade of ESD, such as school education, social education, training in business companies and institutions, education for citizens, regional centres of expertise on ESD (RCEs), activities of ESD or ESS (education for sustainable society) in each local society.

If the significance of a green economy becomes clear to individuals, it will lead to actions. With the awareness that the final responsibility of sustainable development lies in individuals, it is important to link this to a life style change.

## 3. Opinions on Specific Themes

### 3.1

#### Proposals on the Green Economy in the Context of Sustainable Development and Eradication of Poverty

##### 3.1.1 Priority Areas and Procedures for Greening of the Economy

Japanese stakeholders recognize the green economy as important in moving forward with sustainable development. The following reasons were cited for the necessity of discussing the green economy:

- As economic activities underlie environmental problems, it is necessary to discuss fundamental problems;
- Biodiversity and natural capital that support economic activities are significantly deteriorating at present. We need an economic mechanism that reflects the cost of the deterioration of natural capital and risk to people, including future generations; and
- Under constraints on resources and climate change, we need an economy that is well aware of these constraints. We regard a low carbon strategy through the development of technologies for efficient utilization of resources and green innovation in infrastructures, including roads and buildings, as an area we should address on a priority basis. It is also essential to proceed with efforts in areas conducive to the promotion of energy saving. (Examples: Development, improvement and diffusion of energy-saving, low-carbon technologies, development and diffusion of long-life materials and products, shift to energy-saving, low-carbon industrial structure and utilization of renewable and natural energy, etc.) It is also desirable to promote the utilization of sustainable ecosystem services based on the Aichi Biodiversity Targets and Nagoya Protocol adopted at the tenth meeting of the Conference of the Parties to the Convention on Biodiversity (CBD-COP10) held in 2010. The greening of finance and agriculture, forestry and fisheries is also an important issue.

Various ideas have been proposed as necessary efforts and procedures for the promotion of the green economy:

- Stability of governance of each country is important in facilitating the green economy, and it is necessary to have a mechanism to promote democratic systems, laws and regulations, free trade and investment;
- Governance of global multinational corporations and financial systems is also important, and initiatives such as ISO26000 should be further promoted;
- Citizens lack the awareness and knowledge of the green economy, and it is necessary to get them across through school education and civil society;
- Consumption styles not to break down the balance of natural capital should be established;
- Since it is important for each individual to make purchase decisions on the basis of information on the environment, etc., information for such decision-making should be provided; f) Legal system development, administrative system improvement, information disclosure, participation of all stakeholders and third-party monitoring bodies should be ensured; and
- Efforts should be promoted while monitoring progress with the use of appropriate indicators. It is necessary to position the perspective of Communication, Education and

Public Awareness (CEPA) as the basis of efforts toward the green economy the international community will make with the holding of Rio+20 as motivation and to encourage the synergy effect between CEPA activities to achieve the Aichi Biodiversity Targets under the Convention on Biodiversity and promote the U.N.

Decade on Biodiversity and each country's obligations concerning the public awareness, education and training concerning the Framework Convention on Climate Change and the U.N. Convention to

Combat Desertification, etc.

### 3.1.2

#### Measures Necessary in Each Area to Promote the Greening of the Economy

To use natural capital having the nature of common property across generations in a sustainable way, it is recommended to start in-depth discussion on the User Recovery Principle centering on the idea of the user of natural capital being responsible for restoring the original state and paying the cost when natural capital is used beyond a sustainable pace, and considering the direction of institutionalizing that principle in the countries concerned. 34

Given the limits on the environmental capacity of the earth, sustainable development and growth requires the realization of economic growth and creation of employment. In addition, in the present capital market, stabilization of the financial markets is an important factor. In order to promote the green economy, financial instability that could hamper corporate activities poses a major impediment and causes a setback in the driving power. Regulations on excessively speculative investment and regulations to break wild fluctuations would be required.

As a prerequisite for the greening of the economy, it is necessary to consider natural capital in terms of the real economy. The World Bank's ongoing initiative to incorporate ecosystem services into national economic accounting provides a useful reference.

It has been demonstrated that tools to promote the greening of the economy are diverse. They are broadly divided into regulations and incentives, management tools and voluntary efforts, and the following tools are considered effective:

- (a) Regulations: Introduction of the feed-in tariff and other systems for the promotion of renewable energy, utilization of tax systems that reflect costs imposed on others, including future generations, and risks such as the environmental tax and international solidarity levy, and tougher environmental regulations, etc.
- (b) Incentives: Expansion of preferential tax, financial and fiscal treatment of and commendation systems for business corporations and organizations, etc. that promote the development and diffusion of environment-friendly technologies and products, evaluation and announcement, etc. of efforts by business corporations, appropriate application of accounting standards.
- (c) Utilization of international standards and guidelines: Utilization of international standards as tools for realizing the green economy is also effective. It is important to position ISO26000 issued in November 2010 as a tool to give shape to the green economy in organizational management and promote it at an international level.
- (d) Voluntary efforts (Pledge and review): Voluntary efforts to promote the green economy are important as is the formation of systems to support them.

The role of consumers is important in promoting the green economy, and to that end, communication between producers and consumers are also important. As an effective tool, it is important to review inadequate points in the existing environmental labeling and improve it globally.

International institutions and national governments, as an informational environment for promoting the conservation and sustainable utilization of natural capital, jointly build an international database on available natural capital, etc., in regions of the world and establish the system for monitoring, evaluation and verification of the status of its utilization.

In order to promote product design under constraints on resources, launched the Finite Design 35

Initiative to Support a Sustainable Society with the participation of research institutes, product designers, business corporations, traditional craftsmen and consumers, etc., of various countries for such efforts as (1) closer cooperation among institutions concerned with finite design research; (2) development of common product protocols conducive to finite design (develop and share common product protocols concerning processes and parts that serve as the pivots of recycling and reuse); (3) diffusion of the top-runner format; and (4) visualization of the degree of sustainability of natural capital utilization (visualize the degree of sustainability of natural capital utilization by quantitatively showing the amount of natural capital required for the manufacture of goods and services consumers make use of in their everyday life and the waiting time for their recycling).

In order to develop the capital market to support the green economy, urge institutional investors around the world to embrace the Principles for Responsible Investment (PRI) and ask them to enhance the transparency of their investment behaviors. Furthermore, business corporations compile corporate reports that integrate financial as well as sustainability issues, and governments and exchanges institutionalize such reports.

Since the green economy based on gender disparity cannot be regarded as sustainable development, strive to promote the green economy on the basis of institutional and organizational cooperation between divisions that promote the green economy and divisions that promote gender equality.

### 3.1.3

#### Efforts Necessary to Ensure Economic Growth and Poverty Eradication through the Greening of the Economy

Promotion of the green economy means a shift in the direction of growth toward economic growth that breaks out of the resources-depleting growth to date and confirms to the environmental capacity of the earth. Low-carbon and sustainable utilization of resources will become possible, together with economic growth, employment creation and food security, through promotion of new environmentally sound technology development and reconstruction of labor-intensive and sustainable domestic industries. It is also essential for the business community to provide manufacturing and services friendly to the environment and human rights throughout the supply chain. In every effort, it is necessary to develop institutional frameworks that facilitate the poorest segment of the population, particularly poor women in developing countries, to benefit from the green economy. Development of environmentally sound technology, in particular the progress in small-scale power generation technologies based on renewable resources, contribute to the provision of cheap energy to poor people in rural areas. Development of sustainable and responsible agricultural, forestry and fisheries industries is highly likely to similarly contribute to ensuring employment and food for poor people in rural areas who have high dependence on natural resources.

Sustainable base of the pyramid (BOP) business is in the spotlight to eradicate poverty from the 36 perspective that supporting people living in poverty in their employment, business launching and livelihood and thereby enhancing their purchasing power should help their economic growth as well as business expansion.

It is necessary to help raise the awareness about examples of best practices and develop frameworks of support for BOP business in consultation with stakeholders involved.

## 3.1.4

## Values the Greening of the Economy Brings

The greening of the economy should contribute to the realization of low-carbon and sustainable utilization of resources, along with economic growth, employment creation and food security, and should at the same time be conducive to eradication of poverty. Promotion of the green economy should contribute to correcting the existing structural disparity, rather than fixating such disparity. In particular, the aspect of employment creation is highly important. Various countries have set respective employment targets related to the green economy, and Japanese New Growth Strategy calls for employment creation to the tune of 1.4 million jobs. Gender equality should be emphasized in the creation of employment.

As the green economy can also nurture sustainable domestic industries and promote the development of alternative resources and alternative energy, it can be expected to enhance the capacity to adapt to surges in prices of food, resources and energy the international community is now confronted with by reducing the dependence on overseas sources of supply.

The greening of the economy also allows the non-economic value to be recognized anew. In addition to the richness of natural capital and selfless cooperation among community members that cannot be measured by the economic value, the cost and risk, etc., imposed upon others, including future generations, in a hard-to-see manner comes under consideration.

The greening of the economy prompts changes in people's values and individual choices and also encourages people to seek sustainable lifestyles.

## 3.1.5

## What Are Appropriate Indicators to Make the Richness of Life and Mind and the Costs and Risks Hitherto Unconsidered Visible?

In order to make the richness of life and mind and the costs and risks that have not been considered previously visible, new indicators are necessary in addition to the existing indicators such as the efficiency of resources and energy and carbon dioxide emissions. In particular, it is considered extremely important to reflect the economic value of ecosystem services, such as green accounting, in the national accounting system to recognize the negative impact of development on the natural environment. Concerning natural capital in particular, it is important to introduce the idea of the speed of regeneration and incorporate it into the method of evaluating natural capital, in addition to its stocks and resource productivity.

Along with physical and objective social evaluation indicators, subjective indicators such as the satisfaction of people as key players in life are necessary. However, it has been argued that the richness of life cannot be measured by a uniform indicator as it depends largely on the values of people. The indicators should include one that measures the achievement of gender equality through the green economy.

## 3.2

## Proposals on the Institutional Frameworks for Sustainable Development

## 3.2.1

Problems in the International and Domestic Organizational and Institutional Frameworks for Sustainable Development and Ways to Improve Them Differences in emerging issues and the existing policies have made the U.N. system outdated, and the Rio+20 should serve as an opportunity to allow for discussions on the institutional frameworks that should be enhanced.

The institutional frameworks for sustainable development require an institutional design that reflects the changes of the times, and the following three points are important as the basic points of view. The first is the importance of multilevel governance. Sustainable development needs to be addressed not only by the United Nations alone but also at all of the multilateral, regional, national, local and RCE levels. The second is the importance of the participation by multi-stakeholders. Sustainable development cannot be left to governments alone. It is also necessary for various other stakeholders to participate in the process and decision-making. The third is the recognition that we cannot rely on the United Nations to solve all problems.

As for institutional reform, it is necessary to clarify the goals of the reform plan, vision and time axis. We cannot expect to develop an effective institutional design unless we address the whole spectrum of problems, including institutions, instead of dealing only with institutions.

There also is an urgent necessity to build international governance concerning water, food, energy, resources and radioactive contamination. For agricultural operators in particular, food self-sufficiency is most important for security as well, and therefore the vision and system on which the primary industry can be established are of importance. Food and water are fundamental to human beings, and priority should be given to the building of the system that can safeguard the bare-minimum livelihood.

The five options presented by the U.N. Environment Program (UNEP) indicate only the broad direction and are not necessarily adequately specific proposals, making the comparative evaluation of the options fundamentally difficult. What is necessary at the present stage is to give more concrete shape to the five options. For example, there could be a variety of ways to strengthen the UNEP, the U.N. Economic and Social Council (ECOSOC) and the U.N. Commission on Sustainable Development (CSD). Since the five options are all related to reform of the U.N. organizational structure, it is likely to take considerable time to implement them and their effects emerge only over the medium and long term. U.N. reform can be expected to be effective only when it is carried out in tandem with appropriate measures taken not only by national governments and international organizations but also at multi levels involving regions, states, localities and all other stakeholders. Theoretically, the five options are not mutually exclusive. For example, the establishment of the World Environmental Organization (WEO), one of the options, and reform at ECOSOC and the CDS can be supported at the same time. Also, post-reform ECOSOC can be converted into an umbrella organization for sustainable development, for instance, into the Sustainable Development Council (SDC) as already discussed. The functional strengthening of the UNEP can include the conversion of the UNEP into the WEO in the future. Criteria for evaluation of the specific options should not be limited to the facilitation of sustainable development but also give importance to efficiency. It is also necessary to take the political feasibility into account.

Regarding the strengthening or turning into a specialized agency of the UNEP, there were opinions that it would be wrong to believe that turning the UNEP into a specialized agency would solve everything and reform of the UNEP should focus on making existing programs, for example, economic and social development policy, chiefly environment-oriented and the enhancement of environmental assessment and public awareness-related activities, leaving capacity-building to other more suitable organizations, while others argued that the strengthening of the UNEP should take precedence or that the functions of the WEO should be clarified.

## 3.2.2

## Specific Proposals Concerning the International and Domestic Organizational and Institutional Frameworks for Sustainable Development

Promotion of environmental policy integration (EPI) for sustainability: In order to enhance the synergy effects between environmental and development policies and their

implementation, further efforts should be exerted at national levels. Environmental policy integration (EPI) for sustainability is one of effective methods. This represents a deliberate attempt to give precedence to environmental conservation before exchange conditions arise between environmental, economic and social goals. In particular, what is needed is a system based on the principle of complementarity where the policy integration by local governments that can present specific proposals on problems for which policies should be integrated is welcomed and respected.

Adjustments between conventions: Systems are segmented under many multilateral conventions, etc., and adjustments between them are insufficient. Most environment-related conventions are regional conventions that have different memberships, and it is deemed difficult to make adjustments between them. As for global conventions (such as the Chemicals Convention, the Convention on

Biodiversity and the Convention on International Trade in Endangered Species of Wild Fauna), cooperation among their respective Secretariats is proceeding, and such an approach is more realistic.

Strengthening of the partnership between the United Nations and Bretton Woods and other 39 institutions: U.N. agencies need to strengthen the partnership with international institutions that are promoting international cooperation for sustainable development.

Strengthening of the monitoring function: It is necessary to strengthen the check and balance function by citizens regarding sustainable development. As for radioactive contamination, it is necessary to strengthen specialized international institutes, including NGOs, with the functions of monitoring internal exposure and other health damage from radioactive contamination and the environment and presenting recommendations.

Promotion of the bottom-up approach: What is being fundamentally questioned in the institutional frameworks is the leadership. Instead of placing expectations on the leadership provided by a specific country, what could be considered is the direction of enhancing the status of governance by people who can offer effective solutions to problems through, among others, the bottom-up approach (at the levels of local governments, NGOs, business corporations and industries, and regions).

Building of the multilevel governance: Global standards are being developed by the clout of multi-stakeholders, rather than under decisions by the heads of state or intergovernmental agencies (Example: ISO16000). Multilevel governance that can cover the whole range of areas is important.

Building of a system that encourages corporate reform: It is necessary to build a mechanism that can promote responsible investment by business corporations. Systems that promote corporate social responsibility (CSR), such as environmental accounting, etc., are important, and the U.N. Global Compact can be commended as the first step.

Strengthening of compliance and enforcement of laws: Laws and regulations reflecting unique conditions of respective countries are one of very important tools to put policies related to the environment and development into action. Without effective compliance and enforcement of these laws and regulations, policy measures designed for human health and sustainable development would be doomed to failure. It is important to continuously strengthen compliance and enforcement of relevant laws in regions, states and local governments through the sharing of developed countries' best practices by developing countries, etc. To that end, the capacity building for law enforcement by developing countries and international support are essential.

Building of a funding mechanism for ensuring sustainable development: In order to enhance the effectiveness of institutions involved in sustainable development, ensuring the additional financing and effective utilization of existing funds is of great importance. National governments need to beat their brains and build a funding mechanism for ensuring sustainable development.

Enhancement of private-sector participation: As we cannot hope for much increase in contributions to the United Nations, it is important to incorporate business corporations into the framework in order to make good use of private-sector funds for sustainable development, for example, to extract funds from global corporations. It is also necessary to further transmit specific environmental activities (best practices) of business corporations globally. While there already exist mechanisms to appropriately monitor and keep close tabs on activities of global corporations in some areas (for example, the Bank for International Settlements), such mechanisms are necessary in all areas related to sustainable development.

Building the governance structure with stronger local autonomy in mind: With the clear recognition that local governments (big cities, in particular) are major players in climate policy measures and that local governments rich in natural resources are major players in biodiversity policies, the governance structure that reflects these facts must be built up. It is necessary to urge local governments for proactive actions and establish the new function of supporting and facilitating international cooperation between local governments. We should consider how to position international networks of local governments and big cities, such as the ICLEI-Local Governments for Sustainability (ICLEI) and the C40 Cities Climate Leadership Group (C40), and we should also allow local governments' access to environmental and climate funding programs of the World Bank, regional development banks, the Global Environmental Facility (GEF), Climate Investment Funds (CIF) and the Green Climate Fund (GCF), and programs for utilization of know-how of advanced local governments, in order to support international cooperation between local governments.

Integration with policies to promote gender equality: As gender equality and empowerment of women are essential to promote sustainable development, it is necessary to promote institutional mechanism to enhance collaboration among the organizations and divisions that are responsible for gender equality and sustainable development.

Establishment of a new global convention: As a specific proposal, we should consider the establishment of a regional or global convention that put into action the ideas in line with Principles 10 of the Rio Declaration on Environment and Development and the ensuing Aarhus Convention developed by the U.N. Economic Commission for Europe (UNECE). It would give legal authority access to information by citizens and citizen groups, and promote accountability and dialogue with stakeholders by effectively realizing multilevel governance.

Promotion of forecast science for enhancing responsiveness to variability: In order to enhance responsiveness to variability and reduce the uncertainty concerning social systems in the dynamically changing global environment, proactively promote the Global Forecast Service. The accurate understanding about regional impacts of such fundamental problems as climate change, biodiversity and water can lead us to government policy planning and better disaster prevention particularly in developing countries. That scientific information on the earth is offered in an easy-to-understand and open manner and provides multi-stakeholders with the real beginning of key solutions to global environmental issues. This will be made possible with the networks of Japanese universities and research institutions taking the initiative and business corporations offering technologies. It is also important to establish places for sharing scientific knowledge about disasters (including health hazards) and exchanging views.

## Joint Action and Learning Initiative for National and Global Responsibilities for Health (JALI)

Joint Action and Learning Initiative on National and Global Responsibilities for Health (JALI): Submission on Rio+20 Outcome Document

The Joint Action and Learning Initiative for National and Global Responsibilities for Health (JALI) is a global network of civil society and academics working towards a post-Millennium Development Goals global health agreement grounded in the human right to health. In particular, we are exploring the potential for a new treaty, a Framework Convention on Global Health. It has the potential to close unconscionable global health inequities and serve as a platform for linking, progressing, and creating greater accountability on a broad spectrum of issues, including climate change and nutrition, vital to protecting and improving the public's health.

We encourage the Rio+20 Outcome Document to recognize the inextricable connection between health and sustainable development, and to support the development of a rights-based Framework Convention on Global Health, as described below.

#### Connections between health and sustainable development

The links between human health and sustainable development are manifold, with great synergy between the two. Concerns central to sustainable development, such as climate change and agriculture, have tremendous health implications. An effective response to climate change and food security will save lives and improve health. These responses must themselves take conscious steps to protect health, such as through climate change adaptation strategies. Air and water pollution harm both the environment and human health; indoor and outdoor air pollution contribute to more than 3 million deaths annually. The most authoritative interpretation of the right to health recognizes a healthy environment among the underlying determinants of health.

Another link between health and sustainable environment is through the imperative to preserve biodiversity. The richness of life on this planet – planets, animals, and micro-organisms, both land and marine life – is also the source of a large portion of medicines. Destroying habitats and species means destroying potential sources of new medicines. Similarly, biodiversity is the source of genes being used in bioengineering to make crops such as rice and maize more nutritious and resilient, protecting and promoting human health. A loss of biodiversity may degrade the nutritional quality of local diets. Furthermore, ecosystem services are critical to clean air and water and fertile soil, among other contributions to better health.

The connection between health and the environment extends to the importance of universally available quality health services. One of the greatest challenges to sustainable development is population growth. Enabling all people to access quality reproductive health services, while improving children's health (which also requires improving the health of mothers) so that parents can be confident that their children will survive into adulthood will enable families to have fewer children, thus slowing population growth. Furthermore, ill health – a major cause of impoverishment directly and through health-related spending, and of reduced economic growth – is a significant impediment to development and poverty reduction, and to the resilient societies that are best positioned to develop sustainably.

Meanwhile, one of the most important modalities for securing adequate financing for health, a just, equitable tax system, is also a source of income that can fund the many forms of investment required for sustainable development. And in ways such as those described above, improved health services that a just tax system can help secure will also contribute to sustainable development.

In short, one of the fundamental building blocks of sustainable development is human health. And any overarching effort to improve human health must include steps to improve the health of the planet.

#### A Framework Convention on Global Health

A Framework Convention on Global Health (FCGH) could be just such a comprehensive endeavor to improve human health. It could be the basis of the post-2015, post-MDG global health framework. It would aim to close today's gross health inequities, both among and within countries; ensure universal coverage; create accountability among governments and other global health actors; create and catalyze more inclusive, participatory local, national, and global health processes; achieve adequate funding, and; improve coordination and collaboration based on inclusive country ownership. The treaty would enable health to take its rightful position of priority in other legal regimes that affect health, such as trade and investment.

The FCGH could institutionalize the norms, structures, and processes – the global governance – required to realize the potential of these initiatives and to enable all people to enjoy the right to health. For instance, it could:

- include ambitious yet achievable global targets, with processes to adapt them to local circumstances and ensure national and community ownership;
- require comprehensive public health strategies addressing both health services and social determinants of health;
- move towards clarifying what are the "key" health services that universal coverage should encompass and all people should enjoy, while still enabling adaptation to local circumstances and priorities;
- develop a financing framework with clear funding benchmarks for governments' domestic health spending and for international health funding commitments, including non-health sectors central to the underlying determinants of health;
- establish targets on and develop mechanisms to dramatically reduce domestic health inequities and ensure the accountability of health services to the communities they serve;
- support civil society and community participation in planning, implementation, and evaluation of local, national, and international partner-supported health plans, policies, and programs;
- establish commitments and monitoring mechanisms to ensure that health plans, policies, and programs emphasize the health needs of traditionally discriminated against and underserved populations, including women, people who are poor, and marginalized groups; and
- offer specific measures that countries should take in trade, environment, finance, and other realms to protect and promote health, including mechanisms to evaluate the adoption and effective implementation of these measures.

States can take immediate steps to achieve an FCGH, such as by:

- lending support to civil society, governmental, and other efforts to develop the targets and indicators, rights and responsibilities, and other aspects of the framework, including innovative incentives and sanctions to promote compliance; and
- supporting consultations on the FCGH, including and especially among disadvantaged populations and communities who stand to be most impacted by the treaty.

States could work with civil society and international institutions such as the World Health Organization and UN Office of the High Commissioner for Human Rights to take steps now to advance the goals of and lay the groundwork for successfully implementing an FCGH, including:

- supporting and sharing information on initiatives to educate communities on health and human rights;
- supporting and sharing information on community accountability mechanisms, such as village health committees and community scorecards; and
- developing indicators and disaggregating data in order to develop and monitor policies to better secure the health needs of marginalized populations.

The UN Secretary-General has endorsed an FCGH, aptly placing it in the context of human rights: "Let the AIDS response be a beacon of global solidarity for health as a

human right and set the stage for a future United Nations framework convention on global health." By also endorsing and calling for an FCGH through its Outcome Document, Rio+20 has the potential to help ensure that an FCGH will give due weight to climate change, food security, and other health issues most directly linked to sustainable development. And an endorsement will build momentum towards achieving a global health agreement that has the potential to transform the global health landscape and serve as a major step towards securing for everyone the human right to health.

Momentum is growing to holistically address health – ensuring universal coverage of equitable, quality health systems and of fundamental human needs such as clean water, sanitation, and nutritious food, while prioritizing the determinants of health and the needs of the world's least healthy and most marginalized people. The Rio Political Declaration on Social Determinants of Health has reaffirmed and deepened a global commitment to an inclusive approach to health. As improving global health will powerfully contribute to sustainable development and closing global inequities, the Rio+20 Outcome Document should also advance a holistic approach to health, including by supporting an FCGH. The time has come for a Framework Convention on Global Health that would extend, elevate, and realize global commitments to human rights, health equity, and health for all.

## Kehitysyhteistyön palvelukeskus Keva ry

Finnish NGOs' Contribution to Rio+20 Bureau Compilation Document

Nearly twenty years have passed since the 1992 Earth Summit, yet development in North and South remains dangerously unsustainable. Extreme poverty, climate change, deforestation, loss of biodiversity and rising resource use, among other ills, demonstrate the lack of political leadership and inefficient implementation of international agreements on sustainable development. Finnish NGOs<sup>1</sup> demand a change: social and environmental development goals need to be understood as being more important than economic goals. Thus, we recommend the following to be included in the conference declaration.

### 1. Assessing remaining gaps

Despite the promises made, the social, economic and environmental dimensions of sustainable development are not in balance. In order to find a coherent and balanced way to combine the dimensions of sustainable development and to support the achievement of the Millennium Development Goals, Rio+20 needs to adopt a rights based approach to sustainable development.

For instance, conventions on biological diversity and climate change have not been properly implemented, and stagnation of multilateral cooperation prevails. Therefore, it is crucial to agree on the timetable and concrete measures to accelerate implementation of international agreements on sustainable development. Governments must also agree to elaborate national and local action plans that substantially improve governance of sustainable development objectives.

#### Framework Convention on Climate Change (UNFCCC)

Climate change increases vulnerability and poverty, and makes challenges related to natural resources, food security and water shortages even more urgent. Eventually, it threatens our very existence. As the first step, developed countries need to acknowledge promptly their responsibility of the climate crisis, to take concrete actions towards emissions reductions, and to commit urgently to providing the required support for climate action in developing countries. In Rio+20, governments must raise their ambition regarding increased emissions reduction targets and financial commitments, equitable effort sharing, and robust implementation. Recommendations

- Assess 20 years of progress since the Earth Summit in 1992, take stock of existing greenhouse gas reduction commitments and adaptation efforts, and raise the ambition in the light of the current climate science that shows that more emission cuts are needed than previously estimated.
- Respect the principle of common but differentiated responsibilities (CBDR).
- Ensure the flow of substantial, predictable and sufficient climate finance beyond 2012. Climate finance must be additional to the commitments to raise development aid to 0.7 percent of GDP by 2015.

implementation.

- Commit to set up low carbon action plans (industrialised countries zero carbon action plans) until 2050 (milestones for 2020, 2030, and 2040) as a key tool.

#### Convention on Biological Diversity (CBD)

Ambition regarding biodiversity protection should be raised and concrete measures taken to make sure that the commitments made under the framework of CBD will be achieved. Governments should promptly acknowledge their responsibility for and capability to deal with the crisis of biodiversity, and urgently commit to providing the required support for biodiversity protection in developing countries. The wave of mass extinction should be stopped by 2020.

#### Recommendations

- Recommit to obligations agreed to in the Strategic Plan for biodiversity 2011–2020, including the Aichi Biodiversity Targets agreed at the 10th Conference of the Parties to the Convention on Biological Diversity in Nagoya, Japan, in October 2010. Sign and ratify Nagoya Protocol on Access and Benefit-sharing.
- Raise ambition regarding the targets of the Convention on Biological Diversity and their realization by respecting the principles of common but differentiated responsibilities and the precautionary principle.
- Recommit to respecting the rights of Indigenous Peoples as proclaimed in the UN Declaration on the Rights of Indigenous Peoples.

### 2. Sectoral priorities

All human beings and nations should be guaranteed equitable access to and equitable distribution of energy, food and clean water. Also sustainable forest and marine resources management and support for sexual and reproductive health and rights play an important role in a move towards a more sustainable development. Human rights should be taken as the basis for sustainable development.

#### Energy

About 1.4 billion people globally live without access to electricity and 2.5 billion people cook on open wood, dung or charcoal fires. Energy access and development go hand in hand: it is highly unlikely that any of the MDGs will be achieved without access to modern energy services. Many developing countries have an abundance of renewable energy sources and have huge scope for improving energy efficiency. In short, they can be supported in leapfrogging fossil fuel-based economies towards low-carbon

sustainable energy. Global energy consumption must decrease heavily. Developed countries must acknowledge their ecological debt and stop adding to it. Decarbonizing the economy by 2050 will require a transformation to a less-consuming lifestyle, a reduction in energy use, the neutralization of carbon emissions from fossil fuels and a shift to renewable sources of energy that do not add to the atmospheric accumulation of carbon dioxide. Providing rural areas with decentralized grid systems powered by energy from solar, biomass or small scale hydro might not attract private investments. Nevertheless, such projects must be core business of a partnership aiming at energy access for all. Hence, while supporting joint public-private investments to a certain degree and for certain countries, this financial model will have to be supplemented with a grant-based system.

#### Recommendations

- Commit to removing barriers to renewable energy and energy efficiency investments, including subsidies to fossil fuels.
- Rio should deliver the urgent phase-out of counter-productive subsidies, for example fossil fuel producer subsidies or subsidies to unsustainable fishing or agricultural practice.
- As 2012 is the UN year of access to sustainable energy, agreeing new energy goals to expand the energy access of the poorest, shift to renewables, and increase in energy efficiency must be a priority for Rio+20.
- The target should be set by the United Nations of, by 2030, everybody having universal access to clean, reliable, effective and affordable energy services for cooking and heating, lighting, communications and productive uses.
- Commit to a 'leapfrog fund' to finance access to sustainable energy initiatives.

## La Prévention Routière Internationale (PRI)

Eemnes – The Netherlands, 1 November 2011

### Safer Roads @ Rio+20

La Prévention Routière Internationale PRI is a worldwide umbrella for road safety. Our core business is: education, communication, information, capacity building and advocacy.

PRI is focused at the prevention of road crash victims.

Main priorities: Young People and Developing Countries.

PRI is member of the United Road Safety Collaboration (UNRSC) is determined to contribute to the Decade of Action for Road Safety 2011 – 2020.

Considering that:

1,3 million road crash victims and 50 million serious injuries per year.

Statistics are tip of the iceberg. Foremost road safety is about emotions and grief of persons who lost a beloved one in traffic or who got handicapped for life.

The yearly economic and societal costs of road safety amount to billions.

Traffic has an big impact on environment.

Safer Roads should by part of Sustainable Development. Traffic (safety) measures could walk hand in hand.

Therefore:

Public Transport and Bicycling and Walking should be promoted. Less cars will prevent road crash victims, will diminish CO2 emission and will use less space. Besides walking and cycling contribute to the health positively.

Lower driving speeds will prevent crashes and (fatal) injuries, will diminish CO2 emission.

These priorities have a positive impact on the prevention of road traffic crash victims, on sustainable development and on the quality of life.

## La Sociedad Civil Cubana

Documento de las organizaciones de la sociedad civil cubana e internacionales con sede en Cuba hacia RIO+20

Introducción:

En junio del 2012 se cumplirán 20 años de la Conferencia de las Naciones Unidas sobre el Medio Ambiente y el Desarrollo, celebrada en Rio de Janeiro en 1992. La mayor parte de los acuerdos y los retos que se reconocieron en ese momento histórico esperan aún respuesta y entre ellos resulta crucial el riesgo de extinción de la especie humana, explicitado en el discurso del Comandante en Jefe Fidel Castro Ruz en dicha Cumbre, "... debido a la destrucción sistemática de sus condiciones naturales de vida..."

Hoy más que nunca, la humanidad requiere de soluciones inmediatas a problemas tan cruciales como los que colocan en peligro su propia supervivencia. Los avances observados en temas ambientales en las últimas dos décadas son insignificantes si se toma en cuenta el nivel de deterioro real provocado por el actual modelo de consumo y la lógica del sistema capitalista patriarcal y depredador, como sucede en los casos del petróleo y los combustibles fósiles.

1. Las organizaciones de la sociedad civil cubana e internacionales con sede en Cuba, reunidas en la Asociación Cubana de Naciones Unidas ratifican la vigencia del paradigma del Desarrollo Sostenible y sus principios. Aun se mantienen vigentes y por cumplir la "Declaración de Río sobre Medio Ambiente y Desarrollo", la "Agenda 21", La "Declaración del Milenio" y los "Objetivos de Desarrollo del Milenio", el "Plan de Implementación de Johannesburgo", el "Programa de Acción de Barbados para el Desarrollo Sostenible de los Pequeños Estados Insulares en Desarrollo" y la "Declaración de Naciones Unidas sobre Derechos de los Pueblos Indígenas".
2. Naciones Unidas tiene el compromiso de presentar una evaluación general del estado de cumplimiento de las metas previstas en la "Agenda 21", los "Objetivos de Desarrollo del Milenio" y el "Plan de Acción de Johannesburgo", tal como reconoce en su párrafo 20 inciso C la Resolución de la AGNU (A/RES/64/236).
3. Las organizaciones firmantes de este documento, preocupadas por la actual devastación del planeta; la situación que vive hoy la humanidad; la falta de compromisos de algunos países industrializados y la actual posición de las Naciones Unidas ante ellos, hacemos énfasis en que se considere que:
4. La Conferencia de las Naciones Unidas sobre Desarrollo Sostenible debe evaluar de forma objetiva el avance del deterioro ambiental y consolidar un plan de acción para la implementación de los acuerdos aún no cumplidos, la detención y reversión de dicho deterioro, así como garantizar que las discusiones en torno a todos los temas sean totalmente inclusivas.
5. Debe reiterarse que las discusiones en relación con los temas centrales de la Cumbre de Río+20, "Economía Verde en el contexto del desarrollo sostenible y la erradicación de la pobreza" y el "Marco Institucional para el desarrollo sostenible", no tendrán repercusión alguna si no se realiza una evaluación profunda de los logros y dificultades presentados en los pasados 20 años, teniendo en cuenta los enfoques que desde los países del Sur se tienen sobre Desarrollo Sostenible.

Sobre economía verde en el contexto del desarrollo sostenible y la erradicación de la pobreza consideramos que:

6. La "Economía Verde" es un concepto controversial e insuficiente, se encuentra en construcción y carece de enfoques multisectoriales y multidimensionales, pero existe la posibilidad de que acciones económicas sustentables resulten instrumentos útiles en la implementación de una "Economía Ecológica". Por tanto la "Economía Verde" debe descansar sobre tres principios: las demandas del medio ambiente, las demandas del desarrollo (tanto en su dimensión económica como social) y el principio de equidad. Los enfoques relacionados con este debate internacional no deben sustituir al paradigma del desarrollo sostenible, como objetivo fundamental de la conferencia de Río 1992 y cuyos preceptos y principios con los años han mantenido igual o mayor vigencia.
7. Urge que Naciones Unidas implemente y de seguimiento a mecanismos concretos y efectivos para erradicar la pobreza, la exclusión, las inequidades, las desigualdades y todas las formas de discriminación y violencia. Parte indisoluble de esa lucha son la educación universal y gratuita, la alimentación adecuada para alcanzar una salud plena, el derecho al trabajo, remunerado según sus resultados, y otras conquistas de la humanidad a lo largo de la historia, basadas en la proscripción de las guerras y otros actos de agresión, así como en el respeto irrestricto a la soberanía de los estados y el cese de otras formas encubiertas de dominación que deben ser eliminadas de la tierra, con el objetivo de lograr una vida mejor para sus ya más de 7 mil millones de habitantes.
8. Debe mantenerse la plena vigencia del principio 7 de la "Declaración de Río", donde se establecen las "responsabilidades comunes pero diferenciadas" para los Estados y los mecanismos de financiamiento y transferencia de tecnologías en condiciones preferenciales para los países en desarrollo. Dichos mecanismos formarían parte de la compensación que los países industrializados "deben" a aquéllos al aplicarse el principio antes mencionado.
9. La economía debe resultar un instrumento en el logro de un Desarrollo Sostenible y no un fin en sí misma, así como que la erradicación de la pobreza implique también un cambio en los patrones de producción, distribución y consumo a nivel global, incluyendo los hábitos y estilos de vida derrochadores y dispendiosos.
10. Destacamos la necesidad de construir una economía ecológica que implique la transferencia gratuita de tecnología entre todos los países, particularmente aquellas capaces de transformar las matrices energéticas mediante el aprovechamiento eficiente de las fuentes renovables, incorporando también las provenientes de los saberes tradicionales y ancestrales de los pueblos originarios.
11. Los Estados son responsables de gestionar, garantizar el acceso y beneficio de los servicios ambientales a sus poblaciones, así como la creación de capacidades para la erradicación de la pobreza. Deben oponerse asimismo a todo tipo de mercantilización y comercialización de la naturaleza y a todas las formas de comercio de carbono.

Sobre el Marco Institucional para el Desarrollo Sostenible consideramos que:

12. A pesar de las dificultades existentes durante estas dos décadas, algo se ha avanzado en términos del Marco Institucional, reconocemos que durante estos años se han realizado esfuerzos como los procesos GEO que contribuyen a una mayor y mejor comprensión de los problemas regionales que nos afectan.
13. Resulta imprescindible para lograr un "Marco Institucional" adecuado, considerar la participación social, no sólo en el manejo y gestión del medio ambiente y la energía, sino también en la toma de decisiones al respecto, visto ello desde la perspectiva de las culturas tradicionales, el respeto a las mismas y el reconocimiento a su eficacia, ponderándose los niveles de desarrollo comunitarios y locales, así como su representación en los organismos multilaterales
14. El fortalecimiento de agencias de Naciones Unidas como el Programa de las Naciones Unidas para el Medio Ambiente y de la Comisión sobre el Desarrollo Sostenible, permitirá facilitar la cooperación internacional efectiva en este ámbito, al respecto es necesario implementar el Plan Estratégico Intergubernamental de apoyo tecnológico y creación de capacidades (Plan de Bali) para lograr una estrategia coherente y válida.

Ciframos nuestras esperanzas en que de esta Cumbre salgan compromisos efectivos y tangibles que garanticen la preservación del medio ambiente a escala global y el uso sostenible de los recursos naturales, en un marco de justicia y equidad social a favor de la supervivencia y el bienestar de la humanidad.

## La Vida en Bici

----- GREEN ECONOMY RIDES A BIKE

Contribution by Mati Kalwill for the compilation of the Zero Document

United Nations Conference On Sustainable Development RIO+20

Buenos Aires, Argentina - October 2011

**Please open the original submission to see this image**

### Summary

We are sending this document to be considered for the section of the Zero Draft which will refer to sustainable mobility and specifically urban cycling as a feature of urban viability as we discussed at the conference. This contribution has two objectives:

(1) Support the great potential of bicycles in the road towards a Green Economy, which we base on the strong relations between: the three pillars of Sustainable Development; the Indicators for a Green Economy as proposed by the United Nations in the working definition of this concept; and three fundamental values of urban cycling, as proposed by La Vida en Bici, the organization that created and promotes this contribution.

(2) Delineate a proposal of specific action oriented to the Institutional Framework for the Sustainable Development in relation to Sustainable Mobility, especially as it refers to the promotion of the bicycle as a preferent form of transportation in cities around the world.

## 1. Perspective on Urban Cycling on the road to Green Economy

We ask you to take into consideration that through promoting the bicycle as the preferred mode of transportation in cities around the world, the effort to create Green Economy is supported. We base this vision on the fact that Urban Cycling entails at least three fundamental values related directly to the pillars of Sustainable Development according to the definition created by the United

Nations; and the indicators proposed by United Nations for the construction of a

Green Economy.

We will elaborate on these concepts next so that the relationship between the three are clearly stated:

1)

Sustainable development pillar: Environmental protection.

Indicator of green economy: Environmental indicators.

Value of urban cycling associated with this pillar and indicator: The bicycle is a form of transportation of low environmental impact that offers an everyday, accessible way of reducing people's ecological footprint.

2)

Sustainable development pillar: Economic Development.

Indicator of green economy: Economic Indicators.

Value of urban cycling associated with this pillar and indicator: Has to do with transportation that can be accessed in an egalitarian way, the bicycle is an instrument that promotes equality and social inclusion.

3)

Sustainable development pillar: Social Development

Indicator of green economy: Indicators of progress and wellbeing

Value of urban cycling associated with this pillar and indicator: The bicycle increases people's quality of life, better their physical fitness, reduces the risk of fatal accidents in the public space, and increases the health and general happiness of citizens.

## 2. Proposal to promote urban cycling from the Institutional Framework for

### Sustainable Development through an international treaty

Given the ample relationship between green economy, sustainable development, and urban cycling, we propose that through the Institutional Framework for Sustainable Development that will be discussed at the conference, an **International Treaty to promote the bicycle as preferred form of transportation in cities around the world** is considered. Kind greetings,

Matias Kalwill

Director of La vida en bici

## Latin American Network of Non-Governmental Organizations of Persons with Disabilities and their Families (RIADIS) and the Global Partnership for Disability and Development (GPDD)

### Joint Submission by the Latin American Network of Non-Governmental Organizations of Persons with Disabilities and their Families (RIADIS) and the Global Partnership for Disability and Development (GPDD)

*Note: RIADIS is a network formed by disabled persons' organizations from 18 countries in Latin America and the Caribbean. RIADIS' main goal is to promote actions that will result in full respect of human rights, non-discrimination and inclusive development, focused in a sustained improvement of the quality of living conditions of persons with disabilities and their families. GPDD is an unprecedented alliance of more than 70 international and regional Disabled Persons's Organizations (DPOs), government ministries, bilateral and multilateral donors, United Nations (UN) agencies, NGOs, national and international development organizations, and other organizations, committed to promoting economic and social inclusion of persons with disabilities in middle and low-income countries.*

### General Comments: Why to mainstream Disability in Rio + 20 Outcome

**Inclusive development must integrate all the sustainable development strategies:** A fair and just development comprehends equity, equality of opportunities, and

protection of vulnerable groups. "Progress tends to bypass those who are lowest on the economic ladder or are otherwise disadvantaged because of their sex, age, disability or ethnicity".<sup>1</sup> Development can be inclusive – and reduce poverty – only if all groups of persons contribute to creating opportunities, share the benefits of development and participate in decision-making.<sup>2</sup> Also, to keep global growth sustainable means a stronger focus on inclusion.<sup>3</sup>

**Disability and poverty are intrinsically linked:** More than a billion persons are estimated to live with some form of disability, or about 15% of the world's population. Disability disproportionately affects vulnerable populations. There is a higher disability prevalence in lower-income countries than in higher-income countries. Persons from the poorest wealth quintile, women, and older persons have a higher prevalence of disability. Persons who have a low income, are out of work, or have low educational qualifications are at an increased risk of disability.<sup>4</sup> Disability issues should be an integral part of collective efforts and a concrete step to reducing the risk and impact of poverty in any country.

**As a Human Rights Issue, Disability is relevant to Sustainable Development:** More than 100 countries are legally bound to the Convention on the Rights of Persons with Disabilities (CRPD) which sets out with great clarity the obligations on States to promote, protect and ensure those rights. Particularly, its Preamble notes that despite "various instruments and undertakings" persons with disabilities continue to face human rights violations and barriers to their full inclusion and participation as equal members of society, and that the majority of disabled persons live in "conditions of poverty."<sup>5</sup> It also anticipates that promoting the full participation of persons with disabilities "will result in (...) significant advances in the human, social and economic development of society and the eradication of poverty," and

4 WHO World Report on Disability 2011

5 Convention on the Rights of Persons with Disabilities, preambular para. (k) and (t)

highlights the "importance of mainstreaming disability issues as an integral part of relevant strategies of sustainable development."<sup>6</sup>

**All MDGs are relevant to persons with disabilities and persons with disabilities must be included in all MDG efforts:** Although persons with disabilities are not included in any of the MDGs' Goals, Targets or Indicators, recognition of the need for inclusion in the MDGs is reflected in recent General Assembly Resolutions.<sup>7</sup> In addition to representing a key target group under Millennium Development Goal 1 ("Eradicate extreme poverty and hunger"), persons with disabilities are also key targets when considering each of the other Goals.<sup>8</sup>

**Disability is relevant to Gender Equity:** Women have a higher prevalence of disability.<sup>9</sup> Women with disabilities experience gender discrimination as well as disabling barriers.<sup>10</sup> Women with disabilities comprise three quarters of all disabled persons in low and middle-income countries. 65-70% of women with disabilities in low and middle-income countries live in rural areas.<sup>11</sup> Women in general are more likely than men to become disabled because of poorer working conditions, poor access to quality healthcare, and gender-based violence.<sup>12</sup> Only around 19% of women with disabilities are in the global workforce.<sup>13</sup>

Because of increased risk of gender-based violence and lack of access to reproductive health care services, women with disabilities face unique challenges in preventing HIV infection. They experience significantly lower rates of primary school completion and fewer mean years of education than men with

---

disabilities and women without disability<sup>14</sup>. Mortality rates amongst girls with disabilities are much higher than for boys with disabilities.<sup>15</sup>

**Disability Issues related to Green Economy**

• **Persons with disabilities lack access to water more often than their non-disabled peers:** In developing countries, persons with disabilities have to travel long distances to get water. Information about water distribution, points of water distribution and water access, water pump design, and water containers are not accessible. In addition, for many, there is a lack of social networks or assistance where needed. Prevention messages on water safety are not accessible. Disproportionately expensive water has a serious impact on persons with disabilities living in extreme poverty.<sup>16</sup>

• **Persons with disabilities are among the most affected by climate change and natural disasters:** Individuals with disabilities are disproportionately affected in disaster, emergency, and conflict situations due to inaccessible evacuation, response and recovery efforts. Common experience reveals that persons with disabilities are more likely to be left behind or abandoned during evacuation in disasters due to a lack of preparation and planning, as well as inaccessible facilities and services and transportation systems. Most shelters and refugee camps are not accessible and persons with disabilities are many times even turned away from shelters and refugees camps. Disruption to physical, social, economic, and environmental networks and support systems affect persons with disabilities much more than the general population. There is also a potential for discrimination on the basis of disability when resources are scarce. Furthermore, the needs of persons with disabilities continue to be excluded over the more long-term recovery and reconstruction efforts.<sup>17</sup>

• **Decent Work includes considerations to disability:** Decent work is a clearly defined universal and indivisible objective, based on fundamental values and principles. While, in operational terms, it is an evolving target, changing to reflect varied national and local situations and taking due consideration of different levels of development and national capacity, its integrated and balanced nature cannot be compromised. Such an integrated approach must include policies, strategies, programmes and activities must target specific disadvantaged or marginalized groups, such as persons with disabilities.<sup>18</sup>

• **Equal Transportation and livable buildings and cities require universal design and access for all:** An accessible environment, while particularly relevant for persons with disabilities, has benefits for a broader range of persons, including children, pregnant women and older persons. Access to public accommodations – buildings and roads – is beneficial for participation in civic life and essential for education, health care, and labour market participation. Transportation provides independent access to employment, education, and health care facilities, and to social and recreational activities. Without accessible transportation, persons with disabilities are more likely

to be excluded from services and social contact. A lack of accessible communication and information affects the life of many disabled persons.<sup>19</sup>

#### Disability and the institutional framework for Sustainable Development

• **Good Governance requires the participation of persons with disabilities:** Often persons with disabilities are excluded from decision-making in matters directly affecting their lives.<sup>20</sup> There is a need to consult persons with disabilities and their organizations on their concerns more closely in making sustainable development more inclusive.

• **Rio + 20 processes and products must be accessible to All:** Websites should be rendered accessible, caption should be widely provided and reports in alternative communication formats should be available

## Law School of Getulio Vargas Foundation – FGV Direito Rio

### NORMATIVE RECOMMENDATIONS FOR RIO + 20

The recommendations in this document are the result of preparatory meetings and online public consultations conducted and organized by the Research Program on Law and the Environment - (PDMA) at Getulio Vargas Foundation School of Law in Rio de Janeiro (FGV DIREITO RIO). These initiatives include: the Rio+20 International Preparatory Meeting, held on 24 and 25

June 2011. This preparatory meeting was entitled: "Green Economy in the Context of Sustainable Development: Governance of Public and Private Stakeholders", and resulted in a book compiled by Carina Costa de Oliveira and Rômulo S. R. Sampaio. Two other initiatives included: the Online Forum for Sustainability regarding Rio+20 (<http://riomais20.direitorio.fgv.br/>), which received contributions from around the world debating issues relating to governance and green economy divided in 70 topics. Lastly, it is worth mentioning PDMA's participation in The Access Initiative - a network of nongovernmental organizations that works with the implementation of Principle 10 of Agenda 21 designed to address the issues of access to information and public participation.

Several partnerships were crucial to organizing those initiatives and continue to be important as we get closer to the official debates during the Rio+20. The organizations participating with PDMA in these endeavors are: *Centre International de Droit Comparé de l'Environnement*, *Pace University* and Brazilian American Institute for Law and the Environmental (BAILE), the *The Access Initiative*, Núcleo de Estudos e Pesquisas do Senado Federal Consultoria do Senado, Escola da Magistratura do Estado do Rio de Janeiro, Academia Paranaense de Direito Ambiental, Ministério Público da União, PUC-Goiás, Universidade Católica de Brasília, Uniceub, Universidade Federal do Pará, IEDC - Instituto Estudos Direito e Cidadania, Mackenzie-SP, Prefeitura do Rio, CEDA, NKF Advogados, Tribuna Animal, CEDAM, FEMPERJ, PUC-São Paulo, IBRADA, and Universidade Estadual do Amazonas. In addition, professors, researchers, and professionals, who are not part of the above mentioned institutions above mentioned, participated in the development of the set of proposals. They are all cited at the end of this document.

Some recommendations are made on the general topics of the conference based on the following major subjects: 1) Definitions, 2) Sustainable Trade and Investments, 3) National and International Governance, 4) National Institutional Framework for Sustainable Development, 5) International Institutional Framework for Sustainable Development. In each topic recommendations are divided in of national and international scope.

## GREEN ECONOMY IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT AND POVERTY ERADICATION

### 1) Definitions

#### a) Important aspects for Green Economy concept

- 1) The need for internalization of social and environmental negative externalities. Policies promoting internalization of negative externalities include, but are not limited to, building reliable methodologies for natural resources valuation and working with tax incentives to encourage sustainable practices (PDMA).
- 2) Defining social goals and creating objective criteria to achieve them within the context of a "green economy". These goals include: job expansion, consumption decline, promoting more sustainable and housing guarantees. Relevant policies would promote sustainable public expenditure, enable green regulation and encourage public investment in priority areas (PDMA).
- 3) In relation to green economy, it is observed that the more this analysis is divided into sectors, the easier policies that could encourage the construction of "green" perspective can be identified. Each specific area, such as construction, tourism, biodiversity, energy, cities, enjoys its own set of peculiarities. The concept of green economy could be taken from the sustainable progress of each economic sector (PDMA).

4) "There should be an environmental concern on the macroeconomic policy design. The decisions related to interest rate, trade balance and the adjustments to be made in the trade balance are used to induce the production / import / export of certain products. Each of these products contributes differently to maintain an ecologically balanced environment. So we must be concerned with the regulation of microeconomic aspects such as the internalization of externalities through tax incentives or parafiscal taxes, but also, and perhaps with even greater force, we should be concerned with the macroeconomic aspects of regulation as the establishment of mandatory parameters that prevent the adoption of macroeconomic policies potentially harmful to the environment "(Arivaldo de Souza).

**b) Important aspects for sustainable development concept**

1) Identifying general criteria for sustainability from a definition given by each country. Each country can send to the UN Secretariat for the Rio+20 its definition of sustainable development. This proposal stems from disparities between economic, social and environmental development of each state. Each one must identify how it can contribute to the present and the future of those from the following generations.

2) Opinion on the relevance of the concept of each State:

"A concept is an abstraction that is used to intellectualize a complex issue. Thus, it is possible to explain the complexity of reality that becomes more accessible. However, the risk that comes with the use of a concept is the simplifying and trivializing of it. It can be regarded as the perfect mirror of reality. It is a methodological and scientific error. Many times the same happens to the concept of sustainable development. People who work on this issue want to universalize and standardize the concept. As a result, they destroy the content of sustainable development. The principles of sustainable development must be implemented by each state. Each State has its own

level of development, its economies and its society. Therefore, they are different and have neither the same goals, nor the same means to accomplish their goals. Environmental considerations, for instance, do not have the same value in

each state. In this sense, what is sustainable development for a State is not necessarily the same thing to another State. So in this sense, it is not useful to have a single definition of the concept of sustainable development. In practice, every State knows its needs within its development. Thus, it can decide its policies according to its reality. Finally, it is useful to emphasize a last point. The final receptors of development and sustainable development theories – humans - are sometimes forgotten and neglected by those working on these issues. Their realities are so complex, so different that it is difficult to understand how a theory of sustainable development can be created without some practical studies. Moreover, these theories are often built in offices, in few hours. This is one reason why sustainable development has little practical effect "(Nitish Monebhurrun).

3) Opinion on the debate:

"Ultimately, Planet Earth is bearing the benefits or the burden of how effective a theory of sustainable development is built". The Planet's environment must be balanced in order to provide for a harmonized relationship between humans and other creatures that, combined, form the biota. That is the question of sustainable development. Furthermore, sustainable development is a political concept which aims to establish the grounds for dialogue between different stakeholders. The answer for sustainable development is "Shall we all talk? What are the terms? The question that may be asked is what are the parameters to developing each political entity and what are the parameters of sustainability?" (Arivaldo de Souza).

**2) Investments and Sustainable Trade**

**a) Forests**

**International Recommendations**

1) Adopting a treaty dealing with forests (Luciane Martins de Araújo).

2) Increasing the input of financial resources in order to provide for the recognition and payments for environmental services, using the Global Environmental Facility as a model. (Luciane Martins de Araújo).

3) Strengthening and harmonizing existing environmental certifications (José Antônio Tietzzman Silva).

4) Including recommendations for environmental damage under the Human Rights Council and UN Councils or Commissions of the Regional System of Protection of Human Rights (José Antônio Tietzzman Silva).

**National Recommendations**

1) Implementing monitoring mechanisms and instruments through voluntary and coercive measures. (Fernando Meneguín).

2) Implementing policies and measures to combat deforestation (Fernando Meneguín).

3) Implementing state incentives for environmental preservation, and opening up the process for public and private participation (Fernando Meneguín).

5

**REDD:**

4) Use annual fluctuations in the opportunity costs in forested areas, rather than carbon stocks (Virgílio Gibbon).

5) Unifying the credit registries of all the states into a single registry office to avoid double valuations of credits on the national level (Virgílio Gibbon).

6) The need to incorporate the concept of opportunity cost in the search for solutions to the issue of native forests deforestation (Virgílio Gibbon).

7) Establishing a REDD+ regime demands that the rights and duties are clear not only in national but also in international levels (PDMA).

8) Local participation and transparent processes of defining access to benefits and allocation of

REDD+ resources are crucial for guaranteeing effective governance (PDMA).

#### **b) Renewable energy**

##### **International Recommendations**

1) Specifically, a framework convention on renewable energy could include:

a) Establishing a renewable energy list classified according to economic criteria (cost of production, levels of energy demand, the necessary resources for its production, levels of importation, exportation, capacity to create jobs, etc) and environmental (rate of substitution of fossil fuels, environmental impact, carbon balance of the production process, etc.) (Meryem Deffairi).

b) Establishing a binding target, "a minimum" of renewable energy in 10 years for developed countries and in 15 or 20 years for developing countries (obligation of result, leaving the states free of the means used to achieve this) and finally integrate the planning requirements for each state. (Meryem Deffairi).

c) Providing a mechanism for financial sanctions applicable in 10 years, and every five years, depending on the level of renewable energy in each state, by paying a fine to an independent international institution responsible for "re-injection" of funds in development projects of technology for renewable energy production. (Meryem Deffairi).

2) Instead of discussing a new institutional framework, we should question the function and capacity of action undertaken by the International Agency for Renewable Energy established in January 2009 (IRENA <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade).

##### **National Recommendations**

1) States should be Memberships in the International Agency for Renewable Energy established in January 2009 (IRENA - <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade).

2) Regulating ethanol in Brazil - implement the Regulation on Conformity Assessment for Ethanol Fuel, signed by Brazil, the purpose of which is to define criteria for evaluating the intrinsic properties of ethanol, considering established technical standards, and assessing social and environmental requirements applicable to the production process, based on labor and environmental laws in Brazil and abroad (PDMA).

3) Adopting government policies to encourage transition from energy sources based on fossil fuels to renewable energies (Luciane Martins de Araújo).

4) Implementing, through local government, legislation and regulations that promote the use of renewable energy (Luciane Martins de Araújo).

5) Giving preferences in the process of granting intellectual property rights to renewable energies that would favor developing countries (Luciane Martins de Araújo).

6) Facilitating the acquisition of patents, given the need for investment in renewable energies precipitated by recent weather events (Luciane Martins de Araújo).

7) Reducing tariffs and establish subsidies in order to implement technologies used to produce renewable energies as well as to reduce their cost and increase production (Luciane Martins de Araújo).

8) Promoting public policies aimed at reducing consumption in order to reduce consumer power demand (Luciane Martins de Araújo).

#### **c) Biodiversity and compensation mechanisms**

##### **International Recommendations**

1) Producing a judicially manageable definition of biodiversity and give it legal standing in the international arena (Jessica Makowiak).

2) Creating international compensation mechanisms for loss of biodiversity and their criteria

(Jessica Makowiak).

3) Bolstering the notion of compensation with recognized principles of international and environmental law (the precautionary principle, "polluter-pays" principle). Such relief or compensation may also be injunctive (Jessica Makowiak).

4) Ranking priorities in order of the intensity of the threat to biodiversity, the possibility of preventing losses, and of compensation. (Jessica Makowiak).

5) Limiting compensation actions where projects do not cause major or irreversible reduction of biodiversity (Jessica Makowiak).

6) Defining, classifying and prioritizing compensation arrangements in the context of biodiversity (Jessica Makowiak).

7) Providing in the texts of such laws or agreements means of compensation and provisions for monitoring, surveillance and control (Jessica Makowiak).

8) Imposing sanctions for instances of noncompliance with measures for monitoring and their effects (Jessica Makowiak).

9) Accessing compensation practices at the institutional level (which actors are appointed to decide, implement and monitor compensation measures) (Jessica Makowiak).

10) Identifying means of channeling economic resources allocated to biodiversity conservation towards biodiversity-rich developing states (Luiz Gustavo Bezerra).

#### **d) Green Private Contracts**

##### **International Recommendations**

1) Promoting the inclusion of social-environmental clauses and prohibit "stabilization" clauses in order to enable the adoption of standards in the area of private law for human and environmental rights ratified after the signing of agreements (Sílvia Pinheiro).

**e) Technology Transfers**

**International Recommendations**

- 1) Promoting funding mechanisms for the acquisition of clean technology in developing countries (Renata Calsing, Maria Marinho and Carlos Henrique Rubens Tomé Silva).
- 2) Establishing a fund that allows the purchase of clean technologies considered relevant to environmental protection (Renata Calsing and Maria Marinho).
- 3) Recognizing the need to stimulate the creation of collaborative platforms for clean technology licenses (Renata Calsing and Maria Marinho).
- 4) Promoting discussion on the adaptability of a mandatory license allowing access to clean technologies and discuss other mechanisms of transfer (if the invention improves upon existing technology or reduces production costs, the company holding the license will exercise its exclusive right in order to differentiate itself in the market. Therefore, the incentive to transfer technology through licensing will only be effective if states establish mechanisms to compensate the private sector holder or co-holder of protected technologies that impact environmental protection) (Renata Calsing and Maria Marinho).

**f) National and international trade systems**

- 1) Investing U.S. bonds certificates that comprise the international reserves of

BRICS members (Brazil, Russia, India, China and South Africa) in funds managed by the shareholders (Virgílio Gibbon).

- 2) Developing rules for the Investment Fund regarding the possibility of issuing a "Green Currency" up to value of its assets. The Green Money shall only be applied to actions or funding of sustainable projects of countries that agree to be beneficiaries of the Fund (Virgílio Gibbon).
- 3) Accede to a Shareholders Agreement that accords the Green Currency the same treatment given to the U.S. dollar today. In other words, it is computed as international reserve and gives rise to the issuance of corresponding domestic currency (Virgílio Gibbon).
- 4) Adopting social and environmental indicators on the stock market. Examples: Domini 400

Social Index (DSI), Dow Jones Sustainable Index (PDMA).

**g) Sustainable Production**

- 1) Creating a coordinated consumer products policy based on the evaluation of the environmental impact of products throughout their life cycle. Fostering discussion between the public and private sectors on the subject of producing more effective measures and lowering costs (PDMA).
- 2) Promoting the idea of corporate social responsibility throughout the entire production cycle, including: local communities, paid employees, shareholders, business partners, suppliers, consumers, and public authorities (PDMA).
- 3) Sustainable financing - direct funding for specific areas: such funding would benefit some communities or disadvantaged municipalities by granting loans through local development banks in deposits, with rates equal to or below the market price (PDMA).

**h) Sustainable Consumption**

- 1) Responsibility of individuals and companies for their sustainable consumption (PDMA).
- 2) Consumer protection against misleading advertising by companies through notices that detail environmental protection or certifications related to Corporate Social Responsibility in their Codes of Conduct (PDMA).
- 3) Creation of a website specializing in the exchange of information and tips on environmentally friendly products and companies (NKLF Lawyers Association).

**i) Sustainable Construction**

**International Recommendations**

- 1) Adopting of a statement of principles for sustainable construction at the Rio +20 Conference  
(Luiz Gustavo Bezerra).

**National recommendations**

- 1) Creating financial incentives (benefits and tax exemptions) for sustainable products and technologies to be used in construction (Luiz Gustavo Bezerra).
- 2) Creating a government website for the commercialization of sustainable technologies and products (Luiz Gustavo Bezerra).

**j) Exploitation of Genetic Resources**

**International Recommendations**

- 1) Ratification of the Nagoya Protocol and the Nagoya-Kuala Lumpur Protocol, ensuring the implementation of the ABS regime and the liability regime for damages in the case of transnational movement of GMOs (Solange Telles da Silva and Tarin Frota Mont'Alverne).
- 2) The Right to access information on biotechnology and nanotechnology (Solange Telles da Silva).
- 3) Requirements for independent studies on the risks and adverse effects on human health and the environment before genetically modified organisms are made available for human and animal consumption (Solange Telles da Silva).

4) Requirements for monitoring after such GMOs are made available on the market and for the publication of these studies (Solange Telles da Silva).

#### **National recommendations**

1) It is important that countries have the legal tools necessary to access these resources effectively and benefit from sharing in a fair and equitable manner, especially after the adoption of the Protocol of Nagoya (Tarin Frota Mont'Alverne).

### **3) Green Economy in the Sustainable Development context: Governance and**

#### **Institutional Framework a) State Liability**

##### **International Recommendations**

- 1) All Signatories shall promote sustainable management, especially within the government administration (Maria Augusta Ferreira).
- 2) Sustainable management means one that is conducted with transparency, accountability, and in an ethical manner, with public participation and respect for the concerns of interested parties (stakeholders – employees, customers, suppliers, society, and government), human rights, and the environment (Maria Augusta Ferreira).
- 3) Respect for the environment in public administration is founded on the following pillars: environmental education, sensible use of resources, proper disposal of waste, sustainable public procurement, and a healthy work environment (Maria Augusta Ferreira).

##### **National Recommendations**

1) The environmental responsibility of federal, state and local entities includes, beyond liability for damages, a responsibility to prevent damages by reducing the environmental impact of state activities, though the adoption of sustainable management practices (Maria Augusta Ferreira).

#### **b) Companies Liability**

##### **International Recommendations**

- 1) Creating guidelines that impose strict liability on companies for environmental damages caused by those companies, with joint and several liability between both parent companies and their subsidiaries (Carole Peychaud).
- 2) Having an Agreement on "Rights and responsibilities of market players" with guidelines such as: (PDMA)
  - a) Minimum criteria, which would constitute the basis for the Code of Conduct for Companies (obligations and their subjects must be precise and clear) (PDMA).
  - b) Creating an obligation to produce annual statements that consider environmental and social criteria; (PDMA).
  - c) Promoting imperatives for voluntary certifications obtained according to the standards of ISO, for example (PDMA).
- 3) Environmental conventions containing provisions for conflict of laws and jurisdictional conflicts, giving preference to the laws and courts that could best grant relief. Examples of rules (PDMA):

##### **a) Conflict of laws:**

1) In the case of compensation for environmental damage, the rule most favorable to the victim and to environmental protection should be applied; 2) if there exists environmental insurance, the law on the rights of the insured should be applied, 3) in case of environmental damage, the law of the jurisdiction of the parent company may be applied if it has control over the activities of its subsidiary.

##### **b) Conflict of jurisdictions: (PDMA)**

- 1) The victims of environmental damage may choose the court most expedient for the granting of relief, for example: based on the proximity of the evidence;
- 2) If the parent company has control over the activities of its subsidiary, the jurisdiction of the parent company will be competent to hear the case;
- 3) A multinational corporation may be sued in the court of the domicile of the defendant. If the defendant is a corporation, the domicile of the defendant may be found in any of three places: a) where the company has been incorporated, b) the location of its headquarters, or c) its principal place of business.

#### **Specific Recommendations for International Law of Investments**

- 1) The integration of clear environment protection provisions in international investment agreements: the future investment agreements or the renegotiation of existing agreements should include specific provisions on environment protection. These provisions can consider (Nitish Monebhurrn):
  - (i) **The definition of an investment activity:** The activities of those companies which are constituted without knowledge of domestic environmental laws should not be qualified as an investment and therefore should not benefit from the protection of the investment agreement. The international investment agreement provision on the definition of the investment must underscore this point. The agreement must state that the investor has a duty to check, examine and understand the legal framework of the host state, especially the one applicable to the environment, so that it shall start and conduct its activity accordingly.
  - (ii) **The definition of the environment:** Environment is not an abstraction and in the vein of the previous proposition, some details must be available to define or to identify what is to be understood by environment. It might be a complex task to give an exhaustive definition but it is not impossible to give a list of indicators. These indicators may vary from one state to another.
  - (iii) **Affirming the right of states to regulate according to their environmental concerns:** compensation is usually provided in case of exploitation. For example, expropriation with environmental motives should have a specific status and the compensation for this kind of expropriation should be designed to give legitimacy to the

objective of environment protection.

(iv) **The legitimate expectations of States:** The agreement must declare that States have a legitimate expectation that private companies investing on its territory will always act in good faith in order to collaborate with them, whenever

12

environmental goals are concerned. Therefore, private companies have a duty to act accordingly and must not frustrate these expectations.

2) The integration of clear rules of conflict in international investment agreements: *emphasizing the prevalence of environment protection norms over investment protection norms* (Nitish Monebhurrn):

(i) **The principle:** Whenever there is a potential conflict between the investor's or the investment's protection and the environment protection, the investment agreements must present clear rules of conflict. The investment agreement can assert that whenever an investment protection provision is in conflict with an environmental norm, the latter shall prevail over the former. As environment protection is a unanimous goal which is fundamental, it must be a priority.

3) Promoting the use of the systemic integration principle (Nitish Monebhurrn):

(i) The principle: Hereby, agreements should declare that international investment law is not isolated from the rest of international law and that the interpretation of an international investment treaty does not exclude references to other non-investment norms, like environmental norms. This is in agreement with article 31(1)(c) of the Vienna Convention on the Law of Treaties. Hence, environmental norms can be integrated in international investment dispute settlements. They can be invoked by states and will have to be taken into consideration by arbitral tribunals.

#### **National Recommendations**

1) Implementing and publicizing the system of National Contact Points in the OECD so that companies can be questioned about their actions by society (PDMA).

2) Controlling the private activities through: 1) creation of precise sustainability criteria which companies should present; 2) mandatory presentation of these criteria, and

3) Government oversight of the information published. These criteria may be based on the GRI (PDMA).

#### **c) Financial Institutions Liability**

1) Organizations, whether public or private, national or international, which finance or support activities or projects which pollute the environment or may potentially pollute the environment shall require the submission of all documents relating to the environmental licensing of the project financed by them and issued by responsible controlling agencies, under penalty of becoming jointly liable for any effects arising from the violation of this Act or its regulations (Bruna Acerbi).

2) In addition, an environmental cost-benefit analysis must be taken into consideration, defining the aims of a project and identifying its impacts, defining them according to their relevance and measurement in physical units, as well as appraising them in monetary terms. (Luiz Borges)

3) Experience from a Brazilian financial institution on incorporating socio-environmental criteria into institutional and management policies of credit allocation: "Itaú Unibanco has a Socio- Environmental Risk Policy which sets out the internal guidelines for the identification of socio-

environmental risks of the projects<sup>1</sup> to be financed. Consequently, Itaú Unibanco has a specialized multidisciplinary team, which (i) accesses the socio- environmental conformity of the project and that of the potential corporate client,

(ii) issues an opinion which is taken into account in the credit approval process, and (iii), as the case maybe, monitors the projects and respective clients. To check socio-environmental conformity, this team: a) verifies if the potential corporate client is involved in activities related to forced labor, child labor and prostitution. Should such activities come to light, the request for credit will be turned down; b) verifies if the potential client operates in sectors which have a significant socio-environmental impact, such as<sup>2</sup>: (i) extraction and production of wood, firewood and charcoal from native forest areas; (ii) mining and industrialization of asbestos; (iii) fisheries; or (iv) production and sale of firearms, munitions and explosives. In these cases, Itaú Unibanco conducts specific investigations in accordance with the activity involved: i) investigates the potential customer's socio-environmental management and the existence of any legal or administrative actions or news items which might cast the client in an unfavorable light; ii) solicits socio-environmental documentation with respect to the potential client and the project itself, among which, the environmental license; iii) undertakes technical visits, as required; and (iv) requests a technical analysis of the project where necessary. Once the financing is approved, the contract is drawn up to include environmental clauses allowing Itaú Unibanco to suspend with immediate effect the liberation of funds and to require early repayment of the operation in the event of the financed entity's non-compliance with the socio-environmental legislation and regulations. There are also specific contractual provisions for such cases, among others, genetically modified organisms (GMO) research, compliance with legal forest reserve norms, permanent preservation areas and lands declared as pertaining to indigenous peoples' reservations. Where a transaction is collateralized with real estate, Itaú Unibanco checks as to whether the property given in guarantee carries any environmental liabilities through an examination to be performed by an appropriate expert" (Itaú Unibanco).

#### **d) The liability of non-governmental organizations**

1) Consolidate Chapter 27 of Agenda 21, in particular: "27.1. (...)The credibility of non- governmental organizations lies in the responsible and constructive role they play in society. Formal and informal organizations, as well as popular movements, should be recognized as partners in the implementation of the Agenda 21. The nature of the independent role played by non-governmental organizations within a society calls for real participation (...); 27.5. Society, Governments and international bodies should develop mechanisms that allow non-governmental organizations to play their partnership role in a responsible manner and effectively in the process of environmentally sound and sustainable development. 27.6. In order to strengthen the role of non-governmental organizations as social partners, the United Nations System and Governments should begin a process of reviewing formal procedures and mechanisms for the involvement of these organizations at all levels from policy-making and decision-making to implementation, in consultation with non-governmental organizations (Erico Mabellini).

1 Projects: construction, implementation or expansion of production units or infrastructure.

2 Mentioned sectors are examples. Periodic evaluations are made to ascertain the inclusion of new sectors.

**e) Information Access and Public Participation**

**International Recommendations**

- 1) It is necessary to define the meaning of the right of access to information at both the international and national levels (PDMA).
- 2) Signing a Regional Convention in Latin America in order that the principle of information access may be implemented, under the control of an institution, such as ECLAC (The TAI Network).
- 3) Ratifying of the Aarhus Convention (PDMA).
- 4) Establishing the right to access information on biotechnology and nanotechnology as well as nuclear and other advanced technologies (Solange Telles da Silva).

**National Recommendations**

- 1) Establishing publication deadlines for all documents related to environmental decisions (PDMA).
- 2) Imposing financial penalties in the case of noncompliance with publication deadlines (PDMA).
- 3) Ratifying of the Aarhus Convention (PDMA).
- 4) Signing a Regional Convention in Latin America to be implemented the access to information in the region under control of a regional institution (PDMA).
- 5) Establishing a fully detailed decree of often imprecise terms, with some examples of articles (PDMA):
  - a) Public audiences may be conducted, for instance, by sector, population or community, in order not to allow domination of the audience by people who have greater chance to express themselves (Colin Crawford).
  - b) Requiring effective mechanisms of access to all relevant documents to public audiences by population and interested communities, as well as access to versions with comprehensible language of details of the proposed projects (PDMA).
  - c) Providing training courses for community leaders and mediation techniques in order to qualify the ones who need to access the public audience procedures (PDMA).
  - d) Requiring public participation from the beginning of the procedure or process that will affect a specific community (PDMA).
- 6) Requiring the preparation of Environmental Impact Report (EIR) linked to the Preliminary Study Environmental Impact Assessment (EIA) (PDMA).

- 7) Environmental documents shall be available on the Internet (Larissa Clare Pochmann da Silva).

**f) Oversight and Accountability**

- 1) Implementation of the monitoring system such as the GRI in the States (PDMA).
- 2) Controlling of information provided by the companies in their annual reports by the state through a government agency (PDMA).
- 3) Disclosure of corporate balance sheets on the Internet (with compatible data set by States) (PDMA).
- 4) Rule on the requirement of social balance, with the prediction of environmental and social aspects (PDMA).
- 5) Issuing a decree stipulating the criteria that should be in the company's annual social report in order to make that information comparable (PDMA).

**g) Green Public Procurement**

**International Recommendations**

- 1) Writing more specific guidelines on the green bidding topic at Rio +20 (Teresa Villac P Barki).
- 2) Strengthening of the sustainable Public Procurement in the MERCOSUL (Teresa Villac P Barki).

**National Recommendations**

- 1) Insertion of sustainable hiring in the planning activities of public entities (Teresa Villac P Barki).

**h) Water: The Creation of Protected Areas on the High Seas**

- 1) In order to achieve sustainable development, States should create marine protected areas (Fernanda Salgueiro Borges).
- 2) Marine Protected Areas should be considered as areas of full protection, essential for the conservation of biodiversity and for the maintenance of essential ecological marine processes (Fernanda Salgueiro Borges).
- 3) Any activity affecting or potentially affecting the ecological balance and biodiversity conservation in marine protected areas should be considered prohibited in respect of

the right to an ecologically balanced environment for the present and future generations (Fernanda Salgueiro Borges).

4) Marine Protected Areas should ensure the protection of biodiversity and the quality of marine waters, to avoid acidification and death of organisms for biotic and abiotic necessary to capture carbon from the atmosphere, responsible for mitigating global warming and climate changes (Fernanda Salgueiro Borges).

5) Marine Protected Areas should ensure the preservation of natural fisheries resources, required for food security of present and future generations (Fernanda Salgueiro Borges).

***j) Water: The Management of Aquifers Located under the Territories of Several***

***Countries***

1) Reduce asymmetric information (specific case of Guarani Aquifer) (David Cassuto and Romulo Sampaio).

2) Increase regional and local engagement (awareness, capacity-building and traditional knowledge) (David Cassuto and Romulo Sampaio).

3) Harmonization of national legislation (David Cassuto and Romulo Sampaio).

4) Regulatory structures (environmental services) (David Cassuto and Romulo Sampaio).

***j) Taxation as a Means of Environmental Management***

**International Recommendations**

1) Establish a limit (cap) for each country of carbon emissions. The initial cap will be the result of the average carbon emissions over the past three to five years. A transition rule might be created (more lenient rule) for developing countries and LDCs (Least Developed Countries – according to WTO classification) - so that these countries are not disadvantaged because of their low level of current development, and so they can still develop despite the targets for carbon reduction (Tatiana Falcão Octaviano).

2) The carbon emitted in each country shall be taxed in order to encourage companies to use resources in developing new technologies for clean energy production. The tax rates should be the same in each country (we suggest the establishment of a maximum rate and minimum rate), so that they are not created "carbon tax havens" (Tatiana Falcão Octaviano).

3) Establishing maximum and minimum rates that will also prevent the adoption of tariff adjustments on products importation (Border Tax Adjustments "BTA") (Tatiana Falcão Octaviano).

4) Creating a treaty that establishes a origin for the carbon emitted as a result of international activities (Tatiana Falcão Octaviano).

5) Creating a new international body with police power in order to monitor and eventually penalize those who do not comply to the limits imposed by the treaty (Tatiana Falcão Octaviano).

**National Recommendations**

1) Green tax:

a) Establishing a less onerous form for the final consumer, for fuel tax, so as to encourage the consumption of cleaner fuels (such as biodiesel and alcohol) in order to reduce the consumption of high carbon concentration fuels, which are more pollutant, such as diesel and coal burning (Tatiana Falcão Octaviano).

b) Establishing a green contribution (purposing the creation of a fund to combat climate change and reduce the harmful effects of global warming) on fuel. The contribution would be progressive, more burdensome to diesel fuel and less to biodiesel, for example (Tatiana Falcão Octaviano).

c) The funds raised with the contribution should be used in development of green Brazilian technology for the production of electric cars, development of new forms of biodiesel (for instance, it is possible to transform peel potatoes and other vegetables into fuel) and even for the promotion of "green" initiatives such as increased efficiency in the recycling project, replanting of forests (which are also internationally known as "carbon sinks" as we consume and re-absorb carbon from the atmosphere), construction of bike lanes to encourage bicycle use by local people, etc (Tatiana Falcão Octaviano).

***k) The Non-Regression Principle in Environmental Law***

**International Recommendations**

1) Integration of the principles of non-regression of the human rights area into environmental law

(Michel Prieur).

2) In order to preserve the sustainable development and ensure the necessary protection of the environment, states may not take legislative, administrative or judicial measures importing an unlawful reduction of their protection levels granting by laws that protect the environment except in public interest prevalent case (Maria Morelli).

3) If states adopt a legislative, administrative or judicial measure which reduces levels of environmental protection in force, they shall justify the reasonableness and proportionality of the measure (Maria Morelli).

**National Recommendations**

1) The environmental goals should be achieved in a gradual manner, through provisional and final targets, on the basis of a state planning that facilitates the implementation of activities related to these goals (Maria Morelli).

2) Efforts to ensure environment protection and conservation cannot decrease. So in this sense, it is forbidden to adopt legislative, administrative or judicial measures that illegitimately reduce

levels of environmental protection legislation, except in case of public interest, which must prevail (Maria Morelli).

**l) The definition** and criteria for local sustainability

#### **National recommendations**

1) Definition and promotion of sustainability indicators that can be used for the formulation of local environmental policies. Indicators should reconcile the protection and preservation of goods, services and environmental and cultural resources with economic and social development needs (PDMA).

**m) Policies and standards for the protection of animals**

1) Review: As founder and director of an NGO for the animal and environment, I would like to emphasize, that the animal protection associations also have great value to the conservation of the natural environment, which is "habitat" of wild animals from all over the world. The claims of the Animal Rights Movement will allow the Rio + 20 Conference to transcend the anthropocentric world view, by citing that not only humans, but also many non-human life forms that inhabit this planet with us, as the non-human animals are subjects of rights. Another important role of the third sector aimed at the protection of animals is the constituted authorities to help in the fight against wildlife trafficking, criminal activity that destroys the environment in a completely unsustainable and unacceptable way, in all respects (Erico Mabellini).

#### **4) Green Economy on Sustainable Development context: eradication of poverty**

**a) Regularization**

1) Establishing property rights in forested areas and biomes in order to prevent illegal deforestation. (Fernando Meneguín).

2) The concession of rights to public lands to ensure better monitoring of national resources and to facilitate land regularization (Fernando Meneguín).

3) Imposing limits on land use; the concession of land rights, which are not absolute, but provide benefits to the title holder and to the state though terms and restrictions on the use of the land (Fernando Meneguín).

4) Establishing an effective policy and a coordinated regional planning (Jose Heder Benatti).

a) The State must be proactive and coordinate the process of regional planning for public policies that are effective, because the lack of a public goods allocation policy may leave space for the a chaotic land occupation of public areas, through land invasion and deforestation, which often happens when there is no such policy.

b) So in this sense, it is necessary to establish a regional planning policy to include: land regularization; environmental licensing of rural properties; obedience to the social function of ownership; control, enforcement and economic instruments

19

capable of stimulating the sustainable management of natural resources, especially forests.

i) For example, the economic or tax incentives can stimulate private

spending in certain areas, discourage bad behavior, and correct the market trends that can encourage actions against nature conservation and the natural resources protection.

5) Land regularization in order to ensure control and define property rights, allowing the public power to know who is occupying land and how they are being used (Jose Heder Benatti).

a) Firstly, to overcome the current land chaos, land ownership must be determined - who is the owner of the land, public or private sector? If public, which federative entity?

b) Official recognition of the different existing forms of occupation should allow the state and society to have the control over the use of land and other natural resources. Therefore, the regularization will be positive and not negative, since it prioritizes family occupation.

c) Another positive effect of land regularization policy is the fight against illegal occupation of public lands.

6) There are several necessary steps to implement a land use (José Heder Benatti):

d) To overcome the limited management capacity of agencies responsible for planning land, whether in its technical or staff.

e) Understand that the consolidation of rural property, respecting the social and environmental assumptions, represents an important step towards the strengthening of citizenship and environmental protection.

7) The process of regularization of land occupation should (José Heder Benatti):

f) Be accompanied by a survey and a descriptive, georeferenced memorandum. The financial costs for its preparation should be the responsibility of recipient of legitimacy, with exception of the processes of regularization of small properties.

g) Include in the title deeds issued by the land agency clauses requiring the beneficiary to maintain, conserve and, if appropriate, restore the permanent preservation areas and legal reserves.

8) Other necessary and complementary actions to the regularization (Jose Heder Benatti). h) Scanning of land acquis.

i) Modernization of access to registry information of rural land in order to increase the effectiveness of the real estate property registration processes records and ensure that information can be obtained quickly and from a distance by public authorities relating to questions of federal land.

**b) Environmental Education**

#### **International Recommendations**

1) Making investment in education a priority in developing countries and underdeveloped countries, since the lack of education contributes to unemployment which results in crime and poverty. In addition, ensure that education serves as a tool for public awareness of the current problems in the world, such as politics, health and environmental preservation. The unequal distribution of wealth is also a consequence of poor education (Patricia Pellanda).

#### **National Recommendations**

- 1) Environmental education, at all levels, is everyone's responsibility because it contributes to the reduction of social inequalities. The principle of transversality should be followed in schools (Maria Collares).
- 2) Government should be able to train teachers to teach environmental education at all levels of government and to monitor the effectiveness of the method adopted (Maria Collares).
- 3) Information on Environmental education requires transparency to public in order to contribute to the protection of natural resources, the public health and to the poverty eradication (Maria Collares).
- 4) Environmental education propels sustainable development. It should be compulsory in schools, social, professional and public activities (Maria Collares).
- 5) The inclusion of Environmental Law as a mandatory subject in law schools in order to contribute to educate professionals to apply effectively environmental legislation in all activities (Maria Collares).

#### **c) The fundamental right to land and food3**

##### **International Recommendations**

- 1) Regarding the right to food, the focus of debates is on hunger eradication of people. This problem cannot be based on instruments that aim at increasing food production in the world, but on appropriate means to combat social inequalities and unequal distribution of wealth (Patricia Pellanda).
- 2) Cooperation and mobilization of all countries is necessary to fight against poverty and social exclusion. It is necessary to decentralize poverty policies in order to enforce cooperation, based on the premise that resources should be made available by the richest countries for the poorest countries (Alexceia Ferreira).
- 3) Encouraging the application of a "Solidarity Economy", warning private sector that their donations and supportive attitudes may contribute to the results of the company itself (Patricia Pellanda).

##### **National Recommendations**

- 4) Guarantee of land and territories granted to indigenous people and traditional communities as a collective right, transcending the idea of merely individual property (Patricia Pellanda).
  - 5) Prevent State's domestic law equating indigenous lands to family farms. On this perspective it is important to achieve an international commitment and recognition of specific features of indigenous people and their cultural practices. This measure will prevent the high development
- 3 Recommendations presented in this topic were defined by Alexceia Ferreira, Antonio Araujo, Felipe Iubel Belao, Fernando Cesar Pellanda, Herik Chaves, João Renato Lima Paulon, Juliana Correa Tuji, Liana Amin Lima da Silva and Patricia Précoma Pellanda.

of agribusiness lands and other explorations that have been occurring frequently on these populations' lands (Patricia Pellanda).

- 3) The commitment of States to reduce/eliminate corruption in politics. In addition to this, States shall punish those who: divert funds, individually enrich and "forget" their real function towards government and social obligations. Corruption can be reduced by strengthening social bases and basic education (Patricia Pellanda).
- 4) Public awareness that many problems can be solved in the short term through measures introduced by them and taken by the population itself, independent from the government. Problems such as hunger and environmental devastation belong to everyone. In long term, the eradication of poverty can be solved through an alliance between civil society and government. Since it is a problem that concerns everybody, it is the essential to engage various sectors of society (Patricia Pellanda).
- 5) Besides sufficient quantity of food to fulfill basic human needs, the quality of food and water should be prioritized, in order to achieve international food security intended. Quantitatively and qualitatively appropriate nutrition result in positive consequences for the health sector such as diseases reduction, especially those arising from the use and the consumption of pesticides and new technologies (transgenic) (Patricia Pellanda).

#### **d) Definition and Criteria for a Sustainable City**

##### **National Recommendations**

- 1) Definition and promotion of sustainability indicators that may be used for the development of local environmental policies. These indicators must reconcile the protection and the preservation of goods, services, environmental and cultural resources with the needs of economic and social development (PDMA).

#### **e) The rights of indigenous people and of traditional communities**

##### **International Recommendations**

- 1) A Protocol is necessary to precise definitions, obligations and rights of indigenous people and traditional communities with provisions such as (PDMA):
  - a) Prior, free and informed consent in relation to any activity held in indigenous areas;
  - b) Participation in the implementation of projects that can affect their lives;
  - c) Protection and guarantee to land access, natural resources and to benefits derived from their use;
  - d) Recognition of traditional knowledge of indigenous people and protection of people relocating to other territories;

e) Monitoring mechanism should be created at the international and national levels to ensure transparency and effectiveness of these rights.

2) Indigenous people may be impacted from the consequences of global climate change. It is

necessary to ensure that such impacts are mitigated and that training and adaptation to climate change are rights of these peoples (PDMA).

3) Indigenous people have a crucial role in the conservation of environmental resources. This role should be recognized for compensation for environmental services and distribution of REDD benefits (Reducing Emissions from Deforestation and Degradation) (PDMA).

#### **National Recommendations**

1) Better access to information and participation of indigenous people in the implementation and development of projects that affect them directly or indirectly (PDMA).

2) Recognition of land and territories granted to indigenous people and traditional communities as a collective right, transcending the idea of merely individual property (Patricia Pellanda).

3) More precise definitions of terms such as traditional communities (Colin Crawford).

#### **NATIONAL AND INTERNATIONAL INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT.**

##### **5) National Institutional Framework**

###### ***a) Legal and Procedural instruments***

###### **International Recommendations: procedural instruments**

1) Acceptance of civil society participation through representative entities such as *amicus curiae*

in international environmental dispute settlement (Larissa Clare Pochmann da Silva).

2) Establishing a right to sue, the lack of implementation of environmental treaties in national tribunals (Gérard Monédaire).

3) Creation of Regional Integrations, provided with a distinct legal personality from the Member States, competent to sign Environmental Treaties (Gérard Monédaire).

4) Right of petition, so that the society can intervene in the Legislative Assemblies or Commissions (Gérard Monédaire).

5) Imposition of financial sanctions to disobedience or incomplete compliance with Tribunals decisions or laws concerning environment (Gérard Monédaire).

6) Reversal of the burden of the proofs in environmental disputes (Carole Peychaud).

###### **International Recommendations: legal instruments**

1) A treaty on the reparation of environmental transnational damage affecting citizens of other countries (Larissa Clare Pochmann da Silva).

###### **National Recommendations: procedural instruments**

1) Disclosure of condemnation of environmental damage with destination of these values to international public funds. Publicity of the application of these values to environmental protection (Larissa Pochmann Clare da Silva)

###### ***b) Analytical methods to measure the effectiveness of law enforcement***

###### **International Recommendations**

1) The Secretariats of the Conventions must require States to designate national institutions to be National Points of Contact responsible for identifying the implementation of environmental treaties (PDMA).

2) The priority must not be the creation of new laws and treaties, but the political and legal commitment to the implementation of existing standards (Patricia Pellanda).

###### **National Recommendations**

1) Application of environmental quality standards such as agricultural pesticides eradication that have occurred in Europe (Solange Teles).

2) Creation of legal environmental sustainability indicators of environmental governance (Solange Teles).

##### **6) International Institutional Framework**

###### ***a) Existing Institutions***

###### **International Recommendations**

1) Creating a new international agency within the United Nations to discuss sustainable development, which would incorporate the UNEP and the committee within the ECOSOC responsible for sustainable development (PDMA).

2) Creating a committee inside this new body that would represent international NGO's selected according to their performances (PDMA).

- 3) Focus on UNEP (PDMA).
- 4) The transformation of the UN Economic and Social Council to the Economic, Social, and Environmental Council (PDMA).
- 5) Reforming of the Commission on Sustainable Development in the General Assembly (PDMA).

***b) The Necessity of new institutions: the World Environmental Court***

**International Recommendations**

Considering the International Court of Justice (ICJ) importance in the international community - we propose the reform of the ICJ or the foundation of a World Environment Court, based on the following proposals (Rafael Prado):

- 1) Increase flexibility of the ICJ Environmental Chamber, and encourage the use of principle of the public participation principle and the access of stakeholders to justice (not just government but also civil society). The public participation principle is fundamental principle in International Environmental Law and was recognized by the ICJ Judgment in the same case of the Pulp Mills on the Uruguay River (Rafael Prado).
- 2) ICJ shall demonstrate its wide jurisdiction over environmental matters involving Member States, not by modifying its Statute inserted in the UN Charter, but materializing the public participation principle and access to information and to justice, in case of environmental issues that directly affect national populations of litigants countries (Rafael Prado).

***c) The necessity of new Institutions: World Environmental Organization***

**International Recommendations**

- 1) Environmental conventions Secretariats, as technical instances of conventions, would be specialized organs in the new International Organization (Sandro Schmitz dos Santos).
- 2) There would be a Settlement Body, according to the model of WTO, which would also be a consulting and arbitration body on violations of International Environmental Law. This body would also be composed of a Commission with competencies similar to the Inter-American Commission on Human Rights (IACHR) (Sandro Schmitz dos Santos).
- 3) Three would be the new organization sources of income: the quota-share from the participant countries, major financial penalties for environmental damage, and fees obtained from carbon credits certification and environmental economics in general (Sandro Schmitz dos Santos).

**Moderators of the Forum Rio + 20, researchers and institutions that have contributed for the recommendations**

## Major Group for Children and Youth

Major Group for Children and Youth Contribution to the Outcome Document of Rio+20

This is the contribution of the Major Group for Children and Youth, incorporating the perspectives of young people from all regions. It specifies our goals and priorities for concrete action and change.

The world faces significant challenges that can only be tackled by global cooperation. Rio+20 offers a unique opportunity to make a new programmes for genuinely sustainable development globally, nationally and locally. Our hope for Rio+20 is that there is significant participation by heads of state in the negotiations to ensure commitments are taken more seriously, and that governments are held accountable for agreements that are not implemented. Finally, we call for the adoption of a UN General Assembly resolution to strengthen the agreements reached at Rio+20.

### 1. OBJECTIVES

#### A. RENEWED POLITICAL COMMITMENT

We call for:

- A holistic commitment to mainstreaming and implementing Agenda 21 and the Rio declaration, while taking it further by including new and emerging issues. All relevant international organisations and national legislatures, with the involvement of civil society, should adopt formal mechanisms to ensure that economic and sustainable development discussions are not held in isolation. These mechanisms should have the authority to act as a check-and-balance on the formulation and implementation of policy.
- Implementation of all agreed upon commitments from the previous CSD cycles by member states, including incorporating them into their National Sustainable Development Strategies. This can be supported by incorporation into the programmes of international financial economic institutions, namely the IMF and the World Bank Group, as well as the WTO. International institutions can take the lead in ensuring that policy recommendations are followed through.
- Securing of resources for development and implementation of Action Plans. There is a need for thorough and transparent evaluation of budgets, governance of the allocation of funds, donor coordination, collaboration between existing initiatives and use of funds. We call for the establishment of a dedicated instrument for financing and implementing Sustainable Development outside of the World Bank Group, which implements decisions in general, and specific decisions on sustainable development as decided by various forums ranging from the UN-CSD, the UNFCCC, the CBD, the CCD, UNEP, etc., or in terms of transitioning to the Green Economy (in the context of Sustainable Development and Poverty Eradication), or within specific sectors (e.g. energy, agriculture). This instrument should be governed with a fair geographic representation, which reflects both funding partners and recipients, next to the full inclusion of non-state actors in its governance.
- Sustainable Development Goals (SDGs) with sufficient ambition to meet environmental and social challenges. As the UN General Assembly office, under the guidance of the UN Secretary General, is currently considering the post-Millennium Development Goals (MDGs) framework, the process leading towards the adoption of the SDGs must be streamlined with this follow-up of the MDGs. In his recent report, the UN Secretary General indeed named Rio+20 as an important international event that could contribute to the post-2015 framework. This new SDGs framework should consider in particular the links between poverty, gender inequality, climate change, biological diversity, human rights, ending violence and inequity. Finally, a strong implementation framework and related institutional elements should be developed in order to guarantee the review of the implementation and the compliance of each state.

#### B. PROGRESS AND IMPLEMENTATION GAPS

We call for:

- Dynamic policies that take into account the diverse economic, environmental and social contexts in which they operate in different member states. This must be captured in the introduction, implementation, monitoring and evaluation stages of the policy design. Adverse impacts of "one-size-fits-all" policies such as structural adjustment must also be addressed.
- The adoption of a 10 Year Framework of Programmes on Sustainable Consumption and Production by 2013 and ensuring its integration into policies and law by 2015.
- Member states should establish evaluation and monitoring mechanisms that will obtain specific feedback and data to determine the effectiveness of policy implementation pertaining to the agreements made at the Sustainable Development Summits, addressing and correcting implementation gaps and providing accountability for both member states and civil society. This should include an integrated regional reporting system between economic, social, environmental and other aspects of Sustainable Development that has clear indicators, and milestones to monitor implementation and to build accountability and ownership of the solutions.
- Addressing the impact of armed conflict on local communities and the environment, with special consideration for related conditions that pose severe threats to children and youth, such as: disruption of basic services, endemic disease, intolerance, terrorism, and environmental hazards and degradation (e.g., landmines and medical waste). Additionally, strengthen international, national, and local partnerships to engage local stakeholders in support of environmental assessments and integrated financial mechanisms; and post-conflict reconstruction, capacity building, victim assistance, and risk education.

### C. NEW AND EMERGING CHALLENGES

Policies designed to tackle short-term economic crises must not reinforce and prolong unsustainable practices of consumption and production. The current economic crisis can be an opportunity to reflect on systemic ecological, economic and social problems, to pre-empt new and emerging challenges and develop long-term strategies to prevent future climate, energy, food and water crises.

It is important that economic, social and human rights institutions are strengthened and that the environment perspective is integrated into their work. In addition, at the UN level, interagency and inter program networks should be established in order to facilitate communication and coordination among different UN actors in order to have an integrated approach and effective international governance on Sustainable Development. Though the goals of economic and social development and environmental sustainability can be in conflict at times, there is a need for them to co-exist to secure a sustainable future. This should lead to:

- Redefined enforcement of sustainable development agreements
- The coordination of multilateral economic, human rights and environmental agreements
- Access to justice
- Donor coordination for efficient and appropriate use of funds
- More effective monitoring and evaluation of implementation gaps, assessment of progress and evaluation of emerging challenges.

Radical changes in the geopolitical world amplify the challenge of providing water, energy and food to a growing population, particularly in developing countries, where children and youth are the most affected by precarious living conditions. Given that the previous Earth Summit successfully elevated the status of sustainable development goals, global leaders must incorporate the water, food and energy security nexus into Rio+20 discussions, so that its importance as a sustainability concept is also validated. This is essential to promote and deliver comprehensive frameworks at a local and regional level that account for the intricacies of an interconnected world.

### 2. GREEN ECONOMY IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT AND POVERTY ERADICATION

We consider a Green Economy to be egalitarian, low-resource economic and social systems that cultivate societal and cultural wellbeing and thriving and resilient natural ecosystems. A Green Economy fully integrates key principles of the Rio Declaration: intergenerational and international equity, and pays special attention to the inclusion of youth and children as the building blocks of a sustainable future. The transition to the Green Economy will require an improved notion of wellbeing, measured with indicators beyond just GDP, that fully take into account the limits of our common planetary and social boundaries.

We call for:

- Youth unemployment to be reduced through the creation of green jobs with a living wage and the stronger consideration of the impact of employment policy on youth. Governments should promote young people's role in the workforce by providing them with the appropriate skills and knowledge to improve their employability. Possible initiatives could include locally appropriate job-training in the context of sustainable development, start-up capital for young entrepreneurs and apprenticeship programmes.
- Education for Sustainable Development (ESD) must equip the next generation of youth with skills, training and capacity to help create the Green Economy. ESD should be structurally integrated into the national sub-national curricula and made accessible to all, taking into account local communities' needs. Priority should be given specifically to drastic improvements in teacher training for ESD and recognition and support for alternative forms of education, non-formal learning, online resources and peer education.
- The creation of a "Global Technology Sharing Facility", which would enhance sharing, enable prior assessments and provide monitoring of technology on the global scale. Alternatives to market-based intellectual property rights have to be developed and new digital information infrastructures could foster the rapid circulation of knowledge and technologies worldwide, based on the notions of fair access and mutual benefit sharing. We must also protect and nurture traditional, local and Indigenous knowledge and recognise their value as alternative technologies. Public and private stakeholders must collaborate internationally and strive to incorporate cradle to cradle design into new and existing technological and product lifecycles.
- An integrated approach to the conservation of species and ecosystems, particularly threatened species and ecosystems. Compliance with international conventions, and agreed international standards for the recording of natural resources and periodic assessment by independent authorities, in collaboration with all stakeholders. These efforts are crucial to ensuring that consumption of natural resources is below regeneration rates. Natural resource impact labelling should be mandatory for every industrial product.
- Strong legislative and executive actions by governments to promote the sustainable development of our Blue Economy, avoid depletion of finite water resources and achieve long term food security for fisheries-dependent communities. Actions should include the establishment of a global network of marine protected areas and "no-take zones", including a moratorium on mineral exploration in the Arctic and proper mechanisms for conflict resolution over aquatic resources, with special emphasis on water. Conflict over future water availability and allocation decisions, under likely global pressures like climate change, must be recognised and addresses as a serious global threat to long-term peace and security.
- A 'low-carbon' future that promotes renewable energy and energy efficiency. Specific, measurable, attainable, results-oriented and time bound (SMART) targets should be devised for the development, accessibility and efficient use of clean energy, and demand reduction and energy conservation. This should involve unprecedented funding and technical support for the development of low carbon, renewable infrastructure.
- An urgent start to the transition towards a green, fair and people-centered agriculture that promotes a sustainable food system producing sufficient, healthy and balanced food for all and maintaining and/or enhancing ecosystems, biodiversity and natural resources. Investments in rural areas should be increased to assure decent incomes and living conditions while creating job opportunities for rural communities, especially including youth. Governments must protect the rights of those working and subsisting off the land and aim towards collective, decentralised ownership for sustainable, resilient and productive ecosystem management. Traditional farming and indigenous knowledge, past and present, offer a wealth of potential solutions and should be recognised as such. It is our hope that an outcome of Rio+20 might be a revitalisation of vital knowledge sharing mechanisms in agriculture.
- Strengthening the capacity of national healthcare systems with an emphasis on universal and comprehensive Primary Health Care. This should include universal access to family planning services for women and girls, because this already proves to be an in-demand, cost effective method of increasing communities' resilience to climate change impacts, whilst meeting the health and development needs of people around the world. Women and girls should receive education and easy access to comprehensive health services and supplies.
- The integration of sustainability into all tourism-policies and management practices through the creation of a 'Green Economy Roadmap' aiming at the active participation of local populations in developing sustainable tourism. Development institutions should work collaboratively with the tourism industry to foster increased potential for local hiring and sourcing and significant opportunities in tourism oriented toward local culture and the natural environment.

- The promotion of holistic and long-term sustainable city planning based on master planning that takes in account population growth, natural resource utilisation, ecosystem preservation, public space accessibility, building design, efficient transport and waste management. Sustainable architecture should strive to improve living conditions, reduce vulnerability and diminish exposure to hazardous materials. This could be made possible through financial incentives and mandatory technical standards for new developments.
  - The removal of harmful subsidies that result in unsustainable practices and threaten development. These include agriculture, fossil fuel and fishery subsidies. If such vast sums of money were being directed toward sustainable development, we would be great strides further on the path to realising the kind of world we want to see. 3.
- INSTITUTIONAL FRAMEWORK FOR SUSTAINABLE DEVELOPMENT

#### A. Balanced participation of all stakeholders

- Ombudspersons for Future Generations

Rio+20 should secure collective commitment for the establishment, at the national level, of Ombudspersons for Future Generations. These independent institutions, working from the heart of government, should be mandated to provide an assessment of the long-term impacts of public policies and legislative proposals. They should also respond to citizen petition, investigating claims of environmental crimes and offences and engaging in either conciliation or litigation.

Furthermore, we call for the establishment of an independent Office of the UN High Commissioner for Future Generations. Similar to the national level Ombudspersons, the High Commissioner would seek and analyse system faults on the global level, i.e. situations where even the normal, regular flow of activities results in significant jeopardy of the interests of future generations. This office would have both an agenda-setting and advisory role with regard to the long-term environmental and social coherence and impacts of UN agencies, policies and programmes and other multilateral treaties. It would function in close cooperation with civil society. This office would also support the capacity of developing countries to establish effective mechanisms of intergenerational accountability and provide a forum for the exchange of best practices in relation to the establishment of national Ombudspersons for Future Generations.

- Participation of stakeholders

We call on governments to seize the opportunity offered by the Rio+20 process in order to re-engineer participation within Sustainable Development and to elevate this as a cross-cutting issue in the whole SD-governance.

- Government needs in Rio to either adopt one global or several regional conventions based on principle 10 of the Rio 1992 Declaration and including a compliance mechanism, on the model of the Aarhus Convention.
- At the international level, civil society participation should be evaluated and elevated at all relevant political forums, including financial institutions. Such participation should include the representation of a minimum of 2 non-voting representatives of civil society in the respective bureau.
- All states should urgently implement the Agenda 21 recommendation of establishing national sustainable development councils. Where such Councils already exist, they should be strengthened and provided with adequate resources, political leverage and support by exchanging best-practices. These councils should by default try to mirror all Agenda 21 Major Groups.

#### B. Ensuring progress towards global sustainability

While key legal principles have already been recognised at Stockholm and Rio Conferences, compliance with these principles has been critically lacking, thus requiring the urgent establishment of new accountability mechanisms.

- World Environmental Court

We call for the establishment of a World Environmental Court to take decisions related to the non-respect of national obligations under international environmental law. This court will provide a forum for individuals and communities to hold states party to international environmental agreements legally accountable for their commitments. Procedures for individuals and communities to file a complaint to the Court should be based on those of existing Human Rights courts such as the European Court of Human Rights.

- Creating a new momentum for the implementation of the precautionary principle

Rio+20 presents a unique opportunity to develop institutional arrangements necessary for the full and effective implementation of the precautionary principle. We call for the legal recognition of the fact that industrial production and commercialisation of new substances and technologies should not be authorised in the presence of a reasonable doubt regarding their potential to harm our environment or the natural capital left to our children. In the case of practices and activities creating short-term risks for ecosystems and communities, a proper insurance mechanism should obligate those taking the risks to be in the capacity to fully repair any damages intentionally or accidentally resulting from their actions.

#### C. Ensuring knowledge-based decision making

- Intergovernmental Panel on Sustainable Development (IPSD)

Given the growing fragmentation of knowledge, we call for the establishment of an Intergovernmental Panel on Sustainable Development that functions as an umbrella organization which should design a sustainable development research agenda for the 21st century that reviews relevant scientific knowledge (including not only natural sciences but also social sciences such as economics). Scientific evidence should contribute to knowledge-based policy making and policy monitoring. The Panel should also be mandated to provide an assessment of ecological boundaries.

#### D. Creating a set of global institutions for sustainability

Delivering political coordination and momentum

- UN Council on Sustainable Development

We call for the immediate establishment of a Council on Sustainable Development as a subsidiary to the UN General Assembly, with the authority to adopt legally binding decisions. This Council would seek integration of all composing elements of Sustainable Development, at a higher political level than is currently the case within the existing UN bodies dealing with the matter. It should also be mandated to coordinate the work on Sustainable Development of both the Bretton Woods and UN institutions in a coherent manner. Finally, this institution should enshrine Civil Society participation within its design, upgrading the existing CSD practices amongst others, including representatives of Major Groups within its governance (Bureau).

- Stewardship for Global Commons

We also call for the immediate establishment of a transparent and participatory trusteeship for the transitional governance of the global commons until they are adequately governed by legally binding rules, based on a sense of shared responsibility and the principles of subsidiarity and intergenerational equity. This process should lead by 2015 to the establishment of a permanent, legally-binding Global Commons Trust that cooperatively and responsibly develops, manages, maintains and equitably shares in the usage and benefits coming from resources that are held in common by the community at large. Whilst sympathetic to the vulnerable, there must be a local-global framework and participatory processes to address the issue of free riders.

#### Ensuring implementation

- Upgrade UNEP into a new UN Environmental Organisation with status as a specialised UN agency with the capacity to deliver

We call for an upgrade of both mandate and status of the current UNEP in order to enable this organisation to supervise all environmental sustainability initiatives within the UN. This new, specialised agency will provide an accountability mechanism for policy makers and national ministries and should coordinate all UN programs, agencies and affiliates who are working on initiatives related to or having an impact on environmental sustainability. The international community must ensure that it possesses the adequate means to successfully implement its mission.

The long-term review process for the improvement of Sustainable Development Governance at the UN level should assess the pros and cons of other institutional frameworks, such as the creation of an all-encompassing World Organisation for Sustainable Development.

---

## Marine Conservation Institute

Marine Conservation Institute is pleased to be able to submit these recommendations to you and your office for consideration regarding Rio+20 preparations. We are a registered non-profit organization with

consultative status with the United Nations Economic and Social Council (ECOSOC).

We welcome the preparations and discussions to date for Rio+20 and would like to highlight four main

areas where we feel valuable global progress could continue to be made at the Conference:

1. The expansion of the scope of the Green Economy initiative to more fully integrate maritime activities — the so-called *Blue Economy*;
2. The recognition of the need for an overarching global mechanism to protect biodiversity in the marine areas beyond national jurisdiction (hereafter referred to as the "high seas");
3. Agreement to codify the precautionary approach through required impact assessments *before* human activities are authorized to proceed on the high seas, including fisheries;
4. A phasing out of the most harmful form of fishing in the high seas, bottom trawling, by 2015 — the target date for sustainable fisheries set by the 2002 World Summit on Sustainable Development.

On the following pages, these recommendations are further explained. Thank you for your careful consideration.

Sincerely,

Jeff Ardron, Director High Seas

600 Peninsula Avenue SE, Suite 210 • Washington DC 20003 USA • +1 202 546 5346 • [www.Marine-Conservation.org](http://www.Marine-Conservation.org)

### Recommendations

The first recommendation concerns articulating a Blue Economy, reflecting the principles of the Green Economy developed by the UN Environment Programme, amongst others. As such, it is overarching and hence encompasses the three other recommendations that follow it. The next three recommendations are central to how ecological sustainability could be operationalized in the Global Ocean. Fisheries in particular are considered, due to the overwhelming impact they have on the marine environment — one larger than all other human activities combined.

With regard to protecting biodiversity and fisheries reform, the slowness of progress can be traced to a lack of a global governing authority by which to enforce compliance (Recommendation 2, below). The precautionary approach must be better applied in existing institutional programs and measures, through the requirement of meaningful impact assessments before human activities including existing fisheries are allowed to continue or proceed (Recommendation 3, below).<sup>1</sup> Finally, as a first step, the most harmful human activity in the ocean — bottom trawling — should be phased out by 2015, which matches the deadline agreed to in Johannesburg for sustainable fisheries (Recommendation 4, below).

#### 1. The Blue Economy

***A Blue Economy includes economic fair play by maritime industries and ecological sustainability in the marine environment.***

The Global Ocean ties together all continents and nations. It is well-known that most of our planet is ocean, but less appreciated is that this grand ecosystem affects planetary cycles, such as oxygen production and climate regulation, and hence our everyday health and safety. We applaud the steps taken by UNEP to further our thinking on the Green Economy and support the positions of Small Island Developing States (SIDS) and others to better integrate maritime activities and the marine environment into this flagship concept — the so-called *Blue Economy*.

The Blue Economy is a sustainable framework for human maritime activities, extending forward several generations into a future that will be very different from what we currently know — a world of heightened sea levels, changed climate patterns and marine biological distributions, and likely human displacements as low lying island nations contend with sea level rise. In such a world, human activities will be much more carefully scrutinized according to their long-term ecological and carbon footprints, especially along our shorelines and on our islands — the birthplace of the Blue Economy.

Drawing upon a tradition of respect and attentiveness, traditional maritime peoples can provide a leadership role in shaping the Blue Economy, re-connecting human activities to the marine environment, a link that in recent years has often been disregarded. Ultimately, the principles of the Blue Economy apply to all places, land and sea. For SIDS, the cause-effect connections of daily decisions

1 This is reflected in UN General Assembly resolutions concerning bottom fisheries: 61/105 (2006) and 64/72 (2009).

are real and obvious, but these may not be so apparent to distant water fishing nations, thousands of miles away. The Blue Economy vision of maritime nations, including SIDS, should be seen as an affirmation of the general principles of the Green Economy, with clear feedback loops and opportunities for adaptive, innovative approaches in the marine environment.

In climate change and depleted fisheries, crises are already upon us, and much engineering and development will be necessary; however, this cannot be the same ill-conceived expansion that has taken away our natural buffers and natural capital, leaving us with coastal erosion, depleted fish stocks, and debts to pay. Rather, it calls for a far more thoughtful approach, directing funds and incentives towards actions that will right the balance, while removing support and perverse subsidies for activities that cause us long-term harm. The Blue Economy recognizes it is one ocean, one world.

Although different jurisdictional considerations will apply, the Blue Economy encompasses the global oceans, including the almost two thirds that lie beyond national jurisdictions.

The Blue Economy can be realized in a variety of ways. Regardless of the approach, however, it will involve marrying good economic practices (“fair play”) with ecologically sustainable development.

**Economic fair play** is characterized by transparency, accountability, good governance, and a level playing field.

**Ecologically sustainable development** embraces the ecosystem approach, providing for healthy oceans and healthy maritime communities.

#### ***Economic fair play***

Maritime nations, particularly developing nations, have learned through hard experience the importance of fair economic practices within and outside of their maritime jurisdictions. A Blue Economy should encourage local development to service local resources, as well as fair global trade practices. Fair play includes:

- i. **Transparency:** disclosure of information related to maritime activities and exploitation;
- ii. **Accountability:** the linking of decisions to responsible authorities, with a procedure allowing for correction of behaviors;
- iii. **Good governance:** the existence of responsive institutions producing regulations appropriate for evolving circumstances, with the ability to monitor and enforce compliance;
- iv. **Level playing field:** ensuring that maritime players play by the same rules, and that perverse economic subsidies are removed.

#### ***Ecologically sustainable development: operationalizing the Rio Declaration and Agenda 21***

Ecologically sustainable development is the second component of the Blue Economy, equally important as good business practices.

Ecologically sustainable development has already been clearly articulated in many documents and resolutions, most of them stemming from the Rio Declaration and Agenda 21 developed in Rio de Janeiro almost 20 years ago.

Providing for healthy oceans and healthy maritime communities requires an ecosystem approach, taking into consideration the bigger picture and longer timeframes. Too often, coastal and marine development has been driven by short-term gains. With climate change, ocean acidification, and sea level rise now broadly accepted as an inevitable concerns of our future, our thinking will have to become more far-sighted, taking better account of this changing world. Decisions that are robust to uncertainty should be given preference over those that rely on everything going according to plan. Uncertainty planning is not new, and has been widely practised already in such diverse fields as aviation, medicine, and military operations. However, in environmental and resource management, uncertainty is regularly disregarded, overshooting the bounds of sustainability, passing on the liability to future generations. We are now one of those “future generations.”

## **2. An overarching global mechanism to protect biodiversity in the marine areas beyond national jurisdiction (the “high seas”)**

***Covering almost half of our planet’s surface, the high seas require an integrated mechanism, through international laws, agreements, and institutional arrangements, to protect its vast wealth of biodiversity.***

As recognized at the 2011 meeting of the Ad Hoc Open-ended Informal Working Group to study issues relating to the conservation and sustainable use of marine biological diversity beyond areas of national jurisdiction, there is a need to address issues not currently articulated or fully implemented under the UN Convention for the Law of the Sea (UNCLOS). We hope that Rio+20 could catalyze a high level commitment to address these gaps, including *inter alia*:

- i. Agreeing on the need for governance reforms that fulfill States’ commitments under UNCLOS for the effective conservation and protection of the marine environment and marine biodiversity in areas beyond national jurisdiction;
- ii. Establishing a mechanism for the establishment and management of a fully comprehensive, effectively managed and globally representative system of high seas marine protected areas (MPAs) including no-take reserves;
- iii. Establishing a mechanism for the fair access and sharing of benefits derived from biodiversity in areas beyond national jurisdiction.

Regarding the second point, calls and agreements for MPAs are numerous, and include the Convention on Biological Diversity amongst others, but again the issue is

implementation. Recent research coming out of Australia demonstrates that the management of large no-take reserves is much less expensive than attempting to manage several smaller places with a variety of management conditions.<sup>2</sup> The Blue Economy is also a cost effective economy.

2 Ban, N, Adams, V, Pressey, R, Hicks, J. 2011. Promise and problems for estimating management costs of marine protected areas. *Conservation Letters*: 00, 1-12 (website pre-publication)

### 3. Require impact assessments before human activities are authorized to proceed on the high seas

***The precautionary approach is now seen as part of customary international law and should be formally applied, including the requirement for prior impact assessments, in the programs and measures of international maritime authorities.***

The original Rio Summit is perhaps best known for its articulation and support of the precautionary approach (Rio Declaration, Principle 15). What is less known is that in Agenda 21, language about taking precautionary measures is mostly found in Chapter 17 (Protection of the Oceans), where it can be found in six different articles, including the sub-section quoted below. This is more than in any other chapter of Agenda 21, including chapter 35 (Strengthening the scientific basis for sustainable management). Indeed, even 20 years ago, the precautionary approach was driven by marine considerations.

Since that historic affirmation, the precautionary approach has been recently recognized as part of customary international law by the International Tribunal for the Law of the Sea (ITLOS) in its advisory opinion released 1 February 2011<sup>3</sup>. On the one hand, this recognition is a great step forward for maritime law; but on the other it still leaves the question of implementation unanswered.

Twenty years ago, Agenda 21 already recognized most of the issues facing maritime nations.<sup>4</sup> The value of environmental impact assessments was recognized under Rio Declaration Principle 17. Although monitoring the state of the environment is mentioned throughout Agenda 21, only the *marine* chapter, Chapter 17, deals with prior impact assessments. However, this forward-looking vision still awaits implementation on the water.

3 135. The Chamber observes that the precautionary approach has been incorporated into a growing number of international treaties and other instruments, many of which reflect the formulation of Principle 15 of the Rio Declaration. In the view of the Chamber, this has initiated a trend towards making this approach part of customary international law. [...]

4 For example, Agenda 21;17.97: There are many uncertainties about climate change and particularly about sealevel rise. Small increases in sealevel have the potential of causing significant damage to small islands and low-lying coasts. Response strategies should be based on sound data. A long-term cooperative research commitment is needed to provide the data required for global climate models and to reduce uncertainty. Meanwhile, precautionary measures should be undertaken to diminish the risks and effects, particularly on small islands and on low-lying and coastal areas of the world.

### 4. Phase out the most harmful form of fishing, bottom trawling, by 2015

***It is now widely recognized that bottom trawling is the most harmful of legal fishing methods. Other harmful methods like dynamite fishing and drift nets have already been made illegal, but bottom trawling persists.***

Marine Conservation Institute has long championed protection of the high seas, having organized the first international workshop on the environmental effects of bottom trawling in 1996.<sup>5</sup> Two years later, our President Elliott Norse co-authored the seminal paper on the topic.<sup>6</sup> Our work continues to demonstrate bottom trawling's ecological and economic unsustainability; in short, there is no good reason for this harmful activity to continue.<sup>7</sup> We are members of the Deep Sea Conservation Coalition (DSCC) and support its call for a phase-out of bottom trawling by 2015.

Bottom trawling involves dragging trawl nets with heavy steel plates ("doors") and rollers across the ocean floor, crushing coral, sponges other bottom (benthic) structures and life forms as they go. Deep-sea species in general are slow growing and slow to reproduce, meaning that fishing in the deep sea is, with very few exceptions, unsustainable in terms of targeted species, as well as bycatch species such as deep-sea sharks. The deep-sea corals, some of which are thousands of years old, are easily damaged and can take many decades or even centuries to recover.

In addition to the damage caused, deep-sea fishing on the high seas is neither economically significant nor substantial in terms of global fisheries catch production. In 2008, the United Nations Food and Agriculture Organization (UN FAO) published a report that estimated the high seas bottom fishing fleet in 2006 was no more than a few hundred vessels, catching some 250,000 tonnes of fish. This catch was valued at approximately 450 million US dollars, representing a mere 0.3% of the marine capture

fisheries worldwide.

The 2002 World Summit on Sustainability resolved to, "*on an urgent basis and where possible by 2015, maintain or restore depleted fish stocks to levels that can produce the maximum sustainable yield.*" Part of meeting that commitment will mean phasing out the most ecologically damaging human activity in the high seas — bottom trawling — by the target date, 2015.

### Input For Compilation Document from the Working Group

#### "Coastal Zones: 21st Century Challenges" Context of the Document

This document represents the inputs provided by the authors in order to participate in the construction of the "focused political document" for the Rio+20 outcomes. As part of the effort to construct and

achieve the Rio+20 goals, the authors' points of view are comprised of contributions from members of the following major groups: the Scientific and Technological Community, and NGO's Concerning the

Sectoral Priority of Coastal Zones.

Coastal zones are the most productive regions in the world, both biologically and economically, but they are also the most populated. They face a harsh future due to greater challenges stemming from hunger, wars, and health related issues threatening populations and countries' economies. These challenges constitute the core of this document. Will nations work together to save these zones that buffer our world? They must be included in the next ten-year agenda before it is too late.

Following the recommendations provided by the "co-chairs' guidance note," this document has been redacted in the form of focused inputs. The material the authors submitted was coded, synthesized, and condensed to create this document. While this document communicates the most significant concerns of the authors as a group, it is not a consensus document. This document enables us: (i) to establish our inputs to the Compilation Document by November 1st, (ii) to propose adapted material to the Rio+20 delegations from various governments through each country's correspondent, and (iii) to publish an extended reference document concerning the sectoral priority of Coastal Zones from the perspective of 21st Century Challenges.

**115 authors from the working group "Coastal Zones: 21st Century Challenges" actively participated in the creation of this "Inputs for Compilation Document." They are from 30 countries, and the following Institutions, Universities, Research Centers, and NGO's:**

Aristotle University of Thessaloniki, ARUC, Aurecon, Australian National Centre for Ocean Resources and Security University of Wollongong, Australian Rivers Institute, Baltic Environmental Forum, Boskalis Offshore, Brock University, CALCH, CEAB/CSIC, Center of Researches in Material Sciences of Borj Cedria, Centre de Suivi Ecologique, Centro Desarrollo y Pesca Sustentable, CETMEF/DS, Chao Pescado, CNR-INSEAN, Coastal Protection and Restoration Authority - Louisiana, Cooper Ecological Monitoring, Inc., École des Hautes Études en Sciences Sociales, ESA PWA | Environmental Hydrology, European Commission, Joint Research Centre, Gaz-system, German Association of Aquaculture, Greenpeace, Hellenic Centre for Marine Research, Helzel, IFM- GEOMAR, Institut Universitaire Européen de la Mer, Jagiellonian University, Kyushu University, Laboratorio Nacional de Energia e Geologia, Latvijas Universitāte, LittOcean, Marine Sciences For Society, National Research Institute for Rural Engineering Water and Forestry, Nelson Mandela Metropolitan University, Norwegian Directorate of Fisheries , NUI Galway, OANNES, Oceanógrafos Sin Fronteras, OGS National Institute of Oceanography and Experimental Geophysics, Pepperdine University, Queen's University, Regional Ministry of Environment of Andalusia - Consejería de Medio Ambiente/Junta de Andalucía, Scripps Institution of Oceanography, Snowchange Cooperative, The Norwegian University of Life Sciences, The Pomeranian Maritime and Vistula River Basin Cluster Association, The Royal Marine Conservation Society of Jordan, UNESCO-IHE, Universidad Autónoma de Baja California Sur, Universidad de Cádiz, Universidad de La Laguna, Universidad de Las Palmas de Gran Canaria, Centro Interdisciplinario Manejo Costero Integrado, Universidad de la República-Uruguay, Universidad del Magdalena, Universidade do Algarve, Universidade Federal do Rio Grande, Universidad Nacional Autonoma de Mexico, Universidad Politécnica de Madrid, Universitat Autònoma de Barcelona, Universitat Politècnica de Catalunya, Université Bordeaux 1, Université de Moncton, Université de Picardie Jules Verne, Université du Québec à Rimouski, Université de Versailles Saint-Quentin-en-Yvelines, Université du Havre, Université du Québec à Rimouski, University of Bergen, University of Florence, University of Patras, University of Tartu,

University of Ulster, University of Western Australia, Waseda University, and Technical University of

Delft.

#### Introduction

20 years have passed since the Rio Earth Summit in 1992. 20 years of efforts to better understand, inform, and improve the relationships between our societies and our planet's coastal zones. These efforts have crystallized into tangible outcomes in the form of improvements in environmental culture and international agreements upheld by over 100 national and transnational coastal zone plans, protocols, and conventions.

While moving forward with these national and international efforts, we realize that the balance between development and stewardship is still broken, and many more efforts are needed to create a harmonious relationship between the use of knowledge in society and our planet's coastal zones. Through the active participation of 115 researchers from 30 countries, the following baseline document has been constructed to highlight the perspectives of academia regarding "Coastal Zones:

21st Century Challenges." Please consider it our input for the RIO+20 compilation document.

#### (i) Input For Compilation Document

The majority of our planet's population is concentrated in coastal zones, narrow spaces that amplify the most urgent and emerging questions of sustainability and development. In coastal zones, we clearly see the fragility of the three elements that constitute sustainability: world population growth, economic tenuity, and the increase of environmental degradation. Coastal zones are key in illustrating **(a)** the challenges our societies face and **(b)** the potential solutions, priorities, and views regarding the implementation of practices and policies that build upon previous successes. These two points structure the document.

#### (a) The Challenges That Our Societies Face

Any initiative to truly help society progress sustainably must integrate the limits of the planet and be co-constructed with the affected communities. The consensus is that the challenges we face in coastal zones are mostly anthropogenic or amplified by human activities that clearly transgress ethical limits.

Due to human development on the shoreline and in river basins, along with off-shore industrial non- sustainable activities, our challenges are:

**Red Flag Challenges Impacting Lives of Coastal Zone Residents:**

- Malnutrition, hunger, freshwater availability
- Wars and other violent conflicts
- Lack of education
- Climate change and its consequences
- Over-exploitation of marine living resources
- Toxins in fish and shellfish, and pathogens such as cholera and hepatitis, are threats to human health
- Population growth
- Global economic crises

**Challenges in Policy:**

- Harmonize the interests of coastal environment users, including local community members, coastal municipalities, regional and/or inter-municipal planning, national, transnational, and international stakeholders, through the continuous improvement of economic-legislative instruments and the elaboration and implementation of coordinated strategies for the use of natural, social, cultural, and institutional resources
- Rethink economic growth and the flows of energy and materials
- Preserve 100% of the areas where the indigenous peoples of the coasts remain, including the Saami, Chukchi, Siberian Yupiaq and many others
- Integrate research and education into the decision making process
- Make information readily and easily accessible to facilitate informed decision-making
- Protect natural and cultural resources at all levels: local, regional, national, and international, while keeping coastal communities safe
- Monitor and control the coastal and littoral maritime traffic, industrial activity, and the related hazards of oil pollution, chemical transport, collision, GIS reduction, and technical failures
- Introduce policies that: make change trends mandatory, protect existing coastal habitats and ecological functions, recover the fishing stocks, and prevent illegal and habitat-destructive fishing
- Prevent over-population in developing regions and minimize damage in already over- populated areas
- Balance urban growth by using space more efficiently
- Plan sustainable spatial allocation and management for fisheries and aquaculture
- Plan sustainable spatial allocation and management for energy production and supply

**Challenges from Pollution and Climate Change:**

- Oceanic temperature warming and change in alkalinity
- Decreasing oxygen levels leading to dead zones, species extirpation, and noxious gas emissions
- Seawater intrusion in coastal aquifers
- Coastal and sea pollution caused by wastewaters and solid wastes that have been treated ineffectively or not at all
- Pollution by toxic waste, metals, nutrients, contaminants
- Floods, erosion, and rising sea-levels
- Illegal or little regulated extraction of natural resources to fill increasing demand
- Amplified vulnerability of coastal populations, particularly the economically disadvantaged
- Loss of habitat and loss of biodiversity
- Irreversible ecological destruction
- Toxic blooms due to pollution
- Coral reef bleaching
- Introduction of invasive species

- New diseases among organisms
- Dispel the assumption that the coast is "safe"

**Challenges in Research:**

- Generate an information baseline of coastal ecological and social processes that researchers can measure against
- Take into account the social and human dimensions of uncertainty
- Study in greater depth the interconnectedness of natural systems to better understand how to sustain coastal and oceanic health
- Conduct research in support of management on multiple spatial and temporal scales
- Develop and establish an integrated oceans monitoring network, and create inter- operable open-access databases that can provide reliable data on a user community's defined goal(s)
- Interdisciplinary approaches to solve any challenge
- Integrate all stakeholders in the research process
- Develop innovative techniques for the restoration of ecosystem functions
- Evaluate the success of the integrated coastal management political processes and practices on a local to global basis
- Identify and quantify the human-induced stressors acting on coastal ecosystems and populations

**(b) Potential Solutions, Priorities, and Views Regarding the Implementation of**

**Practices and Policies that Build Upon Successes**

**Economy and Development Models:**

- The model of development based on infinite economic growth needs to be questioned: To what degree do activities on coastal areas facilitate general development and what manner of development is currently needed?

Can development be based on sustainability and how can the socio-economic structure respond to international competitiveness?

- A trade-off between the economy and the environment exists; destructive industries have to be challenged and held accountable for their social and environmental consequences
- G20 announced the preparation of a charter on "sustainable economics," we must make explicit *how* such a charter should be implemented from a global governance perspective

**Governance, global/local articulation:**

- The efforts cannot only come from local governments and communities the challenges are global in nature
- UN Ocean should be supplemented by other trans-governmental and non- governmental networks as additional forms of governance
- Intergovernmental Panel on Maritime Basins (IPMB) should contribute to providing governance systems with common and reliable information and promote coherent responses from these systems
- Build strong connections between transboundary maritime basins related to large marine ecosystems and maritime regions of the world
- Apply a deliberative approach that concertates on managing emerging challenges and linking all spatial and temporal scales

**Collaborative Policy Making:**

- The instruments for the implementation of integrated coastal zone management are: an integrated approach to coastal land and marine spatial planning, cross-sectoral and multiregional agreements, public participation, effective cross-border consultation system, monitoring and assessment of socio-economical and ecological changes and trends, comprehensive analysis of sustainable development indicators, financial and legal mechanisms for ICZM implementation, and connected and collaborative decision-making between all administrative levels from global to local
- Move from the theoretical framework into realizing the necessary actions
- Improve the articulation between ICZM and adaptation measures
- Integrate local and traditional knowledge with policy making
- Learn from international experience and practices in integrated coastal management, and adjust lessons to other contexts
- Evaluate the success of the integrated coastal management political processes and practices on a global basis
- Participation of coastal communities is vital, not only to vindicate the legitimacy of strategies, but also to provide them with the opportunity to express their doubts, to rebuild their trust, to learn how to live in a changing environment, and to manage social conflict
- Create respectful partnerships with traditional societies on Earth, as they can provide crucial observations and knowledge regarding emerging challenges
- Make decisions that are compatible with the core values of affected coastal communities and coast-dependent peoples

- Increase interdisciplinary training and cross-collaborations among tertiary programs and teams
- Natural science data must be combined with social science understandings of the places where regulations are to be implemented
- Natural scientists, engineers, economists, lawyers, and social scientists must recognize their responsibility and role in the process and collaborate with each other to achieve common goals

#### **Legislation and Regulation:**

- Define coastal zones in both spatial and temporal dimensions, since coastal dynamics cast some legal uncertainty on how coastal zones are determined
- Improve and reinforce legal frameworks controlling coastal activities
- Make good practices mandatory for stakeholders; hold elected politicians accountable for their promises
- Coordinate states and various sectors

#### **Information, Education, and Awareness:**

- Improve the competence of and resources for local and regional coastal zone authorities
- Knowledge must be shared, promoted, and used in order to a) aid society in developing a critical approach, b) exercise pressure on policy makers, and c) develop realistic, sustainable, and feasible policies
- Promote public awareness of the socio-ecological values of the coastal resources and ecosystems

#### **Research:**

- Encourage the scientific development of new sustainable, useful technologies
- Improve treatment plant performance; increase general use of new biodegradable materials
- Long-term studies that identify past and present evolutionary trends of the coast
- Intelligent and sustainable use of marine resources to enable the development of new, sustainable medical and pharmaceutical products
- Develop and establish integrated monitoring networks and coherent forecasting systems that provide coastal managers and policymakers with critical coastal state indicators in order to ensure the safety of coastal communities while assuring the preservation of the natural coastal dynamics
- Bring together competence and synergy to develop an ecological sustainable aquaculture in order to protect the biodiversity and environment in the ocean, as well as provide a safe and sustainable source for human food
- Combine infrastructures like offshore wind energy facilities and aquaculture installations

#### **Conclusion**

A general comment to conclude our document is this: the challenges we face in coastal zones are mostly anthropogenic or amplified by human activities that clearly transgress reasonable limits. We insist on the fact that any initiative to truly help society progress sustainably must integrate the limits of the planet and be co-constructed with the affected communities.

#### **Reminder**

This document represents the inputs provided by the authors in order to participate in the construction of the "focused political document" for the Rio+20 outcomes. As part of the effort to construct and achieve the Rio+20 goals, the authors' points of view are comprised of contributions from members of the following major groups: the Scientific and Technological Community, and NGO's Concerning the Sectoral Priority of Coastal Zones.

Following the recommendations provided by the "co-chairs' guidance note," this document has been redacted in the form of focused inputs. The material the authors submitted was coded, synthesized, and condensed to create this document. While this document communicates the most significant concerns of the authors as a group, it is not a consensus document. This document enables us: (i) to establish our inputs to the Compilation Document by November 1st, (ii) to propose adapted material to the Rio+20 delegations from various governments through each country's correspondent, and (iii) to publish an extended reference document concerning the sectoral priority of Coastal Zones from the perspective of 21st Century Challenges.

Maryknoll Sisters

*Making God's love visible*

## Institutional Framework

### Anthropological and Moral Considerations:

*P.O. Box 311, Maryknoll, NY 10545-0311*

*Tel: 914-941-7575 [www.maryknoll.org](http://www.maryknoll.org)*

It can be said that the most important discoveries of the modern period are the discovery of evolution and the realization that the human species and human culture are part of evolutionary development; part of the interrelated and interconnected Earth system.

Humanity can trace its origins fairly well through its early emergence to its development as Homo Sapiens-Sapiens, morally characterized by individuals' assuming responsibility for their own actions. The present period would seem to be bringing forth a new evolutionary moment within the human species; the development of the Universal Human. This stage is morally characterized by assuming personal responsibility for the well-being of Earth. It is accompanied by knowledge of the influence of human behavior on Earth and its life-support systems. It is conscious of responsibility to future generations of life. The Universal Human has universal responsibilities!

Currently, the United Nations Commission on Sustainable Development, as an institutional structure, does not correspond to the above way of understanding human emergence and contemporary development. Consequently, the structure is hindered in facilitating the goal for which it was created: Sustainability.

### New Institutional Structure:

Therefore, Maryknoll supports creating a Sustainability Council that would be responsible to the General Assembly. The sustainability of the Earth Community of Life should be given the highest priority by the United Nations.

It is to be expected that Member States may initially oppose this move as the development of global conscience is uneven; many members are most deeply concerned for their Nation States. Nevertheless, the Earth Summit affords an opportunity for framing thinking and acting that will have long term effects on the fulfillment of the main objective of the United Nations, establishing peace and human security throughout the world. This can only be accomplished on a foundation of sustainability. In addition, the creation of a new and updated physical structure at United Nations Headquarters in New York should be aligned with new and updated organizational structures that facilitate the achievement of the United Nations' high objectives.

The recommended structure would accomplish three important tasks over time:

It would ensure that all people have a voice in the work of securing a viable future for the human family - rooted in vigorous life-support systems.

It would function as an important element of global governance that would lessen the negative environmental, social and economic impacts of large corporations that are not adequately accountable to government structures and may actually control government policy through powerful lobbying mechanisms.

It would pave the way for the next major work of the United Nations in the broadening of Human Rights to include Earth Rights.

The role of Civil Society should be enhanced beyond the currently established Major Groups so that it is inclusive of the range of Society's expertise, cultural arrangements and spiritual depth and insight.

While the Sustainability Council would find its main functionality through just social, environmental and economic development, it would act with overarching vigilance for well-being in all United Nations endeavors, building on past achievements even while its direction is cast firmly toward the future.

---

## Mesoamerican Society for Conservation and Biology (MSBC)

### Key findings and recommendations from the regional report for Mesoamerica on sustainable mountains and development

Mesoamerica extends from the Tehuantepec Isthmus in Mexico, including all Central American countries (Belize, Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, Panama) and the states of Southern Mexico (Campeche, Yucatan, Quintana Roo, Chiapas, Tabasco and Oaxaca), to the Darien Gap, with a total of 862,468 km<sup>2</sup>. Altogether, Mesoamerican mountains sum up 217,733 km<sup>2</sup> or 25.2% of the entire region. Mesoamerican boasts a remarkable 12% of the world's biodiversity for only about 2% of Earth's terrestrial extension.

A total of 86 indigenous ethnic groups occupy 118,136 km<sup>2</sup> or 54.2% of mountain territories in Mesoamerica. The greatest global threat to mountains and sustainable development in the region is climate change; other direct threats are mining industry, hydro-electric dams, urban sprawl to mountainous areas, deforestation and soil erosion.

Since Rio 1992, Mesoamerica finds itself immersed in a new and more complex international situation without having achieved, in recent years, rapid advances in human development and regional integration. This panorama poses strategic challenges that will not only require innovative and bold regional and national responses, but also major improvements in the collective capacity to implement them. Altogether, forests, state protected areas, biological corridors and indigenous territories cover 72.6% of mountains in Mesoamerica. Mountains clearly represent the region's opportunity to strengthen conservation and sustainable development initiatives, in opposition to the more densely populated and industrially developed lowlands. In this regard, the Mesoamerican Biological Corridor (MBC) is the region's best opportunity to implement sustainable mountain development, if the Central American Integration System and its Central American Development Commission (SICA-CCAD) are allowed to work properly with a strong backing from the countries in the region. Connectivity conservation and management best practices should be replicated and adapted in the region, fostering the institutionalization of the regional initiative but expressed in local manifestations through alliances between governments and the civil society. Currently, the MBC covers only 36,208 km<sup>2</sup> or 16.61% of the mountainous regions of Mesoamerica, with room for increasing connectivity.

The design of connectivity landscapes in mountains should be further conducted in order to fill conservation gaps, complete the regional network of protected areas, and in order to better plan land-use, connect mountainous areas at the regional and continental scale with more densely populated lowlands, providing a readily link that may enhance the appreciation for mountains in the regional psyche, and allow for the mitigation and adaptation to climate change.

## Metadesigners Open Network

**Rio+20 United Nations Conference on Sustainable Development, 2012**

### Proposal from the Metadesigners Open Network

Submitted by John Wood Emeritus Professor of Design Goldsmiths, University of London New Cross,

London UK SE14 6NW.

**Email:** [j.wood@gold.ac.uk](mailto:j.wood@gold.ac.uk)

**Web:** <http://metadesigners.org/> (N.B. membership needed for full access)

**Twitter:** <http://twitter.com/#!/metadesigners>

**KEYWORDS:** design thinking, metadesign, synergy-of-synergies, diversity-of-diversities, paradigm change, top-down plus bottom-up

*a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?*

**OVERVIEW:** We need more comprehensive, 'joined-up' ways to feed, cloth, shelter, assemble, and communicate. This amounts to a paradigm change, which requires radical innovation, both at a conceptual and at a pragmatic level. So far, top-down methods have failed to achieve this within a liberal,

democratic context. This proposal therefore calls upon world leaders to ask 'design thinkers' to help them change social paradigms that sustain our collective habits of behaviour. This approach would require support with the continuing development of a more high-level, self-reflexive, comprehensive, inclusive and integrated mode of design that it refers to as 'metadesign'. Design thinking is important, because designers are trained to attract behavioural change in direct, imaginative ways, via products, services and images. Working in metadesign teams, designers, and other experts, would apply their skills to the location and cultivation of synergies on many levels. Ultimately, this would achieve a global synergy-of- synergies.

**OUTCOMES:** We would define the primary, systemic outcome of Rio+20 as A GLOBAL PARADIGM CHANGE THAT SEEDS MORE ECOLOGICAL BEHAVIOUR. The pace, and precise means, by which this transition takes place would need to be declared as the shared responsibility of everyone on the planet, rather than the exclusive task of governments, corporations and NGOs, etc.

**CONCRETE PROPOSAL:** The cultivation of synergy would be a key principal objective for Rio+20. Synergy is an affirmative, under-explored factor that transcends the current, parsimonious, lose-win, obsolescent paradigm of 'sustainability'. The ultimate aim of Rio+20 would be the co-creation of a global 'SYNERGY-OF- SYNERGIES'. An introductory definition of synergy is that it is the free, unforeseen abundance that

emerges from a judicious combination of EXISTING RESOURCE ENTITIES (e.g. materials, actions, ideas and/or problems). Primary synergies can also be synergized with other entities (including synergies) to create secondary or subsequent orders of synergy. As the origin of synergy is always 'difference', Rio+20 would publish a practical framework in which a 'DIVERSITY-OF-DIVERSITIES' (e.g. political / cultural / biological / ecological / monetary) could be locally identified, managed or created. These would become the basis for new, more complex and integrated, modes of entrepreneurial (and entredonneurial) prosperity.

**DOCUMENT STRUCTURE:** This would be launched as a call for the radical, collective re-definition of FUTURE PROSPERITY, and other key aspirational, desirable values that currently drive the economy. It would *not* be framed within a target-led agenda for reducing carbon, or pollution, etc.,. In effect, it will ask citizens everywhere '*HOW WOULD YOU LIKE TO LIVE?*' [our experiments have shown that, if asked in a neutral way, almost everyone has surprisingly modest and inclusive needs]. The full proposal would offer some generic definitions of synergy and would invite local communities, where politically feasible, to re-

create, adapte, refine and/or approve them for developing their own charters [similar to the Transition Towns model].

*b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?*

**CRITIQUE OF EXISTING APPROACHES:** There are many reasons why previous, and current, attempts to achieve biodiversity, greenhouse gas reductions, etc. are failing. One is that democratic governments and international bodies continue to use measures that are the least effective (c.f. Meadows, 1999), such as setting targets, agreeing timelines, directing appropriate fiscal measures, devising sanctions and penalties. These are indirect measures that have inauspicious or counter-productive feedback loops. In general, they are too bureaucratic to inspire a behaviour change in those whose immediate task is to make the policies work. In short, they do not easily change hearts and minds in the long term. They need augmenting with a more radical, subtle approach that transcends the existing mindset. This must be conducted using thinking that is commensurate or attractive to the new paradigm, not with the existing paradigm. Other reasons addressed in this proposal relate to the language of 'sustainability' that is part of this old paradigm.

*c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);*

**IMPLEMENTATION:** Metadesign teams (recruited from the specialist design professions and from transdisciplinary design agencies such as IDEO, in consultation with their professional guilds and academies) would be commissioned to assist governments. These changes would serve to refresh and reframe the perceived PURPOSE of business and education in ways that would eventually reform existing fiscal and legislative approaches. They would need to work in harmony with the newly agreed definition of prosperity. Paradigms cannot easily be changed exclusively via top-down methods because they are sustained by assumptions, beliefs, and habits that are part of a complex web of economic, cultural, aesthetic, psychological and other forces that reinforce one other. This requires the SYNERGIZING OF TOP- DOWN AND BOTTOM-UP INITIATIVES. While designers have the potential for this challenge, they would need to work alongside imaginative managers to cope with the scale and complexity of the task. What we know as 'design' emerged in the 19th century as a set of specialist skills and practices. Since 2005, with research funding from AHRC and EPSRC we began to orchestrate these practices as a unified METADESIGN framework. Loosely speaking, metadesign is a team-based, self-defining superset of existing specialisms of design, management etc. that looks for opportunities to create a synergy-of-synergies.

*d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed*

*decisions to be reached and actions to be implemented?*

**MECHANISMS FOR ACTION:** Instead of designing discrete products, brands, or services, metadesigners would be commissioned to orchestrate 'top-down' and 'bottom-up' initiatives. They would broker effective, non-fiscal solutions for communities and their governments. Some work can be achieved in a top-down level by devising frameworks for CIRCULAR SERVICE-BASED ECONOMIES, perhaps with the help of organizations, such as 'Cradle-to-Cradle', Twitter, Facebook, etc. However, it is also vitally important TO LANGUAGE NEW OPPORTUNITIES. This entails intervening creatively at the level of language, by

circulating newly coined concepts; words and images (e.g. via Wikipedia, Wikimedia, Oxford dictionaries etc.) co-designed and disseminated also via bottom-up organizations, such as 'Transition Towns', Local Currencies initiatives, or Permaculture groups. They would also work in holarchic teams that we train to find, invent or cultivate synergies. These teams would include radical thinkers and experts from anthropology, social media etc., They would be put together with creative thinkers from advertising agencies, mathematics, bio-semiotics, science, economics, philosophy and design.

## METIS Global Awareness Network

Among the few entities in the world involved in climate change crisis struggle providing strategic support to all three pillars of Sustainability: **Education, law & policy formation & climate movement**

*Earth Summit 2012 Rio+20, Earth's last chance*

*"This is the story of Rhysling, the Blind Singer of the Spaceways - but not the official version. You sang his verses at school:*

***'We pray for one last landing; On the globe that gave us birth; Let us rest our eyes on the fleecy skies; And the cool, green hills of Earth'***

*Or perhaps you sang in French, or German. Or it might have been Esperanto - while Terra's rainbow banner rippled over your head.*

*The language has been of no great importance, provided that it has been a language of the Earth...*

*"The Green Hills of Earth" by Robert Heinlein*

Low expectations are often a self-fulfilling prophecy. High expectations, on the other hand, will inevitably lead to disappointment. Thus **Metis Global Awareness Network** contributes with no expectations but **intense effort & concrete proposals** for a positive outcome of the UN Conference on Sustainable Development at Rio de Janeiro, 4-6 June 2012, or Rio+20, or **Earth Summit, last chance** in the world to tackle with **climate change, sustainable development** and **Institutional framework**. One would anxiously wait to see the acceptance of what Humanity would get in return.

## INTRODUCTION

Half a century of uncontrolled financial & population growth has caused unequivocal anthropogenic character climate change. The planet needs at least 50 years to recover to normal if no more negative factors make the situation worse. Earth Summit's agreement has thus to include, among others:

1. **Institutional framework** based on, at least, three principles.
2. **Time scarcity unanimous consensus** based on scientific data defining **time frame** for re-engineering.
3. **Global Social Contract** on a Green Economy in the context of Sustainable Development and Poverty Eradication with **SHORT** term, midterm & long term sustainable development scenarios. Minimum prerequisite: Ensure the **Short term** scenario implementation focusing on time scarcity.
4. **Population growth voluntary control** enhanced by strong **concrete incentives**.
5. **Sustainable urbanization** in a framework of new green cities.
6. **Global Awareness campaign** to motivate the general audience towards sustainability.

## FOCUSED POINTS

1. A 'ready-to-operate' **Institutional framework for sustainable development** based on...
  - a. the realistic principle... **Global problems require global solutions;**
  - b. the down to... earth one: **All six parameters (people, time, planet, money, ideas & material reality) have to be taken - at last, into documented consideration;**
  - c. and the last but not least cynical one... **What governments and mostly markets have to realize is that there is as much money to be made out of the wreckage of a civilization as from the up-building of one.**

## 2. Time scarcity

**How much time is left?** 'Left' for what? 'How much time is left for ongoing destruction-as-usual?' 'For the end of the world?' 'How much time to 'green economy'? 'How much time to 'sustainable development'? 'How much time to reach earth tipping points or non irreversible situations?' 'How much time to return to 'normal' -not 'new' normal (e.g. 1950 planet status)? Speaking of climate change three crucial variants are to be examined: **Planet Earth, human race, human civilization 'as-we-know-it'**. To shortly answer: Time left for **Planet Earth** is about 4 billion years. Time left for **human race to go extinct** is about 2-3.000 years. Time left for **human civilization to cease to exist** is about, no more-no less than 30-50 y-e-a-r-s. What about 80 or 100 for everybody to agree? OK!!!

**Metis Global Awareness Network** [Accredited Observer](#) to the

Among the few entities in the world involved in climate change crisis struggle providing strategic support to all three pillars of Sustainability: **Education, law & policy formation & climate movement**

Crucial **psychological / mental barrier** concerning climate change is average **human lifespan**. Every negative prediction **below** this number is confronted by **suspiciousness and denial**; all negative predictions **beyond** this number are faced by **indifference** or **SEP**. *"It would be an enormous relief if the recent attacks on the science of global warming actually indicated that we do not face an unimaginable calamity requiring large-scale, preventive measures to protect human civilization as we know it."* Al Gore, 2/27/10

3. A **Global Social Contract** on a Green Economy in the context of Sustainable Development and poverty eradication with **SHORT term, midterm and long term** sustainable development scenarios. Contract's sine-qua-non prerequisites should be: **a. Time scarcity. b. Negative stances' neutralization** by creating **win-win situations** (who doesn't want a solution & why - what is needed to agree). **c. Population growth control** (how-to-do it incentives). **d. Food and fuel prices control** (how-to-do rules). **e. Short term** sustainability scenario (what-to-do). Agreement's implementation degree will prove - or NOT, Humanity's maturity level directly linked to salvation probability. [Global Public Policy Networks](#) could be very effective **specific cooperation mechanisms** for implementation of agreed goals. A '**new**' actor in the stage of world affairs. A **non-state entity** in that they are not states, and **not necessarily incorporated in the legal sense**, they may take on an international role, even without the formal status of an international or multilateral organization/institution. These networks are comprised by **various actors** from **civil society, governments, government agencies, industry, industry groups, and perhaps multilateral organizations/institutions**. Their activities cover the range of steps in the policy process, beyond to policy proposals or lobbying, **including agenda setting, policy formulation, negotiation, rule making, coordination, implementation, and evaluation**. Their expertise can often play an important role in global debates and norm establishment. [Beyond Multilateralism: Global Public Policy Networks, The role of Global Public Policy Networks in supporting global Institutions.](#)

**Global Social Contract** (GSC) relevant actors are considered to be ALL; (official) social stakeholders and (unofficial) dominant players. What is expected by each part according to expertise and capabilities:

**UN SYSTEM:** credibility; the GSC under the auspices of UN.

**WESTERN WORLD & BRICS LEADERSHIP:** compromise on sustainable development goals and commitments;

**NATIONAL GOVERNMENTS:** agree to share a percentage of local responsibilities with global entities; generate policies for a non- taxable percentage on annual companies budget once spent for sustainable development investments and substantial Corporate Social Responsibility programs.

**IFF:** develop feasible global plans; locate and re-allocate resources.

**SCIENTIFIC ORGANIZATIONS:** provide maximum possible **RELIABLE** data; make practical steps to integrate major scientific achievements of 20th c. into development plans - it's about time; [IPCC Fourth Assessment Report](#) has been a very good start mainly on global warming unequivocal anthropogenic nature. However many issues have remained open to documentation due to their unprecedented global size e.g. sea levels rise, etc. Ambiguity on these issues opens the way to skeptics & denials' speculative strategy.

**OLD & NEW RELIGIONS:** cooperate for the common interest.

**CIVIL SOCIETY:** more concrete proposals; green voluntary activity to turn into Third Sector business activity.

**TRADITIONAL MEDIA, SOCIAL NETWORKING and ADVERTISING COMPANIES:** 'spread the word' with no ambiguity policies. **WEB, PROGRAMMERS, and TELECOMMUNICATIONS BIG PLAYERS:** offer the open big field & hi-tech networking. **INTELLECTUALS & ARTISTS, SHOW BIZ, SPORT and LIFESTYLE** personalities: active social participation.

**TRADITIONAL** (EU, USA) and **NEW** (BRICS) **GEOPOLITICAL FORMATIONS, LOCAL GOVERNMENTS** & (political, financial, etc) **INTER- NATIONAL ENTITIES** to develop investment programs enhanced by strong incentives to support coal, oil and nuclear industries to turn to renewable energy production in order to give an end to this unprecedented **BALANCE OF FEAR AND INEFFECTIVENESS** GAME amongst bureaucracy, greedy financial market and governments. There are all kinds of incentives; they only need reallocation. [Investment Incentives](#), [INVESTMENT INCENTIVES Malaysia's Perspective](#), [International Monetary Fund](#);

Among the few entities in the world involved in climate change crisis struggle providing strategic support to all three pillars of Sustainability: **Education, law & policy formation & climate movement**

**TRADITIONAL and MODERN energy producers** - and the **rest of the MARKET** - based on the principle 'yesterday's competitor is tomorrow's ally', agree on emerging market shares and play an institutional role in the global game to **SAVE THE CLIENT**.

**Emerging SUSTAINABLE FREE MARKET** has to accept support to traditional energy demanding in return its own vital space and support by incentives.

**GENERAL PUBLIC:** responsible demand from all the above parties to implement each one's agreed contribution.

#### 4. Global Population growth voluntary control enhanced by strong concrete incentives.

The biggest issue confronting the planet is the collective demand we put upon it. And the difference in impact between population growth in Third World countries, which are poor, against that in the Western world, where it consumes and wastes so much more is enormous. Anyway the global rate of human population growth peaked around 1963, but the number of people living on Earth - and sharing finite resources like water and food - has grown by more than two-thirds since then, topping out at 7 billion today. This has definitely to stop. It has to be done, firstly, **voluntarily**; second, its promotion has to be done offering various **strong incentives** in content and form considering the issue strong cultural features. However, **IT HAS TO BE A SUBSTANTIAL PART OF THE DEAL**, otherwise all other policies will **INEVITABLY** fail.

#### 5. Sustainable urbanization

Traditional cities about to exponentially grow with no control consist one of the most crucial pollution factors. There is **NO** way to sustainable urbanization concerning contemporary cities, the same way an old car cannot become new. Unique sustainable solution is **NEW GREEN CITIES BUILDING FROM SCRATCH** in a near-by location. Positive side effects: **ECONOMIES OF SCALE**; Revitalization of construction field, still among the core elements of development; Unemployment decrease; Integration of tele-working in the new building design. A return-to-homeland program supported by strong incentives for old cities residents.

#### 6. Global Awareness campaign

**Humanity has to believe in what experts already know.**

A Global Awareness campaign, based on **'win-win' criteria amongst ALL**, official and unofficial social, stakeholders and dominant players, to be launched on core terms like 'Sustainable development & Employment - [Sustainability Science](#)', 'Climate change crisis

- [Climate Change Science](#)', 'Green Economy', 'Population Growth', 'Civilization-as-usual continuity', 'Production & consumption voluntary simplicity' etc. Its implementation will be the result of ALL parts' cooperation each one offering according to expertise and capabilities':

**UN SYSTEM:** credibility.

**NATIONAL GOVERNMENTS:** loose regulation and 'green light'. **INTERNATIONAL FINANCIAL & SCIENTIFIC ORGANIZATIONS:** reliable data. **RELIGIONS:** genuine blessings.

**CIVIL SOCIETY:** proposals & good-will; accreditation: 'green dexterities' to become an additional vocational asset like 'IT dexterities'.

**TRADITIONAL MEDIA, SOCIAL NETWORKING and ADVERTISING COMPANIES:** public opinion support expertise and free 'air time' /

space based on a well balanced percentage of paid and CSR adds.

**WEB, PROGRAMMERS, and TELECOMMUNICATIONS BIG PLAYERS:** offer infrastructure; tolerance.

**INTELLECTUALS & ARTISTS, SHOW BIZ, SPORT and LIFESTYLE** personalities: engagement to become Sustainability Ambassadors etc.

**TRADITIONAL fossil fuel and MODERN energy producers** - and the **rest of the MARKET:** funding campaign via CSR initiatives and supporting with incentives, within the framework of an agreement among themselves and governments on each one contribution concerning clean energy production share.

**GENERAL PUBLIC:** further dissemination of content, based on informed consent.

**DENIALS / SKEPTICS' ACTIVITY WITH NO RELEVANT STRONG DOCUMENTATION** has to be included in the campaign on how similar activities are to be confronted on international legal scale officially. **Skeptics do represent a picturesque situation NO MORE.** They represent a **t-h-r-e-a-t**, 1. International community has to develop a new

strategy against the phenomenon as a whole. Public administration, governments, and international entities have to be persuaded to deal with it in the most formal way. Contemporary climate change denial/skepticism with no scientific documentation has many common points with '**spreading false news during war**'. Relevant actions to influence population morale are characterized as '**high treason**'. '**Crimes against Science & Humanity**' is another relevant area since such an activity is against the planet and Humanity living on it. There must be a campaign to the highest level and legal steps have to be taken **to pass an international law against it**. In case one could prove two entities or individuals had previous communication and agreement of relevant actions (news circulation, publications, declarations, etc) '**conspiracy**' is another legal domain; Last but not least, violation and/or **undermining of constitutional environmental rights** is the overall legal umbrella.

#### Global Awareness campaign primary targets:

- o **Public awareness on core terms**, e.g. 'Sustainable development & Employment - [Sustainability Science](#)', 'Climate change crisis - [Climate Change Science](#)', 'Green Economy', 'Population Growth', 'Civilization-as-usual continuity', 'Production & consumption voluntary simplicity' etc.
- o **Population growth control** incentives.
- o **Warning on legal Denial confrontation**.

#### Global Awareness campaign secondary targets:

- o **Environmental Education** from student-oriented item to turn to Lifelong Learning initiative.
- o **Sustainability Intensive Training** for the Market (from multinational corporations' CEOs to producers and from new businessmen to consumers) to become an introductory module to all training items.
- o **Public access to information clearing houses** development on international / regional / national / local / personal scale.
- o **Public active / creative participation** on international / regional / national / local / personal level.
- o **International cooperation** infrastructure based on win-win flexible frameworks, e.g. Global Public Policy Networks.

**Please note:** Hyperlinks guide to indicative web sites, not the 'best' or more 'reliable' ones.

## Millennium Consumption Goals Initiative (MCGI)

PROPOSAL ON MILLENNIUM CONSUMPTION GOALS (MCGs):

INPUT TO THE RIO+20 COMPILATION DOCUMENT

submitted by

THE MILLENNIUM CONSUMPTION GOALS INITIATIVE (MCGI) AND SUPPORTING ORGANIZATIONS

### 1. INTRODUCTION

Chapeau/Summary of proposal

Establish a set of Millennium Consumption Goals for the period 2012-2020 and for subsequent decades, complementing the Millennium Development Goals, and helping to ensure that the basic needs of the poor are met, preserve and strengthen earth's natural resource base on which human society depends, and enhance global prosperity, while ensuring a good quality of life and well being for everyone by 2020, improving intra- and inter-generational equity, and accelerating the shift to more sustainable consumption and production as an essential step towards the ultimate goal of sustainable development.

Background to Millennium Consumption Goals (MCGs)

The Millennium Consumption Goals (MCGs) generally support the major objectives and themes of Rio+20: Securing Political Commitment, Assessing Progress, New and Emerging Challenges, Green Economy, and Institutional Framework for Sustainable Development. In particular, they will:

- a. help to secure not only political but also wider multi-stakeholder commitment to the ultimate goal of sustainable development;
- b. facilitate the assessment of progress towards existing international agreements (especially environmental commitments);
- c. address the emerging challenges of unsustainable consumption and resource shortages (including climate change);
- d. become an important tool to achieve the green economy in the context of sustainable development and poverty eradication; and
- e. be a key element of the new governance framework for sustainable development.

The MCG idea was proposed in January 2011 in New York by Prof. Mohan Munasinghe, during the inter-sessional preparations for Rio+20 - the 2012 United Nations Conference on Sustainable Development in Brazil. It has received worldwide support since then. It is linked to Agenda 21, which stressed the need for “changing unsustainable consumption and production”, and to the component on sustainable consumption and production within the 10 Year Framework of Programs mandated by the 2002 World Summit on Sustainable Development in Johannesburg.

Millennium Consumption Goals are needed urgently because unsustainable patterns of consumption, production and resource exploitation have led to multiple problems threatening the future of humanity – like poverty, unequal consumption, resource scarcities, conflict and climate change. The global economy driven by consumption already uses natural resources equivalent to 1.5 planets earth. The 1.4 billion people in the richest 20th percentile of the world’s population consume over 80% of global output – 60 times more than those in the poorest 20th percentile. Meanwhile the Millennium Development Goals (MDGs) seek to raise consumption levels of over 2 billion poor people. Clearly, the consumption of the rich is not only unsustainable, but also “crowding out” the prospects of the poor. A business-as-usual attitude that ignores the problem will exacerbate conflict and increase the risk of global unrest. Instead of viewing the affluent as a problem, the novel concept of MCGs will persuade them to contribute to the solution without having to reduce their quality of life – thereby yielding a more positive result. The MCG approach offers the hope of a more manageable future rather than an unpredictable and potentially disastrous outcome.

## 2. MCG CORE PROPOSAL

### Basic MCGs

The long term objective of the MCGs is to achieve sustainable development, by:

- a. making consumption and production more sustainable in economic, environment and social terms;
- b. improving overall well being;
- c. reducing the burden on natural resources;
- d. freeing up resources to alleviate poverty; and
- e. ensuring intra- and inter-generational equity.

MCGs seek primarily to provide consumption targets designed to motivate the world’s rich to consume more sustainably. MCGs for the affluent would be designed to complement the Millennium Development Goals (MDGs), which seek to empower the world’s poor.

The MCGs should begin by addressing under-consumption of the poor:

1. Meet basic human needs (food, water, energy, shelter, health, education, etc.)

Addressing unsustainable consumption of the rich, the following well studied, resource-related MCGs would target:

2. GHG emissions reduction
3. Energy use (conservation, fossil fuels, renewable energy, transport, buildings, urban, etc.)
4. Water use (conservation, quality, re-use, etc.)
5. Land and biomass use (urban habitats, rural land, buildings, forests, protected areas, agro-ecol. balance, biodiversity, etc.)
6. Ores, metals and industrial minerals
7. Construction materials and minerals
8. Pollution and waste (air and water effluents, solid waste, toxic waste and chemicals, etc.)

MCGs would aim to increase human and ecological well-being by bringing about less material-intensive lifestyles, and improved livelihoods including reduced working hours and better working conditions. Focus areas might include:

1. Food and agriculture
2. Health and obesity (diet, smoking, exercise, etc.)
3. Transportation, housing and habitats
4. Recreation and leisure

Other MCGs could target:

1. Economic-financial systems (progressive taxation, banking reform, measures of well being, etc.)
2. Military expenditures

### Additional Path to Sustainability

The MCGs provide an effective additional path towards global sustainability, for the following reasons:

- MCGs would apply everywhere, so the idea cuts across developed and developing country boundaries, thus reducing the potential for deadlock due to national and regional self-interest.

- Since the rich account for over 80% of consumption and pollution, shifts in their consumption can effectively reduce the environmental burden and free up resources to raise poorer peoples’ living standards. While doing so, the affluent could also maintain or improve their quality of life, starting with existing technologies and methods.

- MCGs lead to an inclusive, multilevel strategy, which combines both bottom up and top down approaches. They seek to influence the behaviour of affluent people at individual, community, city, enterprise, regional, and country levels. This complements the more conventional approaches that rely on top-down, large scale actions (by UN, central government, etc.). The MCG concept is both fractal and subsidiary, because the basic idea remains unchanged (like a snowflake) at finer levels of detail, and effective

implementation is possible from the global/government to local/individual levels.

- MCGs have the potential for quicker results, by energizing civil society and business to ~~act now~~<sup>act</sup>. This could shift the behaviour of many high-consumption households and businesses, without relying only on central government policies and long-term investments. Furthermore, rich individuals could be motivated to act more effectively in their own enlightened self-interest, since they are better educated, have more influence and enjoy better access to resources.

- MCGs will empower the middle tier of decision makers (eg., Mayors of cities, leaders of community organisations, and CEOs of companies), and enable them to act more decisively and quickly <sup>V</sup> for example, to establish voluntary MCGs and implement them. They are more effective, in touch with ordinary people and form the critical bridge between the general public and national/global leaders.

- MCG-MDG <sup>twinning</sup> is possible, by directly linking an MCG activity in a rich community/country with an MDG activity in a poor community/country <sup>V</sup> some cities have already launched such activities.

- MCGs could mobilise, empower and link sustainable consumers and producers (including associated global supply chains) into a virtuous cycle. The same advertising that now promotes over-consumption and waste could be used to encourage more sustainable consumption. Over a period of time, social values and habits could be changed to favour more sustainable behaviour (like the gradual change in attitudes towards smoking). More ethical and moral behaviour that is socially responsible would be encouraged, especially among the young.

- MCGs will empower the person to define meaningful consumption rather than permitting meaningless consumption to define the person.

### 3. TARGET GROUPS

To move this idea forward, the Millennium Consumption Goals Initiative (MCGI) was launched at the UN by a broad coalition of stakeholders called the MCG Network. It is action-oriented, multi-level, pluralistic and trans-national. The MCGI is targeting the UNCSD 2012 conference to establish an international mandate for the proposal.

The MCGI seeks to encourage consumers and producers (especially the more affluent) to behave more sustainably without lowering their quality of life. This is a broad-based initiative, and there will be a role for all stakeholders, including the UN system, civil society, business, government, international financial institutions, and the academic/research community. The MCG Network is engaging with civil society through all major groups. The MCGI feels that by acting together now on the MCGs, we will make the planet a better and safer place for our children and grandchildren.

### 4. ACTION PLAN AND POLICY IMPLEMENTATION

The MCGs are intended to be an important practical tool within an overall strategy for sustainable development, which would supplement broader, ongoing initiatives in the areas of sustainable consumption and production (SCP) and the green economy (GE).

There is broad initial consensus supporting the MCG concept, but stakeholder consultations and robust dialogue is needed to move this idea forward sensibly and systematically. This process has already been launched through the MCGI and its partners. Ongoing and planned research provides a basis for already setting preliminary targets and policies. There are also many existing examples of best practice that enable us to act now. We hope that the deliberations at Rio+20 will resolve any remaining issues, build the consensus and provide the first mandate to establish MCGs for an initial period 2012-2020, with more to follow in subsequent decades. Suggestions for further discussion are given in Annex 2.

Parallel approaches: top-down and bottom-up

The MCGs will be a set of benchmarks to which the more affluent could aspire, while improving their own well being and helping to ensure the basic needs of the poor. These targets would encourage a combination of voluntary actions by rich consumers, supported by enabling government policies that will help to achieve more sustainable consumption and production. The proposed strategy is inclusive and multi-track. A top down effort at the international level seeks to move the MCG forward on the UN agenda, including creating a mandate, setting benchmarks at the global level, and establishing an enabling governance and implementation framework. Rio+20 is a key event in this process, and a robust and constructive discussion followed by a broad statement of support from delegates at Rio+20 is sought. The MCGs would then become an UN initiative, with clear global targets in designated areas.

While progress is being made at the UN/international level, the MCGI will encourage and work with many who prefer not to wait for broad multilateral, and are acting NOW. This bottom-up approach involves pioneering individuals, communities, organisations, firms, cities, regions and nations, who are willing to set up their own specific voluntary MCGs, monitor and implement them, and report progress. In particular, decision makers at the level of cities and companies are more willing to commit to voluntary MCGs than national leaders, and better able to achieve their targets .

Voluntary MCGs could be pursued by the willing, at whatever level they choose, and focusing on the goals they prefer. A sensible commitment is all that is required to make a start.

#### Activities

Activities that contribute to the MCGs include various sectoral interventions involving a range of actors, from local to global, and are essential at every level, especially at the city, community, local, company and organisational levels. Enabling actions will be necessary at national and international levels, taking full account of regional and subregional conditions to support a locally driven and country-specific approach.

Generally, the programmes should be designed to:

- Use the principle of subsidiarity to delegate authority, accountability and resources to the most appropriate level, and empower cities, communities, local groups, firms and organisations to ensure that the programme will be implemented at all levels;
- Develop immediate measures to encourage and support those groups who wish to establish and implement voluntary MCGs;
- Contain a long-term strategy aimed at establishing the best possible conditions to meet the basic human needs of the poor, and eliminate poverty and reduce inequalities, with special emphasis on the most disadvantaged groups - in particular, women, children, youth and refugees.
- Link with and complement the MDGs, wherever appropriate.
- Empower poor groups and communities to meet their basic human needs, and empower affluent groups and communities to establish and achieve MCGs.
- Give priority to key national and sub-national capacity-building efforts for implementation of the above activities, focusing at the city and local community level and firm level, in order to support a community-driven approach to MCGs and to establish and strengthen mechanisms to allow sharing of experience and knowledge.

(g) Effectively deploy a range of known economic and non-economic policy tools, and explore the use of new instruments to encourage more sustainable consumption and production.

#### Role of Government

Governments (at all levels) should provide an enabling framework of policies and measures to assist appropriate international, non-governmental and local community organizations, cities and businesses to establish and implement appropriate MCGs.

Governments should improve the collection of information on target groups and target areas in order to facilitate the design of focused MCG programmes and activities, consistent with national sustainable development objectives, target-group needs and aspirations. Follow up and monitoring implementation will be a major responsibility of governments, to ensure that commitments and agreed targets made by specific actors are indeed achieved.

In addition, governments should be encouraged to develop policy objectives and instruments to achieve sustainability goals relating to their own activities (eg., sustainable procurement, reduction of military spending, and greening all relevant operations).

#### International and regional cooperation and coordination

The UN system, through its relevant organs, organizations and bodies, in cooperation with Member States and with international financial institutions, appropriate international and non-governmental organizations and the business community, should make the MCGs a major priority and should:

- (a) Assist Governments, when requested, in the formulation and implementation of national action programmes on MCGs;
- (b) Promote technical cooperation among developing countries for MCG activities;
- (c) Strengthen existing structures in the United Nations system for coordination of action relating to MCGs, including the establishment of a focal point for information exchange and the development, formulation and implementation of replicable programmes and projects on MCGs;
- (d) In the follow-up of the implementation of emerging Rio+20 agreements, give high priority to the review of the progress made on MCGs and sustainable consumption and production;

#### Financing and cost evaluation

A mechanism should be set up to estimate costs of setting up, promoting and administering the MCGs, and for raising the necessary funds. Costs and financial terms, including any that are non-concessional, will depend upon, inter alia, the specific strategies and programmes Governments and other stakeholders decide upon for implementation.

#### ANNEX 1. LIST OF PERSONS/ORGANISATIONS SUPPORTING THIS SUBMISSION

1. Mohan Munasinghe, Chairman, Munasinghe Institute for Development (MIND), Colombo, Sri Lanka. <http://www.mindlanka.org/>; and Professor of Sustainable Development, SCI, Univ. of Manchester, UK .
2. Uchita De Zoysa, Executive Director, Centre for Environment and Development, Colombo, Sri Lanka. <http://centreforenvironmentdevelopment.blogspot.com/>
3. Philip Vergragt, Research Professor, George Perkins Marsh Institute, Clark University Worcester MA USA; and Senior Associate, Tellus Institute, Boston, MA, USA. <http://www.tellus.org/index.php>.
4. Andrew Crone, President/CEO, Trailhead Perspectives, Whitewater, WI, USA, <http://www.trailheadperspectives.org/>
5. Sylvia Lorek, Chair, Sustainable Europe Research Institute Germany, Cologne, [www.seri.de](http://www.seri.de)
6. Jeffrey Barber, Executive Director, Integrative Strategies Forum (ISF), MD, USA, [www.isforum.org](http://www.isforum.org)
7. Leida Rijnhout, Executive Director, ANPED - Northern Alliance for Sustainability, Brussels, Belgium. [www.anped.org](http://www.anped.org)
8. Luis Carlos Silveira, Director, Vale Sustainable Development Institute, Belem, Brazil, <http://www.vale.com/en-us/sustentabilidade/instituto-tecnologico-vale/pages/default.aspx>
9. Janis Brizga, Chair of the Board, Green Liberty, Latvia, Riga, [www.zb-zeme.lv](http://www.zb-zeme.lv)
10. Thomas Brose, Director, Climate Alliance, Frankfurt, Germany, [www.climatealliance.org](http://www.climatealliance.org)
11. Faiz Shah, Head, Development Management, Asian Institute of Technology, Pathumthani, Thailand, [www.ait.ac.th](http://www.ait.ac.th)
12. Fatima Rodrigo, UN Representative, International Presentation Association of the Sisters of the Presentation, <http://internationalpresentationassociation.org/>
13. James Gustave Speth, Former Administrator-United Nations Development Programme/Professor of Law-Vermont Law School, USA.
14. Allen L. White, Vice President and Senior Fellow, Tellus Institute, USA, [www.tellus.org](http://www.tellus.org).
15. Bjarne Pedersen, Global Director, Partnerships and Organisational Empowerment, Consumers International, United Kingdom, [www.consumersinternational.org](http://www.consumersinternational.org).
16. Sena Alouka, Jeunes Volontaires pour l'Environnement,Togo, [www.ong-jve.org](http://www.ong-jve.org).

27. Jean Stoner, UN Representative, Sisters of Notre Dame de Namur, NY, USA, <http://sndatun.wordpress.com>

## ANNEX 2. POINTS FOR FURTHER DISCUSSION

- a. Are the candidate areas for MCGs given above broad enough, or should the initial MCGs be limited to a few key areas (say 8-10 MCG like the 8 MDG)?

Perhaps it would be wise to identify MCGs related to the seven "priority areas" identified for Rio+20 aside from the three main themes.

- b. How do we identify the primary target groups? The poor whose basic needs are to be met, may be identified through existing poverty programmes. The rich could be the world's top 20 percentile of income earners in the world (both developing and developed countries), or should the MCGs use another criterion (like wealth)?

- c. Recent work (eg., International Resources Group) provides sufficient data to identify preliminary targets for sustainable use of key resources and environmental media at the global level. How can we facilitate scalability, by building in sufficient flexibility into the definition of MCGs, so that they can be adapted and harmonized to fairly reflect characteristics at lower levels (e.g., country, province, city, community, organisation, family, individual)?

- d. How can we set up an effective governance mechanism to measure, report, monitor and implement the MCGs? We could draw on the past experience of UN programmes, including the MDGs. Specific questions include:

- finding the right balance between bottom up (voluntary actions and behaviour change encouraged by social pressures) and top down (govt. policies and mandatory measures to change consumption habits)

- achieving better coordination among stakeholders, including consumers, producers and govt. Linking up with the MDGs to raise poor people's consumption along more sustainable paths

Some long term considerations also need to be explored, although they need not be resolved immediately to implement the MCGs. Key questions include:

- How do we improve the measurement and reporting of well-being, since current measures like GDP imply that more material consumption is better. We need to develop and popularize measures that encourage sustainable development (e.g., include environmental and social externality costs).

- What the other indicator or target-linked projects are being proposed at Rio+20? Are there any ties or synergies possible with these efforts?

- What information and measures are needed to shift values, public opinion and behaviour in the direction of sustainable consumption and production in the long run (e.g., like attitude changes re. smoking during past decades). Such information and measures should be reliable, understandable, convincing and meaningful and speak to the needs and interests of the particular audiences they are targeting, delivered through trusted channels by trusted and credible knowledge brokers.

---

## Mont-Blanc Meeting association

Five projects and 20 proposals to change the model with RIO+20

Extract from the orientation document of the fifth edition of the Mont Blanc Meetings

The International Forum for Social Economy, known as the Mont Blanc Meetings developed an orientation document, the final version of which will be sent to all the Heads of State taking part in the Rio 2012 summit on sustainable development. Then it will be distributed internationally so as to contribute to the positioning of the Social Economy as a major, vital player in the changes underway in globalisation.

The purpose of the various families of the social and solidarity economy (SSE) go well beyond the economic field. Since its origins, it has strived for a fairer, more democratic, more ecological society with more solidarity.

It cannot be separated from its economic purpose (associating for entrepreneurship), from its social purpose (justice and democracy), and therefore it is not possible to reduce its role, its weight and its contribution to economic indicators of wealth alone, to the number of companies it has created and to the number of jobs created (more than 10 % of world GDP). In short, its economic weight is far from sufficing to define it. The SSE is a stakeholder in the construction of a credible alternative to the dominant economy, on the condition that there is not an underestimation of its social and ecological role and the impact of its project, its ethic, its governance, its achievements and its influence on other players in the economic world (public enterprises or enterprises in the market sector).

Without changing the dominant economic model, it can contribute to going beyond it and influence the economy as a whole by showing through its practices, values and policies, its ability to handle the challenges of sustainable development, i.e. economically viable, socially equitable and ecologically sustainable development.

However, it must invest the field of political representation, by federating it solidly on both the national and the international fronts. To do this, our organisation proposes contributions which are addressed to public authorities and international institutions, contributions which are inspired by the best practices of the international experience of the SSE around five projects translating in operational terms ways of getting out of the crisis:

- democratising the economy and regulating finance;
- promoting shared governance;
- providing new social choices;

- Better feeding the planet and redeploying the

b environment;

- Changing the direction of globalisation to make

c it more human.

Finally, we conclude on the common theme of these proposals: create movement with a federative political action in alliance with other organisations and institutions.

First project: democratising the economy and encouraging territorialisation

- We want to encourage, by all means necessary, the development of a vast non-capitalist sector of SSE enterprises operating democratically on the challenges of the global crisis that we are going through. We believe that an essential precondition of this development is the universal affirmation of the plurality of forms of entrepreneurship through the recognition in law of the statutes of co-operatives, mutuals, associations and foundations.

- We are concentrating on developing quality employment in the context of an economy serving well-being in a fair world.

- We support the taking or the taking back control of common goods (water, land, natural resources...) by communities and States, in particular through the development of co-operatives, mutuals and associations. And at the same time, therefore, forms of ownership both private and collective, ensuring sustainability for enterprises and organisations (co-operatives, associations, mutuals) and access to goods and services (free seed, open software, etc...).

- We invite public authorities to support with greater force the biodiversity of the economy, collective entrepreneurship and sustainable and solidarity territories development, through policies and legislation which are relevant. We need to strengthen, on the basis of common objectives, links between the SSE, the State and local authorities, by forging close local and national partnerships, using the local footholds that co-operatives, mutuals, associations and foundations have, to help young people access jobs or support the development of responses suited to new needs.

- We want to develop a finance system for the SSE, or favourable to it, to support the development of new collective enterprises (workers' funds, orientation of SSE investment towards the SSE thanks to social, environmental and governance criteria, public and international support programmes for collective enterprises starting up, SSE financing institutes...) and we share with others the principle of strong regulation of finance. We are inciting co-operative and mutualist banks and alternative banks to provide local support to business, solidarity-based environmental initiatives in the SSE and create common tools to finance it.

The Mont-Blanc Meetings Vth Edition 2011 continental and international SSE projects. We are also calling on Governments and major international banks to set up partnerships with them with this aim.

- We particularly draw the attention of Governments to the fact that their choices in strategic and/or sensitive areas are not reduced to a bipolar choice (privatisation v. nationalisation); the SSE is a third way.

## Mountain Agenda, University of Bern, Switzerland

Submission to the Rio 2012 Secretariat for the Compilation Document

Theme: Sustainable Mountain Development with a focus on green economy and institutions

by Thomas Kohler, Associate Director, Centre for Development and Environment, University of Bern, Switzerland

This submission is organized as follows:

-numbering of paras refers to the guidance note

-paras pertaining to 3a), 1 and 2 refer to Sustainable Development in general.

-All other paragraphs refer to Sustainable Development in Mountain Regions.

pertaining to 3a: Expectations for the outcome of Rio 2012

1. We expect bold decisions, resulting in quantifiable outcomes, which are the result of specific action based on a short catalogue of common principles of Sustainable Development (SD). The outcomes of action must be monitorable in 5 year intervals.

2. While based on common principles, SD takes place in concrete contexts. We mention 3 such contexts, which we expect to be addressed specifically in the outcome documents, and which could help structure these documents: (1) sectoral issues such as those presented for example in the UNEP report on Green Economy; (2) the largely different circumstances of industrialised countries, countries in transition, and developing countries; and (3) the specific constellations of regional contexts, which strongly limit global blueprints for achieving SD.

3. Specifically, we expect that the mountain regions of the world will be addressed as a key regional context. Without sustainable development in mountains, sustainable development at the global level cannot be achieved:

With about 25% of land surface of the earth and 12% of global population,

- Mountains provide freshwater to over half of humankind, including megacities and conurbations on all continents; drylands of the world depend to over 80% on freshwater from mountains. Global Sustainable Development is a fallacy without a safe supply of water from mountain regions.

- Mountains harbour over 50% of all biodiversity hotspots of the world. As centres agro-biodiversity, they harbour the genetic pool of key global food crops such as wheat, maize, and potatoes. A world striving for higher food security must not lose this capital.
- Mountains are important for recreation and tourism in an increasingly urbanised world. Tourism is among the fastest growing industries at a global level, and mountains have a significant share in this growth on all continents. The Alps as the second most important tourism region in the world after the Mediterranean Basin lead the way. They show the crucial role of tourism for local employment and income generation without sidelining environmental concerns.
- however, mountains are hazard-prone environments. They are more exposed to risks than other environments. Poverty rates in mountain regions are significantly higher than on global average. Property rights are often not assured, especially in common property regimes and for indigenous communities. Both are widespread in mountain regions. These problems must be tackled more rigorously than in the past.

#### Pertaining to 3.b - d. Implementation, actors, mechanisms

- Green economy roadmap: Mountains have a high potential for greening the economy at all levels, which should be reflected on the outcome documents. Keyword include green energy, especially hydropower; biodiversity and agrobiodiversity (see below), and hazard prevention. - Sustainable development goals: within a global frame of SD principles, specific goals and monitorable indicators need to be defined for mountain areas as a specific context for SD. Efforts to this end have been made by Andean countries already. They deserve support.
- Views on implementation: Actor inclusiveness: In mountain regions, the 3 pillars of SD are strongly interconnected. Therefore, concepts for SD transcend sectoral approaches while based on sound sectoral knowhow of key stakeholders including authorities, local communities, external development agencies, research institutions, and the private sector. Appropriate forms such as local and regional bodies must be established for negotiating sustainable development outcomes for mountain regions. Donor and funding agencies, bilateral and international, as well as governments need to help establish and fund such bodies. Actor ownership: Regional and country ownership of SD processes and visions are key. Lessons how to achieve this can be learnt from the Poverty Reduction Strategy process.
- Specific cooperation mechanisms: The World Mountain Forum, a novel initiative based on public-private partnership, has a potential to channel substantial expertise and funds into mountain development, and to create new linkage between mountain and lowland populations. The Forum could be officially launched at the Rio 2012 Conference.

#### Pertaining to 4.a. Objectives of the conference

- Gaps. Watershed management. Following Chapter 13 of Agenda 21 from the Rio 1992 Earth Summit, important inroads have been made in watershed management, with a focus on mountain areas and highland-lowland contexts. Approaches have become more participatory and transsectoral. However, important gaps remain relating to area coverage. Given the world's need for freshwater, efforts in watershed management in mountain regions must be stepped up in the coming decade. FAO with its global watershed programme should lead the way in sharing experience with actors engaged in this domain.
- Gaps. Generating and strengthening knowledge. Chapter 13 also stressed the need for improving the knowledge on mountain regions. Progress has been made since 1992, but important gaps remain relating to patterns of climate change and their impact on water resources and hazards; and relating to the effects of economic globalisation on mountain populations and land management.
- New challenges and opportunities: Sustainable development in mountain areas faces a series of new challenges. These are climate change; the effects of globalisation including labour migration, irresponsible exploitation of resources such as minerals, timber, and water for large scale hydropower, and loss of cultural identity due to the dominance of western urban values, transmitted to the most remote mountain places by mass media, standardised formal education, and tourism. The challenge is not to prevent these processes from happening, but to turn them into opportunities via appropriate national policy frames.

#### Pertaining to 4.b. Green economy for poverty alleviation and SD

- Green energy: There is a huge untapped potential in mountain areas for hydropower development especially in developing countries, which presents an opportunity for green energy supply in support of a greener economy beyond mountain areas. Small hydropower in mountain areas has been particularly successful in providing affordable energy, creating local jobs, increasing wellbeing and reducing poverty, while very substantially reducing carbon loads without disrupting effects on local ecosystems. Efforts should be targeted to double small hydropower generation within the next 5-7 years especially in mountain regions of developing countries. GEF with UNIDO and ICSHP are called upon to take the lead to achieve this target.
- Large hydropower development has a huge potential to green the global economy much beyond mountain areas. Sadly, experience shows that it can only be promoted if global environmental and social standards such as those established by the World Commission on Dams are fully met, especially relating to fair compensation of mountain communities.
- Other investment in greening the energy sector in mountains should be promoted depending on local conditions. This refers to solar power, wind power, and energy from biogas. More efficient stoves are a cheap, low-tech, accepted and easily upscalable option for reducing carbon emissions by half, reducing women's drudgery, creating a healthier homes, and saving wood and dung, the most important sources of energy in the mountain areas of developing countries.
- Payment for Environmental Services (PES): important as they may be as incentives, more must be learnt from experience made. The compensation must be large enough to generate interest upstream for service provision – a challenge in densely populated mountain regions with many providers. Other unsolved issues concern the exclusion of poor land users, landless poor, valuation of services, and monitoring the effects of PES on quality and quantity of the services they are expected to provide.
- Mountain farming is green owing to low external inputs. Due to topography, it is small-scale, family based, labour-intensive, and multifunctional. It supports agrobiodiversity, hazard prevention and creates amenity by providing diversified landscapes. These are all traits that pertain to a green economy. Support for mountain farming should thus be stepped up. Finding markets for quality mountain products is a proven way of increasing mountain farm incomes and create value chains that benefit mountains and lowland areas. Such programmes need more support in future.

#### Pertaining to 4.c. Institutional framework

- Local institutions are crucial for SD and for resource management in mountain areas; no one individual will manage alone in these demanding and harsh environments. In order to ensure sustainable resource use in mountain areas, local institutions need to be acknowledged and strengthened. Local property rights need to be clear and secure, especially relating to common property regimes and to indigenous communities – both are widespread in mountain areas.
- Capacity development including research and outreach is important in order to address the specific challenges for sustainable development as they are presented by mountain environments. Local experience is particularly important; care must be taken to include community knowledge as well as globalised knowledge provided by outside experts. Capacity development should include local-on-the job, vocational, to technical and academic levels.

- Regional centres of competence in training, research and outreach have shown their value for sustainable mountain development and for advocating the case of mountains in national, regional and global arenas. Support for regional centres of competence in mountains, whether established or in the making, must be increased. As a rule, donor programmes should invest a minimum of 20% of the project funds into such institutions. However, the establishment and maintenance of such a centre is a long-term task. Core funding has to come from non-time bound funding bodies such as governments or foundations.

## Mountain Forests for Sustainability

### Mountain Forests for long-term Sustainability

Critical imbalances in Earth's hydrological cycle and 'Climate Change' are presently threatening all of life on Earth. It is therefore imperative that this situation is more broadly understood and that work towards remedying it is implemented. Many eminent people have gathered together in influential environmental assemblies to address these global difficulties.

"Healthy mountain ecosystems are the foundation of healthy people, both in the mountains above and in the plains below. To save civilization, there is no greater urgency today than to regenerate and conserve our mountains. "Their role in regulating our climate and water systems is fundamental to the sustenance of our life on this planet." (Dr Ashok Khosla, Lucerne World Mountain Conference 11/10/11) It would seem from their common consensus that the way to potentially mitigate and solve these problems rests with implementing sustainable development programs. When considering sustainable development and the survival of life on Earth, the health and balance of the global fresh water system is the most important issues that needs to be addressed and raised to a level of paramount importance. When considering Earth's fresh water system, it is vital to think about Mountain Regions.

"Mountains are the primary sources for the Earth's supply of fresh water. They provide critical storage of fresh water, stored in the form of ice and snow and in lakes, wetlands and reservoirs. This water is later released, providing critical flows to rivers and streams. Such valuable storage of fresh water is vital for all life on Earth.

All of the world's rivers originate in the Mountains and flow to the oceans, sustaining the life of all beings, in all ways of life here on Earth." (United Nations, Agenda 21, 1992)

If we consider the Earth as our home in a similar way to which we might consider a great house with many floors and rooms, it is easy to understand the dangers, which threaten the whole house, should the roof become destabilized? In this manner we could consider all land above 3,000 feet as the roof and all below as the body of the house. 'The Roof of the World' is comprised of all of Earth's mountain regions. However some areas form the top of 'The Roof of the World'. One of these areas is the Andes another is known as the Himalayan Hindu Kush. The Hindu Kush region covers an area of more than 4.3 million square kilometers. It spans large areas of Tibet and China, along with areas in Bhutan, Nepal, India, Afghanistan, and Pakistan. This region stores more snow, ice and permafrost than anywhere else on Earth outside the Polar Regions.

Due to this it is now being known as 'The Third Pole'. Scientific evidence shows that the Tibet Plateau, the main body of the Qinghai-Tibet Plateau, is the "starter" and "regulating area" of Climate Change in the Northern Hemisphere, playing an important role in conserving water resources and controlling the Climate (Zhang Yongze, Director of the Environmental Protection Bureau of Tibet Autonomous Region). Glaciers form the water towers of Earth. Over the last century, mountain glaciers worldwide have, on average, been seriously decreasing in length and volume. Glaciers worldwide have been retreating so rapidly that they may completely disappear soon (Chadwick, 2007).

"In the past half-century, 82% of the Tibetan plateau's glaciers have retreated. In the past decade, 10% of its permafrost has degraded. As the changes continue, or even accelerate, their effects will resonate far beyond the isolated plateau, changing the water supply for billions of people and altering the atmospheric circulation over half the planet." (Qui, Nature, 2008)

Considering this, the health of 'The Roof of the World' seriously needs immediate attention and the detrimental affects of hydro-dams on the environment in these regions should also be reconsidered. Along with all life on Earth, hydro dams are dependent upon healthy glacial flow. With melting glaciers they are not so reliable now, as when first conceived. Given the quantity of high quality free solar energy in mountain regions it would be beneficial to replace hydro-dam electrical projects with solar power projects.

"The U.N expresses its deep concern at the number and scale of disasters and their increasing impact within recent years, which have resulted in massive loss of life and long-term negative social, economic and environmental consequences for vulnerable societies throughout the world, in particular in mountain regions." (United Nations, 2006)

In mountain regions high altitude forests, through the action of precipitation and transpiration play a major role in the creation of snow (Bandyopadhyay, J. 1995). Precipitation is the process by which water molecules (H<sub>2</sub>O) form rain and snow. This occurs in relation to a combination of different factors, particularly when certain plants and trees are present. Deciduous trees such as oak release large amounts of a powerful hydrocarbon, known as isoprene into the atmosphere. Isoprene breaks down into a compound called dihydroxypoxide. This is very reactive and forms multitudes of bio- aerosols. These act like a vacuum cleaner of the atmosphere and are an essential factor in cloud formation (F. Paulot, J. D. Crounse, 'Unexpected epoxide formation in the gas- phase photooxidation of isoprene', Science 325(2009). It is interesting that the oak species is one of the main indigenous plants of the Himalayas. However it has been massively depleted due to its commercial value. Another factor in precipitation is known as ice nucleation, whereby bacteria produced by plants are blown into the atmosphere. These form the nuclei seeds around which ice crystals form. Snow and most rain begins with the formation of ice in clouds (C.E. Morris, D.G. Georga Kopoulos, D.C. Sands).

The stability of Earth's rivers and water tables depends upon maintaining the integrity of watersheds. These, in turn, depend upon the healthy biodiversity of the high altitude forests. It has been recognized that the protective function of stable forest cover is vital for safeguarding them. It has been said that only 25% of the Earth's indigenous mountain forests are still intact (Maggio, Gregory F. and Owen J. Lynch. 1996). This implies that 75% is missing.

"Despite all of the great benefits that mountain forests provide they have been disappearing at a startling rate in the last decade." (Bishkek, Global Mountain Summit, 2002)

These forests are the natural mechanism, which would normally be involved in making the mountain snows and replenishing the glaciers. These snows also act like a mirror reflecting solar radiation. As they melt, the mirror thins and more solar rays penetrate through to the Earth. When this ice melts, it increases the quantity of water vapor in the atmosphere. Water vapor (H<sub>2</sub>O) is a very powerful greenhouse gas, which normally stays in the atmosphere for no more than nine days. However if it is not brought to Earth through precipitation, it rises into the upper atmosphere and increases the problems of the greenhouse effect (Santer 2007).

This is a pivotal global problem that affects and threatens all life on Earth, along with all economies. Therefore it needs to be addressed and remedied without further delay.

To stop this problem from escalating, certain indigenous, high precipitating, fast growing plants should be planted, throughout mountain regions imminently. Trees like oak, which are slow growing and fragile when young, need the support of numerous other plants to be able to take root and survive; especially in seriously eroded mountain areas. Encouraging, supporting and spreading biodiversity is crucial.

Earth's hydrological system, unlike coal, uranium and oil, is a fast regenerating system. Given the right ingredients, of mixed indigenous mountain forest, it can be rebalanced and maintained.

From our research it appears to be both essential and plausible to reforest approximately 25% of Earths mountain regions within the next thirty years; so enabling natural ecological systems to re-balance themselves. The nature of Earth is an interconnected system. If we can view it from this perspective we have more chances of working in harmony with it and of solving problems related to it and ourselves.

Due to rapidly deteriorating environmental conditions along with the growing fragility of mountain regions, it is urgent that an interconnected method is applied. This should be coupled with the protection and regeneration of indigenous mountain forests along with a ban on mountain region deforestation by all U.N countries. Other countries could be encouraged with financial incentives to do likewise. Co-operation between world governments and groups is essential to enable the effectiveness of an endeavor of this

magnitude. The involvement of mountain communities is absolutely fundamental. Therefore any methods used need to fit with their requirements and traditions.

Considering this, we have looked at how these communities traditionally preserved their environments through cultural and religious practices.

One of these ways that has proven to be particularly effective is that of designating specific areas as Sacred Groves. Traditionally these groves were created and protected by local communities. They are forested sites where religious, cultural and educational activities take place. Well-preserved Groves are storehouses of valuable biodiversity. Many of the plant species found in them have great medicinal, economic and land restorative value and would otherwise be extinct.

"Sacred groves can benefit local agriculture by preserving a habitat for birds that control insect outbreaks in adjacent crop fields and may also serve as seed banks for locally adapted crop varieties and medicinal plants. Even small groves can be surprisingly effective in conserving biodiversity" (Warren and Pinkston 1998) "A scientific understanding of the sacred groves would be significantly important for designing strategies for the rehabilitation of degraded landscapes, involving local people's participation." (Gadgil and Berkes, 1991)

It is a method, which is still in use and accepted by traditional mountain communities and could potentially be adopted by many other communities. This would involve the creation of new sacred groves and the preservation and restoration of existing ones. If preferred some could be designated as Peace Parks. It could conceivably be done through the making of many small groves throughout large rugged regions. Green corridors/belts could be the means by which these are linked and through which biodiversity is able to spread and establish itself fast. In these corridors useful medicinal plants and vegetation could be planted for both local immediate needs and cottage industry. Because it is a method, which has proven successful and which is interrelated with both the ancient and present day traditions of indigenous communities, it could spread fast and easily, without the normal resistance that many conservational efforts so often come up against. Using a combination of methods ranging from traditional knowledge, companion planting and permaculture techniques, the establishing of high altitude indigenous forests fast is still possible. Local communities could be organized into collectives using co- operative methods for managing and maintaining these groves and green belts/corridors. These methods could increase employment and economies within mountain regions. It has already been agreed by world governments that:

"High levels of funding, investment and greater support are required in mountain areas. This is essential for the survival of both highland and lowland communities." (U.N General Assembly, 29 September 2005).

Payment for Environmental Services schemes could be used to support mountainous countries and communities to establish and protect indigenous mountain forests using the proposed methods. Over time many related and interrelated projects could be designed which promote and support green economies. Various education programs could be implemented teaching and linking communities both locally and globally.

Active Remedy Ltd. has researched and presented these ideas as a way to help mitigate environmental disasters and their resulting calamities, along with offering it as a global model for environmental restoration and conservation. They are intended to help in achieving long-term environmental sustainability as outlined in the 'Millennium Development Goals'.

"Where there are threats of serious or irreversible damage; lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (UNCED, 1992 Principle 15)

This could be a way whereby many seemingly unrelated groups and individuals could join together and support a common global program for the benefit of their projects and the greater good of the whole.

---

## Mountain Partnership

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably. Moreover, the ability of mountain systems to provide essential goods and services for all of humanity is increasingly under threat from climate change, globalization, a chronic lack of investment and ongoing land degradation. Mountain Partnership members recognize that despite the progress that has been made in promoting sustainable development of mountain regions, national and international development agendas still treat mountains, if at all, as marginal environments. As a result, poverty rates are higher than in non-mountain areas.

In the context of a Green Economy, new opportunities for investments by the private sector are emerging in mountain regions, especially in renewable energy, sustainable agriculture, and ecosystem goods and services. However, innovative institutional arrangements are urgently required to trigger governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, as well as the actual mainstreaming of mountains into overall national development and conservation processes.

Enhancing the global political commitment that translates into increased investments tailored to mountain regions will directly benefit poor mountain communities and indirectly humanity as a whole. Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

---

## Mountain Partnership Secretariat

### Inputs for the Compilation document

#### By The Mountain Partnership Secretariat (MPS)

#### Background

Over the last almost 10 years, the Mountain Partnership has been able to successfully promote sustainable development in mountain regions worldwide, as a multi-stakeholder mechanism involving an increasing number of members from around the globe. It is recognized as the only global instrument representing the mountain community and mountain issues in international processes and acting as a platform for advocacy for sustainable mountain development, knowledge exchange and improving local capacity.

The Mountain Partnership is a UN type two initiative, launched at the World Summit for Sustainable Development in 2002. It is an action oriented voluntary alliance of partners dedicated to improving the lives of mountain people and protecting mountain environments around the world. Presently, 50 countries, 16 intergovernmental organizations and 114 major groups (e.g. civil society, NGOs and the private sector) are members. Work is carried out

with a wide range of partners, in particular with the United Nations Environmental Programme (UNEP), the International Centre for Integrated Mountain Development (ICIMOD), the Consortium for the Sustainable Development of the Andean Ecoregion (CONDESAN), the University of Central Asia (UCA), the Mountain Research Initiative (MRI), the Centre for Development and Environment (CDE). The Mountain Partnership receives financial support from the Swiss Agency for Development Cooperation (SDC),

the Italian Cooperation, the Food and Agriculture Organization of the United Nations (FAO) and the World Bank. =

The main activities of the Mountain Partnership include:

- *Advocacy for sustainable mountain development* at the highest policy level, in particular the three UN Conventions – climate change, desertification and biodiversity, as well as the UN Commission on Sustainable Development, including the Rio +20 process and beyond;
- *Knowledge sharing with and among mountain communities*. The Mountain Partnership taps the wealth and diversity of resources, information, knowledge, and expertise to support positive change in mountain areas.
- *Strengthening the capacity of local actors*

The Mountain Partnership complements, supports and strengthens on-going initiatives in sustainable mountain development. The Mountain Partnership also functions as a broker for joint initiatives; facilitating contact between countries and institutions in view of joint

activities and creating conditions for cooperation and resource mobilization at the national, regional and global level. The strategic areas of work include adaptation to climate change, water, biodiversity, green economy, food security, indigenous people, agriculture, migration, gender and forests, in mountain regions.

#### **Expected outcome of Rio+20: Mountains for the World**

The outcome of Rio+20 should include provisions to strengthen the current partnerships that have demonstrated their advocacy role for sustainable development in their respective areas of work.

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably. Moreover, the ability of mountain systems to provide essential goods and services for all of humanity is increasingly under threat from climate change, globalization, a chronic lack of investment and ongoing land degradation.

Mountain Partnership members recognize that despite the progress that has been made in promoting sustainable development of mountain regions, national and international development agendas still treat mountains, if at all, as marginal environments. As a result, poverty rates are higher than in non-mountain areas.

In the context of a Green Economy, new opportunities for investments by the private sector are emerging in mountain regions, especially in renewable energy, sustainable agriculture, and ecosystem goods and services. However, innovative institutional arrangements are urgently required to trigger governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, as well as the actual mainstreaming of mountains into overall national development and conservation processes.

Enhancing the global political commitment that translates into increased investments tailored to mountain regions will directly benefit poor mountain communities and indirectly humanity as a whole. Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should

have a prominent place in the Rio 2012 agenda and in particular in its final declaration.

In order to protect future water supplies, reduce poverty in mountain populations and unlock the economic potential of mountains, the Mountain Partnership strongly advocates the following actions, presented at the closure of the World Mountain Conference held in Lucerne, Switzerland in October 2011:

- 1) Adapt and develop mountain governance that takes into account the unique characteristics of mountains in order to overcome poverty, food insecurity, and social exclusion.
- 2) Facilitate mountain communities to gain fair access to resources and share benefits of their use equitably.
- 3) Involve mountain people in decision making processes that concern their livelihood, economy, environment, and culture.
- 4) Strengthen and develop national, regional and global institutions that address highland- lowland interactions and transboundary cooperation, support capacity building, generation and dissemination of knowledge, technical expertise and innovation for sustainable mountain development.
- 5) Provide enabling conditions and incentives for investment by the private sector in sustainable development in mountain areas and include appropriate funding in national budgets in order to enhance wellbeing and reduce disparities.
- 6) Recognize the vulnerability of mountain ecosystems within the three Rio conventions and adopt action plans for each related to sustainable development.
- 7) Make best use of all new and existing funding mechanisms such as the Global

Environment Facility.

To achieve these ends strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

In order to be in a better position to respond to increasing expectations from MP members and other mountain partners in support to sustainable mountain development, the outcome of Rio+20, building on Agenda 21, Chapter 13, might consider elevating that status of the Mountain Partnership from a type two initiative to a stronger type of instrument within the UN structure. Considerations around this opportunity shall be discussed within the framework of the Partnerships Programme of the UN.

## **Mountain Research Initiative**

Inputs for the Rio +20 Compilation Document with particular focus on Sustainable Mountain Development

Prepared by

Dr. Gregory Greenwood, Director Mountain Research Initiative Institute of Geography University of Bern Bern, Switzerland

with inputs from Dr. Thomas Kohler, Centre for Development and Environment, University of Bern, and Dr. Daniel Maselli, Swiss Development and Cooperation Agency, Bern

Based on material provided participants in the World Mountain Conference held in Lucerne, Switzerland

11-12 October 2011

---

Our review of the past twenty years of history in the various mountain regions of the world leads to the following.

#### I. Problem Statement

Since 1992, mountain regions, which constitute nearly a quarter of the land area of Earth, have not performed up to their potential. Instead of playing a vibrant role in the life of the nations within which they are found, mountains have, with some notable exceptions, failed to match their surrounding areas in terms of the growth of environmental, social and economic capital. All too frequently, mountains have experienced losses of environmental capital through pollution and erosion of soil and biodiversity, losses of social capital through breakdowns in family and social disintegration, and losses of economic capital with stagnant economic growth, increasing poverty and destruction of infrastructure.

This fate is however not inevitable for mountain regions. Few observers of the Alps in the early 1800s, when they were characterized by severe environmental challenges, poverty and emigration as are other mountain regions today, could have imagined the Alps in 2011, when they play a central role in the life of Europe and offer benefits to both residents and visitors. While the development trajectory of the Alps cannot be followed by all other mountain regions, the high level of environmental, social and economic capital of the Alps shows that marginal regions can achieve sustainable development and enter more fully into the life of nations.

#### II. Principles of Sustainable Mountain Development

Pertinent to 3b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

**Innovation:** Sustainable mountain development (SMD) is fundamentally about the search for the comparative advantage of mountain regions in the life of nations. The comparative advantage of mountains is not a given but is in fact discovered and indeed created by actors through innovation, the pursuit of novel actions. The development of the Alps was not ordained by any government or organization but rather discovered and constructed by myriad actors over two centuries. Thus a first principle in SMD is to promote ability of stakeholders to innovate, to conduct the search for the comparative advantage of their region.

**Exchange:** The very notion of comparative advantage implies exchange with the larger world. The nature of this exchange is central to SMD, spelling the difference between being a colony and an equal member within the nation. But exchange, rather than autarky, is a fundamental premise. **Investment:** Taking advantage of the comparative advantage without destroying capital necessarily requires investment in at least one of the three dimensions, and more likely in all three. New enterprises and more broadly, new roles for mountains in the life of nations will require investment. Mountains have not seen the nature and level of investment in environmental, social and economic capital necessary to achieve on-going sustainable development. In addition, wealth created from mountains has seldom been reinvested in the mountains themselves but has been exported to distant centers. A central outcome of Rio+20 must be the steps needed to define and obtain that investment and especially, re-investment.

**Security and Justice:** Investment will not be forthcoming if civil disturbance and the absence of law make returns on investment unlikely. Unfortunately, war, conflict, drug interdiction and the absence of law characterize far too many mountain regions and make a mockery of any development efforts. **Sustainability:** If it is to result in sustainable solutions, the search for comparative advantage must be conducted within the three dimensions of environmental, social and economic capital. Sustainable solutions are those that create capital in one or more dimensions without sacrificing capital in any of the others. All three of these dimensions must be enshrined with the law.

**Enfranchisement:** The importance of different types of capital is unavoidably a measure of the political importance of those who hold those values. For decades, the relatively powerlessness of those who held environment values meant that environmental values were deeply discounted in the social calculus. Similarly, to the degree that indigenous populations in mountains are disenfranchised, and particularly when their ownership of resources is dismissed, the values that they hold dear will figure little in the decisions taken. For the dimensions of environmental, social and economic capital to be meaningful, stakeholders must be enfranchised within the political economy both to promote the development of truly long-term solutions and to participate in the trading and compensation that inevitably accompanies change.

#### III. Guidance for Sustainable Mountain Development

Pertinent to 4a. "Contributions could include possible sectoral priorities (e.g., (e.g., energy, food security and sustainable agriculture, technology transfer, water, oceans, sustainable urbanization, sustainable consumption and production, natural disaster preparedness and climate change adaptation, biodiversity, etc.) and sectoral initiatives that contribute to integrate the three pillars of sustainable development could be launched and endorsed at Rio+20."

Sustainable mountain development requires multiple actions by the government, by the private sector and by civil society.

##### Public Responsibilities

The government responsibility is to create an enabling framework, one that facilitates the search for a better future while respecting the boundary conditions for sustainability. The government can seldom perform the search by itself, but must instead bring all the actors within society to participate in the solution.

- Establishing peace and the rule of law. Unless and until mountain regions are secure and basic legal rights ensured, the investment required for sustainable mountain development will not be forthcoming. This requirement affects not only zones of civil conflict such as Afghanistan and Pakistan but also areas such as the Tropical Andes, where drug interdiction campaigns create conditions not dissimilar to combat.

- Providing legal and procedural recognition of three dimensions of sustainability. If the law does not require an impartial assessment of the impacts of decisions on environmental, social and economic capital, governance lacks the information essential for an informed decision. In nations with environmental disclosure laws, such laws should be expanded to include the other two dimensions. In nations without such laws, they should be legislated. In addition, on-going measurement and periodic assessment of all three dimensions is essential for governance to monitor results and readjust trajectories.

- Clarifying the tenure rights of mountain communities. The ownership of mountain resources sets the stage for all subsequent steps in sustainable development. Those who have little or no ownership rights, regardless of their historical claim, will have no standing to contest decisions and will be excluded from any negotiations that lead to compensation. In the absence of clarity, powerful, often external, actors can monopolize and in the broadest sense, mine what were heretofore community resources. The solution is not obvious as many actors both within and outside mountains have plausible claims to resources, with water and minerals being only the most obvious examples. However, long-term investment, again by actors both within and outside mountains, requires clarity of tenure. On-going efforts to establish or to protect already legal tenure is a fundamental requirement for sustainable mountain development.

- Promoting investment in all three forms of capital. While not solely a government responsibility, investment in human resources through education and health is central to sustainable mountain development. Certain key sectors especially communications, transportation and banking to facilitate exchange, and renewable energy to increase productivity and lower environment degradation generally require government support. Government policies can also encourage the investment of private capital through preferential tax treatment, advanced land and utility planning, and even the location of government jobs and services in mountain regions. Finally government decisions on

parks and protected areas set the stage for both protection in core areas and tourism development in buffer areas.

-Ensuring physical security of life and property. Mountains are particularly hazardous regions with glacial lake outburst floods, landslides, mudflows, avalanches, floods, and earthquakes, all of which expose important investments, not to mention lives, to risk. Governments should make appropriate investments in hazard zoning, early warning systems and emergency incident command.

-Protecting diversity. Mountains are areas of high biological and social diversity, as evidenced by many different crop varieties and a plethora of languages and ethnicities. This diversity is an important resource in the search for comparative advantage. Crop varieties from mountains may be the source of useful genes lost from current cultivars. Techniques inherited from more self-sufficient societies may be key in achieving a less consumptive global society. Governments should ensure that this diversity is not lost.

#### Private Responsibilities

The private responsibility is to invest in innovation, to launch enterprises that create wealth and employment. The private sector should rightly focus on generating wealth, subject to the other two dimensions of sustainability, as mountains must cease to be seen as backward areas burdening the rest of society.

Innovation should focus on achieving higher incomes through higher productivity and added value while lowering exposure to both endogenous and exogenous shocks. Important foci include:

- Traditional export products that are likely to remain or increase in importance in the future, such as energy, water, minerals, tourism and trade routes;
- Improved subsistence cropping regimes that increase yields and food quality, lower risk and otherwise improve food security. Hedging risk through a combination of cash and subsistence agriculture is likely to remain important in mountain regions for the foreseeable future. The key is to offer choices to farmers so that they can pick the best combination for their households.
- Improved or novel subsistence and cash products from grazing and forestry, which in mountains are generally managed as common property regimes, even in developed countries.
- Novel products such as additional ecosystem services in the form of reduced sediment, or increased carbon sequestration, and indeed, products that we cannot even imagine now but which mountain entrepreneurs will discover.

Crosscutting innovations include

- Improved banking and insurance services, especially to facilitate the use of remittances from the mountain diaspora;
- Improved communication services include mobile networks;
- Vertical integration, so that producers are more attuned to the desires of distant consumers;
- Branding of mountain products to distinguish them from similar products and to capture additional value of mountain products;
- Cheap and renewable energy, which will lower the pressure on vegetation and enhance capacity to add value.

#### Civil Society Responsibilities

The civil society responsibility is to give voice to mountain people and to provide critical oversight to government and private decisions.

-Gaining representation of mountain communities in governance. If mountain communities are not represented in government, and more broadly, in the governance of the resources that are central to their existence, then their interests will not be considered in decisions and they will be excluded from the flows of wealth generated from mountain resources. It is thus essential that mountain communities create entities that represents their interests and can influence governance not just through government itself, but also through the media and other cultural forums. This is not a role for the government, nor for the private sector (which certainly already has its lobbyists), but for nongovernmental organizations and for other civil societies organizations.

Volunteer Project Manager: Léa Corrêa Pinto

The Platform is now composed by almost 500 networks, civil organizations and citizens who have already signed the Adhesion Letter .

The Mountains Valleys Life & Citizenship Platform for *Sustainable Development on Times of Climate Change* was launched in Sao Paulo State, parallel to the **1st Rio +20 Paulista Seminar**, also during the **Seminar of the 4th edition of the MDGs** promoted by The Presidential General

Secretariat , the United Nations Development Programme ( UNDP ) and the National Movement for Citizenship and Solidarity, as well as during the **National Dialogue and Convergence Meeting** of Agroecology, Environmental Health and Justice, Food Sovereignty , Solidarity Economy and Feminism, in Salvador, Bahia.

#### The Platform Launched

**Please download the original submission to see this image**

#### A case study: Threatened Cassador Basin is one of the civil historical of the Platform

Protestors block Brazil road project -The Earth Times by Jack Freeman, 4/13/97

In São Paulo Metropolitan Green Belt lies the Cassador Basin located **in the core area, of the Atlantic Rainforest World Heritage- Mab – Unesco, it hides the Iteiri Fauna and Flora Reserve**, officially under private protection, since 1978 (P-163/78IBDF) and an official member of Planet Society- Unesco (Project BRA022). Around there it is planned the duplication of the highway dividing these important area.

"It must be made clear," they say in a flyer, "that there is no opposition to the construction of the highway" itself, calling it "a very important project linked to the economic well-being of millions of Latin Americans."

But, they add, "the rainforest must not be destroyed" by the roadbuilders. "The authorities must change the design of the proposed duplication" of the roadway, they say, "in order to avoid destruction of a priceless ecosystem. A well designed project will cause no

harm to the environment; on the contrary, the unique nature of this beautiful landscape will be enhanced."

They add that there are many examples, the world over, of environmentally insensitive building projects that have been reversed because of pressure brought by

**Please download the original submission to see this image**

#### Serra do Mar Civil Society and Ecologists

Thus, although all efforts being yet unsuccessful, for caution a group of citizens , the Iguassu Iteiri Reference Center from the Citizenship Movement for Water, Mountains and Forests and others civil society organizations, considering that not just in Cassador Basin but all over mountains are been neglected decided that it was time for more effective actions and mobilization

supported by the prevention and precaution principles and against the environmental legal flexibilization. From theory to practice . This is the origin of the Mountains Valleys Life & Citizenship Platform For Sustainable Development on Times of Climate Change towards Rio+20, on the basis for desirable participative governance.

1. The Mountains, Valleys, Life and Citizenship Platform, created by the individuals and the entities undersigned, warns the Brazilian and the Global society about the importance of mountains and valleys, from the urban to the rural and the forested ones, regarding their space, territoriality, local and downstream communities from the strategic, global economic and socio-environmental points of view through the perspective of climate change;

2. Permanent Preservation Areas - APPs are those protected areas in terms of 2º and 3º Articles of the Brazilian Forest Code (Federal Law No. 4.771/1965). The Brazilian legal concept of APP relates to such areas, regardless of soil cover, the environmental function of preserving water resources, landscape, geological stability, biodiversity, plants and animals gene flow, as well as of protecting the soil and of ensuring the well-being of human populations;

3. The environment is the set of conditions, laws, influences and interactions of physical, chemical, biological, social, cultural and urban, which allows and governs life in all its forms (Brazilian Federal Law No. 6938/1981);

**Please download the original submission to see this image**

4. The Constitution of the Federative Republic of Brazil (1988) asserts, in Article 225, that the environment is a healthy and balanced right of the community, therefore everyone - the Government and the society - have a duty to defend it for their own enjoyment and for the future generations;

5. The United Nations Conference on Environment and Development (1992), held in Rio de Janeiro guarded Chapter XIII of AGENDA XXI, for fragile mountain ecosystems, because they are important sources of water, energy and biological diversity. In addition, they are key resources – for minerals, forest and agricultural products - and are a source of pleasure. As a major ecosystem representing the complex and inter-related ecology of our planet, mountain environments are essential for the survival of the global ecosystem.. Yet mountain ecosystems are undergoing rapid change. They are vulnerable to accelerated soil erosion, landslides and rapid loss of genetic diversity and habitat;

6. Rio +20 is an excellent opportunity now to assess the status of the Sao Paulo, the Brazilian and the Global mountains, slopes and valleys environmental degradation, the actions taken in support of sustainable mountain development, the challenges, the opportunities and the necessary steps to move forward in the future;

9. In times of climate change, it is essential that all development activities, among them the infrastructure for transmontana mobility, are seized based on the principles of **precaution and prevention**, since natural disasters recorded in 2010 killed more than 296 800 people in the world;

8. It urges the incorporation to the concept of **sustainability, the concept of survival** considering that in one year the average number of victims was more than quadrupled since 1980 (66.000 deaths) and costed about \$ 130 billion. 950 natural disasters were recorded in 2010, a figure well above the average of 615 over the last 30 years. In Brazil, relapse enhanced, the tragedies of the highlands, by 2011; Over the next 60 years, the storms in the city of São Paulo and in Rio de Janeiro, in the coastal towns and along the Atlantic Mountain Range - Serra do Mar - **will triple**, as, scientific study conducted by INPE (National Institute for Space Research) in partnership with the MIT (Massachusetts Institute of Technology) and IAE (Institute of Aeronautics and Space). The forecast is based on increasing the **temperature Atlantic Ocean water over the past 60 years, which was 0.6 ° C;**

## Tragical Landslides in Brazil

### Please download the original submission to see this image

10. The Mountains, Valleys, Life and Citizenship Platform, calls everyone to join forces and to contribute with proposals and to promote debate with a view: on the maintenance of existing environmental legislation; on the weighting of the true public interest, through the prism of medium and long term, as to public and private enterprises, on the analysis of all alternatives, and regardless of the immediate costs, the forecast is to opt for greater safety of the population, to the less disastrous alternative, to the adoption of the best scientific and technological knowledge, with the purpose of ensuring to all the multiple functions of natural resources;

11. The Mountains, Valleys, Life and Citizenship Platform confirms the population aspiration for a Brazil and for a World with more health, less injustice, in which the quality of life for all is a criterion taken into account. A World in which the poorest are not relegated to places destroyed, dangerous and unhealthy. Where nature is respected in order to remain our main source of life and not the messenger of our diseases and disasters, (CBDFDS, 2011).

Children Contexts

### The Mountain's Magie

All over the world mountains have been a children's theme on their drawings and have been worshiped by the traditional natives, and around here it is just the same, even up to now by one another as well as in the other countries! The belief that mountains get mad when hurtled could be accepted, considering the up-to-date geological and geotechnical knowledge. Nowadays mountains preservation must be based on incentives. Also it is necessary to alert about compensation mechanisms in order that the mountains good willers not to become dependent of evil actions against nature

---

## Movement Nova Friburgo in Transition

### MANIFESTO OF THE MOVEMENT NOVA FRIBURGO IN TRANSITION

The world's problems cannot be solved by skeptics or cynics whose horizons are limited by obvious realities. We need men and women who can dream of things that never were. (John F. Kennedy)

One of the biggest challenges of rebuilding Nova Friburgo, severely hit by the biggest natural disaster in the history of Brazil, is to provide housings on a large scale and in safe places, from requiring techniques solutions which should not repeat the mistakes from the past. The natural disaster caused by heavy rains that devastated the Rio De Janeiro state mountains in January, was in the world-wide media because of our city vulnerable situation, due to an urban development related to the overlapping of the private interests above the collective ones. It brings up the urgency to radically update the way we deal with our habitat. Although these natural disasters happen year after year, with increasing frequency and intensity, it can be seen that the actions of the Government has been limited to its emergency aspects, not solving the problem in structural terms.

The Movement Nova Friburgo in Transition has as intention to insert the city in World-wide movement of the Cities in Transition (Transition Towns) from the actions of the civil organized society and the Government, for the accomplishment of the necessary changes, so that the city reaches a situation of urban sustainability, becoming less vulnerable to the effects of climatic changes, economical and/or energy crisis. We understand that every crisis is, also, a moment for chances and possibilities to change courses. It doesn't mean only to construct houses for the homeless, but rebuild these cities under new approaches, constructing, instead of those huge complex built in areas far from the workstations, districts planned under the perspective of sustainable ecosystems development.

The basic proposal of the Movement is the accomplishment of an eco-district pilot project, so that this experience can be redone in other places, encouraging a radical change in the current urbanization model, and promoting a more immediate positive repercussion toward to the desired transition, than just enforcing a urban legislation that, however indispensable, presents more results in the long run.

This eco-district project could be accomplished through a national competition of ideas.

The winners would participate, in a cooperative way, developing the project, based on a reference term created by a multidisciplinary technical team (architects, sociologists, geologists, engineers, geographers, anthropologists, economists, etc.) and representatives of the future residents. Parallel to that, wide eco pedagogical campaigns would be carried out, especially with the population target of the project (homeless people and inhabitants of areas that are in risk). There are institutes and workshop-schools in the region, such as: TIBA (Institute of Technology Intuitive and Bio-Architecture), Pindorama Institute, Bambu-Rio, CECNA, Mãos de Luz, Escola da Mata Atlântica, etc. They could qualify young volunteers to work, under the orientation of architects and engineers, in the construction of the new constructions and urban infrastructures, by applying sustainable technologies and ecological principles as the permaculture.

In a perspective of inversion of the current trend of extensive and predatory urbanization, this new urban settlement would have to be one vertical eco-district, in a conception of "compact city", with a similar urban quality to the ones in Brasília, but with some differences:

1. The traffic system will privilege the pedestrians (with attractive wide sidewalks and public parks), the bikers (with a wide bike road and public places to park the bikes), and a mass collective transport (moved by electricity or bio-fuel);
2. The urban implementation will have to adjust to the local geomorphologic characteristics, taking advantage on the topographical declivities, with the intention of avoiding the use of elevators (vide example of the "Conjunto Pedregulho", by the architect Reidy) and fitting the sight through the use stilts;
3. Use of local and eco-techniques materials, taking in account the geographic and cultural characteristics of the place and of the future residents;
4. Use of natural and renewable energies, biological treatment of the sewer, garbage separation and recycling, landscaping, organic garden, permaculture, etc.
5. Qualification of young volunteers to work erecting urban constructions and infrastructures (as in the Movimento Oasis, in Santa Catarina - BR).

The basic idea is the collective development of a trial design, radically new, regarding the current status that could serve as reference in the transition from the current predatory and chaotic urban standard to a model of sustainable development, like synergy. This is the appropriate moment for the fulfillment of this proposal, because of the Conference Rio+20 that's is going to happen next year, when Rio De Janeiro receives environmentalists from the entire world to evaluate the advances of the ECO-92.

To conclude, the perspective of a transition for a sustainable urban model also involves, necessarily, the people involved in the project and in its results, by the combination of values such as cooperation, neighborliness, solidarity, creativity and conscience of being part of the planet, under penalty of making it impracticable to live on Earth.

---

## National Confederation of Engineering, Architecture and Agronomy (CONFEA) - Brazil

Rio+20Recommendations from the CONFEA, the National Confederation ofEngineering, Architecture, and Agronomy, Brazil.

General Content: What are the expectations for the Rio+20:It is expected that the multilateral and UN system will reach a consensus on poverty reduction under a sustainable economy, while adopting cleaner technologies.

1. What are the comments on existing proposals: a. What are the views on implementation:The tree UN conventions - climate change, biodiversity, and desertification- could be implemented in full measure, with commitments and money. b. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisagedThe Climate Fund should be strengthened to implement greener economy and drastically reduce the use of fossil fuels. The Fund should be fed from a carbon tax to be created, while the collected funds should be invested to implement the new recommendations of the conference.2. Specific Elements: a. Objective of the Conference:The conference should strengthen the focus on poverty alleviation and food security under a greener economy and sustainable technologies, for all countries. Sectoral priorities:Increase in the use of biomass energy to be implemented together with food security. Strengthening the transfer of greener technologies among countries. b. Green economy c. Institutional framework for sustainable development d. Any proposals for refinement of the two themes.

## National Right to Life Educational Trust Fund

STATEMENT:

Human beings are the center of all sustainable development.

The loss of mothers and babies due to lack of even basic health care and the failure to dedicate adequate resources to save women's lives is the greatest impediment to development in all areas.

It is essential to the achievement of MDG Goals 4 & 5 (as well as 6) and to their empowerment that women of the developing world receive the kind health care, particularly maternal and child health care, which has been available to women in the developed world for over 60 years, that would provide a safe outcome for mother and child.

The world has failed to reach these goals because the resources have been directed toward decreasing the number of children women deliver, rather than making the delivery of their children safe and has failed to properly direct resources to save women's lives.

There is no doubt that unless and until MDG 5 (improving maternal health) is fully realized, none of the other MDGs will succeed and the world will be no better off than we were when the MDGs were conceived 11 years ago.

Even though the new estimates by Lancet of 350,000 per year are 150,000 fewer than the WHO estimates of over 500,000, these new estimates are still shockingly high. MDG 5 will not be achieved by 2015 unless there is a significant acceleration in allocation and in proper direction of resources.

We have grave concern about the false and dangerous claims that the way to reduce maternal mortality in the developing world is to legalize abortion. It is never necessary to directly attack the unborn child to protect the health of the mother in non life threatening cases and that laws against abortion should and do allow for those medical procedures that prevent the death of the mother while at the same time striving to save the baby's life.

The WHO also tells us that 99% of maternal mortality occurs in the Developing World. We have known how to save women's lives in the developed world for over 60 years. According to WHO, the dramatic decline in maternal mortality in the Developed World from 1940's to 1950's coincided with the development of obstetric techniques, the availability of antibiotics and improvement in the general health status of women (WHO, Maternal Mortality: A Global Fact Book, 1991)

The lack of modern medicine and quality health care, not the prohibition of abortion, results in high maternal mortality rates. Legalized abortion actually leads to more abortions—and in the developing world, where maternal health care is poor, legalization would increase the number of women who die or are harmed by abortion.

Legal abortion does not mean safe abortion. The evidence shows that a country's maternal mortality rate is determined to a much greater extent by the quality of medical care than by the legal status of abortion. Abortion complications are not a function of the legality of the procedure, but by the overall medical circumstances in which abortion is performed.

In its 2003 Report, Unsafe Abortion (Fifth edition), the World Health Organization states: "In some countries, lack of resources and possibly skills may mean that even abortions that meet the legal and medical requirements of the country would not necessarily be considered sufficiently safe in high-resource settings". In other words, as they said in their 1998 Report, "the legality or illegality of the services may not be the defining factor of their safety".

Comparison made between nations that have strong abortion restrictions, such as Ireland and Poland, and nations that permit abortion on demand, such as Russia and the United States, demonstrates that nations with strong abortion restrictions actually have lower maternal death rates than countries that permit abortion on demand.

For example, in India abortion is broadly legal, but maternal deaths are common due to dangerous medical conditions. According to Abortion Policies: A Global Review by the UNPD, "Despite the liberalization of the abortion law, unsafe abortions have contributed to the high rates of maternal mortality in India [570 maternal deaths per 100,000 live births in 1990.]"

Conversely, the maternal mortality rate in Paraguay is much lower, despite the prohibition of most abortions and the fact that "clandestine abortion is common." The rate has actually been declining—"from 300 deaths per 100,000 live births in 1986 to the most recent 1995 government estimate of 190 deaths per 100,000 live births."

The key, therefore, to reduction in maternal mortality rates from all causes, including abortion, is the improvement of maternal health care, not the legalization of abortion. In the developing world—where medical care, antibiotics, and even basic asepsis are scarce or absent—promoting abortion would increase, not decrease maternal mortality.

No abortion is ever completely safe, and, of course, abortion is never safe for the youngest member of the human family—the unborn child, who at the time of most abortions, which are performed at eight or ten weeks, already has a beating heart, brain waves, eyes, ears, fingers and toes.

Abortion is not good for women. With every abortion there is at least one dead and one wounded and sometimes two dead. Mothers still die and many are terribly wounded physically, emotionally or psychologically by abortion.

Again, human beings must be the center of all sustainable development.

---

## Native American Olympic Team Foundation (NAOTF)

### The Native American Olympic Team Foundation (NAOTF)

The mission of the Native American Olympic Team Foundation (NAOTF), a partnership between Olympians and Native American leaders and Elders, is to "create joyful unity through sports and education, to help heal Mother Earth for all our children, including through the Olympics."

NAOTF was co-founded by Olympic skier Suzy Chaffee, who introduced fun fitness to America while serving on four Presidents Councils of Physical Fitness, and led the Title IX March that enforced Equal Opportunities for Women in School Sports and Education, which helped save the U.S. a trillion in healthcare and welfare.

A snow miracle in Telluride, Colorado, 16 years ago, after Suzy taught a Lokata Indian named Rollingbears to ski with a ticket donated by the ski area, inspired the ski area to partner with Suzy to pioneer Telluride's Ute ski and snowboard program. Chaffee then enlightened and inspired ski areas/communities across North America to give thousands of their nearby underserved Native youth a chance to ski and snowboard on over a million acres of their beloved ancestral mountains. Thanks to lifting the health, behavior, academics, joy, job and Olympic opportunities of their children, the Elders have been inspired to lead Gratitude Snow ceremonies that have helped save countless ski areas from droughts, including the Salt Lake Olympics.

Over the years, NAOTF created a working partnership between the U.S. Ski Industry leaders, scientists, such as the late Nobel Peace Prize winner, Stanford's Dr. Stephen Scheider, and a group of Native American Elders and Earth healers. For example, Seneca Elder Robert John Knapp who inspired Pope Benedict to declare, "It is a sin to poison the water," and gifted Cherokee Earth healer, Olivia Ellis, Phd., master gardener at President Jefferson's Monticello Gardens.

They agreed that these ceremonies that give appreciation to Mother Earth, raise the electromagnetic vibration of the mountains where no toxins can exist. And in purifying the mountains of the blankets of poisonous smog from the cities, it restores Nature's cycles and the natural weather and precipitation of regions. Elders-led gratitude ceremonies next to oceans have a similar purifying affect on water, also proven by Dr. Emoto, who often partners with tribal Elders worldwide to restore contaminated bodies of water.

Further empowered by the work that the United Nations is carrying in the area of Harmony with Nature and its holistic approach, NAOTF orchestrated high visibility model mountain and ocean ceremonies in Vail, Colorado, and Puerto Vallarta, Mexico, respectively, leading up to the UN's

2011 International Mother Earth Day. We deeply honor the Indigenous Bolivians for initiating this Day, after losing their only glacier/ski area and water supply for 2 million people in La Paz.

Learning from the Elders and proven by scientists that these ceremonies can also smooth out the earth changes related to 2012, NAOTF called upon the US Ski Industry leaders, David Ingimie, to assist us in reaching out to ski leaders on other Continents to share this ceremonial solution to inspire communities to live in more harmony with Nature, to help ensure that future generations can enjoy snowsports. Through our world press stories (some articles getting 10 pages on Google, including Forbes.com, USA Today, the Vatican and two UN websites), and contact with foreign ski leaders, added to partnerships with Michelle Cousteau, George Bauman, and Mountaineers, our stories have helped inspire many communities to invite the

Indigenous Elders to lead cross-cultural ceremonies in Australia, South America and Europe, which reconnect us with our Earth-honoring Indigenous roots.

Scientists have also proven the power of prayers. To help diminish and purify the oceans from radiation from Fukushima's nuclear catastrophe, NAOTF circulated in the press worldwide Dr. Emoto's Hawaiian Elders' powerful healing prayer.

To help prevent Los Alamos' nuclear catastrophe on our soil, which would have dwarfed Fukushima's, NAOTF gave world press spotlight to the prayers led by the Apache Elders, and united with prayers by hundreds of cross-cultural people of different faiths done on Mt. Baldy, one of "19 Holy Mountains." The rains miraculously came and winds shifted across the street from the Lab. These Holy Mountains on four Continents are energized so that each prayer on any part of them, even in the parking lot if you are disabled, is like 3,000 people praying with you. Stories available on [WWW.SNOW-RIDERS.ORG](http://WWW.SNOW-RIDERS.ORG).

Stanford's scientists and others corroborate the pioneering efforts of Sir George King, astrophysicist-mystic, to store prayers by hundreds of pilgrims on Holy mountains in the U.K. and U.S., to be able to send them to prevent or diminish catastrophes and more quickly recover from them.

Practical and Spiritual solutions need to go hand in hand to restore the Earth. Mother Earth has warned the Elders that man cannot keep polluting the lands and mountains. Doing ceremonies is a band aid to compassionately assist in emergency droughts and catastrophe, but our countries and individuals need to make bold green changes to prevent reruns. Yet these miracles, more than anything woke up Suzy and communities to realize that Mother Earth really listens to heart-felt prayers and appreciation.

Therefore since the toxins from all countries end up in the oceans, and we are headed toward mass extinctions, and the trade winds bring clouds of toxins to the Arctic regions and melt our glaciers, and every time we use a product with toxic chemicals we are contaminating our very drinking water which is the key to life, we must quickly shift to using all natural products and foods. The US has only banned 5 toxins, E.U. 35, and Japan 48, and we must do more to survive and thrive.

#### NAOTF RECOMMENDATIONS

Since most people have a hard time believing that the UN has made this phenomenal mind and heart shift in the last few years, which NAOTF heartily applauds, we recommend that the UN uses its immense resources and networks to better get the word out that they believe that Mother Earth is a living, and infinitely loving, compassionate intelligent being. Our Earth Family needs to hear that UN leaders and ambassadors from each country support these Elders-led ceremonies that are backed by Nobel Laureate scientists.

Therefore, NAOTF recommends:

1. That RIO-20 actively encourages world participation in Elders-led ceremonies and prayers, and to share joyful sports, dance and music activities, especially with the youth, which will also help prevent 2,000 tribes from going extinct each year, according to the U.N.
2. That the U.N. raise awareness and encourages our Earth Family to make pilgrimages to the Holy mountains (See Annex 1). The Aetherius Society, founded by Dr. King to assist pilgrims access them safely via Aetherius.org. And there are regular groups one can join. Some can be climbed in an hour and others in a day.
3. To restore our dying oceans, get agreements by all countries to ban 100 of the most dangerous toxins within 3 years, using the E. U. model, combined with the proposed U.S. model, approved by Elders, which test chemicals by using human cells in petree dishes rather than genociding millions of animals.
4. Follow the Mexican Government model of assisting farmers in becoming organic certified. Mexico has many organic farms.
5. Encourage all schools to have organic gardens to prevent obesity, diabetes and teach children to organic farming, to help restore world soil and water purity. And ideally have local Elders bless them at a ceremonial dance.
6. That all 192 UN member states strongly enforce laws protecting the headwaters of vast regions, since healthy normal Nature cycles are critical to ensure gentle abundant rain, snow and snowmelt for drinking water, Nature and Agriculture. Aspen (next Castle Peak, a Holy Mountain), and the Arizona Snow Bowl (on the San Francisco Peaks, sacred to 13 tribes), are the water sources of Colorado and the Southwest. They both found that through tribal-led ceremonies and detoxing their ski areas and towns with a variety of wind, solar, biodiesel mass transportation and snowcats, they restored their abundant snow cycles. While the Snow Bowl wanted to use wastewater in the snowmaking that could not filter hospital drugs, the tribal ceremonies and prayers we circulated worldwide made it so that the snowmaking was never needed for the last 4 years.
7. Acknowledge Student Green power through praising Middlebury (Vermont) College Students who created the first Zero Carbon Ski Area in partnership with Native (Wind) Energy, which won a world clean energy Oscar in Switzerland. Also the US Colleges who switched to green cleaning, including North Arizona University, which helped end Arizona Snow Bowl's snow drought.
8. Urge everyone with standard toilets to put a rock or two into its reservoirs, which could perhaps save quadrillions of gallons of precious water from going down the drain.
9. NAOTF recommends that Elders are allowed to present some of their contributions to live in harmony with nature and honour Mother Earth:

- Johann Grander should present his GRANDER METHOD AT RIO-20.

- Jamie Scheckman, founder of MountainRiders Alliance, who is ushering in a new era of Green Ski Areas that honors harmony with Nature above profit, should be cited as a model.

[http://live.tetongravity.com/\\_News-MRA-Skilogik-And-Suzy-Chapstick-To-Help-Native-Skiers/blog/5400887/75233.html](http://live.tetongravity.com/_News-MRA-Skilogik-And-Suzy-Chapstick-To-Help-Native-Skiers/blog/5400887/75233.html)

- Robert John Knapp speak on behalf of Mother Earth about preserving Her waters, given his Seneca Nation's Water Prophecy. Humanity may be as touched as Pope Benedict was to declare it a sin to poison the water.

#### DIET AND EXERCISE - KEY TO HEALTHY GREEN COUNTRIES

The Elders say what we eat affect the way we think and the same can be said about what countries eat. In order to create a healthy Earth Family with the energy and vision to live in harmony with Nature and restore our planet, we need to create psychologically healthy

populations through diet and exercise. Karl Jung (Swiss), "The Father of Modern Psychology," realized while living with a Pueblo Indian Family the five keys to being psychologically healthy: Sports, ideally in Nature and daily PE so kids can get naturally high and develop intuition; Fine Arts classes in schools to express who we are; giving

back our unique gift for the greater good (now curing bullies); and giving gratitude, including to Mother Earth. Therefore, NAOTF urges all countries:

1. To support daily sports plus the arts to create a psychologically healthier Earth Family, which is critical to creating good earth guardians. Also spread awareness of the other keys.
2. To help spread this research about Stevia as a cost-effective alternative to the world diabetes-obesity epidemics.
3. To urge star athletes to cheer on their country's children to reduce diabetes by also giving clinics in schools.

#### RESTORING EARTH THROUGH A NUCLEAR-FREE WORLD

**1. Above all else, RIO-20 leaders must urge humanity to ensure the Prophecy of Peace and Prosperity for 1,000 years by boldly enlightening and insisting our leaders and representatives learn from Fukushima and the Gulf catastrophes, and stop serving the nuclear and oil corporations, given their connection to wars and annihilation. The People have spoken through both the Nuclear and Wall Street protests around the world, that we want a nuclear-free world, since nuclear is motivated by what turns out to be sociopathic greed by the Military Industrial Complex. President Eisenhower warned us about them in his farewell speech. 2012 is the winding down of the greed machine and the rise of heart-centered, and those serving the People through safe clean wind, solar, geothermal and tidal turbine energy are flourishing. See Annex to learn the lessons of how three worlds have Already been destroyed.**

#### Forests

1. Urge humanity to further protect our forests following 2011's Year of the Forests, by encouraging all schools, Parks, Forest Departments, and ski areas to give an honorarium to Indigenous Elders or teachers to lead hikes in Nature to help students and hikers see through the eyes of their ancient Earth-honoring ancestors. 4th grade students in Telluride were totally fascinated by a Cherokee teacher who substituted a Forest Ranger who got sick. Aspen SkiCo then contacted NAOTF.org to implement such a program for their 4,000 per year Nature Adventurers on skis, snowshoes and shoes in summer.

#### Annex

##### Background Information on the Stevia Plant

Diet is also key to creating healthy Earth Guardians. Recent studies found that consuming high levels of sugar damages our brains, causes ADD and ADHD, the sugar blues, depression and violence – a pipeline to prison. The U.S. and Mexicans are the biggest consumers of Coke and Pepsi, which have 40 grams of sugar, when 15 grams of sugar is the recommended healthy limit per day. When a Mexican-American teacher got the sugary soda machines banned in the LA School district, violence in schools was also reduced by 65%. (NPR Radio) Yet there is a solution to *the Wall Street Journal* findings that “the number of adults with diabetes has doubled world-wide over the last three decades to nearly 350 million, and nearly threefold in the U.S.” “And Diabetes long-lasting and disabling condition is going to be the largest cost for many health systems.”

1,500 years ago the South American tribes discovered a flowering herb called Stevia Rebaudiana, which the Spanish then helped spread worldwide since it is the only known natural sweetener with zero calories, zero carbohydrates, and a zero glycemic index, which gives you zero fluctuations in blood glucose and energy roller coasters, and zero contributions to any disease. Yet surprisingly not everyone knows about this extraordinary sweetener.

Asia is the largest grower and user of Stevia, and have nearly stamped out diabetes. Stevia keeps blood sugar levels healthy to avoid hypoglycemia, which makes one vulnerable to the overuse of the fermented sugars in alcohol, which is only a step away from alcoholism and drug abuse. Another study found that “82.6% of those who attempted suicide were under the influence of alcohol and drugs.”

The tribes also used organic Stevia leaves for their anti fungal, viral, bacterial, cavity and gum disease qualities to heal wounds. There are many companies now making Stevias available in powder packets, liquid bottles, shakers, tabs, syrups, and canisters (fiber baking version) that are sold at healthfood stores, online, many grocery stores, supermarkets and super discount stores worldwide. While all Stevias are healthier than the toxic processed sugars, GMOed high fructose corn syrups in most sodas, and chemical sweeteners, the pure organic Stevias without additives, such as NOW Foods, Pyure Sweet, and KAL, plus Zevia and Rainforest Colas, have the healthiest qualities. Because Stevia is also an antioxidant which dilates blood vessels, it increases mental activity and reduces the craving for tobacco, sugar and alcohol. And no side effects have ever been found.

Pure organic Stevias without fillers are the best solution for managing or possibly reducing diabetes, as well as for those who want to enjoy vibrant health and never want to get it.

The U.S. manufacturers have some of the healthiest best tasting organic Stevia sweeteners and Stevia sodas, which are available in other countries, are now becoming available also to Latin America. Because Mexico has the highest Diabetes in the world, including children, in a role reversal, NAOTF united some of the Pan Am heroes who are gladly cheering on the Mexican children, as well as their countrymen, to be Lean, Clean and Diabetes-free through Stevia awareness!

##### Background Information on Purifying our Waters Solution

As part of encouraging other Continents to invite their Indigenous Elders or Shamen to lead ceremonies, I learned from the leaders of the Kitzbuhl ski Club about their revered local astrophysicist-shaman, Johann Grander, who has help purify their waters so they can drink from

their streams. His Grander Method is now used by ski areas across Austria and other countries. “As a result, Kitzbuhl's fields are also flourishing, and we have an abundance of natural spring drinking water, which we use for the little snowmaking we need, despite our low altitude. Austria also uses clean hydro power, and no nuclear plants ever, and all 28 E.U. countries having strict laws protecting our waters, thanks to banning 35 toxins, including chlorine, and our mountain communities are monitored regularly by the government and universities,” said the KSC Vice President Peter Obernauer.

“Because of different damages and stressors today, our water lacks its original cleanliness and potency,” says Johann. In the YouTube video, “Water: the Great Mystery” researchers in 11 countries and Nobel prize winner, Kurt Wuthrich, studied the only other known original water, which is protected by a tribe in Venezuela, and found it had 40,000 times the potency on all our organs than tapwater.

The GRANDER water revitalization system gives water the information back it needs to build up its self-purification process and its power,” says Johann, who was honored by the Russians after verifying his science. Its applications for swimming pools, home water systems, speedy recovery for injured Olympians, and spas, is used by enlightened communities around the world, including a green hotel in Boston and a Country Club and swimming pool in Taos, New Mexico. <http://usa.grander.biz/en/johann-grander>

## Natural Resources Defense Council (NRDC)

Submission of the Natural Resources Defense Council to the Secretariat of the United Nations Conference on Sustainable Development - "Rio+20 Earth Summit" -

November 1, 2011

The Natural Resources Defense Council ("NRDC"), a non-governmental organization in consultative status with UN Economic and Social Council, is pleased to submit our views as a contribution for "inclusion in a compilation document to serve as basis for the preparation of zero draft of the outcome document" for the June 2012 UN Conference on Sustainable Development ("Rio+20 Earth Summit"). Here, we set our vision for a different kind of summit, provide a list of potential deliverables from Rio+20, and describe NRDC's international activities and experience with international sustainability summits.

### A Vision for a Different Kind of Summit

The June 2012 Rio+20 Earth Summit will be held "at the highest possible level, including Heads of State and Government or other representatives." It will mark the 20th Anniversary of the first "Earth Summit", held in Rio in 1992. Rio+20's key objectives are to stimulate a transition to a green economy in the context of sustainable development and poverty eradication, and to strengthen global governance. This Summit comes at a critical point in the world's collective efforts to support "development that meets the needs of the present without compromising the ability of future generations to meet their own needs."

In January 2012, UN Secretary General Ban Ki-moon warned that the world is running out of time to avoid future "disasters" due to our ever growing consumption and pollution. He called for a "free market revolution for global sustainability". We couldn't agree more, and hope that this Summit will be truly transformative and historic. As world leaders, CEOs, civil society, and citizens gather in Rio next year, the Summit must do more than just deliver another agenda with lofty goals for the distant future. There are already hundreds of existing commitments and pledges in various treaties and plans of action, many of which have failed to be enacted. Instead, Rio+20 should generate real actions on the part of governments at every level, as well as by businesses and civil society groups, to immediately deliver the necessary actions to put us all on a more sustainable path.

Often overlooked is that Earth Summit 2012 itself will be an important milestone in global governance. We hope that the zero document will provide the basis for a discussion of how best to structure the Rio+20 meeting so as to assure its success. The Summit's success is particularly important after the perceived failure of the 2009 Copenhagen climate summit and growing skepticism worldwide about the ability of such international negotiations and gatherings to do anything worthwhile on the huge environmental and economic challenges we face. In the end, the summit process will involve thousands of officials, business and civil society leaders throughout the world and a collective investment of hundreds of millions of dollars. Learning from previous UN gatherings, here is our vision for the Rio+20 Earth Summit to make sure that it produces real results and progress.

### Three Days of Recognition and Support for Country Actions

The official high-level Rio+20 meeting now scheduled for June 4-6 must be different than earlier summits. The three-day meeting should put the spotlight on individual and collective actions of presidents and prime ministers to move toward sustainable development. These sessions should:

- Encourage all presidents and prime ministers to use their allotted time for speeches – usually about 5 minutes - to present on the specific sustainable development initiatives, challenges, and needs in their respective countries.
- Create the expectation for new or substantially scaled-up commitments from all countries, which are specific and short-term; and identify partners for technical assistance and coordinating actions.
- Produce a politically-binding outcomes document of not more than ten pages that recognizes the imminent threat of exceeding our planet's natural boundaries, the need to move to a new green economy, and recommit governments to act on their promises to move towards sustainable development, and
- Generate an appendix of country commitments to the outcomes document that provides a foundation for a registry of such commitments at a new global center for sustainability actions.

### Four Days of Engagement and Cooperation with Major Stakeholders

The period of four days (May 31-June 3) following the final preparatory meeting and before the official summit provides an unprecedented opportunity to engage sub-national governments, businesses and civil society on an equal footing. These sessions should be coordinated closely and in parallel with the official meeting; they should:

- Invite, regional, provincial, state, and local government officials, CEOs of major corporations, and civil society leaders to give presentations on sustainable development challenges and opportunities in their sectors
- Create the expectation for commitments from all major businesses and governments that are specific and meaningful, and complement or exceed national goals, and
- Produce a listing of major stakeholder commitments and is in parallel with the national registry above and could contribute to the global center.

### Proposed Rio+20 Earth Summit Deliverables

A central goal of the 2012 Earth Summit should be to generate specific "deliverables". Each of these "deliverables" should consist of: (1) specific, short-term commitments by countries, communities, corporations, and civil society groups; (2) commitments to work together where appropriate, including sharing technical assistance and coordinating actions; and (3) provisions for monitoring and reporting to ensure that the commitments are delivered on the ground. The zero draft document should include an initial compilation of such actions which should be developed, agreed to where appropriate by "coalitions of willing", and launched at Rio+20.

### BROAD POLICIES TO SUPPORT A GREEN ECONOMY

Governments, corporations, and civil society should support laws and policies to speed the transition to a green economy – defined by UNEP as "low carbon, resource efficient and socially inclusive" - including:

1. Replace or supplement GDP and other traditional economic metrics with broader indicators, such as the UN System of Environmental and Economic Accounting.
2. Actively phase out environmentally-harmful subsidies, including fuel subsidies, following the binding commitments already made by G-20 countries.
3. Remove barriers to trade in environmental goods and services, as outlined in the WTO's Doha Development Agenda.

4. Adopt the mitigation hierarchy in standard corporate and government operations, so that the environmental impacts of extractive industries and infrastructure activities are: (1) avoided, (2) minimized, or (3) offset by responsible parties.

5. Institute sustainable procurement standards, including ones encouraging the use of recycled products and renewable energy.

6. Implement aggressive and sustained green jobs policies, particularly those focused on youth.

#### ENHANCED GOVERNANCE

Governments should:

1. Establish a Global Center for Sustainability Actions to record, monitor and aggregate, encourage, and support all the various commitments on sustainability.

2. Negotiate regional treaties on Principle 10's environmental access rights, including access to information and justice.

3. Take specific actions at the national and sub-national levels to increase access to information, public participation in decision-making, and access to justice.

#### CLIMATE AND ENERGY

While the climate change treaty negotiations will continue, governments, companies, and civil society groups should come to Rio prepared to take tangible steps towards greater deployment of low-carbon energy technologies; improved energy and water efficiency; reduced deforestation emissions; reduced black carbon emissions; and the stimulation of low-carbon economies, such as:

1. Develop and enforce best practice and minimum performance energy and water standards for appliances and equipment and ensure an ongoing process to develop all cost effective standards by 2015

2. Phase out inefficient light bulbs through the establishment of minimum energy efficiency standards that reduce energy use of new bulbs by at least 65%

3. Scale-up renewable energy use by countries undertaking specific policies and programs to speed up the deployment of clean energy in their country in order to more than triple the amount of wind, solar, geothermal, and tidal power that is used throughout the world.

4. Promote clean and efficient vehicles that will cut greenhouse gas emissions from new vehicles by 30% by 2020 and by 50% by 2030, including policies, programs and standards adopted by individual countries that address sales and use of new, and where appropriate, imported and/or used vehicles.

5. Adopt low carbon fuel standards to avoid of the use of fuels with higher lifecycle greenhouse gas emissions than conventional petroleum.

6. Stimulate a market for clean cook stoves and invest in the efficient production of biomass fuels, with the goal of having clean and efficient stoves in 100 million homes by 2020 and thereby minimizing incidence of respiratory illnesses; deforestation; and destruction of local habitats

7. Replace polluting, inefficient, expensive, dangerous and unhealthy kerosene-based lighting with cleaner alternatives, such as solar lanterns.

8. Phase down HFCs and other "super greenhouse gases" by governments adopting new commitments covering these super greenhouse gases under the Montreal Protocol and by companies agreeing to phase down their use in products that they produce, use, or sell. Develop programs and policies to recover CFCs and other super greenhouse gases from fridges, foams, electrical transformers, and other equipment from which they are leaking to the atmosphere.

9. Reduce deforestation emissions by key corporations committing to avoiding purchasing products that cause deforestation, such as soy or cattle from deforested lands in the Brazilian Amazon, palm oil from deforested agricultural land in Indonesia, or illegal wood and wood products throughout the world. More countries should also commit to adopt, implement, and enforce requirements that all imported wood and wood products come from legal sources.

10. Undertake large-scale, environmentally and socially responsible reforestation efforts

11. Strengthen and increase the use of green building technologies and standards by working with the new GLOBE Alliance

12. Phase out lending by public and private financial institutions for energy projects with high GHG emissions and scale-up the financing for renewable sources of energy (e.g., at multilateral development banks, export credit agencies, and other financial institutions)

13. Commit to systematically evaluating, and where cost-effective, applying ecosystem-based approaches to adaptation (e.g., rehabilitating mangroves may be more cost-effective against storm surge than building a sea wall).

14. Create and enforce standards to reduce environmental risks associated with natural gas development, including the use of "fracking" to access natural gas.

15. Promote the development of clean transportation fuels by adopting low carbon fuel standards and eliminating subsidies for fuels with higher lifecycle greenhouse gas emissions than conventional petroleum.

#### OCEANS

1. Establish and monitor marine protected areas on the high seas and protect vulnerable marine ecosystems within national waters.

2. Integrate assessment and management of the various uses of ocean resources (wildlife migration routes, fishing grounds, fossil fuel operations, shipping lanes, etc) using marine spatial planning techniques.

3. Ensure that human activities with the potential to negatively affect marine life are subject to prior environmental assessment.

4. Reduce and control ocean noise pollution by incorporating noise into the design and management of marine protected areas and marine spatial plans, and by requiring use of best available noise-reduction technologies in commercial and industrial activities, including oil and gas exploration.

5. Reduce plastic pollution in the oceans, including by banning or taxing single-use plastics, supporting the use of recycled plastics in new products, and holding manufacturers responsible for plastics through their entire life cycle.

6. Stop "ghost fishing" – fishing gear lost or abandoned at sea that destroys fragile habitats and catches fish and mammals for decades after it is lost – by improving fishing technologies and providing incentives to prevent loss of gear and return old fishing equipment to shore for recycling.

7. Establish an international monitoring network for ocean acidification to enable the identification of vulnerable regions and industries and to provide an early warning system for industries already experiencing harm.
8. Designate the high seas of the Central Arctic Ocean as a zone for international scientific cooperation, where extractive and polluting activities are suspended until we have a better understanding of the area and the potential effects of such activities.
9. End the harvest, sale and trade of shark fins.
10. Schedule, as a matter of urgency, an intergovernmental conference to address multiplying threats to ocean areas beyond the jurisdiction of individual nations.

#### PUBLIC HEALTH

1. Endorse the finalization of a global mercury treaty by February 2013 that will aggressively limit the global use and trade in mercury and reduce global mercury emissions.
2. To immediately reduce the global supply of mercury, ban the export of mercury from remaining large exporters in the developed world, and the primary mining of mercury for export, and secure the agreement by chlor-alkali and large mining companies not to place mercury into commerce and take responsibility for ensuring its safe management.
3. Create new partnerships around the responsible sourcing of raw materials for production and the regulation of specific harmful chemicals.
4. To reduce vehicle pollution in cities worldwide, reduce sulfur in the global gasoline and diesel fuel supply to 50 ppm by 2020, concurrent with the adoption of cleaner vehicle emission technologies and standards.

#### WATER

1. Develop an independent certification system for the sustainability of public and private sector water use.
2. Adopt action plans for sustainable financing of equitable water supply services and watershed protection based on reviews of charging structures for all categories of water use, as well as strategic financial planning, tariffs, taxes and transfers.
3. Establish policies to provide rivers with the quantity, quality, and timing of flow they need to sustain life within them.

#### About NRDC

NRDC is a non-profit environmental advocacy organization headquartered in the United States with more than 1.3 million members and e-activists. With a staff of more than 400 people, NRDC addresses the broad range of pressing environmental challenges, including climate change and energy, oceans, toxics, wilderness and wildlife, and sustainable communities. We have five offices in the United States and one in Beijing, China. Over the last four decades, our staff attorneys, scientists, and other resource specialists have advocated and cooperated with the U.S. and other governments, international agencies, corporations, and other NGOs to produce major policy changes and progress in many arenas.

NRDC has a long history of international involvement. In addition to our office in China, we have an initiative on India and significant engagement on key issues in Canada, Mexico and elsewhere. Over the years, we have been very active on ozone layer protection, climate change, international toxics, and selected biodiversity matters.

NRDC has had a particular interest in international sustainability summitry. NRDC was one of the few American environmental groups that participated in the 1972 UN Conference on the Human Environment. We were very active in the 1992 UN Conference on Environment and Development in Rio de Janeiro. ("Earth Summit") NRDC created "Earth Summit Watch" to monitor the implementation of commitments made in Rio. In 1993 and 1994, we undertook unprecedented surveys of national sustainability actions. Our 1994 report contributed to the start of an informal global network which made major progress over the several years towards the global phase out of leaded gasoline.

NRDC also participated in the 2002 World Summit on Sustainable Development in Johannesburg. NRDC was and continues to be a proponent of the "partnership and initiative" approach as a vehicle for delivering on sustainability commitments. For the last decade, we have been actively involved in the Partnership for Clean Fuels and Vehicles which has now achieved success with the removal of virtually all lead from the world's gasoline supply. For almost two years, we have been working with other civil society organizations in the U.S. and worldwide on preparations for the Rio+20 Earth Summit.

NRDC's Director for Global Strategy and Advocacy S. Jacob Scherr is leading NRDC's "Race to Rio" campaign. In launching the campaign last June, NRDC President Frances Beinecke wrote that its main purpose is "to encourage leaders from all sectors and levels of society—government officials, CEOs, mayors, activists—to come to Rio to talk about what they are doing now to address the huge challenges we face." NRDC staffers from across the organization are involved in NRDC's preparations for Rio+20, including the development of this document. Special thanks for their contributions so far to my colleagues Michael Davidson, Jake Schmidt, Leila Monroe, and Lisa Speer. We also want to acknowledge the research assistance of our graduate student team at Yale University.

---

## NCD Alliance

### NCDs in the Rio+20 conference outcomes

The NCD Alliance, an international network of over 2000 organizations working on non-communicable diseases (NCDs) including cancer, cardiovascular disease, chronic respiratory diseases, and diabetes, believes the outcome document from the Rio+20 conference must contain a strong focus on health, specifically the threat to sustainable development and poverty eradication posed by the global NCD epidemic.

Rio +20 will be a critical opportunity to build on the efforts already underway to accelerate progress towards sustainable development and reduce poverty and inequality, which will ultimately contribute toward the prevention and control of NCDs worldwide.

Overall outcomes of the conference should be sustained political commitment and willingness to adequately address and invest in NCD prevention and control on the local, national, regional, and international levels. The conference will also provide a platform for Member States and other stakeholders to follow up on the commitments made during the UN High-level Meeting (HLM) on the Prevention and Control of Noncommunicable Diseases, held on 19-20 September 2011 at UN Headquarters.

### NCDs since the Johannesburg Declaration

The 2002 Earth Summit in Johannesburg, South Africa, put forth a comprehensive agenda for action on sustainable development. Paragraph 19 of the Johannesburg

Declaration on Sustainable Development highlights a key area for further attention in the Rio+20 Outcome Document. It states:

'We reaffirm our pledge to place particular focus on, and give priority attention to, the fight against the worldwide conditions that pose severe threats to the sustainable development of our people, which include...endemic, communicable and chronic diseases, in particular HIV/AIDS, malaria and tuberculosis...'1

In the 10 years since the adoption of the Johannesburg Declaration, NCDs (referred to as chronic diseases in the declaration above) have emerged as one of the foremost development challenges of the 21st century. There is growing evidence that NCDs are impeding progress to achieving the UN Millennium Development Goals (MDGs). Effective prevention and control of NCDs requires that these diseases not be dealt with in isolation but be fully integrated into all aspects of the global development agenda.

#### NCDs and the eradication of poverty

The linkages between NCDs and sustainable development, particularly as a means toward the eradication of poverty, are clear and require concrete actions on the part of all stakeholders.

Member States unanimously adopted a Political Declaration during the HLM recognizing NCDs as a global development priority and the "the vicious cycle whereby NCDs and their risk factors worsen poverty, while poverty contributes to rising rates of NCDs, posing a threat to public health and economic and social development."

According to the World Health Organization, 100 million people are pushed into poverty annually because they have to pay directly for health services, which results in up to 5% of the population being forced into poverty in many countries.

In addition to the economic burden they place upon individuals, families, and communities, NCDs are already having devastating consequences on the global economy. A recent study by the World Economic Forum and Harvard University estimates that NCDs will cost the world economy \$47 trillion over the next 20 years, representing 75 percent of annual global GDP and surpassing the cost of the current global financial crisis.

#### NCDs in the green economy

WHO's Health in the Green Economy series, published in spring of 2011, highlights the relationship between sectors of the green economy and health and recommends solutions that both mitigate climate change and improve health conditions, particularly in low-income settings.<sup>5</sup> The NCD Alliance urges Member States and other stakeholders to strongly consider these solutions in the discussions and outcomes of the Conference.

The NCD Alliance suggests the following priorities for consideration during the Rio+20 Conference:

**Health systems integration:** The NCD Alliance urges governments to integrate NCDs into existing health policies and health systems strengthening initiatives, refocusing health systems on prevention, health education, and chronic disease care. Strengthened health systems will also benefit other diseases and conditions, including HIV/AIDS and other infectious diseases. The Rio Declaration should reaffirm the commitment made by Heads of State in the Political Declaration issued at the HLM to 'promote, establish or support and strengthen, by 2013, as appropriate multi-sectoral national policies and plans for the prevention and control of non-communicable diseases' (para 45).

**Development goals:** The MDGs currently contain no goals or targets for NCDs. Yet, NCDs cause 60 % of all deaths globally (36 million) each year and four out five of these deaths occur in low- and middle-income countries. It is therefore critical that Member States include NCDs in discussions at the Conference and at the 2013 MDG Review Summit, and commit to including targets on NCDs in the follow up development framework when the current MDG goals expire in 2015.

**Donor assistance:** Less than 3% of official development assistance (ODA) on health is spent on NCDs.<sup>6</sup> The NCD Alliance requests all governments with major overseas aid programmes to low and middle income countries to end the policy ban on funding NCDs that most bilateral donors operate now. Bilateral donor countries must live by the commitments made in the Paris Declaration on Aid Effectiveness. The Rio Declaration should support the commitment in HLM Political Declaration to 'promote all possible means to identify and mobilize adequate, predictable and sustained financial resources and the necessary human and technical resources, and to consider support for voluntary, cost-effective, innovative approaches for a long-term financing of non-communicable disease prevention and control' (para 49).

**Whole of Government engagement:** NCD plans must involve the whole of government, not just the health sector. Action to prevent and control NCDs requires the active engagement of ministries of finance, foreign affairs, education, agriculture, and transportation, trade and others.

**Adopt policies to prevent NCDs:** Only governments have the power to regulate environments so that healthy food, smoke free places and physical activity are the norm and not the exception. The NCD Alliance expects governments to regulate unhealthy food content – salt, trans-fats and sugar - and harmful use of alcohol through policies on price, availability and marketing. Governments must accelerate implementation of the Framework Convention on Tobacco Control (FCTC) and tax tobacco to the level recommended by the WHO to both reduce tobacco use and generate revenues that can be used for sustainable development.

**Universal access to NCD medicines, technologies and care as a human right:** Today, over 100 million people with NCDs are denied access to the basic medicines (including for pain relief), technologies, education and care they need to stay alive and stay healthy.<sup>7</sup> Individuals and families in many contexts are being tipped into poverty by catastrophic expenditure on NCD care. NCDs are not new diseases and many can be treated effectively with off patent medicines. NCD prevention, and investment in early NCD diagnosis and treatment, is both morally right and sound economic strategy.

**Follow Up Action on Non-communicable Diseases:** Heads of State committed to a 'comprehensive review and assessment in 2014 of the progress achieved in the prevention and control of non-communicable disease' (para 65) in the HLM Political Declaration.

The Rio Declaration should recommend that this review culminate in a High-Level Meeting of the United Nations to ensure that prevention and control of NCDs are given adequate follow-up as a priority factor in achieving sustainable global development.

---

## Netherlands Platform Rio+20 (NPRio+20)

### PRIORITIES FOR A SUSTAINABLE FUTURE

#### Civil society outcomes of the Netherlands Rio+20 preparations

##### Preface

A lot has changed for the better in the twenty years that have passed since the Earth Summit in Rio de Janeiro in 1992. Millions of people, especially in Asia and Latin America, have escaped the poverty trap and are even daring to look beyond today's horizon. Big strides have been taken in the areas of education, health care and women's

rights, whilst at the same time companies, together with knowledge institutes and NGOs, are looking for ways in which to operate in an ecologically and socially responsible manner.

However, we still face many challenges today. Back then, the Convention on Biological Diversity was signed to stop the decline in biodiversity. At last year's conference in Nagayo it became clear that the targets were far from being met. The execution of the Convention on Climate Change that was agreed upon in 1992 and of Agenda 21, one of the most important results of the 1992 Rio meeting, also leaves much to be desired.

There are a lot more obstacles between ambitions and actions than we had foreseen twenty years ago. It has become clear that more is needed than simply signing ambitious agreements to achieve a society in which 7 billion, soon to be 10 billion, people can live well without exhausting natural resources.

One of the important lessons we can learn from Rio is that sustainable development is a matter of trial and error. It calls for the continual reinvention of the way in which we live together and fulfill our own needs. In short, it calls for permanent innovation in social, economical and technological areas.

This document contains a number of priorities that we believe can accelerate sustainable development and bring us a few steps closer to reaching the ambitious goals of Rio 1992. They can be roughly subdivided into economical priorities (number 1-7), social/cultural priorities (8-10) and priorities for individual sectors (11-18).

On the one hand they are meant to serve as an inspiration to the Dutch government for their contribution to the Earth Summit: a contribution that is a part of a European Union-wide effort. On the other hand they are intended to place the theme of sustainable development higher on the Dutch social agenda.

The story of their development is an extraordinary one. In June 2011, the Netherlands Civil Society Platform Rio+20 was founded, a group of NGOs, companies, knowledge institutes and interested individuals. Their aim was to make an inspirational contribution to the UN-conference on sustainable development held in Rio de Janeiro in 2012.

Several meetings were organized with NGOs, young people, companies, researchers and individuals. They were all asked to put forward what they think is needed to achieve a green economy and to consolidate the institutional framework for sustainable development, the two main themes of Rio2012. In the months since June there have also been opportunities to contribute, both through the website and through discussions on LinkedIn. Social media, such as Twitter and Face book, were also used to bring the theme to the attention of the general public.

This document containing the 18 priorities is only a snapshot. It is a 'living' document, whilst the discussion in the Netherlands on the goals and themes of the Earth Summit continue to evolve and expand. As the National Platform we will further develop these priorities over the coming months and augment them with inspiring initiatives from the Netherlands that show how sustainable development is actually becoming reality.

Prof. dr. ir. Louise O. Fresco, Chair of the Netherlands Platform Rio+20

#### PRIORITY 1. Reinventing our economy

Exploitation, pollution and exhaustion are strongly stimulated by the use of hot money, when the high returns on quick investments are the only priority. This has led to a growing rift between the interests of shareholders (short term profits) and those of other stakeholders of a company that would profit more from continuity and social responsibility. Taxation of flows of capital, such as the Tobin Tax, or the much further reaching Robin Hood Tax, form part of the solution to this problem.

New forms of financing are also needed, in which investors adhere to stricter social and ecological standards and are willing to enter a long-term relationship with their investees. This type of long-term relationship provides businesses with the opportunity to keep a continued and consistent focus on sustainable development. Alternative forms of financing, such as crowd financing, and the cooperative, an invention dating back to the late 19th century, all have to be considered with regard to their potential as sustainable financing methods.

A universal social protection floor is needed to help more people escape poverty; a social safety net that allows people to at least survive difficult periods. Apart from obvious ethical considerations, such a safety net is of economic importance too as it improves mobility, entrepreneurship and keeps labour potential at a consistent level.

#### PRIORITY 2. Internalising external costs

The economic system of production and consumption has costs associated with it that are not included in the prices consumers pay for products. The polluter pays, but not to a large enough extent. First we would need to develop indicators that can be used to determine the cost of products to society. These indicators would allow companies to calculate the 'footprint' of their products using life cycle analysis. Consequently the price of a product should then reflect the total costs over its lifetime, including the processing and disposal costs.

Secondly, mechanisms are needed that allow for the internalisation of external costs. Companies should produce annual sustainability reports, which would not only include their economic performance data, but also data on their social and ecological impact. Like economic data, external accountants should check these data. Managers will be appraised on the basis of these numbers. Another option, for companies as well as local and national governments, is the use of benchmarking: comparing performances based on representative and quantifiable data.

On a national level, governments could develop indicators for a green or sustainability-GDP, in which the social and ecological costs, such as pollution levels and exhaustion of resources, are included in the GDP of a country. This 'green-GDP' would provide a much better insight into how the income of a country and the division of wealth are developing. Certain data could be used to determine whether a country is developing in a sustainable manner and, if so, what the extent of this sustainability is. These numbers would be open to the public.

#### PRIORITY 3. Green taxation

An environment-focussed system of taxation would provide an important boost to internalisation of external costs. This would mean a lowering of taxes on labour and a rise in taxation of raw materials and energy from fossil fuels and would have positive social consequences, especially for countries that have economies based largely on production and mining of raw materials.

Green taxation could also be achieved by having varying VAT-tariffs. Levies on pollution, such as the (over 40-year old) water purification levy in the Netherlands, have also proven to be very effective in steering the behaviour of companies and individuals in the right direction. Taxing waste is an important method to stimulate the re-use of raw materials.

A variation on this theme would be the creation of (international) trading markets for pollution rights. This system has already proven successful in the reduction of the NOx-emissions (nitrogen oxides) and the recent CO2-trading scheme (The ETS, European Emission Trading Scheme) is also up and running, but has yet to prove its effectiveness.

#### PRIORITY 4. Provide a legal foundation for sustainable product chains

The Netherlands has been one of the originators of sustainable production chains. What started with the Dutch 'Max Havelaar'-initiative for fair coffee trading has over the years grown into a global range of initiatives for transparent and sustainable trade, for example the Marine Stewardship Council. To date, the initiatives have mainly been private. Companies and NGOs develop and implement a set of standards and certification schemes are used to make sure they are enforced. These standards are not just environmental, but also focus on labour conditions, education and whether trade unions are facilitated.

To better stimulate transparent and sustainable supply chains (the sustainable trade initiative in the Netherlands can be found on: [www.idhsustainabletrade.com](http://www.idhsustainabletrade.com)), these private initiatives need a legal foundation to help convince laggards to join, and to exclude free riders. There are occasional examples where steps have been taken to 'close the backdoor', but further steps are needed: on a national level through legislation and by changing government purchasing policies and on an international level by promoting transparency (EIT/VOECD) and by agreements on differential import tariffs for sustainable products (WTO).

#### PRIORITY 5. Closing the cycles

##### a) Biological cycles

The finiteness of natural resources compels us to close up recycling loops. This appears relatively straightforward for our biological resources, as they are inherently regenerative. This is an illusion. The loss of soil fertility in large parts of the world is a worrisome trend, as it impacts agricultural productivity worldwide. This is not just a result of inorganic nutrient loss, but also of organic material. New techniques, as well as institutional mechanisms (such as carbon bundling), are needed to stop and reverse the loss of soil fertility.

Loss of biodiversity has also to be stopped. For this, systems are needed to properly value our biological capital (TEEB) and to protect it with new financial and policy instruments. At the same time there is a need for better biodiversity data. Agreements for the free exchange of data and objects in this field are also urgently needed.

##### b) Technical cycles

The finiteness of raw materials and the burden on the environment of mining these means that we need to drastically reduce the use of 'virgin' materials. As well as recycling, this involves reduction of their use (dematerializing), finding multiple uses and redesigning products so that they contain less of them (the 5Rs: reduce, re-use, recycle, replace and re-design). The energy content of materials also has to be used as efficiently as possible.

A lot of innovative initiatives are already being developed in relation to the 5Rs. Current legislation and other practical hurdles are, however, proving burdensome at the moment. A critical review of the relevant legislation is therefore needed. Combining a more streamlined legislation with a tax on waste would promote the re-use of materials and products.

A lot of initiatives also strand due to a lack of leadership in the cradle-to-cradle value chain. Governments and international organisations can play an important role in orchestrating the different parties in these chains.

#### PRIORITY 6. Public (-private) ownership of public goods

Over the last few decades it has become apparent that the free market economy isn't the cure-all for matters regarding ownership and distribution. When shareholder-value is the only important consideration when taking business decisions, social and ecological values can get pushed to the sideline. For example, big fluctuations in prices of raw materials are leading to social and economic instability. This can partly be prevented by new rules and legislation. But only partly. Many public goods and services, like drink water supplies, sanitation, waste collection and processing, the electricity grid and other networks, decentralised energy production and storage and ownership of the land charge register would benefit from different ownership models.

At a local or national level, the not-for-profit public enterprise offers an alternative. Town and county councils can own shares, as is the case with the Dutch water supply companies. Another example is the housing corporations that have a primarily social mission, although private capital can be invested. The public-private enterprise has the advantage that it works like a business without the disadvantage of shareholder-value being the main determinant for management decisions. Instead social and/or ecological values are, or can be, the main focus.

Internationally, the management of global public goods needs to be considered, such as the planet's biodiversity, the ozone layer, our oceans and the earth's climate. Proper management means that all the various parties, i.e. governments and other beneficiaries cooperate and share their collective responsibilities. This is not so straightforward, as the management of climate change and execution of the biodiversity agreements have shown. As species are lost increasingly fast and the impacts of climate change are becoming increasingly noticeable, new forms of ownerships of global public goods are needed, since they form the foundation of our world heritage.

#### PRIORITY 7. Changing routines

Consumers (and organisations) act based on routines. Lifestyle and actions, including the preference for certain products, are therefore hard to change. This explains why people can say one thing when they are speaking as civilians and act completely differently in their role as consumers. Finding ways to change people's non-sustainable routines therefore needs to be a priority.

One of the ways to do this would be to provide consumers with on the spot (in the real or virtual store) information on whether a product meets (or does not meet) certain sustainability requirements, perhaps using a QR-code that can be read on a Smartphone.

Another option would be to deploy intelligent marketing and communication techniques that would increase the desirability of sustainable products and restore the association between sustainability and high product quality. Sustainable construction, for example, is more than simply building in an energy-efficient manner. It also means paying attention to the aesthetic qualities of a building. If they are appreciated for their beauty, buildings will have much longer lifetimes.

Shifting from product ownership to product rental can change consumer routines. The use of rental cars, for example, forces consumers to consider each time whether they are not better off taking the bicycle or public transport, as the operational costs of the car are more apparent and therefore better comparable. In general, the rental of capital goods, whereby the supplier remains the owner and the consumer simply pays for its use, stimulates the recycling mindset and thereby sustainable development.

#### Priority 8. Sustainable education

Sustainable education means being able to learn from mistakes and having the ability to cope with insecurities. The acquisition of knowledge and skills needed for this are one of our priorities. They have to be given a place in the curriculum of schools and in staff training programs: from low-end to high-end jobs.

Core qualities are:

- Awareness of one's own value(s) and that/those of other people
- The ability to think in terms of systems

- The ability to distinguish between facts, opinions and suspicions
- The ability to learn from one's mistakes.

The relevant knowledge and skills can largely be taught through the normal curriculum and through regular on-the-job training, and informally through the media. This would require an adaptation of the educational system, for example by incorporating sustainable development themes into all subjects. It also requires adaptation in company culture and a focus in the media and marketing on sustainable development.

#### Priority 9. Empowering people

People feel a responsibility towards their own environment (and towards future generations), but do not always see the opportunity to substantiate that feeling. Priority should be given to social innovations that allow people – together with others – to regain control over their direct environment; for example, through urban agriculture. Here nature management is combined with food production. Although the contribution to the food supply is rather modest (approximately 5%), urban agriculture does make an important contribution to the restoration of the relationship between city dwellers and their food sources.

The Internet is responsible for connecting people in an intelligent manner. This has created a new balance between local and global activities and can give a worldwide sense of shared responsibility for our planet. It means a great opportunity to mobilise the knowledge and creativity of the masses and use it to generate ideas for sustainable development, even outside one's own direct living area. For example, games or social media can be used to collectively develop sustainable products and services.

#### PRIORITY 10. Stimulate dialogue

Developing a green, sustainable economy and at the same time eradicating poverty can only be achieved if a dialogue takes place between various parties at various levels. A strategic dialogue, where a general course for the coming years is determined, as well as an operational dialogue, where the requirements for a sustainable product are developed, are both important. In order for the dialogue to be constructive, all involved parties should join the debate. If necessary, parties should be assisted in formulating and defending their interests.

It is important that all parties in the debate are aware of their own value and the value that other parties bring to the table. Only then is it possible – despite having different values and interests – to develop a common strategy or to reach a common goal. A distinctive feature of constructive dialogue is the occurrence of 'integrated negotiation'; when the various parties are not just dividing up the cake, but are working on baking a new cake together.

#### PRIORITY 11. Accessible healthcare

In both the Northern and Southern hemispheres the number years lived in good health is strongly dependent on a person's wealth. The gap between rich and poor is increasing. One of the ways to bridge this gap would be to make healthcare accessible to all, irrespective of income. Health insurances and health trusts could make an important contribution. On the one hand by reimbursing costs made by their members and on the other hand by using their capital to invest in improving the healthcare system. A sustainable health care system that is accessible to people with low incomes, based on the model of collective health insurance funds, can then be created.

#### PRIORITY 12. Multiple land use

Growing cities are absorbing more and more agricultural land, as are the creation of new infrastructure, the production of energy (mining, damming, wind parks, CSP) and of course the production of food and plant-based raw materials. Increasing acreage by encroaching on nature is detrimental to ecosystems, species diversity and thus to the proper functioning of spaceship earth's life support systems.

Multifunctional land use is necessary to cope with the growing need for space. It is a challenge to combine the diverse uses, such as living, working, recreation, nature, intensive agriculture and water management in such a way that not only people and planet will flourish, but that prosperity does not suffer.

The challenge should be met for urban areas as well as for the countryside. Innovations are needed in town planning and management to combine multiple uses of land, such as metropolitan agriculture, agricultural nature management, home care farms and industrial ecology systems. Focus should not only be on dealing with a growing population, but also on dealing with shrinking populations, as is happening in some areas.

#### PRIORITY 13. Intensifying agriculture (in an ecological manner)

Food demands will double over the next few decades as a result of an increase in wealth and the growth of the world's population. On top of that, agriculture will become a supplier of construction materials and raw materials for the chemical industry as well. This calls for an intensification of agriculture in areas where the soil, climate and water supply allow for it. Intensification alone, however, is not sufficient. A drastic ecological modernization is also needed in order to prevent an equal growth of pressure on the environment, e.g. exhaustion of nutrients and the threat of water shortages. The yield per acre, per litre of water, per kilogram of nutrients, per gram of pesticide and per man-hour needs to be improved.

Despite a global trend towards urbanization, the livelihood of millions will continue to depend on – mostly small-scale – agriculture and livestock farming. Ecologically focused modernization not only demands an improvement of crops and other technical measures custom-made to different local circumstances and farm sizes, but also education, (micro)-investments and an improvement of infrastructure.

#### PRIORITY 14. A consolidated approach to water management

Nearly a billion people worldwide have no access to safe drinking water and three billion people lack basic sanitation. At the same time damages due to flooding are on the rise, as more and more people work and live in low-lying river deltas. Damage due to droughts – often in these same areas – is also increasing as a result of climate change and the exhaustion of aquifers.

Even though water is our most essential human need, we treat it carelessly. To meet water needs of humans and ecosystems in future, we need a more consolidated approach to water management. Techniques are needed to use water more efficiently, and institutional mechanism to decide on the different 'water priorities'. These can range from drinking and industrial water needs and irrigation to preventing water pollution and the conservation and improvement of aqueous ecosystems.

#### PRIORITY 15. Promoting human-powered transport

Transportation of people and goods is a large burden on available energy resources. Even if we were to switch from fossil fuels to electricity as a source of energy this would still be the case, as the energy still has to come from somewhere. If the electricity can be produced sustainably – which is not the case at the moment – electric transport will still take up a lot of natural resources including (rare-earth) metals and space.

It should therefore be a priority to promote human-powered transportation, i.e. walking and, in particular, especially cycling. This is not just good for the environment and the

climate, but also for the general health of the population; something particularly poignant as today there are more obese than starving people. Making half of all transport events human-powered should be feasible, especially in flat areas. This not only requires infrastructure to allow for safe walking and cycling, but also economic and planning policies that actively promote these types of transport.

#### PRIORITY 16. Creating an enabling environment

Sustainable development will bring forth extensive technological and social innovations. Scientific research and the development of new ideas and concepts, and the translation of these into new products and services, should be given priority. The creation of an 'enabling environment' will provide start-up companies and those wishing to expand with the opportunity to get involved with new developments from a very early stage, so that great social challenges, such as underdevelopment, poverty, an aging population, making society more ecological, and limited natural resources, can be met.

Governments can make an important contribution by letting social and ecological aspects determine its purchasing policies and – together with industry and NGOs – develop standards for sustainable purchasing. It has to be taken into account that these standards will be ever changing, due to the evolution of the insights into what sustainable development actually entails.

#### PRIORITY 17. Deploying sustainable technologies

Twenty years ago many people believed that rapid technological development was the driving force behind the exhaustion of natural resources and the uneven division of wealth in the world. It has now become clear that technological developments form at least part of the solution. Scientific research and technological developments are essential for efficiently using natural resources (e.g. solar energy). However, scientific research and technology do not lead to a sustainable society per se. That requires embedding of research and technology in society and the development of technologies that stimulate people to act sustainably.

In practice, the success of innovations (including sustainable ones) is largely dependent on the interplay between knowledge institutes, NGOs, businesses and government. The conditions needed for new technological development to become a hit in society can be created by exchanging information and by forming strategic alliances, also across the equator. A new covenant between science, politics and society can lead to a kind of communal design process based on a widely supported set of demands.

#### PRIORITY 18. Sharing knowledge

Sustainable developments are often delayed by the restricted access to results of scientific research and technological developments to those organisations and individuals who can benefit from them. A lack of research infrastructure and financial means in developing countries can result in local researchers lacking awareness of new scientific and technological developments.

Intellectual property legislation is another way in which access to new developments is prevented, as it means that new developments cannot be used at all, or only after large licence payments.

The first hurdle can be overcome by publishing new scientific breakthroughs on the Internet and making these articles accessible at little or no cost. Research funding agencies have an important part to play in this by including open access requirements in their contracts with researchers. Collaborations and exchanges can be used to improve scientific infrastructure in developing countries.

Protection of intellectual property rights cannot simply be abolished, as they are an important stimulus for researchers as well as for venture capitalists. The only thing that can be changed is the price one has to pay for a licence. A few years ago it was, for example, decided to keep the licence cost for anti-HIV/AIDS medication low. A more structural solution would be to set up a court of arbitration that can force companies to issue licences and can determine the licence costs.

#### FINAL NOTE

As stated in the preface, this set of priorities is a living document. It will be debated in meetings to come, on our website and via social media. Although it is not final, it already sets ambitious goals and shows us the paths towards realising them.

Sustainability is not a fixed state but a learning process and our goals will shift as we know more. But we must begin – now.

## New Vision International

**Focusing on Entrepreneurship for Job Creation and Agri-Business for Enhancing Sustainable Development and Poverty Eradication. *Topic suggested and submitted by Bernard Nyembo***

**New Vision International – <http://www.nvint.org>**

### INTRODUCTION

"An Ant on Move Accomplish More Than a Dozing Ox." Lao Tsu.

The purpose of this paper is to provide a significant contribution to the pillars of sustainable development that could be launched and endorsed at Rio+20. The objective is to share our insights on the final document about this important event. Our endeavor implements the gaps and proposes some guidelines to Government, the Civil Society and the UN organizations, as well as Transnational Corporations.

Our expectations for the outcome of Rio+20 is to see a new era of Actions in the field, rather than scientific, scholars and technocrats in air-conditioned offices in New York, Paris, or London, focusing on theories about development and world problems. In order to achieve it, we tap into our thirty years of international experience in Banks, Trading, and Humanitarian for providing achievable framework for action in order to revamp sustainable development plans, with a focus on Entrepreneurship, Agri-Business, Global Trading and Partnership. Specifically we integrate Finance, Energy and Green Economy in the context of sustainable development and poverty eradication.

The world economy is still struggling to recover from the worst recession since the Great Depression. Therefore in this paper, we insist that the G-20 and policymakers cannot afford to waste the opportunity for a more fundamental reorientation of policies and institutions. Strict regulation of the financial sector; orienting it more towards investment in fixed capital, agri-business and transfer of technologies is key to greater stability of the global economy and to its return to a sustainable growth path. This requires increased coherence between the multilateral trading system and the international monetary system, a reorientation of fiscal policy at the national and regional levels, rather than focusing exclusively on balancing budgets or on achieving public deficit target. However, unless there is a reversal of the current trend of diminished income expectation of the average household and a return to policies that emphasize the importance of mass income growth as the basis for sustainable and balanced development in rich and poor countries alike, all other attempts to regain growth will be in vain.

Poverty reduction is a central feature of the international development agenda and contemporary poverty reduction strategies increasingly focus on “targeting the poor”, yet poverty and inequality remain intractable foes. Combating Poverty and Inequality argues that this is because many current approaches to reducing poverty and inequality fail to consider key institutional, political and political dimensions that may be both causes of poverty and inequality, and obstacles to their reduction. Economic integration and interdependence in the world today have reached an unprecedented level. As a result, the globalized economy cannot function for the benefit of all without international solidarity and cooperation. This was highlighted by the global financial and economic crisis that

followed the collapse of big financial institutions, and it has underlined the need for developing approaches to new forms of global collaboration.

The G-20, which has become a leading forum for international economic cooperation, successfully coordinated an immediate policy response to the crisis, or “Great Recession”

as it is now called. Coordinated monetary policy easing by leading central banks marked the first step, with most members of the G-20 launching large fiscal stimulus packages as

well as emergency support programs to restore financial stability. The aggregate impact of these measures stopped the economic free fall and won policymakers an important first

round in battling the crisis.

But, despite intense discussions, little progress, if any, has been achieved in major areas that were also concern to the G-20. These include financial regulation, inter alia for tackling problems related to the “financialization” of markets for many primary commodities, and, even more importantly, reform of the international monetary systems for curbing volatile short-term capital flows that are driven mainly by currency speculation. Meanwhile, global economic recovery has entered a renewed phase of fragility because a process of self-sustaining growth through private spending and employment is not assured, especially in developed countries. Many of these countries have shifted their fiscal policy stance from stimulus to retrenchment, which risks leading to prolonged stagnation, or even to a contraction of their economies.

Given the lack of growth in employment and wages in Europe, Japan and the United States, their policies should aim at continued stimulation of their economies instead of trying to “regain government spending. The main global risk is that wages and mass incomes might not increase sufficiently to feed a sustainable and globally balanced process of growth based on domestic demand. This indicates that the risk of higher inflation resulting from rising commodity price is very small. Only few countries that have strong growth and overshooting wage dynamics face inflation risks.

Therefore, we propose the G-20 to: (i) Encourage and support entrepreneurs for job creation in order to fight poverty; (ii) Launch an international Task Force for facilitating and monitoring the Diaspora from poor countries relocate in their homeland for making positive changes; (iii) Facilitate credit access for enhancing investments in Agribusiness and Food quality; (iv.) Encourage our plan for the creation of an Ethical Bank for Development.

In this paper we argue that the main issue is Job Creation and Equal Opportunities. Based on our own experience as Entrepreneurs we will focus on three main issues that constitute the critical elements of a sustainable and inclusive development strategy: (i) patterns of growth and structural change (whether in the agricultural, industrial or service sectors) that generate and sustain jobs that are adequately remunerated and accessible to all, regardless of income or class status, gender, ethnicity or location; (ii) comprehensive social policies that are ground in universal rights and that are supportive of structural change, social cohesion and democratic politics; (iii) protection of civic rights, activism and political arrangements that ensure states are responsive to the needs of citizens and the poor have influence in how policies are made.

Therefore, without investigating theories, we explore through our experience of Entrepreneur, the causes, dynamics and persistence of poverty; we examines what works, and what has gone wrong (and why) in international policy thinking and practice; and lay out a range of policies and institutional measure that countries can adopt to alleviate poverty by job creation.

We approach the topic with the spirit of re-visiting and implementing specific cooperation mechanisms, partnership arrangements or other development schemes pertained to the Millennium Development Goals (MDGs) for sustainable development.

Through our experience, we illustrate and we assess the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development while addressing new and emerging challenges. We describe how green economy can be a means to achieve sustainable development, and how to add value by transforming agriculture into business. And we describe our own experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication.

To make the paper looks more practical, we provide a limited number of quotes and references. A small bibliography is available at the end. We rather explore our expertise in order to present “A Case” based on our experience of Entrepreneurs and Businessmen. Therefore, we organized the paper in seven parts: (i) The Need of a New Direction, and a New Vision of World Affairs. (This part is certainly the most important); (ii) Food Security and Sustainable Agriculture (Agri-Business); (iii) Revisiting Aid, and Technology Transfer; (iv) Energy (oil); (v) Job Creation; (vi) Our Own Experience as Entrepreneurs and Businessmen; (vii) The Role of International Organizations and the Transnational Corporations in world affairs.

## **PART I: THE NEED OF A NEW DIRECTION AND A NEW VISION**

### **OF WORLD AFFAIRS.**

#### **I. A NEW ETHICS.**

The world's richest 20% now get 86% of the world's GDP, while the poorest 20% get

1%. The income of the world's two hundred richest people doubled between 1994 and

1996 to over a trillion dollars. The world's three richest people have assets greater than the combined output of the 48 poorest countries. The result is not only acute social and political tensions but a rise in armed conflicts and foreign military aggression against sovereign states, bringing the world to the brink of a third world war. As a result, many puzzles are in conflicts: Shall we use the puzzle of criminal laws as price? How about the puzzle of prison? How about the puzzle of criminal intent? How about the puzzle of the tort/crime distinction? Etc.

Such dilemmas should force us to think about the fundamental, "is criminal law mistaken about economics and finance? Even law and economics guru Richard Posner conceded that economic explanations for criminal behavior are "not... entirely satisfactory". Economist George Stigler goes further. He said, "the fault lies not in economics, but in the law itself." If we do not learn the lessons from the Oil crises and the financial crunch, some specialists will introduce the idea of "de-regulation", and financial/economical "re- habilitation". But homo economicus is incapable of being rehabilitated. He is, and always will be, happy to follow any course of action, legal or illegal, that maximizes his own material welfare. This principle is killing the Oil price, and may create other tsunamis.

It is critical that the young generation of African Leaders working in international institutions should be aware of the Jekyll/Hyde Syndrome and many others criminal attitudes and behaviors from the deciders towards world affairs. In world affairs, especially in international institutions, it is critical to understand why some people have the tendency to shift between selfish and unselfish behavior - and vice versa - in response to social context. Acting like Mr. Hyde implies there is no difference between the motives and attitudes of criminals, and the motives and attitudes of law-abiding citizens. As Gary Becker has explained it, "the approach... assumes that a person commits an offense if the expected utility to him exceeds the utility he could get by using his time and other resources at other activities. Some persons become 'criminals', therefore, not because their basic motivation differs from that of other persons, but because their benefits and costs differ".

In Stevenson's novella, however, Dr. Jekyll's basic motivations differed greatly from Mr. Hyde's. Hyde was a psychopath of "wonderful selfishness" who was "wholly evil". Today we are expected to follow the rules even when self-interest tempts otherwise. An

individual who steals, rapes, and murders whenever it suits him is acting like Hyde in a social context where he should act like Dr. Jekyll. Something has gone seriously wrong and is still going wrong with the global economy. The criminal's Hyde persona dominates in situations where his Jekyll persona should be in charge. Modern societies are not set up to endure such individuals, especially in big institutions commanding world affairs. We must take a new vision, a new direction.

Hyde not only succumbs to temptation, he does not try to resist it. A person who always acts Hydish poses a danger to the rest of us, just as Hyde posed a danger to the inhabitants of nineteenth-century London.

The above observations should lead to question whether the policymakers who create financial crunches are dangerous silent killers. Why?

To lawyers, murder is "malice", defined as the mental state of indifference or hostility toward the welfare of others. Indifference toward others is, of course, the very definition of homo economicus. A person who shows "malicious" indifference toward others in situations where the social signals say he should show concern is a serious threat. The difference between the criminal and the law-abiding citizen may only be a matter of degree. Tort law deals with otherwise-pro social individuals who miscalculate a risk or fail to recognize a danger. We should target purely selfish individuals who just don't care. Such persons pose a danger not only to his immediate victim, but to everyone else around him.

We need a new vision, new paradigms in order to transform homo economicus to homo sociologicus. This implies among other things, revisiting the laws and regulations in order to fight the global economic injustice. According to Frans de Waal, even chimpanzee tribes select a dominant male (a "Big Chimp") to keep order and settle fights: "Dominant chimps generally break up fights either by supporting the weak against the strong or through impartial intervention. Broken windows theory got its name from the title of an influential article by James Q. Wilson and George L. Kelling published in 1982 in the Atlantic Monthly, "if a window in a building is broken and left unrepaired, all the rest of the windows will soon be broken... One unrepaired broken window is a signal that no one cares, and so breaking more windows costs nothing." One remembers how in June 2008 a young golden boy, Bradley Birkenfeld, banker said at the U.S. District Court in Fort Lauderdale, Florida. He and other UBS bankers had advised their U.S. clients to cheat by creating offshore accounts; to stash watches, jewelry, to use Swiss credit cards to prevent the IRS from tracking their purchases, etc. When Judge Zloch asked him why he nevertheless participated in the scheme, Birkenfeld replied softly, "I was employed by UBS... I was incentivized to do this business...".

The above examples show that we are not blind; we know how it works and who are hiding behind the curtains in the matter of "fixing commodities prices, including oil". It works exactly like the "future", the speculation, or the "casino" banking, and other (virtual) structured products. We recommend the section at page 12, *"The Invisible Hand: The incidence of Maladjusted Persons in Business and in World Affairs."* This section is the most important since it illustrates how if well used, social sciences (non-

quantitative) can control quantitative data in order to correct the grave distortions and deviations of commodities prices in the Global Market.

## SUMMARY OF ISSUES TO BE ADDRESSED

We herewith provide a synopsis of issues to be addressed in order to comply with the

MDS.

### 1. The Banking System

As the problem of mispricing a systemic feature of financial markets, regulation should

focus on the system, rather than on behavior inside the system, with a view to enduring that the system as whole better serves real productive investment and growth in the real economy. A clear separation of deposit-taking institutions from those that are engaged in investment banking activities could help prevent gambling and casino "banking" by commercial banks. This would also reduce the size and increase the diversity of banking institutions. Publicly owned banks could play a more important role, not only for development finance purposes, but also as an element of diversity and stability. These kinds of banks have turned out to be more resilient during crises, and they have partly compensated for the credit crunch in the private system caused by the recent crisis. They may also help promote competition in situations of oligopolistic private banking structures<sup>1</sup>.

### The International Aid. (Details are provided at p. 15, Section, "Technology Transfer".)

Aid of Official Development Assistance (ODA) refers to resources made available by governments on concessional terms primarily to promote development and the welfare of developing countries<sup>2</sup>. This can take the form of grant funds, grants in kind, services or concessional loans that have at least 25% grant component. It can come from a single donor country or from many donor countries that course aide through multilateral institutions such as the World Bank, the European Commission or United Nations (UN) agencies. The former is referred to as bilateral aid while the latter is known as multilateral aid.

### What is wrong with Aid?

<sup>1</sup> Trade and Development Report, 2011 Unctad, p. 19.

2 According to the DAGOECD, ODA refers to "Grants or loans to countries and territories on the DAC List of ODA Recipients

(developing countries) and to multilateral agencies) which are: (a) undertaken by the official sector; (b) with promotion of economic development and welfare as the main objective; (c) at concessional financial terms (a loan, having a grant element of at least 25 per cent). In addition to financial flows, technical co-operation is included in aid. Grants, loans and credits for military purposes are excluded. Transfer payments to private individuals (e.g. pensions, reparations or insurance payouts) are in general not counted. (DAGOECD)

1. Aid is given to countries according to the economic, political and security interest of donor states.

2. Aid is given with policy conditionalities to favor the commercial interests of donors.

3. Aid comes with strings attached and aid has been so broadly defined that much of the

money counted as aid never even enters the recipient country.

4. Aid finances a huge and expensive aid industry.

5. Aid is owned and managed by donors.

6. Aid benefits are captured by domestic elites at the expense of the poor and

marginalized.

### 3. South-South Cooperation

In his Report 2010 about South-South Cooperation: Africa and the New Forms of Development Partnership, the Unctad indicates that International trade has and will continue to play a vital role in the economic development of Africa. It provides employment, contributes to technology transfer and is an important source of foreign exchange needed for imports of intermediate and capital goods used in domestic production. In recent years, African countries have intensified efforts to exploit this potential of trade for strong economic growth performance observed in the region between the second half of the 1990s and the onset of the financial crisis in 2008 was accompanied by a spectacular increase in trade. Africa's total merchandise trade also increased from \$217 billion in 1995 to \$986 billion in 2008. Its share of global trade also increased from 2.2 per cent in 2000 to 3.3 in 2008. This means that Africa currently has a share of world trade that is higher than its share of world gross domestic product (GDP) (2.5 per cent) but much less than its share of world population (14.6 per cent.)

### 4. About Oil

What a difference a decade makes. By 2010, a new understanding about the natural limits

of oil production had sunk in at the EIA and its experts were predicting a disappointingly modest petroleum future. In that year, world oil output had reached just 82 million barrels per day, a stunning 15 million less than expected. Moreover, in the 2010 edition of its International Energy Outlook, the EIA was now projecting 2020 output at 85 million barrels per day, hardly more than the 2010 level and 30 million barrels below its projections of just a decade earlier, which were relegated to the dustbin of history. (Such projections, by the way, are for conventional, liquid petroleum and exclude "tough" and "dirty" sources that imply energy desperation -- like Canadian tar sands, shale oil, and other "unconventional" fuels.)

The most recent EIA projections also show oil's share of the world total energy supply -- far from remaining constant at 38% -- had already dropped to 35% in 2010 and was projected to continue declining to 32% in 2020 and 30% in 2035. In its place, natural gas and renewable sources of energy are expected to assume ever more prominent roles. So here's the question all of us should consider, in part because until now no one has: Are the decline of the United States and the decline of oil connected? Careful analysis suggests that there are good reasons to believe they are.

### Our Recommendations:

1. G20 should take the ownership for encouraging the Diaspora to relocate back home in order to bring their expertise and to make positive changes. I will recommend the name of "G20-Support Team of Diaspora from Poor Countries" (G20-STDPC). Such dynamism will create jobs and will reduce poverty.

2. Remembering Some Lessons from the Financial Meltdown and the Bailout.

In 2007 -- 2008 we have since seen the bailout of Bear Stearns and serious concerns about Lehman and -- the GSE's, as well as the continuing bother of the classic too-big-to-fail doctrine.

The supply of capital worldwide is faltering as sovereign wealth funds pulled back to the sidelines and policymakers are discussing allowing non-bank private equity funds to aid the recapitalization. As a result of the continuing need for capital, press and policymakers are once again discussing direct government and government-sponsored bailouts. In doing so, however, I want to remind readers that there are (at least) three lessons that legislators and regulators -- and investors -- should be aware of before assembling any systemic bailout. Those lessons are knowledge accumulated through the history of successful and unsuccessful bailouts.

We probably won't get it right the first time, but that would not be surprising, even in the global and historical context. The first binding principal is that if the target institutions like the terms, the bailout isn't going to work. Second, adding leverage to insolvent institutions doesn't help them achieve less insolvency. Third, recapitalizations work but only if properly structured.

### 11. Some Measures

Although the challenge is tough, it doesn't mean that it can't be achieved. We must avoid restrictions by adapting our business culture to new environment. For example, we could begin interest in the wider world, building a culture of adventure, a thirst for challenge and a healthy curiosity about alien culture, religion, food, etc. It will help if the local people in the firm are multilingual, multiracial or multi-cultural.

The world is changing very fast. No one can cope with such a trend while dealing with old ideas, and conservative attitudes. We must rethink the role of a bank in our economy.

**Among the series of solutions:**

1. Review the fundamental mission of a bank: securing and lending money. Banks and financial institutions must seek maximum protection of funds. The motto must be: prudence, manage risks.
2. The Concept of Homo Economicus has proven its limits.

Let's take another (empirical) metaphor distilled from Prof. Stanley Milgram of Yale

University. In 1961-1963 Prof. Milgram conducted a weird experiment about obedience

to authorities.<sup>3</sup> Today some gurus of Economics and Finance are making the same experiment under our noses.

The law must play an important role, however conscience is key. In 1958 political economist Edward Banfield concluded that poverty in Southern Italy was directly attributable to what he dubbed "amoral familism". Take away one leg of a three-legged stool, and the stool no longer stays upright. Take away conscience, and law and reputation, by themselves, may no longer suffice to ensure a civil society. As said Robert Putnam, "our increasing reliance on television and other forms of electronic entertainment contribute to declining pro social behavior. Electronic entertainment keeps people indoors and isolated, away from public places and from each other. It encourages narcissism, materialism, and envy...."

The assumption that people are selfish has been embedded in economics from the beginning. From at least Hobbes's day, economic thinkers have emphasized self-interest in explaining human behavior. This seems appropriate in a well regulated marketplace, where selfish behavior is common and contributes to social welfare. The homo economicus approach is a wonderful tool for analyzing problems like monopoly, surplus, and shortage.

But, outside this arena, especially in the Oil Price Market, the assumption of rational selfishness may be of questionable value in helping us address social problems like failing schools, rising crime, poor medical care, political corruption, financial frauds and manipulations, or CEO malfeasance. Slogans like, "Accountability", "Transparency", "Incentives" are often used by cynical crooks in order to delude. The most obvious example may be Steven Levitt and Stephen Dubner's 2005 blockbuster, *Freakonomics: A rogue Economist Explores the Hidden Side of Everything* (2005). According to the authors, "incentives are the cornerstone of modern life. Morality... represents the way that people would like the world to work – whereas economics represents how it actually does work."

There many things to say about Ethics in order to prevent the same mistakes that put us into this current financial mess. It is time to stop watching them play the yoyo game, and the "Milgram Experiment" on the oil prices and the global economy. If we do not take responsibility to act now, the consequences will be devastating on poor countries. Emphasizing the power of material incentives and ignoring conscience not only hampers our ability to address certain social problems, it can make those problems worse. We

*3 The Wikipedia: In this experiment, 37 out of 40 participants administered the full range of shocks up to 450 volts, the highest obedience rate Milgram found in his whole series. Thus, according to Milgram, the subject shifts responsibility to another person and does not blame himself for what happens. This resembles real-life incidents in which people see themselves as merely cogs in a machine, just "doing their job," allowing them to avoid responsibility for the consequences of their actions. The shocks themselves were fake, the participant who took the place as the 'learner' in the experiment was in fact a paid actor who would simulate the effects of the shock depending on the voltage. Milgram became very notorious for this tactic, and his experiment was soon classed as highly unethical as it caused stress to the participants in the study. The study soon became one of the most talked about psychological experiments in recent history, invading headlines across the world, and resulted in Milgram finding himself in the centre of public attention. There was a huge divide in the psychological community as many [who?] believe that his deception was necessary in*

*proving fault with the human condition and helping to explain the actions of the Nazis in the Holocaust, which was the main reasoning*

*behind the creation of the study.*

must continue cultivating conscience and go beyond Homo Economicus, it already proved its limits.

3. Restore the credibility of the International Monetary Fund (IMF) and change its mission to a global central bank for overseeing the rudderless global financial system, monitor risk of big players like Citigroup, Deutsche Bank, HSBC, and large insurance groups.

4. New Banking Paradigms:

- Stability first, then transience, entrepreneurship, advisory before taking risks.
- Technocracy versus adhocracy, rationalism, intuition logic based on "how and knowledge" rather than hierarchyization and a rigid chart for the decision making.
- Job openings fitting the candidate capable of adaptability; vision and go beyond.

Rather than job description predetermined and conformity.

5. We can limit the impact of this financial crisis by lowering interest rate. It will induce consumers to buy and to regain confidence.

6. We should review the Doha Agreement on the international trade in order to segregate and or to avoid the international recession.

7. Suppress toxic debts as well as other financial instruments related to credit.

8. Encourage and innovate instruments of collaterals including the letter of credit, bid and performance bonds.

9. The G20 should insure that the World Trade Organization (WTO) is fairly monitoring subsidies to companies involved in international trading. Again the Doha Cycle must be re-dynamized.

10. Bagehot's Dictum: Bail out Illiquidity, not Insolvency and Make Sure it Hurts. Despite the paucity of the FDIC's problem bank list – and indeed because the FDIC is staffing up their resolutions division to historic levels – there are lot of banks in trouble today. The typical starting place for systemic assistance is Bagehot's dictum. Bagehot's dictum is the classic rule of bank policy (as opposed to monetary policy): lend to illiquid, but not insolvent, institutions at a penalty rate.

Bagehot therefore necessitates answering the question: which ones are insolvent and which just illiquid? Hence, the problem with applying Bagehot's dictum to bailout policy

is that it is difficult to distinguish illiquid from insolvent institutions during a financial crisis. Following the crisis, therefore, institutions that are clearly insolvent must be allowed to fail. Institutions at the margin may be candidates for targeted recapitalizations, but only in tightly supervised conditions.

11. No institution should want a bailout – hence Bagehot’s stipulation of a penalty rate. Even in the depths of the Great Depression thousands of banks were so deeply troubled

that they could not be rescued. Those that received Federal recapitalization did so through preferred stock investment with full voting rights, which the Reconstruction Finance Corporation used to replace officers and directors and forcibly restore institutions to solvency. No bank wanted the funds and the Federal control that came with them. Today, while many banks are in trouble the FDIC does not seem to want to reveal the true extent of the difficulties. Those difficulties need to be revealed for Bagehot’s rule to be applied.

#### 12. Loans Don’t Help

Because of the aversion to the harsh realities of Bagehot’s rule, nearly every bailout program begins by trying to lend money to the affected institutions in order to mask wide spread insolvencies.

The Great Depression’s Reconstruction Finance Corporation attempted loans initially, but Mason<sup>4</sup> showed that loans to weak institutions actually increased the chance of failure. The Discount Window was opened to weak banks in the Thrift Crisis, but, showed that discount window lending was a similar waste of money and effort. For Japan, Calomiris and Mason document the efforts to lend to banks in the early 1990s, and how authorities quickly concluded the effort was a failure and moved to recapitalizations. In each case the effort was based on the allegation of the effectiveness of Great Depression programs

administered by the Reconstruction Finance Corporation. The problem is, showed that those programs didn’t work. The short reason is that giving additional leverage to a bank already in trouble will only make the situation worse.

#### 13. Recapitalizations Help, but Change Management and Close the Back Door.

In each of those cases, recapitalizations were the next logical step. In the Great Depression, the Reconstruction Finance Corporation took a three-step approach: close the weakest banks, recapitalize the sounder institutions, and exert iron-fist control over the banking industry after the Federal Government owned voting stock in nearly every commercial bank (and many nonfinancial corporations) in the US. The Reconstruction Finance Corporation replaced officers and directors of banks and corporations and prohibited dividend payments for as long as they owned stock in the institution. The Reconstruction Finance Corporation then used that same control to direct credit to strategic industries for the ensuing war effort and post-war recovery. Notably, the Reconstruction Finance Corporation was the only government agency to be shut down after its policies were alleged to part of widespread pattern of greed and corruption in the

1950s.

US officials wanted to reinstate the Reconstruction Finance Corporation recapitalization program in the 1980s Thrift Crisis, but found they did not have adequate authority to do so. Hence, regulators resorted to regulatory goodwill capitalization (forbearance) to fund

4[https://exmail.smarsh.com/exchweb/bin/redir.asp?URL=http://research.stlouisfed.org/publications/review/92/09/Misuse\\_Sep\\_Oct1992.pdf](https://exmail.smarsh.com/exchweb/bin/redir.asp?URL=http://research.stlouisfed.org/publications/review/92/09/Misuse_Sep_Oct1992.pdf)“Schwartz (FRB St. Louis Review 1992).

bank capital, which was ultimately withdrawn by Congress. That withdrawal led to a Supreme Court breach of contract ruling against Congress and in decades of lawsuits (that are still being worked out). Congress’ withdrawal of regulatory goodwill was the only time Congress has been successfully sued. But Japan used direct recapitalization to rescue its banking system in the 1990s. As a result, much of the capital injected by the Japanese government was immediately tunneled out of the banks in the form of excess shareholder dividends. A second recapitalization program was necessary to make an impact.

#### **The Invisible Hand: The incidence of Maladjusted Persons in the Conduct of**

##### **Business and in World Affairs.**

Today the most notorious criminals are on the street, and/or are hiding themselves inside powerful institutions. People evidencing Antisocial Personality Disorder (ADP) are everywhere. The most characteristic of these “silent killers” can be summarized as follows: (1) Failure to conform to social norms with respect to lawful behaviors as indicated by repeatedly performing acts that are grounds for arrests; (2) Deceitfulness, as indicated by repeatedly lying, us of alias, or conning other for personal profit or pleasure; (3) Impulsivity or failure to plan ahead; (4) Irritability and aggressiveness as indicated by repeated physical fights or assaults; (5) Reckless disregard for safety of self or others; (6) Consistent irresponsibility as indicated by repeated failure to sustain steady work or honor financial obligations; (7) Lack of remorse as indicated by being indifferent to or rationalizing having hurt, mistreated, or stolen from another.<sup>5</sup>

The most dangerous are Psychopaths and Schizophrenics. These maladjusted persons who should be in hospitals and/or in high security prisons are spreading dangerous viruses among us. Psychopaths are people evidencing a condition characterized by lack of empathy or conscience, and poor impulse control or manipulative behaviors. At work place psychopaths use manipulative skills of some of the others are valued for providing audacious leadership. Some have argued that psychopathic is adaptive in a highly competitive environment, because it gets results for both the individual and the corporations they represent. But Psychopaths are interspecies predators who use charm, manipulation, intimidation, and violence to control others and to satisfy their own selfish needs. Lacking in conscience and in feelings for others, they take what they want and do as they please, violating social violence to control others and to satisfy their own selfish needs. Lacking in conscience and in feelings for others, they take what they want and do as they please, violating social norms and expectations without guilt or remorse. Psychopaths miss the very qualities that allow a human being to live in social harmony. Psychopathy can be a product of genes, trauma, or disease.

5 P.46, Cultivating Conscience, By Lynn Stout.

Eventually the most popular dangerous attitude is “the schizophrenic’s behavior.” Schizophrenics constitute a social menace because schizophrenia seems to be the most important disintegrative forces within our cultures. It is a lack of emotional tone, the

« dead-pan » expression, and the verbal irresponsibility. And a general lack of any

consciousness of abstracting, a schism within the personality, with extreme ravage around the patient. Or a split between « the intellect » and « the emotions. » The patient exhibits an almost chronic poker face, a « dead-pan » or « dead-fish » expression. He seems usually to show no affective reactions, to experience little or none of the grief, affection, joy, etc., which are felt and expressed by normal people. These ignored patients are spreading thousands of “viruses” (stress), ranging from verbal bacteria to cancers, and ending to wrong decisions, and conflicts around them. Most of these patients are designed to manage uncertainties and to take very crucial decisions for the rest of the world, including... commodities and oil prices...

## PART II: GREEN ECONOMY, AGRI-BUSINESS AND FOOD.

Since 2008, about 60 countries from all continents have faced social disturbances brought forth by the dramatic increase in the prices of the most important foodstuffs. In Bangladesh, Egypt, the RD Congo, the Philippines, Angola, and a major part of West Africa, just to name a few, social tensions and violent demonstrations were initiated by multitudes that vehemently claimed their right to a more dignified and faire life. Because of rise in the price of the basket of essential foodstuffs, it is estimated that an additional

100 million people will face hunger in the world. It is an indescribable tragedy. It

generates anguish, anxiety and helplessness in people and nations, threatening social peace and political stability.

From 2006 to 2008 the price of rice increased by 127%; wheat, by 136%; corn, by 125%; soy, by 107% and milk, by 80%. Likewise, the price of beef increased by over 60%; of chicken by over 50%, just like for eggs and edible oils. And prices this year have exceeded 2008 levels for all these products. (Source: Mr. Leonel Fernandez, President of the Dominican Republic, at the Unctad 58th Session in Geneva, 12-23 September 2011.)

This inflationary behavior has been explained by the off-season droughts faced wheat producing countries; by the increase in oil prices and its impact on fertilizers, pesticides and transport; by the use of food crops to produce biofuels, as has been the case of ethanol produced out of corn; by the increasing standards of living in Asia and the subsequent higher demand for meat; by decrease in food reserves; by the effects of climate change; or by the variations in the composition of demographic groups in several parts of the world.

Without attempting to dispute the truth inherent to all these explanations, little attention has been paid to the role played by speculation in the rise of international prices. According to academic experts, speculation has been one of the main factors in the economic and financial crisis that began in 2007. They attribute between 20 and 40% of the rise in international commodity prices to speculation. Futures markets have allowed the anticipated negotiation of prices between commodity producers and their wholesale clients. In this fashion, the participants have been able to distance themselves from the effects of any unforeseen fluctuations in final prices or in their financial or productive

costs. They involve producers and buyers around transaction of tangible products acquired by the latter and sold by the former by an agreed date...

In this traditional way, futures markets have given security and certainty to producers and consumers when facing volatility. As a consequence the volatile and uncontrolled rise of commodity prices causes trade deficits, inflationary pressures, interest rate hikes and currency devaluations, with their accompanying social costs and political pressures to fight fluctuations by means of prices subsidies to commodity products; subsidies which are almost impossible to provide in the absence of fiscal surpluses and international financing. In the same manner, commodity – producing countries are also affected eventually, due to the decline in the long – term demand for their products, resulting from the inability of end – users to accommodate their budget to the high cost of speculation.

Commodity – exporting countries should have the greatest interest in preventing the immense suffering of citizens in importing countries, whose income is weakened by market volatility, eroding their purchasing power, their quality of life and their hopes for a better future.

The topic to be raised should be the Corporate Social Responsibility (CSR) in raising awareness that firms have responsibilities other than to their owners and the bottom line. Yet despite all the talk about the importance of stakeholders, transparency, corporate citizenship and sustainability, the developmental and regulatory impacts of CSR remain highly questionable. With regards to the above, we propose that G20 should examine why the experience of CSR pales in comparison with the promise, what needs to be done to address the intellectual crisis of CSR, and forms of corporate accountability and regulation more conducive to inclusive patterns of development by exploring new avenues for job creation.

Despite progress in Europe and in Asia, the world is still affected by major development challenges: Poverty, Education, Gender Inequality, Health, Environment and Sustainable development. Yet, the Nansen Principles to responds to climate and environmentally- related displacement need to me informed by adequate knowledge and guided by the fundamental principles of humanity, human dignity, human rights, and international cooperation. In Africa particularly faces a number of post-transition challenges: weak governance and fragile institutions, frozen conflicts, inequality, expansion of the informal economy, demographic dynamics (uncontrolled), Migration flows, etc. Agriculture, by its inherent multifunctionality, has the potential to both influence and address the factors that contribute to food insecurity. Organic agriculture relies on five capital assets for success (natural, social, human, physical and financial) and so contributes to and builds ups stocks of these natural, social and economic resources over time thus often reducing many of the factors that less to food insecurity.

### Benefits of such policy:

1. Increase in food availability especially in developing countries,
2. Benefits to the natural environment,
3. Benefits to the natural environment,
4. Benefit to community, cooperation and partnerships,
5. Increase in education, skills and health,
6. Improvements to infrastructure and markets,
7. Increase in farmer and household incomes.

### Factors contributing to food insecurity in Africa:

1. Lack of consistent access to food,
2. Degraded natural resources, practice of mono-cropping,
3. Community and group issues,
4. Lack of education and knowledge. Health and disease, gender issues,
5. Poor infrastructure, lack of access to appropriate technologies,
6. Poverty, lack of access to markets,
7. Land-tenure issues, political issues (External factors.)

**Other priority areas for investment in the transition towards a green economy are:**

1. Small holder food agriculture, where farmers should be assisted and credited for investing in sustainable livelihoods,
2. Sustainable agriculture, which must be de-industrialized, given that at present time is largely hydrocarbon-based,
3. Clean, decentralized rural energy systems,
4. Less polluting public transportation systems.

**The Impact and Consequences of Global Warming for Agriculture:**

Generally, the impact and consequences of global warming for agriculture tend to be

more severe for countries with higher initial temperatures, greater climate change exposure, and lower levels of development. Particularly hard hit will be areas with marginal or already degraded lands and the poorest part of the rural population with little adaptation capacity.

**As a summary:**

1. Higher temperatures affect plant, animal and farmers' health, enhance pests and reduce water supply increasing the risk of growing aridity and land degradation.
2. Modified precipitation patterns will enhance water scarcity and associated drought stress for crops and alter irrigation water supplies. They also reduce the predictability for farmers' planning.
3. The enhanced frequency of weather extremes may significantly influence both crop and livestock production. It may also considerably impact or destroy physical infrastructure for agriculture.
4. Enhanced atmospheric concentrations of CO<sub>2</sub> may, for a limited period of time, lead to "natural" carbon fertilization and thus a stimulus to crop productivity.
5. Sea level rise is likely to influence trade infrastructure for agriculture, may inundate producing areas and alter aquaculture production conditions.
6. The impact of global warming has significant consequences for agricultural production and trade of developing countries as well as an increase risk of hunger.

**Our Recommendations**

Price stability is an indispensable prerequisite for food security. It is also imperative for

the smooth transition to new patterns of energy generation. And it is an urgent need for developed and developing countries that are seeking to prevent further economic crises and social unrest.

Even though there has been a slow and fragile recovery from the 2007-2008 financial crisis, at the end of 2010 and beginning of 2011, a new wave of financial speculation has once again, increased oil and food prices. This can continue in the future in the absence of regulatory mechanisms. These mechanisms should be implemented without exclusions that would ensure the existence of transparent futures markets, where all transactions are properly cleared and accounted for, such that the participation of institutional investors could not have speculative effects.

That is why a new consensus is needed among all members of the United Nations with regards to the stability of commodity prices. A consensus that must rely on appropriate oversight and regulatory mechanisms at both national and multilateral levels, in order to preserve the positive role of the commodity futures markets, which should reduce price fluctuations by allowing farmers to protect themselves through hedging and thus ensuring market integrity, mitigating manipulation and allowing the market's price discovery function.

There is also an urgent need for the international sharing of the best practices for regulating the futures market, to promote the growth of commodity production, to provide reliable trade flows and thus mitigate price volatility, so that more people can buy these products and more producers can sell their products on world markets.

A new consensus in these terms is possible. Because it will benefit all members of the United Nations. Because only in the United Nations can such a consensus be legitimated. And because legitimacy is the foundation of good governance, which is a precondition for the stability we need to ensure food security for all.

### **PART III: REVISITING “AID”, AND TECHNOLOGY TRANSFER.**

*Poverty of poor nations is a permanent danger to rich countries.*

In this section we explain why “Aid” must be replaced by “partnership and technology transfer. Our position is corroborated by Dambisa Moyo in her bestseller, “Aid, Why Aid is Not Working and How There is a Better Way For Africa.”<sup>6</sup>

#### **I. The Dilemma about “International Aid.”**

Every unhappy country is unhappy in its own way, but all are alike in their inability to produce equitable growth. The roots causes are often also the main reasons why disbursing foreign assistance in these places is fraught with difficulty: weak state institutions or overbearing bureaucracies, few accountability mechanisms, pervasive corruption; lack of human capital, and so on. The countries that most need development assistance are often also those that are least able to cope with it. In decades past, the standard response by donors was to implement aid programs directly, with little active involvement from recipient countries. This approach often achieved the immediate objectives of individual projects – but it did nothing to address the underlying problem of institutional weakness.

Since the 1980’s many programs were launched to help poor countries end their growing misery. But these programs generated many ill effects resulting in immigration and other dramas when people try to escape misery in their homelands. Despite international conferences and plans about poverty, the world is still confronted with an unprecedented growth in inequalities and a spectacular increase in the gap between rich and poor, aggravated by the current financial crunch. It raises concerns and questions about the

6 Dr. Dambisa Moyo is an international economist and New York Times best-selling author of both *Dead Aid: Why Aid is Not Working and How There is a Better Way For Africa*,<sup>[2]</sup> published in 2009, and *How the West Was Lost: Fifty Years of Economic Folly - And the Stark Choices that Lie Ahead*, published in early 2011.

result of colonialism, especially in Africa. The case of the Democratic Republic of Congo is very critical.

Eventually, if by democracy is meant discussion and debate among equal human beings making a free choice of a project for a collective future. Then, the unilateral imposition of market rules on individuals and peoples is the antithesis of democracy. The market, as defined by contemporary neoliberals, where “free and equal partners” act in a deregulated space, is pure fiction, as is the belief that the free market is a condition for the existence of other liberties. In fact, market function inevitably leads to battles of wills and power struggles, which the strongest usually win. The crux of the matter, then, is by whom and for whose benefit the market is regulated

#### **Solutions are possible.**

For example, instead of pursuing the traditional policy that attaches little importance to how dictatorship is devastating people in poor countries, the New Administration could change drastically attitude, considering and treating dictatorship governments as terrorists groups.

Eventually, entice cooperation with talented members of the Diaspora in order to make positive changes in their homelands. As a consequence, the G-20 will lighten the correlation between social investment for economic development and democratization through different schemes.

Among them: new vision on Africa, working with the Diaspora as new G-20 partners for developing poor countries, reviewing financial programs, creating a New Development Fund, encouraging trading with poor countries.

Eventually, if by democracy is meant discussion and debate among equal human beings making a free choice of a project for a collective future. Then the unilateral imposition of market rules on individuals and peoples is the antithesis of democracy. The market, as defined by contemporary neoliberals, where “free and equal partners” act in a deregulated space, is pure fiction, as is the belief that the free market is a condition for the existence of other liberties. In fact, market function inevitably leads to battles of wills and power struggles, which the strongest usually win. The crux of the matter, then, is by whom and for whose benefit the market is regulated.

#### **1. Changing Vision on Africa**

Poor countries need commitment of international and national strategists. However, Africans must be the architects of their own development. The role of the G-20 should be supporting such an effort. It is critical that the Diaspora must bring its expertise back home for improving the living conditions.

- Africa is a potential market and there will be no future without Africa. A study published by the IRIN in Johannesburg in 2005 reveals that the new field in 2055 will be Africa.
- The continent is the second lung of the world. With 30 million square kilometers of landmass, Africa is three times the size of China, more than three times the size of the US and six times bigger than Europe.
- Africa has huge water resources, and abounds in agricultural and mineral resources.
- In 2025, one in four of the world’s population will be African - an estimated 1.9 billion people. In 2055, Africa will be the second demographic power of the world - more than Europe, North America, and Latin American countries combined.
- Africa has 830 million people and millions of immigrants (Diaspora) scattered around the world.

#### **2. Working with the Diaspora as new partner for developing poor countries.**

The cost of hiring international project managers and of buying goods and services on the international market prompted questions as to whether the aid money was being well- spent.

Therefore, instead of encouraging charities to stimulate social development in poor countries, we strongly recommend integrating the Diaspora and transform it to a “G-20 Partners for Development” in poor countries.

#### **PLAN**

- Select and recruit well educated, trustworthy and capable people in the Diaspora in each specific field.

- Grant them a special status and protection so that they can return and work safely in their homelands.
- Sign a clear agreement with the government of their homelands and protect this Work Force by the means of a special status as International Civil Servants for Development.
- Instead of financing corrupted and/or incompetent governments in poor countries, the New Administration should pay these civil servants and give them a clear mission in their respective areas of expertise. The past decade has seen a shift away from direct execution towards national ownership of development efforts – i.e., ownership by the national administrations of the recipient countries.
- A special division at the G-20 should evaluate the performance and the achievement of the Diaspora operating in homeland.
- The G-20 should avoid large paper work that recipient governments have to provide in order to qualify for development assistance because they are not only

expensive to draft and lengthy; but also tend to be a major distraction from more basic tasks in the building of effective states.

- Also, too great a focus on ownership actually discourages frank discussion between donor and partner, because many issues are deemed to be matters for the partner country alone.

### 3. Financial Programs

It is a mistake for donors to continue generously pledging so-called grants and loans to governments of poor countries.

- We have seen billions of dollars "given" to poor countries, however, money has been misused, diverted or stolen by the heads of poor countries, especially African governments.

- Vast and urgent needs have emerged since then, which makes it yet even more

imperative to convert the pledges into cash quickly and give them to private investors.

- Bearing in mind the growing challenges faced by populations in poor countries in all regions, donors will have to be prepared to mobilize additional resources for urgent as well as long-term needs.

- Micro credit should be limited because it creates dependence and it reduces the market share.

- Business in poor countries are facing many other problems going from unjustified suspicions from the officials, passing to the market barriers erected for political reasons rather than business and free trade, and the unfairness of international financial institutions like the IMF.

- If supported by the financial institutions, entrepreneurs in poor countries will enhance operations and diversify activities in other market places. The effective financial products and instruments would be multiple, ranging from international transferable commercial guarantees and collaterals to credit lines facilities to entrepreneurs.

The result will be: creation of jobs, with a significant impact on reducing poverty and its ill effects.

The G-20 should be involved in facilitating access to finance to poor countries exporters. The direct consequences of such a global strategy would be multiple and nurturing. We will see the resurgence of a new economic era in poor countries. The informal economy would be eroded and businesses will export, get strong currencies from their transactions with rich countries, acquire and develop new technologies, inflow of tax in poor countries resulting from international trade, job creations, including the development of the

banking industry and related sectors. The global impact would be the reduction of unemployment and the amelioration of social and economic life in poor countries.

This is why the next G-20 Conference should encourage institutions and private investors to rethink credit programs and business incentives to poor/lesser developed countries.

We should insist on the commitment of the international and national strategists in order to ensure that adequate and fair financial facilities are available to the poor for them to export their products and services into the international market. It will be a significant way to share the economic resources of our global world. As a direct consequence, it will generate jobs; reduce poverty and its ill effects in poor countries.

### 4. Create a New Development Fund.

In addition to existing programs, the G-20 should give a special budget to the Diaspora. The purpose should be the rehabilitation and construction of the core infrastructures in homeland. However, the G-20 should create an entity designed to insure good governance in the recipient countries.

In order to achieve this, we must work together to create flexible mechanisms that bring funds and expertise more rapidly to where they are needed, particularly for creating jobs, exploring and setting up new technologies in poor countries, and helping businesses from these countries to export their goods and services.

### 5. Encouraging trading with poor countries.

There is nothing more false and misleading than equating democracy with free markets. If democracy means discussion and debate among equal human beings making a free choice of a project for a collective future, then the unilateral imposition of market rules on individuals and peoples is the antithesis of democracy. The market, as defined by contemporary neoliberals, where "free and equal partners" act in a deregulated space, is pure fiction, as is the belief that the free market is a condition for the existence of other liberties. In fact, market function inevitably leads to battles of wills and power struggles, which the strongest usually win. The crux of the matter, then, is by whom and for whose benefit the market is regulated. The G-20 can play this role too.

**Actions to be taken by the G-20 in order to make it happen:**

- G-20 should advocate for rich countries not seal up its borders, but look harder at the terms of engagement. Business insists that trading nations respect its property rights.

- The G-20 should use its power to influence the UN and its affiliated organizations should interfere in facilitating poor countries to access credits, for exporting their products and services, and then to face foreign competition. As a result, there

would be tremendous economic benefits of opening services markets such as helping exporters and producers capitalize on their competitive strength; enhancing consumer savings; fostering innovation and technology transfer.

- The G-20 should change stereotypes built on investments from poor countries, access to affordable financial supports, suppressing marketing barriers, suppressing protectionism, and facilitating the visas to poor investors. It will lead to a platform where we will have unconditional allies around the world.

**In order to achieve such challenges, many steps can be taken:**

- Suppressing market barriers and protectionism.

Poor countries businesses are stunned how rich countries protect their market by means of restrictions and drastic regulations going from visas and immigration, to business authorizations to entrepreneurs from poor countries. There are huge administrative and market barriers as well as dark protectionist mutterings on both sides of the Atlantic. Resistance has grown to unfettered changes in ownership through mergers and acquisitions.

- Immigration issues.

Qualified workers from around the world with proven experience need facilitation to immigrate to the US. However access to visas and employment permits is very difficult to obtain. In business for example, investors are facing difficulties in negotiating and or trading face to face with their clients, and other partners in America. So they may chose, although very risky, was to rely on their supplier and their technology, for sub-contracting.

- Integrating immigrant financial force

We must spur the market dynamism into our hubs, and explore the impact of the immigrants in the global. In Third world countries, the transfers done by the Diaspora are superior to the public budget. The economies of poor countries will continue being financed by the Diaspora. The success will depend on how this financial force will be integrated in the local, regional and global economies.

As a result, the G-20 will become the "Enabler".

#### **TECHNOLOGY TRANSFER: WHAT CAN FIRMS DO?**

Technology transfer is one of the important engines for development. It also provides corporations the tools they need for competing in the local and in the global market,

especially export of products and services.

There are a variety of ways to export professional services. Today most businesses tend to think to professionals traveling to a foreign country and selling their services as a consultant. But businesses sell many such services at home to non-residents. Some legal and medical services fall into this category. Some services require an on-to-ground presence. Banking and advertising services, for example, generally require offices close to the clients. It illustrates the importance of measuring and having Consultants.

#### **1. Trading Services Across Borders.**

Business services can also be traded across borders, as with the sale of franchises or the delivery of software across borders. And some architects can organize their work so that much of it is delivered over the Internet and they can stay at home and still work with their clients via the Internet.

One way of getting around the problem of scale is for individuals to join together. The large international legal and the large international accounting firms have tried and tested this technique of partnerships over a long period and managed to make it work extremely effective.

#### **2. Word of Mouth and Trade Promotion Organizations (TPOs.)**

Word-of-mouth marketing international is the first principle. It is just to be very good at

what you are doing. The second is to get exposure – via international conferences, publications, formal and informal networking, and to network effectively, following up correspondence, staying in touch.

Then when an opportunity does arise, they think of you. Sometimes it means taking on unprofitable work for a period to establish a reputation. Or doing something for free. (Somewhat like the samples that merchandise exporters can provide.)

#### **3. Trust and Experience Make a Good Service Partner.**

You should build and/or to enhance these assets.

- Build personal relations, aim for best in class.
- A strong local base from our experience, firms with international ambitions need to already be one of the "best in their class" in their local environment in some important or niche area. They need to have a strong financial base.
- Interest in the wider world. They also need to possess a culture of adventure, a

thirst for challenge and a healthy curiosity about alien culture, religion, food, etc. It helps if the local people in the firm are multilingual, multiracial or multi- cultural. Today being fluent in English is very important.

- Excellent grasp of technology. Easy and effective access to Internet is a great tool.

An impressive website, high bandwidth access, good internal communication infrastructure, mobile capability and preferably a File Transfer Protocol (FTP)

service are the minimum requirements nowadays.

- Meeting international standards. And it is also important to develop capability in a

set of standards in compliance with either British and/or American standards. And work with the ISO.

- Respect creativity. Respect the creative output of your service sector professionals. Give them due credit for their intellectual innovations, which are the intangible, yet most valuable asset they have to trade.

- Opening the community and the government's eyes.

**Small firms can:**

- Find sustainable service niches. Devise an exit strategy if the demand in their niche dries up.

- Target opportunities requiring a high skill set and not only offer "cut and trim"

services

- Move to favorable locations, such as high-tech business parks, to reduce costs

(office space, telecom, etc.)

- Use their size as strength: decisions can be made quickly and staff can be kept motivated.

- Look at opportunities for niche markets that the bigger players will not compete for. At a time when the market for providing business process services continues to grow quickly, new opportunities are appearing all the time.

- Try to partner with a foreign firm, either one that is already established in the country and can offer world-class facilities, or one that markets its services overseas.

**Strategies can:**

- Make available effective infrastructure so that suppliers can compete on costs.

They must also help create the legal structure and provide a secure environment.

- Form effective partnerships with business to attract investors and promote an attractive national offering.

- Treat information technology as a priority sector.

- Give incentives to brokers, who play a crucial role in ensuring that services get to

the market, so that they become active participants in making deals.

**4. Think it Through.**

- Think strategically about communications.

- Build support with target groups.

- Integrate communications in your business plan.

- Plug into your National Brand: Build a global image.

- Put your stamp on trade.

- Reaching out with the Web. Simply building a web site won't bring visitors. It takes careful strategy and targeted marketing to lure visitors to the site once, and even more work to bring them back.

- Links bring new readers.

- Trade forum (also use them online.)

- Evolve as a portal

- Learn more about your reader.

- Build a global image.

**PART IV: ENERGY.**

In the Energy Industry, Oil remains the most popular source. However, its prices do not necessarily follow the Demand and the Offer trend. In an article published in September

2011, Edouard Nsimba, PhD in Economics, and Expert of the UN, Ed described and questioned "Do Higher Prices Indicate a Tight Market?" He brought the following analysis about Oil price variations.

After averaging \$116.5 per barrel (pb) in July 2011, Brent oil price decrease a bit to an average of 109.7 pb in mid-August 2011 (we refer here to spot prices as opposed to future prices). Contrary to expectations, oil price will strengthen further during the last quarter of 2011; a quarter of which, for seasonal reasons, global oil demand always

increases, which in turn often lead to a rise in oil price. The US light crude (WTI) rose to

\$115.0 pb in mid-August 2011; the highest in 22 years and exceeded –by far– the

psychological threshold of \$40.0 pb. In March 2011, oil prices as measured by the OPEC's reference basket averaged \$110.5 pb and remained unchanged so far. The surge in oil prices is led by market fundamentals, a great deal of speculation and lately a "fear premium". The former reflects stronger-than-expected global oil demand and lower than normal world oil inventories, particularly private inventories.

Oil demand increased in the United States in view of a colder than usual winter and an increasingly fuel-inefficient automobile fleet. Other sources of oil demand strengthen have been China, which has become the world's second largest oil consumer, Japan due to its nuclear power plants disaster (especially Fukushima), the inability of the plant return to full capacity any times soon and the German government's decision to gradually abandon nuclear power as source of alternative energy. Furthermore, government stocks have increased, thus contributing to higher demand and keeping the pressure on prices, whereas private inventories dropped to levels that kept refineries, particularly in the United States, dependent on fresh supplies therefore also maintaining the pressure on prices. Worldwide, global oil demand is expected to average 89.5 million barrel per day (mbd) in 2011 and slightly increase to an average of 91.1 mbd in 2012.

Meanwhile, market sentiment has remained volatile. At the beginning of this year, market sentiment remained strong as the global economy entered a more definitive recovery phase. Additionally, market participants started to anticipate fuel shortages and other potential supply disruptions particularly since the deterioration of the security situation in Iraq and repetitive attacks on oil infrastructure in Yemen. Market sentiments radically changed in mid-2011 responding to world economic downswing, fiscal consolidation and

its pro-cyclical policies. World oil supply, however, did not increase as abrupt disruption is taking place in Libya and Syria. Saudi Arabia and other OPEC producers are not willing to step in and calm the markets. Global oil supply is expected to average 87.7 mbd in 2011 and 89.4 mbd in 2012. The global oil market will remain tight with world oil demand slightly exceeding global oil supply, suggesting that oil price will remain high. Downside risks associated with higher oil prices are a big concern for both developed and developing countries. The relatively optimistic outlook for the world economy is based on the assumption that the petroleum prices will retreat to below \$70 pb by the end of 2011.

If, however, geopolitical events push upward further the petroleum prices, which in the

middle of 2011 are already extremely high, the global economic growth could be substantially curbed, and in a worst scenario, if a disruption of oil supply were to happen at large scale, the world economy would be sent into a recession, as witnessed in the two previous major oil shocks (1973-1974, 1979-1980). As stated, higher petroleum prices will act as an increase in international tax, reallocating wealth from a large number of oil-importing economies to a relatively small number of oil-exporting countries, from consumers to oil-producers. As a result, there will be a net welfare loss for the world economy as a whole.

However, there are two significantly different cases in terms of the impact of higher oil prices on the world economy. In the first case, the higher prices are mainly caused by a temporary disequilibrium between global demand and supply, and they will act as a brake to slowdown otherwise an overheated world economic growth, a normal market mechanism (although the distortion in the global oil market is notably more pervasive than in other markets). In the second case, however, the higher oil prices are primarily pushed up by a substantial supply shock, and if the disruption persists for a considerable period, an oil crisis will lead to a global recession. While the world economy will suffer notable welfare losses in both cases—for example, as shown by our world oil model, an increase of \$10 pb in petroleum prices will lead to a loss of about 0.5 per cent in the world gross product; in the latter case, the world economy will be aggravated by an indirect but even more severe whammy of shocks in confidence. A review of the past two oil crises suggests that the negative indirect consequences are likely to be larger than the direct effects.

The indirect effects stem from a sharp collapse of consumer and business confidence brought about by the higher prices. In both 1973 and 1979, the index of consumer confidence in the United States dropped by more than 50 per cent when oil prices stayed at their peak levels for about 6 to 12 months. In both instances, this loss of confidence resulted in a recession in the United States, to the detriment of growth in the world economy as a whole. For some net fuel-importing developing countries, higher oil prices might also trigger financial instability, severely damaging short-term prospects. Please, note that most quantitative studies based "static comparative analysis" can only catch the linear relationship between the oil prices and the welfare loss through income and substitution effects, but cannot reflect the non-linear impact from the shock on confidence.

There will certainly be a difference in the impact of an oil price shock on various country groups. The direct welfare loss from the income effects of increased oil prices for net fuel-importing countries differs from country to country and depends on the share of oil in total consumption. Most developed economies, the United States in particular, are still the largest per capita consumer of oil; however, per capita consumption in Asian developing economies has increased significantly, making them more vulnerable than previously to increases in prices and, in several cases, more affected than other countries in relative terms. Meanwhile, changes in the structure of production, towards service sectors, have made output in most developed economies less energy-intensive and will correspondingly reduce the adverse direct impact of any oil shock.

In contrast, more industrialization in many developing countries, such as China, during the past decade has been energy-intensive. For instance, oil consumption per unit of GDP in China, and many other developing countries is more than twice of that in most developed economies. As a result, for any given oil-price shock, these countries will experience a larger adverse effect than during earlier episodes.

The price spike is a matter of deep concerns for oil consumer countries, especially developing countries. If export revenues remain unchanged, oil-importing countries have four main ways of responding to these higher prices:

- Reducing the quantity of oil imports: this will slow their rate of economic growth;
- Reducing expenditures on other imports: since a large part of developing country

imports are capital goods and other inputs for production, this will also slow their rate of economic growth;

- Using foreign exchange reserves to meet the increased costs: the reserves of many developing countries are less than the unofficial prudential benchmark of three months' import expenditures, limiting on their ability to exploit this option;
- Obtaining additional financial resources from abroad, either from official sources

or by borrowing on international capital markets. High levels of existing debt, reinforced by the present general reticence of international capital markets to lend to developing countries, limit the scope for additional international private borrowing in most cases.

Even before the world economic recession (2007-2008), rising oil prices had already dampened growth in many oil-importing developing countries through the adverse impacts on their trade balances. Fiscal positions had also deteriorated, constraining government expenditure and/or raising the level of domestic public debt. The overall effect is a loss of economic welfare for oil-importing developing countries. From the point of view of the balance of payments, the countries most affected by higher oil costs are those with a high proportion of oil in their imports and in their GNP or with limited foreign exchange reserves to absorb the "shock" of higher prices.

Market volatility and differing assumptions about the future of the world economy are reflected in the range of price projections for both the short term and the long term; however, most projections show prices rising over the entire course of the projection period although slowing after 2025. The other projections range from \$78 per barrel to

\$95 per barrel in 2015, a span of \$17 per barrel; and from \$78 per barrel to \$135 per barrel in 2035, a span of \$57 per barrel. The only series that do not report projections in WTI terms are IEA's World Energy Outlook 20107, where prices are expressed as the IEA crude oil import price, and INFORUM, where prices are expressed as the average U.S. refiner acquisition cost of imported crude oil.

#### **How America's Decline Is Linked to Oil.**

In his ironical article published on September 15, 2011, Michael T. Klare describes,

America's rise to supremacy was fuelled by control over the world's oil suppl. Now, the decline of the U.S. coincides with the decline of oil as a major energy source. According to Michael T. Klare, America and Oil is like bacon and eggs, Batman and Robin. As the old song lyric went, you can't have one without the other. Once upon a time, it was also a surefire formula for national greatness and global preeminence. Now it's a guarantee of a trip to hell in a hand basket. The Chinese know it. Does Washington? America's rise to economic and military supremacy was fueled in no small measure by its control over the world's supply of oil. Oil powered the country's first giant corporations, ensured success in World War II, and underlay the great economic boom of the post-war period. Even in an era of nuclear weapons, it was the global deployment of oil-powered ships, helicopters planes, tanks, and missiles that sustained America's superpower status during and after the Cold War. It should come as no surprise, then, that the country's current economic and military decline coincides with the relative decline of oil as a major source of energy.

If American power is in decline, so is the relative status of oil in the global energy equation.

In the 2000 edition of its International Energy Outlook, the Energy Information Administration (EIA) of the U.S. Department of Energy confidently foresaw ever- expanding oil production in Africa, Alaska, the Persian Gulf area, and the Gulf of Mexico, among other areas. It predicted, in fact, that world oil output would reach 97 million barrels per day in 2010 and a staggering 115 million barrels in 2020. EIA number-crunchers concluded as well that oil would long retain its position as the world's leading source of energy. Its 38% share of the global energy supply, they said, would remain unchanged.

#### **"When Deeds Speak Words Mean Nothing" (South Africa...)**

At our former position at the Italian state energy company, ENI (Ente Nazionale Idrocarburi), among other things our role was to check the historical reference prices, price formation, taxes and other prices of oil derivatives, scrutinize the physical market,

7 The EIA carries out interesting researches on oil prices. Information can be found at <http://www.eia.doe.gov>. (Energy

Price Volatility and Forecast Uncertainty, Source: EIA).

*In April 2009 I attended the EIA Annual Conference at the Washington Convention Center. Many Experts participated in this event, including Dr. Steven Chu, the US Secretary of State.*

etc. We realized that prices follow a cyclical trend, based on the market risks rather than the systemic risks.

It became clear to us that Crude Oil Prices increase when such events occur:

- Wars and armed conflicts (Angola, Iran-Irak, Irak-Koweit, etc.),
- Change of political regimes, or instability in some countries, terrorism, etc.
- Prices tend to increase especially in summer because of holiday season (people use more cars, airlines, ships, etc.)
- Oil prices are stable in winter.

But the question remains, "what will be consequences of high prices of oil on very poor

countries when the current financial will spread worldwide? "

#### **Summary of Recommendations:**

Because of increase of the population, cars production, heavy industry and transformation industry demand of oil, etc., my feeling is that Oil prices will continue to rise high and can reach a pick of \$160 in 2012.

We are pretty much convinced that if this scenario happens, the following would happen:

1. The GDP and the private consumption would be severely hit because incomes and revenues would be eroded by higher living costs.
2. This could drag many advanced economies back into recession.

The yoyo game (you start with economic recession followed by economic recovery and

again economic recession) will never last. The homo economicus philosophy is the trigger of our current international financial crisis.

3. At the same time, inflation would rise, increasing pressures in already heated poor countries, especially those who do not produce and export oil. However, the policymakers will come again with "appropriate" counter measures in order to fix the yoyo. We should expect the emerging economies represented by the BRIC countries (Brazil, Russia, India and China) to play a big role in order to reach an acceptable break- even-point about oil prices. And I strongly recommend that the BRIC should work

closely with the Opec countries.

From my experience at ENI, I also realized that the Oil industry is linked with the transportation demand. Both industries are in turmoil. If we do not take the necessary realistic measures to accommodate transport with the oil prices, we will pay the high price in five-ten years. For example, how many cars, trains, aircraft, ships, do we have in the world? How about in 2050? Are we dreaming about the Hybrids and Electric cars? How will we monitor and catch the CO2?

## **PART V: JOB CREATION.**

Why do we experience bankruptcies, layoffs, and growing unemployment? How can we reverse the trend by creating jobs? In today's developing and transitional economies, can we expect organized business interests to support social and other public policies conducive to inclusive development? Does the rise of big business facilitate or undermine this objective?

Based on our own experience of Entrepreneur, here are 13 actions to be taken for job creation:

### **1- Support Start ups and Small Business Companies.**

Startup companies suffer in securing a loan from banks and financial institutions. On one

hand, banks offering unacceptable conditions and terms for loans and credits, and on the other hand, finance being used as a political weapon. The largest difficulty to obtain the needed initial investment is the unacceptable conditions and terms for loans and credits from banks and lenders. Such difficulties can force some vulnerable startup to take a high risk exposure for losing intellectual property by sub-contracting with other businesses already operating in the international market. The G20 should address such critical contradictions between theories and practice.

How?

- Generate a policy encouraging innovation and creativity (I.e., new industries.)
- Review our Patents system for encouraging escrows accounts for start ups,
- A significant budget should be secured in order to cope with the effects of climate change.

- Sanctions shall be taken against abuses.

### **2. Prioritize Agri-Business and Technology Advance.**

They are both one of the basic tools to measure the competitiveness and the economic growth of a country. They are the main barometers for integrating and improving productivity of goods and services in other fields. Special units should explore these fields through effective entrepreneurship schemes.

### **3. Encourage trading with emerging economies.**

These countries are becoming dynamos of economic activity. In other words, the contribution of these countries reinvigorates the global economic activity. In particularly countries with a high economic rate growth, including Africa.

### **4. Energy, environment (ecology, climate changes), and development.**

- Encourage Entrepreneurs, and Students attend international conferences and workshops on climate changes.
- Develop new energy sources technologies and export it as well.

### **5. Promoting new industries we will generate significant revenues.**

For instance, we should design our environmental agenda to be a stimulus plan for the

clean-energy industry. A carbon tax or a cap-and-auction system, along with eliminating tax cuts for oil companies, could raise revenue for investments in green power or to retrain workers in older industries.

### **6. Education; innovation, research and training**

- Double the number of women in poor countries to attend colleges,
- Remunerate companies and or individuals, who innovate in their specific fields,
- Build an International Task Force for checking counterfeits.

### **7. No risks, no opportunities.**

We should remind and encourage people to take risk because risk is an opportunity. Not taking a risk may become a risk too. Entrepreneurs must participate to changing programs by being more action oriented, and risk takers. This program should be taught at high school and reechoed by the media.

Today the business world is locked with buyouts and acquisitions, which force some investors to believe that the fight is over, already won, or lost. What if your biggest competitor today, launches a product that could very well sink your biggest line? Or, what if an unforeseen shift in politics causes currency prices suddenly open a new market. Or, close an old one? How will you adapt? The Japanese have invented products which are already performing in the market, especially in automobiles and robotics. Amongst other things they introduced comfort and miniaturization, "the nano- technology." Your size is not necessarily a guarantee for your success and/or your survival within a never-ending competitive environment. And, you do not have to be big in order to see big. Your vision, creativity and technology can play a significant role in how fast and how well you can deal with new markets. Quality of the products and good risk management are essential to success.

#### **8. Government must be committed.**

Governments should be a partner to business and should focus on innovation, motivation,

ethics, and new markets

#### **9. Added value, products and services.**

The G20 should restore the qualities of products and services. For example, producing

coffee and/or ingredients, packing and labeling them at the place of production. The G20 should support manufacturers of products and services made locally. Governments should reduce tax to local companies, and increase tax of those who manufacture their products and services abroad, then import them to the country (i.e., dumping.)

#### **10. Ethics should be the motto.**

Because Ethics is an intangible assets with more value than material and money. The new administration should strive for ethical investments and should integrate human values into its goals and objectives.

We should respect the creativity of our entrepreneurs and give them due credit for their

intellectual innovations, which are the intangible, yet the most valuable asset they have to trade. We should pledge an intangible asset that stands far beyond measurable figures, and go much further because we do not see only with our eyes. Together we can make the difference of the difference, and change the transformation.

#### **11. Innovation.**

We must continue improving the quality of our products and services. Businessmen and Businesswomen should carry out activities towards specific schemes, and continue to take measured risks. They should have a long term vision and an aggressive strategy because after India and China, Africa is the next potential market. They should scrutinize the market opportunities and adapt strategies to the function of revenue and the type of resources it represents. It requires being organized, and be prepared for mutations within different industries. Mostly, they should be aware and alert to changing circumstances, which can make some businesses vulnerable or provide opportunities. The focus should therefore be on the future.

Organizations must be trained to respond quickly to signs of change and they should be able to quickly move people and money where needed. We should launch a United Nation's Pool of Innovativeness and Creativeness (UN PIC). It will operate as a melting pot where experts will distill ideas and experience and apply them in practice. However, they should be aware of imperfections; solutions should be monitored adequately for financial matters.

#### **12. Export Products and Services.**

Financial institutions are important in assisting businesses for exporting their goods and services. Exporting know-how is one of the engines for jobs creation, and the reduction of poverty in our blessed country. Such a conjunction of constructive ideas between entrepreneurs, investors and the government will be a terrific weapon to fight inequalities and to open a new era of an ethical global market.

#### **13. Businessmen and businesswomen must be highly motivated.**

We must believe in the power of networks for generating uncanny synergies that entrance

new paradigms in the financial and banking industry. If we preserve and if we improve access to international market, especially to emerging economies; competition will be enhanced; thereby inducing company to innovation; creativity and added value. As a consequence, job creation, as well as ending the current financial crisis.

### **PART VI: OUR OWN EXPERIENCE IN THE INTERNATIONAL MARKET.**

Today's international crisis appears to be an accumulation of various factors. In September 1999, while employed as a Risk and Operations Control Specialist at Barclays Bank in Geneva, Switzerland, I predicted this type of scenario. I have seen the risks inherent with credit derivatives and hedge funds in an industry left without control. I wrote papers for alerting about the ill effects and the need of governments to control such Damocles spears. Today, I realize that my previous analysis is being corroborated by many experts.

The following is based on my experience as Businessmen and Entrepreneurs in America, in Europe, and in Africa. In August 2005 I created a sole proprietorship in San Francisco, that we named, NVI Finance, Trading & Services, (NVI), designed to create a strategy of competitiveness and of growth. We subcontract in the areas of Finance, Agri-Business, Energy, and Mining. We remind people that the size of an investment or of a corporation is not necessarily a guarantee for survival and/or success in an ever-ending competitive environment. Our objective is to set up an architecture engine of innovation and creativity in new technologies. Focus on added value, comfort, and quality. Export to other markets, including the emerging economies and transition economies. This process would require the commitment for the government to ensure that such instruments are fair and available to all.

We approached faculty and scholars for applying new technology to business. We shared responsibility and competences between businesses and government. We propose to "solve immediate problems; set short-term agenda rather than thinking large policies and strategies." In order words, entice new paradigms and support Start ups.

#### **MILESTONES: Towards a Restructuring of the Banking System**

In this section we share our experience in the linkages and implications between export development and poverty reduction for Export Strategy-Makers". We will induce different topics to be debated by the audience, such as, Export Competitiveness and Poverty Reduction: Complementary or Competing Objectives? Pro-Poor Export

Strategies: What Works - A National, Regional, or Municipal Approach? Bringing the Poor into the Export Process: Is South-South Trade the Answer? Bringing the Poor into the Export Process: Is Linking Small Producers and Big Exporters a Solution? Bringing the Poor into the Export Process: A Question of Education or Entrepreneurship? Bringing the Poor into the Export Process: Is Access to Finance the Trigger? Gender and Export-Led Poverty Reduction: A Strategic Imperative? The Fair Trade Initiative:

Sustainable Commercial Opportunity or Development Trap? Export and Poverty: Impact Measurement – What are the Verifiers?

## EXPERIENCE #: LAUNCHING AN ETHICAL BANK

"Never doubt, that a small group of thoughtful, committed citizens can change the world. Indeed, it is the only thing that ever has." (Margaret Maed.)

Today the banking industry is locked with buyouts and acquisitions, and thereby forcing some investors to believe that the fight is over, already won, or lost. What if your biggest competitor, today, launches a product that could very well sink your biggest line? Or, what if an unforeseen shift in politics or in currency prices suddenly opens a new market? Or closes an old one? How will you adapt? The Japanese have invented products which are already performing in the market, especially in automobiles and robotics. Amongst other things they introduced comfort and miniaturization, "the nano-technology." Your size is not necessary a guarantee for your success and/or your survival within a never-ending competitive environment. And, you do not have to be big in order to see big. Your vision, creativity and technology can play a big role in how fast and how well you can deal with new markets.

Because we want to entice investments and entrepreneurship, we decided to launch an ethical bank designed to facilitate credit access. We will locate the bank in Geneva, Switzerland, for penetrating the international market. However, this strategy illustrated how it is difficult for businesses from poor countries to benefit the financial support in trying to sell their products and/or services worldwide. Despite difficulties, we use our size as an opportunity, and we are determined to achieve our objective.

We wrote the business plan, we completed the procedures, policies and strategies, we approached auditors and lawyers, and we discussed with the officials, for the banking license. Our main activity is granting credits. We will carry out also private banking activities for managing assets, and other facilities in the international arena. Our operations will be supervised by a Board of Directors and managed by an Executive Committee of experts, selected because of their outstanding experience and caliber in banking and world affairs. Client relationships will be carried out by qualified Private Bankers. Specialized departments will centralize operational support, while specific units

will run business quality control and compliance offices. We are ready to start operating. However, we need the required initial capital. And this is our major difficulty.

Therefore, we decided to explore another avenue for generating the funding ourselves. We decided to launch a bakery in San Francisco, with a Beta return. Profits generated will constitute a portfolio for financing the capital of our ethical investment bank. But, we soon find ourselves in the middle of contradictions between theories and practice. To one hand, banks offering unacceptable conditions and terms for loans and credits. To the other hand, finance being used as a political weapon. Basically we faced distrust, prejudices, disrespect and no recognition, just to impeach us to export our products and services. The market being locked by the giants, who decide who should be in the market or not.

We found some similarities between our approach and philosophy with Bank Raiffeisen created in 1902 by Reverend Pastor Johann Traber, at Bichelsee in the Canton (province, or state) of Turgovie. Today this bank has over 450 branches in Switzerland. Each shareholder is a co-operator, and part-owner of the bank. Until today, this bank is committed to the ethic preached by its founder. Like in 1862 Frederic Guillaume Raiffeisen we also decided to reconstitute the capital where it was produced, i.e. to the villagers in the form of saving and mutual petty cash for credits – against best terms guaranties.

The following lines describe how we started, the problems we are facing, and why we believe that financial support is the trigger for poor countries businesses to export. We will also describe how we try to solve this problem. Let see why we believe that poor countries can compete and how this vision led (epitomized) our business proposal for the creation of an investment ethical bank. Then we will describe how we organized the job, difficulties faced, and how we tried to solve them.

### Why should G20 supports our initiative for launching an Ethical Bank?

#### 1. The Momentum.

Success is not an accident. Although mergers and acquisitions are still dumping the

market, limiting and discouraging new entrants in the banking industry, we sustain that the game is not over. Our global strategy will reinforce our position in the emerging countries, and adapt our penetration strategy. This strategy sounds like a new miracle medicament entering into the market. We will avoid frontal and lateral attacks, and we will not adopt the surrounding technique. We prefer to conquer a market segment, and take advantage of inestimable trump, "the small entrant," for becoming the enemy who did not know how, but learned, and went beyond results. For example, we will explore the International Migration schemes.

Each year, immigrants and expatriates invest about 55% more than foreign investors. The Immigrants from Asia, Latin America, Arabs and Africans send back home hundreds of billions of Dollars, for the needs of their respective families. We encountered this

network, as well as, the African Americans community. We can defeat Goliaths by innovating top products at higher prices but with a low cash flow. This strategy can work, on the condition that our innovation (credit) should be really a small marvel offering advantages for which customers are ready to accept the price.

#### 2. Our Interpersonal Skills.

There are many factors and indicators that spur on to great efforts for the success of our endeavor. And we count on our interpersonal skills. We are encouraged, first by the new configuration of the emerging countries. In particular those with a high economic rate growth – are becoming dynamos of economic activity. In other words, the contribution of these countries reinvigorates the global economic activity. We want to explore this structural evolution. Second, we want to react against the inadequacies and perequations of different investment programs in the EC's. For example, the New Partnership for Africa's Development (Nepad), led by South Africa is an excellent plan.

However, its "unfulfilled commitments" by nations pose one of the greatest threats to the global investments network. We want to change such a situation by granting loans facilities to entrepreneurs, with another perspective for credit and risk.

#### 3. Risk Alertness.

Another indication of our chances for success is our notion of Risk. We interpret risk as

implying opportunity for greater returns. In our philosophy, risk is an investment, and also a stimulant that generates our excitement in any venture. We believe that when risk can be treated in a more discriminating manner, it becomes less threatening and more amenable to management, if not to elimination. Most important, we are aware that in evaluating risk, one dimension that is too often ignored is the risk of no action. In the real world, inaction involves risk - which a competitor may act, that customer preferences may change, that a new technology may appear from the shadows, and that factor costs may change.

#### 4. We promote business with a focus on Africa - by facilitating credit access.

We focus on Africa because it represents a terrific potential. Africans are reshaping their continent and improving their living conditions. The world is changing very fast. No one can deal with such a trend while coping with old ideas, and conservative attitudes. Today the main priority of nations is the eradication of poverty by providing employment. Since the 1980's many programs pretended to eradicate poverty, however, the ill effects of poverty caused immigration with dramas. We believe that African can do it themselves and enter in the international arena as competitors, not as subordinates or assisted. Like in sport, the new generation of African is multi qualified in the best school worldwide, and experienced. Especially, the Diaspora and its descendants. We want to explore these synergies.

##### **5. We understand the role of the Diaspora in the economy.**

We bank on an increase of transfer from the Diaspora for the economic rise of their

countries of origin. On November 2005 Sixtine Léon-Dufour, a World Bank expert quoted that the number of immigrants was 105 millions individuals in 1985. It counted

twice twenty years later. Immigrants from the South transfer 20% of their revenues in their homeland, the equivalent of 167 billions US in the first semester of 2005 (126 billions a year before). Despite the excessive transfers fees of organizations like Western Union. To the world scale, from now such flows of private capital represent two times the amount of the public assistance offered by the richest countries to the third world. They constitute the second source of direct investments. The World Bank suspects that these official figures could have been increased to 50% if we had computed the informal transfers, i.e. hidden money in the suitcases and funds sent back home by the means of non official network. Since 2001, the amount of transfers has soared to 73% and the trend does not show any sign of reversal.

The transfers done by the Diaspora represent an important part of the GDP of the recipient countries. In Tonga, for example, the amount of salaries equals 31% of the GDP, 16% in Salvador, almost 26% in Lesotho... «Besides, these amounts should be considered at the same degree than revenues from exports», thinks François Bourguignon.

The amount of transfers done by the American Latino immigrated in the United States, the "remesas", have reached the top in 2004, particularly in Mexico, Salvador or the Dominican Republic, countries dependent on such foreign exchange resource. Between

2003 and 2004, the total "remesas" in Latin America and in the Caribbean have shifted

from 38 to 45 billion dollars, as per the International Bank for Development (IBD)

estimates.

Experts estimate that if the money transfer are stopped, poverty will increase at least of ten percent in Mexico, which represent approximately the third of "remesas", that is to say 16,6 billion dollars (12,7 billion of Euros) in 2004. To the world record of "remesas", Mexico is the second after India, and accumulates a third of the transfers to Latin America and the Caribbean. Twenty two percent of Mexican families receive such manna from their relatives. The Mexican government leans on the Remesas for building infrastructures (streets, schools, etc...). The program "one for two" or "one for three" allows the immigrant worker to transfer money into a Common Fund in his original county. Then the government multiplies twice or three times the balance of the Fund allocated to a specific plan. Today, Mexicans or Americans originally from Mexico represent 9% of the population of the United States, in other words, 26,6 millions persons. Besides Mexico, money from the Diaspora is the cornerstone of the economy for countries like the Dominican Republic, the Salvador, Guatemala, Columbia, Cuba, China, and African countries.

We still believe that the economies of emerging countries will be fuelled and controlled by the Diaspora. The success will depend on how this financial force will be integrated in the local, regional and global economy. We can help because we understood that since we are small, the best strategy is to be very smart.

##### **EXPERIENCE# II: International Trading. Exporting is the Issue; However, Financing is the Key. The Case of "Encore Bakery" in San Francisco, California**

**(July 2006.)**

Poor countries are capable to compete in the global market.

Countries like India and Pakistan have seen exports of services such as software development, back-office support and services supplied by call-centres, expand in a significant way. Some descendants from immigrants from poor countries were educated in good schools, and some have good work experience in specific fields. However, when this elite try to create or reproduce the same business in their home land, they face difficulties for finding the initial investment from banks. How can a company operate internationally without good banking references?

We only tried exporting our services because local market is limited, and risk taking. Good information and best risk management are the keys to success. Moreover, there is a clear link between development and the benefits brought about by exporting products and/or services in the international market.

Proof of these benefits is that poor countries which businessmen have embraced and invested in the establishment of a services industry worldwide are clearly in the forefront of the battle against poverty and illiteracy. They have seen greater product and process innovation. However, they are penalized on access to foreign capital and world-class technology. The explosive growth of the Internet - and of Internet-related sectors - in countries like India is only one example, however breathtaking. It clearly shows how modern services can help to overcome the constraints of economic poverty, geographic periphery, and social exclusion.

We wanted to entice business from poor countries to export their goods and services. Because we have experience in the diet Bakery and we can produce a high quality of

product compared to our competitors. However, our specialists are located in Africa. So we decided to buy frozen products from an experienced bakery in Europe, and bake them in America for the resale. Later we will start building our brand, and bring our specialists from Africa to America. The cost of exporting frozen products to America was unbearable for a start up of our size. We suspended the project.

Let summarize the main difficulties we encountered in exporting our services and products from Africa to America.

##### **1. Financial risks for banks.**

We needed money for starting operations. Banks proposed hard conditions, like a standby letter of credit, or normal business credit application, collaterals, etc. Where to find them when you are a new entrant? And the same question, "why should we deal with you, while other products are already in the market?"

We found out that it is not easy to export business and professional services. This doesn't

mean that it can't be done. We partnered with those who are already into the market. We spent six months in building and enhancing this intangible asset.

-We realized that firms with international ambitions need to already be one of the "best in their class" in their local environment in some important or niche area.

-Our European partner has already a strong financial base. So we began our interest in the wider world, building a culture of adventure, a thirst for challenge and a healthy curiosity

about alien culture, religion, food, etc. It helps if the local people in the firm are multilingual, multiracial or multi-cultural.

## **2. We became fragile vis a vis our competitors.**

Because we cannot find banking supports, we decided to meet our competitors, establish personal relationships and work together as partners. We became dependent on them. In order to reduce such a big risk, we learned that "trust and experience" is the main ingredient for becoming a good service partner.

## **3. Barriers.**

We faced other barriers for exporting our products and our combined know how (acquired in Africa and in Europe) to rich countries, especially in the USA. My team and myself identified a number of issues that commonly act as barriers to services exporting.

### **THE CORE DIFFICULTIES FACED.**

Basically we faced distrust, prejudices, disrespect and no recognition, just to impeach us to export our products and services. The market being locked by the giants, who decide who should be in the market or not, and raising a cynical question, "why should we deal with you, while other products are already in the market?"

#### **Difficulty #1: the initial capital.**

The most difficulty was finding the initial capital for exporting our goods and services. To the one hand, banks offering unacceptable conditions and terms for loans and credits. To the other hand, finance being used as a political weapon. We realized the unfairness of international financial institutions like the IMF.

#### **Difficulty #2: Prejudices from the authorities.**

We experienced prejudices from the authorities: disrespect and non recognition. When we tried to build our own capital through banking, we found out how rich countries protecting their market by means of restrictions and drastic regulations about visas and immigration. Administrative and market barriers as well as dark protectionist mutterings on both sides of the Atlantic. Resistance has grown to unfettered changes in ownership through mergers and acquisitions.

#### **Difficulty#3: Higher Transportation Costs.**

Higher transportation (freight) costs as a result of shifts in politics pertaining to terrorism

(the case of the US take over Dubai and foreign companies owning US ports). Most of

the business and professional service firms are bigger and seem to have closed the market. Hesitations from customers. Difficulty to establish our brand and to build our reputation.

#### **Difficulty#4: Huge Marketing Budget, discrimination about qualifications than others.**

Working under the umbrella of our suppliers and different partners, difficult for a trade promotion agency to keep finding new relevant opportunities.

#### **Difficulty #5: The risk exposure for losing our intellectual property.**

The situation is that poor countries and their businessmen are economically on the bondage of rich countries. So we decided to sub-contract with huge institutions.

### **THE MAJOR LESSONS LEARNED IN TRADING FOODSTUFFS.**

Our misfortune at "Encore Bakery" in July 2006 in San Francisco helped us identify a number of issues that commonly act as barriers to services exporting. Our experience is that it is not easy to export business and professional services. For us the interesting thing is that foreseeing companies should rethink their programs and strategies in order to export, or to bring new technology.

#### **The core challenges are:**

**1. Scale** - Most of the business and professional service firms are bigger and seem to have closed the market. In fact there are many niches, and most companies have poor management and strategy. Moreover, it was very difficult for a trade promotion agency to keep finding new relevant opportunities. So we decided to work with people who can help us to create a network.

**2. Why do it over there when you can do it here?** This comment summarizes the views of most of our professional service companies. If they make a comfortable living working in the domestic market, where is the incentive for them to seek work offshore in an unknown environment? Again, this is a big mistake, lack of vision. The giants are already into the market. Most of the business and professional service firms are bigger and seem to have closed the market. Our reaction was to explore further niches, because most companies have poor management and strategy.

**3. You can't ship samples** - If you are exporting automobile accessories or coffee, you can send samples and these can be tested, assessed and compared by the potential buyers. But if you are exporting professional services, buyers don't really know the quality of what they are getting until they have received them.

**4. Reputation** - People tend to buy professional services based on the reputation of the supplier. And reputations are very hard to establish and very fragile. People tend to buy professional services based on the reputation of the supplier. And reputations are very hard to establish and very fragile. So we decided to sub-contract with a multinational in Europe, already in the market for years.

**5. Relying on Word of Mouth for Marketing** - This applies both onshore and offshore. But it is probably more difficult to make the translation to an international domain than it is domestically. As a company from a poor country, operating in America, we discovered that we will be requested more qualifications than others. We decided to operate

under the umbrella of our suppliers.

We changed our strategy and we adapted our marketing. We identified and we explored interesting niches. We also moved from San Francisco to Oakland, a favorable location, for costs reduction (office space, telecom, etc.) Eventually we started using our size as strength: decisions were made quickly and staff kept motivated.

Looking at opportunities for niche markets that the bigger players will not compete for. At a time when the market for providing business process services continues to grow quickly, new opportunities are appearing all the time. Partnership with a foreign firm, either one that is already established in the country and can offer world-class facilities, or one that markets its services overseas. As a result, we made available effective infrastructure so that our suppliers can compete on costs. They must also help create the legal structure and provide a secure environment. We are creating an effective partnerships network with business to attract investors and promote an attractive national offering.

We treat information technology as a priority sector. And we are giving incentives to brokers, who play a crucial role in ensuring that services get to the market, so that they become active participants in making deals.

**6. Recognition of Qualifications** - Professional qualifications that allow you to practice law, dentistry, medicine or accounting in your home country are very often not recognized by other countries unless you go through complex testing and admission procedures (and possibly not even then).

If you are exporting automobile accessories or coffee, you can send samples and these can be tested, assessed and compared by the potential buyers. But if you are exporting professional services, buyers don't really know the quality of what they are getting until they have received them. So we decided to go on delivering loaves of bread to our customers and have them taste them first.

**7. Capacity to do Only a Part of the Whole Job** - Typically companies have to find niche opportunities or they have to be subcontractors to the larger firms who can tender for the big projects.

**8. Financial Risk** - When you are working in a foreign country where the legal systems

are unfamiliar, where your partners may be untested, where the political regime may be unstable, where business practices are unfamiliar, etc., then the financial risk is magnified.

**9. Language/Cultural Skills** - Case studies that worked at home may not translate easily into a foreign business environment.

**10. Very Short-Term Contracts** - Professional service consultant may find a job that lasts a few weeks and then they have to find another one. This is very difficult for them. And it is very difficult for a trade promotion agency to keep finding new relevant opportunities.

**11. Difficulty Getting Finance** - Business and professional services generally do not require a lot of capital. This is one of the advantages. But it's also a drawback when you need a line of credit so that you can undertake a lengthy service contract. The banks don't want to know people who rely on their wits or what's in their head as their main asset.

**12. Difficulty Getting Paid** - To resort to the legal system of the foreign country may be prohibitively expensive and legal systems are notoriously to the advantage of the locals.

**13. Access and Visa Issues** - Hand in hand with the difficulty of having professional qualifications recognized comes the difficulty of getting a work permit and/or a visa to operate within a foreign country. We have qualified people from poor countries with proven experience in the baking in the industry but living in Africa. We immediately realized how access to visa and employment permits is very difficult to obtain from rich countries. So we decided to rely on our supplier and their technology, for sub-contracting in America. Rich countries protect their market by means of restrictions and drastic regulations about visas and immigration.

As a consequence, poor countries businesses are facing difficulties in negotiating and or trading face to face with their clients in the international market.

In July 2006 we were running after a contract valued at three millions dollars in Poland. But we were the direct victims of visas barriers.

When the agreement was pre-approved, we set up a meeting in Warsaw. However, we had only the Schengen visa in our passport, the Polish visa took five days. Due to the emergency, we decided to fly to Berlin, from where we would obtain the Polish visa at the border. Despite all the evidence and the commitment of our partner in Poland, the visa was scheduled in a week. We had no time to wait, we returned to California. Then we continued dealing with this case by phone and by email.

**14. Loss of Intellectual Property** - We have many examples of companies who have given copies of their training manuals, methodology and plans before signing any contracts. And have thus lost their intellectual property without any compensation. Even where there is copyright, trademark and patent protection, it can be difficult and

expensive to pursue the infringers. By doing so, we put our intellectual property and ideas in danger from competitors. We have given copies of their training manuals, methodology and plans before signing any contracts. And have thus an exposure for losing our intellectual property without any compensation. Even where there is copyright, trademark and patent protection, it can be difficult and expensive to pursue the infringers. We believe that this is a kind of narrow minded question, and lack of vision, being cut from the reality. It does not mean that because a product exists already in the market that the battle is over. Large groups could be vulnerable, not only with an offensive price policy, or only technological turmoil's, but also by grinding its periphery. The Japanese have proven it, and keep on with such a usury war. We have found some weaknesses in the banking industry, especially in the credit sector for transactions pertaining to investors in the emerging countries.

**15. Difficulty Finding the Opportunities** - From the perspective of our overseas trade posts, it is easier for them to concentrate on the traditional areas or merchandise – where import and distribution channels are easily identified.

**16. Market Barriers.** It was extremely difficult to export to America and to penetrate the market. Therefore we concentrated on the traditional areas or merchandise – where import and distribution channels are easily identified. We identified the baking and we selected different types of products that we want to explore in California. Since 2001, the climate remains forbidding. There are dark protectionist mutterings on both sides of the Atlantic. Resistance has grown to unfettered changes in ownership through mergers and acquisitions. These could escalate into full-blown protectionism given a global macroeconomic dislocation, particularly of international trade in goods and services. My group has and is still experiencing such ill.

Even in the area of transportation (freight), we are facing problems. The recent Dubai case was a genuinely close question. On the one hand, non-US companies already own US port operations, with long proven experience in the field. And the US Coast Guard is responsible for port security, regardless of who owns the facilities. On the other hand, because of shifts in politics the US took over Dubai and foreign companies owning US ports freight operations. And we know how affordable were the freight costs

offered by these companies from poor countries. Now, because of suspicions on terrorism, many affordable freight companies from poor countries are discouraged to deal with US ports. We have to pay three times more than before.

The decision was taken by the political process, not by the marketplace or the economic impact on the free trade. As a consequence, it eroded other values. When rich countries trade with poor countries, they should not seal up their borders, but it means looking harder at the terms of engagement. Business insists that trading nations respect its property rights, What about human rights and social rights?

#### **Our Recommendations:**

We believe that it is a mistake for donors to continue generously pledging grants and loans to governments of poor countries. We have seen billions of dollars "given" to poor countries, however, money have been misused or stolen by the head of many African governments. Vast and urgent needs have emerged since then, which makes it yet more imperative to convert the pledges into cash quickly and give them to private investors.

Bearing in mind the growing challenges faced by populations in poor countries in all regions, donors will have to be prepared to mobilize additional resources for urgent as well as long-term needs. And we must work together to create flexible mechanisms that bring funds and expertise more rapidly to where they are needed, particularly for creating jobs, exploring and setting up new technologies in poor countries, and helping businesses from these countries to export their services and goods too.

Our experience taught us that the reality is obviously different from what is preached by governments and international organizations. Exporting services and goods from poor countries is a typical example. It is difficult to conceive social and economic development when, on one side, businesses from poor countries are relegated to the second class, and erecting barriers to impeach them to operate in the international market as partners. They simply do not have the financial capacity to put in place the infrastructure of exporting and distributing in all areas where it is needed. On the other side, the market is generally owned and operated by richest countries through their MNC's.

Therefore, if the market is not open to poor countries, services and or products exports system will take much longer to be established, and delay productive investment in other areas.

Changing features in international trade in services are reflecting the needs of businesses from poor countries to export their products and services worldwide. These changes have brought about new concepts and problems. An array of challenges remains before us. My team and myself are a good source for organizations likes ITC, UNCTAD, WTO, FMI, and many others for creating a platform that will focus in this matter with new perspectives.

#### **EXPERIENCE# III: Launching a Fund in Switzerland for the Diaspora**

Our team is very concerned about the integration of the Diaspora in the development process. We have a solid educational background coupled with a thorough long experience, and high ethical values in international affairs. Prior to launching a bank in Switzerland designed to foster the efforts of the Diaspora in entrepreneurship, we decided to start a financial platform, called World Diaspora Fund (WDF).

WDF is an investment company for the international Diaspora, in respect to a cooperative model, similar to the Raiffeisen Bank in Switzerland. Essentially we will be offering Collaterals and Bonds to facilitate access to Credit Instruments and Bank Loans. We

prioritize ethical investments in agriculture, principally in Africa because we believe that agriculture is amongst the key indications of the economic goodwill of a country.

Following our field survey, we realized the major weaknesses of other financial institutions operating in the same areas; we went further ahead of them to innovate by providing opportunities to the community:

- We would create jobs both locally and in the Diaspora's homeland.
- We would bring the money back where it is most needed for fighting poverty.
- Today there is no financial entity that consolidates the Diaspora savings in order to build a portfolio for development plans, and to answer to the specific financial needs of these communities.

In other words, there are no institutions serving the Diaspora with collaterals, bonds, other means of money transfers, savings, investments, equity, etc., encompassed in ethics criteria.

- The international Diaspora is an interesting human and financial resource for the

economic and social progress of the community. Its members are well equipped with good education, know how, entrepreneurship, and they are open to positive changes. WDF scrutinizes such resources in order to generate more revenues for the development process.

- We innovate the transfer's niche by consolidating an Investment Fund because

today the international Diaspora contributes essentially to the immediate needs of their families in their homelands.

These aggregate remittances count in billions of US Dollars per year, but they respond essentially to emergency assistance in different social areas such as food, health care, education, housing, etc. At the macroeconomic level, these transfers represent an important part of the GDP of the country of origin and they impact the payments balance.

We sought good opportunities in Switzerland and in the Emerging Economies, and we want to explore them. Therefore, we decided to rely on new synergies for transforming a new vision of banking, by integrating human values in our goals and our objectives. We will enhance business in Africa by operating in Geneva, one of the best financial places of the world, situated in the center of Europe.

#### **PART VII: THE ROLE OF INTERNATIONAL ORGANIZATIONS AND THE TRANSNATIONAL CORPORATIONS.**

Now let see how International Organizations and Multinationals impact world's affairs.

## I. The World Trade Organization (WTO), the General Agreement on Tariffs and

### Trade (GATT), and Transnational Corporations (TNC's).

The financial crisis is being used as a political weapon to discourage investors from poor countries to export their goods and services. As we are involved in the baking industry (the primary sector), we should point out two concerns about international organizations like the World Trade Organization (WTO), and the International Monetary Fund (IMF) for problems related to agriculture and international financing.

We refer to the CETIM (Centre Europe Tiers Monde in Geneva) observation in 1999 on a special session on Agricultural Free Trade imposed on the South through WTO Agreements and its Consequences." These organizations pretend to be only for technical assistance for organizing seminars in national capitals (some 20 to 25 per year), regional seminars, as well as workshops and symposia in Geneva. Tellingly, the most recent symposium dealt with the challenges and opportunities of cross-border trade in services. But what are the results so far? Business from poor countries trying to find finance for exporting, need to maintain a permanent office in export markets. The UN can interfere to ask countries members to alleviate restrictions.

As mentioned by the joint written statement by CETIM, and AAJ (American Association of Jurists) at the UN Human rights session in 2004: "We would like to seize this opportunity to draw the attention of the 51st session of the Sub-commission on the consequences of free trade policies imposed on countries of the South by the WTO in

particular on agricultural issues. The WTO officially started its work in January 1995, succeeding to the (GATT) after the conclusion of the Uruguay Round negotiations. The agreements signed at that time include for the first time one on agriculture.

This is a source of concern for a growing number of peasant organizations, NGOs and some countries of the South. This agreement makes it compulsory for these countries to stop controlling importation of food and other agricultural goods. They are also required to reduce and eventually stop all subsidies to peasants, thereby exposing them to the competition of international agricultural markets. Four years later the disastrous consequences caused by the liberalization of the agricultural sector in certain countries of the South are becoming more and more obvious: the control of the world food system has fallen into powerful hands, to be more specific it has fallen into the hands of agribusiness. These changes concern the life style, revenue, and even the survival of small farmers worldwide and food security in many countries. International organizations policies should be reviewed and people should be re-educated on financing exports from poor countries to richest. The first set of problems and challenges has to do with the political sensitivities of market opening in different services sectors.

Several NGOs and civil society groups consider that opening services markets is a dangerous path to follow for less competitive economies. They claim that there is an intolerable level of intrusiveness by the WTO rules in areas of national policy competence such as education and health care.

My team and myself are pragmatic, action oriented. However, we wonder if there are active organizations to support initiatives like ours. We suggest that the UN and its affiliated organizations like the WTO should interfere for facilitating poor countries to access credits, for exporting their services and products, and then to face foreign competition. As a result, there would be tremendous economic benefits of opening services markets such as helping exporters and producers capitalize on their competitive strength; enhancing consumer savings; fostering innovation and technology transfer. Therefore, we came to the conclusion that organizations like the IMF and the WTO maintain a service as a public monopoly if they so wish.

The liberalization of international commerce cannot lead to the development of national agricultural economies. Indeed, the beneficiaries are neither the peasants nor the third world governments. The liberalization of commerce has mainly enriched agribusiness transnational companies (TNCs) such as Cargill and Continental. Giant food-processing companies already control three quarters of the world's cereal trade.

In short, world competition that the WTO aims to introduce is altogether unfair, inappropriate and disloyal.

Unfair because TNCs from the North have at their disposal highly developed technology and experience in agricultural industry that can only lead to the disappearance of traditional agriculture which has no means to defend itself. "In general (traditional agriculture) is not in a position to survive competition with powerful trans-nationals

which benefit from strong economy of scale, from large capital investment and technology, and which have good access to world markets. The technological and management skills brought by investors render them more competitive compared to local producers."

Inappropriate because free trade doesn't correspond to any real need but serves the profits of TNCs and the enrichment of elites.

Disloyal not only because agriculture is subsidized in countries of the North but also because "on the one hand foreign investors are strongly encouraged, and on the other hand small scale producers are subjected to significant constraints particularly an inequitable fiscal burden designed to discourage them." And finally TNCs are not subjected to any controls.

### Outsourcing

Outsourcing of services has become an important feature of international trade in

services. Developed countries have gained access to a new pool of talent abroad and have boosted productivity. Developing countries, on their side, have seen the establishment of high-tech industries and gained a substantive increase in income related to services jobs. Outsourcing is thus influencing policy decisions in both developed and developing countries, in ways which require complex examination of trade, economic and social factors.

Countries like India have seen exports of services such as software development, back-office support and services supplied by call-centres, expand in a significant way. Some African countries have also seen an increase in their exports of non-traditional services. The positive spin-off effects of liberalizing services have been felt in the form of increased Foreign Direct Investment and the creation of new businesses to support the new services providers. Matched with sound educational policies and investment in infrastructure, the services sector has proven a powerful engine for growth and development.

Not all of these changing features in international trade in services have been fully reflected in the negotiations. Also, these changes have brought about new concepts and problems. An array of challenges remain before us.

The first set of problems and challenges has to do with the political sensitivities of market opening in different services sectors. Several NGOs and civil society groups consider that opening services markets is a dangerous path to follow for less competitive economies. They claim that there is an intolerable level of intrusiveness by the WTO rules in areas of national policy competence such as education and health care.

The water distribution sector is often cited as a good example of this debate. Water distribution is obviously a basic service in any country. It is difficult to conceive social and economic development without this service. On one side, this is a service of general public interest, and as such it is generally owned and operated by the government,

through public companies. On the other side, many governments simply do not have the financial capacity to put in place the infrastructure of water distribution in all areas where it is needed. Therefore, if the market is not open to private investment, a water distribution system will take much longer to be established, and delay productive investment in other areas.

What must be stressed in this debate is that the GATT does not require the opening, privatization or deregulation of any service. In respect of water distribution and all other public services, different policy options are perfectly legitimate and are open to all WTO Members. I wish to underline this point: neither the current rules in the GATS, nor the new round of negotiations will force WTO Members to open the totality of their services sectors to private or foreign competition. WTO Members are free to maintain a service as a public monopoly if they so wish.

What also needs to be stressed are the economic benefits of opening services markets

such as helping exporters and producers capitalize on their competitive strength;

enhancing consumer savings; fostering innovation and technology transfer.

A second set of problems and challenges has to do with inexperience with the GATT. Participation in services negotiations is more demanding than government officials were used to in old-fashioned trade negotiations on goods.

The services economy is not only larger than agriculture and manufacturing in most countries in the world, it is also far more diversified. And the services agreement, the GATT, is far broader than conventional trade agreements for goods. It covers not only cross-border trade, but movements of consumers, of producers/investors, and of persons. Negotiations are thus more complicated — and so are the country-internal processes of preparation, coordination and implementation. Services negotiations generally require Trade Ministers to work with their colleagues who have regulatory responsibility in different services sectors — and the difficulties of such internal coordination should not be underestimated.

The complexities of services are also quite clear in the negotiations in the rule-making areas, that is on the disciplines for domestic regulation, the question of an emergency safeguard mechanism, as well as the need for and scope of rules on government procurement and on subsidies. Leaving aside the practical difficulties of some of these instruments, several Members argue that progress in rule-making would provide them with some degree of comfort to enable them to make further specific commitments. These Members point out that, if they knew they could count on a mechanism such as an emergency safeguard, more commitments could be made. In contrast, others are concerned that such a mechanism could unnecessarily undermine the predictability of the commitments sought in the Round.

For the moment, many governments continue to be more hesitant in their approach to services trade than they use to be in manufacturing. Although one can understand this situation, it is nonetheless unfortunate, since the benefits of services liberalization are key to any development strategy. Barriers are still far higher and less transparent in services

than in most goods markets (with some notable exceptions such as agriculture).

What can be done about this? On our side in the WTO, a key factor is technical assistance. Based on donor funds, the Secretariat has been conducting a broad range of technical assistance activities. These include seminars in national capitals (some 20 to 25 per year), regional seminars, as well as workshops and symposia in Geneva. Tellingly, the most recent symposium dealt with the challenges and opportunities of cross-border trade in services.

Two further points need to be added to my list of negotiating 'challenges' in services. One is the idea that one will only negotiate services once there has been movement in other areas of negotiations. Of course, bearing in mind a long and painful negotiating history in areas such as Agriculture, this is understandable. However, the quality of results of negotiations in services may be seriously affected by the delay in tabling requests and offers.

Services negotiations do not lend themselves to the same formula-based approaches as agriculture or goods. Rather, they are advanced mostly sector-by-sector in a host of bilateral meetings. There might not be sufficient time to successfully complete this time

— and resource-intensive process if it is not allowed to advance at its proper pace.

This would be problematic especially for an area of focal interest to many developing countries: Mode 4 — the presence of natural persons. It is the most protected, most sensitive and, by the same token, most challenging area under discussion. I am fully aware of its particular importance for small and medium-sized companies that cannot maintain permanent offices in export markets, but need the flexibility to move staff as the opportunity arises. Any meaningful outcome, however, needs time — time for negotiation in Geneva and time for preparation, coordination and persuasion in capitals. Given the tight schedule before us, we cannot afford to wait any longer.

Finally, there is an urgent need for political guidance and orientation to services negotiators. It has become increasingly relevant in recent months that political input is badly needed to advance services negotiations. The main concern is no longer the absence of a sufficient number of offers — three-quarters of the Membership has participated in the process to date and submitted at least initial offers of new or improved commitments. But it is widely recognized that the quality is poor and, if implemented, would open hardly any new access opportunities for service providers.

We are at a crossroads. Should the bilateral request-and-offer process simply be

continued, or do we need to develop complementary mechanisms that would (re-) launch this process on a higher plain? If so, what would these mechanisms look like — and how could they be translated into clear guidelines to be endorsed by Ministers in Hong Kong? Members need to focus further on these issues as a matter of priority — and arrive in Geneva with fresh instructions from their political leaders.

Services are a core element of the Doha Development Agenda — and a satisfactory result is a condition sine qua non for the whole project. Therefore, my message to you is: your support for the services negotiations is crucial to the whole Round.

Defenders of free trade admit that subsidies distort the market, but maintain that these distortions will disappear thanks to the new measures progressively introduced by GATT as from 1995. The result is a widely held but illusionary opinion that producers from all four corners of the world are placed on an "equal footing"!

This GATT agreement represents a real fraud. In reality developed countries have agreed to reduce their subsidies by between 20% and 36%. So, far from getting rid of industrialized countries' subsidy structures, GATT has left them largely intact, notably thanks to the bilateral agreement between the United States (US) and the European Union (EU) called the "Green Box". Through this agreement, the US and the EU have been able to maintain or even increase subsidies targeted at their agricultural exports! On the other hand, certain governments of the South have been encouraged to further liberalize their economies, reducing their taxes by 24% on imported foodstuffs and by increasing their minimum import from 1% to 4%.

### III. THE WORLD BANK

We wonder about the increasingly significant role being played by the World Bank in Human Rights activities. In innumerable papers the real experts - not the World Bank scribes - describe the funereal role of the World Bank in matters such as the right to Development and Human Rights in general. All over the world, peoples are protesting at the policies of the Bretton Woods institutions. During the Social Summit held at Copenhagen over 600 NGOs said in a joint statement, later signed by thousands of NGOs the world over that "the policies of the LMT and the World Bank are among the main obstacles to real economic and social development", and declared that they were in favor of the democratization of these two institutions.

And another article in the San Francisco Chronicles of October 23, 1997 from Mr. Simon, calling to abolish the IMF. Mr. Simon, secretary of the Treasury from 1974 to 1977, and president of the John M. Olin Foundation: "The Clinton administration is asking Congress to approve \$3.5 billion in additional funding this year for the International Monetary Fund. Congress should not only reject this proposal, but also take the long overdue step of ending all future funding for the IMF. As a practical matter the

institution cannot continue to exist without the participation of the most powerful nation in the world. By withdrawing its funding, then, the U.S. can take a leadership role in putting this outdated organization out of business... And George Shultz, the esteemed former secretary of state and of the Treasury, has called for the elimination of the IMF. In

a 1995 lecture before the American Economic Association, Mr. Shultz observed that "the IMF has more money than mission." As a consequence, he said, we should "merge this

outmoded institution with the World Bank, and create a charter for the new organization that encourages emphasis on private contributions to economic development. This would make a great deal of practical sense."

Globally speaking it is difficult to overstate the difference between the spectrum of positions in services negotiations at the time of the Uruguay Round and the situation today. We have moved from a picture where most developing countries were reticent, if not outright opposed, to negotiating services, to a new set of positions, where some important developing countries have become strong negotiators. Availability of world-class services has enabled exporters in developing countries to capitalize on their competitive strength, whatever the goods and services they have to offer.

An increasing number of developing countries, building on foreign investment and expertise, have been able to make impressive inroads in international services markets. Services opening has become an indispensable element of development strategies. In turn, this has prompted many initially skeptical governments to change track. Having largely remained on the sidelines of the Uruguay Round, they now play an increasingly vocal role in the services negotiations.

The phenomena of outsourcing and cross-border supply of services, facilitated by IT and FDI, have introduced new strategic elements in the negotiations. Modes of supply of certain services, which were difficult to conceive in the past, have not only materialized in practice but in some instances have become commonplace.

### IV. The Food and Agriculture Organization (FAO).

In November 1996 Heads of States and Heads of Government from 186 countries met in

Rome for the Food World Summit organized by the Food and Agriculture Organization (FAO). They proclaimed their national commitment and their political will to make constant efforts to eradicate hunger in the world. They have also decided to do all that is in their power to reduce the number of people suffering from chronic under-nourishment by the year 2015, this concerns over 800 million people.

The FAO adopting free trade theories pretends that withdrawing domestic commercial barriers will enable all countries to export their products which have a comparative advantage and eliminate less productive activities. The FAO concedes that this will lead to "adjustment costs" for producers but insists that these costs will in the long term be made profitable thanks to exportation opportunities and large profits reaped through modernization. But free trade is an illusion, which serves the interests of the strongest, and worldwide liberalization would be harmful because of the unequal conditions of production and of the diversity of market players.

We would first like to talk about agricultural subsidies. Farmers from the South face enormous inequality when it comes to agricultural subsidies.

A small farmer from the South earns in a year hardly more than what his US "colleague" receives as subsidies per ton through the Export Enhancement Program (EEP), (i.e. 77\$ per ton). The latter if suitably equipped will produce between 800 and 1000 tons per year

and will consequently receive, in subsidies alone, a 1000 times the revenue of his colleague from the South.

### CONCLUSION

Because we want to see a new era of Actions in the field, we suggested a topic pertained to *"Focusing on Entrepreneurship for Job Creation and Agri-Business for Enhancing Sustainable Development and Poverty Eradication."* We described that the world is still confronted with an unprecedented growth in inequalities and a spectacular increase in the gap between the advanced countries and those of the Third World.

We approach the topic with the spirit of re-visiting and implementing specific cooperation mechanisms, partnership arrangements or other development schemes pertained to the Millennium Development Goals (MDGs) for sustainable development.

Among our core contribution, we propose that the G-20 should:

- Encourage and support entrepreneurs for job creation in order to fight poverty.

- Launch an international Task Force for facilitating and monitoring the Diaspora

from poor countries relocate in their homeland for making positive changes.

- Build a bridge for facilitating credit access for enhancing investments in

Agribusiness and Food quality.

- Encourage our plan for the creation of an Ethical Bank for Development.

Because we want to see it happen, we provided our contribution to the pillars of sustainable development that could be launched and endorsed at Rio+20. We tapped into our thirty years of international experience in Banks, Trading, and Humanitarian for

providing realistic solutions. We insisted on linked topics:

The need of a new direction and a new vision of world affairs. We indicated that we must pay attention about incidence of maladjusted persons; we described the most of these silent killers (psychopaths, schizophrenics, etc.). Most of them are on the streets and are involved in the decision making process and policymaking. We proposed the necessarily to review the "Homo Economicus" and to replace it progressively by "Homo Sociologicus". We integrated Finance, Energy and Green Economy in the context of sustainable development and poverty eradication. We proposed new paradigms in the banking industry in order to avoid setbacks and other financial meltdowns.

We evoked the contradictions about "aid", we proposed rather to work with the Diaspora by creating an international task force associated with the G-20 in order to integrate the Diaspora in the development process in poor countries. We focused on poverty reduction because it is a central feature of the international development agenda and, the main cause of inequalities.

About Agri Business and Food Security, we indicated how preventive solutions can be taken right away in order avoid the high cost of speculation in preventing the immense suffering of citizens in importing countries, whose income is weakened by market volatility, eroding their purchasing power, their quality of life and their hopes for a better future.

We encourage the Corporate Social Responsibility (CSR) in raising awareness that firms have responsibilities other than to their owners and the bottom line. We also described the necessity to review Energy with a priority on oil. Both, producers and importers of Oil must review the mechanisms of price fixing, and take Speculators out of business. The most focus was on Technology Transfer and we proposed plans for Job Creation. We insisted on the necessity of encouraging Entrepreneurs and Startups, especially those from poor countries. The G-20 should advocate and facilitate credit access to job creators.

Again we plead for supporting our plan for launching an Ethical Bank. Our staff is ready with Business Plan, and the Strategy. Barriers, protectionism, visas facilities, and other barriers must be alleviated.

Eventually we applied a feedback and we proposed some guidelines to Government, the Civil Society, the UN organizations, International Organizations, and Transnational Corporations in world affairs.

Both agriculture and technological advance is one of the basic tools to measure the competitiveness and the economic growth of a country. Our Team is exploring these sectors such fields through effective financing entrepreneurship schemes. Agriculture and technological are the main barometers for integrating and improving productivity of

goods and services in other fields. This trend is not an isolated factor; it includes the banking industry too.

Poverty in poor countries threatens the entire world. It knows no borders. It is our collective responsibility to ensure that all countries -- rich and poor -- change their minds, find new ways to shift and to enhance business with new perspectives. Such a conjunction of constructive ideas is a terrific weapon to fight inequalities and to open an new era of global ethical business. Private initiatives (like our plan for an ethical bank) are the engines for the reduction of poverty in poor countries. Such initiatives should be encouraged by governments, international institutions, and individuals.

The experience of the Task Force NVI illustrates how the financial support to business from poor countries are the main key for helping them to export their goods and services. Thereby, they can expand their operations and diversity their activities in other market places. The direct consequence will be the creation of jobs in their homeland, with a significant impact on reducing poverty and its ill effects. Digging into our endeavor to create an ethical investment bank located in an emerging country, we realized the cynical and the contradictions between how in theory rich nations try to help poor nations in the international market.

Our experience in our sole proprietorship, "NVI Finance, Trading & Services" evidences that poor countries can compete in the global market by exporting their services and products to rich countries too. We challenged ourselves because the size of an investment or of a corporation is not necessarily the guarantee for survival and/or success in an ever- ending competitive environment. Risks are opportunities (and dangers) to be taken. Success is not an accident.

We identified niches and we advocated for ethical investments in a tremendous and a potential market, Africa. We anticipated innovative solutions in order to prioritize actions for job creations in order to fight poverty and its devastating consequences for the individual, and the community.

Not taking a risk may become a big risk too.

Our team can make a difference, and change the transformation, because we pledge an intangible asset that stands far beyond measurable figures, and we go much further because do not see only with our eyes. We are changing something fundamental.

Poverty of poor countries is a permanent danger to rich countries. Thank you for supporting our endeavor.

Bernard Nyembo

## Ngāti Kahungunu Iwi Incorporated

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

This submission to the compilation document for the Rio+20 United Nations Conference on Sustainable Development is presented on behalf of Ngāti Kahungunu Iwi Incorporated (Ngāti Kahungunu). Ngāti Kahungunu are an Indigenous tribe of Aotearoa New Zealand.

Ngāti Kahungunu, as an Indigenous people, define our identity as a people through our inalienable, inherited connection with the natural environment that forges a reciprocal relationship whereby our ancestral landscape gives us holistic sustenance as a people, and we cherish our obligations to the environment to act as guardians, protecting the ability of our descendants to have a living and full relationship with the natural environment.

Ngāti Kahungunu consider Indigenous peoples contributing leadership to sustainable development is a fundamental aspect of our status as Indigenous peoples and a necessary expression of our inherited values and relationship with the natural environment. Recognising the alignment between our values and the driving objectives of Rio +20, we share the optimism of many that the conference will galvanise a step change in global practice toward sustainable development and green growth.

For the purposes of the compilation document, this submission concentrates on the general question posed:

What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Ngāti Kahungunu wish to signal our aspiration to develop, in advance of Rio+20, a partnership contributing Indigenous peoples, private sector and state leadership in the protection and restoration of the Pacific Ocean.

For Ngāti Kahungunu, the Pacific Ocean is fundamental to our identity as we are a voyaging people who trace our migration to New Zealand across the Pacific Ocean, and through our migration, forged strong genealogical connections with many of the peoples of the South Pacific. In addition to tracing our identities to the Pacific Ocean, we also celebrate the critical role of the Pacific Ocean in contributing to carbon sequestration and the wider sustenance of many states and communities.

Our vision is to restore Indigenous knowledges and peoples to being active guardians of the Pacific Ocean, generating economic, environmental, social and cultural outcomes. In advance of Rio+20, we intend to explore the development of a multi-stakeholder partnership amongst Indigenous peoples, states and private sector actors in the form of payment for ecosystems services arrangement.

---

#### **b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

---

#### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

---

#### **d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

Ngāti Kahungunu wish to signal our aspiration to develop, in advance of Rio+20, a partnership contributing Indigenous peoples, private sector and state leadership in the protection and restoration of the Pacific Ocean.

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

It is our aspiration that the partnership we intend to explore amongst Indigenous, state and private sector partners can contribute to poverty eradication, decreasing aid dependence and generate 'green collar' jobs for Indigenous peoples.

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Ngāti Kahungunu Submission to the Rio+20 United

Nations Conference on Sustainable Development

This submission to the compilation document for the Rio+20 United Nations Conference on Sustainable Development is presented on behalf of Ngāti Kahungunu Iwi Incorporated (Ngāti Kahungunu). Ngāti Kahungunu are an Indigenous tribe of Aotearoa New Zealand.

Ngāti Kahungunu, as an Indigenous people, define our identity as a people through our inalienable, inherited connection with the natural environment that forges a reciprocal relationship whereby our ancestral landscape gives us holistic sustenance as a people, and we cherish our obligations to the environment to act as guardians, protecting the ability of our descendants to have a living and full relationship with the natural environment.

Ngāti Kahungunu consider Indigenous peoples contributing leadership to sustainable development is a fundamental aspect of our status as Indigenous peoples and a necessary expression of our inherited values and relationship with the natural environment. Recognising the alignment between our values and the driving objectives of Rio +20, we share the optimism of many that the conference will galvanise a step change in global practice toward sustainable development and green growth.

For the purposes of the compilation document, this submission concentrates on the general question posed:

What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Ngāti Kahungunu wish to signal our aspiration to develop, in advance of Rio+20, a partnership contributing Indigenous peoples, private sector and state leadership in the protection and restoration of the Pacific Ocean.

For Ngāti Kahungunu, the Pacific Ocean is fundamental to our identity as we are a voyaging people who trace our migration to New Zealand across the Pacific Ocean, and through our migration, forged strong genealogical connections with many of the peoples of the South Pacific. In addition to tracing our identities to the Pacific Ocean, we also celebrate the critical role of the Pacific Ocean in contributing to carbon sequestration and the wider sustenance of many states and communities.

Our vision is to restore Indigenous knowledges and peoples to being active guardians of the Pacific Ocean, generating economic, environmental, social and cultural outcomes. In advance of Rio+20, we intend to explore the development of a multi-stakeholder partnership amongst Indigenous peoples, states and private sector actors in the form of payment for ecosystems services arrangement.

## NGO PROTESTE (Brazilian Association of Consumers Protection)

CONTRIBUTIONS TO THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT - RIO+20

PROPOSITION: PROTESTE – ASSOCIAÇÃO BRASILEIRA DE DEFESA DO CONSUMIDOR (BRAZILIAN ASSOCIATION FOR CONSUMER PROTECTION)

### I. PROFILE, HISTORY AND MISSION

PROTESTE – Associação Brasileira de Defesa do Consumidor, Brazilian Association for Consumer Protection, registered at CNPJ/MF under number 04.591.034/0001-59, based on 6.420 Lúcio Costa Ave, Rooms 101 to 106 – Barra da Tijuca, Rio de Janeiro/RJ, and representative office on 173 Dr. Bacelar Street, commercial complex 52 – Vila Clementino, São Paulo/SP, is a non-profit Civil Association, independent from governments and enterprises, political or religious groups, whose statutory purpose meets the requirements foreseen by Articles 4th, II, "b"; 5th, V; 6th, I, II, III, VI, VII, of Law no. 8.078, of September 11, 1990 and 2nd, of Decree no. 2.181, of March 20, 1997.

It was established in July, 2001, on the initiative of IPEG – Instituto Pedra Grande de Preservação Ambiental, from Atibaia (SP), established 20 years ago, and ABC-Test-Achats, Associação Belga de Consumidores, Belgium Consumer Association, that has been defending European consumers for over 44 years.

The Association, that currently has about 250 thousand active associates, is the biggest organization for consumer protection in Latin America and is a qualified OSCIP entity – Civil Society Organization for Public Interest (D.O.U. – Official Journal of the Union – no. 237 of 12/05/03).

It is associated to Euroconsumers – European Association -, the second biggest consumer protection association in the world, with over 1 million associates, which unites organizations from Belgium, Portugal, Spain and Italy. It is also associated to Consumers International – organization that brings together entities for consumer protection from all over the world, and that promotes de defense of the interests of consumers through local centers, in particular from Latin America and Caribbean, with headquarters in Santiago, Chile.

PROTESTE is also a member of ICRT – International Consumer Research and Testing, independent organization that unites associations of consumers from all over the world, with the view of stimulating cooperation in research and comparative tests.

It is the mission of PROTESTE to raise standards of consumer protection in Brazil by all instruments at its disposal. For this purpose, its goals are:

- Inform, guide and defend the consumer, individually and collectively, fighting for the improvement of consumption relations in Brazil;
- Promote and implement the compliance of consumer protection laws, as well as fight for the improvement of all the correlative amendments;
- Help improve the quality of life of consumers in Brazil, particularly with regard to the quality of products and services, providing also orientation to the access to Justice, when necessary.

In order to inform, guide, represent and defend the interests of the Brazilian consumer, PROTESTE has its legitimacy granted by its bylaws (art. 4th), as well as by the Code of Consumer Protection (art. 4th, "b" and art. 5th, "V"). We act in accordance to Article 5th, XVII to XXI of The Federal Constitution and to Articles 53 to 61 of the Brazilian Civil

Code, that expressly

rules Civil Associations in Brazil. We do not advocate individually, neither appoint Law offices to our associates, for ethical reasons.

In that sense, supported by Article 103 of Law no. 8.078/90 and article 2nd of Federal Decree no. 2.181/97, PROTESTE is an entity that is part of Sistema Nacional de Defesa do Consumidor (SNDIC), National System for Consumer Defense, coordinated by Departamento de Proteção e Defesa do Consumidor (DPDC), Agency for Protection and Defense of the Consumer, agency linked to the Ministry of Justice.

Such organization has been seriously acting through the ten years of its existence in Brazil, and its work for consumers defense has been recognized not only by civil society but also by public agencies, like Public Prosecutor Office and Federal Chamber, as well as public and private companies. We highlight, once more, that all the work is done with complete independence.

Brazil is among 20 the most important emerging countries, where the society has the need for an independent association, able to work in an organized way, without the intention to compete with the existing System but on the contrary, cooperating with expertise and high-standard technical knowledge. PROTESTE is among the twelve biggest consumers defense organizations in the world concerning to action, expertise and contribution to society, all of that achieved in its ten-year journey.

Among our activities, we also highlight:

- ProTeste Magazine (published monthly, except January), Money and Rights (published bimonthly) and ProTeste Health (monthly), which are not sold in newsstands, and through them we disseminate the results of comparative tests performed by the organization with a series of products and services, in order to provide consumers with information and guide them in their purchases and when contracting services, besides publishing articles of interest in various areas.
- Members Service: support and guidance about consumers' rights and intermediation with companies that do not comply with CDC (Consumer Defense Code), in the search of an out-of-court settlement, achieving high success rates. More than 70.000 contracts were settled.
- Comparative Tests and Research: More than 5.900 items were evaluated – from food commodities to financial services. Dissemination of results through our magazines and website. Notification of competent authorities, regulatory and monitoring agencies when ruling is inappropriate, incomplete or inexistent, as well as when we find dangerous, unsafe or tainted products;
- Prosecution of Public Civil Actions: credit cards, phone services, Banks, tainted products, etc.;
- Participation: with Public Hearings and Public Consultation, related to Consumers Rights;
- Media: through radio spots, interviews to newspapers, TVs and sites of interest, always for providing consumers with assistance and guidance about the issues on focus.

Over the years of operation, we released 108 issues of ProTeste Magazine, 34 issues of Money& Rights Magazine and 03 issues of ProTeste Health Magazine, which regularly bring articles with practical tips that help consumers in choosing the best products and services on the market.

We achieved several victories through those ten years, like empowerment of arguments for automobile safety, campaigns against consumption accidents and in favor of healthy food for children, CET – Custo Efetivo Total (Real Total Cost), Terms of Adjustment of Conduct signed between the Public Prosecutor's Office and AMBEV. We also expressed ourselves by means of

several different ways, including legal ones, in favor of the users of wire line and wireless telephony services, pay TV and electricity. Besides, through comparative tests of products and services we were able to identify needs for updating rules so consumer's safety and rights could be improved. Several laws and technical Standards have been changed in Brazil due to PROTESTE work. Our most important achievements are:

- Implementation of conveying information about the Real Total Cost in financial operations;
- Demands in order to include airbags as factory-set features in all vehicles manufactured in

Brazil from 2014 on;

- Creation and implementation of a national data bank for consumption accidents;
- Charging of differentiated electricity rates for the low-income population.

The activities of PROTESTE show their impact in society mainly through raising their awareness. Brazilian consumers have a power that they do not realize at times, especially due to the ascension of the working classes, since our consumer market has surpassed that of developed countries. This way, by following our comparative tests, by choosing higher-quality products and services and the ones that offer the best cost-benefit ratio, by demanding them to become safer and more environment-friendly, our consumer becomes more discerning and help improve all citizenship relationships, not only those related to consumption.

Our work is not important for our associates, but for all Brazilians. Next we show numbers related to the population assisted by PROTESTE, organized by type of service:

- More than 70.000 calls for legal advice, from our 250.000 associates;
- More than 11.000 mediations between consumers and companies, showing an average of

75% of satisfactory solutions;

- 250.000 associates and their families receive the magazines published by PROTESTE (different age groups are benefiting);
- 250.000 associates and consumers throughout society benefit from our actions with the Prosecutor's Public Office and the Judiciary (when needed, through Civil Public and Collective Actions);
- 250.000 associates and consumers throughout society benefit from our contributions to Public Hearings (federal, state and municipal Legislative Power);

- 250.000 associates and consumers throughout society benefit from our contributions to

Public Consultations (Regulatory Agencies);

- 250.000 associates and consumers throughout society benefit from the Campaigns and Projects we develop (at times in partnership with other civil and public organization) for implementing the improvements demanded by the consumer market;
- 250.000 associates and consumers throughout society benefit from the warnings and information we provide consumers by means of different media (radio spots, interviews to newspapers, radio stations, TV channels and websites).

## II. CAMPAIGNS AND PROJECTS

Campaigns and Projects focused on education for conscious consumption, prevention of accidents, demands for improvement of public policies, financial education, quality of life, etc.

- Campaign Healthy Feeding from an Early Age and Forever
- Campaign against Liquid Alcohol
- Project for Prevention of Consumption Accidents
- Campaign for Lowering the Rates for Basic Wire Line Subscriptions in contracts for fixed telephony
- Campaign Care for School Bags

- Campaign There is no Age for Living with Quality Live (focused on the elderly)
- Campaign Transparency in Financial Services
- Campaign Plastic Money is Money
- Campaign for Mandatory Sale of Fractionated Medicine

PROTESTE, being aware of all the activities being developed in various fronts – as we believe we have thoroughly listed here, is, in fact, the biggest independent non-governmental organization for consumer defense in Latin America. For being representative all around the country, PROTESTE is able to mirror, clearly and precisely, consumers real needs, as well as some of the woes and difficulties in the quest for improvement in products and services in the market, looking for a balance, so strongly stated in the National Policy for Consumption Relationship, as highlighted in Article 4th of the Code for Consumer Defense (Law 8078/90).

PROTESTE has also been consolidating its position and being recognized in the national scenery, due to its capacity of media mobilization – as it has also been pointed before -, that sensitizes and guides public opinion, feeding opinion makers in our country with serious and objective information.

## III. RATIONALE OF THE PROPOSITION AND ITS RELATIONSHIP WITH THE SCOPE OF RIO+20 AND EXPECTATIONS

Having introduced the work we have been performing in the scope of Consumer Defense in our country, PROTESTE is able to actively cooperate to the debates of The United Nations Conference for Sustainable Development — Rio+20.

Protecting the environment and the consumer are principles of the economic order, as stated in Art. 170 from the 1988's Constitution of Brazil. The ways for such protection, both of the environment and of the consumer are the same, being based in human dignity and quality of life, taking into account the intergenerational fairness. Being hierarchically under the Federal Constitution, The Code of Consumer Defense is also applicable to Civil Public Actions concerning to environment damage. In that sense, Article 3rd of the Law of Civil Public Action, Law no. 7.347/81, provides for a unified system for protection of the environment, consumers, assets and rights of artistic, aesthetic, historic, touristic and scenic value, to any other diffuse or collective interest, by infringement of the economic order and popular economy, to the urban order. Therefore, the "diffuse interests" approach makes a clear link between consumption and environment.

Accordingly, it is impossible today to think in protection of the environment dissociated to the protection of the consumer. The main topic of Rio+20, the 'Green Economy', and all its correlated issues, have been object of our acts and researches. We believe in the concrete contribution of PROTESTE for the priorities established as scope of the Conference, especially energy, sustainable production and consumption (waste, disposal and recycling), impact of pollution and health. A holistic perception of consumer and environment protection are seen, and shall the joint agenda lead the desired sustainable development.

Intending also to follow-up specific aspects of Brazilian legislation, PROTESTE has signed a partnership for research with the Group of Applied Studies to the Environment: preventive and reparative supervision of environmental damage, from the Law School of São Paulo University. It's a group constituted by 8 researchers and 4 students, coordinated by lead researcher Associate Professor Patricia Faga Iglecias Lemos, who has published books on the environment area, especially "Solid Waste and Civil Responsibility pos consumption". Professor Lemos have been doing research on prevention and repair of damage to the environment. The Group has taken part on the Workshop Climate and Health in Megacities, held in São Paulo on April 9 and 10, 2011 at FMUSP, acting in the Working Group about Waste, and proposing actions for mitigation and

adaptation to climate changes, concerning to waste management in the cities and impacts to health. As a consequence of such workshop, the Group took part of the C40 Large Cities – Climate Summit 2011 Conference, held in São Paulo from May 31 to June 3, 2011, in which the Charter of Recommendations on Health was presented. It is important to mention that the Group members Patricia Faga Iglecias Lemos (leader), João Múcio Amado Mendes and Ana Carolina Corberi Famá are co-authors of the document mentioned above. The Group has also taken part of an international research, in partnership with Institute "The Right for A Green Planet", as part of the project Law and Climate Changes in Amazonian Countries, whose objective is stimulate the development of regulatory tools related do climate changes in Bolivia, Brazil, Colombia, Ecuador, Peru and Venezuela, all of them part of Amazon Cooperation Treaty. Group components and data as well as their curriculum might be seen at the national resumé database "Currículo Lattes", at ([www.cnpq.br](http://www.cnpq.br)).

The United Nations Program for the Environment (Pnuma) has described Green Economy as a system of activities related to production, distribution and consumption of goods and services that leads to improvement in human welfare in the long term. Such improvement must take into account the preservation of natural resources as well as the use of the least environmentally- harmful productive processes, leaving behind an economic model that prioritizes a production that is dissociated to preservation.

Changing that economic model depends on the important role played by the consumer; When well informed, the consumer can make better choices that take into account consumption patterns and reflect on environment protection.

In order to insert Green Economy to its priorities, PROTESTE develops actions and initiatives that improve human welfare and social justice, as well as reduce significantly the environmental risk and the risk of shortage of natural resources. Our tests and analysis aim to show to those that are part of the production and consumption chain - manufacturers and importers, traders and representatives, consumers and authorities - the methods used in the production and their consequences, so that sustainable development is enhanced on its environmental, social and economical aspects. The benefits of sustainable production and consumption spread through the whole society, not being restricted only to the individual consumer of a good or service. For that purpose, PROTESTE stimulates Sustainable Consumption, providing the customer clear, visible, systematic and efficient information about products and services.

Sustainability is, no doubt, a matter of perspective. Therefore, only an Economy based on renewable energy sources and closed substance cycles can be sustainable. The expectation is that the Conference will propitiate new partnerships and commitments from the estates, which should consider the current economic model and consequently its sustainability. For that, the principles of Rio/92 that support such model should be revisited. "The principle of sustainable development should be understood in line with the other principles of environment protection. The goods that bring economic, social, cultural, and political development are the same that are important for a healthful quality of life. For that reason, there is no sense in a disordered development, which harms the environment".<sup>1</sup>

As well clarified by Enrique Leff, the command and control system, as a set of rules, is not enough to prevent entropic degradation. "It is necessary to head to a sustainable development paradigm taken from eco-technological processes, based on the productive potential of living systems and of the cultural organization, which means, a process of participative management and collective appropriation of nature".<sup>2</sup> In such sense is the work of PROTESTE inserted, enabling the consumer to make better choices.

<sup>1</sup> LEMOS, Patrícia Faga Iglecias. *Meio ambiente e responsabilidade civil do proprietário*: análise do nexo causal. São Paulo: RT, 2008, reprinted, p. 59-60. (*Environment and Civil Responsibility: analysis on the causal link*)

<sup>2</sup> See LEFF, Enrique. *Racionalidade ambiental: a reapropriação social da natureza*. Rio de Janeiro: Civilização

Brasileira, 2006, p. 207 e 208 (*Environmental Rationality: social reappropriation of nature*) and LEMOS, Patrícia Faga Iglecias. *Resíduos sólidos e responsabilidade civil pós-consumo*. São Paulo: RT, 2011, p. 41. (*Solid Waste and post-consumption Civil Responsibility*).

Among the priorities indicated as goals of Rio+20, we listed 3 main themes, highlighting the comparative tests intended to be made and their rationale, as reported below:

- Energy: the issue of energy is a priority for enabling Green Economy. It's important to work with quality standards for products that are linked to the levels of environmental impact. In that sense, art. 9th of Law no. 6.038/1981 (National Policy for the Environment) foresees incentives to implementation on equipment and technology developed for the improvement of environmental quality, which allows the incorporation of environment- friendlier technology, as well as the correct waste disposal, loss control and reduction in the use of toxic substances, aiming to preserve natural resources. PROTESTE tests are relevant for they analyze the energetic benefits and provide the consumer with correct information.

Sustainable Production and Consumption (Waste, Disposal and Recycling): the choice of the issue considers the importance of the contributions of green economy for eradicating poverty, as well as the need for the consumer to be correctly informed on how to perform waste disposal. The reverse logistics was foreseen in Law no. 12.305/2010 (National Law for Solid Waste) for the following products: pesticides, their waste and packaging, batteries, tires, lubricants, their waste and packaging, compact fluorescent lamps, sodium steam bulbs, mercury and mixed lamps and electronic devices and their components. Therefore, testing products and monitoring the implementation of such a new system is justified, to provide the necessary information to consumer. It is important to emphasize that as stated by Decree 7.404/2010, which regulated the mentioned law, after the implementation of the reverse logistics, the consumer who disobeys the established obligations can be charged, if it is recurred, to be liable for environmental violations, being punished with fine varying from R\$50,00 to R\$500,00, which may be converted in services for preservation, improvement and environment quality repair. On the other hand, considering the need for eradication of poverty, tests linked to reverse logistics system should consider the existence or not of partnerships between manufacturers and/or importers and pickers cooperatives, as well as social and laborer conditions and compliance of labor laws.

- Impact – Pollution and Health: Preventing pollution depends on changes in equipment and in productive processes, with higher efficiency of supplies (raw material, energy and water, etc). It means reduction in the origin, changing productive processes that will bring benefits to the consumer and to the environment. Regardless of legal requirements, companies can adopt such practices, adding value to the business.

The selection of the mentioned aspects took into account their relevance in the scope of the priorities of Rio+20, their inter-relationship and the desire for seeing the purposes of the Conference being met.

Considering that PROTESTE is associated to Euroconsumers – European Association, to Consumers International – organization that brings together entities for consumer protection from all over the world and is a member of ICRT – International Consumer Research and Testing, independent organization that also unites associations of consumers from all over the world, with the view of stimulating cooperation in research and comparative tests, our Brazilian experience can also be shared with other countries, aiming to a cooperation that shall bring global results that enable sustainable development.

#### IV. TESTING SCHEDULE FOR 2012: energy, waste disposal and impact to pollution and health

PT 110 – February/ 2012

Microwave ovens:

Analysis of energy consumption when in standby mode. The difference in energy consumption among brand is really high. The idea is to warn consumers about that difference, so the choice may be done for a product that spends less natural resources and also provide tips on how to use the product without damage to the health, like using it only with specifically designed material for microwave ovens.

Wall paint:

Analysis of the products, in order to inform the consumer which of them adopt safer chemical processes and environmentally clean ones, based on the investment in methods that mitigate environmental impact, like reduction in the use of energy and water, more efficient production generating less waste and prevention of pollution and reduction on the emission of volatile organic compounds (VOC).

GPS:

Studies on reverse logistics and proper disposal are planned. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics of electronics, and the need for informing addresses of collection stations for the disposals and post-used products.

Lubricants for cars:

Warn the consumer about the correct disposal of this product, including its packaging, showing that there is already recycling possibility for this kind of lubricant.

Wood Certification:

Show the consumer which of the products are certified by FSC or Cerflor, lobbying for governmental investment that makes certified Wood become more competitive compared to the non-certified, increasing its consumption potential.

PT 111 – March/ 2012

Digital Camera:

Studies on reverse logistics and proper disposal are planned. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics of electronics, and the need for informing addresses of collection stations for the disposals and post-used products.

Fuel

Show the consumer the measures that have been already taken in order to reduce the pollution caused by cars: banning the use of lead in gasoline, limiting its volatility, using of reformulated gasoline, limiting the use of sulfur content on diesel, etc. as well as the changes that still haven't been made. Warn the consumer of the cleaner types of fuel.

PT 112 – April/ 2012

Sewer:

Evaluate the areas on the coverage of the sewerage system in Brazilian cities. Comments and discussions about the link between the United Nations Millennium Goals for water, sanitation and consumers are made.

Anti-bacterial soap:

Comment on the impacts of its production and disposal to the environment. Focus on health, prevention and toxicity of products.

PT 113 – May/ 2012

Blender:

Assess the durability of the product, showing the consumer the concept of obsolescence planned by the manufacturer.

Showers:

Analyze energy consumption. Evaluate water pressure compared to bath time as to quantify the consumption.

Cooling Liquid:

Comment on the impacts of its production and disposal to the environment. Focus on health, prevention and toxicity of products. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Air pollution:

Show consumers the quality of the air in their city and an overview, that will be build based on data from INEA and CETESB, from 2009 to now. Alternatives for a healthier life in the city, ways to reduce pollution, ways to reduce stress, etc.

Green Houses:

Show consumers ways to make the dwelling-place become more sustainable, providing tips to reduce heat and energy consumption and increase comfort and air quality without the need for remodeling.

PT 114 – June/ 2012

Tablet:

Reverse Logistics and correct disposal. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics of electronics, and the need for informing addresses of collection stations for the disposals and post-used products.

Checklist for traveling:

Focus on sustainability, benefits that tuning the car bring to the environment.

Window cleaners:

Show consumer the products that contain chemical components that may impact negatively the environment, such as water pollution. We could provide a homemade recipe, environment-friendly, for window cleaner.

PT 115 – July/ 2012

Coffee maker:

Energy consumption will be analyzed. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics of electronics, and the need for informing addresses of collection stations for the disposals and post-used products.

LED TV:

Reverse Logistics and correct disposal and energy consumption. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics of electronics, and the need for informing addresses of collection stations for the disposals and post-used products.

Ground Coffee:

Warn consumers about the impact of production to the environment. Value the producers who minimize socio-environmental impact to the farming communities, stimulate sustainable production and social responsibility.

Self –tanning products:

Comments on the impact of disposal and production for the environment. Focus to health, prevention and toxicity of products.

PT 116 – August/ 2012

Multifunction printer:

Reverse Logistics and correct disposal and energy consumption. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics of electronics, and the need for informing addresses of collection stations for the disposals and post-used products.

New or Second-hand Cars:

Compare environmental impact of second-hand cars, pollution and fuel consumption of old engines with the impact of waste production when the engines are not reused and the impact of manufacturing new cars.

Olive Oil:

Warn consumers about the impact of production to the environment. Value the producers who minimize socio-environmental impact to the farming communities, stimulate sustainable production and social responsibility.

Bleach:

Verify which products are biodegradable and the potential impact to the consumer and to the environment.

PT 117 – September/ 2012

Mixer:

Energy consumption will be analyzed. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Washing Machine

With the inclusion of this product in the PBE (Brazilian Labeling Program), manufacturers, in order to reduce energy consumption and be granted with positive evaluation at the Energy Saving Procel Seal, have been reducing the quality of the product. In the tests, washing capability of the machine in a single cycle will be evaluated. An overview of older models will be shown.

Macintosh Computer:

Reverse Logistics and correct disposal and energy consumption. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Car Batteries:

Show the evolution of batteries so they contain less toxic material and the correct way for their disposal in order not to pollute the environment.

PT 118 – October/ 2012

Camcorder:

Reverse Logistics and correct disposal. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Liquid Coconut Soap:

Comments on the impact of disposal and production for the environment will be made. Focus to health, prevention and toxicity of products.

Soymilk:

Warn consumers of the impact of large-scale production of soybean in Brazil to the environment. Value the producers who minimize socio-environmental impact to the farming communities, stimulate sustainable production and social responsibility.

PT 119 – November/ 2012

Wireless telephone:

Reverse Logistics and correct disposal. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Toothpaste:

Comments on the impact of disposal and production for the environment will be made. Focus to health, prevention and toxicity of products.

PT 120 – December/ 2012

Air conditioner:

Energy consumption will be evaluated and tips on how to increase efficiency of the air conditioner, like temperature and correct placing, will be given. Air quality will be analyzed, verifying interval between filter cleaning and if there is difference among brands.

Issue of the cooling gas used (no-polluting, ecological gas). Reverse Logistics and correct disposal. Verification if manufacturers and importers have adjusted their productive process to Law no.

12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Car radio:

Reverse Logistics and correct disposal. Verification if manufacturers and importers have adjusted their productive process to Law no. 12.305/2010. It states the reverse logistics and the need for informing addresses of collection stations for the disposals and post-used products.

Frozen Chicken:

Warn consumers of the impact of large-scale poultry production to the environment and address the issue of humane slaughter.

## V. CONCLUSIONS

The United Nations Conference – Rio+20 brings new opportunities to revitalize the global partnership for sustainable development, relevant to the participation of governments, international organizations, non-governmental organizations, experts for the implementation of local, regional and global solutions. It is necessary to work out the efficiency mechanisms for economic activity, with quantitative and qualitative minimization, with less polluting raw-material, renewable energy and reduction of use of natural resources in the productive process, among other issues. Regarding to disposal, the priority order is: non-production, reduction, reuse, recycling, waste treatment and adequate final disposal.

As established at Principle no. 10 of Rio/92, the best way to approach environmental issues is by making sure that all citizens interested are able to take part in the discussions, in appropriate levels. For that, it is essential that information is made accessible, and PROTESTE has widely disseminated through its researches.

Considering such aspects, PROTESTE believes it is inserted and capable of taking part in the discussions of the Conference, being able to contribute to the Green Economy and the implementation of cooperation mechanisms.

King Regards,

Maria Inês Dolci

## Non Timber Forest Product-Exchange Programme

### Sustainable Mountain Development

#### Draft Regional Report

#### South East Asia and Pacific

#### prepared for the

#### Lucerne World Mountain Conference 10-12 October 2011

#### From Rio 1992 to Rio 2012 and beyond

### DRAFT FOR DISCUSSION From Rio 1992 to 2012 and beyond: Sustainable Mountain Development

#### Southeast Asia Pacific (SEAP) Mountain Region

The report aims to provide an overview and assessment of trends, issues, and challenges for promoting the agenda of sustainable mountain development in the SEAP region since 1992 highlighting the progress made and lessons learned in key sectors and sub-sectors; it covers all the three pillars of sustainable development and scopes out opportunities in the two themes of the Rio+20 – Green Economy and Institutional Framework for sustainable development and poverty reduction..

The Swiss Development Cooperation (SDC) as a part of the Mountain Partnership Consortium (MPC) has provided financial support to carry out this study. The views expressed in this document are those of the authors and do not necessarily reflect views of the organization they are associated with.

## Executive Summary

Southeast Asia and Pacific (SEAP) mountains, which are spread across two geographic regions – mainland Asia and island/archipelagic states in the Pacific Ocean - form one of the world's highest but also most severely threatened biodiversity pools. A number of indigenous peoples who are marginalized, poor, and underserved by their respective nation states live in structurally weak and fragile SEAP Mountains even made more vulnerable by increased frequency and intensity of rainfall, extreme temperatures and severe tropical storms. Expanding global population and economic pressures are driving migrant lowland settlers toward SEAP Mountains while extractive companies harness the mountains' timber, minerals and water resources without giving due share to the local communities. In general, the mountains have not been mainstreamed in the governance of most Southeast Asian countries, which highlight the need for policy reforms to protect social and ecological systems in the mountains, strengthen sustainable development, prevent environmental damage, and improve national and regional food security.

Governments and civil society organizations, international and local donors, and development agencies have played key roles in facilitating development and/or resolving conflicts arising from competing demands on SEAP mountain resources. Lessons learned in addressing conflicts showed that these involve a slow process that is best initiated by creating an environment for dialogs to take place. Toward this end, stakeholders must be capacitated on collaborative negotiations and non- adversarial communication skills to enable them to engage in multi-stakeholder dialogs that strive for win-win solutions and aim to do the greatest good for the greatest number of people in the long run. Improving governance, meeting the economic needs of the people, and making them more self-reliant through proper education avert conflicts that border on terrorism in remote regions of SEAP Mountains.

People in the SEAP Mountains need to take charge of development of the welfare of their communities and the mountains in partnership with civil society, particularly for advocacy and building public support for mountain-specific policies and development approaches. Partnerships need to be forged with the private sector based on corporate social responsibility initiatives to provide innovative, simple technological and market solutions to livelihoods problems in the mountains following low carbon or green growth pathways. Specifically, private sector support can be directed for empowering mountain stakeholders with community-based technologies and for developing business skills. Product value chains through cooperative efforts among the primary producers and private businesses can result in reasonable returns on their investments for both the mountain people and downstream commercial enterprises. Ecotourism can be promoted to help generate income in mountain communities and among indigenous peoples as strategies, to counter violent conflicts and finance mountain conservation and sustainable development.

Participatory action research that takes into account local good practices and indigenous knowledge are needed to determine carrying capacity of mountains and for implementing plans and measures for adapting to and mitigating the worsening impacts of climate change and unregulated human activities on mountain resources. There is growing awareness on the benefits provided by the SEAP Mountains in terms of ecosystem goods and services. Increasing frequency of mountain-originated disasters both in the uplands and lowlands has raised policy level awareness for integrated approaches. Combining the increased awareness, with traditional and scientific knowledge will help improve sustainability in resource use by creating opportunities for multi-stakeholder participation that can address pressing mountain issues and challenges. Effective participation of communities in mountain governance – supported by enabling policies – can pave the way for sustainable mountain resource management practices, and help end pervasive poverty in the uplands through carefully-planned and community- controlled, human development initiatives. In summary, this report advocates:

- Developing good governance mechanisms that account for unique characteristics and wealth of mountains and meet needs and aspirations of mountain people in reducing

poverty and conserving the region's once-rich biodiversity through sustainable development approaches.

- Assisting mountain communities in negotiation and collaborative dialogues for resolving conflicts and enabling them to participate in sustainable mountain development activities in collaboration with government, civil society, donors and the private sector.
- Strengthening research by combining traditional practices and scientific knowledge for developing actionable plans for implementing with the meaningful participation of stakeholders both in the mountains and downstream.
- Consolidating international and national funding mechanisms and resources for financing sustainable development programmes and achieving well being of mountain people.

## PART I: Setting the stage

### 1.1 General overview and introduction of the South East Asia and Pacific (SEAP Region)

Geographic areas lying between the continents of Asia and Australia, covering countries that are located south of China, east of India and north of Australia comprise the Southeast Asia and Pacific (SEAP) region. SEAP lies at the intersection of geological plates, with heavy seismic and volcanic activity. Although SEAP mountain ranges are much smaller compared to the Himalayas, they are much richer in floral and faunal diversity.

The region is divided into two geographic areas: (1) Mainland Southeast Asia or Indochina comprising of Cambodia, Laos, Myanmar, Thailand, Vietnam and Peninsular Malaysia, and (2) Maritime Southeast Asia, also called the Malay Archipelago which is composed of Brunei, East Malaysia, East Timor, Indonesia, the Philippines, and Singapore. The Myanmar Mountains are actually part of the Himalayan ranges with peaks ranging between 5,881 meters above sea level (masl) corresponding to the highest mountain of Hkakabo Razi to over 2,000 masl for 30 other peaks. The second highest peak in the region is Puncak Jaya (4,884 masl) in Indonesia, followed by Mount Kinabalu at 4,093 masl, which is the highest mountain of Malaysia and Borneo.

The area is rich in history, has varied people and cultures living amidst warm tropical climate. The mountains, jungles, lakes, rivers, and SEAs of Brunei Darussalam, Cambodia, Indonesia, Lao PDR, Malaysia, Myanmar, the Philippines, Singapore, Thailand, and Vietnam form one of the biggest biodiversity pools in the world. They are also home to numerous centers where restricted-range birds, plant and insect species are concentrated. Southeast Asia has one-third (or 284,000 square kilometers) of all coral reefs, in the world, which are also among the most diverse.

In the Philippines, there are three large mountain ranges in the country's largest island, Luzon, of which Sierra Madre is the longest. The world-famous, almost perfectly cone-shaped Mayon Volcano in the province of Albay and Mount Bulusan in the province of Sorsogon form part of the Caraballo de Baler mountain range. The highest mountain peak in the Philippines is Mount Apo, located in Davao del Sur, Mindanao Island, which has a height of 2,954 masl. Other notable Philippine mountains are Mt. Pulag (the second highest mountain peak located in Northern Philippines), Mt. Banahaw and adjoining San Cristobal in Laguna and Quezon provinces (Luzon), Mt. Arayat in the province of Pampanga (Luzon), Mt. Baco in the island of Mindoro, Mt. Matalingajan in the island province of Palawan, and Mt. Makaturing in Lanao del Sur province (Mindanao).

Papua New Guinea (PNG) has a distinct mountain geography, biodiversity and culture. It is classified as one of earth's mega diverse regions, owing much of its diversity to its varied and distinct topography. It has isolated mountain ranges that are home to unique fauna and flora found nowhere else. Each mountain range has been bestowed with different species whose composition changes with altitude. The forest biodiversity found in the lowlands are similar to those in Southeast Asia. In mountains at about 1500 masl, the faunal biodiversity is very different from regions with much higher species diversity. The faunal diversity traces its origin in Australia, among the marsupials in this island-continent. Shrub and grasslands dominate the tropical montane forest vegetation at 3000 masl. After crossing timberline, cryosphere and alpine grassland and herbaceous plants dominate the vegetation. The region also has rich bird and butterfly habitats.

The major river basins of the SEAP region, with the Mekong River as the major river system, are shown in Figure 1 below:

### 1.2 Mountains of Asia Pacific region

It is estimated that some 40 million sq km or 27% of total land area of the world lies above 1,000 masl. The breakdown of this elevated land surface is as follows: 24 million sq km at 1000-2000 masl,

10 million sq km at 2000-3000 masl, 6 million sq km above 3000 masl. A large percentage of the high

(900m+) to low (300-900m) mountains are found in Eurasia as can be seen in Table 1 below:

Table 1: Distribution of Mountain Typesii						
Mountain Type (Elevation range)	Africa	Australia	Eurasia	North America	South America	World
High Mountains (900m+)	4	1	23	16	11	13
Low Mountains (300-900m)	13	12	21	10	11	14
Hill (0-300m)	11	12	10	18	5	8
Total	28	25	54	44	27	35

Asia is unique among the continents in that it is mountain heartediii. Geographically, mountains in the

Asia Pacific can be categorized as follows (Table 2):

These mountain systems serve as vital source of ecosystem goods and services for people living in the Asia Pacific mountain areas as well those downstream. Such goods and services include natural system regulation, water and energy, forest and biodiversity, fertile top soil, tourism, minerals, protected areas and carbon and several other secondary and tertiary products from the mountain areas. Unlike many goods and services that are produced downstream, mountain services are strongly integrated with the topography and coexist with other mutually supportive mountain resources. For example, a nicely managed watershed ensures better biodiversity, prevents the occurrence of potential hazards, provides balanced flow of nutrients to cultivated land, and contributes to forest and plant conservation, maintains landscape beauty and the vast diversity of economic opportunities, as well as the richness in culture and languages of people living in the mountain areas. Among these services, water seems to be the single most important service that the mountains in the region offer.

### **1.3 Trends in the SEAP mountain regions over the last twenty years**

To our knowledge, no comprehensive report has been prepared to exclusively account for the SEAP mountain people. Available information is taken from largely generalized sources and hardly shows the real picture of the SEAP mountain situation.

#### **1.3.1 Demography and socioeconomic development**

In 2005, the total population of Southeast Asia was estimated at 558.2 million (ASEAN, 2005). This makes up about 8.6% of the world's total population in the same year. All member countries are experiencing different levels of socioeconomic development under diverse socio-cultural imperatives. Nonetheless, all countries in ASEAN are

undergoing demographic transition albeit at different rates and stages.

Population growth rate is high among all countries. In 2009, Malaysia, Philippines and Papua New Guinea experienced more than 2 percent population growth. The total population of the developing member countries grew by 1.7% in 1990 but by 2009, growth had slowed to less than 1.1%. Quality of life (life expectancy for both men and women) has increased in all countries from 1990 to 2008. Majority of these countries are categorized under Medium Human Development. Literacy rate at all age groups has increased quite significantly.

Between 1970 and 2000, the young adult (15-24 years) population grew from around 18 percent to approximately 21 percent of the total population in the SEAP region. This age group has been and will continue to be a major factor that contributes to migration levels, especially rural to urban movement. As a consequence, urban areas become increasingly "young" in their demographic profiles.<sup>1</sup>

One factor that sets the Southeast and East Asian countries apart from most other countries in the world, with the exception of those in Latin America, is the high level of female migration, especially rural to urban migration. The level of female migration has increased over recent decades. Moreover, in such rural-urban migration streams, the majority of female migrants are young and unmarried. These result in urban populations that include large numbers of young unmarried females, who usually live away from their families. The concentration of young adult females in urban areas is particularly pronounced in the "mega cities" of East and Southeast Asia.<sup>2</sup>

<sup>1</sup> Guest, Philip, *Bridging the Gap: Internal Migration in Asia*. Paper prepared for Conference on African Migration in Comparative Perspective, Johannesburg, South Africa, June 4-7, 2003. Population Council, Thailand.

<sup>2</sup> Ibid.

Since the 1980s, labor migration has been increasingly feminized in East and Southeast. By the beginning of the twenty-first century, more than two million women were estimated to be working in the region, accounting for one third of its migrant population. Most female migrants are in reproductive occupations such as domestic work and sex services, in private households, and informal commercial sectors. Despite the great need to protect their welfare and human rights, governments of destination countries view migrants as mere workforce to meet labor shortages, and neglect the implementation of protective measures and gender-sensitive policies. Under pressure to increase foreign revenues, labor-source countries encourage their women to migrate and remit their earnings from abroad. In the face of global competition, governments of source countries have shown little interest in their migrant women's welfare. Given the E/SE Asian countries' bleak human rights record, non-state actors have assumed increasing importance in advocating migrants' rights, which they have done through local and transnational networks.<sup>3</sup>

### 1.3.2 Globalization and economic liberalization

Many civil society organizations see the forces of globalization as threats to sustainable mountain development, and that these forces are greatly skewed in favor of external interests. Mining and expansion of plantations for agro-fuels are considered the biggest threats to forests and forest communities, as such encroach on ancestral domains, displace indigenous tribes and endanger forest ecosystems. The island province of Palawan in the Philippines, for example, has 354 mining applications while the island of Mindoro has 92, some of which are already operating sans the proper permits. In contrast, land titling has remained a long and difficult process for indigenous communities. The issuance of permits for gathering non-timber forest products (NTFPs) has remained to be slow and tedious. Community development plans that are supposed to serve as permits take a long time to approve. In the meantime, the livelihood of mountain communities is negated, as many are not able to harvest rattans and other NTFPs.<sup>4</sup>

Globalization and economic liberalization impinge on mountain people in multiple ways. Economic opportunities have diversified, opening up markets for high value-low volume products available in the mountains. Likewise, several new technologies were introduced that helped in establishing small- and medium scale enterprises (SMEs) in the mountain areas. Overall, there is net positive effect on the livelihood of mountain people.

On the other hand, bonafidé mountain residents do not benefit much from businesses owned and operated by non-mountain people. The mountain peoples' involvements in such enterprises are restricted to low-profit making supply of cheap raw materials or the provision of menial labor as porters or helpers. Meanwhile, competition for the limited products in the mountain areas has increased, and the introduction of goods from outside threatens the security of markets for locally- produced products. Many traditional systems and processes, like "barter trade," are now becoming things of the past as dependency of mountain people on imported products is increasing. This has also intensified out-migration from mountain areas, thereby affecting negatively the preservation of specific cultures, traditions, customs and languages across mountain regions.

The integration of mountain subsistence economies with the urban-based market has made it necessary for mountain people to earn cash incomes that are chiefly available in urban centers in the lowland.

### 1.3.3 Political changes and democratization movement

The remoteness, ruggedness and relative inaccessibility of mountain areas have spawned the poverty and isolation of mountain communities. Receiving little government support for development and

<sup>3</sup> Yamanaka, Keiko and Nicola Piper, *Feminized Migration in East and Southeast Asia: Policies, Actions and Empowerment*. Summary. Occasional paper. United Nations Research Institute for Social Development. Geneva, Switzerland. December 2005. iv

*management through advocacy, livelihood and research and learning programs*. NTFP-EP for South and

Southeast Asia.

social services, remote mountains have virtually become ungoverned spaces where the State faces significant challenges in establishing control over the area. These areas have poorly controlled or delineated land borders, where the central government's authority is not felt or is virtually non- existent. It follows that in these regions, the state is unable or unwilling to perform its functions. This is not to say that these territories are devoid of governance; rather, the structures of authority that exist are not related to the formal institutions of the state. <sup>5</sup>

The factors that determine governability include: (1) the level of state penetration of the society; (2) the extent to which the state has a monopoly on the use of force; (3) the extent to which the state controls its borders; and (4) whether the state is subject to external intervention by other states. State penetration of society can be measured in terms of the presence or absence of state institutions; the state of the physical infrastructure; the prevalence of the informal or gray economy; and social and cultural resistance to state penetration.<sup>6</sup>

As ungoverned territories, mountains become the arena for internal or inter-border armed conflicts such as those seen along the Afghan-Pakistani borders, in the Philippines and some other parts in the Asia Pacific region. In the RAND study (2007), the eight case studies covered the Pakistani-Afghan border region and the Sulawesi-Mindanao arc in Southeast Asia.

Several measures were proposed (RAND, 2007) to deny non-state armed groups from using ungoverned spaces as their sanctuary. Such measures include the reevaluation of the role of development assistance and the strengthening of governance. Currently, the United States emphasizes security cooperation and military assistance in dealing with the security problems that ungoverned territories generate. Extending the reach of government should also involve other activities. One possible option is the use of development assistance as a tool to encourage recipient governments to invest in infrastructure and institutions in regions where they have abdicated their governing responsibilities.

The promotion of competent practices will also help government gain back its control over ungoverned spaces. Lack of coordination among agencies is a major obstacle in improving governance. Therefore, providing expert advice to officials on how to coordinate actions across departments and to minimize bureaucratic competition is an important step in strengthening public sector capabilities. The improvement of the transportation infrastructure could have profound effects in many ungoverned territories as such will enhance overall mobility within society.

The United States has been grappling with radical Islamist groups in Southeast Asia, particularly those in the Philippines, Indonesia, Malaysia, Thailand, and Singapore that are suspected to have ties to the Al Qaeda terrorist network. Southeast Asia is a base for past, current, and possibly future Al Qaeda operations. For nearly fifteen years, Al Qaeda has penetrated the region by establishing local cells, training Southeast Asians in its camps in Afghanistan, and by financing and cooperating with indigenous radical Islamist groups. Indonesia and the southern, generally mountainous regions in the Philippines have been particularly vulnerable to penetration by anti-US Islamic terrorist groups.<sup>7</sup>

In 2009, the US government shifted its counterinsurgency (COIN) efforts to blend comprehensive civilian and military efforts while simultaneously containing insurgency and address its root causes. Unlike conventional warfare, non-military means are often the most effective elements, with military forces playing an enabling role. COIN is an extremely complex undertaking, which demands that policy makers have a detailed understanding of their own specialist field and a broad knowledge of a variety of related disciplines. Strategies are focused primarily on the population rather than the enemy and seek to reinforce the legitimacy of the affected government while reducing insurgent influence.

5 Rabasa, Angel, Steven Boraz, et al. *Ungoverned Territories: Understanding and Reducing Terrorism Risks*.

*RAND Project Air Force*. San Monica California. 2007. xv

6 Ibid.

7 Vaughn, Bruce, Coordinator. *Terrorism in Southeast Asia, CRS Report for Congress*. Congressional Research

Library. Updated February 7, 2005.

This can often only be achieved in concert with political reforms to improve the quality of governance and address underlying grievances, many of which may be legitimate.<sup>8</sup>

In the case of the Philippines, the administration of Pres. Benigno Simeon Aquino III has embraced a paradigm shift that hews to the US COIN concept in its Armed Forces of the Philippines (AFP) Internal Peace and Security Plan (IPSP). The IPSP seeks to draw support from the broadest spectrum of stakeholders. It highlights the importance of increased stakeholder involvement - the national and local government agencies, nongovernment entities and the entire citizenry in addressing peace and security concerns. It gives equal emphasis to combat and non-combat dimensions of military operations. On the other hand, the IPSP departs from the old parameters and explores non-combat parameters of success in addressing the country's peace and security problem.

The AFP realized that insurgency is largely driven by structural problems in Philippine society, such as unequal development, non-delivery of basic services, injustice, and poor governance - all of which are beyond the military's purview. Moreover, insurgency cannot be viewed from a strictly state- focused perspective, that is, it is not a threat to the sovereignty of the state alone. More than the threat it poses to the country's democracy and institutions, insurgency and armed conflict threatens the way of life, safety, and security of Filipinos. Addressing the insurgency problem, therefore, is something that cannot be done by the military alone.<sup>9</sup>

How structural development has favored urban areas in the Philippines is shown in many poverty alleviation studies. The gap between urban and rural areas has been increasing. While the poverty incidence in the urban areas has declined by 14 percentage points between the years 1985-2000, rural poverty incidence decreased by only 4 percentage points over the same period. Consequently, rural poverty is now more than double that of urban poverty. Urban and rural poverty incidences are presented in the following table.<sup>10</sup>

#### Poverty Incidence of Families, Urban-Rural, 1985-2000

Urban-Rural Area	1985	1988	1991	1994	1997	2000
Philippines	44.2	40.2	39.9	35.5	31.8	33.7
Urban	33.6	30.1	31.1	24.0	17.9	19.9
Rural	50.7	46.3	48.6	47.0	44.4	46.9

Source of Data: Family Income and Expenditures Surveys, 1985 – 2000, NSO

The Philippines has no segregated data between lowland and upland rural communities. Given the remoteness, ruggedness and relative isolation of mountain communities, it is likely that they would receive the least in terms of basic government services.

The highest State entity in remote hinterland communities in the Philippines is that of the military. Towards peacefully securing peace in far-flung mountains, the Armed Forces of the Philippines (AFP) must continue to sustain community development initiatives, including the construction of basic social infrastructures. Engineering and civic action units shall be deployed in areas where there are governance vacuums - which the Americans call ungoverned territories. Construction of short- gestation, high-impact projects

such as irrigation systems and farm-to-market roads is intended to jumpstart the long-term building of more specialized projects by national government agencies and local government units.<sup>11</sup>

#### 1.3.4 Climate change as a major driver of change

A large body of scientific and historical evidence indicates that recent changes in climate in many mountain regions of the world are often greater than those observed in the adjacent lowlands. Mountains represent unique areas for climatic change detection and the assessment of climate-related impacts. Climate along with vegetation and hydrology changes rapidly with the height of mountains, over relatively short horizontal distances. As a result, mountains exhibit high biodiversity, often with sharp transitions (ecotones) in vegetation sequences. In addition, mountain ecosystems are often endemic because many species remain isolated at high elevations. This is unlike lowland vegetation communities that occupy climatic niches spread over wider latitudinal belts.

Climate change in the SEAP Mountains can bring about changes in water resources and hydropower generation, on slope and top soil stability, vegetational composition, disrupt cropping patterns and bring about other hazards that in turn impact on the well-being and livelihoods of mountain people.

To address these natural disasters and vulnerabilities, States have adopted disaster risk reduction as a matter of public policy. In the case of the Philippines, Republic Act 10121, otherwise known as the Philippine Disaster Risk Reduction and Management Act of 2010 was passed by Congress. In the declaration of policy, the constitutional rights to life and property had been affirmed to include addressing the root causes of vulnerabilities to disasters, strengthening the country's institutional capacity for disaster risk reduction and management, and building the resilience of local communities to disasters including climate change impacts.

#### 1.3.5 Environmental degradation and land-use changes

Rapid human population growth is often identified as one of the main factors behind environmental degradation. Population affects the environment mainly through changes in land use and industrial metabolism (Turner and Meyer, 1991).

Southeast Asia has the highest relative rate of net forest loss (0.71%) and degradation (0.42%) in the humid tropics (Achard *et al.* 2002), and could lose up to three-quarters of its original forests and almost half its diverse species by 2100 (Brook *et al.* 2003). While extensive forests are still found in Laos and Myanmar for commercial logging, widespread land use conversions of montane rainforests into rubber and palm oil plantations take place in Sabah and Sarawak in Malaysia. Logging operations and road development pose a big threat to tiger habitats, and the conversion of forests to agriculture or commercial plantations has resulted in more frequent encounters between tigers and livestock (WWF). Human-tiger conflicts bring about very strong negative sentiments toward tigers among local people.

The main driver of deforestation in Indonesia and Malaysia - and one of the key drivers in Papua New Guinea and the Solomon Islands - has been the expansion of the palm oil monocultures. This economic activity has been associated with widespread forest conversion and indigenous conflicts. In addition, palm oil production has also resulted in the destruction of key habitats of endangered primates. As a result of deforestation, Indonesia has become the third-largest emitter of carbon dioxide. The logging that precedes these industries in most cases opens up the forest and provides added financial incentive to deforestation for agriculture. Sawit Watch states that the Indonesian government has already expanded oil palm concessions to cover 9.4M hectares and has granted permits for over 26 million hectares.<sup>12</sup>

The balance may tilt, however, in favor of the green economy and forest conservation with the billion dollar agreement between the government of Norway and the Indonesian government to implement REDD. The signing came at the heels of the pledge of the Indonesian government for a two-year deforestation moratorium. However, there continues to be the lack of clarity on the implementation of the moratorium several months after the moratorium was declared on January 1, 2011. There is a strong lobby by plantation firms to exclude existing plantations from the moratorium. There are many competing proposals as to which kinds of forests will be included and the time frame covered by the moratorium.

#### 1.3.6 Community involvement in natural resources management

In the 20th century, Southeast Asia's forests were nationalized and the timber industry expanded its operations throughout the region, resulting in the degradation of vast forest areas in the region. In the meantime, indigenous systems of natural resource management were displaced. The erosion of customary systems has led to the deterioration of natural resources in many parts of the region. The dissolution of traditional local institutional arrangements and practices has not been replaced with the establishment of more effective institutions and adequate resource management regimes.

12 Annual Report 2010 to HIVOS.

The rise of state agencies and private companies as forest managers has generally coincided with an accelerating loss of natural forests throughout the Asia region during the post World War II era. Tropical rainforests in Southeast Asia receded from 250 million hectares in 1900 to below 60 million in 1989 (Poffenberger, 1990).

By the 1980s, the deforestation of Asian lowlands as well as the deteriorating condition of many upland watersheds began to generate serious concern among national planners and the development community alike. Floods and brownouts affecting Bangkok, Jakarta, Manila and other urban centers brought deforestation issues to the attention of the public, thereby initiating a new generation of environmental protection policies including logging bans. There has been growing recognition through the 1990s in many Asian nations that rural people have an important role to play in managing and protecting forestlands, including those nominally under state jurisdiction.

Over the past two decades, a ground swell of support has emerged from many quarters to assist communities to re-establish management and control over their resources. Planners have crafted national Community Forest Management (CFM) policies, while legislatures have passed laws in empowering communities and local government with resources stewardship rights and responsibilities. The objectives of CFM is to establish the mechanisms for enhanced community participation in planning, development and

benefit-sharing in selected watershed protection forests and production forests, and create possibilities for collaborative planning and management. These objectives are based on the premise that collaborative management is a practical solution to achieve sustainable multiple-use forest management. Thus, CFM's main feature is that it empowers local communities to participate in the planning and management of natural resources.

The experiences with CFM in the past two decades have shown the possibility of mainstreaming benefits for mountain peoples. ASEAN governments have embarked on policy-making from the top-down with bottom-up good practices in collaboration with regional civil society organizations. In the next phase of support of the Swiss government to ASEAN's Multi-sectoral Framework on Climate Change and Food Security (AFCC), the Swiss Development Cooperation has asked the NTFP-Exchange Programme (NTFP-EP) for South and Southeast Asia to focus on enhancing civil society engagement of the ASEAN Social Forestry Network (ASFN) with vulnerable groups such as indigenous and other mountain communities. In general, NTFP-EP would assist in facilitating mechanisms and initiatives between government and civil society partners to enhance social forestry policy and practice under the food security and climate change theme.<sup>13</sup>

### 1.3.7 Information and communication technologies (ICT)

ICTs have provided a new set of tools to provide solutions to development problems faced by regions like Southeast Asia. As a sector, ICT has contributed to the creation of the most rapidly growing industries, such as electronics, business process outsourcing, and telecommunication and internet services. As an infrastructure, ICT is seen as an enabler of economic growth and competitiveness based on the uptake and utilization of ICT in business and society (ADB, 2011). Southeast and Pacific nations spent 3 to 9 percentage of their total GDP (2008) in ICT related expenditures. In the last two decades, cellular subscriptions had exponentially grown and internet users also increased.

These show the high expectations about the applicability of such technologies. However, current uses are not necessarily focused toward human development. Policies are lacking to integrate ICTs with economical goals, and to combine ICTs with other development tools and engender active people's participation. The digital divide is still large: more than 40 personal computers per hundred persons in a few countries, but less than 10 in most.

13 Annual Report 2010 to HIVOS. *Strengthening community and NGO capacity in sustainable NTFP management through advocacy, livelihood and research and learning programs*. NTFP-EP for South and Southeast Asia.

### 1.3.8 Expansion of tourism and ecotourism

The tourism sector is a major contributor to the socioeconomic development of Southeast Asian countries. For example, prior to the 2011 floods, Thailand has become hugely popular, attracting more than 12 million tourists every year. Tourism has made a large contribution to Thailand's economy (typically about 6 percent of gross domestic product) more than any other Asian nation.

Thailand, Laos and Cambodia are increasingly struggling to identify destinations in their respective countries and attract a market that lends itself to sustainable tourism. Many Southeast Asian countries had planned to develop ecotourism as early as 1998, but had faced problems associated with the lack of infrastructure development, the adequacy of personnel training, the absence of, or delays in plan implementation, and political instability.<sup>14</sup> The focus shifted to community-based approaches to ecotourism development because of the industry's heavy reliance on national parks and other protected areas.

According to Leksakundilok (2004), Cambodia received 174,574 foreign tourists at an annual increasing rate of 12.56 percent from 1962-68. Tourism in Cambodia grew very quickly thereafter, particularly after the 1993 election organized by the UN. The number of tourists increased by 21.3 percent per annum on average (from 118,183 in 1993 to 218,843 in 1997); in 1994 there was an increase of 49.44 percent (Khanal and Babar, 2007).

### 1.3.9 Major policy and legal reforms in NRM sectors

The policy link of national and local government units in natural resource management (NRM) is a crucial factor to the state of a country's natural resources. In the 1990's, a number of SEAP countries started to decentralize or devolve power and authority to local political units in response to criticisms of too much centralization in the past. Devolution involved the transfer of responsibility in the delivery

14 Dowlings, Ross K., *Ecotourism in Southeast Asia: A Golden Opportunity for Local Communities*, Tourism in

Southeast Asia—A New Direction. Chon, K.S., Editor, The Hayworth Hospitality Press. New York. 2000. p. 2

of basic services from the national government to the local government, including personnel, assets, equipment, programs and projects (Elazegui *et al.* 2001).

Each country is at a different stage in the implementation of decentralization policies but they must all deal with pressures stemming from competing uses for common natural resources, confusion over conflicting policies and/or laws, and socio-cultural diversity. Different case studies in Southeast Asian countries demonstrate that, although recognition is growing at all levels of society of the potential of decentralization as a viable option for natural resources management, reforms have not yet reached their desired levels. There have been only sporadic and intermittent attempts to develop ideal decentralization structures in compliance with the principles of subsidiarity, accountability, and capacity. Upward and downward accountability within and across sectors, jurisdictions, and organizations, both public and private, has yet to be fully established or practiced. Human, financial, and political resources are insufficient at the local level to match the increased responsibility that local governments have been granted under decentralization. Meanwhile, the perpetuation of the vicious circle of rural poverty continues, leading to further natural resources degradation. Decentralization efforts in Southeast Asia are still in the nascent stage, characterized by "learning-by-doing." Thus, it is still too early to conclude whether the ongoing reforms in Southeast Asia will ultimately be successful. (Kurauchi, *et al.* undated).

The devolution process within the national legal decentralization framework has started to flex its muscle in favor of downstream and upstream forest-dependent communities. In May 2009, indigenous communities in Malaysia celebrated a landmark court judgment on land rights in the case of Madeli Salleh versus the Superintendent of Land and Surveys. The judgment defined native customary rights not only as forest-felled, cultivated and settled, but also communally protected forest. This was strengthened by judgments in two recent cases in January 2010 that confirmed the rights of communities to their land, in particular the protected forest. It also provides leverage for community-based conservation and traditional land use and management for food security and increased income through NTFP development.<sup>15</sup>

### 1.3.10 Harnessing the potential of water resources (Mekong Commission)

Water sources in Southeast Asia are strained by the increasing demand for water from different sectors such as agriculture, industry and domestic users. The situation is likely to worsen in the future. Shared water resources in Southeast Asia are also a concern (Yian, 2005). Energy demand is mostly met through fossil fuel-generated electricity; however, hydroelectric energy production is growing.

The Asia and Pacific region produces less than 32% of world's energy, with the People's Republic of China (PRC) producing almost half of the total energy in the region. Most

Asian economies rely on imports to meet their energy needs. Measured by GDP per unit of energy use, most Asian economies are becoming more energy efficient. Vietnam's electricity production increased eight times between

1990 and 2007. Other economies in Southeast Asia recorded large increases, including Cambodia, Indonesia, Lao PDR, Malaysia, and Thailand.

The Mekong River is one of the least developed major international river basins, covering parts of China, Myanmar, Laos, Thailand, Cambodia and Vietnam. The Mekong River is marked, on the one hand, by under-utilization of its vast water resources potential, and on the other by frequent large magnitude flooding that causes widespread damages and devastation. The governments of the four riparian countries of Lao PDR, Thailand, Cambodia and Vietnam signed in 1995 the Agreement on the Cooperation for the Sustainable Development of the Mekong River Basin, which established the Mekong River Commission. The objectives include the promotion and coordination of sustainable management and development of water and related resources for the countries' mutual benefit and the people's well-being by implementing strategic programs and activities and sharing of scientific information and providing policy advice (WMO and MRC, 2006). The importance of the water

15 Annual Report 2009 to HIVOS.

resources development potential in the basin is evident in the amount of fresh water resources per capita estimated in the year 2002 as follows: 38,136 m<sup>3</sup>/per capita in Cambodia; 60,307 m<sup>3</sup> in Lao PDR; 6,653 m<sup>3</sup> in Thailand and 11,081 m<sup>3</sup> in Vietnam.

The landlocked Southeast Asian mountains provide neighboring downstream communities within Laos with hydroelectric energy. Laos will build 10 hydroelectric dams, with five already under or nearing construction, over the next five years as part of its goals to become the "battery of Southeast Asia."<sup>16</sup> However, the Xayaburi hydro-electric plant, planned on the Mekong River, met with regional opposition. Cambodia, Thailand and Vietnam have called for delay in the dam's construction on the grounds that it could impact on downstream fisheries and sediment flows. To date, only China has built dams on the Mekong River, the longest waterway in Southeast Asia.

The Philippines can provide a solution to resolve these incipient water-resource conflicts. In building the Ambuclao-Binga hydroelectric dam in Benguet Province in Northern Philippines, multiple stakeholders with competing claims entered into collaborative negotiations and non-adversarial communication skills prior to actual negotiations and created a mechanism for dialogues that the stakeholders can access at any time. Needs-based negotiations of various players serve as the starting point for coming up with win-win solutions.<sup>17</sup> The practice of seeking free and prior informed consent (FPIC) of key stakeholders before arriving at any decisions by all the parties involved is an alternative approach to averting stakeholder conflicts.

WMO and the Mekong River Commission signed a Memorandum of Understanding in July 2003 and the first consultation meeting was held on October 2003 in Phnom Penh. The objective of this project is to establish and operate a real-time flood information system in the Mekong basin with Cambodia, Lao, Thailand and Vietnam as participating countries.

Pollution and weak institutions are obstacles to effective water management in most of Southeast Asia. Heavy river pollution has affected Indonesia, Malaysia, the Philippines and Vietnam. Weak institutions in Malaysia, for example, mean that the available technical expertise lacks legislative or enforcement powers. Privatization is an increasingly popular option for water management and delivery. Privatization is, however, not without controversy as it raises public fears of "unbridled capitalism." Furthermore, government failure does not automatically justify private sector involvement in the water sector as transforming state monopoly into a private monopoly could worsen the situation, especially if the monopolist would take advantage of its privileged position (Yian, 2005).

### 1.3.11 Social and political reforms in Indonesia, Cambodia and Vietnam

The Asian financial crisis in 1997-1998 changed Indonesia's economic and political landscape virtually overnight. Indonesia was one of the worst casualties of the krismon (monetary crisis), and the resultant economic disaster severely damaged the legitimacy of the New Order regime, eventually triggering President Suharto's political demise. This in turn catalyzed a swift transition in Indonesia characterized by deep political and economic decentralization. Since this "big-bang" reform occurred, Indonesia has displayed modest yet positive economic growth, dealt with major separatist movements, and established arguably the most democratic state in the region. The Indonesian economy is driven significantly by domestic consumption, which arguably sheltered Indonesia from unfavorable external shocks during the recent global financial crisis.<sup>18</sup>

Meanwhile, Indonesia's Forestry Administration reported in 2010 that there are 427 community forestry site applications covering over 400,000 hectares in 20 provinces, but only 126 sites equivalent to 145,036 hectares have been approved. The Community Forestry Program (CFP) is one of the sub- programs in the recently launched National Forestry Program (NFP). In theory, Community Forestry (CF) holds promise for sustainable forest management and promotion of community-based forest livelihoods. Non-government organizations (NGOs) and other stakeholders including the reconstituted National Community Forestry Coordinating Committee (NCFPCC) continue to raise concerns about boundary overlaps between economic land concessions (ELCs) and community forestry areas. ELCs continue to be allocated with limited community consultation and information disclosure, and pose considerable impediments to meeting the 2M community forestry target. Community protected areas (a parallel social forestry and community based natural resources management mechanism under the Protected Areas Law) face the same challenges.

One of Cambodia's Millennium Development Goals targets is to designate 2 million hectares of forest land as Community Forestry by 2030.<sup>19</sup> But disputes over land and natural resources in Cambodia remain an utmost concern especially in developing the green economy and the institutionalization of CF as an expression of devolution and decentralization. There have been increasing cases of land grabbing, as well as evictions and loss of livelihoods in both rural and urban areas. Correspondingly, growth in civil society actions is emerging: activism and protest action with human rights defenders being threatened, intimidated, physically abused and temporarily detained. Active non-violence and mobilization of community networks are also rising. The disputes center on ELCs and international land deals over commercial projects such as real estate, mining and plantations. While a sub-decree on procedures for registering communal lands of indigenous peoples has been passed in April 2009, so far, only three pilot titles in the Northeast are underway. Interim protection measures for indigenous land claimants are weak against ELCs, which are generally favored over possession rights of IPs

despite the Land Law and the new sub-decree.<sup>20</sup>

Vietnam has undergone an impressive socio-economic transformation. The country's current economic development stems from its twenty-year reform program, known as the Doi Moi (renovation process). This was introduced in 1986 after Vietnam experienced a huge economic crisis in the

mid-1980s during which over 70 per cent of the Vietnamese population lived in poverty with an

average per capita income of less than US\$100. Since then, the economy has opened up with export

and investment surging. In stark contrast to Vietnam's economic situation in the mid-1980s, the average economic growth rate has consistently been above 7 per cent per year in the last two decades. Today's GDP per capita (The Economist, 2010) is US \$1,240 while the household poverty rate stood at 12.3 per cent of the population in 2009. Like its neighbor, China, Vietnam and its economy are increasingly outward investment-oriented and export driven. The total export volume made up over 65 percent of the country's GDP in 2008, with the US, the EU, Japan and Australia as the biggest export

markets. Vietnam is in a transition from being an aid-recipient to becoming a middle-income country.

Most indicators of the population's living standards and welfare have improved.

In the natural resource management front, Vietnam is experimenting with co-management schemes and benefit-sharing for forest communities living in national parks. Vietnam's new biodiversity law gives recognition for reasonable use of biodiversity to harmonize conservation with hunger and poverty alleviation. The concept of people participation in forest management is still very new in the country's national parks, and various sectors are still struggling to reach compromises. The government is slowly starting to give communities permission to harvest within national parks. The Raglay community in Nui Chua was relocated at first and had been kept away from their forest and forest resources when the Nui Chua National Park was established. They were made to plant trees and crops they can use economically, but most of them still had their farms inside the park. Now they are starting to have access to NTFPs and at the same time help the park management in patrolling the

19 Annual Report 2010 to HIVOS.

20 Ibid.

area.<sup>21</sup> In the meantime, a trial Benefit Sharing Mechanism has been initiated based on the Vietnam

Conservation Fund that will develop five protected areas.

### 1.3.12 Major activities in promoting the Mountain Agenda

A great majority of Southeast Asian countries took part in the UNCED in Rio in 1992, and almost all have acceded to or ratified the relevant international conventions and treaties for sustainable development. Each has taken a different thrust toward the realization of national development objectives. These include economic incentives, new legislation, and a social reform agenda.<sup>22</sup>

A decade later, the Asian Development Bank (ADB), United Nations Economic and Social Commission for Asia and the Pacific (ESCAP), United Nations Development Program (UNDP), and United Nations Environment Program (UNEP) established a partnership (the Task Force) to undertake the preparatory process for the World Summit on Sustainable Development (WSSD). Forty-nine (49) representatives from the governments of Brunei Darussalam, Cambodia, East Timor, Indonesia, Lao People's Democratic Republic (Lao PDR), Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam attended the meeting held in October 2001 at the ADB Headquarters in Manila. About 40 representatives of major stakeholder groups from seven countries also took part in the meeting. The preparatory process crafted a sub-regional action plan which peripherally tackled sectoral SMD issues such as sustainable land management and biodiversity conservation, and sustainable water resource management.<sup>23</sup>

The Philippines formulated Philippine Agenda 21 (PA21) which has since been considered as the highest policy framework for civil society participation in environmental governance in the country. In

1996, the leaders of more than 5000 organizations under the informal banner of the Asia Pacific

Sustainable Development Initiatives (APSUD) rallied around PA21 as their framework for negotiations with government on the Asia-Pacific Economic Cooperation Council (APEC). Even those

who questioned APSUD's stance in APEC did not oppose PA21; rather, they questioned the sincerity

of government in carrying out the promises they made to put the Individual Action Plan (IAP) under

PA21.<sup>24</sup>

Other regional funding mechanisms came into existence. An example is the Samdhana Foundation based in Bali, Indonesia. The foundation acts as an adviser for Global Greengrants Fund grants to groups in Laos, Cambodia, Thailand, Malaysia, East Timor, Indonesia, and the Philippines. Its vision is for a region where natural, cultural, and spiritual diversity are valued and environmental conflicts are resolved peacefully, with justice and equity for all parties. Achieving this requires that communities that directly manage their local natural resources have clear rights, ready recourse to justice, strong and skilled leadership, stable financial resources, and access to appropriate technical support.<sup>25</sup> There have been a number of Southeast Asian NGOs and community-based organizations that had received Samdhana funds including 112 grants in Indonesia, 54 in the Philippines, and 14 others received by Lao PDR, Malaysia, Myanmar, Cambodia and Thailand.

### 1.3.13 Role of non-government (NGOs) and civil society (CSO) organizations

The forces of globalization and the emergence of civil society have led governments to accept the role of non-governmental organizations (NGOs) in the governance of society. An important contributor to the growth of Asia Pacific civil society is the emergence of a favorable political and social environment for the operation of Non-Governmental Programs. The restoration of democratic

21 Annual Report 2009 to HIVOS.

25

governments in various nations helped to galvanize public support for civil society organizations, which played a large role in the movement (Kim, 2004).

They have become legitimate (policy) actors involved directly in many social and economic policy making process. They have become part of policy networks that link state bureaucracy and the market. There are many factors that have influenced the NGO sector's growth in the region. For nations that have undergone political regime changes, socio-political democratization enabled many NGOs to take advantage of newly found freedom of association and representation.

The rapid growth of the civil society sector and the growing recognition of civil society players in the policy making and service delivery functions have warranted the redefinition of the relationship between the NGO sector and the state. The (re)emergence of civil society in the region often created uneasiness on the part of the government in terms of state-NGO relationship. Unlike some developed nations that have experienced more "evolutionary" changes in the state-NGO relationship, many of Asia Pacific nations, especially those that have witnessed political democratization, have undergone changes that are more "revolutionary" in nature. Government bureaucrats in many of Asian countries had adopted the developmental state model where strong and centralized governments and top-down decision making process were the accepted norm. In addition, the change from an exclusive bureaucratic network to a more inclusive network in terms of policy-making and implementation process occurred within a short period of time and was forced upon state bureaucracies. Changes in (democratic) governance in a very short time span have necessitated shifts in societal players' positions and roles. But the quicker the state bureaucracy moves to accept diversity and democratic governance, the easier the transition will become for all parties concerned.

Numerous cases where civil society has provided the good practices eventually led to the crafting of state policies in Southeast Asia. In Papua New Guinea, the 1998 Steering Committee meeting developed a set of principles for effective development on the Managalas Plateau. The "Sustainable Development Guidelines" covered aspects of forest use, gardening, water and other issues in resource management and community development. These guidelines were intended to inform the plans and decisions of each village. Significantly, these bottom-up guidelines have now been recognized and adopted by the government. A Memorandum of Understanding (MOU) has been signed between Partners and the Oro Provincial Government providing an initial foundation for government recognition of the Managalas sustainable development guidelines. This is the first local level recognition of community development management rules in PNG and by itself, a significant achievement. Sustainable harvest guidelines have been completed for the okari and there is some recognition of harvest regimes that take these into account.

NGOs have also been leading the promotion of organic farming. In the Philippines, Alter Trade promoted fair trade among agrarian reform beneficiaries in the upland and lowland farms of Negros Occidental. Alter Trade sees "the necessary role of government, academic institutions, church, private sector, NGOs, organized producers and consumers and civil society in propagating sustainable agriculture and development." It has entered into multi-stakeholder partnerships to harness the potentials and facilitate complementation among the different social sectors.<sup>26</sup>

The idea of an alternative trading system - or what the Japanese support groups call people-to-people trade - was first broached in 1986 during a conference in Japan. Invited to the conference were consumers' cooperatives, environmental activists and organic agriculture movements. Present were three major groups - the Kyoseisha Coop, a large consumers cooperative in Kyushu, the Tokushima Association for the Betterment of Life, a consumers group in Tokushima Prefecture in Shikoku Island, and the Chubu Recycling Citizens' Group, an influential citizens' organization in Nagoya concerned with the environment and direct producer-consumer linkages. These groups committed to buy muscovado sugar, which was largely seen as a "poor man's sugar." Alter Trade view muscovado sugar as an apt statement of its vision to help the poor people of Negros Island in the Philippines. It adopted

26 Mugar, Norma, Alter Trade's Reply to NDF-Negros, February 7, 2007. (Accessed November 26, 2010). [http://www.europe-solidaire.org/spip.php?page=article\\_impr&id\\_article=5137](http://www.europe-solidaire.org/spip.php?page=article_impr&id_article=5137)

the brand name Mascobado, "mas" meaning the masses - the ordinary people. The product was first shipped to Japan in 1987 with cooperatives in Japan as its initial market. A year later, trading firms that espoused the principles of fair trade from Switzerland and Germany, and then Italy, began buying the poor man's sugar.

Another NGO in Negros Occidental, central Philippines, the Broad Initiatives for Negros Development, Inc. (BIND) has been helping farmers use vermi-compost as fertilizer and herbal plants to ward off farm pests in organic rice and vegetables production (The Manila Times 19 February

2005). They also produce organic livestock among many other products. <sup>27,28</sup>

### 1.3.14 Poverty reduction measures and successes

One important lesson that has emerged in tackling poverty and food insecurity concerns the use of investment policy and institutional reforms to enable the rural poor to partake of domestic markets and improve access to technology, infrastructure and education. Many success stories would show that the main push to these efficiency-enhancing reforms has come, neither from globalization nor agricultural policy, but from internal realization that the country and its citizens are the major beneficiaries of state-initiated reforms. Governments must develop capacity to find the appropriate mix of policies and institutions that would maximize the enormous benefits from globalization while protecting its people against its risks and pitfalls.

Although poverty remains as one of the most pressing issues facing Asia and the Pacific, the Southeast Asian region should be credited for continuously making progress in reducing income poverty and enhancing people-oriented achievements toward the Millennium Development Goals (MDGs). Despite some progress over the last few decades, the region remains home to two thirds of the global poor.

Economic growth during the last 25 years has averaged at five percent per year and has been accompanied by a decline in the relative importance of agriculture in the national output and employment. The response of poverty to this growth and structural transformation has been equally remarkable, with the headcount ratio in 2002 registering a more than 50 percent drop from the 1990 figure. Although impressive, Southeast Asia's overall record in growth and poverty reduction has not been uniform, which is evident in the experiences of countries like Indonesia, Philippines and East Timor as well as the transition economies namely, Cambodia, Lao PDR, Myanmar and Vietnam. In these countries, liberalizing agricultural trade, combined with public investment in productivity-enhancing support services, would advance the interests of the poor (Balisacan *et al.* 2009).

### 1.3.15 Growing urbanization and labor migration

Southeast Asia is one of the world's least urbanized regions. Its level of urbanization is roughly the same as that of Asia as a whole and slightly above that of sub-Saharan Africa. According to UN projections, it will be at least another 50 years before the level of urbanization in Southeast Asia approaches that already achieved in Europe, North America or Latin America, where less than 25 percent of the population now live in non-urban areas. Even among the 25 percent who remain in rural settings, most no longer

lead traditionally rural lives (Jones, 2002).

Rapid economic growth has fundamentally changed the composition and distribution of Southeast Asia's labor force. Over the past 25 years, a labor force that was predominantly agrarian and rural has become increasingly urban and industrial. As Southeast Asia's regional economy shifts from agriculture toward industrial and technological pursuits, employers increasingly require highly-skilled and talented professionals, which the local educational institutions cannot readily supply.

27 Faylon, Patricio and Cardona, Eileen C., Philippine Agriculture: Retrospect and Prospects in Good Agricultural Practices Amid Globalization, May 16, 2007. Philippine Council for Agriculture, Forestry and Natural Resources Research and Development (PCARRD), Los Baños, Laguna, Philippines, <http://www.agnet.org/library/bc/54006/>. Accessed September 3, 2011.

28 Samonte, Angelo, S., *NGO lends helping hand*, Manila Bulletin, February 19, 2005. <http://www.docstoc.com/docs/2908129/Manila-Bulletin> Accessed September 3, 2011.

Consequently, the developing nations of Southeast Asia are faced with a variety of human resource dilemmas.

The changing structure of urban population across different categories reveals a shift of growth dynamics from large to second order cities and the stagnation of small towns. The pace of urbanization has been modest to high in select countries in Asia, not because of their level of economic growth but because of rapidly growing informal sectors (Kundu, 2009).

There has been a growing concentration of international out-migrants from Asia to a few countries in the developed world. In 1960, 57 per cent of all migrants lived in the less developed regions but this has increased to 37% by 2005. Asia accounts for 53 million or 28 per cent of this sector basically due to its high demographic weight. In terms of the share in total international migrants, exactly half among the top twenty countries are from Asia, both in 1990 as well as in 2005.

Since the 1990s, migration within Asia has grown, particularly from less-developed countries with massive labor surpluses to fast-growing newly industrializing countries. Since the mid-1980s, rapid economic growth and declining fertility have led to strong demand for labor in the new industrial economies of East and Southeast Asia. Labor migration within Asia grew exponentially in the first half of the 1990s. Some migrants returned home during the Asian financial crisis of 1997-1999, but labor migration resumed quickly. Early migrant flows mainly comprised of low-skilled workers. In recent years, flows of highly skilled workforce have increased throughout the region, and the demand for health-care workers is increasing.

Often cited as the main reasons for the movement of workers both within and external to the region, are wage differentials, the availability of jobs and work opportunities (in some cases for long periods), and opportunities for workers to grow in the labor market (Acharya, 2003). On the downside, opportunities in nearby urban areas have spawned slum areas. About two-thirds of the urban population in most Southeast Asian cities lives in slums.

The number of urban dwellers swelled between 1990 and 2009, with increases of 12 percentage points or more in PRC, Indonesia, Lao PDR, Malaysia, Philippines, and Thailand. Likewise, highly urbanized mountain cities such as Baguio City in the Philippines grapple with population growth due to the influx of immigrants from the plains and outlying mountain communities.

### 1.3.16 Human Resources Development

Asia and Pacific is a vast region with economies at different stages of growth. World-wide competition has increased, the pace of economic change has accelerated, and the process of development has become less predictable. The advent of globalization has fostered not only technological change and continually falling communication and transport costs but also decisions of developing countries to embrace market-oriented development strategies that have increasingly opened up markets to the world economy. The world is thus fast becoming one interdependent global market place.

A key contributor in this regard is the knowledge and skills of the workforce. Technological changes, especially information technology and telecommunications, and competition in the fast moving competitive global marketplace have changed work organizations and working patterns. Virtual offices are emerging as companies are leveraging cyberspace and electronic technology to cut costs and to boost productivity. These firms need reliable and educated workers, who are able to understand the new forms of information, adaptable, and who can work in a team environment. Employees need both technical skills and the capacity to cope with continuous and radical changes in virtual businesses.

Finding adequate human resources in Southeast Asia presents a problem, as there is a shortage of skilled labor in many of the developing countries. However, doing business in the region offers opportunity for employing a relatively inexpensive workforce in the Asian region.

### 1.3.17 Growing awareness and importance of indigenous and traditional knowledge

The rich diversity of plants in the Asia Pacific region has been used by people for many generations, for food and medicine, among many other applications. There is an abundance of, and a constantly evolving, local expertise in plant genetic resources. Annual global sales of products derived from the manipulation of genetic resources lie between US\$ 500 and US\$800 billion annually. Sale of herbal medicine alone is estimated to have exceeded US\$ 12.5 billion in 1994 and US\$ 30 billion in 2000, with annual growth rates averaging between 5% and 15%, depending on the region (GRAIN, 2002).

Indigenous peoples (IPs), many of whom are mountain dwellers, represent a significant proportion of the world's poor. Reducing poverty among native tribes would contribute greatly to attaining the MDGs. As stewards of biodiversity in many environmental hot spots, IPs deserve to be assisted and protected as doing so redounds to safeguarding the global environment (IFAD, 2003).

### 1.4 Rapid economic growth

The rapid economic expansion in both China and India is a boon for the more advanced economies in Southeast Asia, notably Singapore, Malaysia, Brunei, and Thailand. But growth in China and India will negatively affect the less-advanced neighbors, notably the transition countries, as well as the Philippines and Indonesia, as industries in these countries still have to contend with unskilled labor.

The Asia and Pacific region accounts for almost one-third of global GDP measured in purchasing power parity (PPP) terms. Many economies in the region have made substantial increases in their per capita GDP in recent times. Although the 2009 GDPs were lower in constant prices, most economies still managed to post modest or even healthy, growth, despite weakening export markets and lower shares of exports in GDP in almost all economies as compared with pre-crisis levels.

### 1.5 Major and support organizations in sustainable mountain development

### 1.5.1 Hydro-meteorological observation facilities

Hydro-meteorological data and information are essential to support water resources development and management, and for flood forecasting and disaster warning activities. The existing hydrological and hydro-meteorological networks in the region are insufficient, especially in the mountainous areas. Technologies involved in the data collection, transmission and processing should be improved to achieve state-of-the-art process sophistication and operational efficiency.

### 1.5.2 Earth observation facilities

Earth observation satellites have a central role to play in understanding the Earth system as a whole. They overcome the difficulty of obtaining accurate, continuous, simultaneous measurements of the Earth's atmosphere, oceans, ice sheets, land surface and interior. They are often the only way to highlight gradual change on a global scale.

The relevance of geographic information (GI) and earth observation (EO) applications in supporting decision-making is being increasingly realized by technical experts, practitioners and policy makers. There is a growing need for generating spatial and temporal data to aid planning, management and policy formulation in the mountain context. Because of the vast biophysical and socio-cultural diversity of mountain ecosystems, data generation is difficult. Consequently, the proper delineation of areas where appropriate management and policy reforms can be initiated is hardly done. In addition, available records and data sets are often not comparable because of differences in standards, scale, and accuracy and collection procedures.

The last decade has witnessed an unprecedented growth and development in earth observation data and applications. Earth observation techniques through remote sensing are proving to be more cost-effective than ground-based techniques over large areas. There has been an emergence of high resolution satellite data in recent years, with greater degree of spatial and temporal variations than ever

before. The sharper resolution can yield useful, site-specific information that are needed to come up with more unambiguous prescriptions to deal with location-specific problems in the mountains.

## PART II: Progress of changes in the SEAP region since 1992

### 2.1 Overview of the assessment and results

#### 2.1.1 The specific aims of the SEAP Regional Assessment

- review commitments, by taking stock of the progress made in development across the mountain areas of the world over the past 20 years, by presenting and appraising strategies, policies, and instruments, and programs by mountain communities, governments, civil society organisations, academia, and the private sector for promoting sustainable mountain development in the South East Asia and Pacific (SEAP) mountain regions;
- Analyse emerging issues and challenges, by identifying gaps relating to mountain development in different mountain regions recognising that there are regional specificities and variations; and
- Discuss ways forward for closing these gaps and for enhancing sustainable development in mountain regions worldwide.

#### 2.1.2 General Methodology and Assessment Process

The assessment followed a common framework for case study selection and case study methodology. The report must ensure the inclusion of the three-pronged objective of securing renewed political and financial commitment, assessing the progress to date and remaining gaps, and addressing new and emerging challenges as a strategic entry point to the Rio+20 agenda. The assessment focused on the two major themes of the Rio+20 Conference: Green Economy and Institutional Framework for Sustainable Development and Good Environmental Governance. The report covers two geographic areas to provide the context of SEAP region and was prepared following a multi-stakeholder dialogue and consultations.

#### A. Virtual (e-conference) consultations

Table I: Summary information on the ICIMOD-organized e-Conferences (Stakeholder Consultation on Rio+20 Conference)				
Event	Event duration	No. of stakeholders participated	Countries represented with major concentration	Total contributions and eye catchers
Southeast Asia and Pacific e-conference	1-30 June 2011	150	20 countries AP, Europe, North & Latin America (mostly from South and Southeast Asia)	Over 100  Key topics: Natural resource (NR) conflicts,  indigenous community rights over NRs

#### B. Commissioning of case studies

Table II: Distribution of case studies by countries and themes			
Event	Countries covered	Total case studies/remarks	Thematic focus

South East Asia and Pacific case studies	Indonesia, Philippines, PNG and Vietnam	4 case studies that involved examination of what worked and what did not and what are the policy weaknesses	Watershed management, forest conservation, Beekeeping and bio- resources conservation
--	---	---	---

### C. Workshop of stakeholders from the SEAP region

Table III: AP regional capacity building and knowledge sharing workshops			
Event	Participating countries	Key highlights	Major outputs
Asia-Pacific Youth Forum on Climate Actions and Mountain Issues (convened as Asia Pacific Youth meeting on Rio+20), 8-12 August 2011	<b>43 YOUTH from 17 countries</b> <b>SEAP countries:</b> Cambodia, Indonesia, Japan, Kazakhstan, Korea, Philippines, Singapore, Thailand, Vietnam	- Capacity building sessions - Motivational sessions - Sustainability exercises - Team works developing youth statements for Rio+20	- Asia Pacific Youth Declaration on Climate Change and Sustainable Development - Asia Pacific Youth Position paper on Rio+20
Regional Sharing Workshop on Assessment of Challenges and Opportunities in the Asia Pacific region for Rio +20, 23-25 August 2011	<b>161 participants from 10 countries, with 37 contributors</b> SEAP countries that participated: Indonesia, Philippines, Malaysia, PNG and Vietnam	- Presentation of and discussion on case studies - Presentation of Key Informants - Sub/regional group works to assess key issues, challenges and opportunities and develop recommendations	- Finalization of structure of Assessment Report - Documentation of key issues, challenges and opportunities - Development of key recommendations

### 2.2 Major progress by sectors highlighted by the four case studies

2.2.1 Community-based biodiversity/forest conservation in PNG

2.2.2 Collaborative forest management in Vietnam

2.2.3 Watershed management in Ikalahan, Philippines

2.2.4 Honey Bee Management as a NTFP product in Indonesia

#### 2.2.1 The Managalas Plateau Conservation Area Project, Oro Province, Papua New Guinea

The Partners with Melanesians Inc. (PwM) is a non-government organization that implemented the Managalas Plateau conservation project in Oro province in Papua New Guinea. PwM envisaged establishing, coordinating and promoting the work of all members of the community and partner organisations through equal participation and self-reliance, and practices of sustainable alternative development. PwM has been working with the local

communities in the case study area since 1984. PwM's involvement in the Managalas project had affirmed its belief that the full participation by the people in development is needed, as everyone benefits from doing so in the process. Although dealing with rural people was difficult, PwM insisted on the community's active participation in development processes or programs that were intended to improve their lives, and transform the context and conditions within which they live and upon which their well-being depended. The local people were made to realize that they cannot remain recipients and mere spectators of development, but rather, that they are the cause of development.

#### 2.2.2 Vietnam: Collaborative Forest Management (CFM) in Bidoup Nui Ba National Park, Lam Dong province

Collaborative Forest Management (CFM) was introduced in 2007 and has been implemented at Bidoup Nui Ba National Park within a project called "Piloting an Approach to Multiple-Use Forest Management in Lam Dong Province." The objectives of CFM were to establish the mechanisms for enhanced community participation in planning, development and benefit-sharing at selected watershed protection forests and production forests, and to explore possibilities for collaborative planning, management and benefit sharing.

Multi-stakeholder Forest Management Groups (FMG) were established at village level involving communities, forest officials, and local government representatives.

The FMGs have enhanced cohesion in forest protection work, with local people working together as self-managed groups in coordination with the national park and forest guards. Revolving Credit

Funds (RCFs) were also established in pilot villages. The RCFs appear to have been a success, as they allow the provision of village-managed credit to those who had no access to loans. While the loans did

not actually "pay" people to protect forests, they have helped increase their motivation for such work.

Another project, "Piloting of Payments Environmental Services," in the forest sector in Lam Dong province, contributed significantly toward poverty reduction and enhancing forest protection. As a result, there has been a significant increase in both the income of households and the area of forest contracted for protection with communities for the period 2008-2011.

The key factors to success of CFM in BNNBP were: (i) FMGs were established based on a process of negotiation and consultation with stakeholders; (ii) Implementation of CFM ensured fair and real benefits for all parties, and (iii) The piloting of payments for environmental services contributed significantly toward poverty reduction and enhanced the effectiveness of FMGs in protecting the forests.

The application and replication of CFM in Vietnam would need legal regulations and guidelines at the national level, but the project design did not have any provision for involving decision makers at that level. Consequently replication could be difficult, or limited to within the province only. The FMGs appear to have enhanced coordination for forest protection between local people and the authorities but they have yet to facilitate broader participation by local people in other conservation activities. In

this context, there is an effort to elaborate the lessons learned from collaborative forest management in policy documents that can provide a common basis for better understanding of concepts and in formulating and implementing necessary laws and policy regulations in the future.

### 2.2.3 Forest Honey Network Indonesia (JMHI)

Forest-based carbon sequestration is considered to be the most efficient and effective long-term greenhouse gas mitigation policy. Carbon is stored within forest products and that keeps the gas out of the atmosphere. Studies indicate that the amounts of carbon stored in forest products are increasing by about 40 million tons per year. Currently, forest products store more than 3 billion tons of carbon globally. Forests are an important renewable natural resource. They contribute substantially to the economy by providing goods and services to the people and industry. They also play an important role in enhancing environmental quality by influencing the life support systems.

Many products are harvested from the forests that are not timber-based, but originate from plant materials. These are called non-timber forest products (NTFPs). Forest communities have derived sustenance from NTFPs in periods of stress and have used NTFPs as inputs or raw materials for the production of items of daily use in normal times. NTFPs include bark, roots, tubers, leaves, flowers, seeds, fruits, sap, resins, honey, fungi (mushroom), moss, lichen, herbs, vines, shrubs, or trees and animal products, such as, meat, skins, bones, and teeth. They are used for food and medicine and as a source of income. NTFPs are consumed in rural and urban homes, and are traded in local, regional, and international markets.

The Food and Agriculture Organization claims that at least 150 non-wood products are found in international markets (United Nations, 1997). NTFPs provide small but significant sources of income, particularly for women and for families that do not have access to agricultural markets. The conspicuous lack of information on the scope and value of these markets is a major obstacle to the sustainable development of these resources. Forest landowners, harvesters and processors, and policy makers greatly influence how NTFPs resources are used, and whether suggested policies can be successful.

The case study is about indigenous collectors of honey from the forests, which together with wax, are sold at low prices in Indonesia. It describes how, since 2005, an expanding community-based Forest Honey Network Indonesia (JMHI) has been operating. The case also stresses vital success factors, one of which is the full support

- in some locations - of local governments/agencies. The exemplary performances of the regencies of Sumbawa Besar and Luwu, as well as that of the Danau Sentarum National

Park management are also discussed. Furthermore, it explains how the network, together with its members, partners and supporters, have succeeded, firstly, to dramatically increase the quality

standards of this NTFP, and secondly, how the affiliated honey collectors got into sustainable harvesting and active forest conservation.

The network has gradually expanded and currently includes members in the following locations: Kalimantan (Danau Sentarum National Park, Mount Meratus and Serengkah in Ketapang regency),

Sulawesi (North Luwu in South Sulawesi, Ueesei in Southeast Sulawesi), Sumbawa Besar (Batulante watershed), Java (Ujung Kulon National Park, Banten) and Sumatra (Tesso Nilo National Park, Riau). Though not all harvesting sites are in the mountains, the bees routinely migrate between higher and lower elevations, benefiting from variations in flowering season at different altitudes. Therefore, intact mountainous forest ecosystems are crucial for honeybees (*Apis dorsata*) colonies to thrive. Hence, the good condition of the upland forests also benefits communities outside of the mountains that (mainly) work with honey and wax. Still, all of this could go terribly wrong - with forest degradation and conversion still rampant in many locations - if urgent measures are not taken to bolster the commitments of organised honey collectors.

Thirdly, the activity has demonstrated how this venture has contributed to significantly better income situation in many of the sites. Finally, some lessons learned and ambitious, but realistic plans for the near future are shared. One example of the latter is that of scheduled increased support for women, eager to become top-of-the-line artisans working with wax as the primary raw material.

In Indonesia, the JMHI is very much on the frontline of this development. The members collectively aim at establishing an Indonesian top quality product, as well as promoting truly sustainable harvesting practices, and the conservation of the forests upon which the bees depend. An interesting aspect of it is that a number of these initiatives operate in and around national parks or otherwise protected forest areas and with full support of (local) government, park management and other agencies. However, the deterioration of the resource base casts a shadow on the efforts, with the unabated heavy pressure on the remaining forests in Indonesia. This case study is an example of successful sharing of knowledge about forest conservation through community-based forest honey harvesting, production and marketing.

### 2.2.4 Living in watersheds: a Case Study of the Experiences of the Ikalahan in Forest

#### Management

Long before the Kyoto Protocol and terms like 'carbon sequestration' were popularised in the Philippines, the Ikalahans (literally, 'people of the broadleaf forest') had practiced their own ways of conservation and sustainable livelihoods. Forest-based carbon sequestration is believed to be the most efficient and effective, long-term, GHG mitigation policy.

The Ikalahans are the indigenous people in the province of Nueva Vizcaya in the northeast of the Philippines. They belong to the Kalanguya-Ikalahan tribe, which inhabits the Ikalahan ancestral domain. The domain, which includes the Kalahan Forest Reserve, covers 38,000 hectares in Nueva Vizcaya plus about 10,000 hectares in Nueva Ecija. The Ikalahans are known for their indigenous knowledge practice systems, which are environmentally sustainable. The indigenous practices have been transferred, protected and maintained for generations. Among these practices are the *day-og* and *gengen* which are ancient composting techniques that take only about three months to complete,

on level and sloping land, respectively. The resulting compost is used for restoring soil fertility of upland farms. The *pang-omis*, which is a method of expediting the fallow, was invented by one of the tribal elders while *balkah* is a contour line of deep rooted plants that traps eroded topsoil at the belt line (Rice 2000).

In 1973, Ikalahan tribal elders organised the Kalahan Educational Foundation Inc. (KEF) to protect communities from possible eviction by land grabbers. They pioneered the Social Forestry Program of the Philippine Government in 1974 when they entered a contract with the government to manage

15,000 hectares of their ancestral domain.

First the Ikalahan leaders controlled occasional wildfires in the area and also improved their food supplies, then turned to developing various forest-based natural resources to provide income for the residents. They trained the population in the principles of ecology and focused efforts on enabling the Ikalahan to be self-sufficient, minimising their dependence upon external raw materials and markets. Some of the products they are now developing are jams and jellies from wild fruit, hand-made paper,

brooms and baskets, mushrooms, organic vegetables and fruit, and furniture. In 1994, the carbon stock measurement system was set up. They also promoted the Forest Improvement Technology (FIT) to expedite the growth rate of indigenous trees to improve carbon sequestration.

According to Espaldon (2005), the economic activities in the mountain reserve indicates that

forest management in the area is about 10 years ahead in terms of measuring ecological benefits of protecting forest ecosystems. The Ikalahans also hope to receive payments for the environmental

services of their forests through carbon sequestration, irrigation water for downstream areas, and eco-

tourism. To the Ikalahans, the primary role of government is primarily to protect their rights to their lands and resources. The government should allow forest dwellers freedom to manage the resources and benefit from them.

The accomplishments of the Ikalahan people demonstrate what initiative and role modeling can do. While many ethnic communities are known to live harmoniously with nature, being content with their traditional knowledge system, the Ikalahans have gone a step further by learning about, and practicing more ecologically friendly and sustainable agro forestry skills. The efforts of the Ikalahan have been rewarded by the emergence of expanded forest cover that contributes to the ecological, economic and food security of the community. The Ikalahans are confident that they can protect their remaining primary forests while making a living from niches in the secondary forests. They are also convinced that it will be achieved in their own lifetime with enlightened government cooperation.

These projects have significance to the industry. Markets for non-traditional forest products and the capacity for NTFP enterprises to add value at the local level are not well known, but are thought to have significant impact on rural economies. However, no data on its potential for, and its market value, are available. The NTFP sector is growing rapidly, perhaps faster than the timber industry, and the trend is expected to continue. The forest officials of state and central governments have to take proper steps for enhancing sustainable collection and marketing of the NTFPs, involving the local people in the process. This way, local people benefit and forests are conserved, lead towards sustainable development in the locality and region.

### 2.3 Evaluating progress with sustainable mountain development: Progress, changes, and lessons learnt in the region over the last 20 years

**Table 2.1. Summary highlights of the case studies in the select SEAP Mountains**

Case study theme	Major highlights of findings
Conservation area project	Aim was to have equal community participation and self-reliance and development of sustainable alternative livelihoods through conservation; equitable benefit sharing is not possible due to poor policy implementation
Community-based Forest Honey Network	Establishing an effective 'working' network is key for sustainable NTFP management; support from government agencies is crucial; Indigenous honey production by the growers
	empowered community organizations, improved economic gains and enhanced conservation and SD
Integrated forest and watershed management	Effective implementation of Payment for Ecosystem Services can help a large population to escape from poverty, protect and expand forests, restore wildlife, provide health services and eventually utilize generated revenues for social benefits
Collaborative forest management (CFM)	Multi-stakeholder (at all levels) consultation is critical to ensure project sustainability and effective replication or up-scaling; Convincing all parties about benefits can lead to a win-win situation.

### 2.4 Analysis of initiatives: challenges, opportunities, lessons learned, links to

#### Rio+20

This section is focused on evaluating the progress in the Southeast Asia Pacific (SEAP) regions.

It does not refer specifically to Rio 1992, but summarises progress and changes in general over the last

20 years: In the SEAP region, the three pillars of *Sustainable Mountain Development* have been influenced by many emerging trends and challenges, which are:

**Social transformation:** Devolution and decentralization underpin social transformation across the SEAP region as communities become more demanding of the attention of their politicians and governments. But income inequalities, rising food prices and water scarcity have aggravated social tensions and regional conflicts. The region is confronted with a development pattern that pushes people and resources against natural or sustainable limits, which is more apparent in the marginalized highlands.

Migration has exacerbated in the last two decades and as a consequence, nearly brings to completion the feminization of subsistence agriculture<sup>29</sup>. Sustained migration compensated though remittances reflects an economy that is dependent as ever. Inadequate appreciation of mountain specificities has led to unplanned implementation of infrastructural development, thereby enhancing vulnerability.

**Ecological Crises:** Infrastructure development has contributed significantly to natural resource degradation<sup>30</sup>, as well as to human displacement. Climate change-induced variability of temperatures and precipitation has multiplied risks through water stress, cropping shifts and natural hazards, exacerbating the fragility of the natural resource base in the region.

Climate change adaptation is still nascent in the region but climate change impacts on crop productivity and food security has been widespread. Across the region, wildlife intrusion on cultivated landscape (due to natural resource degradation) has impinged upon livelihood security of large agrarian population in the mountains.

**Economic transition:** Land use change, urbanization and market expansion has transformed economic landscape in the mountains. In mountain areas with longer history of sedentary agriculture, as in Nepal, Bhutan, Sikkim and Uttarakhand, the fruits of development have come slow and late, but have accelerated with mixed results, in the last few decades within the SEAP mountains.

Community control over resources, for example community forestry in Nepal and *Van Panchayats* in Uttarakhand, has demonstrated the virtues of community empowerment. However, opportunities to convert such comparative advantages into competitive advantages from economic standpoint have

<sup>29</sup> Increased acceleration and scale of migration has negatively contributed to loss of local labour, brain, enterprise and leadership, has been underscored by delegates at the Regional Assessment Workshop on Rio+20 at ICIMOD, Kathmandu, Aug 23-25, 2011

<sup>30</sup> Road building, urban expansion and mega-projects have contributed to eco-degeneration across SEAP region.

been squandered in Southeast Asia. Governments, knowingly or unknowingly, have allowed poverty to persist.

## 2.5 Institutionalization of Agenda 21, Chapter 13

A key plank to building ecological infrastructure is to institutionalize the decentralization and devolution of decision-making processes. These must extend from local governance to community- based natural resource management regimes in various parts of Southeast Asia.

In the Philippines, the Philippine Congress enacted laws to ensure compliance with the devolution mandated by the 1987 Philippine Constitution. Foremost among these laws is the Local Government Code of 1991 which enabled various political subdivisions to "attain their fullest development as self- reliant communities and make them more effective partners in the attainment of national goals." The Philippine Constitution stipulates that the "State shall provide for a more responsive and accountable local government structure instituted through a system of decentralization where local government units shall be given more powers, authority, responsibilities, and resources."<sup>31</sup>

In 1995, then Philippine President Fidel Ramos issued Executive Order No. 263 adopting community- based forest management (CBFM) as the national strategy to ensure the sustainable development of the country's forestlands and provided mechanisms for its implementation.

Ramos also adopted and mandated the operationalisation of the Philippine Agenda 21 (PA 21) on September 26, 1996, with the issuance of Memorandum Order No. 399 which also identified the roles of the Philippine Council for Sustainable Development (PCSD). Quite remarkably, for a mountainous archipelagic country, PA 21 left out Chapter 13's sustainable mountain development agenda, that could have complemented the CBFM policy. The short-lived Estrada Administration re-affirmed PA21 as the country's framework for sustainable development by issuing Memorandum Order 47, which directs all local government units to localize PA21 through sustainable integrated area development (SIAD). SIAD is now also recognized as a potent framework for poverty eradication.<sup>32</sup>

## 2.6 Analysis of initiatives: Challenges, opportunities and lessons learned, linked to Rio+20

a. A recent CIFOR<sup>33</sup> study suggests that the strengthening of community-managed forests

could be a more cost-efficient and effective solution than traditional forest management to reducing deforestation and ensuring the sustainable use of forests while benefiting local livelihoods. Community forestry forms an essential component of the proposed Philippine sustainable forestry management bill.

b. Reinforcing the devolution process is the Philippine Republic Act 7586, otherwise known as the National Integrated Protected Area System (NIPAS) Act. Each established protected area shall be administered by a Protected Area Management Board (PAMB). Among its functions are to delineate and demarcate protected area boundaries, buffer zones, ancestral domains, and recognize the rights and privileges of indigenous communities under the provisions of the Act. Members include the DENR officials, barangay (village) officials, three representatives from NGOs and community-based organizations.

<sup>31</sup> General Provisions, Basic Principles, the Code, Policy and Application, *the Local Government Code of the Philippines*.

<sup>32</sup> Centre for Alternative Development Initiatives, *Philippine Agenda 21*. [http://www.cadi.ph/philippine\\_agenda\\_21.htm](http://www.cadi.ph/philippine_agenda_21.htm). Accessed September 2, 2011.

<sup>33</sup> CIFOR, *Deforestation much higher in protected areas than forests run by local communities*, Press Release, <http://www.cifor.org/mediamultimedia/newsroom/press-releases/press-releases-detail-view/article/238/deforestation-much-higher-in-protected-areas-than-forests-run-by-local-communities.html>. Accessed August 29, 2011.

c. One such protected area under the Philippine system is the Mount Kanlaon Natural Park (MKNP), created by Congress under Republic Act 9154 of 2001. Part of the Western Visayas Biogeographic Zone, MKNP has high biodiversity value because of its relative endemism and species richness.

d. MKNP has formulated biodiversity conservation strategies by zoning MKNP's land use, implementation of community-based protection measures designed to protect,

conserve and develop its remaining resources, rehabilitation of highly disturbed and degraded habitats and ecosystems, and the conduct of biodiversity monitoring and researches, among others. Moreover, official policy has enshrined the importance of different tenurial regimes in public and private lands to provide mountain communities, especially the indigenous peoples, with inalienable rights such as free and prior informed consent (FPIC) in what otherwise would be open access regimes against encroachers such as extractive industries equipped with timber or mining licenses.

e. Lately, Philippine President Benigno C. Aquino III has tasked the Department of Environment and Natural Resources (DENR) to implement the National Greening Program, which seeks to plant 1.5 billion trees in 1.5 million hectares nationwide in six years, from 2011 to 2016.

f. In Papua New Guinea, a 1998 coordinated action (in cooperation with other groups such as MICAD, Greenpeace and ICRAF) resulted in the cancellation of proposed Gora-Itokama Forest Management Area and an oil palm operation in the same year. Concerted actions that included letters from lawyers serving as legal representatives in behalf of the communities, placing of newspaper advertisements, lobbying the government and the Forest Authority Board, and holding press conferences have averted the implementation of these environmentally disastrous ventures.

g. Another significant example of how activism can sway governments to stop resource extractive activities in SEAP Mountains was the designation of an area for conservation in the PNG Forest Authority Forest Plans. This was the first time such formal recognition was given to a forest area in PNG that was not initially considered to be a formal conservation area. As a result, there is greater security for the resources of Managalas and Collingwood Bay. These two large areas have also opened the possibility for a protected forest corridor from the Kokoda trail to the Oro Province border.

h. Initial financial support to the NGO Partners with Melanesians Inc. (PwM) came from the MacArthur Foundation, the World Bank, and Biodiversity Conservation Network (BCN). Consensus building among the stakeholders started in the late 1980s. As the project evolved to include more and more areas, the need for a long term commitment from donor partnership was realized when the Rainforest Foundation of Norway (RFN) entered into this partnership in

1997. Since then, various other partners have joined in this project including the Government of PNG through the Targeted Community Development Program (TCDP) and Community Aid Abroad (CAA) of Australia, IUCN Netherlands, DOEN Foundation Netherlands, World Bank, UNDP GEF funds, Democratic Governance Transition Phase (DGTP) of Australian Aid now called Strongim Pipol Strogim Neisen (SPSN) and Canada Fund.<sup>34</sup>

### **2.7 Opportunities for green economy and poverty alleviation in SEAP region**

a. Adopting a human ecology approach, biodiversity conservation also means strategies to promote green economies and inclusive social development, targeting the alleviation of poverty conditions among indigenous and settler communities in the PA while promoting the active participation of communities in the management of biodiversity parks. These require the adoption of more sustainable, non-destructive alternative livelihood practices, sustainable

34 Mahuru, Rufus, The Managalas Plateau Conservation Area Project, Oro Province, Papua New Guinea. SMD Case study.

agriculture technologies, community-based eco-tourism, provision of land tenure security, and advocacy on ecological integrity.<sup>35</sup>

*The Kalahan Educational Foundation (KEF) got control of nearly 15,000 hectares of their tribal lands in 1974 with Memorandum of Agreement No. 1, a tenurial and forest resource use right instrument from the national government which was then under martial rule. Eventually, MOA No. 1 has evolved into the certificate of forest stewardship agreement (CFSA), and much later the community-based forest management agreement (CBFMA) while simultaneously maintaining the name Memorandum of Agreement Number 1, (MOA #1), being the first of its kind. The land covered by the MOA has been known as the Kalahan Reserve.*

b. Another Southeast Asian devolution example is the Collaborative Forest Management (CFM) scheme at the Bidoup Nui Ba National Park (BNBNP) in Vietnam, through the project "Piloting an Approach to Multiple-Use Forest Management in Lam Dong Province" which began in 2007. The devolution process was initiated with six forest management units involved in a sub-project of "Establishing a mechanism for collaborative forest management with local communities" from 2007-2009.

*The BNBNP Protected Area Management Board adopted measures to deal with increasing human pressure within the park by boosting the income of the people living around or inside the forest, especially through buffer zone development projects and increasing community-based forest protection efforts. The socialist government realized that it alone cannot sustain a ranger force big and strong enough to forcibly keep the people out of the forest. Thus, the government realized that forest management is not possible without the involvement of the neighboring populations. Most of the human pressure comes from the indigenous ethnic minorities, K'Ho and M' nong, whose daily living comes from traditional agriculture and the exploitation of forest products. However, agricultural lands are fast becoming scarce. As a result, BNBNP's biodiversity is under threat due to the increasing conversion of forest land into agricultural land and illegal exploitation of natural resources.*

c. Regulation, however, needs to be coupled with economic incentives in order to achieve green growth-based development. An emerging feature of developing green economics in mountain forests is the promotion of non-timber forest products (NTFPs). The BNBNP assisted communities to develop on-farm alternatives for forest products such as orchids, ornamental plants, ferns improved for commercial purposes, and the planting of medicinal species for the consumption by the local communities.<sup>36</sup>

*One such ecological infrastructure is rainforest conservation and the expanding role of NTFP value chains in mountain livelihoods for poverty alleviation. In the Philippines, rattan and abaca feed major industries. These serve as traditional materials for furniture and fabrics, which can also be tapped as materials in the manufacture of specialty products.<sup>37</sup> The history of livelihood generated from both products is pro-poor and pro-indigenous peoples and are therefore well-accepted by the local economy and considered as non-risks to ecology.*

d. To support forest conservation, non-timber forest resources are emerging as alternative resources to timber utilization. The Philippines remains one of the biggest furniture exporters among ASEAN countries, and rattan furniture accounts for more than 65% of export volume

35 Malabor, Hermene, Ibid. e-Conference on Sustainable Mountain Development in the Southeast Asia. The Southeast Asian e-Conference lead coordinator Benedicto Q. Sánchez confirms Malabor's post. They are both members of the MKNP Protected Area Management

Board.

36 Le Buu Thach, Vu Ngoc Long, Le Van Huong, A Vietnam case study: *Collaborative forest management (CFM) in Bidoup Nui Ba National Park, Lam Dong province*

37 Sustainable mountains: people, resources, community and environment, <http://winner-tips.org/magazines/sustainable-mountains-people-resources-community-and-environment/>. Accessed August 28,

in this sector. Aside from use in furniture making, rattan is also used as raw material in the manufacture of walking sticks, fish traps, hammocks or sleeping mats, handicraft, footballs, carpet beaters, hat, bags and baskets, buggy whips, twines and toothbrushes. On the other hand, the Philippines supplies about 90% of the world's supply of abaca. This NTFP performs a multi-function role as plant hedge to crops planted on a sloping land, often found at the foot of volcanoes, applying the sloping agricultural land technology, better known as SALT. This technology was developed in the Philippines and has now been adopted in a growing number of other countries including the Hindu-Kush Himalayan Mountains.

e. Another devolved process in developing the green economy is the community-based Forest Honey Network Indonesia (JMHI) which started in 2005 in Indonesia. Those involved in the process cited that among the venture's success drivers are the full support (in some locations), by the local governments/agencies as well as the exemplary performances of the regencies of Sumbawa Besar and Luwu, and the Danau Sentarum National Park management officials.

*The JMHI has developed NTFP subsectors that have created an organic industry-wide niche market. One such example is that of organic Apis dorsata wild honey. The Forest Honey Network Indonesia (JMHI) actors included in the value chain are the honey collector groups and local supporters who are involved in organizing the primary producers and implementing improvements at the grassroots level. Riak Bumi handles coordination of technical support in the entire network, particularly for the production side; and Dian Niaga EcoTraders, based in Jakarta, takes the lead in the joint marketing of products of JMHI members at the national and regional level.<sup>38</sup> This is therefore an example of public-civil society-private sector partnership resulting in pro-poor solutions for the mountains.*

*Other institutional support groups include BioCert, a certifier based in Bogor which guides the process toward organic certification and assists JMHI in establishing internal control mechanisms; Gekko Studio for developing promotional materials such as video clips and organizing special events; and the NTFP Exchange Program for South & Southeast Asia (NTFP-EP), a regional network and its partners, notably the Bee Research & Development Center in Hanoi and the Keystone Foundation in Kotagiri (TN), India for technical assistance.*

f. At the institutional level tasked to finance the building of ecological infrastructure, some heavily-indebted Southeast Asian countries negotiated that a portion of their foreign debt be condoned in exchange for local investments in environmental conservation measures.

g. The US Tropical Forest Conservation Act of 1998 provides developing nations with significant tropical forest, a democratically-elected government, and an economic reform agenda, with debt condonation in return for conservation efforts. This program has benefited upstream mountain stakeholders, especially communities. The US Government signed a 2009 agreement with Indonesia to forgive nearly \$30 million in Indonesian debt in exchange for Indonesian government efforts to protect Sumatra Island forests, which are home to endangered tigers, elephants, rhinos and orangutan. These tropical animals are found in the mountains dominated by Lake Toba, formed from the caldera of an ancient volcano.

*Through the endowment fund established through a 1992 debt-for-nature swap, the United States Agency for International Development and the Philippine government created the Foundation for the Philippine Environment (FPE) with an endowment worth US\$ 21.8 million. Similarly, the 1996 debt reduction agreement between the Governments of the Philippines and Switzerland led to the creation of the Foundation for a Sustainable Society*

(FSSI) to

*sustainably manage economic development of poor communities, including*

*mountain communities such as those with various community-based tenurial instruments. Then in 2002, the US and Philippine government created the Philippine Tropical Forest*

38 De Beer, Jenne, Indonesian case study on wild honey.

*Conservation (PTFCF) to manage the debt swap to improve the status of Philippine mountain dipterocarp rainforests.*

h. The Philippines enacted Republic Act 10068, otherwise known as the Organic Farming Law of 2010. Elsewhere in Asia, civil society and other private initiatives practice organic farm management. Indonesia has the highest area coverage under organic agriculture at 52,882 hectares; Japan, 29,151 hectares; South Korea, 28,218 hectares; Philippines, 14,134 hectares; Thailand, 13,900 hectares; Vietnam, 6,475 hectares; Malaysia, 600 hectares; and Laos, 60 hectares.<sup>39</sup>

*In Negros Island, the governors of the two provincial governments in 2005 declared to make the entire island as the organic food bowl of Asia. People in Negros began diversifying their economy some years back, turning some large tracts of sugar plantations into more profitable ventures such as fish ponds, farms nurturing high value crops, as well as organic farming.<sup>40</sup>*

*NGOs such as BIND have been leading the promotion of organic farming in the Philippines.*

i. Based on partial reports, projected sales of organic products will reach 50.2 million from Fresh Start Organics, Organic Market (organic food), Peñalosa Farms, and muscovado sales in Bacolod alone (Personal communication with Ramón Uy Jr., President of the Organic Market of the Organik Na Negros! Organic Producers and Retailers Association, ONOPRA). Not yet included in this estimate are the projected sales from other private companies, NGO-assisted communities, organic fertilizers, and natural and health-promoting products. In the cold highlands of Benguet province in the Philippines, organic Arabica coffee is being grown through the partnership of a private firm, Figaro Foundation Corp., and the Benguet State University (Inquirer News Service 25 March 2004).<sup>41</sup> While Southeast Asian countries reel from the conversion of mountain and lowland forests into monocultures, some countries have turned environmental losses into an opportunity.

j. In an early section of the present report, it was mentioned that the Bacolod-based Alter Trade group has exported muscovado sugar to fair trade markets in Japan, Germany, Switzerland, Austria, France, Malaysia, and South Korea.<sup>42</sup> The biggest challenge facing domestic muscovado producers is in complying with standard production processes to overcome foreign quality restrictions. Alter Trade had sought assistance from the Industrial Technology Development Institute of the Department of Science and Technology (DOST) to improve its production processes. As a result, Alter Trade Company has one of only two muscovado mills whose products pass strict global market requirements. Alter Trade's success shows that the muscovado sugar remains one of the country's export winners.

k. Meanwhile, ecotourism remains a potential major market segment in the SEAP Mountains. It has been targeted for expansion and promotion of nature-based tourism in the

region. Ecotourism can provide the economic basis for the conservation of natural areas. An indication of commitment to an ecologically sustainable tourism was manifested when the three ASEAN travel associations (the Tourism Association, the Federation of Travel Associations, and the Hotel and Restaurant Association), met to discuss the quality and sustainability of tourism in the region.<sup>43</sup>

## 2.8 What expectations for SMD were raised by Rio 1992?

Many ASEAN countries have translated the ideals of Agenda 21 into their own national development plans or have created national councils for sustainable development. Several laws and regulations have been passed to control environmental degradation and natural resource depletion, and recent advances in science and technology have helped in improving people's lives. The stabilization of political regimes has also helped in the rapid development of countries in Southeast Asia. Economic, social, and environmental cooperation among the countries of the sub region, such as ASEAN and the Greater Mekong sub-region, has yielded positive results in many areas.<sup>44</sup>

The problems, however, have not disappeared during the last decade; in some areas, they have become more serious. Rapid population growth, which has resulted in greater demand for natural resources and energy, is threatening the gains made in several countries. The major constraints to adopting Agenda

21 include a lack of financial support and the absence of capacity in several countries to address an overwhelming number of issues. Official development assistance from wealthier countries has slowed

or has stopped altogether from being forthcoming.

In 2001, under the aegis of the Asian Development Bank, a sub-regional report for Southeast Asia put forward nine sub-regional action plans (SRAPs) for sustainable development. The report also developed discussion on "Emerging Issues" to cover globalization, biotechnology, and information technology. None of the SRAPs, however, dealt with problems peculiar to mountain development issues. The oversight had come to light in recent years as extreme weather events brought about by climate change caused mudslides and flash floods, killing thousands of residents, destroying property, and disrupting economic activities.

The Philippines joined the United Nations in celebrating the 2002 International Year of the Mountains. Aside from the national IYM committee, some civil society groups organized their own IYM committees, (e.g., Negros IYM Committee in Central Philippines) that linked up with other stakeholders in local government, national line agencies, academia, community-based organizations, and faith-based organizations. They crafted their own SMD agenda for local lobbying efforts. Starting Subsequent to the IYM, Mountain Forum has since linked up with various players in the Philippines including representatives from civil society, academia, corporate-based foundations, and government.

Sadly, the civil society agenda never went beyond the crafting of provincial resolutions and the yearly observance of June as the Mountain month, in compliance with a presidential declaration to this effect. Often, civil society develops good practices based on alternative conceptual development models at the grassroots levels, which later find traction in academia and political circles. Cutting edge, good practices at the local level remained oases of sustainable development amidst dominant economic models of over-utilization and overconsumption of natural resources, where the search for the highest profit margins tend to focus on lowland urban-based centers. Mountains are important only insofar as industries can extract resources to feed the needs of lowland, if not overseas industries.

In the meantime, mountain communities with their subsistence, i.e., hunting and gathering, economies, are left out in the cold. These communities are incapable of raising the ROIs of lowlanders. Indigenous knowledge of human interaction with mountain natural resources, especially NTFPs, is neglected since lowland-based economies view these products as unprofitable.

## 2.9 New issues/challenges after 1992

During the Rio conference, there was already discussion of climate change issues among global development partners, but every country invariably focused on reducing its own global carbon footprint. Two decades later, the theme that resonates among Southeast Asian countries is climate change adaptation, which has also expanded into disaster risk reduction.

44 Ibid. Executive Summary. p. xx

With the worsening of climate change, civil society and community-based organizations explore turning crisis into opportunities. In Vietnam, the BNPP project on "Piloting of payments environmental services (PES)," in the forest sector in Lam Dong province was designed to contribute towards poverty reduction and enhancing forest protection, through forest management groups (FMG) models equipped with practical mechanisms for implementing PES. Under the PES scheme, forest protection payments ranged from 350-400,000 VND/ha. This exceeds the amount previously paid under Program 661 (100,000 VND/ha) and appears to have provided greater motivation for forest protection work - the level of payment now competes with the rate paid for rural labor (100,000

VND/day).<sup>45</sup>

Where 20 years ago, development planners talked of isolation, remoteness and ruggedness of mountain communities, advances in information technology has reached the point that even mountain farmers and indigenous communities can use cellular/mobile phones to communicate with one another. Local governments in the Philippines have linked up with corporate telecommunication groups to set up missionary cell sites to be used for rapid transmission of information for forest protection against poachers.

## 2.10 Major themes of SEAP regional initiatives

CBNRM, NTFP, and SFM have been the major development themes in the region, while ecological agriculture, integrated water resources management, and inclusive development have received far less attention. Prior to Agenda 21, the Philippines implemented the Environmental and Natural Resources Accounting Project, 1991-2000 (ENRAP) to address deficiencies in the System of National Accounts (SNAs) in order to reflect economic-environment interactions by explicitly recognizing the potential of the natural environment as a productive economic sector. The ENRAP project, which developed an environmental accounting framework that drew on principles from the environmental and resource economics literature, applied imputation approaches that are consistent with definitions of depreciation and environmental damage widely accepted in economic theory and that are commonly applied by practicing environmental economists.<sup>46</sup>

### 2.11 Future actions needed

Green Accounting or Inclusive Wealth Accounting within the mountain context should be developed for measuring green economy transition at the macroeconomic plane. As the ICT revolution has addressed the inaccessibility issue of the Mountains, the fragility can be attended to through building community-based ecological infrastructure. Marginality, on the other hand, can be tackled through decentralized governance.

Environmental and Economic Accounting. <http://www.nscb.gov.ph/peenra/workshop/Technical%20Papers/Session%203%20ENRAP.PDF>. Accessed September 1, 2011.

## PART III: Challenges and opportunities for sustainable mountain development

### 3.0 Emerging challenges and opportunities

Climate change, disasters, and social and political conflicts are the emerging challenges facing SEAP Mountain ecosystems, while gradual democratization, devolution, and good governance are seen as opportunities that can help bring about sustainable development among mountain communities.

#### 3.1 Emerging trends and challenges for SMD in the region

The biggest challenge for Southeast SMD is the formulation of mountain specific policies that can go beyond traditional forestry concerns. The Southeast Asian synthesis has identified different stakeholder groups whose varied interests need to be brought to the discussion table to ensure that rights are respected and protected, and that the consequent needs are fulfilled. The stakeholders, as defined by the e-conference include the indigenous peoples, non-indigenous, migrant settlers from the lowlands resource users and extractive companies; visitors and travelers, indirect stakeholders, and even the future generation.<sup>47</sup>

#### 3.2 Addressing Trends and Challenges

To address new challenges, evidence-based advocacy to influence policy-making has been suggested. Across the Hindu-Kush Himalayan region a range of innovative solutions on resource conservation, alternate market and institutional development have been showcased. New pathways need to be determined to catalyze sustainable mountain development, such as:

**Niche markets:** Given the SEAP Mountains' rich biodiversity, there is an urgent need to build markets for niche products coming from the region. Capturing diversity to compensate for lack of volume, branding of mountain products can leverage market opportunities for building and strengthening local economies and resource base.

**Partnership protocols:** Increased electronic communication has been one of the hallmarks of change in SEAP Mountains. Mountain communities are now connected to the world but are essentially driven by the externalities of change. The change is neither demand-led nor based on an assessment of community needs, and consequently has an appearance of being imposed against the community's will.

Mountain communities need partnership protocols between diverse actors like community organisations, cooperative societies and private sector under sub-regional growth agenda to promote sustainable mountain development. An array of 'good practices' can trigger policy changes at the macro-level, with new partnerships as change drivers.

**Green growth:** Favourable demographic conditions are creating potential for rising prosperity in many developing countries, as large youth populations enter labor workforces. Better marketing, institutional arrangements and policies can ensure benefits from green economy (ecotourism, niche products and eco-system services) to improve local livelihoods. But the current green economy agenda need to be made more mountain-sensitive, and should focus primarily on SEAP mountain issues.

47 Razal, Ramón and Sánchez, Benedicto, *Sustainable Mountain Development in Southeast Asia—The Synthesis*. pp. 6-10

#### 3.3 SEAP: Mountain specific challenges

A lot of challenges remain for the Southeast Asian green economy in the light of national/regional efforts to promote sustainable mountain development. The main hurdle is deep-rooted path of brown economy which includes land use conversions of forests to chemical-based monocultures such as palm oil and sugarcane plantations, extractive industries such as irresponsible mining and logging, and mainstream tourism.

China, already the world's largest generator of electricity from freshwater trapped in giant dams, announced plans to nearly double its hydropower capacity by 2020. For downstream Southeast Asian states of Myanmar, Laos, Thailand, Cambodia and Vietnam, China's plans could trigger cross-border conflicts based on two points of concern. The first is how much water will be impounded in Chinese reservoirs behind the dams in these projects. The second is how hydropower operators, all of them state-owned firms, will regulate the flow of water once the reservoirs has impounded enough water and the generating units are ready to run.

Competing demands for forest-based resources give rise to major conflicts in Southeast Asian mountains. In the past 20 years, armed conflicts have struck forest areas in Southeast Asian tropical forests. Notorious examples are Cambodia and Myanmar where rebel warfare largely played out in remote cross-border forest areas. Conflicts of lesser intensity include inter-communal struggles and forms of protests that frequently occur along forest frontiers in Indonesia. Although each of these conflicts has its own historical and political context, many reveal a distinctive role of the forest, its timber, and the rights over them.<sup>48</sup>

The Golden Triangle is one of Asia's two main illicit opium-producing areas. Encompassing 950,000 square kilometers, the area overlaps the mountains of four countries of Southeast Asia: Myanmar, Vietnam, Laos, and Thailand.

Meanwhile, Maoist-inspired revolt in the Philippines based largely in remote forest mountains has stubbornly resisted all attempts at eradication by the national government.

The ungoverned remote, isolated and rugged terrain of the country's scattered mountainous islands provide insurgents the spaces needed to build its guerrilla fronts. In addition, the government has to contend with armed Muslim secessionists and bandits who are based in Mindanao's forested mountains.

Findings by the Intergovernmental Panel on Climate Change (IPCC) indicate that the effects of climate change will impact all countries of the Southeast Asia Region. IPCC predicts a rapid glacier melt in the Himalayas - with a rate of recession greater than anywhere else in the world, along with increased floods and landslides, reduced water and food resources, more frequent storms, and rising sea levels.

The Philippines, lying along a typhoon belt, is visited by an average of 19-20 cyclones a year. Most typhoons emanate from the Pacific Ocean which lies at the eastern board of the Philippines. A natural mitigation measure is the mountain range located along the eastern coast of the country. Other mountains which dot the country have aided as natural barriers to the strong winds which have often breached 250 kms per hour recently, because of the prevalence of super typhoons.<sup>49</sup>

Many Southeast Asia countries are well within the Pacific Ring of Fire. This is a 40,000 kilometer- long "system of faults", which is responsible for 90 percent of the world's earthquakes. Mountainous Southeast Asian countries like Indonesia and the Philippines face volcanic eruptions and tectonic earthquakes. These natural hazards add to the fragility of Southeast Asian mountains.

48 de Koning Ruben, Capistrano Doris, Yasmi Yurdi, and Cerutti Paolo, Forest-Related Conflict Impacts, Links, and Measures to Mitigate, Rights and Resources Initiative, p. 1

49 Delica, Zenaida, Preserving the Mountains, <http://www.adpc.net/infores/adpc-documents/zen-mountains.pdf> Accessed

As early as 1998, ecotourism has been on the drawing board for most of Southeast Asia, but countries still face problems associated with the lack of infrastructure development, the need for and adequacy of personnel training, the lack of plan implementation, and political instability.<sup>50</sup> Retaining the mountain youth in the locales where they could help develop niche goods and services has been a problem in many countries as well. As more and more mountain children get to study within the mainstream educational system, they are tempted to pursue the "beaten path of other rural youths", and thus emerge to follow the brain drain of mountain population toward the urbanized lowland cities if not overseas.

On the other hand, in some cases in Southeast Asian mountains, highly urbanized mountain cities such as Baguio City in the Philippines grapple with population growth due to the influx of immigrants from the plains and outlying mountain communities. This has strained limited resources in the mountain urban centers and increased the vulnerability of mountain dwellers, especially when new communities are established without regard for the risks associated with steep slopes, erodible soils, and unstable ground foundations. Managing these contradictions, diversities and social tensions which the mountain communities face is a major challenge that needs adequate attention from all concerned.

### 3.4 Opportunities

The foundations for building ecological infrastructure have already emerged in Southeast Asia, both sectorally and cross-sectorally.

The flipside of challenges are opportunities. The shift is vital to ensure the stability of mountain ecological commons, the water cycle and its benefits to organic agriculture and households, the conservation of Southeast Asian tropical rainforests to enhance carbon cycle and climate mitigation, soil fertility and its value to diversified crop production, and the local microclimates for safe human ecology for both upstream and downstream communities. These are all crucial elements of a mountain-based green economy.

Two decades after Agenda 21, global efforts led to the creation of ecological infrastructure to reduce deforestation and increase reforestation to support upstream and downstream agriculture and rural livelihoods. Tropical rainforest goods and services support much of the economic livelihoods of Southeast Asian mountain communities. Increasing ecological infrastructures managed by local government units and Green-for-debt-swaps schemes offer appropriate opportunities for forest-rich local communities. Collaborative forest management can be a good strategy to carry out REDD+ initiatives in mountains since the participation of the community can help assure social equity and more inclusive development, eventually leading to poverty reduction in the mountains.

The Royal Cambodian Government has prepared a National REDD+ Road Map, which served as the basis of funding applications to the UN-REDD and of the Readiness Preparation Proposal (RPP) to the World Bank's Forest Carbon Partnership Facility (FCPF). The UN-REDD approved the proposal for

\$3M over 2 years, and UNDP and FAO committed an additional \$1.35M. WB has already earmarked

\$3.6M over three years but the final approval has yet to be given. Barring any strong civil society concerns about the RPP and the process involved in developing the proposal, approval will be secured.

Key concerns raised by Cambodian NGOs and civil society groups center on securing NGO/CSO representation in REDD+ management arrangements, the definition of main drivers of deforestation in Cambodia to include ELCs and mining activities and concessions, and the explicit integration and application of free, informed and prior consent in the management arrangement as well as in the implementation of the plan.<sup>51</sup>

50 Dowlings, Ross K., *Ecotourism in Southeast Asia: A Golden Opportunity for Local Communities*, Tourism in

Southeast Asia—A New Direction. Chon, K.S., Editor, The Hayworth Hospitality Press. New York. 2000. p. 2

51 Annual Report 2010 to Hivos.

2009 was a crucial year for climate change lobbyists, and although many were disappointed with the turnout of the UNFCCC negotiations in Denmark in December that year, opportunities for forest conservation through the global mechanism for "Reducing Emissions from Deforestation and Degradation" (REDD) opened up. With its 3.8M hectares of remaining dipterocarp forest, rich biodiversity, decentralized forest governance, and enabling forest management policies, the Philippines hopes to become eligible for the REDD + regime.<sup>52</sup>

### 3.5 Specific actions needed

Need-based conflict resolution and seeking the free and prior informed consent (FPIC) of the local communities before planning natural resources conservation management in fragile and biodiversity rich ecosystems should be made mandatory. As funds from the government and donor sources for local initiatives dry up, there is a need for timely updates on CBFM policies to avail of other funding opportunities elsewhere, such as from private sector groups and other donor groups with more stringent fund availment

and release requirements.

The examples given above, which demonstrate how problems can be turned into opportunities, for example, decentralized PES as well as strengthening of local governments through decentralization, devolution and empowerment, can be adapted as initial institutional frameworks. Weak local community participation and poor benefit-sharing schemes can be addressed by upholding communal property rights. The Philippines provides an example of decentralized CBFM institution which other SEAP countries can replicate. As a word of caution, decentralization without devolution cannot lead to good resource governance. The adoption of a multi-stakeholder approach to resource management will also help in implementing well-intentioned legislative acts, policies and executive orders.

REDD is not yet fully understood by many people, particularly forest communities, who can fall victims to unscrupulous carbon traders. It is in this light that the network NTFP-EP for South and Southeast Asia formed a consortium of NGOs and forged a partnership with the Forest Management Bureau to spread awareness on the concept and come up with a National REDD Plus Strategy for the country, thereby ensuring local community participation in the global climate change discourse.<sup>53</sup>

### **3.6 Way Forward and Policy Recommendations**

#### **3.6.1 What specific actions are needed to contribute to the Rio+20 priorities in the mountain areas of your region?**

Our analysis of the case studies and e-discussion outputs indicate that Mountain people have not been the real drivers of change in the SEAP Mountains. The people in power – such as the political leaders, bureaucrats, non-governmental actors and international development players including donors have taken the driver's seat in mountain development. The traditional or public sector institutions that are generally centralized and function in an archaic manner have determined the course of change in SEAP mountain regions. Although changes did take place since the Rio summit in 1992, both spatially and temporally, some changes have turned for the worst in many mountain areas.

It was argued by a contributor to the SEAP SMD e-conference that SEAP Mountains have become the safer refuge for people who had escaped the violence of wars and social conflicts unleashed in the plains. The prevailing peace and tranquility allowed them to develop unique socio-cultural 'bonding' with the mountains. However, due to neglect, marginality and poverty, the mountain communities are generally the losers in the seemingly good processes of decentralization, devolution and governance.

In general, changes introduced by successive regimes have occurred at the expense of prevailing peace and harmonious co-existence in the SEAP Mountains. Peace means more than just the absence of war in the mountains. New kinds of conflicts over the sharing and appropriating natural resources such as

52 Annual Report 2009 to Hivos.

53 Ibid.

water, forest, pasture, and biodiversity wealth have emerged, which in many cases had gone beyond the carrying capacities of traditional social institutions in the mountains. The undesirable, seemingly irreparable changes ushered in the past can be reversed by engaging and connecting with diverse mountain dwellers in a multi-stakeholder discussion and dialogue fashion. A neo-institutional mechanism of nurturing green economy that suits the mountain people can be created, while investments in developing technology to lessen vulnerability of SEAP Mountains should be made.

Translating good intentions into sustainable or smart actions warrant the re-thinking of existing institutional frameworks and the development of good governance practices while promoting low- carbon growth path in the SEAP Mountains. There is a downstream demographic push to extract more resources and put pressure on the ecological balance in some parts of the SEAP region. Multi-pronged strategy through people education, awareness-raising, leveling the playing field, crafting of enabling policies, and creating institutional spaces could help in managing the growing demand on mountain resources and services. Learning from local cultures, rebuilding on local knowledge, and encouraging many good practices could be crucial drivers of change. Participatory conflict resolution techniques as those practiced in the Philippines might be useful learning for some of the SEAP mountain communities.

The trans-boundary nature of natural resources including water and the trans-boundary relations in managing mountain resources, have yet to get the attention they deserve. Countries in the SEAP region ought to develop joint policies, programs, regulations and institutions for sustainable development of SEAP Mountains because of their common problems and the possibility for linked solutions to such problems. Cross-scale and cross-border linkages can help unravel complexities arising from the need to equitably share natural resources across diverse social systems. Clearly, there is a case for negotiating out-of-the-box solutions which are possible through collaboration and cooperation amongst the key players involved in sustainable management of SEAP Mountains.

A diverse group of people influences the Rio+20 agenda, as well as interprets and positions the green economy agenda based on their own understanding and contexts. They contend that Green Economy should not merely be an upgraded concept of 'sustainable development' agreed on 20 years ago, but that it is a totally different program that can reinvigorate SMD. The crucial question to ask is, "What form of green economy can be an effective instrument for addressing the problems faced by SEAP Mountains?" Like the concept of sustainable development that has limits in terms of its interpretation and application, applying "Green Economy" for other purposes should be avoided.

It has been argued that the 'top down' agenda of Green Economy is to break the current inertia in the global climate change debate. In the SEAP mountain regions, it is understood that environmental gains need not be at the expense of the economy if Green Economy has to provide green jobs and deliver green products. A balanced approach is needed to promote the 'Green Economy' concept in SEAP Mountains. Issues of scale, indigenous peoples' rights to resources, and the outcomes of 'green economy' will be important to consider. Already, the 'Green Economy' concept has been assailed as being too heavily dependent on technologies, on financial and human resources, with negative implication on its feasibility, sustainability and gender dimensions. Just as important is the need to address governance issues and to explore how multi-stakeholder participation in designing, implementing, and benefit-sharing from Green Economy initiatives can be enhanced.

Evolving development and institutional frameworks for low-carbon, or green growth should clearly and properly reflect the needs and aspirations of the mountain people so that they can liberate themselves from the vicious cycle of poverty, unbridled population growth, and environment degradation. The drivers for the transformation to Green Economy and institutional mountain governance should be the people of the mountains themselves, represented by genuine community leaders, not external forces who might fund and benefit from such initiatives.

### **3.7 Way forward for sustainable mountain development in the SEAP mountains**

#### **3.7.1 Undertaking more research, such as those that will define carrying capacity of mountains**

Apart from their high elevation and steep slopes, SEAP Mountains have relatively thin top soil that is

vulnerable to erosion owing to the intensity of tropical monsoon rains in the region. Natural causes are aggravated by human-made activities, such as unsustainable farming practices, human settlements, construction of road systems, and destructive logging and mining operations. There is a great need for information that will serve as inputs for planning in the mountains, including the implementation of measures that will help in mitigating the worsening impacts of climate change and unregulated human activities on the mountain's resources. Scientific inputs, as well as strategies that consider political and socioeconomic factors must be taken into account and within a multi-disciplinary framework, to come up with realistic solutions to address the environmental crisis besetting the mountains (Upadhyay, June 3, 2011).

The paucity of data is further aggravated by the lack of confidence in available information on mountain resources. Abi Aguilar (June 16, 2011) contends that government data is generally disaggregated and difficult to use in local conditions. Suspicions about the reliability of mountain data stems from methods that are employed to gather information, which Agha Iqbal Haroon (June 6, 2011) asserts as being collected by majority of non-government actors through local leadership that is part and parcel of land lords. Poudel (June 30, 2011) has critiqued the research and development efforts on the mountains, which he considers as having remained more or less on an *ad-hoc* basis, done within very short field work, and with a few set of objectives that are determined using the experience of the lowlands or outside the mountain, resulting in outcomes that are out of reality. Poudel believes that improving the design of mountain research will entail taking into account local, customary rules and regulation, local geographical terrain, aspect, and values, among others.

To avoid the pitfalls of research that do not produce meaningful results or whose value is not acceptable to the various mountain stakeholders, a multi-stakeholder, participatory type of research should be undertaken where all are given the opportunity to be involved in conceptualizing the research design, in planning the methodology, in undertaking the data gathering activity and in field trials, up to the interpretation of research data. Benedicto Sánchez (June 10, 2011) demonstrated that this is possible, citing his experience in developing sustainability thresholds for various species of rattan at the Northern Negros Natural Park in Mt. Mandalagan. The dialogic approach may appear to be done using a non-conventional research methodology, but the fact that it has generated research information acceptable to users and regulators attests to the fact that a participatory approach can stand on solid ground, and possibly even withstand scientific inquiry.

The manner of doing research is just as crucial as the kind of research that needs to be undertaken in response to the pressures on SEAP Mountains. In line with this, it is important to listen to what stakeholders are saying as important to them. E-conference participants have identified an initial list of research initiatives on mountains, like dealing with low carbon, clean fuel initiatives as mentioned by Chethika Abenayake (June 25, 2011). Swapna Deb considers the need for slope conservation efforts as important (June 29, 2011). The conduct of biodiversity researches also needs to be prioritized and made in conjunction with developing strategies for economic and social development so as to engender the active participation of communities in or near protected areas in managing their biodiversity resources (Malabor, June 6, 2011). The problems of water scarcity, disposal of huge amount of wastes, and crowded streets and traffic jams that are associated with growing urbanized mountain centres like Baguio in the Philippines (Chariz Castro, June 30, 2011) and Kathmandu, Nepal (P.B. Pandey, June, 30, 2011) could have been anticipated if their carrying capacity had been properly measured.

### 3.7.2 Improving mountain governance and innovating on institutional mechanisms

The precarious state of some of the SEAP Mountains and the marginalization of mountain people is attributed in part to the failure of governance within mountain ecosystems. Such failures arise because of incompatibility between traditional governance systems employed by the native people, and state governance that introduces development interventions which may be good on the surface, but turns out to be out of sync with local realities. The state is also seen as generally tolerant of extractive industries in the mountains in the name of development —mining and logging—which impact greatly on the mountain's topography including river and downstream pollution, erosion, landslides, displacement and community conflicts (Dictaan-Bang-oa, June 8, 2011).

Krishna Poudel (June 16, 2011) believes that this can be overcome by capacitating mountain people to exercise governance over their resources. However, this will not materialize, nor will become sustainable, if the economic standard of the people living in the mountains are not improved. Krishna thinks that giving access to state power can be achieved with proper education so that in the end, mountain people will appreciate that they are responsible for the consequences of their own action. Malabor (June 29, 2011) echoes the same sentiment. Likewise, Malabor believes that mountain people should participate in their governance with more power and the capacity to decide for their community. Toward this end, Malabor sees the need to further strengthen the barangay which is the smallest unit of governance in the Philippines, and understandably, the most accessible to the mountain people. Apart from mountain barangays being provided with their own education, livelihood and basic services programs, health and peace officers, the barangays should also have a say on the kind of projects that will be implemented in the respective communities.

### 3.7.3 Common grounds and bases for regional cooperation

**Caring for and protection of SEAP mountains is a collective responsibility.** A few urban centres in the SEAP Mountains are growing, but the fact remains that a large portion of SEAP Mountains have remained undeveloped, difficult to access, and structurally weak and fragile. No group has come out to claim sole ownership of the vast SEAP Mountains, and understandably so. What is clear is that many are aware of the numerous benefits that the mountains provide, as well as of the impending threats associated with global climate and economic pressures. This common awareness of the mountain as a wellspring of benefits and the anticipation of mountain-related disasters that can extend to the lowlands with far greater negative consequences has increased since Rio '92. This has driven all mountain stakeholders to consider collaborative efforts in protecting and conserving the mountains and the resources therein.

**Melding of traditional knowledge with externally-generated science is a key to sustainability in SEAP Mountains.** Despite some reservations by a number of e-conference participants over the value of scientific knowledge brought to the mountains by external scientists (e.g., Dr. Grazia Borrini-Feyerabend, ICCA Consortium Coordinator and IUCN CEESP Vice Chair; June 6, 2011), there were other participants who described cases that have demonstrated the value of collaboration that resulted in melding traditional knowledge with externally-generated science. One such case is the multi-stakeholders' sharing of knowledge on the proper utilization of non-timber forest products in a mountain community in the Philippines (Benedicto Sánchez, June 10, 2011). There was something to be learned from everybody, claimed Benedicto, where a variety of participatory approaches in the planning process, including community ranking of resources with economic and ecological values and knowledge on the NTFPs' marketability or the lack of it, were shared. The dialog also offered opportunity for a more balanced gender perspective although the outcome still leaned toward resources preferred by men. The continuing dialogs also resulted in the avoidance of harvesting endangered tree fern species that were considered essential to the natural regeneration of the secondary community rainforest ecosystem and of wild orchids which could not command a price as good as domesticated species that have saturated the market.

Angelo Mordeno (international consultant, June 19, 2011) likewise described interventions that had enabled the local people in Nepal to meet their needs for firewood and for electricity from power

plants through tree plantations. Other technologies that he suggested during his work in Nepal in 1983, included the (a) use of small machines to open up access roads, (b)

minimal road construction with compulsory provision of drainage structures, terracing, gabion-wiring down slopes, and graveling of access roads, (c) planting maguey and other soil-holding plants (bio-engineering) along the slopes, and (d) log transport by small long-distance skyline/cable cranes.

**Active participation of communities in mountain governance produces results that indicate there is hope to look forward to in SEAP Mountains.** Many participants shared work experiences showcasing the active participation of mountain communities in a number of efforts that otherwise would have failed if communities did not take part in them. Benedicto Sánchez (June 10, 2011) has described community participation in determining utilization thresholds of different rattan species, resulting in community defined thresholds more stringent than existing natural resource policies, and thereby ensuring the sustainability of said NTFP resources. Similarly, Swapna Deb (June 10, 2011) told of village community planning and participation that resulted in transparency in project implementation, enhanced enthusiasm among the people, and made them give up on destructive method of shifting cultivation and instead embrace a number of water harvesting structures like farm pond, fish pond, irrigation canal and providing high yielding, high value crops. The Ikalahan model, as described by Dictaan-Bang-oa (June 29, 2011) also shows how indigenous and montane community sustainable mountain management practices strengthened the community's hold on their ancestral territory and promoted the development of their culture and identity. As Grazia Borrini-Feyerabend (June 20, 2011) has aptly put it, "The alternative to destructive megaprojects is not hopeless

'poverty'... it is small scale, carefully-planned and community-controlled, sustainable human development."

## Sustainable Mountain Development

### From Rio 1992 to Rio 2012 and beyond

#### Sustainable Mountain Development

In 1992, at the United Nations Conference on Environment and Development (UNCED) – commonly referred to as

'Rio 1992' or 'the Rio Earth Summit' – mountains received unexpected high political attention. They were granted a chapter in the 'Agenda 21' as fragile ecosystems that matter for humankind.

Since then, a wide range of efforts by different actors have been undertaken to promote 'Sustainable Mountain Development'. Some of them relate to the above event others just emerged on their own. However, in view of the forthcoming UN Conference 'Rio +20' in 2012 it seems relevant to assess and understand what has been achieved by whom and how. It appears equally important to learn what has worked or not and why in order to draw lessons for more effective interventions in future. The anticipation of possible future challenges or opportunities may further help to be better prepared for their management. This will certainly encompass the adaptation and mitigation of Climate Change as the 'main stream concern of the last decade' well as probably the 'new mainstream paradigm' of Green Economy. But as in the past, major unexpected and unpredictable political, social, economic or even technological changes and innovations may overshadow any of these mainstreams.

In this complex world of today, the Swiss Agency for Development and Cooperation as one of the most committed agents in global Sustainable Mountain Development (SMD) over the past 20 years, has commissioned a number of regional reports to assess achievements and progress in major mountain regions such as in particular Central Asia, Hindu Kush-Himalaya (HKH) and the South East Pacific, South and Meso America or the Middle East and North Africa (MENA). The Swiss Federal Office for Spatial Development (ARE) has commissioned - in the context of the Swiss Presidency of the Alpine Convention 2011/12 – a specific report on the Alps. In addition, UNEP has provided a separate report on Eastern Europe and started compiling a report on Africa's mountains.

The insights gained through these assessments in which key local, regional and global actors have been actively involved are meant to feed into a range of processes such as the UN Secretary General's High Level Panel on Global Sustainability (commonly referred to as 'GSP'), the preparation of the UN Conference in Rio 2012 and possibly the next cycle of the 'Commission for Sustainable Development' (CSD) or its possible successor structure. The present document is to be considered as a 'work in progress'. Hence the Organizers of the 'Lucerne World Mountain Conference' highly welcome inputs, feedbacks, and suggestions for further improvement.

## Nord Sud XXI

Nord-Sud XXI initial Inputs to the Drafting of the Rio+20 Declaration

Nord-Sud XXI respectfully calls upon States to consider the following in preparing the draft Rio+20

Declaration:

**1. The right to development should be reaffirmed** - This right has been reaffirmed consistently since

its declaration in UNGA Res. 41/128 in 1986, of which we celebrated the 25th anniversary in 2011. As

a leading principle of law guiding the work of the Rio Conference and reflecting the even stronger

consensus on this right today, it is appropriate to reiterate this principle

**2. Reaffirm the need for all States to take action based on the best available science to deal with the adverse impacts of climate change respecting the principle of common but differentiated responsibilities based on historical responsibility** - This basic principle is a foundation of the Rio Declaration and the treaties adopted as a consequence. For example, article 3, paragraphs 1 and 2

of the United Nations Framework Convention on Climate Change reiterate this principle for States in

regards to action to address the adverse consequences of climate change.

**3. Support the right to food and food sovereignty for all States and all peoples** – The right to food is a basic human right. All States must ensure it for their people and cooperate with other States who have difficulties doing so to ensure that they have the resources to do so. This duty requires also

that States take steps to ensure food security, including controlling speculation that makes food too expensive for all persons to afford.

**4. Reject forms of commoditization of human life and values** – All forms of carbon trading, including REDD and REDD+, should be vetted to ensure that they contribute to reducing aggregate greenhouse gas emissions and do not increase incentives to high emitters.

**5. Forums concerning development and environment should be made more inclusive** – environment and development forums, especially the UNFCCC bodies, should be more inclusive and enhance the participation and capacity to participate of developing countries and civil society, especially from developing countries.

**6. Decision making processes concerning environmental, developmental, trade related, and international economic financial matters should be democratized**

– It is no longer legitimate for decisions over these vital areas of international affairs that affect billions of peoples' well-being to be made in undemocratic forums with very limited and very unequal participation by States. A necessary condition of democratic decision making is a wide range of stakeholder participation based on common values and goals.

**7. Mechanisms should be created or existing ones should be made readily available to effectively protect individuals' human right to water** – The right to water has been recognized by the UN General Assembly, without a single 'no' vote. A focused effort should now be made to ensure its implementation.

**8. Poverty must be reduced by creating mechanisms of accountability for all stakeholders** – Both governments-towards their own people and as donors-as well as private actors must be held accountable for reducing poverty.

**9. War and other similar forms of coercion should be absolutely banned from international relations**

– The greatest threat to human development is the use of force or war and other forms of coercion including the use of sanctions, especially unilaterally imposed sanctions. These threats to human development must be eliminated and absolutely banned. Consideration should be given to begin the process of removing the United Nations' right to use force in any circumstance.

**10. Development assistance must be made more equitable** – Development assistance should be based on both current needs and the ability of more wealthy countries to contribute to needy countries as well as on the historical responsibility that some developed countries have for conditions of exploitation suffered by the people of less-developed countries.

**11. Education about the environment should be significantly enhanced** – Teaching environmental sustainability should be a requirement of all levels of education—primary, secondary, and tertiary.

**12. Local agriculture should be protected** – Small farms and peasant farmers should be protected and preserved because of they support community values and are usually contribute more to sustainable development.

**13. Development, agriculture, and economic activity should be made sustainable** – Governments should commit to ensuring that each of these areas of human activity are made sustainable. The formation of a high level accountability mechanism should be suggested.

**14. A sustained effort to achieve and build on the Millennium Development Goals should be ensured**

– States should commit to enhancing their efforts to achieve the MDGs and to building on their achievements even after 2015.

**15. Commitment to addressing the social determinates of health to achieve development** - The effort within the World Health Organization and by States as reflected by the 2011 Rio Declaration on Social Determinates indicates a commitment by States to tackling the social determinates of health in a manner that serves the wider goal of social development.

**16. The 'green economy' should be understood in the context of development and environmental sustainability** – States should commit to dealing with the issues raised under the heading of 'green economy' in a manner and by actions that are consistent with the sustainability of development and of the environment.

**17. Encourage a rights-based, people-centered approach to social development** – States should reflect the new international order that emphasizes human rights and the protection of individuals and peoples basic rights.

**18. UN Committee on World Food Security should be empowered to identify current food deficiencies and propose plans to address them** – States should empower the mechanism they created to address the food crisis ensuring that they do so taking into account to the views and concerns of small scale food providers and ensuring food security is enhanced.

## Northern Alliance for Sustainability

### Introduction

Next year, in June 2012, world leaders and civil society meet for the Rio + 20 conference. While the global economy faces increasing challenges and the planetary environment is under stress as never before, it is clear to us that these twin challenges must be tackled together. Rio + 20, with its' focus on the transition to a green and sustainable economy, offers a unique opportunity to make a new programme for genuinely sustainable development globally, nationally and locally. At present the lack of commitment to the Rio + 20 event from governments is alarmingly weak. We, as non-governmental organisations within global civil society, want to increase the engagement of governments while ensuring that discussions before and in Rio + 20 take a positive and forward-looking view of a global green economy and lead to real commitments and lasting change.

This paper is a contribution to this process. It sets out a set of goals and priorities for action by governments and others. It draws from many sources and discussions including the recent declaration from the UN DPI conference held in Germany in September 2011. We invite all organisations concerned for sustainable development and the success of Rio + 20 to discuss and support these goals.

#### 1) Commitment to Rio + 20

Despite some progress made since the UN Earth Summit in Rio in 1992, human-induced loss of biodiversity, global climate change, desertification, deforestation, acidification of the oceans, and many other problems continue.

The current economic model promotes unsustainable consumption and production patterns, facilitates an inequitable trading system, has failed to eradicate poverty, assists exploitation of natural resources towards the verge of extinction, and has induced multiple crises on Earth. The urgency to change the roots of our economic model has to be stressed. As civil society we want to promote fair and equitable sustainable development for all with respect for the limits of our common ecological and social capital.

We urge governments to send their Heads of State or Government with the commitment to End the Rio+20 conference with a roadmap and politically binding targets for each country to meet an agreed set of goals: the Sustainable Development Goals (SDGs) and agree on a strategy to achieve them. Agree on a set of principles, linked to the Agenda 21 principles, to frame the transition to a Green and Fair Economy.

## 2) The transition to a green and sustainable economy

We recognise that:

Our current economic models suffer from a series of market and institutional failures. It does not need reform but replacement. A true 'green' economy within a sustainable society requires policies that make the step from efficiency toward sufficiency. So far there is little sign that the technology and efficiency approach can lead to the reductions in the use and waste of both renewable and non-renewable resources on the scale that is needed to tackle climate change, biodiversity loss, detoxifying our environment and enable us to live within global limits.

The steps taken so far fail to meet the scale and urgency of the problems humanity is confronted with: as such the approach taken to achieve sustainable production and consumption so far has been too weak. We call for a stronger approach to sustainability. We need technological innovations and efficiency gains and we need to make them universally available but we have to recognise that these will never be enough to achieve an economy that stays within the limits set by nature and by the social capital we have.

We urge leaders to face the facts: if we really want to halt the path of destruction that we're still in, then we need this stronger approach to sustainability. That means we need sufficiency policies for countries that are currently consuming beyond global limits. We have to stop telling consumers that they need to consume more in order to save the economy. Despite agreements at Rio 1992 and Johannesburg 2002 there has been a clear failure to integrate environmental, social and development priorities into economic policies. Social engagement and other elements of "well-being" that are at the core of sustainable development are still not taken into account when making economic policy. We have to shift from economic growth and more consumption to more well-being for all and more equal opportunities to consume in ways that foster social values and stay within the limits set by nature.

We urge governments to:

Establish national roadmaps for a green and sustainable economy, based on the fair share of natural resources and CO2 emissions. Policies for sustainable and humane agriculture need to be an important part of this, given its fundamental importance with regards to food security, food sovereignty, livelihoods, human health, animal welfare and environmental impacts.

Establish on a global scale a set of Millennium Consumption Goals (MCGs) for the period 2012-2031 towards establishing an intergenerational right to equitable consumption opportunities. Over-consumption needs to be capped and gradually lowered in order to give the necessary environmental space for under-consumers to meet their basic needs. Rethink the financing of social security systems currently based on continuous economic growth, which perpetuate the crisis, and with this rethinking start to move towards an economic model that is grounded in sustainable development principles;

## 3) Improved and new forms of governance to enable that transition

We recognise that:

The crises we face are multiple and complex, and that existing institutions are inadequate to tackle these challenges to humanity. Changes will be needed at every level, but action at the global and intergovernmental level will provide critical leadership in this process of change.

We urge governments to:

Establish a global sustainable development coordinating mechanism and parallel institutions at the national level, empowered to pursue system-wide policy coherence for Bretton Woods and UN institutions to advance sustainable development principles, pathways, and policies in a coordinated manner. A Council of the UN General Assembly on sustainable development should ensure that governance for sustainable development is at the top of the UN agenda. Upgrade UNEP to the status of specialised agency in the UN system.

Upgrade the International Panel of the sustainable use of Natural Resources. To implement the MCGs and a "resource capped economy" this panel has to define the sustainable extraction limits on a series of resources and define the fair share of distribution/capping of these resources.

Establish an International Environmental Court to implement environmental justice on a global scale. Crimes against the environment should be considered as a criminal offence and should be treated as such by this court. End the criminalisation of environmental movements and activists where this is occurring. Establish an Ombudspersons for Future Generations at global, national and local levels, who will advocate for sustainable development. Serve as an auditor at the heart of governments and deal with citizens complaints. Develop regional or international conventions to take forward Principle 10 of the Rio Declaration to ensure access to information, public participation and access to justice in environmental decision-making. Develop a Precautionary Principle Convention to assess new and emerging technologies, armed with the legal power to ban technologies that put the planet at grave risk.

Develop and resource National Councils on Sustainable Development to drive the transition to green economies and develop a national sustainable green economy roadmap for each Member State of the UN by 2017. Other governance levels should do the same.

Recognise that meaningful coordination and participation processes among civil society organisations require reliable and stable resources; we therefore urge a steady increase in the funding for such processes achieves a better balance between core- and project-based funding.

Many of the specific points in this text are taken from the declaration of the 64th Annual UN DPI/NGO conference in Bonn (3-5 Sept 2011).

---

## Norwegian Forum for Development and Environment

### INTRODUCTION

In a 'renewed political commitment for sustainable development', ForUM strongly advocates that the Rio+20-conference shall be a new starting point for sustainable development, including the implementation of the goals drawn up in Agenda 21 in Rio de Janeiro in 1992, as well as ensuing resolutions. We emphasize the need to critically review the results of the outcome documents of Rio-1992, Johannesburg-2002 and the other major global summits leading up to Rio-2012.

We recognize that governments, institutions and other decision-makers of the world community have failed to solve the most urgent crises humanity has faced: armed

conflicts, growing disparities between nations, particularly between countries in the South and countries in the North, a worsening of poverty and hunger, continued and growing human-induced deterioration of the planet's ecosystem leading to loss of biodiversity, desertification, deforestation, acidification of the oceans and threatening levels of global warming and climate change.

We also recognize that the prevailing economic system and policies are major causes of social and ecological imbalances of the planet. The recent financial crisis and its enduring and deepening consequences for the world economy and for the worsening of life-circumstances for large parts of the world's population show that the current economic model has indeed been a hindrance for implementing the aims and strategies of Agenda 21.

We therefore welcome the initiative to focus on the transition to a green and inclusive, sustainable economy at the Rio+20-conference in June 2012. Such an economy must be in accordance with the definition of "sustainable development" as it was given in "Our Common Future" in 1987: "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs".

We are aware of the necessity to transform the dominating values from the ideals and goals of economic and material growth with excessive belief in technology and efficiency - to a growth in life quality independent of unsustainable consumption patterns and exploitation of cheap human labor. A "green economy" must be an "economy of sufficiency" for all.

We realize that social, economic and environmental developments are three spheres inextricably intertwined. A substantially transformed and green economy must therefore be aimed for increasing social justice, equity and healthy eco-systems.

We also recognize the urgent need to develop and strengthen the institutional framework for sustainable development including the governance of the implementation of the internationally agreed goals of sustainable development at all levels; nationally, regionally and globally - involving both women and men as well as youth.

As we recognize nature's limits as identified in The Nine Planetary Boundaries - and what she can endure concerning waste and pollution - we also recognize the huge potential capacity of individuals and of the human community in facing challenges and solving problems in a constructive way. This we want to see manifested in Rio de Janeiro in June 2012.

To meet the challenges mentioned, ForUM will point to the following:

#### FIRST AND FOREMOST

A main challenge for the immediate future will be to bridge the gap between rich countries and poor countries – as well as to bridge the growing gaps within countries. People living in poverty have the right to a decent livelihood including clean and affordable water, food, shelter, education, health-care and possibilities for unfolding cultural activities.

A green and inclusive economic growth in developing countries is necessary to achieve social justice and welfare for all.

The wealthy countries should declare their willingness towards the least developed countries (LDCs) to take responsibility for the socio-economic and ecological - including climate-related - debts that industrialized countries have accumulated in the past.

This implies a substantial transfer of financial and technological resources from the North to the South.

#### ON "GREEN ECONOMY"

A "green economy" has several goals; we highlight two:

- 1): To secure that production and consumption does not exceed the limits of the planet's ability to deliver its eco-systems' services and
- 2): to facilitate a just sharing of resources globally.

A green economy must be developed at the local, national, regional and global level. The bottom-up-approach will be of importance. The complexity of nature and the diversity of cultures demand a diversity of economic models.

We are concerned that the term "green economy" may be used as a means to "green-wash" unsustainable political and economic activities.

The rich countries owe the developing world support to increase and develop green production and processing of products. National markets in developing countries and these countries' opportunities on the world market must not be undermined by rich countries' export-subsidies.

A global green economy is about balance in the human community as well as in the ecosystems. The consumption within a number of areas must be reduced in the rich world, while it needs to be raised for people in poor countries and areas. Justice is about the just allocation of resources / benefits and the fair distribution of ecological footprint.

To achieve this, the Rio-conference should call upon governments to inter alia:

- Practice "green taxation";
- Phase out subsidies leading to negative environmental impacts globally, like subsidies to fossil fuels, bio-fuel and nuclear energy, chemical fertilizers and over-fishing etc;
- Donor countries should provide financial and technological support to developing countries in order to stimulate green economy initiatives;
- Eliminate developing countries' illegitimate debt.

For both North and South it is important to create new indicators of wealth creation, or what is known as "sustainable welfare" - to replace or complement the GNP / GDP – discourse. We therefore call upon all governments to:

- Support and further develop such initiatives as UNEP's System of Environmental and Economic Accounting (SEEA), Green Accounting or Inclusive Wealth Accounting. Such initiatives must be based on appropriate domestic and fiscal measures and policy reforms.

#### ON "GREENING OF THE FINANCE SECTOR"

The transition to a green and inclusive economy requires a thorough reform of the financial sector. The financial economy must be a tool that serves the real economy. The Rio+20-conference should take the initiative to implement restrictions on that part of the financial industry that engages in speculation - often under the name of "investments". Speculation in basic human needs such as water, food, land, minerals, health care etc. must be prevented through the states' control or regulation. The introduction of tax on financial transactions can help limit speculation and provide funds that can be allocated to key areas of development - especially in the South.

The Rio+20-conference should therefore call upon governments to:

- Ban speculation on water, food, land, minerals, health care and other human basic needs;
- Restrict investments in financial instruments not related to real commodities and services;
- Urge all governments to establish a Financial Transaction Tax.

Developing a financial sector serving sustainable development is demanding and will require strong efforts in which representatives from governments, the economic and financial sector and civil society must come together as equal partners. This should take place at national and international levels.

We therefore urge the Rio-conference to:

- Initiate and establish an international platform for the research and development on how to cure the financial system.

#### ON ENERGY

Populations in poor urban and rural areas shall all have equal access to modern, renewable and affordable energy. We recognize the poor countries' need to substantially increase per capita energy consumption in order to combat poverty.

Rich countries dependent on finite energy resources must reduce their energy consumption, enhance energy efficiency and change to renewable energy forms.

The Rio-conference should call upon the world's governments to:

- Set clear targets for universal energy access and an increase in energy supply from renewable sources;
- Develop low carbon energy plans;
- Support the research on and development of green energy technology;
- Support the development and production of green and renewable energy through tax incentives, feed-in tariffs, subsidies etc.

#### ON AGRICULTURE AND FOOD SECURITY

A sustainable, small-scale farming adapted to ecological conditions is a major solution to environmental and social imbalances as well as lack of food security. Building upon the document "Time to act" we call on governments to:

- Ensure that agriculture in all its dimensions be a core issue at the UN CSD in Rio and subsequently in global policy and practice;
- Give strong and increasing support to small scale, agro-ecological and other forms of sustainable, ecological food production;
- Commit the UN – in 2012 to a negotiating process leading to an international technology assessment (bio, nano and geo-engineering) and information mechanism that strengthens national sovereignty and choice and respects the Precautionary principle and builds the capacity of developing countries and communities to assess the health, environmental, economic and social impacts of new and emerging technologies;
- Underline that the principle of common but differentiated responsibilities must be respected. That industrialized countries should pay their ecological and climate debt to developing countries, including payment for damages caused by their historical greenhouse gas emissions.
- Set robust targets to address inefficient and unsustainable use of water.

#### ON GOVERNANCE

The Rio+20-conference should encourage governments to adhere to the principles of participation, accountability and transparency concerning decision-making in the fields of environment and sustainability. We therefore call on governments to:

- Support initiatives to upgrade Principle 10 of the Rio-principles (1992) to a framework convention on global and regional levels.

ForUM also supports a number of initiatives for strengthening the institutional framework for sustainable development at global level. We therefore call upon governments to:

- Strengthen and upgrade UNEP to a "specialized agency";
- Establish a Council on Sustainable Development on par with the Council on Human Rights (UN HRC);
- Provide a mechanism within the Council on Sustainable Development to deal with emerging issues;
- Develop a framework convention incorporating the Precautionary principle dealing with new and emerging technologies, bio-engineering and nano-technology;
- Develop a framework for including sustainable development as an integral part of the curriculum of educational systems at all levels.

---

## nrg4SD - Network of Regional Governments

North and South Subnational Governments committed to Sustainable Development consider that:

In terms of a reformed Institutional Framework

1. Any future institutional framework for sustainable development should be deeply rooted in the principles of multilevel and multi-stakeholder governance in order to allow for interaction, synergy and complementarity between all levels of governments in the elaboration and implementation of sustainable development policies and to encourage ownership of the challenges and the opportunities of sustainable development by all sectors of our societies. Adequate institutional frameworks should be based on the principles of coherence and coordination; transparency and accountability; participation and flexibility and; science base for policy making.

2. A clear territorial dimension should be considered in international sustainable development policies and therefore be coupled with adequate implementation resources and

governance tools at subnational level as a condition for obtaining results on the ground.

3. A new category of "Governmental Stakeholders" should be introduced among the observers accredited to UN processes in order to recognise the governmental nature of Federated States, Regions, Cities and Local Authorities and fully unfold their contribution to international negotiations and policies on sustainable development.
4. An institutionalised multilevel governmental dialogue should be put in place between UN institutions, UN Member States and "Governmental Stakeholders". The mechanism of such a dialogue should be part of the Rio+20 redesigned institutional framework, and enable subnational governments to contribute to the design of global policies on sustainable development.
5. The active participation of civil society stakeholders in international negotiations in a representative and relevant manner should be guaranteed and encouraged by all levels of government.
6. The UN Environment Programme UNEP should be strengthened and upgraded to a fully resourced Specialised Agency with a comprehensive mandate covering all international sustainable development instruments and focusing on mainstreaming sustainable development concerns into UN bodies; centralising all sustainable development initiatives and relevant existing bodies within the UN as well as the liaison with an independent intergovernmental group of sustainability experts; consolidating information, and knowledge; putting forward proposals for international binding measures, and alerting the international community about breaches of SD policies and instruments. This Agency should be vested with a strong monitoring and control system.
7. The UN Commission for Sustainable Development (UN CSD) should be upgraded into a Council and have a stronger monitoring and control mandate, including the elaboration of recommendations to UN members and the scrutiny of the initiatives of any UN body related to sustainable development.
8. An independent Intergovernmental Group of Sustainability Experts should be established in order to further encourage research, development and innovation in the field of sustainable development and to move towards innovative integrated and standard approaches, parameters, indicators and tools for sustainable development which are based on shared initiatives and intergovernmental expertise.
9. The international community should move progressively towards the establishment of a fair and transparent international environmental jurisdiction.
10. Independent, multi-stakeholder, multilevel and fully resourced sustainable development commissions should be created at national level within the possibilities of their respective jurisdictions and encouraged at subnational level. They would constitute an asset for the elaboration of inter-ministerial over-arching sustainable development strategies and for the compliance of public policies with sustainable development goals; while they would help reduce other negative impacts of policy fragmentation.

In terms of a Green Economy in the context of Sustainable Development and Poverty Eradication (SDPE)

11. A transition towards a Green Economy in the context of SDPE shall be framed in the wider and sole goal of opportunities and encouraging a progressive paradigm shift in our societies capable of harmonising sustainable and inclusive economic development, responsible sustainable consumption and production (SCP) patterns, decent and green jobs efficient use of resources, energy efficiency and use of renewable energies, quality of life for all citizens, access to food, water and energy for all, intergenerational solidarity, access to information and participation by all sectors, environmental protection and conservation, ecological services of ecosystems and biodiversity and the resilience of our communities to climate change.
12. All levels of government should make further progress in the development of collaboration and partnerships mechanisms between the public and private sectors. The transition to a more sustainable pattern of development does not only represent a problem but, on the contrary, offers a whole series of opportunities particularly when environmental improvement and the generation of economic and social value added are considered in terms of potential synergy. The opportunities must be made use of through appropriate measures in the fields of economic policy, education and social change; the creation of alliances between employment policies and environmental policies
13. Crucial for a Green Economy in the context of SDPE is the maintaining and development of local frameworks. Further support and redevelopment of local markets will be key to achieve sustainable development and especially to eradicate poverty as these local market chains provides sustainable income at the lower level, and indirect benefits (reinforcement of the communities, financial resilience, and reduction of the environmental impacts).
14. A Green Economy in the context of SDPE can only constitute a tool for sustainable development and poverty eradication provided transparent and widely supported drivers, criteria and monitoring, reporting and verification systems are identified. Innovative and integrated parameters that go beyond the Gross Domestic Product GDP indicator and that guarantee a territorial dimension will be vital to a Green Economy capable of securing sustainable development and eradicating poverty.
15. UN member states and UN bodies should make full use of the contributions of subnational governments as key enablers to a transition to a Green Economy in the context of SDPE. These contributions consist namely of regulatory competences; long-track experience in elaborating territorial economic strategies in close collaboration with other levels of government and academia, civil society or private sector actors; prioritisation of public investment in their territories in areas that stimulate green economic sectors; subnational fiscal and market-based mechanisms to promote green investment and innovation; subnational green and ethical public procurement policies; community-based capacity building; training and education initiatives, and international solidarity initiatives.
16. Networks of local and regional governments can help the exchange of experiences, good practices and knowledge on a global scale to facilitate policy making for a Green Economy in the context of SDPE. These can help to build capacity and adequate bottom-up policies, based on local priorities and circumstances.
17. Sustainable development compliance should be integrated in all international, national and subnational policies for economic competitiveness and guaranteed for initiatives funded by any UN bodies.
18. Further efforts should be made to adopt innovative international financing mechanisms for sustainable development accessible to all levels of governments.

In terms of Other Topics

19. As more and more land is converted to urban uses and more and more citizens live in urban agglomerations, the patterns that this development assumes within a territory and its inter-connection with the subnational/regional level will have far-reaching effects on sustainable development goals. A city-region approach to the articulation of a territory in a sustainable manner becomes as essential as ever to achieving sustainable development goals on the ground.
20. These urbanisation pressures call for particular attention to rural sustainable development and rural-urban linkages in the elaboration and implementation of sustainable development policies.
21. Gender policies will be key to sustainable development goals and gender conditionality should be considered in sustainable development initiatives funded by UN national and subnational governments or UN bodies.
22. Access to education for sustainable development constitutes a must for social transformation in the North and poverty and inequality eradication in the South, as well as

favouring sustainable human development, intergenerational solidarity, North-South interaction and democracy. For all these reasons, access to sustainable education should be taken into account while designing children education programmes from an early age, as well as into a wide range of relevant professional and vocational training fields.

23. Efforts should be made towards the elaboration of a new language for sustainable development matters based on a multidisciplinary approach, and capable of communicating the new challenging as opportunities, as well as of capitalising on new communication technologies.

24. New international conventions shall be elaborated on management of international waters and the seabed and the participation and information in the field of sustainable development (Rio Principle 10). The latter could be easily achieved by enlarging the scope of the Aarhus Convention.

25. Further efforts should be made by the international community in order to further streamline the principles of sustainable development into the Breton-Woods system. This should encompass the adoption of international financing rules for sustainable development; the effective allocation and commitment of 0.7% of GDP of developed countries to Official Development Assistance (ODA); the establishment of a Financial Transaction Tax (FTT), and the allocations of its revenues to low carbon projects. Commitments to phase out inefficient fossil fuel subsidies (eg. G20 and APEC) should be expanded to include all UN Member states.

#### In terms of Outcomes of the Conference

26. An ambitious, firm, transparent, fair and comprehensive political outcome on a renewed commitment to sustainable development that embraces the Millennium Development Goals MDGs is necessary and possible.

27. It should be accompanied by verifiable objectives, roadmaps and timescales, adequate resources and governance tools at relevant levels of government.

28. The future Institutional Framework for Sustainable Development must be deeply rooted in a multistakeholder and multilevel governance approach, encompassing innovative participatory mechanisms for stakeholders while fully recognising the governmental nature of subnational governments.

29. new category of "governmental stakeholders" should be introduced among the Aobservers accredited to UN processes in order to recognise the governmental nature of Federated States, Regions, Cities and Local Authorities and fully unfold their contribution to international negotiations and policies on sustainable development.

#### Subnational Governments – Key governmental actors in the Sustainable Development Institutional Framework

In essence, nrg4SD and its members believe that the current name of the Major Group "Local Authorities" is too restrictive and unrepresentative of the governance structure of many UN Member States. "Referring to stakeholders of strictly governmental nature as NGOs fails to reflect the variety of subnational governmental actors and constitutes a missed opportunity to capitalise on the local knowledge, wide array of competences and strong leadership inherent to the governmental nature of Federated States, Regions, Cities and other Local Authorities - all of which work in full complementarity and synergy among themselves and also with national governments and international organisations. The Rio +20 Conference should therefore take this opportunity to reflect on the evolution of Major Groups since 1992 and introduce a new category of "governmental stakeholders", which could regroup Federated States, Regions, Cities and other Local Authorities.

Since the Rio Summit in 1992, when stakeholders were given a voice through the establishment of Major Groups by the UN, subnational governments all over the world have been fully involved in sustainable development processes and have demonstrated in a number of ways - for instance via Local Agenda 21 initiatives - that their contribution and leadership is essential to help achieve the ultimate objectives of sustainable development. The concrete initiatives of subnational governments have significantly evolved over the past years and shown that the efforts and initiatives of a country become stronger when transposed and complemented by subnational governmental stakeholders such as Federated States, Regions, Cities and other Local Authorities.

Twenty years ago, the idea of referring to any stakeholders different to the State that sit in the UN as "Non-Governmental Organisations" (NGOs) certainly allowed for structuring and channeling the participation of various stakeholders in the incipient sustainable development process under a set of Major Groups. However, nowadays, referring to stakeholders of strictly governmental nature as NGOs appears somewhat as an intrusion in the very much needed space for Civil Society within the sustainable development process. It also constitutes a missed opportunity to capitalise on the local knowledge, wide array of competences and strong leadership inherent to the governmental nature of Federated States, Regions, Cities and other Local Authorities. Last but not least, the current name of the Major Group "Local Governments and Municipal Authorities" is restrictive and fails to reflect the variety of subnational governmental actors – from Cities and Local Authorities to Federated States and Regions - that work in full complementarity and synergy between them and with national governments and international organisations. As a matter of fact, Federated States and Regions can play a pivotal and strategic role in the articulation of synergetic multilevel governance in their respective territories. But today, they do not even feature clearly in the current Major Group structure.

In this context, subnational governments believe that the Rio +20 Conference should take the opportunity to reflect the evolution of Major Groups since 1992 and introduce the category of "governmental stakeholders" among the accredited observers to the UN system. This category should regroup Federated States, Regions, Cities and other Local Authorities. In addition to the strengthening of a governmental stakeholders group, a thorough multilevel approach towards an institutional framework and policy making is important to establish the role of subnational governments.

It is worth noticing that the notion of "governmental stakeholders" is not new to the UN system but comes directly from recent developments within 2 Rio Conventions. At their last meeting in October 2010 in Nagoya, the parties of the UN Convention for Biological Diversity (UN CBD) adopted Decision X/22 endorsing the Plan of Action for Subnational Governments, Cities and Other Local Authorities. The Decision invites Parties to involve Subnational Governments, Cities and other Local Authorities when revising their national biodiversity strategies and action plans. Besides, the Plan of Action establishes Advisory Committees of Cities and of Subnational Governments. Furthermore, in December 2010 in Cancún, México, the Parties of the UN Framework Convention for Climate Change (UNFCCC) adopted the Cancun Agreements, which recognises in paragraph 7 - a first in an UNFCCC official agreement - subnational governments and local authorities as key „governmental stakeholders" in all aspects of global climate change efforts.

Subnational governments believe that the inclusion of a territorial dimension in all international sustainable development policy, coupled with adequate implementation resources and governance systems at subnational level, will be central to achieving solid results on the ground.

The economic, social and environmental challenges our societies are facing are crying out for multilevel and multistakeholder governance adapted to the modern times. Thus, we call for the creation of innovative participatory mechanisms allowing stakeholders a more direct role in policy making. A true multilevel and multi-stakeholder Institutional Framework for Sustainable Development will help turn the current and emerging sustainable development challenges into opportunities. In addition, it would facilitate discussions between UN institutions, UN Member States and "Governmental Stakeholders" on the design of international policies on sustainable development, hence enhancing subnational governments' contribution to international negotiations and the successful territorial implementation of international policies.

#### Subnational Governments – Key enablers of the transition to a Green Economy for SDPE

At a wider international level, subnational governments have a significant role in establishing the enabling conditions for a green economy outlined by UNEP's Report. Their contribution to these enabling conditions is outlined below in more detail. Subnational entities are often responsible for the implementation of national and international

policies, including policies related to sustainable development. They often constitute spatial and cultural entities that have a significant and coherent impact.

Establishing sound regulatory frameworks – Subnational governments have regulatory competences essential to vertebrate their respective territories from the social, economic and environmental point of view. This leads them to elaborating general economic and sustainable development strategies, as well as thematic ones on climate change, waste or social inclusion for instance. Subnational governments have long-track experience in elaborating these strategies in close collaboration with other levels of government and with actors from the academia world, civil society or the private sector.

Prioritising government investment and spending in areas that stimulate the greening of economic sectors – Thanks to their regulatory, budgetary and often fiscal competences, subnational governments can steer public investment to green a wide range of economic sectors and also influence the market. Competences in the area of public procurement and public provision of services allow subnational governments to incorporate not only economic but also environmental and social parameters in this field. This can set market trends and accelerate the market penetration of certain sustainable services and goods.

Limiting government spending in areas that deplete natural capital - Because of the above-mentioned competences, subnational governments can help national governments phase out subsidies with negative impacts on sustainable development or on the profitability of green investments. Also, a detailed knowledge of their respective communities is an asset in order to structure subsidy reforms that do not entail negative consequences to the poorest communities.

Employing taxes and market-based instruments to promote green investment and innovation – Subnational governments are able to influence the private sector behaviour through financial incentives and disincentives and green taxation. They can also contribute significantly to internalise the value of ecosystem services into the economy. Often they do provide incentives to the private sector and forge partnerships with it to accelerate the innovation, development and diffusion of environmentally sound technologies. These mechanisms can encourage long-term investments in infrastructures – for instance in the fields of sustainable mobility and renewable and efficient energy systems – that otherwise would not be viable. At the opposite end, subnational governments can discourage unsustainable industries and practices by means of restrictive authorisation policies and heavier taxation.

Investing in capacity building, training and education – Subnational governments, like national governments, are well positioned to tap into the reservoirs of engineering and manufacturing firms, as well as academic and research institutions, that are operating within their territories to encourage the sharing of scientific and technological skills and know-how with developing countries. Moreover, subnational governments can enter into cooperation agreements with private sectors companies that hold green or low-carbon technology patents and proprietary rights that can be offered to developing countries.

Subnational governments constitute social cultural entities. Their closeness to citizens and experience in working directly with other stakeholders, creates a pivotal position for raising awareness, providing public information on the environmental and social costs of certain practices, giving expert advice and counselling, and involving a range of stakeholders in the complex process of changing behaviours and production and consumption patterns.

It should be highlighted that subnational governments are involved in the international system of development cooperation and they orient their public policies in this field towards the Millennium Development Goals. Through development cooperation, subnational governments act as privileged hubs for implementing initiatives of co-development, and deepening democratisation and alignment processes. In conclusion, subnational governments are ultimately an active part of a new inclusive multilateralism for sustainable development.

---

## Nurses Across the Borders Nigeria and SeaTrust Institute USA

a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

Rio+20 provides an opportunity to reinvigorate multilateralism in sustainable development through reversing what has gone wrong over the last 20 years. Taking advantage of this opportunity requires specific recommendations that equate to actions and an epistemological shift that balances and integrates sustainability's three pillars in a repair of the structural flaws in the UNFCCC/Kyoto model that has led to a misunderstanding of the nature of climate change between 1985 and 2009. The changes required, particularly in the face of the policy and monetary capital supporting the current challenged process requires examining past successes for guidelines that can be integrated within today's context to bring greater equilibrium to a process that now focuses on market and technology at the expense of both people and the environment.

To achieve the goal of a working multilateral process that continues to engage the countries that mostly contribute to emissions, those that will continue to increase their contributions, and those that will be most affected by the outcomes of climate change means forging incentives for all to continue to meaningfully participate in crafting the incremental solutions rather than artificially constructing an unenforceable legal structure upon an already fragile system. The ultimate goal should still be a comprehensive and binding global climate change agreement but to get there, reaching both within and outside of the UNFCCC may prove more effective to getting real results in real time. Recalling the comments of Mexico's Foreign Minister Espinoza at COP16 in Cancun in the face of a single country's challenge to an agreement by the other 194 members, consensus is not unanimity. Even with such official statements, the UNFCCC process as consensus diplomacy faces serious challenges and there is mounting evidence that collaboration may move processes more effectively by creating conditions that encourage rather than preclude, and that retain key countries rather than driving them to disengage from the issues of climate change and from the regime.

Consider:

- The Montreal Protocol ; is a frequently cited example of multilateral success. Like the UNFCCC, it is a framework with vague objectives and no specific obligations for its signatories. Its hallmarks are the capability for rapid modification to incorporate developing scientific information and technical advances with the ability to incite credible regulatory commitment. In accommodating alternatives developing out of science to promote effective public policy, it spawned successor agreements and removed competitive advantages for non-parties. Despite its differences from the UNFCCC, potentially transferrable factors that led to success include trade-related environmental measures, built-in flexibility for risk and uncertainty, and its provision of specific guidance on engaging developing countries. Other good practices that break down rather than reinforce barriers to sustainability goals, reduce transaction costs and increase legitimacy should be referenced as starting places for structuring the Outcome document.
- Trust is a prerequisite to durable legally binding agreements. Rebuilding confidence and trust in the regime is served by eliminating arbitrary divisions between countries, sectors and within systems to increase flexibility to changing science, political and economic systems while supporting incentives and reordering priorities that put people and the environment on a par with market systems and technologies.

b. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

Many of the current proposals are exclusionary of other goals. Many if not most rely on market mechanisms as the overriding primary indicator. Adopting a "both/and" approach instead of "either/or" assumptions allows bottom-up to meet rather than compete with top-down efforts. Both are needed, but need to be reinforcing of the basic

tenets of sustainable development that expose the limitations of relying almost exclusively on financial arrangements and technology funding that relegate the protection of the Earth and human welfare to the equivalent of a business plan calling for a commodification of the commons. This requires redefining the "green economy" as a fundamental principle of sustainability in human and environmental terms that include a definition of global public goods and a vision of attaining a high quality of life for all .

Some reasons why current approaches are divisive and ultimately unsuccessful are that they privilege economic methods, metrics and techniques over knowledge co-generation through asymmetrical collaboration such as what has been shown to be effective between indigenous communities and biologists in co-managing natural resources .

Working at this type of knowledge interface of cultures, disciplines and interests involves people at the community level in policy-relevant participation, in gathering data, interpreting expert opinions within local contexts, and direct participation in national level discourse that transcends sectoral priorities and offers suggestions that can be replicated in other global locations through integration into the UNFCCC structure. What is needed is to enhance the sustainable development concept with appropriate new indicators. The universal and measurable indicator of human health in action frameworks, which is evidenced in successes and failure metrics by agriculture, disaster risk reduction, energy, climate change, trade and labor policies among others, the pillars of sustainable development are aligned with appropriate attention to the social and environmental values that operate to support healthy global economies.

c. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.)

The goal of implementation is to make practical, not merely rhetorical progress. Rigid processes that impede this goal need to be restructured with priority given to institutional development that allows for the legal framework to evolve within the institutional processes, and including the full range of appropriate actors in policy development and implementation.

- The previous two Earth Summits, the United Nations Conference on Environment and Development (UNCED ) in 1992 and the World Summit on Sustainable Development (WSSD ) in 2002 together with the Convention on Biological Diversity's (CBD) Aichi Biodiversity Targets, the Hyogo Framework for Action 2005-2015 and the Millennium Development Goals (MDGs) provide a framework for achieving sustainable development. Implementation has been incomplete and many gaps remain in areas ranging from human health, to disaster reduction, migration and the oceans. For example, the Millennium Development Goals (MDGs) could achieve a renewed prominence through integration with other sustainable development initiatives. The current MDG framework does not address growth or governance in its 60 goals for peace, development, the environment, human rights, the vulnerable, hungry, and poor, Africa, or the United Nations. Rio+20 is an opportunity to link the MDGs to Sustainable Development Goals and establish targets beyond 2015. Similar opportunities exist with other actions and frameworks.

- Pushing the legal framework in advance of institutional revisions weakens an already brittle structure. Strength, stability and binding authorities must develop rather than launch prematurely offering incentives such that no state benefits from withholding and no state accrues benefits by failing to comply.

- A more flexible process requires a restructured interaction among policy actors to reflect the interdependence between local, national and multilateral processes. NGOs, frequently cited as the most effective local implementation agents for poverty eradication, education and capacity building, adaptation and disaster reduction and relief, need direct and specific support from the multilateral system and from governments rather than being considered either competitive or a "necessary inconvenience." Directly involving civil society in setting policy as well as in local implementation of action supports prioritizing institutional development over the development of a legal framework - a necessary requirement to rebuild trust. It also gives local interests a voice in any policy as NGOs can represent those interests more authentically than governmental bodies whose foci are often sufficiently (and often appropriately) different from the local community.

d. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Unavoidably, the necessary partnership development and trust building processes take time and while immediate action on climate change is critical, avoiding a process breakdown through intractable conflict and stalemate requires taking the time to develop meaningful inclusion. This is true at national and multinational levels. To address the immediate requirements for action while rebuilding workable multilateral processes, new and borrowed mechanisms can be engaged to move climate change mitigation and adaptation action forward while building flexibility, inclusion and incentives into the multilateral UNFCCC/Kyoto process that allow for its continuation and evolution. For example, the following could be considered singly or in combination:

- Building bridges rather than artificially separating trade and climate change communities; incorporating learning from international trade law lessons about the fragmented and cyclical nature of international laws to create climate change incentives comparable to the drivers of trade negotiations, possibly through inserting climate change chapters into RTAs (regional trade agreements) which move faster than multilateral processes. RTAs could include geopolitical and security interests for conclusion of regional climate change agreements.

- Convening groups of countries for bilateral and regional climate change agreements and purposefully including the diverse range of institutions now relegated to non-decision making (like the Civil Society Organizations) in current regime complexes . Incorporating successes and working mechanisms into combined multilateral standpoints that reward political support for climate change action, discourage free-riding, and leverage actions such as RTAs with strong commitments for GHG emissions, health and adaptation commitments.

- Linking sustainable development to poverty reduction, considering differentiating responsibilities by GDP, per capita GDP, total emissions, per capita emissions and population/environment interrelationships in bilateral and mini-lateral actionable decisions building towards multilateral agreements.

Conclusion:

The current Kyoto Protocol is a top-down agreement that has proven to be very rigid. It is dominated by market mechanisms with insufficient regard for social and environmental values and methods. With complementary climate agreements, it could transform from what many see as the only structure providing a legal basis for climate change action into a more workable system within our emerging multi-polar world. Trade and climate change in cooperative alliance can act together to dissolve arbitrary barriers and include the appropriate actors at the right points in the process for swift and durable movement. Concepts like variable geometry (also known as enhanced cooperation) can enhance and make the UNFCCC more viable, more realistic, and more trusted .

Successful policy interlinks efforts to address ecological, social, economic and cultural issues. It interweaves local and regional actions with regional, national and multilateral processes and agreements which can become permanent and binding, yet flexible.

---

## Observatorio Mexicano de la Crisis

INTERNATIONAL DIALOGUE ON OUR WAY TO RIO+20

A contribution from Mexico's civil society

February 2011

Observatorio Mexicano de la Crisis A.C.

## INTRODUCTION

Due to the importance of Green Economy in Rio 2012, and as part of the International Green Economy Dialogue the Observatorio Mexicano de la Crisis (Mexican Observatory of Crisis) hosted an event together with the Mexican Environmental Ministry on February 3rd 2011. Up to forty experts from academia, civil society, government and the private sector participated in this event.

This document includes the results of this debate in order to contribute both to a strategic vision on green economy and to the design that is coherent both from a developed and emerging economies perspective.

The present document covers three main aspects of a Green Economy Strategy: priorities of a Green Economy strategy for Mexico, production, consumption and trade and public policy.

## PERTINENCE AND SCOPE OF A GREEN ECONOMY STRATEGY

There are important factors that need to be taken into consideration to promote a Green economy strategy, first the costs of business as usual need to be clearly stated both at the environmental and economic level. This means not just addressing each issue independently but also understanding interconnecting aspects and their impact.

The scope of the strategy also needs to define the extent of the reform process, but mostly it needs to be understood as a way to further a more comprehensive agenda, as the one set by sustainable development (equity, rational natural resource management and the needs of the present without compromising the ability of future generations to meet their needs) in which social aspects and pro-poor initiatives can be preserved and continued. In this sense, even when this is mainly an economic strategy, for its implementation it will be necessary to take into account other efforts made throughout the years, in different countries and by other international agencies inside the framework of sustainable development and the MDGs, i.e The Marrakech Process.

It is also important for the Rio Summit to be clearly understood as the beginning or continuation of an ongoing process that will require a set of environmental, political, policy, social, economic instruments to be designed, discussed and applied by each country. Therefore it is mandatory that the Summit is attended by Heads of State and/or Government, to state their commitment to these efforts.

## THE CHALLENGES OF BUSINESS AS USUAL

Considering the case of Mexico it is clear that a different growth pattern will be helpful to face current environmental, social and economic challenges, such as: Climatic impacts on land use, on biodiversity, irrational use of natural resources and water sanitation, waste management, and non-sustainable patterns of energy consumption.

Regarding social aspects like inequality, unemployment, underemployment and increasing violence. Economic issues including lack of competitiveness, low levels of taxation, lack of innovation, non-dynamic internal market. Even when, these challenges can be originated by different circumstances they end up being interconnected so they require comprehensive solutions that can work at the local, regional and national levels.

## II. PROMOTING THE TRANSITION – GOING BEYOND THE STATUS QUO

Currently, there are in Mexico policies which go against the promotion of an environmentally friendly economic growth, such as:

Policies and programmes for the agricultural sector that promote single-crop farming, migration and polarization among rural and urban areas. Therefore it is necessary to consider integrated policies that will help recover traditional forms of production and property that will restore both agricultural productivity and social structures and the quality of life in rural areas.

Increasing subsidies to urban areas promotes migration from rural communities, as well as centralization and concentration in big cities. It is necessary to recognize the real cost of living and services provided to cities, which can be reflected as an ecological foot print tax. MAKING CHANGE POSSIBLE – THE ECONOMICS AND THE POLITICAL ECONOMY OF STRUCTURAL ADJUSTMENT

In terms of political economy, there will be many adjustments to be made in order to promote a new strategy. As there will be winners and losers in the short run it is necessary to establish the means of dialogue in which rules an agreements can be defined, negotiated and accepted by different players. Therefore, it is strongly recommended that some of these instruments can be included in the policy toolkit. In the case of Mexico, these are some of the areas in which it will be necessary to pay attention:

There are no public policy instruments to promote a Green economy oriented industrial sector.

It is also necessary to create incentives to further change in production, even to consider the substitution of the current production line to a circular process to reduce waste. Emphasis should be place on innovation, training and human resources development.

National green clusters can be promoted by using integrated public policy instruments that will foster innovation and strategic sectors. Diversified industries are needed, as well as programmes to attract small and middle size producers into new green sectors. This will help provide the green economy strategy with an instrument to promote equality at the social level.

As one of the main components of the strategy is to understand the way in which Green economy can work in favour of development, in the case of Mexico it will be useful to have access to technology transfers that will help create value chains and clean industries without reproducing non sustainable international patterns of trade or macroeconomic disturbances.

Education is important in terms of promoting a new culture, which is not just respectful of the environment but also willing to shift consumption patterns and lifestyles.

Consumers need to be aware of the environmental impact of their choices. In this sense, "green purchases" from big buyers as the government, universities and retailers can be an important incentive.

A strong communication strategy needs to be implemented at each stage so governmental and private institutions can be able to inform the general public about the benefits of products, policies and decisions both in economic and environmental terms. Best practices catalogs and successful experiences can be used as a powerful instrument to communicate this message.

Any new strategy will need to be accompanied by strong transparency, accountability and social participation instruments, as well as other means to prevent corruption.

#### MEASURING PROGRESS

Any measure towards the implementation of a Green economy Strategy needs to take into consideration the social dimension and effects of policies, both in terms of costs and benefits.

It will be important to advance on the design and inclusion of indicators to measure the environmental benefits of specific projects and initiatives.

Green taxation needs to be promoted with clear goals and objectives as part of the whole strategy, and must include follow-up and performance indicators.

#### DELIVERING ON GREEN ECONOMY

The design and implementation of a Green economy Strategy needs to take into account the need for mainstreaming development and in particular social concerns. Considering, previous experiences in which growth was not necessary a prerequisite for development, but a source of new problems by ignoring prevailing social inequalities. Hence, policy recommendations must integrate equality, inclusion, economic, environmental, social, development and innovation issues. Together with institutional arrangements for planning and definition of regulation instruments that will promote green economy in an integrated fashion, including different ministries and levels of government and stakeholders.

Nevertheless, as mentioned before, the Green Economy Strategy must not be considered as a replacement for sustainable development which still has much to offer for developed and developing countries alike.

Finally, all the participants in this exercise (experts and interested parties in the field) will like to thank the UN for the opportunity to contribute with their insights and will be looking forward to participating in future stages of Rio+20.

---

## Oceana - Protecting the World's Oceans

The signatory non-governmental environmental organizations, Oceana and the Natural Resources Defense Council, representing over 1.8 million members and online activists from around the world would like the 20th United Nations Conference on Sustainable Development to address the emerging threat of ocean acidification to marine life, ocean-based resources and the people who are dependent on them. To solve the problem of ocean acidification we encourage aggressive reductions in carbon dioxide emissions from the international community, a major initiative to create fully protected marine reserves, and the establishment of an international network of monitoring stations to better understand and adapt to changes in marine life from a more acidic ocean.

#### Threats from Ocean Acidification

Currently, human activity - through the burning of fossil fuels - is changing the basic chemistry of our seas at an unprecedented rate, making them more acidic. As atmospheric CO<sub>2</sub> has risen, the oceans have become 30% more acidic over the last 150 years (Caldeira and Wickett, 2003). Scientists predict an increase in acidity by approximately 150% by 2100, if we continue to pollute as we are now (Caldeira and Wickett, 2005; Feely et al., 2004; Orr et al., 2005; Doney et al., 2009). This will have far reaching consequences for life in the seas which could lead to widespread social and environmental costs (Turley and Boot, 2011).

Rising ocean acidity reduces the availability of carbonate, a critical component of shell or skeleton building for animals like clams, oysters, mussels, plankton, and coral (Fabry et al., 2008). As atmospheric CO<sub>2</sub> rises, the oceans could become corrosive enough to literally dissolve shells, and potentially threaten populations of these animals. Without significant reductions in carbon dioxide emissions, ocean acidification could affect marine food webs and lead to substantial changes in aquaculture and fisheries, threatening protein supply and food security for millions of people as well as the multi-billion dollar global fishing industry (Monaco Declaration, 2009)

By mid-century vast ocean regions may become inhospitable to coral growth and reefs are expected to erode faster than they can grow (Hoegh-Guldberg, 2005). Regions dependent on healthy coral reefs for fisheries, tourism, and storm protection are at high risk. Ocean acidification will be especially challenging for coastal and small island developing nations that are highly dependent on ocean based protein and resources, which currently lack the capacity to adapt to these changes (Cooley et al., 2011).

#### Reducing Carbon Dioxide

The important actions taken in the next several decades regarding carbon dioxide emissions will influence the pH and the health of our oceans for thousands to millions of years into the future. The primary solution to worldwide ocean acidification is dramatically reducing carbon dioxide emissions, which is also a key strategy in solving climate change. However, many governing bodies like the United Nations Framework Convention on Climate Change (UNFCCC) are focused only on mitigating climate change which involves overall reductions in greenhouse gases, potential geo-engineering projects, and a limitation of 2 degrees Celsius increase in global average surface temperature. Even if climate change goals are met, the changes to the oceans' pH could be detrimental to many forms of marine life, ocean-based economies and cultures. The international community must focus on reducing carbon dioxide emissions to effectively mitigate ocean acidification.

#### Establishing Marine Reserves

It is critically important to protect sensitive marine environments from additional stressors that can exacerbate the debilitating impacts of acidification. Establishing fully protected marine reserves can help protect biodiversity and improve the resilience of our oceans in the face of rising acidity. Keys to the long term success of marine reserves involve creating sustainable sources of funding as well as local capacity to enforce their fully protected status.

## Creating an International Ocean Acidification Monitoring Network

There is also a pressing need to better understand and monitor the threat that ocean acidification poses to societies worldwide (Feely et al., 2010). Currently, there are only approximately 30 monitoring stations capable of measuring ocean acidity, and most of these are in developed countries. There is virtually no monitoring of biological impacts of acidification anywhere in the world. An international network of monitoring is needed to identify areas of vulnerability and develop effective adaptive management strategies for marine resources. States and coastal communities need information that can help them assess risks, plan for impacts and initiate management strategies, including, for example:

**Vulnerability Analyses** – Based on current research and observations, scientists have identified broad geographic regions and marine species that are vulnerable. High latitudes, regions of upwelling, and coastal estuaries with heavy river input, will experience episodes of corrosive water first. In addition, certain species such as tropical corals and some oysters and other mollusks are particularly sensitive to changes in carbonate chemistry. There may be many other marine animals and entire ecosystems that will be affected, and a more comprehensive and refined understanding of vulnerabilities is greatly needed.

**Early warning systems** - Real-time information about ocean chemistry can serve as an early warning system for already affected regions and industries. For example, oyster hatcheries along the west coast of the United States which were suffering from lower pH have deployed monitoring systems to alert their operators to episodes of corrosive waters which are harmful to larval oysters. With the use of these systems, hatchery owners have restored their production by 80% and have rescued their businesses.

**Management guidance** – Ocean acidification is happening against the backdrop of a rapidly changing ocean. In addition to changes in ocean chemistry, ocean water is getting warmer, oxygen availability is decreasing, and a host of local stressors exacerbate global change. Enhanced ocean observations are critically needed to improve ocean management in a changing world.

Sincerely,

Lisa Suatoni  
Senior Scientist, Natural Resources Defense Council

Matthew Huelsenbeck  
Marine Scientist, Oceana

Oceana is the largest international organization working solely to protect the world's oceans. Global in scope, Oceana has offices throughout the Americas and in Europe and more than 500,000 supporters around the world. Oceana works to protect and restore the health of the oceans using science-based campaigns. As part of our efforts to promote sustainable fishing, one of our top priorities is in addressing the considerable subsidies many countries provide to their fishing sectors. Oceana has been a leader in advancing global reform of fishing subsidies at the World Trade Organization (WTO) and in the Trans-Pacific Partnership (TPP) agreement.

Oceana submits these comments with the belief that Rio+20 is an important opportunity to contribute to achieving healthy economies and sustainable development through the global reform of fishing subsidies.

## Oceans and the Green Economy

The heart of the Rio+20 conference is the recognition that the world's resources are capable of raising millions out of poverty, but only if they are managed intelligently. Central to achieving these objectives is the "Green Economy."

Given the significance of the oceans, both to the environment and to the lives and livelihoods of billions of people, a group of Pacific Island nations have introduced the concept of the "Blue Economy" and correctly recognize that this must be an integral of part of any Green Economy.

The Green Economy theme of this conference recognizes strong economic performance as a prerequisite for achieving sustainable development. In the context of the oceans, this begins with an urgent need for global reform of fishing subsidies.

Sustainable development will only take root and produce the Green and Blue economies that are sought if we create a framework to support it. Individual initiatives will struggle as long as economic incentives continue to encourage destructive practices.

Ten years ago, the World Summit on Sustainable Development in Johannesburg (Rio+10) recognized this when it declared that many subsidies to the fishing sector create incentives to overfish and support illegal, unreported, and unregulated fishing. Fulfilling the promise of the Green and Blue economies requires following through on those commitments. Only by doing so can we ensure the ocean will continue to offer its bounty both today and in the future.

## The World Depends on the Oceans for Food and Livelihood

Oceans cover more than two-thirds of the globe, provide income and livelihood, and supply people with a key source of protein in their diets. More than a billion people depend on fish as a key source of protein. Fishing activities support coastal communities and hundreds of millions of people who rely on fishing for all or part of their income.

However, oceans are a source of immense but not inexhaustible wealth.

Ten years after the Rio+10 Summit recognized the need to reform fishing subsidies, the world's fisheries are close to irreversible collapse. Fish populations, as well as other ocean wildlife, have been depleted to a fraction of their historical levels – and their disappearance can trigger cascading adverse effects throughout the ocean.

The United Nations Food and Agriculture Organization (FAO) concluded in its 2010 State of the World Fisheries and Aquaculture report that more marine fish populations are now classified as overexploited and depleted than ever before. In fact, 85 percent of global fish stocks are fully exploited, overexploited, depleted, or recovering from depletion. More than 90 percent of the ocean's large predators -- tuna, marlin and sharks -- have disappeared as a result of industrial fishing. The global economic losses due to overfishing are estimated at US\$50 billion a year.

## Fishing Subsidies are a Major Driver of Global Overfishing

Despite the precarious state of the oceans, many governments continue to provide large subsidies to their fishing fleets. These subsidies allow fleets to fish longer, harder, and farther away than what would otherwise be possible. The scope and magnitude of fisheries subsidies and their impacts on overcapacity and overfishing are so significant that global subsidy reform is likely the single greatest action that can be taken to protect the oceans.

Fishing subsidies are defined as direct or indirect financial transfers of funds from public entities that help make the fishing sector more profitable than it would be otherwise. Fishing subsidies can create incentives to fish more, even when catches are declining. Subsidies can generally be described in three categories: beneficial, ambiguous, and capacity-enhancing. Beneficial subsidies enhance the growth of fish stocks through conservation, monitoring and control of catch rates. Ambiguous subsidies can lead to positive or negative impacts on the fishery resource depending on the design of the program. Finally, capacity-enhancing subsidies stimulate overcapacity and overfishing through artificially increased profits that further stimulate effort and compound resource overexploitation problems. Fuel subsidies, boat construction, and foreign access agreements are all examples of capacity enhancing subsidies.

An estimated US\$16 billion in capacity-enhancing subsidies are provided to the global fishing sector each year, representing approximately 20 percent of the value of total world catch. The intensity of these subsidies is even greater than those to agriculture.

Government subsidies have led to pervasive excess capacity in the global fishing fleet, while ongoing government support for fishing ensures that overcapacity is maintained. The global fishing fleet is up to 250 percent larger than what is needed to sustainably fish the oceans. Subsidies enable activity which results in overexploited fish populations, undermine fishing control programs, and prevent depleted fish populations from recovering.

#### Fishing Subsidies Lead to Unsustainable Economic and Environmental Practices

Fisheries subsidies are not only environmentally destructive, but also preserve uneconomic and inefficient practices. Large-scale, distant water fleets are often highly subsidized for their operations. A recent study found that bottom trawling on the high seas would not be profitable without high levels of government subsidies. This fishing practice is destructive enough that the United Nations has called for it to be severely restricted.

Fishing subsidies have also been shown to support illegal, unreported and unregulated fishing. IUU fishing represents a major loss of revenue, estimated between 11 and 26 million tonnes per year, worth between US\$10 and US\$23 billion. This is a particular concern for some of the poorest countries in the world which depend on fisheries for food, livelihood and revenue.

The damage to ocean resources and biodiversity from overfishing will likely have implications that we cannot fully anticipate. However, one immediate danger is the impact that overfishing could have on food security. The FAO states: The maximum long-term potential of the oceans has been reached. As a result, increased demand for wild-capture fish cannot be met by increasing fishing effort without restoring fish populations and ensuring their ongoing sustainability. Sustainable fishing can only be achieved through compliance with effective fisheries management programs, by controlling illegal fishing and by limiting subsidies.

Beyond mere economic losses, losses to food production and the inequality of funneling ocean resources away from the least and lesser developed countries to their more industrialized neighbors present enormous difficulties. Healthy fisheries could produce even more, both financially and in food for the world's people.

#### The Rio+20 Conference has a Critical Role in Addressing Fishing Subsidies

An international framework to manage fishing subsidies is an essential step towards a sustainable economies and natural resources. The Rio+20 conference has a role and opportunity to support and advance these global objectives. Specifically, the Rio+20 conference should:

1. Reaffirm and strengthen the commitment of the Rio+10 conference and the Johannesburg Plan of Implementation calling for global fishing subsidy reform.
2. Build on the commitment of the Rio+10 agreement to restore stocks to levels that can produce the maximum sustainable yield by 2015, by taking actions to control and reduce global fishing subsidies.

Thank you for your consideration of these comments.

---

## OceanCare

### Input for the Zero Draft (Rio + 20) by OceanCare

OceanCare is a Non-Governmental Organization with a special consultative status at the ECOSOC and a founding member of the International Ocean Noise Coalition (IONC), a partnership of more than 150 non-governmental organizations deeply concerned about the impacts of ocean noise pollution on marine ecosystems. At the invitation of the Second Preparatory Committee, the following is OceanCare's input for inclusion in the compilation document that will serve as the basis for the zero-draft of the outcome document for UNCSO.

OceanCare looks forward to participating at the Rio+20 meeting and it is our view that the most important outcome of UNSDO will be agreement on a shared and holistic vision addressing current gaps in international law, including the UN Convention of the Law of the Sea (UNCLOS).

The future of humanity is inextricably linked to a healthy ocean. This fundamental fact should guide our every interaction with the seas. However, scientists instead warn that harmful anthropogenic impacts such as climate change, overexploitation, and pollution are causing a devastating loss of marine biodiversity. Similarly, the significance of healthy oceans to sustainable development and poverty eradication cannot be underestimated. The status quo threatens the ability of the oceans to maintain vital ecosystem services and food security for hundreds of millions of people. As several delegations recognized during the March 2011 PrepCom meeting, we should be concerned not only with creating a sustainable green economy but also one that recognizes the value of a strong blue ocean economy.

Rio+20 provides an ideal opportunity to set in place a framework to build a blue economy based on an understanding of the value of healthy oceans to humanity and to support strong governance to that end. At present, existing regulatory frameworks do not prove adequate enough to prevent pollution, degradation of habitats, loss of marine biodiversity, acidification and overexploitation.

Recognising this, OceanCare and IONC support the proposal put forth by a vast majority of States relating to the negotiations of an implementing agreement of the UNCLOS. Such an agreement would have the overarching goal of long-term conservation and sustainable management of marine life, and the protection and preservation of the marine environment. It would also provide an integrated framework for existing, new, emerging and intensifying uses and activities in areas beyond national jurisdiction including through the implementation of environmental impact assessments and marine protected areas. An UNCLOS implementation agreement could serve as an improved regulatory framework, inter alia, for the problem of increasing anthropogenic ocean noise pollution.

Anthropogenic noise levels in the marine environment are increasing at an alarming rate. In some areas, noise levels have doubled every decade for the past 60 years. There is mounting concern that noise proliferation poses a significant threat to marine ecosystems and the survival of marine mammals, fish and other ocean wildlife.

Marine animals use sound to navigate, find food, locate mates, avoid predators and communicate. Flooding their world with intense sound interferes with these activities and results in serious consequences. A growing body of scientific research confirms anthropogenic noise can induce a range of adverse effects in fish, marine mammals and other

ocean creatures, from disturbance to injury and death.

According to the UN Secretary General, "Ocean noise involves the introduction into the sea of sound generated by various human activities, including commercial and non-commercial shipping, air guns used to carry out seismic surveys, sonar, underwater detonations and construction and resource extraction. Over the last fifteen years, research has indicated that such noise has been impacting numerous species of marine mammals and fish, which depend on hearing for communicating and accomplishing other functions vital to their survival and reproduction. Impacts from ocean noise include mortalities, injuries, temporary and permanent hearing loss, disruptions in essential activities, habitat abandonment and loss of biodiversity, chronic stress, the masking of biologically important sounds and alterations in the behaviour of commercially harvested fish." (A/66/70/Add.1 - 354)

Since 2005 the UN General Assembly has addressed noise through its annual resolutions on the law of the sea by recognizing the threat that ocean noise poses to marine biodiversity and encouraging further research and studies to better understand and minimize the impacts of ocean noise on marine living resources and on fishing catch rates. Other organizations addressing ocean noise include CBD, CMS, FAO, IMO and IWC at the global level, and Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area (ACCOBAMS), Agreement on the conservation of Small Cetaceans of the Baltic and North Seas (ASCOBANS) and the Convention for the Protection of the marine Environment of the North-East Atlantic (OSPAR) at the regional level.

The International Ocean Noise Coalition and OceanCare believe that the commitment to an UNCOLOS implementation agreement is a tangible result that should be negotiated at the Rio+20 meeting. Using this new instrument, limitations of underwater noise in all oceans and seas at the international, national and regional level could be set and other mitigation measures to minimize acoustic pollution could be devised.

Another issue of concern for OceanCare is the International Whaling Commission (IWC). Since Rio+20 is expected to strengthen environmental governance, this conference should identify those organizations that need modernizing and work towards ensuring that they are viable into and beyond the 21st century. In light of ongoing discussions at the UN General Assembly on global governance, it would be appropriate to make sure that this body, which is the only one with a universal competence, is also involved in improving the current institutional framework, including in relation to environmental institutions. Admittedly, this would contribute to improving intra-institutional cooperation. Similarly, representation should also be guaranteed. There are currently still fora, including the IWC, where civil society, IGOs, NGOs and stakeholders are not invited to participate at a meaningful level. Governance is not effective if its exercise is not carry out by all the actors of the international community.

Rio+20 should also prioritize achieving coherence within the various multilateral environmental agreements and United Nations programmes. The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) for instance needs to intensify intra-institutional cooperation if it is to succeed in managing trade in those species that are listed in accordance with its provisions. Although there is little doubt that polar bears, for instance, are menaced by international trade in their skins, any action within the framework of CITES would deal only with this one threat to their conservation. However, this species is also threatened by climate change and loss of habitat. A synergy would hence be necessary to ensure that all the organizations with a mandate that is relevant for the conservation of polar bears are involved in a cooperative effort aimed at addressing protection of this species. Many other examples could similarly be provided. Thus, Rio+20 should look at the need for environmental governance from a holistic perspective and make sure that sufficient guidance is provided to the international community. The environmental pillar of sustainable development is as important as the social and the economic ones.

---

## Oikos - Cooperação e Desenvolvimento

The Global Challenge of Food Security in the Twenty-First Century

By: João José Fernandes

Population growth, increased global GDP and the consequent change in consumption patterns, price volatility, market failures, water scarcity, land degradation and soil erosion, loss of biodiversity in ecosystems, climate change and in some regions political instability and social upheaval, are some of the factors that condition the agro-food systems in the coming decades. According to the latest projections, world population, now 7 billion people will reach 8.1 billion in 2030 and 9.2 billion in 2050 (FAO, 2009ai). Virtually all population growth will occur in developing countries (DCs), where the soil and water resources are already facing enormous pressure. In 2006, the population suffering from food insecurity amounted to 854 000 million (FAO 2008ii). In 2009, the population with food insecurity rose to 1.02 billion due to the rising of prices seen in 2008 (FAO, 2009biii). The origin of this trend reversal is the rise in grain prices caused by a set of stressors: drought breaks in production and exporting countries (Australia, Canada), speculative capital in agriculture commodities, rising oil prices and increased demand for cereals – whether stating the result of demographic pressure – or the result of demand for raw materials for the production of biofuels. In the future, this combination of factors – now understood as cyclical – can become a structural trend. Indeed, demographic pressure and the expansion of consumption in emerging economies, the depletion of fossil fuels (Pick Oil), climate change, soil erosion and soil degradation, advancing desertification and water scarcity are factors that strongly condition the demand for and supply of food in the medium and long term.

How to Answer the Challenge of Global Food Security?

Facing the enormous challenges of food security, two main trends are perceived. The first marked by technological optimism, the second championing the enlargement of the market role, as a panacea for all ills of resource scarcity and environmental degradation. These two trends, with more or less charitable empathy for the poor, mark the mainstreaming economic thinking.

Limits of Technological Innovation Approach

Between 1950 and 2000, world population grew from 2.5 billion to 6 billion people, but the world economy expanded sevenfold. In terms of agriculture, growth in productivity per hectare on the level of cereals rose from 1.1 to 2.7 tons. The application of scientific knowledge to agriculture (advances in genetics and improved agronomic practices), coupled with powerful economic incentives to farmers, has allowed an enormous expansion of world agricultural product. At the level of genetic advances, there is the effort of finding varieties with greater capacity for channelling the photosynthates to the seed. In terms of agronomic practices, expansion of irrigation areas, the intensive use of fertilizers and control of diseases, insects and weeds. However, while in the period from 1950 to 1984 the cereal production rate has expanded faster than population growth, increasing production of cereals per person by 34% since 1984 grain output growth was exceeded by population growth. This drop was not more noticeable only due to increased efficiency in the cereals conversion process into animal protein (Brown, 2005iv).

But is technological innovation the master key and sufficient to meet the challenge of sustainable use of soil and feed a growing population?

In our view, investment in technological innovation may be important but faces major difficulties. Therefore, we are inclined to a more integrated and comprehensive approach. In fact, there are two main obstacles to an answer based solely on technology:

- 1st The current technologies' reserve, available to farmers to increase productivity is almost exhausted, at least for the major powers cereal producers'. As mentioned above, the techniques used during the last decades have extensively explored the genetic potential, in order to increase the percentage of photosynthates that is forwarded

to the growth of the seed.

- 2nd A paradigm shift would require increasing the efficiency of the process of photosynthesis, something out of the current possibilities. It is the efficiency of photosynthesis, which, coupled with the availability of agricultural land, defines the quantity of food that the earth can produce.

As Lester Brown notes (Brown, 2005), the advances made until now in genetic engineering and biotechnology are not promising signs in this line of research, limiting the focus on plant tolerance to herbicides, resistance to insects and diseases. To a lesser extent, there were some results about the resistance to drought or salt tolerance. These advances allow only marginal gains in terms of agricultural productivity. Given the physical limitations placed on increasing the efficiency of photosynthesis – and thus to the increased productivity of the soil – that the current technological paradigm does not seem able to overcome, we must choose complementary strategies for the expansion of agricultural output. One possible approach is the increase of multiple cropping, i.e. more than one crop per year. In some Asian countries the challenge is to maintain this practice, but countries like the U.S. can gain considerable production with the encouragement of this practice. This will require a reorientation of agricultural research for the development of technologies that enable the acceleration of the maturity cycles of crops from the first and second planting seasons. Another way to increase food production to increase water productivity. The construction of small systems to capture and store rainwater, as well as the development of precision irrigation techniques may prove to be an excellent contribution to conserve the existing irrigation areas, or even to contribute to its expansion. Land productivity can also be increased through the use of crop residues for the production of food, as the case of corn or cane straw of rice and wheat for animal feed, thereby allowing a second crop on the same land. In some parts of the world as in Africa, investment in transport and storage infrastructures could play an important role in increasing food production, facilitating the transition from subsistence farming to agriculture with great economic and productivity increases. These two measures are essential for the efficient link from producers to markets. Finally, it is necessary to find strategies to a more sustainable agriculture, or facilitate the decoupling of product per hectare (Santos, 2009v), given the level of non-renewable resources that produce damage to the natural environment (fertilizers, pesticides, etc...). Sustainable agriculture, particularly relevant in marginal agricultural land implies a more efficient use of resources and the copy of the natural processes at the level of nutrient cycling, nitrogen fixation, soil remediation, and use of natural enemies to control pests. In addition, we need a greater investment in human and social capital, particularly in developing countries. The training of farmers will help to self-sufficiency and the improvement of their agricultural practices, the focus on social capital is decisive for the increase in scale, integrated management of watersheds and forests, as well as access to credit and markets for small producers.

#### The Market Limits

The creation of markets for all ecosystem services assumes that the commercial interaction between economic agents will reveal the value of services inducing the appropriate incentives to the production, while the ecosystem management organizes itself in order to respond to these incentives. In our opinion, this solution is not applicable in all situations. There are other complementary solutions and, in certain circumstances, more feasible. There are three grounds:

- 1st The market failure does not occur only by the lack of commercial value to some of the services, but also due to the lack of protection of the rights of some stakeholders, including future generations.

- 2nd The creation of markets focuses on the scale of the service, to the detriment of the ecosystem scale. Ecosystem services, object of value, are only the "discrete and identifiable end products" (Kroeger e Caseyvi). Thus, the ecological functions underlying ecosystems are not subject to valuation.

- 3rd Moreover the fact that there are some barriers to the creation of markets as it is the case for some of the services of forest ecosystems. For example, refer to the complexity of the services of biodiversity conservation, the volatility of other services such as carbon sequestration, risks of future losses, the need for long-term monitoring, the impossibility of exclusion in the case of pure public goods such as air quality or climate, and the high transaction costs, e.g. costs of certification of carbon sequestration, which add to the cost of providing the service. The barriers to the creation of markets for some ecosystem services, the need to incorporate all ecosystem services in the decisions of managers, coupled with the need to protect the rights of interested parties who have no voice, as is the case of future generations, lead us to complementary solutions able to ensure effective governance of ecosystems, to be combined in different proportions and whose validity must be assessed according to specific circumstances. We emphasize, in addition to the creation of markets, the regulation by the state, the (re)defining and protecting of the rights of different individuals and groups, the accountability of managers (civil liability, or "societal license to operate"), the definition of new forms of organization for an ecosystem-wide management, or instruments such as green taxes and public payments for environmental services. Finally, it is noted that, even if the solution is the creation of markets, state intervention can be decisive. One of the classical situations is the need for intervention by the states in terms of defining property rights. There are no markets without clear and respected property rights. It is usually the state to define these rights and make them comply, namely through the exclusion of non-owners. Thus, following Bromleyvii, we can say that "while market processes can be used instrumentally after a previous definition of socially desirable environmental conditions, we cannot leave the market to decide on how clean should be our water or our air. The market is also not able to turn out how much biodiversity should be preserved for future generations. " Thus, we cannot accept technological innovation and market instruments as sufficient to solve all the challenges of sustainable food security. They are certainly necessary conditions but not sufficient.

#### Which role for Sustainable Consumption?

An increase of production which corresponds to the expected consumption as a function of population growth and increased purchasing power is problematic. First, because in the coming decades we will face constraints on natural resources such as soil or water and secondly the increased production and agricultural productivity is only sustainable if it does not result in irreversible losses of biodiversity and increased emissions of irreparable greenhouse gases (GHG). Thus, the solution should be found in a balance between a more eco-efficient agriculture and more sustainable consumption. The term "sustainable consumption" entered the international agenda through Agenda 21, the action plan for sustainable development adopted by 179 heads of state at the Rio Summit in 1992. However, the concept of sustainable consumption is far from obtaining a broad consensus. The first problem is related to the perception of the ultimate (or motive) of the act of consuming. The utilitarian approaches value consumption as a means to increase the utility (welfare) and the decisive factor is the information and knowledge that enable rational utility maximization. In this context, the instruments for sustainable consumption are a certification of "green" consumption and tax incentives to the consumption of "environmentally friendly" products. The scale of the analysis is the individual. It is also in the light of this scale that we situate the psycho-social approaches to consumption. Under this paradigm, the consumer arises as a response to a stimulus of the social or psychological needs. The consumption is then a kind of "identifier" of personality and social group membership. In this context the sustainable consumption emerges as driven by social marketing, aiming at the promotion of an "environmentally friendly lifestyle"; consuming a "green" product often promoted by a "celebrity", "is part of belonging to" a "tribe". More recently, some movements have been characterizing the consumption as an act determined by the supply-infrastructure (by supply chains). The scale of analysis becomes the society; consumption is understood as a routine habit, almost imperceptible. Sustainable consumption is then to be distinguished not only by individual preference for consumption, but by the initiatives – usually at the local level – aiming at overcome the constraints that are imposed by the format of the global supply chain of goods and services. An example is the local initiatives linking producers and consumers that outline the intermediation of large stores (Seyfang, 2009). The latter approach to sustainable consumption is actually a very profound transformation in consumption patterns, the motion falls into the so-called "New Economy" as opposed to current mainstreaming concept of sustainable economic consumption.

Table 1 summarizes the key differentiating elements between both approaches. (Please reference Submission Document for Table)

#### Sustainable Consumption and the New Economy

In order to understand the specificity of the concept of sustainable consumption in the "New Economy", it is necessary to briefly characterize this movement. First of all, bear in mind that we are no longer under a concept of consumption as "green washing", or consumption as a driver of economic growth. On the contrary, it is proposing a reduction in consumption in absolute terms. Immediately, from the three concepts of sustainable consumption mentioned above, it is this that more boldly relates to the global challenge of food security as introduced at the beginning of our text: population growth, rising standards of consumption, resource scarcity, biodiversity loss, soil degradation and climate change.

What distinguishes the "New Economy" of the mainstreaming concept of Economy?

The distinctive features of the "New Economy" (NE) are four: (i) a comprehensive understanding of the meaning of "welfare" (wealth), (ii) a richer conception about the "labour", (iii) new uses for the money and currency options, (iv) reintegration of ethics in economic life (Boyle, 1993). Influenced by the ecological economics (Costanza, 1991x) the New Economy (NE) puts the environment at the heart of economic analysis, accepting that there are ecological services that cannot be replaced by other types of capital and that ecosystems do not respond in a predictable and linear way to external pressures. It follows that the economy cannot be seen as an abstract mechanism that can generate indefinitely "value" and should take its place in the environment and society as a starting point. The first consequence is the need to design the development of new paradigms such as "welfare", "quality of life", using indicators that can measure social progress and the goals of economic activity more appropriately, in detriment of the sole use of Economic Growth Indicators (GDP - Gross Domestic Product) and its derivatives (Seyfang, 2005xi). The second starting point of the NE is related to the concept of "labour", trying to include the performance of unpaid tasks but socially reproductive, which support communities and families and, accordingly, contribute to the market economy. This approach implies a view of economics that assign "value" to informal, voluntary and unpaid "labour", complementing the formal remuneration for work. A sustainable economy would allow people to enjoy a portfolio of options, undertaking a wide variety of forms of labour – domestic, voluntary work for the community, paid informal employment with local currencies and informal employment in the market economy. The third feature of the NE is the concept of money. The conventional economics describes the money as a politically and socially neutral technology, which allows to fulfil four functions: to serve as a medium of exchange, a unit of account, a store of value, and a standardized instrument for the deferred payment. NE, by contrast, argues that these functions are rather conflicting agendas (e.g., withdraw money from a local economy to a store of value, inhibits its movement within the community and meeting local needs), and acknowledges that monetary systems are social constructions whose design emphasizes certain purposes and encourages certain behaviours over others. For example, I think we can all agree that the use of the monetary system favours a narrow range of economic activities (valuing what is scarce and not what contributes to the well-being), uprooting the exchange currency of its environment and social ambience, and inhibiting sustainable consumption. The corollary of this understanding is the need to design new systems of exchange, designed to serve different purposes and to allow an inclusive systemic approach of the social and environmental context of economic activity. NE acknowledges that this approach may be less efficient than a strictly economic point of view, however, by incorporating social and environmental factors appears to be much more rational. Embryos of this approach are the many initiatives around the "complementary currencies" that have emerged among local communities as diverse as the United Kingdom, Brazil and Argentina since the early 1990s. Last but not least decisive, NE considers ethics as central to economic activity. Unlike the apolitical abstractions of conventional economics (which obviously obeys ideologically based policy prescriptions) NE implies a normative analytical approach, which aims to describe and facilitate the transition to a more sustainable society (Seyfang, 2005). With regard to the experience of practical application of this new economic model, NE still lacks empirical investigations to test its ideas and concepts. One area where is relevant to promote a systematic scrutiny of the NE' initiatives is precisely the assessment of its contribution to sustainable consumption. To meet this challenge, Seyfang advances five indicators that must be present in a strategy of sustainable consumption, consistent with the proposals of NE, namely: location, reducing the ecological footprint, community-building, collective action, and creating new procurement and supply infrastructures (Seyfang, 2009). These indicators are briefly presented in Table 2.

Table 2: Evaluation/ Assessment indicators for sustainable consumption (Please reference Submission Document for Table).

In contrast to a "green consumption", so often vulnerable to strategies of "green-washing," the proposal from the NE suggests a sustainable consumption that contributes to an effective reduction of all consumption that does not contribute to the well-being. In contrast to the utilitarian concepts of sustainable consumption, or approaches based exclusively on the identification around social and psychological standards, NE points to the core of sustainability challenges: the promotion of social welfare, quality of life, a quest for courageous social cohesion and environmental protection. In conjunction with measures of eco-efficiency in agriculture and climate change adaptation, the use of economic policy instruments that allow the internalization of many of the environmental impacts of agricultural and livestock production (including market based instruments, such as payment for ecosystem services) – proposals for sustainable consumption of NE certainly have an important contribution to make in response to global challenges of food security. Will these measures be enough? Will we be able to implement them fast enough? Here's the challenge I leave to civil society practitioners and public decision makers.

---

## One Earth Initiative Society

**One Earth Initiative Society:**

**Input into the UNCSD 2012 compilation document**

**1 November 2011**

**One Earth Initiative Society**

1205 – 1255 Main Street

Vancouver, BC V6A 4G5 Canada

Tel.: +1 604.669.5143

E-mail: [info@OneEarthWeb.org](mailto:info@OneEarthWeb.org)

Web.: OneEarthWeb.org

**A. What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

In terms of **outcomes of Rio+20**, the One Earth Initiative Society expects to see:

- Renewed political commitment at the highest political level to move to sustainable development and to adopt sustainable consumption and production patterns.

- A bold vision of "a future we want" that is attractive, inspiring and a source of hope for humanity.
- An Outcome document that includes, or is accompanied by, a green economy roadmap.
- A Ten-Year Framework of Programmes in support of regional and national SCP

initiatives.

- A new, enhanced, comprehensive and more inclusive process for the UN to engage with civil society that addresses the current limitations, weaknesses and exclusionary nature of the 9 Major Group system.

Regarding a possible structure of the **Outcome document**, we suggest that it be short, and should include the following key elements:

- An introduction that recognizes the gravity of the situation faced by humanity and the urgent need for a 'great transition' to sustainability.
- A set of strong values and guiding principles drawn from, for example, the Earth

Charter, and that include:

- f* The need for reciprocity, cooperation and sharing;
- f* The need to achieve absolute reductions in material and energy throughput at the global scale;
- f* Recognition that at the global scale, more growth on a finite planet already in a state of ecological overshoot is anathema to sustainable development.
- f* Embracing sufficiency as an organizing principle;
- f* A reemphasis on Principle #10 of the Rio Declaration on access to information, transparency, public participation and access to justice; and
- f* An approach to global sustainability built around 'contraction and convergence' (decreased per-capita Ecological Footprints in the rich, industrialized countries, and higher rates of consumption in the low-income countries).
- Sustainable development goals, similar to the Millennium Development Goals, with global targets and timetables.
- A non-negotiated appendix of countries' own commitments to sustainable development and provisions for monitoring, compliance and reporting.

#### **B. What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

- A **green economy roadmap** needs to include specific goals and a timeframe with short-, medium- and long-term targets to help guide action.
- It also needs to include indicators and a mechanism for monitoring and reporting.
- It needs to be clear on the barriers that are preventing the world from moving to sustainability despite the warnings of science that this is more urgent than ever (see C., below, for examples).
- It needs to feature a list of policy instruments that can guide countries' options on affecting change around production and consumption systems (see below, for examples).
- Countries should be encouraged to 'think out of the box' and prototype new ways of organizing their economy and of carrying out projects that contribute to sustainable patterns of consumption and production.
- Listed below are potential **policy instruments** to be considered by UN-member States and other stakeholders; they are organized in order of decreasing coerciveness, from the 'hard' policy instruments that include laws and regulations as well as 'carrots and sticks' (rewards/penalties), to 'soft' policy instruments, which include voluntary, non-binding recommendations and guidelines, education (formal and informal), information sharing, and organizational structure:
  - f* **Regulatory instruments** – Norms and standards, bans, caps and emission limits, building codes, etc.
  - f* **Economic instruments** – Fiscal, or market-based instruments (subsidies, taxes, user fees, green public procurement, bonus systems, emissions trading, etc.), investments in infrastructure that support sustainable consumption and production
  - f* **Participatory instruments** – Urban planning, public dialogues, policy discussions, participatory budgets, etc.
  - f* **Voluntary instruments** – Unilateral commitments, negotiated agreements, voluntary setting of targets, voluntary certification schemes, etc.
  - f* **Informational instruments** – Ecolabels, information centres, websites, demonstration projects, etc.
  - f* **Educational instruments** – Training, integration of whole-systems thinking in formal and informal education, research, etc.
  - f* **Organizational/institutional arrangements** – Cooperation schemes, public- private partnerships, agreements between different levels of government, etc.

#### **C. What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.)?**

- The **conventional, incremental-change approach** to sustainability is failing to make sufficient progress in reversing the worsening social and ecological trends, and new models, mindsets and metrics are required to guide action for systemic and transformative change.
- **Systems thinking** needs to form the basis of action plans, roadmaps and frameworks for action to avoid fragmented thought, jumping to conclusions, short-sighted decision making and the "problem-solving treadmill", which have hampered significant progress towards sustainable development at the global scale thus far.

- There needs to be a recognition of the **barriers that prevent the urgent transition to a socially just and ecologically sustainable world**; these include:

*f* Fragmentation of sustainability initiatives at all scales

*f* Inertia in the system (including of habits as well as social and cultural norms;

in infrastructure and technologies; etc.)

*f* Paralysis in front of tremendous complexity

*f* Need for political leadership

*f* Skewed markets resulting from misplaced subsidies, the externalization of costs , short-term profit seeking, a non-level playing field and entrenched interests

*f* Misunderstandings around the seriousness of issues

*f* Unpopularity of proposed measures and policy solutions

*f* Influence of powerful interest lobbies

*f* Inability to effectively apply a systems perspective to problem solving

*f* Too much emphasis on efficiency as a means to reduce material and energy throughput when historically, lower prices brought about by gains in technology and efficiency have led to overall increases and bigger footprints when an overall cap on resource use is not established

- Implementation needs to focus on being **scientifically relevant** (i.e. leading to absolute reductions in resource use and negative ecological impacts at the global scale; reigning in climate change; etc.).

- Examples of **specific, high-leverage policies** to be implemented for a green economy:

*f* Instituting a socially fair carbon tax or equitable cap-and-trade system

*f* Phasing out of subsidies and investments for unsustainable, inhumane systems

*f* Freeing up the length of the working day, week and year to reflect a work-life balance that promotes well-being

*f* Reforming our banking system in support of a larger diversity of community-

based savings, lending and investment

*f* Putting a stop to urban sprawl through increased densification in existing urban centres

*f* Discouraging car use, especially in urban areas, and investing heavily in efficient and comfortable public transportation options and self-propelled infrastructure (i.e. car-free spaces)

*f* Retrofitting existing buildings to a minimum of PassivHaus norms

*f* Implementing choice editing to remove unsustainable options from the market place by industry and government

*f* Maximizing public purchases through green and fair-trade procurement

*f* Reforming the World Trade Organization so that it serves to promote fair trade

- **Diverse actors have specific roles**, tools and approaches that they bring to bear on addressing the consumption and production system. The World Business Council developed a useful characterization of these different roles:

#### **Role of governments and regulators**

*f* International agreements

*f* National policies, laws and regulations

*f* Fiscal structures and incentives

*f* Guidance for businesses and consumers

*f* Monitoring

*f* Enforcement

#### **Role of businesses**

*f* Economic development

*f* Legal compliance

*f* Ethical practices

*f* Sustainable sourcing, production and distribution

*f* Eco-efficiency and waste reduction

*f* Consumer choice editing

*f* Consumer choice influencing

*f* Recycling

*f* Innovation

*f* Example-setting

#### **Role of civil society (NGOs)**

*f* Independent assessment

*f* High profile public campaigns

*f* Critique or endorsement

*f* Thought leadership

*f* Choice influencing

#### **Role of consumers**

*f* Purchasing decisions

*f* Lifestyle choices

*f* Political support

*f* Peer-to-peer influencing

- No single actor can achieve broad, systemic change alone, and cooperation and dialogue is mutually beneficial and needs to be encouraged.

#### **D. What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

- Multistakeholder cooperation could be organized around a **10-Year Framework of Programmes (10YFP)** in support of regional and national initiatives on sustainable consumption and production. Although the ideas for this framework were successfully negotiated and agreed at the 19th Session of CSD, they have yet to be implemented. The UN Conference on Sustainable Development has a timely opportunity to adopt this 10YFP as one of the positive constructive institutional outcomes for moving the sustainable development agenda forward.

- Rio+20 should open a new discussion track on **improving the model, process and effective engagement of civil society** in sustainable development policymaking and decisions. The Outcome document can include commitment to review current and new models of civil society participation and to design a new, more inclusive and effective participation structure for civil society organizations (CSOs) to be meaningfully engaged in the current and future sustainable development governance framework and institutional structures, including the United Nations.

Strengthening Institutional Frameworks for

Sustainable Development: Ending Impunity for

Economic, Social, and Environmental Crimes

Submission to the UN Conference on Sustainable Development

1 November 2011

The One Justice Project supports new thinking and measures dedicated to ending impunity for serious violations of international economic, social, and cultural rights and international environmental law at the 2012 United Nations Conference on Sustainable Development.

To this end, the One Justice Project makes the following four recommendations to States in the context of general debates, negotiations, and commitments on institutional frameworks for sustainable development.

**Recommendation No 1:** States should recognise the critical importance of individual criminal accountability in developing and strengthening institutional frameworks for sustainable development.

Over the past 25 years, States have adopted commitments, principles, and initiatives aimed at advancing and strengthening the interdependent and mutually reinforcing pillars of sustainable development – economic development, social development and environmental protection – at the local, national, regional and global levels.”<sup>1</sup>

However, States have failed to take steps to address serious violations of international economic, social, and cultural rights and international environmental law that undermine the very foundations of the economic, social, and environmental pillars of human development. Corruption, forced labour, pillage, large-scale environmental pollution and destruction, harmful medical experiments, and the deliberate and discriminatory denial of access to food, shelter, medical care, education, and culture remain common throughout much of the world.

<sup>1</sup> Johannesburg Declaration on Sustainable Development, in Report of the World Summit on Sustainable Development, Johannesburg, South Africa, August 26 to Sept. 4, 2002, A/CONF.199/20 (New York, United Nations, 2002).

These serious violations of international law have severe and long-term consequences on the well-being of present and future generations and weaken the very conditions that make sustainable human development possible. Most importantly, they are not the product of a lack of resources or of structural factors beyond human control, but result from the deliberate and morally blameworthy acts and conduct of individuals that should be recognised as criminal in appropriate circumstances.

Mechanisms of criminal accountability for serious violations of international economic, social, and cultural rights and international environmental law can promote progress toward sustainable development by instituting the basic conditions of good governance, ensuring that laws are properly enforced and that individuals are held accountable for their violation, and providing marginalised communities with the rights and protections afforded by law, including recognition and redress to victims of crime. In these ways, the establishment of individual criminal accountability for acts and conduct that undermine the pillars of sustainable development finds support in an emerging international policy agenda that views the rule of law and legal empowerment as integral to

economic and social development, poverty eradication, and environmental protection.<sup>2</sup>

The One Justice Project recommends that States recognise that institutional frameworks for sustainable development must include fair and effective legal mechanisms for investigating and prosecuting all serious violations of international law that undermine the foundations of the economic, social, and environmental pillars of sustainable development.

Recommendation No 2: States should condemn the impunity that remains for serious violations of international economic, social, and cultural rights and international environmental law.

The international community has made significant strides in ending impunity for serious violations of international law amounting to war crimes, crimes against humanity, and genocide – the core international crimes that have been prosecuted and tried by both domestic and international criminal courts in the second half of the twentieth century. This current system of international criminal justice is founded on the principle that individuals should be held criminally accountable for the most serious violations of international law – what the Rome Statute of the International Criminal Court defines as “grave crimes that threaten the peace, security and well-being of the world” and “atrocities that deeply shock the conscience of humanity.”<sup>3</sup>

But with few exceptions, international crimes focus on serious violations of civil and political rights and do not cover the serious violations of international economic, social, and cultural rights and international environmental law that are of direct relevance to sustainable development.<sup>4</sup> Moreover,

2 World Summit on Sustainable Development, “Johannesburg Principles on the Role of Law and Sustainable Development,” adopted at the Global Judges Symposium, August 2002; Commission on Legal Empowerment of the Poor and United Nations Development Programme, “Making the Law Work for Everyone,” (2008) Report of Commission on Legal Empowerment of the Poor, Volume I.

3 Rome Statute of the International Criminal Court, United Nations Diplomatic Conference of Plenipotentiaries on the Establishment of an International Criminal Court, U.N. Doc. A/CONF.183/9, (1998), Preamble.

4 Exceptions include the crimes against humanity of persecution (Rome Statute, Article 7(1)(h)) and other inhumane acts

(Rome Statute, Article 7(1)(k)) and the crime of genocide of deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part (Rome Statute, Article 2(c)), although there is little

authority in support of their expansion to economic, social, and cultural rights. Relevant war crimes include starving civilians as a method of warfare (Rome Statute, art. 8(2)(v) (xxv)), subjecting individuals to harmful medical or scientific

the scope of application of international crimes, especially in cases before existing domestic and international courts, has focused on behaviour that is essentially limited to situations involving physical violence on a large scale.<sup>5</sup> Although there are understandable historical and political factors that explain this focus on armed conflicts and physical violence, the exclusion of other serious

violations of international law with equally grave consequences for human populations from the scope of international criminal law has troubling implications for the integrity of international law and the access to justice that it provides for victims of morally opprobrious acts.

The problematic limited focus of international criminal law is all the more striking when one considers the few existing international crimes that engage with economic, social, and environmental harm. For instance, while subjecting individuals to harmful medical or scientific experiments or causing widespread, long-term and severe damage to the natural environment are war crimes when committed in the context of an armed conflict, equivalent behaviour, with equivalent consequences, of the sort that frequently takes place in the context of peace is simply not a crime under international law.

Despite the critical importance of repressing these serious violations of international law for securing the peace, security and well-being of the world, they remain outside the scope of existing treaties and institutions in the field of international criminal law. This is yet another way in which the international community has failed to abide by the principle of international human rights law that all

human rights are equal, interrelated and indivisible.<sup>6</sup> As noted by the U.N. Committee on Economic, Social and Cultural Rights in other context, “despite the rhetoric, violations of civil and political rights continue to be treated as though they were far more serious, and more patently intolerable, than

massive and direct denials of economic, social and cultural rights.”<sup>7</sup>

The One Justice Project recommends that States condemn the impunity that remains throughout the world for a whole range of serious violations of international law, namely international economic, social, and cultural rights and international environmental law, and should recognise that these violations are the product of behaviour by individuals that is sufficiently deliberate and morally opprobrious to be recognised and treated as criminal in both domestic and international law.

experiments (Rome Statute, art. 8(2)(b)(x)), and causing widespread, long-term and severe damage to the natural environment (Rome Statute, art. 8(2)(b)(iv)).

5 War crimes are committed in the context of an armed conflict, crimes against humanity are committed as part of a

widespread or systematic attack against any civilian population, genocide involves the intent to destroy, in whole or in part, a national, ethnical, racial or religious group, and aggression involves the use of armed force against a State or other acts that threaten international peace and security.

6 The equality of rights vision has been reaffirmed repeatedly by the international community in instruments including

the Proclamation of Teheran (1968) Art. 13 ("Since human rights and fundamental freedoms are indivisible, the full realization of civil and political rights without the enjoyment of economic, social and cultural rights, is impossible...");

U.N. General Assembly Resolution 32/310 (1977) Art. 1(a) ("All human rights and fundamental freedoms are indivisible and interdependent, equal attention and urgent consideration should be given to the implementation, promotion and protection of both civil and political, and economic, social and cultural rights. and the Vienna Declaration and Programme of Action, as adopted by the World Conference on Human Rights on 25 June 1993, U.N. Doc. A/CONF.157/23, para. 5 ("All human rights are universal, indivisible and interdependent and interrelated. The international community must treat human rights globally in a fair and equal manner, on the same footing, and with the same emphasis...").

7 CESCR, Statement to the World Conference on Human Rights, U.N. Doc. E/1993/22, para. 5.

Recommendation no 3: States should commit to taking all appropriate steps for investigating and prosecuting serious violations of international economic, social, and cultural rights and international environmental law that amount to existing domestic or international crimes.

The impunity that subsists for serious violations of international economic, social, and cultural rights and international environmental law is all the more problematic given the overall, well-recognised weakness of enforcement mechanisms in these fields. More often than not, serious violations of international economic, social, and cultural rights and international environmental law are not recognised as crimes or are not treated as such by legal authorities. As a result, civil society actors in developing and developed countries have had to resort to civil liability to obtain a measure of justice and compensation for serious violations of international economic, social, and cultural rights and international environmental law. However, civil liability remains a costly, time-consuming, and ultimately unsatisfying alternative to mechanisms of criminal investigation and prosecution. Civil liability does not capture the gravity, morally blameworthiness, and the harmful consequences that can characterise conduct amounting to serious violations of international economic, social, and cultural rights and international environmental law. Indeed, the notion that such behaviour should merely give rise to civil liability, rather than criminal liability, feeds the perception that it is not especially morally opprobrious and that it falls within the range of acceptable human conduct.

The deliberate nature, grave consequences, and frequency of serious violations of international economic, social, and cultural rights and international environmental law requires that they be recognised and treated as crimes by all States. To some extent, this can be achieved through the enforcement and extension of existing domestic and international crimes that encompass acts and conduct amounting to serious violations of international economic, social, and cultural rights and international environmental law.

The One Justice Project recommends that States take all appropriate measures at the domestic and international levels to ensure that serious violations of international economic, social, and cultural rights and international environmental law that amount to existing crimes are investigated and prosecuted as such.

Recommendation no 4: States should commit to negotiating an international convention for the prevention and repression of economic, social, and environmental crimes.

Ending impunity for serious violations of international economic, social, and cultural rights and international environmental law requires more than changes in the enforcement of existing domestic and international crimes however.

Serious violations of international economic, social, and cultural rights and international environmental law frequently result from governance gaps arising from the activities of transnational corporations. A patchwork of weak, non-existent, or inadequately enforced laws across borders has resulted in gaps in the governance of transnational corporations operating in developing countries, providing a "permissive environment for wrongful acts by companies of all

kinds without adequate sanctioning or reparation."<sup>8</sup> While criminal law at the domestic level may offer opportunities to take action against individuals responsible for corporate abuses, governments in developed and developing States have generally been unwilling or unable to investigate and prosecute the acts and conduct of corporate directors and officers.

Any serious effort aimed at addressing these governance gaps must provide consensus definitions of criminal violations of international economic, social, and cultural rights and international environmental law, ensuring consistency and coherence between judicial systems across the world. Rule of law assistance will be required to enable developing States to strengthen their existing enforcement mechanisms and ensure that they can consistently enforce relevant domestic criminal provisions covering these serious violations of international law. The establishment of forms of extra-territorial liability will also be critical, enabling States to take jurisdiction over crimes allegedly committed abroad by their nationals or directors or officers of nationally incorporated corporations. Finally, obligations and mechanisms for international judicial cooperation between States will be required to coordinate the efforts of States in the fight against impunity for these crimes.

In sum, what is needed is a stand-alone international convention that would require state parties to exercise criminal jurisdiction over serious violations of international economic, social, and cultural rights and international environmental law. Following the model employed for crimes of international concern, such as the theft of nuclear materials, terrorist bombings, or torture,<sup>9</sup> such a

convention could define relevant economic, social, and environmental crimes, commit state parties to enacting these crimes in their national legislation, investigating and prosecuting cases falling within their jurisdiction, and cooperating with other States in investigations and prosecutions.

The One Justice Project recommends that States commit to initiating negotiations aimed at elaborating and adopting an international convention that identifies and defines the most serious violations of international economic, social and cultural rights and international environmental law as crimes of international concern; creates grounds of jurisdiction for their effective investigation and prosecution by states; obliges states to initiate investigate and prosecute alleged crimes falling within their jurisdiction; and provides mechanisms for international judicial cooperation, support, and capacity-building.

<sup>8</sup> Report of the Special Representative of the Secretary-General on the issue of human rights and transnational corporations and other business enterprises, Protect, Respect and Remedy: a Framework for Business and Human Rights, U.N. Doc. A/HRC/8/5, para. 3.

<sup>9</sup> See, e.g., Convention on the Physical Protection of Nuclear Material, 3 Mar. 1980, 1987 U.N.T.S. 125; International

Convention for the Suppression of Terrorist Bombings, 15 Dec. 1997, 2149 U.N.T.S. 256; Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment, 10 Dec. 1984, 1465 UNTS 85.

#### Overview: The One Justice Project Conception of Economic, Social, and Environmental Crimes

Each of the crimes listed below is a serious violation of existing obligation of international law and draws on wording from international treaties, declarations, cases, and reports. For specific references on sources and wording, see: [www.onejusticeproject.org](http://www.onejusticeproject.org).

#### Economic Crimes

- the appropriation of private or public property without lawful basis or legal justification;
- the embezzlement, misappropriation or other diversion of public resources or property by a public official; and
- the exaction of work or service from any person under the menace of any penalty and for which the said person has not offered himself or herself voluntarily.

#### Social Crimes

- the discriminatory denial of access to primary, secondary, technical, vocational and higher education;
- the discriminatory denial of access to minimal levels of water and food sources;
- forced evictions;
- the discriminatory denial of access to minimal level of medical services, facilities and treatments;
- the subjection of persons to medical or scientific experiments of any kind which are neither justified by the medical, dental or hospital treatment of the person concerned nor carried out in his or her interest, and which cause death to or seriously endanger the health of such person or persons; and
- the discriminatory systematic destruction, prohibition or diversion of books, religious works, historical or religious monuments, or documents and objects of historical, artistic, cultural or religious value.

#### Environmental Crimes

- the causing of widespread, long-term and severe damage to the natural environment; and
- the unlawful pollution of air, water or soil through the release of harmful substances or organisms which cause death to or seriously endanger the health of affected persons.

The One Justice Project (1JP) seeks to end impunity for serious violations of international economic, social, cultural, and environmental rights, wherever they are committed. Through innovative and collaborative research, advocacy, litigation, and capacity-building activities, 1JP works for the recognition, investigation, and prosecution of these violations as crimes under national and international law.

For further information on 1JP, visit [www.onejusticeproject.org](http://www.onejusticeproject.org) or contact Sébastien Jodoin ([sebastien.jodoin@onejusticeproject.org](mailto:sebastien.jodoin@onejusticeproject.org)), Katherine Lofts ([katherine.lofts@onejusticeproject.org](mailto:katherine.lofts@onejusticeproject.org)), or Yolanda Saito ([yolanda.saito@onejusticeproject.org](mailto:yolanda.saito@onejusticeproject.org)).

**DIANA RODRIGUEZ - Vicepresidenta**

Aportes al documento cero de los jóvenes Colombianos a la Conferencia de las Naciones

Unidas Sobre Desarrollo Sostenible Rio + 20, Rio de Janeiro Brasil 4 - 6 de Junio de 2012

### **1. Presentación:**

La Corporación Jóvenes de Ambiente es una corporación sin fines de lucro que por medio del trabajo con jóvenes tiene como objetivo principal la gestión, la formulación, la elaboración, la ejecución, la evaluación, el control y el seguimiento de los estudios, los planes, los programas, las actividades y los proyectos, encaminados a la protección,

la conservación, el mejoramiento y el aprovechamiento sustentable del ambiente y los recursos naturales en un ámbito local, regional, nacional e internacional, con una visión

holística interdisciplinaria,

que permita dar soluciones acordes a los problemas

ambientales, con el fin de asegurar la calidad de vida de las diferentes poblaciones del planeta tierra, desde el enfoque infanto juvenil Colombiano.

## **2. Antecedentes:**

Como actores de la sociedad civil, participamos en este proceso

adolescentes,

jóvenes y mujeres principalmente, haciendo efectivo nuestros derechos

constitucionales consagrados en la Constitución Política de 1991,

así como la

legislación establecida a

nivel internacional. Como ejemplo de

este último

contexto, se puede mencionar la Agenda 21 que en su capítulo 25, establece en

su numeral 25.2, lo siguiente: "Es una necesidad imperiosa que la

juventud de

todas partes del mundo participe activamente en todos los niveles pertinentes de los procesos de adopción de decisiones, *ya que ello afecta su vida actual y tiene repercusiones para su futuro. Además de la contribución intelectual y de la*

*capacidad de movilizar apoyo que tiene la juventud, los jóvenes*

*tienen una*

*manera particular de analizar las cosas que es menester tener en cuenta."*

Así mismo, en la agenda 21 en sus capítulos, 23, 24, 26, 27, 29, 30 y 32, se propone que

las mujeres participen en la

toma de decisiones, la planeación y la ciencia, establecer

comunicación entre ONGs y gobiernos, asegurar la libertad de expresar y promover ideas

de las ONGs, a pesar de

que no gusten a gobiernos e industrias,

garantizar la

participación de los indígenas en las decisiones políticas que los afecten así como

#### **Nit. 900296806-4**

respetar y proteger su cultura, entre otros temas internacionales ratificados por el gobierno nacional.

Lo anterior, muestra la legalidad del presente documento y la legitimidad otorgada con la aprobación y participación de estos grupos poblacionales en las iniciativas, encuentros, redes sociales y demás formas, medios de comunicación e instrumentos utilizados para la participación de los jóvenes colombianos en la Cumbre de Rio + 20, Brasil 2012.

### **3. Metodología**

A partir de la metodología

descriptiva<sup>1</sup> se revisó la bibliografía pertinente al tema de

juventud, ambiente, participación, economía verde, desarrollo sustentable, declaraciones nacionales e internacionales. Seguidamente, se utilizó la metodología exploratoria con un formulario on line a través del siguiente link: <https://docs.google.com/spreadsheet/viewform?formkey=dG1OUUR3LTliUDJXdjEzamlwcmFXbEE6MQ> el cual fue publicado en la página de facebook de la ONG, en las redes sociales a las que pertenece, y en la página de la Cumbre de los Pueblos: <http://jovenes-colombia.rio20.net/> dando cumplimiento al principio de transparencia con la población juvenil Colombiana e internacional.

Finalmente, las dos etapas anteriores se unificaron, utilizando la

metodología

correlacional a través de la cual se dio análisis a la información obtenida para responder las preguntas planteadas en la Resolución 64/236 de la Asamblea General de las Naciones Unidas y en el documento del Ministerio de Relaciones Exteriores de Colombia sobre Rio + 20.

### **4. Qué resultados quieren los jóvenes Colombianos de la Cumbre de Rio + 20?**

#### **4.1 Resolución 64/236 de la Asamblea General de las Naciones Unidas:**

##### **4.1.1 ¿Cuáles son las expectativas en relación con los resultados de Rio+20, y qué**

**propuestas concretas hay**

**a este respecto, incluidas las opiniones sobre una**

**posible estructura del documento final?.**

Como ONG ambiental es relevante aclarar que nuestros países latinoamericanos son los que tienen en su escala poblacional un número mayoritario de jóvenes que no están representados equitativamente en las entidades internacionales de la

rescaten, revaloricen

y protejan los cultivos tradicionales de sus

pueblos. Se

destinen fondos y generen incentivos para el desarrollo de proyectos de agricultura sostenible que ayuden a mejorar las producciones y dignifiquen el trabajo de las comunidades campesinas. Es muy importante que se definan fondos y generen incentivos para el desarrollo de proyectos de agricultura sostenible que ayuden a mejorar las producciones y dignifiquen el trabajo de las comunidades campesinas.

En materia de Economía Verde se deben impulsar proyectos inclusivos para la juventud y todos los sectores de la población tanto urbana como rural, generando empleos verdes dignos, así como espacios de participación.

También es indispensable promover el consumo responsable

Se financien y/o acepten como parte de pago de deuda externa recuperación y conservación de la biodiversidad.

proyectos de

En materia de Participación y Acceso a la información, se debe producir y difundir información accesible en términos técnicos, en distintos lenguajes e idiomas para asegurar la participación informada de la comunidad y aumentar la efectividad del derecho al acceso a la información. Es necesario que se produzcan reportes de sustentabilidad para medir y comunicar su impacto económico, social y ambiental y dar cuenta del cumplimiento de los compromisos internacionales asumidos. Adicionalmente se propone la creación de Consejos Juveniles a nivel local para monitorear los compromisos asumidos por los estados en todos los niveles, asegurando de esta manera la participación de los jóvenes en espacios de toma de decisión y procesos de construcción de políticas públicas, sobre todo en relación a la administración de recursos naturales.

En materia de residuos sólidos, el concepto de basura cero se debe adoptar como objetivo para toda la comunidad, todo proceso productivo y toda actividad económica. Se debe garantizar el cumplimiento del principio de "precaución" en el desarrollo y comercialización de nuevos productos por parte de las empresas y se promueva la creación e implementación de leyes de residuos sólidos urbanos y

rurales que involucren a las empresas y las haga responsables del los mismos.

ratamiento de

En materia de educación ambiental es muy importante asumir de manera obligatoria y responsable la planeación, implementación, evaluación y seguimiento de la educación ambiental en todos los niveles educativos, de manera diversa, transversal, pluricultural, incluyente, universal y gratuita. la Educación Ambiental se debe adoptar como proceso y espacio de recuperación de tradiciones

**Nit. 900296806-4**

culturales, un alto respeto por la identidad territorial, incluyendo y empoderando a grupos vulnerables.

En materia de ciudades y comunidades sustentables, es necesario que se adopte el concepto de "ciudades para personas", basadas en la integración social y espacial, incorporando principios de ordenamiento territorial, zonificación ecológica y gestión ambiental, a su vez fomentar la inversión público-privada en infraestructura, medios de transporte y programas de concienciación. Se esencial

impulsar un acuerdo internacional para promover medios

de transporte

sustentables, incluyendo a la bicicleta como forma de transporte preferente en las ciudades. también es preciso que se promuevan las prácticas y tendencias de la cultura urbana sustentable como ferias, colectores solares, recolectores de agua de lluvia, agricultura urbana, procesos domésticos de reciclado de aguas grises, diseño y arquitectura sustentable.

En materia de Legislación, es vital que: se ratifiquen y cumplan en los tiempos acordados los protocolos y tratados firmados a nivel internacional. Se dé jerarquía

institucional de máximo nivel a la autoridad ambiental nacional,

incluyendo la

transversalidad y amplitud de competencias. Se Instrumenten de forma efectiva los

tratados y acuerdos

ambientales internacionales firmados, a

través de la

formulación y reglamentación de leyes nacionales.

**4.1.2 ¿Cuáles son las observaciones, en caso de que las haya, en relación con las propuestas existentes? (por ejemplo, una hoja de ruta para la economía verde, un marco de acción, unos objetivos de desarrollo sostenible, una asociación mundial revitalizada para el desarrollo sostenible, u otras?).**

La economía verde

debe apoyar el mercado de productos naturales, más

saludables, reconociendo económicamente la propiedad nativa de los productos del país de origen (en vía de desarrollado), además debe incentivar el cultivo de alimentos orgánicos y hacerlos accesibles a los diferentes grupos sociales.

El mercado energético debe ser coherente con el enfoque ambiental, disminuyendo el consumo de combustibles fósiles que liberan el carbono

capturado en el subsuelo, generando problemas mundiales de

calentamiento

desarrollo sustentable, así como facilidades

para obtener

Los gobiernos deben crear políticas de juventud, ambiente y empleo articuladas, con jóvenes calificados para elaborar proyectos y hacer seguimiento adecuado desde las instituciones públicas.

Actualmente no hay

áreas específicas en las instituciones gubernamentales y

privadas de jóvenes que promuevan un trabajo intergeneracional en la sociedad, por lo que se deben crear en principio en los Ministerios de Ambiente y del Interior, así como en las agencias internacionales.

Disminuir las restricciones en la entrada de productos perecederos por apariencia.

Elaborar convenios investigación.

para la generación y el uso de energías

alternativas e

Incrementar significativamente los incentivos y la inversión en

infraestructura

sostenible y energías renovables, disminuyendo como medida urgente y prioritaria la inversión en energías no renovables o de alto impacto en el ambiente.

Los desastres naturales son un problema grande en los países

de desarrollo,

debido a la poca planificación con recursos escasos de los entes públicos y a la corrupción, por lo que deben aumentar las ayudas internacionales a los países para estos temas ambientales, y para la fiscalización de recursos.

Las ayudas internacionales no deben apropiarse de los recursos do

ados a través

del pago de profesionales extranjeros que desconocen las realidades locales y gastan gran parte de los recursos.

**4.1.4 ¿Qué mecanismos de cooperación específicos, arreglos de asociación u otros medios de implementación están previstos utilizar y cuál es el plazo pertinente para que se adopten las decisiones propuestas y se apliquen las medidas?**

Para lograr el desarrollo sustentable es necesario involucrar a los actores sociales locales con respeto de sus creencias y apropiación de recursos territoriales, por lo que se debe evaluar el tema de las patentes dándole reconocimiento a los derechos de las comunidades locales ya que gracias a ellos los recursos naturales patentables existentes. De ser lo contrario las poblaciones locales deslegitiman las patentes y crea violencia y pobreza.

Los países desarrollados deben reconocer con respeto la autonomía de los países en vía de desarrollo, ya que los primeros llegaron invasivamente a matar y hacer atrocidades a estos países en épocas antiguas, y nunca han solicitado perdón lo

que se observa con

un maltrato actual entre las sociedades extranjeras, con

**Nit. 900296806-4**

políticas discriminación y de inmigración que repiten la historia

y lesiona los

derechos humanos de todos independientemente de la clasificación que de por sí es discriminatoria. Esto se debe solucionar para que exista una cooperación real entre países.

Reconocer el papel

de las ONGs como acercamiento entre las instituciones y

organizaciones con la sociedad civil, asignando presupuestos anuales.

En países en vía de

desarrollo se observa que las Naciones Unidas realizan

convocatorias para proyectos en los que no se publican transparentemente los resultados, ya que los encargados de las asignaciones ceden los contratos a sus propios familiares, haciendo corrupta la organización. Es necesario reglas contra

estas conductas que

impiden la actuación de las Naciones Unidas

s real con la

sociedad civil. Tiempo: Inmediato y permanente.

La cooperación sería más ágil e impactante si aumentarán el número de población beneficiada y los proyectos fueran ejecutados por ONGs locales que conocen a la sociedad civil.

Respeten, protejan y

revaloricen los conocimientos de tecnologías ancestrales,

reconociendo la propiedad intelectual de las comunidades originarias.

Impulsen un acuerdo internacional para promover medios

de transporte

sustentables, incluyendo a la bicicleta como forma de transporte preferente en las ciudades.

Se observa de lo

anterior que muchos temas ya habían

sido tratados

anteriormente en Cumbres, foros, encuentros y otros, posiblemente porque la

sociedad civil ha sido

no participativo, por lo que solicitamos que las cumbres no

sean a puerta cerrada, sino SEAN ABIERTAS Y TRANSMITIDAS

EN VIVO EN

CADA IDIOMA, se ratifiquen y cumplan en los tiempos acordados los protocolos y tratados firmados a nivel internacional.

Den jerarquía institucional de máximo nivel a la autoridad ambiental nacional, incluyendo la transversalidad y amplitud de competencias, ya que los interés

económicos prevalecen sobre los socioambientales, lesionando

juventud.

a la niñez y

## Oregon State Bar Sustainable Future Section

Rio + 20 United Nations Conference on Sustainable Development

October 30, 2011

Ladies and Gentlemen:

Subject: Input for the Rio 20 Compilation Document

As the Executive Committee of the Sustainable Future Section ("the Section") of the Oregon State Bar<sup>1</sup>

Law is an essential element when addressing the two themes of Rio 20: "green economy" and "the institutional framework of sustainable development". As Our Common Future explains, in the United States of America, we write to request that the Rio 20 Compilation Document include the reasons and the manner in which the legal profession can join forces with other economic and social actors to promote sustainability. Lawyers can educate clients by including sustainability as an aspect of legal counseling, and lawyers can, and must, change their own practices to make them more sustainable.

"Sustainability requires the enforcement of wider responsibilities for the impacts of decisions. This requires changes in the legal and institutional frameworks that will enforce the common interest. Some necessary changes in the legal framework start from the proposition that an environment adequate for health and well-being is essential for all human beings including future generations. Such a view places the right to use public and private resources in its proper social context and provides a goal for more specific measures." Our Common Future Art. 76, available at <http://www.un-documents.net/ocf-02.htm>.

Indeed, Annex 1 of Our Common Future is a "Summary of Proposed Legal Principles for Environmental Protection and Sustainable Development Adopted by the WCED Experts Group on Environmental Law". <http://www.un-documents.net/ocf-a1.htm>. Notwithstanding the key interaction between law and sustainability, lawyers in general have not yet played a significant role in the sustainability movement and its growing impact on social goals and behaviors.

We feel it is essential to examine the important role lawyers can play regarding sustainability in the Rio 20 Compilation Document. Traditionally, law as a profession has been regarded by many as reactive, that is, lawyers follow their clients in the decision-making process. Yet lawyers help clients make fully informed decisions. A lawyer educated about sustainability is able to provide clients with information on the impact of clients' decisions in terms of advancing or hindering a green economy and operating within an effective institutional framework for sustainable development. The Oregon State Bar provides a model that can be applied to other professional lawyers organizations, and the Sustainable Future Section provides a model to educate lawyers in sustainability and to facilitate integrating sustainability into the practice of law. This paper explains specific actions that were effective in creating the Oregon model so that they can be imitated.

Oregon State Bar Task Force on Sustainability

After years of growing interest among individual Oregon attorneys and attorney groups, in 2008 the Oregon State Bar Board of Governors ("the Board") commissioned a task force of Oregon lawyers to review and make recommendations to the Board relating to sustainability. The charge required the task force to consider the Bar's internal operations and carbon footprint, consider how to educate and encourage lawyers and law firms in sustainability, consider how the Bar should integrate sustainability

into the Bar structure and whether, and how, the Bar should be concerned about the rights and opportunities of future generations, consider the judiciary's and the administration's use of resources, and make recommendations regarding all of the above. The task force fulfilled its charge and submitted a Sustainability Task Force Report in 2009 recommending a framework by which the Bar and individual lawyers could incorporate sustainability into the legal profession and individual law practice. The report recommended that the Bar's governing body adopt a bylaw that would include considerations of sustainability principles, form a "Sustainable Future Section" for lawyers to study and educate lawyers in the application of sustainability to law and law practice, and evaluate the Bar's carbon footprint and determine how to lessen that impact.

1. Bylaw:

In October 2009, the Board added Article 26 to the Oregon State Bar Bylaws:

"The Bar supports the goal of sustainability, generally defined as meeting present needs without compromising the ability of future generations to meet their own needs. Because Bar operations and the practice of law impact the environment and society generally, the Bar will be cognizant of sustainability in its internal operating practices as well as in its service to members. Internally, the Executive Director will designate a sustainability coordinator for Bar operations, will encourage continuous sustainability improvement in Bar operations, and will report to the Board of Governors at least annually on progress and impediments. In the practice of law, principles of sustainability may

be important in addressing competing economic, social and environmental priorities that impact future generations. The Bar will encourage education and dialogue on how law impacts the needs and interests of future generations relative to the advancement of the science of jurisprudence and improvement of the administration of justice."

## 2. Sustainable Future Section:

With approximately 290 lawyer members, the Section is devoted to the relationship between sustainability and law. The Section supports sustainability by providing institutional expertise to the Oregon State Bar and its members, educating attorneys and other legal professionals on sustainability and its integration into the law and on best office practices, and promoting dialogue on how law interfaces with the needs and interests of future generations. The Section provides opportunities for the judicial branch and Bar to engage in constructive dialogues about creating new legal frameworks around sustainability and in facing the daunting challenges of climate change.

Among the Section's activities, it has begun study groups focusing on topics such as emerging sustainability criteria in requests for proposals involving legal services, and the feasibility and effect of creating a state office of legal guardian to analyze how proposed legislation and administrative rules might impact the environmental interests of future generations. A 2009 report exploring this latter topic in depth is "Recalibrating the Law of Humans with the Laws of Nature: Climate Change, Human Rights, and Intergenerational Justice".

To educate lawyers, the Section maintains a website (<http://osbsustainablefuture.org/>), produces a quarterly newsletter, and organizes one- to two-hour legal education programs on a variety of topics directly related to sustainability. Examples of topics covered in the newsletter include: "The Law Office Sustainability Policy", "The Ethical Dimensions of Sustainability", and "The Precautionary Principle". Program topics have included "How Sustainability is Transforming the Practice of Law", "Should the Oregon Constitution be Amended to Protect the Environmental Rights of Future Generations?", "The Paperless Office", "Human Right to Water", and "Ecosystem Services". Continuing legal education credits are available for most programs sponsored by the Section. In addition, in 2010, the Section created Sustainable Leadership Awards to recognize the exceptional contributions of lawyers and law firms in advancing sustainability. The Section is in the process of creating a Partnership in Sustainability program to recognize law firms implementing and maintaining sustainable office practices that satisfy criteria established by the Section.

## 3. Carbon footprint:

The Oregon State Bar office operates for 60 hours a week with 135 workers on the main shift and 135 personal computers, serving approximately 17,500 members in Oregon, other states, Washington D.C., U.S. territories, and other countries. The Sustainability Task Force Report and subsequent carbon footprint reports provide the Bar information on the extent to which greenhouse gas emissions result from its operations and key actions the Bar can take to conserve resources and reduce this impact.

## Conclusion

Lawyers may assist their clients in two ways to advance the themes of Rio 20 and sustainable development: we can educate clients, and we can reflect sustainability values in our own operations as individual professionals and as a profession as a whole. The example of the Oregon State Bar demonstrates how lawyers can do this. With information and awareness of the relationship between law and sustainability, lawyers can further sustainable development by helping craft legally sound frameworks for the private and public sectors to implement the steps that will undoubtedly be a product of Rio 20.

Thank you for considering this input.

Sincerely,

Oregon State Bar Sustainable Future Section, Executive Committee

---

## Oxfam

### General Content

#### **a) What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?**

1. Oxfam expects governments to make the Rio+20 outcomes a cornerstone, marking an unequivocal change of course towards an era of more sustainable and inclusive economic development in which the struggle to end poverty is a central concern of all. Governments should view Rio+20 as an opportunity to:

Set the vision for 21st century development, and agree to establish the measures, goals and institutions required at national and international levels to shift economies and, more broadly, our model of development, onto more sustainable, equitable pathways.

Identify areas where on-going multilateral action is needed to manage shocks and scarcities so as to minimise their impacts on poor and vulnerable communities.

Engage and inspire citizens and civil society both to contribute directly to sustainable consumption and production patterns, and to support strong governmental and intergovernmental action necessary to achieve these.

#### 2. Specific proposals that could help deliver such an outcome include:

Development of, and agreement on, new indicators of economic progress, additional to GDP, focused on well-being and equality, on building social, human and economic wealth, and preserving natural resources.

Replacing the existing, broken food system, with one that is equitable, sustainable and resilient by focusing on key hotspots of: food and nutritional security; land grabbing; the impacts of food price volatility; patterns of distribution and consumption; investment in smallholder agriculture, and in women producers in particular, and; agro-ecological approaches that value and invest in soil, water, forest and biodiversity conservation.

Establishment of new energy goals that expand affordable energy access by the poorest people, and incentivise renewable energy and energy efficiency.

Introduction of measures to raise resources for sustainable development-related issues from new and additional sources such as a fair carbon charge on international transport and/or a financial transactions tax to generate financial flows to combat climate change and poverty eradication.

Reforms geared towards enhancing global institutional co-ordination and coherence – in particular to mitigate, and respond to, resource-related crises and risks, such as food and climate shocks, while increasing transparency and expanding civil society participation.

More detailed proposals that Oxfam believes merit special attention as part of the Rio+20 outcomes are described in the Annex to this document (below). The Rio+20 outcome document needs to provide space for tried and tested policies which will ensure a just transition to sustainability, as well as innovations. Both will require a special focus on international and national policies to protect poor people's rights and interests, especially rules to improve secure access to natural resources, such as land, water, and other critical resources.

3. In order to deliver expected outcomes, the structure of the outcome document will need to include:

Overarching principles for a new prosperity in which resources are shared, resilience is built, and wealth and power are distributed to the many, including a re-affirmation of the Rio Principles agreed in 1992.

Time-bound goals and targets, including related economic estimates, to give meaning to the intentions expressed by governments.

A place for action-oriented proposals, such as those mentioned under #2 (above), including specific provisions for means of implementation and follow-up.

---

**b) What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?**

**Green Economy Roadmaps**

Poverty eradication, equity, and resilience must be central – not supplementary – to any vision of and/or approach to more sustainable and inclusive economies, no matter how they are described. Oxfam believes that it is critical to ensure key principles of fairness are at the heart of the vision. In particular, this includes:

Expanding access and protecting poor people's rights to natural resources. People in rural communities are especially reliant on natural resources for their livelihoods and resilience, yet their access to, and rights over, these resources are often inadequate and insecure. Rio should endorse an approach, which ensures effective regulation to protect people's rights to these assets, and creates benefits.

Promoting gender equity. Rural women in developing countries have long experienced unequal and insecure access to natural resources, while depending disproportionately on them. Supportive policies include, for example, securing women's land rights or designing energy services to meet women's needs.

Ensuring a just, resilient transition to cope with industrial change and increased shocks and stresses from volatile commodity prices (oil, food) and as climate change gathers pace. Policies need to ensure the transition is fair and increases resilience (e.g. promoting jobs for low-income workers, using social protection measures effectively).

Ensuring fairness in global efforts to manage natural resources. Equitable burden-sharing between countries has long been accepted as both ethically just and politically necessary for a global climate deal. As the world starts to hit limits for other key resources (e.g. land, water), the issue of „fair shares" in consumption may become relevant to these as well.

Voice and participation. Ending poverty will remain elusive so long as people living in poverty are excluded from the decisions their lives depend upon. Participation and accountability have long been emphasised as critical for sustainable development, but in many countries these remain weak. For instance, discussions on new low-carbon strategies can be highly technical, skewed by elite interests or focused on technology solutions not suited to poor people's needs. Roadmaps should make a specific effort to include marginalised groups, build their understanding of the issues and their capacity to hold governments to account. Global institutions must also open themselves to the same principles.

Roadmaps will need a clear destination for what they are trying to achieve. There is no coincidence in the fact that crises of sustainability and equity are occurring after decades in which economic growth has been almost universally pursued as a goal in and of itself. Any new roadmaps must begin by setting course for a destination in which economies are managed to both respect the biophysical limits of the planet's natural resource base and deliver a set of social development goals – including universal access to health and education, progressive taxation, gender equity, expanding access to productive agricultural land. Both aspects are critical to ensuring equity, and end to poverty.

Any roadmaps need to point in the direction of absolute decoupling of resource use from economic growth, while equitably expanding access for people living in poverty. A key marker for the sustainability of a country's economic development path is, in the first instance, the extent to which it has decoupled economic growth from resource use in

absolute terms. That is, in order to achieve environmentally sustainable economic growth at the global scale, global use of natural resources must fall while GDP continues to rise (relative decoupling, where GDP grows faster than growth in resource use, is insufficient). Given that the planet's renewable resources are already being used far beyond sustainable levels, absolute decoupling is needed quickly in order to prevent irreversible environmental damage.

## Sustainable Development Goals

Discussion of Sustainable Development Goals (SDGs) must not divert political attention delivering and investing in achieving the MDGs between now and 2015.

To serve as meaningful indicators of progress, any sustainable development goals will need to address the absence in the MDGs of measures to address inequity, as well as the absence of targets and policies that ensure environmental sustainability. Over the next decade we need a very rapid transition to a new model of prosperity, which delivers growth that both respects planetary boundaries and has equity at its heart.

Rather than adding a new set of indicators in parallel to the existing Millennium Development Goals (MDGs), new proposals for sustainable development goals should aim to serve as a comprehensive framework for the post-2015 period, ensuring that the issues covered by the existing MDGs feature prominently in the coming period.

There are a range of options for defining the scope and content of any SDGs. One option which appears to merit further examination may be to structure these around two critical, inter-locking principles: planetary boundaries, and a social development threshold. In other words, taken as a whole, the selection of goals and objectives could define a safe and socially just operating space for humanity and help measure progress towards that end.

Experience shows that global goals need to be rooted in national indicators and developed through comprehensive participatory processes. To help ensure accountability, any global goals or objectives defined would need to be enmeshed within a set of national indicators. Such indicators could also be used to complement Gross Domestic Product (GDP) and transform the current (limited) understanding of economic progress. Information must also be made public, and widely accessible.

---

### **c) What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.);**

Innovative finance for climate change and poverty reduction

A fair green transition will require a mobilisation of public finance on a massive scale to leverage private investment and so help "close the implementation gap." As well encouraging rich nations to meet their commitment to spend 0.7% of GNI on development aid, Rio+20 is an opportunity to get agreement and backing for innovative finance mechanisms. Two mechanisms that are gaining political momentum among governments (in the EU, G20, UNFCCC) and are supported by many expert reports are:

Revenue-raising from tackling international transport emissions. Schemes to cut air and shipping emissions, which are currently unregulated, could raise more than US\$15bn each year. This should be used to address climate change adaptation and mitigation in poor countries.

A tax on financial transactions. An average tax of 0.05% on all transactions between financial institutions could generate US\$400 billion worldwide for poverty-reduction and climate change – and help address the risks of high frequency trading. Several countries already levy certain types of financial transactions tax.

What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Reforming institutions, rules and processes is vital, since „unsustainability“ is largely a result of weak governance at all levels (global, regional, national, local). The existing ideas for a minor reconfiguration of the UN system being discussed by governments for Rio+20 fall short of what is needed to achieve the transformational changes sustainability requires. Governments need to:

Assert firm backing for stronger multilateral governance needed to a) assess and regulate resource use so these remain within safe environmental limits and are shared fairly; b) mobilize investment to public goods and shift the behaviours of business and consumers; and c) protect vulnerable people by limiting risks and building resilience to shocks. Specifically, establishment of a global framework with robust international standards and accountability mechanisms to help regulate transboundary access to land, water, and other critical resources is important.

Prioritise the need to build resilience to shocks and stresses as a new challenge for the international system. The frequency and intensity of shocks (financial, economic, food, environmental, weather-related etc) experienced by poor communities are increasing, but without any major advances in resilience. At an international level, a resilience agenda would involve, for example, more leadership and investment on Adaptation and Disaster Risk Reduction and exploring a multi-stakeholder initiative to develop a Common Resilience Framework – needed to harmonise currently un-aligned interventions across development, risk reduction and climate change adaptation.

Focus on improving co-ordination and coherence in the short-term. Institutional silos and fragmentation between different parts of the international systems continues to be a key problem – leading to wasted resources, lower impacts and short-lived or conflicting outcomes. More joint work between agencies on cross-cutting issues, like food or energy security, to create shared goals, develop and share data, and build common analysis and responses is vital.

Play the „pathfinding“ role to see where future deals are needed in the long-term. There are some areas where future agreements and co-operation will be needed, but

understanding of the issues or solutions may be limited, or political consensus does not yet exist (e.g. food price volatility, soil degradation, water grabs, „fair shares“, conflict-related resource shocks etc). Rio+20 provides a space to identify these gaps and tensions, the different interests at stake, and agree initial steps to address these – for instance, by commissioning assessments of the readiness of existing institutions and agreements to handle future stresses.

Formalize means by which civil society can contribute to international decision-making processes relevant to sustainable development.

Ensure global institutional support for the future that already exists, in the form of innovative solutions that are sustainably growing greater prosperity today. Organizations, businesses, movements, and networks for a new prosperity are appearing, growing, and connecting up all over the world. Poor farmers" organisations demanding fair shares from national budgets and market chains. Development NGOs working on sustainable agriculture. Environmental organizations calling for a sustainable future. Women"s groups claiming their rights to resources. Communities leading low-carbon lifestyles. Movements, such as Fair Trade, which link ethical consumers and the private sector. Grassroots campaigns calling for the right to food to be respected. The list is long and growing. Mechanisms dedicated to incubating, cross-fertilizing, and disseminating sustainable solutions globally in the coming decade will be essential to realizing sustainable development.

---

**d) What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?**

---

### Specific Elements

**a) Objective of the Conference: To secure renewed political commitment for sustainable development, assessing the progress to date and remaining gaps in the implementation of the outcomes of the major summits on sustainable development and addressing new and emerging challenges.**

---

**b) Green economy in the context of sustainable development and poverty eradication: views regarding how green economy can be a means to achieve sustainable development in its three dimensions, and poverty eradication; what is its potential added value; experience to date, including what has worked and how to build upon success, what are the challenges and opportunities and how to address the challenges and seize opportunities, and possible elements of an agreement in outcome document on a green economy in the context of sustainable development and poverty eradication**

---

**c) Institutional framework for sustainable development: Priorities and proposals for strengthening individual pillars of sustainable development, as well as those for strengthening integration of the three pillars, at multiple levels; local, national, regional and international.**

---

**d) Any proposals for refinement of the two themes. Recall that Resolution 64/236 describes the focus of the Conference: "The focus of the Conference will include the following themes to be discussed and refined during the preparatory process: a green economy in the context of sustainable development and poverty eradication and the institutional framework for sustainable development".**

Oxfam submission to UNCSD with inputs for the Rio+20 compilation document

Oxfam works with partners around the world to find lasting solutions to poverty and injustice. Currently, we work in more than 70 countries and respond to an average of 30 humanitarian emergencies each year. Our efforts aim to help people realize their fundamental rights to a sustainable livelihood, including decent jobs and access to – and protection of – the natural resources upon which livelihoods depend; to health, education and other essential services; to life and security; to participate fully in the decisions that affect their lives; and to equity, for women, ethnic minorities and others suffering discrimination. We fight poverty and suffering through campaigning, long-term development work, and emergency response. Oxfam is a confederation of 15 different affiliates from around the world (<http://www.oxfam.org/en/about>).

With the 20th Anniversary of the 1992 Earth Summit just months away, Oxfam observes important progress over the past two decades – on reducing poverty, and mainstreaming concerns about climate change and other sustainable development issues – but also a global model of economic development that is still failing to result in more inclusive or sustainable societies. Progress on sustainable development since 1992 has been weak and, overall, threats have worsened.

Whilst millions of people have been lifted out of poverty, the benefits of growth have been unevenly distributed and global income inequality is rising. Hunger levels are almost unchanged from 40 years ago, despite gains in income and agricultural productivity. We have faced two food price crises within 3 years and now a famine in Somalia. A weight of evidence demonstrates that inequality leads to instability, prevents productive investment, undermines institutions of government, and contributed to the financial crisis from which the world is still suffering. Protests now emerging around the world show the extent to which citizens are concerned about this corrosive power of inequality. But only a handful of the world"s leading economies have reduced income inequality since 1990. Women continue to be systematically excluded from economic opportunities across the world.

Life depends on the planet"s natural resources, those we use for food, water and energy, and yet the current trajectory of resource use is appalling. Humanity"s ecological footprint has more than doubled since 1966 and we are using nature"s services 50 per cent faster than Earth can renew them. We have transgressed 3 out of 9 critical planetary boundaries (biodiversity, greenhouse gases, nitrate use). Further natural resource depletion threatens to widen the gross inequalities of today, whereby most resources are consumed by a well-off minority. No country has yet demonstrated that it is possible to achieve high average income with sustainable natural resource use. Only four of the world"s leading economies have reduced their carbon emissions since 1992.

The world"s broken food system shows what happens when policies work only for the few and fail the many, when policies both undermine the natural resources we depend on and fail to address resulting vulnerabilities. Another 20 years of the same won"t only be bad for people living in poverty; it will be bad for everyone. Rio+20 must begin to reverse these trends. It is a rare chance to restore credibility, by getting serious about implementing the solutions that exist already, and concentrating efforts on key sectors that can help catalyse transformational change on a global scale.

What are the expectations for the outcome of Rio+20, and what are the concrete proposals in this regard, including views on a possible structure of the Outcome document?

1. Oxfam expects governments to make the Rio+20 outcomes a cornerstone, marking an unequivocal change of course towards an era of more sustainable and inclusive economic development in which the struggle to end poverty is a central concern of all. Governments should view Rio+20 as an opportunity to:

Set the vision for 21st century development, and agree to establish the measures, goals and institutions required at national and international levels to shift economies and, more broadly, our model of development, onto more sustainable, equitable pathways.

Identify areas where on-going multilateral action is needed to manage shocks and scarcities so as to minimise their impacts on poor and vulnerable communities.

Engage and inspire citizens and civil society both to contribute directly to sustainable consumption and production patterns, and to support strong governmental and intergovernmental action necessary to achieve these.

2. Specific proposals that could help deliver such an outcome include:

Development of, and agreement on, new indicators of economic progress, additional to GDP, focused on well-being and equality, on building social, human and economic wealth, and preserving natural resources.

Replacing the existing, broken food system, with one that is equitable, sustainable and resilient by focusing on key hotspots of: food and nutritional security; land grabbing; the impacts of food price volatility; patterns of distribution and consumption; investment in smallholder agriculture, and in women producers in particular, and; agro-ecological approaches that value and invest in soil, water, forest and biodiversity conservation.

Establishment of new energy goals that expand affordable energy access by the poorest people, and incentivise renewable energy and energy efficiency.

Introduction of measures to raise resources for sustainable development-related issues from new and additional sources such as a fair carbon charge on international transport and/or a financial transactions tax to generate financial flows to combat climate change and poverty eradication.

Reforms geared towards enhancing global institutional co-ordination and coherence – in particular to mitigate, and respond to, resource-related crises and risks, such as food and climate shocks, while increasing transparency and expanding civil society participation.

More detailed proposals that Oxfam believes merit special attention as part of the Rio+20 outcomes are described in the Annex to this document (below). The Rio+20 outcome document needs to provide space for tried and tested policies which will ensure a just transition to sustainability, as well as innovations. Both will require a special focus on international and national policies to protect poor people's rights and interests, especially rules to improve secure access to natural resources, such as land, water, and other critical resources.

3. In order to deliver expected outcomes, the structure of the outcome document will need to include:

Overarching principles for a new prosperity in which resources are shared, resilience is built, and wealth and power are distributed to the many, including a re-affirmation of the Rio Principles agreed in 1992.

Time-bound goals and targets, including related economic estimates, to give meaning to the intentions expressed by governments.

A place for action-oriented proposals, such as those mentioned under #2 (above), including specific provisions for means of implementation and follow-up.

What are the comments, if any, on existing proposals: e.g., a green economy roadmap, framework for action, sustainable development goals, a revitalized global partnership for sustainable development, or others?

#### Green Economy Roadmaps

Poverty eradication, equity, and resilience must be central – not supplementary – to any vision of and/or approach to more sustainable and inclusive economies, no matter how they are described. Oxfam believes that it is critical to ensure key principles of fairness are at the heart of the vision. In particular, this includes:

Expanding access and protecting poor people's rights to natural resources. People in rural communities are especially reliant on natural resources for their livelihoods and resilience, yet their access to, and rights over, these resources are often inadequate and insecure. Rio should endorse an approach, which ensures effective regulation to protect people's rights to these assets, and creates benefits.

Promoting gender equity. Rural women in developing countries have long experienced unequal and insecure access to natural resources, while depending disproportionately on them. Supportive policies include, for example, securing women's land rights or designing energy services to meet women's needs.

Ensuring a just, resilient transition to cope with industrial change and increased shocks and stresses from volatile commodity prices (oil, food) and as climate change gathers pace. Policies need to ensure the transition is fair and increases resilience (e.g. promoting jobs for low-income workers, using social protection measures effectively).

Ensuring fairness in global efforts to manage natural resources. Equitable burden-sharing between countries has long been accepted as both ethically just and politically necessary for a global climate deal. As the world starts to hit limits for other key resources (e.g. land, water), the issue of „fair shares“ in consumption may become relevant to these as well.

Voice and participation. Ending poverty will remain elusive so long as people living in poverty are excluded from the decisions their lives depend upon. Participation and accountability have long been emphasised as critical for sustainable development, but in many countries these remain weak. For instance, discussions on new low-carbon strategies can be highly technical, skewed by elite interests or focused on technology solutions not suited to poor people's needs. Roadmaps should make a specific effort to include marginalised groups, build their understanding of the issues and their capacity to hold governments to account. Global institutions must also open themselves to the same principles.

Roadmaps will need a clear destination for what they are trying to achieve. There is no coincidence in the fact that crises of sustainability and equity are occurring after decades in which economic growth has been almost universally pursued as a goal in and of itself. Any new roadmaps must begin by setting course for a destination in which economies are managed to both respect the biophysical limits of the planet's natural resource base and deliver a set of social development goals – including universal access to health and education, progressive taxation, gender equity, expanding access to productive agricultural land. Both aspects are critical to ensuring equity, and end to poverty.

Any roadmaps need to point in the direction of absolute decoupling of resource use from economic growth, while equitably expanding access for people living in poverty. A key marker for the sustainability of a country's economic development path is, in the first instance, the extent to which it has decoupled economic growth from resource use in absolute terms. That is, in order to achieve environmentally sustainable economic growth at the global scale, global use of natural resources must fall while GDP continues to rise (relative decoupling, where GDP grows faster than growth in resource use, is insufficient). Given that the planet's renewable resources are already being used far beyond sustainable levels, absolute decoupling is needed quickly in order to prevent irreversible environmental damage.

#### Sustainable Development Goals

Discussion of Sustainable Development Goals (SDGs) must not divert political attention delivering and investing in achieving the MDGs between now and 2015.

To serve as meaningful indicators of progress, any sustainable development goals will need to address the absence in the MDGs of measures to address inequity, as well as the absence of targets and policies that ensure environmental sustainability. Over the next decade we need a very rapid transition to a new model of prosperity, which delivers growth that both respects planetary boundaries and has equity at its heart.

Rather than adding a new set of indicators in parallel to the existing Millennium Development Goals (MDGs), new proposals for sustainable development goals should aim to serve as a comprehensive framework for the post-2015 period, ensuring that the issues covered by the existing MDGs feature prominently in the coming period.

There are a range of options for defining the scope and content of any SDGs. One option which appears to merit further examination may be to structure these around two critical, inter-locking principles: planetary boundaries, and a social development threshold. In other words, taken as a whole, the selection of goals and objectives could define a safe and socially just operating space for humanity and help measure progress towards that end.

Experience shows that global goals need to be rooted in national indicators and developed through comprehensive participatory processes. To help ensure accountability, any global goals or objectives defined would need to be enmeshed within a set of national indicators. Such indicators could also be used to complement Gross Domestic Product (GDP) and transform the current (limited) understanding of economic progress. Information must also be made public, and widely accessible.

What are the views on implementation and on how to close the implementation gap, which relevant actors are envisaged as being involved (Governments, specific Major Groups, UN system, IFIs, etc.).

Innovative finance for climate change and poverty reduction

A fair green transition will require a mobilisation of public finance on a massive scale to leverage private investment and so help "close the implementation gap." As well encouraging rich nations to meet their commitment to spend 0.7% of GNI on development aid, Rio+20 is an opportunity to get agreement and backing for innovative finance mechanisms. Two mechanisms that are gaining political momentum among governments (in the EU, G20, UNFCCC) and are supported by many expert reports are:

Revenue-raising from tackling international transport emissions. Schemes to cut air and shipping emissions, which are currently unregulated, could raise more than US\$15bn each year. This should be used to address climate change adaptation and mitigation in poor countries.

A tax on financial transactions. An average tax of 0.05% on all transactions between financial institutions could generate US\$400 billion worldwide for poverty-reduction and climate change – and help address the risks of high frequency trading. Several countries already levy certain types of financial transactions tax.

What specific cooperation mechanisms, partnership arrangements or other implementation tools are envisaged and what is the relevant time frame for the proposed decisions to be reached and actions to be implemented?

Reforming institutions, rules and processes is vital, since „unsustainability“ is largely a result of weak governance at all levels (global, regional, national, local). The existing ideas for a minor reconfiguration of the UN system being discussed by governments for Rio+20 fall short of what is needed to achieve the transformational changes sustainability requires. Governments need to:

Assert firm backing for stronger multilateral governance needed to a) assess and regulate resource use so these remain within safe environmental limits and are shared fairly; b) mobilize investment to public goods and shift the behaviours of business and consumers; and c) protect vulnerable people by limiting risks and building resilience to shocks. Specifically, establishment of a global framework with robust international standards and accountability mechanisms to help regulate transboundary access to land, water, and other critical resources is important.

Prioritise the need to build resilience to shocks and stresses as a new challenge for the international system. The frequency and intensity of shocks (financial, economic, food, environmental, weather-related etc) experienced by poor communities are increasing, but without any major advances in resilience. At an international level, a resilience agenda would involve, for example, more leadership and investment on Adaptation and Disaster Risk Reduction and exploring a multi-stakeholder initiative to develop a Common Resilience Framework – needed to harmonise currently un-aligned interventions across development, risk reduction and climate change adaptation.

Focus on improving co-ordination and coherence in the short-term. Institutional silos and fragmentation between different parts of the international systems continues to be a key problem – leading to wasted resources, lower impacts and short-lived or conflicting outcomes. More joint work between agencies on cross-cutting issues, like food or energy security, to create shared goals, develop and share data, and build common analysis and responses is vital.

Play the „pathfinding“ role to see where future deals are needed in the long-term. There are some areas where future agreements and co-operation will be needed, but understanding of the issues or solutions may be limited, or political consensus does not yet exist (e.g. food price volatility, soil degradation, water grabs, „fair shares“, conflict-related resource shocks etc). Rio+20 provides a space to identify these gaps and tensions, the different interests at stake, and agree initial steps to address these – for instance, by commissioning assessments of the readiness of existing institutions and agreements to handle future stresses.

Formalize means by which civil society can contribute to international decision-making processes relevant to sustainable development.

Ensure global institutional support for the future that already exists, in the form of innovative solutions that are sustainably growing greater prosperity today. Organizations, businesses, movements, and networks for a new prosperity are appearing, growing, and connecting up all over the world. Poor farmers“ organisations demanding fair shares from national budgets and market chains. Development NGOs working on sustainable agriculture. Environmental organizations calling for a sustainable future. Women’s groups claiming their rights to resources. Communities leading low-carbon lifestyles. Movements, such as Fair Trade, which link ethical consumers and the private sector. Grassroots campaigns calling for the right to food to be respected. The list is long and growing. Mechanisms dedicated to incubating, cross-fertilizing, and disseminating sustainable solutions globally in the coming decade will be essential to realizing sustainable development.

Annex: What are the issues that need to be urgently addressed through the Rio+20 process?

Rio needs to go beyond defining a vision and green economy principles by agreeing concrete measures, which can catalyse the shift to a sustainable, equitable economy. Whilst precise goals and actions require further thought and definition, three areas Oxfam already sees as important are: food and agriculture, energy, and alternate economic indicators.

Food security and sustainable agriculture

The food system is under intense pressure to meet demand for a growing population in a world of resource-constraints. Arable land and water resources are being degraded and squeezed by demands for other uses. Climate change is an additional threat. Women farmers“ livelihood security is undermined by highly unequal access to productive resources technologies and services. Investing in smallholders, rural economies and sustainable agricultural practices in developing countries can boost poor people’s incomes, food availability and environmental protection - and provide the „growth spark“ for development. Inclusion in decision-making and ensuring access to land and water, new technologies, agricultural extension, credit, markets and social capital can significantly increase women’s productivity and the food security of their communities. Setting a new course for global agriculture requires multiple interventions and a much stronger role for governments. Some key priorities for action in developing countries, which Rio+20 can support, are to:

Change the terms of debate toward an “ecosystems approach”. Despite significant developments in agriculture, policy remains dominated by an interventionist approach

focused on specific techno-fixes and inputs, such as agrochemical application. However, there is huge potential for low-input, agro-ecological farming techniques to raise yields, improve soil fertility, conserve natural resources and reduce dependence on expensive inputs (e.g. System of Rice Intensification). Several expert agencies and reports advocate these approaches (the UN Special Rapporteur on the Right to Food, UNEP, UNCTAD, FAO and the IAASTD).

Increase and re-align finance flows to sustainable smallholder agriculture. Donors, governments and companies need to increase investment in smallholders, agriculture extension services, conservation agriculture and rural infrastructure. R&D should be redirected toward „technologies of practices" (not just specific products or inputs). All governments should massively increase incentives and support to farmers willing to adopt agro-ecological farming methods. Donors should: (1) commit to invest in food security and sustainable small-scale food production past the I"quila commitment period, outline a clear strategy for spending the money to enable the scaling up of proven sustainable approaches, and measure and report on progress against commitments, specifically in support of smallholders, women, and country-led plans; and (2) set out plans to allocate a minimum of 10% of their ODA to agriculture and food security in order to match the commitments of African governments in the 2003 Maputo Declaration. Perverse subsidies should be dismantled, including biofuels mandates and trade-distorting agricultural subsidies in the EU and North America.

Champion the needs and contribution of women producers. Women produce much of the food consumed in developing countries, yet receive just 7% of total aid to agriculture, forestry and fishing. Inclusion in decision-making and ensuring access to land and water, new technologies, agricultural extension, credit, markets and social capital will dramatically increase women"s productivity and the food security of their communities. Governments should commit to: provide women food producers equal access to inputs, credit, and extension services; implement and enforce existing gender-equitable policies on land rights and tenure; and enact policies that substantially increase access to land and water resources for women.

Refocus agricultural research on food security and sustainability Governments must task the CGIAR research institutions with R&D improvements to orphan crops, robust research on improving agro-ecological practices and food processing technologies, and both quantitatively and qualitatively assessing their impacts on livelihoods and food security. Research institutions must have measurable targets established by local- and country-level needs assessments. They must support research partnerships involving collaboration among poor women and men farmers, extension services, and agricultural scientists.

Rebuild extension services prioritising women smallholder food producers. Governments and donors should commit to support scaling-up of national extension services and focus on capacity building of extensionists, innovations, best practices, participatory processes, and peer-to-peer learning. Developing country governments should commit to an unprecedented push to rebuild agricultural extension services to small-scale food producers to help achieve widespread uptake of agro-ecological practices to address key threats to soil, water, biodiversity and food security including specific approaches and measurable targets to provide services for women food producers.

Focus on key threats to soil, water and biodiversity. Soil health, water availability, and biodiversity are three pillars for a productive agro-ecosystem, yet these are under threat. For instance around a quarter of vegetated land on earth has already been affected by human-induced soil degradation and three-quarters of plant genetic resources – vital to make production resilient to pests and weather shocks - have been lost over the last century.

Promote smallholder access to land, water, other natural resources, markets and information – with a strong role for governments. Smallholder food producers, who know how to produce under the most variable conditions, are being pressured to migrate to cities. Cultural diversity and knowledge about local conditions are declining, as is agro-biodiversity. This wide agenda encompasses, for example, improving access to finance (credit, insurance) and information (market prices, weather forecasting), supporting producer organisations to strengthen their links into value chains, improving land tenure systems and water rights, and investing in on-farm and rural infrastructure (storage facilities, roads, access to basic services) as well as access to social nets and incentives for the youth to remain in their communities. This agenda must have a special focus on women"s needs in rural areas.

#### Energy access and clean energy

There is already strong interest in making the energy sector a focus for Rio+20, which Oxfam welcomes. Transforming our energy systems is essential to cut poverty, meet the Millennium Development Goals, boost growth and help countries cope with rising fossil fuel prices while also limiting the increase in global average temperature to 1.5°C, which is critical to achieving the objective of the UN Climate Change Convention.

Rio+20 should build political commitment by agreeing new energy goals. The UN"s 2012 campaign of Sustainable Energy for All provides a starting point for defining what those goals could be. This aims for, by 2030, universal access to modern energy services, a 40% reduction in global energy intensity and increase of renewable energy use globally to 30%.

Increasing poor people"s energy access should be the priority. On current projections, the numbers of people using traditional biomass for cooking will be higher in 2030 than today and those without electricity access will only fall by a small margin. New goals and investments must focus on the full range of energy services that poor people need, such as energy for lighting, cooking, heating and cooling, access to information and communications, and mechanical power. Achieving universal access will require additional finance of \$35-40 billion per year by 2030, with at least \$15 billion of that needed in the form of grants for the least developed countries.

#### Measures of Progress Beyond GDP

Governments at Rio should champion the development and systematic use of new indicators of economic progress, which can „measure what matters" in the 21st century, far better than GDP has done. A fair green economy will require new measures of economic progress. These can provide a new compass to steer economies and targets for governments and policy-makers. Leading, credible experts and institutions are throwing their weight behind this agenda – from the 2009 Stiglitz-Sen-Fitoussi Commission, to the work of OECD and UNEP.

New indicators could draw on the Stiglitz-Sen-Fitoussi proposals to: shift from focusing on economic output to measuring income, including its distribution across households; recognise the value of unpaid goods and services, particularly in the care economy and in environmental service provision; and give value not just to the current stream of goods and services but to changes in the underlying stock of assets from which all wealth is generated – a nation"s natural assets (ecosystems, renewable resources), human assets (people"s knowledge and skills), social assets (institutions and community), and physical assets (infrastructure and machinery). Measures and goals on inequality should be a particular focus, given the link between equality, social cohesion, resource use and development. Economies, defined in these broad terms, can grow and progress substantially from where they are today.

## Pachamama Alliance, Four Years.Go and 4YG Media

### Submission to the Delegates to

### Rio + 20 Earth Summit 2012

**From:**

**The Four Years.Go. Campaign**

**The Pachamama Alliance**

**4YG Media, LLC**

**PLEASE READ THIS!**

This submission has been developed collaboratively by the three organizations listed above and represents input from an NGO, a public awareness campaign and a social benefit "for profit" entity.

**Act With Absolute Urgency** In the 20 years since the originally Earth Summit in Rio, **governments have almost universally failed** to meet their commitments and/or accomplish the goals laid forth in Agenda 21 and following documents. This is well documented in many other submissions and reports. (see attachment A – Where we Stand as a Global Family)

The irony is that total wealth is growing, longevity is increasing, more people are healthier than ever before. Deaths due to violent conflicts have dropped to levels unimagined just a few years ago.

And yet, the gap between the elite holders of power and money (the 1% or .1% or .01%) and everybody else is staggering and growing. The evidence mounts daily that while the path we are on may look rosy for now, there are cracks that are on the verge of breaking wide open, producing a global collapse of monumental proportions.

Despite the agreements made in Rio in 1990, humanity remains on a completely unsustainable course. In the best models of future economic activity, as examined by MIT, anything like business as usual leads to atmospheric carbon levels that would almost certainly trigger catastrophic climate tipping points. (MIT published a paper assessing influence on climate change of different scenarios from IPCC, US Govt. Climate Change Science Program and Shell. See report 163, <http://web.mit.edu/globalchange/www>) The "best possible scenario" of smooth transition to existing technologies and almost seamless cooperation of governments outcome produces 650 ppm carbon dioxide equivalent, well beyond any reputable "safe levels" of 350 or 450 or even the old conventional wisdom of 550.

The time for a complete "Remake" of humanity's operating manual is NOW. There will never be a better window of opportunity. In fact we may never get the chance again.

We have the technology, the resources and working examples of the processes, industries, and economic and social systems that will avert these crises, as well as lay the groundwork for a global system in which everyone will prosper, while restoring the vital capacity of the natural ecosystems that we all depend upon for our food, water, and every aspect of robust commerce.

The window of time to implement these solutions is very short. Conservative estimates suggest that we have less than one decade to transcend the irreversible tipping points that "business as usual" has us accelerating toward. The time to confront the finite nature of the living systems of the planet to support a wasteful development paradigm is upon us.

WE DEMAND THAT **YOU** ACT WITH THE URGENCY THAT COMES WITH KNOWING THAT THE WELL-BEING OF ALL FUTURE GENERATIONS OF ALL SPECIES HANGS IN THE BALANCE.

#### **Adopt a NEW WORLDVIEW**

When we say "urgency" we do not suggest a frantic, fear induced, automatically reactive attempt to "do more or better or different" things. What is called for are genuinely transformative measures. As delegates entrusted with the fate of humanity (yes that's the mandate you have been given!) we suggest that you consider that the view of the world that we have inherited from the last 400 to 500 years of reductive science and engineering has led us astray. The world is not a "clock" or a machine. It is not merely a vast materialistic puzzle to be figured out. Nature is not a realm separate from the idealized human realm which exists to do our bidding. We do not live in the insanely inaccurate model of unlimited resources and an unlimited waste depository that current economics assumes. We live in a real, live, vibrantly thriving eco-logy of life. Economy is, in fact Ecology.

Looking from the whole we can see that the life-giving systems have been thrown out of balance by human activity. We now need to restore that balance. It will take a truly restorative approach to act on behalf of the whole.

The perspective that we are asking that you, and we all, take is that of the whole. What we are asking is that you use one principle to judge the policies and agreements that you discuss, debate, support and adopt:

**"Do I, in my deepest heart, from my highest self, believe this policy will lead toward a just, thriving, sustainable way of life for all?"**

WE DEMAND THAT YOU TAKE INTO ACCOUNT THE WHOLE – ALL OF HUMANITY, ALL OF LIFE, ALL OF TIME – TO THE VERY BEST OF YOUR ABILITY.

#### **Listen to the best of "Civil Society"**

There is a groundswell of small-scale, autonomous activity to address the issues we face. The existence of over 2 million NGO's, each addressing some aspect of the crises we face and the stunning opportunity before us is but one testimonial that a sea-change is underway. A phenomenon with no central guidance, the imperative to take on our world as it is - and as it could be - has no parallel in history.

This massively self-organized civil uprising is exploring the positive tipping points on our horizon – generating the collective and collaborative awareness and activities that in their aggregate will result in a transformation of how we live and do commerce on this planet. Government must do everything it can to encourage, empower and support these emerging movements. As we write this the "Occupy Movement" is gaining momentum, but government is acting to suppress it. Government is supposed to act on behalf of ALL people, but it is attempting to suppress those who are giving voice to the 99%.

Another source of wisdom that can serve us now is the voices of indigenous groups that have not been tainted by the mechanistic worldview. We are not suggesting a "return to the stone age", by any means. The insights gained by modern science and engineering must be woven into one fabric with the indigenous recognition that we live in a world of connected communion with all beings.

WE INVITE YOU TO PAY MORE ATTENTION TO THE VOICES OF THE PEOPLE, NGO'S AND TO REPRESENTATIVES OF INDIGENOUS PEOPLE'S DELEGATIONS THAN TO THE SMALL SUBSET OF HUMANITY THAT IS REPRESENTED BY CORPORATE BOARDS OR HEADS OF STATE.

### Adopt These Policies:

We support all of the measures put forth by GreenPeace and many of the measures put forth by other stakeholder groups. At the same time these measures mostly do not go to the core. They do not embody a sustainable worldview.

This is a time for the most unusual expression of courage that humanity as a whole has ever been called upon to make. We must act in cooperation, and toleration, with the greatest of alacrity. We must do something that has never been done before.

ON BEHALF OF THE WHOLE, WE REQUEST THAT THESE MEASURES BE ADOPTED AND INCLUDED IN THE AGREEMENTS MADE AT RIO+20:

- Adopt as a fundamental principle the legal distinction of the Rights of Nature: the recognition that every eco-system, and the natural populations of all species that comprise them, have the right to exist, to persist, and to thrive. A model for this can be found in the constitutions of Ecuador and Bolivia.
- Make Ecocide, the environmental equivalent of Genocide, the 5th International Crime Against Peace alongside Genocide, Crimes Against Humanity, Crimes of Aggression and War Crimes. A proposal has been put forward that defines ecocide as "The extensive destruction, damage to or loss of ecosystem(s) of a given territory, whether by human agency or by other causes, to such an extent that peaceful enjoyment by the inhabitants of that territory has been severely diminished." Include in the criminal activity governments that engage in subsidizing ecocidal activities.
- Embrace and codify the recognition that the healthy natural living environment is a commons. From this commons all economic and commercial activity is afforded. It is a resource to be shared and stewarded by all nations and industries, all peoples and all markets. This commons we all share, and that shares itself with us is to be maintained and enhanced for the benefit of all.
- Create the legal structures that will require all commercial activity to be accountable for its impact on all communities that it affects, and for their operations that do affect us to be transparent.
- Create a new community-based money system that is not based on debt, and does not automatically accumulate wealth in the hands of those who issue currency. Follow the models put forth by BALLE and local alternative currencies.
- Adopt an enforceable policy granting indigenous communities the right of consent for development projects in their territories. The current "right of consultation" has proven ineffective.
- Mandate a transition to an equitable distribution of social goods – the wealth that is produced by all of us working together. Specifically limit the size of the gap between those who have the most and those who have the least. It may take time to achieve a restored balance in wealth around the world, but the current trend must be reversed.
- Transform the World Bank, IMF and UNDP into a new set of governance bodies that represent all people of earth equally to allocate the necessary resources to meet all of the millennium development goals. Put in place criteria to measure whether any proposed and ongoing activity is actually producing a thriving, just and sustainable way of life for all.
- Demand that the UN Security Council be replaced by a body of governance in the United Nations that represents Earth's people.

The above prescriptions are more than ambitious. They require us as a world community to act in concert and concern for one another as never before. The good news is that humanity is actually in the process of turning toward a thriving, just, sustainable way of life for all. There are two pathways, we can either go through collapse, or we can shift and thrive.

The opportunity you have is accelerate that process so that we take the high road of creative design, of collaboration and communion with Earth and our fellow creatures.

We are nowhere near plumbing the depths of the human soul, and our capacity to do what needs to be done, when it is clear that we must act. We have no idea how powerful we may be as human community. An unprecedented awareness that our fates are connected, and that the success of any one of us depends on the success of all, is arising. Information travels faster, and in more channels now than ever before, than ever though possible in our wildest dreams. And before lies the distinct possibility of truly creating a heaven on earth – a world that works for everybody.

Anyone participating in this Earth Summit has the opportunity to be part of making this possibility a reality.

As delegates participating in the decision-making bodies of this Summit, you have a chance to make history that will be celebrated for centuries to come. It is time to transform how we live with one another, and with all life on this one, irreplaceable home we call Earth.

## Park City

I write to you as an elected representative of a mountain community in the United States, and as a member of the international Mountain Partnership organization. Through local efforts as well as partnerships with communities from around the world, Park City strives to be a leader in forging a more sustainable development path. From declining snowpack levels to widespread anthropogenic threats facing surrounding forest ecosystems, we represent an early indicator of challenges to come for the global community. We also represent the potential, and strong desire for, a reorientation towards true sustainability for mountainous regions.

The City of Park City has taken a number of tangible actions to reduce our carbon footprint and engage our citizenry to do the same. Amidst growing concern about climate change and its impact on our local identity, community members in Park City banded together to support the Save Our Snow initiative. Determined not to let their economic and cultural livelihoods melt away, community leaders have joined together to address the local carbon footprint and promote sustainable development. A "Save Our Snow Action Plan" was completed in 2010 and acts as a guiding document for carbon reduction strategies.

Despite local successes and best intentions, it is clear that much more is needed to enhance the sustainability of communities like ours worldwide. The majority of mountain communities face pressing, near-term ecological threats which harbor dramatic implications for economies and social structures. It is in the face of these challenges that I urge you to position mountain communities as a key part of the agenda for Rio 2012.

Whether in the form of carbon mitigation strategies, climate adaptation, or poverty alleviation, mountain regions deserve a distinct voice at the landmark event in Rio next year.

Sincerely,

Mayor Dana Williams Park City Municipal Corporation P.O. Box 1480 Park City, UT 84060 USA

## Partnership on Sustainable, Low Carbon Transport

On behalf of the Partnership for Sustainable Low Carbon Transport<sup>1</sup> and various undersigned agencies, multilateral development banks, non-governmental organizations, associations, and businesses, the following statement is submitted for consideration as input to the compilation document which helps to develop the zero draft of the declaration for the Rio+20 Global Conference on Sustainable Development.

Many recent statements recognize the vital importance of transportation in advancing sustainable development, including the Bangkok 2020 Declaration, endorsed by 22 Asian countries,<sup>2</sup> the Bogota Declaration, endorsed by 9 Latin American nations,<sup>3</sup> as well as the Report of the Secretary General to the UN Commission on Sustainable Development 19th Session on Policy Options and Actions for Expediting Progress in Implementation: Transport.<sup>4</sup> Building on these declarations, we urge the CSD, governments, and others to recognize sustainable transport as a sustainable development goal, in and of itself, and to:

1. Adopt a Sustainable Development Goal specific to transportation: Achieve sustainable transport that enables universal access to safe, clean, and affordable mobility.
2. Adopt targets and indicators to measure progress towards sustainable transport and promote the development and adoption of control plans for transport-related pollution:
  - A. Ensure global transport greenhouse gas emissions and transport sector fossil fuel consumption peak by 2020 and are cut by at least 40 percent by 2050 compared to 2005 levels,<sup>5</sup> while ensuring transport contributes to timely attainment of healthful air quality in all cities; Indicator A1: Annual fossil fuel consumption per person for personal transport and annual fossil fuel consumption per ton for freight Indicator A2: Annual transport fossil fuel consumption by mode and related greenhouse gases Indicator A3: Transport-related pollution contributions and number of days cities are in non-attainment of World Health Organization Air Quality Guidelines for key pollutants including Particulate Matter (PM)-10 and PM-2.5, Nitrogen Dioxide, and Ozone Indicator A4: Share of passengers and freight trips and passenger kilometers and ton kilometers by mode and distance-averaged vehicle load factors by mode Indicator A5: Vehicle fleet size, average fuel efficiency and total vehicle-km traveled by mode
  - B. Support the Decade of Action for Road Safety (2011-20) and cut traffic-related deaths in half by 2025
  - C. Ensure universal access to sustainable transport through support for safe, affordable public transport and safe, attractive facilities for walking and bicycling. Indicator C1: Share of passenger trips and passenger kilometers traveled by public transport, walking, cycling, paratransit, car, motorcycle Indicator C2: Daily time spent in travel and share of household income spent on transport by poorest 20% Indicator C3: Proportion of urban roadways with safe walking & cycling facilities Indicator C4: Proportion of population within 1 km of public transport Indicator C5: Ratio of traffic deaths amongst wealthiest 20% to poorest 20% of population
3. Strengthen institutional arrangements to advance sustainable transport: A. United Nations: Enhance UN agency coordination around critical sustainable transport tasks to improve effectiveness in global agenda setting, capacity building, data collection and monitoring of progress, technology transfer, regional development, and cooperation with other sectors: this includes amongst others UNDP, UNEP, UN-HABITAT, UN-DESA, UNCRD and the UN regional commissions. Following the examples of UN-Energy and UN-Water, consider the establishment of UN Transport. B. Development Agencies and Banks: Adopt and monitor (a) sustainable transport targets, (b) goals to advance equitable access for all, and report on these targets and goals. Increase support for sustainable transport capacity building and transport sector climate resilience and adaptation. C. Multi-lateral Carbon Finance Instruments: Foster transport sector contributions to CO2 mitigation roughly equal to its 23% of energy-related carbon burden by improving transport sector access to carbon finance with sector-appropriate appraisal requirements for CDM, GEF, and CIF funds, and a transport sector window to the Green Climate Fund.<sup>7</sup> D. Enhance Private Sector Participation: Foster public private partnerships and implement new business models in support of sustainable transport. E. Capacity Development: Strengthen both current voluntary multi-stakeholder partnerships on sustainable transport as well as intergovernmental processes on transport.
4. Endorse and encourage voluntary country actions for sustainable transport:
  - A. Double the mode share of urban public transport by 2025 relative to 2010<sup>8</sup>; boost walking, cycling, and ridesharing; and aim for a drive-alone light-duty motor vehicle mode share of one-fourth or less.
  - B. Expand and improve bus rapid transit, mass transit, bike lanes, sidewalks, urban public space, information and logistics systems, ridesharing, and regional freight and intermodal facilities.
  - C. Prioritize the provision of avoid-shift-improve strategies, including bus rapid transit, mass transit, bike lanes, sidewalks, urban public space, information and logistics systems, traffic operations and management, transit-oriented development, and regional freight and intermodal facilities over the construction of additional elevated or high-speed surface urban roads.
  - D. Mitigate adverse impacts caused by the provision of improved transport and fairly compensate those displaced by transport infrastructure improvements.
  - E. Adopt new road and urban design standards to prioritize safety, universal design, and use of sustainable transport modes, with incentives, requirements, and funding to spur timely implementation of standards by municipalities. F. Encourage and help fund implementation of sustainable transport and land-use plans for all cities emphasizing transit-oriented development G. Foster institutional capacity building related to sustainable transport and urban development H. Foster opportunities for public-private partnerships and innovative financing for sustainable transport and urban development.
  - I. Shift subsidies and financing priorities from fossil fuels, roads, and private motor vehicles to instead support sustainable transport, targeted user-side-subsidies, and pro-poor development.
  - J. Adopt the polluter pays principle, ensuring revenues from road use fees, parking and congestion charges, and fuel taxes at least fully cover road expenditures and related externality costs.
  - K. Identify and invest in strategies to enhance transport sector climate adaptation and resilience. The Need for Action in the Global Transport Sector at Rio +20: Rapid global economic development and urbanization are fueling massive growth in the demand for transportation. Current practices of meeting increased transport demand mostly by growing automobile fleets and road network capacity are unsustainable. A study for the UN Environment Program estimates that transport-related externality costs in developing countries may range as high as 10% of GDP.<sup>9</sup>

<sup>[8]</sup> Some 1.3 million people die in road accidents annually. Of those who die, 9 in 10 are from low- and middle-income countries and about half are pedestrians, cyclists, and motorcyclists, drawn disproportionately from among the poor. Fatalities are projected to rise 80 percent by 2020 in low- and middle-income countries (just as they fall by 30 percent in high-income countries), 10 at an economic cost to the developing world of up to US \$100 billion a year (equivalent to all current annual overseas aid from OECD countries).<sup>11</sup>

<sup>[9]</sup> Transport accounts for one-fourth to more than 80 percent of various local air pollutants in cities that cause and exacerbate respiratory illness, heart disease, premature death, and cancer. Air pollution is estimated to cause approximately 2 million premature deaths worldwide per year, with more than half of this burden borne by people in developing countries.<sup>12</sup>

<sup>[10]</sup> Studies by the IPCC have suggested that cuts of greenhouse gas emissions by as much as 50 to 85 percent below year 2000 levels will be needed to limit the potential for catastrophic climate change.<sup>13</sup> Yet unless comprehensive changes in policy are made, car ownership will triple to over 2 billion, trucking will quadruple, and transport-related greenhouse gases will grow by 80 percent.<sup>14</sup> A 2-degree Celsius climate protection goal certainly cannot be met without a considerable contribution to CO2 mitigation by the transport sector.

A study by the United Nations Environment Programme shows that sustainable, low carbon, transport initiatives that reallocate just 0.34 per cent of global GDP in support of public transport infrastructure and efficiency improvements to road vehicles have the potential to cut the volume of road vehicles required to support equal economic activity by about a third, diminish the use of fossil fuel by up to a third, and boost transport sector employment by 10 percent.<sup>15</sup> As the transport sector already directly provides 5 to 8 percent of a typical country's total paid employment, with much higher indirect value added and employment in related sectors, there is significant economic development potential from pursuit of such initiatives.<sup>16</sup> The impact of these changes in the structure of transport services on climate change would be to reduce greenhouse gas emissions by 2050 by 68 percent below business as usual trends (and about 36 percent below 2010 levels. 16 percent more jobs per unit of investment than new road and bridge construction.

The technologies and policies needed to obtain these sustainable transport benefits are well known, have proven to be effective, and often come at a small or even net-negative cost when accounting for such factors as fuel cost savings and other co-benefits. Yet they do require a commitment to concerted action. Because the transport sector is uniquely critical to all the three pillars of sustainable development – economy, society, and environment – it must be addressed by a sector-specific SDG developed around the above targets. Lacking such a goal, neither development assistance nor carbon-finance programs have focused effectively on many available low-cost opportunities for progress in the transport sector.

The Broader Outcomes of an Agreement on the Proposed Transport-Specific SDG: Achieving the proposed SDG necessitates a global commitment to a set of best practices and strategies contained in new sustainable transport paradigm, known collectively as “Avoid, Shift, Improve” (ASI). The ASI Best Practices focus on avoiding unnecessary motorized trips with smarter planning, pricing, and technology; shifting trips to more sustainable modes through price incentives, better information, and improved service quality; and improving vehicle efficiency with cleaner fuels, improved network management, and more efficient vehicle technology. All the elements of ASI have been demonstrated at scale. Successful examples of this include Bus Rapid Transit, bicycle-sharing and bikeway networks, integrated land-use/transport planning, parking limitations and management, smart parking and car-sharing, vehicle registration quotas, congestion pricing, vehicle emission standards, and intermodal freight and logistics systems.

## People and Ecosystems Program - World Resources Institute

### Purpose of this Framework Document

One of the two major themes of the 2012 Conference on Sustainable Development (Rio +20) is the green economy in the context of sustainable development and poverty eradication. In preparation for the conference, many countries have moved forward with developing national strategies or roadmaps to guide the transition. There is no one size fits all strategy for making the green economy transition because countries differ greatly in national capacities for economic governance, existing per capita consumption levels, states of technological and industrial development, economic composition, and incidence and severity of poverty.

Nonetheless, a significant outcome at Rio +20 would be broad consensus that the transition to a green economy is a global imperative complemented by commitments from governments at every level to move forward with making that transition happen. To expedite that process, stakeholders at the Rio +20 conferences could agree on a general framework document that provides guidance on what national or sub-national green economy roadmaps should look like so as to foster international coordination and policy coherence. This paper presents suggestions on how that framework document could be structured, and what content it may contain.

Roadmap documents should be prepared with transparent, multi-stakeholder participatory processes that develop evidence-based policy prescriptions. In preparing green economy roadmap documents, it would be useful to include at least seven major elements:

1. Imperative to act
2. Defining the green economy
3. Guiding principles
4. Pathways to the green economy
5. Policy toolkit
6. Financing strategy
7. Enabling conditions

#### I. Imperative to Act – An Economy Out of Balance

An effective way to introduce roadmap documents is by asking “What problems are green economy reforms trying to solve?” and, as a corollary, “What opportunities for economic growth and prosperity do green economy reforms seek to leverage?” Clearly identifying worrisome economic conditions and trends and how the pattern of economic growth has failed to advance the environmental and social pillars of sustainable development is key. Providing a remedy for these conditions and thereby opening the door to new opportunities for simultaneously advancing all three pillars thus becomes the key motivation for undertaking green economy reforms.

##### Problems with the prevailing economy

At the global level, conventional economic development pathways that have been followed for most of the last century have improved lives for billions of people but have generated a number of worrisome conditions and trends that can be synthesized into three fundamental aspects: (1) inefficiency, (2) unsustainability, and (3) inequity.

Inefficiency is manifested in tremendous quantities of waste, in products with short life spans, in production processes that consume far more energy, water, and materials than necessary, in prices that do not reflect true environmental and social costs, in economic activity that does not advance human well-being and in misallocation of capital by public and private actors to investments that fail to yield sustainable development returns. Inefficiency is also manifested in vulnerability and volatility of economies that are overly specialized and trade dependent and thus exposed to price and supply shocks and international financial, economic, and political crises on a regular basis.

Sustainability is jeopardized by the depletion or degradation of the stocks of natural, human, built and social capital on which all economic activity ultimately depends. The Millennium Ecosystem Assessment found that approximately 60% of the world’s ecosystem services are being degraded or used unsustainably.<sup>6</sup> Our ability to produce food from the land and food from the sea faces multiple threats in the form of nutrient pollution, climate change, urban sprawl and harmful agricultural and fishery practices.

Local and indigenous ecological knowledge is being eroded as nature-based cultures and language disappear. Proliferating slums are a stark indication of underinvestment in the built capital of cities – vital sanitation, water, energy, and transportation infrastructure on which an increasingly urbanized world must depend. The number of people living in slum conditions has risen from 657 to 828 million since 1990. Investment in all types of capital is hindered by extraordinary levels of both consumer and public debt.

Gross inequalities in income, wealth, and opportunity have steadily worsened for several decades. The U.N.’s World Institute for Development and Economics Research finds that the richest 2 percent of adults now own more than half of all global wealth, with the richest 1 percent alone accounting for 40 per cent of global assets. The vast bulk of the world’s wealth, the study concludes, sits “highly concentrated” in the pockets of a relative few. Persistent poverty, measured through a multi-dimensional lens affects nearly 3 billion.

##### Underlying causes

Roadmap documents should also strive to identify the root causes of inefficiency, unsustainability, and inequity. Some have traced these shortcomings to a series of market and institutional failures inherent to the neo-classical growth models such as externalities, inadequate investment in public goods, competitive barriers, and asymmetrical access to information. Others cite key barriers in the areas of finance, fiscal policy, skills, innovation, public procurement, and planning. Others trace the origins of economic crises to the lack of democratic oversight in the institutions of global and national economic governance.<sup>13</sup> Still others assert that an economy which requires growth in its physical dimensions is doomed to fail on a planet with finite resources.

All or perhaps just a few of these shortcomings and causes may be relevant for any particular country, state, or city. The important point, however, is for roadmap documents to begin with an articulation of the problems green economy reforms are designed to address.

#### II. The Green Economy – What It Is, and What It Is Not

What is the green economy? In the run-up to Rio +20 there has been a wide divergence of opinion on what the green economy actually is and whether or not it provides a useful basis for collective action. To dispel these concerns, roadmap documents should clearly articulate what the green economy is and is not. The United Nations Environmental Program (UNEP) defines the green economy in functional terms: “one that results in improved human well-being and social equity while significantly reducing environmental risks and ecological scarcities.” The green economy has also been described in terms of an overall strategy for growth, one that fosters economic growth and development, “while ensuring that natural assets continue to provide the resources and environmental services on which our well-being relies.” The green economy has also been described in relation to sustainable development, as an economy that corrects the market and institutional failures of the prevailing economic model and thereby makes the economy a more efficient vehicle for advancing the neglected pillars of sustainable development.

##### Key attributes of the green economy

Regardless of the varying definitions, perhaps the most important task of roadmaps is to draw a distinction between the green economy and the prevailing economy that currently exists. In contrast with the prevailing economy the green economy can be described in terms of three overriding attributes:

1. Efficient – an economy whose growth is decoupled from use of energy, water, and materials in production, includes social and environmental costs in pricing, allocates investment to its highest and best use, and minimizes the stream of harmful wastes and pollutants, including greenhouse gas emissions.
2. Sustainable – an economy that builds rather than depletes natural, human, built and social capital and that is resilient to natural disasters, climate change, political strife, and financial and economic volatility.
3. Equitable – an economy that significantly reduces inequalities in the distribution of wealth, income, and opportunity and ensures that the benefits of growth are distributed fairly and leave future generations as least as well off as the current one.

Characterizing green economy attributes in terms of these three overriding themes would help advance a consistent vision of what a successfully greened economy looks like.

## Safeguards

In roadmaps, it is also important to identify what the green economy is not, and what risks green economy reforms seek to avoid. The green economy is not a new playing field for competition amongst nations, rather, a framework for cooperative action. The green economy is a pathway to and not a substitute for sustainable development. Green economy reforms are not tools for further increasing disparities in technological capacity, concentration of wealth, income, or market share. The green economy is not a one size fits all solution but a framework for solutions appropriate to particular country situations. Nor is the green economy a new basis for conditionalities on aid or international investment or for trade barriers against developing world products. By articulating these safeguards in roadmap documents, countries can help alleviate concerns about business-as-usual strategies disguised as green economy reforms.

## III. Guiding Principles of the Green Economy

What are the principles of the green economy? To establish a basis for evaluating policy and holding decision makers accountable it may be useful for roadmap documents to articulate a concise set of guiding principles of the green economy. The forty year history of major summits and conferences on sustainable development provide a rich body of literature from which to draw, and include principles related to beneficial management of both renewable and non-renewable resources, improving quality of life through economic and social development, protecting natural habitats for their economic values, common but differentiated responsibilities and respective capabilities, sustainable production and consumption, fair trade, liability for environmental damages, full-cost accounting and many others green economy roadmaps can reiterate.

More recently, the Earth Charter and proposed green economy principles by various civil society organizations also provide guidance. Some common principles address:

- Economic democracy – The green economy transition should be planned and implemented through inclusive and transparent participatory processes consistent with Principle 10 of the Rio Declaration.
- Full cost accounting – Prices, public investments, and policy decisions should fully account for all market and non-market benefits and costs so as to promote decisions that maximize net public benefits.
- Qualitative growth – Growth in the green economy is more about growing the qualitative dimensions of well-being rather than economic activity for its own sake.
- Restoring capital – Stocks of natural, human, social and built capital should be restored rather than depleted to maintain quality of life for the next generation.
- Cooperation – Greater cooperation amongst nations, corporations, workers and communities is key to ensuring that green economy benefits are broad based.
- Resiliency – Diversifying production processes, sources of supply, and employment opportunities is critical for maintaining adaptability in the face of change.
- Fair distribution of benefits – The green economy should place a priority on improving quality of life for those least well off.

## IV. Green Economy Pathways

What are the pathways to the green economy? The core of green economy roadmaps are the pathways countries adopt to make the transition from brown<sup>21</sup> to green. Green economy pathways are cohesive sets of policies and practices implemented to achieve specific green economy goals like replacing inefficient processes with resource efficient ones. Pathways can be sector specific or economy-wide in nature or based on geography or critical issues. Examples include:

- Eco-efficiency
- Low-carbon development
- Livable, walkable cities
- Transforming agriculture
- Investing in natural capital and ecosystem services
- Sustainable production
- Sustainable consumption

Appendix 1 provides a template for describing major attributes of some green economy pathways referenced in roadmap documents and the green economy literature. Differences in initial technological conditions, stage of industrial development, economic composition, geographies, and political systems all make the selection of which pathways to adopt or prioritize somewhat unique to each country. For each pathway selected, roadmap documents should:

### 1. Define the nature of the transition

For each pathway, the precise nature of the transition – or what needs to change – may vary greatly from country to country. For example, for low-carbon development, the amount of renewable energy in a country's electrical generating mix may already be at a maximum, so low-carbon development may mean transitioning predominant transportation fuels from petroleum to biofuels or electricity or significantly reducing personal vehicle use.

Small island developing states may have limited capacity for local agricultural production, so the transition to food security may be more about securing local benefits of commercial fisheries and reducing overfishing rather than replacing a certain amount of crops for export with crops for local consumption.

### 2. Set goals, targets and timelines

An important step in further refining the nature of the desired transition along any particular pathway is to express that pathway in terms of goals, targets, and timelines. To foster accountability, quantitative targets should be developed rather than qualitative goals if possible. The final declaration issued at the 64th annual UN DPI/NGO conference in Bonn contains examples of both quantitative targets and qualitative goals for the green economy that may prove useful in preparing roadmap documents. These include goals and targets for 2020 or 2030 related to sustainable consumption and production, sustainable livelihoods, climate sustainability, clean energy, biodiversity, water, healthy seas and oceans, healthy forests, sustainable agriculture, green cities, subsidies and investment, and indicators.

### 3. Describe current conditions

Pathways have beginning points and end points. End points consist of goals and targets with specific dates for attainment. As beginning points, roadmap documents should characterize current conditions with respect to those same goals and targets. For example, in its Green Economy Report, UNEP noted a current rate of recycling for e-waste of 15% but suggested a worthwhile green economy target of 100%. Qualitative descriptions may also serve as benchmarks for evaluating improvement. For each pathway in

its national green growth roadmap, for instance, the Kingdom of Cambodia explains current conditions qualitatively in terms of challenges the green economy transition seeks to address. With respect to transportation, these current challenges include “increase of vehicles on the streets leading to traffic congestion; lack of affordable and convenient public transport options; violation of traffic rules; little or no control over the number of vehicles; high single occupancy and insufficient provision of facilities for pedestrians (sidewalks, traffic lights, etc.).”

#### 4. Identify, prioritize, and sequence policy interventions

For each pathway, roadmaps should identify policy interventions and how those interventions will be sequenced over time. It may be useful to rank and prioritize policy interventions based on cost and impact. Take low-carbon development as an example. Conservation and efficiency improvements may present high impact options that can be implemented at a low cost, while carbon capture and storage or new biomass plants may have much less impact and cost far more. It would make sense, then, to sequence policies to implement low cost-high impact solutions first.

#### V. Policy Toolkit

What policies could help shift a country toward a green economy? Stimulating the green economy may require a major overhaul of economic policies and incentives. Roadmaps can include an in-depth evaluation of current policies to identify those that promote economic activity that is inefficient, unsustainable, and/or inequitable. Roadmaps could then discuss a strategy for phasing out or converting those policies into ones that foster resource efficiency, more sustainable use of natural resources, and more equitable distribution of income and wealth. Policy options can generally be grouped into four major categories – regulatory based, taxation based, expenditure based, and institutional based.

Regulatory-based approaches rely on the authority of governments to set standards, control land use, and issue permits and authorizations through legislation or administrative actions. Taxation-based approaches include income, sales, property, value added and other traditional taxes but also taxes on resource use and pollution, tariffs, and impact fees. Expenditure-based approaches include all forms of government investments, loans, subsidies, contracting, procurement as well as expenditures on programs that affect economic development such as research and development. Institutional-based approaches are ones related to government and corporate accountability, public participation, and property rights.

The table below identifies some policy tools that roadmap documents can identify and discuss in each major category. As with other roadmap elements, such policies will vary with initial technological conditions, stage of industrial development, economic composition, geographies, and political systems. Policy tools can be mapped into green economy pathways to provide clarity on how the green economy transition will actually be implemented over a specified time period.

#### Sample of Policy Options in the Green Economy Toolkit

(Please reference full submission for Sample)

VI. Financing Strategy How can the green economy transition be financed? Transitioning to the green economy along any particular pathway will necessitate changes in how governments, banks, pension funds, corporations, and even individuals spend, loan, and invest money to build capital and create quality green jobs. It will also require changes in how money raised so that taxes, tariffs, and fees provide disincentives for wasteful, polluting, and unsustainable forms of economic activity. Roadmap documents should specify what those changes should be for both internal (i.e. raised through taxes or tariffs) and externally (i.e. borrowed or invested from abroad) leveraged funds. UNEP recently reported that roughly 2 percent of global GDP per year between 2010 and 2050 would be needed to finance a transition to a global green economy. There are many innovative financing strategies countries are pursuing to achieve their specific green economy financing goals. For example:

##### Redirect harmful subsidies

Subsidies play a significant role in perpetuating dependence on unsustainable goods and services by artificially depressing their prices relative to more sustainable alternatives. Subsidies fall into two major categories – production and consumption - and come in a variety of forms, including preferential access rights, public spending on research, development and infrastructure, import and export restrictions, preferential lending, price controls, tax exemptions, and mitigation of risks. Redirecting subsidies has been widely noted as a promising strategy because it requires no new sources of revenue. Globally, fossil fuel subsidies are estimated to run \$US 640 billion per year, so redirecting even a share of these towards renewable energy solutions may have a major impact. Roadmap documents could identify all the ways harmful activities are now subsidized and propose long-term strategies for redirecting them to promote the green economy transition.

##### Implement ecological tax reform

Eco-taxes are a strategy for internalizing the externalities associated with pollution, waste, and unsustainable consumption and resource use. Roadmap documents can identify priorities for policy experimentation. The number of successful eco-tax programs that have yielded broad sustainable development benefits is growing. In 1999, Germany introduced its Ökosteuer or ecotax which shifted the tax burden away from labor costs to tax the consumption of oil and electricity use. The revenue from the tax is used to lower pension contributions and promote renewable energy. The ecotax has led to reduced fuel usage, lower emissions, growth in renewable energy and the creation of new jobs.

##### Collaborate with patient capital

Pension funds, insurance companies, and mutual funds are often regarded as holders of “patient capital” that could be an invaluable source of investment for the green economy. In the OECD alone, these investors held over \$65 trillion as of the end of 2009. These entities are also sensitive to environmental risks, and have a business interest in reducing it. For example, in response to climate concerns, HSBC Insurance established a “green insurance” program in Brazil, Argentina and Mexico that put a segment of the premium paid by insurance policy holders towards forest preservation. With an emphasis on the long-term, institutional investors are more open to investments that reap sustainable development benefits and not simply the highest financial return. Roadmap documents could identify ways policy-makers could collaborate with these investors to match patient capital with opportunities for green growth and sustainable development.

##### Develop micro-finance and micro-insurance programs

Green economy finance does not always need to be in large installments. Micro-finance and micro-insurance programs are often more appropriate and effective in improving economic conditions in impoverished areas and supporting clean drinking water, sanitation and energy access. For example, the Grameen Shakti bank in Bangladesh has successfully granted loans supporting solar home systems. The system has also helped to create new jobs (due to improved energy access for businesses) and improve income security for villagers.

##### Prepare green stimulus packages

In the wake of the 2008 economic crisis, many countries opted for stimulus packages that emphasized green technologies, green jobs, and ecological restoration. Globally, it is estimated that \$US 512 billion out of \$3.3 trillion in public stimulus funds were allocated to low-carbon and environmental infrastructure investments. Japan, for example,

announced a \$US 15.4 billion stimulus package in 2009 to foster environmentally-friendly technologies. Roadmap documents could include a long-term needs assessment that would serve as the basis for future stimulus spending.

## VII. Enabling Conditions

What enabling conditions should be in place to expedite the transition to a green economy? Enabling conditions establish a general economic environment that makes green economy reforms possible, and effective. Key enabling conditions may include good governance, compatible trade regimes, technology transfer, regulatory authority, new indicators of progress, innovation, green workforce skills, education, and policy coherence. For state and local governments, the most important enabling conditions may be provided by national governments – for example, the authority to implement certain kinds of taxes or impose certain regulatory constraints. For national governments, the most important enabling conditions may relate to supportive trade regimes or international programs for transfer and dissemination of green technologies. There has been a wealth of research on enabling conditions for the green economy that could be incorporated into roadmap documents.

For example, good governance is critical, and has been well addressed in the green economy literature. If a green economy is to be a tool for achieving sustainable development and poverty eradication governments need to highlight the importance of improving national environmental governance. Roadmap documents provide a forum for doing so. Achieving sustainable development will require making policy decisions that involve balancing competing interests and reaching environmentally sustainable, economically sound and socially equitable outcomes. If decision making processes are secret, non-participatory and unaccountable, a few selected and powerful interests will influence policy and developmental decisions. Principle 10 and good national environmental governance which recognizes coordination, efficiency, transparency, engagement and accountability becomes a foundational and enabling requirement for the success of a green economy and sustainable development.

As another example, research on new sustainable development and green economy indicators has been ongoing for decades and provides a basis for roadmap documents to establish metrics that “measure what matters” and hold decision makers accountable for monitoring the effectiveness of green economy reforms. The OECD has proposed a set of indicators capturing major aspects of green growth. These include socio-economic attributes, environmental and resource productivity, natural asset base, environmental quality of life, and economic opportunities and policy responses. The World Bank has launched an ambitious initiative on wealth accounting that incorporates changes in stocks and flows of natural capital and ecosystem services. In the U.S., the State of Maryland recently adopted a Genuine Progress Indicator to supplement GDP, guide policy and provide an indication of how well the state was growing with respect to sustainable development by taking economic costs associated with depleting natural capital, carbon emissions, and inequality into account.

Fostering green innovative capacity is another enabling condition that is considered a high priority. Innovative capacity is defined as how well entrepreneurs are supported in their efforts to find new business models, create new technologies and develop new processes. The key is to find ways to create an environment that maximizes the potential for innovations in either products or processes that result in an environmental gain by way of reduced material, water, or energy use. Policymakers and international agreements are critical for setting the stage for innovation as they can support targets for energy and resource efficiency as well as waste reduction. An innovation is more likely to succeed when the rules of the game are clear and consistent. These rules tell the innovator the bounds within which they must work and the characteristics his solution must include. For example, efficiency standards drive innovators to create and provide products that meet a set of criteria. Japan's Top-Runner program sets energy-efficiency standards for appliances and vehicles higher than the best performance value of each product currently on sale in the market.<sup>40</sup> By encouraging a global “race to the top”, the international community can challenge innovators and entrepreneurs to think outside the box.

By explaining the imperative to act, what the green economy is and is not, what principles on which it operates, pathways, policies, financing approaches and enabling conditions, green economy roadmap documents will provide clear signals that governments are making long-term commitments to make the green economy transition occur. This, in turn, will provide a measure of certainty with respect to future regulatory and policy environments that may help motivate equally longer-term investments by both public and private actors. Preparing roadmaps through inclusive, transparent, and participatory processes will ensure that the transition to a green economy receives widespread public support. For these reasons, a global framework for preparation of green economy roadmaps should be a priority outcome for the Rio +20 process.

## People for Solidarity, Ecology and Lifestyle (SOL)

Contribution to Outcome Document of the Rio+20 Conference agreed on by the signing Austrian NGOs

Despite some progress made since the UN Earth Summit in Rio in 1992, human-induced loss of biodiversity, global climate change, desertification, deforestation, acidification of the oceans, overuse of resources, unequal access to resources and many other problems continue. The recent economic crisis and the upcoming shortage of natural resources increase the threat of poverty and human rights abuse especially to the poorest and most vulnerable segments of the world's population - mainly in the global south.

The current economic model promotes unsustainable consumption and production patterns, facilitates an inequitable trading system, has failed to eradicate poverty, assists exploitation of natural resources towards the verge of extinction, and has induced multiple crises on Earth. The urgency to change the roots of our economic model has to be stressed. As civil society we promote fair and equitable sustainable development for all with respect for the limits of our common ecological and social capital.

Emerging countries are in the process of copying the unsustainable development model of industrialised countries and industrialised countries try to secure their already declining economic and political positions. Thereby unsustainable practices are perpetuated while developing countries are relegated to being suppliers of raw materials and confronted with endemic poverty and the effects of climate change.

The current growth-led development paradigm has proven to be unsustainable. It does not need reform but replacement. A true 'green' economy within a sustainable society requires policies that include efficiency and sufficiency and equity. So far there is little sign that the technology and efficiency approach still including the growth-paradigm alone can lead to more equal access to resources and to the reductions in the use and waste of both renewable and non-renewable resources on the scale that is needed to tackle climate change, biodiversity loss, detoxifying our environment and enable us to live within global limits.

Despite agreements at Rio 1992 and Johannesburg 2002 there has been a clear failure to integrate environmental, social and development priorities into economic policies. Social engagement and other elements of “well-being” that are at the core of sustainable human development are still not taken into account when making economic policy. We have to shift from economic growth and increasing consumption to enhancing well-being and equal opportunities for all, within the limits set by nature.

We urge the governments to:

 Establish national roadmaps for a radical transformation towards a zero carbon economy by 2050 that is fully respectful of planetary limitations and the human rights for

current and future generations, based on the fair share of natural resources and CO2 emissions. The necessary changes must be proportionate to a country's contribution to the current problems and its capability to take action.

<sup>14</sup> Establish on a global scale a set of Millennium Consumption Goals (MCGs) for the period 2012-2031 towards establishing an intergenerational right to equitable consumption opportunities. Over-consumption needs to be capped and gradually lowered in order to give the necessary environmental space for under-consumers to meet their basic needs.

<sup>15</sup> Rethink the financing of social security systems currently based on continuous economic growth, which perpetuate the crisis, and with this rethinking start to move towards an economic model that is grounded in sustainable development principles.

## People's Coalition on Food Sovereignty

Greening the Economy in Agriculture: Greening the Economy for Whom?

People's Coalition on Food Sovereignty Input document to the Rio+20 Summit

1 November 2011

Two decades after the Earth Summit, the world is nowhere near its avowed goal of achieving sustainable development for the people. The unbridled extraction and exploitation of resources mainly of developing countries to suit the profit-driven interests of industrialized countries is pushing marginalized peoples, including small farmer holders, pastoralists, women and indigenous peoples, into deeper poverty and misery. The crisis of capitalism has exacerbated the situation of over a billion hungry people in the world while a few take control of the world's resources.

The People's Coalition on Food Sovereignty (PCFS), a growing network of various grassroots groups of small food producers particularly of peasant-farmer organizations and their support non-government organizations, advocates food sovereignty which refers to the inalienable right of peoples, communities and countries to define their own agricultural, labor, fishing, food and land policies which are ecologically, socially, economically and culturally appropriate to their unique circumstances.

PCFS stands for the attainment of a sustainable economy both in the social and environmental sense that allows people to live under an environment that allows, among others, for the determination of their own food and agricultural systems. In this sense, sustainable development as enunciated in the Rio Declarations should mirror food sovereignty.

UN Special Rapporteur on the Right to Food Olivier De Schutter in a recent UN assembly hit the nail in the head when he stated that "farmers must not be disempowered labourers in their own land" and that the failure to help small-scale farmers to live decently in farming is a key cause of hunger. De Schutter stressed the need to reverse the thinking that "agricultural development can only occur through large-scale, top-down investments", and emphasized that with "the right support and encouragement, farmers can drive the change themselves." He called on governments "not to shirk their responsibilities...to equip smallholders to rise up the value chain."

The Rio+20 Summit provides an opportunity to do away with production systems that have caused irreversible and irreparable environmental destruction and push for genuinely sustainable systems.

In the agriculture sector, the Greening the Economy in Agriculture (GEA) has been introduced by various development actors, most notably the UNEP in 2008 at the height of the financial crisis. GEA posits two "unique opportunities" on the part of governments, i.e., a significant slice of the multi-trillion dollar stimulus package to revive the global economy by placing these in environmental investments, and that such investments along with domestic policy reforms and development of international policy and market infrastructure can "set the stage for a transition to a truly Green Economy."

The "Green Economy" buzzword that has since been used has been generally described as "one which achieves increasing wealth, provides decent employment, successfully tackles inequities and persistent poverty, and reduces ecological scarcities and climate risks."

While there is as no single definition of GEA yet, the Food and Agriculture Organization (FAO) states that GEA refers to "increasing food security (in terms of availability, access, stability and utilization) while using less natural resources, through improved efficiencies throughout the food value chain. This can be achieved by applying an ecosystem approach to agriculture, forestry, fisheries management in a manner that addresses the multiplicity of societal needs and desires, without jeopardizing the options for future generations to benefit from a full range of goods and services provided by terrestrial and marine ecosystems."

FAO adds that GEA "strives to balance diverse societal objectives, by taking account of the knowledge and uncertainties about biotic, abiotic and human components of ecosystems and their interactions and applying an integrated approach to agriculture, forestry, fisheries and food chains within ecologically meaningful boundaries."

Dissecting the GEA initiative, however, reveals inherent flaws on how its stated goals can be achieved. Continue control by corporate giants and industrialized nations over those in the south are evident using the cloak of environmental protection. For instance, proposed enabling conditions such as tariff imposition and taxes on processes and products deemed not green enough can easily turn into finance conditionalities by northern countries on southern countries.

PCFS thus forwards the following proposals, primarily on the GEA initiative, based on the zero draft guidelines:

1. Food sovereignty is a fundamental principle that should be reflected not only in Rio+20 documents pertaining to agriculture and fisheries but as an overall framework for the genuine sustainability of the world's resources especially for the benefit of developing countries. Food sovereignty embodies self-reliance and self-sufficiency; local and collective methods of production; biodiversity-based, ecologically sound, sustainable methods of production; economic democracy (rights to decent livelihood, food, health, shelter and other basic necessities); rejection of patenting of life and genetic resources; and rejection of chemical intensive, large-scale industrial farming.
2. The Rio+20 outcome document must strive for poverty eradication and not mere poverty alleviation. Doing so must first entail the recognition that the depletion and plunder of the world's resources have been carried out primarily by industrialized countries and their giant companies at the expense of developing countries faced with massive poverty. Poverty eradication therefore needs to be addressed at the structural level. The trickle-down approach has long been proven to be ineffective.
3. The framework of the Rio+20 Summit should be Agenda 21 and other Rio agreements, as well as the Rio Declaration and Rio Conventions. The summit should be a comprehensive assessment and evaluation of these agreements vis-a-vis various sectors. The particular principles of the Rio Declaration that must be given primary focus are the precautionary principle, the principle of prevention, the polluter pays principle and principle 10 on access to information, and participation of civil society. The role of civil society organizations (CSOs) must be accorded due recognition and their recommendations reflected in the outcome document.
4. The Green Economy Agenda as presently crafted is patently corporatized and should be reworked. The target for the world's farmers to "scale up adoption of green

agriculture by partnering with leading agribusinesses" and for the world's top 40 agribusinesses to play this leading role indicate that no fundamental change in development strategy is being carried out. This even gives added justification for agribusiness giants to deepen their stronghold on global agriculture. People-based and biodiversity-based food production systems over corporate industrial agriculture and fisheries must be developed. In the same vein, public enterprises should remain in public control. Privatization must be stopped.

5. Multilateral and bilateral trade policies in agriculture by the World Trade Organization, international financial institutions, and those initiated by industrialized countries that have further opened up developing countries' already weak economies to the world market (which is in tight control by industrialized countries and their corporations) must be reversed. The liberalization of agriculture has made southern countries more food insecure today than in the past and violate their peoples' right to food. The international framework for sustainable development (IFSD) should ensure that multilateral finance institutions and other related bodies respect the right to development.

6. The IFSD should also be translated into the creation of a broad inclusive multi-stakeholder consultative body which shall work for the implementation of Rio+20 resolutions and Agenda 21. It is important for this body to be democratic and participatory, and gives due accord to the important role of civil society organizations.

7. Policies supporting genuine agrarian, aquatic, pastoralist and forestry reforms must be implemented. Biodiverse ecological agriculture that benefits small producers must be promoted.

8. Promotion and commercialization of agrofuels must be rejected.

9. The rights of small farmers holders, pastoralists, women and especially of indigenous peoples must at all times be respected, promoted and upheld.

10. Large-scale, destructive mining must be opposed. As a major industry in manufacturing, major policy reversal is needed to abate the wanton destruction of non-renewable resources that have caused the destruction of indigenous peoples' and small farmers' communities.

11. Serious policy and legislative changes in sectors hardest hit by symptoms of the crisis of global capitalism such as food crisis and climate change must be advanced. Control over natural resources and land tenure by peasants, women and indigenous peoples must be translated into policies for genuine implementation.

12. The GEA initiative should not eclipse and overwrite the intent of the Rio Declaration for sustainable development for the people. The Rio+20 outcome document must reflect the genuine interest of marginalized peoples, especially the small farmers holders, pastoralists, indigenous peoples, and women to have control over the land from which they depend on to live.

Food security and agriculture are integral to sustainable development and must be defined according to the interests and welfare of those who are at the frontline of food production beginning from the grassroots level. Community-based, cooperative farming that use sustainable methods must be promoted. Government subsidies for the promotion of such must be prioritized.

The problems hounding agriculture today – food crisis, high food prices, rural poverty, hunger, malnutrition, large-scale foreign land acquisitions and landlessness, among others – are symptoms of a system that fails to address the needs of a growing global population. The different economic development aspirations of rich and poor countries in the midst of worsening environmental problems can only be addressed by delving into conflicting issues such as trade and debt. The opportunity provided by the Rio+20 summit to address these maladies must not be lost on these basic realities.

Global efforts to green the economy must primarily provide an environment for those hardest hit by the environmental crisis – the marginalized peoples of the world -- to better their socio-economic conditions. It is this yardstick that should serve as blueprint for all multi-stakeholders involved in global efforts for genuine sustainable development. #

## People's Movement for Climate Change (PMCC)

### PEOPLE'S MOVEMENT ON CLIMATE CHANGE

#### Submission to the UN Conference on Sustainable Development

Climate change is the result of unsustainable development, and threatens to keep the poor especially in the South to realize their right to develop. Climate change and its impacts are quickly getting worse. Rio+20 must tackle this challenge squarely along with other sustainable development challenges.

The Peoples' Movement of Climate Change (PMCC) is a network of individuals and organizations in the South asserting that solutions to the climate crisis lie in the hands of the people. This submission focuses on elements expected to be included in Rio+20 outcome document. The outcome document should:

- Be guided by the following principles:

- o Sovereignty. People must ultimately have stewardship, access and control over natural resources and the wealth accruing from their use. Nations, communities, and sectors should be able to utilize their resources to meet their social needs, and pursue independent and ecologically sustainable paths to development.

- o Respect for the environment. In using environmental resources, the needs of the people and the planet must take precedence over the pursuit of profits.

- o Social justice and human rights. Unsustainable development is a social justice issue. It entails unjust environmental, social and economic outcomes and human rights violations. Efforts to achieve sustainable development should also achieve social justice and uphold human rights.

- o Responsibility. The environmental and human well-being is our shared responsibility, but the burden to act must be commensurate to one's contribution to causing unsustainable development.

- Put social justice, human rights, and human development at its heart. Ending poverty, inequality and other forms of injustice must not be afterthoughts to sustainable development strategies. At the core of sustainable development is creating societies and forms of development in which all human rights are realized and economic and development benefits are fairly shared leading to human and environmental well-being.

- Recommit countries to the principle of common but differentiated responsibility (CBDR). Recent years have seen attempts to redefine, weaken, or reject CBDR. All countries should reaffirm CBDR in Rio.

- Commit countries to adequate global action. Efforts of countries should not be a patchwork of individual actions that ultimately fall short of what is needed, but must add up to the magnitude of change required at the global level to achieve sustainable development.

- Commit Northern economies and corporations to radically alter production and consumption patterns in order to shrink their ecological footprints to fair and sustainable

levels.

- Commit Southern economies to shift to low-carbon and equitable development paths with the support of compensatory financial and technology transfers from the North and a coherent international economic environment.
- Set a roadmap for the rapid transition away from fossil fuels as energy sources and towards new, renewable energy sources and systems such as wind, solar, geothermal, sustainable micro-hydro, and so on.
- Promote local, ecologically-sound farming led by small farmers that prioritizes achieving food security and self-sufficiency.
- Commit countries to halt deforestation, stop large-scale mining and commercial logging activities by TNCs in the South, and the encroachment of export cash-crop plantations into forests.
- Call for an immediate end of all subsidies and investments by governments and international public financial institutions to fossil fuel projects that will lock the world with carbon-dependent energy, production, and transportation systems far into the future. Redirect public funds to research and investments in developing environmentally-friendly technologies, renewable energy systems, sustainable mass transportation, and so on.
- Commit countries to review, renegotiate, or repudiate unequal multilateral and bilateral trading and investment arrangements that undermine environmental regulations and allow for the unrestricted exploitation, pollution, and destruction of Southern resources by Northern corporations.
- Commit Northern states to deeper international cooperation to support sustainable development in the South through greater sharing of resources (finance, technologies, capacity-building) and coherent trade, investment, finance, aid and technology policies.
- Commit countries to reject false solutions that allow corporations mainly from the North to continue harming the environment and communities, provide new and greater opportunities for profit, and reinforce and expand corporate control over natural resources and technologies including carbon market, carbon offsetting, geo-engineering, nuclear power, megadams, and genetically modified crops.
- Ensure that sustainable development governance is democratic, participatory, and equitable, allowing for the representation and participation of social sectors and marginalized groups.
- Support the institutionalization of democratic planning and participatory management in the use and conservation of resources for present and future production, consumption, and other social uses.
- Call for greater public investment on research and development (R&D) of ecologically sustainable energy, production, and transportation systems, emphasizing participatory approaches and combining formal science with local knowledge.

## Pesticide Action Network Asia and the Pacific (PAN AP)

### CONTRIBUTION OF THE PESTICIDE ACTION NETWORK ASIA AND THE PACIFIC (PAN AP) TO THE UNITED NATIONS CONFERENCE ON SUSTAINABLE DEVELOPMENT 2012 (RIO+20)

#### Assessing the 20 years of Rio

Rio's twin failures 20 years after the Agenda 21 – an unprecedented ecological crisis and the global economy sinking into a protracted depression manifesting in a worst jobs crisis, poverty and hunger, and poor social outcomes – are telling that the direction of Rio+20 should be more than institutional reforms. Global leaders must recognize at this point that the concept of sustainable development has only been a weak undercurrent to the mainstream of neoliberal globalization. Today's global problems – food crisis, climate crisis, ecological crisis and economic crisis – are all brought about by the reckless, profit-oriented patterns of production and consumption that neoliberal globalization has intensified for decades. **Rio+20 is expected thus to extricate itself from the same policies of open multilateral trading system, privatization, capital liberalization and the like on which Rio was originally based.**

This also entails the **rejection of growth indicators such as international trade and development aid, fiscal reforms, market infrastructure, financial mobilization and the like, and market-based solutions such as carbon trading, carbon market, pricing of and investments in natural resources.**

#### Food Sovereignty as a mechanism for sustainable development

**Rio+20 is expected to be framed within food sovereignty**, a progressive concept that represents basic human rights, since sustainable development after all is about the right to self-determination and sovereignty over natural wealth and resources and embodies the whole range of economic and social rights. **Rio+20 is also expected to put premium on ecological limits first instead of aiming for growth and setting limits to growth later – limits that are always applied on people's well-being but not on profits.**

Following these calls for framework thus entails **global policy-making placing due emphasis on the role of agriculture in ensuring that basic human rights and sovereignty are respected. Rio+20 must recognize the role of small-scale, biodiversity-based and ecological agriculture that is being practiced by millions of food producers round the world in achieving both food security and environmental soundness.** This should be the core and foundation of any economy that is aimed at replacing the current one that is in crisis.

#### "Greening" the same old roadmap

The proposal of a "green economy" has many pitfalls for those aspiring for food sovereignty. One of these is the explicit proposal to price natural resources and all other resources of the economy including human knowledge, assuming it would discourage transnational corporations (TNC) plunder, but actually introducing the complete commodification of nature and ecosystem services. The green economy treats nature and ecosystems as tradeable assets, thereby completing the privatization of commons.

It openly proposes the privatization of knowledge, whether common or indigenous, promoting intellectual property rights (IPRs) and patents by citing that such investments in R&D and innovation may generate "innovation rents", which are nothing but royalties. It even assumes that innovations have "global marketability" thus can be patented, licensed and marketed widely. One way thus to curtail this tendency is to **avoid altogether in Rio+20 the discussion of World Trade Organisation (WTO)-plus issues such as IPRs, innovation and resource pricing that remained contentious up to the collapse of WTO talks.**

The green economy is not only picking up lost causes in the failed negotiations in the multilateral trading system but also **pushing for the contentious issues in the climate conferences, including REDD+ (reducing emissions from deforestation and forest degradation including conservation, sustainable management of**

**forests and enhancement of forest stocks**), which is a mechanism to allow industrialized countries to continue their emissions as long as they pay some forest sector somewhere in the Third World. **This should not be the content of Rio+20 and not extended to ocean carbon or even soil carbon as the green economy proposes.**

**Renewable energy and low-carbon technologies should be promoted and supported. But it should not be within the framework of a carbon market and pricing just to entice investors.** One positive mechanism is the **phase-out of fossil fuel subsidies and replacement by government incentives such as feed-in tariffs, direct subsidies and tax credits** to make renewable energy attractive to investors. Yet, the green economy also proposes these incentives to be attached to the emissions trading scheme, which basically is a system that allows heavy CO2 emitters to just pay for their excess emissions. **Non-market-based solutions and community-managed renewable energies should be explored by Rio+20.**

In agriculture, the green economy relies correctly on the development of smallholder farming, which however is incorrectly pegged at global investments, trade and agri-business.

**Various issues that may have been overlooked or downplayed in the proposal to green agriculture must be the content of Rio+20 discussions. These include trading cartels that control production and trade, ownership and access structures that can get in the way of its goals of increasing productivity and farm yields, shifting farmers' incomes from rents and loan interests to basic commodities and services by freeing them from tenancy and usury.**

**The bottomline of action and outcome indicators of green economy in agriculture must also be reviewed** as these are quite problematic. **These are policy measures that include trade and export policies and payments for ecosystem services through agriculture, whereas a review on the impact of decades-long agricultural trade liberalization and privatization of irrigation and agricultural infrastructure on poor farmers is yet to be done.**

The green economy is also looking at government support where there is none to begin with for farmers to convert to green agriculture and to achieve environmental targets. It is endorsing the IPR regime and liberalization of services by proposing to eliminate barriers to trade in technologies and services needed for the transition to green agriculture.

There is also danger in relying on donor support, specifically official development assistance (ODA), and in openly endorsing the Principles for Responsible Agricultural Investments (RAI) by the World Bank and others, which has served as the license for the continuation of the massive, global foreign land acquisitions that are happening. The green economy is enticing private funds, institutional investors and speculators to invest in agriculture, specifically in corporations that manufacture and market agricultural products and inputs and those that provide services. The "enabling environment" of the green economy itself is problematic as private and public investments are emphasised and, without reservations, invites leading agribusiness corporations and financial institutions to cash in on green economy, with IPRs, prices and other market mechanisms as appeal. In the words of the UNEP, "... these companies have the power to determine, to a large extent, how the global agriculture sector could endorse and encourage green and sustainable farming practices."

This is problematic as these food and agri-chemical TNCs and financial institutions do not have record of sustainable farming practices and genuine support to smallholder agriculture, in the same way that ODA carries conditionalities that are not specific on biodiversity-based, ecological agriculture but rather on technology, capital, micro credit and government legislation to facilitate the corporations. **Instead of funding and investments, Rio+20 must prioritize the broader participation of the communities and basic sectors, paying close attention to economic democracy, gender justice and ecological sustainability.**

The calls for the rejection of commodification and commercialization of nature, carbon trading, market-based solutions, TNC technology and biotechnology, foreign land acquisitions as well as setting aside food production for the sake of "alternative" energy production should reverberate on the road to Rio. **Policies should focus on food sovereignty as the overarching framework to deal with the food crisis; prioritizing small-scale agriculture based on biodiversity and ecology and putting an end to the entire wasteful and unsustainable chain of corporate agriculture; promoting a consumption and lifestyle pattern that covers the basic food and water needs for everyone's well-being; and supporting research for community conservation and management.**

**Ultimately the discussions should focus on revolutionizing the growth indicators with priority on broader social goals such as food security, education for all, health, gainful employment and ecological sustainability. Growth indicators should be guided by ecological limits and the correct application of human knowledge and technology, which incorporates ecological integrity and health, gender justice, and cultural diversity.**

Pesticide Action Network (PAN) is a global network working to eliminate the human and environmental harm caused by pesticides and to promote biodiversity-based ecological agriculture. PAN Asia and the Pacific (PAN AP) is committed to the empowerment of people especially women, agricultural workers, peasant and indigenous farmers. We believe in a people-centred, pro-women development through food sovereignty, ecological agriculture and sustainable lifestyles.

Comments and suggestions should be addressed to Sarojeni Rengam, Executive Director (sarojeni.rengam@panap.net, panap@panap.net), Telephone Nos. 604-6570271 or 604-6560381.

Ocean Earth: How Rio+20 Can and Must Turn the Tide

<http://www.pewenvironment.org/news-room/reports/ocean-earth-how-rio20-can-and-must-turn-the-tide-85899365240>

Rio+20: Time to Turn Back the Tide

An analysis of the gaps in the implementation of the ocean-related outcomes of the major summits on sustainable development

<http://www.pewenvironment.org/news-room/other-resources/rio20-time-to-turn-back-the-tide-85899361026>

Introduction

As the global population continues to rise, humanity's dependence on healthy and productive ocean ecosystems will increase. Despite this dependence, governments continue to authorize activities that threaten the health and productivity of the ocean. Overexploitation of fish stocks, destruction of marine ecosystems and a steady trend in biodiversity loss threaten the food security, economic stability and livelihoods of tens of millions. In spite of some fisheries management efforts, global fish stocks continue to experience serious declines, with some stocks on the high seas particularly at risk. Various measures to promote the protection of biodiversity on the high seas have been agreed to at the international level; however, the international community has largely failed to implement these measures. The international community must take urgent action to reform ocean governance to ensure the sustainability of global fish stocks and to ensure legal instruments are in place to facilitate the protection and long term sustainable

use of marine biodiversity in areas beyond national jurisdiction. This would include action at all levels as set out below:

#### Implement Previous Commitments

To address global gaps in ocean governance, the international community must recommit political will to implementing the commitments of the previous Earth Summits, the Convention on Biological Diversity Aichi Biodiversity Targets (CBD) and the Millennium Development Goals (MDGs). (Please refer to our analysis of the gaps in the implementation of the ocean-related outcomes of the major summits on sustainable development, at <http://www.pewenvironment.org/news-room/other-resources/rio20-time-to-turn-back-the-tide-85899361026>.)

In particular, action must be taken at all levels to implement:

- (a) The Johannesburg Plan of Implementation (JPOI) target to maintain or restore fish stocks to sustainable (MSY) levels by 2015; Page 2 of 4
- (b) The JPOI target to address overcapacity by 2005;
- (c) The JPOI target to address Illegal, Unregulated, and Unreported (IUU) fishing by 2004;
- (d) The JPOI and Convention on Biological Diversity (CBD) targets to eliminate harmful subsidies that contribute to overcapacity and overfishing by 2020;
- (e) Principle 3 of the Rio Declaration to ensure that the right to development must be fulfilled as to equitably meet developmental and environmental needs of present and future generations;
- (f) Principle 15 of the Rio Declaration to ensure that precautionary management is utilized to avoid significant damage to the environment before it takes place;
- (g) Principle 17 of the Rio Declaration to undertake Environmental Impact Assessments (EIAs);
- (h) The JPOI and Millennium Development Goal (MDG) targets to reduce global biodiversity loss;
- (i) The JPOI and CBD targets to establish Marine Protected Areas (MPAs), including in particular marine reserves.

#### IUU Fishing

Illegal, unreported and unregulated (IUU) fishing continues to undermine efforts to sustainably manage global fisheries. Countries heavily dependent on marine fisheries for food security and economic revenue, in particular small island developing States and coastal States, are impacted the greatest. In 2002 through the Johannesburg Plan of Implementation (JPOI), States committed to address IUU fishing by 2004. However, IUU fishing continues to be a significant issue threatening global fish stocks today. A 2011 report by the UN Office on Drugs and Crime (UNODC) has recognized the possible connections between international organized crime and illegal fishing. The UN General Assembly (UNGA) has also noted this possible connection and UNODC recognizes illegal fishing as 'environmental crime.' States must combat IUU fishing by taking action at all levels to:

- (a) Implement effective monitoring, control, surveillance, compliance and enforcement measures to ensure that conservation and management measures are implemented and enforced;
- (b) Recognize that illegal fishing is a criminal activity and often linked to organized crime; and ensure that appropriate resources are deployed to combat this form of crime; and
- (c) Combat IUU fishing through the use of flag State, port State, national and market measures, particularly by encouraging States to become parties to the FAO agreement on Port State Measures to Prevent, Deter and Eliminate Illegal, Unreported and Unregulated Fishing, and by promoting timely implementation of this Agreement.

#### Shark Conservation

Shark populations have plummeted globally over the past several decades primarily due to overfishing and an unsustainable international trade in shark fins. Sharks' life history characteristics make them particularly susceptible to overexploitation and depletion. States agreed in Nagoya at the CBD Conference of the Parties in 2010 to sustainably harvest and manage fish stocks so that overfishing is avoided. States also committed to ensure that fisheries have no significant adverse impacts on threatened species. Recognizing these commitments and the depleted state of many shark populations, States should agree to take action at all levels to:

- (a) Prohibit the take of threatened or endangered species of sharks that are listed as such by the International Union for the Conservation of Nature (IUCN) or in national legislation.

#### Destructive Fishing Practices

Destructive fishing practices threaten deep sea fish stocks and vulnerable marine ecosystems (VMEs) occurring in areas beyond national jurisdiction. Deep sea species are often slow growing, long lived and have low reproductive potential. These characteristics make them highly vulnerable to depletion by deep-sea fleets. Bottom trawling is particularly destructive to these ecosystems and species. Recognizing the devastation to deep sea ecosystems and fish stocks caused by bottom fishing practices, a number of international fora including the UNGA and the CBD have called on States to take action to prevent significant adverse impacts on biodiversity in areas beyond national jurisdiction. However, some countries continue to authorize their vessels to fish even though they have not effectively implemented the measures associated with these resolutions. Under the Rio Declaration, States recognized their responsibility to ensure that activities under their jurisdiction or control should not cause damage to the environment in areas beyond the limits of national jurisdiction. To promote the conservation and sustainable use of biodiversity in areas beyond national jurisdiction States must take action at all levels to:

- (a) End destructive fishing practices which damage vulnerable marine ecosystems and recognize that bottom fishing in violation of previous UNGA resolutions is IUU fishing and should cease immediately;
- (b) Recognize that deep sea bottom trawling is the single most destructive fishing method on the high seas and agree to phase out this practice by 2015.

#### Science-Based Fisheries Management

In Johannesburg in 2002, States agreed to restore global fish stocks to sustainable levels by 2015. However, stocks continue to be targeted at unsustainable rates. The FAO reported in 2010 that 85% of global fish stocks are fully exploited, over-exploited, depleted or recovering from depletion, --the highest percentage ever. Fisheries managers have all too frequently ignored scientific advice and failed to effectively implement internationally agreed precautionary management measures. This has contributed to a system of international fisheries management which continues to prove unable to reverse the precipitous decline in global fish stocks. States must take action at all levels to address these declines by agreeing to:

(a) Prohibit fishing in a given area or on a given stock if the fishery is not fully in accordance with relevant international commitments and resolutions and if precautionary, science-based management measures are not in place. These measures should include adequate bycatch mitigation measures.

#### RFMO Accountability and Transparency

Regional Fisheries Management Organizations (RFMOs) are tasked with managing a significant proportion of commercial fishing operations occurring on the high seas. Despite having mandates to ensure the conservation of biological resources occurring within their areas of remit, RFMOs have often failed to implement sustainable management practices. RFMOs should be held accountable for their responsibilities. The United Nations General Assembly (UNGA) has the responsibility to oversee international cooperation and development under the UN Charter. In the past, the UNGA has influenced progress towards achieving fisheries management goals associated with large-scale pelagic driftnet fishing and deep sea bottom fishing. This precedent should serve as a model for future action. To promote the conservation and long-term sustainable management of marine resources, States should take action to:

(a) Ensure transparency and accountability of RFMOs through UNGA oversight.

#### Marine Biodiversity Conservation

Under the Rio Declaration, States committed to implement precautionary management measures and to ensure the right to development is fulfilled as to equitably meet developmental and environmental needs of present and future generations. However, marine biodiversity loss driven by anthropogenic activities is increasingly harming the ocean's ability to provide vital services to humanity. Under the JPOI and MDGs, States agreed to targets to reduce global biodiversity loss. The rate of biodiversity loss is not slowing, but the tools to combat this problem have been identified by the international community and committed to in the Rio Declaration, JPOI and CBD targets. However, an adequate legal framework to effectively implement these tools is absent. In order to address these gaps in ocean governance, States should:

(a) Initiate a process towards a new implementing agreement under the United Nations Convention on the Law of the Sea for the protection and conservation of high seas biodiversity. Current gaps which could be specifically addressed through an implementing agreement include:

- Comprehensive prior EIAs and Strategic Environmental Assessments (SEAs), together with ongoing monitoring of the marine environment;
- Identification, designation and management of a global network of high seas MPAs, including in particular no-take reserves;
- Implementation of the precautionary principle and ecosystem approach in decision making and fisheries management;
- The reform of RFMOs to incorporate a broader ecosystem conservation focus;
- Provision of access to and dissemination of information and transparency in decision making processes.

## Planet Under Pressure

### Interconnected risks and solutions for a planet under pressure

#### Transition to sustainability in the context of a green economy and institutional frameworks for sustainable development

Rio+20 Policy Brief produced by the scientific community to inform the United Nations Conference on Sustainable Development (Rio+20). These briefs were commissioned by the international conference Planet Under Pressure: New Knowledge Towards Solutions ([www.planetunderpressure2012.net](http://www.planetunderpressure2012.net)). The conference is sponsored by the International Geosphere Biosphere Programme, DIVERSITAS, the International Human Dimensions Programme and the World Climate Research Programme. Email [owen.gaffney@igbp.kva.se](mailto:owen.gaffney@igbp.kva.se) for full document.

The 2012 United Nations Rio+20 Summit must be seen in the context of a significant expansion of the scientific knowledge base since the 1992 Rio Earth Summit.

We now know definitively that humans have become a prime driver of change at the planetary level, significantly altering Earth's biological, chemical and physical processes. There is increasing evidence that humans are driving the Earth system towards dangerous thresholds or tipping points. The functioning of the Earth system as we know it is at risk. We know that solutions exist, but, as the international community contemplates action, the natural resource in shortest supply is time.

The urgent global risks and challenges facing all nations are interconnected: poverty alleviation; the financial crisis; economic development; political stability; pollution; food, water and energy security; health; wellbeing; climate change; ocean acidification; and loss of biodiversity, to name just some. Understanding this interconnectedness is crucial for tackling these challenges and improving the wellbeing of all societies.

This policy brief outlines key interconnections at a global level and makes six recommendations for lowering the risk of catastrophic change to the Earth system, achieving sustainable prosperity and wellbeing for all, and protecting natural capital (land, water, soil, biodiversity and ecosystem services). These actions underpin the shift to a green economy and the transformation of the world's institutional frameworks for sustainable development.

#### Summary of key points and policy recommendations from the Planet Under Pressure policy brief on interconnected risks and solution.

1 Reduce risk. Concerted, global and immediate action is needed to reduce the risk of fundamentally disrupting the stability of the Earth system, with consequences for global economic and political systems. The immediate priority is to stabilize the global climate at a temperature of no more than 2°C above pre-industrial levels. We must reduce the carbon intensity of the global economy, undertake a massive decarbonisation of the energy sector and effectively manage Earth's carbon and radiant energy budgets. Other immediate challenges include: massive biodiversity loss, ocean acidification and disruption of the nitrogen cycle, all of which need coordinated action.

2 Transform global governance to address the interconnected nature of today's challenges. While our global societal systems are increasingly interconnected, our governance systems often act independently and are slow to respond. Nations must work together to devise effective ways of protecting such globally common resources as the atmosphere, oceans, freshwater, biodiversity, the ice sheets and natural cycles for the benefit of all societies, present and future.

3 Engender strong leadership. Leadership is a powerful catalyst for action. This includes:

Broaden accountability and empowerment from global to local levels to improve all people's access to and participation in international decision making.

Establish an international high-level consultative body on global sustainability. Such a body would include a chief scientific advisor or "planetary ecologist" and broad representation from the UN General Assembly, UN system, G20, International Monetary Fund, World Bank, World Trade Organization, business and civil society, as well as science and technology organizations. Part of its role would be to review regular global sustainability assessments.

Strengthen and upgrade the Commission on Sustainable Development; upgrade the UN Environment Programme to agency status and strengthen its links to sustainable development policy and the global economic system.

4 Halt unsustainable production and consumption and value natural capital. Economic systems ignore global-scale costs and benefits to humanity (e.g. the cost of disrupting the climate system). The world's biggest market failure is to exclude the value of the stable functioning of the Earth system. Nations must adopt new measures of well-being that go beyond financial metrics to include quality of life. The successor to the Millennium Development Goals must have global sustainability at its foundation.

5 Develop global knowledge systems for interconnected challenges. This includes:

Deploy modern communications infrastructure across all nations. Communications infrastructure has become as important to quality of life and prosperity as our transport, water and power infrastructures.

Launch a major international research initiative for global sustainability. This collaborative endeavour will challenge the research, policy and business communities to provide the resources, knowledge and tools required to manage global risks and navigate an increasingly interconnected world.

Bring cohesion to the international science–policy interface. Establish an Intergovernmental Panel on Global Sustainability to ensure scientific coherence. This would produce a regular 'State of the Planet' assessment that includes socio-economic dimensions and brings together and expands upon existing assessments, strengthening links between science and policy.

Develop an international approach for tackling emerging technologies eg. synthetic biology, geoengineering and nanotechnology.

Ensure international treaties are dynamic enough to respond to new information effectively.

Invest in tertiary education in developing countries. Education builds endogenous capacity to address global challenges, improves well-being and generates economic growth.

Create a global integrated monitoring system for global sustainability.

6 Build resilience and prepare for unavoidable changes. The great acceleration in human activity, seen largely since the 1950s, has committed the Earth system to substantial change, some of which is not reversible on human timescales. All nations must be ready to adapt to inevitable environmental and social changes.

---

## Planetary Boundaries Initiative

UN Conference on Sustainable Development, Rio de Janeiro, 4 – 6 June 2012

Input for Compilation Document Submission by the Planetary Boundaries Initiative

This submission is made on behalf of the newly-formed Planetary Boundaries Initiative, which includes amongst its aims the promotion of a Declaration on Planetary Boundaries.

We submit that States at the Rio Conference should adopt a Declaration on Planetary Boundaries, along the lines of the draft Declaration which is set out at the end of this submission.

If this is not possible, then the outcome document should:

- prominently reflect its Principles;
- contain a commitment by States to develop a legal instrument which would reflect its Principles; and
- pending development of such an instrument, contain a commitment to confer the function of promoting and developing the Principles, and development of such an instrument, on an over-arching international body.

Why a Declaration on Planetary Boundaries?

In 2009, 29 scientists published a paper putting forward the planetary boundaries concept. The concept posits that there are nine critical Earth-system processes and associated thresholds that we need to respect and keep within, in order to protect against the risk of irreversible or even catastrophic environmental change at continental to global scales. Doing so would create a safe operating space for humanity, within which human economy and society would be able to play out. According to the concept's authors, three of the nine suggested thresholds have already been crossed (for climate change, biodiversity and the nitrogen cycle).<sup>1</sup> The threshold for the phosphorus cycle (linked, within the concept, to the nitrogen cycle) has also been crossed, according to a scientific paper earlier this year.<sup>2</sup>

What is new about the concept is that, rather than understanding environment, economy and society as three pillars of sustainable development, it makes clear that sustainable

<sup>1</sup> Rockström, J et al. Planetary boundaries: Exploring the safe operating space for humanity. *Ecology and Society* [online] 14, 32 (2009). Available online at [www.ecologyandsociety.org/vol14/iss2/art32](http://www.ecologyandsociety.org/vol14/iss2/art32)

<sup>2</sup> The paper is entitled 'Reconsideration of the planetary boundary for phosphorus', authored by Carpenter and Bennett, was published in February 2011 in *Environmental Research Letters* and is available here:

[http://iopscience.iop.org/1748-9326/6/1/014009/pdf/1748-9326\\_6\\_1\\_014009.pdf](http://iopscience.iop.org/1748-9326/6/1/014009/pdf/1748-9326_6_1_014009.pdf)

development can only take place within the safe operating space identified by the biophysical realities of critical natural thresholds.

The idea has been acknowledged by the Secretary-General's High-Level Panel on Global Sustainability: the overall goal for its report later this year and input into Rio+20 is "To eradicate poverty and reduce inequality, make growth inclusive, and production and consumption more sustainable while combating climate change and respecting the range of other planetary boundaries."

The planetary boundaries concept has important implications for future governance systems. Current systems, including international laws, have not yet developed sustainability principles that ensure stable and resilient ecological systems for protecting human health and well being. Instead our institutions are often caught in conflict

between short-term financial gains and long-term sustainability.

The draft Declaration on Planetary Boundaries is intended as a statement of first principles that lay the institutional framework for such planetary boundary thinking. It calls for humanity to recognize, respect and be responsible for not transgressing planetary boundaries – internationally, regionally, nationally and locally. It sets out general requirements under each of these three heads, and provides for an over-arching institutional home which cooperates with current institutions and actors across the range of human activities that affect planetary boundaries. In time, such an institution could become -under a UN Convention on Planetary Boundaries -an over-arching Planetary Boundaries Commission.

Rio +20 is an obvious opportunity to explore this innovative approach to sustainable development, including in order to develop ideas around Sustainable Development Goals and/or Millennium Consumption Goals.

Those behind this Declaration believe there is an urgent need to take action on this governance issue to ensure that everyone, including present and future generations and particularly the vulnerable and marginalised, have the protections and rights necessary to live in a social and physical environment that provides for their health and well being.

The draft Declaration follows. It is available, along with a Commentary, here:

<http://planetaryboundariesinitiative.org/>

Funding for the draft declaration was provided by WWF-UK:

Peter Roderick and Debbie Tripley

Planetary Boundaries Initiative

1st

November 2011

Draft Declaration on Planetary Boundaries

We, the peoples and nations of our planet, Earth,

Cherishing its beauty, diversity, vitality and community of life,

Recognising the innate linkages between components of the ecosystems that sustain life, and valuing their fundamental role for human existence, development and wellbeing,

Conscious of facing a critical period in the history of our planet,

Concerned that rapidly growing dependence on fossil fuels, industrialised forms of agriculture and escalating demands on natural resources have reached a level that could damage the biogeochemical feedback systems that maintain a habitable planet, resulting in irreversible and, in some cases, abrupt environmental change, which could profoundly undermine long-term human existence and that of other forms of life,

Recalling commitments made at the United Nations Conference on Environment and Development in respect of sustainable development and future generations, and in particular, Principle 15 of the Rio Declaration concerning application of the precautionary principle,

Determined to respond to the strong scientific consensus and growing evidence base that there are identifiable Earth-system processes on which human existence, development and well-being depend, and which must be safeguarded from the threats of serious or irreversible damage as a result of human activities,

Recognising that safeguarding those processes from such threats is necessary in order to promote sustainable human development and social justice, and likewise that promoting sustainable human development and social justice is necessary for safeguarding those processes,

NOW DECLARE AS FOLLOWS:

Principle 1 – The Fundamental Principle

Earth-system processes that are necessary for ensuring a safe operating space for humanity should be recognised and respected. We are all responsible for safeguarding those processes from the threats of serious or irreversible damage as a result of human activities.

Principle 2 – Recognition

Recognition of necessary Earth-system processes means:

- (1) acknowledging that such processes exist;
- (2) acknowledging the need to act in order to safeguard such processes from the threats of serious or irreversible damage as a result of human activities;
- (3) researching and developing our understanding of the nature and vulnerabilities of such processes, including of the thresholds at which they could shift into new states and of where boundaries at a safe distance from such thresholds would lie; (4) identifying the human activities that affect such processes, and monitoring the effects of such activities, including collecting, collating and presenting scientific data and information by reference to such processes and the human activities which affect them; and
- (5) developing and communicating information about such processes in ways which are transparent and designed to encourage public engagement, trust, common understanding and acceptance of shared responsibility for safeguarding them.

Principle 3 -Respect

Respect for necessary Earth-system processes means:

- (1) using scientific information to understand their thresholds;
- (2) determining their boundaries transparently on the basis of scientific advice, having taken into account social and economic considerations, public opinion and having

assessed the risk of crossing the boundaries;

(3) making decisions, across the range of human activities which affect such processes, to minimise the risk of crossing the boundaries;

(4) designing appropriate public and private sector institutions in order to safeguard such thresholds and boundaries.

#### Principle 4 -Responsibility

Being responsible for safeguarding necessary Earth-system processes means:

(1) establishing over-arching legal principles and duties to recognise and respect such processes across the range of human activities that affect them;

(2) ensuring people have the right to have them recognised and respected;

(3) guaranteeing rights to information, participation and access to justice, including appropriate and effective remedies; and

(4) creating an independent public enforcement body with appropriate and effective legal powers and duties.

#### Principle 5 -Institutions

(1) The function of promoting and developing these Principles should be conferred on an over-arching international body (the Planetary Boundaries Institution (PBI)), coordinating a network of regional, national, and sub-national bodies.

(2) The function of promoting and developing these Principles involves cooperation among the PBI and the network, and institutions and organisations with responsibilities across the range of human activities that affect necessary Earth-system processes, at the appropriate levels, as well as engagement and communication with the public.

(3) The PBI and network will also have the function at the appropriate level of providing scientific information and advice for the purposes of Principle 3(1) and (2), based on coordination of the evidence available from research on the thresholds and boundaries of necessary Earth-system processes.

(4) The PBI and network will be assisted in its work by independent, transparent and participative panels at international, regional and national levels, especially in relation to scientific and other research evidence, socioeconomic considerations and public engagement.

#### Principle 6 -Commitments

(1) UN bodies and agencies, other international institutions and inter-governmental organisations with responsibilities for activities that affect necessary Earth-system processes, regional economic integration organisations and States will:

(a) review the laws, policies, strategies and arrangements they have in place for recognising, respecting and being responsible for safeguarding necessary Earth-system processes from the threats of serious or irreversible damage as a result of human activities in accordance with these Principles;

(b) make any improvements necessary to apply these Principles;

(c) cooperate with, provide to and exchange data and information with the PBI and network at the appropriate level; and

(d) report periodically to the PBI and the network at the appropriate level and the independent enforcement body under Principle 4(4) on the effects of activities on such processes and on the extent to which they are applying these Principles.

2. In reviewing and improving their laws, policies, strategies and arrangements, States and regional economic integration organisations will, in conjunction with the PBI and network at the appropriate level, consider:

(a) the impact of their activities on Earth-system processes that are necessary for ensuring a safe operating space for humanity, and

(b) how they can ensure that their activities do not exceed their fair share of that safe operating space.

## Plant-for-the-Planet Children's Initiative

### Plant-for-the-Planet Children's Initiative Children's Declaration

Our „3-Point-Plan to save our future“

We, young people – 3 billion of the world population – are concerned and frustrated that our governments and business leaders are not doing enough to save our future. We feel that radical and holistic measures are needed urgently from us all.

We now need more actions and less talking. Climate crisis and poverty are interlinked and affect us all. We need to find efficient ways to cope with it, adapt to it and take action to stop it.

We note that climate change is leading to loss of natural resources and makes it difficult to achieve the Millennium Development Goals. Climate change has serious consequences not only for ecosystems, but also for human health, job security and social development. Together we can make a difference.

We, the children, are leaders of the next generation, will take action, and urge the people all over the world to take action as well with our “3-Point Plan to Save Our Future.”

1. Put carbon in the museum.

We absolutely need to get our CO2 emissions levels down to zero by 2050. The technology for such a CO2-free future already exists. With today's engineering capabilities we can easily make the transition to 100% renewable energy (without the need for nuclear power) by 2050.

2. Put poverty into the museum through climate justice.

In order to stop the predicated warming of 2°C, which the heads of government already promised to do in Copenhagen, a maximum of just 600 billion tons of CO2 can be emitted until the year 2050. If we emit more than this, the temperature will rise higher than 2°C thus causing the ice on Greenland to melt and mean sea levels to rise by as much as 7 meters. 600 billion tons divided by 40 years leaves an allowance of 15 billion tons per year. In 2010, 31 billion tons of CO2 were emitted, more than double the

allowance! One of the major problems as we kids see is that it is often the people in the poorer regions who suffer most from the consequences of climate change. This is despite the fact that they have done the least to cause it. Considering this, we believe that the 15 billion tons allowance of CO2 per year must be fairly shared amongst all the worlds' citizens. For us children there is only one solution: everybody gets the same. This would mean 1.5 tons of CO2 per person, per year.

But how does this help to solve the problem of global poverty? On average an American citizen emits around 20 tons of CO2 per year and a European citizen emits around 9 tons. In comparison, people in Africa emit on average only 0.25 tons per year. Our proposal: The people in the rich countries, who want to emit more CO2, must buy the rights from those who emit less. This is our principle for climate justice. With the money that the people in the poorer countries earn they can then invest in agriculture, education, health and more. They will also have an incentive to invest in renewable energy technologies so that they can maintain the right to sell their CO2 emission allowance. This will also stop them from making the same senseless mistakes that we in the West have.

3. Planting 1,000 billion trees.

As both a symbolic and a practical action for climate justice it is our goal to plant 1,000 billion trees, or 1 trillion trees, around the world. These trees will absorb an additional 10 billion tons of CO2 every year! While this may sound like an enormous amount, we know that if we work together it is achievable!

In China alone 2.7 billion trees were planted in 2009 as a contribution to the UNEP-Billion Tree Campaign. If every person on our earth would plant 150 trees over the next ten years we would reach our target of 1,000 billion trees by 2020. And if it's not possible for a country to plant trees in its own area, it can support the planting of trees in southern countries. With a bit of effort our target is definitely achievable.

Of course we know that we can't stop climate change just by planting trees. But by planting 1,000 billion trees in the next 10 years this will help to absorb more CO2 and give us a kind of 'time-joker' or buffer so that we have a bit more time to get our act together and really start reducing our carbon emissions. Considering that from 2009 to 2010 we actually increased emissions by 5%, instead of decreasing them, it is clear that we still have a lot to do. If we continue to increase our carbon emissions by 5% every year we will have used up our 600 tons budget, and caused the climate to rise by 2C, by 2024. Alternatively if we continue with the same rate of emissions as in 2010, we will have hit the 600 billion tons mark by 2029. These statistics are highly concerning and this is why we also consider each tree that we plant to be a symbolic action sending a clear message that we need to take action against climate change today.

While Plant-for-the-Planet is essentially a children's initiative we know that we will need some help from the adults if we are going to achieve our goals. This is why we have sent our "3- point-plan" to the heads of governments all around the world.

1,000 billion trees we children cannot manage alone we need help of the adults. But we children have already started and are planting one million trees in every country on earth.

## Population and Climate Change Alliance (PCCA)

### Submission of the Population and Climate Change Alliance (PCCA) to the Rio+20 Zero Draft Outcome Document Preparations

#### Mission Statement

The Population and Climate Change Alliance (PCCA) is a network of Non-Profit Organisations that works together on population and climate change issues through a loose umbrella coalition.

PCCA strives to advance Sexual and Reproductive Health and Rights (SRHR) through active awareness raising and advocacy work on the linkages between population and climate change, and believe that increasing (universal) access to voluntary family planning can make a significant contribution to climate change both in adaptation and mitigation strategies and programmes.

#### The PCCA includes the following organisations:

[Danish Family Planning Association](#) (Sex & Samfund)

[International Planned Parenthood Federation](#) (IPPF)

[Marie Stopes International](#) (MSI)

[Population Action International](#) (PAI)

[Population and Sustainability Network](#) (PSN)

[Population Health Environment \(PHE\) Ethiopia Consortium](#)

#### The following additional organisations are signatories to this submission from the PCCA:

[Action for Global Health](#)

[AIDOS - The Italian Association for Women in Development](#)

[Association of Youth Organizations Nepal](#) (AYON)

[BioRegional](#)

[Blue Ventures](#)

[Change Mob, Brazil](#)

[Community Health Africa Trust](#) (CHAT), Kenya

[DSW \(Deutsche Stiftung Weltbevölkerung\)](#)

[Ecopop, Switzerland](#)

[Family Health Options Kenya \(FHOK\)](#)

[French Family Planning Movement](#)

[Institute for Global Health, University College London \(IGH, UCL\)](#)

[Interact Worldwide](#)

[Partners in Population and Development, African Regional Office \(PPD ARO\)](#)

[Pathfinder International](#)

[Population Matters](#)

[Portuguese Family Planning Association \(APF\)](#)

[RFSU - The Swedish Association for Sexuality Education](#)

[Rutgers WPF](#)

[Sex og Politikk – The Norwegian Association for Sexual and Reproductive Health and Rights](#)

[Shirkat Gah- Women's Resource Centre, Pakistan](#)

[The Irish Family Planning Association \(IFPA\)](#)

[The Sustainable World Initiative](#)

[Väestöliitto – Family Federation of Finland](#)

[Women's Center, Georgia](#)

The PCCA welcomes the opportunity to contribute input to the preparation of the zero draft of the Rio+20 outcome document. In this submission we contribute predominantly to 'Specific Elements: Objectives of the Conference' and 'Sectoral priorities and initiatives that could contribute to integrate the three pillars of sustainable development that could be launched and endorsed at Rio+20.' We focus on the linkages between population dynamics and sustainable development, and the opportunities that must be seized to advance sustainable development through achieving universal access to sexual and reproductive health and rights; a cross-cutting theme significant to each of the three pillars of sustainable development.

1.

## **Summary**

1.1

Population dynamics, including growth, urbanisation and migration, interact with the environment to influence availability of natural resources, biodiversity, climate change and other key Rio+20 priorities.

1.2

Unsustainable population growth and lack of access to reproductive health services undermine development and poverty alleviation efforts, with implications for governments' capacities to make a transition to a green and fair economy.

1.3

Between now and 2100 the world population is expected to increase from 7 billion to over 10 billion. Consideration of population dynamics with a sexual and reproductive health and rights (SRHR) focus must be included among other sustainable development initiatives, including those that address unsustainable and inequitable consumption, and will increase their effectiveness.

1.4

Addressing unmet need for contraception to enable all women and couples to plan and space their children as they wish offers scope to achieve population stabilisation and contribute to poverty alleviation, gender equality, environmental sustainability and other important aspects of sustainable development.

*Focus for policy recommendations and Rio+20 outcomes:*

1.5

Global population dynamics can and must be addressed in ways that respect and protect human rights.

1.6

Human health and well-being, including SRHR, are central components of sustainable development.

1.7

Integrated population, health and environment approaches have synergistic effects.

1.8

Population dynamics, including population growth, density, urbanization, migration and ageing, must be integrated into development strategies and environmental planning,

with systematic use of population data and projections.

1.9

Rights-based sexual and reproductive health programmes, including family planning services, should be recognized as essential components of new global initiatives to increase resources for sustainable development and adaptation to climate change.

1.10

Rights-based sexual and reproductive health programmes, including family planning services, should be recognized as legitimate components of national climate change adaptation programmes and funding mechanisms, to increase the resilience of the communities most vulnerable to climate change.

1.11

Renewed commitment and greater investment is necessary to achieve the International Conference on Population and Development Programme of Action and the Millennium Development Goals.

1.12

Recognizing the links between population dynamics and sustainable development, governments should ensure universal access to sexual and reproductive health, including family planning, empowerment of women, and investment in education, particularly of disadvantaged children and youth, and girls and young women, with programmes that respect and protect human rights.

2.

## Introduction

2.1

The UN Earth Summit in 1992 was a momentous international event, that stated “to achieve sustainable development and a higher quality of life for all people, States should reduce and eliminate unsustainable patterns of production and consumption and promote appropriate demographic policies”.<sup>1</sup> Recognising the significance of population dynamics and SRHR for sustainable development, Agenda 21 called for “programmes that promote demographic trends and factors towards sustainability”.<sup>2</sup> This included reproductive health programmes and services to “enable women and men to fulfil their personal aspirations in terms of family size, in a way in keeping with their freedom and dignity and personal held values”.

2.2

In accord with the 1992 Summit, the International Conference on Population and Development (ICPD) in Cairo in 1994 recognised the interrelationships between population, development, the environment, and human rights, including the right to health.<sup>3</sup> Moving away from demographic targets, the paradigm that emerged from Cairo endorsed a progressive vision of comprehensive sexual and reproductive health programmes, placing human rights and the individual needs and wishes of women at the centre of this approach. Empowering women and realising universal reproductive health and rights was recognised as a goal in its own right, as well as critical to achieving sustainable development.

2.3

These principles agreed at the 1992 Earth Summit and the 1994 International Conference on Population and Development are even more relevant today, yet over the last two decades they have not commanded the necessary attention at both the national and international level. While global environmental and sustainability issues are more pressing than before, particularly with the onset of climate change, both the vision of the ICPD Programme of Action (PoA) and Millennium Development Goal 5b to achieve universal access to reproductive health by 2015 are far from realization. Since 1994 the world’s population has increased from 5.5 billion to 7 billion, and until recently was expected to stabilize at 9 billion but is now expected to exceed 10 billion by the end of the century.<sup>4</sup> Ninety-seven per cent of the growth in the world’s population before 2050 will be in the developing nations.<sup>5</sup> With these countries already struggling to meet their citizens’ basic needs, such rapid population growth threatens to further undermine progress towards sustainable development.

2.4

Sustainable development will not be achieved until women’s right to plan and space their pregnancies, enabling them to choose the number of children they have, is realized. Yet an estimated 215 million women in developing countries have an unmet need for contraception, meaning that they are at risk of an unwanted pregnancy and say that they do not want to get pregnant during the next two years, but are not using contraception, often because they do not have access to reproductive health services.<sup>6</sup> Donor investment in family planning has actually decreased dramatically since the mid-to-late 1990s, at the same time that demand is increasing.<sup>6</sup> In this submission the PCCA sets out the important links between population dynamics, sexual and reproductive health and rights (SRHR) and sustainable development. We call for population dynamics and SRHR to be recognised as a critical aspect of sustainable development, and make recommendations for Rio+20 outcomes which have synergistic effects for the three economic, social and environmental pillars of sustainable development.

3.

## Population, consumption and sustainable development

3.1

Agenda 21, the Action Plan for 1992 Rio summit calls for “integrated environmental and development approaches at the local level, taking into account demographic trends and factors”.<sup>2</sup> This approach acknowledges that population size, as a key determinant of use of the planet’s finite resources, is a critical component of sustainability, and that additional demographic trends are also significant. As well as population size, density, migration, urbanisation and ageing influence are relevant to sustainable development as they influence consumption rates and have implications for economic growth, poverty reduction and governments’ capacities to make the transition to a green and fair economy and adapt to climate change. We outlined above the rate and scale of population growth that has taken place since 1992, and that projected for the future. Given such growth, the success of sustainable development initiatives which fail to address the consequences of demographic change for sustainability and do not encompass the necessary focus on SRHR, will be considerably limited.

3.2

We welcome the recognition in the May 2010 report of the Preparatory Committee for Rio+20 that addressing both population and consumptions issues is critical to achieving

sustainable development. The report acknowledges that demographic transition must be achieved in the global South in order to raise living standards in poor countries, at the same time as addressing the impact of inequitable and unsustainable patterns of consumption, particularly in the global North. 7 We strongly support this approach which we hope will be advanced at Rio+20. It is sometimes perceived that consideration of the role of population dynamics in determining environmental sustainability distracts from the pressing problems of unsustainable and inequitable patterns of consumption by developed countries. We believe, however, that this either / or approach to 'population' and 'consumption' issues is simplistic and the absence of population dynamics from sustainable development approaches will significantly compromise the effectiveness of other interventions. It is important therefore, that the summit holistically addresses the whole range of factors relevant to sustainable development.

3.3

It is sometimes assumed that addressing population growth requires coercion and restrictions on individual rights and freedoms. On the contrary, global population dynamics can and must be addressed in ways that respect and protect human rights, through advancing SRHR to fulfil women's rights to plan and space their pregnancies according to their wishes. Our submission recommendations focus on this approach. Many of our messages and recommendations echo the recent Civil Society Declaration of the 64th Annual UN DPI/ NGO Conference focusing on preparations for Rio+20.8 This demonstrates the considerable support that exists from civil society for advancing SRHR, gender equality and empowerment of youth as vital strategies for achieving sustainable development and the transition to a green and fair economy.

4.

#### **Population, environment and biodiversity**

4.1

A focus on demographic trends and SRHR is critical to sustainable development, because it is the ways that population and society interact with the natural environment which determine environmental sustainability. Population growth, density and migration can place extreme pressures upon the natural environment. Acting in tandem with climate change in many developing countries, rapid population growth increases demand for natural resources and results in intensified agriculture and use of land and water supplies. This in turn can exacerbate environmental problems, including deforestation, land and water shortages and degradation, and loss of biodiversity due to habitat destruction, depleting the natural resource base upon which the health and wellbeing of populations, and overall sustainability, depend.9 Demographic trends are increasingly being identified as significant for the global conservation of biodiversity, with high rates of population growth contributing to loss of biodiversity. A study found that population growth rates in twenty-five areas of the world identified as 'biodiversity hotspots', are significantly higher than the population growth rate of the world as a whole, and above the average for developing countries.10

4.2

The detrimental impacts of population dynamics upon the environment are felt the greatest by society's poorest populations, including women and children, deepening poverty and increasing their vulnerability to climate change. As a result of rapid population growth, overcrowding and increasingly climate change, poor communities can be forced to inhabit or migrate to the most ecologically fragile areas which are particularly vulnerable to environmental degradation. The need to feed growing populations is causing deforestation and more intensive use of natural resources, further jeopardising food security. This issue is particularly critical in some parts of Africa, where the population is set to more than triple by the end of the century, at the same time as communities and governments will be struggling to cope with the effects of climate change upon agricultural output. Given the links between demographic pressures, environmental degradation, conflict situations and vulnerability to climate change and natural disaster, integrated approaches to population, health and environment issues have synergistic effects, benefiting the health and well-being of communities, and the ecosystems upon which they depend. Ensuring that women have the means to plan and space their pregnancies as they wish is critical for increasing the resilience of poor communities, in the face of scarcity of natural resources, climate change and increasing frequency of natural disaster. SRHR programmes must also be considered a vital component of the response to emergency situations, including natural disaster and conflict situations.

5.

#### **Population dynamics and climate change**

5.1

Consideration of the links between population dynamics and climate change is complex and sensitive, because it is consumption rates and patterns in the global North that is driving climate change, yet it is the countries of the South, where the majority of population growth is taking place, that are the most vulnerable to the impacts of climate change. While discussion of the links must acknowledge these complexities, as well as the responsibilities of the global North to address the unsustainable consumption patterns driving climate change, the links are too important to ignore. Population growth and lack of access to reproductive health in many of the poorest communities hardest hit by climate change is exacerbating their vulnerability and undermining adaptation capacity, meaning that advancing SRHR offers opportunities to increase climate resilience. These links are increasingly being recognized by developing countries themselves.

5.2

In the National Adaptation Programmes of Action (NAPA) reports in which the forty least developed countries set out their most pressing climate change adaptation issues and priorities as part of the UN Framework Convention on Climate Change, ninety- three per cent of the countries identified population growth as one of the factors confounding their attempts to adapt to the effects of climate change. The most frequently mentioned climate change adaptation issues identified as being exacerbated by population growth are: soil degradation and erosion, fresh water scarcity, migration, deforestation and shortages of farm land. Additional vulnerabilities linked to population growth include loss of biodiversity and natural habitat, desertification and diminishing fish stocks.11

5.3

As recognised by the recent Civil Society Declaration of the 64th Annual UN DPI/ NGO Conference focusing on preparations for Rio+20, attainment of MDG 5, including universal access to reproductive health, offers opportunities to strengthen the resilience of people and communities to the consequences of climate change and environment degradation.8 Integrating SRHR programmes into climate change adaptation plans would enable women to determine the size of their families and make adapting to the effects of climate change easier. It would increase resilience at the individual household level, and have wider effects for society as the resulting prevention of unplanned pregnancies would lead to reductions in population growth and the associated pressures upon resources.9

5.4

One analysis determined that globally there are 26 population and climate change "hotspots." These are countries with low climate change resilience that are experiencing rapid population growth and high projected declines in agricultural production.i In hotspot countries, an average of one in four married women would like to avoid pregnancy, but is not using modern family planning. The average number of children born to each woman in hotspot countries is 4.6, and the average population growth rate is 2.2 percent. If unchanged, this rate of growth would result in a doubling of the population in 31 years.12

5.5

Migration presents another important adaptation issue, both in terms of migration resulting from scarcity of natural resources, and the mass migration that is likely to take place in the future due to the sea level rises expected to result from climate change. One third of the world's population lives within 60 miles of a coast, and 13 of the world's 20 largest cities are on a coast.<sup>13</sup> The necessary migration will be easier to achieve if women and men are able to exercise their right to plan and space their pregnancies, both because of reductions in the average family size and greater per capita availability of land due to reduced population growth. Achieving universal reproductive health is also a critical intervention for promoting gender equality and reducing the particular vulnerabilities of women and girls to the impacts of climate change.

6

## Population dynamics, poverty and a green and fair economy

6.1

The Rio Earth Summit recognised that "human beings are at the centre of concerns for sustainable development."<sup>1</sup> This recognition is important because it acknowledges that without ensuring human well-being and rights, sustainable development will not be achieved. As well as being significant to the environmental pillar, population dynamics and SRHR are critical to the social pillar of sustainable development, and a focus on these aspects of sustainable development also has synergistic effects for the economic pillar, with implications for transition to a green and fair economy.

6.2

We use the term 'green and fair economy', because the current economic model that promotes growth at all costs must be replaced by a new model based on fairness and equity, thereby both promoting environmental sustainability and addressing the social inequalities inherent in the current model. It is crucial that the term "economic growth" is not simply replaced with "green growth" or a "green economy", with business as usual. Strengthening the social pillar of sustainable development at Rio+20 is vital for ensuring progress towards a truly green and fair model of development, and one which values, and measures dimensions of, both human and environmental well-being.

6.3

Population dynamics and SRHR are linked to key determinants of poverty and other critical aspects for sustainable development, including health, education, gender and economic development. Increasing access to comprehensive sexual and reproductive health services that respect and protect human rights, is critical to realizing the human right to health. These services include not only family planning programmes but the full range of services and information necessary for individuals to enjoy sexual and reproductive health and well-being, including those benefiting maternal and infant health, as well as HIV/AIDS treatment and prevention. At the individual level, the agency, equity, health and resilience of women are strongly influenced by women's ability to exercise reproductive choices. Increasing access to education, particularly of girls and women, must also be a strong focus for advancing the social pillar of sustainable development, and will have synergistic effects with health and gender equality. Empowering women to plan and space their pregnancies as they wish increases women's opportunities for education, employment and political engagement, and resilience, in turn contributing to prospects for a green and fair economy.

6.4

Rapid population growth is associated with high levels of poverty and low levels of human development. In countries with low levels of economic development it places pressure on national resources and public services, reducing governments' capacity to meet the basic needs of their citizens and undermining development.<sup>14</sup> By the end of the century the population of the countries in the world with the highest fertility rates (concentrated in the poorest countries) is set to triple.<sup>4</sup> Without urgent investment in SRHR programmes, including voluntary family planning, this rate of growth will outpace poverty alleviation and undermine other sustainable goals, at the same time as reducing the capacity of governments to undertake initiatives aimed at making a transition to a green and fair economy.

6.5

Due to the links between high rates of population growth and poverty, achieving demographic transition in developing countries has been recognised as an "urgent goal" for Rio+20.<sup>7</sup> We fully support this goal, which offers considerable opportunities to advance the social goals of sustainable development. These include poverty alleviation, health, education and empowerment of women, and other issues of social inequality which must be addressed for a successful transition to a green and fair economy which offers development prospects for all. But we urge that it will not be achieved without advancing SRHR and ensuring that voluntary family planning services are available to all. We also emphasize that while the increased number of young people entering productive years that results from demographic transition offers opportunities to drive growth and development, if this potential is to be realized governments must increase investments in basic services, including health and education, and other means for empowering youth.

6.6

Demographic transition is also an urgent sustainable development goal because of the environmental limits humanity faces, at the same time as seeking to promote prosperity for all human beings now and in the future. Taking population dynamics into account will help to focus the sustainable development agenda on planning for the composition, distribution and movement of the population in the long-term, which in turn shapes areas vital to the green economy, including food security, employment, health, social protection and environmental protection.<sup>15</sup>

i Analysis based on Population Action International's *Mapping Population and Climate Change* website: [http://www.populationaction.org/Publications/Interactive\\_Databases/climate\\_map.shtml](http://www.populationaction.org/Publications/Interactive_Databases/climate_map.shtml). "Low resilience countries" are those in the lower two quartiles of the Vulnerability-Resilience Indicators Model. "High population growth" is defined as above the median population growth rate of 1.33%. "High projected decline in agricultural production" are those where the projected declines in relative terms are above the median of all countries expected to experience decline between 1990 and 2020.

1.

## Conclusion: Advancing sustainability through sexual and reproductive health and rights

7.1

In this submission we have outlined the many reasons why advancing SRHR is essential for achieving sustainable development and the need for a focus upon population dynamics if the effectiveness of other sustainable development initiatives is not to be undermined. In conclusion we wish to bring to the attention of the international community the substantial opportunities that exist to advance a wide-range of sustainable development goals, by meeting the need for sexual and reproductive health programmes that respect and protect human rights; a proven and highly cost-effective development intervention.

7.2

Worldwide there is a vast unmet need for contraception in developing countries, meaning that real opportunities do exist to reduce world population growth, by reducing unplanned pregnancies. As discussed, 215 million women in developing countries have an unmet need for contraception, meaning they are at risk of an unwanted pregnancy, say they do not want to have a child in the next two years, but are not using contraception, often because they do not have access to reproductive health services.<sup>6</sup> Women who have an unmet need for effective contraception account for 82 per cent of all unintended pregnancies in developing countries.<sup>16</sup> At the same time as demand for contraception is increasing, donor investment in family planning is decreasing, despite international commitments made to achieving universal reproductive health as part of the ICPD PoA and MDGs.<sup>6</sup>

7.3

Meeting the unmet need for family planning in developing countries while simultaneously fulfilling unmet need for maternal and newborn services would require an estimated doubling of current global investments. This investment would deliver dramatic achievements for maternal and infant health: averting an estimated half of all newborn deaths and two-thirds of all maternal deaths in developing countries. Furthermore it would support considerable progress towards other development goals, averting two-thirds of all unwanted pregnancies and easing population pressures.<sup>6</sup> Cost-benefit analysis shows just how cost-effective investing in family planning is. For every dollar spent in family planning, between 2 and 6 U.S. dollars can be saved in interventions aimed at achieving other development goals, including education, maternal and child health, HIV/AIDs and environmental sustainability.<sup>17</sup>

8.

## Recommendations

8.1

Global population dynamics can and must be addressed in ways that respect and protect human rights.

8.2

Population dynamics, including population growth, density, urbanization, migration and ageing, must be integrated into development strategies and environmental planning, with systematic use of population data and projections.

8.3

Rights-based sexual and reproductive health programmes, including family planning services, should be recognized as essential components of new global initiatives to increase resources for sustainable development and adaptation to climate change.

8.4

Rights-based sexual and reproductive health programmes, including family planning services, should be recognized as legitimate components of national climate change adaptation programmes and funding mechanisms, to increase the resilience of the communities most vulnerable to climate change.

8.5

Renewed commitment and greater investment is necessary to achieve the International Conference on Population and Development Programme of Action and the Millennium Development Goals.

8.6

Recognizing the links between population dynamics and sustainable development, governments should ensure universal access to sexual and reproductive health, including family planning, empowerment of women, and investment in education, particularly of disadvantaged children and youth, and girls and young women, with programmes that respect and protect human rights.

9.

## Response to additional questions

9.1

*General content question a): Expectations for the outcome of Rio+20 and the Outcome document*

Rio+20 presents a critical opportunity for international leaders to agree and commit to urgent action required to promote a new, sustainable model of development which reflects environmental limits and seeks to deliver prosperity for all. We wish to see international agreement on a politically-binding outcome document that commits governments to wide-ranging actions aimed at strengthening each of the three pillars of sustainable development, ensuring that the social pillar is not neglected, and that human rights including sexual and reproductive health and rights are at the centre of sustainable development initiatives.

9.2

*General content question b): Comments on existing proposals, including a green economy roadmap and sustainable development goals (SDGs).*

Regarding the proposals for SDGs, we believe it is important that there is a greater focus upon environmental and sustainability issues by the international development agenda, and one which reflects the responsibilities of the global North to address unsustainable and inequitable patterns of consumption. At the same time the important focus on poverty reduction must not be lost, and for this reason we recommend that the MDGs are encompassed within the SDGs or any other possible post-2015 international development framework. For the reasons outlined in this submission, achieving MDG 5 on reproductive health must be considered central to the achievement of sustainable development. We support the recommendation of the Civil Society Declaration of the 64th Annual UN DPI/ NGO that an SDG on health includes "achieving universal access to health care and services, and wherever feasible free at the point of use for women and children, and including sexual and reproductive health."<sup>8</sup> Furthermore, in 2014 the original deadline for implementation of the ICPD Programme of Action will be reached, which provides a more detailed framework for achieving universal SRHR, and one which acknowledges that its realization is critical for sustainable development. Reflecting the importance of achieving the ICPD PoA, its timeframe has already been extended by the UN,<sup>18</sup> and we recommend that the goals it sets are also encompassed with the SDGs. Please refer to section 6, particularly para. 6.2 for views on the green economy.

9.3

*General content question c and d): Implementation and Cooperation Mechanisms*

We endorse the calls in the Civil Society Declaration of the 64th Annual UN DPI/ NGO, for full engagement and involvement of all stakeholders, and with particular attention to the views and participation of civil society in the global South, including girls, women, young people and other marginalised social groups.<sup>8</sup> This includes preparation for the summit, involvement in the summit and full participation in implementation of the agreed outcomes and sustainable development governance.

9.4

*Specific elements question a): Sectoral priorities and initiatives*

Our overall submission focuses on the sectoral priority of population dynamics and SRHR, and one which as a cross-cutting issue offers important scope for integration of the three pillars of sustainable development.

9.5

*Specific elements question b): Green economy*

Please refer to section 6.

9.6

*Specific elements question c): Institutional Framework for Sustainable Development*

Please refer to section 6 in particular for proposals to strengthen the social pillar, and throughout this submission we have focused on the synergistic benefits of a focus on population dynamics and SRHR across each of the three pillars of sustainable development.

9.7

*Specific elements question d): Refinement of the two themes*

We urge that sufficient space is awarded at Rio+20 for population dynamics and sexual and reproductive health and rights as a thematic issue and a cross cutting theme, within the focus upon a green economy in the context of sustainable development and poverty eradication.

## Population Matters (UK)

### Population Growth: the Neglected 'Green' Issue

## A Text for Rio+20

*"Population stabilization should be a priority for sustainable development": Kofi Annan, former UN SecretaryGeneral. (Key Recommendation of GHF 2009).*

*"Either we reduce our numbers voluntarily, or nature will do it for us brutally": Maurice Strong, SecretaryGeneral first Earth Summit, Rio, 1992.*

*"It's no reducing your footprint if you keep increasing the number of feet": popular saying.*

use

**1. Population Growth as a Multiplier of all Other Environmental Problems:** Each additional person: needs **more food, water, energy**, land, timber and minerals; and produces more waste, CO2 and pollution; the rich consuming and polluting more than the poor. Thus rising populations: increase soil exhaustion, erosion, desertification, habitat destruction, deforestation, aquifer depletion, CO2 emissions, sea level rise, climate change and chemical pollution; and reduce the finite and dwindling natural resources available per person, increasing long term **poverty**. Thus all environmental, and most economic problems become harder, and ultimately impossible, to solve with ever more people. **Population stabilisation is a necessary, but not sufficient, condition for sustainability.**

2

**. The 'Sustainable Development Goal':** Impact (on the environment) = Population x Affluence (resource consumption) x Technology – the 'IPAT function. Thus long-term biophysical sustainability requires: improved technology, giving greater **resource efficiency**; and reduced resource-consumption by the rich; and stable or reducing populations. Smaller populations can sustainably consume more resources per person than larger ones, while remaining within the biophysical limits of a finite planet; and indefinite growth being physically impossible, it is certain that population growth will end in any case at some point. This can only happen: either (preferably) sooner by fewer births; or later by more deaths, overwhelming any attempt at a '**Green Economy**'.

**3. Population Growth as a Variable, not a 'Given':** As the global population passes 7 billion in 2011, its growth (at 80 million per year, 10,000 per hour) is clearly **a driver of all the new and emerging challenges**. The UN now project the population for 2050 between 8.1 and 10.6 billion – a range of 2.5 billion, or the Earth's entire population in 1950. Clearly sustainable prosperity will be far easier to achieve, the nearer to 8.1 bn the population stabilizes. This will need priority, and resources: in developing countries for non-coercive family planning and women's education and empowerment programmes; in developed countries for public information programmes/incentives, aiming to balance reproductive rights with social and environmental responsibilities to current and future generations.

pe

**4. Resources for Family Planning:** There are currently 215 million women (and rising) with an unmet need for family planning (FP). Total world aid for FP is only 10% of the Goldman Sachs bonus pot – a derisory figure. EU aid for FP is 0.4% of total EU aid. Priority for FP is low, partly because the 'population' problem has in recent years been marginalised as one largely of sexual and reproductive health and women's rights; whereas in reality it affects the long-term prospects of success for all programmes across all Departments. Some 40% of all pregnancies world-wide remain unintended. The cost of meeting the unmet need for FP, some \$6.7 bn per year, is less than Americans spend on Halloween.

ry

**5. Action at Rio+20 a draft Text:** Ignoring the population multiplier guarantees ultimate failure for all sustainable development initiatives, since ever-rising populations will overwhelm any . To address this, the following draft text for Rio is proposed:

d

development gains [The Conference]

**Recognises: that all population growth, especially in developed countries, increases impacts on the environment, and reduces the natural resources available per person; that population stabilization in all countries is therefore a necessary condition of biophysical sustainability; that prospects for sustainable development will thus improve, the sooner population can be stabilized within ecologically sustainable limits; and that this can best be achieved by noncoercive population stabilization/reduction policies in all countries, comprising the provision of family planning and women's education and empowerment programmes to meet all unmet need for contraception, and the promotion of a cultural shift in favour of smaller families;**

**Calls on:**

**All Governments to give priority to the introduction, promotion and resourcing of such programmes;**

**All Governments to implement a programme of assessment and evaluation, both of their resources relevant to the wellbeing of their people, and of the impact of population growth on it;**

**se programmes.**

**• Donor countries to give priority to support of th**

Programme for South-South Cooperation between Benin, Bhutan and Costa Rica

Programme for South-South Cooperation between Benin, Bhutan, Costa Rica.

In the framework of the UN Conference on Environment and Development (1992) in Rio de Janeiro, Benin, Bhutan and Costa Rica separately entered into bilateral Sustainable Development Agreements (SDA) with the Kingdom of Netherlands being formalized in 1994. The Programme for South-South Cooperation between Benin, Bhutan, Costa Rica and the Kingdom of the Netherlands (henceforth PSC) grew out of those Bilateral Sustainable Development Agreements, in 2002, at the Rio+10, World Summit for Sustainable Development (Johannesburg). In the framework of this decision however, Benin, Bhutan and Costa Rica realized the enormous potential for South-South cooperation and sustainable development that their past collaborations presented. In 2005, based on the priorities agreed in Johannesburg and the Millennium Development Goals, Costa Rica, Benin and Bhutan came under the umbrella of South-South Cooperation, with a US\$13.2 million grant from the Kingdom of Netherlands. PSC was adopted into the foreign policy and national plans of each partner country by the respective High Level representatives. This set the stage for each government to incorporate SSC into their international relations agendas. In Bhutan this agenda was included in the 5-year Development Plan, Benin adopted it into its national policy and Costa Rica incorporated SSC into its National Development Plan and state policy in 2007. Aiming to convert ideas exposed in the Strategic Partnership Agreements and the Millennium Development Goals into concrete results, the four countries attended a multi-stakeholder workshop, a reunion where priorities, common challenges, and opportunities for collaboration were identified. Specifically, PSC identified four development goals that it would work towards.

- 1) Develop reciprocal projects on the ground that will generate knowledge and empower stakeholders. The results of these projects would be used as inputs for sector strategies and policy making.
- 2) Mobilize national governments, the civil society, and the academic and private sectors in partner countries to renew and reinforce commitment to sustainable development.
- 3) Contribute to sustainable development and poverty reduction in partner countries, taking into account environmental, economic and cultural idiosyncrasies.
- 4) Explore the potential of South-South partnership to promote international commitments and mutual cooperation for sustainable development and experiment with a new North – South – South model of development cooperation.

These goals were set around four thematic areas which included: 1) sustainable tourism, 2) sustainable production and consumption chains, 3) conservation and sustainable use of biodiversity, 4) access to sustainable energy and efficient energy use. Gender equity and women empowerment was a cross-cutting theme emphasized in all PSC projects. The PSC was meant to execute reciprocal projects of common interest between 2007 and 2011.

*PSC ensures sustainability:*

PSC recognized that the participation of private sector, local and community organizations ensures projects continuation in the medium and long run, by creating a strong sense of ownership among the stakeholders. In order to be eligible for PSC funding, the projects had to establish their sustainability in three ways:

- **Organizational:** each project described the organizational structure in place when the contractual relationship (between the PSC and the organization) would end. Roles and responsibilities, and the authority and control that will be exercised over the operations in each participating country were clarified at the onset.
- **Economic:** each project was expected to develop mechanisms that allowed actions to continue once the funding from PSC ended. These mechanisms included the development of new commercial products and services, income generation, new jobs options, improvement of efficiency in micro enterprises, development of new microenterprises.
- **Environmental:** each of the projects intended to efficiently manage water resources, energy, solid and liquid

waste, and CO2 emissions during project implementation." PSC catalyses the transition to sustainability by supporting innovation in policies, seeding initiatives, replicating successes, establishing new partnerships with civil society organizations between the partner countries, and disseminating information.

**Impressive Results** The value of allowing the Southern partners take ownership is reflected in the impressive results achieved by PSC to date. Only 5 years in running, and with a relatively small fund, PSC has involved over 180 organizations to achieve the following results:

- 26.706 direct beneficiaries
- More than 2500 new jobs
- 374 new microenterprise
- 1.280 people participating in productive activities
- 1.227 people that are working in a productive activity related to the training
- 477 communities benefited
- 1.533 indigenous people trained
- 673 new products and 179 new services developed.
- 1160 women involved in decision making
- Microenterprises generated \$250.000, 00 of incomes on 2010, by the sales of products and services made by

the project. The results obtained by each of the projects over-achieved the indicators that were planned since the beginning of the programme. PSC has incredible results on agricultural production, sustainable and efficient production schemes, green microenterprises and green jobs, products and services; a national and international impact that transferred technologies and knowledge among developing countries, and an important advance to sustainable development efforts and an example of how this kind of partnerships can generate green economies.

Given the commendable results that PSC has achieved over the years, efforts are currently underway to find a new source of funding showcasing PSC as a successful model of cooperation that can be easily replicated and improved with the participation of more partner countries of the South, PSC evolved into Partners for South-South Cooperation (PSSC), with the intention of including new partner countries.

***PSC partnership, a replicable and scaling up model:***

One of the most attractive features of PSC has been its transferability and sustainability. The ease and success of these adaptations can be attributed to the simple but ingenious methodology of PSC, that allows efficient standardized training and technology transfer, while remaining flexible and responsive to varied contexts. It is reflected in the verifiably positive impact that it has had on the stakeholders at both the local and national level on the three countries.

A recent UNDP report on scaling up MDGs argues that local actors play a pivotal role in achieving MDGs. These local actors include the government, local communities, the

private sector and the civil society (UNDP, 2010). National and local leadership efforts are wasted if the stakeholders of these initiatives do not develop a sense of ownership. Without

this sense of local and national ownership among the different stakeholders, the actors involved will not put in an effort into the Project. The sense of ownership on the micro level can best be illustrated through the experience of the PSC, it is a good example of how local and national partnerships work together to achieve success.

The government continues to pass legislation, fund and implement initiatives, make declarations and set national goals to ensure persistence in conservation. The PSC is a good example of how local leadership can make an impact at the national level and international level. As a local action, had the advantage of knowing precisely the gaps in environmental context, it also had an easier time entering the communities, something that is always a problem for outside North-South partnership.

However, neither the scale up of each of the 36 projects, nor the successful implementation of sustainable development policies, would have been possible without the support created by the comprehensive institutional structures. PSC illustrates the importance of national institutions to environmental protection. Ownership at the micro-level feeds ownership at the macro-level where the government takes responsibility for sustainability. It's important to outline that government has taken on the onus of the overall management of sustainability efforts. Inspired by and working together with international actors, the government should create a comprehensive framework of policy, institutions and incentives that both support local ideas and promote national and international efforts.

***PSC a successful partnership seeks for international support.***

SSC is an innovative approach to development, an approach promoting effective development by learning and sharing knowledge, best practices, resources and technical know-how among developing countries (reciprocal learning). PSC were expected to generate results that would empower local communities but also provide inputs for national policies. In areas where grassroots initiatives were already well developed, PSC hoped to start second phase projects that would form the bridge between the micro and macro level implementation. PSC was aiming to initiate grassroots and micro-level projects the results of which would inform multi-stakeholder policy dialogue in the three partner countries. PSC projects were also expected to facilitate policy dialogue between the private and public sectors. PSC would also streamline and systematize knowledge transfer and best practices generated by the projects to allow for ease of transfer to beneficiaries within and outside of the projects.

The success formula of PSC was independence from donors, emphasis on real reciprocity and equality between members. Through PSC the three countries have come together sharing skills and knowledge on agriculture, environmental issues, efficient use of energy and much more. The reciprocal knowledge exchange and mutual learning had strengthened sectors such as academic, governmental, non-governmental organizations, private and civil society, and at the same time had increased cost effectiveness, promotes transfer of appropriate technologies and ensures local ownership, leadership and capacity building. This experience has shown that south-south countries can learn best practices from each other, by working closely together countries were able to tap into the diverse knowledge of each partner. The contributions of the 36 projects, to more than 25.000 beneficiaries in the three countries, have been not only financial but also technical, including services (training, technical assistance, information and business development services), market access, technology transfer, research and others. This was possible by adapting to the national reality of each of the partners, the knowledge and the techniques exchanged.

With the PSC experience and the ideal of "Thinking globally, acting locally" the program introduces a new perspective on cooperation, and invites development countries to establish strategic partnerships that allow them a unique development process to face similar needs, interests and challenges by supporting South-South Cooperation. As it was mentioned, one of the main lessons learned through PSC is that the exchange of experiences between countries allows and improves the

capacity building of all the participating partners. The exchange of knowledge, technologies and culture represents a new way to achieve sustainable development.

So in accordance to this experience, developing-country partners can support this process by:

- Increasing the scale of engagement, by enhancing technology transfer and learning, enact effective financial and political compromise to developing partners programs and initiatives. It's also important to encourage reciprocal actions (SSC) that focuses on relevant topics like:
  - Environmental protection through the sustainable use of biodiversity and the efficient use of energy.
  - Establishment of gender equity as a cross-cutting theme on every action.
  - Development of productive initiatives in order to generate employments and increase incomes (reduce poverty).
  - Enhancing people's access to sufficient food through organic agricultural production and commercialization.
  - Climate change as a result of implementation of low-cost effective technologies, organic production, etc. among many other themes for sustainable development.
- Cooperation through the implementation and support of partnerships as an essential model to eradicate poverty (an indispensable requirement for sustainable development).
- To give special priority to ALL developing countries, as the most vulnerable actors. Adaptation and mitigation actions that seeks for environmental improvement and development of all developing countries.

Additionally, the triangular cooperation like the one developed on the PSC Program (between the Kingdom of Netherlands, Benin, Bhutan and Costa Rica) demonstrates how countries from the South with the economical help of the North can co-operate in a spirit of "global partnership", were everyone is aware of their responsibilities and take part of a common action to improve the quality of life of the people. The North, representative by development countries and international organization, has a vital role to play in SSC provided this role permits the South partners the autonomy needed to carve out their own paths towards development. It is important to support through South-South Cooperation a more cost effective type of cooperation, since developing partner countries have similar societies, economies values and visions when compared with northern partners.

From the other hand, it's also valuable the support of international organizations, as mechanism that support South-South Cooperation mainly through programs, networks, and information systems that promote cooperation among developing countries.

***PSC partnership important lessons for Rio+20 and: future SSC activity:***

- **South-South Cooperation can and has produced very impressive results** despite possible skepticism surrounding the idea. At the start of PSC many were worried that the overhead and management of a program between three vastly different Southern nations would be too complicated for a successful development initiative. 3 years and more than 26.000 direct beneficiaries later, the PSC results speak for themselves. The program has indisputably shown that once momentum is gathered, the running of SSC is neither complicated, nor expensive.
- **PSC can generate green economies** through the implementation of a model that look to transfer technologies and knowledge among developing countries, and the

promotion of social development by agricultural production, sustainable and efficient production schemes, green microenterprises and green jobs, products and services

• **Language, culture, religion and geography are not barriers to cooperation.** Although language and culture may establish a first start problem, these problems were long forgotten. If anything, experiences from PSC projects have showed that language ceases to be an issue at the grassroots level where beneficiaries learn through

hands on experience. All interviewees were eager to learn about the culture of their partners and most project involved cultural learning along with technology and skill transfers.

• **Permitting greater autonomy and responsibility among the Southern partners leads to a strong sense of ownership and accountability and hence more efficient results.** Traditional North-South relationships had engendered an expectation of the beneficiaries that the North will always give them money as a "gift". So when the funding ran out, projects would stop because the beneficiaries were expecting the donor to give them more money and to tell them what to do with it. The PSC has done a lot to change this attitude. PSC has shown that when the providing partner is willing to allow the receiving partners make their own decisions, the receiving partners take on responsibility for the project's success, by creating a sense of ownership; SSC has made the Southern partners a lot more active in their projects. PSC went from one partner only giving and the other partner only taking to a relationship of give-and-take. They become accountable not only to their constituencies and to the provider, but also to each other.

• **Technology and knowledge transfer is most efficient when counterparts identify with each other.** Being able to see firsthand the success of other farmers or producers using the same techniques that they were teaching proved to be a lot more convincing for beneficiaries than any set of empirical evidence would.

• **South-South Cooperation has to be based on reciprocity, equality, and participation in order to succeed.**

The absence of any one of these pillar would distort the SSC, hampering the comfortable and conducive environment that allows partners to freely express their views. This ensures that all partners are on the same page and everyone ones that they have the right to complain if they feel that one of these principles is violated.

• **International actors and pressures can play a role in conservation** but only as motivators for national actions. Many important conservation efforts were initiated and the indispensability of international funding cannot be denied, but these efforts would have been wasted had they not been matched by national creativity, local enthusiasm and hard work. This sort of interaction between international and national actors is noted on PSC.

• **SSC will not replace North-South Cooperation.** PSC's North-South-South collaboration shows that development will only be possible if both the North and the South come together under a respectful and reciprocal partnership that makes the best of each other's comparative advantages and allows each partner to put in the greatest effort. Each partner has a lot to learn from the other and achieving development goals without help from the North would be impossible.

•

**Developed and developing countries lacks of sufficient high-level political support to carry on international climate change commitments.** PSC's experience provide the impetus, results and necessary lessons for the introduction of a new model of development cooperation, based on mutual respect, reciprocity, participation and the willingness to teach and be taught, to improved path towards achieving global development goals. This made possible the effective implementation of PSC on the development of each of the 36 reciprocal projects. **Developed countries play a key role as a financial support of SSC;** this kind of cooperation and results are possible with the financial support of North countries.

## Programme for the Endorsement of Forest Certification (PEFC) International

Contribution by PEFC to the Outcomes of the Rio+20 Conferences

PEFC, the Programme for the Endorsement of Forest Certification and world's largest forest certification, recalls the 2011 UNEP "Forests in a Green Economy" report.

"Forests are a critical link in the transition to a green economy – one that promotes sustainable development and poverty eradication as we move towards a low-carbon and more equitable future," writes Achim Steiner, UNEP Executive Director. "Biologically-rich forest ecosystems provide shelter, food, jobs, water, medicine and security to more than 1 billion people, as well as regulate our global climate."

Mr. Steiner emphasizes that "[w]hile we have a suite of proven sustainable forestry practices and policies that work, they must now be scaled up and enforced to safeguard these natural assets."

PEFC supports these important messages.

Over the past 20 years, forest certification has become one of the most important tools for global society to promote sustainable forest management. Yet despite major strides in certification, only nine percent of the world's forests have been certified and ninety percent of these are in Europe and North America. Similarly, despite some progress in alleviating poverty around the world, population growth means that in real terms the number of people living below the poverty line remains high – poverty is a major reason for deforestation and illegal logging. This situation is further complicated in rapidly emerging economies where land tenure rights have to date been ill-defined or may be weak and evolving.

Forest certification system such as PEFC are an important mechanism that offer potential to contribute to improving livelihoods, particularly in developing countries, and to assist in lifting people out of poverty. Forest certification is also important in assisting us in moving towards the Aichi Biodiversity Targets, including that by that by 2020, forests are managed sustainably and forest loss is halved. This, however, requires us to mainstream forest certification throughout the world and especially in the Global South. To achieve this, all forest certification systems and stakeholders must seek to ensure that our efforts to expand forest certification are additive and not duplicative, contributing to an expansion of the overall total certified forest area. In a world where deforestation continues unabated in many nations, stakeholder must collaborate whenever possible. While PEFC – the Programme for the Endorsement of Forest Certification – is the larger of the two global forest certification systems, we must utilize the different approaches offered for the best of society as a whole. We must agree on a common framework to guide forest certification and its stakeholders in their actions.

The Rio Forest Certification Declaration ([www.rfcd.org](http://www.rfcd.org)), supported by PEFC, the world's largest forest certification system and by hundreds of people who have signed the Declaration online, represents such a common framework. PEFC calls for the inclusion of the "Rio Forest Certification Declaration" in the outcomes of the Rio+20 conference.

## The Rio Forest Certification Declaration

### Preamble

The challenge of safeguarding the environmental, social and economic benefits that the world's forests provide is critical for life on Earth. It requires a world in which people manage forests sustainably, a world that recognizes the integral and interdependent nature of our planet, a world that acknowledges and values the significance of rural communities, indigenous peoples, and families that depend on forests for their livelihoods.

### Principle 1: Human beings are at the centre of sustainable forest management

Public and private policies designed to promote sustainable forest management can only succeed if they enhance the quality of life of people who live in and/or depend upon forests.

Application: Forest certification systems and all stakeholders must act to protect and promote forest-dependent populations, local communities, smallholder forest owners, workers, family foresters, women, youth and children, and indigenous peoples all of whom are entitled to a healthy and productive life in harmony with the forests on which they depend.

### Principle 2: Recognize and respect national sovereignty in the design and implementation of sustainable forest management policies and standards

In accordance with the Charter of the United Nations, the Rio Forest Principles, and the principles of international law, all states have both the sovereign right and obligation to develop their own sustainable forest management objectives. States must act to ensure that activities within their jurisdiction or control do not cause environmental, social, or economic damage to areas and people beyond the limits of their national jurisdiction or violate international protocols and conventions.

Application: Forest certification systems, forest stakeholders, especially Major Groups and OECD countries, must respect each nation's chosen path to promote sustainable development, the Millennium Development Goals, and sustainably managed forests in their actions, policies and guidelines.

### Principle 3: Protect the complexity of forest ecosystems, forest-dependent economies, and rural culture by adopting integrated forest management plans and policies

In order to promote sustainable forest management, forest certification standards, national forest policy, and private and public procurement guidelines must meet the needs of present and future generations by promoting economically viable, ecologically sound, and socially just outcomes based on the national and/or local context.

Application: Forest certification standards, public policy and procurement guidelines must integrate competing demands in order to meet the needs of all stakeholders to deliver balanced socially, economically and environmentally sustainable solutions.

### Principle 4: Contribute to poverty reduction through empowerment of the poor

Peace, social justice, global economic equity, and environmental protection are interdependent and indivisible. Poverty reduction is an indispensable requirement for sustainable forest management; it is an integral part of the development process and cannot be considered in isolation from it. The linkage between deforestation and poverty is strong, compelling, and in need of specific attention. Measures diminishing forest resources to increase agricultural resources to contribute to food security must directly contribute to the sustainable livelihoods of those affected.

Application: Forest certification systems, Major Groups and governments may contribute to mitigate deforestation and promote afforestation within their boundaries and jurisdictions and seek to safeguard forest resources. Standards and policies must promote the efficient use of forest resources, good forest management, and provide for increased wealth retention in rural communities through partnerships with smallholders, community-owned forests, and indigenous peoples' organizations, in addition to maximizing formal employment opportunities.

### Principle 5: Open and accessible stakeholder processes are essential

Sustainable forest management is best achieved through the empowerment of all stakeholders in open and accessible processes. Special outreach must occur for those groups lacking a tradition of involvement or lacking the resources required.

Application: Forest certification governance systems, private and public procurement entities, and standards development processes must seek to ensure the involvement of Major Groups and governments in a multistakeholder, consensus-driven process, respecting the right to self-identification and self-determination while avoiding governance systems and decision-making processes designed to restrict the voice or participation of any stakeholder.

### Principle 6: Transparency, inclusiveness, and collaboration are fundamental prerequisites for global sustainability

Expanding sustainable forest management to all of the world's forest requires cooperative and transparent processes among all stakeholders and governments. Promoting division, competition, and exclusivity among and between different approaches to sustainable forest management wastes limited resources, encroaches on stakeholder-driven processes, diverts attention from areas where deforestation and unsustainable forest management are still common practices, and fails to expand the total volume of global well-managed forest area.

Application: Certification schemes, procurement guidelines, and those seeking to protect forests must promote standards, policies, and practices, which are inclusive and recognize the superiority of all types of sustainably managed forests and certification systems as a tool to promote sustainable development.

### Principle 7: Utilize the benefits of renewable and climate-smart forest-based products

Sustainable forest management must adapt to complex societal challenges such as climate change, population growth and increasing resource shortages caused by unsustainable patterns of production and consumption, especially those that are high-carbon emitting. Recognizing the unique attributes of forest products from sustainably managed forests both in terms of carbon sequestration, other ecosystem services, and development values is critical for public and private policy makers, including climate policy negotiators. Application: Forest certification systems, governments, and procurement entities must recognize and use all tools available to support forests to adapt and thrive with these challenges including adaptive silvicultural practices, promotion of recycled and forest-based products for their unique attributes in terms of carbon sequestration, other ecosystem services, and development values.

### Principle 8: Rely on science, local experience, and traditional forest-related knowledge to advance sustainable forest management

Sustainable forest management will be most successful when it is based on scientific, local experience and traditional forest knowledge, as well as international protocols and

processes. Improving scientific understanding through exchanges of scientific, local and traditional forest-related and technological knowledge, and the development, adaptation, diffusion and transfer of technologies, is critical to the delivery of a balanced approach to sustainable forest management. Indigenous peoples have a vital role in sustainable forest management because of their knowledge and traditional practices.

Application: Forest certification systems, governments and procurement entities must develop standards based on the best available science, local and traditional knowledge and be structured such that developing countries, communities and small forest landowners have a clear path to meet the forest management standards. These approaches must be independently verifiable, using guidelines and requirements in compliance with internationally respected organizations such as ISO. Conflicts of interests between governmental procurement entities, standard-setting bodies, certification organizations, accreditation bodies, and auditors must be handled accordingly in order to provide legitimacy to the process.

Principle 9: Use a precautionary approach to prevent irreversible damage

In order to best safeguard forest resources, precautionary approaches must be widely applied by all stakeholders where there are imminent threats of serious or irreversible damage. Application: Forest certification systems, governments, and procurement entities must strive for continuous improvement while remaining aware of the consequences of their programmes and standards for all stakeholders.

Principle 10: Promoting global acceptance of sustainable forest management through voluntary programmes and education is the fastest path to healthy forests and vibrant rural communities Achieving sustainable forest management is a major challenge in many parts of the world. Voluntary forest certification and private and public procurement policies are important tools to protect forests and forestdependent populations.

Application: Forest certification systems, Major Groups and governments have an obligation to make available and use, for the advancement of sustainable forest management, their respective areas of expertise, influence and power. Policies, standards and tactics that negatively affect forest-dependent people, deny markets to sustainably managed forests, and create development obstacles, lead to inefficiencies in the allocation of resources, and are a barrier to advancing sustainable forest management globally and locally

---

## Progressio

Progressio Submission to the UNCSD Rio+20 Conference Zero Draft Compilation Document

1 November 2011

Executive summary

Progressio recognises the importance of Rio+20 for reigniting progress towards sustainable development, in the context of increased environmental degradation, competition over scarce resources and climate change.

Rio+20 should not be seen as the end of a journey, but a catalyst to start off new initiatives and processes that builds on outcomes of previous 'Earth Summits', coupled with new awareness, learning and knowledge. Given the particular impact of environmental stress on poor people and communities, a clear poverty and equity focus must be at the heart of Rio+20.

Water should be a key focus area under the Rio+20 process, as a fundamental resource that underpins both life and livelihoods and therefore represents an essential part of sustainable development. This should build on experiences, knowledge and outcomes from previous 'Earth Summits', as well as other relevant processes and new research, including the impacts of climate change on the water cycle.

A Green Economy cannot function without water. Water is not a 'sector', and its cross cutting nature makes it a fundamental part of many important aspects of a Green Economy, such as agriculture and energy. Green Economy policies therefore need to include recognition of water to ensure water related impacts are fully acknowledged and accounted for, in particular where usage can have direct or indirect impacts on other sectors or users.

Water insecurity and scarcity affects a large proportion of the world's population, with a particular impact on the world's poorest people, who are often put at further disadvantage where there is competition over water resources. A core focus on sustainable and equitable water resources management is therefore essential, with clear poverty and equity objectives, and active involvement of key stakeholders.

A strong gender approach must also be included. Women are generally the main water managers on a household level in developing countries, both for consumptive and productive use, and their knowledge and participation should be acknowledged, and they should be provided with adequate support according to their needs.

### 1. Introduction

Progressio welcomes the opportunity to submit our views to the UNCSD Rio+20 Zero Draft process. Progressio aims in this submission to draw particular attention to the significance of water as an urgent issue for Rio+20, including its vital role for sustainable development and poverty eradication.

#### 1.1 About Progressio

Progressio is an international development charity that enables poor communities to solve their own problems through support from skilled workers. We work in partnership with civil society organisations in 11 countries around the world and we also lobby decision-makers to change policies that keep people poor. Our work is guided by three themes: Participation and effective governance, Sustainable environment; and HIV and AIDS. Progressio is the working name of the Catholic Institute for International Relations (CIIR).

#### 1.2 The importance of Rio+20

The UNCSD Rio Earth Summit in 1992 was a landmark event in terms of sustainable development, however, there has been a considerable lack of progress in many areas since, and there is an urgent need to speed up progress, in particular in the light of growing challenges of environmental degradation, competition over scarce resources and climate change. Given the precarious state of our planet, a failure at Rio would come at a high cost. The challenges of natural resource degradation and climate change are not only detrimental for the future of this planet, but also interlinked and fundamental for the global economic system and development challenges, including the achievement of the Millennium Development Goals (MDGs). Progressio believes that the Rio+20 Conference presents a vital opportunity to get progress back on track.

### 2. Expectations of Rio+20

#### 2.1 Outcomes of Rio+20

Rio+20 should not be seen as the end of a journey, but rather as a catalyst to start off new initiatives and processes. It is fundamental that these build on the outcomes and learning from previous Earth Summits, including the Rio Declaration and Agenda 21, coupled with recognition of new challenges and knowledge. Key challenges should be identified and dealt with through concrete measures that are based on principles of long term sustainability and a pro-poor approach.

Viable propositions that deserve further attention and elaboration include the Sustainable Development Goals (SDGs). The SDGs would address the Agenda 21 aims, and could be used as a possible foundation for building international political commitment at Rio, providing measurable 'tangible goals' for the sustainable development debate. The SDGs would apply in all countries, and therefore act as a complementary, successor framework to the MDGs, which end in 2015 and focuses mainly on the Global South. However, the SDGs should not detract from the urgent need for a post-2015 framework that focuses on poverty or from funding for that agenda.

### 3. Water

"Water problems will figure prominently at the forthcoming UN Conference on Sustainable Development in Rio de Janeiro, in 2012 – Rio + 20." UN Secretary General Ban Ki-moon, World Water Day, 22 March 2011

#### 3.1 The water crisis

Only 2.63 per cent of global water is freshwater, which includes a large part that is tied up in snow and ice. Despite this, there is currently no overall global water scarcity, but a number of regions are chronically short of water, and climate change is expected to make this worse. In addition, further complexities surround water scarcity issues. It has been estimated that out of the 2.8 billion people that live in areas facing water scarcity, 1.2 billion live in 'physical water scarcity' and 1.6 billion in 'economic water scarcity', meaning that water access is not limited by supply, but constrained by financial, human or institutional capacity. To solve the water crisis, focus must therefore not just be on managing supply and demand, but also on access constraints in broader terms, such as governance and equity aspects.

Increased attention is being given to the cross cutting nature of water for many different uses and tension around availability and prioritisation, for example, in the so called 'water, food and energy nexus'. To ensure equitable access and environmental sustainability both in the short and long term, an interlinked approach is fundamental, which also needs to include the impacts of climate change, in particular given the predicted severe impact on water resources.

In addition to the basic need of water, food production is particularly important given that 70 per cent of freshwater withdrawals are for agriculture, highlighting direct linkages between water availability and food security concerns. There are also direct linkages to the rural poor, recognising that smallholder farms feed one-third of the world's population. Furthermore, increased reliance on water intensive sources of energy is raising questions around long term sustainability even for many renewable energy sources, a concern that also needs to be recognised within climate change mitigation policies.

Poor people are often hit hardest and despite progress on the MDG 7 target on access to water, almost 900 million people still lack access to safe drinking water and even if the target is met, 672 million will be left without. Women are often particularly affected, since they are often responsible for water management on a household level, both for consumptive and productive use. Furthermore, population increase, changes in consumption and production patterns, environmental degradation, pollution and a number of other factors implicate on water availability. Lack of progress on access to water also often has fallback effects on other MDGs, such as gender equality, hunger, health and education.

#### 3.2 Water and the Rio process

Water is not a new concern within the UN 'Earth Summit' framework. Outcomes of both the 1972, 1992 and 2002 conferences include direct references and recommendations in relation to water, and are complemented by the Millennium Development Goals. Most importantly, Agenda 21: Chapter 18 is dedicated to water 'Protection of the Quality & Supply of Freshwater Resources: Application of Integrated Approaches to the Development, Management & Use of Water Resources'. This comprehensive chapter proposes six programme areas for the freshwater sector:

- (a) Integrated water resources development and management;
- (b) Water resources assessment;
- (c) Protection of water resources, water quality and aquatic ecosystems;
- (d) Drinking-water supply and sanitation;
- (e) Water and sustainable urban development;
- (f) Water for sustainable food production and rural development;
- (g) Impacts of climate change on water resources.

To facilitate implementation, each programme area is divided into Basis for action, Objectives, Activities, Means of implementation, including Financing and cost evaluation, Scientific and technological means, Human resource development, and Capacity-development.

Furthermore, the Johannesburg Plan of Implementation includes several references to water, many with particular reference to the Millennium Development Goals. This includes the launch of a programme of actions, with financial and technical assistance, including actions to 'promote priority action by Governments, with the support of all stakeholders, in water management and capacity-building at the national level and, where appropriate, at the regional level, and promote and provide new and additional financial resources and innovative technologies to implement chapter 18 of Agenda 21' (see Appendix III).

In the Rio+20 context the challenge of access to clean water and sanitation is one of the main concerns, but also water availability more generally, noting that "increased action is imperative". Furthermore, water is being recognised in broader terms than before with a focus on its role as a cross cutting resource, included as an essential part of the 'Green Economy' and the so called 'water, food and energy nexus'. As a consequence suggested solutions have largely moved away from a primary focus on management issues, towards market based approaches, including full cost valuation and pricing, to solve the problems around supply and demand.

### 4. Green Economy and Water

#### 4.1 Rio+20 and the Green Economy

The 'Green Economy in the Context of Sustainable Development and Poverty Eradication' is one of the main focus areas of Rio+20. While the Green Economy has been set in a broader concept of the intersection between environment and economy, to highlight synergies rather than trade-offs, coupled with social issues, no clear definition has been agreed within this context, partly due to some resistance to the concept in itself. UNEP's definition is therefore sometimes used, "A Green Economy is one that results in improved human well-being and social equity, while significantly reducing environmental and ecological scarcities."

Outside of Rio+20, Green Economy is often used more or less interchangeably with Green Growth. OECD has identified Green Growth as “fostering economic growth and development, while ensuring that natural assets continue to provide the resources and environmental services on which our well-being relies”. The most significant difference to UNEP’s definition is the lack of reference to social equity, a key fundamental for achieving sustainable poverty reduction.

Despite a clear definition, the Rio+20 process has identified different green economy policies that indicates a general direction: green stimulus packages; eco-efficiency; greening markets and public procurement; investment in sustainable infrastructure; restoration and enhancement of natural capital; getting prices right; and eco-tax reform. ‘Getting prices right’ is defined as better reflecting environmental externalities in market prices, especially for natural resources. A consultative bottom-up approach is also recommended, with government leadership and multi-stakeholder engagement, with careful design to ensure social equity.

Furthermore, it is acknowledged that there is no simple one-size-fits-all for poverty reduction, and that poverty eradication and enhancement of the livelihoods of the most vulnerable deserve priority in measures promoting a green economy transition. In the long term, a development path limiting environmental impacts would be more conducive to prosperity and poverty alleviation. The poor are generally most affected by trends, such as climate change and environmental degradation and shocks such as food scarcity and shifts of the economy that decrease such risks will benefit the poor. Production and consumption systems that are compatible with sustainable development play a key part in this.

#### 4.2 Water and the Green Economy

The Stockholm Statement to Rio+20 from World Water Week 2011 argues that water is “the bloodstream of the Green Economy”, and recognises the interconnectedness of water, food and energy as a fundamental priority. It also calls for universal access to water and sanitation by 2030, over and above current MDG aspirations.

UNEP’s report ‘Towards a Green Economy’ identifies investment in clean water and sanitation services to the poor as one of the biggest opportunities to speed up the transition to a green economy in many developing countries. Not having access to water is costly, since either large amounts of their disposable income have to be spent on purchasing water from vendors or large amounts of time, in particular from women and children, have to be devoted to carting it. In addition, the cost of water-borne diseases is high. UNEP estimates that under a scenario of an investment of around 0.16 per cent of global GDP per year, water use at the global level could be kept within sustainable limits and the MDG for water could be achieved by 2015.

UNEP argues that a green economy should acknowledge where water is scarce, and manage it carefully, to ensure use is kept within sustainable limits. The role of water in both maintaining biodiversity and ecosystem services should be recognised, valued and paid for, and the use of technologies that encourage efficient forms of recycling and reuse is encouraged. To progress towards the pursuit of green objectives various tools can be used, such as the redesign of governance arrangements, the improved specification of property rights, the adoption of policies that reflect the full costs of use including the costs of adverse impacts on the environment, and through improved regulation. The suggested indicators for tracking progress include the number of people without access to reliable supplies of clean water and sanitation, as well as the volume available per person in a region.

The report recognises that the complex flow of water resources affects its availability and opportunities to manage it. Given the high level of water used by agriculture, one of the biggest challenges is to find a way to significantly increase the productivity of irrigated agriculture, so that water can be transferred to other sectors without adversely affecting the environment or food security. The report argues that gauging the true value of ecosystems, including water, is a key part of the movement towards a green economy, coupled with market-based approaches, as well as consumer driven accreditation and certification schemes. Water entitlement and allocation systems are other options, however, the environment should have rights that are either equal or superior to those of other users of a water resource.

To reduce the cost of a transition to a green economy, the report recommends improvements in governance arrangements, reform of water policies and the development of partnerships with the private sector. Other key recommendations include the phasing out of perverse subsidies and adopting freer trading arrangements, which are believed to bring benefits to many sectors. In terms of water and sanitation, the report remains decisive on the importance of full cost accounting, but inconclusive on ‘how best to charge poor households for access to water and sanitation services’. It concludes that green economies should include commitment to factoring social equity into the transition to arrangements that influence investment and decisions by people and industry, but how this is done largely depends on the context.

#### 4.3 A water and poverty analysis

The lack of a clear definition of a Green Economy within the Rio+20 context presents a potential hazard in that what is considered ‘green’ becomes a very broad concept that primarily responds to short term concerns, without adequate analysis of cross cutting issues or social and environmental impacts in the long term. If not managed carefully this could ultimately lead to negative impacts on sustainable development and poverty reduction, including from a water perspective.

The Green Economy needs to be a fair one, where the social dimension of sustainable development needs to be given greater emphasis, and one that acknowledges key environmental limits and planetary boundaries. It will therefore be essential to comprehensively analyse potential effects on environmental, social and economic levels, both on short and long term, and across sectors and including the impacts of climate change. Core sustainability and equity principles must guide the process, including strong environmental and social safeguards, with a clear focus on cross cutting water related impacts.

As described above, the UNEP report argues that shifting to a green economy usually involves a commitment to begin charging for the full costs of resource use. The main tension is how to include principles on social equity, including how to charge for water and sanitation services, also recognising that this is now a human right. While market based approaches, including a full cost valuation of water, could provide benefits in terms of discouraging over usage, social equity principles are essential to ensure poor communities are not put at considerable disadvantage, in particular in a context of increased environmental degradation, competition over water resources and climate change. Furthermore, while some argue that there is little practical difference between private or public provision of water, attention need to be paid to the private sector’s mandate to maximise profit and implications for poor communities, as this could undermine poor communities’ ability to pay. From another perspective, profit maximisation could also lead to encouragement to consume more.

Progressio, CEPES and Water Witness International’s report ‘Drop by drop: Understanding the impact of the UK’s water footprint through a case study of Peruvian asparagus’ highlights tensions between large scale agribusiness and water for local communities, which can serve as an illustrative example of the importance of recognition of water related impacts and lessons for a Green Economy. The report illustrates a number of far reaching impacts of the growth of agribusiness, largely supported by international investment, including rapid depletion of the aquifer, and with negative fallbacks for poor and marginalised communities in the Ica Valley and beyond, such as lack of water for drinking and for irrigation.

Green Economy policies should avoid moving into a ‘new paradigm’ on water, without proper recognition of lessons learned through other water related processes, in particular in terms of poverty related aspects. Integrated Water Resources Management (IWRM) and other similar approaches, including community and ecosystems based management, have come through as viable strategies from the Rio and other processes. Implementation has been slow, partly due to lack of political will, but it is essential that they still form a key part of the Green Economy process. The important role of poor communities and other key stakeholders need to be recognised, not just as beneficiaries, but as key agents and co-creators of positive change. The Rio Declaration and Agenda put local communities, with particular emphasis on women, as a key component of sustainable development and it is essential that this recognition is also reflected in Green Economy policies.

To avoid negative fallbacks of Green Economy policies, principles of social equity must therefore be included, including principles of development through a human rights framework. Adequate and efficient regulation is also important, as well as ensuring poor people are involved in decision making, to ensure sustainability and that their knowledge and needs are recognised. This should include women, who are often responsible for water management on a domestic level and therefore hold vital information on water availability and access, and therefore must play a key part for any solution to be sustainable. The cultural aspects of water must also be recognised, including the management functions ritual and beliefs can entail, in particular for indigenous groups.

The linkages to other poverty related processes must also be recognised. Sustainable and equitable access to water has impacts on other development related issues, such as gender equality, health, education, food production and work opportunities, all key elements of the MDGs. Furthermore, the potential impact of climate change must be recognised, given that the water cycle will be particularly affected, and could therefore severely undermine any progress if not taken into account. Again, poor people are likely to be hit the hardest.

#### 5. Recommendations

- Rio+20 represents a vital opportunity to reignite progress towards sustainable development that should be seen as a catalyst to start off new initiatives and processes that builds on outcomes of previous 'Earth Summits', coupled with new awareness, learning and knowledge.
- Given the particular impact of environmental stress on poor people and communities, a clear poverty and equity focus must be at the heart of Rio+20, including gender considerations.
- The impacts of climate change must be taken into consideration at all times, both from a mitigation and adaptation perspective.
- Viable propositions that deserve further attention and elaboration include the Sustainable Development Goals (SDGs).
- Water should be a key focus area of Rio+20, as a fundamental resource that underpins both life and livelihoods, that is also cross cutting and impacts on multiple sectors and users. It therefore also represents an essential part of the Green Economy.
- This includes a core focus on sustainable and equitable water resources management, with clear poverty and equity objectives, and active involvement of key stakeholders, including a gender perspective.
- The Green Economy must be a fair one, where the social dimension of sustainable development is given greater emphasis, and one that acknowledges key environmental limits and planetary boundaries.

## Progressio Ireland

### 1. Introduction

There is no doubt as to the importance of the 1992 UNCED Rio Earth Summit. Since the summit, however, there has been a disappointing lack of progress, particularly with respect to the issues of environmental degradation, competition over scarce resources and climate change. This revisit to Rio signifies a major opportunity to attempt to speed up the progress on these areas.

Water has been recognised as essential for sustainable development as highlighted in Agenda 21. However, it very much remains a key concern and this commitment to Agenda 21 needs to be reiterated and strengthened. For Progressio Ireland, water is an area of concentration and expertise. In particular, we look at the issues of fair and sustainable access to water for poor and marginalised communities. In this submission, therefore, Progressio Ireland will draw particular attention to the significance of water as an urgent issue for Rio+20, including its vital role for poverty eradication.

Progressio Ireland is an independent Irish organisation that is part of the Progressio family. The Progressio family works internationally to enable people in developing countries to challenge and change the situations that keep them poor. We work in partnership with civil society organisations in 11 countries around the world and we also work within Ireland and the wider European context to push decision-makers to change policies that support inequality and keep people poor. Our work is guided by two themes: participation and effective governance and sustainable environment.

The summary of the submission is outlined below. Later in the document there is a more detailed explanation around these issues.

### 2. Summary

a. Progressio Ireland recognises the importance of Rio+20 for reigniting progress and commitment to sustainable development on a domestic and global scale, in the context of increased environmental degradation, competition and conflict over scarce resources, and climate change, and urges the secretariat to ensure that these concerns are put at the heart of the agenda.

b. Water should be a key focus area under the Rio+20 process, as a fundamental element that underpins both life and livelihoods, and therefore represents an essential part of sustainable development and human development. This should build on experiences, knowledge and conclusions from previous Earth Summits, as well as other relevant processes and new research, including the impacts of climate change on the water cycle and the importance of water as a development issue.

c. Water insecurity and scarcity affects a large proportion of the world's population, with a particular impact on the world's poorest people. Environmental degradation and competition over water resources is increasing and, furthermore, climate change is expected to have a substantial impact on the hydrological cycle, with follow on effects on people and ecosystems. A clear poverty and equity focus must therefore be at the heart of Rio+20.

d. A Green Economy cannot function without water, as recognised by both UNEP and many water experts, such as in the World Water Week statement on Rio+20. Water is not a 'sector', and its cross cutting nature makes it a fundamental part of many important aspects of a Green Economy, such as agriculture and energy. Green Economy policies therefore need to include recognition of the importance of water to ensure water related impacts are fully acknowledged and accounted for, in particular where usage can have direct or indirect impacts on other sectors.

e. A Green Economy in the context of sustainable development and poverty reduction must be underpinned by principles of social equity, including on water. This includes a core focus on sustainable and equitable water resources management, with clear poverty and equity objectives, and active involvement of key stakeholders.

f. A strong gender approach must also be included. Women are generally the main water managers on a household level in developing countries, both for consumptive and productive use, and their knowledge and participation should be acknowledged, and they should be provided with adequate support according to their needs.

### 3. THE WATER CRISIS

Only 2.63% of global water is freshwater, which includes a large part that is tied up in snow and ice. Despite this, there is currently no overall global water scarcity, but a number of regions are chronically short of water, and climate change is expected to make this worse. It has been estimated that out of the 2.8 billion people that live in areas facing water scarcity, 1.2 billion live in "physical water scarcity" and 1.6 billion in "economic water scarcity", meaning that water access is not limited by supply, but constrained by financial, human or institutional capacity.

Water is a resource that has many uses. Frequently tension arises around the availability and prioritisation of these uses (e.g. the "water, food and energy nexus"). Looking at freshwater supply alone is therefore not sufficient if we aim to ensure sustainable access of water for all, which also caters for other vital needs, such as for food production, energy provision and ecosystems, which also needs to be assessed in terms of impacts of climate change.

In addition to the basic need of water, food production is particularly important given that 70% of freshwater withdrawals are for agricultural purposes, highlighting direct linkages between water availability and food security concerns. There are also direct linkages to the rural poor, recognising that smallholder farms feed one-third of the world's population. Furthermore, increased reliance on water intensive sources of energy is raising questions around long term sustainability even for many renewable energy sources, a concern that also needs to be recognised within climate change mitigation policies and water management policies.

Poor people are often hit hardest and despite progress on the Millennium Development Goal (MDG) 7 on access to water, 900 million people still lack access to safe drinking water. Large private companies in developing countries often monopolise water use, leaving very little access to water for the poorer residents. The UN Human Development Report (2010) also claims that those living in slums in Sub Saharan Africa actually pay more for drinking water than residents in New York or Paris. Women are often particularly affected, since they are often responsible for water management on a household level, both for consumptive and productive use. Furthermore, as the world population reaches 7 billion and continues to increase, changes in consumption and production patterns, environmental degradation, pollution and a number of other factors will have implications for water availability. Lack of progress on access to water also often has fallback effects on other MDGs, such as gender equality, hunger, health and education.

### 4. RIO +20 AND THE GREEN ECONOMY

The 'Green Economy in the Context of Sustainable Development and Poverty Eradication' is one of the main focus areas of Rio+20. The Green Economy has been set in a broader concept of the intersection between environment and economy, to highlight synergies rather than trade-offs, coupled with social issues. However, no clear definition has been agreed within this context, partly due to some resistance to the concept itself. UNEP's definition is therefore sometimes used, "A Green Economy is one that results in improved human well-being and social equity, while significantly reducing environmental and ecological scarcities."

Outside of Rio+20, Green Economy is often used more or less interchangeably with Green Growth. OECD has identified Green Growth as "fostering economic growth and development, while ensuring that natural assets continue to provide the resources and environmental services on which our well-being relies". The most significant difference to UNEP's definition is the lack of reference to social equity, a key fundamental for achieving sustainable poverty reduction.

Despite a clear definition, the Rio+20 process has identified different green economy policies that indicates a general direction: green stimulus packages; eco-efficiency; greening markets and public procurement; investment in sustainable infrastructure; restoration and enhancement of natural capital; getting prices right; and eco-tax reform. "Getting prices right" is defined as better reflecting environmental externalities in market prices, especially for natural resources. A consultative bottom-up approach is also recommended, with government leadership and multi-stakeholder engagement, with careful design to ensure social equity.

Furthermore, it is acknowledged that there is no simple one-size-fits-all for poverty reduction, and that poverty eradication and enhancement of the human rights, living standards and livelihoods of the most vulnerable, deserve priority in measures promoting a green economy transition. In the long term, a development path limiting environmental impacts would be more conducive to prosperity and poverty alleviation, especially now that population growth has highlighted the limits of our planet, and the desperate need for development and growth that is sustainable. The UNHCR (2010) reiterates this, arguing that human development and sustainable development are inseparable. The poor are generally most affected by trends like climate change, environmental degradation and food scarcity, and shifts of the economy that decrease such risks will benefit the poor. Production and consumption systems that are compatible with sustainable development play a key part in this.

### 5. WATER AND THE GREEN ECONOMY

Water is not a new concern within the UN "Earth Summit" framework. Outcomes of both the 1972, 1992 and 2002 conferences include direct references and recommendations in relation to water, and are complemented by the MDGs. Most importantly, Agenda 21: Chapter 18 is dedicated to water- "Protection of the Quality & Supply of Freshwater Resources: Application of Integrated Approaches to the Development, Management & Use of Water Resources". Furthermore, the Johannesburg Plan of Implementation includes several references to water, many with particular reference to the MDGs, included the added target on access to sanitation.

In the Rio+20 context the challenge of access to clean water and sanitation is one of the main concerns, but also water availability more generally, noting that "increased action is imperative". Furthermore, water is being recognised in broader terms than before with a focus on its role as a cross cutting resource, including as an essential part of the 'Green Economy' and the so called 'water, food and energy nexus'. Within this context suggested solutions have largely moved away from a primary focus on management issues, towards market based approaches, including full cost valuation and pricing, to solve problems around supply and demand.

Furthermore, the Stockholm Statement to Rio+20 from World Water Week 2011 argues that water is "the bloodstream of the Green Economy", and recognises the interconnectedness of water, food and energy as a fundamental priority. It also calls for universal access to water and sanitation by 2030, over and above current MDG aspirations.

UNEP's report "Towards a Green Economy" identifies investment in clean water and sanitation services to the poor as one of the biggest opportunities to speed up the transition to a green economy in many developing countries. Not having access to water is costly, since large amounts of their disposable income have to be spent on purchasing water from vendors, or large amounts of time, in particular from women and children, have to be devoted to collecting and transporting it. In addition, the cost of water-borne diseases, like cholera and malaria, for example, is high. It is estimated that in developing countries, 80% of all illnesses are caused by water-borne diseases. UNEP estimates that under a scenario of an investment of around 0.16% of global GDP per year, water use at the global level could be kept within sustainable limits and the MDG for water could be achieved by 2015.

UNEP argues that a green economy should acknowledge where water is scarce, and manage it carefully, to ensure that use is kept within sustainable limits. The role of water in both maintaining biodiversity and ecosystem services should be recognised, valued and paid for, and the use of technologies that encourage efficient forms of recycling and use/reuse are encouraged. To progress towards the pursuit of green objectives various tools can be used, such as the redesign of governance arrangements, the improved specification of property rights, the adoption of policies that reflect the full costs of use including the costs of adverse impacts on the environment, and through improved regulation. The suggested indicators for tracking progress include the number of people without access to reliable supplies of clean water and sanitation, as well as the volume available per person in a region.

The report recognises that the complex flow of water resources affects water availability and opportunities to manage it. Given the high level of water used by agriculture, while also considering the importance of agriculture, particularly in developing countries, one of the biggest challenges is to find a way to significantly increase the productivity of irrigated agriculture, so that water can be transferred to other sectors without adversely affecting the environment, food security or people's livelihoods. The report argues that gauging the true value of ecosystems, including water, is a key part of the movement towards a green economy, coupled with market-based approaches, as well as consumer driven accreditation and certification schemes. Water entitlement and allocation systems are other options. However, the environment should have rights that are either equal or superior to those of other users of a water resource.

To reduce the cost of a transition to a green economy, the report recommends improvements in governance arrangements, reform of water policies and regulations and the development of partnerships with the private sector. Other key recommendations include the phasing out of perverse subsidies and adopting freer trading arrangements, which are believed to bring benefits to many sectors. In terms of water and sanitation, the report remains decisive on the importance of full cost accounting, but inconclusive on how best to charge poor households for access to water and sanitation services. It concludes that green economies should include commitment to factoring social equity into the transition to arrangements that influence investment and decisions by people and industry, but how this is done largely depends on the context.

## 6. GREEN ECONOMY, WATER AND POVERTY ANALYSIS

The lack of a clear definition of a Green Economy within the Rio+20 context presents a potential hazard in that what is considered 'green' becomes a very broad concept that primarily responds to short term concerns, without adequate analysis of cross cutting issues or social and environmental impacts in the long term. If not managed carefully this could ultimately lead to negative impacts on sustainable development and poverty reduction, including from a water perspective. It is therefore essential to comprehensively analyse potential effects on environmental, social and economic levels, both on short and long term, and across sectors and including the impacts of climate change. This includes strong environmental and social safeguards, with a clear focus on cross cutting water related impacts, as an essential part of a Green Economy.

Green Economy policies should avoid moving into a 'new paradigm' on water, without proper recognition of lessons learned through other water related processes, particularly in terms of poverty related aspects. Integrated Water Resources Management (IWRM) and other similar approaches came through as viable strategies from the Rio process, and other pertinent processes. Implementation has been slow, partly due to lack of political will. However it is essential that they still form a key part of the Green Economy process. The important role of poor communities and other key stakeholders also need to be recognised, not just as beneficiaries, but as key agents and co-creators of positive change. The Rio Declaration and Agenda 21 put local communities, with particular emphasis on women, as a key component of sustainable development and it is essential that this recognition is also reflected in Green Economy policies.

As described above, the UNEP report argues that shifting to a green economy usually involves a commitment to begin charging for the full costs of resource use. The main tension is how to include principles of social equity, including how and what to charge for water and sanitation services, also recognising that this is now a human right. While market based approaches, including a full cost valuation of water, could provide benefits in terms of discouraging over usage, social equity principles are essential to ensure poor communities are not placed at a considerable disadvantage, particularly in a context of increased environmental degradation, competition and conflict over water resources and climate change. Furthermore, while some argue that there is little practical difference between private or public provision of water, attention needs to be paid to the private sector's mandate to maximise profit and implications for poor communities, as this could undermine poor communities' ability to pay. From another perspective, profit maximisation could also lead to encouragement to consume more.

To avoid negative fallbacks of Green Economy policies, principles of social equity must therefore be included, including principles of sustainable development and growth through a human rights framework. Adequate and efficient regulation is also important, as well as ensuring that poor people are involved in decision making processes in order to ensure sustainability and that their knowledge and needs are recognised. This should include women, who are often responsible for water management at a domestic level. The linkages to other poverty related processes must also be recognised. Sustainable and equitable access to water also has impacts on other development related issues, such as gender equality, health, education, food production and work opportunities, all key elements of the MDGs. Furthermore, the potential impact of climate change must be recognised, given that the water cycle will be particularly affected, and could therefore severely undermine any progress if not taken into account. Again, poor people who are the least able to cope or mitigate the effects of climate change and water shortage are likely to be the worst affected.

Progressio Ireland's sister organisation Progressio recently worked with CEPES and Water Witness International to research and publish the report 'Drop by drop: Understanding the impact of the UK's water footprint through a case study of Peruvian asparagus'. The report highlights tensions between large scale agribusiness and water for local communities, which can serve as an illustrative example of the importance of recognition of water related impacts and lessons for a Green Economy. The report illustrates a number of far reaching impacts of the growth of agribusiness, largely supported by international investment, including rapid depletion of the aquifer, and with negative fallbacks for poor and marginalised communities in the Ica Valley and beyond, such as lack of water for drinking and for irrigation.

## 7. RECOMMENDATIONS

The Rio+20 process presents a vital opportunity to reignite progress towards sustainable development, particularly in the light of increased environmental degradation, competition over scarce resources and climate change. The Rio+20 process should be used to strengthen the commitment to the issue of sustainable development.

Water represents a cross cutting and urgent issue that should be at the heart of the Rio+20 process, including as a fundamental aspect of the Green Economy or Green Growth.

Water is not a unique or singular 'sector' and its cross cutting nature must be acknowledged, including the current and potential impacts on poor and vulnerable communities, and with a gender focus. This includes linkages to agriculture and energy, where both short and long term effects must be taken into account, as well as the impacts of climate change.

Social equity and participation must be at the heart of the Rio+20 and Green Economy process, with a focus on sustainable and equitable water resource management. This is also crucial for achieving the MDGs, and should recognise the human right to water, sanitation and a standard of living dependent on access to clean water.

---

## Province of San Luis, Argentina

Province of San Luis, Argentina

RIO+20 Declaration Statement

Major Group: Local Authorities

2012 United Nations Conference on Sustainable Development

The province of San Luis in Argentina considers RIO+20 as a crucial opportunity to reaffirm and renew commitments towards achieving sustainable development, the eradication of poverty and integrating economic, social and environmental pillars.

Whilst it is essential that delegates of RIO+20 provide concrete actions and deliverable targets it must be emphasized that the objective should not be to create new goals. Instead we would like to see a focused agreement that assists the implementation of programs needed to turn existing commitments into reality (the Millennium Development Goals and Agenda 21). With this in mind, and from the perspective of a local government, the following proposals must be considered:

Recognize that local authorities are often under-resourced, under-financed and hence can lack the necessary skills and capacity to develop sustainably despite having the most potential to provide responsive action that is best suited to their local economic and social circumstances;

Recognize the need for a more efficient UN system of reporting and monitoring to remove the administrative and financial burden on local government authorities;

Recognize that with satisfactory resources and training local authorities have the potential to implement concrete solutions to combat poverty and abandon unsustainable practices whilst providing effective environmental governance;

Recognize that the capabilities of local governments must be strengthened to enable the adoption of responsibility and the delivery of policies;

Reaffirm that the green economy is not limited to national policies and/or agendas but instead local authorities have the opportunity to create autonomous regional green economies that provide new jobs, new markets, technological innovation and social empowerment;

Encourage the sharing of knowledge, best practices and technological innovation between local authorities through the development of partnerships between industrialized and developing countries, plus, establishing stronger South-South collaboration;

Encourage better cross-border cooperation between local authorities in trans-boundary resource management, particularly concerning forest and river basin environments;

Emphasize the implementation of long sighted policy-making to ensure a path towards low carbon development and a green economy;

Recognize the importance of collaboration between businesses, local governments, and universities in low carbon development;

Support formalized local private-public sector partnerships that coordinate, finance, and implement shared initiatives and objectives;

Encourage local economic incentives as a mechanism to provide cost-effective investment in green technology and solutions, including energy efficiency and renewable energy;

Emphasize the role of local authorities in the effective enforcement and monitoring of toxic chemicals, using a combination of regulatory and voluntary measures including the removal of environmentally harmful subsidies and the penalization of environmentally contaminating companies;

Emphasize the importance of youth education programs as a tool to create opportunities for social entrepreneurship;

Recognize environmental education as an interdisciplinary study of scientific and social academic subjects and encourage making it a cross component of school curriculums;

Design educational initiatives to develop children as Environmental Natives, recognizing their intuitive physical and cognitive connection towards the environment including their awareness, perception, reasoning, and judgment;

Recognize the importance of citizen empowerment in environmental resource management, governance and monitoring;

Emphasize the role of Information Communication & Technology as an effective tool to:

- Contribute to the monitoring of local resource protection and management;
- Provide adequate access to information regarding the rights and responsibilities of natural resource use;
- Transfer of inter-generational and inter-group cultural knowledge, values and practices;
- Deliver formal and informal citizen education and participation through digital inclusion;
- Strengthen community identity, supporting and empowering self-organizing networks;
- Foster leadership and active engagement in democratic, political processes;
- Encourage South-South local authority collaboration and communication;
- Strengthen the mobilization and training of citizens, in particular, youth groups and marginalized communities;

Promote the use of information technology as a cost effective solution for the coordination and development of infrastructure initiatives;

Ensure City Municipalities prioritize reducing their ecological footprint focusing on waste reduction and recycling, energy efficiency, water preservation, sanitation, sustainable procurement, sustainable consumption and behavior, sustainable planning and design, sustainable public transport, biodiversity conservation, plus, the equal distribution of natural resources;

Recognize the essential role of urban authorities in the reduction of poverty, plus, enhancing public health and quality of life;

Encourage local, sustainable agricultural production to provide better food security and local rural employment;

Recommend that local authorities allocate 2% of the total cost of any publicly funded project towards environmental and social initiatives, and incorporate this method of accounting into their decision making process.

## Provincial Government of Teruel

From Rio 1992 to 2012 and beyond: 20 years of Sustainable Mountain Development - What have we learnt and where should we go?

### Key messages

Since 1992, when chapter 13 on mountains as fragile ecosystems was introduced in Agenda 21, the demand for goods and services from mountains has grown considerably. We assert that mountains are territories with a future and opportunities for Europe and the world. They have much to deliver to society at large and have great potential for smarter, greener and more inclusive development. They are also distinctive areas, because of their altitude, their steep slopes, their low population density, their challenges and their opportunities, and consequently should be addressed specifically. We call for public and private investment in these areas. The return on investment might indeed take longer in these areas than in urban areas or lowlands, but the

investment itself will undeniably be more sustainable.

At the same time, these mountain territories are faced with a number of challenges. Indeed, the ability of mountain systems to provide essential goods and services for all of humanity is increasingly under threat from climate change, globalization, a chronic lack of investment, ongoing land degradation in some areas, the absence of an integrated approach to territorial development in many countries, and increasing trends to the concentration of population in ever bigger agglomerations. We recognize that, despite the progress that has been made in promoting sustainable development in many mountain regions, most national and international development agendas still tend to treat mountains, if at all, as marginal environments. On the basis of its experience in the field of sustainable mountain development, its role in development of mountain policies at European, national and regional level, and its specific economic, environmental and social contexts, EUROMONTANA recommends that the United Nations, in the discussion at UNCSD, to be held in Rio de Janeiro in 2012: recognise the specific role of mountains and the corresponding need for integrated mountain development policies and targeted investment;

recognise in particular the role provided by mountain ecosystems in providing services that support and enhance the Earth's sustainability, and the key role that mountain communities play in delivering these services, by developing concepts of payment and compensation for ecosystem services, and implementing such concepts, and considering the economic value of services provided in the general interest (green accounting), integrate the assets of mountain regions in processes leading to sustainable development and green Economies, recognising that a geographical differentiation is needed; to identify therefore the conditions required to fully unleash mountain development potential and invest to secure that these conditions exist; adopt a multi-sectoral, multi-level and multi-stakeholder approach enabling the UN to direct its Sustainable Development policy towards concrete areas of interest and to identify and strengthen entities for cooperation and the implementation of such policies at the appropriate levels, whether regional, local or mountain range, promote networks and partnerships of mountain stakeholders at all levels (governmental, civil society, private sector) and encourage the relevant national and international organisations to consider mountain-related concerns. to support mountain-specific observation, research, knowledge development and awareness on environmental, economic and social aspects of mountain areas.

### Mountains can deliver green growth

Mountains and their economies are particularly well placed to deliver green growth, due to their rich natural and cultural heritage. They are the water towers of the world and major reservoirs of biodiversity and natural resources. Due to their topography, altitude and large forest areas, the renewable energy potential in mountain regions is superior to that of many lowland areas; though this also represents a challenge for landscape and biodiversity. As mountain agriculture provides many high-quality products and services, including organic or environmentally friendly farming and extensive rangelands, this sector, often in cooperation with others, can serve as a laboratory for the conservation of biodiversity in balance with human use of resources and interest.

Mountains are also among the most exposed to global change. This means that greening the economy is important for mountain economies to reduce their vulnerability and to increase local added value and employment as well as secure synergy between economic growth, environmental protection and social progress.

With their natural and cultural diversity and importance for downstream regions in terms of resources and ecosystem services, mountain areas are important innovation motors in Green Economies, particularly in sectors where they are ideally placed to invent new and promising solutions, such as green transport, renewable energy supplies, life sciences, new forms of food supply chains, sustainable tourism, or remote service delivery.

However, innovative institutional arrangements are urgently required to foster governance models and decision support systems aiming at both the integration of the social, ecological and economic capital at all scales in mountain regions, and the mainstreaming of mountains into overall national development and conservation processes.

This requires in particular:

major investments to assemble the conditions allowing these areas to fully and sustainably exploit their potential, notably in the sectors of environmentally-friendly transport, energy, ICT and services of general interest; a multi-sectoral approach aiming, inter alia, at adequately rewarding the provision of ecosystem services from mountain areas in the general interest, where necessary by correcting market failures related to the specificities of mountain territories. Land managers such as farmers and foresters should, in particular, be equitably remunerated for the provision of public goods resulting from their economic activities .

general support to the development of initiatives adding value to mountain products (food, crafts) and services (tourism...) in relation to their specific cultural and environmental features.

Euromontana has elaborated, in relation to these issues, recommendations on how to remunerate positive externalities provided by mountain land managers; foster the innovation potential of mountain areas; support development of sustainable tourism renewable energies, and services of general interest in mountain areas. It also has developed the European Charter for Mountain Quality Food products, launched at the European Parliament in 2005 and signed by almost 70 governments and organisations. This should lead to the adoption soon of specific protection for mountain food products at European level, opening the way to a specific market segment for mountain quality products, expected by many consumers.

Mountain development can contribute to a more inclusive global development

Enhancing global political commitment that translates into increased investments tailored to mountain regions will directly benefit mountain communities, some of which are very poor, and indirectly humanity as a whole. Mountain regions are likely to contribute widely to social innovation, thanks to their intense community life. Their governance and cooperation models are often unique, but may also provide valuable models for other regions. Furthermore, sustainable mountain development is a component of a more balanced territorial and place-based development which is highly needed and likely to contribute to a more even and socially sustainable distribution of population and wealth on Earth. A more inclusive and place-based approach to development requires the adoption of a multi-stakeholder approach and a multi-level governance approach. Across the world's mountains, the numerous networking entities active at different (governmental, NGO, research level, development agencies...) demonstrate a strong identification in the search for sustainable development solutions for mountains. The dynamism of the Euromontana network, bringing together different sorts of actors at different levels, since its creation in 1996, is a good demonstration of this. The UN can build on the European expertise in this respect – including European networks, inter-governmental conventions such as Alpine or Carpathian conventions, as well as emerging institutions in mountain research and policy development. The UN must also promote the development of multi-level governance. Mountain ranges are functional areas whose geographical extent often overlaps multiple administrative boundaries. Euromontana is convinced that a focus on functional areas such as mountain ranges can help UN Sustainable Development policies to approach environmental and Green Economy challenges on a regional level, according to the Local Agenda 21 concept (thinking globally, acting locally). Hence, sustainable mountain development, notably through integrated and socially inclusive policies, as well as low carbon technologies, should have a prominent place in the Rio 2012 agenda and in particular in its final declaration. To achieve these ends, strong and united advocacy for mountain issues with tangible results in future UNCSD negotiations is essential.

\*\*\*\*

Provincial Government of Teruel (PGT) is the main actor responsible for carrying out a policy of development on the territory it represents. The province of Teruel is an area of 14.809 km<sup>2</sup>, composed by 236 municipalities. It elaborates and implements policies for the sustainable management and development of the territory. Province of Teruel is a low density populated rural territory- 9,8 inhabitants/km<sup>2</sup>- and a high environmental and landscape value that has been notably preserved

abstract

The proposal of thinking the Earth as an immense condominium, mainly aims to take advantage of that already widely tested legal tool of individual and collective interests conciliation, in order to supply a global legal basis capable of globally placing and contextualising instruments and structures that can sustain a new framework of harmonisation between the individual interests of each State and the superior claims of all Humanity.

To achieve a green economy, the constitution of a global common heritage is proposed, which would be managed by an entity capable of accounting for each State's contributions towards the maintenance of the global natural systems. These contributions must be evaluated by a common metric, translatable into a common monetary value.

Using, as a starting point, the proposal to make the climatic system a Common Heritage of Humanity, the intention is to build a global juridic support from which will spring rights and duties that can sustain the construction of a green economy capable of producing environmental services.

The setting up of this heritage aims to solve several complex structural and operational problems, such as the dispersion of benefits and obligations throughout the planet, which originates the 'market gap.' In order to make the settlement of accounts and the institutionalisation of a common interest management operational, an agreement must be reached as to the use of a metric that will translate into units the consumption and supply of collective benefits, also deciding on the common value of each unit.

01

Global Juridic Support

#### 01.1 The need to evolve from the concept of *Common Concern of Mankind*

The UN General Assembly Resolution 43/53 of 6/12/1988, "recognizes that climate change is a common concern of mankind, since climate is an essential condition which sustains life on Earth." The Resolution appeared as a response to the impossibility of applying the classic solution of the 'tragedy of the commons' on this subject, usually obtained by dividing the common assets and privatisation. It indicated a new approach to the Common Heritage of Humanity regime through the concept Common Concern of Mankind. This concept has common roots with the concepts *common interest*, *global commons*, and even *intergeneration equity/responsibility/rights*.

The option of juridic consecration of a problem or concern, such as the *Common Concern of Mankind*, simultaneously means the identification of the problem and the official appeal to its resolution, but it is still not an instrument able to implement solutions. The need to truly address this concern, demands a definition of the generic and undetermined concept of *Common Concern of Mankind*, something rather more palpable than a mere concern existing only in the spirit of human beings.

The evolutionary transformation from a simple proclamation of concern or interest to the construction of juridic objects capable of managing the rights and duties related to the pursuit of the common interests of Humanity has become a pressing need, without which the Law cannot fulfil its primary duty of organisation.

#### 01.2 A Common Heritage to overcome the 'market gap'

The dispersion of the majority of environmental benefits and costs throughout Humanity is identified by the economy as a market gap, since "there is no trade institution where one affecting positively another (or others) receives compensation for it or one affecting negatively another (or others) pays the respective cost." <sup>1</sup>

Concerning the common assets, and specially the global ones, the rights of property are under-defined. The existence of many agents using one resource in these conditions, leads to a market gap, to the inefficient use of that resource and to a special propensity to the excessive use of it.

Carbon or biodiversity green markets are interesting conceptual and experimental labs for the construction of a green economy, but do not respond to the global dimension of benefits and costs diffusely spread throughout the global natural systems. "One global solution to the challenge of sustainability is a prerequisite to a sustainable life, locally and regionally."<sup>2</sup> From the UNGA Resolution 43/53's recognition of climate change as a common interest, we may apprehend that the system where these changes take place, in this case, the climatic system, can no longer be consider *res nullius*, i.e., it no longer has an absence of interest over it and, therefore, it can no longer be freely used.

"The notion of common interest leads to the creation of a legal system whose rules impose duties on society as a whole and on each individual member of the community."<sup>3</sup>

In this context, the Common Heritage of Humanity regime remains the only one capable of supplying an international legal framework suitable to the regulation of goods, which summon us to other dimensions of the Human condition, no longer in the strictly material sense but rather in the qualitative sense, concerning Humanity's well-being.

José Manuel Sobrino comes forward with a concrete proposal: "A formal legal approach to the notion of Common Heritage of Humanity would certainly exclude the vital resources as well as the climatic system itself. However, in my opinion, the evolution of the international community, the patrimonial dimension of these goods, the need for transmission, would allow the application of the fundamental principles of Common Heritage of Humanity, and thus, make them free from any private or State appropriation, accessible to all and managed by an international institution, particularly taking into account the unequal development of the States. In this sense, it can be argued that the climatic system has the dimension of a legacy for Humanity, which involves the idea of transmission of a climate suitable to life, to our generation and future generations."<sup>4</sup>

This option of configuring a global natural system as a *res communis omnium*, i.e., as a common property extended to all Humanity, may become the ground work that will allow the resolution of a series of complex problems, such as the space-time inadequacy of the Law to the new global phenomena and the inevitable 'market gaps' resulting from the undefined property of these global environmental goods. It may also allow the quantification of this common interest, opening doors to the creation of an accounting system of the rights and duties related to this common heritage.

"The environmental wellness is not suitable to a function of exchange and alienation, but rather a function of collective fruition."<sup>5</sup> Many attempts have been made to use market tools to promote the organisation of a function of 'exchange and alienation,' aiming to reach optimum ecological and social levels, integrating the economy and the environment. The fact that no one can be excluded from this 'global collective fruition,' means that all will have access to the improvements introduced in the global common system without paying. In the same way, all are faced with the possibility of bearing with the usage costs of the global natural systems incurred by others. This fact precludes the 'function of exchange and alienation' of a traditional market. The solution lies elsewhere. What is then the part played by the Law in this context? One of the main functions of the Law ought to be organising the collective fruition of goods or global natural systems, which several agents are entitled to use, without any right of excluding other agents.

### 01.3 Immaterial Natural Heritage?

The difficulty of delineating a juridic object related to the interest/concern of Humanity, does not lie with the natural asset intended to be preserved, but rather with the difficulty of defining that asset without clashing with the physical and geographical spaces of the different sovereignties. On the one hand, it is known that the 'laws of nature' exist, that the natural cycles and the global natural systems work, but the discoveries that revealed their global functioning are recent and the mental shift needed to separate these systems from the sovereign spaces has not yet been achieved. On the other hand, there is no juridic object, suitable to the characteristics of that 'environmental wellness' of diffuse and intangible character, that can go beyond concern without overstepping sovereignty. As a result of the chemical composition changes of the atmosphere, changes occur in the oceans; from the interaction between these two systems, changes occur in the dynamics of temperature and energy transmission and distribution and in all the complex network of balances and unbalances that ensure the environmental conditions needed for human well-being. This notion of functional processes in the chemical composition of the atmosphere or the oceans, is never to be confused with the geographical notions of national territory, airspace, exclusive economical zone or even the geographical space of an ecosystem.

Therefore, we are not in the spatial dimension of the State territories, but rather of 'functional systems' whose dimension is always global. The maintenance of these equilibriums, which are the support of human welfare, is the so-called *Common Interest of Mankind*, and its unbalance the so-called *Common Concern of Mankind*. Simone Borg<sup>6</sup> identifies this common interest as a legal status of an intangible common resource encompassing the global common goods.

Thus it seems an immaterial dimension of nature exists, which although existing within a geographical space of the planet, is beyond the physical space of the sovereignties and of the physically appropriable material goods.

The assignment of a patrimonial dimension to the climatic system, as proposed by Sobrino<sup>7</sup>, not only allows the deterritorialisation of nature, but also the individualisation of the natural function, isolating it from the concept of sovereignty, since the functional dimension goes beyond the notion of aerial, maritime or terrestrial space and enters the intangible realm of nature, which, for all effects and purposes, is where we find the Common Concern of Mankind. This 'immaterial' nature, because it unites us all, is the essence and the true Common Heritage of Humanity.

02

Common metric

### 02.1 The need for a common metric

The first step towards this integrated management will be finding a measure, acceptable to all, that can translate into units the consumption and the availability of the collective welfare achieved through the several global natural systems. For that, it is fundamental to previously solve the problems of using various methodologies, of the biological and spatial differences between distinct geographical units, and of the differences between the several ecological services provided by the different ecosystems. A system is also needed that can solve the problems of the services appropriation impossibility and of the free access and non-exclusion with regard to the whole human community.

### 02.2 The global hectare, the ecological footprint and the biocapacity

The Global Hectare, by the Global Footprint Network, has not only the virtue of including, in the same metric, the different impacts on the ecological system through the ecological footprint (debit), but also of incorporating the benefits of the ecological services through biocapacity (credit). This tool is already accepted and recognised today as a metric being used internationally. It is already being used as a tool for the implementation of public policies, as it happens in the European Union. It is a metric usable on the local, regional or global scale, allowing the interchange of information. The global hectare, as the measuring concept it is, has not only the advantage of compatibility with an Immaterial Natural Heritage of Humanity, but it can also obtain balances that may enable the settlement of accounts.

### 02.3 A green economy that produces biocapacity

In this factual process of globalisation, it is pressing to reach a consensus on the need to develop an economy that can operate in harmony with the 'common home,' thus serving human beings. It is expected that the Rio+20 Summit will be the beginning of an accelerated but thorough process of global transition towards an economy that generates growth, generates employment and eradicates poverty, by investing on and preserving the natural capital upon which our long-term survival is based.

"Considering, however, the state of degradation the environment has reached, intergenerational responsibility should go further: it is no longer sufficient to leave the environment to future generations as it was received, it is necessary to recover the quality of the environment, reaching close to optimal levels." 8

Ultimately, building a green economy is more than reducing pollution, developing green technologies, improving ecoefficiency and trying to organise the 'function of exchange and alienation' of the rights of pollution, with all its perverse effects. Building a green economy is also maintaining and recovering the natural capital, introducing in the international relations accounting and in the GDPs, the positive contributions of each intervener in the global system, allowing, in this way, the existence of incentives to the recovery of the planet's biodiversity to sustain human life.

We know that, at this point, we would need 1.5 planets to ensure the replenishment of resources consumed, which means that the demand for these environmental services is 0.5 times higher than the supply. If the environmental services are vital for Humanity's welfare, why is this economy incapable of producing and distributing them according to demand?

8 Aragão, Maria Alexandra de Sousa, O princípio do poluidor pagador, pedra angular da política comunitária do ambiente, Boletim da Faculdade de Direito, Universidade de Coimbra, Coimbra Editora, Coimbra 1997, p-31

03

Common value

### 03.1 The need for a common value

The option of using the same metric for demand and supply, which allows a reading of the local contributions to the planet, makes it possible to declare that each biocapacity unit (global hectare) made available by the common natural systems, provides equal benefits to all Humanity. Therefore, the economic compensation awarded to cover the provision costs of each global hectare must be identical all over the planet. This is also key for the building up of trust and reciprocity.

While it is true that a value for the vital services is being sought after, despite its incalculable value, it is also true that "the perception of the lack of correspondence between the derisory market value and the supreme real value, must be seen as an incentive to reach a value closer to reality, rather than as a hindrance towards valuation, for fear that the calculated value will fall short of the real one. (...) In short, the timidity in assigning a monetary value to the elements of nature has as consequence the continued exploitation of resources at zero or close to zero cost, which, from a resource preservation point of view, is certainly worst than the assignment of a price, no matter how low or sloppy it may be." 9

How can a value be found to compensate those who provide ecological services of common interest?

Concerning the supply of environmental services, what is proposed is the quantification of the provision costs for the indirect benefits performed by the common natural systems. We wish to know how much it costs to offer a biocapacity unit, which is a benefit used by all at a global level, and that is directly related with the maintenance/recovery of the ecosystem's good condition.

As a starting point, that value should be obtained from several ecosystems in different countries, and that should be the key data for the political process of reaching a price. Since we understand from the start that the payment of the ecosystem's services will never cover their real value, what must be aimed at, is finding a more adequate value to perform a compensation for the services of common interest.

Plus, given the economic and exchange differences between countries, the common value may also be an appropriate tool to respond to the historical differences between countries with regard to the consumption and use of the global natural systems. It may also provide a more balanced distribution of the financial resources between the rural and the urban worlds.

### 03.2 The Ecological Fiscal Reform

The compensation for the benefits performed in the common natural systems, implies a broader view on economy and on the tax system itself, since this new financial compensation cannot be achieved by adding new taxes to the existing ones. The transition to a green economy entails the construction of a fiscal system that ensures a redistribution of profits based on each one's positive and negative contributions towards the common interest. In other words, that on the one hand, it penalises the impacts on the environment, on the other hand, it encourages the performance of collective benefits. These proposals are based on the conviction that there must be a decrease of taxes on labour and an increase of taxes on the impacts on the environment, i.e., on the consumption which translates into the ecological footprint.

9 Aragão, Alexandra, A natureza não tem preço... mas devia. O dever de valorar e pagar os serviços de ecossistemas. Estudos de

Homenagem ao Professor Jorge Miranda. Outubro 2011.

04

Governance of a Common Heritage

When speaking of assigning an economic value to the ecological services, the immediate association is that it will be necessary to transform them into tradable products and that a conventional market will have to be created. This is not the correct approach because we are speaking of free-access goods and a conventional market cannot be used to manage goods of which consumption no one can be excluded. Since all countries consume and provide ecological services that are reflected on the global natural systems, only by obtaining the balance between the total supply and consumption, can an agreement be reached where everyone's interests are safeguarded. A permanent supply and demand management will be necessary, and it ought to be performed by an institution within the United Nations. The environment is not a tradable product, but rather an asset to be maintained.

### 04.1 Settlement of accounts of a limitless common heritage

Nowadays it is already possible to define those limits within which the conditions for human life are maintained and which boundaries should not be overcome. This limit of the Earth's natural system itself must be understood as "a specific point related to a global-scale environmental process beyond which humanity should not go."<sup>10</sup> This notion of boundary will be a normative judgement, informed by science, but greatly based on the human awareness of risk. If the value of this heritage is measured by the capacity of the Earth's natural system to ensure human living conditions for the future generations, in this case the climatic system, the safe and proper value of the inherited heritage would correspond to the CO<sub>2</sub> concentration in the atmosphere. A heritage with an appropriate value would be 350ppm.

The Earth Condominium, by juridically separating the sovereignty of each State from the common natural systems, proposes a global juridic support that will allow the creation of an accounting of each one's contributions towards the regular functioning of these systems and the creation of a management system, which we consider to be the best structural conditions to overcome this 'social trap.'

With this theoretical/conceptual scenario as a starting point, we propose the structured combination of the various existing solutions, to which some improvements and adaptations would be made, giving them the integrated dimension of a necessary path of structural reform to build a human green economy.

## Rat für Nachhaltige Entwicklung

### Preamble

The German Sustainability Code is a standard offering transparency as to a company's sustainability performance. It creates a scope of validity by applying benchmarking to corporate social responsibility. Its application is voluntary. The commentary provides details on the application of the GSC.

The German Council for Sustainable Development strives to see the German Sustainability Code applied well beyond the group of companies already actively engaged in sustainability reporting. It will critically monitor the application of the GSC.

The German Sustainability Code arose during a dialogue process involving numerous stakeholders. Representatives from the financial markets, businesses and civil society actively participated in the dialogue process. Businesses have field-tested the German Sustainability Code and found it to be highly practicable.

### Content of the German Sustainability Code

#### STRATEGY

##### Strategic Analysis, Strategy and Goals

1 The company discloses how, for its main activities, it analyses the opportunities and risks related to sustainable development. The company outlines what measures it is taking in order to operate in line with the main and recognised sector-specific, national and international standards.

2 The company discloses how the strategy devised for its main activities and the systematic implementation of the strategy takes into account all aspects of sustainability which have a substantial impact on the company, for example strategic competition-based positioning, innovation management, business activities that conserve the climate, environment and resources; demographic developments, the value-added chain, the product life cycle, the product portfolio, etc.

3 The company discloses what qualitative and/or quantitative as well as temporal sustainability goals are set and operationalised, and how their level of achievement is monitored. The company discloses how the main suppliers, employees, capital markets, customers and main stakeholder groups are included on a regular basis.

4 The company states how deep into the value-added chain the sustainability criteria are verified and what significance sustainability has for added value.

*Key performance indicators (KPI) GRI 1,2 Description of key impacts, risks, and opportunities*

or

*EFFAS 1.5.1. The company should outline the importance of ESG for the corporate strategy and explain how ESG aspects are taken into account when implementing the strategy.*

#### PROCESS MANAGEMENT

##### Rules and Processes

1 Within the company, accountability for the sustainability of the company is specified in corporate management.

2 The company discloses whether the sustainability strategy is implemented using rules and processes. The company depicts specific circumstances from purchasing, production, services, human resources, investment, research and development as well as logistics/transport and marketing and describes how suppliers, customers as well as other stakeholder groups (e.g. employees) are taken into account.

3 The company discloses how, along the lines of financial parameters, key performance indicators on sustainability are integrated into periodical internal planning and control and how the reliability, comparability and consistency of data applied to internal controls and external communication are safeguarded through appropriate processes.

##### Incentive Schemes

8. The company discloses how target agreements and remuneration schemes for executives are also geared to achieving the sustainability goals and how these are geared towards lasting value creation. It discloses the extent to which sustainability performance forms part of the evaluation of the top management (board/managing directors) conducted by the monitoring body (supervisory board/advisory board).

##### Stakeholder Engagement

9. The company discloses how the relevant stakeholders are identified, how a dialogue takes place with them on a regular basis and how they are systematically integrated into the sustainability process.

place with them on a regular basis and how they are systematically integrated into the sustainability process.

**Innovation and Product Management** 10. The company discloses how innovations in products and services are enhanced through processes which improve sustainability with respect to the company's utilisation of resources and to the user. A further statement is made as to whether the economic, social and ecological effects of the company's main products and services are currently or will be assessed and improved through its value-added chain and product life cycle.

*Key performance indicators (KPI)*

*GRI EN6 Initiatives to provide energy-efficient or renewable energy based products and services, and reductions in energy requirements as a result of these initiatives.*

*GRI EN26 Initiatives to mitigate environmental impacts of products and services, and extent of impact mitigation.*

*GRI FS11 Percentage of assets subject to positive and negative environmental or social screening.*

or

*EFFAS E13-01 Improvement rate of product energy efficiency compared to previous year.*

*EFFAS V04-12 Total investments in research on ESG-relevant aspects of business such as*

*e.g. eco-design, eco-efficient production processes, decreasing impact on biodiversity, improving health and safety conditions of employees or supply chain partners, consulting on integration of ESG aspects in change management, development of products to exploit ESG opportunities etc. in monetary terms*

*i.e. currency as a percentage of revenue.*

*EFFAS V04-13 Percentage of products or services for -increasing eco-efficiency of client applications or operations, -developing and using clean technologies, -increasing fuel-efficiency, -offsetting climate change, carbon emissions, resource depletion, -making ESG-relevant products operable, -financing of ESG-relevant products or services.*

## ENVIRONMENT

### Usage of natural resources

11.The company discloses the extent to which natural resources are used for the company's business activities (input and output of e.g. materials, water, soil, waste, energy, emissions, land, biodiversity). It discloses in what way the sustainability management system incorporates the entire product life cycle into the analysis.

12.The company discloses what qualitative and quantitative goals it has set itself with respect to the efficient use of resources, the use of renewable energy sources, the increase in raw material productivity and the reduction in the usage of natural resources and how these goals have been met.

## Reality of Aid Asia Pacific

**Asia Pacific CSO Statement on Development Cooperation for Sustainable Development** 15-17 August 2011 Bangkok, Thailand

### Introduction

Poverty and marginalization have increased significantly through multiple crises in food, employment, environment and economy, fundamentally exposing the failure of the free market model of development. The systemic proportions of these crises have not only aggravated the situation of the poor and marginalized but also threatens to further worsen their conditions as the financial crisis centered in the advanced countries continues to unravel with severe consequences for the rest of the world.

Rather than seize the opportunity presented by the current crisis to break from the failed neoliberal development strategy that has dominated official policies and programs for over three decades, political leaders are making a renewed push for corporate-led growth of the global economy. We in civil society urge our governments and international institutions to abandon the current model of development in favor of new approaches that are people-focused, rights-based, democratic and ecologically sustainable. In simple terms this means a model of development that directly responds to the people's needs – including realizing their right to food, land, free education, and access to health services and overall human development. A radical transformation of existing power relations within and among countries lies at the very basis of such a new system.

The 4th HLF in Busan presents an opportunity to reform the existing aid architecture to embrace sustainable and people-centered development approaches, which is essential in pursuing a new development path and abandoning the failed models of the neo-liberal era. Only by empowering the poor and marginalized to claim their rights can a development path be built that is both successful in alleviating poverty and sustainable in the long term.

Reforming the ODA regime requires strong political will, drive and leadership to take on entrenched interests and inertia. Civil Society Organizations (CSOs) play a crucial part in the reform process representing the voices and carrying the demands of the impoverished and marginalized. Consequently, if Busan is to achieve any meaningful result there is a need to first reaffirm the crucial role of civil society as development actors in their own right, while strengthening their roles and increasing their space in development processes through institutional changes.

In fulfilling these roles and claiming their space, CSOs around the world are calling on donors and governments gathering at Busan to:

1.

Fully evaluate and deepen the Paris and Accra commitments through reforms based on democratic ownership.

Strengthen development effectiveness through development cooperation practices that promote human rights standards and focus on the eradication of the causes of poverty and inequality.

Affirm and ensure the participation of the full diversity of CSOs as independent development actors in their own right.

Promote equitable and just development cooperation architecture.

In addition to these CSO Key Asks, civil society from the Asia Pacific that gathered during the Regional Conference on Development Models: Promoting a Transformative Agenda on Sustainable Development in Bangkok, Thailand from August 15- 16, 2011 are also calling for the following:

### On Private Sector for Development

The current thrust towards inviting private sector participation in development – including through private-public partnerships (PPP) – must not erode government's obligation to ensure the right to development of the people.

Private sector involvement in ODA-funded programs and projects should be development effective. At the minimum, private sector actors in development should abide by existing standards on human rights, accountability and transparency.

PPPs should focus on public goals including poverty eradication, social equity and environmental protection rather than the pursuit of private profits.

Private sector participation in development should be subjected to public scrutiny and accountability. There should be democratic people's participation at every stage from needs identification, risk assessment to project or program implementation and evaluation.

Public funds and aid money that go to the private sector should promote sustainable livelihoods and catalyze productive economic development of small-scale enterprises and cooperatives that provide direct and immediate benefits for the poor and marginalized.

#### **On Climate Finance (CF)**

CF must be development effective. The parameters for financing for climate justice and environmental justice must be defined within the frame of genuine sustainable development, biodiverse ecological agriculture, human rights and genuine peoples' participation especially of marginalized sectors including indigenous peoples.

CF should be over and above traditional aid flows (development aid) and it should be adequate and predictable

The World Bank should not be allowed as manager/trustee of the Green Climate Fund. The greening process should not be used as a tool to impose policy prescriptions.

No to market-based mechanisms, including carbon trading and ODA-financing for large scale biofuel production that adversely impacts the environment

Governance of CF should be democratic, participatory, transparent and focused on the global South.

#### **On South – South Cooperation (SSC)**

South-south cooperation or cooperation among developing countries should: 1) ensure the well-being and development of the people of cooperating countries; 2) follow existing international frameworks and conventions on human rights; 3) observe transparency and accountability and ensure people's meaningful participation throughout the undertaking.

Strengthen the UN's role in monitoring and setting norms for SSC. The role of other stakeholders including parliaments and other elected bodies should also be strengthened.

SSC should prioritize cooperation on common issues and problems of peoples of the South such as hunger, poverty, migration and climate crisis, among others.

People's cooperation and people's solidarity efforts should be supported by governments as part of South-south cooperation (SSC)

#### **Conclusion**

There is an urgent need for a development model that would provide enduring solutions to the systemic crisis that beset us today. Development policies in the past have been guided by the free market paradigm, evade redistribution of wealth and ignore the social dimensions of development. Its failure to deal with recent crises has emphasized the need for a development model that prioritizes people's well-being.

Given these challenges, the HLF in Busan must advance to development effectiveness, and tackle other urgent development challenges confronting the world today. To have lasting relevance, Busan should usher in a new development cooperation architecture that is inclusive, democratic, equitable, sustainable and just. CSOs have a crucial role in ensuring that these calls are heard and that Busan truly contributes to eliminating the causes of poverty and promotes people's sustainable development.

---

## **Research Program on Law and the Environment - (PDMA)**

### **NORMATIVE RECOMMENDATIONS FOR RIO + 20**

The recommendations in this document are the result of preparatory meetings and online public consultations conducted and organized by the Research Program on Law and the Environment - (PDMA) at Getulio Vargas Foundation School of Law in Rio de Janeiro (FGV DIREITO RIO). These initiatives include: the Rio+20 International Preparatory Meeting, held on 24 and 25 June 2011. This preparatory meeting was entitled: "Green Economy in the Context of Sustainable Development: Governance of Public and Private Stakeholders", and resulted in a book compiled by Carina Costa de Oliveira and Rômulo S. R. Sampaio. Two other initiatives included: the Online Forum for Sustainability regarding Rio+20 (<http://riomais20.direitorio.fgv.br/>), which received contributions from around the world debating issues relating to governance and green economy divided in 70 topics. Lastly, it is worth mentioning PDMA's participation in The Access Initiative - a network of nongovernmental organizations that works with the implementation of Principle 10 of Agenda 21 designed to address the issues of access to information and public participation.

Several partnerships were crucial to organizing those initiatives and continue to be important as we get closer to the official debates during the Rio+20. The organizations participating with PDMA in these endeavors are: Centre International de Droit Comparé de l'Environnement, Pace University and Brazilian American Institute for Law and the Environmental (BAILE), the The Access Initiative, Núcleo de Estudos e Pesquisas do Senado Federal Consultoria do Senado, Escola da Magistratura do Estado do Rio de Janeiro, Academia Paranaense de Direito Ambiental, Ministério Público da União, PUC-Goiás, Universidade Católica de Brasília, Uniceub, Universidade Federal do Pará, IEDC - Instituto Estudos Direito e Cidadania, Mackenzie-SP, Prefeitura do Rio, CEDA, NKF Advogados, Tribuna Animal, CEDAM, FEMPERJ, PUC-São Paulo, IBRADA, and Universidade Estadual do Amazonas. In addition, professors, researchers, and professionals, who are not part of the above mentioned institutions above mentioned, participated in the development of the set of proposals. They are all cited at the end of this document.

Some recommendations are made on the general topics of the conference based on the following major subjects: 1) Definitions, 2) Sustainable Trade and Investments, 3) National and International Governance, 4) National Institutional Framework for Sustainable Development, 5) International Institutional Framework for Sustainable Development. In each topic recommendations are divided in of national and international scope.

### **GREEN ECONOMY IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT AND POVERTY ERADICATION**

#### **1)Definitions**

##### **a) Important aspects for Green Economy concept**

1) The need for internalization of social and environmental negative externalities. Policies promoting internalization of negative externalities include, but are not limited to, building reliable methodologies for natural resources valuation and working with tax incentives to encourage sustainable practices (PDMA).

2) Defining social goals and creating objective criteria to achieve them within the context of a "green economy". These goals include: job expansion, consumption decline, promoting more sustainable and housing guarantees. Relevant policies would promote sustainable public expenditure, enable green regulation and encourage public investment in priority areas (PDMA).

3) In relation to green economy, it is observed that the more this analysis is divided into sectors, the easier policies that could encourage the construction of "green" perspective can be identified. Each specific area, such as construction, tourism, biodiversity, energy, cities, enjoys its own set of peculiarities. The concept of green economy

could be taken from the sustainable progress of each economic sector (PDMA).

4) "There should be an environmental concern on the macroeconomic policy design. The decisions related to interest rate, trade balance and the adjustments to be made in the trade balance are used to induce the production / import / export of certain products. Each of these products contributes differently to maintain an ecologically balanced environment. So we must be concerned with the regulation of microeconomic aspects such as the internalization of externalities through tax incentives or parafiscal taxes, but also, and perhaps with even greater force, we should be concerned with the macroeconomic aspects of regulation as the establishment of mandatory parameters that prevent the adoption of macroeconomic policies potentially harmful to the environment "(Arivaldo de Souza).

#### b) Important aspects for sustainable development concept

1) Identifying general criteria for sustainability from a definition given by each country. Each country can send to the UN Secretariat for the Rio+20 its definition of sustainable development. This proposal stems from disparities between economic, social and environmental development of each state. Each one must identify how it can contribute to the present and the future of those from the following generations.

#### 2) Opinion on the relevance of the concept of each State:

"A concept is an abstraction that is used to intellectualize a complex issue. Thus, it is possible to explain the complexity of reality that becomes more accessible. However, the risk that comes with the use of a concept is the simplifying and trivializing of it. It can be regarded as the perfect mirror of reality. It is a methodological and scientific error. Many times the same happens to the concept of sustainable development. People who work on this issue want to universalize and standardize the concept. As a result, they destroy the content of sustainable development. The principles of sustainable development must be implemented by each state. Each State has its own level of development, its economies and its society. Therefore, they are different and have neither the same goals, nor the same means to accomplish their goals. Environmental considerations, for instance, do not have the same value in each state. In this sense, what is sustainable development for a State is not necessarily the same thing to another State. So in this sense, it is not useful to have a single definition of the concept of sustainable development. In practice, every State knows its needs within its development. Thus, it can decide its policies according to its reality. Finally, it is useful to emphasize a last point. The final receptors of development and sustainable development theories – humans – are sometimes forgotten and neglected by those working on these issues. Their realities are so complex, so different that it is difficult to understand how a theory of sustainable development can be created without some practical studies. Moreover, these theories are often built in offices, in few hours. This is one reason why sustainable development has little practical effect "(Nitish Monebhurrin).

#### 3) Opinion on the debate:

"Ultimately, Planet Earth is bearing the benefits or the burden of how effective a theory of sustainable development is built". The Planet's environment must be balanced in order to provide for a harmonized relationship between humans and other creatures that, combined, form the biota. That is the question of sustainable development. Furthermore, sustainable development is a political concept which aims to establish the grounds for dialogue between different stakeholders. The answer for sustainable development is "Shall we all talk? What are the terms? The question that may be asked is what are the parameters to developing each political entity and what are the parameters of sustainability?" (Arivaldo de Souza).

#### 2) Investments and Sustainable Trade

##### a) Forests

##### International Recommendations

1) Adopting a treaty dealing with forests (Luciane Martins de Araújo).

2) Increasing the input of financial resources in order to provide for the recognition and payments for environmental services, using the Global Environmental Facility as a model. (Luciane Martins de Araújo).

3) Strengthening and harmonizing existing environmental certifications (José Antônio Tietzmann Silva).

4) Including recommendations for environmental damage under the Human Rights Council and UN Councils or Commissions of the Regional System of Protection of Human Rights (José Antônio Tietzmann Silva).

##### National Recommendations

1) Implementing monitoring mechanisms and instruments through voluntary and coercive measures. (Fernando Meneguim).

2) Implementing policies and measures to combat deforestation (Fernando Meneguim).

3) Implementing state incentives for environmental preservation, and opening up the process for public and private participation (Fernando Meneguim).

##### REDD:

4) Use annual fluctuations in the opportunity costs in forested areas, rather than carbon stocks (Virgílio Gibbon).

5) Unifying the credit registries of all the states into a single registry office to avoid double valuations of credits on the national level (Virgílio Gibbon).

6) The need to incorporate the concept of opportunity cost in the search for solutions to the issue of native forests deforestation (Virgílio Gibbon).

7) Establishing a REDD+ regime demands that the rights and duties are clear not only in national but also in international levels (PDMA).

8) Local participation and transparent processes of defining access to benefits and allocation of REDD+ resources are crucial for guaranteeing effective governance (PDMA).

##### b) Renewable energy

##### International Recommendations

1) Specifically, a framework convention on renewable energy could include: a) Establishing a renewable energy list classified according to economic criteria (cost of production, levels of energy demand, the necessary resources for its production, levels of importation, exportation, capacity to create jobs, etc) and environmental (rate of substitution of fossil fuels, environmental impact, carbon balance of the production process, etc.) (Meryem Deffairi).

b) Establishing a binding target, "a minimum" of renewable energy in 10 years for developed countries and in 15 or 20 years for developing countries (obligation of result,

leaving the states free of the means used to achieve this) and finally integrate the planning requirements for each state. (Meryem Deffairi).

c) Providing a mechanism for financial sanctions applicable in 10 years, and every five years, depending on the level of renewable energy in each state, by paying a fine to an independent international institution responsible for "re-injection" of funds in development projects of technology for renewable energy production. (Meryem Deffairi).

2) Instead of discussing a new institutional framework, we should question the function and capacity of action undertaken by the International Agency for Renewable Energy established in January 2009 (IRENA <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade).

#### National Recommendations

1) States should be Memberships in the International Agency for Renewable Energy established in January 2009 (IRENA - <http://www.irena.org/home/index.aspx?PriMenuID=12&mnu=Pri>) (Priscila Pereira de Andrade).

2) Regulating ethanol in Brazil - implement the Regulation on Conformity Assessment for Ethanol Fuel, signed by Brazil, the purpose of which is to define criteria for evaluating the intrinsic properties of ethanol, considering established technical standards, and assessing social and environmental requirements applicable to the production process, based on labor and environmental laws in Brazil and abroad (PDMA).

3) Adopting government policies to encourage transition from energy sources based on fossil fuels to renewable energies (Luciane Martins de Araújo).

4) Implementing, through local government, legislation and regulations that promote the use of renewable energy (Luciane Martins de Araújo).

5) Giving preferences in the process of granting intellectual property rights to renewable energies that would favor developing countries (Luciane Martins de Araújo).

6) Facilitating the acquisition of patents, given the need for investment in renewable energies precipitated by recent weather events (Luciane Martins de Araújo).

7) Reducing tariffs and establish subsidies in order to implement technologies used to produce renewable energies as well as to reduce their cost and increase production (Luciane Martins de Araújo).

8) Promoting public policies aimed at reducing consumption in order to reduce consumer power demand (Luciane Martins de Araújo).

#### c) Biodiversity and compensation mechanisms

#### International Recommendations

1) Producing a judicially manageable definition of biodiversity and give it legal standing in the international arena (Jessica Makowiak).

2) Creating international compensation mechanisms for loss of biodiversity and their criteria (Jessica Makowiak).

3) Bolstering the notion of compensation with recognized principles of international and environmental law (the precautionary principle, "polluter-pays" principle). Such relief or compensation may also be injunctive (Jessica Makowiak).

4) Ranking priorities in order of the intensity of the threat to biodiversity, the possibility of preventing losses, and of compensation. (Jessica Makowiak).

5) Limiting compensation actions where projects do not cause major or irreversible reduction of biodiversity (Jessica Makowiak).

6) Defining, classifying and prioritizing compensation arrangements in the context of biodiversity (Jessica Makowiak).

7) Providing in the texts of such laws or agreements means of compensation and provisions for monitoring, surveillance and control (Jessica Makowiak).

8) Imposing sanctions for instances of noncompliance with measures for monitoring and their effects (Jessica Makowiak).

9) Accessing compensation practices at the institutional level (which actors are appointed to decide, implement and monitor compensation measures) (Jessica Makowiak).

10) Identifying means of channeling economic resources allocated to biodiversity conservation towards biodiversity-rich developing states (Luiz Gustavo Bezerra).

#### d) Green Private Contracts

#### International Recommendations

1) Promoting the inclusion of social-environmental clauses and prohibit "stabilization" clauses in order to enable the adoption of standards in the area of private law for human and environmental rights ratified after the signing of agreements (Sílvia Pinheiro).

#### e) Technology Transfers

#### International Recommendations

1) Promoting funding mechanisms for the acquisition of clean technology in developing countries (Renata Calsing, Maria Marinho and Carlos Henrique Rubens Tomé Silva).

2) Establishing a fund that allows the purchase of clean technologies considered relevant to environmental protection (Renata Calsing and Maria Marinho).

3) Recognizing the need to stimulate the creation of collaborative platforms for clean technology licenses (Renata Calsing and Maria Marinho).

4) Promoting discussion on the adaptability of a mandatory license allowing access to clean technologies and discuss other mechanisms of transfer (if the invention improves upon existing technology or reduces production costs, the company holding the license will exercise its exclusive right in order to differentiate itself in the market. Therefore, the incentive to transfer technology through licensing will only be effective if states establish mechanisms to compensate the private sector holder or co-holder of protected technologies that impact environmental protection) (Renata Calsing and Maria Marinho).

#### f) National and international trade systems

1) Investing U.S. bonds certificates that comprise the international reserves of BRICS members (Brazil, Russia, India, China and South Africa) in funds managed by the shareholders (Virgilio Gibbon).

2) Developing rules for the Investment Fund regarding the possibility of issuing a "Green Currency" up to value of its assets. The Green Money shall only be applied to actions or funding of sustainable projects of countries that agree to be beneficiaries of the Fund (Virgilio Gibbon).

3) Accede to a Shareholders Agreement that accords the Green Currency the same treatment given to the U.S. dollar today. In other words, it is computed as international reserve and gives rise to the issuance of corresponding domestic currency (Virgilio Gibbon).

4) Adopting social and environmental indicators on the stock market. Examples: Domini 400 Social Index (DSI), Dow Jones Sustainable Index (PDMA).

#### g) Sustainable Production

1) Creating a coordinated consumer products policy based on the evaluation of the environmental impact of products throughout their life cycle. Fostering discussion between the public and private sectors on the subject of producing more effective measures and lowering costs (PDMA).

2) Promoting the idea of corporate social responsibility throughout the entire production cycle, including: local communities, paid employees, shareholders, business partners, suppliers, consumers, and public authorities (PDMA).

3) Sustainable financing - direct funding for specific areas: such funding would benefit some communities or disadvantaged municipalities by granting loans through local development banks in deposits, with rates equal to or below the market price (PDMA).

#### h) Sustainable Consumption

1) Responsibility of individuals and companies for their sustainable consumption (PDMA).

2) Consumer protection against misleading advertising by companies through notices that detail environmental protection or certifications related to Corporate Social Responsibility in their Codes of Conduct (PDMA).

3) Creation of a website specializing in the exchange of information and tips on environmentally friendly products and companies (NKLF Lawyers Association).

#### i) Sustainable Construction

##### International Recommendations

1) Adopting of a statement of principles for sustainable construction at the Rio +20 Conference (Luiz Gustavo Bezerra).

##### National recommendations

1) Creating financial incentives (benefits and tax exemptions) for sustainable products and technologies to be used in construction (Luiz Gustavo Bezerra).

2) Creating a government website for the commercialization of sustainable technologies and products (Luiz Gustavo Bezerra).

#### j) Exploitation of Genetic Resources

##### International Recommendations

1) Ratification of the Nagoya Protocol and the Nagoya-Kuala Lumpur Protocol, ensuring the implementation of the ABS regime and the liability regime for damages in the case of transnational movement of GMOs (Solange Telles da Silva and Tarin Frota Mont'Alverne).

2) The Right to access information on biotechnology and nanotechnology (Solange Telles da Silva).

3) Requirements for independent studies on the risks and adverse effects on human health and the environment before genetically modified organisms are made available for human and animal consumption (Solange Telles da Silva).

4) Requirements for monitoring after such GMOs are made available on the market and for the publication of these studies (Solange Telles da Silva).

##### National recommendations

1) It is important that countries have the legal tools necessary to access these resources effectively and benefit from sharing in a fair and equitable manner, especially after the adoption of the Protocol of Nagoya (Tarin Frota Mont'Alverne).

3) Green Economy in the Sustainable Development context: Governance and Institutional Framework

#### a) State Liability

##### International Recommendations

1) All Signatories shall promote sustainable management, especially within the government administration (Maria Augusta Ferreira).

2) Sustainable management means one that is conducted with transparency, accountability, and in an ethical manner, with public participation and respect for the concerns of interested parties (stakeholders – employees, customers, suppliers, society, and government), human rights, and the environment (Maria Augusta Ferreira).

3) Respect for the environment in public administration is founded on the following pillars: environmental education, sensible use of resources, proper disposal of waste, sustainable public procurement, and a healthy work environment (Maria Augusta Ferreira).

##### National Recommendations

1) The environmental responsibility of federal, state and local entities includes, beyond liability for damages, a responsibility to prevent damages by reducing the environmental impact of state activities, through the adoption of sustainable management practices (Maria Augusta Ferreira).

#### b) Companies Liability

##### International Recommendations

1) Creating guidelines that impose strict liability on companies for environmental damages caused by those companies, with joint and several liability between both parent companies and their subsidiaries (Carole Peychaud).

2) Having an Agreement on "Rights and responsibilities of market players" with guidelines such as: (PDMA)

a) Minimum criteria, which would constitute the basis for the Code of Conduct for Companies (obligations and their subjects must be precise and clear) (PDMA).

b) Creating an obligation to produce annual statements that consider environmental and social criteria; (PDMA).

c) Promoting imperatives for voluntary certifications obtained according to the standards of ISO, for example (PDMA).

3) Environmental conventions containing provisions for conflict of laws and jurisdictional conflicts, giving preference to the laws and courts that could best grant relief. Examples of rules (PDMA):

a) Conflict of laws:

1) In the case of compensation for environmental damage, the rule most favorable to the victim and to environmental protection should be applied; 2) if there exists environmental insurance, the law on the rights of the insured should be applied, 3) in case of environmental damage, the law of the jurisdiction of the parent company may be applied if it has control over the activities of its subsidiary.

b) Conflict of jurisdictions: (PDMA)

1) The victims of environmental damage may choose the court most expedient for the granting of relief, for example: based on the proximity of the evidence;

2) If the parent company has control over the activities of its subsidiary, the jurisdiction of the parent company will be competent to hear the case;

3) A multinational corporation may be sued in the court of the domicile of the defendant. If the defendant is a corporation, the domicile of the defendant may be found in any of three places: a) where the company has been incorporated, b) the location of its headquarters, or c) its principal place of business.

#### Specific Recommendations for International Law of Investments

1) The integration of clear environment protection provisions in international investment agreements: the future investment agreements or the renegotiation of existing agreements should include specific provisions on environment protection. These provisions can consider (Nitish Monebhurrn):

(i) The definition of an investment activity: The activities of those companies which are constituted without knowledge of domestic environmental laws should not be qualified as an investment and therefore should not benefit from the protection of the investment agreement. The international investment agreement provision on the definition of the investment must underscore this point. The agreement must state that the investor has a duty to check, examine and understand the legal framework of the host state, especially the one applicable to the environment, so that it shall start and conduct its activity accordingly.

(ii) The definition of the environment: Environment is not an abstraction and in the vein of the previous proposition, some details must be available to define or to identify what is to be understood by environment. It might be a complex task to give an exhaustive definition but it is not impossible to give a list of indicators. These indicators may vary from one state to another.

(iii) Affirming the right of states to regulate according to their environmental concerns: compensation is usually provided in case of exploitation. For example, expropriation with environmental motives should have a specific status and the compensation for this kind of expropriation should be designed to give legitimacy to the objective of environment protection.

(iv) The legitimate expectations of States: The agreement must declare that States have a legitimate expectation that private companies investing on its territory will always act in good faith in order to collaborate with them, whenever environmental goals are concerned. Therefore, private companies have a duty to act accordingly and must not frustrate these expectations.

2) The integration of clear rules of conflict in international investment agreements: emphasizing the prevalence of environment protection norms over investment protection norms (Nitish Monebhurrn):

(i) The principle: Whenever there is a potential conflict between the investor's or the investment's protection and the environment protection, the investment agreements must present clear rules of conflict. The investment agreement can assert that whenever an investment protection provision is in conflict with an environmental norm, the latter shall prevail over the former. As environment protection is a unanimous goal which is fundamental, it must be a priority.

3) Promoting the use of the systemic integration principle (Nitish Monebhurrn):

(i) The principle: Hereby, agreements should declare that international investment law is not isolated from the rest of international law and that the interpretation of an international investment treaty does not exclude references to other non-investment norms, like environmental norms. This is in agreement with article 31(1)(c) of the Vienna Convention on the Law of Treaties. Hence, environmental norms can be integrated in international investment dispute settlements. They can be invoked by states and will have to be taken into consideration by arbitral tribunals.

#### National Recommendations

1) Implementing and publicizing the system of National Contact Points in the OECD so that companies can be questioned about their actions by society (PDMA).

2) Controlling the private activities through: 1) creation of precise sustainability criteria which companies should present; 2) mandatory presentation of these criteria, and

3) Government oversight of the information published. These criteria may be based on the GRI (PDMA).

c) Financial Institutions Liability

1) Organizations, whether public or private, national or international, which finance or support activities or projects which pollute the environment or may potentially pollute the environment shall require the submission of all documents relating to the environmental licensing of the project financed by them and issued by responsible controlling agencies, under penalty of becoming jointly liable for any effects arising from the violation of this Act or its regulations (Bruna Acerbi).

2) In addition, an environmental cost-benefit analysis must be taken into consideration, defining the aims of a project and identifying its impacts, defining them according to their relevance and measurement in physical units, as well as appraising them in monetary terms. (Luiz Borges)

3) Experience from a Brazilian financial institution on incorporating socio-environmental criteria into institutional and management policies of credit allocation: "Itaú Unibanco has a Socio- Environmental Risk Policy which sets out the internal guidelines for the identification of socio- environmental risks of the projects<sup>1</sup> to be financed. Consequently, Itaú Unibanco has a specialized multidisciplinary team, which (i) accesses the socioenvironmental conformity of the project and that of the potential corporate client, (ii) issues
